 141. What do you pay for your return goods from Narrabri? About 25s. per ton.
 142. Then it costs you more for return goods than for what you send from here? Usually; but that is not the average price.
 143. Is it usual for a carrier to charge more for a return load? As far as my experience goes it is.
 144. What is the average you are paid per ton? About 30s.
 145. What had you to pay whilst the Carriers' Association was in existence? About £2 10s. a ton. During the last two seasons the wool has been carried for £1 per ton.
 146. What is the average weight of your fleeces? About 6½ lb.
 147. How is your place watered? By tanks. There is no bore nearer than Woolabra and Bulyeri.
 148. Has boring been tried? No.
 149. Has there been any agitation for one? Yes; at a point about 10 miles from here.
 150. Do you think there is any possibility of bores being a success in this district? I think they would be.
 151. What is the reason the agitation to which you have referred has not been successful? It could not be successful until the passing of the Artesian Wells Act.
 152. Is the soil good enough to grow wheat or hay? Not generally. The land does not seem to be suited for agriculture. I may state that there are large settlements to the north and north-west from Millie,

Millie, and all their wool would be loaded at a siding in the vicinity of Millie if the proposed line were constructed. The fact of there being closer settlement in the locality means that there will be a great quantity of back loading. Commencing at Millie to a point about 17 miles north-west—Minna Minane—there are altogether about twenty holders, occupying about 70,000 acres of land, which has a carrying capacity of about 55,000 sheep. They give upwards of 900 bales of wool, or 130 tons.

153. Is any of that area under cultivation? No; there are also to be made available in the near future about 12,000 acres on Minna Minane and Cumbadalong.

154. When land is thrown open in this district, is it usually well applied for? A larger number apply than there are holdings for.

R. Boland.
16 May, 1898.

Alexander Donaldson, manager, Bunna Bunna Holding, sworn, and examined:—

155. *Mr. Hassall.*] How far is Bunna Bunna from Millie? Twenty-five to 30 miles west.

156. What is the area of Bunna Bunna? 130,000 acres. It carried 82,000 sheep. The wool is carried to Narrabri, and is sent from there, *via* Newcastle, to Sydney. Generally a man contracts to take it to Narrabri, the rate to which place is 2s. per cwt. The back loading costs 1s. 6d. per cwt.

157. Are there many settlers on Bunna Bunna? There are a good many on old Bunna Bunna. Any land made available is eagerly competed for. I can corroborate the evidence of Mr. Boland. I think the construction of the proposed line would be a great benefit to the country.

158. What description of stock are generally sent in? Principally sheep; I frequently send 15,000 away per annum. They are generally trucked at Narrabri. I also truck about 1,200 bales of wool per annum.

159. Do you look upon this as a good, sound sheep country? Yes; it is very free from disease, and it is admirably suited for settlement.

A. Donaldson.
16 May, 1898.

Charles John Hamilton, selector, Moomin, sworn, and examined:—

160. *Chairman.*] Where is Moomin? Twelve miles from Millie in a northerly direction.

161. How far are you from the proposed line? About 14 miles.

162. How far are you from the Moree line? About 20 miles.

163. What is the area of your holding? 2,800 acres. My brother, however, has three selections, and altogether I represent 12,000 acres.

164. What does the country carry? About a sheep to 1½ acre.

165. Are you cultivating anything? No.

166. Have you any intention of doing so? Yes. I think the country will grow hay, but I do not think it will grow wheat.

167. Are you on the plain country? Partly.

168. Where do you draw your stuff at present? Last year we took it to Gurleigh siding, 26 miles, and paid £1 a ton. If I went straight across from my place the distance would be 20 miles, but the charge per ton would not be reduced. Although the railway would save me 6 miles carriage, its construction is not quite so vital to me as to others; but in my opinion it would be a good line to construct in the interests of the district and the Colony. I have heard the evidence of Mr. Boland and Mr. Robertson, and I can corroborate it.

C. J.
Hamilton.
16 May, 1898.

John Herbert Duff, selector, Millie, sworn, and examined:—

169. *Chairman.*] Have you heard the evidence of Mr. Boland, Mr. Donaldson, and Mr. Hamilton? Yes.

170. Do you believe their evidence to be correct? Yes.

171. What is the area of your holding? A little over 3,000 acres.

172. Where does your wool go to? To Narrabri, and thence to Sydney by train and boat.

173. Do you wish to add anything to the evidence which has already been given? No, excepting that the construction of the line would save road carriage to those in the district.

J. H. Duff.
16 May, 1898.

Thomas Joseph Boland, selector, near Millie, sworn, and examined:—

174. *Mr. Hassall.*] I believe you are one of the family of six brothers? Yes. We hold adjoining selections. We have 8,000 acres near Millie, and 5,000 acres at Mulgyer. We depasture about 7,000 sheep.

175. Do you corroborate the evidence of Messrs. Roger Boland, Duff, and Hamilton? Yes.

176. Have you anything to add on your own account? No.

T. J. Boland.
16 May, 1898.

Robert Cameron, selector, Pidgee Pidgee, sworn, and examined:—

177. *Mr. Fegan.*] Where is Pidgee Pidgee? Sixteen miles from Millie.

178. What is the area of your holding? I and my brothers hold 5,000 acres.

179. How many sheep do you run upon it? About one sheep to the acre, although at present we have 8,000 sheep upon it.

180. Where do you send your wool? To Sydney, *via* Narrabri.

181. How many miles is your holding from Narrabri? Fifty.

182. What do you pay for carriage? £2 a ton, and the same for back carriage.

183. How far is the proposed railway from your holding? It runs through it. I have a statement in regard to the holdings from Waterloo Creek extending into Boolcarrol Station—J. H. Murphy, Jews' Lagoon, 20,000 acres and 200 bales of wool per annum; C. Macfarlane, 4,000 acres and 40 bales of wool; James Duff, 11,000 acres and 200 bales of wool; J. Frazer, 2,000 acres and 24 bales of wool; Philip St. Wilson, 8,000 acres and 100 bales of wool; Cameron Bros., 5,000 acres and 70 bales of wool; D. and D. Cameron, 6,500 acres and 50 bales of wool; M. F. Fingleton, 5,000 acres and 50 bales of wool; J. Small, 5,000 acres and 50 bales of wool; G. R. Watson, 3,500 acres and 40 bales of wool; J. and J. Hunt, 3,500 acres and 40 bales of wool; Jacob Hunt, 2,560 acres and 30 bales of wool; W. Hunt, 1,280 acres and 20 bales of wool. I should like to mention that the holdings farthest west have often brought their wool this way when the river water has been out on the Knowley-road.

R. Cameron.
16 May, 1898.

- R. Cameron. 184. What distance is the furthest holding from Boolcarrol? Twenty miles. I contend that there is a necessity for the railway to be constructed because near the stations west the ground is flooded, and it is impossible for the produce to get to Narrabri by any other way but Millie. I may state that a settler named Watson has put 30 acres of wheat under crop this year.
- 16 May, 1898. 185. Has he grown wheat previously? No; but he has grown hay and got very heavy crops.
186. Where is Mr. Watson's holding? About 23 miles from Millie. I may state that he grew a few acres of corn last year.

John Vaughan Wilson, selector, Thalaba, sworn, and examined:—

- J. V. Wilson. 187. *Mr. Hassall.*] How far is your holding west of Millie? Twelve miles. I hold 8,000 acres, carrying about 8,000 sheep.
- 16 May, 1898. 188. Can you corroborate the evidence of Mr. Cameron? Yes.
189. Where do you send your wool? To Narrabri; thence to Sydney by Newcastle or Morpeth; the rate of carriage is about 2s. per cwt. each way.
190. Do you know the country lying west? Yes; right down to Collarendabri.
191. Do you look upon the country further west as being as good as your own? About the same.
192. Were you here during the flood of 1890? Yes; I lost a number of sheep during that flood.
193. Is much of the country to which reference has been made low-lying? No, not much of it.
194. Does that road between here and Collarendabri follow the highest ground? I think so, with the exception of the Tiber, 12 miles from here.
195. What is the greatest depth of water you have ever seen there? About 2 feet.
196. How far is it from your holding to Woolabra? It will be 28 miles when the direct road is opened.

1898.

Ebenezer Doust, retired civil servant, Paterson	88
Edward John Cann, storekeeper, Paterson	89
George Studdert Waller, grazier and dairyman, Wollarobba, Dungog	89-93
Thomas Randles Whitehouse, wardsman, Dungog Hospital	93-94
Thomas Irwin, farmer and grazier, Bandon Grove, near Dungog	94-96
Joseph Abbott, grazier, and Mayor of Dungog	96-97
Walter Bennett, journalist, Dungog	97-100
Frederick Augustus Hooke, grazier, Dungog	100-101
Edward Piper, storekeeper, Dungog	101-103
Samuel Stanley Kingston, farmer, Bandon Grove, near Dungog	103
William Orr Skillen, Dungog	104-105
John Alexander Jones, butcher, and alderman of Dungog	105-106
Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works	106-109
Charles Percy Thomas, solicitor, Stroud	109-111
Gordon Lancelot Andrews, bank manager, Stroud	111-112
James McIntyre, storekeeper, Stroud	112-113
Andrew McNeill, butcher, Stroud	114
Thomas Sydney Magner, postal assistant, Stroud	114
Charles Westley Cripps, C.P.S. and Land Agent, Stroud	115-116
Alexander Thomson Lawrie, grazier, Rawdon Vale, near Gloucester	116-120
Rue Bergin, licensed surveyor, Dungog	120-122
John Notley, creamery proprietor, Barrington River	122-123
Angus Beaton, farmer, Barrington	123-124
Norman Bell, farmer, Barrington	124, 125
John James Gallagher, hotel proprietor, Krumbach	125-127
James William Gossip, farmer, Rosedale, near Stroud	127-128
John Thomson, Mayor of Taree	128-131
Ernest Frederick Meares, bank manager, Taree	131-132
Henry Winter Flett, grazier and farmer, Taree	132-135
Peter Anthony Muscio, farmer, Puffleet, near Taree	135-137
Thomas Burnham Boyce, journalist, Taree	137-139
Robert Cox, Cundletown	139-140
James Levick, retired builder, Dumaresq Island	140-141
Henry John Cornish, dispenser of medicine, Cundletown	141-142
James Collins, farmer, Dumaresq Island	142
William George Everingham Smith, farmer, Dumaresq Island	142-143
Moritz Ahronson, storekeeper, Cundletown	143-144
Hector Gollan, Tinonee	144-145
William Smith, saw-mill proprietor, Tinonee	146
Harry Josling Hammond, storekeeper, Wingham	146-149
William Wallace Stewart, contractor, Wingham	149-151
William Fotheringham, hotelkeeper, and Mayor of Wingham	151
Andrew Peter Gillogly, farmer, Marlee, near Wingham	151-153
John Abbott, retired farmer, Woolla Woolla, near Wingham	153-154
Henry Deane Walsh, District Engineer, Newcastle	154-155
Michael Fagan, landowner, Kendall	155-156
John Moore, farmer and grazier, Kendall	156
William McGrath, Port Macquarie	156-157
Henry James Perrett, saw-miller, Kendall	157-158
David Laughlin, farmer, Camden Haven	159
Alfred Brooks, Resident Engineer, Camden Haven	159-160

APPENDIX.

Sworn statement by Thomas Dykes, Cooperbrook.

PLAN.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM MAITLAND TO TAREE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Maitland to Taree," have, after due inquiry, resolved that it is not expedient the proposed railway should be constructed; and, in accordance with the provisions of sub-section (IV) of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

DESCRIPTION OF THE PROPOSED RAILWAY.

1. The proposed railway, which is regarded officially as a section of the North Coast Railway, and is 113 miles 66 chains in length, leaves the Great Northern line at 20 miles 47·24 chains from Newcastle and about half-a-mile north of West Maitland Station, and, proceeding northerly, it crosses the Hunter River about 4 miles from its junction with the Paterson River, and follows up the valley of that river until it reaches the township of Paterson. There the Paterson River is crossed, and the line continues its northerly course to about 40 miles from Newcastle in the parish of Fingal, where the direction becomes north-easterly, and, after passing over the Wallaroba Range, Dungog is reached. At Dungog the Williams River is crossed, and, at between 59 and 60 miles from Newcastle, the railway, still maintaining a north-easterly direction, surmounts the Monkerai Range and proceeds to the Karuah River. Crossing this river the direction of the line changes to almost due north, and continues so to Avon Station, 96 miles from Newcastle, and thence down the Avon Creek and Gloucester or Barrington River, past the township of Gloucester. The Gloucester River is followed to near its junction with the Manning River, which is crossed at about 112¼ miles from Newcastle, near Wingham, and the line, keeping on the north side of the Manning, passes through the township of Wingham to Taree, where it ends at a distance from Newcastle of 134 miles 33·24 chains. The heaviest grades on the route are 1 in 60, and the sharpest curve 12 chains radius. As the country is intersected by several ranges and rivers, six tunnels and a good many large bridges are required.

THE NORTH COAST RAILWAY—HISTORY OF THE PROPOSAL.

2. As far as the records of the Department of Public Works show, the North Coast Railway was first advocated in September, 1882. The necessity for constructing a line of railway from Maitland to Morpeth northwards was urged upon the then Minister for Works, and approval being given to a survey between both Maitland and Morpeth and Taree a survey was commenced in 1884, and completed in 1886. In the latter year the Minister for Works was again interviewed on the subject of the railway, and a promise was given that the matter should have full consideration and

and be laid before the Cabinet, the Minister at the same time expressing the opinion that if a railway were made it would to a great extent obviate the necessity for spending large sums of money in keeping open the entrances to the North Coast rivers, although they would, no doubt, have to be kept open to some extent. No further step in regard to the railway appears to have been taken until 1889, when an exploration of the surveyed line was made with a view to improving it where desirable. The following year the Acting Engineer-in-Chief for Railway Construction forwarded to the Minister a report in which he pointed out that the North Coast Railway seemed naturally to fall into three sections:—

1. From the main North Line to the Manning.
2. From the Manning to Coff's Harbour.
3. From Coff's Harbour to Grafton.

With regard to No. 1 section, the surveys made follow two main routes—(a) which starts from Morpeth, and proceeds *viâ* Seaham, Bulladelah, and Larry's Flat to Wingham; (b) which starts from Maitland, *viâ* Paterson, Dungog, Gloucester, and Larry's Flat to Wingham. The (a) route, it was explained, might be cheaper than route (b), but there were serious objections to it. The Hunter would have to be crossed at a point where it is navigable, and the traffic would be blocked unless an open bridge were built; river traffic at Seaham would be interfered with for the same reason; and the country generally which the line would pass through is poor, with only a few small patches of good land. On the other hand, (b) route starts from West Maitland, and would cross the Hunter above navigation; the rivers generally along the route would be more easily crossed than those on the (a) route, and navigation upon them would not be interfered with; and generally the (b) route was preferable. A revised survey of this route was then carried out, and an estimate of cost prepared, this amounting to £1,378,925.

In 1891 the Railway Commissioners were asked to report upon the project, and they did so, to the effect that the matter had been carefully inquired into, and there appeared to be no prospect for many years of the line proving remunerative. At this point the proposal rested until October, 1892, when it was again brought under the notice of the Minister for Works; but it was not until 1897 that any further definite action was taken by the Minister. In September of that year, verbal instructions were given to the Engineer-in-Chief for Railway Construction to prepare estimates, &c., with a view to obtaining another report from the Railway Commissioners; and the estimate of 1891, for the first section of the line, Maitland to Taree, having been revised, and reduced to £982,283, the Railway Commissioners reported, and the proposed railway was referred to the Public Works Committee.

RAILWAY COMMISSIONERS' REPORT.

3. The Railway Commissioners' Report is dated 24th November, 1897, and they do not recommend the line. Their estimate of the annual cost is £49,468—interest on capital expenditure at 3 per cent. £29,468, and cost of maintaining permanent-way and traffic and locomotive expenses £20,000; and the traffic estimate is £18,000—live stock and goods £10,000, and coaching and mails £8,000. The difference between cost and earnings is £31,468.

The question of the proposed construction of the line, they say, was most carefully considered by them. They personally went over the greater portion of the route and visited the surrounding country, and not only had the benefit of exhaustive information placed before them by local residents at the various centres, but in addition had obtained reports from their officers upon the traffic and other matters bearing upon the prospects of the line.

In estimating the probable revenue it has been necessary, they state, to give special consideration to the effect of the water competition which would be encountered throughout the greater portion of the district to be served by the railway. "It is true," their report states, "that the water service is at times somewhat precarious, and there is a generally expressed opinion among the residents that it is not satisfactory; yet it must be fully recognised that freight charges and fares are, as a whole, even now much less than those which could be quoted in connection with the proposed railway, and would, no doubt, be considerably reduced if such a course became necessary to retain the traffic." Notwithstanding

Notwithstanding the advantages attached to regularity and speedy transit by rail, as compared with the present water route, the Commissioners feel satisfied that the bulk of the produce of the district would remain with the steamers. "For perishable freights," they say, "such as cream, butter, fruit, poultry, &c., and stock—particularly calves and pigs—the advantage of quick transit by rail would probably operate largely in favour of that method of carriage, and a liberal allowance has been made in this connection in estimating the revenue"; but as regards the supply for general merchandise to the district, there is no reason to assume that it will be diverted from the steamers, except perhaps to the extent of some low-freight goods.

With regard to passenger traffic, the Commissioners state that it is doubtful whether it would be largely secured, the steamer fares generally being now considerably less than could be charged by the railway. "As with the goods," the report states, "there will be the advantage of regular and speedy transit, and in addition the opportunity of avoiding the discomfort of a sea-voyage; nevertheless, it cannot with any degree of safety be assumed that the passenger traffic would be generally secured." Briefly summarising the question, the Report proceeds:—"It may be stated that the districts would be vastly benefited by the facilities usually afforded by a railway, but the traffic generally would only go to it when water carriage could not, with advantage, be made use of. This has been the experience in connection with all other lines where water competition exists.

ESTIMATED COST.

4. The estimated total cost of the proposed railway for a single line only, tunnels and large bridges to be constructed accordingly, is £982,283, or an average of £8,629 15s. 4d. per mile. By dividing the line into three sections it is found that the most expensive portion is that between Gloucester and Taree, a length of 41 miles 43 chains, the average cost per mile of which is £9,784 6s. 4d. Next to this is the section, from West Maitland to Dungog, 32 miles 63 chains, the average cost per mile of which is £8,440 13s. From Dungog to Gloucester, 39 miles 40 chains, the average cost per mile is £7,572 12s. 8d. The estimate for earthworks in the three sections is £331,874 19s.; for large bridges, £126,007; for culverts and timber bridges, £96,655 11s. 6d.; and for tunnels, £58,625.

THE COUNTRY THROUGH WHICH THE RAILWAY WOULD GO.

5. A previous paragraph describes the route of the railway. It is necessary, however, to describe also the class of country through which the line is located.

Adjacent to the Hunter River, around Maitland, the character of the country is so well known that it requires no description in detail. An outlet for the produce of the Maitland district is already provided for by the Hunter River and the Main Northern Railway.

After leaving the alluvial flats at Maitland, and proceeding towards the River Paterson, the country, although considerably improved by occupation, and containing occasional belts of good land, cannot be regarded as other than second-class grazing country. On the Paterson, although there are good flats suitable for cultivation, they are limited in area; much the greater portion of the country consists of hardwood ridges. Taking the country as a whole, the same description applies, for all general purposes, to the land in the neighbourhood of the Williams, Karuah, Avon, and Gloucester Rivers. In places the flats widen out sufficiently to form good agricultural areas, but in many others rough hardwood ranges extend right down to the banks of the rivers and creeks. In the vicinity of Gloucester there is a fair area of both agricultural and pastoral land. Between the hills there are, in places, narrow brush valleys; but, generally speaking, the country as a whole, from the Hunter flats to the Manning River, excepting the alluvial flats on the banks of the rivers and creeks previously mentioned, may be described as land not likely to be sought after, nor such as will give an adequate return for the expenditure of labour. Evidences of cultivation and genuine settlement away from the river flats are infrequent. In addition to this the line, for about 50 miles, passes through the estate of the Australian Agricultural Co.; and, with regard to the intentions of the company respecting this land, and the question of devoting it to other purposes than that to which it is at present put, it is impossible to form
OTHER

OTHER MEANS OF COMMUNICATION.

6. For the first 12 miles from Maitland, as far as Paterson, the country may be regarded as served by the Great Northern Railway. At Paterson the river of that name furnishes sufficient depth of water to enable river boats to trade there from Newcastle, and even if the proposed railway were constructed the possibilities of water-carriage between Paterson and Newcastle are such that it appears very probable that the river boats would prove successful competitors against the railway line.

Dungog, which is a centre of some importance, finds its outlet at present by about 14 miles of road-carriage to Clarencetown, from which place the Williams River is navigable for river boats sufficiently large to deal fairly well with the present produce of the district. Such freights might be charged on the railway as would attract to the line a portion of the trade of Dungog and of a considerable district lying up the Williams and its tributaries; but in the opinion of the Committee, neither in this instance nor in that of Paterson, even if the trade were obtained, would there be sufficient to justify the construction of the line.

Stroud, the next centre contiguous to the railway, finds its chief outlet by way of Booral Wharf, on the Karuah River, about 12 miles of road-carriage connecting the township with the wharf, from which there is water-carriage to Newcastle or Sydney, *via* Port Stephens. In this case the trade of the place is insignificant, and the competition by water communication such as would be likely to keep the trade from the railway.

At Gloucester, and north therefrom, including the mining district of the Barrington, the road-carriage is sufficiently far to render it probable that the traffic connected with this portion of the country would be obtained by the railway; still, after investigation, the Committee are of opinion that the amount of such traffic would be too small to justify the construction of a railway through a large tract of privately owned and unproductive country, a very great proportion of which is not possessed of those qualities necessary for speedy and profitable development.

Krambach, a settlement distant about 25 miles by road from Gloucester towards the Manning, is separated from the surveyed railway route by a considerable distance of broken country; but even with the railway adjacent to the settlement it is probable that almost the whole of the produce of the district would still go to market by the route at present adopted, which is by road 10 miles to Bullock wharf, on the Wollumba River, and thence down that river, *via* Forster and Cape Hawke, to Sydney. Droghers drawing 6 feet of water can load at Bullock wharf, and improvements are in progress which eventually will enable light-draught steamboats to proceed up the river.

From the Manning River itself a consideration of the rates likely to be charged on the railway, compared with the present cost of ocean transit, makes it clear that the main portion of the produce of the district will continue to find its way to the metropolis by water, as it does at present.

Although the line referred to the Committee terminates at Taree, it is regarded primarily as a portion of the North Coast Railway. The Committee, therefore, en route to Port Macquarie, made inquiries with regard to an extension of the line northwards from the present proposed terminus. Except along the rivers and creeks, the country, as far as the Macleay, may be regarded as inferior for either agricultural or grazing purposes, and although there are magnificent forests of timber, which, for many years, will probably be the source of the main exports from the outlying portion of these districts, there are already in existence for this traffic cheaper means of transit than could be offered by a railway.

In addition to what has already been said of the manner in which the trade requirements of the various centres between Maitland and Taree are served, it may be mentioned that the Government are spending £5,000 on harbour works at Camden Haven, and that a dredge is clearing the Camden Haven River as far as the crossing of the Northern Road, at which place, in the near future, there will probably be a permanent depth of water in the river of about 6 feet. This will provide an outlet which will enable the water-borne traffic from the district to reach Sydney so much more cheaply than it could be conveyed by the proposed railway, that it is hopeless to expect that the railway, if constructed, would be much used.

It may be mentioned that the roads throughout the district are excellently maintained.

INDIFFERENCE

INDIFFERENCE REGARDING THE RAILWAY.

7. During the visit of inspection and inquiry which the Committee made along the route of the proposed railway, a feeling of indifference on the part of a large proportion of the residents of the districts traversed was very pronounced. Only at Dungog, Gloucester, and the towns on the Manning was any particular interest shown in the matter; and, at Taree, it was admitted that the line could not be expected to pay unless it were regarded as a section of the North Coast Railway, and the railway as a whole were constructed. At some places presumed to be interested, it was difficult to find witnesses who cared to take the trouble to come forward and give evidence on the subject. Everywhere the estimated cost of the line excited astonishment at its magnitude, and it was generally admitted that a railway upon which so large an expenditure would be incurred could not possibly for many years be expected to pay; though at the same time it was suggested that the prospects of the line would be improved if it were extended beyond Taree. Even on the Manning the most that could be said in its favour was that it would be used by the farmers and other shippers of produce for perishable goods. All other goods, it was admitted, would go by water, which is by far a cheaper route than the railway. Passengers to Sydney, it was stated, would be much more numerous than they are now, from the fact that the uncertainty of the trips by water and the discomforts of the voyage deter many from going; but it was not proved to the satisfaction of the Committee that the passenger traffic on the railway would be considerable, and it was evident that it could not be regarded as sufficient to justify the construction of the line. When asked which was the more desirable, or the more important to the district, the railway or the improvement of the Manning entrance, the residents of the river were unanimously of the opinion that the improvement of the water communication with Sydney was the work more urgently required and likely to be the more beneficial.

THE COMMITTEE'S RECOMMENDATION.

8. The Committee are of opinion that the proposed railway should not be constructed, for the following reasons:—(1) Because the country as a whole along the route is not capable of profitable development; (2) there are means of communication already in existence for conveying the produce of the various portions of the districts concerned to market at lower rates than could possibly be charged by the railway; (3) the large expenditures proposed at the entrances to almost all the waterways will further improve the present means of transit; and (4) the population to be served along the route, which is somewhat distant from the road and water communication available, is comparatively unimportant.

RESOLUTION PASSED.

9. The Committee have passed the following resolution:—

“That, in the opinion of the Committee, it is not expedient the proposed Railway from Maitland to Taree, as referred to the Committee by the Legislative Assembly, be carried out.”

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 6 July, 1898.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM MAITLAND TO TAREE.

TUESDAY, 22 FEBRUARY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the expediency of constructing a Railway from Maitland to Taree.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Vice-Chairman.*] Do you desire to submit any statement to the Committee? Yes; I have prepared a statement for the information of the Committee, which I will now read:—

R. R. P.
Hickson.

Department of Public Works, Sydney, 1 February, 1898.

22 Feb., 1898.

NORTH COAST RAILWAY.—SECTION, WEST MAITLAND TO TAREE.

As far as our records show, this line (*i.e.*, the North Coast Railway) was first advocated in September, 1882, when Mr. Young and other Members of Parliament urged upon the then Minister for Works, Mr. Lackey, the necessity for constructing a line from Maitland or Morpeth northwards. The Minister approved of a survey being made, and the portion between both Maitland and Morpeth and Taree was commenced in 1884 and completed in 1886.

On 17th June, 1886, a deputation consisting chiefly of Members of the Legislature waited upon Mr. Lyne and asked that arrangements for the construction of the North Coast Railway might be hurried on. The deputation represented in strong terms the extent and fertility of the districts through which the proposed line would pass, and the isolation from the metropolis and from suitable markets of the large population was condemned. Many of the farmers, they said, could find no suitable market for their produce in consequence of the rivers, their only present means of conveyance, being closed by bars, and it was no uncommon thing to see thousands of bushels of corn rotting on the wharfs because there was no means of carrying it away. The deputation further stated that there was a large extent of cedar brush and good valuable land which only required communication with a market to render it capable of sustaining a large population. In support of their representations, the deputation quoted certain statistics from which it would appear that the line right through to Grafton would tap districts containing an area of 16,060 square miles and a population of 51,782 souls.

Mr. Lyne, in reply, said it seemed to him that if a railway were made it would, to a great extent, obviate the necessity for spending large sums in keeping open the entrances to the rivers although they would, no doubt, have to be kept open to some extent. The Minister concluded his remarks by stating he would gladly recommend any railway that would pay and afford facilities to producers, and that he would give full consideration to the matter and lay it before his colleagues.

No definite step appears to have then been taken, but in the meantime there appears to have been considerable controversy as to the question of route, and in July, 1889, Mr. T. R. Firth, Assistant Engineer for Railways, was deputed to make an exploration of the survey line with the view to making any improvements in same.

Mr. Deane (Acting Engineer-in-Chief for Railways), in forwarding this report for the Minister's information (27th February, 1890), stated that the North Coast Railway seems naturally to fall into three sections.

1. From the Main North Line to the Manning.
2. From the Manning to Coff's Harbour.
3. From Coff's Harbour to Grafton.

With regard to No. 1 section, which is now before the Committee, the surveys follow two main routes, viz:—

- "A" which starts from Morpeth and proceeds *via* Seaham, Bulladelah, and Larry's Flat to Wingham.
- "B" Which starts from Maitland *via* Patterson, Dungog, Gloucester, and Larry's Flat, and Wingham.

With regard to these routes, Mr. Deane pointed out that, although the construction of "A" may be cheaper than that of "B," there are serious objections to it, viz., that the Hunter must be crossed at a point where it is navigable, and the traffic would be blocked unless such an objectionable structure as an opening bridge were built; river traffic at Seaham would be interfered with for the same reason; and the country generally that the line passes through is poor, with only a few small patches of really good land. On the other hand, "B" route starts from West Maitland and crosses the Hunter above navigation; the rivers Paterson, Hunter, Williams, and Karuah are crossed more easily than on "A" route; and navigation is not interfered with, &c. "B" route was therefore in general direction recommended for adoption.

The revised survey of "B" route was commenced in September, 1890, and completed in June, 1891, and following is an estimate of it which was prepared by Mr. Deane in September, 1891.

Section 1. West Maitland to Dungog, length, 32 miles 63 chains; estimated, cost £382,869, or £11,677 per mile.

Section 2. Dungog to Gloucester, length, 39 miles 40 chains; estimated cost, £419,519, or £10,621 per mile.

Section 3. Gloucester to Taree, length, 41 miles 30 chains 80 links; estimated cost, £576,537, or £13,931 per mile.

Total for whole line, £1,378,925 for a length of 113 miles 53 chains 80 links.

Upon this estimate being submitted to the Minister (Mr. Lyne) he asked the Railway Commissioners to report, and in reply (21 December, 1891) they stated the matter had been carefully inquired into, and a responsible officer had gone over the route proposed, but there would appear to be no prospect of a line for many years being remunerative.

R. R. P.
Hickson.
22 Feb., 1898.

Nothing further appears to have been done until October, 1892, when a deputation representing all the coastal districts between Sydney and the Queensland Border, consisting of Messrs Young, McKinnon, and other Members of Parliament, waited upon Mr. Lyne and urged the submission of the first section of the North Coast Railway to the Public Works Committee.

Mr. Young, in introducing the deputation, pointed out that all along the North Coast there were large centres of population; that the soil was so rich, and the rainfall so regular, that the coastal districts would make homes for millions of people. He also stated that the transmission of produce by sea was found to be dearer in many cases than it would be by rail where entrance to harbours and rivers was bad, and that under the system which the Minister (Mr. Lyne) was introducing in the Public Works Act—namely, an improved betterment principle—the cost of the line would be small. The deputation thought it would be better for the whole line to be submitted to the Public Works Committee instead of in sections, so that they should see the advantage the line would be to the country, although they did not ask that it should be undertaken at once.

The Minister, in replying, said it must be understood that it would be practically impossible to undertake this line with any probability of completing it under many years. The rough cost of taking it through to Grafton was about 3½ millions. Personally he was in favour of the line; but if it were submitted as a whole he would have to make it clearly understood beforehand that it was submitted as a whole simply to establish the principle of its construction, and that only a certain amount would be spent each year in the construction of the line by degrees, &c. As regards the richness of the soil through which the line would pass, he thought it scarcely worth while to impress that fact upon anyone, as it was generally recognised that the soil was excellent. The principle trouble, Mr. Lyne said, was money; but he promised to consult the Cabinet on the matter.

It was not until September, 1897, that any further action was taken in connection with proposal (although the construction of the line had been repeatedly urged in the meantime) when the Minister verbally instructed the Engineer-in-Chief for Railway Construction to prepare estimates, &c., with a view of obtaining a report from the Railway Commissioners upon the matter.

The estimate of 1891 was revised and the cost reduced from £1,378,925 to £982,283, or £8,629 15s. 4d. per mile, and the papers were thereupon forwarded to the Railway Commissioners who reported as follows:—

Sydney, 24 November, 1897.

Proposed Railway Line, West Maitland to Taree, 113 miles 66 chains.

“In accordance with the provisions of the ‘Public Works Act of 1888,’ section 13, we beg to report as under:—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of a single line of railway (exclusive of land and compensation) at £982,283

Annual Cost—

Capital expenditure at 3 per cent. £29,468
Cost of maintaining permanent-way, and for traffic and locomotive expenses 20,000
Total annual cost £49,468

Traffic Estimate—

Livestock and goods .. £10,000
Coaching and mails..... 8,000
Total estimated traffic £18,000

The question of the proposed construction of the line referred to has been most carefully considered by the Railway Commissioners.

They have personally gone over the greater portion of the route and visited the surrounding country, and have not only had the benefit of exhaustive information placed before them by local residents at the various centres, but in addition have obtained reports from their officers on the traffic and other matters bearing on the prospects of the line.

In estimating the probable revenue, it has been necessary to give special consideration to the effect of the water competition which would be encountered throughout the greater portion of the district to be served by the railway.

It is true that the water service is at times somewhat precarious, and there is a generally expressed opinion among the residents that it is not satisfactory; yet it must be fully recognised that freight, charges, and fares are as a whole even now much less than those which could be quoted in connection with the proposed railway, and would, no doubt, be considerably reduced if such a course became necessary to retain the traffic.

The regularity and speedy transit by rail as compared with the present water route, and consequent influence on the traffic in the direction of the railway, has been fully weighed; and notwithstanding the advantages attached to the former, the Commissioners feel satisfied that the bulk of the produce of the district would remain with the steamers.

For perishable freights, such as cream, butter, fruit, poultry, &c., and stock—particularly calves and pigs—the advantages of quick transit by rail would probably operate largely in favour of that method of carriage, and a liberal allowance has been made in this connection in estimating the revenue.

As regards the supplies of general merchandise to the district, there is no reason for assuming that it would be diverted from the steamers, except, perhaps, to the extent of some low-freight goods.

With regard to the passenger traffic, it is doubtful whether it would be largely secured, the steamer fares generally being now considerably less than could be charged by the railway. As with the goods there will be the advantage of regular and speedy transit, and, in addition, the opportunity of avoiding the discomfort of a sea voyage; nevertheless it cannot with any degree of safety be assumed that the passenger traffic would be generally secured.

To briefly summarise the question, it may be stated that the districts would be vastly benefited by the facilities usually afforded by a railway, but the traffic generally would only go to it when water carriage could not, with advantage, be made use of. This has been the experience in connection with all other lines where water competition exists.

In view of the large capital expenditure, involving an annual interest charge of £29,468 (which would be increased by the interest on cost of land and rolling stock), and the yearly cost of working, estimated at £20,000, in all a liability of £49,468 per annum, and of the fact that the probable revenue would not exceed £18,000 a year, the Commissioners cannot recommend the construction of the line.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this twenty-fourth day of November, one thousand eight hundred and ninety-seven, in the presence of

CHARLES OLIVER, Chief Commissioner. W. M. FEHON, Commissioner. DAVID KIRKCALDIE, Commissioner.	}
	}
	}

H. McLACHLAN, Secretary.

The line now proposed begins by a junction with the main Northern Line at 20 miles 47·24 chains from Newcastle, and about half a mile north of West Maitland station. Proceeding northerly it crosses the Hunter River about 4 miles from the junction, and follows up the Paterson River Valley, crossing that river at the township of the same name. From here the northerly course is maintained to about 40 miles from Newcastle, in the parish of Fingal, where the direction becomes north-easterly, and after passing over the Wallaroba Range, Dungog is reached. Here the William's River is crossed, and between 59 and 60 miles from Newcastle the Monkerai Range is surmounted, the north-easterly direction being continued generally to the Karuah River. From the crossing of this river the direction is almost due north to 96 miles through Avon station, and down the Avon Creek and Gloucester River passing the township of Gloucester.

The Gloucester or Barrington River is then followed to near the junction with the Manning River, which is crossed at about 112¼ miles from Newcastle, and the north side of this river is taken through the township of Wingham to Taree where the line ends at 134 miles 33·24 chains from Newcastle.

The heaviest grades are 1 in 60, and the sharpest curve 12 chains radius. The country is generally undulating and intersected by several ranges and considerable rivers; hence six tunnels and a good many large bridges are required.

2. *Mr. Hoskins.*] Have you ever been as far as Taree? Yes; I have been along the whole of the north coast up to the Brush.
3. Is the country between Maitland and Taree as rough as that on the South Coast line between here and Wollongong? The country about the rivers is remarkably good, but the country between the rivers is rough.
4. I notice that this report states that there will be a good many tunnels, and there will be four or five rivers to cross by means of bridges; therefore the line will certainly be an expensive one? Yes.
5. I suppose that very expensive and long bridges will be required? Yes; they all cross above the navigable portion of the river, so they are not so large as one might expect, but they are good-sized bridges.
6. It is proposed by this scheme to avoid the navigable portion of the rivers? Yes.
7. Have you been to the port of Taree? Yes.
8. Is the navigation of the Manning at Taree so very difficult that steamers cannot be regularly employed in that trade? The North Coast steamers are regularly employed in that trade.
9. They run regularly, with some interruptions now and then in consequence of bad bars, or occasioned by heavy seas? Fairly regularly.
10. Is not the country, as a rule, between Maitland and Taree not particularly good, except when you get on the flats of the Manning River close to Taree;—it is rather a wild, rough country not favourable for farming purposes? There is very good land about Stroud and Taree and Gloucester, and along the whole of the Manning down to Taree, and there is good land, although it is limited in extent, about Paterson and Dungog, but it is rough country between Dungog and Gloucester.
11. Was not nearly all the land of any value in that tract of country sold years ago, and is it not now in the hands of private owners? Most of the land about Gloucester and Stroud belongs to the A.A. Co.
12. I mean other land? A great deal of it; I could not tell you to what extent though.
13. It is in the hands of private individuals—you can see that from the appearance of it; it has been enclosed? Yes, a great deal of it has.
14. Looking to the limited area of land, except on the Manning River, where it belongs to the A.A. Co., and judging from the quality of the land, and the roughness of the country, there does not appear to be room for the many millions of people who, this statement represents, could be settled on the land if there were a railway there? If the A.A. Co.'s property were cut up, it would carry a very large population.
15. But after all said and done, the land belonging to the A.A. Co. going from Gloucester to the Hunter is not a very extensive tract of country, and going towards Stroud too? It is a large tract of country. I could not tell you the acreage from memory.
16. There is a good deal of land belonging to the A.A. Co. no good for anything? There is some of it good for grazing, but the ranges are not good.
17. Well, having regard to the large area of this Colony and the great quantity of land that has not been alienated, and bearing in mind that the people of the district of the Manning have pretty regular communication with Sydney by water, do you not think that there are other districts that it would be more advantageous in a public sense to supply with railways than this district? I hardly think that is a question I can answer. It is more a matter for your decision.
18. I mean, looking at the physical character of the country, and not the policy? It is a difficult country to make a line over. There is no question about that.
19. Do you know whether the construction of the railway from Sydney to Nowra has led to the diversion of a large quantity of traffic from the steamers trading on the coast to the railway? I could not say to what extent. I know the steamers are running still, but I do not know what the traffic was before the line was opened.
20. Have you been over the South Coast line lately? Not for two or three years.
21. Have you noticed that the construction of that line has led to largely increased settlement of people in that portion of the country served by the railway? I am not prepared to answer that question, for I was never in that part of the country before the line was made.
22. *Mr. Wright.*] Have you been on the Manning? Yes.
23. Can you give the Committee any idea of what proportion of the land is good and what proportion of it is bad along the route of this railway? I cannot tell you that. You will get that information from the Lands Department.
24. I mean, taking the river flats—the arable land along the rivers—and the mountainous country between them;—do you think that 10 per cent. of the whole land is valuable? I should say a great deal more than 10 per cent.
25. And fit for agriculture? Yes; much more than 10 per cent., I think.
- 26–29. What are the intervening ports between Taree and Sydney? Camden Haven and Port Stephens.
30. Is there any kind of port at Camden Haven? It is a very small place, and I think that the amount of land behind Camden Haven is small in area.
31. The land along the Manning River is good? Yes; the land all along that river is good.
32. And there are lakes this side of the Manning River that are navigable? Yes, the Myall Lakes.
33. What river runs into Port Stephens? The Karuah and the Myall.
34. Are they navigable for small vessels? Yes; the Karuah is navigable for small vessels up to Booral, and the Myall as far as Bulladelah.
35. Port Stephens is a good port? Yes.
36. So between the Manning and Newcastle there are practically two ports besides the Manning River itself? Yes.
37. From your knowledge of the country, would you say that the producers of that country have very much difficulty in getting their produce to the market? It is uncertain. As I said before, the North Coast steamers run fairly regular, but there have been times, with bad bars and floods in the river, when the produce could not be got down.
38. It is very unusual for the Manning to be blocked? It is not usual.
39. It is the best river along the coast, except the Clarence River, is it not? Yes, I daresay it is, except the Richmond and the Clarence.
40. So the inconvenience those people suffer in getting their produce to market will not be a very great one? I do not think it is a very great one.

R. R. P.
Hickson.

22 Feb., 1898.

R. R. P.
Hickson.
22 Feb., 1898.

41. Can you give the Committee any idea of the freights charged, for instance, from the Manning River to Sydney? I cannot.
42. You have no idea? Not the slightest idea.
43. Would you think 6d. or 7d. a bag for maize would be a big freight from the Manning? I am not in a position to give an opinion upon that.
44. Can you give us any idea what the railway freight would be on this line to the Manning, for instance? No; I leave that to the Railway Commissioners.
45. Is there a large area of good land around Dungog? The land about Dungog is pretty good, but I do not think there is a very great extent of it.
46. And there is not much on the Paterson, is there? Not very much. Along the river it is very good indeed, but I do not think it goes very far back.
47. And after you leave Dungog and get to Gloucester, the country is almost worthless? It is very poor, rough country.
48. And what beyond Gloucester? It is good land, I believe, along nearly the whole route of this line down to Taree; but I have not gone down that portion. I have gone up the road by Krambach. But Mr. Deane has been over that, and can tell you what the land is like along the Barrington.
49. This proposed railway goes to the west of the road? Yes.
50. What is the country west of this line;—is that any good at all? There is not much good land to the west of the line.
51. All mountainous, poor country, is it not? Yes.
52. Is there much good land about Port Stephens? No, not much.
53. How far will the railway be from the navigable waters of Port Stephens—from Stroud, say? A long way—it is on the other side of the range. I could not tell you how many miles it would be as the crow flies, but it will be on the other side of the range.
54. That is Stroud on one side and the railway on the other? Yes.
55. *Mr. Trickett.*] I suppose this line is only put forward as part of a subsequent extension; or is it put forward as a line by itself? It is put forward at present on its own merits.
56. It is a very expensive line? Yes.
57. It would go through a great deal of private property—the A.A. Co.'s, for instance? Yes; it goes through a large portion of private property.
58. Of course the cost of that you have not arrived at in this estimate? No; this estimate is exclusive of resumptions.
59. *Mr. Lee.*] Referring to the figures supplied in the report of the Railway Commissioners, it is stated there that the cost of maintaining the permanent way, and for traffic and locomotive expenses, will be £20,000 per annum? Yes.
60. And that the annual total estimated traffic will be £18,000? Yes.
61. Would it not appear from those figures that if the construction of the railway cost nothing at all, it would not pay to work? Well, the figures speak for themselves.
62. But is that not the case;—the Railway Commissioners estimate the cost of working at £20,000, and the receipts at £18,000; therefore, excluding the interest upon capital—£29,468—the actual earnings of the railway would not pay for the annual maintenance and ordinary expenses? That is so.
63. *Mr. Roberts.*] Do you know what is the population of Taree, Wingham, Cundleton, Croki, Cooperbrook, and other towns through which the proposed railway will pass? I could not tell you off-hand, but I could get the information for you.
64. You know the Manning district well? I know it fairly well.
65. Is there not a large settled population around Taree? On the river there is.
66. Also at Wingham? Yes.
67. And there is a good settled population at Cundleton and at other towns on the river, is there not? There is a fair population at Cundleton. The land all along there is very good.
68. Is not the land all the way from Taree down to the Heads exceptionally good? To very close to the Heads, but at the Heads it is poor land. On the west side of the river it is very excellent land.
69. And around Wingham? Very good land around Wingham too.
70. And Cundleton and Croki;—is not the land in the neighbourhood of those towns exceptionally rich agricultural land? I think that the land along that river is second to none in the Colony, Maitland excluded, perhaps.
71. Do you know anything of the productive nature of the soil there? No; I could not say I do.
72. It has been given to maize-growing for a number of years, has it not? Yes; I believe that is the principal crop.
73. Is not the land admirably adapted for dairying purposes? I am hardly able to reply to that question, but I believe it is.
74. Have you not heard that the dairying industry on the Manning River has of late years made marked progress? It has all along.
75. Do you know Cooperbrook? Yes.
76. Are not large shipments of timber constantly taking place there? Yes; it is a very good timber district.
77. There is exceptionally good land about Cooperbrook, is there not? Very good land.
78. And there is a large settled population, going up the river towards Taree, right from Cooperbrook to beyond Wingham? Yes.
79. Is it not a fact that all this large population in the Manning River District have for many years past carried on their farming operations at great disadvantage, owing to the difficulty in getting their produce to market? Yes; they have had some difficulty.
80. Have you not heard of the steamers being frequently detained at the Heads, owing to the small draught of water on the bar? They are occasionally detained.
81. Only occasionally? I think so. If you take the number of trips they go out as compared with those when they are stopped, I think you will find that it is only occasionally that they are stopped.
82. Have there not been frequent wrecks at the Manning River? There have been some wrecks there.
83. Is it not a fact that the navigation is dangerous to travellers? No; I would not say that it is dangerous. The bar is not a very good one, and it requires a special class of steamer to work it, and the steamer that does work it does so fairly successfully.

84. But there have been frequent wrecks there? There have been wrecks—there have been wrecks at every bar on the coast.
85. Have you any estimate in your office as to what would be the probable cost of making an absolutely safe entrance to the Manning? That scheme will be before the Committee before very long.
86. Is it a fair thing to estimate roughly that it would cost at least £250,000 to make an absolutely safe entrance to the Manning River? I do not think so.
87. It would cost a very large sum of money to make navigation safe and sure at the entrance to the Manning River? Yes.
88. Seeing the large population settled there, could you tell us—does not the Minister think that those people have a right to some expenditure of the public money to enable them to get their produce to market, they themselves being taxpayers? I think so. If any reasonable scheme can be proposed, I think they have, most decidedly.
89. And if it will cost a very large sum of money to make the entrance safe, it is, at any rate, a debatable question whether it would not pay better to construct a railway? It is certainly debatable.
90. Have you been over the proposed line? Not the whole route. I know most of it.
91. You have been from West Maitland to Dungog? Yes; I know Paterson and Dungog.
92. It is fine farming land about Paterson? Yes; shallow—I do not mean of soil, but towards the hills.
93. For what grain is it best adapted? There are large quantities of lucerne grown there.
94. And then from Dungog to Stroud—do you know the country? I know Stroud, but I do not know the country between Dungog and Stroud—across the range.
95. Is not Stroud one of the oldest settlements in the Colony? Yes.
96. And there is very good land all around Stroud? Yes, very good land all about Stroud and Gloucester.
97. Does this line go to the west of the range? It goes down the Barrington to the west of the range.
98. It is good land on the Barrington? I believe so, but I have not been there.
99. And then this way to Wingham and Taree? Yes.
100. You know the alternative route by way of Seaham? Yes; I know most of that.
101. Which route would be the more fertile one? The proposed one—the one by Paterson and Dungog. The other line goes through an exceptionally rough country.
102. Then there would be difficulties in the crossing of the rivers too? Yes, difficulties about Maitland.
103. Navigation would probably be impeded? Yes. There would be three rivers to cross—the Hunter, the Paterson, and the Williams.
104. Therefore the Department prefers what is known as the “B” route? Yes.
105. There have been several deputations asking for a line from the Hunter to Grafton, have there not? Yes.
106. This may fairly be considered as an instalment of that line, may it not? Yes. As submitted to the Committee, it is complete in itself to the Manning. But there is no doubt that, in time, the line would also extend along the north coast up to Grafton.
107. Have any Members of Parliament representing the districts between the Manning and Grafton recommended the construction of this North Coast railway? Yes, some have; but some further north have recommended a connection with the New England district.
108. That would be north of Grafton? No, from Coff’s Harbour.
109. But anywhere south of Coff’s Harbour they would all favour this North Coast line? Yes, I should say so.
110. You have been from Taree to Kempsey? Yes.
111. You know the entrance to Camden Haven? I have never been down to Camden Haven. I have been in Camden Haven by water from the sea, but never been ashore there.
112. Do any steamers go into Camden Haven? I think so. I am not quite sure about that. I think that one of the small coastal boats calls there sometimes.
113. It is a good farming and timber district around Camden Haven? I think it is a good timber district, but I do not know about farming.
114. You have been to Port Macquarie? Yes.
115. Is there the same difficulty with regard to navigation there as at the Manning? There is more difficulty, because the steamers only get in just inside the bar at Port Macquarie—they do not go up the river.
116. Is the Hastings not so well dredged? It is a shallower river all through than the Manning.
117. The land up the Hastings is remarkable for its fertility, is it not? It is very good land all along the Hastings.
118. And there is a very large farming population settled along that river? Yes.
119. Do you know the distance from Port Macquarie to Taree—about 50 miles? Yes, I think so, as far as I remember. I could get you the exact distance.
120. Is it not a fairly level country all the way from Taree to Port Macquarie? Yes, fairly level.
121. Thence on to Kempsey the Macleay River is one of the best maize-growing districts of the north coast, is it not? It is a very fine agricultural district.
122. There is a very large settled population at Kempsey? Yes.
123. Kempsey is what may be termed a very important town with a large settled population around it? Yes, a very good town.
124. *Vice-Chairman.*] Has there been any very large expenditure on the Manning of late years? There has been dredging going on there for many years—constantly.
125. What is the condition of the bar at the present time? The last accounts from the Manning, 18th instant, give 9 feet on the bar, and 8 feet on the crossing at high water; the steamer draws 7 feet.
126. Have you heard of any difficulties? I do not think there is any difficulty just at present. I think that vessels are going in and getting out all right.
127. Or during the last two years? I would not like to say from memory what the difficulties have been during the last two years, but I can easily get you all that information; it is recorded in the office.
128. Is there not a proposal at the present time under consideration for the expenditure of a large sum of money to improve the Manning River? A scheme for that will be before this Committee before very long.
129. What, approximately, is the proposed expenditure? I could not say. I do not know yet what the estimate will be.

- R. R. P. Hickson.
22 Feb., 1898.
130. In a general way, can you say what is in contemplation? Works something of the same class as at the Macleay, in a general way—training-walls and breakwaters.
131. Involving a very large expenditure? It will involve a considerable expenditure, but the amount of it I am not prepared now to say.
132. In the statement that you placed before us there is a paragraph in the representations made by a deputation some years ago, as follows:—
- Many of the farmers, they said, could find no suitable market for their produce in consequence of the rivers, their only present means of conveyance, being closed by bars, and it was no uncommon thing to see thousands of bushels of corn rotting on the wharfs, because there was no means of carrying it away.
- If such works as you have in contemplation for the improvement of the river be carried out, will that disability exist? It would be very considerably removed, but of course you understand that it will not be totally removed, because there is still the heavy sea to contend with, and there are times when, even at the Clarence—where there is ample water—vessels cannot get in and out. That is due to the heavy sea outside, and that you can never get over. Even at the port of Newcastle, vessels are detained on account of heavy weather.
133. Is this your reply: That the Manning will be placed in an equally good position with any of the other rivers on the coast? With some of them it will be placed equally well—say, with the Macleay or the Richmond.
134. Or the other northern rivers? Yes; excepting the Clarence. I do not think it will be as good as the Clarence.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- H. Deane.
22 Feb., 1898.
135. *Mr. Wright.*] Have you any statement to make further than that submitted by Mr. Hickson? I have a description of the line and also a detailed estimate to submit.
136. Will you kindly read them?

NORTH COAST RAILWAY.—WEST MAITLAND TO TAREE.

(Length, 113 miles 66 chains; estimated cost, £982,283, or £8,630 per mile, exclusive of land and compensation.)

This line begins by a junction with the main Northern line at 20 miles 47·24 chains from Newcastle, and about half a mile north of West Maitland station. Proceeding northerly, it crosses the Hunter River about 4 miles from the junction and follows up the Paterson River Valley, crossing that river at the township of the same name. From here the northerly course is maintained to about 40 miles from Newcastle, in the parish of Fingal, where the direction becomes north-easterly, and after passing over the Wallaroba Range, Dungog is reached. Here the Williams River is crossed, and between 59 and 60 miles from Newcastle the Monkerai Range is surmounted, the north-easterly direction being continued generally to the Karuah River. From the crossing of this river, the direction is almost due north to 96 miles through Avon Station and down the Avon Creek and Gloucester River, passing the township of Gloucester.

The Gloucester or Barrington River is then followed to near its junction with the Manning River, which is crossed at about 112½ miles from Newcastle, and the north side of this river is taken through the township of Wingham to Taree, where the line ends at 134 miles 33·24 chains from Newcastle.

The heaviest grades are 1 in 60, and the sharpest curve 12 chains radius. The country is generally undulating and intersected by several ranges and considerable rivers; hence six tunnels and a good many large bridges are required.

For convenience in making out the estimate I have divided the line into three sections. The first section is from West Maitland to Dungog, the second section is from Dungog to Gloucester, and the third section is from Gloucester to Taree; and then I have a summary of the three, given at the end.

18 August, 1897.

NORTH COAST RAILWAY.—WEST MAITLAND TO DUNGOG.

REVISED estimated cost of a single line of railway 32 miles 63 chains in length, with 71½-lb. rails. Ruling grade, 1 in 60; sharpest curve, 12 chains radius. Tunnel and large bridges for single line only.

NORTH COAST RAILWAY—WEST MAITLAND TO TAREE

Revised Estimate—Summary

Part	Description	Length	Estimated Cost	Average per mile
		m c	£	£ s d
1	West Maitland to Dungog	32 63	276,748	8,440 13 0
2	Dungog to Gloucester	39 40	299,119	7,572 12 8
3	Gloucester to Taree	41 43	406,416	9,784 6 4
	Total	113 66	982,283	8,629 15 4

H. Deane. I wish to add that the survey of the line passes through 12 miles and 55 chains of Crown land, and 101 miles 11 chains of alienated land. Fifty-one miles of the latter are owned by the Australian Agricultural Co. I have here a summary of the steepest grades, which is as follows:—

SUMMARY OF STEEPEST GRADIENTS.

Grade.	Length against the load.	Length with the load.	Grade.	Length against the load.	Length with the load.
	chains.	chains.		chains.	chains.
1 in 60	521	582·5	1 in 85	46·5
1 in 61	87·5	133	1 in 85·5	14
1 in 62	117·5	1 in 87	33·5
1 in 64	113	1 in 88	62·5
1 in 65	39·5	1 in 89	50
1 in 66	103	98	1 in 90	58
1 in 68	74	20·5	1 in 92	78
1 in 70	69	72·5	1 in 94	72
1 in 72	96	1 in 96	41
1 in 75	45·5	87	1 in 100	106·5	12
1 in 80	154	406·5			
1 in 82	60	54	Total	1,857·5	1,655·5

137. Have you finished your official statement? I have to hand in a revised Book of Reference.

138. Any plan accompanying these? I have a plan of the line in two parts, to a scale of 10 chains to the inch; and the section in two parts, to a scale of 10 chains horizontal and 100 feet vertical.

139. Can you inform the Committee how many private land-holdings there are included in those 101 miles of alienated land? The book of reference will show them. I have not summarised them.

140. I see there are a large number of holders, independently of the A.A. Company? Yes.

141. The A.A. Company hold rather more than one-half of the entire length, and the rest is held by numerous holders? Yes.

142. Can you tell the Committee why this line, in comparison with lines you have recently submitted, is so expensive as to cost £8,629 per mile? The country is entirely different. It is very uneven in character.

143. Is it rugged, or simply undulating country? It is quickly undulating country, for the most part.

144. Much rock? Yes; no doubt there will be in the cuttings a very considerable amount of rock.

145. Have you been over the line yourself? Yes.

146. What would you describe the country as being generally along the route of this railway—I mean for occupation;—is it good, bad, or indifferent? I think that, taking it generally, the country is good. It is chiefly of two classes: the country at the bottom of the valleys—the river flats—which is highly fertile; and the higher ground from those flats up the slopes of the hills, which looks like good pastoral country, which carries, or did carry at the time I went there, abundance of good grass. Then there is a third class of country, which is rugged and covered with timber, and is of a character that is of very little use.

147. How is the water supply of the country? There is plenty of water. We cross several rivers.

148. There is good fresh water all the way? Yes; very good water all the way.

149. Does any portion of the country carry good marketable timber? Yes; nearly all the way along the route you get good timber, especially ironbark, tallow-wood, and white mahogany.

150. All timbers that are merchantable? Yes; very good timbers—first-class timbers.

151. I suppose the ironbark timber occurs on the poorest land—on the ridges? In going through the country, I noticed that the ironbark grew on the best grazing land, and it was by no means what you would necessarily call a poor soil. It was soil that was somewhat shallow, perhaps, but not at all bad in character.

152. Clay? No; generally brown soil, very similar to what you got overlying the shale in some parts in the neighbourhood of Sydney.

153. Decomposed shale, very likely? I think decomposed shale, with a good deal of humus in some cases with washings of decayed basalt and trap.

154. I suppose that all the timber required for the construction of the line could be got on the route? Yes; I am told that a little way back from the line there is any quantity of good timber.

155. Will the line be ballasted all through? Yes.

156. Will you explain to the Committee what necessity there is to ballast a line like this over hard country? In the first place, there is a great difference in the rainfall. The rainfall on the coast side of the Dividing Range is much more frequent, and does much more damage to the cuttings and banks than it does in the interior, and the ground being very uneven necessitates the provision of ballast so as to make up for short inequalities—slacks in the line. We shall use the ballast to keep the line in position—to keep the line true.

157. Would it be possible to construct the line with only a little ballast if you used it only on the banks and let the cuttings remain unballasted? It would not be worth while. The cost of ballasting after all would be such a small proportion of the whole cost of the line that it would not be worth considering. Then again, with regard to leaving out the ballast in the cuttings, that would be very objectionable, because if you put your sleepers right down on the hard rock you would have a hard road, which would be injurious to the locomotives especially and to the rolling-stock generally.

158. You mean, in fact, packing them underneath? You must have an elastic stratum between the sleepers and the formation, and in the cuttings, on account of drainage, you require to lift the road more, or otherwise to make your cuttings wide, and have deeper water-tables. Therefore, as regards drainage, it is as broad as it is long; in fact, it is cheaper to put ballast in cuttings than to widen out the cuttings and make broad ditches.

159. Your main contention why the line should be ballasted is, I understand, on account of the excessive rainfall in the coastal districts? That is one point, and the other point is the unevenness of the country, and the tendency for the permanent-way to settle irregularly, which it does not over low and even banks; and thirdly, as I point out, in the cuttings it is necessary for elasticity.

160. If timber is to be obtained on the ground, and the country is really not of a very serious character, I cannot understand why the expenditure should be so large as it is—between £8,000 and £9,000 per mile? You will see that the earthworks on the first section cost £2,380 per mile, on the second £2,542 per mile, and on the third £3,670 per mile. Then the ordinary small culverts and timber bridges amount to a considerable sum, £699, £785, and £1,028 respectively, and there are large bridges, which cost £1,608, £637, and £1,159 per mile respectively for the three sections. H. Deane.
22 Feb., 1898.
161. Yes, I see those items of expenditure are heavy? Then, of course, there are the tunnels.
162. Then there are the rails, the sleepers, and the ballast? Yes.
163. There would be no possibility of reducing this expenditure to any appreciable extent, would there? No; the expense has been cut down to the greatest possible extent. The ruling grade has been made 1 in 60, which, if this line is sometime to be, as it will be, an important trunk line, is quite steep enough.
164. Is that both ways? Yes. And the sharpest curves are 12 chains radius.
165. On that line you could carry almost any traffic? You could carry any traffic.
166. And run at any speed you like? Yes.
167. In designing the railway you have taken into consideration the fact that, if constructed, it will eventually be an intercolonial line? Yes; that it will be a main line, eventually advancing to join with Queensland.
168. And recognising that fact, you are proposing to construct what, in railway parlance, is known as a first-class road? Yes. I may say that it is a first-class road as regards stability. I would prefer for express trains to have something flatter than 1 in 60, and better curves than 12 chains radius.
169. But I suppose that for the local requirements of the district, if the railway were constructed for that purpose alone, you could materially reduce the cost, could you not? I do not think so. I would not recommend it. I think that if the country were really well settled—if it were possible to utilise the country to the largest extent—a line such as has been estimated for would probably pay. Of course the present conditions fall very far short of that.
170. Have you limited your expenditure for station buildings and that class of work? Yes, I put station buildings down to the possible lowest limit, following a principle that has been adopted for some years past, namely, that in the first instance they should be made cheaply, and afterwards as trade develops they can be enlarged to suit.
171. As the line is now proposed, is it provided with all the necessary sidings and roads to stations? Yes. I have had to make various assumptions, of course, as regards the number of stations, because it would be premature to go into the question in detail; but I may say that the assumed number of stations amounts to one in every 10 miles.
172. I suppose you have provided every centre of population with station accommodation? Yes; and every place where an important road comes in.
173. Leaving the future development of traffic to be provided for as it is developed? Yes.
174. Do you think, as a railway man of great experience, that a railway constructed along this line could successfully compete with water carriage along the coast as regards the heavy goods? That I would rather hesitate to express an opinion upon.
175. I am only asking you in general terms; is it not a recognised principle in traffic all over the world that water carriage can successfully compete even against railway-borne carriage for heavy classes of goods? Well, water-borne carriage, of course, is very much cheaper, as a rule, than railway carriage. On the other hand, of course, there are many classes of goods for which water-borne carriage is entirely unsuitable.
176. At all events, you do not profess to give an opinion on the question of carriage? I have not studied that part of the question.
177. Can you give the Committee any idea of the value per acre of the various classes of land this railway passes through, bearing in mind that a great deal of the land is private property? I do not think that I can give even an approximate estimate. The land on the river flats is extremely good and fertile, and no doubt very valuable, whilst the land rising up the slopes of the hills looks to me like very good pasture. It struck me, from opinions that I heard expressed, that that part of the land was very much under-valued—that it was really better than actually was stated. The A.A. Company have about 700 square miles in their grant, and they have a comparatively small number of head of cattle. They use the country entirely for breeding purposes. I daresay that the managers of the property would tell you exactly how many head of cattle there are. But I failed to see Mr. Etheridge at Gloucester. He was ill at the time I passed through, and I was unable to see him, but I believe that something between 8,000 and 12,000 would express the number of the head of cattle on the run. Even if the higher figures—12,000—be correct, it seems absurd that 700 square miles of country should carry only 12,000 head.
178. Your general impression of the land you passed through is that, taken as a whole, it is good land? Yes. The reason why I conclude it is good land—not only the flats, but also the slopes of the hills—is that it carries good kinds of grasses.
179. Well clothed with grass? Yes; and not wiry stuff, but grasses that are recognised by the Department of Agriculture as of high value.
180. Good nutritious grasses? Yes.
181. Can you tell the Committee from memory if, along the route of this railway, there are many subdivisions, suburban township allotments, and small holdings—if it cuts them up very much? At Paterson and Dungog, the line passes through small holdings, and at Wingham too; but I do not suppose that on that account the total cost would be very largely affected.
182. Are there not small holdings in the shape of farms about these river flats which are intersected by the proposed line? I think I should have to go into the matter in detail in order to answer that question.
183. You are not in a position to supply the information just now? By comparing the plan with the book of reference it can easily be done.
184. Will you furnish the Committee later on with the number of holdings through which the line passes, and divide them into areas—holdings of less than 20 acres which are cut up by the line? I think I probably can.
185. *Mr. Trickett.*] In 1891, I see you gave an estimate of the cost of this line at £1,378,925, as against £982,283 to-day, or a saving now of £396,642;—can you explain the difference? It is partly due to a revision of location, but chiefly due to the reduction of prices that has taken place within the last ten years.
186. Chiefly owing to the reduction of prices of labour and material? Yes.

- H. Deane. 187. Is this a line that would be an expensive one to maintain if constructed? It would be more expensive than the light lines of the interior. Lines consisting of heavy cuttings and banks are always more expensive to maintain than lines of no embankments.
- 22 Feb., 1898. 188. Owing to the number of heavy earthworks, and the tunnelling and the culverts and the crossings that have to be effected here, it seems to be rather an expensive line to maintain? Yes. Without going into the matter very carefully, I should say that it would cost from £60 to £80 a mile; but I do not wish to state authoritatively that it would cost that. It is possible that the Railway Commissioners' officers have gone into the question.
189. Apparently, material of all kinds necessary is available along the line—material necessary for construction, in the shape of gravel, stone, and timber; material for making bricks, and so on? Yes.
190. Can you tell us what the total length of the tunnelling is that would have to be effected—I think there are four tunnels? One on the first section, 336 yards; one on the second section, 647 yards; and there are four tunnels on the third section of an aggregate length of 629 yards, making a total of 1,612 yards of tunnelling.
191. Would they be made available for a single or a double line? A single line.
192. Would they all require to be lined with brickwork? Probably. I have allowed for that.
193. Would the cuttings be of a heavy character? Yes. On the last section of the line they are very heavy.
194. Through rock? Yes.
195. It is chiefly these cuttings and earthworks that build up the heavy expenditure on this line, is it not? The heavy expenditure is very largely due to the earthworks.
196. I suppose that, having made such a substantial reduction between 1891 and to-day as that of £396,642, you must have cut it down to the lowest possible degree? Yes. I should not consider it safe to do any more cutting down.
197. That is a very substantial reduction, is it not? Yes.
198. Would the line be a fenced line? Yes.
199. Through all these big holdings, you have provided for fencing? Yes; I have provided for fencing.
200. I suppose you do not express any opinion as to the policy of the line—whether it should be only a line to Taree, or should go further along the coast? No.
201. Judging by the *précis* that Mr. Hickson handed in and read, I suppose you dismiss from consideration entirely the proposal "A"—to start from Morpeth? Yes.
202. The fact of its having to cross a navigable portion of the Hunter almost puts it beyond consideration? Yes.

WEDNESDAY, 23 FEBRUARY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY, (VICE-CHAIRMAN.)

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 203. *Mr. Hassall.*] You have nothing to add to the statement made by yourself yesterday? No; I do not think that there is anything.
- 23 Feb., 1898. 204. In view of the proposal to construct this railway from West Maitland to Taree, that can only be regarded as the first section of a coast railway;—what I mean is that it would not be advisable to stop at Taree, in the event of that portion being constructed? I have not generally dealt with the motives of the Government in submitting railways, but with the engineering part of the question entirely. I think that Mr. Hickson would probably have been able to give you better information than myself, in giving the general reasons.
205. Do you think it would be justifiable to construct a line of railway from West Maitland to Taree in view of the traffic going along that particular length of line, and stop at Taree? At present the traffic would be very small; but I believe that the Minister looks upon this as part of the North Coast line to be eventually constructed.
206. In the event of that portion being constructed, do you think it would be necessary to extend it along the North Coast in order to warrant its construction? I do not see how to answer that question exactly.
207. I can understand that you would rather deal with this extension from an engineering standpoint? Yes.
208. I see the country is described as undulating? Very much so.
209. Is that not rather an elastic expression;—would you not call it mountainous? I should not call it mountainous. The part that is traversed by the line scarcely contains either peaks or ridges of sufficient elevation to entitle them to the name of mountains, but it is quite as bad as mountainous country.
210. In view of the estimated cost per mile, it is almost as bad as mountainous country—it would almost convey that impression to the general public? Yes.
211. I presume that the cost is calculated on the very lowest estimate? Yes; for the class of line proposed.
212. There could be no reduction compatible with public safety? Not safely.
213. And you favour the route from West Maitland *via* Dungog and Gloucester to Taree in preference to the one *via* the Paterson and Port Stephens? Yes.
214. For the reason that it would be a shorter route and the line would be rather more cheaply constructed? The crossing of the Hunter is the easiest possible, and you avoid competing with the river traffic.

215. Putting it in that light, on the line from West Maitland *via* Dungog and Gloucester to Taree you will practically cross the rivers above the point of navigation? Yes, you will. H. Deane.
216. But on the alternative route, by the Paterson, you would strike the rivers where they are navigable? 23 Feb., 1898.
Yes.
217. And consequently the expense of crossing would be much greater? Yes.
218. In your evidence you say that this line would pass through nearly 100 miles of alienated land? Yes, a little over 100 miles.
219. Have you any idea what that land is worth? I have not formed any estimate.
220. Have any inquiries been made as to what would be the cost of resumption? I do not know whether the land valuer has been instructed.
221. Your estimate, I presume, is based on the cost of the line exclusive of the cost of resumption of land, or whatever claims might be made in that respect? Yes.
222. *Mr. Lee.*] This railway route will cross how many rivers—the Hunter, the Paterson, the Williams, the Karuah? Yes.
223. Does it cross the Barrington? No; it crosses the Manning, and it crosses the Avon at Gloucester, but the last named is a small crossing compared with the others.
224. The point selected on the Hunter is about 4 miles from the junction of the railway lines? Yes.
225. What sort of bottom have you there? Very good. We get rock at the bottom.
226. At an easy depth? Yes.
227. Some of these rivers are large rivers where you cross them—the Paterson, the Williams, and the Manning;—have you had borings made in each of these streams to find out the depth? Yes.
228. Would you tell us whether any considerable amount of silt would have to be passed through there? I have not the information here, but I can provide it. There is no difficulty whatever as to the foundations of the bridges.
229. On that point all we want to be assured of is this: Would your estimate of cost of the bridges be likely to be exceeded in consequence of your meeting with a greater depth of silt than you anticipate? No.
230. Therefore, you think that your estimate will be within the mark? Yes.
231. Would we be likely to run the same risk as they had at the Hawkesbury, for instance? No; the conditions are entirely different.
232. Do you propose to put down iron cylinders for all those bridges? I think probably for the larger rivers.
233. But would those large rivers not necessitate foundations of that sort? They would necessitate either cylinders or some method of sinking by caissons.
234. That is to say that you have in any case to provide for the cylinders in the contract? Yes; what I mean is, you have water difficulties. You would either have to sink separate cylinders, in pairs or in groups, for each pier, or you would sink a large pier with perhaps one or more holes for getting out the material from the bottom—piers with wells in them.
235. But if it is intended to put iron bridges there, it would of necessity mean cylinders being used? Yes, I think the principle of excavation can be roughly classed as cylinder excavation. What I mean to say is that these cylinders need not be a true circle, but, as is often done, and was the case in the Hawkesbury, oval piers.
236. But on the same principle of excavating and making solid concrete? Yes.
237. What is the greatest span of the bridge over any one stream? Of course you will understand that any information of that sort will be rather approximate, for one may find on closer inspection when the permanent survey is made that it may be desirable to give or cut off a few more feet.
238. At this stage we will take the calculations as only approximate? Yes. At the crossing of the Hunter the width of the openings would be about 790 feet.
239. The total width of the openings? Yes.
240. On how many piers? I should probably put three principal openings over the channel, and ten openings distributed on each side. That length would about cover the flood-water channel at the point where we cross. Now I will give you information about the Paterson.
241. I am not going into detail; I only wanted to see what was your maximum span over any one stream;—have you taken into consideration the nature of those streams under condition of flood? Yes.
242. Have you designed your openings with a view of admitting the passage of flood waters and debris without injuring the bridges? Decidedly.
243. You are aware that all those rivers are subject to very heavy floods? Yes.
244. Does the crossing of the Manning present any unusual difficulty? No; the Manning, where the survey crosses it, is rather wider, I think, than the Hunter; but, from my inspection of the site, I think it is very likely that if the construction of the line were authorised I should shift it a little. The crossing of the Manning, as laid out, would necessitate a bridge of about 1,090 feet in length. I think that that might possibly be reduced by crossing the river a little higher up; but as against the saving of the bridge work there would be more earthwork on the northern side, as we should run into cutting. It is a matter of careful calculation when the line is permanently laid out as to which is the more economical and would serve the purpose better.
245. Will the height of bridges over the Paterson, the Williams, and the Manning admit of ordinary drogher steamers—that is, small river steamers—passing underneath? On the Paterson there is no navigation above where we cross.
246. But they go up the Paterson above your proposed crossing-place? No.
247. Whereabouts on the Paterson do you cross? At the town of Paterson.
248. Yes; but which side of the town? The upper side of the town.
249. You know where the present road-bridge is on the Tocal side of the Paterson? That is much lower down—that is below the town. We cross the Paterson on the higher side of the town. The steamers go up to above the road-bridge to the Paterson township, but the railway survey is above the point of navigation. With regard to the Williams there is no navigation above Clarence Town.
250. Not even by those little steamers? No; I understand they do not go up any higher. At any rate the river at Dungog, where we cross, is not navigable. Of course the Karuah is not navigable where we cross. The Manning is not navigable there either—simply a rushing stream at low water.

- H. Deane.
23 Feb., 1898.
251. Are any of the approaches to either of these rivers subject to inundation at flood-time; if so, what provision have you made for that? It has all been provided for. Wherever there is any inundation area that will be bridged across.
252. The Hunter, for instance, spreads over one bank considerably? Not at the spot where we cross, and I have provided in the estimates for a bridge that spans the flood-waters completely.
253. After leaving the railway line at Maitland you keep on the high land, I presume, as far as Aberglasslyn, and you cross the river somewhere above Bolwarra House? You cross it almost in line with the waterworks. The railway goes at the back of the waterworks, and there is an embankment that has been made for the purpose of keeping the floods of the Hunter from going down an old flood channel near Cummings'. It is a well-known spot.
254. Knowing that side of the Hunter to be very low, and subject to floods, I wanted to know what provision you have made, for I have known it flooded a mile at a time? We are on high ground all the way, excepting where the dam has been made, and where we cross a depression, and I propose to put in a number of openings there, so that in case the dam should give way the safety of the line will not be endangered.
255. Have you had to make any special provision for that sort of thing on any of the other rivers? No; the other rivers are easily dealt with.
256. Supposing it were determined at some future time to extend this line from Taree, which would be the first large river you would have to cross, say, from Taree to Kempsey—treating it as a section of the North Coast line? The map shows the rivers it would pass over. The first really large river is the Hastings, but the Dawson, Lansdowne, Stewart, and Camden Haven Rivers, which are first crossed, are of considerable size.
257. When the survey approaches the Barrington at Gloucester, do you then follow down on the southern bank of the Barrington River, or do you cross it? It is the eastern side—the right bank of the Barrington. The Barrington runs north. The Avon and the Gloucester combine, and then the river is called the Barrington. On some of the maps it is called the Gloucester River right to the Manning. On the map that is exhibited here the Barrington is called the Gloucester right to the point where it reaches the Manning.
258. What term shall we use from that stage;—shall we term it the Gloucester or the Barrington? I think it is generally known as the Barrington.
259. The line then follows the river Barrington down on the eastern side? Yes.
260. To its junction with the Manning? We do not follow it all the way. When we get to a certain bend, we pass over from the Barrington Valley into Baker's Creek Valley. The line is by that means not only shortened, but we also get rid of a good many engineering difficulties; and we meet the Manning and cross it just below where Baker's Creek runs into it.
261. Taking the survey from Gloucester down the river, it appears to be of a very serpentine character? Yes.
262. For what reason? The country is very rough.
263. To enable you to follow the course of the river, you have had to follow in and out little bends on the river? No; it is to enable you to get as near a contour line as possible that you have to follow the course of the river. Some of the elevations are considerable, lying back from the river.
264. But the country just there is exceedingly rough, is it not? It is very uneven. There is beautiful pasture land there.
265. Very rocky? The ground for the most part is covered with soil and good grasses, but it is very often very steep and lumpy.
266. Then you have to keep back some little distance from the stream? We are pretty close to it in some cases.
267. Are you not aware that that river is subject to very frequent and sudden floods? We are far above the level of the river.
268. A portion of that water is supplied by the table-lands of New England? Yes; we are well above the river. In fact, you will find, if you go down that river, there are very few river flats that you can make use of.
269. That accounts for the serpentine nature of the survey? Yes.
270. I presume it has not been possible to get a more direct route and maintain the same grade? No. If you tried to straighten the line up you would get a succession of tunnels. A survey was originally made round by Krumbach, and it is shown on the map—a line going easterly from Gloucester, as far as Krumbach, and then northerly to Wingham. That line crossed the Manning at Wingham, and thence proceeded to Taree.
271. How close will the line be to the coast, say from Gloucester? I should think about 40 miles. If you take it in a direct line—a line which, of course, you could not follow—I should think it would be about 30 miles. It would be about 40 miles by road.
272. Then, as a matter of fact, by going from the point of commencement to the Manning, no port of any note is passed on the coast, excepting Port Stephens? No; and we are a long way in from that. As regards navigation, the receipts of the line can be interfered with only by the shallow-going vessels on the Paterson, which run up to Paterson—they are stern-wheeled steamers—and the vessels of heavier draught which go up to Clarence Town on the Williams.
273. As a matter of fact, then, the traffic that goes now on the Paterson and the Williams by the auxiliary steamers is likely to go on after this line is made? Probably.
274. This made you keep sufficiently far back from the head of navigation on those rivers, and consequently the navigable portions of the rivers are likely to be still used? Those rivers would always be made use of for a good deal of traffic, and probably for that class of traffic the railway would compete with them very little.
275. *Mr. Roberts.*] I see two lines marked on the map, one a broad red line and the other a dotted line;—would you kindly explain which you prefer? The broad red line is the one which is submitted. That is the one that keeps farthest inland, and is above the navigation of all the rivers. The dotted line crosses the Hunter and the Williams, and almost touches Port Stephens, and I am given to understand that it does not pass through anything like so good a class of country as the other does. I did intend on my return journey to come back along that route more or less, through Bulladelah, but the weather broke, and

H. Deane.
23 Feb., 1898.

and I might have been kept several days in trying to get along there, and so I gave up the idea. But I think there is no doubt that if a line is to be made to the Manning the line that is submitted to the Committee is the right one.

276. Would the eastern line—that is the dotted red line, *via* Bulladelah—go over more rivers or water-courses than the line submitted? Yes; it would be a great deal worse in that respect. It would cross the Hunter at Morpeth, or just below Morpeth at Hinton. It would cross the Williams at Seaham. I do not know whether it would cross the Karuah below the point of navigation, but it would cross the Manning at Wingham, where the cost of bridging would be very much higher.

277. Would that be on account of the extra width? Yes, the extra width and the lowness of the banks.

278. But is the number of rivers or watercourses exactly the same? No, it would not be exactly the same. I can scarcely make a comparison. But on the whole, what rivers we did cross would be very much larger, because we should be nearer their mouths.

279. And consequently it would cost more to get over them? Yes.

280. In the line submitted—I think it is called line "B" in Mr. Hickson's report—no interference with navigation would take place? No.

281. Is the country, too, in the line submitted, far superior in fertility to the more eastern line? I am told so.

282. What rivers would have to be crossed in going from West Maitland to Dungog? Only the Hunter and the Paterson. There are one or two creeks in addition.

283. Is that what makes the line so expensive as £8,440 per mile—I mean the fact of crossing those two rivers, the Hunter and the Paterson between West Maitland and Dungog? Yes, partly.

284. What is the cost of the line from Dungog to Gloucester? £7,572 per mile.

285. What rivers are crossed during that part of the journey? There is the Williams at Dungog, and the Karuah.

286. Then from Gloucester to the Manning, what rivers do you cross? There is the Avon and the Manning, and, after Gloucester, the Barrington.

287. At what point do you cross the Manning—above Wingham? Yes; between 14 and 15 miles above Wingham.

288. Is not Wingham at the present time the head of navigation? Yes; small vessels go up there.

289. And there is a large population around Wingham, is there not? It is not a very large town.

290. But the surrounding neighbourhood is well populated? It is well settled.

291. And then from the crossing-place above Wingham, am I right in understanding that the line goes down the northern bank of the Manning to Taree? Yes. It does not follow the river-bank exactly, but it is on the northern side.

292. Did you visit Tinonee? Yes; I crossed at Tinonee coming back—in a punt there.

293. That is where the Great Northern Coast Road crosses the Manning? Yes.

294. Did you notice the country about there as regards its fertility;—is it not of an extremely fertile character from Tinonee up to Taree, and all round about Tinonee? All the low-lying land is evidently very fertile—there are heavy crops.

295. Is there not a large settled population around Taree? Yes.

296. How far down, going further north, did you go—did you go to Cundleton? No; I did not go beyond Taree. I did intend to take a drive outside as far as I could go, but the rain set in and I thought it best to make my way back. We did not get up there that bad storm which you had in Sydney, but the rain came on about the same time, and became rather heavy.

297. I suppose you took the opportunity to inquire, or possibly see for yourself the vast area of exceedingly fertile land on the banks of the Manning—I refer to the land about Cundleton, Croki, and Cooperbrook, towns on the banks of the Manning? Yes, I heard a good deal about it.

298. Did you pass through the town of Stroud? No. Stroud is off the railway route.

299. You leave Stroud on the right going up? Yes, on the east.

300. Does your line go through what is called the Brushy Mountain, between Gloucester and Taree, or does it go to the west of it? To the west of it. The road goes over the Brushy Mountain, but the survey does not.

301. Did the original survey go through that mountain? Yes.

302. But you found out a better route? The Barrington route is better. It permits of better grades, and less earthworks.

303. And it avoids the Brushy Mountain? Yes.

304. What is the country like from West Maitland to Dungog;—is not that fine agricultural country? From West Maitland to Paterson, if you go by the lower road—the more easterly road—you go through magnificent country the whole way. But on the more westerly road—on the western side of Paterson—it is more undulating. You get a good deal of timber country, the timber having, however, been mostly cut out, and the country converted into grass land. After leaving Paterson the valley of the Williams closes in, and you get the average class of country over this route. It is mostly undulating, fertile areas on the rivers, and good grass land up the slopes.

305. Then all the way from Dungog to Gloucester, it is what you might call good pastoral country, with good patches for agriculture, is it not? Yes.

306. Then from Gloucester to Taree, taking Dungog as the starting point, where does the A.A. Company's land commence? Not until you get over the range from Dungog—a few miles out of Dungog. About 60 miles from Newcastle you come on to the A.A. Company's land, and that is 7 or 8 miles from Dungog.

307. Taking that point—7 or 8 miles from Dungog—for how many miles does the proposed line go through the A.A. Company's land? Fifty-one miles.

308. Where does the 51 miles terminate on the line? The property extends to the Manning. The boundary on the survey is crossed very near the crossing of the Manning—at Baker's Creek.

309. Is it all the A.A. Company's land? Yes.

310. Is the land belonging to the A.A. Company now used principally for pastoral purposes? Yes; they have a breeding station. There are some farms on the flats.

311. Is not the land of a character suitable for settlement—admirably adapted for the settlement of a large population—I mean the A.A. Company's land through which the proposed line passes? I should think so. That is my impression.

- H. Deane. 312. And if the railway were constructed, is it not probable that, owing to the proximity of that land to the shipping port of Newcastle, a very large population would settle there? I think that if the land were in the hands of the Government, and were thrown open, it would attract a very considerable population.
- 23 Feb., 1898. 313. Having been over the proposed line, and, I presume, looked very carefully into the matter, do you not think you could see your way clear to reduce the estimate of the cost of construction? No; I should not like to attempt it.
314. Did you visit the Manning Heads? No; I had not an opportunity of going there.
315. Have you ever been there? No; it is the first time I have been over this country at all. I did not think it worth while to risk being weather-bound. The weather looked so very unpromising that I thought it was best to get on my way back for fear of being stuck up somewhere.
316. You have heard of the difficulties experienced by residents on the Manning, as regards communication with the outside world, owing to shallow water on the bar? Yes. It is a similar obstruction to what occurs on all the north coast rivers.
317. *Mr. Black.*] Would not the proposed line intercept a great deal of the traffic that now goes to the Northern railway—as far as Dungog, at all events, surely, and possibly as far as Gloucester? No.
318. Is there no traffic from the vicinity of Dungog that now goes to the Northern line? No, except it may go to Maitland, and there be taken; that, of course, would not mean any competition.
319. You do not think then that any of the receipts which are credited to the proposed railway are falsely credited to it? No, not in that way; certainly not.
320. And there is not likely to be any over-estimate on that score? No.
321. *Mr. Hoskins.*] In the 51 miles of this proposed railway travelling through the A.A. Company's land, did you observe many persons engaged in agricultural pursuits on that land? There are a number of farms along the route.
322. Can you say, approximately, what proportion of those 51 miles of land belonging to the A.A. Company has been devoted to agriculture, and is occupied by farmers? I am afraid I can scarcely give an estimate. The area of land, I am sure, is very small, indeed, in proportion to the area owned by the A.A. Company.
323. Therefore, the A.A. Company, I take it, use that great extent of land—51 miles, through which this line would run—for grazing purposes? Yes.
324. For breeding cattle? Yes.
325. They do not fatten them there? No.
326. They take them to Warra for that purpose? Yes.
327. Did you ever hear anybody say what the A.A. Company would be likely to ask for that land which they have devoted to breeding purposes if they wanted to sell it? No.
328. Looking to the number of creeks, watercourses, and rivers that have to be culverted and bridged, would you not say that on the last section of this proposed railway—the one going to Taree—the country is as rough as it is on the South Coast line, going from Como to Bulli? No; I should not say that it was, because between Como and Bulli there are seven tunnels, and some of them are very long—two of them nearly a mile long each.
329. The tunnels on the other line would be longer than those on this line, but there would be a number of tunnels on this line? Yes; but they do not amount to very much. There are four tunnels on the section from Gloucester to Taree, and they amount to a total of 629 lineal yards; but the country is rough; even when we follow down the Manning River, on the northern side the country is rough. You cannot get a level patch of land to make a railway on. The slopes of the hills on the north side come right down, and the country is very lumpy indeed, and there are consequently heavy earthworks.
330. In addition to that, are there not many creeks and water-courses to pass over with culverts? Yes.
331. More than on the Bulli line? Yes; I believe there are. They are larger, at any rate, and more important.
332. You have told us that there are, at any rate, a good many level tracts of rich alluvial flats on the rivers; but are not those river flats very narrow in width and do not extend to any great distance? They do not extend to a great distance.
333. They are all pretty well taken up and occupied, are they not? Yes.
334. *Vice-Chairman.*] Have there been many surveys made of this proposed line from Maitland to Taree? There have been a good many deviations made.
335. Can you briefly give the history of the work done by your surveyors, because I observe that when they started first a large portion of the line was 1 in 40, and the cost was estimated at much more per mile than at the present time;—you have reduced the grade to 1 in 60, and the estimate from very nearly £1,500,000 to less than £1,000,000;—would you kindly give an explanation? The reduction in the cost is chiefly due to the reduction in prices of work, but there also has been a considerable reduction due to carefully laying out the line and the use of sharper curves—curves of 12 chains radius.
336. In order to reduce the grade to 1 in 60, have you been obliged to lengthen the line appreciably? That I am not sure about. The adoption of flatter grades has, in some places, no doubt, lengthened the line considerably. On the other hand, there has been a shortening of the line; for instance, by the Barrington deviation, which was not the original one, a shortening of the line, I think, by about 10 miles.
337. Was it originally proposed to take the line along the river? No; over the Brushy Mountain, and round by Krambach.
338. You now take it down the river? We take it down the Barrington, and cross the river near where Baker's Creek runs in, and then follow the northern side of the river. We get a more direct route, and on the whole it is better, because it has better grades, and would probably be lower in cost. I will send you a statement as to the different surveys.
339. Do you think it possible, on further examination, to reduce the estimated cost? I should not like to reduce the estimate at the present moment, but I think that it is quite possible that, if the construction of the line were authorised, and it came to be permanently staked, small deviations and alterations could be made which would cause a reduction in cost here and there. On the whole, however, I think the line cannot be much improved. I should add that the system which I adopt at the present time in making the trial surveys is, in my opinion, a better one than used to be adopted, for this reason: that it gives a very much better and closer means of estimating than the older method. The surveyors on my staff are all experienced men. They know exactly what is wanted; they are not hampered in any way, and I make

use of their own experience, to the utmost; and I give instructions for the line to be selected and laid out with such care as to be approximately the line that will ultimately be adopted, avoiding, however, the consideration of too many minor details, which would take up too much time.

H. Deane.
23 Feb., 1898.

340. I suppose that at the time the survey was first made, when the ruling grade was 1 in 40, that was considered a sufficiently easy grade; the instruction to the surveyors was not to have anything more severe than that? I cannot speak as to what was done at that time, because I was neither in my present position, nor had I charge of the surveys, but I am under the impression that at that time it was considered necessary in making a trial survey only to show the practicability of the proposal. The trial survey was made more with the idea of showing the practicability of the route than of showing the best that could be made of it.

341. And where a grade of 1 in 40 could be obtained the route was to be regarded as practicable? Yes; and very vast improvements would be left for the permanent staking. Of course that system did not enable one to give so careful and accurate an estimate as is possible at the present time, although it might be a good system if accuracy of cost were not necessary.

342. At the present time it is, and for some time past it has been, the practice to instruct your surveyors to seek a less severe grade than 1 in 40? Yes, the best possible grade under the conditions.

343. *Mr. Hoskins.*] In the event of the construction of this railway being authorised by Parliament, how many years do you think it would take before it was finished? I should think it might be done in about three years.

344. *Mr. Roberts.*] How many stations have you provided for? I have provided for a station about every 10 miles—at all the principal towns and centres of settlement, and principal roads of access. I now hand in particulars of the holdings of 20 acres and under, the statement having been prepared in the Survey Office. Those are the particulars referred to by Mr. Wright in his examination of me yesterday. Although I think that the statement is accurate, it must be accepted as an approximate statement only.

THURSDAY, 24 FEBRUARY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

345. *Mr. Trickett.*] I suppose you have carefully read and considered the Commissioners' report, dated the 24th November, 1897, on this proposed railway? Yes.

H.
McLachlan.
24 Feb., 1898.

346. Since then have the Commissioners seen any reason to alter the conclusions that they came to in regard to this railway? No, the Commissioners see no reason to alter their opinion.

347. That report is entirely unfavourable to the construction of the line? Yes.

348. The report states that the Commissioners have personally gone over a great portion of the route. Have you gone over it yourself? No, I have not.

349. I suppose that Mr. Harper, as usual, will be able to give us detailed particulars as to the traffic? Yes.

350. Can you tell us whether the Commissioners regard this line on its own basis, or in connection with a possible extension to the north? They have looked upon it on its own merits.

351. Have they considered, if it went further north, whether that fact would tend to make it a more remunerative line? No, not to my knowledge.

352. They have not looked at it from that point of view? No.

353. I suppose you can say that if the Commissioners themselves had been the first people in regard to a project of this kind, this Committee, in all probability, would never have heard of it? No, they would not.

354. In the face of those extraordinary figures showing that this line at the start would result in a loss of £31,468 a year, are you able to tell us how it is such a project as this comes before the Committee? Of course that is a matter in which the Commissioners would not take any part. The Government, as a matter of policy, propose a line, and the Commissioners, according to their duty, have to make a report as to the financial prospects of the line. That is where their duty comes in, and they have made their report accordingly.

355. In this report considerable prominence is given to the fact that water competition would be encountered in the case of this line being constructed, and that such competition is always a very strong factor against the success of a railway? Yes. It must naturally be a very strong competitor, and a successful competitor in most instances, with a railway.

356. As Secretary for railways you have been frequently asked your views on that point. Do they still remain the same, namely, that where water transit is available it can be done more cheaply than by railway, and is usually availed of? Yes. On the general question of competition by sea, I may read the following extract from a report of a Select Committee of the House of Commons on Railway Companies Amalgamation. In that report, which was made some years ago, they refer particularly to the question of competition by sea, and, as they sum up the matter effectively, I made this extract:

In the first place there can be no doubt that effective competition exists between places between which there is transit by sea. The sea is a highway which cannot be closed or restricted, and which admits any number of competing carriers. Ships are readily built, profits upon them are rapidly made, and constant improvements in building and economy in working encourage incessant building; and, readily as they are built, they are still more easily transferred from one trade or voyage to another. Where there is a demand for sea carriage the supply is sure to follow. Consequently, when railways compete with ships, fares and rates are generally exceptionally low.

Consequently the competition of sea carriage is an important element in determining railway rates for goods, and has a large indirect as well as direct operation. The extent and importance of this form of competition may be in some degree estimated from the answer of a very competent witness, who states that after some inquiry he believes that it affects the rates for goods at three-fifths of all the railway stations in the United Kingdom.

H. McLachlan. One of the witnesses—Mr. Farrer, who is a recognised railway authority at home—was asked the following question :

24 Feb., 1898.

I wish to ask you some questions as to the amount of competition, in your opinion, existing, or which may be maintained between the railways themselves, and between the railways and other means of conveyance; and first, as to competition by sea, you would say, I have no doubt, that this is competition which is real and effective?

His reply was :

Very real and very effective; and one which, if proper precautions are taken, can scarcely come to an end. It appears throughout the evidence given before this Committee, and before the Royal Commission, that that competition tells in every way, direct and indirect, in the way of reducing the rates on goods especially, and sometimes the fares for passengers, but the rates on goods to an enormous extent; and in many ways in which you would hardly think, in the first instance, that it would reduce them.

That sums up the matter fairly well.

357. Those views you fully endorse at the present moment? That is our experience.

358. In the Commissioners' report there is the following paragraph :

It is true that the water service is at times somewhat precarious, and there is a generally expressed opinion among the residents that it is not satisfactory; yet it must be fully recognised that freight charges and fares are, as a whole, even now much less than those which could be quoted in connection with the proposed railway, and would no doubt be considerably reduced if such a course became necessary to retain the traffic.

Have you the comparative figures on which the Commissioners base that statement? They are in Mr. Harper's report. Those rates would be very much less than the rates we could afford to quote, or that we have quoted.

359. Would you prefer to leave that evidence to be given by Mr. Harper? Yes.

360. He will be able to give us exactly the comparison to show that the freights by the steamers would be to the advantage of the steamer traffic both for passengers and goods? Very much so. Of course there is another important consideration which enables them to compete with us. I suppose they would save 30 per cent. in distance.

361. I was going to ask you a question about that; the distance is much less by steamer? Very much less.

362. How would the time compare? There would not be a great difference in time, compared with an ordinary trip. The North Coast boats with a fair wind have done the trip in fourteen hours. Their average would be sixteen or seventeen hours; and, with a mixed train service, I do not suppose that we should do it in more than perhaps two or three hours' shorter time—that is, in view of the longer distance we should have to travel. So far as the interference with trade is concerned, of course you would be able to get the local pilot's evidence. But I understand from the Steamer Company that they have had little interference with their operations, practically, for twelve months past.

363. But in regard to the distance to and fro—the water distance being shorter—even if the people came by train, they would have to pay considerably more, and therefore they would still avail themselves of the water? Yes; as a matter of fact, as regards water competition, they are much more favourably situated—that is, taking like with like, at any time. But the saving in distance, I think, would be at least 30 per cent.

364. The Commissioners also state in their report :

For perishable freights, such as cream, butter, fruit, poultry, &c., and stock—particularly calves and pigs—the advantages of quick transit by rail would probably operate largely in favour of that method of carriage, and a liberal allowance has been made in this connection in estimating the revenue.

What is the experience of the Department in that direction with regard to the South Coast trade? The experience is that we get the perishable traffic; but of course you can understand that we get it more particularly in this way: we have a regular service—two trains a day, practically—whereas the boats may run only twice a week. At present, they run no oftener to the Manning. If we were to run a daily train on this proposed line, we should get the butter and the milk and such things, but there is not much profit in carrying them. However, I do not think we should get much of goods that could be waited for—general goods, and maize and other things. There is another consideration which must not be lost sight of, namely, that the greater part of the traffic would be from farms on the banks of the river where the people are settled; and the steamers in every case include delivery from the private wharfs, for they drogher the stuff down, their boats running a good distance up the river, and afterwards they land it on the wharf in Sydney, and store it there. Therefore, in addition to having to pay much higher rates by railway, the people would have to pay more transmission charges to reach the railway station.

365. In fact, it almost seems a question whether, if a railway were constructed to Taree, the Commissioners would have to go in for some means of collecting the trade, so as to bring it to the railway? That, of course, would add enormously to our expenses.

366. If the steamers still competed, and by means of small droghers collected the freight from the producers' homes, or from the wharfs near to them, at a small rate, it seems very probable that the people themselves would not take the trouble of bringing their stock to the railway station, either by driving them a considerable distance or by means of vessels? The stock would not be such an important consideration, for it is not a big stock district. Take our experience of the South Coast: we send more stock into that district than we bring from it. But with regard to general goods, the steamer's rate, which is already much lower than ours, includes, practically, delivery to the nearest wharf, and very often the people with big farms would have their own wharfs from which the droghers would take the goods. Take the case of maize. The steamer's rate is practically 10s. a ton, delivered in Sydney on the wharf, and in most cases it would be taken from the farmers' wharfs themselves. Our rate for grain is an extremely cheap rate—one of the lowest rates that we quote—but even that would be higher for maize than the steamer quotes, and the farmers would have the additional cartage to the railway station.

367. The Commissioners mention certain lines of perishable freight that would, perhaps, go by the railway;—do you know what is the chief freight sent from the Manning River? The principal freight would be farm produce—maize; and then there would be general goods going into the district.

368. You are aware, I suppose, that the Government have in contemplation the expenditure of a considerable sum of money for improving the entrance to the Manning River? Yes.

369. And that, I think, is also a matter under reference to this Committee? Yes. Of course, that would simply assist competition against the railway.

370. If that were carried out, it would make the competition by steamer against the railway even more keen? Yes, more effective.

371. In regard to the South Coast line, are you able to tell us whether the passenger traffic by steamer has been affected much by the construction of that railway? We get most of the passenger traffic on the South Coast line. The regularity and the frequency of our trains hold that.

372. It is a fact, is it not, that this railway, if it were constructed, would go through a very large stretch of private property? Yes.

373. The greater part of it? Yes. About 50 miles of it, I think, would run through one estate.

374. And that, I suppose, must necessarily add very largely to the cost of the railway? Yes; that is, if you had to purchase land. I think the capital cost does not include land resumption; but, of course, Mr. Deane will be able to say.

375. The Commissioners have not estimated any amount for that? No.

376. But it necessarily would be a very large amount if the land had to be purchased? It would necessarily add to the cost. I daresay that a lot of the land would not be dear land.

377. Have you anything else to state in addition to the statement which has been handed in on behalf of the Commissioners with regard to this railway? Not at present.

378. And it is one that neither the Commissioners nor yourself can recommend for construction? The Commissioners do not recommend it.

379. *Mr. Hassall.*] Are you aware that there is also before the Committee a proposal to improve the facilities for vessels entering the rivers along the northern coast? Yes.

380. Do you think there is any justification for both proposals—that is, for this extension of the Northern Railway, and for the improvement of the bar harbours of the various northern rivers? The Commissioners have simply looked at the matter from a railway point of view, and they think that financially it will not be a success.

381. Taking into consideration the competition that must ensue from the river traffic? The competition that exists to-day.

382. And not only exists now, but any improvements made in the bar harbours along the northern coast will render that competition more difficult to meet? Yes.

383. The railway extension from West Maitland to Taree can only be one step in the construction of a north coast railway? That is a matter which has not been considered by the Commissioners. They do not recommend this step.

384. Do they, or do they not, recognise that the first step must mean an ultimate extension further north? I am not sure. They only had this proposal referred to them—not, I think, as the first stage of a coast railway—and they reported on this proposal on its own merits.

385. And in their report on this particular extension of the railway from West Maitland to Taree they have not taken into consideration a further extension to Coff's Harbour, or, ultimately, to the Tweed and Lismore railway? Not directly.

386. But they recognise, I presume, that any construction of a north coast railway must undoubtedly mean competition with water carriage? With the existing facilities, yes.

387. And for that reason they do not recommend it; I notice that, in 1891, you, on behalf of the Railway Commissioners, sent a letter to the Under Secretary for Public Works, in which you said:

With reference to the request that the Railway Commissioners would report upon the proposal for the construction of the North Coast line—West Maitland to Taree—(estimated cost, £1,378,923), I am directed to say that the matter has been carefully inquired into, a responsible railway officer having gone over the route proposed; but there would appear to be no prospect of the line for many years being remunerative. As the personal inspection of the proposed line by the Commissioners would involve much loss of time and expense, and it is probable that the Government may determine to postpone the matter for the present, I return the papers herewith, and shall be glad of further advice.

? Yes.

388. Has anything further been done, as far as the Commissioners are concerned, in connection with that proposal? Nothing except this particular proposal. This is the next step practically.

389. And as you have already told Mr. Trickett, the Railway Commissioners have not seen fit to alter their opinion in any way? No.

390. I presume they have given the matter very careful consideration? Yes; and they went personally over the route, and took evidence on the ground. They went very carefully into the matter.

391. And in their opinion, is the estimate of loss annually, amounting to £30,000, roughly speaking, borne out by the result of their inspection? Yes; their report was made after their inspection, and after they had given very careful consideration to the matter.

392. So that, in their opinion, the construction of this line, and the working of it, would result in an annual loss of over £30,000? Yes.

393. They have seen no reason to alter that opinion? No.

394. And for that reason they cannot recommend its construction? No.

395. *Mr. Lee.*] The report of the Commissioners on this proposal has been arrived at not altogether upon the circumstances attending this proposal, but after having had the advantage of railway extension carried out under somewhat similar conditions? Yes.

396. Therefore they are now in a position to speak positively on the point as to water carriage *versus* railway carriage? Yes.

397. Have they not a precedent to guide them in the Illawarra line, as far as Nowra? Yes. That is a more thickly populated district, and more likely to bring traffic, and of course this line will cost a good deal more.

398. Is it a fact that the coast steamers are still trading to the southern ports as far as the railway line has been extended? Yes.

399. And have been running against the railway line since it has been constructed? Yes.

400. Do you happen to know whether they carry any large quantity of produce from that district? The steamers get a large portion of the produce from the district, and we find the coast affects us in competition very keenly, at even a very long distance from the coast. That is, I think, what is referred to in that English evidence, that directly and indirectly sea competition affects the railway. We know from our own experience that we are affected by sea competition fully 100 miles from the coast. For instance, in the case of Glen Innes, which is 104 miles from the sea coast, and also on the Cooma line we have the same trouble. The distance from Queanbeyan to Nelligen is 67 miles. We are asked

H.
McLachlan.
24 Feb., 1898.

very often to quote reduced rates on account of this sea carriage. I was turning up a letter only yesterday from Queanbeyan, which is 67 miles from the nearest southern sea-port, and, to show you the feeling, I may say that in this letter the writer says:—

It compels me to approach you [that is the Railway Commissioners] on the subject of a reduction in the rates of railway carriage. The accessibility of Nelligen as a port gives us the option of water carriage.

That is 67 miles from a railway station. So you can see to what extent water carriage affects the railway—in one case 104 miles, and in the other 67 miles—and affects it keenly.

401. Can you tell us the class of goods or produce that you carry from the Illawarra district? I should not like to say from memory; but generally I take it to be what we call the lower class goods. The general goods go to the steamers.

402. Would you carry such things as maize and other low priced goods? As a rule, those are the goods we would get—the low class goods, what we call the miscellaneous and the “A” class goods.

403. Can you carry maize as cheaply from the Illawarra district as by steamer? There is very little maize grown there. Our rate for maize from Taree, supposing the maize were put on the trucks, would be a couple of shillings dearer than the steamer rate to the wharf in Sydney, and the steamer, of course, has this advantage, that it would drogher the maize in a much better position, probably, for the farmer. So, even as regards maize, the steamers would be in a much better position than we should be, and they would also have fully 30 per cent. less distance to run. According to the coast chart the distance of the Manning River heads from Sydney in a direct line is 141 miles. Of course, you would have to allow a little margin for not following a direct course. But the distance from Taree to Sydney would be about 230 miles.

404. Your experience on the South Coast line has proved that you have not been able to get the whole of the traffic of that district? No.

405. And at present there are at least two steam companies competing with you? Yes.

406. Do you see any prospect of ultimately obtaining the whole of that traffic? I do not. The sea competition must always be very real and very effective.

407. That line has been in use sufficiently long to enable the Commissioners to decide what should be done to obtain the traffic, has it not? Yes.

408. And have they been able to strike a rate sufficiently low, consistent with proper railway management, to enable them to obtain that traffic? Not to get the whole of the traffic.

409. If that obtained on the south coast, I presume that the Commissioners are of opinion that it will obtain on the north coast as well? Yes; I may say, in regard to those two lines you have referred to particularly—Sydney to Nowra, and Goulburn to Cooma—on the Goulburn to Cooma line, the result for 1896, including interest for that year, was a loss of £47,000; whilst on the Sydney to Nowra line, the loss, including interest, the same year was £49,000.

410. Is that an exceptional year? No; for the previous year, 1895, the loss on the Sydney to Nowra line, was £54,000—it picked up £9,000 in 1896.

411. 1896 seems rather a favourable year? Yes, for that line. On the other hand, the Cooma line has gone back. Of course the Illawarra line is in a far better position than this line is likely to be in. On account of the directness of its association with Sydney, you have a big passenger traffic. The Illawarra district is more thickly populated, and the milk, cream, and butter traffic coming up directly gives us business I do not think we would get from Taree.

412. Has it not also the further advantage of running into an old established dairying district? Yes, and I think that its resources are better than those of the Taree district.

413. If it were not for the dairy produce, that line would fare very badly? There is a certain business in coal. Of course the coal-mining population being pretty dense, too, it gives you passenger traffic.

414. But it does not give you very much coal traffic? It all helps the earnings.

415. At all events, looking at it all round, it is a much superior line for traffic than the Taree line would be? It seems to me to be so.

416. For none of those industries exist between Maitland and Taree? No.

417. Then, again, in the north the problem that you had to deal with for so many years—the competition of the Clarence River with Glen Innes,—has been a difficult one? It has been a difficult question.

418. And you have been unable to compete with that? Yes.

419. And you still lose traffic? A certain amount.

420. That again would influence the Commissioners in coming to a decision, showing how difficult it is to compete with water carriage? Yes.

421. If the entrance to the Manning River were made navigable under all circumstances, and if a railway were run to the Manning River as well, do you think there is the slightest probability of the railway ever capturing the trade? I do not think so; not the paying trade.

422. You would get the bulk of the passenger traffic? We might get a good deal of that; very many people prefer land to sea.

423. But since the produce grown there, chiefly maize and stuff of that kind, is at a very low price, you hold that it would be impossible to expect it to be sent by train, when the farmers have the advantage of water carriage? We might get a portion of the maize, but very little of the general dear goods; and I am doubtful if we would get very much of the maize.

424. *Mr. Roberts.*] Can you tell the Committee the places that the Commissioners visited along the proposed railway? No, personally I cannot. Mr. Harper was with them. They mention them in their report. I should not like to speak from memory.

425. Did the Commissioners go by sea, and come back overland, or did they go overland and come back by sea? They went both ways overland.

426. Can you say whether they had any opportunity of seeing the entrance to the Manning? They were at Taree; I do not think they went to the entrance to the Manning. I do not think they went below Taree.

427. I think you said, in answer to Mr. Trickett, that the Manning was within fourteen hours of Sydney? With a fair passage I believe the steamers have done the trip in fourteen hours. In regard to those 141 miles, I might have mentioned that they were nautical miles, and I suppose that they will be equal to 170 land miles.

428. That would be from Sydney Heads to the Manning entrance, would it not? Yes.

H.
McLachlan.
24 Feb., 1898.

429. Do you know that the trip has been done in fourteen hours ; is it not a fact that it generally takes from eighteen to twenty or twenty-four hours to get to off the Manning Heads from Sydney? The Assistant Secretary to the Company told me that you could take their average trip as being about seventeen hours.

430. You are aware there is a long journey up from the Manning Heads to Taree? About 28 miles, I think.

431. So that a steamer leaving Sydney, say this afternoon, the people would not be able to get their goods out of the steamer at Taree until the day after to-morrow? They ought to get them out to-morrow afternoon, I should think, at Taree.

432. Would there not be all the different wharfs to stop at going up the river? I am not sure about the time; but the Secretary told me the time of their trip on the average, and that it might be taken as seventeen hours.

433. That is to get off the Heads; but there is a long journey up the river with the stoppages at the various wharfs? I have not been on the river myself.

434. It would be nearly forty-eight hours before the people at Taree could get their merchandise? I should not think it would be anything like that; but, of course, the Company could give the Committee information as to that, or the Sectional Committee could obtain it.

435. But seeing that it might take from forty to forty-eight hours to get goods there, when they could be taken in four hours by rail—and the same thing applies to passenger traffic—would it not be a fair thing to assume that the railway, on account of expedition in transit, would get the bulk of the traffic—passenger as well as goods traffic? There is not a great deal of passenger traffic from that district, and there is not likely to be, I think. So far as drapery, spirits, and goods are concerned, the detention of a day does not make any difference. You can see that in regard to the road carriage on the south coast and the north coast, which takes perhaps a week longer than by rail, but that does not stop competition.

436. You say you do not think there would be a large passenger traffic from the district: but would not that be owing to the people having to undergo the discomforts of a sea voyage now? It is too remote from Sydney, I think, for us to get a very big passenger traffic, and the population of the district is not what you would call a dense one.

437. But is not the population, although it may not be dense, scattered among numerous towns along the river? They are a class of people who do not travel. As a rule, you find that a farming population are not big travellers. They are not like a mining population—they are not a travelling population.

438. Is it your experience on the South Coast that the farmers there are not travellers? To some extent it is; but, still, on the South Coast the circumstances are very different, because they are very much nearer to Sydney, and the expense of travelling is so much less. Besides, a great deal of the traffic into that district is tourist traffic, and recently large smelting works have been established there, and there is a big mining population in the district. Therefore, the circumstances of the two lines I do not think are in any way similar.

439. Have you ever been over this country from Maitland to Taree? No; I know that very few people go over it from choice at the present time.

440. Are you aware that the scenery along the proposed route would compare very favourably with the scenery on the South Coast? Yes; but it is a longer distance away. It is certainly not better.

441. If a railway were constructed from Maitland to Taree, is it not possible that many of the natural beauties of the place would be opened up and attract a number of tourists in the same way as they are attracted to the South Coast? No; I do not think you would get much tourist traffic there. The distance from Sydney alone would prevent it. Besides, you have prettier places elsewhere and much more accessible and much more cheaply reached. Personally, I do not think that you would get much tourist traffic in this district. That is my own opinion.

442. There are equal attractions for tourists along this line as there are on the South Coast? So there may be; but, as I have pointed out, the greater distance from Sydney and the greater cost must, of course, prejudice it very much when you compare it with the South Coast.

443. You think that the distance would prevent tourists from going there in such numbers as go to the South Coast? Distance, and the cost of travelling.

444. Are you aware that coal has been discovered between Maitland and Taree? Yes; I believe there is coal there, but not worked.

445. If they had the advantage of railway transit, is there not a possibility that it would open the country in that way, and develop the mineral resources of that part of the Colony? Of course you have plenty of coal country opened up already, so much nearer to a port, so I do not think there would be any great benefit in doing that. I do not think that the Commissioners have allowed anything for that traffic, nor do they expect to get it.

446. Are you aware that the Manning is fast becoming what I may call a dairying district—that large areas of land are being devoted to dairy purposes? Yes, I believe that it is becoming a dairying district but we have the experience of a dairying district which has been opened up pretty fast, that is between Lismore and Murwillumbah. On that line, in 1896, we lost £28,000, and that is a better dairying district.

447. But is not the South Coast railway principally dependent on the dairy produce to feed the railway? As I have said, it has very large resources; for instance, there are industries in the district, and coal-mining is carried on extensively there, and then there is a big passenger traffic, such as I do not think you are likely to get on this Taree line.

448. What I wanted to point out, or get you to see is that that tended to rapidly decrease the loss on the South Coast railway, and would it not be a fair thing to assume that the same thing would obtain in a few years on the North Coast line? No, I do not think so. Of course the smelting-works are helping the South Coast line a good deal, and the increased passenger traffic has helped it a good deal, and also a greater business in coal.

449. Are there not on the north coast, between Newcastle and the Richmond, some eight or nine rivers that would require a large expenditure of money to afford safe and sure navigation? Yes, they would require a good deal of money to improve the mouths.

450. Does it not appear to you that if this money, instead of being expended on improving the entrances to the harbours, were expended in railway construction, the result would be more beneficial to the Colony generally, because in the one case the Government would receive some return for their outlay, and in the other

H.
McLachlan.
24 Feb., 1898.

other they receive nothing? It is very problematical. In the first place the expenditure would probably amount to millions of pounds as against thousands of pounds, and it is doubtful whether the line would earn sufficient to pay working expenses. That is the feeling of the Commissioners.

451. Is it a fair thing to say, that in one case the expenditure would amount to millions of pounds, and in the other to only thousands of pounds,—seeing that each of these eight or nine rivers would on an average require an expenditure of £250,000? The Richmond, the Clarence, the Macleay, and the Manning, would be the four rivers that would have to be dealt with. I do not know what the proposal in regard to Trial Bay is.

452. The expenditure in each case would be about £250,000? I did not know that it would run into that.

453. It would average that, I think? On this section of line alone the expenditure would amount to £1,000,000.

454. Are you able to say whether if the line were continued to Grafton, the loss would be minimised? No; the Commissioners have not looked at that. I think that the estimate allowed for passenger traffic allowed 40 passengers a day on this line, and the Commissioners think that that is a fairly liberal allowance.

455. *Mr. Wright.*] Touching Mr. Roberts' last question, this railway to Taree would cost nearly £1,000,000, and I suppose that an extension of this line to Grafton would cost quite as much again? I could not say; but I understood that it would cost a good deal more.

456. You cannot say; but from the nature of the country you think that it would cost as much per mile as this proposed line? I think that it would cost more. Our experience is, that it is more costly to make railways along the coast than to the coast through ordinary country.

457. And the traffic would not be very materially increased? I think not.

458. About the land along the route on this railway, I think Mr. Trickett asked you some questions; is it true that the A. A. Co. have offered free that portion of their 51 miles of land through which this line would run? I am not aware. Of course it would not have been offered to the Commissioners. It may have been offered to the Public Works Department.

459. It would not come under your observation? No. I do not think it has been before the Commissioners.

460. *Vice-Chairman.*] What is your experience with regard to the North Coast passenger traffic by water in competition with the railway traffic? We get a great deal of the North Coast passenger traffic—you mean Newcastle. I have not the figures with me; but I know that we get a very good passenger traffic, and the steamers do also. They are running at less fares.

461. The steamer charges are lower than the railway charges? Yes.

462. What is the difference? Our rate is £1, 1st class return. I believe they have altered their fares lately; but I think that they charge 5s. steerage on the Newcastle boats, and 10s. or 12s. saloon.

463. As far as you remember, the railway fares are about double the steamer fares? Yes.

464. What, approximately, would be the comparison between the railway fares and the steamer fares if the railway were extended to Taree? At the present time, the steamer fares to Taree are £1 5s. saloon single, and £2 return. If we took a somewhat similar distance on the railway, we should be about 50 per cent. or more extra. For instance, our single fare would be £2 and the return £3, as against £1 5s. and £2, and no doubt if competition came about they would still further cut for business.

465. Can you give us any information about Taree as regards freight for the different classes of goods? To Taree, I believe they would charge in many cases about one-third of what our charge would be, for general goods.

466. What would probably be the comparison of the freight by rail and by steamer to Taree upon their present rates? For passenger fares they would be at least 50 per cent. under, and for general goods they would be less than half of our rates. For maize our rate would be about 11s. 9d., and that we reckon is our lowest up-rate. That is without any charge for getting the stuff to the railway station, which would make the cost about 13s. Their rate is 10s., so even for our very lowest product they are still considerably under us—you may say 30 per cent. under.

467. Did the Commissioners take into consideration the probability or otherwise of the interest on the cost of construction being overtaken within a reasonable period? No; they do not see any prospect of its being overtaken.

468. Do they look upon it as a permanent loss? Yes.

469. The prospects of the line afforded them no encouragement whatever? From a financial point of view, none.

470. *Mr. Wright.*] On the South Coast railway do you carry much maize from Shoalhaven to Sydney? No.

William Henry Hall, Sub-editor of Statistical Year Books, Government Statistician's Office, sworn, and examined:—

W. H. Hall.
24 Feb., 1898.

471. *Mr. Hassall.*] I believe that you have some statement to make in reference to the population along the route of this proposed line of railway? Yes. I have taken a distance of 10 miles on each side of the projected line. In the county of Durham there is a population of 6,280. That is distributed over certain localities.

472. Does that include the whole of the population, or only the adult population? The whole of the population. In the county of Gloucester there is a population of 4,110; in the county of Macquarie there is a population of 3,210, making an aggregate population for the district of 13,600. The following list gives the details of the population:—

<i>Localities in County Durham.</i>	
Bendolba	115
Bolwarra	530
Brookfield	125
Clarence Town	580
Dungog (M.)	1,100
Gresford	635
Hinton	620
Largs	285
Paterson	385
Seaham	85
Vacy	185
Woodville	250
Outside of Localities	4,895
	1,385
	6,280

Localities

<i>Localities in County Gloucester.</i>			
Bandon Grove	325		
Clarkson's Crossing	95		
Kimbriki	140		
Monkerai	170		
Stroud	305		
Thalaba.....	200		
Tinonee.....	255		
		1,490	
Outside of Localities		2,620	
			4,110
<i>Localities in County Macquarie.</i>			
Coopernook	320		
Croki	75		
Cundleton.....	330		
Dumaresq Island	240		
Ghinni Ghinni.....	120		
Killawarra	95		
Mitchell Island	365		
Oxley Island	365		
Taree (M.)	730		
Wingham (M.)	570		
		3,210	
Outside of Localities (all included in various islands above, &c.)	
			3,210
Total population of district			13,600

W. H. Hall.
24 Feb., 1898.

473. That return, I presume, is made up to the present year? It is the latest return.
474. Have you compared that return with returns for previous years? No.
475. What I wish to find out is whether the various districts enumerated are increasing or decreasing in population, or are at a standstill? Without making a comparison, and taking it out for each year, it would not be possible to say. I was asked to produce evidence according to the latest records we have, and I have confined myself to that.
476. I suppose you have no idea what are the principal occupations of the residents? No.
477. You can only give us that return of the estimated population of the various places in the district through which the line would pass? Yes.
478. You cannot give the Committee any information as to their pursuits or anything of that character? No, I cannot.
479. And you cannot tell us whether the population is increasing, at a standstill, or retrograding? Not without making further inquiry.
480. *Mr. Wright.*] Can you tell the Committee what proportion of the population you have enumerated is within 10 miles of Maitland? I could not, without taking the map and going through the localities again. The population of Largs is 285; Seaham, 85; and Hinton, 620.
481. *Mr. Roberts.*] Which town contains the largest population? Dungog—1,100 in the municipality.
482. What is the population of Taree? 730.
483. Wingham? 570.

Henry Richard Carleton, Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

484. *Mr. Lee.*] You are aware that this proposed railway is to start from West Maitland, and go *via* the Paterson and the Williams, and across the Manning River to the township of Taree? Yes, I heard something about it, and I glanced at the plan here this morning.
485. A distance of 113 miles from Maitland;—do you happen to know the distance from the Manning heads to Sydney? 141 miles.
486. Do you know about the time it takes coastal steamers to make that trip? They do about 9 knots, I think, and it would take from sixteen to seventeen hours.
487. You know the Manning River pretty well? Yes, I made a survey of it.
488. You know the situation of Taree? Yes, very well.
489. If this line were carried to Taree, and your proposed harbour works were also carried out, what would be the effect on the produce of the district—which way would it go? It would still go by the river and by sea.
490. Why would they patronise the sea and not the railway? It would certainly be cheaper by sea, and I think it would be more convenient. The railway would serve only one side of the river. The farmers on the other side would have to bring their produce over the river and handle it twice to bring it to the railway.
491. I suppose that both banks of the river are occupied, and under cultivation? Yes.
492. Which, in your opinion, would best serve the the district—a port or a railway? I think it would be better to improve the entrance to the river.
493. Are you of opinion that there is any necessity for both works? I hardly think that there is.
494. If the port were kept open and a railway were made, would not the effect be that one must certainly rob the other to a certain extent? They would certainly enter into competition.
495. If the port were at all times an accessible port, would the fact of a railway running to Taree shut out the present coastal steamers from it? Not if you had a good entrance.
496. You think, therefore, that water communication is almost certain to be sustained? I think so.
497. You say you believe that a port would best suit the district? Yes.
498. I believe that the entrance to that river is uncertain at times? Yes.
499. And under conditions of that kind, if there were a railway, the inference is that the perishable goods and the passenger traffic would be likely to go by the railway? Yes.
500. But would that apply to such produce as maize, and things of that kind, and live stock? I think not. A reduction in freight would draw all that produce by water.
501. Are your Department doing anything to the South Coast entrances now—are you carrying on any works at Shoalhaven? We are doing some dredging on the South Coast, and repairing the jetty at Eden.
502. Notwithstanding the fact that there is a railway down there, it appears to me the Department still have to keep open the waterways? Yes.

H. R.
Carleton.
24 Feb., 1898.

H. R.
Carleton.
24 Feb., 1898.

503. Which, of course, must sustain competition with the railway? The Shoalhaven bar is one of the best on the coast; that is why we have not to do anything there.

504. The Department is spending money on the river there? Yes, but the Shoalhaven bar is one of the best on the coast, and does not require any expenditure to keep it open. It faces directly north, and is so very well sheltered that we never have any trouble with it.

505. Do you think that it would be in the interests of the country to construct this railway to Taree and allow the entrance to shoal up? I do not think it would.

506. As a matter of fact, is it not the policy of every country in the world to keep open their waterways—to keep up the ports? Yes. I look upon a river as a natural highway.

507. Irrespective of any other means of communication, is it not the universal policy of every country to keep open its ports? I think so.

508. Are they not valued above every other means of communication? Yes.

509. Therefore, have you any reason to suppose that, if a line were made to Taree, the people of that locality would be satisfied to allow the entrance to that river to close up? I do not think they would.

510. Would there not be a continual agitation on the part of the people to your Department to have work done there? I would expect something of that kind.

511. Therefore, the construction of the railway would not do away with the necessity of work at the port? There would always be a certain amount of traffic on the river.

512. *Mr. Roberts.*] Is not the entrance to the Manning one of the most difficult for navigation at the present time? It is rather a dangerous one, and troublesome.

513. Have there not been many wrecks there within your knowledge? Yes, there have been a good many.

514. Owing to the want of improvement of the entrance? Yes; it labours under the difficulty of having the headland on the northern side, which is a very bad thing for any entrance.

515. Does it not require continual dredging in order to allow vessels of even very light draught to get into the river? Yes, until the harbour works are fairly extended.

516. At the present time the producers in the Manning River district labour under very many disadvantages do they not, in getting their produce to market? They do to some extent. Vessels are sometimes delayed in consequence of a shallow bar.

517. Have you any record as to the delays of steamers inside the entrance with produce on board for Sydney? I believe there has not been so much delay of late years, so far as I can ascertain. But I made a survey of the entrance myself, in 1887 or 1888.

518. If you can give us any information of that kind, I am sure that it will be acceptable to the Committee; I want to show by my questions the great delay that takes place, and consequently the loss to the people of the Manning River district through their inability to get their produce to market? I will read you an extract from my report of the 15th July, 1889—a description of the River Manning which I wrote to be sent to Sir John Coode:—

Previous to the floods of last winter, the bar was extremely shallow and the coasting steamer, drawing 7 feet, was bar-bound fifty-nine days in one year. Changes, however, when they do come, are rapid, and the bar has been known to increase from 5 to 11 feet in depth in one night.

I have made some inquiries since then, and I have found that there have been no delays reaching that amount since, as far as I could make out. The greatest trouble appears to be in the winter time.

519. Does the bar silt up more in winter? I understand that last winter a vessel instead of making seven or eight trips per month made only three or four.

520. Would that be a steamer? Yes, I believe a steamer. And during that time many crossings had to be made at night. I do not consider that at all desirable—going out at night.

521. It is undoubtedly dangerous? Yes.

522. And is it not a fact that the dangers to be encountered when going to Sydney, prevent what might be termed a really good passenger traffic between the metropolis and the Manning River district? I daresay they would frighten some people.

523. From your knowledge of the district, would you not think that there would be a fairly good passenger traffic on the railway if it were constructed? There ought to be. It is a thickly settled country about that river.

524. It would strike you that the people would be as likely to travel on the North Coast railway as they would be on the South Coast railway? Yes.

525. You have been pretty well all over the district, have you not? Yes, the whole of the river and all its tributaries as far as the boat could be pulled over.

526. Is there not a vast area of extremely fertile land? Yes, it is a very fertile country. The Cundle plains are spoken very highly of, and Oxley Island is all excellent land.

527. Reaching right away down nearly to the Heads? Yes. Mitchell Island is lower down.

528. Do you not think that if a railway were constructed, a vast amount of settlement would follow on country within easy reach of the railway after getting to Taree? I only know that portion of it, say, from Gloucester to Taree through the A. A. Company's country, or from Stroud.

529. Have you been overland? Yes, by the road, dozens of times, but not by the railway route. I usually go across the Karuah to Stroud *via* Raymond Terrace, and to Gloucester. The road from Gloucester to Taree is closer to the sea than the railway line would be.

530. Are you not aware that the country through which the line is surveyed is better country than that over which you travelled on the road between Gloucester and Taree; the proposed railway line does not go along near the coach road? No; it does not go over the Brushy Mountain.

531. It goes to the west? Exactly.

532. You have not been over that country? I do not know that part. I have been out to the Barrington and to Copeland.

533. Are you aware that the country from West Maitland to Dungog is superior to that traversed by the coach road to the Manning? I have heard that spoken well of.

534. Did Sir John Coode send in an estimate for the improvement of the entrance to the Manning? Yes. Sir John Coode's estimate was £193,930; but the Minister has since submitted a proposal to the House which has been referred to this Committee, and the estimate for which will be very much less than that. The details are not worked out yet—Mr. Darley has it under consideration—but I know enough of it to say that it will be considerably less than that.

535. Would it be £50,000 less, do you think? More than that amount less than Sir John Coode's estimate.

536. Have you any record of the money that has already been expended to temporarily improve the entrance to the Manning? Yes. On the 30th June last we had spent £16,870 at the Manning. That is the total expenditure on harbour works, but does not include the dredging. I have not got the cost of the dredging. It has been going on for a number of years.

537. There has only been £16,000 spent on that work? Up to June last. The amount would be over £20,000 now.

538. What work is going on at the present time? Training walls on the Manning. Contracts have been let for the construction of what is known as the north training bank in Sir John Coode's scheme.

539. What is the amount of the contract? It is a rate per ton. We are not committed to anything. The contractors are working on a monthly agreement, and can be stopped at any moment.

540. How long has this work been going on? Two and a half to three years.

541. Has sufficient work been done to prove its value or efficacy? To some slight extent. It is hardly sufficiently far advanced to judge of it yet.

542. Is it a portion of the scheme that is to be submitted to this Committee? It is.

543. How many dredges are at present employed on the Manning? Last week there were two—a lighter dredge and a small sand-pump; but the sand-pump left for Cape Hawke yesterday or the day before.

544. Is the river navigable for ocean steamers at Wingham? I think that any vessel drawing 6 feet could get to Wingham.

545. Wingham is the head of navigation? Yes.

546. Is the navigation right up to Wingham often interfered with on account of the silting up of the river? No; I have not heard much complaint since we dredged the upper channel, near what is called the Devil's Elbow. Vessels, as a rule, only go to Taree.

547. Do not steamers go up to Wingham every trip? I do not think that the coasting steamer goes to Wingham. I think she stops at Taree.

548. Is that on account of insufficient water? That is very likely one of the reasons, and I suppose on account of loss of time it is better to bring the things down by drogher, collect them at one centre, and load them into a larger vessel.

549. I think you said it would take seventeen hours to go to the Manning;—that would be from Sydney Heads, would it not? Yes.

550. After getting to the Manning Heads would there not be considerable delay for people living at Taree and Wingham in obtaining their goods? No; the vessel times herself so as to arrive at the bar at high water and go straight in and straight up the river. She makes two calls on the way—one at Croki and one at Cundleton. The stoppages are not very long ones—an hour or so at each place.

551. Is there not great delay in getting up sometimes;—when the steamers get to the Manning Heads they have to put out to sea on account of the shallowness of the bar sometimes? Yes; if the vessel arrives too late for the tide, or in bad weather; but it is known at what time that high water occurs, and a vessel leaves here so as to reach the Manning bar, or any other bar it is going to, at the time of high water, and then it goes straight in.

552. I think you said that the winter was the worst period of the year for the silting up of the bar? Yes, the winter seems to be the worst time.

553. Would that be when there is a prevalence of south-easterly gales;—would not a westerly wind tend to clear the channel? It would have the effect of keeping down the sea. Whether it would assist in scouring or not, I could not say. But we always get a smooth bar with a westerly wind, and then you are likely to have dry weather and an absence of floods and freshes, and the bar may be shallower in consequence.

554. But with a north-easterly wind in summer time, does not the bar silt up more rapidly than in winter? A continuance of north-easterly weather, of course, is bad.

555. Do you know the district sufficiently well to say that there is any reason why it should not become an important dairying district? The Manning is a very fertile district.

556. Have you heard that the farmers at the present time are going in extensively for the production of butter, milk, cream, and such other things as are produced on the South Coast? Yes; I saw that a start was being made in that direction.

557. Do you not think that a large amount of settlement would take place along the proposed line, having in view the favourable character of the country, with some few exceptions, if this railway were constructed? I daresay there will be more settlement where it passes through the A.A. Company's land. There are very few settlers there at present.

558. Would not the paucity of settlers be traceable to the fact that the A.A. Company are not desirous of leasing or selling their land? Very likely. I do not know what terms they offer.

559. Can you give the Committee any information as to the likelihood of the A.A. Company giving land for railway purposes in the event of this line being constructed? I could not say.

560. *Mr. Hoskins.*] How much money do the Government or your Department propose to expend in improving the entrance to the Manning River out of the vote passed by Parliament recently—£100,000? The estimate is not got out yet; but it will be something over £100,000.

561. From the experience you have acquired of the entrances to the rivers on the eastern coast of this Colony, are you of opinion that, by the judicious expenditure of, say, £100,000 in improving the entrance to the Manning River, the entrance to that river can be made as available for vessels desirous of entering the Manning, and as safe entering, as almost any of our rivers on the coast? I think it will be about equal to the Macleay—that scheme which the Committee has before them at present. We will get about the same results at the Manning as we hope to get at the Macleay.

562. Do you or do you not consider the entrance to the Manning River is especially dangerous and difficult of access? It is rather a dangerous one in consequence of the headland being on the northern side. It does not get much shelter from the southerly weather.

563. Do you consider that the Department can make the entrance to the Manning River so fairly good that the natural difficulties of the entrance, which will be somewhat overcome by the expenditure of public money, will not be greater than they are on the average at the other rivers on the coast? I think we can. I think we can make a good job of it.

H. R.
Carleton.
24 Feb., 1893.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie. 564. *Mr. Roberts.*] Do you produce a map giving some information concerning the question before the Committee? Yes. The map that I produce shows the tenure of the country within 20 miles on each side of the proposed railway from Maitland to Taree, converging to a point at Maitland, so as to allow for the influence of the main line from Newcastle to Brisbane.
- 24 Feb., 1898. 565. Would you explain as fully as possible the various colorings of the map, and describe the country in such a way as would be of service to the Committee? The blue tinting shows the alienated land; the green tinting shows reserves; and the brown tinting shows unalienated Crown land. The extent of alienated land within the limits described is 1,192,000 acres; the reserves amount to 281,000 acres, and the Crown lands, distinct from reserves, amount to 752,300 acres. I should also mention that the blue shading represents church and school lands under lease, amounting to about 201,000 acres.
566. Where are those church and school lands situated? Along the western boundary of the A. A. Co.'s grant mostly, and also along part of the southern boundary. There are seventy pastoral leaseholders on that area, and fifty agricultural leaseholders. That is on the blue shading.
567. Can you give the Committee any information as to the fertility of the country or otherwise? No; I am not in a position to give any evidence on that point.
568. Or as to its capabilities? No; those are matters that do not come under my cognisance, except indirectly. I have been over the country several times, but I do not know sufficient about it to express an opinion.
569. Have you been over the country from Maitland to Taree? Not from Maitland, but from Hexham, along the usual coach road.
570. That would be by way of Stroud and Gloucester? Yes.
571. Is there any fine country about Stroud? Just passing through a couple of times I did not pay much attention to it, and I cannot speak from casual observation.
572. Would you care to give an opinion as to the value of the country as affording facilities for agricultural settlement? No, I do not know enough about it to express a reliable opinion.
573. Have you any further information? Probably some of this brown-tinted land is held under annual lease; but that is only an ephemeral kind of tenure, and we do not keep a record of that at the head office—it is a kind of tenure that would not affect the question of settlement materially.
574. Is there more than one Lands office along the route of the proposed railway? There is a Lands office at Taree and one at Stroud, and I think there is another at Dungog. Then, of course, there is the Lands office at Maitland.
575. *Mr. Hassall.*] Your map shows the country 20 miles on each side of the proposed railway? Yes.
576. An area of country 40 miles in width? Yes, excepting at Maitland, where it runs to a point.
577. Have you any idea of the character of the country that still remains Crown land? I could not speak with any degree of reliability. The best of the land has been alienated. About one-third of the blue-tinted land is that part of the A.A. Company's grant within the 20 miles limit.
578. On the eastern side, the A.A. Company's land is bounded practically by Crown land, as shown by the brown tinting? Yes.
579. Practically, the whole distance being Crown land and reserves? Yes, just along the boundary.
580. That land must, I presume, have been open for selection? Yes, for some time past.
581. And yet it has not been taken up? No, it has not been taken up.
582. Would the natural inference be that that land is of inferior quality? Yes, from the appearance of the map. I cannot speak from a personal knowledge of the country.
583. You have not travelled over the country sufficiently to know much about it? Not to express a reliable opinion.
584. *Mr. Lee.*] What is the tenure given to the lessees of the church and school lands? The average tenure of those lands would be up to the year 1910; but they have power to convert their holdings into homestead selections or settlement leases under the recent Church and School Lands Act—that is to say, to a certain extent.
585. Are those leases held under conditions of improvement or residence? I could not say.
586. Is that the usual condition inserted in church and school lands leases? I have never had any dealings with the church and school lands leases. They are under a separate branch of the Department.
587. Do you know how many leases there are covering these church and school lands? Yes, I have said that there are 70 pastoral leases, averaging about 1,800 acres each, and there are fifty agricultural leases, averaging about 50 acres each.
588. Do you know where those agricultural leases are? No. They are just grouped together in one mass. I could not tell you without looking it up what part they occupy.
589. You have nothing to do with the church and school lands? Not to any extent. I have not had any dealings with the leases, and I cannot say what the conditions are.
590. Can you say whether any applications have been made to the Department to have these lands resumed and brought under the settlement lease and homestead lease provisions of the Act? I cannot say. The Act was only recently passed, and I do not know if any applications have been made under it yet.
591. The land on the eastern side of the A. A. Co.'s boundary as shown in brown, is Crown land? Yes.
592. Do you know whether it is settled? It is not settled. There may, perhaps, be annual leases over part of it. That is only an ephemeral kind of tenure.
593. You look upon annual leases as being of a very temporary character? Yes, without requiring residence at all.
594. Do you know whether it is contemplated to make that portion of land settlement areas? Not to any extent. There is one on the eastern limit—about 1,400 acres.
595. On which reserve is that? It is just adjoining the east boundary of reserve 12,521.
596. What is the nearest port to that? Forster.
597. As a matter of fact that port would be as close to that settlement lease as the railway line would be? Yes; those are homestead selections.
598. And if any settlement were to take place in that direction, does it seem probable that the produce from that would be taken to the proposed railway? I think not. Besides the acreage is so small, being only 1,400 acres altogether. But more might be picked out by-and-by for settlement.
599. The whole of the land along the proposed line from Maitland to the Manning, almost, appears to have been alienated? Yes.

600. If this line is to develop settlement along the route, where is the settlement to take place? It would have to take place on these vacant patches of Crown land. Those are the only portions of land where it could take place. C. E. Rennie.
24 Feb., 1898.

601. Do you happen to know whether the Church and School lands are being subdivided into small areas for agricultural purposes? I cannot say. There is only the fact, as I have stated, that a certain number of small areas are held as agricultural leases.

602. Is there any demand for this kind of lease on the Manning River—settlement or homestead leases? I gather not, judging from the fact that no large areas are being set apart for that purpose. There are 1,000 acres near Timonee being set apart for homestead selection, and that appears to be the only area anywhere near.

603. Has that been thrown open? I could not say, but I could find out.

604. But those kind of leases have been made available in every other part of the Colony;—why are you not bringing them into operation with reference to this land? I presume that there is no great demand; but the district surveyor can give you better information on that point.

605. On the county map do you notice the district from Gloucester to the junction of the Gloucester River with the Manning? Yes.

606. North of that, according to your map, there appears to be a large area of unalienated land;—is that because the country is inferior? I presume so, from the fact that it is not being taken up, but I do not know the country sufficiently to say.

FRIDAY, 25 FEBRUARY, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Francis Clarke, Esq., M.P., sworn, and examined:—

607. *Mr. Hoskins.*] Are you the Member for the district through which this proposed railway would run? I am the Member for The Hastings and The Macleay district, which is beyond where the proposed line would terminate. The present proposal is to construct a railway only as far as the Manning. My electorate adjoins that. I might say that the reason why I wished to give evidence was that action had been taken by me which was partly the cause of this matter being brought forward—that is to say, I had given notice of a motion in the House which was discussed, and through that motion the Minister promised to submit this proposal to the Public Works Committee. Having taken that part, I thought I would like to be examined with reference to the proposal. F. Clarke,
Esq., M.P.
25 Feb., 1898.

608. Are you aware that there is a proposal which has been submitted by Parliament for the consideration of this Committee as to the propriety of sanctioning the expenditure of £100,000 in improving the entrance to the Manning River? I am aware of that.

609. Do you think that we would be justified in sanctioning the expenditure of that sum of money on improving the entrance to the river Manning, and at the same time sanctioning the expenditure for the construction of this proposed railway to the Manning, which is to cost £982,283? I might say that my object in bringing the matter prominently before the House was that the two proposals might be considered. I knew that money was being expended on improvements of the harbours of the north coast, and there were so many doubts expressed by different people as to the success of those works that I thought the Government might be justified in considering a scheme for the construction of a railway from which they would receive a revenue rather than expend money on harbour works which might not be a success, and from which they would receive no revenue whatever in a direct way.

610. The principal Assistant Engineer for Harbours and Rivers, Mr. Carleton, was examined here yesterday, and in reply to a question from me he stated that he considered that when the money authorised by Parliament to be expended in improving the entrance to the Manning had been expended the entrance to the Manning would be quite as good as the entrance to the Macleay River? Quite so.

611. Looking at the present public indebtedness of the Colony—£62,000,000—and also at the small population of this district, do you think that there is any justification for the expenditure of £2,000,000 to supply the people of this district with additional facilities for getting to and from the Manning River? I regard the line not only as a means of access or outlet for the people of the Manning, but also as part of the whole railway system along the north coast, and I may say that the section to the Manning, while it traverses the least productive part of the coast from a railway point of view, is also the most expensive to construct. I regard the whole north coast line as one which must come in the future, it being a very much shorter route to Brisbane than the present route, and also affording a quicker means of reaching the metropolis, even supposing that proper harbour means of communication are established.

612. How do you make it shorter;—do you mean this proposed railway and the existing Northern Railway as far as Maitland, as compared with the sea voyage? You misunderstand me. I am comparing the route from Sydney to Brisbane by the present railway route as against the proposed route *via* the north coast to Brisbane. I understand that the difference in length is 69 miles.

613. Do you think that any persons now living will, even if they live to a good old age, see a railway made along the coast from Sydney to Brisbane? I think so.

614. We have had some experience of the construction of railways parallel with the sea in the case of the South Coast Railway;—do you know the loss that is caused to the country by the working of the South Coast Railway in a district which has a much larger population than the district that would be intersected by the proposed line, and where there are large industries going on and several townships of importance? I am aware that there is a loss on the South Coast line.

F. Clarke,
Esq., M.P.
25 Feb., 1898.

615. About £45,000 a year? I might point out that the line along the south coast passes through very unproductive country so far as freight for the railway is concerned.

616. Would this proposed line pass through a more productive country? More so than the south coast line—that is, so far as providing freight for the railway is concerned. I regard the north coast as being very much superior to the south coast from that point of view.

617. But between Maitland and Taree where is this productive country? As I have mentioned, the section you are now considering passes through the least productive part of the north coast, and that is why I regret that the whole scheme of making a railway to Lismore was not submitted to the Committee, as it would have been in a much more favourable position than part of the scheme only.

618. Do you know that there is a railway from Lismore to the Tweed on the borders of Queensland through a very productive district, and that the loss on that line is about £17,000 a year? Because it is an isolated line, and very difficult to maintain on that account.

619. I admit it is very difficult to maintain, but at the same time it passes through a very productive district;—have you been over the tract of country proposed to be intersected by this line? I have a good general knowledge of the country. I was born at Stroud, through which town this railway would pass, or very close to it, and I have a knowledge of that part of the country—in fact, of that country up to as far as the Macleay,

620. Do you know that three-fourths of the land—nearly all of the land except that on the top of the mountains—is private land? It is all private land and thickly settled.

621. Is the A.A. Company's land thickly settled? That is the only exception.

622. That is 51 miles in length? And that is along the section of the railway which I think will be the least profitable.

623. The A.A. Company's land occupies 51 miles out of the 113? It is purely grazing country, and even if it were held in smaller occupations, it is not agricultural land—it would not provide very much in the way of freight for the railway. I mean to say that it could not be made to produce much more than it does at present, even if it were held in small holdings.

624. But that 51 miles of country belonging to the A.A. Company produces only young cattle now? Exactly. It is used, I understand, as a breeding station.

625. And according to your description, which confirms what other witnesses have said, supposing a railway were made going through 51 miles of the A.A. Company's land, it would not get much freight from that land judging from the quality of the land and its sparsely settled condition? It is a fact that the railway would not get much from that land.

626. The railway could not get less from the district between here and Wollongong? This country is better than that country.

627. But you know there are a large number of working miners living in that district? I admit that.

628. You have never heard that the A.A. Company would give the land required by the Government for this railway free? I have not heard so.

629. Did you ever hear that they would expect large compensation for any land taken from them by the Government? No; I have not heard that.

630. There is some good land on this proposed route, near Dungog and Taree, and other places; but the area of rich alluvial land is very limited, is it not? It is limited to the valleys of the different rivers.

631. And they are very narrow? They are not extensive valleys. A great quantity of the produce from those rivers, above where the railway would intersect the rivers, would naturally come to the railway for carriage to the Sydney market; and another advantage that the north coast people would have would be in getting direct communication with the market of Newcastle as well as the market of Sydney.

632. But is not the Newcastle market liberally supplied with meat and agricultural produce from the rich valley of the Hunter, and the Upper Hunter and the Liverpool Plains? Of course it is supplied to a very great extent; but I have often noticed that maize, for instance, commands a better price at Newcastle and Maitland than it does in Sydney. Although there is maize grown, of course, in the Hunter River Valley, still the maize commands a better price there than here.

633. I suppose you do not expect that this proposed railway would carry much agricultural produce of any kind to Sydney, seeing that it would have to compete with cheaper carriage by water? Of course it would have to depend a great deal on the rate of freight.

634. We have it in evidence that for the carriage of maize on the railway the very lowest charge that could be imposed would be from 13s. 6d. to 13s. 10d. a ton, while at the same time it is taken by the steamers for 10s.? That is about the rate by the steamers.

635. Do you think that under such circumstances any maize would be taken by railway to Sydney? I do not think there would be under the circumstances. Of course, while that state of things continued, no one would patronise the railway for the carriage of maize.

636. You mean that rate of freight? Yes. I mean that whilst the water offered cheaper facilities than the train the farmers, of course, would patronise the water.

637. And is it not the fact that everywhere agricultural produce is carried more cheaply by water than the railway people can afford to carry it by land, not only in this country, but also in Victoria and in England? Quite true, because they have no roads to maintain.

638. If you are in favour of the construction of this proposed line of railway, costing within a few pounds of £1,000,000, what trade do you think there would be on it? If you will permit me to point out, I set that expenditure as against the proposed expenditure on the bar harbours. You have considered some of those proposals, and I suppose will consider others. You have the Manning River, the Camden Haven River, the Hastings River, the Macleay River, the Nambucca River, and the Bellinger River,—there is a proposal before you to consider the improvement of each one of those entrances, the cost of improving which will no doubt run into a large sum of money. I am not prepared to say how much; but that information might be obtained from the Public Works Department. Besides that, there is the expenditure which has already been incurred in Coff's Harbour, Woolgoolga, the Clarence River, the Richmond River, the Tweed River, and Byron Bay. My opinion is that you should take into consideration not only the expenditure that has been made, but also the expenditure which, no doubt, will be made in the future, if we are to make those entrances at all available. And from them we will receive no revenue; and you should set that against the expenditure on the railway, from which the State will receive a revenue. I do not say that you would have a railway which you could look upon as a profitable line from the start; but you would certainly have a railway which would ultimately pay interest on the capital.

F. Clarke,
Esq., M.P.
25 Feb., 1898.

639. Where is the trade to come from to provide for the working expenses and interest? I am not answering your question directly. It is, of course, impossible for me to say where the trade is to come from. We must, however, recollect that these rivers are yet in an almost undeveloped state. I may answer your question by asking, where is the trade to come from to pay the interest on the great expenditure proposed on the various harbour works, twelve in number, which I have already enumerated; and even with that expenditure you will have an uncertain means of communication.

640. The interest on that expenditure could easily be met by imposing moderate tonnage dues? Well, so far, nothing of that sort has ever been attempted.

641. There has been, but through Parliamentary action they were discontinued? But the works I have mentioned are paid for with borrowed money, and there is no direct revenue received from them. Of course the Colony receives a benefit in an indirect way.

642. How near would this proposed railway go to some of those ports to which you have referred as places where expenditure has already been incurred, say, Camden Haven? The railway, I suppose, would be within 12 or 15 miles of the heads of Camden Haven, and it would be about 12 miles from the mouth of the Hastings, which is the next river further north. I know the locality thoroughly well, being the representative of that part of the Colony. The railway would cross the river at a place called Wauchope, 11 miles above Port Macquarie.

643. The people residing in those districts would, no doubt, be glad enough to get some of the public money that would be expended in making the railway; but do you think they would take their produce 12 miles to a railway when they had a vessel within half a mile of them? I do not think so, unless, of course, on account of the certainty in reaching the market on the one hand, and the uncertainty on the other.

644. We had evidence yesterday from Mr. Carleton, and he pointed out that whilst some years ago there were great delays and stoppages at the Manning River Heads through gales of wind and floods for a long time at different periods, yet within the last few years the stoppages have been very trifling indeed, the steamers trading very regularly, except occasionally when there is very rough weather? I admit that the steamers, considering all the difficulties, maintain the trade with fair regularity, but still there are drawbacks. On the last occasion I was in Port Macquarie, I was delayed there a considerable time through there not being sufficient water on the bar, and, of course, that was a thing that the captain, no matter how skilful he might be, could not provide against.

645. But delays happen all over the world. For instance, vessels crossing from England to France have sometimes to lay to because of a gale of wind? But there was no gale of wind on the occasion to which I refer; the weather was perfectly calm, and the steamer drew only about 8 feet 6 inches of water, but yet she could not negotiate the bar even with that draught.

646. I gather from your evidence that you do not consider that much of the land that would be intersected by the proposed railway would, considering its capabilities and the sparseness of the population, be a feeder of any consequence to the railway? No. There are belts of country through which the railway would pass between the rivers which would not provide any freight for the railway.

647. I ask you, as a public man, do you consider that this Colony, with its great expenditure and small population, would be justified in spending money in improving the entrance to the Manning River, and at the same time in spending this large sum of money, nearly £1,000,000, in making this railway? No, I do not think that the two proposals can well be justified—that is, both the harbour works and the railway. I do not think that the State should undertake both schemes. That is why I think the State should undertake the work which is the most likely to return it some revenue.

648. Supposing that the Government were to approve of a recommendation of this Committee and were to make this railway, and discontinue improving the entrances to the Manning and other rivers of which you have spoken, do you think that the people of those localities would quietly sit down and tamely submit to the loss of the expenditure in those districts of the money which the river works would necessitate? I hope that the people do not look upon the expenditure of the money in their district as the first consideration. I myself do not think they do. I think they regard the expenditure of the money as a means of providing them ultimately with a shipping port, and if the evidence goes to show that a shipping port can be established in those places beyond all doubt, then I myself would not be a strong advocate for a railway.

649. *Mr. Wright.*] I take it from your evidence, that of the two proposals you prefer a railway? I should prefer a railway on account of the certain means which it would always afford all classes of people of reaching the centre of population.

650. You think that the railway would be the most beneficial in the interests of the country and the State? I think it would. At the same time, I do not think that the State would be justified in carrying out the whole scheme at once; it should be a work to be done by instalments.

651. Supposing that a railway were constructed right through to Lismore, so as to connect with the Queensland border, do you think that the people along 400 miles of our coast-line would be satisfied at being deprived of water communication? It would not deprive them of water communication.

652. If the harbour works were abandoned, it would, to a large extent, deprive them of water communication? It would, of course. They would have to take it as they found it in its natural state.

653. But would not the people on a coast-line between 300 and 400 miles in length, and having several good rivers flowing into the ocean there, be justified in agitating and demanding from the State the construction of harbour works, even if the railway were built? At no part would the railway be very far from the sea-coast, but I am not in a position to say what would be the greatest distance.

654. It is proposed to cross the rivers at the head of navigation? Practically at the head of navigation. The railway could always be reached from the rivers by droghers or punts. The people instead of droghering down towards the heads would drogher up the river towards the railway.

655. But you have missed my point;—I say, do you think that the people, on a coast extending 300 or 400 miles, would be satisfied to allow their harbours to be choked up with silt, even if they were provided with a railway;—would they not continually agitate for harbour works as well as the railway? I do not think they would.

656. You are under the impression that they would be satisfied with the one scheme? I think so.

657. A railway from Maitland to the Queensland border, exclusive of that portion which is already built, we must assume would cost nearly £4,000,000;—do you assume that the State would be justified in making provision for that expenditure, not in one year, but spread over a series of years? I think so.

658.

F. Clarke,
Esq., M.P.
25 Feb., 1898.

658. And do you think that there is any possibility of the railway ever paying in the future? Yes, I do, because there are great possibilities in front of the northern district.

659. The rate by steamer from the Manning River is 10s. a ton, and we are told by the Secretary for railways that the lowest railway rate from the Manning would be 30s. a ton; is it not likely that in the event of the railway being constructed, the steamers to secure traffic would reduce their rates still more? I have already admitted that the proposal to construct the railway to the Manning, and taking that as a comparison, is hardly a fair comparison to make, because, as I have explained, it travels practically through unproductive country until it reaches the Manning. The country at Dungog would be served by water pretty well, so that the railway would not secure much of that trade, and practically there would be very little trade to the railway until Taree or the Manning River were reached. Therefore, I think, it is hardly a fair test to take the statement of the Railway Commissioners, which I have no doubt is correct. I am not disputing it for a moment; but carrying the limited amount of freight they would have to carry from Taree, they would have of course to charge a much higher rate than they would charge later on when the railway were extended to more productive parts of the North Coast country.

660. You see that we have to take into consideration the fact that when you get into fertile parts—that is, the Manning and the Macleay—you are still further from Sydney, and the railway rates are increasing in much larger ratio than the steamer rates? As mileage increased the railway rates would increase, no doubt, in a greater ratio than the water rates would.

661. The produce of the Macleay district is largely maize, is it not? Yes.

662. We are told that the districts are gradually going out of maize cultivation and into dairying, which would, of course, reduce the amount of freight? I do not think that it is correct to say that the district is going out of maize cultivation. There is nothing to show that that is the case. The people are certainly going in very largely for dairying, but they are simply using the land now for the purposes of dairying which before they hardly received anything from,—that is to say they only used it as ordinary run for stock. I do not think that the area under maize has been curtailed in the slightest by the introduction of the dairying industry on the Macleay.

663. Are we to understand that the rich flats would be still cultivated for maize crops, while the back land would be used for dairying purposes? I think that would be the case; of course, subject to changes that any wise farmer would make, that is, throw certain paddocks out of cultivation occasionally in order to give them a spell.

664. As member for the district, and knowing the country well, do you see any reason to apprehend that there will be a diminution of the total freight, or do you think that there will be an increase of it? I think it is likely to increase.

665. Notwithstanding the fact that there may be a good deal of dairy farming, you still think that the bulk freight will be likely to increase? Yes.

666. Are you aware what is the population along this line? I have estimated it, but I have not the figures with me.

667. The Statistician's Department tell us that from Maitland to Taree, taking in 10 miles on either side of the line, the whole way the population is about 14,000—that is, starting from Largs and Seaham close to Maitland and going some 10 miles north of Taree, and taking 10 miles on either side of the railway line, the total population is about 14,000, of which upwards of 1,000 are within 5 miles of Maitland? I know that the population in that part is not closely settled; once you get from the Hunter River Valley the population is very thin until you reach Taree.

668. Did you think that the population was larger than I have stated? From the estimates that I have made—of course taken from the "Statistical Registers"—I knew that the population was not great—not so great as might have been expected.

669. I take it from your evidence that, irrespective of the amount of settlement, and the production of the country, you think that a railway could lead to largely increased settlement, and largely increased production? I certainly think that it would, because it would bring into settlement and cultivation places which are now too small for men to profitably occupy them under present conditions, and means of reaching a market.

670. If there were a proposition before this Committee to construct a railway from Taree on to Kempsey and thus to complete the section, would you be satisfied if this Committee recommended the total abandonment of harbour improvements and the construction of the railway? That would hardly be fair to the people living north of the Macleay, and for that reason I would not like to do so; but if it were only the people of the Macleay itself who had to be considered I think that they would be very well served by a railway.

671. If the railway were to go right through to Lismore would you, as a member for a district in that part of the Colony, be satisfied if all the harbour works were to be discontinued as soon as the railway had been completed? Yes, as soon as it had been finished; but in the meantime temporary means of communication should be provided.

672. Dredges in the meantime should be kept going? Yes.

673. *Mr. Trickett.*] Do you recommend this line by itself or as part of a line along the whole of the northern coast? As part of the line along the whole of the northern coast.

674. Do you think that to construct it on its own merits would be a mistake? Yes, I think so.

675. I see that there has been a very long agitation for this railway—since 1882;—I think deputations have waited upon various ministers, and I see that one of the reasons urged is that lines have been built in other parts of the country, and therefore a line should be built in this part. I suppose you do not endorse that feeling? No, not at all.

676. The present Minister for Works advanced as a reason that the residents of the coastal districts had for many years past paid their fair share for the construction of lines in other parts of the country, but the benefit they received was only indirectly felt. I suppose you do not urge any such reason? No; I do not think that is a strong argument to put forward.

677. And I notice, too, that when he was not a Minister, and when he went before another Minister, he urged that the construction of this line should be carried out only if the betterment principle were introduced into the Public Works Act;—what do you think of a proposal of that kind? Well, if the betterment principle had to be applied, of course it should be applied to all lines; but there are a good many objections to the betterment principle. It is not always the people through whose country the railway passes who benefit the most, after all, from the railway. There are also the consumers who benefit to a large extent, and it is very difficult to apply the betterment principle.

678.

678. I understand that your chief reasons in support of the railway are that trade would probably grow up, and the inhabitants would get the benefit of direct and certain communication with their best market? Yes. It would also bring the people not only of the North Coast districts, but also the people of Sydney and the South Coast more in touch. There would be immense social advantages. When I say social advantages, I mean that industries would be benefited by bringing the people more closely together. At present they are almost cut off from the benefit of civilisation. I might say that in supporting this railway my object from the very first has been to bring before the Government or the Public Works Committee the two proposals side by side, that is, providing communication by water, or providing communication by rail. I look upon them as alternative schemes, and it is for the Government to decide which is the more advisable scheme to carry out. I could not, at present at least, justify both proposals—I would not attempt to do so. If it can be shown that communication could be better established, and more effectually established by means of water, then of course I would say that the railway ought not to be constructed now. But if on the other hand it can be shown that better facilities can be afforded by rail, and that the railway has a fair prospect of paying, then of course I would say "abandon the water and adhere to the proposed railway scheme."

F. Clarke,
Esq., M.P.
25 Feb., 1898.

679. If a railway were decided upon, of course it would not be necessary to spend large sums of money in keeping open the river entrances? No, I should certainly think not.

680. *Mr. Hassall.*] I presume that you look upon this extension from Maitland to Taree merely as an instalment of what must eventually be a North Coast railway? Yes, I look upon it as an instalment of the North Coast railway.

681. Do you think it would be justifiable to extend the railway from West Maitland to Taree only, and let it stop there? Certainly not.

682. As you have already told the Committee, with your knowledge of the country, you say that that would probably be the most unproductive part through which the railway would go? I certainly think that, and the records of the Public Works Department will also show that it is the most expensive section of the railway to construct. That is to say, the cost per mile is greater on that section, I think, than on any other section.

683. Have you any idea what the average cost per mile would be in running it right through? I think it averages, according to the estimates that have been made, £11,000 per mile.

684. Right through? Yes; I think that is the average cost. But the papers are here, and I do not wish to be too positive.

685. The total length right through from West Maitland to Lismore is, approximately, 392½ miles, and the total cost in round numbers £3,782,377; that, I presume, does not include the cost of resumption or severance, or anything connected with the land through which the railway would pass. That gives an average for the total length of £9,650 per mile. Do you think that, in the present state of the country, it would be justifiable to carry out this railway in addition to the improvement to the various rivers on the northern coast? No; I do not.

686. I understood you to say, in reply to Mr. Trickett, that you thought the two proposals, that is the improvement of the rivers, and the construction of the railway, might have been submitted practically together? That is what I thought, so that the Committee might come to a decision as to which is the better scheme to carry out.

687. So that a comparison could be made between the two schemes—that is the improvement of the rivers, and the construction of the railway right through—the benefits that would be derived from the adoption of either, and the probable returns from either of the two schemes for the expenditure? That was my wish.

688. Does the country improve much running from Taree northward? The country to the north of Taree—I am speaking of the rivers, not the whole of the country, because you will understand that between the rivers there are belts of unproductive country—there is less unproductive country to the north of the Manning than there is between the Hunter and the Manning.

689. Where do you first touch the sugar-growing country going north? The first part where you touch the sugar-growing country would be about Woolgeolga, that is a little beyond Coff's Harbour.

690. And from there right up to the border a good deal of sugar-cane cultivation is carried on? Yes.

691. Can you give us any idea of the extent of country lying back from the head of navigation towards the mountain range? On an average it would be about 60 miles from the head of navigation up to the foot of the mountain range.

692. Is that country pretty well occupied? That country is pretty well occupied on all the rivers.

693. I presume, from what you have already said, that the settlement is, practically, along the river valleys? Yes; along the rivers and the branches of the rivers.

694. How would the traffic above the head of navigation on the river compare with the traffic from the head of navigation downwards? I am inclined to think that the traffic from the head of navigation downwards would be greater—the land is richer and more thickly settled—than it would be higher up, on account of the distance of land carriage for one thing. People are not inclined to go in for extensive agriculture on the reaches of the river above navigation; that is, for any great distance, although some of them do cultivate as much as 40 miles away from the head of navigation.

695. How do they convey their produce? By horse-waggons. It costs them about 1s. 6d. a bag of maize for land-carriage from their farms to the shipping-place—that is, to the head of navigation. Farming at that distance is not very profitable.

696. Are there decent roads along the banks of the rivers? The roads are very good in nearly all cases.

697. Then the whole of this country is practically accessible by decent roads from the head of navigation to the mountain range? Yes, with few exceptions. There is a splendid road from the Macleay to Armidale, and from the Hastings there is a very fair road to Walcha, and from the Manning there is a very fair road, I would not say how far, but certainly up to the foot of the mountain range.

698. As far as settlement could profitably extend? Yes.

699. From the head of navigation downwards, I presume, the country is more thickly settled in consequence of facilities afforded for conveying the produce to market? Yes, and smaller holdings.

700. Is it not reasonable to suppose that, under all circumstances, even if the railway were constructed, they would prefer to drogher the produce down to the coastal steamer rather than to droghering it up to the railway, thus increasing the cost of carriage? Yes.

701. That is reasonable to suppose? Yes, and also in view of the fact that the water-carriage would, no doubt, be cheaper than the railway carriage.

702.

F. Clarke,
Esq., M.P.
25 Feb., 1898.

702. Therefore, in the construction of the railway, we would practically have to depend upon the traffic that could be brought down to it from the country lying between the railway line and the foot of the mountain range? To a very large extent you would have to depend upon that trade.

703. Have you any idea of the extent of the timber reserves in that part of the country? Yes; there is some very valuable timber all along the coastal districts. From the Manning River as far as I have been up the coast, that is, to Woolgoolga, about 12 or 15 miles beyond Coff's Harbour, there is very valuable hardwood timber all along the road.

704. I presume that that timber would probably lie between the proposed railway line and the mountain range? That timber, you may say, is on the series of ranges dividing the different water-sheds, and extends for a considerable distance up towards the table-land of New England.

705. That might become a large industry;—do you think there is any prospect of that? I am inclined to think that, unless there are some means taken to provide for a second growth of timber—that is, for cultivating the timber, as it were—it is not an inexhaustible supply. I do not regard it as being an inexhaustible supply by any means, unless some measures be taken to provide for the growth, cultivation, and care of young trees.

706. Then if the railway were constructed, you could hardly calculate upon a very large timber trade being secured? No; I am of opinion that the timber trade would be more likely to drift to the sea-coast than to go any other way.

707. It being a product that will not stand any great cost of transit? Quite so; and of course it being a product the value of which is not deteriorated, practically, however much it is knocked about.

708. Do you think that the construction of a railway line would have the effect of developing the dairying industry to any great extent? It might to some extent, but I think that, with the modern means which they have of carrying products of that character in the cool chambers of the steamer, it is not likely to be affected at all events by the non-existence of a railway.

709. So that under any conditions, a railway, even if constructed right along the north coast, would always have a strong competitor in the water carriage? Certainly it would have a strong rival in the water carriage.

710. *Mr. Roberts.*] Have you looked at the figures furnished in the Railway Commissioners' report showing the loss on this proposed line of £31,000 per annum? Yes, I saw those figures.

711. Do you regard that as a satisfactory estimate;—do you think it is over-estimated or under-estimated? It is difficult to answer that question, but I am inclined to think—and I have been inclined to think from the time the Commissioners made their hurried trip up there that they hardly gave sufficient time to enable them to come to a correct conclusion. They hardly took sufficient time to inquire into the matter. It seemed to me as if they went on that trip with their minds made up beforehand.

712. Do you know the route they took? I understand they went overland from Hexham or Raymond Terrace, driving along the main road as far as the Manning, and that they took evidence in one or two of the townships on the Manning—I think at Taree, and also at Wingham.

713. At Wingham? I think so, but I would not be positive as to that; and it is quite possible that those whom they examined would not be prepared with certain information at such short notice.

714. How long were they really at Taree and Wingham? I think they were there only a couple of days altogether, as well as I recollect.

715. Is it not a fact that the more fertile land on the Manning is after you pass Taree, up the river? Yes, I understand so. I do not know the Manning River above where the North Coast road intersects it. I have never been up the river beyond Wingham.

716. Have you been to Cundleton? I have been through Cundleton.

717. Have you seen the Cundle Plains? Yes.

718. Is there not a vast area of remarkably fertile land between Taree and the Manning Heads? Yes, there is—down about Jones's Island, and in the vicinity of Croki. You travel through very productive country for several miles from the time you reach the Lansdowne River until you reach Cundleton.

719. Is the Lansdowne River a tributary of the Manning? Yes.

720. And all along the banks of those rivers the land is, you may say, unsurpassable in the Colony? Yes; it is excellent land.

721. And suitable for dairying or any other purpose? Yes, any purpose whatever.

722. Is it not true that for many years past there has been a feeling of discontent amongst the residents of the North Coast District, because of the little work that has been done by the various Governments to enable the farmers to get their produce to market? Yes; that is a fact. They regard themselves as having been neglected by the various Governments in the past.

723. And is it not true that they feel they are isolated from the outside world owing to their peculiar situation,—they being residents in a district where navigation has been absolutely dangerous and uncertain ever since the districts have been settled? That is so. The people there have been very discontented with regard to their means of communication with the centre of population.

724. Do you not think, as one familiar with this great North Coast District, that the time has arrived when something should be done for the people there, either in giving them a railway or some other means of easier communication with the metropolis? I certainly think so. I think the people of the North Coast Districts are entitled to better treatment in that respect than they have received in the past. I consider that they have been scandalously treated in the past with regard to affording them facilities to get their produce to market.

725. Have you been over the proposed line from Maitland to Taree, or have you travelled over what is known as the mail-coach road from Raymond Terrace to Taree? I have only travelled over the main North Coast Road; I have not followed the route of the railway.

726. That will be from Hexham to Tinonee, and thence on to Taree? Yes.

727. Is it not true that the proposed line would go through better country than the North Coast Road goes through? Yes; I think it would. It would tap richer country. If they kept down too near the coast after leaving the Hunter, they would get into that swampy and sandy country which is peculiar to the sea-coast; whereas, by keeping further to the west and higher up, they would tap a more productive country.

728. Therefore, the Commissioners in going over the North Coast Road, did not possibly have an opportunity of seeing the fine agricultural land that is to be seen between Maitland and Dungog? No. That

is one reason why I thought at the time the Commissioners made their visit that they did not spend sufficient time in the locality to form a correct conclusion,—because anyone, particularly a stranger, going into that district for the first time, and travelling along the main road, would never realise—would never dream—that there were such places perhaps within a very few miles of him. The road, as a rule, is taken through the most unproductive country. As a matter of fact the road goes through the best country for a road—the country where the road is the easiest to maintain—and it avoids the more productive parts.

F. Clarke,
Esq., M.P.
25 Feb., 1898.

729. This proposed line goes west of the mountain range? Yes.

730. Where the most productive country is to be found? Yes; practically, the North Coast Road, with the exception of the parts where it crosses the rivers, passes through the high ridges and timber country.

731. Would it not strike one, driving through the country from Maitland to Taree, that it was intended to be the home of hundreds of thousands of people? Yes it would strike one that with proper facilities for reaching the market there was a very great future before the country.

732. Having that in view, do you not think that before many years pass over there will be every probability of the line paying interest on the capital,—that instead of there being a loss of £31,000 per annum, that loss would be rapidly decreased on account of the settlement that must naturally take place? I am inclined to think so. I am inclined to think that that apparent loss—or that imaginary loss, for I cannot look upon it as anything else—would be very shortly completely wiped out, and that the line would show a profit.

733. You knowing the sense of the people of the district and with what unpleasantness they view the discomforts of the sea-voyage, do you not think that there would be a large passenger traffic on the railway? Yes, I am inclined to think that fully 90 per cent, of the passengers would travel by train in preference to going by sea, more particularly with the class of boats that are, and must be, on that line whilst the bar harbours are in their present condition.

734. Would it hardly be a fair thing to take the present passenger traffic by the steamers as an example of what the passenger traffic would be if a railway were constructed? No, certainly it would not be a fair gauge to test the passenger traffic, because there are lots of people now who would more frequently visit the metropolis but for the terrors of the sea-voyage, and the discomforts to which they are subjected, and the loss of time occasioned also. On the other hand, the coast districts would be visited by a large number of people from the city and suburbs. At the present time, if you visit one of those places, the probability is that you cannot get away when you want to. Consequently nobody will venture to make a trip thither, the uncertainties of travel being so great.

735. No one will go thither, except on account of urgent business or possibly for family reasons? Exactly.

736. Is it not true that owing to the shallow water, as a rule, on the bars, the steamers are very small, and consequently very uncomfortable, making the voyage one of dread, rather than one of pleasure to the people living in the district, and that is why more people do not travel by them? That is so. But even with the discomforts and all the disadvantages of the steamers, there is still a very large trade done in passengers. I have been on some of the steamers when there was no sleeping accommodation, and when some of the passengers had to lie on the upper deck of the steamer, there not being sufficient berths for them.

737. Is not the water communication very uncertain? Very uncertain indeed. During the past season, on the Macleay, the "Burrawong," the boat which trades there generally, has had to lie-to in Trial Bay to receive the cargo brought out over the bar by the drogher.

738. And what would apply to the Macleay would apply to the Manning, and to pretty well all the rivers on the North Coast, except, possibly, the Clarence, where great improvements have been made? That is so. There is always an amount of danger, and the boats trading on those rivers are specially constructed with very shallow draught, and their build does not suit themselves either for speed or comfort.

739. Is not the scenery to be found on the North Coast—I mean the natural beauties of the district—to be favourably compared with what is to be found on the South Coast, or in other parts of the Colony? Yes; I think the scenery of the northern rivers—especially between the head of navigation and the table-land—will compare favourably with any scenery in new South Wales. It certainly compares favourably with a route that is well known, that is from Moss Vale to Kangaroo Valley. That is a well-known and favoured route. I have been over it, and the scenery on the North Coast rivers is quite equal to that.

740. Are you aware that there are very attractive falls, and scenery of that kind, to be found at the head of the Manning? I was not aware that there were falls at the head of the Manning; but I know there are falls at the head of the Macleay—the Apsley Falls—which are a very great pleasure resort to people who can get access to them easily; and we also have on the Macleay Limestone caves, which are at present almost unknown, except to the local people, on account of the isolated condition of the place.

741. If the proposed railway were constructed, is it not fair to assume that a large tourist traffic would be encouraged? I certainly think so. People from the metropolis could make the round trip, as you may call it. That is to say, they could take the train up as far as Lismore, and the coach from there to Tenterfield and come back by the other line, or they could break the journey at any of the rivers, for there are always a means of getting a private if not a public conveyance from any town on the rivers up to some town on the main railway line.

742. What would be the difference in the distance from Sydney to Brisbane if the line went through from West Maitland to Taree, and thence on to Brisbane? According to the official reports, I believe that it is either 59 or 69 miles shorter by the coastal route than by the present route to Brisbane.

743. That is from Sydney? Yes. It would also avoid the heavy pull up to the top of Ben Lomond, and down again, in the trip to Brisbane.

744. And the trains could be run at less cost to the Railway Department? No doubt they could be run at less cost, because the grades would not be so steep.

745. The railway would go through comparatively level country? Yes.

746. Has not a line been surveyed all the way from Maitland to the Queensland Border or to Grafton? It has been measured, I think, beyond Grafton—from Maitland to Lismore, I think. In fact, I think it has been surveyed more than once—some parts of it at least—and a portion of it, I think, is permanently staked.

747. Would you have preferred if the whole question of the North Coast line had been submitted to the Committee? Yes, most certainly; because the consideration of a section of it only is, I think, an unfair way of putting it before the Committee. I think the whole of it should be considered as one scheme, not with

- F. Clarke, Esq., M.P.
25 Feb., 1898.
- with a view of carrying it all out at once, but for the purpose of getting an idea of the amount of traffic likely to be brought to the railway throughout, and also to take into consideration the reduced cost which some sections offer as compared with other sections.
748. Taking it from Maitland to Grafton, would the other sections show less loss than this section would ;—which do you regard as the most fertile part of the line between Maitland and Grafton? I think the Macleay River is the most fertile river between Maitland and Grafton, leaving the Clarence River, of course, out of the question. I admit at once that the Clarence has a greater basin and a greater area of fertile land than the Macleay.
749. *Vice-Chairman.*] What about the Richmond? I think the Richmond is better than either of them.
750. *Mr. Roberts.*] Is it a fact that the further you get north—of course, allowing for belts of unproductive country—the more fertile the country becomes? Yes.
751. Then, perhaps, you would say that you thought that the Macleay was about the centre of the most fertile country? Yes, I think the Macleay is about the centre of the most fertile country. It is, I think, about midway between the Clarence and the Hunter.
752. If this line were constructed, a large business would be opened with Newcastle, would it not? Yes, I have already mentioned in my evidence that I think that Newcastle would receive a considerable portion of the trade from the northern rivers. In fact, I think there would be also a trade to some extent from Newcastle northwards. I feel sure there would.
753. And it would bring the people of Newcastle within easy distance of these attractive fertile districts? Yes. It would allow them means, which they cannot at present get—they would have direct means of communication. At the present time if they want to reach these districts they have first to go to Sydney, and then from Sydney to the various rivers.
754. You have already told us of the fertility of the Manning and the fitness of the land for the purpose of dairying or such other purpose as a farmer might think best—that land would grow anything? Yes.
755. Would the same remarks apply to the neighbourhood of Port Macquarie—I mean up the Hastings? Yes. They have very fertile land up the Hastings River, suitable for either agriculture or dairying.
756. Vast areas of agricultural land? Yes.
757. And are not the same difficulties experienced by the people there in getting their produce to market? Yes, they have the same difficulties to contend against.
758. As are met with by the people on the Manning? Yes.
759. What is the distance from Taree to Port Macquarie? I suppose it is about 60 miles.
760. So that if this railway went to Taree, it would be of great service to the people between Taree and Port Macquarie? Yes, it would.
761. Until the line, I mean, went on further? Yes; I feel sure that a great number of people would drive to the Manning, and take the train from there to Sydney, as they often do now, in order to shorten the sea trip somewhat, catch the steamer at Croki, and get into Sydney more quickly. That is done now, I presume, in order to shorten the sea journey. On the other hand the people of the Macleay often drive to Port Macquarie and take the steamer there so as to reduce the sea journey from that part.
762. What is the population between West Maitland and Grafton? I have not got the statistics of the population.
763. Is it not somewhere about 100,000? I really forget what the population is, though I have looked it up in statistics on previous occasions when considering this question.
764. Even at the present time, whether it be 100,000 or not, and I have good reason for assuming it is 100,000—would not the population very soon be enormously increased if a railway were constructed? Yes, the construction of a railway has, I think, always tended not only to increase population but also traffic as well; and I feel sure that the construction of a railway to the north coast would enable people to live on a smaller area of land, and make a living, than they could do at the present time.
765. Is it not a fact that along the north coast you get the most regular rainfall in the Colony? Yes, that is so. I think we suffer less from drought on the north coast than the people do on any other part of the sea coast, on account of the regularity of the rainfall. If there is any rain coming at all we seem to get it up there.
766. And through having this regular rainfall the soil is remarkably rich? Yes.
767. And on account of this regular rainfall, and the undoubted fertility of the soil, it is a fair thing to assume that, if regular communication were given, such as a railway would afford, an immense population would, in the near future, be settled in these districts? Yes; I feel quite certain of that. The place is capable of carrying an immense population. The only thing required is certain means of communication with the centres of population, and a market.
768. And do you think that that could be best afforded by the construction of a railway? I myself think that a railway is preferable to the sea. As a quick means of communication it is certainly preferable.
769. And I understand that one of your reasons for recommending a railway is that the Government would get some return for their outlay? Exactly. They would get some revenue at least for their outlay, whereas in the expenditure of money on harbour works, they are simply constructing works to enable a private company to trade to the district.
770. There would, in your opinion, be every probability within a few years of the line ultimately paying, owing to the enormous population that would be attracted to these fertile districts? That is my opinion. I certainly think that the line would ultimately pay.
771. *Vice Chairman.*] May your evidence be summed up in this way: that unless the Committee are prepared to recommend the construction of the railway from West Maitland to Taree, as a portion of the North Coast railway to Lismore, you are unfavourable to its construction, and would prefer the improvement of the coastal harbours? Yes; that is a fair summing up of my evidence. I should not at all be in favour of a railway to the Manning only, because I do not think that a railway to the Manning only would be justified. I would only be favourable to it as part of the proposed North Coast railway system.

Joseph Witer Allworth, Acting Chief Surveyor, Department of Lands, sworn, and examined:—

- J. W. Allworth.
25 Feb., 1898.
772. *Mr. Lee.*] You are a district surveyor? I am at present Acting Chief Surveyor for the Colony.
773. But you have been surveyor for the district of Maitland for a good many years? Yes, I have.
774. Do you know the districts that are embraced by this proposed railway? Yes.
775. Does your district extend as far as the Manning? Yes.

776.

J. W.
Allworth.
25 Feb., 1898.

776. Have you a personal knowledge of that part of the country? I have, of a good deal of it.
777. The Crown lands shown within a certain area on either side of the railway survey, are shaded on that map in brown;—can you tell us the nature of those Crown lands, how they are held, and what they are fit for? Some of them are held under annual leases for pastoral purposes, and some of them are forest reserves.
778. Those would be the green portions? Yes.
779. Do you contemplate bringing under settlement or homestead leases any portion of those Crown lands? Yes, parts of them.
780. Whereabouts? West of Gloucester.
781. About how far? Nearly 20 miles from Gloucester.
782. In large areas for pastoral purposes, or in small areas for agriculture? Large areas for pastoral purposes,—areas of 3,000 or 4,000 acres I propose.
783. About how many of them are there likely to be? Eight or ten.
784. Taking them at the higher number, it would settle about ten families? Yes: then there is some land for homestead selection at Coolongolook.
785. How far is that on the eastern side of the railway? I suppose about 20 miles from the railway.
786. Is the area large? About 3,000 or 4,000 acres.
787. It will be a small settlement? Yes.
788. There do not appear to be any Crown lands within the immediate vicinity of the railway survey between Gloucester and the Manning, except little patches here and there? No, there is not. Of course there is that large strip of church and school lands.
789. You see that apparently large area of Crown lands on the north of the Manning River, and north of the Barrington; what kind of country is that? A good deal of that is rough mountain land.
790. Is it likely to be suitable at any time for other than grazing purposes? No; I do not conceive that it would be.
791. And I suppose third-class grazing land at that? It would want a good deal of improving to make it fair grazing land.
792. I presume that the fact that there is no small settlement on the conditional purchase, at the present time, is evidence of the unsuitability of the position of the land? It is out of the way, and that, of course, is one reason.
793. Do you think that if the railway were constructed, it would be the means of settling any population of any note on that country? Not on the Crown lands; but I think it would on some of the other land. I think it would, for instance, on the A. A. Co.'s land.
794. Excepting odd pieces here and there in the valleys of the river? Yes.
795. How are the Church and School lands held? Some as farming leases and some as grazing leases.
796. Has it been decided by the Department what is going to be done eventually with those? The present lessees have certain rights, and until they determine whether they will exercise them or not, we have not considered the subject.
797. But even then, will they become Crown lands in the ordinary sense of the word or will they still be held as Church and School lands? They will become Crown lands.
798. Is any large portion of that area of Church and School lands suitable for small settlement? That area at present is partly held for farming and partly for grazing. I do not think that changing it into Crown lands will alter that fact.
799. Would it be more productive if it were alienated in smaller holdings? No, I do not think so. I do not think it would be desirable to alienate in smaller ones than are held now.
800. Do you think the construction of the railway would have any influence upon it? I think it would improve the value of that land. Some of it is good farming land, and, of course, being near the railway would help it.
801. What is the area of it, all told, not including that portion down towards the coast? I do not know. I have never made a calculation.
802. The A.A. Company's land is, of course, held in fee-simple? Yes.
803. Without any conditions? So I understand.
804. Do you happen to know whether that large tract of freehold contains any areas suitable for agricultural purposes? Yes, there is a fair quantity that is suitable. Of course it is not very large in comparison with the whole, but there is a large area around Gloucester which is suitable.
805. What could they grow there? They could grow corn. They grow maize on one side of the river, and they could grow it on the other.
806. Anything else besides maize? They could grow cereal crops in places.
807. Wheat? I think wheat could be grown in parts. About Gloucester there is much land which is fairly rich—land on the water-course.
808. But it is in small areas is it not? Around Gloucester there must be several thousand acres.
809. But not good land in one block? Yes, fair land in one block. The fair land is pretty well altogether.
810. The construction of a line might induce the holders of that land to open it for further use? Yes.
811. The next question is what people would be able to pay for it so as to produce maize and send it to market at a profit? That would depend on the railway freight.
812. Considering the proximity of the large corn-producing districts to water carriage, do you think it would be possible for the farmers to grow maize inland and send it by rail, say to Newcastle or Sydney, when from the rivers it could be conveyed to those places much more cheaply? That is, in fact, whether they could compete with the rich lands and the water carriage; I do not suppose they could.
813. At the present time, I suppose that nearly all that country is used for pastoral purposes alone? Yes.
814. And although there is a little cultivation, it is chiefly for home use? You are talking about the A.A. Company's land—that is nearly all used for pastoral purposes. There are some farms but not many.
815. Then the construction of this line, if it were to bring about settlement, would, of course, be directly in the interests of the private owners of that land? I do not say that quite.
816. Well, it would if it ran through their estate 51 miles? It would be a very great advantage to them, but I do not think it would be altogether in their interests. It would be in the interests of the Church and

J. W. Allworth.
25 Feb., 1898.

- and School lands, and the pastoral people in the direction of Rawdon Vale, who would come in and join the line at Gloucester.
817. The settlement is not very thick along there at any part? No, it is not very close there at all.
818. In which direction do the Copeland gold-fields lie from Gloucester? Six miles west of Gloucester.
819. Knowing that country as well as you do, without committing yourself as to whether as a matter of policy it is advisable to make this railway or not, do you think that the best route has been selected by the railway surveyors? Yes; I think that this route is the best, because it is farthest from water-carriage.
820. Would you care to offer any opinion as to the advisability of making this line? I have never given very much thought to it.
821. I suppose you know the river flats on nearly all these rivers—the Paterson, the Williams, the Karuah, and the others? Yes.
822. Are they not all subject to floods? Yes, they are all subject to floods.
823. And is not that the best land to be found? The flood land is the richest. You get the richest crops off the flooded areas.
824. That is the land which is chiefly cultivated, is it not? Yes.
825. And in some seasons there is almost a complete loss owing to floods? I do not know that that occurs very often. They recover very quickly where they grow lucerne, but of course with corn the season is lost if there is a flood.
826. Then we are to understand that the Crown land of any value that will be affected by the construction of this railway is very limited in area? Yes.
827. Although there appear to be a large quantity of Crown lands at the further end of the line, those lands are of a hilly character and of an inferior quality? Yes; they are not likely to be settled upon for some time, I should think. There is no present demand for them.

TUESDAY, 1 MARCH, 1898.

Present:—

- THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).
- | | |
|--|----------------------------|
| The Hon. JAMES HOSKINS. | CHARLES ALFRED LEE, Esq. |
| The Hon. CHARLES JAMES ROBERTS, C.M.G. | THOMAS HENRY HASSALL, Esq. |
| The Hon. WILLIAM JOSEPH TRICKETT. | GEORGE BLACK, Esq. |
- FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

J. Harper. 828. *Mr. Wright.*] Have you a statement to lay before the Committee? Yes. I may explain that in 1891 I made my first report on this subject to the Commissioners. It might not seem necessary to go back as far as that in view of a later report, but as one bears on the other, I think it will be as well to submit both. The report that I made in 1891 is as follows:—

New South Wales Government Railways, Goods Superintendent's Office, Sydney, December, 1891.

NORTH COAST LINE—WEST MAITLAND TO TAREE, Manning River.

Total length, 113 miles 54 chains; estimated cost, £1,378,923, or (say) £12,095 per mile.

WHEN directed to report upon the probable revenue and working expenses of the proposed extension, my instructions limited me to an investigation of the section submitted, and, consequently, the information elicited deals only with the district through which the survey passes and those so adjacent to it as to be served by its construction.

I deem it necessary to refer to this matter in explanation of an apparent treatment of the proposal rather as a local branch line than as a portion of a coastal trunk one. As none of the traffic of the districts through which the road is projected reach the existing lines at any ascertainable point in such a manner as to permit of identification, the ordinary methods of estimating probable traffic and checking information furnished from local sources are unavailable, and, consequently, the data for arriving at correct conclusions are somewhat vague. At the present time, the carriage of the district is almost exclusively by water on the rivers Paterson, Williams, and Manning. The North Coast Co. have, however, very courteously placed all the information in their power as to the trade of the latter river at my disposal, and thus I am enabled to approximate sufficiently closely for all purposes the trade which falls into the three rivers.

The line junctions at 20 miles 57 chains from Newcastle to the north of West Maitland, and the following is a list of the towns through which it passes, or which will be served by it:—

	Distance from Junction.	Population of Town.		Distance from Junction.	Population of Town.
Oakhampton	2½ miles	500	Copeland	72 miles.	220

(a) These towns are not on the proposed line, but would be served at the mileage mentioned.
(* Beyond the terminus 53 miles, but we would, no doubt, obtain passenger traffic.

The estimated populations of the districts which embrace these towns are as follows:—

Paterson	2,500
Dungog	2,000
Clarence Town	1,600
Taree	6,000
Port Macquarie	4,000
Total	16,100

I do not think, however, we could expect to derive either coaching or goods revenue from more than, say, 12,000 people.

The character of the country through which the line passes is agricultural on the various rivers and creeks, and the balance grazing of good to indifferent quality. The line passes for 52 miles through the A.A. Company's grant of 464,640 acres. No adjoining Crown lands will, therefore, be benefited over this extent of railway frontage.

Maize,

Maize, tobacco, and fruits are successfully cultivated on the river flats. Only small quantities of wheat are grown. A large quantity of grazing land is used exclusively for breeding and holding store stock; dairying only being carried out to a limited extent—the total dairying stock in the counties of Durham, Gloucester, and the electorate of the Hastings and Manning amounting to 13,232 head, and of ordinary cattle, 31,297; pigs, 27,787. J. Harper. Mar., 1898.

Sheep will not thrive in these coastal districts, and any live-stock traffic would be confined, generally speaking, to pigs, as our experience has taught that store stock, such as are principally held in these districts, are not railed to market or fattening grounds.

Timber is plentiful on several parts of the line, and of excellent quality, but a great deal of the ironbark has been cut out, and the getters of sleepers and other first-class timber are working as far as 20 miles away from the rivers.

As I have already said, the present trade is chiefly carried by water, and with such advantages as are possessed in the direction of this economical means of transit by a very large proportion of the residents, I am afraid we should be very slow to win the carriage of their very low grade traffic such as timber, maize, potatoes, &c.

At present droghers of large capacity reach the town of Paterson on that river at any time throughout the year, and without competition carry at the rate of 5s. per ton the whole trade to and from the district to Morpeth and Newcastle. Our rates to Newcastle under the most favourable conditions for the lowest class of traffic, viz., maize, would be 3s. 6d. per ton, but I am satisfied that it would be carried for less in competition by water, as these traders not only serve the population at the head of navigation, i.e., Paterson, but carry for numerous farmers on the river-banks, occupying only five or six hours in transit.

The same competition would always exist at Clarence Town, the head of navigation of the river Williams. From the point in question to the Hunter, vessels with a draught of 10 feet trade, and steamers carry passengers and cargo to Newcastle, occupying five hours on the journey, and charging freight at the rate of 5s. per ton. Our lowest freight for maize would be 6s. 6d. per ton, and average freight at 3d. per ton, per mile 17s. per ton.

Again, on the Manning, which carries the largest population, and is the most productive of any of the districts through which the line passes, ocean-going steamers and vessels call at all the principal towns to which, even if a railway were constructed, the great bulk of the trade of the outlying settlements must converge. The present rate of carriage (again without competition), is 12s. 6d. per ton to Sydney; our lowest freight (for their staple, maize), over this mileage would be to Newcastle 9s. 8d. per ton, and to Sydney 13s. 4d. per ton, average freight at 3d. per ton per mile would be to Newcastle 31s. 3d. per ton, and to Sydney 58s.

It will thus be seen that these districts already have a very economical means of transit to and from their markets, and that we should always find a very strong competition with all the advantages, except despatch, in favour of the water carriers, even with such products as would form the bulk of the trade, and are on our lowest grade of freight charges.

It is true that one of the strong arguments advanced in favour of a railway rests upon the uncertain character of the river entrance. There is no doubt but that this fact militates very much against fruit-growing and butter-producing on the river, but for general trading purposes I am disposed to think that this obstacle does not make itself very much felt; in other words, that the evil consequences at least to traders are, perhaps, exaggerated. The pilot at the Manning River Heads has been good enough to furnish me with a return showing the arrival and departure of the steamers to and from the river for the period 1st October, 1890, to 30th September, 1891. It will be observed that sixty-three trips have been made during the period. It is quite true that in several instances the steamers have been detained presumably by the condition of the bar, but I think an examination of the detailed list will show that there has been no such interruption to communication as would induce the residents to abandon this means of carriage for a great deal of their traffic whilst the freights are as distinctly in its favour as they undoubtedly would be.

The portion of the district through which the proposed line passes, and which would most undoubtedly be served by it owing to lack of river communication, is from Dungog to the point where the line crosses the Manning. This district is isolated from river communication. Dungog is 15 miles from Clarence Town, the port for the Williams River, and there is no doubt that this town and district to the north-west would rely largely on the railway as a carrier; but from a point about 5 miles from this town on the railway line, the latter passes for another 30 miles through the property of the A. A. Company before it again benefits settlement at Copeland and on the Barrington; and, thence again through 20 miles of the same Company's land until it reaches the Manning. This country and its products would undoubtedly be ours for traffic purposes without fear of competition, but it at once represents the least densely populated and the least productive, and serves comparatively little Crown land.

I have ventured to traverse at some length the possibilities of this proposed line, and to indicate the results which may follow its construction, because I feel it can in no sense claim to be of national importance as an urgent work when compared with those necessary to open up other parts of the Colony.

As I have endeavoured to indicate, the settlers on Crown lands in this portion of New South Wales are comparatively well off in regard to communication with markets, and I am satisfied that, taken as a local line, the one under consideration would not pay working expenses for many years to come, and I am supported in this conclusion by our experience of the Cooma and South Coast branches which in many respects offer more favourable promise of doing so than this one.

My estimate of goods traffic is based largely on the returns obtained as to the Manning River trade from the North Coast Company, and applied to the district generally. The timber, stock, and passenger traffic is, of course, an estimate based on such experience as is available, but I have in each case made most liberal allowances for development following the construction of the road.

I have shown, in the first place, the probable value of the whole of the traffic of the district, leaving out of consideration the competition by water. As this means of conveyance would certainly continue to be used for the carriage of at least half the traffic, to obtain a true expression of the value of that which would be won by railway the estimate should be reduced 50 per cent.

Estimate of value of goods traffic, assuming that the line carried the whole trade.

	Average miles.	Tons.
Taree District, including Wingham, Cundleton, Tinonee, Barrington, and Gloucester, &c.	110	{ In 7,200, at 4d. per mile, £13,200. { Out 4,000, at 2d. " 3,660.
Dungog District, including Stroud, Clarence Town.....	33	{ In 4,320, at 4d. " 2,376. { Out 1,750, at 2d. " 481.
Paterson District.....	12	{ In 3,000, at 4d. " 600. { Out 1,250, at 2d. " 125.
Timber carried on whole line, say, 300 tons per week, at 10s. per ton	15,600, at 10s. per ton 7,800.
Live stock, whole line, 400 trucks per annum, 100 miles. at 8d. per mile.	2,400 1,333.
Total	39,520 £29,575.

Coaching Traffic.

Forty passengers per day, yielding 10s. each	£6,260
General coaching.....	1,500
Mail subsidy, 114 miles, at £12 per mile	1,368
Total coaching.....	£,9128

It would be, of course, idle to think for one moment that the railway would obtain the goods traffic indicated above in competition with the three rivers. If we obtained even one-half, it is the most that could be expected.

It will be also observed that having in view the general character of the possible traffic, the rate allowed (15s.) for the tonnage is most liberal.

Working Expenses.

This line will in certain respects be a costly one to work. Its ruling grade is 1 in 60, and the following are approximately the number of miles and grades of 80 and under :—15½ miles of 1 in 60; 9¼ miles of 1 in 60 to 70; 10 miles of 1 in 70 to 80.

The

J. Harper.

1 Mar., 1898.

The curves, however, are even more formidable. Roughly speaking, there are :—70 curves of 12 chains radius ; 4 curves of 13 chains radius ; 2 curves of 14 chains radius ; 28 curves of 15 chains radius ; 32 curves of 16 chains radius ; 2 curves of 18 chains radius ; 44 curves of 20 chains radius.

The Cooma line, except that its ruling grade is 40, offers a fair comparison as to working expenses ; and I have, therefore, adopted its train mile cost, 3s. 10d., in arriving at an estimate.

To perform the service of the Taree line, a daily mixed mail service and a tri-weekly goods service will at least be necessary ; or, 1,368 mixed miles and 684 goods miles per week—106,704 miles, at 3s. 10d. per mile, £20,493 per annum ; the interest on £1,378,923, £55,156 per annum. Total, £75,629, annual cost of proposed line.

829. Your estimates so prepared in 1891 of the working expenses, I understand, are almost identical with those more recently prepared by the Commissioners? Yes.

830. What are they? About £20,000. It is rather a singular coincidence, considering that the two sets of estimates were prepared absolutely without any reference to each other.

831. At the time the Commissioners prepared their estimates, at the latter end of last year, they were unaware of your previous estimates being in existence? Yes.

832. Will you give me the total earnings? The total earnings I estimated in 1891—this was assuming that all the traffic of the district were carried by the railway—amounted to £28,703. The report that I made in 1897 is as follows :—

New South Wales Government Railways, Chief Traffic Manager's Office, Sydney, 14 Nov., 1897.

PROPOSED LINE, MAITLAND TO TAREE.

(Distance, 114 miles ; estimated cost, £982,283).

As directed by the Commissioners, I have again made careful inquiries as to the prospects of traffic on this proposed line, having caused a most exhaustive inquiry to be made in the district, in addition to my own personal one. The general circumstances have not altered since 1891, with the exception that the dairying industry has made great strides in the district, and will no doubt still continue to do so ; but I need scarcely point out how little railway-earning freight is produced by this source of production. As previously pointed out, the traffic produced in the whole of this district is almost exclusively of a low-grade character from a railway freight point of view, and the great bulk of it finds a consumption in the markets of Sydney, and, therefore, the charge by rail as against water carriage should generally be calculated on its delivery in the metropolis. The existing freights by steamer are higher than those charged from Sydney to Melbourne, and it goes without saying, are capable of very material reduction, and, after our experience on other lines running parallel with the coast, this fact requires to be very carefully watched in its bearing on the possible traffic of the projected line. This factor, in determining the route by which produce would be carried, is of all the greater importance by reason of the fact that a great portion of the land under cultivation lies in proximity to, or on the banks of navigable rivers, and the produce is picked up *en route* by steamers and conveyed to Sydney or Newcastle, or is delivered at central points by droghers.

The probable volume of the timber traffic would also be controlled more or less by the same causes, and the estimate elsewhere of £3,500 per annum would, in view of all the circumstances, be exceedingly liberal, when it is borne in view that this traffic is neither of a perishable nor urgent character, and can be dealt with by small vessels of light draught and at cheap rates.

The estimate which I furnish of live stock traffic is also an exceedingly liberal one, as the district cannot be regarded as a fattening one, and we would require to carry a very large proportion of pigs and dairy cattle to realise it.

With regard to the passenger traffic, I have estimated forty passengers per day travelling through the year, equal to 12,600 per annum, at an average rate of 10s. per head. It is claimed that a large number of passengers would be attracted outside the immediate district to be served by the railway from the population of the Macleay and of Port Macquarie, but it is exceedingly doubtful whether the majority of the residents of these districts would be prepared to pay for 95 miles of coach journey, and 230 miles of train journey to Sydney, equal to 45s. 6d. return second-class, in preference to the cheaper rate by steamer.

The following is my detailed estimate of the traffic of the various districts which will be served by the line :—

Paterson.

At present the service is performed by drogher, and the produce is delivered by water at Sydney and Newcastle. The rate for dead weight to Sydney is 7s. per ton, and to Newcastle, 3s. 6d. per ton. A very large proportion of the produce of this district is grown on the river and delivered direct by droghers. It is only 12 miles to Maitland by an excellent road, and for passenger purposes most of the families will have their own conveyances, and will use them, as in many cases they would have to drive nearly as far to a railway station as to Maitland. I certainly do not think we can look for very much produce, goods, or live-stock traffic, under the favourable conditions of cheap transit which exist at present, and which would no doubt be reduced under competition.

My estimate of the traffic of this district is as follows :—

		£	s.	d.
Produce, &c.	500 tons at 1s. 6d.	37	10	0
Goods	200 „ 4s.	40	0	0
Live stock—pigs.....	50 trucks at 15s.	37	10	0
		£115	0	0

Dungog.

The Dungog District, as pointed out in my report of 1891, is served from Clarence Town, the head of navigation on the Williams River, distant 15 miles from Dungog. The following are the existing rates for dead weight :—To and from Newcastle, 5s. per ton ; to and from Sydney, 13s. 4d. per ton. To this has to be added road carriage, which is at present high, amounting to 10s. per ton, but which would no doubt under the circumstances of competition be very materially reduced. It may be stated that the steamboat company are reputed to be paying 20 per cent. on preference shares, and 10 per cent. on ordinary shares, with a bonus of 2½ per cent., and the original £1 shares are now valued at 56s. The local storekeepers and many of the residents of Dungog are shareholders in this company, and would naturally be inclined to give the water route preference. In estimating the traffic as under, therefore, I am convinced that a very liberal view has been taken of the possibilities of winning the traffic by rail :—

		£	s.	d.
Produce.....	4,000 tons at 3s. 6d.	700	0	0
Goods	2,000 „ 6s.	600	0	0
Live stock.....	350 trucks at 20s.	350	0	0
		£1,663	0	0

Stroud.

The goods traffic of this district is at present carried to and from Booral wharf, a shipping point distant 11 miles by an excellent road from Stroud. The distance to the nearest point on the line is 4 miles at about 60 miles from Newcastle. I have but little doubt as the steamers would still continue to trade to Port Stephens for the purpose of serving the requirements of those living on the lower portions of the estuary that such a rate would be quoted as would enable them to retain the bulk of the traffic. My estimate of the traffic is as follows :—

		£	s.	d.
Produce	1,000 tons at 4s. 6d.	225	0	0
Goods	100 „ 7s. 6d.	37	10	0
Live stock... ..	200 trucks at 20s.	200	0	0
		£462	10	0

Gloucester

Gloucester and Copeland.

J. Harper.

At the present time the population of these districts is about 1,000, and as most of the land is locked up, production is small. There is no doubt that when the land is eventually thrown open by the Agricultural Company very considerable developments may be looked for, but in view of the fact of the land being in the hands of a private company, one would not be justified in giving any estimate based upon the future intentions of the owners. My estimate of the traffic is :—

		£	s.	d.
Produce (say)	1,000 tons at 6s. 6d.	325	0	0
Goods	100 „ 10s.	50	0	0
Live stock	200 trucks at 25s.	250	0	0
		£625 0 0		

Taree and District.

For the reasons of sea competition already referred to, I am of opinion that the bulk of the traffic from this district would still be sea-borne, the exception probably being butter, fruit, live-stock, and goods of a perishable character, and then only when requiring urgent despatch. At the present time the rates charged by steamers are—12s. 6d. per ton for dead-weight, and 30s. per ton measurement. I am convinced that these rates would be lowered immediately competition commenced, and that we would not, for ordinary goods and produce, get higher rates over the extension than those given in my estimate, viz. :—

		£	s.	d.
Produce	4,000 tons at 8s. 6d.	1,700	0	0
Goods, &c.	1,000 „ 12s. 6d.	625	0	0
Do.	500 „ 20s.	500	0	0
Live-stock	500 trucks at 30s.	750	0	0
		£3,577 0 0		

Timber Traffic.

For the timber traffic of the whole of the districts served by the line, I estimate the freight as equal to £3,500 per annum.

Summary.

My summarised estimate of the whole of the traffic is as follows :—

	£	s.	d.	£	s.	d.
Goods and stock traffic—						
Paterson district	115	0	0			
Dungog „	1,663	0	0			
Stroud „	462	10	0			
Gloucester „	625	0	0			
Taree „	3,577	0	0			
Timber traffic	3,500	0	0			
						9,942 10 0
Coaching traffic—						
Passengers	6,300	0	0			
Mails	1,368	0	0			
Sundries	400	0	0			
						8,068 0 0
Grand total						18,010 10 0

833. That is really the total given to us by the Commissioners in their report? Yes.

834. You visited this district personally? Yes.

835. Did the inhabitants of the various places furnish you with any estimate of traffic? No.

836. They gave you no estimate? They gave the Commissioners figures as to what the boats carried.

837. They gave you nothing by which you could check your figures? Of course we got information as to the acreage under crop, the production of the various districts, and that kind of thing.

838. How did that bear out your estimate made in 1891? It was correct in 1891; for as a matter of fact, I got it from the steamboat companies.

839. You got the actual amount carried? Yes.

840. What do you think of the district as an agricultural one? On the rivers and creeks it is very good, but a good deal of it is very indifferent.

841. What is it between Maitland and Clarence Town? On the Paterson there is a lot of good country, but the back country is merely grazing land.

842. From Clarence Town to Dungog, what is it like? It is principally grazing land, and a lot of it is indifferent.

843. From Dungog to Stroud? On the creeks it is good. The other land is simply grazing land.

844. What percentage of the land would you consider good, so far as your observation went? Of the whole district, I should not consider that more than 25 per cent. of it was suitable for agriculture.

845. That is from Maitland to Taree? Yes.

846. Supposing that this land, belonging to the A. A. Company, were thrown open for agriculture, is it suitable for agriculture? In the neighbourhood of Gloucester there is a lot of very excellent land.

847. The railway would pass through 51 miles of the A. A. Company's land? Yes.

848. What proportion of that do you think is fit for agriculture? I should think not more than one-third of it, even if that much.

849. Do you think that the construction of this railway would conduce very largely to increased settlement? That would depend on the terms on which the land there could be acquired.

850. But apart from the A. A. Company's land? Well, immediately adjoining the line there is scarcely any other land but the A. A. Company's, with the exception of some church and school leases. There is some excellent land in the district, but it is very patchy.

851. Not more than 25 per cent. of it is good? Not suitable for agriculture.

852. Is the Manning fairly populated? Yes.

853. And rich land? Yes. The Manning carries a large population.

854. Is it now producing anything like the maximum amount of products? I should scarcely like to say that. I have not been all over the district.

855. There is a good deal of land between the coast and the railway, is there not? Yes.

856. There would be certain expense in bringing produce from that land to the railway? It would never come.

857. You think the steamer would pick that up? Yes.

858.

- J. Harper.
1 Mar., 1898.
858. Have you calculated for the western side of the railway only? For passenger traffic and for goods, except butter and perishable articles of that kind, for the eastern side of the line I do not allow anything. I do not think that the people there would pay a higher rate than is now charged by the steamer.
859. You have only estimated your traffic for a very short distance to the east of the line and for the whole of the western portion of the district? At Taree; but at intermediate points I have embraced the Stroud district, which is four miles from the nearest point of the line, and generally from 14 to 16 miles from it.
860. You go down to the navigable waters? Yes; to Bulladelah for passenger traffic.
861. And goods traffic you have not taken into account? I have allowed a certain portion for Stroud, the northern portion of the valley.
862. You have had a large experience in estimating the products of districts in connection with railway construction? Yes.
863. Do you feel satisfied that the estimate you have given to the Committee to-day represents the total volume of traffic that would be received? I am satisfied that it represents all the traffic we would get on this line.
864. What about any prospective increase? Our experience has not taught us that the traffic of the coast lines increases, and on this line I should look for a decrease rather than an increase.
865. You think that the competition of steamers might even make the traffic less than your estimate? Yes; that is our experience on the Cooma Line, and with the exception of developing the milk traffic on the Illawarra Line, it is also our experience there.
866. In reporting upon this line, do you look upon it as a local extension, or as a portion of a through line? I deal with it as a local line.
867. You do not take into consideration the possibility of further extension to Byron Bay or the main line? No.
868. Do you think that that would alter the aspect of the thing at all? For the worse, probably.
869. You think that the more the mileage of the haulage the greater the annual loss would be? Yes.
870. The more successful the competition by water would be? Yes.
871. Do you know the present freight between the Manning and Sydney? Maize, 10s. a ton from Taree; ordinary goods, dead weight, 12s. 6d.
872. That is a less rate than you have estimated for? Yes. I have allowed 20s. Measurement goods are 30s.; but I have not estimated much at 20s.
873. The measurement goods from that district would necessarily be very small in quantity? Measurement applies in sea carriage for a good many articles to which it does not apply in land carriage.
874. It could not apply to maize? No. The bulk of the produce of the district is carried at 10s. a ton.
875. The bulk of the produce is timber and maize? Yes. Maize is carried at 10s. a ton, and timber is carried at less. I am quoting the steamer freight.
876. Timber is carried at so much per 100 feet? Yes.
877. What is the population you mentioned? I have a more recent statement of the population which I can give you. My previous statement was prepared in 1891.
878. Was this prepared by yourself? Yes.
879. Will you give us the total? 19,500. That includes the districts of Gresford, Paterson, Dungog, Stroud, Gloucester, Copeland, Coopernook, Cundleton, Taree, Tinonee, and Wingham.
880. Are you aware that the Statistician's Department have supplied us with evidence showing that the population along the whole length of line, including Taree, and taking 10 miles on either side of the line, is about 13,000? Yes; but I take more than that. For our purpose 10 miles would not be the right limit.
881. The 10 miles' limit you think is not sufficient? No.
882. You have based your estimate simply on your knowledge as a railway expert? Yes; as the traffic would fall in—as to where it would be likely to come from.
883. Where is your nearest point from the existing railway—do you start from Largs? Half a mile the other side to the north of Maitland. But I do not start to take the population until I get to the neighbourhood of Paterson—nothing to the south of the Hunter is included.
884. You include only the population who, you feel sure, from your knowledge as a railway man, would use the line? Yes.
885. It has been mentioned that the scenery along the line is very beautiful, and that the line might become a tourist one;—what do you think of the possibilities of that? I am afraid it is too far to go for the scenery. It is 118 miles from Sydney to Maitland, and 114 miles further to Taree, and the scenery is very limited to induce people to go so far.
886. During your visit, did you see anything very impressive in the scenery? There are one or two pretty spots, but nothing to compare with the scenery on either the Cooma Line or the South Coast Line.
887. Nothing to hold out the slightest hope of there being a tourist traffic on this line? No; with the exception of brush, which you can get in the Illawarra district as well, there is nothing to compare with the scenery within 50 miles of Sydney.
888. Then the traffic will depend entirely on the residents? Yes.
889. Are there any navigable waters between Taree and Sydney, except at Port Stephens? There is the Paterson and the Williams.
890. I mean on the coast? No.
891. The only points of competition are the River Manning and Port Stephens? Yes.
892. The greater productive area on the whole length of the line is the Manning itself? Yes.
893. The larger proportion of the population is also on the Manning and its neighbourhood? Yes. At Coopernook, Taree, Tinonee, and Wingham, there are altogether 11,000 of the total population of 19,000.
894. Considerably more than half of the whole population is on one river? Yes.
895. And the intermediate country, after you leave Dungog, is sparsely populated? In the neighbourhood of Dungog there is a population of 4,000.
896. Would this railway be likely to capture the traffic about Clarence Town? Certainly not.
897. You think that the service is already too good there? Yes.
898. What service is there between Clarence Town and Newcastle? It occupies about five hours in time, and the freight is 5s. per ton to Newcastle.

J. Harper.
1 Mar., 1898.

899. And what does it cost to bring the stuff on to Sydney? Our rate for maize from Dungog to Darling Harbour would be 12s. 2d.
900. You say the freight is 5s. from Clarence Town to Newcastle? Yes, and 13s. 4d. to Sydney.
901. 13s. 4d. by steamer as against 12s. 8d. by rail? Yes.
902. You have the advantage? Yes; but I think it would not be very long before the steamer charge would be less than 13s. 4d.
903. Your rate is about the lowest rate you could carry at? Yes, that is absolutely our lowest rate.
904. And you think that the steamers with competition would lower their rates? Yes; the rate is cheaper to-day from Taree than from Clarence Town. It is even cheaper from Melbourne to Sydney than from Clarence Town.
905. So you do not anticipate capturing trade at Clarence Town or Dungog? No; I have given an estimate of a certain quantity of trade that we would get at Dungog.
906. It appears to me that the bulk of the trade you think you could get would be between Stroud and Taree? Yes.
907. Where there is no water competition? Yes; but unfortunately at the present time there is very little production in the Gloucester district. That end of the A.A. Co.'s land the company is reserving very closely, and will not part with any of it. It is some of its best land.
908. Do you not think that it is possible that the construction of a railway through their land would induce them to sell some of it? I think it naturally would.
909. You say it is good land? Yes.
910. That might become populated? After all said and done, it is a question whether the people would not be better situated on the banks of navigable rivers. Personally, I do not myself think that for the purpose of maize-growing or anything of that kind, you can mention any of the districts through which this line would pass in the same breath with the more northern river districts.
911. Are we to act on the assumption that unless the A.A. Co.'s land were sold, and peopled by an agricultural population, you see no earthly chance of this railway paying? No; I do not see it even then.
912. That is the only chance of its ever paying working expenses? Yes.
913. And you see no possibility of that chance? No; I do not.
914. Have you reported on the line further along the coast? Yes; between Casino and Lismore.
915. Did you go as far as Kempsey? Not this trip.
916. Do you think that any of the trade of the Upper Macleay would be likely to be brought to Taree? I do not think that it is at all likely to be carted 95 miles to a railway.
917. And we are not likely to secure any of the passenger traffic? No; it would mean a coach journey of 95 miles and then having to pay a train fare for 230 miles. I may mention our experience to-day on the south coast which just occurs to me. We have an extension to Nowra, and Nowra is 39 miles from Ulladulla, and now, notwithstanding that, I suppose that 90 per cent. of the passenger traffic from Ulladulla goes by steamer.
918. And Ulladulla is a very inferior port, is it not? Yes; certainly not as good as the Macleay.
919. Only very small steamers go there? Yes.
920. Can you give the Committee any information as to the products of the south coast;—do you bring much produce for instance from Nowra to Sydney? None, except butter, cream, and cheese.
921. What about the supplies (the stores) going to Nowra—can you give the Committee any idea of the tonnage carried over-sea and by railway? I cannot say what is carried by sea. I do not know that, but 430 tons, including all classes, were carried by railway to Nowra last year.
922. But the consumption in the district must be very much larger than that? Yes; of course the balance is carried by steamer.
923. Instead of getting the whole of that traffic you do not get much more than 10 or 12 per cent. of it I do not think we get one-tenth of it
924. And you think that what takes place at Nowra would take place at Taree if this railway were constructed? Yes. This will give you an idea of the traffic we carry to Nowra: during the whole of the year we carried, first-class, 2½ tons; second-class, 5½ tons; and third-class 55 tons. They represent articles of general consumption, and outside produce.
925. One thing that guides you in this report is that you cannot successfully compete with water-carriage on the coast, even if the harbours are indifferent? That is our experience, on both the Cooma and the Illawarra lines.
926. You have not been able to capture all the traffic on the Cooma line? We have less traffic on the Cooma line than we had when it opened, with the exception of stock.
927. The tendency is to send it by the cheaper water route? Yes.
928. Supposing it were determined to construct a railway to the Manning River, and to stop all works of improvement of the navigation of the river, do you think that the inhabitants there would be satisfied? No; I am sure they would not. I can speak from experience in that direction of our Lismore-Tweed line. What I should expect to occur in regard to this line is what has occurred on the Tweed and the Brunswick and other rivers. Directly the railway works had been authorised, and were in course of construction, I should expect the people to press more keenly than ever for the improvement of the river entrances. That is what they did on the more northern coast.
929. So you think that in addition to the construction of this line, the agitation for the improvement of the navigation of the Manning would be quite as strong or even stronger than it is at the present time? Yes.
930. I suppose with the object of getting cheaper carriage by setting one against the other? I do not know what the object would be, but I dare say one would be found.
931. You do not think that the abandonment of the improvements of the river would meet with the approbation of the inhabitants? No; and I do not think it would be fair, either, to the inhabitants of the lower reaches of the river.
932. How far would this line cross the Manning above its entrance? I think it is 40 or 50 miles to Wingham from the entrance.
933. And nearly all below that—which comprises, I suppose, the great bulk of the fertile portion of the Manning River—you are satisfied that the produce would be carried by sea, even if this railway were constructed? Yes, I am sure it would.

- J. Harper. 934. *Mr. Lee.*] I want to ascertain the cost of carriage by steamer from various places, which I will enumerate, directly to Sydney, and also the rates from the same places by rail to Sydney;—do you think you will be able to give me that information? Yes, I think I can give you that.
- 1 Mar., 1898. 935. I ask you first of all to give me the cost from the Paterson to Sydney by water? By water, 7s. per ton for all dead weight, and 10s. measurement. The railway freight to Sydney from the same point would be from 10s. 2d. up to 76s.
936. What would maize be by rail? 10s. 2d.
937. And I suppose an average of ten bags per ton? No, about nine.
938. The next will be from Dungog? Through to Sydney by steamer the rate is from 13s. 4d. to 20s., and by railway the freight would be from 12s. 2d. to 78s.
939. In that 12s. 2d. would be included the maize? Yes.
940. The next will be from Stroud? Eighteen shillings to 26s. by water, and 13s. 2d. to 79s. 6d. by rail.
941. Gloucester and Copeland? That would scarcely be fair, because there would be a long road carriage from Gloucester. The river scarcely comes into it there at all.
942. That is to say, you would get that traffic? I have practically credited the whole of that traffic to the line.
943. Take the next place? From Taree the steamer freight is 10s. for maize, and 12s. 6d. to 30s. for other goods. The railway freight would be from 17s. 2d. (for maize) up to 92s.
944. Those are the rivers which you have to compete with? Yes.
945. It would appear from your rates that the charge on the railway for maize would be 17s. 2d., whereas by boat it would be 10s.? Yes; it is 10s. to-day.
946. In estimating the quantity of traffic that you would be likely to get, on what basis did you separate that which was likely to go by steamer from that which was likely to go by train? I took approximately the neighbourhood where the produce was grown, and wherever it was grown, wherever it seemed favourable for reaching the railway, outside the rate, I gave the line credit for it.
947. Taking your estimate of the traffic from the Manning River, the amount I think you estimated would be £3,577, exclusive of timber? Yes.
948. What quantity of maize, if any, did you include in that amount? 4,000 tons, at 8s. 6d., I have given, and that would chiefly represent maize.
949. That would be 8s. 6d. a ton from Taree to Maitland? Yes. I have only given the line credit for earnings by itself.
950. That maize would be grown on the river banks? Yes; but it might be grown away from the river banks, and higher up than Wingham. I looked at it in this light, that a market for a certain quantity might be found in the neighbourhood of Newcastle or Maitland. At times there is, of course, a market there, if they happen to be suffering from floods or droughts, and there is a better season elsewhere, and I thought it better to credit them with that rather than with finding a market at Sydney.
951. It would depend very largely on circumstances? Decidedly.
952. On the whole, taking the traffic in a general way—that is to say, with the river fairly navigable, and the crops fairly good—do you think there would be a probability of so much as 4,000 tons of maize being sent by rail? Well, maize and other things of that kind. It is a very liberal estimate. But I think it is better to err on the side of liberality than otherwise when the quantity is an unknown one to any extent.
953. If the steamer can move it to Sydney so much more cheaply than the railway could, how could you expect the railway to get any of it at all? I have pointed out that a good quantity of this would find its market at Maitland, or at up-country towns, and would not go to Sydney at all. Assuming that it were required, say, somewhere up the north-western line, it could be delivered at 8s. 6d. per ton at Maitland, and would be that much closer to the seat of consumption than if it were shipped to Newcastle.
954. Would it not then be coming from an extreme point, and be running through districts which produce the same article closer to the market? Generally they do, but not invariably.
955. You find that maize is a low class article to touch at any time in regard to freight charges? Yes.
956. And it is rather an expensive freight for the railway to touch? Yes.
957. Inasmuch as it requires a great deal of handling, and there is not much profit got out of it? Yes.
958. What has been your experience on the South Coast line—have you carried much maize there? No, we do not carry any there. It is all on the river banks. It never finds its way to the railway at all.
959. It is picked up by the steamers? Yes. It may sometimes be carried for the purpose of feeding horses along the line where it is not grown.
960. And you think that what has happened upon that line is likely to happen on the northern rivers, that is wherever the rivers are navigable the produce will go *via* the port? Yes.
961. When you were going through this district, and making such a comprehensive estimate, as you undoubtedly have done in this matter, did it appear to you that that part of the country presented any unusually good prospects for the future? No, not from a railway point of view. It is undoubtedly a good district.
962. Admitting that it is all that it is said to be, did it occur to you that if it were pierced by a railway that fact would induce much larger settlement? It would probably induce settlement of a character. Dairy farming would, no doubt, be much increased.
963. Supposing that all the available land were taken up for dairy farming—and we are informed that a very large proportion of it is very inferior grazing land—and supposing that dairying in a large way were to take place, would the produce of the dairying be of such importance as would add any material freight to the railway? No; it would not amount to much. As a matter of fact, you know as well as I do the enormous quantities of milk which are carried for consumption by the large population of Sydney from the Illawarra District. Well, last year the total freight earned on the Illawarra Line for the carrying of dairying products amounted to £6,000. That included all the dairy produce.
964. Milk, cream, butter, cheese? Yes. Of course, a very large quantity of that was made up with milk. We get a great deal more from milk than from cream.
965. But your milk business on that line is a special business? Yes.
966. And you have not been able to do on any other line what you have been able to do on that line by running special milk trains? No; it is close to a large population.

967. It is only by running special milk trains on that line that you obtain that traffic? We could not run special trains from Taree to Sydney for the milk traffic. At Taree I have allowed 1,000 tons, at 12s. 6d., which would largely include dairy produce. At Taree I have allowed for 5,500 tons of produce; 4,000 tons represent the maize. The greater part of the 1,000 tons at 12s. 6d. would represent the produce of the dairying district, and the 500 tons at 20s. are for other things. J. Harper.
1 Mar., 1898.
968. Does that include dairy produce? Any such perishable goods as would not be sent by steamer. The 1,000 tons would include dairy produce.
969. Are you aware of the great strides that dairying has made on the Richmond River? Yes.
970. And that large quantities of butter have been produced there;—do you think the same thing would take place in the Manning District? I do not think that that would be as good a dairying district as the more northern rivers. I do not think that the pasturage is as rich there as it is farther north, and there is also a more severe winter there.
971. Did it occur to you, when you were in that district, that it could be better opened up by some other means than a railway? Well, I do not know, except it were by the improvement of the river entrance.
972. Do you think that that part of the Colony is suffering from any great disability from want of a railway? I certainly do not. I think that the people there have been in the habit of crying out a good deal because of not getting their butter and cream to market, owing to the conveyance of it being delayed. I have frequently known steamers bar-bound on the Richmond for three or four days, but the appliances which the companies have—the refrigerating chambers, and so on—are such that they can tide over difficulties of that kind, and I daresay that, as industries develop in this district, they will get over the difficulties caused by a temporary stopping at the bar.
973. There is no doubt that the residents have to submit to some inconvenience during adverse times—that goes without saying? Yes.
974. Would your acquaintance with the capabilities of these districts lead you to suppose that within a reasonable time the freight that you have estimated would be increased? No; I should not expect it. I should expect that with the development of competition it would be more likely to fall off in certain directions. Practically, there is no competition to-day on the Manning at all. The traffic is really in the hands of the North Coast Company.
975. You did not see sufficient there to induce you to recommend the Railway Commissioners to favourably consider the proposed extension of the railway? No.
976. In estimating the traffic of a district, you are not governed by the fact that the line will not pay immediately? No; I lay my estimate just as the figures are before the Committee—just as I estimate the traffic.
977. Irrespective or whether the line would or would not pay? Yes.
978. You simply give what you believe would be a fair estimate of the traffic to be expected? Yes. If I draw a deduction it is only from figures which are equally at the command of the Committee.
979. A large proportion of the route goes through the A. A. Company's land—51 miles; if the agricultural portion of that were made available and settled upon, do you think that that would lead to the estimated freight being doubled? No, certainly not.
980. It would mean some extra freight, of course? Yes.
981. But you do not anticipate a considerable addition? No; the improvement would take place chiefly in the neighbourhood of Gloucester, and the population in that district probably might increase from 1,000 to 2,000 or 3,000.
982. I presume that your Department still have the difficult question to deal with of fighting for railway traffic as against sea-borne traffic at many points? Yes.
983. Have your Department devised any scheme yet by which they can overcome that difficulty? It is impossible so long as the users of the permanent way outside the Heads do not have to pay interest on capital cost, as we have to do.
984. Have you not in some cases made a considerable reduction by means of your differential rates for the purpose of getting traffic? Yes; we have them in operation on the Cooma line, and the main northern line to Glen Innes and elsewhere.
985. All those points are some distance from the seaboard? Yes.
986. And yet you have been unable to capture the whole of the traffic? Yes; the only traffic that has fallen to us has been the low-grade traffic.
987. Therefore, your fears are that, if you have railway communication along the northern coast, you will be perpetually competing with the rivers? Yes.
988. And that eventually the rivers will beat you? Yes; that is our experience wherever we are running parallel with the coast.
989. *Mr. Roberts.*] Did you accompany the Railway Commissioners on their visit of inspection of the proposed railway? Yes, in 1897.
990. Which road did you take? We went from Paterson through Dungog, and through Gloucester to Taree by the main road, and we came back by Wingham and through Gloucester, Stroud, and Raymond Terrace to Hexham.
991. You did not travel along the coach road all the way from Hexham to Taree? No; the line is right away from that, the line passes through Paterson and Dungog.
992. Persons travelling along the coach road from Raymond Terrace to Stroud would not get a correct estimate of the value of the country? No; practically the road from Maitland through Paterson to Dungog is never very far away from the line, and by coming in from the accommodation house midway between Gloucester and Stroud you see the country on both sides, and going from Wingham to Taree you see the country practically there. Where the line crosses the Manning it is not practicable at all for buggies; it is very rough country following the Gloucester River down to its junction with the Manning.
993. You did not travel along that road? In 1891 I went 12 miles out and that was quite far enough—that is east of the Barrington.
994. There is some very good land in that neighbourhood? Yes; but the country is very rough, and there is only a cleared track.
995. There is a large area of land that could be opened up there if the railway were made? Yes; that is where the A.A. Co.'s land is on the Barrington and Gloucester,

- J. Harper. 996. Can you give the Committee any information as to the probability of the A.A. Co. selling or leasing their land? It is impossible to know what a corporation like that will do. I suppose that anyone would have thought that long ago the A.A. Co. would have parted with their land in the neighbourhood of Newcastle, but they have not.
997. Did you hear whether it was likely that the A.A. Co. would give the land through which the proposed railway would pass? No; I never heard anything to that effect.
998. How long did you remain on the Manning? In 1891 I was there about a fortnight, or nearly three weeks.
999. In 1897 I mean? We were there six or seven days, but I had an officer up there for about three weeks, who travelled all over the district getting me statistics.
1000. Are you quite sure that all the information that could be afforded you to enable you to prepare that estimate? Yes.
1001. On the occasion of the 1897 visit, did you go lower down the river than Taree? No; the traffic would not come up to Taree.
1002. Are you familiar with the land on the lower Manning? Yes.
1003. You have been over that country? Yes.
1004. Is it not admirably adapted not only for dairying purposes, but also for any purpose that any farmer might think fit to put it to? Yes, it is no doubt excellent land; but, as I said before, I do not consider it as good as that on the more northern rivers. The rainfall is greater and the soil is better, I think, on the Richmond and the Tweed.
1005. But is not the rainfall in the Manning district remarkable for its regularity? I know that at the time we were there it was remarkable for its scarcity. We had to drive about 30 miles for a drink for the horses.
1006. But you admit that the soil is remarkably rich? Yes.
1007. Fit to grow anything? Yes; there is splendid land in the neighbourhood of Dungog, too, on the Williams.
1008. It is only here and there that you meet with indifferent land along the line? I do not know. You pass through a great deal of it on the A.A. Co.'s land. When you get back from the river, with the exception of the creeks, from Dungog practically through to within 3 or 4 miles of Gloucester on the main road, it is generally very indifferent, very sour. The same remark applies to a lot of the land between Paterson and Dungog—there is a lot of very sour country.
1009. In giving the information that you did to Mr. Wright that, I think, only 25 per cent. of the land was good, had you taken into consideration all the good land below Taree on the Manning? Yes; there is only a very small proportion of the land fit for agriculture. There is a settlement there, but when you travel over the country yourself, and see that so much of it is of an inferior character, you can see much better than by merely looking at the map what proportion of good land there is.
1010. In forming your estimate, did you take into consideration that traffic at all? The whole of the passenger traffic was Taree traffic.
1011. I mean between Taree and the heads? The whole of the dairying and passenger traffic, but I did not take into consideration any maize. I could not conceive it possible that people down there would cart their produce, or bring it by drogher to Taree, and then pay 20 per cent. more than they are paying to-day.
1012. From inquiries that you made down there, did you not find a lot of discontent amongst the people as to their isolated position, as far as getting their produce to market was concerned? You find that everywhere where they want a line. I found that out at Dural.
1013. But are not the cases dissimilar? It is only a difference in degree.
1014. Have you ever travelled from Taree to Sydney by water, or *vice versa*? No; I have never been in the Manning Heads; but it is no worse than Ulladulla.
1015. You have never been to the Manning Heads? No.
1016. Therefore, you can hardly form an idea, can you, as to the discomfort to passengers travelling to Sydney by water, and the delays that probably take place when they are sending down their maize and other produce? Those occur at all bar rivers, but I do not think that they are of such a character as would induce people to pay the much higher rates.
1017. Do you think that the case would be met if the river entrance were made safer and more certain? I think it is a far more legitimate thing for the residents of the Manning to press for than for a railway. I think that it is the natural highway, and that which is capable of being improved should be improved.
1018. You think that that would be a more desirable way of spending the public money? I think so.
1019. Can you tell the Committee whether the receipts on the South Coast Line have decreased compared with what they were a few years ago? Taking away the traffic which has developed at Dapto, which is of an abnormal character, and the coal traffic, which from another point of view is also abnormal, the general receipts from goods are less. The passenger traffic is greater, but that is chiefly due to tourists.
1020. Of course, the South Coast Line has always shown a loss; but I meant whether that loss had decreased? Yes, it has decreased from the causes I have mentioned. The line has become better known, and is used more by tourists; and the opening of the Dapto Works has developed a very large traffic in the ores and other accessories connected with the smelting operations, and there has been a large increase in the volume of coal carried.
1021. It is chiefly owing to passenger traffic that the loss has been lessened? Yes; passenger traffic and carriage of minerals.
1022. Did you report on the South Coast Line, or can you recollect the nature of any report that was put before Parliament before the South Coast Line was determined upon? No; I had nothing to do with that.
1023. If the loss is steadily decreasing on the South Coast Line, is it not possible that a similar state of things may take place on the North Coast? No; for the same reasons are not likely to operate on the North Coast Line. There are large coal deposits on the South Coast Line, the working of which is diminishing the loss on that line. Then there is the opening of the smelting works under exceptionally favourable circumstances, having coal and other adjuncts to smelting close at hand; and then, chiefly, the fact of the district lying close to Sydney, and its becoming a big tourist resort. The increase has been more in passenger traffic than in anything else.
1024. But are you not aware that coal has been discovered along this line, somewhere in the neighbourhood of Stroud and Gloucester? But you would not seriously talk about the haulage of coal for 58 miles, would

J. Harper.
1 Mar., 1898.

would you, when it cannot be successfully developed within 30 miles of Newcastle. The Greta pits, with some of the best coal in the Colony, are practically idle.

1025. But if this line became an established fact, the coal would be sent? Where would they send it to.

1026. The nearest port—possibly Port Stephens? There would be no communication with Port Stephens. Besides, we have too much coal opened up already.

1027. The nearest port, of course, would be Newcastle? Yes; and that would be about 50 miles away.

1028. Is there not a large population at Newcastle, and round there, and would not the opening of this line tend to open up business relations along the proposed North Coast Line? You see that all the towns are situated, as I have pointed out, practically on navigable waters. As regards the scenery, I do not think that the Newcastle people would find enough interest in it to go out into the bush by means of this coast line.

1029. Not even to see the beauties of the Manning River? No; not even to see the beauties of the Manning River.

1030. Is not the land so fertile and rich, and the rainfall so satisfactory, that a man and his family could live on a very small area of land? I daresay he could if he were industrious.

1031. And if the A. A. Company's land were thrown open, would not a very large population indeed settle there? That would largely depend on circumstances.

1032. And ultimately bring enough traffic to the line to make it a paying one? You must remember that there are not 484,000 acres of the A. A. Company's land undeveloped. I suppose that the land capable of agriculture or settlement is under 40,000 acres. A very large proportion of that 484,000 acres has been alienated by the Company. They have either parted with the fee simple, or it is under lease. The land which they are holding, and I am under the impression they will hold for a considerable time, is on the Gloucester and Barrington Rivers, and on the Manning. That is the richest portion of their land, and that is the land they are not prepared to part with. It is only their other estate they have parted with, or are prepared to part with. I may mention that the land they are retaining for themselves is about the only part of their run which is fattening country. All the rest of their run is sour country, which is fit only for breeding store stock.

1033. In forming your estimate of traffic, did you reckon on the basis of a daily train service? No. To lift the traffic that we would have to lift I provided for a daily mail train, and for a tri-weekly goods service at least. We would have to run that over these grades in order to lift the traffic I have estimated for, and probably we should have to run two trains a day.

1034. Your great fear is that you would never be able to compete with the steamer service? Yes; that has been our experience wherever we are in competition with the water. I will illustrate this way: to-day the only goods we carry from Parramatta are, practically, fruit. All the other Parramatta goods traffic is carried by river or road.

1035. *Vice-Chairman.*] Is it not a fact that in addition to the river competition you have between here and Parramatta, there are no less than four carrying companies doing business between here and Parramatta? Yes; but I mentioned the river as being pertinent to this inquiry.

1035. *Mr. Roberts.*] In forming your estimate of passenger traffic on this line, were you guided in any way by the number of people who travel by steamer? No. I took rather the estimate of population of the districts; for instance, the Cooma district which is situated in about the same way; if anything this district is more favourably situated than the Cooma district is for steamer traffic.

1037. Are you not aware that the people are prohibited from travelling on account of the uncomfortable voyage they have to undertake owing to the uncertainty of getting out at the Manning entrance, the small steamers that must necessarily run there with a very small draught of water, and the possibility of getting caught in a south-east gale in going to Sydney? That is all right. But I do not think that you would rest assured that, assuming a line were built there to-morrow, that bar is going to remain in its present condition.

1038. It has been like that for the last twenty years? But according to the pilot's report in 1891, I think there were only three failures to get out of the bar in eighteen months.

1039. That may have been a very favourable year—every year is not alike? I took the year that was current at that time.

1040. In order to lay stress on any argument of that sort, you really want to take ten years? Personally, I would not attach the least bit of importance to that, in view of the experience we have had. I daresay that if you were to look up the reports of the Committee you would find that one of the strongest arguments in favour of a railway between the Richmond and the Tweed was that the Tweed was an absolutely impracticable river, and that the only means of giving relief to the residents in that locality was to abandon the river Tweed, build a railway, and improve the entrance to the Richmond. During the construction of that line, as a matter of fact, a deviation was made for the purpose of meeting the requirements of residents on certain flats of the river, and before the line was finished, there were two snagging dredges at work in the creek to which the line had been diverted for the purpose of getting the produce off the adjoining land, and I think that for one year two dredges and 300 men were employed in improving the entrance to the Tweed River. That occurred during the construction of the line, one of the strongest arguments in favour of which was that, the Tweed entrance being impracticable, there was only one way of giving relief, and that was to build a railway. Having that within my knowledge, I cannot for a moment assume that the Manning is going to be abandoned.

1041. Of course this line, if it should ever be gone on with, would be only a portion of a line, to go as far as Grafton;—have you been right over that line—the dotted line—as shown on the map? No; but I know it from description.

1042. You know it, I suppose, because of your official position, but you have not been over it personally? I have not been over it personally, but one of my officers has reported upon it.

1043. Would this line have been placed on a more favourable basis if the whole line had been put before the Committee—would you have looked upon it with a more favourable eye? Personally, I should regard it as the maddest scheme ever conceived, especially in view of the experience we already have with the Cooma line. I never conceived of such madness as running a line absolutely parallel with and on the coast.

WEDNESDAY,

WEDNESDAY, 2 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

J. Clarke. 1044. *Mr. Hassall.*] You are aware of the proposed construction of a railway from West Maitland to Taree? Yes.

2 Mar., 1898. 1045. You have, I believe, some information to give us? Yes.

1046. Will you kindly make a statement to the Committee? It is in reference to information showing the conveyance of mails between Maitland and the Manning River, and intermediate places, by road, and the cost of conveying them between Sydney and the Manning River by sea. The mails between Sydney, Maitland, and the Manning River are conveyed by road *via* Hexham, Raymond Terrace, Stroud, and Gloucester to Taree. There are also lines running from Maitland to Dungog along the proposed line of railway. Beyond Dungog, towards the Manning, there is only a very small line, across what they call the Monkerais to Weismantel's.

PARTICULARS of Contracts for the conveyance of mails overland between Hexham Railway Station, Raymond Terrace, Gloucester, and Taree, with the Branch Service between Gloucester and Copeland North; Taree and Wingham; West Maitland, Paterson, and Dungog; and West Maitland and Clarence Town.

Contractors'		Postal Lines.	Distance in Miles.	Frequency of Communication.	Mode of Conveyance.	Annual Amount payable to Contractors.	Date of Termination of Contracts.

						£ 1,692 15 0	

1897.—Cost of conveyance of the mails by sea between Sydney and the Manning River..... £31 8 0.

The average number of mail-bags per day from Hexham to Taree is 40, and they weigh 12 cwt.; from Gloucester to Copeland North about 4 a day; Taree to Wingham about 3 a day; West Maitland to Dungog about 10 a day,—the weight from West Maitland to Dungog is about 1½ cwt. per day; from Taree to Hexham the average is about 33 bags a day, weighing altogether 5 cwt.; Copeland North to Gloucester about 4 bags a day; Wingham to Taree about 3 bags a day; Dungog to West Maitland about 10 bags a day, weighing about 1 cwt. That is all the information I have in regard to the prices of contracts, the number of bags, and the weight of mails.

1047. The total cost by land is £1,692 15s. per annum, and by sea £31 8s., or a grand total of £1724 3s? Yes.

1048. Those places are apparently all served by daily mail? Yes; seven times weekly to Paterson, and six times weekly to the other places.

1049. What does "13 or more times," or "6 or more times," mean; do you make any allowance to the contractor for conveying the mail more times per week than stated? All the service is included in the £675. The contractor goes at different times from the railway station to Hexham, and to Raymond Terrace, and comes from Raymond Terrace to the railway station. He goes in the morning and afternoon, and on Sunday morning, making altogether thirteen times a week.

1050. And in the event of his having to go more times, there would be no increase in the cost? Yes, there would be; but thirteen times is enough for Raymond Terrace—twice a day, and once on Sunday.

1051.

1051. How long does a letter take to go from Sydney to Taree by road, and by steamer? Sydney to Taree—posted here 4.45 p.m., Monday to Friday, and on Sundays, reaching Taree at 7 o'clock next evening. J. Clarke.
1052. That is by train to Hexham, and then by coach? Yes; the time between postage here and arrival at Taree is about 26½ hours. When the mail is sent by steamer, ordinarily speaking, we calculate that the steamer starts at about 4, 5, or 6 o'clock, and they hope that she will get there about next day at noon—any time up to the evening. She may get there a little before noon. We look upon the steamer as being fast to Taree. 2 Mar., 1898.
1053. Then, practically, the time of the journey by steamer and by land is about the same? Yes. Of course the steamer is supposed to get there more quickly; but sometimes the steamer calls at Newcastle; or if the wind happens to be blowing a little harder than usual the steamer takes a little longer; but taking all things into consideration the time is very much the same.
1054. *Chairman.*] How many hours does it take from Sydney to West Maitland? A little over four hours.
1055. Therefore, to Taree, the time is nine hours as against twenty-four? You get up to Taree in about ten hours as against twenty-four.
1056. *Mr. Hassall.*] Do you find the mail matter increasing in that quarter or decreasing? I cannot say exactly; but it is sure to be on the increase.
1057. Have you any idea whether the contracts are being taken at less prices than formerly, or at increased prices? Lower than they used to be—from £1,530 to £1,348 15s. I am alluding to the Raymond Terrace service.
1058. But that is pretty well the case all over the country? In most cases; in some places not. It is not so in the case of Narrabri and Walgett.
1059. In the outlying districts you have to keep up the rate to enable them to get through satisfactorily? No, the main lines, such as from Narrabri to Walgett, is where the price has risen a little, I suppose through the bulk of parcels, &c., getting larger.
1060. That is owing to bad roads, and forage having to be brought from a distance, which necessitates the feeding of horses at considerable cost? Yes.
1061. In the district to which you are now referring there is practically plenty of cultivation, and forage may be cheap; therefore, mails can be conveyed more cheaply in that portion of the country than in outlying districts? Yes, much more cheaply.
1062. The people of the district have no complaint, I presume, against the nature of the service—they are satisfied with it? Generally speaking, no complaint. Wingham, I think, is about the only place where they cry out about it. The mail is due there about 8.45 p.m., and if it arrives to time it is delivered that night; but if it happens to be half an hour late, or say does not arrive until 10 o'clock, they do not get the letters until next morning. Of course, the first part of the journey is by train for 100 and odd miles in pretty sharp time, and if the train is a minute or two late, it adds on gradually a minute or two late and the mail soon gets into half an hour late at Wingham.
1063. The people Wingham get a daily mail? Yes.
1064. So even if they are not able to reply to a letter to-day, there will be no difficulty in their doing it to-morrow? Quite so. Then, there is the steamer mail to Taree and places on the river. The only times they are upset is the same as any other place—during flood times, or south-east gales, and of course that upsets the whole running of the land lines there as well as the steamers.
1065. But I presume they are not upset there more than in other parts of the country? Not more than on any other part of the coast, if the wind is blowing from the south-east and they cannot get in, and so on.
1066. As far as those districts are concerned, the construction of the proposed railway line would mean, perhaps, an accelerated service? Yes, it would mean a very much accelerated service, but at very much increased cost. We pay £1,692 15s. for the contracts named. If the railway were built, mail contracts, in connection with the railway, and necessary communication to the places, would cost, say, £800—that would be a saving of £892 15s. Then if we pay £12 per mile per annum for the railway service—the lowest rate that we do pay—that will amount to £1,368. Deducting £892 15s. from £1,368 will leave £475 5s. If we were to pay £20 per mile, which, in the case of this railway we probably would pay, the matter would stand in this way:—there would be £2,280 for the £20 per mile per annum for 114 miles, and deducting £892 15s. saving on the contract, the cost would amount to £1,387 5s.
1067. There would be an increased cost of £1,387 5s. as compared with the present contract prices? Yes.
1068. Would the construction of this line serve the district as well as the main and branch lines that you have enumerated? Of course those branch lines that I have mentioned would be covered by the £800 we should pay to run to and from the railway, and that of course would give the people better facilities, because they would receive the mails earlier and be able to despatch later.
1069. But you have to allow something for the receipt and dispatch of mails? That is allowed for in the £800.
1070. *Mr. Roberts.*] Is a mail made up for the Manning River by every steamer that leaves Sydney and touches there? A mail is made up for every steamer that will suit. Some steamers do not suit. If we know that they are going into Newcastle they do not get anything, for they go there to coal, and remain there until the next morning, and therefore would be behind the overland mail.
1071. Do they carry the mails by steamer by contract or at so much per pound? At 1s. 4d. per pound for letters, and 3s. per cwt. for newspapers and parcels or anything else.
1072. Then the only contract is overland? Yes.
1073. Have you any record as to the average time in which a letter, going by sea, reaches the Post Office at Taree? The journey takes from, say, 2, 3, 5, or 6 o'clock up to about noon next day, or 6 in the evening, or perhaps later; you may say from 18 to 24 hours by steamer.
1074. It takes eighteen hours to go from Sydney Heads to the Manning Heads, does it not? About that.
1075. And it takes about six hours more to get up the river? Yes.
1076. Are not the mails very often delayed owing to various causes, such as bad roads? Of course, if there is bad weather, or floods, or anything of that sort, they are late; but, generally speaking, they run very well now. There is a very good contractor on this end, and a very painstaking man between Gloucester and Taree, a man named Corbett. Delays do occur, even on the railways. They have occurred between Newcastle and here, and Hexham, and so on, when the railway line has been under water, or that kind of thing has happened.
1077. Is the lower rate at which the mails are now carried overland, due to the improvement of the roads? Possibly partly so.
- 1078.

- J. Clarke. 1078. Or is it due, do you think, to excessive competition? Partly to the better roads, and also to competition keeping the prices down.
- 2 Mar., 1898. 1079. When does the mail close overland for the Manning? At 4:45 p.m., Monday to Friday, and on Saturday at 9:30 p.m.
1080. When would those letters be delivered into the hands of the addressees at Wingham? If they run right through to time, they are delivered next evening, about 9 o'clock, or a little later. But when they are behind time from any cause, of course, they have to lie over until the next morning, unless the postmaster is of an obliging disposition, and delivers whenever they come in, which postmasters do sometimes.
1081. Is the postmaster allowed to deliver at any time of the night if he thinks fit? If he likes to oblige the people he can do so. We have no objection. But I think that if they arrive after a certain time, he does not deliver until the morning—that is an understood thing between them.
1082. Do you know anything of the progress of the Manning;—are you able to say whether it is a progressive district? I know nothing beyond just what I hear or read in the papers, in regard to that matter.

Thomas Rhodes Firth, Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and examined:—

- T. R. Firth. 1083. *Chairman.*] What was your previous position? I was Chief Assistant Engineer in the Construction Branch.
- 2 Mar., 1898. 1084. And, therefore, you have a knowledge of the line before the Committee? Yes; I have a slight knowledge of the district it is to go through.
1085. From your reports you seem to have been there? Yes.
1086. *Mr. Roberts.*] Have you prepared any statement in regard to the proposed line of railway from Maitland to Taree? I reported on it at the time I made an examination in 1889, but I have had nothing to do with it since.
1087. You have not any written statement to hand in? No; I will have to refresh my memory by looking at my previous report.
1088. Can you recollect when you were last over the proposed line of railway? I was on that line from June to September in 1889.
1089. What was the nature of your commission—to report as to the best route? To examine the previous surveys that had been made, and report on what I thought would be the best route to take, and to suggest any alterations or improvements that I could.
1090. Starting from what point? From the Hunter River. I took the whole of the surveys that had been made from the Hunter River to Grafton.
1091. After leaving Newcastle, where did you commence your investigation? I commenced at Grafton. I went by steamer to Grafton, and commenced at that end, and I worked all the way down to Wingham, and then I came on to Stroud. I then went back by Bulladelah to Wingham, and then came up the valley of the Gloucester and the Barrington, and then examined the country very closely between there and Maitland, going over the whole of the surveys that had previously been tried.
1092. Is the line, as submitted to this Committee, the one that you recommended? I believe it is.
1093. That is from West Maitland to Taree? Yes; I do know that surveyors were put on to carry out the improvements that I suggested—an alteration of the route from Gloucester especially. That was the principal deviation that I made—from Gloucester to Wingham. The others were minor ones.
1094. Can you recollect what the different routes submitted for your inquiry were;—was one from Morpeth? Yes; the first one was from Morpeth, *via* Bulladelah, to Wingham. There were two starting from Morpeth. One was a continuation of the existing line; whilst the other branched off between the Morpeth station and East Maitland, if I remember rightly, crossing Phoenix Park.
1095. After giving the various routes every consideration, did you come to the conclusion that a line from West Maitland to Wingham and Taree, by way of Gloucester, would be the preferable one? I did; but a slightly the most expensive. The cheapest line that could be made is through Bulladelah; but it is through bad country. It would intercept the navigation at Morpeth, and also, I think, in crossing the Williams; and I considered that it ought to be left out of the question almost altogether owing to the nature of the country. It is not such good country by the Bulladelah route, as by the one *via* Maitland.
1096. The Bulladelah line would be nearer the coast? Yes; closer to the coast, and, as I say, not such good country.
1097. Were you favourably impressed with the land through which the proposed line would pass? Yes; it goes through very good country all the way.
1098. May I ask you, as one who has been over every inch of the line, to describe the character of the country from West Maitland to Dungog;—is that fairly good agricultural land? There is a lot of good agricultural country, and I think that the rest of it is good country. From Maitland to Dungog there is one range to cross; but it is all good grazing country.
1099. Is not Dungog the centre of a large settlement? It seemed a very thriving little township when I was there.
1100. Is it not a municipality? I do not know.
1101. Then from Dungog to Stroud? I did not propose that the line should go to Stroud—not within 6 or 7 miles of it, I think. That would be going too far out of the way. The country is not quite so good; there are some ranges there. It is rather hilly country between Dungog and Stroud; but going up the creek there is some good agricultural land, and it is all good grazing country. Even the ranges, I think, are good grazing country.
1102. When you say good grazing country—bearing in mind the regularity of the rainfall—is it not fair to assume that a man and his family could live on a small area of land there? Yes; I think they could.
1103. In fact all along the line, with the exception of one or two hilly places, would it not strike you as being a country destined to become the homes of thousands of people? It would do very well if cut up into small farms. I think that farmers would be able to live on it, taking into consideration the rainfall, and the nature of the country altogether—that is, if they could get their produce away, of course, and find a sale for it. They could grow the produce. That is as far as I can say.
1104. Where would the influence of the carriage by river come in? Nearly all the way through, unfortunately—that is to say, at the Paterson in the first place, and at Dungog. 1105.

1105. Do the steamers go right up to Dungog? I think small steamers do—droghers—not coastal steamers. The next river to cross would be the Manning, at Wingham. T. R. Firth.
2 Mar., 1898.
1106. When you have passed Gloucester, does not the land appear to be more fertile as you approach Taree? It is not much better than round about Paterson. I think that from Paterson to Dungog the country is very fair. It is very good land all through from Weismantel's down to the Manning—very good agricultural country. It was all used as grazing country when I was there, but there were apparently very few cattle on it.
1107. Are you referring now to the A.A. Company's land? Chiefly. Of course there is a long length of that. It is nearly all the A.A. Company's land down to the Manning.
1108. Can you give the Committee any information as to what the A.A. Company intend to do with the land in the event of a railway being constructed through it? No, I cannot.
1109. Did it appear to excite any curiosity amongst the residents there? There are very few of them. I scarcely saw anyone, except at the hotels where I happened to stay all night.
1110. When you get to Wingham, is there not a large settled population there? Yes. In Wingham and other townships, of course, the people are very anxious for a railway, and I think I remember its being said that it was very probable that the A.A. Company would cut up their land if a railway were constructed; but that is merely a surmise—there was nothing certain.
1111. Are not Wingham and Taree municipalities? Yes, they are both municipalities, and were when I was there.
1112. Of course, in coming down from Grafton, you came through what is known as the Lower Manning—that would be between Taree and Cooperbrook? Yes; I was down at Cooperbrook.
1113. Do you know the Cundle flats? Yes; I was across there, and I also crossed the Lansdowne after leaving the Manning.
1114. Is not the land there of a remarkably fertile character? Yes; that is all rich country around there.
1115. Suitable for dairying or any other purpose that a farmer might think best to devote it to? Yes.
1116. Have you ever been through the entrance to the Manning? No.
1117. Have you heard of the difficulties of navigation there? Nothing that I can speak of in particular.
1118. Have you never heard of the difficulties that the farmers have in getting their produce to market, owing to the shallow water upon the bar at the Manning? Yes, I have heard of the bar across the Manning, and of vessels, of course, being delayed, but it is a thing which has not interested me very much.
1119. Would it not strike you that the people are isolated, as it were, from the rest of the world, owing to the difficulty in getting to the metropolis—they must either encounter the discomforts and the peculiar dangers of the sea voyage, or they must travel about 115 miles by coach to meet the railway system of the Colony? It is not a nice place to be blocked up in for a week by the floods, as I happened to be.
1120. Would you not regard the proposed railway as one that could be easily constructed—there are no great engineering difficulties? No, most certainly not.
1121. What is the cause of the estimated cost being so high? It is broken country right throughout, and you have all those rivers with extensive flood approaches, and there are several tunnels. These make up the expense. I may say that in suggesting an alteration in the line from Gloucester to Wingham, differing from the original surveys, of which there have been two or three, I made a saving in tunnels alone of about £80,000. Still the line is a very expensive one. There are nearly 1,500 yards of tunnelling on that length.
1122. On what part of the line is the greatest tunnelling? Between Paterson and Dungog, and then again between Dungog and Weismantel's. I have not seen the result of the survey, but I believe that there are one or two other tunnels on the Barrington in going down to where I proposed the deviation. Mr. Burge carried out the surveys that I proposed, and he says that there would be 1,577 lineal yards of tunnelling, whereas before there were, I think, 3,100 lineal yards of tunnelling.
1123. You know the Camden Haven District? Yes; I was riding about there.
1124. Of course this line would serve the Camden Haven people if it were constructed? I think they would still use the water.
1125. But the Camden Haven River is not navigable? It is not navigable for large boats, but I think the farmers use it for taking their produce down.
1126. That would be in small boats? Yes; small flat-bottomed boats.
1127. But it is not navigable for steamers? No, not up to the point where the main road crosses, or where the line crosses. The proposed line crosses the Camden Haven, I think, about a $\frac{1}{4}$ of a mile above the road, if I remember rightly.
1128. Going north from Taree, does the country improve, I mean in fertility, and as to its suitability for the construction of a railway? It does not improve, or it improves very little, as regards the cost of building the line, and as to the country you may class it all as the same. On the flats where the rivers are crossed—and there are, of course, a great number of them—there is very good country. I think there are one or two ranges that are not very good grass country; but generally speaking the direction that the railway takes is through good country, right throughout.
1129. Around Kempsey there is a very large population? Yes; there is some splendid flat country there.
1130. And the same may be said about Port Macquarie, and up the Hastings River? Yes.
1131. Are not those people similarly inconvenienced as the people on the Manning are in the way of getting their produce to market? Of course they are all labouring under the same difficulties. They are dependent on wind and tide.
1132. Would you care to express an opinion as to the desirability of constructing this railway? I do not mind expressing an opinion, but I can only say that I do not think it would pay.
1133. Having in view, I mean, the dangerous entrances that have to be encountered? That is a question on which one can scarcely express an opinion. Of course, it is very desirable if you can improve the means of transit for the people, both for themselves and for their produce; but if the question is, will it pay to do so, that is another thing. I do not think it would pay, owing chiefly to the line being such an expensive one, and I do not see any means of reducing the cost much.
1134. You feel sure that the cost has been brought down to the minimum? I believe it has. I was three months riding about on that line, and I made a thorough examination, having the previous survey as a guide, and wherever I saw any difficulties at all, I would spend two or three days trying to find out a better route for the railway.
- 1135.

- T. R. Firth. 1135. Is your fear of the line not paying due entirely to the great cost of it, or do you fear the competition of the steamers? Owing to the great cost, it would require a lot of traffic to make it pay, and it would always have the water traffic to compete with when that could be utilised. If that country were perhaps somewhere further back and without water-carriage it might be advisable to make the line.
- 2 Mar., 1898. 1136. If there were no water competition, you think that, with the fertility of the soil, and the regularity of the rainfall, and the general adaptability of the country for large settlement, there would be every probability of the railway paying in the near future? Yes, I think so.
1137. Would those remarks hold good for the whole of the line from West Maitland to Grafton? Yes, I think so. There is no doubt that there are minerals in that part of the country, too.
1138. Can you name them? They are getting gold up there, and they get alum, I think, near Bulladelah. I cannot call the minerals to mind just now, but I have a faint recollection that there are other minerals there.
1139. In fact, the resources of the whole district are above the ordinary, are they not? Yes, if you take into consideration the rainfall.
1140. Having in view the proximity to the large city and districts of Newcastle, and other towns, would there not be a probability of a large tourist passenger traffic coming on this line? No, I do not think so. Of course if it were connected with Brisbane, there is no doubt that it would have that traffic that way, but until it was connected with Brisbane, I do not think the tourist traffic would be much.
1141. But there is very fine scenery to be found at the head of those rivers? Yes, but you can get fine scenery without going so far as that.
1142. Similar scenery? Yes; you do not want to go further than the Illawarra line.
1143. What other part of New South Wales would you compare with it, as regards its beauty? You cannot beat the Illawarra line for coastal scenery.
1144. There is a large passenger traffic there, is there not? Pretty fair, not very large—not so large as one would expect.
1145. Would it be fair to expect a similar development on the North Coast line? I do not remember seeing any place on the North Coast line that you could possibly compare, in any sense, with the Illawarra line for scenery.
1146. Have you ever been up the Manning River, beyond Wingham? Only where the line goes. I was not looking out for scenery.
1147. Have you been to the head of the Camden Haven River? No.
1148. Nor up the Hastings? No.
1149. So it is quite possible that you have not had the opportunity of observing this fine scenery? No, I did not.

THURSDAY, 3 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Thomas Rhodes Firth, Engineer-in-Chief for Existing Lines, Department of Railways, sworn, and further examined:—

T. R. Firth. 1150. *Chairman.*] The Committee has received a letter from Mr. R. A. Wiseman of Clerkness, Bundarra, in which, referring to the route of this proposed railway, he says:—

3 Mar., 1898.

In the year 1875 I was in charge of the A. A. Co.'s cattle station, "Gloucester." The flood-water from a big flood that took place that year was over the telegraph poles where they cross the Avon Flat from Gloucester to Taree. The survey or line of railway crosses this flat or swamp, and when it was being surveyed, I pointed out to the surveyor the height of the water. I was not believed. If the railway is made from Maitland to Taree as surveyed across the Avon Swamp, and a flood takes place like the 1875 one there, the embankment will all be under water. The flood there is caused by back water. The Gloucester and Avon Rivers with Morgan Creek all flow into the Barrington River within half a mile of one another, in fact a quarter of a mile would cover the three courses.

1151. Do you know the position referred to? I think so. I know the country near Gloucester.

1152. Have you any memo. about it? I have a memo. about the crossing of the river Avon, but not giving a description of the floods to that extent.

1153. What does your memo. say? I made a note as follows:—

The shortest crossing over the Avon is got (that is on the original survey), but it will require long flood openings in addition to the main creek.

And I remember noting that the floods did spread out long distances. I made this note with a view that when the surveys were carried out I should see that sufficient openings were provided. I see that after I had decided that the other line—that is the one going round the Barrington, was the better, I made the following note:—

If this line is tried, it commences at about 83½ miles. High land can be kept for some distance, and a better crossing to the Avon, the Barrington then being followed until a low gap is found, to cross into Baker's Creek, &c.

So I do in the higher ground with the deviation that is now being carried out. I do not think there is anything to fear with regard to the floods going over the tops of the telegraph poles. There will be big floods there. But if ever the water got over the telegraph poles there it would be over all the land between Newcastle and Maitland, I presume.

1154. *Mr. Hoskins.*] Gloucester is pretty high? Yes; there is a good fall from there down to the Manning. It is one of those circumstances that possibly might arise by those three rivers coming up, but I think that no one would be hardy enough to stick a railway up that height.

1155.

1155. Even supposing that the floods should be pretty high, there is plenty of spread for the river without its doing any great harm to Gloucester? I do not think it would get into Gloucester. I was told that it got over the flat in front of "Single's Hotel." T. R. Firth.
3 Mar., 1898.

1156. *Chairman.*] Can you describe the country from Taree to Kempsey? Somewhat similarly to the description that I have given in my report.

1157. And from Kempsey to Coff's Harbour, and Coff's Harbour to Grafton? It is all in the report.

1158. You make no statement in regard to the line to Casino, or onwards to Grafton? I merely provided for the crossing of the river at Grafton with a view of a continuation to Casino.

1159. All the rest of the information that you could give us is in your report? Yes. I provided for crossing the river at Grafton, and likewise for a continuation of the line to Glen Innes if necessary. I placed the station in such a position that it would be suitable for the three lines. I may say that I suggested an alteration from Coff's Harbour to Grafton. The original survey went right along the coast, and then turned off nearly at right angles to Grafton. I suggested a deviation through the Orara Valley, and I believe the survey has been carried out. That was to get better country. There is very fine country in the Orara Valley. In the other part the country is really not much good. It is very poor between the range and the water. By crossing the range we would get into the Orara country, which would, at all events, probably provide traffic down to the Clarence at Grafton. I believe that that survey has been adopted.

1160. The survey located by red dotted lines on the map is practically the line that you suggested? Yes, down Bucca Creek.

Richard Cooke, Secretary, North Coast Steam Navigation Company (Limited), sworn, and examined:—

1161. *Chairman.*] Have you a statement of the fares and freights to the Manning River from Sydney? Yes. R. Cooke.
3 Mar., 1898.

1162. What is the freight per ton? 12s. 6d., either dead weight or measurement.

1163. Is that for maize? No; maize is carried at a cheaper rate.

1164. What rate? Ten shillings a ton—1s. a bag, drogherage included—that is, taking it from the river bank and droghering it, perhaps, 20 miles.

1165. How much of that 10s. per ton do you estimate for drogherage? One fourth.

1166. If a railway were constructed to Taree, would the maize still require to be droghered? Certainly.

1167. Therefore, a railway from Taree to Sydney must carry maize at the rate of 7s. 6d. per ton to equal the ocean carriage? There is very little maize grown at Taree.

1168. But there is on the Manning? Yes; but we get the maize on the tributaries and small creeks.

1169. Do you drogher to where your boat lies? Yes.

1170. And instead of doing that, it would be a case of droghering to where the railway touches the river? Quite right.

1171. The droghering would be just the same, and if you take one-fourth off your 10s. per ton rate, for carriage by ocean to Sydney you get 7s. 6d. Therefore, the train would have to carry from Taree to Sydney under 7s. 6d. to beat you? Yes.

1172. Your freight is 12s. 6d. for ordinary goods? Yes.

1173. Have you any special rate? Yes; a package rate for anything below half a ton.

1174. What is that? For parcels we get 1s. At the tonnage rate it might come to £2 or £3 a ton. Two-thirds of the goods carried to the river go at the 12s. 6d. rate—that is flour, sugar, and other necessaries of life.

1175. *Mr. Wright.*] 12s. 6d. is the minimum rate? Yes.

1176. *Chairman.*] What proportion of the total freight carried consists of packages, they being carried at a higher rate than the other goods? One-third. Two-thirds is carried at the 12s. 6d. rate—flour, sugar, salt, and that sort of thing; but parcels, or a chest of tea, are carried at the package rate.

1177. What are your passenger fares to the Manning? First-class—25s. single, £2 return; second-class—15s. single. We have no return second.

1178. Time of journey? Twenty-four hours; and if we go to Wingham, about thirty hours. We generally come down more quickly. We go for a tide, and always allow a few hours; but the journey would average from seventeen to twenty-four hours.

1179. What does your up-freight to the Manning consist of principally? Flour, sugar, tea and salt. The up-freight is very small.

1180. And your down-freight? During certain portions of the year we are full.

1181. What with? Maize.

1182. What else? Eggs and poultry

1183. Butter? Now.

1184. Much butter? About 5 tons of butter a week, I suppose.

1185. Are you the only company trading to the Manning? The only steam company.

1186. What proportion of the trade is done by sailing vessels? I could not say.

1187. Is it small? I think so—mostly timber.

1188. Is it worth considering? I think not.

1189. Do you bring much timber in your steamers? Very little; a few sleepers for the Railway Commissioners at times.

1190. Is much timber coming out of the Manning now? Not much.

1191. Principally hardwood? Yes; girders.

1192. Have you a statement showing what you carried from the Manning during the last twelve months? No; but I can give you a very good idea, if you reckon the output of maize, which is the principal thing, and of which on an average, since 1893, we have carried about 50,000 bags a year.

1193. Is it increasing at all? I do not think that there is any more land under cultivation. The quantity of maize carried by us just depends on the seasons. If a flood comes, of course, we do not get 20,000 bags; but we have averaged 50,000 bags since 1893.

1194. For the droghering and carriage of that you receive a total amount of £2,500 a year? Yes.

1195. Do you know what the rate for timber per 100 feet is? I think about 2s. 6d.

1196. Is that in logs? Yes.

- R. Cooke.
3 Mar., 1898.
1197. Does it come away from there in the log? Of course, there are a great number of girders; but I cannot speak accurately about the timber, because I never watch it. The steamers never look for timber freight on the Manning.
1198. In point of fact, it goes by sailing boat, and not by you? Yes.
1199. What else do you carry besides maize? Butter and poultry.
1200. Five tons of butter a week;—how much is that worth a ton to carry it? One shilling a box we carry it for, and there are forty boxes to the ton. We carry that in a cool chamber.
1201. That is £2 a ton? Yes.
1202. And you carry 5 tons a week? About 5 tons a week.
1203. That is £10 a week? Yes.
1204. The butter does not amount to very much? No.
1205. Do eggs and poultry amount to much? I suppose they amount to about £20 a trip.
1206. You carry pigs? Yes.
1207. Any number? I cannot tell you the number.
1208. Is it considerable? For a small river it is.
1209. Can you give us any idea what an ordinary trip would average? I suppose that, taking the year right through, we might average 50 pigs a trip.
1210. How many trips a week do you make? I suppose that, taking the year right through, we do not average much more than one trip a week—that is allowing for detentions; fifty-two trips in the year.
1211. What do these detentions amount to? I could not say without going into the matter. They are pretty frequent at times.
1212. How is the Manning bar at present? It is bad.
1213. Taking the last twelve months, what has been the experience of your steamers;—has there been much delay? I may mention that we have a steamer trading now to the Manning which is admirably adapted for the purpose, and which I look upon as being the best shallow boat in Australia.
1214. What name? The "Coraki." We can carry 100 tons on 6 feet, and 200 tons on 7 feet. If we were to send a boat drawing 8 feet, I have no doubt that we should have a good many detentions. We fow both in and out.
1215. What does the "Coraki" usually bring down in amount;—how many tons dead weight in a trip? Going up, I suppose she would not take more than 30 to 40 tons. In a busy season coming down she would bring, I suppose, 150 tons; but in a slack season not more than 50 tons a trip.
1216. How many passengers? I suppose that we average twenty for the round trip.
1217. Ten up and ten back? Yes. I am giving figures for the year right through. Of course, at Christmas time or Easter time we are rushed with passengers for weeks.
1218. We are to regard your estimate as only an approximate one? Yes.
1219. It is a fairly correct one? Yes.
1220. Then, excepting the timber, you do the whole trade to the Manning with one boat? Yes.
1221. Does much corn come down in the sailing vessels? I do not think they bring any. They would have to drogher it, and they have no droghering plant. I may give you, for example, the quantity of maize brought by the "Coraki" on her last two trips—530 bags this trip, and 350 the previous one.
1222. Is your trade increasing? I think not, except as regards butter. The butter industry is the only industry that has made our trade increase a little. No butter came from there until perhaps two years ago.
1223. Do you trade to Camden Haven? No.
1224. To Port Macquarie? Yes.
1225. Can you give us the same information in regard to Port Macquarie as you have given in regard to the Manning? Yes.
1226. *Mr. Hassall.*] There is no steamer traffic at Camden Haven? I think not, but that all the trade is done by sailing vessels.
1227. *Chairman.*] You have nothing to do with Camden Haven? No.
1228. Does the one boat fairly well meet the trade of the Manning? Yes.
1229. Do you often require to improve the steam service? I do not think that last year we sent even what we call a coal boat in there—that is, we did all our own coal service, and the Government coal service, in addition to taking the ordinary outward cargo in the one boat.
1230. Can you say anything as to the delays of the boat? We were not delayed very much last year, because we had a better boat than we ever had before.
1231. How often is the "Coraki" delayed? I could not say without looking up the matter. We never have much to fear through being delayed twenty-four hours. It is the usual thing in bad weather.
1232. Has there been much loss in cargo consequent upon those delays? I think not. We feed and water the live stock.
1233. Are there any serious complaints in regard to the delays? No.
1234. And the maize comes down sufficiently rapidly to arrive in Sydney in fair condition? Yes. I do not think we have had half a dozen complaints from the Manning since we reduced the charge for maize to 1s. a bag.
1235. What is the freight upon pigs? We take the pig freight on the basis of what they realise here, so that if the market is bare we get a good freight, and if it is glutted we get a bad freight. The farmers seem to like that way of charging the best.
1236. Have cattle been shipped on board the "Coraki" and been taken off again, because she could not get out? They may have been on one or two occasions.
1237. Do many cattle come down? Not many; a few calves sometimes.
1238. But not many fats? No; I think they drove them overland.
1239. The pigs and calves get down in good condition? Yes.
1240. There are no serious local complaints in regard to them? No.
1241. What is the freight from Port Macquarie? 1s. 3d. a bag for maize. We base all our freights on the maize rate, as maize is two-thirds of our cargoes everywhere except on the Richmond.
1242. That is 12s. 6d. a ton? Yes; including droghering it right down the Hastings River. No maize—or very little maize—is shipped from Port Macquarie wharf. The 12s. 6d. a ton includes droghering it, also storing it in Sydney, and wharfage; in fact, all expenses are included in that charge.

1243. How much butter do you bring from Port Macquarie? Very little. They are establishing factories there now. R. Cooke...
 1244. Fowls, eggs, pigs? Not nearly so much as from the Manning. Port Macquarie trade is very small, in fact, we have to work it in with two other trades to make it a success. We work it with the Bellinger and the Nambucca trade. 3 Mar., 1898.
1245. What is the freight on pigs from Port Macquarie? It varies, according to the price realised here.
1246. Any timber from Port Macquarie? We do not bring any. The sailing vessels do the timber trade there. A lot of timber comes from there.
1247. Do you bring any cattle from Port Macquarie? No.
1248. What is the passenger fare to Port Macquarie? Five shillings more than to the Manning first-class, but steerage is the same, namely, 15s.
1249. What is the freight for ordinary goods? For ordinary goods, such as flour, salt, and sugar, 12s. 6d. a ton—the same as the Manning.
1250. Are the parcel rates the same as to the Manning? Yes.
1251. Which boat goes to Port Macquarie? The "Rosedale."
1252. Does she work the Bellinger and the Nambucca? Sometimes she cannot work the Nambucca; she always works the Bellinger.
1253. How many passengers would be a fair number to estimate for her ordinary trip from Port Macquarie? I suppose about fourteen for the round trip; taking the year right through, seven up and seven back.
1254. And what amount of goods to and from Port Macquarie? To give you an idea of the trade I may say that 20,000 bags of maize per annum go from Port Macquarie, on the average, and I suppose 15 tons of outward cargo per trip.
1255. Outward cargo being from Sydney to Port Macquarie? Yes.
1256. The next river would be the Macleay? Yes.
1257. What is your freight from Sydney to the Macleay? 12s. 6d. a ton outward, and 10½d. per bag for maize inward, including all drogherage, wharfage, and storage.
1258. Can we deduct from the 10½d. per bag, 3d. for drogherage? Yes.
1259. So that the railway would have to carry a bag of maize to Sydney from the Macleay for 7½d. to equal you? Yes; but I do not think that the railway would either load or discharge it at that rate, and we do both.
1260. The freight from the Macleay is less than from the other rivers—that is accounted for, I presume, because there is more trade on the Macleay? That is one of the reasons.
1261. *Mr. Lee.*] But is there not another reason governing the maize trade;—as a matter of fact, do not your company afford storage accommodation, and allow the corn sold to be removed from there? Yes. We give free accommodation so long as we are not overcrowded. I have seen maize on our wharf for a month.
1262. It enables them to take advantage of the market? Yes.
1263. *Chairman.*] What is the quantity of timber brought from the Macleay? I know nothing about the timber.
1264. What is the freight per 100 feet for any timber you may carry? In quoting a rate for timber, we should quote about 3s. a 100 feet.
1265. What quantity of goods goes outward to the Macleay? I suppose about 50 tons a weekly trip.
1266. Coming down, how much? It is governed by the seasons.
1267. Give us two statements—one for a busy season, and the other for a slack season? It is very hard to say. For months in the year, perhaps, we would have two steamers there, and during the other eight months we, perhaps, could not fill one. We never take much notice of the total quantity. It is the £ s. d. that generally concerns me.
1268. But it comes to the same thing? Yes; I suppose that, since the first of the present year, we have not averaged 50 tons a trip coming to Sydney; but from the 1st April, if we do not have any floods, I suppose that we shall get as much as we can safely carry over the bar.
- 1269-70. What will that be? I suppose that for about four months we may get about 4,000 bags a week, if we can carry it. We have to do a lot of the loading in Trial Bay. We drogher it over the bar.
1271. You are carrying maize at 10½d. a bag, including 3d. for drogherage? Yes; 7½d. a bag would be 6s. 3d. per ton.
1272. Is the trade of the Macleay growing? The dairy trade is growing, but that is the only one that is. However, although that represents a lot in money it represents very little in freight.
1273. Going further—farther north, what is the next place? We come to the Nambucca. The trade there is very small; it is something the same as at Port Macquarie.
1274. Twenty thousand bags of maize? I think there might be more sometimes; but taking the average for five years, I suppose that the two places would not differ very much.
1275. What freight? One shilling and sixpence; this is on account of the bad entrance.
1276. How many passengers go there? If we get five going out and five coming back, we think it a good trip.
1277. What outward freight? Twenty tons about every ten days.
1278. What inward freight? I suppose that if we get 500 bags, that is 50 tons of maize we would think that we had a good trip.
1279. Do you mean in a good season? No; in a good season in ten days we would get 100 tons.
1280. And in dull times 50 tons? At times we would not get 10 tons.
1281. Do any cattle come from there? No; eggs, poultry, and pigs.
1282. The next river we come to is the Bellinger? Yes; that is rather better than Port Macquarie and the Nambucca.
1283. The same cost? Yes. I may mention, to give you an idea of the trade, that a boat like the "Rosedale," which carries about 160 tons, does the whole of the trade of the three rivers.
1284. *Mr. Wright.*] And there is no difficulty about her doing the trade? There may be during a couple of months in the year, and then we put on what we call an ocean drogher, and drogher to Port Macquarie.

- R Cooke. 1285. *Chairman.*] So far as production is concerned, the Bellinger, Nambucca, and Port Macquarie are fairly equal? The Bellinger is the best.
- 3 Mar., 1898. 1286. And the other two are fairly equal? Yes.
1287. And we may take the figures that you have given as being a fair approximation to the figures for either of them, without our going through the items in connection with the Nambucca? Yes.
1288. The next is Coff's Harbour? We do not go there.
1289. Excepting the sailing boats, the North Coast Company does the whole of the trade of the North coast, until we reach as far north as Coff's Harbour? No. There is Cape Hawke and Camden Haven and Port Stephens. We do not touch there at all.
1290. Do other steamers go there? I think that a small steamer now goes to Cape Hawke. I do not know whether steamers or sailing vessels go to Camden Haven and Port Stephens.
1291. Is it worth your while to go to those places? I think not.
1292. The trade done is not sufficiently large to induce you to take them up? The risk is too great, on account of the shallower entrances, and the detention would be too long.
1293. Is there much trade coming out? I think not.
1294. Can you give us the same information in regard to the Clarence? The Clarence, of course, is undoubtedly the best trade on the North Coast.
1295. Do you do the whole steamer trade of the Clarence? No. The Sugar Company do their own work there.
1296. With the exception of the sugar, you do all the steamer trade? I think so. A small boat goes in occasionally, perhaps, with coal or something like that.
1297. Which of your boats goes to the Clarence? The "Kallatina" and the "City of Grafton," and also a freight boat in busy times.
1298. There is a steady trade? Yes. For the last few months we have had to carry coal in the "Kallatina" as ballast, but we shall be busy enough, I expect, in another month.
1299. The outward trade in a dull season is how much? The outward trade does not fluctuate, that is from Sydney to the Clarence.
1300. *Mr. Wright.*] Potatoes are a big item on the Clarence? Yes, for about two months in the year; but sometimes the crop is a failure. We do not look upon it as much.
1301. *Chairman.*] You do not go to the Tweed? No.
1302. What is the book value of your plant? The book value is £80,000.
1303. Does that include steamers? Steamers and droghers.
1304. And wharf property? No.
1305. Just simply your vessels for carrying? Yes.
1306. *Mr. Roberts.*] Have you any record in the office as to the number of times, and for what period the boats when loading with produce for Sydney have been detained at the Manning Heads, owing to the shallow water on the bar? We could, by examining the captains' reports for six or twelve months, get at it; but we do not keep any record of it. We file each report as it comes in, and that states the length of time that the steamer has been detained in the river. The detentions during the last twelve months have been very few.
1307. I want to go back, say, a period of five years? They would be frequent at that time, but we have a better class of boat there now.
1308. Does the "Coraki" draw less water than the "Rosedale"? About the same—slightly less, I think.
1309. How does she compare with the "Electra"? The "Electra" draws about 1 foot more.
1310. Was not the "Murray" lost at the mouth of the Manning? Yes; several boats have been lost there—the "Murray" and the "Brunswick"—and we had the "Electra" stranded there, and the "Rosedale" has been stranded there several times. I can speak only of the period since 1891. We have had the "Electra" stranded there twice, and the "Rosedale" either two or three times.
1311. The "Murray" was lost there? Yes; and I believe that the "Brunswick" was also lost there.
1312. Where was the "Fernmount" lost? The "Fernmount" is running yet. The "Wellington" was lost at the Nambucca, and the "Ballina" at Port Macquarie.
1313. But the Manning has been regarded as a very dangerous entrance for some years past? Yes; until we got a better class of boats—at least, boats more adapted to it.
1314. You regard the "Coraki" as being the best boat you have had there yet? Not the fastest, but the best for the settlers and for the company.
1315. For negotiating the entrance? Yes.
1316. *Mr. Hoskins.*] I gather from your replies to Mr. Roberts that the difficulties in entering the Manning River at the bar are much less now than they used to be, are they not? Yes; but it is in this way: we are better able to cope with the difficulties. I do not think there is any more water there now than there was many years ago.
1317. Does that arise from the improvements made by the Harbours and Rivers Department, or by your having a class of steamers better adapted for the trade? The class of steamers. The improvements that have been carried out so far have not had any tendency to better the entrance, but they may later on. Whether they will as the breakwater goes further out, I do not know.
1318. I suppose you are aware that they are working now on the entrance to the Manning? Yes.
1319. Then the loss of steamers and the grounding of steamers have risen principally, you think, owing to the fact of the company not having steamers adapted to their work? Well, partly so.
1320. *Chairman.*] Supposing that the Macleay, the Manning, the Nambucca, and the Bellinger be furnished with suitable entrances, are you prepared to state that the freights will be reduced? We may reduce them on the Nambucca and the Bellinger—those two small rivers, but as to the freights from rivers like the Clarence, the Macleay, or the Manning, we consider that we could not possibly carry at a lower rate than now. The volume of trade governs us in a great degree in charging freights.
1321. If a suitable entrance be furnished to the Macleay, will you be able to carry more cheaply from the Macleay than you do now? No.
1322. You do not think so? Yes.
1323. There is not a sufficient volume of trade to justify it? No. We consider that we are down at bed-rock price now, because maize is the principal product, and we always take it as low as we possibly can.

The lowest rates we have are the Macleay River (10½d.), and the Clarence River (11d.), and we know that we cannot go lower than that.

R. Cooke.

1324. And the Clarence River has an excellent entrance? Yes.

3 Mar., 1898.

1325. Mr. Wright.] Supposing that you had active competition, do you not think that you would reduce prices? You might reduce prices, but it does not follow that it would pay. I was referring to maize freight just now, and, as I have said, two-thirds of the freight is maize freight.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

1326. Mr. Black.] Have you prepared a statement in regard to this route? Yes; it is as follows:—

W. A. Smith.

EXPENDITURE on Schedule Roads affecting construction of proposed Railway, West Maitland to Taree.

3 Mar., 1898.

Item.	Name.	Years	Total Expenditure	Average Annual Expenditure
1897-8.			£ s. d.	£ s. d.
731	West Maitland, via Dunmore, to Paterson	18	7,372 0 0	455 0 0
742	Clarence Town to Dungog	11	21,379 0 0	1,018 0 0
743	„ via Glen William, to Brookfield	1	180 0 0	180 0 0

1327. Is there any reason to suppose that that amount would be lessened if a railway were constructed from Maitland to Taree? I am well acquainted with the country from Maitland to Dungog; but I do not know the country between Dungog and the Manning.

1328. Have you any reason to believe that if the railway were constructed the amount now spent on the maintenance of roads would be lessened? I can answer that question only so far as the country between Maitland and Dungog is concerned. I do not know the country beyond that. As regards that country, I think that the road expenditure would be slightly lessened; but not to any great extent.

1329. Has your experience shown you that the construction of railways in any part of the country lessens the road expenditure? It lessens it on the main roads; but it increases it on all the feeders of the railway.

1330. Therefore, the general expenditure is not lessened? It is usually increased by reason of increased settlement.

1331. Have you anything to say about the roads as far as Dungog? Usually they are very fair roads.

1332. Well kept? Yes.

1333. So far as you know, are the settlers exposed to any great disadvantages in the matter of road communication? No; they are very well served.

1334. *Mr. Hoskins.*] Is not the experience of the Roads Department that after railways have been constructed, although there is a diminution of expenditure, or perhaps an absolute stoppage of expenditure on some roads, there is an increased demand for other roads which act as feeders to the railway? Yes.

1335. Therefore, the road expenditure practically is not absolutely diminished? No, it is not.

1336. *Mr. Lee.*] It is only in the case of the Great Northern Road, and other roads of a similar character, where the votes have been reduced in consequence of the railways running parallel to them? The expenditure is reduced in the case of all main trunk-roads, whether on the main-road schedule or not, if they run parallel with the railway.

1337. You know the Hornsby and Dural and adjoining railway district? Yes.

1338. Has not the road expenditure increased materially since the Great Northern Railway was made on the roads coming from the Dural country in towards the main line? Yes.

1339. As a matter of fact, that railway has increased the road expenditure considerably? Yes.

1340. And is that not the fact in the country generally? Yes.

1341. The long list of roads that you have read to us as being possibly affected by a railway constructed from Maitland to Taree would, in many cases, have to be maintained even if the railway were made? They certainly would.

1342. And in all probability many side roads as well? Yes.

1343. Has your experience in the Roads Department been such as to lead you to believe that, as a general rule, railway extension has not reduced the road expenditure? It has not reduced the road expenditure, except on the main trunk roads.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines, sworn, and examined:—

G. C. Yeo. 1344. *Mr. Hoskins.*] Have you brought with you a statement showing the number of stock in the district that would be served by the proposed railway? Yes; I have a return showing the number of horses, cattle, sheep, and pigs within the area likely to be affected by a railway from Maitland to Lismore.

1345. Will you state the estimated number? I have returns for three years as follows:—1895—horses, 49,516; cattle, 331,163; sheep, 4,784. 1896—horses, 49,727; cattle, 350,834; sheep, 4,840. 1897—horses, 51,845; cattle, 346,739; sheep, 5,608; pigs, 49,065.

1346. I suppose you have not a list of the owners of this stock? We could produce a list of the owners, but there is a lot of them.

1347. Can you tell the Committee of your own knowledge the number of stock owned by the A. A. Company, who have a large tract of country between Maitland and Taree? I could find out, but I cannot tell you now. I could get the return for the present year of the stock they have on their tract of country near Gloucester.

1348. Have you any further statement to make? I have here a statement of the number of cattle that came from Queensland into the North Coast district. It is as follows:—1896—Tullabudgera Crossing—horses,

horses, 29; cattle, 1,312; sheep, 129. Mt. Lindsay and White's Swamp—horses, 1,184; cattle, 7,496. 1897—Tullabudgera Crossing—horses, 81; cattle, 2,312; sheep, 1,309. Mt. Lindsay and White's Swamp—horses, 220; cattle, 10,887; sheep, 388. The total number of cattle treated at the Ramornie Meat-works, from February, 1897, to August, 1897, was 15,277; there were no sheep. For the year ended 31st December, 1897, the number of horses, cattle, sheep, and pigs in the district from the Paterson, near Maitland, to Taree was as follows:—Horses, 6,765; cattle, 35,361; sheep, 1,473; pigs, 10,048.

1349. *Mr. Lee.*] Could you furnish us with information showing the number of driftways that you have to maintain, their routes, what proportion of stock passes over them, and the places to which they go? Yes, I could.

1350. *Chairman.*] The numbers that you have furnished to the Committee as regards the district between Maitland and Taree would be for an area of country bounded on the east by the seaboard; on the north by the Manning River; on the west by a line approximately midway between the black and red lines on the map, and going in a general southerly direction to West Maitland? Yes. It would actually be the watershed coming down there. The next area which I propose to give the Committee particulars of is one bounded on the east by the coast-line to Coff's Harbour; thence going west to pretty well halfway towards the main Northern Line; and thence going south, preserving a distance midway between the dotted red line and the black line to the Manning River; and thence from the Manning River to the coast. For that district the return for the year ended 31st December, 1897, is as follows:—Horses, 9,561; cattle, 52,150; sheep, 708; pigs, 11,708. I now propose to give the number of stock within the area bounded on the south by the northern boundary of the line going west of Coff's Harbour; on the east by the coast-line to the Queensland Border; and thence westerly by the boundary between the two colonies to a point fairly well midway between the two railway systems; and thence going down approximately halfway between the proposed coast-line and the Main Northern Line. The return for the year ending 31st December, 1897, is as follows:—Horses, 35,419; cattle, 279,228; sheep, 3,421; pigs, 27,309.

FRIDAY, 4 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Justin McSweeney, contractor and timber merchant, sworn, and examined:—

1351. *Chairman.*] You are engaged in the timber trade on the north coast? Yes.

1352. *Mr. O'Connor.*] You carry on a large business as a contractor? Yes.

1353. You get some of your supplies from the north coast? Yes.

1354. What do you principally get? Various kinds of timber grown on the Manning and the Camden Haven rivers.

1355. With which ports do you trade? Camden Haven, and the Manning and Port Stephens.

1356. Do you bring the timber by steamer or sailing vessels? Chiefly by sailing vessels, but in some cases by steamer.

1357. Do you charter the vessels? No; I own the vessels myself.

1358. What do you think would be a fair thing to charge for timber freight? The freight from the Manning is 2s. 6d. per 100 superficial feet; Port Stephens, 1s. 9d.; and Camden Haven, I think, 2s. 9d.

1359. Do you know anything about the proposed line of railway? Not very much. I have seen parts of the route marked off. I think that the railway would open up some good country along parts of the route that I have seen.

1360. Will you tell the Committee whether, with your experience, you think the railway would be able to successfully compete with the water carriage? Unless you could carry on the railway for something approaching the same prices as the boats charge, I am afraid that the boats would take the trade; but if it could be done at anything like the same price as the water carriage, I think that a preference would be given to the railway on account of more certainty in getting down punctually. But I do not think that the people up there would pay an extraordinary difference if there were an extraordinary difference between the two prices.

1361. You yourself know these places well? Yes.

1362. Are there facilities for entering always? Not in rough weather, when the vessels cannot go over the bars. About a month ago I was stuck at the Manning, and had to go overland by coach. We had no certainty as to being able to get out for some days. After waiting for some time we found that it was uncertain when the steamer would be able to cross the bar, and so a party of us had to go by coach.

1363. So, practically, you have to allow that a certain proportion of the people would pay more to the railway on account of certainty of delivery of goods rather than send them by steamer? No doubt that would be so, and passengers would go in preference by the railway. I think that the passenger traffic would increase. I myself would go there very much oftener if there were railway facilities.

1364. Can you tell the Committee anything with regard to the character of the country along the route of the proposed railway? I have seen some very good country in different places along the whole route. With railway facilities I think that some very good country would be opened up and a larger population settled there on account of the better facilities for travelling.

1365. Is it pastoral or agricultural country? A good deal of it is rich agricultural land, and the other parts are pastoral country.

1366.

G. C. Yeo.
3 Mar., 1898.

J.
McSweeney.
4 Mar., 1898.

- J. McSweeney.
4 Mar., 1898.
1366. Is it utilised now to any great extent? No, they do not seem to work it well at all just now.
1367. I suppose that that is principally owing to the fact that their market is uncertain? I dare say that has something to do with it.
1368. The country itself is good? Yes; a lot of the country is very good.
1369. What portion of the country do you especially allude to? The country around Cooperbrook and Taree. That is exceptionally good country, and there is some good land up Camden Haven way, and some very good land about Port Stephens.
1370. Have you any personal knowledge as to the distance between those various places—for example, what is the distance between Taree and Cooperbrook? About 14 miles, I think.
1371. How is communication carried on between those two places generally now? By coach and private vehicles.
1372. Are the roads up there pretty fair? They are very good roads.
1373. What is the character of the land about Cooperbrook and Taree? It is exceptionally good agricultural land.
1374. What are the principal corn-growing districts up there? I have seen corn growing in all the districts.
1375. Is it likely that the timber trade will hold out there for some years? Yes; there is no doubt about that.
1376. In your opinion, what length of time will it last? The timber trade in those districts will last from thirty to forty years at the very least.
1377. Notwithstanding how heavy the demand may be? Yes; there is a vast quantity of timber up there.
1378. It will last a very considerable time? Yes.
1379. What time would it generally take one of your steamers to go to there from Sydney? About two days to the Manning from the time she left Sydney.
1380. Which is the best of those three bars? I think that the Manning is the best bar along the coast. Port Stephens is only an inside bar; it is not a bar exposed to the ocean wash; but the other bars are exposed to the ocean wash.
1381. What is the highest tonnage ship that can go there under fair circumstances? I have sent a boat to the Manning carrying 280 tons.
1382. What about Camden Haven? That would be similar. Sometimes the bar there is very bad, with only 5 feet of water over it.
1383. Is the beach a sandy one? Yes; and at times the entrance gets choked up very badly.
1384. That makes the means of communication rather uncertain? Yes.
1385. And if fair facilities were offered, the railway must take a lot of the trade? I think that the trade would very largely increase if there were a railway, and people knew that there was a certainty of getting backwards and forwards.
1386. There is fine pastoral and agricultural land there, which you are strongly of opinion might be occupied immediately after the construction of the railway? Yes.
1387. *Chairmen.*] How much timber per annum, in your opinion, comes out of the three places you have mentioned—Camden Haven, the Manning, and Port Stephens? I suppose that there are 150,000 superficial feet a week coming down now from Camden Haven; about 60,000 superficial feet from the Manning—but it is quite likely that that will be increased—and about 60,000 superficial feet also a week from Port Stephens.
1388. Is it all hardwood? Yes.
1389. *Mr. Hoskins.*] Is it exported at all? Some of it is brought down for export, but only very little of it, and the rest is sold in the Colony. All that I am bringing down now is for local requirements.
1390. *Mr. Lee.*] On the average, about what number of feet would go to a ton? About 330.
1391. So that practically you would pay 7s. 6d. a ton for the carriage of sawn stuff from the Manning? Yes.
1392. If the railway rates were double that, could you afford to pay them? I do not think so.
1393. What increase on those rates could you afford to pay for carriage by rail? There might be an increase of 10 per cent., but if it went over that, I think it is very doubtful whether the railway would get the trade.
1394. *Mr. Trickett.*] Are there many timber yards on the river? Yes; there are a good many.
1395. Are they steam-cutting yards or not? All steam.
1396. I suppose you could not tell us the total quantity of timber that is brought down from those rivers? In regard to the three rivers, I have given the quantity as near as I can, and I think that about 120,000 superficial feet are brought from Port Macquarie each week.
1397. With regard to the timber trade, which do you look upon as the best means of transit—by vessel or by train? Of course, the only means of transit now is by vessel; but if a train were running, and if the cost by rail and by vessel were anything like equal, I think that the train would be preferred on account of the certainty of getting the timber down.
1398. Is there a large demand for the timber that is supplied from those districts? Yes; there is a good local demand.
1399. Do you think that the demand for Colonial timbers is increasing? Yes; it is increasing. Of course the price is not particularly high, but the demand latterly seems to be increasing.
1400. Is Colonial pine, for instance, increasing in demand? I do not think that that is increasing. I think it is about holding its own. There is always a fair demand for it.
1401. Supposing that this timber trade were to have greater facilities given to it in the way of the timber being brought to Sydney by train, and more were sent down, would there be the extra demand for the timber that would be necessary to meet the supply? I suppose that places would be always growing, and very likely they would want increased quantities each year. That would be a matter, to some extent, of speculation.
1402. For the purpose of house building, and so on, is not New Zealand timber and Oregon and other imported timbers mostly used? They are very generally used—the Oregon particularly.
1403. What is really the scope of employment for the Colonial timber that comes from those northern rivers?

- rivers? We are using it largely just now for the wood-blocking of George and Harris streets in connection with the new tramway. The rest is used for bridge-building and general house purposes.
1404. In what way? For the joists of houses hardwood is used. The roof is generally of Oregon, but the lower timber is generally all hardwood.
1405. The big timbers used are generally Colonial, but flooring, lining, and that kind of thing is generally done with imported timbers? Yes; of course, a good deal of hardwood flooring is also used.
1406. With regard to the timber trade,—is it better to saw the timber locally, or to bring it down in logs to be sawn in Sydney? It is far better to saw it up there, and to bring it down in planks. There is a good deal of waste in cutting up timber, and if you were to bring down the logs you would have to pay freight on a lot of timber which you would not be able to get anything out of.
1407. *Mr. O'Connor.*] Have you your own mills up there? Yes.
1408. *Mr. Hoskins.*] Have you seen the route on the map of this proposed railway from Maitland to Taree? I have seen it on the ground, where it crosses at Port Stephens, near Bulladelah, and I have also seen it up at Camden Haven.
1409. Are you aware that the proposed railway from Maitland to Taree will not go near any of those ports of which you have spoken—either Camden Haven, Port Stephens, or Port Macquarie—but 10, 20, or 30 miles away? Well, the mills are a long way back from the heads; they are 10 or 12 miles up the rivers, and the timber is punted down the rivers to the ports.
1410. But if the timber had to be hauled from the mills to the railway 10, 12, or 20 miles, would not that so increase the cost of production that it would make it still more prohibitive to send timber by railway? Yes; if you had to cart it 10 or 15 miles that would add very much to the cost.
1411. And that would tend to give a preference to sending it by sea? Yes.
1412. For after all said and done, it is not very expensive rafting timber down the river? No; it is much cheaper than sending it by land.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

1413. *Chairman.*] What is the rainfall in the Maitland district? West Maitland, 46·08; Singleton, 31·68; Penhurst, 48·73; Dungog, 50·94; Stroud, 58·90; Moorland, 68·10; Taree, 50·33; Manning River Heads, 62·90.
1414. 68·10 is a very heavy rainfall? Yes; the rainfall is very heavy at Moorland. I do not know the place. The rain-gauge there is a private one, but judging by the contour of the rivers it must be on a hill.
1415. Then the rainfall from West Maitland to Taree approximately along the line of railway proposed to be constructed is between 50 and 60 inches on a fair average? Yes.
1416. How far back is the table-land? From Taree to Murrurundi is due west, and the distance is about 180 or 190 miles. But immediately north of Murrurundi the main range bends away to the east a good deal, and the distance between the coast and the highlands becomes less.
1417. The Manning River raises a little north of Murrurundi? Yes; it rises just opposite Nundle.
1418. Can you give us one or two rainfalls on the table-land at the source of the Manning? Nowendoc, 48·40. Stewart's Brook is on the other side of the main range to the Manning, and about the same distance from the coast, and the rainfall at Stewart's Brook is 38·19. But I should say, in reference to that, that the Stewart's Brook record extends only over five years, three of which have been dry years.
1419. Would we be justified in regarding the rainfall on the table-land at the source of the Manning as being something over 40 inches? Certainly.
1420. That is on the table-land immediately west from the Manning? Yes.
1421. Would you say 45 inches? Yes, I think so. The observer at Nowendoc is a very careful one, and he makes the rainfall there 48·40 for twelve years, and those twelve years take in a fair percentage of good and bad years.
1422. Will you now take from Taree to Kempsey, and give us one or two rainfalls due west of Kempsey—that is, taking the head of the Manning? I cannot find an observer due west there.
1423. Well, approximately? I have a record taken about 40 miles west from the coast, but not near the mountains at all, viz.:—Wauchope, which is at the head of the Hastings branch, 60·57; then there are Port Macquarie, 63·71; Kempsey, 52·19; Camden Haven, 62·31. The record at Port Macquarie is worth more than the others, because it extends over thirty-four years. Then there is Rolland's Plains, which, judging from the map, is about 25 miles due west from the town of Kempsey. The rainfall at Rolland's Plains is 61·81; the rainfall at Trial Bay is 70·80. Then there is a place west of that about 20 miles called Bowraville, where the rainfall is 59·44. You will observe that there is a great diversity in the records just about here on the coast and the neighbourhood of Port Macquarie. I do not know the country personally, but, judging from the best maps, there seems to be a considerable spur of the mountains that comes down just to the north of Port Macquarie. That is the only explanation that I could ever get that seemed at all satisfactory of the great quantity of rain at Port Macquarie. The same thing happens on the north coast further up—on the Tweed River. The Tweed River has the heaviest rainfall in the Colony, and it is near a very high range. The range comes out to the coast there, and I think that the same explanation must be accepted as the cause of the heavy rainfall at Port Macquarie. If the mountain be there—and I have only the map to go by—that is a good explanation. I do not know the Apsley River and the Apsley Falls. I cannot find anybody to observe there. I have no record west of Rolland's Plains just there, but a little farther north, opposite Armidale, there is a place called Bellbrook, about 20 miles from Armidale east, and the record there is 53·79.
1424. What is the record at Kentucky, Uralla, and Armidale;—the water from just east of those places, or some of it, will find its way to the plain? Yes; the drainage from Armidale, I believe, goes into the eastern waters, but I am not quite sure. The rainfall at Armidale, taking a thirty-one years' mean, is 33·01.
1425. And at Kentucky and Uralla about the same? Yes.
1426. At the source of the Macleay 31 inches, and at its outlet 70? Yes.
1427. Will you now take from Kempsey to Grafton? At a place called Fernmount, on the Bellinger River, there is a record of 80·57, which I cannot explain. At Guy Fawkes, which is about 30 miles west-north-west of Fernmount, the record is 68·90. That is in a line between Woolgoolga and Armidale, just about half-way between the two. Woolgoolga has a record of 72·30.

- H. C. Russell, C.M.G.
4 Mar., 1898.
1428. Can you give us the rainfall of the Nambucca? No, I am afraid I cannot. There is a big strip of country south of Grafton—all over the southern branch of the Clarence River—where I cannot find anybody to observe. For instance, there is no observer at Nymboйда.
1429. They are not much interested in records perhaps, when they have a rainfall of 60 or 80 inches? My experience is that farmers are not such good observers as squatters are. They do not take the same interest in the matter. At the mouth of the Clarence there is a rainfall of 57·46.
1430. Can you give us Coff's Harbour? No; there is nothing between Woolgoolga on the coast and Clarence River. Grafton, inland a bit, comes part way between the two, but that is some distance from the coast. The rainfall at Grafton is 39·80. On the high lands, taking the western branch of the Clarence River, at Ramornie, the rainfall is 49·72.
1431. And on the table-land at the source of the river? That is within 10 or 12 miles of the main ridge. At Copmanhurst the rainfall is 54·45. That is, of course, close to Gordon.
1432. And then right west beyond the farthest source? Deepwater, 37·58. Then there is a place, the name of which is not legible on the map, just a little east of Deepwater. It is on one of the upper branches of the Clarence River, and it has a rainfall of 42·37. That is quite close to the top of the mountain, west of Copmanhurst. Then, going north from the Clarence River Heads, Cowper is the next place. Cowper, which is close to the coast, has a rainfall of 49·23. Cumbalum, just at the entrance to the Richmond River, is 79·09; Lismore is 59·16; and Casino, 46·11. Tabulam, where the effect of the high lands is again begun to be felt, has a rainfall of 49·05; Tenterfield, 34·74. A place called Drake, which is just midway between Tenterfield and Tabulam, has 54·45. The Tweed entrance has 74·39, and Murwillumbah 87·99.
1433. Over how long a period does the Murwillumbah record extend? Six years. It gets the effect of the high ranges there, one of the biggest of which is said to rise 5,000 feet.
1434. The rainfall seems enormous? Well, there is Condong, a place close to the mountain, ten years' record, which has a rainfall of 90·14.
1435. *Mr. Lee.*] What is Cape Byron? I have not Cape Byron; but the records on the Tweed are some thing very startling.
1436. They seem to get the heavy rains that come along the north coast? You may say it has been raining there for the last two months, and heavy rain very often. On the northern coast of Queensland, of course, it is much heavier than that. Thinking that it might be interesting to the Committee, I have brought a record of the heaviest rainfall in any month in the records of those places that I have been mentioning. Some of them are considerable. Guy Fawkes has a record of 36·77 for one month. That was in the great flood-time of 1890. In the big flood-time in March, 1890, Lismore had 31·47 in one month. Casino had 27·82 in one month; Lawrence had 24·38.
1437. The highest is 37 inches? No; there is one which is more than 42 inches—namely, Murwillumbah, 42·78, in 1893.
1438. What is the record for a month at Moorland? 40·23.
1439. Can you give us Wingham or Taree? Taree, 30·24 in one month. That was in 1895. Drake, a little farther north, had 35·35 in one month in 1893. Thinking that it might be interesting, I have brought a record of the rainfall that caused the recent flood in the Hunter. The river got up suddenly at Maitland to 30 feet. The highest recorded flood is 36 ft. 6 in. That is the highest flood at West Maitland. On the 13th, 14th, and 15th comparatively heavy rains fell on the Hunter, and the heaviest fall there in the three days was 6·98, and the fall ranged from that, down to under 3 inches. Dungog had 2·58; Clarence Town, 3·32; Hunter's Vale, 3·83; Wingen, 5·98; Jerry's Plains, 4·65; Dartmouth, 4·54; Dalwood (Black Creek), 5·32; Cassilis, 4·95; Buchanan, 4·58; Aberdeen, 4·56. A rainfall giving about 4½ inches in three days brought the river up suddenly at Maitland 30 feet above its ordinary level. I remember reading the report of the first Royal Commission on the Hunter River floods. They came to the conclusion that an inch of rain per day over the catchment area of the Hunter would keep it level with the tops of the banks. Once the rain had wetted the whole surface 1 inch of rainfall would keep the river in high flood.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn,
and further examined:—

- H. Deane.
4 Mar., 1898.
1440. *Mr. Humphery.*] You have brought some information, I think, to complete your evidence, have you not? I was asked to produce a statement as to the surveys. This I have. It is as follows:—

As a result of advocacy of the North Coast railway by both the public Press and deputations to the Hon. the Minister for Works, explorations of the country lying between West Maitland and Morpeth, on the Great Northern line, and South Grafton were authorised by him in 1882.

In October of the same year, Mr. Mansfield was deputed to do this exploration. Between the Great Northern railway and Taree two main routes were examined, namely, from West Maitland and Morpeth, as well as an alternative line to the first portion of the latter from Hexham; and a connecting line, *via* the valley of the Karuah River, joining these main routes.

One main route, after leaving West Maitland, passed through the towns of Paterson, Dungog, and Gloucester, down the valley of Mograni Creek, and proceeded to where the line crosses the Manning River, about 2½ miles south-west of Wingham; thence through that town to Taree, and onwards to South Grafton.

The other main route, after crossing the Hunter River, at Morpeth, passed through Seaham, Clarence Town, and Bulladelah, to a junction with the route from West Maitland, about 14 miles south from its crossing of the Manning River, above Wingham.

As a result of these explorations, trial surveys with ruling gradients of 1 in 40 were made of all these routes with the exception of the alternative line from Hexham, of which no survey has been made. That between West Maitland and Taree was commenced in January, 1884, and completed in February, 1886.

No separate estimate of the original line to Taree has been made; but in 1886 an estimate of the cost of the whole line to South Grafton was made, which gave an average of £14,917 14s. per mile for the whole of the North Coast line to South Grafton, the total length being 305 miles 60 chains.

With a view to reducing the excessive cost, and of improving the whole of the North Coast lines, Mr. T. R. Firth was instructed, in 1889, to examine the surveyed routes, and make explorations to further these objects. Great improvements were suggested by him, the principal between West Maitland and Taree being two extensive deviations. The first, 18 miles in length, commences about 35 miles out from the former town, crossing the Monkerai Range, about 3 miles further south than the previous survey; and then passing down the valley of Sheep-station Creek (or Titcum's Creek), and after crossing the Karuah River, follows up Johnson's Creek to a junction with the original trial survey. This alteration brings the line within 4 miles of the town of Stroud, which is 5 miles nearer than the original route.

The

The second and most important deviation, about 36 miles in length, commences at the town of Gloucester, and following down portions of the valleys of the Gloucester, Barrington, and Manning Rivers, the latter of which it crosses below its confluence with the Barrington, and rejoins the original route at Wingham.

As a result of Mr. Firth's suggestions, an amended trial survey of the whole of the North Coast line was ordered. The portion between West Maitland and Taree was commenced in April, 1890, and completed in April, 1891, a much improved and less costly line with 1 in 60 grades being obtained.

In 1891 the cost of this amended line to Taree was estimated at £1,378,925, or an average of £12,130 8s. per mile. Since then, owing to the reduction of prices, the estimated cost has been reduced to £982,283, or an average of £8,629 15s. per mile.

1441. Have you anything to add to the statement that you have just read? Nothing with regard to that, but I have been asked to give some information as to the floods of the Avon River. I think that a letter on the subject was addressed to the Committee.

1442. A letter from Mr. Wiseman? Yes; I have had the drainage area of the Avon River above Gloucester calculated in the office.

1443. Have you read the letter from Mr. Wiseman, addressed to the Public Works Committee, referring to the flooded condition of the Avon in 1875, and the danger from back-water that would exist if the line as surveyed were constructed? Yes; I have made inquiry into the matter, and had the drainage area of the Avon above Gloucester calculated, and these are the results:—The drainage area is about 130 square miles. According to Professor Kurnot's formula—a formula that is often used in connection with similar cases—the area of waterway necessary to carry the river in flood is 2,500 square feet. The waterway available on the section taken up to the flood-level shown is 11,000 square feet, and consequently more than four times what is actually required, according to the theoretical considerations. The flood-level, shown on the section, above the bed of the river at the bridge is about 22 feet, and at the flood-openings, 15 feet above the ground, the formation level being 4 feet higher. The high flood-level shown is owing to the back water of the Gloucester River, the exit after the junction of the Gloucester, Barrington, and Avon, evidently not letting the water away quickly enough. Mr. Wiseman's letter gives a level somewhat higher apparently than what is stated. I cannot find out in the office whether the surveyor saw Mr. Wiseman and obtained any information from him, or refused to credit the flood-level at all, but I have his report here. The report is dated 12th June, 1891, and talking about this particular section, he says:—

* * * The only bridge of any importance being that required at the crossing of the Avon Creek. As I have already stated, the line, before reaching the Avon, traverses a low flat for a distance of about 30 chains, and as there is no doubt but that this flat is partially under water in times of heavy flood, it would be necessary to have this portion of the line raised some 15 feet. Although the ground on the southern bank of the Avon is low, yet, as far as I can judge, it would not be necessary to go to a great depth beneath the surface before reaching rock.

That is all he says about the flood-level.

1444. Does he say what length of line it would be necessary to raise to a height of 15 feet? He says that the valley is about 30 chains across.

1445. Would that be very expensive? No; I have looked into the matter since I returned from the district, as well as on the spot, and there is no necessity to have a crossing of that length. Mr. Stuart, who went over the waterways some years ago after the survey had been made, and made recommendations as to bridges, accompanied me on my visit to the district, and he pointed out a deviation which he suggested—which I have not troubled the Committee with—by which the crossing of the valley is very much shortened. I think that the Committee can rest very well satisfied that whatever is necessary to be done will be done in the event of the construction of the line being authorised, and that, as Mr. Stuart's proposed deviation is in the direction of cheapening the line, even if the line has to be raised to bring it over the level mentioned by Mr. Wiseman, it can be done for the money included in the estimate.

1446. Have you divided up the whole of the cost of the line showing what the section to Taree will cost, and then from Taree to Kempsey, and then from Kempsey to the next point? The estimates—which I should give the Committee to understand are approximate only, the quantities having been got out very carefully some years ago, but the revision being only an approximate one—are as follows:—Taree to Kempsey—Length, 78 miles 63 chains; estimated cost, £503,849; average cost per mile, £6,394; Kempsey to Coff's Harbour—Length, 65 miles 50 chains; estimated cost, £447,120; average cost per mile, £6,813; Coff's Harbour to Glenrigh—Length, 24 miles 27 chains; estimated cost, £197,047; average cost per mile, £8,096; Glenrigh to Grafton—Length, 26 miles 75 chains, estimated cost, £205,437; average cost per mile, £7,625. Total length, 195 miles 55 chains; estimated cost, £1,353,453; average cost per mile, £6,916. The total estimated cost from Maitland to Grafton is £2,335,736. The length of the section from Grafton to Lismore is 82 miles 28½ chains, and the estimated cost £591,801, making the total estimated cost of the line from Maitland to Lismore, £2,927,537, or an average cost right through of £8,022 per mile. The figures that I have given are exclusive of the cost of the bridge over the Clarence River at Grafton, but the cost of all the other bridges is included. It looks as if the proper place to cross the river Clarence would be a few miles above Grafton, and if you wanted to carry passengers right into Grafton, to do it by means of a punt, but to take the goods across the river 5 or 6 miles up, where the banks are higher.

1447. *Chairman.*] Will the North Coast railway, then, not pass through Grafton? It will pass through South Grafton.

1448. And then follow up the southern bank of the river? I certainly think that is the proper way to do it. I do not see why, if the Grafton station were made on the south bank of the river, a good steam punt or steam ferry-boats should not be used to take the passengers across to North Grafton from the station on the south bank.

1449. *Mr. Hoskins.*] The Clarence is wider at Grafton than almost anywhere else? It would be a very expensive matter taking a bridge across there.

1450. *Chairman.*] How does the width of the Clarence from North to South Grafton compare with the width of the Hawkesbury at the Hawkesbury bridge? The Hawkesbury bridge is a little under 3,000 feet long—a little over half a mile.

1451. How will that compare with the Clarence? The width of the Clarence varies between 1,360 and 2,376 feet.

1452. What did the Hawkesbury bridge cost? I think altogether about £362,000. The cost of the bridge over the Clarence would depend very much on what you want to do. If you want to build a high-level bridge it will be very costly, because the approaches will be very high.

1453.

H. Deane.
4 Mar., 1898.

- H. Deane. 1453. It must be above flood-level? Yes; but to be merely above flood-level it need not be a high-level bridge, for at North Grafton there is a strip of land which has never been flooded. In the town of Grafton itself, I think that the main street has been flooded to the extent of 2 or 3 feet.
- 4 Mar., 1898. 1454. Would the cost of the Hawkesbury bridge—£362,000—be a fair index of the cost of the bridge over the Clarence? I could not say without going into the matter. I do not remember whether any borings have been taken across there, and I should want to know what height you want to go. If you have a high-level bridge it must be sufficiently high to allow the steamers to go underneath it; but if you have a low-level bridge you must have an opening span of some kind, unless, as I suggest, you go higher up the river, which, I think, would be the better way to do it.
1455. You are now dealing with the question of the interception of the traffic? If you were to have a high-level bridge that would allow steamers to go under it, you would be at a great height on the other side of Grafton.
1456. Approximately, what would be the height from ordinary summer level to the top of the bank of the Clarence; would it go 25 feet? I daresay it does. To build a bridge at Grafton of sufficient height to allow the best class of boats, such as the "Kallatina" and the "City of Grafton" to pass under it, is impracticable on account of the low level of the ground on each side of the river—the approaches would be enormously heavy.
1457. Are we justified in regarding it as a fair approximation of the cost of the line from West Maitland to Lismore, in saying that it would cost something over £3,000,000 exclusive of the cost of the bridge over the Clarence, and that that extra amount being left unstated means that? Yes.
1458. The construction cost embraces buildings, or only the running road? Everything you require for the railway and its accommodation.
1459. But not land resumption? No.

TUESDAY, 8 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 1460. *Mr. Lee.*] Would you kindly tell us what would be the rate per ton for the carriage of sawn timber by rail from the Manning to Sydney? From Taree through to Darling Harbour the rate would be 10s. 5d. per ton, with a minimum of 6 tons per four-wheeled truck. I may add that our experience is that they cannot load more than about 4 tons per truck of the class of timber that would come from that district. Therefore the charge would practically be £2 2s. 8d. per four-wheeled truck. If they could load 6 tons per truck they would get it carried for the same as 4 tons.
- 8 Mar., 1898. 1461. Supposing they did not want to send the timber to Sydney, but to Maitland, or some other market, what would be the rate from Taree to Maitland? 8s. 6d. per ton.
1462. From Maitland to Darling Harbour? 9s. 11d. per ton if we charged at the absolute tonnage rate. We charge for the full truck load. It does not cost any more to haul a 6-ton load truck through than a 4-ton load truck through.
1463. But in the case of long timber, do you not use all open trucks? In that case we apply a different principle altogether. We charge for not less than 18 tons; but I am speaking of four-wheeled trucks.
1464. You could not possibly put 18 tons of sawn timber on one of those open trucks? Yes, you could.
1465. Of ordinary sawn boards? Yes.
1466. What would the rate be then? 10s. 5d. That is on the basis of the rate I have taken for the timber—8s. 6d. from Taree to West Maitland, and 9s. 11d. from West Maitland to Sydney.
1467. 10s. 5d. right through by an ordinary four-wheeled truck? Yes.
1468. It would appear then that timber could be brought to Maitland at a much lower price than it could be brought from the river by vessel, and thence by train to Maitland? Yes, I expect it would, if they paid our local rate between Newcastle and Maitland, but I should never anticipate they would do that.
1469. When you were making your inquiries did you ascertain whether there was much traffic of that character between the rivers or any portion of the route and Maitland? There is a good deal of timber grown in the district.
1470. But is Maitland a market for it? I should not say so.
1471. Supposing that you had the timber traffic from Taree, would you consider that 20 tons a week was an item of traffic worth considering? Every item is worth considering, so long as we get enough freight out of it.
1472. But for timber alone, 20 tons a week? I would not think very much of it as a reason for constructing that line, at all events.
1473. Do you think that the timber traffic would have to increase to very much more than that to be of any value to the railway? I have put down what I consider, judging from our experience, is really the outside limit, namely, £3,500 for the timber traffic from that district. If the line were built I should be surprised to see any increase in that volume of traffic if it did take place.
1474. I do not know how you get at your figures, because there is so much more in excess than I have been able to elicit; it is estimated by one very large firm that 60,000 feet of sawn timber—that is 20 tons—are coming out of the Manning River every week, and 20 tons at 10s. 5d. a ton would be £10 8s. 4d. a week, and fifty times that would be £562 10s. per annum? But I think that the evidence you

- you have had has been on the subject of timber that came from the navigable portion of the rivers; but this proposed line runs into back country, where timber has been exploited to a certain extent only. J. Harper.
1475. According to your evidence, the timber traffic would be equal to about £500 a year, but, as a matter of fact, you have estimated a return of nearly seven times as much as that, and therefore you think it is a very liberal estimate? Yes. 8 Mar., 1898.
1476. I mean seven times more than comes out of the rivers now? Yes; and, as I have explained in my report, the estimate is a very liberal one. However, in making the estimate, I had in view the fact that we were exploiting country that the rivers are not exploiting now.
1477. But if your estimate of quantity were reached in the aggregate, would not the cost of freight be considerably less, inasmuch as you would pick the traffic up at intermediate places? Yes, of course; but 10s. 5d. represents the carriage over the maximum distance. And you may practically multiply that seven by two, and make it fourteen. I have been anxious to give a most liberal estimate for that district.
1478. In your estimate you have allowed for timber traffic that may come not only from the Manning, but also from intermediate places? Along the whole of the line practically, and I have taken 10s. 5d. as being the maximum rate for haulage over the 114 miles.
1479. Your estimate is equal to 7,000 tons of timber per annum? It is equal to more than that; it is equal to about 30,000 tons.
1480. But is not that a very large timber freightage? It is about one-twentieth part of what the people of the district claim they would send on the line.
1481. *Chairman.*] It appears that the distance from Sydney to the Manning would be 232 miles by rail; the Secretary of the North Coast Steam Navigation Company has informed the Committee that the freight from the Manning to Sydney, either deadweight or measurement, is 12s. 6d. per ton;—what could you do it at? Our rate for our lowest class of traffic would be 17s. 2d. That includes maize. That, of course, includes the local rate over the line. The rate from Taree to West Maitland is 8s. 6d., and from Maitland to Darling Harbour 8s. 8d. All these lines are asked to bear a local rate until they pay. The estimate that is before the Committee of £18,000 furnished by the Commissioners, represents a rate based on the local rate being applied over the new extension. Of course, if through rates were charged you would have to adjust that estimate by probably dividing it by one-fourth.
1482. If the same rates were charged from Sydney to Taree as from Sydney to Murrurundi? The rate for 232 miles for produce would be 11s. 10d.
1483. That is to say, that if you were to carry grain for some parts of the Colony the charge would be 11s. 10d.; but you would have to reduce your estimate of earnings on this line if you were to charge only that amount? Applying local rates to that line, the charge would be 18s. 5d.; but applying through rates it would be 11s. 10d.
1484. But since your calculation is based on local rates, what would be the result? There is that difference all through. The through rate from Taree to West Maitland would be 8s. 6d., and the difference would be as between 17s. 2d. and 11s. 10d., nearly 7s. If you work that out you will see that we should only get about 1s. 10d. a ton on produce carried at through rates from there. Out of the 17s. 2d. we get 8s. 6d. to Maitland and 8s. 8d. from West Maitland to Darling Harbour; and for through carriage we should get 11s. 10d., as against 17s. 2d. That would be 6s. 4d., which, if we charged a through rate, we should sacrifice out of the 8s. 6d.
1485. That is a non-productive rate? I leave it for you, gentlemen, to form your own opinion.
1486. Along the other lines 11s. 10d. would bring maize to Sydney from a distance equal to that of Taree? Yes.
1487. Supposing that your calculation were made on a through rate, what would the effect be on your estimate? It is just the difference between 8s. 6d. and 1s. 2d. You would practically have to divide it by 7.
1488. There would be no increase in the volume of traffic? I do not think so; for, assuming you had to pay that, our rate for maize would be higher than the present steamer rate.
1489. The steamer rate is 10s. per ton; but of that there is one-fourth drogherage, which the steamer pays? Yes; as long as the steamer pays it. We have to bear a lot of charges in connection with railway freight; but we do not charge them separately on to our customers.
1490. The freight where the railway would compete with the ocean traffic would be only 7s. 6d., of which 2s. 6d. is supposed to be for droghing? I do not know what rate they could carry at. I should think that they ought to do it and be paid well at 5s. I think the present steamer rates are nominal rates.
1491. The distance to Kempsey appears to be 311 miles? The through rate would be 12s. 7d. to Sydney; the local rate would be £1 0s. 1d. at the lowest rate we have.
1492. The steamer freight from the Macleay is 12s. 6d. a ton and 10½d. a bag, or practically 10s. a ton for maize;—how does that come out with your figures? Well, the further you go with the railway the worse you get.
1493. We understand that, if the through rates are taken, the estimate must be reduced by a proportionate amount, and that the volume of traffic will not make it up? That is so.
1494. The distance to Grafton is 427 miles? The through rate would be 13s. 8d., and a local rate would be £1 2s. 2d.
1495. The distance to Lismore is 509 miles? We would charge 14s. for the maize grown there if the charged were based on the through rate; but on the local rate the charge would be £1 4s. 2d.
1496. The distance to the Tweed is 572 miles? The freight would be 6d. more per ton on the through rate.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1497. *Chairman.*] We want some information with regard to the effect of the rivers on the country through which the proposed North Coast line would run? I have here a statement showing the area of the water-shed, the total length of each river, and also the navigable length. C. W. Darley. 8 Mar., 1898.
1498. Take the Tweed? 418 square miles water-shed; length of river, 46 miles, of which 23 miles, up to Byangum, is navigable.
1499. But the Tweed is really navigable for a certain class of ocean-going boats to Murwillumbah? Yes.
1500. Beyond Murwillumbah the river is only fit for droghing? Yes. 1501.

- C. W. Darley. 1501. What would be the draught of a boat that could trade to Murwillumbah? At present a boat cannot go there safely drawing more than about 8 feet.
- 8 Mar., 1898. 1502. Putting it at 6 feet, I think, would be better? Well, it is according to the tide. There is only one flat that is stopping boats from going up.
1503. And there is a possibility of a boat drawing 8 feet going to Murwillumbah where the North Coast line would meet it? It is only a matter of dredging to let a boat drawing 8 feet up.
1504. What about the Richmond River? The Richmond River has 2,683 square miles of water-shed; the total length of the river is 149 miles; and it is navigable up the south arm for 68 miles, part of the way by ocean boats, and the rest of the way by small droghers to Casino, and up the north arm for 60 miles to Lismore; but navigation ends at present at Irvington wharf, 2 miles below Casino—that is on the south arm.
1505. An ocean-going boat can proceed to within a few miles of where the North Coast line would be at Casino, and a boat drawing 8 or 9 feet could reach the North Coast line at Lismore; that would give us the competition of the Richmond as regards, say, an 8-foot boat? Of course, a boat drawing 4 feet—a drogher—can go up above Lismore a considerable distance. The Clarence River has 3,505 square miles of water-shed; the total length of the river is 240 miles, and the river is navigable for a distance of 42 miles to Grafton by ocean-going steamers of large tonnage, and to Copmanhurst, a distance of 67 miles, by droghers. It is open to navigation by 10 and 12 foot boats up to Grafton.
1506. *Mr Hoskins*] Large-sized droghers go above Grafton? Yes, droghers of good size, but drawing only 4 feet of water.
1507. *Chairman*.] Can you say anything about Coff's Harbour? At Coff's Harbour there is an ocean jetty, where vessels in moderate weather can either load or discharge.
1508. Up to what depth? About 15 feet.
1509. The same applies to Byron Bay? Yes; the same applies there, and also at Woolgoolga.
1510. The competition at Byron Bay, Coff's Harbour, and Woolgoolga would be with boats drawing up to 15 feet? Yes. Of course, that depends very much on the weather. In bad weather they cannot go there.
1511. What about the Bellinger? 479 square miles of water-shed; total length of river, 76 miles; and the river is navigable for 14 miles up to Cahill's, for punts and light vessels, and up the south arm for 15 miles; but only small-class boats can go in there.
1512. Boats of 6 feet draught? Five or 6 feet.
1513. Therefore, the competition at Bellinger would be with 5 or 6 foot boats? Yes, at present; but there is no doubt that the works now in progress may improve that.
1514. As the result of your works, do you expect a much greater depth? We ought to get up to 8 or 9 feet.
1515. Is it reasonable to believe that in the near future a boat drawing 8 feet will be able to enter the Bellinger? I think so.
1516. What about the Nambucca? 552 square miles of water-shed; total length of river, 58 miles up Taylor's Arm, and 56 miles up Bowra River; but the river is navigable only to Bowra—a distance of 9½ miles.
1517. What class of boat? About 6 feet.
1518. And there are the same conditions at the Nambucca as at the Bellinger? Yes; at times the bar is very bad indeed.
1519. At present there is an uncertain communication with 5 or 6 foot boats, but you believe that the works that have been suggested will make it possible for 8-foot boats to go there? The river can be improved up to 8 feet.
1520. What about the Macleay? 4,581 square miles of water-shed; length of river, 200 miles; the ocean-going steamers can go up to Kempsey, 32 miles, and droghers can go about 7 miles further—to Green Hills wharf. Good-sized droghers go to Green Hills wharf, and then the navigation ceases. There are rapids there. The Macleay is a good river for 7 or 8' foot boats now, and can be permanently improved, making it not difficult to get 10-foot steamers in there.
1521. What about Trial Bay? Trial Bay is practically the same as the Macleay. At present we have no wharf or means of landing goods in Trial Bay.
1522. You believe that it may furnish competition some day, but at what date you are not prepared to say? It is uncertain.
1523. Then we come to the Hastings? 1,398 square miles of water-shed, and 109½ miles total length of river. The river is navigable up to Morton Creek wharf, a distance of 19 miles, for 7 and 8 foot vessels. As to Port Macquarie, I may say that ocean boats do not go above Port Macquarie, but only droghers.
1524. What about Camden Haven? 238 square miles of water-shed, and the total length of the river is about 18 miles. The river is very fair for navigation at present, but only for small sailing boats, of 4 or 5 feet draught.
1525. Are there any possibilities of improving the Camden Haven? It can be improved and made suitable for 8 or 10 foot boats.
1526. Is there any local reason for its improvement;—is the district a good one? It is a fairly good district, but it is very limited, and at present the trade is chiefly in timber.
1527. Is the Camden Haven likely to be improved in the near future? Yes, at moderate expense. We can improve it up to an 8-foot port. It has a good south head, and is favourably situated for opening; it only wants the river to be properly trained.
1528. Does the district justify it, in your opinion? It justifies a reasonable expenditure.
1529. An expenditure that, in your opinion, will be likely to bring about the result you have suggested? Yes.
1530. What about the Manning? It has 3,164 square miles of water-shed, and is 141 miles long, and it is navigable for 29 miles up to Wingham; but the ocean-going boats only go about 22 miles to Taree.
1531. What class of boat? About 7 or 8 feet.
1532. And you believe that your works will enable a draught of 8 feet to be fairly well maintained? It will take considerable expenditure to improve it.
1533. You can keep it up to 8 feet by a considerable expenditure? Up to 10 feet by a considerable expenditure.

1534. What about Cape Hawke? Cape Hawke is just an inlet, but it has a water-shed of 514 square miles. There are two small streams—the Gooloongolok and the Wollomba—but the river is only navigable for punts about 20 or 30 miles. It is at present navigable for boats drawing 4 or 5 feet of water inside the entrance only, and not further. C. W. Darley. 8 Mar., 1898.

1535. Is there any probability of improvement? Not of very great improvement. It could be improved by a little expenditure, but there is nothing to justify any large expenditure.

1536. What about Port Stephens? There is a water-shed of 1,179 square miles, and there are two rivers, the Karuah and the Myall. The Karuah is about 67 miles long, and the Myall about 60 miles, and navigable to Booral, a distance of 27½ miles. Of course, considerable-sized vessels can go into Port Stephens. But, after that, the Myall River is navigable only for very small vessels.

1537. Almost any vessel can go into Port Stephens? Yes; almost any vessel can go into Port Stephens and get shelter there—can go a considerable distance up into the port; but the Myall River is navigable only for shallow-draught lighters.

1538. What about the Hunter River? 8,269 square miles of water-shed; total length of river, 500 miles. The river is navigable 34 miles, to Morpeth, and the Paterson and the Williams are respectively navigable for 18 and 20 miles above their junction with the Hunter River.

1539. A boat drawing how many feet of water can enter Newcastle? Twenty-three feet into Newcastle; but up the river only 10 or 12 feet.

MONDAY, 14 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Richard Atkinson Price, Esq., M.P., sworn, and examined:—

1540. *Chairman.*] You represent the Electorate of Gloucester, in the Legislative Assembly? Yes.

1541. *Mr. Black.*] Would you like to make a statement by way of introduction? Perhaps it would be the better plan. Taking the district as it is now, although there is a considerable industry in the way of dairy-farming and agriculture, yet for want of proper facilities in the shape of roads and other means of communication, large areas of land exceedingly rich in quality are, at the present time, comparatively speaking, fallow. Of course it may be urged that the district has communication by water; but with bar-harbours, such as exist on the coast, it is impossible to send perishable stuff away, such as butter, farm produce, and live stock, and the progress of the district is retarded in consequence. In considering this line, you must not only take the portion of the country marked on the map, but must also include all that country running across to the county of Hawes. From some of those ridges I have sent specimens of soil to the Government Geologist, for analysis, and no doubt he will give the Committee the result. On those ridges at Rawdenvale and Curracabark, and towards Nowendoc, and right on the dividing line, the land is well adapted for wheat-growing, and also for the growth of the finer qualities of tobacco. Land nearer to the coast is adapted for producing the description of tobacco used as wrappers for cigars, and some of the better cured tobacco has brought as high as 2s. 6d. per lb. in the English market. The line would tap the whole of the county of Hawes. Owing to the number of cattle about there, it is probable that some attempt would be made to slaughter cattle and freeze them there. That would obviate the necessity of sending the stock over the stock route to Maitland, or across to Nowendoc over Hungry Hill, and on to Walcha Road. They now very often send the cattle across to Aberdeen, and, if a railway were constructed, this would be obviated. Perhaps, with the exception of some portions south of the Manning, the land in the district is suitable for dairy farming. There are large flats here and there where green stuff can be grown for winter feed. There exists a sufficient number of little hillocks protected by trees where cattle could be run, and the dairying industry, already pretty large, would become very extensive. I should like to take a few figures from the last Statistical Register, applying to the three counties of Macquarie, Gloucester, and Hawes, and also a portion of Durham. The actual area under crop in Gloucester was 13,452 acres; Macquarie, 25,906 acres; and Hawes, 178 acres. In the county of Hawes there is a large quantity of such land as I have just described. There is also an auriferous belt, a belt of diorite which goes across from Wallis Lake, and passes through Bulby as far as Cell's Diggings. It is about 5 miles wide. Then there is another auriferous belt running across to Nowendoc; that is about 7 miles wide. Then, coming across to Copeland, you meet a geological change, and leave the carboniferous formation. Here you have deposits of copper and limestone. These have not been worked to any great extent; but there are deposits both at Curracabark and Nowendoc. From samples I sent to the Mines Department we have had returns giving as high as 42 per cent. Until the lodes are opened up and developed, it is impossible to strike a fair average. The whole of that stuff would be brought down if facilities were given for cheap transit. The character of the country is adverse to the formation of roads, as a large number of small mountain ranges extend in spurs from the Dividing Range, and there are a number of creeks which render expensive culverts and other works of that nature necessary. A great deal of that land which is now used merely for grazing is so rich in character—I am speaking more particularly with regard to the county of Hawes—that, if facilities of transit were given, it could be utilised for dairy-farming and agriculture. I find on page 2 of the Statistical Register for 1895 that in the counties of Durham and Hunter the total area under cultivation on alienated holdings was 22,393 acres and 3,394 acres respectively. The number of male persons employed in agricultural pursuits was 1,384 in Gloucester, 1,673 in Macquarie, and only 17 in Hawes. For the reason I have already pointed out, Hawes cannot afford under present conditions to employ a very large number of persons in agriculture. Turning to grazing and dairy-farming, I find from the Statistical Register that in Gloucester there

R. A. Price,
Esq., M.P.

14 Mar., 1898.

- R. A. Price, Esq., M.P.
14 Mar., 1898.
- there were 6,419 horses, 6,946 dairy cattle, and 44,974 ordinary cattle; in Macquarie there were 7,542 horses, 5,792 dairy cattle, and 25,865 ordinary cattle; in Hawes there were 1,245 horses, 329 dairy cattle, and 19,879 ordinary cattle. Under the head of live stock in the sheep district of Port Stephens, which includes the greater portion of the district in question, there is an acreage of 942,368; 7,052 horses, and 46,841 cattle. I may say here that, of course, this line is only proposed as part of a north coast line, and in dealing with it many matters other than those of a local character have to be taken into consideration. For instance, this is to be a portion of a line which some day will make a connection right through to Queensland. In that sense it is a national line as well as an alternative line, and a line with advantages from a defence point of view. Turning to the Statistical Register for 1896, I find that the area of alienated land occupied, cultivated, enclosed, and unenclosed, &c., in the county of Gloucester, was 1,985,640 acres; in the county of Macquarie, 1,635,200 acres; and in the county of Hawes, 1,051,520 acres. I do not wish to include in my figures the county of Durham, as I presume that Mr. H. H. Brown, the member for that electorate, will give such evidence. An alternative route has been suggested branching across from Booral through Bulladelah. There is a quantity of very good timber on the other line. On the ranges at the back of the rivers and in the brushes towards Berrico, trees can be seen of a length of nearly 200 feet before the first limb branches out. The timber includes quantities of cedar, abundance of turpentine, and spotted gum. Another matter to be considered is this: Fruit being a perishable commodity, very little comes from that locality, although at Johnston's Creek, at the Monkerai, and also around Copeland, where some seedling oranges were put in some twenty-five or thirty years ago, a large quantity of this fruit is grown. Although not properly attended to, and grown in the natural state, these trees have produced some of the finest oranges in the Colony. The same may be said of other fruits. In the higher parts of the ranges we get colder weather, and there is an admirable class of apple produced. The land on nearly all these ranges is capable of producing exceptionally good fruit. The same remark applies to a lot of the country lying near Bulladelah and Booral.
1542. You spoke of the interference with sea communication by bar-harbours as being a reason why railway communication should be provided;—would that objection be taken away if, by some proposed harbour work, entrance was rendered easy at all times to the rivers of the coast? No; by reason of the amount of perishable stuff sent down, and the uncertainty of getting it out over the bars. Even though improvements were made to the entrance, a period of a week, or sometimes perhaps a fortnight, might elapse before communication would be possible.
1543. But I mean if the bars were removed? It is problematical whether you could remove them so as to ensure certainty of transit, even though you incurred enormous expense.
1544. But if it were done? A lot of country would be tapped by the railway, irrespective of that. For instance, at the Barrington, they have to take maize and other produce a distance of 70 miles to the harbour.
1545. You think that if the bars were entirely removed, there would still be a necessity for railway communication? Railway communication would develop the country, and facilitate dairy-farming and agriculture.
1546. Where would you find your market? You would find a market largely in Maitland, largely in Sydney, and largely in Newcastle.
1547. But which of these would be the market? It would depend entirely upon the fluctuations in the fat-stock market. Probably you would go to Muswellbrook with stores by train. If the market were good for fats at Aberdeen, you would send them there. It would depend entirely upon how the market fluctuated as to whether you would send to Maitland, to Sydney, or to Aberdeen. Then, in the case of produce, there is a big market at Newcastle, and a big market at Sydney.
1548. You are aware, of course, that it would be a good deal further by rail to Sydney than by steamer? That would be compensated for by the quicker transit in the case of perishable stuff. Suppose, for instance, you had a lot of pigs and cattle; by being able to truck them down, you would economise, even though you had a longer journey. People in the country do not mind a little extra expense, if they can get their produce quickly to market.
1549. You think that, provided they had a rapid steam service with no bar obstructions, they would prefer to send their produce to Sydney and Newcastle by the railway, and pay very much higher freight? With regard to the people in Hawes, and on the western side, I should say yes, because they would get their stock to the Maitland market by railway; while if they had to send them to the coast, they would have to drive them and knock them about.
1550. You do not anticipate that a railway would capture the traffic on the lines between the proposed route and the sea? Yes; it would catch all the traffic from the central portions. People would send farm produce by rail even though it cost twice the money.
1551. I infer from your remarks that you recommend the construction of the railway because of the capabilities of the district more than because of its existing sources of supplying traffic? The figures I have quoted show that the existing source of supply is very considerable, even comparing this district with the South Coast; for instance, in Gloucester the number of horses in 1895 was 6,419, and the number of cattle over 50,000; while the figures in the case of the county of Macquarie were also very large.
1552. Is there much land there available for farming purposes? Yes; there is a considerable area of Crown land not yet alienated. I think only 29 per cent. of the land has been alienated. In Gloucester the proportion of land alienated to the total area is 29.54; in Macquarie the proportion is 19.73; in Hawes the proportion of land alienated to the total area is 9.27. So that there is a large balance of Crown land available. Many of these lands have been set apart by the Crown as special areas, for which as much as £3 15s. an acre is asked. This land will grow good wheat and oat crops, and it still belongs to the Crown. There is also a large area under timber reserves.
1553. Of what does the chief timber consist? On the higher ranges you have brush box. On the Avon and around the brushes you have tallow-wood, spotted gum, and ironbark; and going over towards the coast line you have red and grey mahogany and woolly butt. Towards the coast line, the geological formation of the country changes, and you have entirely different description of timber. You then lose the forest box, but you come across some varieties of oak and rosewood, and other timbers useful for ornamental purposes—for veneering and for the manufacture of furniture. You have abundance of gray gum, ironbark, tallow-wood, spotted gum, and cedars.
1554. *Mr. Trickett.*] I suppose you are aware that this railway is estimated to cost nearly £1,000,000? Yes.

1555. And also that the railway Commissioners estimate that it will be run at a loss of £31,468? Yes. R. A. Price, Esq., M.P.
1556. Do you advocate a line to be constructed at the present time with such a prospect as that? The question is upon what data did the Railway Commissioners base their figures. For instance, they do not take into consideration the fact that it is only portion of a national line, that already one portion has been constructed, and it can only be considered a success as a whole. Then, again, owing, I suppose, to the limited time at their disposal, the Railway Commissioners examined the route in a very cursory manner, obtaining only a small amount of evidence. They went along in traps from Dungog to Gloucester. They went along the main road to Taree, and the only opportunity they had of judging of the country was a cursory glance from the top of a vehicle. They were not able to see that the country, being ridgy, is amply provided with water. There is abundance of water supplied by the tributaries to the Manning. Neither did they take into consideration the fact that behind each ridge there were large areas of good land in flats along the banks of the rivers—land capable of growing green stuff for the stock, and suitable for a prosperous dairying industry. Under these circumstances, I am inclined to think that the calculations made with regard to the probable traffic are somewhat misleading.
1557. Are you not a little mistaken as to the mode adopted by the Commissioners of getting evidence; did they not go a little more deeply into the matter than you seem to indicate? Some of the questions show that there was not that amount of information at their disposal which there might have been.
1558. We have had Mr. Harper before us, and he and the Commissioners have assured the Committee that they not only visited the route and the surrounding country, but also inquired as to the existing traffic and probable traffic? I think you will find that no analysis was made of the soil. They only visited the centres, and in ridgy and broken country like that, it is impossible, no matter how observant a surveyor or other officer may be, to ascertain the character of the country unless he rides through and sees it. It is sheer nonsense for a man to say he can go through a country which is one series of ranges and ascertain its character from a glance at one place and another.
1559. How would you regard this aspect of the case: The freight charges and fares by the steamer, taken as a whole, are much less than those which could possibly be quoted by the railway—how do you think that would affect a large amount of the traffic? I think the increased facilities would cause an increase of traffic. Where a man has perishable stuff he will pay more for its carriage. For instance, if you have a mob of fat bullocks, and want to catch the market, it will pay you better to truck them than to have them delayed and knocked about on the steamer. In the case of perishable goods and live stock, the advantages of rail transit are very great. Then again, the railway would be used for the carriage of general merchandise required by the people for consumption.
1560. Do you not honestly believe that the people would still adopt the mode of transit which was cheaper? No. If you had a quick means of transit, it would bring into existence a large amount of dairy-farming. This particular country is specially adapted for that industry. In the first place you have the rainfall, then you have a lot of rich country, providing shelter for the cattle, and you have small fertile flats where you can grow green stuff.
1561. You set up your opinion then on the conflicting question of water-carriage *versus* railway carriage against what is the experience everywhere—that where you have water-carriage, and it can be availed of, it is adopted in preference, because the price is cheaper;—is not that the general experience, not only here, but elsewhere, and why should not the same principle apply in this particular case? For the simple reason that all along that coast you have bar-harbours, and even though you may spend enormous sums of money, I think you will find the bars forming again. All along our eastern coast line we have that difficulty to contend against.
1562. Would you, then, advocate the abandonment of these harbours? Certainly not.
1563. You want money spent on a railway which would be run at an enormous loss, and you want also money spent to improve the harbours to compete with the railway? Because there is a large bulk of trade which could also be utilised for the harbours.
1564. *Mr. Clarke.*] Mr. Trickett has stated that water-carriage is cheaper than railway-carriage;—is not that a fact? Certainly; in every case.
1565. You stated that you would like to have the improvements carried out at the Manning River Heads as well as a railway to Maitland? Yes.
1566. Would not that be very costly to the country? There is a lot of heavy lumber traffic which could be carried by water. The railway will tap a good deal of country apart from the Manning. It seems to me that all that portion of the district in the county of Hawes, and all over that portion where it is exceptionally ridgy, is not taken into consideration at all. They have to go 60 miles to get to the water-carriage. What I want to impress upon the Committee is that there is a lot of back country beyond, and the people there are so situated that they have to go 60 miles to the water, and have to carry their stuff across the ranges.
1567. Assuming that to be the case, would the produce grown on the land which you now describe give a large amount of traffic to the railway? Yes, an enormous amount. The people there do not now grow produce to the extent they would do if they had means of getting it away.
1568. That would apply, I suppose, mostly to live stock and butter? It would apply to wheat and oats and straw crops, which on those ridges will grow exceptionally well.
1569. I thought wheat cultivation in that part of the country had been abandoned for many years. No; more wheat has been grown during the last two years, and there have been some fine specimens, without rust.
1570. Is not maize the chief product of the Manning River District? There is a quantity of maize grown.
1571. Is not maize grown on the whole of the rich flats of the Manning? Yes; and also a good deal of artificial grass, such as rye and clover for dairy purposes.
1572. Still maize is their heaviest item of trade? Yes.
1573. If this railway were constructed, you think that the maize would come by steamer in preference to the railway? It would come by steamer.
1574. It would not come by the railway? Not all of it—a good portion would come by the steamer, unless of course, there was a fluctuating market.
1575. Live-stock and fruit and other goods of that kind would come by rail? Yes.
1576. Are they going in for dairying in that district? Seven new creameries have been started there.
1577. Would that cause a great deal of freight—as much as the maize at present grown? Taking the number of cattle in the district, it will be seen that the freight in butter would be very considerable.
1578. Butter being in a small compass would not pay the railway or the steamer so well as maize? The Barrington maize would come down by rail, because now they have to travel 56 miles to get to the water.

TUESDAY, 15 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

George Charles Yeo, draftsman, Stock Branch, Department of Mines, sworn, and further examined:—

G. C. Yeo.
15 Mar., 18981579. *Mr. Lee.*] The return you furnished to the Committee on a former occasion included the whole area from the extreme northern boundary of the Colony right through the north coast district to Maitland? Yes.1580. And you were asked to furnish a reduced return showing the area that would be affected by the line as proposed? I gave that information on the last occasion. I split the country up into three different districts. I have to-day a return showing the stock travelling from Taree to Maitland. There is only one route by which stock travel. They travel *via* Wingham, crossing the Manning River at Washpool, thence *via* Gloucester to Maitland. The stock traffic by this route from Taree to Maitland last year comprised 30 horses, 2,000 cattle, and no sheep. Mr. Hoskins asked for some information concerning the A.A. Company. The extent of their area at Gloucester is 116,480 acres; and for 1896 they returned 126 horses, 8,180 cattle, and no sheep; and for 1897 they returned 127 horses, 9,273 cattle, and no sheep.

1581. In your return for travelling stock from Taree, would the Gloucester traffic be included? Yes.

1582. That return included stock from all sources? Yes; they would all come from the Manning and intermediate places.

1583. How many animals are carried in a railway truck, as a rule? I could not say.

1584. Taking ten cattle to the truck, the figures given would represent a total of 200 trucks? Yes.

1585. *Mr. Wright.*] Is there any country at the head of the Manning and about Port Stephens, outside the A.A. Company's land, which is occupied by pastoral holdings? I do not know of any.

1586. Is there not some on the eastern fall of the mountains on the coast side of Armidale? Yes; those would be about the most easterly pastoral holdings, and would include the station of Guy Fawkes. Of course, further towards Armidale there would be some pastoral holdings.

1587. With these exceptions, there are no pastoral holdings other than the A.A. Company's land between the table-land and the head of the rivers? No; only small holdings.

1588. *Mr. Hassall.*] Can you give the Committee any information as to the class of cattle embraced in your returns? I know they have started the dairy industry up there lately, and a good many of the cattle, I suppose, would be dairy cattle; but most of them would be small lots of "fats" from small holders about there—small lots coming into the Maitland market from farmers.

1589. Are there any large returns from stockowners in that district? There may, perhaps, be two or three.

1590. Can you give approximately from memory the number of stock returned by some of the largest owners in the district? I think one owner returned about 2,000 cattle. The largest number is that returned by the A.A. Company, namely, 9,000 odd. Then, I think, there was one owner who returned 1,000, odd. The balance is made up by small holders.

William Edwin Tunks, Land Valuation Branch, Department of Public Works, sworn, and examined:—

W. E. Tunks, 1591. *Mr. Roberts.*] You are an officer of the Valuation Branch, Department of Public Works? Yes.

1592. Have you prepared a statement with reference to the proposed railway? Yes. I have prepared an estimate of the probable cost of the line in connection with the resumption of the necessary land? The estimate is as follows:—1,360 acres, £10,500; severance, £8,000; buildings, £4,500; forced sale, £1,500; cost of transfer, £500; total, £25,000; less betterment, 6,500; leaving, £18,500.

1593. Does that include the whole of the land that will be required for the railway all the way from Maitland to Taree? Yes. It provides for a width of a chain and a half and also for a station at each of the towns, and at intervals of 10 miles between the towns.

1594. Have you been over the line yourself? Yes.

1595. Where do you propose putting the stations? At each of the towns of Paterson, Dungog, Gloucester, Wingham, and Taree, and also at intervals of 10 miles between those places. This was done under instructions from the Engineer-in-Chief.

1596. Is the area mentioned the usual area of land taken? Yes, I think so in lines of this description:

1597. What is the width on either side of the line? Forty-nine feet on either side, or $1\frac{1}{2}$ chain right through.

1598. What portion of the line do you regard as the most valuable? The portion between Maitland and Dungog, for the reason that there are more town lands there.

1599. Then you go through the Municipality of Dungog? Yes.

1600. After leaving Maitland, where do you first pick up the A.A. Company's land? The A.A. Company's land is the other side of Dungog—the other side of the Williams River. It is about 10 miles the other side of the Williams River before you pick up the A.A. Company's land.

1601. Does it extend to the Manning? No; the line only passes through the A.A. Company's land for a distance of 35 miles altogether.

1602. Roughly speaking, what is the average value at which the A.A. Company's land is assessed? At an outside value of £1 an acre. The railway passes through the better portions along the creek flats and nearer to the road.

1603.

1603. What is the average value of the land per acre from Maitland to Taree? The average value of the country land is about £3 an acre. That is exclusive of damage by severance, and including improvements, such as clearing and ringing. The average for the town lands is about £77 an acre. A good deal of town lands will be taken for this line. W. E. Tunks,
15 Mar., 1898.

1604-7. Where will they be situated principally? In Dungog, Maitland, and Paterson, and to a small extent in Wingham.

1608. Then I understand that the A.A. Company's land averages £1 all through? Yes.

1609. Speaking generally how would you describe the land through which the whole of the line will pass;—as fairly good country? Fairly good country for grazing, and along the river flats there is some splendid agricultural land.

1610. There are large areas of fine agricultural land? Yes.

Richard Atkinson Price, Esq., M.P., sworn, and further examined:—

1611. *Mr. Clarke.*] Is the country through which this line would pass thickly populated? No; in the central portion it is sparsely populated. R. A. Price,
Esq., M.P.

1612. Can you give the Committee any idea as to the quantity of goods that would be carried by the proposed railway if it were constructed? Do you mean the quantity with its present development, or the quantity if the capabilities of the country were developed. 15 Mar., 1898.

1613. I mean the quantity of goods at present, so as to give an idea of what the return would be from the carriage of those goods? I could not give that information, because the line will create its own traffic in live stock.

1614. You cannot then give any information as to the probable quantity of goods that will go over the line, so as to form some idea of the revenue that will be derived? Yesterday I gave you the figures as to the number of cattle we have there at the present time, and I also quoted the area under crop. Those figures would show the actual quantities in the central portion that would be carried by the railway.

1615. Do you think, in the event of the line being constructed, there will be a large increase? Undoubtedly.

1616. On the Manning, and right through from Maitland to Taree? I am dealing more with the central portion of the district. I am not touching the Manning so much. The whole of my argument deals more with the central and western portion of the line.

1617. If all the produce would go by rail instead of by steamer, can you give us any idea whether there would be sufficient traffic to make up the estimated loss of £31,000? If the whole of the produce for which the country is adapted, and which would be developed, were passed over the line—taking a high state of development—I think it would. I have not worked out the figures, so I cannot say for a certainty; but there would be an immense amount of traffic. For instance, at one place near Barrington, there is a flat locally known as Avon Flat, on which I should say 3,000 families could be profitably employed in farming.

1618. You are aware that a very large sum will be required for the resumption of the land to be taken for the railway, the total amounting to £18,500? I should imagine an arrangement could be made with owners of the land. In the estimate given, I suppose the cost of severance is included. Considering the immense improvement that would be given to the adjoining land belonging to the large holders in the district, I should take it for granted that under the Public Works Act these large valuations will be much reduced. That is a point which should be taken into consideration.

1619. Do you think it possible that the people who own the land through which the line would pass would give it free of cost? I certainly think an arrangement could be made with the A.A. Company, and I think it would be only a fair thing that, the line passing through their land, they should give the greater portion free of cost.

1620. As to this you have no direct evidence, but merely, I suppose, speak on hearsay? Yes, on hearsay; but I believe the land would be given free of cost.

1621. It was stated yesterday that the proposed expenditure on the breakwater at the Manning Heads would be about £100,000? Yes.

1622. The interest on that at 3 per cent. would be about £3,000, and that would be an additional item which the country would have to pay? I think you misunderstand my argument. I have referred to good land in the back country, comprising part of Gloucester, and part of the county of Hawes. Between these lands and the Manning River there is a journey across a series of ranges—including the Brush Mountains and others—of about 50 miles, and the traffic from that part of the district would not go to the coast at all.

1623. But would not the greater part of the heavy traffic still go by sea? Certainly not. A lot of the traffic I speak of would go by land.

1624. Would the maize grown on the Manning River flats go by rail? I am not speaking of the Manning River flats; I am speaking of another portion of the country. The cost of conveying goods to and from Nowendoc and Wingham is £7 a ton. The rate is the same from Rawdenvale and Berrico to Wingham. You have to go over all these ranges I speak of.

1625. Do you think the produce grown on the Manning River flats would go by rail? Some of it.

1626. On the whole, you think the railway would be more useful for perishable goods and live stock than for heavy goods? Yes; that is my contention.

1627. Would there be a considerable passenger traffic? Undoubtedly. There is coal at Stroud which would create a traffic, and there is a series of gold-reefs at Kurraki which are capable of supporting a large population. A yield of 40 oz. to the ton has been obtained at a level of 260 feet. There is an extensive belt of auriferous country, some of the reefs having been proved at various depths, which promises great possibilities in the future.

1628. Do you consider that if this railway were constructed from Maitland to Taree it would be in the public interest? As a national line ultimately, and if the resources of the country were properly developed the traffic would be such as to ensure a sufficient return. I take it that this is only a section of the north coast line.

1629. *Mr. Hassall.*] You know the country very well? Yes, every inch of it.

1630. Do you look upon the land held by the A.A. Company as highly improved land? No; there is no improvement upon it at all.

1631. None whatever? Well, comparatively little.

- R. A. Price, Esq., M.P.
15 Mar., 1898.
1632. Practically, then, it is as they got it years and years ago? There is a good deal of clearing done here and there, but practically it is as they got it.
1633. The land, in your opinion, is not very valuable? A lot of it is valuable, and would be suitable for dairy-farming if cut up.
1634. In view of the extent of country belonging to the A.A. Company through which the proposed line would pass—and I think I understood you to say there was a considerable demand in the locality for land suitable for settlement—do you not think it would be advisable for the State to resume the whole of that land and make it available for closer settlement before constructing a railway? I anticipate that the Government will carry out their intention, in connection with the Bill they introduced, called the Lands for Closer Settlement Bill. I anticipate the Government will push on that measure—they have had it dangling a long time now before the people—and that they will resume the land around the Avon Flats, and the land around Gloucester—lands adapted both for cultivation and dairy-farming.
1635. But it does not seem justifiable to incur such a large expense in the construction of a railway through that country, unless some different conditions prevail? The A.A. Company have subdivided the greater part of it, and they grant leases at a lower price than the Crown does. They will sell the freehold or the greater part of it, and if facilities were given I take it that dairy-farming would be established on a very extensive scale.
1636. In view of the proposal now before this Committee to improve the mouth of the Manning River, do you think the country would be justified in going to the expense of constructing a railway through that country, under existing conditions, and also incurring the expense of improving the navigation of the Manning River in order to serve the same district? Yes; because a large portion of the traffic which would be served by the opening of the Manning River would not be affected by the railway, owing to the ranges lying between the coast and the country referred to.
1637. Then, is the country through which this line passes practically inaccessible from the coast? Well, it would cost you about £7 a ton to take your stuff from Nowendoc to the harbour, or to the head of the navigation of the Manning.
1638. In view of the estimated loss upon this line, do you not think it would be necessary to impose higher rates than are imposed upon lines of a better paying character? This line would be a great feeder to the Northern line.
1639. I want to find out if there is a loop-hole by which we can come to the conclusion that the estimate of loss is too high? I am inclined to think it is too high. I have already pointed out that an officer visiting the district and going along the main road would not be able to get a correct idea of the character of the country. In order to see the country, it is necessary to go off the road, and then it becomes almost inaccessible. I may say that the main road passes through the worst of the land.
1640. As an alternative, which do you think would be the most beneficial to the district along the coast—the improvement of harbour accommodation and river navigation, or the construction of a coastal line of railway; because it must be evident that if the railway is constructed from Maitland to Taree it cannot stop there for ever? I think that the two things could go on *pari passu*.
1641. But, provided you were not able to obtain both these schemes, which do you think would be the more beneficial to the district—the improvement of the navigation or the construction of the railway? We have got the improvement of the navigation, so I do not think we need enter into the calculation.
1642. *Mr. Roberts.*] Have you been over the whole of the proposed line from Maitland to Taree? I have ridden over every square inch of the country.
1643. You are perfectly familiar with what is known as the alternative route, by way of Seaham? Yes.
1644. Have you formed any opinion as to which line you prefer, or as to which would be the best in the interests of the community? I have not gone particularly into the question, as it relates to that part of the district surrounding Seaham and Dungog. I have dealt more with the upper portion around the county of Hawes, and towards the north-west corner.
1645. Would not the eastern line interfere with the navigation of the rivers over which the line would pass? No; I take it you could throw up the banks in places sufficiently high, or you could construct a draw-bridge.
1646. How is the produce from different parts of this district now taken to market;—it is all taken by river, is it not? The produce from Barrington has to be taken 72 miles for shipment or to get it to rail, and this costs a lot of money.
1647. But a large amount goes down the Paterson, does it not? Yes; that would go from the Dungog side. It would go down the Williams.
1648. The traffic is done principally by way of the Paterson, the Williams, and the Manning? The Williams, the Manning, and the Hunter.
1649. If a railway were constructed, do you think a large number of people would cease to use the river? For perishable stuff, yes. Bulky stuff, such as maize, would still go down by the river. There would be a great advantage in sending by railway as regards loading. Without a railway, you have first of all to load your dray, send your team to the harbour, and unload the produce on the steamer. Then there is the delay, and when the steamer reaches the wharf in Sydney the stuff has to be again unloaded into drays, and from there afterwards unloaded. On the other hand, sending by railway, you simply truck your goods at the station, and in the case of live stock they are landed at the Homebush market without any further handling. The value of live stock carried to market by steamer is much depreciated owing to the knocking about the animals receive. If you had a good market for “fats” at Maitland, they could be conveniently sent there by rail, whereas if they had to be shipped on the coast they would have to be driven along the roads and taken on a sea voyage. Under these circumstances it would be really more profitable to send live stock by rail, even though the freight were higher. Our farmers suffer much from delay in getting their produce to market. It has frequently happened that great loss has occurred among consignments of fish and poultry shipped at the Manning.
1650. Is it not a fact that the great delay which takes place in getting produce to the market has caused the agitation for the North Coast railway? Yes, to a great extent. The present state of things retards the progress of the district. On the Barrington they grow maize, and not being able to send it to market they feed pigs with it.
1651. Have you any regret that the whole of the North Coast line from Maitland to Grafton was not sent on at once to this Committee? I have. The line should have been sent as a whole. I do not think that you can consider the question fairly, dealing with it piecemeal. I think it should have been referred to

to the Committee as a national work. Independently of its commercial aspect there is the question of national defence. You have not a fortification along this part of the coast, where there are places of access and some valuable towns, and in the event of a filibustering expedition—though I do not suppose there is much danger of that—you would have no means of rapidly transporting troops and guns.

R. A. Price,
Esq., M.P.
15 Mar., 1898.

1652. As a public man, and a Member of the Parliament of the country, you look upon this proposal, do you not, as an instalment of what is termed the North Coast line, running from Maitland in a northerly direction to Grafton, and possibly right on to Brisbane? That is the aspect in which I look upon it. I look upon this line as only a section, and though from a commercial point of view it might be an expensive line, still we must consider the question of the North Coast line as a whole, and recognise that it would be necessary to carry out that line sometime or other. It would even pay to incur a loss upon this section in view of the great advantage which would accrue from the total length of the railway when constructed.

1653. Do you know the North Coast district? Yes, every part of it.

1654. How does the North Coast district compare with the South Coast district as regards the resources of the country, the natural beauties of the place, and the adaptability of the soil for farming purposes? On the South Coast, having an easy get-away for their stuff, they have cleared a lot of land, and have planted it with rye grass and other artificial grasses, and have carried out drainage improvements, and obtained appliances for dairy-farming. But I think that if properly developed the resources of the North Coast district are greater. They have a greater extent of back country not touched by a railway. Owing to the position of the coastal range in the south, there is there a comparatively small area of land. Speaking of the North Coast as a pleasure resort, you have there a chain of lakes 80 miles long. There is one lake 13 miles by 7 miles, the best fishing-ground in Australia. There are Wallis Lake and Myall Lakes extending down to Port Stephens.

1655. And you have in that part of the country every known mineral? Yes; that is a point I omitted. There is a deposit of alum there quite phenomenal in character. It is larger even than the Italian deposits. I myself on the Myall have obtained sulphide of antimony containing as much as 80 to 100 oz. of silver to the ton. I have had assays made of copper from the country round Carracaback which have given as high as 42 per cent. of copper down to 2 per cent. Then, according to Professor David, there are iron deposits there, some being sedimentary, and others consisting of large ironstone blows, which, owing to the absence of titanitic acid, compare favourably for industrial purposes with any ironstone found in Australia. One defect in the ore is that in some cases it is too rich. In one portion of the district, the cheapest kind of road metal they can get is a brown hematite ironstone, similar to that which is imported by England from Spain. Then at Stroud you have the coal on edge, and we do not know what experiments might prove with regard to some decent deposits there. The coal has been used for forge and other purposes, and I have no doubt that some of it would be suitable for railway purposes. Then going up further you have contiguous belts of limestone. An analysis of the limestone at Bulladelah showed a result as high as from 80 to 86 per cent. Then lower down we have the same thing. In fact, the country is one mass of rich minerals.

1656. You think it only wants a railway to develop these vast resources? Yes; and judicious administration on the part of the Mines Department.

1657. Do you think a large population would quickly settle there if a railway were built;—is not the land all the way from Maitland to Taree admirably adapted for settlement? Yes; because you have there what does not exist in any other part of the Colony, not even in the South Coast. You have a network of rivers or creeks. At Rawdenvale, at Carracabark and at Bawman, and also at a place called Cobokh, you can drive batteries by water power which is never-failing. At the Buchans, looking from the road, you see nothing but immense cliffs which everywhere stare you in the face, and you think the country is all barren; but, crossing the range, on the next ridge past Berrico you come to Rawdenvale, at which place Mr. J. T. Laurie, J.P., one of the oldest residents of that district, experimented in growing arrowroot, with the result that samples which he sent to the exhibition in Paris obtained a gold medal. He was also successful at the Philadelphia exhibition, and altogether received high diplomas for his arrowroot at seventeen different exhibitions. Then again, on the authority of Mr. Sutherland, a Government expert, it has been established that parts of the district will grow tobacco successfully. Both the soil and the humidity of the atmosphere are favourable to the growth of this product, and tobacco can be grown similar to that produced in the Levant, in the Mediterranean. On the coast cigar-wrapper leaf is grown, and on the plains the land will produce tobacco suitable for plug. I should like to say that I have received this morning a letter from Mr. J. Fenning, of Kurraki, an extract from which I should like to read to the Committee, as the reef to which it refers is indicative of a hundred and one other reefs which have been proved to a small depth and abandoned:

“The south drive is showing splendid gold. Main reef crushing about 36 tons. When done will furnish splendid stone. If the north and south reefs keep as good as they now are, the next crushing will be a sensation.”

THURSDAY, 17 MARCH, 1898.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Bartholomew Martin Corrigan, shipowner, sworn, and examined:—

1658. *Chairman.*] You are a shipowner trading to the northern rivers? Yes.

1659. What is the freight between the Tweed and Sydney? On an average about 10s. per ton at the present time.

1660. If the river be improved according to the design, at what rate would you be able to carry goods? At from 7s. to 8s. per ton.

B. M.
Corrigan.

17 Mar., 1898.

TUESDAY,

TUESDAY, 22 MARCH, 1898.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).	
The Hon. JAMES HOSKINS.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

William Edwin Tunks, Land Valuation Branch, Department of Public Works, sworn, and further examined:—

- W. E. Tunks.
22 Mar., 1898.
1661. *Mr. Lee.*] I asked you to furnish some additional information the last time you were here; have you obtained it? Yes; it was with regard to the A.A. Company's property. I have a tracing showing the portion of the property which has been sold. Those portions appear to be the only ones on the estate suitable for agriculture.
1662. And they have been sold by the company? Yes; the portion of the tracing edged yellow shows the A.A. Company's property; the portions coloured pink have been sold by the company; the portions comprise about 20,000 acres adjacent to the railway.
1663. About where would they be situated? The road goes through the centre of the purchased land, and the railway runs near the road. Most of the land sold is between the railway and Stroud. For about 16 miles along the railway line the land has been sold commencing from portion 639.
1664. Is there any arrangement between the Lands Department and the A.A. Company to exchange land upon this estate? I could not say.
1665. Have you any other information with regard to this particular estate? No, only that the sold portions appear to be the only portions fit for agriculture; the rest is simply fit for grazing.
1666. Is it used by the company for that purpose? Yes.
1667. You think the company have sold all the best portions? I believe that inquiry will elicit the fact that all the best portions of the estate have been sold.
1668. Do you think the Committee would be right in inferring that the construction of the proposed railway would not add largely to the agricultural area? Not through that estate. There are good patches of agricultural land along the creeks on other portions of the estate, but they are only here and there.
1669. Are there any reserves for villages or townships along the estate? Only at Gloucester, near the railway line.
1670. The Church and School Lands bound the estate on the western side? Yes.
1671. Do you happen to know how the bulk of that land is held at the present time? It is held under lease at rentals based, I believe, on an average capital value of 6s. per acre.
1672. The proposed railway passes through the A.A. Company's estate for a distance of about 52 miles? Yes. As I have already explained, a good deal of the estate has been sold.
1673. Have you estimated the possible claims for severance which would arise from injury to the A.A. Company's property and to the property of those who have purchased from the company? I have dealt with the other owners separately and distinctly from the company. I have dealt with the A.A. Company for about 35 miles on the line.
1674. You are aware that the Maitland end of the line passes through two or three valuable estates;—have you taken into consideration the claims that are likely to arise for severance in respect of those estates? Yes, the whole thing has been taken into consideration.
1675. Have you any recognised principles guiding you in forming an opinion of the possible damage by severance? Yes, there is loss and inconvenience of working through the railway passing through property. The conservation of water has also to be allowed for. Supposing an estate is divided, for instance, in such a way that one portion will lose its water, in such a case we would allow for conservation. In the case of the A.A. Company's estate there would be very little severance; the railway would divide the property into paddocks, which would be an advantage in a way.
1676. Suppose it were decided that the line should not be fenced, how would you then estimate the loss from severance? In that case the owners would have the means of crossing. The crossings would be allowed at convenient places. Wherever possible, level crossings would be constructed to mitigate the claims for severance.
1677. Considering that a large amount of private land is involved in the proposed railway construction, do you think that you have so estimated the claims which might arise as to prevent the possibility of a largely increased amount of subsequent claims? Our estimate has been made to cover everything. The opinion of the Acting District Surveyor at Maitland was that the country lands all through should average about £2 an acre. That would be the value of the land only. My estimate is based on a higher rate than that. Severance has been allowed all through. In many cases, as I have explained, instead of involving a loss, it is really a betterment, because it has the effect of dividing the property into paddocks.
1678. The department has to consider many claims of this kind? Yes, they are constantly cropping up.
1679. Then you ought to be in a position to give us authentic information upon this point;—do you see in this proposal anything of a character different from that of other proposals with which you have had to deal? No; it is similar to most country lines.
1680. There is not much land held under conditional purchase on the route? I do not think there is any land which has been alienated from the Crown within the last five years.
1681. Your estimate, then, is really upon the basis of actual freehold? Yes.

MONDAY,

MONDAY, 23 MAY, 1898.

[The Committee met at the Chamber of Commerce, Newcastle, at 2 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.
JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

The Hon. Alexander Brown, M.L.C., merchant, Newcastle, sworn, and examined:—

1682. *Mr. Black.*] Perhaps you would prefer to make a general statement in regard to this proposal? The purpose, I understand, for which the Committee are met is to consider the desirability of constructing a railway from West Maitland to Taree. If the proposal is confined purely to a railway from West Maitland to Taree, I look upon it as practically commencing at a datum point, but ending nowhere, and unless it were the basis of a continued North Coast line, I could hardly say that there would be any warrant for its construction.

Hon. A.
Brown,
M.L.C.
23 May, 1898.

1683. Of course, in constructing a railway of that character, you must always take into consideration the possibility of its extension? Yes, certainly. It would all depend on the point it is to start from and where it would end, but I suppose it would be, as you say, an element of consideration that finally it would be extended from its present point so as to reach all the large centres on the North Coast. Assuming that this is to be a portion of a North Coast line to be extended to the line already in existence in the northern portion of the country—the Lismore line—I should say from what I know of the country that I think it is very desirable to construct it. There is a fairly large population already settled, and because of the productive character of a large portion of the country, it would be capable of supporting a very large number of inhabitants, to whom the proposed railway would give means of communication with a large market in the Newcastle district, where there is a very large consuming population; and it would also bring that portion of the Colony into direct touch with Sydney, whose market is not now available to them, because of the spasmodic steam service by which they are necessarily served at present.

1684. Has Newcastle a trade of any dimensions with the North Coast? Newcastle has not such a trade with the North Coast as it would have if it had the opportunity of supplying the requirements of the people there. At present the boats that serve the North Coast do not call in at Newcastle, except only now and again. They make a direct service to the north instead of calling in at this port.

1685. That is to say, there are no local steamers trading from Newcastle northerly? No. The service is between Sydney and the northern rivers. A steamer calls in here occasionally when required. I am referring now more particularly to the North Coast Steamship Company; but I think that a gentleman named Yager has steamers trading between the different places, and if I remember rightly they make Newcastle a continuous port of call.

1686. The chief products in the north, I understand, are timber and maize? Yes.

1687. There is, I suppose, a large market in Newcastle for both those products? I think so. I should fancy that that country on the coast is capable of growing almost anything, especially when you get farther north to the rich flats on the Richmond and the Tweed.

1688. Do you think that timber or maize brought from the North Coast by rail, especially maize, could compete in the Newcastle market with water-borne maize or timber, or with maize grown in the immediate vicinity of Newcastle? No; I do not think so, not at the present rate at which the Railway Commissioners' tariff is fixed for the carriage of these products, but I can hardly look upon the settlement of these rates as the laws of the Medes and Persians, especially when you take into consideration the facilities offered for the carriage of grain and other produce to the seaboard in America and other large countries.

1689. You think, then, at prevailing rates, they could not compete, but that under a rate which you think would be a more just one competition would be possible? I think so. For instance, I doubt very much the prospect of doing anything in regard to the harbours on the North Coast, except merely making them accessible for small craft. I do not think it is possible for those ports to assume the importance of Newcastle or of Sydney, and while they are entitled to be served to a reasonable degree out of the expenditure of public funds, I do not think the time is ever likely to arrive when they will come into competition with a place like Newcastle or Sydney, which has the world for its market.

1690. In other words, the Northern ports are likely to be only places of collection of goods which will find their market elsewhere? I think so; intermediate depôts.

1691. Places of collection and distribution? Yes; places of collection and distribution. I do not think that we, for instance, shall always be confined at Newcastle to the shipment of coal. We have already developed a direct shipping trade in wool and general merchandise, and so we will in wheat and other produce, to other parts of the world from here. That never can obtain, I think, at the northern rivers.

1692. Do you think it would not be possible to so improve the northern ports as places of entrance that you could have a more regular service than you have now? I think so. I think that the expenditure of public money which is going on at those ports now ought to give them extra facilities, but it will not give them facilities for merchandise that has to be sea-borne in the class of ships and steamers which are gradually being built.

1693. If those ports were made more accessible—if a larger class of vessel could enter them, and if the bars which are now shifting and always dangerous could be to some extent permanently removed, do you think that the steam-shipping trade would not be put in such a position that it would be almost impossible for the railway to enter into competition with it? I should not think so. I should think that the land-carriage on a large portion of the material that is produced would be benefited by its proximity to the railway line—in other words, that it now has to be carried to the rivers, and when you put the rail-carriage on to it at a reasonable rate, I do not think that a large portion of the produce, at any rate, would be affected by it; that is, looking at the possibilities which there are in the north with the fertile lands on the North Coast.

1694.

Hon.
A. Brown,
M.L.C.
23 May, 1898.

1694. I suppose that the producers of the more perishable goods—such as butter, bacon, and so on—would prefer the railway? Yes; I think that the want of some kind of communication like that has retarded the great settlement that would have taken place on those rivers if they had had an opportunity of access to market which they have not got to-day. The possibilities of some of these fertile lands are almost marvellous.

1695. You think that it would open up the country for settlement? I do. I happen to know, of my own knowledge, a couple of acres of land that have been well cultivated on the Hunter River, and the produce from that land during the last twelve months, after paying for every expense, has represented £80 divided between two men.

1696. I suppose that under any circumstances the coal which is sent north from Newcastle would go by steamer? Yes. For the purpose of coal transit, I do not think that any railway can compete with water-carriage.

1697. Do you know of your own knowledge if there is any trade between Newcastle and the northern districts in cattle? I cannot say of my own knowledge, but I should think that there would be a good deal of stock come from the north-east.

1698. You have not had any opportunity of examining the proposed route of the railway, have you? No; I have not had any opportunity of examining it. I know something of the locality in which it would go.

1699. You are aware, of course, that it would be rather an expensive railway to construct, because of the number of rivers which run from the dividing range towards the sea? It would be an expensive railway. I have always understood that a North Coast railway was likely to be an expensive railway, but I have also understood that the estimate has been based on the heavy expenditure we have hitherto borne for all our railway lines; but I presume, judging from authorities, that the expense might be considerably minimised. A light line of railway is at all times infinitely preferable to a road.

1700. No doubt it would cost less to make, and also less to maintain? Yes; and it is also a better means of transit, and likewise a source of revenue.

1701. Being informed that the cost of constructing the North Coast railway from West Maitland to Dungog would be £8,440 13s. per mile; from Dungog to Gloucester, £7,572 12s. 8d. per mile, and from Gloucester to Taree, £9,784 6s. 4d. per mile, or a total of £982,283 for the whole construction, with an average throughout of £8,629 15s. 4d. per mile—do you think that under all the circumstances such an expenditure is warrantable? I do not. I should say let it wait, if those figures are correct. They must build railways a good deal quicker and better in America than we do. It was only last night that I read of a contract signed in America for the construction of a railway in Mexico for 350 miles, and the contractors undertook to have 150 miles of it built and in working order in November. In the face of the figures you have given me, I should be disposed to let the project wait.

1702. Do you think if it were possible to construct this railway at the rate of about £2,500 per mile such an expenditure would be justifiable? I do, most decidedly. With an expenditure of from £2,500 to £3,000 per mile, a light line of railway to serve the people of the north would be justified in every sense.

1703. But when you come to figures three or four times as much as that, you hesitate and say it would be better to pause? I think so. We cannot afford to do otherwise.

1704. *Mr. Fegan.*] In 1891 the original estimate of cost was £1,378,925; another survey was made, with the result that the estimate was cut down by £396,642;—still, you think that £982,000 is too high? I do.

1705. And that any line constructed at a cost of £8,400 per mile could not be expected to pay for a considerable time? I do not think that such an expenditure would be justified.

1706. Do you think that the primary reason for constructing a line should be to make it pay? No; that does not necessarily follow, because if we had attempted to carry that out we would never have constructed any railways in the Colony.

1707. You think that the primary idea is to give people facilities to get a market and to open up the country and settle population? Yes, when eventually the railway will pay for itself; but when you come to unwarrantable expenditure it is another thing.

1708. You cannot support the proposal now before the Committee, seeing that the cost would be so great? On those figures I cannot support it.

1709. You know that at the present time we are spending some thousands of pounds in making the approaches to the various rivers on the North Coast much better than they are now? That is the object, I understand; but it is all Government money, and it is being spent principally by the Government, and I know what Government expenditure is.

1710. Is there a possibility of getting that money back, or any percentage on it? Not unless the Government collected port dues, or something of that kind. Indeed, I think that the small amount that they would collect there would be infinitesimal.

1711. Instead of doing that at some of the ports to which this railway, if it were constructed further on, would be contiguous, do you not think that the railway would supply those people even better than the harbour and river works that are being carried out now? Then you deprive them of all means of water-carriage.

1712. You say that you cannot support this line on account of the enormous cost, but as you know that the Government are carrying out works on the northern rivers, and do not propose to charge the people there a penny for carrying out those works, how are you going to get a return for the thousands of pounds spent on those rivers? You will get no return at all, so far as I can see; but we have spent large sums of money there already, and we cannot get it back.

1713. But there is no doubt that ultimately this line would be only the commencement of the North Coast railway? We must be connected with the North Coast by rail; but the question is whether on those figures the time is now expedient for it. I do not dispute those figures—that would be setting my judgment against that of the Engineer-in-Chief—but I have very grave doubts whether in America they would not get some one else to verify them.

1714. But, pending a better survey than we have at the present time, do you think that the people of the North Coast should have some facilities to get their produce to market? I do.

1715. Therefore, the money now being spent on harbour works you do not disapprove of? I do not. As a section of the community the people there are entitled to some consideration.

1716.

1716. *Mr. Hassall.*] Do you think that the country would be justified in spending money on the construction of the proposed railway and also on the improvement of the harbours and rivers? I do—a reasonable expenditure. Hon.
A. Brown,
M.L.C.
23 May, 1898.
1717. That is only on the assumption that the railway could be constructed at a reasonable expenditure? A reasonable expenditure in both ways—to give facilities to the people on the seaboard, and also to give facilities to people who would be touched by the railway.
1718. You are aware that the principal part of this railway runs through private property—the A. A. Co.'s Estate? I am not aware that it does.
1719. Over 50 miles of it traverses that estate? From what I remember of that part of the country I do not think it is of very great value.
1720. Do you think that the construction of a railway through it would open up that country or make it more densely populated? I think so.
1721. Have you any knowledge of that country at all? Yes, I know something of it.
1722. Would you give the Committee your opinion in regard to the country that you know which would be traversed by the proposed line of railway? Some of it is shockingly poor land. It is not very valuable—all of it.
1723. What proportion of it would be suitable for settlement? A very small percentage, indeed, would be suitable for closer settlement, and that would be in the neighbourhood of Taree.
1724. So, practically, the line would have to traverse the greater portion of the country before coming to country—that is, in the Taree district—suitable for closer settlement? Yes; I think so.
1725. *Temporary Chairman.*] Can you tell the Committee if much of the produce of the northern districts is consumed in the city of Newcastle and its environments now? A good deal.
1726. How does it reach here? By rail and by water. It comes by water by means of droghers on the rivers, and then by boats from the North Coast rivers.
1727. Do the North Coast districts supply Newcastle with much butter? I think not. I think that the butter is produced locally; but maize and potatoes, and that kind of produce, find their way here in large quantities.
1728. And there is in Newcastle and its surroundings always a large market for such commodities? The Newcastle people are a consuming population entirely. They are engaged in enterprises which take up all their time, and they depend for produce on the North Coast districts.
1729. There are practically between 40,000 and 60,000 mouths to be fed in this district by the North Coast districts? Yes.
1730. I think you said that you think the small settlers in the north should have reasonable facilities given them by the improvement of their rivers? I do.
1731. It is proposed to spend £50,000 at Port Macquarie, and £50,000 at the Manning River Heads, and a smaller amount at the Bellinger and also at the Nambucca Heads for the purpose of giving those people a certain and ready means of transit;—do you think that the country is wise in undertaking that expenditure? So long as the money is judiciously spent, and is not thrown away as it was at Lake Macquarie, to give them facilities they want, they are entitled to it.
1732. Will there be any prospect of the railway successfully competing for the produce of those districts if we give them fairly good harbours; nearly all the cultivatable land is on the banks of the rivers, and steam droghers go up and down and collect the produce almost at the farmer's door, whereas the produce would have to be carried to the railway;—do you think that under those circumstances any large proportion of the produce would be carried to this railway if it were constructed? I do. I think that a railway there would be practically the same as a railway on the Hunter, where a large proportion of the produce is collected on the banks of the river from certain settlers, but a large proportion also goes down by rail to the metropolis and to Newcastle.
1733. What proportion of the heavy produce of the Hunter goes by rail;—what proportion of the maize, lucerne, and hay is carried by rail as against water freight? A very considerable proportion.
1734. And of other products? Yes.
1735. Are you aware that the products of the northern rivers consist very largely of maize and timber? Yes.
1736. The steamers at the present time do not bring the timber, but they bring the maize? Yes.
1737. Do you think that the railway could successfully compete with water-carriage for the maize? I think it could if the rates were reasonable.
1738. Summing up your evidence it amounts to this, that if a railway could be constructed on the North Coast for a moderate sum the possibilities of the development of that coast are so great that you think the State could undertake the responsibility? You have summed up my evidence in those words.
1739. But you think that the construction of the railway would not be satisfactory unless its objective point were Queensland? That is so.
1740. *Mr. Fegan.*] Do you think that the estimate for goods and passenger traffic, and everything else from Maitland to Taree, about £18,000 per year, is a fair one? I think it is a low estimate.
1741. The annual cost is estimated at £49,468, and the traffic receipts from live stock, goods, coaching, &c., is estimated at £18,000 per year, leaving a deficit of £31,000 a year;—do you think that the estimate of £18,000 for passenger traffic and everything else is too small? I think it is a very careful one.
1742. Careful in what direction? In the direction of economy.
1743. You think it is rather low? I think so.

William Lowe Kidd, Mayor of Newcastle, sworn, and examined:—

1744. *Mr. Fegan.*] Are you acquainted with the country from Maitland to the proposed terminus of this railway—Taree? No; I am acquainted with the country about Maitland and towards Dungog, but no further. W. L. Kidd.
23 May, 1898.
1745. Will you kindly give us a description of the country so far as you know it? So far as that, it is very good for general agricultural purposes.
1746. What is it utilised for? Growing maize to a great extent, and hay and general farm produce.
1747. No wheat grown there? No.
1748. There was a time when a great portion of that country was under wheat? Yes; at one time.

- W. L. Kidd. 1749. What is the reason why the people ceased to place it under wheat? On account of rust.
 23 May, 1898. 1750. But the question of rust has been got over to a considerable extent lately by scientists? I know they now have wheat that will to a certain extent stand against the rust.
 1751. Therefore, there may be a possibility, with greater facilities than the people there have at present, of opening up that country for wheat-growing again? There might be, but I question whether it would pay them to grow wheat instead of what they are growing.
 1752. They are growing maize chiefly? Yes; maize and hay.
 1753. And cattle and dairy produce? Yes; and my opinion is that they are much better-paying products for farmers than wheat.
 1754. That greatly depends on the prices? Exactly.
 1755. Do you think that the construction of a railway there would give them better facilities than they have at the present time? Undoubtedly.
 1756. Do you think that it would be the means of inducing closer settlement there? Not in the district that I know. I think they are pretty well served by the river at present, and I question if the railway would be of much more service to them.
 1757. Do you know the estimated cost of the proposed line? I have heard it stated while Mr. Brown was being examined.
 1758. In round numbers, £1,000,000? Yes.
 1759. Do you think that is a very high estimate? I think it is.
 1760. Do you think there is no possibility of the line paying under those conditions? I do not think it could possibly pay.
 1761. Are you acquainted with the estimate of traffic for the proposed line? Only what I have heard mentioned while I have been here.
 1762. It is something like £18,000 per year? Yes; for the whole length of the line.
 1763. Considering the great cost of construction, and considering the working expenses will be about £49,000 per annum, and the estimated traffic receipts only about £18,000 per annum, you cannot see your way clear to support the scheme as at present before the Committee? Not at that expense.
 1764. That is just your present position? Yes.
 1765. Do you think it is wise that the terminus should be at Taree instead of further on? The answer to that question would, of course, depend a great deal on the facilities the people have on the seaboard in the shape of harbours. If they have good harbours farther north I think it would be a mistake to make a railway to compete with them.
 1766. You are not personally acquainted with country farther than Dungog? No, I am not.
 1767. Therefore you do not know the country the line is to pass through except so far? No. I have only read of it.
 1768. You think that under present circumstances the cattle and dairy produce and the other produce grown in the district at present pay them better than wheat-growing would? I feel certain that they do.
 1769. *Temporary Chairman.*] You heard Mr. Brown's evidence? A great deal of it.
 1770. You heard him say that if a railway could be constructed between Maitland and Taree and along the North Coast at a moderate cost, (say) between £2,500 and £3,000 per mile, he believed it should be constructed? I think so too. I am very much of the opinion which he expressed, viz., that it is better to construct a railway at a moderate cost than to make and maintain a road.
 1771. Do you think that if the State could construct a railway from Maitland or some point near that town to the Queensland Border through our coast lands at a cheap rate, it should be constructed and the State would be justified in its expenditure? I think so.
 1772. You hold the same opinion that Mr. Brown does, that it is really premature to construct a railway at the enormous sum which this line is estimated to cost? Yes.
 1773. You think that we should wait until the population is more dense on the northern rivers, and which would justify the construction of a railway there? I think that the expenditure is too much for our present population.

Alfred Francis Hall, civil engineer and licensed surveyor, Newcastle, sworn, and examined:—

- A. F. Hall. 1774. *Mr. Hassall.*] Have you heard the evidence given by Mr. Brown and Mr. Kidd? I heard all Mr. Kidd's evidence.
 23 May, 1898. 1775. Do you agree with him? I have a better idea of the country beyond where he speaks of.
 1776. Under these circumstances, would you kindly make a statement to the Committee in regard to the character of the country traversed by the line? Yes. I have surveyed land all through the A.A. Co.'s Estate and up about Underbank, Dungog, Copeland, the Barrington, Gooloongoolook, and the Port Stephens district generally. I know the proposed line of route for this railway from Dungog up to the Manning River very well, and I think that if a light line were constructed it would give a good return. By a light line, I mean a line of about 52-lb. rails and a narrower gauge than that proposed.
 1777. Costing what? I have estimated that it would cost about one-fourth less than the estimate for the 4-foot 8-inch gauge. I would propose a light line with a 3-foot 6-inch gauge. I know the "Gloucester" Estate very well—the A.A. Co.'s property—and I estimate that there are about 20,000 acres of land there equal, perhaps, to the medium Hunter River lands. I know it was intended to cut that up at one time or another to make farming lands of it, but I made an estimate of what it would cost at present, and I estimated that 33 bushels of corn to the acre would have to be grown to pay freight to Raymond Terrace or the Karuah River. Consequently that to do any good with that area of land you would have to make it into poultry-farms or pig-breeding runs, and drive your produce to market. You can never look upon it as an agricultural area, although in itself it is one. I know the country to the North Coast. There is a very heavy traffic in cattle. I have often seen 5,000 head going down to Maitland, to be sent thence to Homebush, both store stock and fat stock. But the fat stock was not in such large mobs as that.
 1778. Is that fattening country up there? I think they come from the New England district by way of the Barrington. There is an unlimited supply of limestone and ironstone within 10 miles of the proposed line on the east side. Within a couple of miles of it, close to Dungog, there is limestone, and I think that if there were a railway there that might all be brought into use in Newcastle. I think that the A.A. Company have about 130,000 acres of land in their estate that would be suitable for settlement, and there is some very valuable timber which, under present circumstances, does not pay to cut on their land, and also east of their eastern boundary.
 1779.

1779. What description of timber? Ironbark chiefly, hardwood and cedar. It does not pay to bring timber down to a water-course there beyond a limited area. Nothing beyond Stroud could go down by water. In surveying land for the A.A. Company I always reserved this trial survey line. Whenever a person selected land on the A.A. Company's estate the instructions to me as contract surveyor were to reserve the railway line as surveyed, and we reserved a chain and a half in width wherever we found the railway survey line. Going up the Karuah River, and from Stroud to Gloucester the country is undulating and there are a good many water-courses running into the Karuah, and it is difficult country from Dungog to the Monkerai, and also pretty difficult going towards Krumbach; but I certainly think that a light line with rails such as I suggest could be run over that country for about £5,000 per mile at the very outside. I have surveyed about 150 miles of light lines in New Zealand, and comparing this with one particular line I know of, I think this ought to return a fair profit on the outlay. I cannot speak of the country beyond the Manning River; but there is a good deal of fair country on the Manning which cannot be touched by droghers, and the produce of which would have to find its way down by teams to Tinonee or Cundletown, and perhaps there it might get a drogher to Taree, and go out through the Heads by steamer. That would certainly, in my opinion, embrace 15,000 acres of land on the Manning that must be 20 miles from a steamer. It is outside the A.A. Co.'s estate, of course, and up the Manning. There is a good deal of good country up the Monkerai, on the Church and School Estate, and also a lot of bad country. The same may be said of the A.A. Co.'s land. 300,000 acres of the A.A. Co.'s land is not worth owning. That remark would apply to a good deal of the area coloured yellow on the plan, lying to the east. I should say that a strip of land north-west of the Gloucester River, comprising 30,000 or 40,000 acres, is practically valueless. The same remarks applies almost to the whole of the eastern boundary of the A.A. Co.'s land for a distance of 5 miles, and from 3 to 5 miles westerly from the eastern boundary towards the proposed railway line is also valueless; and a strip down to the western boundary of the A.A. Co.'s land for a mile, may also be classed as being the same kind of country. The Crown land lying east of the A.A. Co.'s land, and painted yellow on the map, is very similar country. Practically, with the exception of the land along the banks of the water-courses, it is similar land to that which I have described on the A.A. Co.'s Estate. The A.A. Co. let their land. They have sold about 30,000 acres of the estate. They retain about 140,000 acres for a run. They will lease you any of the rest of the run land that is outside the township of Stroud, and near the Karuah River, for about $\frac{1}{4}$ d. per acre per annum. You can get about 20,000 acres of the A.A. Company's land for about £12 per annum. I made an estimate of how many acres it took to run a head of cattle on that part of the estate, and I estimated 70 acres per head. That applies to about 300,000 acres of the A.A. Company's land. There are about 120,000 acres which might be settled upon. Any land that is good is inclined to be close to the railway.

1780. The land lying along the route of the proposed railway is fairly good; but when you get 3 or 4 miles from that it is practically valueless? Exactly. As I had said, the "Gloucester" land is very excellent, and a good deal of the reserve of 15,000 acres is very good grazing land—to the west of the Church and School land,—and then the gold-field's area lying to the north-west of Dungog is very superior grazing country.

1781. *Mr. Black.*] You think it would be advisable to construct a light line in this locality; but when you speak of a light line, you mean light, not only as regards sleepers and rails, but also light in the matter of earthworks, do you not? Yes; I am speaking of a narrow gauge line.

1782. But if the country is undulating will it not require earthworks whether the line is or is not light? Yes. Every 4 feet 8 inch gauge has 17 feet at the base of the cuttings; and I think the reason for that is that they anticipate duplicating the line at some time. That appears the system adopted in New South Wales, and I do not think in this case there is any occasion for it. I think that a 3 feet 6 inch line along a 10 feet base-cutting would answer all the purposes required in this place for the next hundred years, and give very great facilities not at hand to-day.

1783. Do you not think that the character of the country and the rainfall are such as would necessitate a heavily-ballasted line? I am speaking only from my own experience, and I have been in New Zealand, where I think they can give you a start for grades, and their lines do not cost anything like the money you speak of. They, of course, go in for a different class of station, and do not put up such buildings as you have at Armidale. People laugh at the New Zealand railways with their 3 ft. 6 in. gauge, though they put in fair average time with their express trains, and they run 20 miles an hour with many stoppages.

1784. But a heavy rainfall necessitates heavily-ballasted lines? Yes; but I surveyed 40 miles of line, and it cost £2,100 per mile complete. That was done as a district railway. I certainly think that if £5,000 was the limit, you could put in a light line of railway from West Maitland to Taree which would answer all the purposes for many years to come.

1785. *Mr. Egan.*] What kind of a road have you from Maitland to Taree? The best "bike" road, I believe, in the colonies.

1786. Therefore there is not very much inconvenience to the people residing there in getting their produce to market? Except as to expense. It costs £3 per ton to get produce from Gloucester to Raymond Terrace or the Karuah River.

1787. How many miles is it from Gloucester to Raymond Terrace? Sixty-four.

1788. They pay £3 per ton on a macadamised road? Yes, they do.

1789. Do you not think that is a very high rate? I know that is the price that I was charged. The mode of conveyance is chiefly by bullock-teams. They go about 10 miles per day with a load of 4 tons. The country is not rough, but that is all they can bring down.

1790. You say you have had experience in New Zealand in railway engineering? Yes.

1791. What is the gauge there? 3 ft. 6 in.

1792. That is the standard gauge throughout that colony? Yes.

1793. Do you not think that the position materially differs when the standard gauge is 4 ft. 8 in. here? I admit that it would be necessary to re-truck at West Maitland, and it would cost 4d. per ton to re-truck.

1794. But seeing that we have not got a 3 ft. 6 in. gauge in this Colony, and seeing also that there is a notion prevalent that there should be a uniform gauge, do you not think that it would be very objectionable to the Railway Commissioners and the travelling public to alter the gauge to 3 ft. 6 in.? I should not advocate it on the main line, but for a feeder.

- A. F. Hall. 1795. But would not that be a main line in time to come? If it is intended to be a main line of course my contention falls to the ground. If it is intended to carry this line eventually to Queensland most of what I have said I withdraw. I am speaking of a line from Maitland to Taree.
- 23 May, 1898. 1796. But would you propose a terminus at Taree;—what have you got there to supply your terminus? I do not believe at all in dead-ends on the railway.
1797. Very well, then, you must take it further on? Yes.
1798. Where would you propose to stop? I do not know the district beyond Taree.
1799. But this really means the beginning of what may be termed a North Coast line? Under these circumstances, what I have said would be of very little assistance to you. I am treating it as a branch line from West Maitland to Taree.
1800. According to your evidence a great portion of the country is of inferior quality, and the line would not pay a return on £900,000? I do not think you could have dumped down 500,000 acres in any part of New South Wales as bad as the A.A. Co.'s Estate.
1801. Therefore the Committee cannot look forward to opening up a large tract of country upon which to settle population there? I think that the railway might open up about 250,000 acres altogether—that is, within that limit-line.
1802. Fair land? Yes.
1803. The other is entirely inferior land? Yes, as far as my judgment goes. There is some very good land around Gloucester, and almost as good along the Barrington River up as far as a township called Barrington, and a strip right down the proposed line of route. You may say for the whole length of the railway you get 80,000 acres of good land on the A.A. Co.'s Estate.
1804. What kind of land is there around Dungog? They have some very excellent land there—land that has been assessed under the Land Tax at £15 per acre—agricultural land. Whatever becomes of the proposal to construct a railway right through to Taree, I do think there ought to be a railway as far as Dungog. Dungog is a flourishing township, and has a good back-ground.
1805. It is how many miles from Maitland? Thirty-six or 37, I think. I have seen them carrying milk in the coach from Wangat to Clarencetown. They do it three times per week. It is 34 miles to Clarencetown.
1806. Is it good country at Clarencetown? There is not much good country immediately at Clarencetown; there is a little good on the Williams River. The country is good along the Williams River for a narrow strip. I should certainly advocate this line going as far as Dungog, even if nothing further were done, and if it cost over £8,000 per mile, I think it would pay handsomely.
1807. From your knowledge of the country, you think that a railway should be constructed from Maitland to Dungog, as it is a more thickly-populated country than the other portion of the line now before the Committee? Yes; and I should advocate extending gradually as population increases. I advocate the American system—sending out a feeder first, and seeing how much it would pay.
1808. You have no doubt that a line to Dungog would pay? Yes; even on Mr. Deane's figures amounting to £300,000.
1809. Were you a land valuer under the Land and Income Tax? I was.
1810. Was this part of your district? I did all the A.A. Company's Estate, and about 300,000 acres lying to the north-west, but I also know the Dungog country very well, and I feel confident that a railway to Dungog would pay, even on Mr. Deane's estimate.
1811. *Temporary Chairman.*] You speak about a construction of a narrow gauge railway;—is it your opinion as a gentleman having some knowledge of what has been done in the other colonies, that New South Wales might profitably construct cocks-pur lines on the narrow gauge principle? I do think so.
1812. Do you think there are many districts in New South Wales where the requirements of the district and its productiveness would justify the construction of a narrow gauge line, whereas by waiting for a broad gauge line those people would be deprived for many years of the advantages of railway communication? I unhesitatingly say so.
1813. You think that if it is determined to construct this line for the purpose of serving the North Coast districts as far as the Manning River, the country would be justified in constructing a narrow gauge line at an expense not exceeding £5,000 per mile? I do.
1814. Whereas if it is proposed to construct a standard gauge railway at an expense of £8,000 or £9,000 per mile, you do not think the country is justified in doing it? Yes; I cannot see where it would get any return.

WEDNESDAY, 25 MAY, 1898.

[The Committee met at the Council Chambers, West Maitland, at 2 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, ESQ. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Alexander Wilkinson, Mayor of West Maitland, sworn, and examined:—

- A Wilkinson. 1815. *Mr. O'Connor.*] How long have you lived in this district? Since 1832.
- 25 May, 1898. 1816. You know the route of the proposed line of railway from near Maitland to Taree? During my travels I have come across several surveyors' marks which, I believe, indicated the trial survey route.
1817. Have you ever been from Maitland along the route? Yes, a good many times to the Manning.
1818. You have been from Maitland to Taree along the proposed line of route several times? Yes.
1819. You know the country well? Fairly well. I have been to the Manning River from Raymond Terrace and by Seaham, and also by Clarencetown and by Dungog.
1820. Would you kindly tell the Committee what you think of the proposal to construct a railway to connect the Metropolis, *via* Maitland, with Taree? I think it would open up a good deal of new country that

that is barely populated at present, because they have no means of getting to market except by a long route along the road. It is very precarious, I think, going by steamers. I have been two or three days going from the Manning to Sydney by steamer—in the "Rosedale" and the "Murray"—and we stuck on the bar twice in one day going over it—not very badly. We were drawing about 6 ft. 6 in., and I think there was about 7 ft. 6 in. on the bar, and the sea was calm, and yet we stuck twice on the bar. I remember being at Taree when the steamer "Rosedale" was bar-bound for more than a week, and the passengers had to go by coach. I had difficulty in getting away on account of the seats being rushed. We crossed the river at Tinonee, and came on by way of the Brushy Mountain to Gloucester, and so on to Raymond Terrace. The country beyond Raymond Terrace, at any rate as far as Booral, is poor land—ironbark ridges, I think, principally—but after you get to Booral the country improves very much, and a mile or two, or perhaps a little more, out of Stroud you come to the Karuah River, and the land there is excellent, but it is rather patchy. The Karuah River is east of the range which divides the Williams River from the Karuah River. It is not a very high range, and on the eastern side of that slope there are very nice patches of land. The river is like all other rivers—it is very crooked—and in those patches there is fine cultivation land. I think it commences about 8 or 10 miles from Stroud, but I believe that most of that land that I am now describing is Church and School land, or was Church and School land. I think it runs up 8 or 10 miles—I am not certain—but the A.A. Company's land runs from somewhere on the Raymond Terrace-Irrawang road to past Gloucester. When I was at Gloucester I was detained there one day, and I spoke to some of the old residents. I think Mr. Hooke was one. He lives at Dungog, and he told me, I believe, that the whole of that area of land was a cattle run, and that only three or four people were employed as caretakers, and that there was quite room enough there to settle 1,000 families upon good arable land—that is, on the A.A. Company's estate. The traffic from the Copeland diggings up to the end of the table-land of New England—Giro—all the traffic up that way and on the Barrington must come down by this road either to Raymond Terrace or to Morpeth. The country from Maitland towards the Paterson and right up the Allen is fine land—a good deal of farm land and excellent pastoral land—and so it is in the county of Gloucester generally. The Paterson is in the Durham district. The Gloucester is the best-watered district I was ever in, the rain there is evenly distributed, and a great deal more of it falls there than about Maitland. It is a fine timber country, the upper end particularly, from the Gloucester to the Manning. It is 45 or 50 miles, I think, from Gloucester to Tinonee, and there are many farms there. The farmers can take their produce only by pretty long water-carriage to Tinonee, and then the difficulty is to get it to Sydney. My brother used to reside on Oxley Island—that is on the south arm of the Manning River. I have been there several times from Tinonee, and the land there is splendid—equal to that on the Hunter. I mean the land on the river flats east from Tinonee. On the west side of Tinonee it puts me in mind of Morpeth. Tinonee is on high land, and on the opposite side of the river is the Taree land, and on the west there are fine, rich bottoms right up to Wingham, which is at the head of navigation. I have been to Wingham, and it is a fine agricultural district. There is fine timber there, and a little to the north of Wingham there is what is called Cedar Party Creek. There is good land upon that, and also good timber. That is 6 or 8 miles from Wingham. Cundletown is 4 or 5 miles below Taree, and the country on the Cundletown side as far as Cooperbrook, which is about 10 miles farther down—and that has been the extent of my journey—is splendid grazing land, something similar to Miller's Forest land, between here and Raymond Terrace. It is rather subject to floods, but that does not injure the grass land. There are several dealers in stock there, who get cattle from the New England district, fatten them there, and bring them down to market here. The difficulty they have to contend with is that the expenses are so heavy that it would not pay them to send small lots at a time; but if they had more conveniences of carriage they would, perhaps, be more regular in sending their cattle to market. They might also send pigs and sheep. Pigs, in particular, they cannot send now. It is a splendid fruit country too. I cannot give you any statistical information as to the amount of crops raised; but they told me, and I know from my brother's experience when he was there, that 50 or 60 bushels of corn to the acre was only a fair average crop.

1821. What is the particular place where you say 1,000 families might be sustained? That was on the A.A. Company's land, from Gloucester towards the Manning; but that is, of course, agricultural land, and would have to be purchased, I suppose.

1822. What would be the distance from the place you speak of to the Manning? The north part would be about 20 miles; but from the bottom it would be about 50 or 60 miles. Forty or 50 miles of that country is owned by the A.A. Company alone. The A.A. Company's land comes within 20 miles of Taree.

1823. Is your statement as to the extent of that country, which you say would sustain 1,000 families, based on your own personal knowledge? No; from information I obtained the day I was stopping there.

1824. What is the quality of the country from Maitland to the Paterson? On both banks of the river Paterson it is good agricultural land, whilst the land on the higher part, away from the river-bank, is first-class pastoral land—that is, for dairying purposes or anything of that kind I do not think that better land could be obtained anywhere. From the Paterson township the land is splendid agricultural land; but it is not of such large extent as is the agricultural land about Maitland.

1825. Is that land at present under cultivation? On the banks on both sides of the river Paterson it is utilised, and crops are being grown upon it.

1826. Do you mean that at some distance back in both cases the land is not utilised at present? Only for grazing it is.

1827. If there were better facilities of transit do you think that that land would be lucratively employed? Certainly. It is better watered—there is a greater rainfall—than it is further west, up the Great Northern line.

1828. There is a large quantity of land there—several hundred acres, I suppose—at the present time utilised only in a middling kind of way? It could be better utilised—not so much between here and the Paterson, because they are not so far away from the market; but the farther you go up the more expensive the carriage.

1829. Can you speak from personal knowledge of the country about Gloucester? It is flat about Gloucester. Between the Gloucester township and what they call the mountains—the Gloucester "Buckets"—it is a very fine flat—fairly good land.

1830. How is it principally utilised at present? It is utilised only for grazing purposes by the A.A. Company.

A. Wilkinson.
25 May, 1898.

- A. Wilkinson. Company. Very nearly 500,000 acres of land affords employment to about only half a dozen people who look after the cattle, but if put into the market that land would support a large number of families. ^{25 May, 1893.} 1831. If there were facilities to get to market there would be numerous families there? Yes, if they could get the land.
1832. From Tinonee to Gloucester what is the country like? There are a good many farms there after you get over the Brushy Mountain, and, in fact, alongside the Brushy Mountain on one side there are settlers taking up land there.
1833. Summing up your evidence, it means that if there were better facilities, which you think would be found in railway communication, hundreds of thousands of acres that to-day are practically waste lands, only a little utilised, would be very valuable? Yes.
1834. *Mr. Black.*] Is that part of the country you have been referring to connected in trade with Maitland? Very little trade with Maitland, except in the Paterson district. The people of Dungog go down to Clarencetown, and thence by steamer to Newcastle. Further up, about Stroud, there is a trader or two, I think, in Port Stephens' Harbour, and they get out from there, and they trade with Sydney and with Newcastle. They are Newcastle steamers—small ones, I think—that go there. Farther up, on the Myall Lakes, is nearer the coast. I do not think the railway would go near there. There is a large trade done in timber. The next place is the Manning River, and the people there trade by steamer with Sydney.
1835. Then the only part that does much trade with Maitland is the Paterson, and that is only a few miles from here? Yes; the Paterson and Allen River, which runs up to the table-land of New England, about 30 miles or so, and whose trade must come here. The difficulty they labour under in trading with Maitland is the expense of the teams. When they are camping anywhere about a large town like this it is not like in the country, where you can turn them into a paddock.
1836. Under those circumstances, do you think it is likely that if a railway were constructed the trade would come this way? Certainly.
1837. But you say the market is in Sydney and Newcastle, and the produce goes to those ports by sea? Yes.
1838. Well, water-carriage being so much cheaper than land-carriage, do you think it is at all likely that if a railway were constructed it could offer rates so favourable as to take the produce away from the sea route? I think so, because they would be able to get it away quicker and surer and more frequently, particularly from north of Port Stephens. They cannot get out of the other harbours at all half of the time.
1839. But providing those harbours were so improved—the entrances improved and the channels deepened—that they could run larger vessels, and more regularly? Yes; but look at the cost.
1840. There is now before this Committee a scheme for the improvement of all those harbour entrances? One proposal is antagonistic to the other—that is certain.
1841. You think it would not be fair to ask the country to improve those harbour entrances and to construct a railway as well? It would hardly pay, I think.
1842. You think that one of the two would have to be abandoned? I should think so.
1843. That it would not pay to construct the railway merely as an alternative means of communication? I do not think it would.
1844. *Mr. Fegan.*] You know the district of Dungog very well? I have been there two or three times.
1845. What portion of the district through which it is proposed this railway should pass will give the greater amount of trade to Maitland? I think the Paterson and Dungog.
1846. What is the chief trade of Dungog with Maitland? There is not a very great direct trade with West Maitland, for this reason: That by going 15 miles or so, they can get their goods up by steamer from Newcastle to Clarencetown, and it is, I suppose, 30 miles from Clarencetown to Newcastle, and 15 to Clarencetown from Dungog by road.
1847. And there is really not so much difference as regards carriage between the rail and the water and road carriage—that is to say, you have a longer distance, and even if the railway were taken part of the way, it would not help Maitland very much? I do not know that. I think the best country would be west of the proposed line as far as I can understand it, and the trade of all that country would come to Maitland.
1848. The people are 35 miles from Maitland at Dungog, and only 15 miles from water at Clarencetown? Yes.
1849. What is the difference between freight by rail and by water? I do not know.
1850. What is the freight per ton from Newcastle to Maitland for various goods;—do you purchase many of your goods in Newcastle? Not very many, and I could not give you any idea of the rail freight. I am not in business now.
1851. Where did you buy your goods when you were in business? Sydney. They came up principally—in fact, wholly, except perhaps something that was wanted very smartly—by steamer to Morpeth.
1852. And from Morpeth you carted the goods? Yes; the cartage would be 3s. 6d. or 4s. per ton. The steamer's charge was perhaps 12s. 6d. per ton, with a liberal discount.
1853. What would you call a liberal discount? Ten per cent.; it ranged from 10 per cent. up to 50 per cent., according to the amount.
1854. Have you bought anything in Newcastle and trucked it to West Maitland? Flour.
1855. How much per ton did you pay for flour? I could not tell you.
1856. *Mr. Hassall.*] You are aware what this proposed line is estimated to cost? I heard it was a very large sum indeed. It surprised me, although I know the country is rather rough in some parts.
1857. The construction of the line from Maitland to Taree, exclusive of compensation, would amount to nearly £1,000,000;—you do not know of the difficulties that would have to be encountered, and which would necessitate the expenditure probably of £9,000 per mile in the construction of this line? I know there is some rough country between the Gloucester road and Dungog. The road from Dungog comes in about 10 or 12 miles on the Gloucester road from Stroud.
1858. Have you any idea of the traffic that would probably result from the construction of a railway into that locality? I could not say.
1859. Therefore, you could not offer any opinion as to the probable result of the traffic, or the return that might be expected from a railway constructed at a cost of something like £9,000 per mile? I have no idea. The only thing I know is that it would be a good thing for this end if we got that traffic, and it would be a growing traffic.

1860. Do you think it would be a good thing for the country if it had to pay too dearly for it? That is A. Wilkinson. another thing. I am in favour of a North Coast railway right up to the Clarence.
1861. Do you think it would be advisable to construct a railway to Taree only, and to let it stay there? ^{25 May, 1898.} No, I should not think so.
1862. Therefore, the only justification for the construction of this portion of the line would be its ultimate extension to the north? Yes.
1863. *Temporary Chairman.*] I see that the A.A. Co.'s land on this route—the "Gloucester" land as it is called—is 116,480 acres, and the railway passes through it for 52 miles;—will you be surprised when I tell you that those 116,000 acres carry only 9,273 head of cattle and 127 horses? I thought it carried very few, because the land wants clearing, and they will never clear it.
1864. Does it not strike you that the land must be very poor in its natural state if 116,000 acres carry only 9,273 head of cattle and no sheep? That is so. I have here a letter from Mr. Holmes, of Oaken-dale, which I desire to hand in to the Committee.

Carl Frederik Söiling, solicitor, West Maitland, sworn, and examined:—

1865. *Mr. Black.*] You are a resident of West Maitland? I am. C. F. Söiling.
1866. How long have you been in the district? Since 1854—since the days of my schoolboyhood. 25 May, 1898.
1867. Is there any particular point on which you wish to give evidence before the Committee? No; I was asked by His Worship the Mayor to attend here to-day, I being a frequent visitor to Clarencetown, Dungog, Paterson, Gloucester, Port Stephens, and that neighbourhood.
1868. Do you think that there will be a large amount of traffic over the proposed railway if it be constructed? That will depend very much on the length to which you extend the line; the proposal from here to Dungog, or to Gloucester, would not be sufficient.
1869. The proposal is from Maitland to Taree? That would not command a very great deal of traffic. The traffic would come in after that.
1870. Do you think that the construction of a line which ended at Taree would not bring a large amount of traffic to the main line? I do not think it would.
1871. That would be only the first link? Yes; in the extension of a very important line, in the opinion of a great many people, between here and Taree.
1872. That is to say, the 113 miles of railway would be valuable only as the first stage of a line to be afterwards constructed at much greater length? That is my opinion.
1873. If that first link is to cost nearly £1,000,000, do you think that such an expenditure—which in itself is not, according to your own idea, going to prove remunerative—is justifiable? If it went only as far as Taree and stopped there, I do not think it would be justifiable.
1874. I go further than that. I say, even if it be part of a scheme, and nearly £1,000,000 is to be expended upon a piece of railway which in itself is not likely to be remunerative, do you think the expenditure is justifiable? With a view of ultimate extension I do—as part of a scheme I do.
1875. Then your reply is that, even if this first section, at a cost of nearly £1,000,000, should not prove remunerative, or have the effect of bringing new traffic to the main railway, when viewed as part of a much larger whole that would be productive, you consider the expenditure is justifiable? Yes.
1876. In what direction can you support that opinion? First, by reason of the products that will be brought from those regions; and, secondly, by reason of the difficulty that seems always to exist with reference to communication by water.
1877. What are the products to which you refer? In the first part of the line agricultural and timber, as far as Gloucester, and occasionally stock. You have some of the best timber country to the north-west of Dungog that, I suppose, exists in the whole of Australia—comparatively speaking, virgin forests.
1878. Do you think that a railway, under any circumstances almost, can successfully compete with water-carriage? At certain times of the season, most undoubtedly, because the delays are both frequent and vexatious.
1879. But do you think that a traffic which is merely intermittent—which you have only at certain times of the season—warrants a vast expenditure of public money? Supposing that the traffic were to become regular and reliable along the line, the other, to my mind, would become less reliable. Less money would be spent upon them if they were less used.
1880. But you said at certain times of the year? As they are now.
1881. Then your answer is, that only in the beginning would the railway have an intermittent trade—that within some period after its establishment, some period which is uncertain, the sea would be less availed of, and railway traffic would be more in vogue? Information from people all along in that direction has led me to that conclusion.
1882. Side by side with this diversion of traffic from the sea to land carriage, would come about, I suppose, a development of the district? It would—there is no doubt whatever about that.
1883. The land is of a character, I understand, that invites settlement? Yes; it is of a character that invites settlement at places. The A.A. Co. constitute one of the special drawbacks at present. Land is not obtainable from them as favourably as from the Government.
1884. Under those circumstances, land being held by that company, and they not parting with it very readily, do you think it is altogether a justifiable expenditure of public money to so increase the value of that alienated property that a still more prohibitive price would be placed by them upon it? With regard to that question, I should say that when the line once gets through their property, and on to the rich lands beyond it, then the inhabitants of the coastal district anticipate a great benefit from the line.
1885. Referring again to one of your earlier replies, is one of the reasons why you think that the proposed section from Maitland to Taree will not be remunerative that it runs through this privately-owned land? That would be one of the reasons certainly—one of the reasons tending to make it less remunerative, for instance, the A.A. Co.'s terms for cutting timber are excessively higher than the terms of the Government, and once you get through on the other side the carriage becomes too expensive.
1886. Are the Government's terms too low, or are the A.A. Co.'s terms too high, or is it a little of both? The Government's terms with regard to some timbers are too high, but the A.A. Co.'s terms are very much higher.

1887.

- C. F. Sölling. 1887. Then, generally speaking, the ownership of this land by the A.A. Co. is an obstacle to the growth of the timber trade, and an interference with settlement? Yes, it is, if one compares that which has been settled under their grant with that which has been settled on the Government land adjoining it—most undoubtedly. The Government land around the borders although infinitely inferior in many respects has been taken up in many places, whereas good land on the company's estate has remained unoccupied by reason of the terms.
- 25 May, 1898. 1888. Then, inferior land owned by the Government has been readily taken up because settlement was barred on much superior privately-owned land? Yes. You say "barred." I mean barred in the way that the terms are too high.
1889. Do you know the character of the country between here and Taree? Between here and Gloucester I know it more intimately.
1890. It is an undulating country? Portion of it undulating, and some of it very rough.
1891. Intersected by water-courses to a very great degree? Yes.
1892. With a heavy rainfall? Yes.
1893. Do you not think that all these facts which you have just mentioned, as to the contour of the country and its climate, render it impossible to construct in this direction a cheap railway? I do not know that I can answer that question, except I say that for 10 or 20 miles near Dungog no light line could be constructed on account of the uneven and mountainous nature of the land; but excepting that little piece it seems to me that a light line could be constructed the whole of the way.
1894. But where so many water-courses necessitate permanent bridges and culverts, and where there is a heavy rainfall, you require ballast, or your line will be washed away? I know nothing about the expense of constructing a line.
1895. *Mr. Hassall.*] Are you aware how much of the A.A. Co.'s land the proposed line would run through? The greater part, if not the whole of their land.
1896. Can you give the Committee any idea of the relative proportion of the good country to the bad country in that estate? No, I cannot.
1897. Do you think that country 116,000 acres of which carries only in round numbers 9,000 head of cattle is suitable for closer settlement? I should not think it was suitable for closer settlement. But my answer would not convey any information at all in regard to the actual facts, for the greater portion of the rich alluvial flats round about Stroud have been alienated by the A.A. Co., and they themselves have gone away to Gloucester, where the lands are not so rich, and have taken their cattle there. For many years past the A.A. Co. have been alienating the rich alluvial flats around Stroud and right away in the direction of Gloucester, and that renders their estate less valuable for the purpose of keeping stock.
1898. They have practically alienated the better portion of their land? Yes.
1899. And retained inferior portions for themselves? To a certain extent they have done that. Immediately around Gloucester there is some good land, and they keep young stock there, and I believe their habit is annually to take them away to Liverpool Plains.
1900. Can you give the Committee any idea of the character of the country lying along the survey line running through their estate? The land they have now is chiefly poor grazing land.
1901. Mountainous in its character? In places.
1902. Practically, when 2 or 3 miles from a water-course it is all mountainous country? Between Dungog and Stroud there are some of the most mountainous and precipitous hills, from 200 feet to 400 feet in height, which until a few years ago were impracticable to any horseman or pedestrian.
1903. Then, practically, you have a large tract of country that the proposed line would traverse which is really of a very inferior character, and you would have to get towards Taree in order to get on to what you would call fairly good country? That is hardly a fair way to put it, for when you get to Gloucester you have very good grazing land, and there is also good grazing land between that and Taree.
1904. Right alongside the eastern boundary of the A.A. Co.'s estate there is a very large area of vacant Crown land; on the north of that company's estate there is an enormous area of vacant Crown land, and following the various water-courses running through this country you see a narrow strip of land which has been alienated and which is under occupation, which evidently goes to prove that the balance of the country is not suitable for settlement or otherwise, it being available for so long a time someone would have taken it up, and the question arises, do you, as a business man, think that the State would be justified in spending something like £9,000 per mile in constructing a line of railway through that country to tap the trade about Taree only? Certainly not.
1905. Then the only justification for the extension of a line through that country would be a probable extension further north in order to bring the coastal traffic down to Maitland and Newcastle, or Sydney, as the case might be? That is so.
1906. But you would have to traverse a very large area of practically poor country in order to get at the richer lands along the northern rivers? That is so.
1907. *Mr. Fegan.*] Can you describe the land from Maitland to Dungog? The land from here, 12 miles, to Paterson is rich agricultural land.
1908. What kind of country would it be to construct a railway through;—is it ridgy? I think you could get almost a level track. But from Paterson to Dungog the land is undulating, with one intersecting or dividing range called the Wollarobba Range.
1909. How far is that towards Dungog? Perhaps 10 miles from the Paterson.
1910. That makes 22 miles of almost level country? Excepting Wollarobba, there is fairly level but undulating country from Maitland to Dungog—that is, about 35 miles.
1911. Therefore, to get to Dungog, you would have only one serious range to cross? I would not call it a serious range; you can drive your buggy across it now at full trot, with the improved roads across it.
1912. Considering that distance, 35 miles, do you think that a light line could be constructed—not a line of the character represented here, costing £8,400 a mile, but a line from Maitland to Dungog of light construction which would assist the people of Dungog to bring their produce to Maitland? I am of that opinion.
1913. Do you think that £8,000 per mile would be much above the cost of this portion of the line, under those circumstances? That would be too much to pay for the construction of a light line.
1914. Could it not be constructed to Dungog, and to give the people of Dungog and neighbourhood facilities to get to market which they have not at the present time? That is my opinion.

1915. You think that the first length could be constructed to Dungog without very heavy cost? I do. C. F. Sölling. My thoughts on that matter are very much guided by what I have heard from people in the neighbourhood, and also by my own knowledge of the country; but I rely more on what people there told me with regard to these matters. 25 May, 1898.

1916. But you do not rely more on the people's opinion as to the kind of country through which the railway would be constructed? No; I know that from personal observation.

1917. *Temporary Chairman.*] The Engineer-in-Chief has divided this railway into three sections—the first being the line you are speaking of from Maitland to Dungog, and he estimates the cost of that portion of the railway at £8,440 per mile? But that is not for a light line.

1918. Can you tell the Committee what benefit is likely to accrue to Maitland and district from the construction of this railway? I think that we should have a very great deal of the trade from a considerable portion of that district centred in Maitland instead of going elsewhere.

1919. If the railway were constructed as proposed, do you think that the trade of Dungog and Stroud and Gloucester would come to Maitland? Not from Stroud and Gloucester, but from a little on this side of Dungog; a great deal of the trade for 14 or 15 miles this side of Dungog would probably come to Maitland.

1920. I suppose you have the Paterson trade at the present time? To a certain extent. A little goes by steamer down the river.

1921. Although only 12 miles from Paterson, you do not secure the whole of that trade? A steamer calls, and naturally takes some of the trade.

1922. Would not the steamer also call there if the railway were constructed? No doubt it might.

1923. And a steamer would call at Clarencetown also, and compete for the Dungog trade? Probably.

1924. Is there any degree of certainty that if this line were constructed it would capture most of the traffic between here and Dungog. Judging from the result of railways generally, I should say that a great deal of the traffic would come up the line to Maitland.

1925. The lighter portion, I suppose? I think a great deal of the heavy portion also, such as timber.

1926. If this line were constructed along its entire length, do you think that the farmers of the Manning and neighbourhood would send their timber and maize over the line when they had a seaport almost at their door? Not unless we gave them very low rates for long journeys.

1927. But the ordinary steamer freight for maize from the Manning is 10s. per ton, whereas the railway rate for maize would be about 13s. per ton;—which would be likely to capture the trade? It would come by the railway if there were only a difference of 3s. Sometimes vessels are kept waiting for several days.

Oliver Kay Young, auctioneer, West Maitland, sworn, and examined:—

1928. *Mr. Fegan.*] How long have you been in Maitland? I was born in the district, and have been here all my lifetime. O. K. Young.

1929. Where does the greater portion of your stock come from? I think that a great portion of it comes from the coast district, particularly in dry seasons. 25 May, 1898.

1930. Along the route of the proposed railway? Adjoining the route of the proposed line.

1931. You were in Court while Mr. Sölling was giving his evidence? Yes.

1932. Do you agree with what Mr. Sölling said with reference to the land? I think he was fairly correct with reference to the state of the country between Maitland and Taree. More particularly he was questioned closely with reference to the land between Maitland and Dungog, and he said there was only one very large piece of very heavy country—the Wollarobba Range—between Maitland and Dungog, and he is correct in saying that.

1933. What is the distance that the railway contractors would have to cut through that range? I think they would skirt the hill. The railway would have to pass over about 4 miles of hilly country.

1934. With the exception of that, the country is fairly level? Yes, with the exception of Wollarobba Hill the country is very level between here and Dungog, and that hill is about 4 miles across.

1935. We have been told that from Dungog to Gloucester the country is rather inferior land? Yes; that is correct. From Maitland to the Paterson it is good agricultural land.

1936. What are the chief products of that portion? Maize, lucerne, wheat, oats, barley.

1937. Do they grow much wheat? A good deal of wheat has been grown on the Paterson and the Allen Rivers; not a very great quantity of recent years, but much more has been grown, and could be grown in that district.

1938. What is the chief reason why the people gave up cultivating wheat;—was it because it does not pay as well as lucerne? No; the rust for many years attacked the wheat here, and the crops failed, and they gave up growing it, but the last two or three years wheat has grown without rust.

1939. What is the country like from the Paterson to Dungog? It is fair land, excepting the big Wollarobba Hill. It is principally grazing land along the route of the railway; but on the outskirts, from the Allen River going to the west, there is a good deal of small agricultural flats, used principally for growing maize, and now for dairying purposes.

1940. You agree with Mr. Sölling that it is very inferior land from Dungog to Gloucester? Most of it is inferior land.

1941. Do you know the land better from Gloucester to Taree? Yes. When you get to Taree, on the Manning, all the Manning flats are good, and extend back. There is good land upon the Manning, back up the Little Manning, to the Barnard River. The principal agricultural land, after you leave the Hunter, is on the Manning River. There is no land as good between the Hunter and the Manning as there is upon the flats of those two rivers.

1942. Do you think that the condition of the country at present is such as to warrant the construction of a railway which would cost something like £980,000;—do you think that the State could look for a return during the next twenty years sufficient to pay the interest on that outlay? I do not think that a section to Taree should be made if it will cost that amount of money; but it seems to me an extraordinary expenditure for that line.

1943. You would not support just an extension to Taree, with a probable termination there? No; I could not.

1944. It must be a North Coast line, I suppose? Yes, if it is anything.

O. K. Young. 1945. And under present circumstances, seeing the cost would be so great, you could not support a railway of that description? Not to say that it would be a reproductive work for the Government, for I do not think it would be.

25 May, 1898.

1946. You know that the Government are spending money in improving the entrance to the Manning River, so as to give the boats going there a better means of access? I understand that the Government are clearing the rivers, and spending money altering the bars.

1947. It is not likely that the produce would come by the railway if the Government afford the people facilities for water-carriage? It would not come from near the mouth of the river and be taken up the river (say) to Taree, and then brought in this direction by railway; but anything within reasonable distance of Taree would be brought to the railway in preference to being sent by boats.

1948. Of course, perishable goods would go by the route by which they could get to market the soonest? Yes. A large number of stock are reared and fattened between Taree and Gloucester.

1949. Maitland is the sale-yard for this portion of the North Coast district? Yes; nearly all the stock comes to Maitland, either to be sold here or to go on by rail to Sydney. Owners of stock in that locality would prefer to truck the cattle than to send it by steamer. All the stock from the Manning intended for Sydney would be trucked through.

1950. *Mr. O'Connor.*] You say there are only two difficulties in the way of this railway;—what might be the extent of the difficult country? I think there are about 4 miles of rise on the Wollarobba Hill.

1951. Would that mean tunnelling? I have not seen the sections. The railway may, perhaps, skirt the hill. The road skirts the hill right round. There is a very fine road made in the side of the hill.

1952. Is there a possibility of the railway skirting the hill? From a good road being taken round, it seems quite possible to skirt the hill with a railway. The same could be done in regard to the Monkerai Range, which is now skirted for road purposes.

1953. You think with those two exceptions the country is comparatively level? Yes; it appears at any rate to be level in riding or driving over it.

1954. *Temporary Chairman.*] Do you notice the portion marked yellow on the plan? Yes.

1955. It is waste Crown land, and that land is open for occupation now on payment of £12 per annum for 21,000 acres, and yet no one in the district thinks it worth taking up;—does that bear out your statement that this land is good for stock-raising? It looks as though it is not worth taking up when it has been lying idle. But the A. A. Company have nearly 250,000 acres of land in the Gloucester district.

Richard Windeyer Thompson, solicitor, West Maitland, sworn, and examined:—

R. W. Thompson.

25 May, 1898.

1956. *Mr. Hassall.*] How long have you resided in Maitland? Over thirty-eight years.

1957. You have some knowledge of the proposal before the Committee to construct a railway from Maitland to Taree? Yes; but it is only right to say that my attention has not been directed to the matter until just before lunch to-day for a very long time past, and I have not had time to think the matter out as I would like to do; but I will willingly give all the information I can. I should like to start by saying that if the expenditure is to be at the rate that I have heard mentioned I do not think it would be justifiable. I do not think that the return would be anything like what it ought to be for many years. If there is to be a loss of £31,000 a year, although I would like to see the railway made, I do not think its construction would be justifiable.

1958. The calculations have been made by officers of the Department, and no doubt received every consideration before being placed before the Committee, and I may say that the former estimate was considerably over £1,000,000, but a revised estimate has been made, and the estimated cost is now reduced to a little under £1,000,000. This has been done after careful consideration of the character of the country that would have to be traversed by the proposed line, and the work that would be necessary to construct such a line as would carry the probable traffic;—I presume that the officers of the Department have made themselves thoroughly acquainted with every circumstance connected with the matter, and they say that the average cost would be a little over £8,000 per mile? Yes. I see that the three sections—West Maitland to Dungog, Dungog to Gloucester, and Gloucester to Taree—will cost respectively £276,748, £299,119, and £406,416, or an average of £8,629 per mile. I have not the slightest doubt that a great benefit that would come from a line to Taree would be in increasing the value of the property of the A.A. Company to an enormous extent, because they have aggregated to themselves by far the largest area of country between Dungog and Taree. They have an immense area of country there, and I doubt very much if any outside people know how much there is of what is really good. There are thousands upon thousands of acres of good wheat land, covered now thickly with oak, scrub, and box. Through neglect in ringbarking and allowing the timber to grow, it has gradually got worse and worse, and the cattle-bearing capacity of the country has got less and less from that very fact; but there are thousands upon thousands of acres of what you may call second-class agricultural land—limestone ridges, volcanic ridges, and ordinary humus, vegetable-mould ridges; but, while the land will grow a large crop of wheat, we have always to consider the extreme humidity of the climate, and no doubt there it is worse than it is in Maitland. The rainfall there is greater than it is here, although we are nearly 20 miles from the coast. So long as we had such dry seasons as during the last three years, we could grow wheat, but if a humid season came again it would mean certain destruction of the wheat crop, and that is the reason why wheat-growing has gone out here.

1959. You heard the evidence given by Mr. Young and Mr. Sölling? I did not hear all Mr. Sölling's, but most of Mr. Young's.

1960. Have you a knowledge of the country? Yes, an exceedingly good knowledge of it. I have not only travelled along the road, but have also been on both sides of the road, very considerable distances both ways, about Gloucester and Stroud; and I have been farther up about Copeland, and also up Curricabark Creek, which runs into the Barnard River. I have been very far up the Barnard, and over the ranges to Couplicurrapa. There is one thing to be said which I have not heard either of the witnesses who have been examined allude to much, and that is the gold-bearing capacity of all that upper country. There is scarcely a range after you get past Gloucester that has not an abundance of gold-bearing reefs in it; but the difficulty of access, even by road, is so great, that the gold-bearing capacity is not made as much use of as I think it would be if a railway were there. It would entice people to that neighbourhood, I have no doubt, and would create settlement in that way; but I do not think it justifies the proposed expenditure.

expenditure. I have been over hundreds of miles of that country on foot, and have examined it carefully, and I have not the slightest doubt that there are thousands upon thousands of acres there belonging to the A.A. Company, the Church and School lands, and the Government which is gold-bearing, and would pay to be worked if the means of transit were a little easier for getting their stores and taking their quartz to batteries, and so on. I have not the slightest doubt that it would increase the value of the A.A. Company's land very much, and that would be the greatest benefit that I see. I think it would induce settlement in that way, because the company, while it is looked upon as a conservative company, has never, as far as I can judge, been averse to selling land if it could get a reasonably good price for it.

R. W.
Thompson.
25 May, 1898.

1961. Do the company lease any land at all? They lease a good deal of land in small grazing portions about Ward's River, and about Gloucester, and even about Stroud too—that is land that does not interfere with the great block of land which they keep for their own cattle-raising. In many instances the leases have been for a good time, for otherwise they would not be of much value to the people on them—they could not ringbark the timber if they had limited tenures. As regards the large area of Crown land, it is, as a rule, very wretched land—third-class grazing land. It wants an immense deal of sapping and opening up before it could be utilised. It is very thickly timbered in many instances, and the grass is exceedingly sour and poor.

1962. To put it into anything like decent order it would necessitate the expenditure of a very large sum of money? Undoubtedly, because the country is of that character that if you sap it you are bound to have an immense crop of suckers and of saplings for many years, as far as the saplings are concerned; and to take advantage of the grazing capabilities of the land you must keep both suckers and saplings down, otherwise the mischief which existed in the first instance is intensified. If the Government would let some of that land upon long leases, for agricultural purposes, it might be taken up. It is at present unoccupied, because if people want it they have to take it up upon the ordinary terms. I think that the terms should be more than twenty-one years, for you would want at least ten years to clear it, to make it anything like what it should be. It is so thickly timbered in some places that it would be some years before you could get the block timber off. It is very good timber, but very inaccessible on account of the extremely steep ranges. You would have to make roads in many directions to get the timber out; but there is some of the best timbered country there that I know, short of the other side of the Little Manning. You can see plenty of trees 70 or 80 feet high, without any branches, which people however do not cut, as they cannot get them to market, and the A.A. Company have an immense area of good timbered country. There are thousands of trees going to waste merely for want of cutting, and there is younger timber growing up still.

William Hope Mackay, grazier, West Maitland, sworn, and examined:—

1963. *Temporary Chairman.*] You are aware of the proposal before the Committee? Yes.

1964. Have you an intimate knowledge of the country between here and Taree? Yes; I travelled over it several times, many years ago.

W. H.
Mackay.
25 May, 1898.

1965. Will you say what you think of the scheme, remembering that the proposal is to construct a railway from Maitland to Taree, to cost practically £1,000,000, with land compensation;—will you tell the Committee what you think of that proposal, and also the country through which the line would go, and if you think the country is justified in spending such a large sum of money to attain that object? I certainly think, in the first instance, the line is not likely to pay. The country is only very moderate in quality, with the exception of the river flats, which are better. The grazing land, as a rule, is only second rate—some good, and some very poor. I do not think that there would be very much trouble in getting across the hilly country.

1966. There would be no trouble, but a good deal of expense; after examining the country on several occasions, and after careful revision by the Railway Construction Branch, the cost of the line was estimated as follows:—Between Maitland and Dungog, £8,440 per mile; between Dungog and Gloucester, £7,572 per mile; and between Gloucester and Taree, £9,784 per mile; and the total cost of the railway is estimated at £982,283, giving an average of £8,629 per mile,—that is, exclusive of any cost of land; that is the reduced estimate after the matter had been gone over three or four times, and the Engineer-in-Chief says that it is the lowest sum at which we could construct a line? I think that the country would be very much more improved than it is at the present if the railway were taken there; but the bulk of the land would be used for grazing purposes only.

1967. Grazing land does not produce much traffic for a railway? There is a good deal of farming on the rivers, or there would be, if there were means of getting the crops away.

1968. Fifty-two miles of the line would pass through the A.A. Company's land;—would they be likely to throw open their land and sell it cheap? I do not know whether they would throw it open; but it would be to their advantage to do so.

1969. Would they sell it cheap, or would we construct this line for their benefit? I do not know if they would sell it cheap; but the bulk or a great portion of the available land is on their property.

1970. And they would derive the principal benefit from the construction of the line? They certainly would.

1971. Do you think there would be much traffic between Dungog and Maitland if the line were constructed? No, I do not think there would be.

1972. You think that the traffic would still follow its present course down to Clarencetown? I should think the bulk of it would.

1973. Well, if there is not much prospect of traffic at this, the most populous end of the line, is there much prospect of traffic as it goes farther away to the north? I do not know anything about the country beyond the Manning River.

1974. Well, is there much prospect of traffic from the Manning River—the line competing with the river and coast steamers? I fancy that all the live stock would come this way.

1975. Does much live stock come through that country? Not a great deal; but I think there would be if the railway were made there.

1976. I gather from what you say that you think that the cost of constructing this line will be very heavy, and you see no prospect of much revenue being derived from it either in this neighbourhood or at the farther end of it? No, I do not at present.

Christopher

Christopher Eipper, journalist, West Maitland, sworn, and examined:—

- C. Eipper.
25 May, 1898.
1977. *Mr. O'Connor.*] Which paper are you connected with? I am the editor of the *Maitland Mercury*.
1978. How long have you been in Maitland? Since 1852.
1979. Do you know the route of the proposed line of railway? I do not know the route. I only know that it is between Maitland and Taree.
1980. Have you ever been over the ground yourself? No.
1981. Would you in your own way kindly give the Committee any information you can to help us to arrive at a conclusion? I have no information as regards the value of the land, nor any very accurate information as to the character of the country. I can only give you information as to the general policy of the construction of the line. I understand that the cost of the line is to be nearly £1,000,000. It seems to me that that is an expenditure which the Government would scarcely be justified in undertaking unless there were a clear view in their minds as to what their policy as regards opening up the country is to be; and also what the objective point of the railway is to be. I understand that the Government intend to continue the improvement of the bar-harbours. If they continue to improve and expend money largely on the bar-harbours, and also construct this expensive railway they will establish two competing lines of communication and that policy is scarcely a justifiable one I think. They ought to decide which method is to be employed to open up the country. Then with regard to the remunerative character of the railway, apart from any consideration about the bar-harbours, the question arises whether the railway, which will always be costly of construction, might not as well be constructed now as hereafter—whether we should wait until the country develops under a good many restraints or whether the railway should be used to develop the country—whether the railway should precede settlement or settlement should precede the railway.
1982. You would not recommend that the railway should be constructed to Taree as the terminal point; and your remarks imply that you think it should be continued to the Queensland Border? Yes; I understand that this is part of a scheme for a North Coast railway.
1983. Although we have no power to consider it; that is what is said; is there anything else you would like to say? I think that, supposing it were warrantable to construct the railway at the estimated cost, it would eventually become a very valuable asset to the country. It would tend to increase very largely the trade of the town of Maitland which is already a considerable commercial centre, and most certainly help in promoting settlement along its course.
1984. And it would also much improve the prospects of Newcastle as a great shipping port? Yes; it would carry traffic to Maitland, and through Maitland to Newcastle.
1985. *Temporary Chairman.*] I take it that your evidence means this, that you think that the State, before undertaking a work like this, should decide whether they intend to carry the produce of the North Coast by rail or to give such facilities as would enable the people to have it carried by sea? Yes.
1986. And consequently you think that if the objective point of the railway is Taree the expense is too large, whereas on the other hand, if the objective point is the Queensland Border, for a North Coast railway, the scheme is much better? I think that something more might then be said in favour of the line.
1987. And you think that the railway although it might not immediately pay would largely develop the country, and lead ultimately to results that might justify the expenditure? Yes.

Henry O'Sullivan White, licensed surveyor, West Maitland, sworn, and examined:—

- H. O'S.
White.
25 May, 1898.
1988. *Mr. Black.*] On what particular aspect of this question would you like to give information? I was a licensed surveyor for the Government for eleven years for that part of the district near Gloucester, Dungog, and the Paterson, and I know the country.
1989. You know the proposed route? As far as Bowman's Creek.
1990. Are you aware of the estimated cost of the railway? I have heard it stated while I have been sitting here.
1991. The estimate is that it will cost somewhere about £9,000 a mile—a total of £982,283; have you given such consideration to the matter as would enable you to say whether such an expenditure would be a justifiable one? The expenditure would not be justifiable in the present state of the country; but it is open to improvement, and the railway might be the cause of its being improved.
1992. Do you anticipate a betterment of present conditions? I fancy so, for there is a lot of available country which could be turned to good account.
1993. How would that be brought about? A great deal of it would be fit for agriculture.
1994. But when is that agricultural development likely to take place? If they have greater facilities for getting to market, no doubt it would take place.
1995. Then you mean that the railway is to precede, and be the cause of the development—not that the railway is to await the development? Yes. After leaving Dungog the line goes through Church and School lands for about 20 miles before it touches the A.A. Co.'s land.
1996. Of what character are those Church and School lands? Where the river Karuah is you find nice agricultural land all along that river.
1997. But it is not of very great extent, is it? The Church and School Lands Estate is 8 miles by 30.
1998. What portion of that is good land? Some of the flats on the river are $\frac{1}{2}$ a mile wide—some more and some less—and some of the ridges there are fit for agriculture. Between the Karuah and Ward's River there is what is called a black soil. It has got its name from being rich black soil which could all be cultivated.
1999. It would not require the construction of a railway to Taree to open up that part of the country? No, I do not think it would. I know nothing of the country beyond Bowman's Creek. I have never been as far as Taree.
2000. Where is Bowman's Creek? A short distance north of Gloucester.
2001. After you pass the Karuah River and Stroud, what about the land then? I know nothing about the A.A. Company's land. I have been to Stroud twice or three times only. I know the land where the road running up to Copeland crosses. The A.A. Company have some very rich land about Gloucester—very large flats there.
2002. Is there much of it? There are very large flats, similar to the flats about Singleton on the Hunter.
- 2003.

2003. A wide extent of open country? Yes; and they run up a tributary of the Gloucester to Rawdon Vale.

H. O'S.
White.

2004. Have you formed any opinion as to whether it would be desirable for the Government to construct this railway? My idea is that in the end it might turn out a success through opening up the country. I have no other reason. There is very good timber to be cut there, and most of that country is auriferous. Beginning at the Karuah, all those ranges are auriferous in a measure, and in some places patches are to be found which are very rich. I was for a time a mining surveyor, and I have some knowledge of that.

25 May, 1898.

2005. What do you think of the gold prospects there? I have known of some rich patches being found, but only a few.

John Rourke, manufacturer and importer, West Maitland, sworn, and examined:—

2006. *Mr. Fegan.*] You know the proposal before the Committee to construct a line from Maitland to Taree? Yes. The only information I can give you is, that I do a fair amount of trade with Paterson, Dungog, and Stroud. Those three places, I presume, would be served by this railway.

J. Rourke.

25 May, 1898.

2007. What business do you do? Saddlery, ironmongery, leather, and general. I have a large manufactory in West Maitland. I do a fair volume of business with those places, and I believe that we would do a great deal more if the train went there. A great deal of the trade now goes to Sydney. The means we have of getting goods to those places are so tardy that some of the people will not deal with us; but I believe that with a railway to Dungog, we should have a very large business in that way.

2008. You think that a railway would develop a much larger trade, not only in your line, but also in other lines, as regards the town of Maitland? I am certain it would.

2009. The estimated cost of constructing this line is £982,000, and the annual loss, after making a liberal allowance for traffic, is estimated at £31,000? I think that on £980,000 you would not get any interest; but perhaps a lighter line could be made. There is not the least doubt that if there were a railway a large volume of trade would come this way, and population would increase, and the country would be opened up to a great extent.

2010. It would give a better return to the railway than the estimated return? I suppose it would.

2011. There is no doubt in your mind that if this line were constructed it would be the means of settling a larger population, and will give greater facilities in connection with the town of Maitland, and therefore greater trade? Yes.

THURSDAY, 26 MAY, 1898.

[The Committee met at the Municipal Council Chambers, East Maitland, at 2 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

George Thomas Chambers, solicitor and ex-Mayor of East Maitland, sworn, and examined:—

2012. *Mr. Hassall.*] How long have you resided in East Maitland? Fifty-four years—I am a native of the place.

G. T.
Chambers.

2013. Have you any knowledge of the scheme before the Committee for the construction of a line from Maitland to Taree? Only what I have seen in the newspapers.

26 May, 1898.

2014. Do you know the country through which the proposed railway would pass? Nearly as far as Gloucester.

2015. Have you any idea what the effect of the construction of that line would be on trade from that part of the district to Maitland, Newcastle, or Sydney? Only under certain circumstances do I think it would affect the trade materially.

2016. Have you any idea of the estimated cost of the line? No.

2017. With regard to the character of the country which you know between here and Gloucester, would you kindly give the Committee the benefit of your information, commencing from Maitland, running out to Dungog, and from Dungog to Gloucester, following the course of the line? That is not the route that I should propose by any means.

2018. Well, with regard to the country through which the proposed line would pass, you may speak first, and then you can give information as to what you think would be a better route? Between this and the Paterson it is in a great measure pastoral country along the proposed line. At the Paterson you reach the head of navigation. Round about the Paterson there is a certain amount of agricultural country. It is very limited because the mountains come down close to the flats, and from there to Dungog, with one or two exceptions—a few selections—it is almost altogether pastoral country.

2019. And in the vicinity of Dungog? It is much the same as near the Paterson—a limited area of agricultural country surrounded by pastoral country of a sort. There are brushes and other country that does not carry much stock.

2020. Then the first-class pastoral country would be limited in area? Until you get back a bit.

2021. There is a considerable quantity of inferior grazing land? Yes.

2022. With regard to the country beyond Dungog in the direction of Stroud? It is much of the same character. There are selections on the creeks here and there, but it is much of the same character. It is pastoral country, speaking of it generally.

2023. What about the land running through the A. A. Company's estate right through to Gloucester, and from there on west? I cannot speak of the land beyond Gloucester.

2024. The country lying between Stroud and Gloucester is similar in character to the country you have already described? It is very rough from Dungog to Gloucester you may say.

2025. Scrubby in its nature? Brushy more than scrubby, with hills and valleys; and beyond Dungog there is the great Monkerai Range.

2026.

G. T.
Chambers.
26 May, 1898.

2026. Is there much settlement about Dungog? All the selectors have their little homesteads.
2027. Are there many of them? A good few, and in the neighbourhood for 7 or 8 miles out.
2028. At Dungog, and neighbourhood, there is a considerable amount of settlement on comparatively small areas? Yes; or if the area is large, a small part is agricultural and a great deal grazing-land.
2029. Does that also apply to the country and settlement about Gloucester? Yes, very much the same. At Gloucester the agricultural areas are not so large in proportion.
2030. Now, with regard to the route you say would be the better;—what would that be? I would suggest that it should commence at the termination of the present line at Morpeth, the head of the navigation on the Hunter, cross over the river at Morpeth where the bridge now crosses, and thence go along the bank of the Paterson until you come to a place called Wallalong. There you would cross the Paterson, and from that point you would be out of all flood reach. After crossing the Paterson you get to moderately high land. You would then go almost straight to Clarencetown, in a direct line, not near Seaham. There is a range there which eventually runs up to the Wollarobba Range—that is, between the Paterson and the Williams—and there is a point between Hinton and Clarencetown, going in a direct line, where you would want a short tunnel; but by following up the gully on one side, and then taking the gully on the other side, you would go almost in a straight line. Clarencetown is the head of the navigation on the Williams. You could join where the bend is above Stroud. You would then serve all the agricultural land up the Williams. The people there now send all their produce down to Clarencetown by drogher, and the railway would catch all that trade, which, if you went by the proposed route to Dungog, you would not get. After joining the proposed line beyond Stroud you follow it as surveyed as far as Gloucester.
2031. Have you any idea of the trade done up in that direction with Maitland? There is a steamer runs every day from Clarencetown to Newcastle, and I think another runs every other day from the Paterson; but the droghers take everything on the river down to Morpeth, where it is put on the Sydney steamers and is taken away by them.
2032. How far can the droghers work up the river? Right up to Paterson.
2033. Is the country at all rough between here and Dungog? Yes; there are two ranges—Little Wollarobba and Big Wollarobba.
2034. Now, with regard to the country to be traversed, and the possible trade to be obtained from that part, do you think that the State would be justified in the expenditure which would have to be incurred, amounting to something like £8,440 a mile, in constructing a line of railway (say) to Dungog? No; I certainly do not think so, because the river traffic would interfere with you so much.
2035. Under any circumstances, the river traffic would compete with the railway traffic? Yes; and coming from Dungog you would lose the produce of all the agricultural area, which is fairly considerable, between Clarencetown and Dungog, because that would go to Clarencetown for water carriage, instead of going back to Dungog to be put on the railway there.
2036. Practically, Clarencetown is a better point for that traffic to go to than Dungog? Yes.
2037. The only traffic that you could expect to come in there would be from the settlement north-west of Dungog, following the course of the Williams River? Yes; and the farther you go the less agriculture there is after you get to Underbank, which is a cattle station.
2038. Practically cultivation ceases there? Quite.
2039. And the ranges run pretty close to the water? Down to the river. There are thirty crossings, I think, over that river. You keep crossing at point after point. I think there are thirty crossing-places between Dungog and Underbank, although I have never counted them.
2040. The matter narrows itself down to this, that the agricultural portion of the country about Dungog, following the course of the river, gradually becomes smaller until it finally runs out altogether? Yes.
2041. And the balance of the country is rocky ranges—scrub which might be suitable, I suppose, for cattle? Yes; very good for that.
2042. But for nothing else, you think? For nothing else.
2043. Do you think, if there were a possibility of constructing the lines at a cost of £2,000 or £3,000 a mile, the expenditure would be justified? I doubt it.
2044. Considering the opposition that would have to be encountered from water-carriage, you do not think the expenditure would be justified? No; I do not. The only way to make the line at all payable would be to connect the heads of navigation with railway communication. By that means, if there were a desire to get quickly to market, instead of sending the produce by river to Newcastle, it could be put on the train and sent. Butter and lots of things I could mention would be sent by train instead of by steamer as at present.
2045. Are there any other points you would like to bring out? No.
2046. You have pretty well stated the case from your point of view? Yes. I do not think that between this and Dungog the present proposed line would pay in the smallest degree—that interest on the capital outlay would never be obtained, or anything like it.
2047. You do not think that the traffic would justify the construction of the line? No; and I think that the portion of the line between Dungog and Gloucester is worse.
2048. From your knowledge of the country, you can practically corroborate the estimate of the Railway Construction Department, who say that they would expect, if the railway were constructed to Taree, there would be an annual loss of over £30,000? I think so. I am certain the line between Dungog and Gloucester would be a dead loss. It would go through fearful country—much worse than the country between here and Dungog; and it would be a very expensive line, on account of the character of the country that it would go through—it is very rough.
2049. *Temporary Chairman.*] You say that there is only a limited agricultural area near the Williams and the Paterson Rivers? Above the Paterson, and round about the neighbourhood of Paterson township.
2050. Is there much dairying done in the district? It is increasing up the Paterson.
2051. Is Newcastle the market for the sale of their produce? Yes; they send it down to Paterson, and it goes thence by steamer to Ireland's at Newcastle.
2052. Do you think that the whole of the products grown in the district around about Dungog and Clarencetown is consumed by the large population round Newcastle? Not solely, because Ireland exports. He has a large butter factory.
2053. At all events, its consumption takes place there in some degree? There is some consumption, but nothing like all the local produce is consumed in Newcastle; there is a great deal more produce than is consumed there.

2054. A portion of it finds its way, I suppose, to Sydney? Yes; quantities of it—not of milk or cream. None of the dairy produce goes to Sydney, except in the form of butter.

2055. So, in the event of the railway being constructed, there would practically be two markets for this district, a portion of the produce going by river to Newcastle for local consumption there, and possibly some going direct by rail to Sydney? Yes; or direct by rail to Newcastle.

2056. *Mr. Black.*] You have said that butter and lots of other products you could name would be sent to Sydney by rail;—what are the other products? Calves would go that way, and also fowls and ducks, and anything perishable—such as fruit and vegetables. I do not suppose that corn or anything of that sort, or green feed, would go that way.

2057. You do not think that they would send vegetables all that distance by train, do you? If you catch the market they are very valuable. If you can get cucumbers in before anybody else you can get your price for them.

2058. *Temporary Chairman.*] Does the district produce much fruit? Yes; there is a great number of oranges grown. The country is more fit for oranges than anything else in the way of fruit.

2059. The principal product of Dungog is timber, is it not? At present; but it is getting less every day.

2060. And that would go by water under any circumstances? Yes; unless it were carried to some local saw-mill, it would go by water to be cut up in Sydney, or it might even go after being cut up. In Maitland we get timber from near Gosford which is brought up by rail to be cut up by the mills here.

FRIDAY, 27 MAY, 1898.

[The Committee met at Paterson, at 11:30 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).	
The Hon. DANIEL O'CONNOR.	THOMAS HENRY HASSALL, Esq.
JOHN LIONEL FEGAN, Esq.	GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Theophilus Cooper, pastoralist, Gostwyck, Paterson, sworn, and examined:—

2061. *Mr. O'Connor.*] How long have you lived in this district? Between twelve and thirteen years.

2062. Do you know anything of the proposed route of this railway? Not beyond Dungog.

2063. You know it up to Dungog? Yes.

2064. Would you kindly tell the Committee in your own way the character of the country from Maitland to Dungog? The character of the country from Paterson to Dungog is undulating. I do not think there are any serious engineering difficulties. The largest range between here and Dungog is Wollorobba, situated about 6 or 7 miles from here.

2065. What is the extent of that range? I suppose that from the foot of the range to the other side it is about 2 miles.

2066. Would it be possible to take the railway along the outskirts without tunnelling? I fancy that by making a slight deviation there would be no occasion to tunnel whatever.

2067. What do you think of the proposal to construct this line? I think that if we construct a railway for a moderate amount it will be very beneficial to the country further on, but certainly it would not benefit the people on the Paterson one jot. We have river communication up as far as here, and we can get our goods from Newcastle for about one-fourth or one-fifth of what you could afford to carry them by rail for.

2068. You get your goods by water carriage? Yes, from Newcastle or Morpeth. I think we can get them up at about 4s. a ton, and I understand that you could not carry them by rail under £1.

2069. Have you any idea of the estimated cost of constructing a line from Maitland to Taree? I cannot speak of anything beyond Dungog.

2070. It is estimated that it would cost £9,000 a mile at least? My candid and firm opinion is that it might be constructed for one-third of that amount, so far as Dungog is concerned. I travelled many years ago along this route, and although there may be very great difficulties there I do not see why there should be.

2071. If it cost £1,000,000 to construct a railway to Taree, do you think it would be a good speculation in the interests of the country? No, I do not. I think it would be paying a lot for very little advantage.

2072. Then, knowing as you do this country very well, you could not advise the expenditure of so large a sum of money for a railway to Dungog? I certainly could not.

2073. What is the nature of the country between here and Dungog, say, for 10 or 15 miles on either side of the proposed line? It is all undulating country and grazing country. Along the river it is just as it is here, nice flats and agricultural land, but I cannot see where the produce will come from to pay the expense of the railway with the slightest chance of profit.

2074. It is 33 miles from Maitland to Dungog? Yes.

2075. Even supposing that the time came when you could construct a railway for (say) £5,000 a mile, would you think that justifiable? I consider nothing over £3,000 a mile will be justifiable under present circumstances. In Queensland they construct railways for £2,000 a mile. If we could construct a railway for about £3,000 a mile, then I should say do it by all means. That is all we want in this district. There would never be any heavy produce carried except grain, and a light line of railway would answer every purpose; and I believe it ought to be constructed for about £3,000 a mile.

2076. You think it could be constructed for about £3,000 per mile from here to Dungog? Decidedly so.

2077. *Temporary Chairman.*] This is a very old settled district, is it not? Yes; one of the oldest in the Colony, I suppose.

2078. How is the land principally held? Principally freehold, I think.

2079. Do most of the farms we saw on the river belong to freeholders? I do not think that where you came along there are any but freeholders. There may be some selectors further back.

2080. Is much of the country held in large estates and as tenant farms? There is the Tocal property which you passed through. I think that is about 10,000 acres.

2081. Are there many tenants on that estate? No; it is held by the Reynolds family.

2082. They utilise it themselves? Yes. 2083.

G. T.
Chambers.
26 May, 1898.

T. Cooper.
27 May, 1898.

- T. Cooper.
27 May, 1898.
2083. All the holdings we saw along the road are freeholds? Yes, all of them.
2084. This railway is divided into three sections: from Maitland to Dungog is to cost £276,748, or an average of £8,440 a mile; from Dungog to Gloucester the estimate is £299,000, or £7,572 per mile; from Gloucester to Taree the estimate is £406,416, or £9,784 per mile; while the total estimated cost of the line is £982,283, or an average of £8,629 per mile; you say you think that a railway could be constructed from Maitland to Dungog for £3,000 per mile? Yes, a light line.
2085. This estimate was prepared by the Engineer-in-Chief for Railway Construction, and it is not the first or second, but a revised estimate, and he assures us as a professional man on his oath that he cannot construct a railway on a lower estimate than that? Well, I am not a professional man; it is only my private opinion, but I consider that a light line of railway might be constructed from Maitland to Dungog for £3,000 a mile.
2086. Supposing that a railway were constructed, is there any justification for believing that it would get traffic enough to pay its expenses? So far as Dungog is concerned, I doubt that even.
2087. From what you say about this district, I gather that your means of transit are by river, and will be by river no matter what other facilities may be offered? Yes; Dungog is only 14 miles from Clarencetown, to which place steamers run.
2088. And in all probability, if a railway were constructed to Dungog, the bulk of the freight would still go by steamer? Yes, of course. Farmers would not pay three times as much for the carriage of their produce in order to send it by railway.
2089. You are acquainted only with the district between Maitland and Dungog? Yes.
2090. And your impression is, that were a railway constructed between those two points, it would not capture the traffic, and would not pay? It would not pay. It could not capture the traffic. We have a steamer almost to our door. The Dungog people have a steamer to Clarencetown, which is only 14 miles from Dungog. It is preposterous to suppose that people would send their produce by rail for £1 instead of by water carriage for 4s., and the passenger traffic would be very trifling.
2091. As an old resident of the district, who knows a good deal about it, you are under the impression that a railway is not wanted, and that if constructed it would not pay? That is my firm conviction.

Ebenezer Doust, retired civil servant, Paterson, sworn, and examined:—

- E. Doust.
27 May, 1898.
2092. *Temporary Chairman.*] Have you resided long in this district? I have been here twenty-two years.
2093. You know the proposal before the Committee to construct a railway from Maitland, *via* Paterson, Dungog, and Gloucester, to the Manning River? Yes.
2094. This railway is estimated to cost £982,000 for the total distance, and £276,000, or £8,440 per mile, between West Maitland and Dungog; do you think there is anything in the district to justify that expenditure of public money? I was a resident on the Manning for twenty years before I came here.
2095. First take the district between Maitland and Dungog? I question whether the railway would pay expenses between Maitland and Dungog; but I believe that if it were taken through to the Manning it would at all events pay interest on the capital outlay.
2096. You formerly resided on the Manning? Yes; and I have been there twice since I left, and that district has gone along by bounds and strides.
2097. What traffic do you think the railway would secure from the Manning River to Newcastle or to Sydney? I believe that the passenger traffic alone would amount to about £50 per week. I judge from the papers. I get the Manning paper, and I see what a number of passengers the steamers have. I believe that the railway would average quite £50 a week for passengers alone.
2098. Anything else? Then there is an immense cargo of things, such as eggs and poultry, which they would never send by steamer, provided they had railway communication.
2099. The coaching traffic is put down by the railway authorities at £6,000 per annum, which is much more than £50 per week? Yes.
2100. Yet this railway shows an annual loss of £31,000 although the Traffic Manager puts down the coaching traffic at double what you say? I only judge from the papers that I see every week.
2101. In view of the estimate prepared by the Railway Department, showing an annual loss to the taxpayers of New South Wales of £31,000, do you think that there is anything to justify the construction of this railway? Of course, I suppose that that loss is only a matter of conjecture.
2102. The railway officials have visited the district and inspected the books of the various steamship companies. They know the estimated receipts for mails. They know the freight charged by the steamers for the conveyance of butter, poultry, eggs, pigs, live stock, maize, &c., and after making the fullest possible allowance for everything that the railway would be likely to carry, they say that there would be an annual loss of £31,000 on the line? That, certainly, is a great loss.
2103. The cost of construction amounts to nearly £1,000,000, and interest would have to be paid on that, and also the working expenses of the line;—in face of the information that I have supplied to you, would you, as a taxpayer of New South Wales, recommend the construction of this railway? No; I could not do so in the face of such a loss as that; but, as there is a line to the southward, I think that if it were possible to get a north-coast line it would be a good thing.
2104. You think that the exigencies of the country demand a North Coast railway? I think they are entitled to it.
2105. You mean a railway right through, connecting with Queensland? Yes; I think that if it connected there it would, perhaps, pay interest at all events.
2106. But what effect would it have on the existing line, do you think? I do not think it would make much difference to that.
2107. You do not think it would draw traffic away from that? It might to some extent, but not much.
2108. It would not draw the local traffic, but through passenger traffic? Yes. Of course, they would not send heavy cargo by the railway if they could get it carried so much more cheaply by water—maize, hay, and that kind of thing.
2109. The Manning River people would be in the same position as you are in here;—you would use the line for light goods and passengers, but the heavy goods you would send down the Paterson River by the steamer? Yes. I could not recommend the construction of the proposed line in view of such a heavy loss as that which is anticipated.

Edward John Cann, storekeeper, Paterson, sworn, and examined:—

2110. *Mr. Black.*] How long have you been a resident in this district? Twenty-five years, but our business has been carried on here for thirty-seven years. E. J. Cann.
2111. Continuously in this town? Yes; and in a smaller town further up in the district. 27 May, 1898.
2112. You have a branch store there? Yes—at Vacy.
2113. Do you get your goods by water from Newcastle? Yes; Newcastle and Sydney.
2114. How much per ton do they charge you for carriage? Ordinary heavy goods, such as iron or flour, we have paid 7s. 6d. for from Sydney, and 3s. 9d. to 4s. from Newcastle. For measurement goods the charge is about 10s. per ton from Sydney, and half that rate from Newcastle.
2115. I suppose you deal in the produce of the district? Yes; we buy three parts of it, I suppose, and that is leaving out dairy produce.
2116. You buy the corn? Yes; we buy maize and wheat.
2117. Any timber? No timber; there is not any timber except hardwood.
2118. To what market is that sent? Sydney and Newcastle.
2119. By water? Yes.
2120. What do you buy besides corn? Eggs, poultry, and all sorts of grain.
2121. How much per ton does it cost you to send your maize to Sydney? Seven shillings and sixpence.
2122. Half that to Newcastle? Yes.
2123. Fowls per crate? It does not matter how many pairs we put in a crate, but it costs us 4d. to send a pair of fowls to Sydney, and half that to Newcastle.
2124. Supposing that a railway were constructed in this direction, do you think that you would be able to make use of it at rates in any way resembling those? Certainly not.
2125. And you would not be likely, as a rule, to use the railway? Supposing that the railway entered into competition with the river we should feel it our duty to support the river boats.
2126. Have you any particular reason for that? Yes; looking at the other towns in the northern district, we, from a storekeeper's point of view, believe that this railway communication would do us more harm than good.
2127. Then you are not in favour of the construction of this railway? Certainly not.
2128. No matter what it might cost? No.
2129. Do you know of any widespread heart-devouring desire on the part of the inhabitants of the district for a railway? I think I can speak very well for the majority of the people, and say that they certainly are against the proposed line.
2130. There has been no agitation for a railway? No; when some gentleman has been putting up for Parliament, he may have been asked a question upon the matter, but the people seem to take no interest in it. Their idea of it is, that it is never likely to come here.
2131. Do you ever by any chance get any goods from Maitland? Very rarely.
2132. When you do, what does carriage cost you per ton? The Maitland merchants ship at Morpeth, and you can reckon one-quarter of the Sydney freight for carriage from Morpeth to Paterson.
2133. *Temporary Chairman.*] This railway from Maitland to Taree is estimated to cost £982,000, or nearly £600,000 between Maitland and Gloucester;—do you, as an old resident of the district, think that it will be unwise, in the interest of the country, to expend so much money in constructing the railway? I do not believe that it would be a good thing at all to construct the railway.
2134. You do not think that the State would be justified in spending nearly £1,000,000 to connect Taree with Sydney by rail? No.

SATURDAY, 28 MAY, 1898.

[The Committee met at the Municipal Council Chambers, Dungog, at 10 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

George Studdert Waller, grazier and dairyman, Wollarobba, Dungog, sworn, and examined:—

2135. *Mr. Hassall.*] Have you resided long in this district? I have known this district since 1853. G. S. Waller.
2136. What area of country have you? 5,000 acres. 28 May, 1898.
2137. What is it principally devoted to? Fattening cattle, dairying, and farming generally.
2138. What area have you under cultivation? Altogether about 300 acres, because I have some tenants.
2139. Where do you send your produce to? We send a great deal of it to Sydney.
2140. In what way? We send fat cattle to Maitland, and sometimes to Sydney when the market suits us.
2141. And your other produce? We send our other produce to Maitland and Sydney.
2142. How do you send it? By drays to Maitland—I mean the farm produce. We send our cream to the factory in this town, but other produce and the fat stock we send to Maitland, and on to Sydney sometimes by rail.
2143. With regard to this proposal to construct a railway from West Maitland to Taree, have you a particular knowledge of the country through which the railway would pass? A superficial knowledge of the country after leaving here.
2144. Will you tell us what you know about it? In my opinion the country is first-class. My reasons for saying so are the good average and regularity of the rainfall, and because the land is good, and it is permanently watered. I think the country will improve very much indeed, and it will carry a very large population.
2145. What is the principal form of occupation now? Dairying and farming generally. They are principally small holders.
2146. With regard to the country held by the A.A. Company, have you any knowledge of that? I have a very good knowledge of it.

- G. S. Waller. 2147. What sort of country is it? My impression for many years has been that when a railway went through, the A. A. Company, like every other individual, would find it to their interest to throw their land open. It is not what we would call a paying property at present, and if a railway went through, they would do as others have done under similar circumstances, and would cut it up into blocks and dispose of it.
- 28 May, 1898. 2148. That would be making their property valuable at the expense of the general public? Yes; it may be taken in that way.
2149. Do you not think that the Government might resume the land, and get the benefit of it for themselves? Quite so.
2150. Do you know the taxable value of their land? No, I do not; but I believe that they have sold blocks at £2 an acre—that is, alluvial land, agricultural land, and grazing land.
2151. Do you know the length of the country held by them which this proposed railway would traverse? Not exactly, but it is considerable.
2152. It is about 52 miles? I suppose it would be something like that.
2153. With regard to the trade round Dungog, have you any idea what trade is carried on, or the extent of it? About fourteen or fifteen years ago there was an agitation, and I prepared some statistics then; but I was told it was useless to do so on the present occasion, because you were so well furnished with all statistical information, and all I can give you now is general information as to the district.
2154. Will you give the Committee your reason for thinking that a railway should be constructed, or why it should not be? Before I do that I should like to show you a little plan that, through the courtesy of the District Surveyor, was prepared for me. It shows the area of land between here and the Paterson which would be served by this railway. I produce a map, the tinted portion of which shows the land that will be served by a railway between Paterson and Dungog. Starting at the Paterson, and following the Dividing Range practically between the waters of the Paterson and the Hunter Rivers, and running to the head of the Paterson River, and then embracing the country lying between the Paterson and the Williams, running back to Dungog, and the intervening country, of course, between Dungog and Paterson, would be served by the proposed railway. The alienated land within the watershed of the Williams and the Paterson Rivers on the north-west of the trial survey line amounts to 230,356 acres. The unalienated—that is, Crown land—between the trial survey line and a line parallel thereto amounts to 186,000 acres, going 2 miles south of the proposed line, which would embrace the country that would be served by the railway; whilst along the proposed line, within 2 miles of it, there are 257,032 acres of alienated and 5,243 acres of unalienated land; making altogether 448,000 acres to be served by the proposed railway.
2155. That is alienated and unalienated land? Yes; the alienated land amounts to about 256,000 and the unalienated land to about 191,000, the total area being 448,000 acres. We have no black-soil plains; but from my knowledge of the country I should say that it is one of the most fertile spots in New South Wales, for many reasons. It is watered by the Williams River, the Allen River, the Paterson River, the Chichester River, and the Little River, as well as by numerous creeks running into those water-courses. From my knowledge of this country I have no hesitation in saying that the greater portion of it will be settled upon. It is not to be supposed that because all that land is unoccupied now it is useless land. There is no access to market from it now. The encouragement is not sufficient, and people are slow to go on to the land. Strangers will not come here. People now here will take up land they want; but strangers will not come, because the facilities are not sufficient. I had five farms to let; but I could not get tenants for them, because there were not sufficient facilities to get the produce to market. I have no hesitation in saying that with railway facilities the greater part of the present unoccupied land will be utilised for agricultural purposes and for dairying.
2156. What do you grow here principally? Corn, wheat, barley, oats, vegetables of all kinds, wine, and fruit. This district is noted for its oranges. I do not know anything that will not grow here except sugar. The district has been noted for tobacco, but of late years, owing to the excise duty, the people have not gone into that industry much, and there is less tobacco grown here than there was at one time. Compared with the western or north-western portion of the country and with the Riverina, this district does not suffer from drought; in fact, I may say that it is well watered, and has an ample rainfall. I think that if we had railway facilities the land here would be taken up in small holdings by dairymen, and *bona-fide* farmers. My opinion is that it would carry about 400 families with 500 acres each—I mean the unalienated land. In dry seasons numbers of stock are brought to this country from Singleton and other places for refuge. Something like 8,000 head of cattle were brought last year to this district for that purpose, and in times of drought I think that cattle might be trained to Maitland, and then brought by rail from Maitland into the district, more particularly between here and Gloucester. Along the coast the grass is permanent, and I cannot understand why it should not pay people to send their stock to this coast district for they would do well here, at any rate for a few months. The timber is very fine on the Crown lands, and there is also a good deal of it on the private lands. People have been cutting timber in this district for a very long time and sending it to New Zealand, but there is still a great deal of old timber on the unalienated lands.
2157. After the most careful consideration, and a large reduction of the former estimate of the cost of construction, the officers of the Railway Construction Branch say that a line between West Maitland and Dungog could not be constructed for less than £8,000 per mile; as a citizen of the State, would you be prepared to enter into a speculation of that kind, and have to bear your share of the loss of £30,000 a year, which it is estimated would accrue from the working of the proposed railway? If Dungog would have to be the terminus, I should pooh-pooh the idea at once but with my knowledge of the North Coast I should say that the conditions are much better further north.
2158. Would the matter resolve itself into this, that you do not think that the Government would be justified in putting the country to the expense of constructing a railway from West Maitland to Dungog, and letting it stop there? Certainly not.
2159. You think that in order to make the line a payable one, and of national benefit it would be necessary to extend it into the North Coast district? Quite so. On no other condition would I advocate the construction of the line.
2160. *Mr. Fegan.*] You say that you had five farms to let, and could not get any tenants? Yes.
2161. And the chief reason was that there were not sufficient facilities here to get the produce to market? Yes.

2162. Did the applicants for those farms find any fault with the land? No; but their first question was how far was it from the railway, and when I told them that we were not served at all by railway I heard no more about the matter. G. S. Waller.
28 May, 1898.
2163. You think you are badly served here so far as means of communication are concerned? I do. Some of us are practically without a steam-service, for we have 15 miles to go to it.
2164. Can you send produce by the Williams River? We can.
2165. How far are you from the point of navigation? 14 miles.
2166. Can you send produce by the Paterson? We can send farm produce.
2167. How far are you from that river? 12 miles.
2168. Considering that you are only 12 miles from one river and 14 miles from another, and that river-carriage as a rule is much cheaper than railway-carriage, do you think there would be any possibility of the proposed railway getting sufficient produce to carry to make it pay? Well, the steam-service is not considered sufficient. There are serious objections to it.
2169. What are the objections? That it is uncertain in bad weather, and that you cannot get to market as quickly as you otherwise could. I always send my cattle to Sydney by the railway. I drive them to Maitland, 25 miles, and train them from there.
2170. Have you ever got goods from Maitland or Newcastle by road? We get our goods from Maitland.
2171. What is the road-carriage? We have our own teams.
2172. If you had to hire teams from other persons, what would the cost be per ton? It would cost me about 15s. a ton at the very least.
2173. That would be for 24 miles? Yes.
2174. How far are you from the Paterson? 12 miles.
2175. And how far from Clarencetown, on the Williams River? About 14 miles.
2176. What would it cost you by boat? I forget what the charges are, but I look upon their charges generally as heavy. People are not at all satisfied with the charges, nor with the treatment that produce receives going that way.
2177. If you have been living so long in the district you must have an idea what the water-carriage would cost you? There are gentlemen living in this town who send produce direct by steamer who would be better able to give you that evidence. I have not used the Williams River Company's boats for a considerable time.
2178. Is the river Williams' boat the boat you generally trade with? It is the one I have been trading with, but, as I say, I preferred latterly to send direct to Maitland by dray and thence by rail to Sydney. I have not used the boats for some time, either on the Williams or on the Paterson. I have had property shamefully treated on the boats. I do not know how it occurred.
2179. Do you send a lot of cream down? I did, but I have not since the factory has been started. I have a separator on my own land, and there is a butter factory in this town. We send them cream to make into butter. The dairying industry is a very progressive one here. I have no hesitation in saying that within the next five years it will more than double itself. The boats now plying on the rivers are small and useless for the purpose of forwarding perishable goods like butter to market.
2180. What does it cost you to send your cream to Dungog? It costs me about 1s. 6d. a can for that short distance. I have paid 1s. a can to take it even 12 miles. Sending the cream away is a very expensive item. It costs me 2s. 6d. a can to send it by boat to Newcastle, whereas I could get it taken from Maitland to Sydney for a little over 2s.
2181. It costs you 1s. 6d. to send your cream to Dungog? Yes.
2182. Considering the distance, that is much dearer than sending it the other way? Well, I get better terms here.
2183. It is simply a matter of £ s. d.? Yes.
2184. You said that your country is good fattening country? Fairly good; not as good as the western or north-western country.
2185. How many head do you fatten? I can fatten one beast to 6 acres, generally speaking.
2186. How many do you fatten yearly? I have fattened 600, but I do not do that every year.
2187. On the average, how many? I fatten, I think, about 300, now that I carry on the dairying.
2188. What is your acreage? 5,000 acres. I fatten 300 head, but I have some calves, and I have a dairy of 100 cows.
2189. What do you let out to tenants—500 acres each? No; they have nothing like 500 acres each.
2190. How many acres are there in the farms you have let? About 150 acres each, but the land is very good.
2191. Do you think that is enough to keep a family? I think they do well and comfortably on it; it is very good choice land.
2192. How many acres have you yourself for dairy purposes? We fatten at least 300 head, or an average of 400, and milk 100 cows.
2193. So there are about 1,600 acres used for dairying purposes? Yes; I suppose so.
2194. How many acres have you under wheat? We have not grown any wheat for some years, but we are growing wheat this year.
2195. Did you ever grow wheat? I have grown wheat. On the poorest of the land that I have, about forty years ago, I grew an average of 25 bushels to the acre.
2196. What is your fat stock worth now? I would not like to sell a good bullock for less than £5. I have a few now that I would not like to sell for £4 or £5.
2197. Why did you give up wheat cultivation? I was induced to do so, but I think I made a mistake.
2198. If you can grow 25 bushels to the acre on the poorest land, and it takes 6 acres to a head of cattle, and your statement makes it 16, do you not think that you are losing a lot of money by putting cattle upon it instead of wheat? I think I have done so. I think it would pay better to grow wheat and oats. There is a certain amount of bother about the thing, but, no doubt, it is very remunerative.
2199. Taking 25 bushels to the acre at 3s. a bushel would make £22 10s.? I know I have made a mistake in discontinuing wheat-growing, but I have recently sent to the Wagga Experimental Farm for seed wheat, and I am planting it now.
2200. How many acres have you under wheat now? I hope to get in 30 or 40 acres for my own use.

G. S. Waller. 2201. All your land is cleared? It is ringbarked.

28 May, 1898. 2202. What would it cost per acre to clear, plough, sow, and crop? I can get it stumped and burnt off for less than £1 an acre.

2203. What would it cost to clear your land, grub it, and burn it off? About 12s. an acre, for the wood has been dead a long time and will burn off easily.

2204. How many acres can you plough in a day? With a good pair of horses they can plough an acre a day easily with a light single plough; you cannot work with more than a double-furrowed plough here.

2205. That would make 2 acres a day ploughed? Yes.

2206. Do you not think that you could use more than a double-furrowed plough on this land? On portions of it you could, but I do not think it would be profitable to do it. I am satisfied that we in this district are fifty years behind the times in our mode of cultivation.

2207. The appearance of the rust did not make you put your land to purposes other than wheat-growing? No. It was more the fuss and bother than anything else. I have to employ labour to do most of the work, but I am satisfied that wheat-growing will pay better than using the land for stock, even if you get only 20 bushels to the acre, for that leaves a good margin.

2208. Putting land under cultivation instead of stocking it would find employment for a large number of people? Yes.

2209. And according to your estimate, if you were to have 1,000 acres under wheat at the present time it would pay you at 4s. 6d. a bushel, which is the present selling price? Yes; and it would pay even at 3s.

2210. And you think that in the very near future a larger portion of this district will be put under wheat-cultivation? Under crops of all kinds. The people have been living off and on the land so to speak. They have not paid sufficient attention to it, and made themselves at home on the land, as they are inclined now to do; the people are becoming alive to the fact that it is not merely having the land but using it which makes it pay.

2211. Do you think that the construction of the proposed railway would give greater facilities to open up the country and put it under agriculture instead of using it for grazing purposes? The cost of carriage is the great question with a man who produces anything.

2212. And the market price? Being able to hit the market. I have sent produce by the Clarencetown boats to what I thought was a good market, but when it got there the market had gone down considerably. The produce was not exactly unsaleable, but I lost heavily on several occasions by not getting to the market at the proper time. I would prefer to pay a little more to make a certainty of getting to the market when I want to do so.

2213. Might there not be a possibility if the proposed railway were constructed that the people would use the boats to beat down the railway freights? I think they would be more inclined to use that which would benefit them most.

2214. But that is the usual custom, is it not? It may be where the boat service is good and reliable, and right to the door, but there is a long and expensive carriage to Clarencetown.

2215. Considering the enormous cost of construction, and that the estimate of traffic receipts is only £18,000 per annum, and the estimated annual expenses and interest amount to £49,000, leaving a deficiency of £31,000 per annum, do you think you could support a line showing that annual loss? I think I am justified in looking to the future. What about all the unalienated land; and that is only the commencement in this district.

2216. You speak about the future of this district, but how will that get rid of the £31,000 annual loss? There is this district to begin with, and then I think there is a great future before the North Coast; in fact, I do not think that, as a sane man, I am exaggerating when I say that there is an immense future before it, because a railway is always such an attraction that the advantages of it encourage new people to settle on the land. The people here now are all old hands, who have been here for some years.

2217. This district is not going ahead? I do not think that there is a more solvent place in New South Wales.

2218. There are no new hands coming into the district? No; that is the disadvantage. There is not sufficient attraction for them.

2219. You can support the construction of this line, realising that the loss will be £31,000 a year? Yes; at the start.

2220. That is only to Taree? Yes.

2221. Do you think the terminus should be at Taree? No. I know that the people on the Macleay want a railway very badly indeed. They would much prefer it, although they have fine steamers there. There is great dissatisfaction there now.

2222. *Mr. O'Connor.*] If the proposed railway were constructed you think not only that the Crown lands would be taken up, but also that a large portion of the land that is already in the hands of private owners would be utilised to a much greater extent than at present? Yes; I feel certain of it.

2223. That being done, of course the produce from that land would help to lessen the loss on the cost of construction? Yes.

2224. *Temporary Chairman.*] You are a grazier and a farmer? Yes.

2225. Do you assure the Committee that the land in this district is first class agricultural land or good grazing land? The land fit for agriculture is as good as anything of the same extent in the Colony.

2226. What part of it—on the river banks? The river and some of the large flats on the creeks, and out from the river it is tip top land.

2227. Is the country we went over yesterday a fair sample of the rest of the country? No; that is a cross-country track.

2228. As a grazier, would you not call that as bad a piece of grazing country as you could see? Yes; but the country is very good in the valley. You crossed the poorest piece of country I believe in the whole district.

2229. As a grazier and farmer can you conscientiously tell the Committee that the bulk of the land in this district is good for any purpose? Yes, decidedly. I say that without fear of contradiction. It is not equal to the north-west nor to the Darling, nor even to the Riverina for fattening purposes, but it will fatten very well. We have sent cattle from here up the Northern line to Tamworth many times in droughts. They have been sent to Maitland, bought there, and sent up the line to Tamworth in dry times.

2230. Do you know the country between Gloucester and Taree? I cannot say very much about it.

2231. The railway would pass through 52 miles of the A. A. Co.'s ground? I believe so. 2232.

2232. And we are told that the land from Gloucester for some distance is the best of their land? Yes. G. S. Waller.
- 2232½. Would you be surprised to hear that 116,000 acres of the company's land carry only 8,000 head of stock, or one beast to 15 acres on the best of their land? I have no hesitation in saying that the A. A. Company's estate is not managed at all. 28 May, 1898.
2233. You mean that they do not carry the stock that they should carry? They do not make anything out of it.
2234. This railway is divided into three sections—Maitland to Dungog, to cost £276,748, or £8,440 a mile; Dungog to Gloucester, £299,119, or £7,572 a mile; Gloucester to Taree, £406,416, or £9,784 a mile;—the total cost of the entire line, exclusive of land compensation, is estimated at £982,283; the Traffic Manager, in his estimate of the traffic, says that he has made the most liberal allowance for everything; he has ascertained the freight carried by the steamers, and the total production of the district, and has added a very large percentage on to it, and he estimates that the total traffic that the railway would secure would amount to £18,010, while the total annual cost would be £49,468; Mr. Harper, who has had a long experience in compiling railway returns, visiting districts, getting the best information, and forming a correct estimate, estimates that the annual loss on this line will be £31,458, and he says he cannot see any chance of that loss being reduced for a very long time;—I ask you, as a taxpayer, if you can recommend to the Committee the construction of a line that would cost £1,000,000, and entail a loss of £31,000 per annum, remembering that we are dealing only with a railway to Taree, and not with the North Coast line? We should look at the effect which the railway would have on the land. We maintain that this land is not brought up to the standard it might reach. Our contention is that the land will be increased in value very much, that closer settlement will be encouraged, and that land now being settled upon will be used for better purposes, and the production will be greater. I think we have a very poor conception of what this district will really be in the future.
2235. Where the railway crosses the Paterson there is navigable water? For flat-bottomed boats only.
2236. And the people of Paterson tell us that there is no chance of their getting their goods by the railway, because they can get them by river for 7s., when it would cost them 21s. by rail;—the Williams River is navigable at Clarencetown? Yes.
2237. Is the railway likely to get any heavy traffic from this district? Yes; pigs and cattle and crops.
2238. I am speaking of the traffic that would pay, such as maize and timber;—is the railway likely to get that? It would not get the timber.
2239. Nor the maize? It might get some of it.
2240. To sum up your evidence, you believe that the future of this district, and the whole of the North Coast districts, may justify the construction of this line? I would say so, under all the circumstances.

Thomas Randles Whitehouse, wardsman, Dungog Hospital, sworn, and examined:—

2241. *Mr. Black.*] In what particular direction do you desire to give evidence? On the timber industry and the mining industry, in that part of the country with which the last witness has been dealing.
2242. Will you, then, make a statement about those matters? I have spent upwards of thirty years in that part of the country, and I am very familiar with it, in fact, so much so, that if you put me there blindfold I think I could find my way out of it.
2243. What part of the country are you specially alluding to? To the heads of the Williams, the Chichester, and the Little rivers. I am well acquainted with all the various kinds of timber there, I having been a sawyer there for sixteen years, and there being scarcely a gully or creek that I have not been working in. I think that I am safe in saying that there is an unlimited supply of timber there.
2244. What kinds? Turpentine, red gum, blue gum, beech, and what we call negro-headed beech. It is a timber that has never yet been in the market, to my knowledge, but it is very plentiful. It is a very hard and very heavy timber, and for that reason we never could see our way clear to bring it out.
2245. Is it a dark timber? No; it is a light timber.
2246. Would there be a market for it? No doubt there would be if we could get it to market, but our difficulty was in getting this kind of timber to market. In getting cedar to market, of course we have not the same difficulty.
2247. Why? Because we can carry the cedar after cutting it out of places where it would not pay to construct a road to it. I am under the impression that if we had a railway to Dungog this timber could be drawn down to water at various parts. Mills could be erected there and worked by water-power, and the timber, then, could be drawn to Dungog, and cut to order, instead of bringing it down in the log. Practically speaking, the timber industry in this district is dead at present, simply because of the expense of carriage.
2248. What quantity of timber do you think there would be;—would enough be sent away daily to load a truck? Yes, until you and I are in our graves and our children after us. The supply is so great that, as I have said, it is practically unlimited; blackbutt and tallow-wood.
2249. How much per ton do you think you could afford to pay for the carriage of that wood? We do not go by the ton, but by the truck.
2250. How much could you afford to pay for the carriage of 300 superficial feet of timber to have it taken by rail to the junction of the northern railway at Maitland? That would depend on what we could get for it—the market price would rule that.
2251. But you know what you can get for timber now, and what it costs you to get it to market by water;—how much could you afford to pay for its conveyance to market by rail? That is a question I am not prepared to answer just at present.
2252. Then you do not know so much about the timber after all? I know the timber is there. Then there are also the mineral deposits which are blocked simply for want of easy carriage to get the ore away. I do not mean to say that that applies to gold-mining altogether.
2253. How many mines are there in the district? There are a good number of mines, but I cannot tell you the number.
2254. Do you know how many men are employed at mining in the district? I do not. I know there is a silver-mine there in which I am completely blocked, because I cannot afford to get the ore away on account of the carriage and the transhipment.
2255. *Temporary Chairman.*] Are you aware that if a railway were constructed to this place it would cost

T. R.
Whitehouse.
28 May, 1898.

you

T. R.
Whitehouse.
28 May, 1898.

you more to send stuff by rail to Sydney than it does now to send it by water? I am not aware of that, because there is the transshipment. If I were to get ore brought to Dungog it would mean so many transshipments—from drays to boats, and boats to trucks, and so forth.

2256. The only transshipment, so far as you are concerned, would be from dray to boat at Clarencetown? I would have to send the ore to Dungog in a dray, and in another dray or waggon to Clarencetown.

2257. Could not the dray that brought it here take it to Clarencetown? No, because the roads are too hard for bullock travelling, and the idea would be to send it by horse teams from here to Clarencetown and by boat from Clarencetown to Newcastle, where it would have to be put in a truck to be sent to Cockle Creek.

2258. What would it cost you to deliver hardwood timber per 100 feet from the mountains or gullies where it is grown to Newcastle at the present time by road and river? I really cannot tell you.

2259. *Mr. Fegan.*] Whereabouts are the mining centres? At Wangat, the Chichester, and the Little River.

2260. Where is your nearest place of shipment? At Clarencetown.

2261. What is the distance respectively from those places? From the Chichester it would be 40 miles to Clarencetown, and from Wangat, I suppose it would be about 30. Wangat is on the Little River.

2262. How long is it since you were interested in those mines? I am interested in them now.

2263. How long, then, is it since you worked those mines? About six months.

2264. The chief reason why you gave up working them was the want of facilities to get to market? Yes.

2265. How long have you been interested in those mines, and how long have they been worked? The silver lode has not been properly worked; it has only been opened out, and I have had the ore assayed. I have had an offer for the ore, but I could not see my way clear to send it away, on account of the expense of carriage.

2266. What was the offer? It was contained in a letter that I received from the Sulphide Corporation (Ashcroft process), Limited, Cockle Creek, dated 13th April, 1897, as follows:—"In reply to your letter of 12th instant, we have to inform you that if you can supply in large quantities ore similar to your sample marked No. 2, we can offer you about £5 10s. per ton for it, delivered in trucks, Newcastle."

2267. Do you think that is a fair offer? Yes, I do, considering that it is what is called a low grade ore.

2268. What would it cost you take it to Clarencetown, and then from Clarencetown by boat to Newcastle? I do not suppose that I could get it delivered in Dungog under 30s. a ton. What the ruling rate is between Dungog and Clarencetown I could not positively say, but I suppose it would not be less than 15s., and then from Clarencetown to Newcastle, 5s. a ton.

2269. What would it cost you to put it in a truck at Newcastle? You ought to know that better than I. I am ignorant of such things.

2270. According to your own estimate, you could get it to Newcastle for £2 10s. a ton? Yes.

2271. What does it cost per ton to get it? That is another consideration.

2272. It ought to be no matter of consideration now with you, you having worked it a certain time? I have not sent any of it away.

2273. You have worked some of it? I have worked it now and again when I had time.

2274. Would it cost you £1 a ton to work it? It can be done for that.

2275. What do you think would be the output? It would be a big output.

2276. So it would really pay at that? I do not know, I am sure. It would be a great risk.

2277. But so far as calculations are concerned they show it would pay even at that? The question is whether it could be carried more cheaply by rail. If it could be placed in truck at Dungog it would go direct to the smelting works.

2278. You say that the reason why you could not accept that offer was that you had not facilities to get the ore to the market; but even with road and water carriage you could make a very good profit apparently, and many men would be pleased to join you if you could prove it? But you know the transshipping of ore does not benefit it.

2279. I know it does not do it any harm? I suppose it does not lose in weight, but the bags get burst open and it is knocked about.

2280. Have you anything else you wish to state? Yes. In the *Maitland Mercury* of the 27th May there is a report of the evidence given by Mr. Chambers, ex-Mayor of East Maitland, who stated that the river would have to be crossed about thirty times. I beg to contradict that statement.

Thomas Irwin, farmer and grazier, Bandon Grove, near Dungog, sworn, and examined:—

T. Irwin.
28 May, 1898.

2281. *Mr. Black.*] How many miles do you live from Dungog? Eight.

2282. How long have you been residing in this district? I have been residing at the same place since

1874. I know the country from here to Taree very well. I have been over it scores of times.

2283. It is now pastoral country, is it not? Chiefly.

2284. Will it be developed as agricultural country or will it still continue grazing country? I think it would develop chiefly into agricultural country if there were facilities to get produce to market.

2285. How does it compare with the land between here and the Paterson? It is superior, I think.

2286. Would you call the land between here and the Paterson agricultural land? Some of it.

2287. How much? All those alluvial flats along the creeks and rivers.

2288. What proportion does that alluvial land bear to the whole? A very small one.

2289. Is the proportion of agricultural land between here and Taree the same as the proportion between here and the Paterson? No; the proportion of agricultural land between here and Taree is much larger. Take a radius of 20 miles around Gloucester, and I do not think you will find more good agricultural land on the same quantity of country in any part of New South Wales.

2290. What class of country is it? Open forest, and alluvial flats along the rivers.

2291. There is not much farming there now? No; it does not pay them to send their stuff to market by bullock drays. It would take them a week to bring a load of wheat or maize from the Barrington to here.

2292. Where do they find their market now chiefly? Here chiefly—either here or Raymond Terrace.

2293. Are they too far from the water for water-carriage? Yes; they are north from here. I have seen a splendid crop of potatoes on the Barrington, and the man who grew them would not dig them, because

it

it would not pay to dig them and take them either to Raymond Terrace or to Dungog at 5s. a cwt., for the simple reason that on the dray the potatoes would be so loaded, one bag on the top of another, that they would not keep.

T. Irwin.
28 May, 1898.

2294. How far is it from where the potatoes are grown to the place of shipment? Sixty miles, I suppose.

2295. Is not £6 a ton rather a high charge for 60 miles of road carriage? Yes; and then they would have to forward them on to Sydney and pay the freight.

2296. How long would they be on the road? A week, or perhaps three weeks if the weather were wet. I have known teams stuck up on the road between Raymond Terrace and Gloucester often for three weeks.

2297. How long ago was that? Twelve years ago.

2298. Are the roads the same as between here and Maitland? Much the same.

2299. How could you get stuck up on roads made like those? Heavily-loaded drays cut into these roads very often. I have seen timber trucks down to the axles. In our own district there is a good deal of unalienated land which could well be taken up if there were better facilities to get to market.

2300. Do you think it will not be taken up until the facilities of traction are improved? I do not think it will. I may say that water carriage is cheaper than the railway freights would be from Dungog, but the expedition in getting your stuff away would counteract that, and we would willingly pay a higher rate to get the stuff away faster to catch a rising market.

2301. How much would you be prepared to pay? Sometimes it would be worth our while to pay twice as much.

2302. Would expedition in getting to market enable you to pay twice, or sometimes three times, as much? On some produce it would—such as butter, fruit, and live stock.

2303. In any case, I suppose, you would continue to send timber and maize by water? I do not know. It costs about 2s. 4d. a bag to send maize from Dungog to Sydney. I paid last time 1s. a bag from here to Clarencetown, and 1s. 4d. from there to Sydney. It has to be transhipped from the river steamer at Newcastle into a larger steamer. Pigs cost 4s. 3d. each from Dungog to Sydney.

2304. You know that this railway is estimated to cost nearly £1,000,000? Yes; from Maitland to Taree.

2305. Do you think there is anything in the condition of the district or in its future prospects that warrants such a tremendous expenditure? Yes; I think the expenditure would be justifiable, because in the near future the railway would pay. I do not think it would pay at the present time, but it would create traffic itself, and the districts would get populated, and, consequently, eventually the railway would pay, and I think the farther you went on with it, the better it would pay. I do not think the railway from here to Maitland would pay, nor anything like it, but going farther north it would cause population to settle within a reasonable distance of the railway, and eventually I think it would pay.

2306. Do you know that such an expenditure, without the cost of resumption, would mean for annual interest on the sum expended about £30,000, and about £20,000 for maintenance and ordinary expenses, making a total of about £50,000 per annum; and do you think that at any period (say within the next twenty years) the return from the line is likely to reach that amount? I would think so.

2307. And you believe that the construction of the railway would facilitate settlement in the district and open up the country? Yes.

2308. In spite of the fact that a large portion of the land is privately owned? Yes.

2309. Do you know if there is any demand for land in the district now? Yes, there is a good demand for good land in the district. Good land will sell readily. This morning, just before I came in, I heard of a sale of 366 acres of land, 5 or 6 miles out of this town up the river, for £2,000.

2310. Is that a fair average price, or is it an exceptional purchase? I think it would be a fair average price for it. It is improved a good deal; there are a house and fences.

2311. It does not include any stock does it? No.

2312. A good homestead, I suppose? Yes; a good bush-house.

2313. Do you think agriculture would pay at such a price as that for land? Well, the man who sold it took it up thirty or thirty-five years ago, and has made a good living upon it ever since.

2314. Then, farming even without a railway cannot be such a bad thing after all? There are worse things than farming, although it is at a low ebb.

2315. *Temporary Chairman.*] Do you know the A. A. Co.'s land—"Gloucester"? Yes.

2316. There is a lot of good land belonging to that company? As good as there is in New South Wales.

2317. How many acres are there of that good land? I have no idea.

2318. Would there be 25,000 acres of good land? Yes; I think there would be.

2319. Land well adapted for agricultural purposes? Yes; and the second-rate land is splendid grazing land all round there.

2320. Do the company sell any of their land now? I think they are willing to sell the land at a certain stated price per acre on very reasonable terms.

2321. Do you know the price? I think it is about £6 an acre. They sell the forest land at less than that—25s. or 30s. an acre.

2322. Do you think that it would pay a man to give £6 an acre for it and clear and cultivate it? Yes. I would readily give £20 an acre for some of it, if there were a railway in the district.

2323. Where does the flour come from that feeds the people of Dungog at the present time? I think we have flour enough in our own district for our own consumption; but for the past ten years there has not been much wheat grown here until the last couple of years.

2324. You have been fed with flour from South Australia and Victoria? Most of our flour came from Sydney. Wheat went down to 2s. and 3s. a bushel, and we thought we could employ ourselves better than in growing wheat.

2325. Wheat at 2s. 6d. a bushel would not pay? It would pay very well at 4s. or 5s. a bushel. I grew a small paddock of wheat this year, and the result was about 30 bushels to the acre.

2326. Three or four shillings, at that rate, would pay you very well? Yes.

2327. You do not look upon the district as a wheat-growing district? No; it is more of a tobacco and maize growing district, and mixed farming and dairying.

2328. Do you consider the land in this district is good grazing land? Some of it.

2329. Where is it situated? There is good grazing land—good fattening forest land—up the river from here for 20 miles. The land you see just about here is only second-class land, and not very good at that.

2330. *Mr. Fegan.*] You have cleared a portion of your land? Yes.

2331. And you have put it under wheat sometimes? Yes.

2332.

- T. Irwin. 2332. Would you give the Committee the benefit of your opinion as to how much it would cost to clear it, sow it, and reap it, at the present rate of wages? Heavy bush land on the river—the alluvial flats—would cost £5 or £6 an acre to clear, and £1 an acre to plant it, and 10s. an acre to gather in the crop, or between £7 and £8 altogether.
2333. But what would be the annual cost? The cost of labour in ploughing and sowing and reaping.
2334. Are wages higher here than they were formerly? No; they are lower. Fellows come round every day looking for work.
2335. How many bushels on the average would you get to the acre? I have grown as much as 45, and as little as 15, bushels to the acre, but a good average crop would be about 25.
2336. And you say that it will not pay at 2s. 6d.? No; I do not think it pays. Maize pays better at 2s. 6d., because you get double the quantity—50 or 60 bushels to the acre—and that pays better than wheat at 3s. or 4s.
2337. But there is land that will not grow maize and will grow wheat? Yes.
2338. You put that land under cattle instead of under wheat? Yes.
2339. Twenty-five bushels, at 2s. 6d. a bushel, would give you £3 2s. 6d.; the outlay at first for clearing would be rather large, but there is now a large proportion of the country already cleared and ready for wheat; I am alluding to land once under cultivation, but now used as fattening country;—do you not think that wheat-growing on that land would pay better than fattening stock, if it takes 6 acres to a head of cattle? It would not take 6 acres of that land to a beast. I think it would take only 3.
2340. Do you not think that £3 2s. 6d. would pay you? It might pay you if you had nothing better.
2341. But while you have something better it will not pay—that is the idea? Yes.
2342. At the same time, wheat would really pay in this district at 2s. 6d. a bushel, would it not? I do not think so.
2343. What would be a fair return for 1,000 acres in this country? Wheat-growing in this district is not like wheat-growing up the northern line near Tamworth, where they use double, treble, and four furrowed ploughs. We can use only the single-furrowed ploughs, and it takes a man and a pair of horses pretty well all day to plough an acre.
2344. Why? Because they cannot do more.
2345. Is the ground too heavy? No.
2346. Why cannot they use the double or treble furrowed ploughs? Our flats are not large enough in extent.
2347. They are not too heavy? No they are not.
2348. So you really could use them if you wished? I daresay you could. Our land is hillier than it is up there where they use them.
2349. Do you not think that it would be more beneficial for the settlement of a larger number of people about here to put land under agriculture than to work it otherwise? Yes; that is why I advocate the railway. It would populate the district. On the large extent of land belonging to the A. A. Co. there are only a superintendent and a couple of stock-keepers; at “Gloucester” the whole concern does not cost the company more than £300 or £400 a year. I do not know how many thousand head of cattle they have, but not nearly as many as the land would carry; and I think that if the company could be got to come to reasonable terms the railway would open up that country.
2350. The chief reason why you support the proposed railway is that you think there will be much more settlement than there is at present? Yes, that is the chief reason.

Joseph Abbott, grazier, and Mayor of Dungog, sworn, and examined:—

- J. Abbott. 2351. *Mr. Fegan.*] You know the proposal before the Committee? Yes.
- 28 May, 1898. 2352. And you have heard from the statements already made that the proposed scheme is estimated to cost nearly £1,000,000? Yes.
2353. And will result in a loss of £31,000 per annum, with an assurance from the traffic manager that that loss is not likely to be reduced for a very great number of years? Yes.
2354. Under these circumstances, do you think the Government are justified in spending such a large sum to obtain such a result? In my opinion, there is no possibility of the line paying for many years; but it might ultimately pay.
2355. You are prepared to accept the statement of the traffic manager, that the line will entail a large annual loss for a long time to come? Yes.
2356. Now, what about the prospects of the line on what are commonly spoken of as national grounds;—supposing that it were the commencement of a through line to the Queensland border, do you think that the expenditure would be a justifiable one? It would have to depend on the traffic further on to pay at all. I think the first thing that the Government should do would be to get the A. A. Company's land from them.
2357. You do not think the Government are justified in spending a large sum of money to enable the A. A. Company to sell their land at a big profit? No; I think the Government should get the land first.
2358. The company have offered to give the land required for railway purposes a chain and a half wide through their estate free? I daresay; it would pay them well.
2359. You are under the impression that before any large sum of public money be spent to open up the district the Crown should first acquire the A. A. Company's land? I think so. The first duty of the Government should be to get that property.
2360. It has been remarked this morning that the A. A. Company have assessed their land at 4s. 6d. an acre for taxation purposes? I have heard that before to-day.
2361. If the Government could re-buy that land for double that money it would be a good spec.? Yes.
2362. A large quantity of it could be re-sold? Yes.
2363. A considerable area of the company's land is really good land? Yes; not brush land but open apple-tree flats.
2364. I suppose there is valuable timber on their land? Yes; tens of thousands of pounds worth.
2365. And also tens of thousands of acres not worth 1s. an acre? There are thousands of acres on the company's estate not worth 1s. an acre.
2366. There is a good deal of Church and School land in the neighbourhood of Gloucester which is good? There is a strip running from Raymond Terrace to Gloucester, and 20 miles further.
2367. That will be thrown open soon? Yes.

2368. Do you think that it will be readily taken up? Yes, I am sure it will all be applied for.
2369. In the event of the proposed railway being constructed, do you see any likelihood of a large accession of population in the district? I think the population would increase largely, more especially if you were to secure the A. A. Company's property.
2370. A large accession of population would mean a considerably larger amount of traffic? Yes.
2371. You know the country pretty well beyond Gloucester? Yes; up to Taree. I have been further on, up to Kempsey.
2372. Do you know the route that the proposed railway will follow? Yes.
2373. Does that pass through or near much of good land? Through the A. A. Company's property it does.
2374. And through the Church and School lands the same? It goes through the Church and School lands on to the A. A. Company's estate, but it does not touch the Church and School lands afterwards, although it is close to them.
2375. Some of the land which it passes through on the A.A. Company's estate might be considered, I suppose, good land on both sides of the line? It would be off the line of railway.
2376. How far? Not more than a mile from one part of the line.
2377. It is all within reasonable distance? A lot of it is.
2378. The bulk of the land would be so reasonably close to the railway that people could not say they were too far from facilities to get to the market? No, they could not, if they had the railway.
2379. What is the farthest distance that a man growing maize or wheat could haul it and make it pay—10 or 12 miles? Wheat is brought 30 or 40 miles from the head of our river to Clarencetown.
2380. Does it pay? I suppose it must pay or they would not keep on doing it.
2381. Sometimes people struggle along making a bare existence? It is only a struggle, I suppose.
2382. What, in your opinion, is the farthest distance a farmer can haul his stuff to market by dray and make a comfortable living? I can hardly state that.
2383. If it is stated in other parts of the country that from 12 to 15 miles is the maximum distance a man should be separated from railway communication, would you take that to be substantially correct? Yes; that would be far enough to be away.
2384. I suppose that none of the good land belonging to the A. A. Company would not be much more than 15 miles from the line? No; I suppose it would not be.
2385. You cannot recommend the carrying out of the present proposal unless the Government first acquire the valuable land now in the hands of the A. A. Company along the route? I certainly think that should be the first thing done, for the Government would then get the benefit of the rise in the price of the land.
2386. The Government would get the advantage of increased price, and that would help to recompense the State for the cost of the railway? Yes.
2387. Do you think that this railway is likely to get any traffic in the neighbourhood of the Manning River; this Committee has to examine into the propriety of spending £40,000 or £50,000 in improving the entrance to the Manning River;—do you think, in the event of the people there getting better facilities to send their produce by sea, they would be likely to send it by this railway if it were constructed? Well, the way the bar has been for many years, I think we would get nearly all the produce by rail.
2388. But we are assured by the engineers that they can make it a safe bar? It has been a dangerous bar ever since I can remember it.
2389. In the event of the bar being made good, is it likely that the railway would capture any of the heavy traffic there? It would get the live stock.
2390. But the live stock from the Manning River is not a very important item—pigs and calves principally? 2,000 fat bullocks went through here last winter.
2391. From the Manning? From Kempsey.
2392. There is a chance of the steamers reducing their freights if they are brought into competition with the railway, and under all the circumstances, do you think that it is likely that the railway will capture much of the trade of the Manning district? It would capture all the live stock and perishable goods traffic, and also the passenger traffic.

Walter Bennett, journalist, Dungog, sworn, and examined:—

2393. *Mr. O'Connor.*] Would you kindly tell the Committee what your opinions are in regard to the proposed railway from Maitland to Taree? I think that some of the reasons that could be advanced for the construction of the line would be that it would afford facilities for settlement, would encourage the establishment of industries, and provide employment for the people, and by doing that, although the line might not pay at the beginning, it would eventually pay. I may point out that the North Coast has produced an enormous quantity of timber, but near the coast the timber has become exhausted. North of the proposed line, extending from the head of the Chichester River to Gloucester, there is a forest reserve of 10,000 acres which carries some of the best timber in the Colony, and I think it is only reasonable to suppose that if a railway were constructed, at least half a dozen sawmills would be speedily working there, more especially as the timber between the proposed line and the coast is almost exhausted.
2394. It would open up new and virgin forests? Yes; it may be taken as a general rule that land near the coast is of poor quality. The higher you get towards the ranges it improves, and if the timber were taken off the reserve the land would undoubtedly carry a very large population. The soil is suitable for fruit-growing and general farming. On what we call the "tops" here, due north of Dungog, there is a large tract of country extending from Nundle to the Little Mountain. It is unoccupied at present. It is open country, suitable for wheat-growing and general farm purposes. I think that in all probability it would be taken up and settled upon. In passing, I should like to express the opinion that the Government should make an offer to purchase the A. A. Company's estate at its fair market value. I think they would be justified in doing it even if the North Coast railway were not constructed, because it is retarding settlement very greatly. It is used as a breeding station for cattle at the present time, and it is not worked to its full capacity. It is not improved; in fact, it is actually deteriorating in value. It is not in the same state it was in fifteen years ago. I may point out that, since I have been in the district, ten years, the population of Dungog alone has more than doubled itself, and the population of the district has very largely increased. This district is eminently suitable for fruit-growing, and that would be very largely

J. Abbott.
28 May, 1898.

W. Bennett.
28 May, 1898.

W. Bennett. gone in for if there were easy and safe means of transit. At the present time the facilities which the stockowners have for sending (say) calves to market are so bad that very few are sent. Calves and pigs would be bred and sent away in thousands if the railway were in existence. In my opinion, if the railway were constructed from Dungog to Maitland, at any rate, it would probably carry the bulk of the produce, and also the merchandise between here and Sydney. At the present time the merchandise from Sydney is brought to Newcastle by boat, and is transhipped into a smaller boat at Newcastle and brought to Clarence-town, and we pay from 13s. to 15s., boat and road, per ton for it to be delivered in Dungog. If the proposed railway were constructed, in all probability the merchandise would be brought in a steamer direct from Morpeth, there would be no transshipment at Newcastle, and the railway would carry it from Morpeth to Dungog cheaper than it can now be carried by river and road. At present we have 5,000 acres of land under cultivation.

2394½. How far are you acquainted personally with the proposed line? I know it only as far as Gloucester.

2395. What is your opinion of the land between here and Gloucester, 10 miles on each side of the proposed line? It is of very fair quality, and I think it is admirably suitable for dairying—well watered good grass lands, and with river flats which are fairly rich.

2396. Were you present to-day when the mayor gave his evidence? Yes.

2397. You heard the suggestion about the A.A. Company giving to the Government sufficient land free for the railway to go through? Yes.

2398. Supposing that the company did that, would that lead to considerable settlement? It would undoubtedly lead to a lot of Crown lands being taken up north of the A.A. Company's Estate, but whether the A.A. Company would utilise the land they have at the present time I cannot say.

2399. You have heard the Chairman very properly remind every witness that this railway, if constructed at present will involve a loss to the Colony of £30,000 a year;—supposing that the railway were made, and those vacant lands, that are so large in area and in many cases so rich, were brought into proper occupation, would not the carriage of the produce go considerably towards reducing the anticipated deficit on the working of the line? I think so. I am of opinion that within ten years the population would so very largely increase, and, necessarily, the production also, that the deficiency in the working expenses would be entirely swept away—that the railway would pay within that time.

2400. Within the area of the proposed railway you can produce cereals of nearly every description? Yes.

2401. You have the great forest, which is a valuable asset? Yes.

2402. You can produce wine and fruit? Yes.

2403. And if you had the necessary facilities to enable you to carry those to the great market—the metropolis of the Colony,—would not that encourage industry, and promote settlement? Certainly it would, to a very great extent.

2404. The natural deduction from that is, that that would go towards wiping out the anticipated great deficit? Yes.

2405. And in course of time, although the railway might involve a loss, as nearly every railway does at the start, you have here natural advantages which would enable you to compete with any other portion of the Colony? I think we have greater advantages than most parts of the Colony. We have an equal rainfall; the country is well watered. Near the coast the land may not be of the best quality, but higher up towards the mountains the land is unsurpassed, and can produce almost anything.

2406. Do you know anything, personally, of the perils of the sea between Sydney and the Manning, the Bellinger, and the other northern rivers? Not personally.

2407. In your capacity as a journalist, do you know that the harbours are very bad and dangerous? I saw a short time ago that on the Bellinger a shipload of maize had to be thrown overboard, and I noticed that at Kempsey, a few months ago, a cargo of pigs were actually starved on board, because there was not enough there to feed them; and I have read in the newspapers that the farmers on the Bellinger had suffered serious loss at times through their inability to get their produce to market.

2408. That being so, it is not likely that those people would run the risk of sending by sea, no matter how attractive and liberal the terms for freight might be, and you think they would utilise the railway? Yes.

2409. Did you notice that the Chairman reminded witnesses to-day that the revenue, from all sources, of this line would be £18,000? Yes.

2410. Supposing that the railway were to charge the same price for transferring a pig from the Manning to Sydney as the steamers do now, the railway would get £15,000 a year alone for the carriage of pigs? I think so.

2411. Therefore, the traffic-manager did not get all the facts necessary to impart correct information? I think that he has under-estimated the revenue in every direction. In this district alone we reckon that we fatten over 10,000 pigs a year. At Copeland, and near Gloucester, there are a large number of mines. At present they are not being worked on account of the refractory nature of the ores; but if the proposed railway were constructed the possibility is that concentrates would be forwarded to Sydney, and many, perhaps thousands of tons of ores, would be treated at the Clyde works.

2412. *Mr. Fegan.*] To your knowledge, how many tons have been sent from that mine you are interested in? I sent 25 tons myself. I could not tell you what quantities were sent before.

2413. You have been in the Colony a considerable time? Yes.

2414. I suppose you will admit that there are a large number of railways now working at a loss which never should have been constructed under the circumstances—that is to say, if a railway does not show that in the near future it would pay, it should not be constructed? I do not hold that opinion. I think that even if a railway did not pay in some cases, it would prove beneficial to the State by increasing production, and settling people on the soil, and thus increasing the national wealth in other directions, and diminishing the unemployed.

2415. Does a railway diminish the unemployed? If it opens up country, and increases settlement, it will tend to diminish the unemployed by giving them facilities.

2416. Sometimes it brings a large number of people into the district, too, and leaves them without any homes or employment, or anything else? You can say the same of any public works. The Bogan scrub clearing, and the sand-shifting in Sydney did the same thing.

2417.

W. Bennett.
28 May, 1898.

2417. Considering the huge loss that is set forth in the estimate, do you not think it would be a long time before you could pull up that loss? I do not think so, because there is such a large area of Crown lands in the vicinity of the proposed railway which will increase in value, and will more than compensate the Government for the loss. There is a large area of Crown lands now lying practically useless and unproductive.

2418. Is there much Crown land to be thrown open in the area surrounded by the red lines on the map? Apparently there is more alienated land than Crown land; but there is a large tract of country outside that area.

2419. Which would be farther from railway communication than you are from Maitland at the present time? That is quite possible.

2420. Then how will you give facilities for bringing those people within the scope of the line;—if the people of Dungog want a railway and they are only 33 miles from Maitland, will you not still have a large number of people away from railway communication? We will, but they will gravitate to the nearest railway station.

2421. You can see the land marked brown on the east of the proposed line? Yes.

2422. Would you describe that land? That land is unoccupied, and is of very poor quality.

2423. And it is Crown land? Yes.

2424. Which cannot be taken into consideration as giving much traffic to the proposed railway? No.

2425. Of the land west of the line marked brown there is very little that you have any knowledge of? Not within that circle; but there is land outside that—what they call the “tops.”

2426. The land within the circle you have not much knowledge of? I have been over portions of it.

2427. What is its character? It is good grazing land, well watered—better in quality than the land about here.

2428. So we must go outside the circle before we have country that will carry a large population? Yes. There is country outside the circle which will support a large population, and the land unsold inside the circle will also carry a good population. On the north-west side it is of good quality, but on this side of the Myall it is of poor quality.

2429. Where are the principal mining centres? There is Wangat and Copeland.

2430. The Copeland is an old gold-field? Yes.

2431. Are there a large number of men working there at present? I suppose there are 300 on the field.

2432. I suppose you have not heard of any results lately you can give the Committee any information upon? The last crushing I heard of was at the “Lady Belmore,” which went 6 oz. to the ton.

2433. I suppose you are not aware of the conditions on which the A. A. Company let forest land? I am not.

2434. They are not as liberal as the Crown in their leasing of forest land? No.

2435. Do you think that much timber would be sent by rail if the proposed railway were constructed to Taree? I think so.

2436. Would the people not send it by boat? At the present time a large quantity of timber is brought through Dungog from places north from here and taken on to Clarencetown, and in all probability it would go by rail from Dungog.

2437. Where is your market for timber? New Zealand principally.

2438. So, even if you had a railway, a great portion of your timber trade would be an export trade? Yes.

2439. Are you intimately acquainted with mining? I have been interested in several mines.

2440. But you are not intimately acquainted with mining personally? I am not a miner.

2441. Do you think the prospects of those mines you speak of are of such a character that the Committee can consider them of some importance in regard to the estimate of railway traffic? I think so. I think that Copeland will ultimately be as productive of gold as it was shortly after it was first discovered.

2442. Do you think that the Barrington will, too? A considerable area is contending with water. Capital is wanted for deep-sinking and pumping. There are refractory ores, and I am positive that half the gold is being lost in the tailings, and they should be sent to Sydney for concentration. Last year a large quantity of tailings and concentrates were sent from Copeland to the Clyde works.

2443. How much a ton do you pay for carriage to Clarencetown? I have paid £1 15s. a ton from Wangat to Clarencetown.

2444. And how much from Clarencetown to Sydney? I think 13s.

2445. And how much from Sydney to the Clyde works? Three shillings.

2446. That is £2 11s. altogether? Yes.

2447. I suppose more than one mineral? Gold and silver.

2448. Any copper? No.

2449. What timber do you chiefly use in mining here? Ironbark.

2450. Is it plentiful? Very plentiful.

2451. Have you any machinery on your mine? There are six or seven batteries at Copeland and Wangat.

2452. The fuel used, I suppose, is wood? Yes; some of them are worked by water power.

2453. I suppose you have not heard of any coal deposits about here? There is a coal deposit between here and Stroud—an outcrop of coal.

2454. You only see the outcrop—it has never been tested? No, it has not; and there is an outcrop at Ward's River, on the Gloucester Estate.

2455. Is it a fact that you have to pay £1 6s. a ton for coal here? Yes, I have paid that for coal brought from Maitland, and I have paid £1 8s.

2456. For years to come there will be plenty of timber for your purpose? Yes.

2457. *Temporary Chairman.*] You are aware of the population affected by this railway proposal—that is, taking the entire population from Maitland to Taree: the total population affected within 10 miles of the line on either side is 13,600 souls, and from that number you have to deduct 2,500 souls served by railway now, about Hinton, Clarencetown, and Maitland, leaving the population to be served by this line at 11,100;—how does that accord with your own ideas of the population of the district that embraces Taree, Wingham, and all along the line from (say) Paterson—do you think it is a fair computation? It seems to me to be a low estimate.

2458. They base their population return thus,—they know the number of voters in each district, and they add to that a certain percentage of population, which they find from experience makes the total represent the

W. Bennett. the entire population; and their computation is 11,100 souls? I may say that between Brookfield and Salisbury in the Williams district only, the police give their returns at over 4,000 people. That is an area which would be affected by the railway; it is not outside the limit.

28 May, 1898.

2459. As reported on page 20 of the evidence, the officers of the Government Statistician's Department estimate the population of localities in the county of Durham—including Bedolbo, Bolwarra, Brookfield, Clarendetown, Dungog, Gresford, Hinton, Largs, Paterson, Seaham, Vacy, and Woodville—at 4895; and outside those localities at 1,385, making a total of 6,280; but a number of those places would not be affected by the proposed railway, for instance, Bolwarra, Clarendetown, Hinton, Largs, and Seaham, because they are on the banks of the Hunter, and in immediate proximity to the present railway; the other population along the route of the proposed line is very slight, for instance, Stroud, 305; Thelaba, 200; Tinonee, 255; Bandon Grove, 325; Clarkson's Crossing, 95; Kimbriki, 140; Monkerai, 170? I think that is a very low estimate.

2460. That is only an approximate estimate based on the number of voters in each district;—you think, from your knowledge of the district, that it is a low estimate? In my opinion it is a very low estimate.

2461. Do you know anything about the Manning River? No, I do not.

2462. Are you under the impression that there is a large area of land there still available for settlement? I understand there is, north of the Manning—between that and the New England district.

2463. Would you be surprised to know that that is known as waste lands of the Crown, and that a lease of 21,000 acres of it can be obtained for £12 per annum, and it is actually unoccupied—nobody will pay anything for it? It is quite possible.

2464. Does not that point to the fact that the land is of the worst possible description? I do not think so.

2465. Why not? The land is probably very rich land, heavily timbered, and would not pay for pastoral purposes; but if it were cut up into homestead selections, on easy conditions, settlers would make homes there.

2466. A settler may take up 21,000 acres, and improve whichever portion he likes, and get that area for £12 per annum? But look at the improvements that would have to be effected.

2467. Every piece of the land in that part of the district that has been considered any good is already alienated, and the officers of the Lands Department say that the unalienated land is practically worthless;—I suppose the district surveyors and officers of the Lands Department should know something about it? They should know something about it. There is a lot of unalienated land within 20 miles of Dungog of fair quality, but the Government are demanding £1 an acre from the ordinary selector, when it is worth only 10s., and if it were offered for 10s. it would be taken up speedily.

2468. Has the Crown offered any land in this district for homestead leases under the 1895 Act? Yes, and it has all been taken up.

2469. Do you think any further area would be taken up if it were offered on the same conditions? I think it would.

2470. You know the conditions are twenty-eight years' lease, with the right of renewal, and at a very small rental? Yes.

2471. You think that a great deal of the vacant land in the district would be taken up if offered under the 1895 Act for homestead or settlement leases? I think so.

2472. You also think that the same thing would apply to the northern lands if offered on the same terms? I think so.

2473. But you do not think people are likely to take them up for pastoral purposes under a twenty-one years' lease at the same rental? They would be practically useless for pastoral purposes.

2474. Why? Because it would cost so much to improve the land.

2475. But open forest land is good enough for pastoral purposes, is it not? I am not acquainted with the land but I have heard it is heavily timbered.

2476. A great deal of it is open timber land? But some of it is not good land.

2477. You think that the country would be justified in spending £1,000,000 and subjecting the taxpayers to an annual loss of £31,000 on this railway for a number of years, because you believe that it would open up the country for settlement, and a large population would be attracted to it? Yes, and land that is useless now and unproductive would be made productive.

2478. And the increase of population would increase the value of the railway asset? Yes.

2479. And also increase the quantity of produce to be carried on the other railways? Yes.

2480. Your contention is that the large annual loss would be gradually decreased by the steady increase in population? That is my opinion.

Frederick Augustus Hooke, grazier, Dungog, sworn, and examined:—

F. A. Hooke.

28 May, 1898.

2481. *Mr. Fegan.*] How far do you live from here? Two miles.

2482. What is your area? 2,500 acres.

2483. What do you utilise it for? Grazing and farming.

2484. How much do you farm? About 40 acres.

2485. Under what? Maize, oats, lucerne, and potatoes.

2486. Which is your market? Dungog principally—the Maizena Company.

2487. Then you do not know much about the carriage of goods either to or from Maitland or Clarendetown? Not personally, but I think that the regular charge for carrying maize from here to Clarendetown is 1s. a bag and 6d. from Clarendetown to Newcastle.

2488. Do you think that if you had a railway you could get it carried more cheaply than that? No, I do not.

2489. Do you think you would get it carried as cheaply? I would not be prepared to say that. I do not think you would get it done more cheaply at all events—perhaps not as cheaply.

2490. What evidence have you to offer in support of the construction of the proposed line? I think it would help us to compete with places where the people are served by a railway. I think we could send more stock away, and would produce more, and would be in more direct touch with the metropolitan markets than we are now.

2491. Of course, you cannot send stock by boat? We do not.

2492. Therefore, you have disadvantages for (say) 34 miles? If we had direct communication by rail we could

could send a great deal more stock away than we do now, because in many parts of this district people do not fatten enough to send away a big lot, and with a railway they could send smaller lots, and when they were not quite so fat.

2493. Are you sending stock to Maitland? Yes.

2493½. How long does it take you? Generally two days.

2494. That means a great deal in the market at times? Yes; it means that if you have a beast not in very good condition two days driving and starving is a great consideration. I think that the railway would cause a larger population to settle here, and that gradually the land not now used would be brought into use. There is a lot of timber here now which is not marketable, because the expense of getting it to market is too great.

2495. It would not pay anybody to send it to market under present circumstances? No, it would not.

2496. Is not the water-carriage used for timber more than anything else, on account of the cheapness of the water-carriage? I suppose it is, but then we are 16 miles from water-carriage—from Dungog to Clarencetown is about 16 miles.

2497. The position you take up in reference to the railway is that you support its construction because in the first place, it would open up country that is now closed on account of the impracticability of getting your stock to market, and poor facilities, more especially for the conveyance of perishable produce? Yes; and it would increase population.

2498. There would not be much land ready to be thrown open if this railway were constructed? Perhaps not in this neighbourhood.

2499. Do you think that it would give an inducement to the A.A. Company to throw open some of their best land for settlement? I certainly think it would.

2500. Would not the construction of the railway to Taree very considerably increase the value of the A.A. Company's land? There is no doubt about that.

2501. Who would chiefly benefit by that? I suppose the A.A. Company would.

2502. The cost of constructing this line would be £982,000, and the traffic receipts would be £18,000, and the annual interest and the working expenses would amount to £49,000;—considering that the annual loss in round numbers would be £30,000, do you think that there would be any probability in the near future of the railway paying anything like interest on the cost of construction? No, I do not.

2503. Do you then think it wise, at this stage, to construct a railway under those circumstances? You said in the near future.

2504. If the line were commenced to-morrow it would take five or six years to complete it? I should think that after a time there would be a great possibility of the line paying.

2505. From what sources? Because population will be settled along the line, and perhaps, indirectly, the Government will make up the expense.

2506. Your case is, that if the line be constructed, the value of land—and the Crown has yet a large area of unsold land—will increase in price, and though the railway may not pay directly, yet the increased value of the land, by rental or otherwise, will help towards paying for the railway? Yes; and population would very much increase, and would have to use the railway, and in that way I think it is very probable the expenses would be met.

2507. If you had to find the money, you would not care to go into a transaction like that as a shareholder? I do not think I would.

2508. However, that is your case—you believe in a great future for this district, that the line would help it considerably, would settle population, would give greater facilities to those on the land at present to send their stock and produce to market, and enable them to command a better market than they do now, which is very limited on account of their being short of facilities, and you think that a large return from the Crown lands would accrue owing to the construction of this line? Yes.

2509. *Temporary Chairman.*] With reference to one of your last answers, I suppose you recognise that there is a wide difference between the enterprise of an individual and the enterprise of the State? I do.

2510. That while it might be proper for the State to go into an undertaking, it might not be likely that private individuals would do so? Yes.

2511. *Mr. Fegan.*] In dealing with the public money, do you not think that just as much consideration ought to be given to it as would be given in dealing with a man's private purse? Yes, I do.

2512. That is to say, all circumstances must be taken into consideration? Yes.

2513. Because we are dealing with the public purse, it does not follow that it is always to be looted? No. But still we should be put in a fair way to compete with other places that are favoured with railways.

2514. You say you think it would cost you more to get your maize to market by rail than it does now by water? I think it would cost as much at any rate.

2515. How will that help you to compete with outside markets? You are only taking one thing.

2516. We will take other things, if the railway would not help you in that one line? It might not in that particular line.

2517. Take calves;—what do you pay for sending a certain number to market? It is almost impossible for us to send calves to market.

2518. If they are taken by team to Maitland they get into a worse condition? It is very hard to get them to market. If we could get calves to market, a lot of the land which is now used and hardly pays would pay handsomely.

2519. If it were all Crown lands that the railway would go through that would alter the case considerably would it not? I suppose it would.

2520. You yourself would be a stronger advocate of the railway if it were all Crown lands that the railway would pass through? Of course I would.

2521. But seeing that the railway will go through 52 miles of the A. A. Company's property, do you not think that that company should stand some of the expense? I most certainly do.

Edward Piper, storekeeper, Dungog, sworn, and examined:—

2522. *Temporary Chairman.*] How long have you been a resident in Dungog? Twenty-five years.

2523. In business all that time? Yes.

2524. *Mr. Hassall.*] Did you hear the evidence given by the previous witnesses? I did.

2525. Do you agree with the evidence tendered by them? Partly.

F. A. Hooke.
28 May, 1898.

E. Piper.
28 May, 1898.

2526.

- E. Piper.
28 May, 1898.
2526. In what points do you agree with those witnesses, and in what points do you disagree with them? One witness gave evidence as to the carriage of maize between here and Clarencetown and said we were paying 1s. a bag, whereas I send down thousands of bags in the year, and we have not paid 1s. for a considerable time. Eightpence to 10d. is the general charge. At present I pay 8d.
2527. To where do you send it principally? Newcastle. I do not suppose that ten out of every 1,000 bags go to Sydney.
2528. Is Newcastle also the principal market for the other produce grown in this district? It is.
2529. You say that the carriage of maize costs you 8d. to Clarencetown at the present time? Yes; and 6d. from there to Newcastle.
2530. So your corn is delivered in the market at a cost of 1s. 2d.? Yes.
2531. Do you handle a considerable portion of the corn grown in this district? I do.
2532. Are there any others in the trade as well who handle it? Yes.
2533. I presume that their experience is practically on all-fours with yours? In all probability; I think it is.
2534. You look to Newcastle for your market, and the cost of conveying a bag of corn from here to Newcastle is 1s. 2d.? At present it is. If the price of corn goes up we will probably pay a little more to the carriers to enable them to pay a little more for the corn which they have to buy for their horses.
2535. There are certain fluctuations in the charge? Yes; when corn is up in price we pay the carriers a little more for carriage, and when corn falls in price what we pay them is reduced.
2536. Is much other produce sent from Dungog or the surrounding district? It is principally maize.
2537. That is your principal export? Yes, it is.
2538. With regard to poultry, eggs, bacon, and dairy or farm produce, is Newcastle the market for those commodities? It is the principal market.
2539. Are there any other points in regard to which you disagree with the previous witnesses? I disagree with them when they say that the line is likely to pay, for I cannot see any possibility of its paying, at any rate, for the present.
2540. Then you think the estimate of the Railway Department is approximately correct? Yes.
2541. That there must be a serious annual loss on the line if it be constructed? I think there must be.
2542. Does your knowledge bear out the statement that the land is exceptionally rich and suitable for closer settlement, and that if the railway were constructed there would be every probability of the land in general being more thickly populated? No doubt some portions of it would be.
2543. But, I suppose, you cannot agree that the whole of the district is available for closer settlement? No; I cannot.
2544. Is it not a fact that between the watercourses traversing a large extent of country between the Williams and the Paterson, and the intervening watercourses running in the same direction, there are very large areas of comparatively worthless scrub? There is, no doubt, a lot of worthless land, but there is also a lot of good valuable land.
2545. I presume that the land along the banks of the various rivers and creeks is exceptionally good? It is very good.
2546. But comparatively limited in extent? Yes, I think so.
2547. Then, judging from what I have seen myself, I should imagine that the ground running back from the watercourses gradually rises into stony ridges? In some places it does.
2548. There are nice patches of low ridges suitable for grazing; but as you reach the summit, I presume you get on land that would take a large amount of money to make it available for profitable occupation? I think it would.
2549. Therefore, the matter resolves itself into this, that with regard to the settlement of this district in future, whether with or without railway communication, a man must be possessed of considerable means to take up this unoccupied land and put it in such shape as would enable him to make a profitable living out of it? I cannot say anything about that.
2550. With regard to the trade of the district, is it increasing very much? The trade is increasing, no doubt.
2551. Is that in consequence of the increased settlement that has taken place, or the increased productiveness of the soil, through superior knowledge being brought to bear on its cultivation? Both, I think; and modern appliances have, of course, a good deal to do with it.
2552. Do you, as a storekeeper, find any great inconvenience, either in getting your goods up from Newcastle or from Sydney, or in sending your produce away? None whatever. If I get a load of corn in, there are generally two drays waiting to take it.
2553. Where do you ship? At Clarencetown.
2554. You do not send to Maitland? No; I have nothing to do with Maitland.
2555. The bulk of your traffic is by road to Clarencetown, and thence by water to Newcastle? Yes.
2556. Are the roads pretty good? They are very good.
2557. What is the general rate of carriage from here to Clarencetown? From 10s. to 15s. a ton.
2558. And the water-carriage? From 5s. to 8s. a ton.
2559. Do you think that any railway could compete with that rate? I feel certain it could not.
2560. Not to pay interest on cost of construction and working expenses? I cannot see how it possibly could.
2561. Do you agree with the witnesses who have said that a railway to Dungog alone would be of little or no service to the country, but would have to be extended up into the North Coast districts in order to open up the country, and give some prospect of its becoming a payable concern? I do not think that a railway from Maitland to Dungog would pay.
2562. Do you think that the railway, if extended further on, would be beneficial to the country? I do not think at present it would.
2563. You have heard of the estimate prepared by the Railway Construction Department giving an annual loss upon a line from Maitland to Taree, on the lowest possible estimate consistent with efficiency, amounting to over £31,000 per annum? I heard that mentioned to-day.
2564. Do you think there is any possibility of that loss being reduced? It might perhaps be reduced.
2565. Do you think it would take some years' traffic to reduce it and make the line a paying one? Very many years, I think.

2566. Is there any other particular point on which you disagree with the evidence of previous witnesses? No; I think that is all I remember now. E. Piper.
2567. Now, with regard to the evidence you agree with? The railway would, no doubt, give facilities for travellers who wish to go to Sydney, 28 May, 1898.
2568. Give more rapid means of communication? Yes; and it would be a benefit in that way.
2569. And it might induce some people to come and settle in the district who have no prospect of coming here under other conditions? It might possibly do that.
2570. *Temporary Chairman.*] Does the traffic from this district always go to Clarencetown? Not always.
2571. The largest trade is with Clarencetown and Newcastle? No doubt about that.
2572. In the event of this railway being constructed, would there be any reasonable chance of its capturing that traffic? I do not think it would capture the heavy traffic.
2573. The maize and timber and material of that kind would still go to Clarencetown on the navigable waters of the Williams River? I think they would; it would be cheaper to send them that way.
2574. Supposing that the railway were constructed, and the Commissioners for Railways thought it was incumbent upon them to win traffic, and they quoted very low rates;—do you think that the steamer proprietors would be able to cut their present rates? I do, and I think they probably would.
2575. What boats run on the Williams River? The Williams River Steam Navigation Company's.
2576. Are there any shareholders in this town? Yes, there are.
2577. Are they largely interested in the Company? They are shareholders in it to a certain extent. There are several of them.
2578. Would it be unfair to ask you who the shareholders in Dungog are? I am one of them myself.
2579. Is it a joint stock company? Yes.
2580. The Committee, I suppose, may conclude that your evidence, as that of an honourable man, is not influenced by the fact that you are a shareholder in that company? It makes no difference to me. I am giving evidence which I believe to be correct.
2581. You believe that this district is well served at present so far as the transport of its products is concerned? I do. The railway might be quicker, but I do not think that the carriage would be done more cheaply.

Samuel Stanley Kingston, farmer, Bandon Grove, near Dungog, sworn, and examined:—

2582. *Mr. Black.*] What evidence have you to offer to the Committee? I think it would be better for the district, that it would increase the population and agriculture a good deal if the proposed railway were constructed. S. S.
Kingston.
2583. What makes you form that opinion? I think that land that is now lying idle would be put under cultivation. 28 May, 1898.
2584. Why do you think so? Because we would have better facilities to reach the market, and we could get a better price for our grain and produce generally. Perhaps the market is up to-day, and before we can get there it may be down again.
2585. How often may that happen? Pretty often—it fluctuates a good deal.
2586. Your reason for recommending the construction of this railway is that you think you could get your produce to market more quickly—that you could send your products in so as to catch a rise in the market? That is one reason.
2587. Are the farmers here always in a position to wait for rises in the market? Some of them are. A good many of the farmers do wait for a rise. I think that there is land now—second-class land—which is not occupied which would come in for growing oats and hay.
2588. Do you think it would be worth the while of farmers to pay about twice as much per ton for carriage all the year, by railway, in order to catch occasional rises in the market, or to attempt to catch those rises? Yes, I think it would.
2589. Rather than to send by sea at half or one-third the cost? It would pay them to pay more; I do not know that it would pay them to pay double.
2590. If you can land produce in the Newcastle market by sea for about 5s. a ton, and it would cost you about 15s. to send it by railway, do you think that under such circumstances you would be likely to use the railway? No, I do not think so.
2591. Do you not think that the difference in price between the sea and railway carriage would often be equivalent to a fair rise in the market of itself? It would.
2592. Do you think that increased settlement in the district is likely to be beneficial to the farmers who are already here? I am sure it would.
2593. I mean increase of farming settlement? Yes; I think so.
2594. Then the law of competition does not hold good in regard to farmers? Farming and dairying—I think it would be beneficial in that way.
2595. You think, if there were a greater community of farmers, instead of competition lowering prices, that by association they would have better circumstances;—is that your opinion? Yes, I think so. Farmers, as a general rule, deal a good deal amongst themselves.
2596. What do you do with your own produce? I generally sell it in Dungog at the present time.
2597. Then you really do not know exactly what you would pay for water-carriage? Occasionally I may send some by water.
2598. What do you pay when you do send it by water? About 1s. a bag for maize to Clarencetown, by road, and 6d. to Newcastle, by water. Storekeepers can generally get it done more cheaply than farmers can.
2599. That is about 15s. a ton to Newcastle? Yes.
2600. What does it cost you to send it from Clarencetown to Sydney? One shilling.
2601. For the railway to enter into competition with the steamer it would have to land goods in Newcastle at the same rates, or about the same rates;—you would be willing to pay a little higher price on account of expedition in delivery by rail? Yes.
2602. It would still cost you about the same for delivery to the railway, I suppose, as it does for delivery to the steamer at Clarencetown? Yes.

William

William Orr Skillen, Dungog, sworn, and examined:—

- W. O. Skillen. 2603. *Temporary Chairman.*] You are resident partner and manager of the butter factory in Dungog?
 Yes.
 28 May, 1898. 2604. How long have you been in the district? About twenty years.
 2605. How long have you been connected with the butter industry? About five months.
 2606. You have an extensive factory here, have you not? Yes, we have.
 2607. Can you give the Committee any information as to how much butter you produce per week, month, or year? We have had only about five months' butter-making.
 2608. What is your output per month or per week? About a couple of tons per week.
 2609. Is the supply of cream increasing? The suppliers are increasing; but the supply of cream is not increasing.
 2610. I suppose that the winter months account for the falling-off in cream? Yes.
 2611. The number of suppliers is increasing? Yes, increasing weekly.
 2612. So, judging from your five months' experience, it seems that the dairying industry is going to be pursued here largely? It will be pursued here very largely.
 2613. Is the land here suitable for dairy purposes? Yes, it is.
 2614. Do the dairymen here feed their stock in the winter, or rely on the natural grasses? Some are feeding their stock, and others are relying on the natural grasses. They are awakening to the fact that unless they feed their stock in the winter they will not do so well, and they are making provision accordingly.
 2615. They are going into the matter in a fairly comprehensive manner? Yes; they apprehend their position exactly, and are making good headway.
 2616. Are they satisfied with the results so far? Yes.
 2617. The majority of them are? Yes.
 2618. I suppose that the dairying is combined with other farming? Yes; but I think that in this district the principal thing will be the dairying.
 2619. You think that the system of mixing farming will not go on? I do not think it will.
 2620. You think that the dairying will be so much more profitable than the other style of farming, that the farmers will devote themselves exclusively to that pursuit? That is my belief.
 2621. What class of cattle have you in the district? A fair class, and it is improving.
 2622. Which breeds? Devons, Herefords, Durhams, and a few Alderneys—not many Alderneys yet.
 2623. Are they crossing the shorthorn and other cows with Jersey bulls? Yes.
 2624. Is it recognised in the district that the Jersey is the best dairy cattle? It is.
 2625. You have not far from here a breeder of Jerseys—Mr. Brown? Yes; one of the best, I believe.
 2626. Are the farmers buying bulls from him? Yes; some of them have stud bulls from him.
 2627. You think the farmers are aware of the fact that if they want to breed and secure good crosses, they must always breed from pure-bred sires? They are alive to that fact.
 2628. Have you ever been down the South Coast? Not for twenty years.
 2629. Do you know that the Jersey, or the Alderney, as you call it, is unpopular in the South Coast? I am not aware of that fact; it is against the book knowledge if such is the case. I have always read that the Jersey cattle are much superior in giving milk and for butter-fat, but for killing purposes the Jerseys are certainly deficient.
 2630. But I mean that, to secure the best milking results, they must always cross the ordinary cattle with pure-bred Jersey bulls and not half-bred bulls? That is what I understood you to mean.
 2631. Is yours the only butter factory in this neighbourhood? It is.
 2632. How many creameries are there? In this district the butter factories have no creameries attached to them; they depend on the farmers themselves possessing separators and sending in their cream from the farms.
 2633. I suppose the larger dairymen all have separators? Yes.
 2634. And they bring the cream into you? Yes.
 2635. What is butter-fat worth at the present time in your district? We pay 12½d. here.
 2636. That is an unusually high price, is it not? It is.
 2637. That is, I suppose, owing to the fact that butter has gone up very much in the market? Exactly so.
 2638. Is it likely to maintain that price? Yes, it will maintain that price for some time to come; in fact, I believe that it will go higher.
 2639. And, of course, the higher price in the winter makes the farmers return them pretty well equal to his summer return? Quite so. My experience is not very far-reaching; but in the later fortnights the return to the farmers has nearly doubled itself as compared with what it was in the few fortnights we had in the summer.
 2640. How many cows are milked in the district? I have no idea.
 2641. Who is considered the largest dairyman? The largest dairyman we have on our books is Mr. Samuel Smith, of Bandon Grove.
 2642. How many cows does he milk? I think he has about forty cows in milk now.
 2643. You are aware that on the south coast they have immense establishments of this kind? I am.
 2644. Kameruka, for instance, milks 1,300 cows? Yes.
 2645. And several other establishments milk from 500 to 750 cows? Yes. I know the factory system is more extensive on the south coast.
 2646. It has only been quite recently established here, I suppose? That is so.
 2647. Is your market Newcastle? No; it is Sydney.
 2648. You are connected with some Sydney firm, are you not? Yes, A. M'Arthur & Co.
 2649. You send all your products to them? We do.
 2650. You sell nothing locally? No, except to the storekeeper.
 2651. There is a large butter factory also in Newcastle? Yes. Mr. Ireland is operating there.
 2652. Is much cream sent from this district to Newcastle? Yes.
 2653. Is much cream sent from the lower part of the Williams River now? Yes.
 2654. Is there any butter factory there? No; there is not.
 2655. But there is a public creamery, is there not? Yes; Mr. Frederick Lowe is the proprietor.
 2656. Do you think that there is likely to be a factory established there? I could not say. We endeavoured to start the factory now held by Skillen and Walker some years ago. 2657.

2657. Do you think that your establishment is large enough to do with all the milk produced in this district for some time? Yes. W. O. Skillen.
2658. What can you manage to manufacture at your best? With the appliances we now hold we could manufacture from 7 to 8 tons per week—that is, working during the day only. 8 May, 1898.
2659. And I suppose that your factory is so built that you could extend it if you should wish to do so? Yes, it is.
2660. So, as the trade demands it, your premises will be extended in proportion? We could put in the necessary machinery; we have the buildings already.
2661. You have been residing here for some years? Yes.
2662. Will you tell the Committee what your own impression is about the proposed railway—first you might apply it to your own industry;—what particular advantage would the dairy-farmer gain by it—for you say the district will soon become largely a dairy-farming one? The dairy-farmer would have this advantage: he would have other firms to whom he could send his products in a couple or three hours, and so have competition with his own town.
2663. Whereas now he is in your hands? Exactly so.
2664. What would he and what would you gain in advantages of rapid transport and reduced rate owing to the construction of the railway? I question if we would have any reduced rate by the railway coming to Dungog so far as that product, or, indeed, any other product, is concerned. We might have quicker transit; that is all we would gain.
2665. You would have quicker and more certain transit? Yes.
2666. But you doubt if you would have cheaper? I am certain we would not have cheaper.
2667. What effect do you think the construction of this railway would bring about? It might improve the timber trade, and, if it went further, it might open up some of the A. A. Company's land, and I do not believe there is any better land in the Colony for dairying purposes.
2668. I should like you to deal with Dungog and its immediate surroundings first? I do not think it would benefit Dungog proper in any way except as regards quicker and more certain transit.
2669. Do you think it is desirable that the whole of the trade of the Colony should be concentrated in Sydney? I do not think it is at all desirable.
2670. Would not the construction of this line have the effect of depriving Clarence Town and Newcastle of part of their existing trade? Certainly it would.
2671. And still further congest the trade in the great metropolis? It would.
2672. And that is a thing you do not approve of? I do not. I believe in decentralisation rather than centralisation.
2673. You foresee no immediate gain to this district from the construction of the proposed railway? Not to Dungog proper.
2674. What is the opportunity around Gloucester and Stroud for increased settlement, and what is their present means of transport? Their present means of transport is by bullock-dray or horse-waggon.
2675. To where? To Dungog or Raymond Terrace.
2676. Raymond Terrace is their port? I think it is their principal port.
2677. They convey their produce to Raymond Terrace, and thence it goes by steamer down the river? Yes.
2678. That is their only means of transport at present? Yes.
2679. Can you give us any idea of the road-freight between those two places and Raymond Terrace? I have no idea.
2680. The population both of Gloucester and Stroud is very limited, is it not? I think so.
2681. Is there good land around about both those places? There is good land around Gloucester. I do not believe there is better land in the Colony than that.
2682. Part of that is the A. A. Company's? I think it all belongs to that company.
2683. There is some Church and School land pretty close, is there not? I do not think there are any Church and School lands near Gloucester; they are a good bit west of Gloucester.
2684. Do you think it is right, in the interests of the State, to construct a big public work at a large cost and allow a corporation, which paid nothing at all for their land, to reap large benefits from it? I would raise my voice against anything of the kind.
2685. Do you agree with previous witnesses, that before an attempt should be made to construct a railway through the A.A. Co's., land the Government should arrange with that company either to take over their land or for them to sell it at a certain fixed rate? I think it should be done, more especially if it is a fact that a 4s. 6d. tax is all we get from it.
2686. You think it would be unfair of the State to tax the ratepayers in order to construct a railway which would go more directly to benefit the A.A. Co. than anybody else? I do so emphatically.
2687. Is the land around Gloucester good for all purposes? I think so.
2688. *Mr. Fegan.*] You say that you send your butter to A. M'Arthur & Co.? Yes. They are interested in the business with us.
2689. You do not sell any in Dungog? We sell it wholesale to the storekeeper and retail it to our own customers.
2690. Can any persons become your customers? Yes; private individuals can come to our own store for it.
2691. And those people can buy it at your own store the same as at any other store? Yes.
2692. What machinery have you? We have the latest type of machinery. We have refrigerators, temperators, churns, butter-workers, &c.
2693. If the proposed railway were constructed would you send your butter by rail—I suppose that would depend on the charge? It would also depend on the seasons. In cool seasons we would send it by water, that being the cheapest carriage.
2694. So the construction of this line would not help you very much? Very little indeed.

John Alexander Jones, butcher, and alderman of Dungog, sworn, and examined:—

2695. *Mr. O'Connor.*] How long have you been here? About thirteen years.
2696. Will you in your own way tell us your reasons either for or against the construction of this railway? I think that, considering the large expense to which people in this neighbourhood had been put to for many years in opening up the country, they are entitled to certain benefits, and amongst those benefits would J. A. Jones.
28 May, 1898.

- J. A. Jones. would be railway communication. It would certainly induce people to take up lands that are now waste from some of the landowners. This district is admirably adapted for fruit-growing, but it is entirely useless as a fruit-producing district at the present time; however, if the proposed railway were constructed, I think that very large orchards would spring up in the locality.
- 28 May, 1898. 2697. Do you produce any grapes in this locality? Very little; but they do well.
2698. Do you think that they would attain the proportions of a wine industry here? There was such a thing here some years ago.
2699. You think that if the proposed railway were constructed it would increase settlement, and more land would be taken up? Yes.
2700. And that would diminish the estimated large annual loss to the State from this railway? I think so.
2701. How far does your knowledge of this country extend? As far as Copeland and Gloucester.
2702. Is the country around there good? Yes. Around Gloucester it is particularly good—splendid agricultural land all along the rivers. I deal largely in pigs. I send a great many to Sydney. The transit to Sydney is not very expensive. I can get them taken from Clarencetown to Sydney at a cost of 1s. 6d. each. The only inconvenience is that they are shipped at 9 a.m. at Clarencetown, and do not reach Sydney till the following morning, whereas with railway communication we could send them down in much less time.
2703. *Mr. Fegan.*] Do you think that you could get your pigs to Sydney for 1s. 6d. by rail? I have no idea.
2704. Have you ever sent any pigs to Newcastle by rail? I have not.
2705. Or by water? We must send them by water; there is no other route. If you send five or six large pigs they charge you a little more, but the difference is very little; for less than twenty and larger pigs they charge you a little more.
2706. You send no cattle? I have sent calves by steamer.
2707. How long since? I sent only one load.
2708. Why? The freight was too heavy;—10s. or 11s. per head.
2709. Then you had nothing left? Very little indeed.
2710. So the reasons you have given to Mr. O'Connor are your chief reasons for looking with favour on the proposals now before this Committee? Yes; there are a good many reserves somewhere on the line which might be opened up. I have no idea what they are like or where they are situated, but there are very large reserves and I think very great timber reserves, and in my opinion the timber industry would be much augmented if there were a railway.
2711. Do you think they would send timber by railway instead of by boat? I should think so.
2712. Is it not a fact that wherever people can get water-carriage for timber they send it by water in preference to sending it by railway? That may be the case, but I do not know. We know nothing about railways in this locality, and only something about water.
2713. The Commissioners could not rely on a great return from timber? No; I grant that.
2714. *Temporary Chairman.*] Then in general terms you think that the people of this district should have the best means of communication the Government can give them? I think so.
2715. And that is a railway? Yes.
2716. Do you think the country would be justified in expending the large sum estimated for the construction of this line? I did not say that exactly.
2717. To make a railway from Maitland to Taree practically means the expenditure of £1,000,000;—do you think that the possible progression of the district and its increased population would justify the State in spending that money, because you believe that sooner or later the State will be recouped for its outlay by increased settlement? It would take a considerable time to increase settlement, but sooner or later it would happen. I am in favour of the Mayor's suggestion in reference to the A. A. Co.'s estate. I think it would be wise if the Government could secure that land previous to the construction of the railway.
2718. But you would not recommend the arbitrary resumption of that land? No.
2719. You think that before a railway should be made through the A. A. Co.'s enormous estate some arrangement should be made between the Government and them by which the Government should take their land at a fair valuation or the company should sell it to selectors at a moderate price? Yes; I think it would be advantageous to the Government in the end to buy it.

MONDAY, 30 MAY, 1898.

[The Committee met at the Court-house, Stroud, at 3 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.
JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- C. McD. Stuart. 2720. *Mr. Fegan.*] You have been over the route of the proposed railway from Maitland to Taree? Yes.
- 30 May, 1898. 2721. Would you mind describing in the first instance the country from Maitland to Dungog? The proposed line leaves West Maitland about 1 mile to the west of the West Maitland railway station on the main northern line. It then takes a northerly direction, and after passing over some fairly good country it crosses the Hunter River. It then skirts the northern side of the upper road between West Maitland and Paterson, along the edge of the high country, so as to keep out of flood-ground and avoid crossing any swamps or places of that description.
2722. Is that the reason why it is so far from the main road? Yes. The main road the Committee came out by is on the eastern side of the Paterson River.

2723.

2723. But another idea was to keep away from navigation? When you reach Paterson you strike the Paterson River at the head of navigation, but you keep above it, and after leaving Paterson you go practically in the same direction, due north, and cross the Wollarobba Range at a low point close to where the main road crosses. The line then runs from that in the same direction, still through broken country, till you come to within about 3 miles of Dungog. The line then bears in an easterly direction in order to avoid a fairly high ridge, and it turns back to its old course and runs between the township and the river Williams. C. McD.
Stuart.
30 May, 1898.
2724. You have been in Court and have heard witnesses say that a light line could be constructed there? Yes.
2725. The amended estimate was based upon your further report upon this line? Yes.
2726. It has been reduced from £1,209,000 to £982,000? It is principally owing to the decreased cost of works; that is the principal alteration made in the estimate.
2727. Has not some slight alteration been made in the route? It is practically the same route.
2728. You have heard witnesses say that a line could be constructed for a much smaller sum than is proposed, viz. £8,440 13s. per mile? Yes.
2729. After carefully going through the estimate, do you think that anything like a large reduction could be made in the cost of constructing the line? I do not think so, for a line of the same gauge. I do not think it would be a fair thing. You would have to bring in much heavier grades which would not be at all suitable for a line which ultimately will be a main line, if it is ever constructed.
2730. You say there was no deviation of route? The estimate was decreased because of the reduced cost of material and labour, both material and labour being cheaper than they were when the original estimate was made.
2731. Have you any idea how many bridges you would need on that first length of the line? There is a large bridge over the Hunter River and there is a large bridge over the Paterson River, and then of course every gully that you have to cross requires either a culvert or a bridge, and the country is so broken that it necessitates a great number of bridges.
2732. The revised estimate for the line between Maitland and Dungog contains these items—earthworks, £78,024 1s., culverts and timber bridges £22,922 1s. 6d., or at the rate of £669 per mile? Yes.
2733. Large bridges—No. 3—£52,707 6s.;—is that for a bridge over the Paterson? I think that that item includes both the Paterson and the Hunter River bridges. The Hunter bridge is a much larger bridge than the Paterson bridge.
2734. Have you any idea what the average grade will be from Maitland to Dungog? If I remember correctly it is worked out for a 1 in 60 grade.
2735. That is all through, is it not? Yes.
2736. I meant between Maitland and Dungog? I think the 1 in 60 grade comes in between Maitland and Dungog—I am almost certain it does in the approaches to the culvert on the Wollarobba Range.
2737. After careful consideration, and having had an opportunity of seeing the various estimates for the various sections, you think that the line cannot be constructed much more cheaply with a 4 feet 8 inch gauge? I do not think it can, and get a good grade.
2738. Would you mind describing the country from Dungog to Gloucester? The country there is very much the same as the country that preceded it? After you leave Dungog you go in the same direction. The first range you cross is the Monkerai, and there you have to have a tunnel to go through it, and long approaches. Then you follow down Ram Station Creek until you get to the Karuah River. The Karuah River is crossed about 5 miles to the west of Stroud. After crossing the Karuah River you cross the main road to Gloucester, and you follow up the valley to Johnson's Creek. This valley you follow up almost to the head of the creek. Afterwards you cross the "divide"—which is very low—between Johnson's Creek and Avon Creek. You then follow the valley of Avon Creek for a short distance, and then turn round to the back of Gloucester—that is, on the east side of Gloucester.
2739. It is estimated, as you know, that the section from Dungog to Gloucester, which you have just described, will cost on the average £7,572 12s. 8d. per mile? Yes.
2740. Where do you commence your tunnel? It is a fairly short tunnel.
2741. Six hundred and forty-seven yards? Yes. It goes through the range a little to the right of where the main road crosses.
2742. Do you think that the estimate is rather large—£23,093 for 647 yards—as labour is at present? No; I do not think so. The cost of tunnels is close on £50 a yard.
2743. You intend to brick it, I suppose? Yes, it will be all lined.
2744. What weight is the heaviest rail you use in railway construction? The estimate in this case was made out for 71½-lb. rails.
2745. But you do use an 80-lb. rail? Yes, on the main line where there is very heavy traffic, and on the lighter lines we use a 60-lb. rail.
2746. So you say that a good average would be a 71½-lb. rail? Yes; even if a 60-lb. rail were used, that would not materially alter the cost of the line.
2747. Considering the grade, which is 1 in 60, and the various earthworks in connection with the proposal, you could not recommend a lighter rail? Not less than a 60-lb. rail.
2748. I meant a 71½-lb. rail? Yes; I think you could use a 60-lb. rail so long as the traffic was not very heavy.
2749. But that would mean that in the long run you would have to take up the 60-lb. rails and put down heavier rails if the traffic should increase? Yes; but that would mean a matter of some years, for the 60-lb. rails would probably carry the traffic for a long time.
2750. Considering the average traffic in this district, what would the life of a rail be? I could not say, because we do not know to what extent the traffic would increase, but I should think that a 60-lb. rail would carry the traffic for the life of the rail. The traffic would not increase to too great an extent for that.
2751. Would you mind describing the third section—that is, from Gloucester to Taree? After leaving Gloucester on the east side you bear in a rather more north-easterly direction. You cross the Avon Creek close to its junction with the Gloucester River. You follow down the right-hand side of that river until you strike the Barrington River, and you follow the Barrington River down almost to where it joins the Manning River. You cross the Manning a short distance below its junction with the Barrington, and then you follow down the northern side of the Manning River, through very broken country, to Wingham.

C. McD.
Stuart.
30 May, 1898.

2752. Would you mind describing that broken country? The country is so broken that, if I remember correctly, there is to be a short tunnel in it. It has spurs, to a great extent, from a range at the back. The country all down the Barrington is very much broken, too. There is a tunnel in it. After passing Wingham you get into easier country, until you get to Taree, where the line terminates.
2753. The last section of the proposed line seems to be heavier than either of the other two sections, inasmuch as the estimated cost per mile is £9,784 6s. 4d.? Yes. The reason for that is that you have the Avon Creek to cross. It is pretty wide there owing to the flood-country, and you have a heavy bridge over the Manning River; and, owing to the broken nature of the country down the Barrington, you have a short tunnel there through one of the spurs, and you have another tunnel between the Manning River and Wingham. You have two tunnels and two considerable bridges on that length.
2754. The length of those tunnels is 629 yards, and the estimated cost £23,393? Yes.
2755. Culverts and timber bridges and large bridges—No. 4—and over-bridges will come to something like £90,000; the earthworks seem to be the heaviest item? The earthworks are the principal item, because the country is so very broken.
2756. Taking the whole estimate, £982,000, do you think that the item "Engineering and contingencies at 12½ per cent." is too high, for it amounts to £109,141? I do not think so. There are so many items that have to be taken into account that are charged against the line. There is all the preparation of the plans, and everything connected with the office, as well as the actual supervision of the work on the field. All these items are forgotten as a rule, but they are now taken into consideration, and that adds very much to the expense.
2757. So you think 12½ per cent. is a fair proportion to set aside for that? I think so.
2758. Along the route of the proposed line, have you a good supply of timber for sleepers, bridges, and crossings? There is a fair supply of timber for sleepers, but there is not much of what I call first-class timber that would do for big bridges. You can get timber for the smaller bridges. For the large bridges I think the timber would have to be brought from a distance.
2759. Have you any idea how far that would be? I cannot say, because they would probably take it from where it could be most conveniently brought, for instance, by train. For the Namoi Bridge the timber has had to be brought a long distance from the coast.
2760. Which coast? Between Newcastle and Sydney—somewhere near Gosford.
2761. So that whilst you may have timber for sleepers for the total length, it would be very difficult to get timber for large bridges without going a great distance? Exactly. The timber may be in the district, but it may be such a distance from the line that it would cost more to bring it than it would cost to bring timber from the nearest station.
2762. The estimate has been made on the supposition that you cannot get timber near? For the large bridges.
2763. At any rate, if you could the difference would be very little? Yes. We have taken an average price.
2764. Is there any possibility of getting a route which would serve the district so well as the one now before the Committee, and along which the railway would be much cheaper and easier of construction? I do not think so. I think the route at present taken goes through about as good country as you could get, and it cuts all the rivers above navigation, which is a very important consideration.
2765. And goes as near to the centres of population as possible? Yes; you can tell that by the towns it goes through.
2766. So that, considering present prices, which you say are very fair—and considering the amount of labour at the Department's disposal, and the low rate of wages that are paid—you think there is no possibility of cutting the cost down much below the present estimate? I do not think so—at least, not to any material extent; and there are many extra items that always turn up afterwards, so that ultimately a line generally costs as much as the estimate.
2767. The estimate of £982,000 does not include payment for the resumption of any land for the construction of the line? No, it does not.
2768. It comprises merely the engineering items? Yes.
2769. Therefore, it would be safe to say that before the line be completed it must cost over £1,000,000? I think you can safely say that.
2770. What is the total length? 113 miles 66 chains; and the ruling grade is 1 in 60.
2771. What are your chief curves? The curves are pretty sharp. I think they go up to a 12-chain radius.
2772. That is rather a sharp curve? Yes.
2773. What is the average curve on the main trunk lines? The main trunk lines have been constructed a long time, and you get a 12-chain radius upon them; but the Commissioners are trying to cut out as many as they can.
2774. I want to know what would be a good working curve? I think from 15 to 16 chains radius is about as sharp as I care about to go at any high rate of speed. It very much increases the cost to get that radius at times.
2775. What would you have to tunnel through;—has the ground been tested? No, it has not been tested. But I should say that in all cases it would be rock; the exact description of rock I cannot tell.
2776. As regards the cost, a great deal would depend on what kind of rock you would have to tunnel through? Yes. Of course, if it were very hard rock the tunnel might do without lining; but I do not think that it will.
2777. In the estimate for your tunnels and your bridges have you made any provision for a double line? No.
2778. You have made no provision for a double line? I am not sure about the bridges; they may be for a double line.
2779. But you do not think they are? No; I do not.
2780. And you are sure that the tunnels are for a single line? I am almost certain they are for a single line.
2781. That, therefore, has to be taken into consideration? It has, of course.
2782. It means, in the extension of this line, if traffic should increase very much, a much larger expense in making provision for a double line? It does, certainly.

2783. *Temporary Chairman.*] There are many sharp curves in this line? There are a good many.
 2784. And some pretty steep grades? Yes; 1 in 60 is the steepest grade.
 2785. Sharp curves affect the life of a rail considerably? Yes, because of the friction on the curves.

C. McD.
 Stuart.
 30 May, 1898.

Charles Percy Thomas, solicitor, Stroud, sworn, and examined:—

2786. *Mr. Black.*] How long have you been a resident here? Five years.
 2787. Do you know the route that is to be taken by the proposed railway? I know most of it from Wollarobba to Gloucester.
 2788. Are you of opinion that the direction taken by the railway under the circumstances, is such as will best serve the district? It would tap the greatest amount of traffic, though it would hardly be the cheapest, and would not be over the most even country.
 2789. How far is this town from the head of navigation? About 12 miles.
 2790. At which point? The new wharf below Booral, on the Karuah.
 2791. Which runs into Port Stephens? Yes.
 2792. Is that the port of shipment for the produce of the district? It is now, for most of it. Raymond Terrace has been hitherto, but I think the principal quantity goes the other way now.
 2793. How far is Raymond Terrace from here? Thirty-one miles.
 2794. On what stream is that? It is on the Hunter.
 2795. Is the traffic which goes to Karuah River for shipment served by vessels as large as those that trade to Raymond Terrace? No; only very small vessels get up to the Karuah wharf.
 2796. What are they—droghers? No; the small coastal steamers. The "Williams" from Newcastle is about the largest.
 2797. Does she go right up? Yes.
 2798. And tranships? No; the "Williams" as a rule goes right down to Newcastle.
 2799. Is she large enough for the requirements of the trade? She appears to be so at present.
 2800. How often does she run backwards and forwards? Once a week I believe.
 2801. She leaves this end once a week? Yes.
 2802. What are the principal outgoing products of the district? Wheat and maize and timber—that would be cedar from beyond Gloucester.
 2803. Do you grow enough wheat here, not only for your own wants, but sufficient to leave a margin for outside sale? Yes, there is a margin for outside sale. Of course all the flour consumed here is not grown locally.
 2804. Where do you get your flour from? Newcastle.
 2805. You have not a mill here? No. At Dungog there are mills to which a great quantity of our wheat goes.
 2806. Have they got over the difficulty of the rust in this district? For the last two years there has been no rust. There was a considerable interval when they did not grow wheat. Since that interval the rust has not appeared.
 2807. You have no idea of the tonnage of the vessel you mentioned? No, I have not.
 2808. You are aware of the course the railway will take when it nears Stroud? By the Washpool is where it crosses the river, I believe.
 2809. You are aware that it will not come within 5 miles of this town? Yes.
 2810. Then, so far as the construction of the railway is concerned, your position as regards intercourse with the outside world will not be very much improved? Not very much—not from here south-east. The settlement trends south-east from where the line crosses.
 2811. How do the people who visit Sydney or Newcastle travel? They go by road to Raymond Terrace and thence by steamer, or they catch the train at Hexham.
 2812. They do not drive to Maitland, as a rule? Not as a rule. They do occasionally; but the general practice is to go to Raymond Terrace, or to Hexham, and thence by train to Maitland, Newcastle, or Sydney.
 2813. I suppose that if the railway were brought within 5 miles of this town they would use it? Yes; I am sure of it. Certainly the town-people would.
 2814. Have you any idea as to the freight by steamer between here and Newcastle, or between the nearest point of shipment from here to Newcastle? No; I cannot speak exactly as to that.
 2815. How is the main portion of the land around here utilised—as pastoral or agricultural? As agricultural along the river, and as pastoral at the back.
 2816. As agricultural along the river flats? Yes.
 2817. They are very limited in extent, are they not? Yes, they are; they do not go very far back from the river.
 2818. I suppose, then, as a rule, there is not more than from 1 mile or 1½ mile to 2 miles on either side of the river? No, taking both sides.
 2819. Do you think that if the railway were constructed there would be any large increase in the number of those following agricultural pursuits in this part of the country? Not in this immediate neighbourhood.
 2820. On any other portion of the route intersected by the proposed railway? I think that up Gloucester way there would be—that is, the Barrington and the country around there.
 2821. From Gloucester to Taree, do you mean? Well, off the line to the north-west, I think there would be a considerable increase.
 2822. On the north-west side of the line? Yes; from Gloucester.
 2823. You know that the proposed line is estimated to cost altogether £982,283? Yes.
 2824. It will cost somewhere about £9,000 per mile;—do you think under the circumstances that such an expenditure would be justified? I do not think the returns from this immediate neighbourhood would justify it up to this point—that is, speaking only for this immediate neighbourhood.
 2825. Do you think the returns between West Maitland and Dungog would justify it? Well, the returns from the Dungog District would be very much larger, but I can hardly say definitely.
 2826. If there be a loss on the 71 miles which lie between West Maitland and Gloucester, do you think there is any likelihood of there being a recoupment from the third section of the line which lies between Gloucester and Taree? I think the largest amount of traffic would come on to the line at Gloucester—
 from the west and north-west. 2827.

C. P. Thomas.
 30 May, 1898.

- C. P. Thomas. 2827. But it is hardly possible that a line which is to be 113 miles 66 chains in length could be made to pay because of the traffic which would reach it at one point? I do not think that it will pay; but I think that is where the line will tap the most traffic.
- 30 May, 1898. 2828. Do you not think that this portion of New South Wales would be in the meantime amply served if the Government went on with those proposals for the improvement of the rivers which are now under consideration? I think it would as it is now, or as it promises to be in the near future, except that part that I speak about. I think that is the one locality that would be really benefited by the railway.
2829. But you see that it would be impossible to construct that portion of the railway, for the benefit of the district, without connecting it with the Northern line? Yes.
2830. You cannot consider that part by itself, because it is at the wrong end? Yes.
2831. How is the land held about here? All the cultivation is in the hands of private owners; they purchased it from the A.A. Company—almost the whole of it.
2832. Do you know what they paid for it? I cannot say from memory.
2833. Can you say approximately? I think they put the cultivation land at about £15 an acre approximately, and the pastoral at 30s.
2834. Will it pay to buy agricultural land here at £15 per acre? That would be improved land—not the rough unimproved.
2835. What would be the nature of the improvements? It would be cleared and fenced.
2836. No buildings? No.
2837. Is that not rather a high price? They maintain a high price for all their holdings, and it keeps the price of private holdings up.
2838. But, of course, what a man who invests his money in land pays for the land is an item in the cost of the product he raises, is it not? Yes, certainly.
2839. And the percentage of cost lessens the percentage of profit? Yes, certainly.
2840. Well, then, how is it that, in a district comparatively speaking far from market, settlers can afford to pay such prices for land if in other districts equally fertile and so much nearer market £15 per acre would be considered a prohibitive price? Well, there is not a fortune in farming in this district, and they have estimated the improved cultivation land on the bank of the river at £25 per acre. In making out the land-tax return they have estimated the unimproved at £5 and the improved at £20, in many cases, for back-country cultivation.
2841. It seems a very high price? Yes.
2842. The settlers here are chiefly old residents, or the sons of old residents, are they not? Nearly all of those about here.
2843. They are not people from other parts of the Colony? Most of them are not; the great majority are old-settled inhabitants.
2844. And perhaps they are disposed to pay a higher price because of the associations? Really very few agricultural properties have changed hands within the last five years. I do not know of any case where the associations have come into consideration in connection with the price, for very few have changed hands within the last five years.
2845. It may be that those values are, after all, purely paper values? Yes, it may be.
2846. And that, if farm property were sold now in the open market, it would not bring those prices? Very likely not. The properties that have been sold have been particularly wanted by the purchasers.
2847. You have had no instances of compulsory sale, have you? None.
2848. If that be so, then perhaps the true basis of assessment has not been made evident? Probably not.
2849. Have you seen any growth or progression in the town or district whilst you have been here? Dairying has started and grown to a certain extent since I came here, and wheat-growing is something fresh since I came here. The rust compelled them to discontinue growing wheat some years ago, and they have started again within the last five years.
2850. There is a creamery in connection with a sawmill near here? Yes.
2851. Do you know anything about the weekly output of butter? They do not make butter; they send the cream away.
2852. To where do they send the cream? I believe to Ireland's, at Newcastle.
2853. Do they send it by steamer? By coach to Raymond Terrace, and thence by steamer to its destination—whatever it is. Several private individuals have separators of their own.
2854. Referring to grazing land, have you any idea of the number of acres that go to a beast in this locality? Most of it is very poor indeed, and you can hardly form an estimate. The bush country is almost too poor to carry cattle at all—the major portion of it—that is, to the east of the town.
2855. Yet it brings 30s. an acre? That nearest the town does. It wants a lot of improving to be of much good.
2856. Is much of the timber about here rung? Not a great deal of it. You can see almost all that is rung from the town or from the road.
2857. How does the cattle raised here get to market? It is driven.
2858. Driven to Maitland? Yes, to Maitland—through Dungog, as a rule.
2859. Have you ever known a drought here since you have been in the district? Yes.
2860. In what year? I think that in the winter of 1895 there was the worst drought we have had.
2861. Was it very severe? It was a severe drought.
2862. As a rule, the rainfall here is very heavy? Yes.
2863. *Temporary Chairman.*] Can you give us any idea of the amount of tonnage that goes in and out of Gloucester in the year? No, I cannot; there is not a large amount now. Excepting cedar, and cattle which are driven, there is not a great deal.
2864. Practically, I suppose there is nothing sent out except live stock and timber? Yes, and cedar—no hardwood from that direction.
2865. The timber goes to Booral, I suppose? Some to Booral, and the other to Raymond Terrace or Dungog.
2866. Just as the market offers, I suppose? Yes.
2867. And the cattle go to Maitland? To Sydney in a few instances, but to Maitland principally.
2868. Have you any idea of the population of the district in the immediate vicinity of Stroud? I suppose about 400.
- 2869.

2869. It is returned by the Government Statistician at 300? Well, between 300 and 400—that is, in the C. P. Thomas immediate vicinity of Stroud.
2870. And the occupation of the inhabitants is purely pastoral? Almost entirely agricultural here; but ^{30 May, 1898.} in the Gloucester district it is pastoral.
2871. That is, on the flats of the river it is agricultural? Yes. In reference to the value of the land, I may mention that what I have stated is only approximate. I could find out exactly, perhaps, what farms have changed hands since I came here, if you thought it material enough.

Gordon Lancelot Andrews, bank manager, Stroud, sworn, and examined:—

2872. *Temporary Chairman.*] You are the Manager of the local branch of the Bank of Australasia? Yes. G. L. Andrews.
2873. You are also representative of the A. A. Company? Yes. I receive their rents here. They are paid into the bank. 30 May, 1898.
2874. Can you give the Committee any information as to the area of land held by that company, say, within 15 miles of Stroud? I cannot tell you that; but I think they own about 500,000 acres in the district.
2875. I mean the areas within 15 miles of Stroud? I cannot say, because so much of it has been sold.
2876. What portion of the land have they alienated—the better or the inferior land? Some of each, except up at Gloucester, and that is really the pick of the country.
2877. We will deal only with the country immediately round Stroud;—have they sold all the good land, say, within 10 or 12 miles round Stroud? No. I suppose there is lots of it not sold yet.
2878. Lots of good land still unsold? Yes.
2879. Can you give the Committee any idea what the company are asking for their agricultural land in this neighbourhood per acre? It varies, I should say, from about £2 to £2 10s.
2880. £2 10s. for the best? No; that is for totally unimproved land.
2881. I want to know the price for their best unimproved land? Taking Booral, for instance, 5 miles away, they are offering now some land at between £8 and £10 an acre.
2882. That is close to navigation, is it not? Within 4 miles.
2883. It is within a fairly practicable distance of a seaport? Yes.
2884. And it is good land too, is it not? Yes; it is good land. It is for a silk worm farm.
2885. Mr. Brady's place? Yes.
2886. Have they any improved vacant land they are offering for sale there? I think only about 15 acres.
2887. Then is the rest of the good land there alienated? Yes; it is all taken up there.
2888. Do the company lease land as well as sell land? They have sold land, and they have leased land as well.
2889. It is practically all in occupation except 15 acres? It has been, up to the last two or three months.
2890. What possibility is there of an augmentation of the population of this immediate neighbourhood if there is only 15 acres of good land available? I am speaking only of that one particular district.
2891. Is there any other good land which the company are prepared to sell or to lease within a reasonable distance of Stroud? I consider there is very good land within a short distance of Stroud that is leased at present.
2892. Have the company still in their own possession unsold or unleased any quantity of good land in the neighbourhood of Stroud? No; I should not say they have—no improved land at all.
2893. Well, good land in its natural state—good land not improved? It would have been snapped up before now if there had been.
2894. I gather from that that the chance of increase of population in this neighbourhood, even if better facilities be given, is considered hopeless? Yes; that is true. I do not think that a railway would better this place at all. It would better the district farther north, nearer Gloucester.
2895. You believe that Stroud has seen its maximum prosperity? I think that a railway near Stroud would not improve it, but that if the railway went beyond Stroud it would take everything with it.
2896. Instead of improving the little town of Stroud, it would destroy it? Stroud was better fifty years ago than it is now.
2897. It was a small trading centre fifty years ago, I suppose? Yes; and it had a larger population.
2898. The opening up of the country and the establishment of other towns have deprived this place of its principal source of revenue? Yes; and its having always been looked upon as a private town.
2899. It was fenced in at one time, was it not? It had a gate at each end.
2900. Well, supposing the Government were to determine to resume the A. A. Company's property, or were to make some arrangements with them to buy it at a reasonable price and offer it again for occupation at reasonable prices, do you think that then the population would be likely to increase at all largely? I do not know that it would here, but it would up at Gloucester.
2901. We are dealing now principally with Stroud and neighbourhood—do you represent the company also at Gloucester? No; I am not their representative there. I merely take their rents here and live on the premises.
2902. As bank manager you receive their rents from tenants? Yes.
2903. And notify the company when the tenants do not make their payments? The company notify me.
2904. Your agency simply consists of that? Yes.
2905. Can you give the Committee information to strengthen the claims of the district, or, say, the claims of the entire coast district, for railway communication; you say that the railway would not benefit Stroud, but would possibly injure it;—what is your opinion of the proposed railway, looking at the district generally along the north coast to Taree? I dare say it would be of great benefit to the northern part of it and to Dungog.
2906. You think it would be of benefit to Dungog? Yes; I believe it would benefit Dungog.
2907. The people there do not appear to think so? I thought they were very strongly in favour of it. They seem to have a very powerful railway league there.
2908. You think it would be beneficial to Dungog, but not to Stroud? I am certain it would not be beneficial to Stroud.
2909. What about Gloucester and the district beyond Gloucester? If the "Gloucester" estate were thrown open, the railway would undoubtedly be of benefit to Gloucester and district, and I believe that the land there would be very quickly taken up. 2910.

- G. L. Andrews.
30 May, 1898.
2910. *Mr. Hassall.*] How is the land principally held around here? It is occupied by the owners, who bought from the A. A. Co.
2911. Am I to understand from that, that the good land around Stroud has been sold by the A.A. Co.? Yes; but there is a lot of it leased as well.
2912. What is the proportion of freehold to leasehold land approximately? I cannot tell you, but I know that some of them have as much as 5,000 and 6,000 and 20,000 acres under lease from the A.A. Co., whilst some have only a few acres or a paddock.
2913. I presume that practically the good farm lands along the banks of the river—the flats suitable for cultivation—have been bought by private individuals from the A.A. Co.? Yes.
2914. Then there are large areas of grazing land, ranging in quality from medium to poor, and held, I suppose, in areas varying in size, under lease from the A.A. Co.? Yes.
2915. But the bulk of the land around Stroud belongs to the A.A. Co. still? Yes; the bulk of it certainly does.
2916. Judging from your reply to a question asked by the Chairman, I suppose that the traffic running through this place is one of its chief sources of revenue—that is, for tradesmen and others residing here? Yes.
2917. The traffic from the district around here passing through Stroud and going to Booral, the port of shipment, as regards products, for either Newcastle or Sydney, is one of the principal factors, for business people, in keeping the town going? Yes.
2918. With regard to another question asked by the Chairman, as to whether if the Government were to resume land owned by the A.A. Co. with the intention of disposing of it if possible, might I ask if you know whether the company are not in a position to offer equally as good terms as the Government would be, their land being freehold? That I could not tell you.
2919. But I presume anyone wishing to deal with the company could get fairly reasonable terms? Yes, anyone could get fairly reasonable terms. The company are most fair to deal with.
2920. And the company would offer every inducement to intending settlers if they thought fit to come and settle on any portion of their estate? Yes.
2921. Either as leaseholders or as purchasers? Yes.
2922. So that, practically, a private individual would stand almost in as good a position with the company as he would with the Government? Yes, I should say, quite so.

James McIntyre, storekeeper, Stroud, sworn, and examined:—

- J. McIntyre.
30 May, 1898.
2923. *Mr. Hassall.*] How long have you been a resident of the Stroud? Over forty years.
2924. Have you or your people been occupied in business here the whole of that time? Forty-three years.
2925. So, practically, you have been connected with business here during the whole of that period? Yes.
2926. What are the principal products of the district? Maize and wheat are the principal.
2927. Is there much wheat grown? There was the last two years, and for twenty or thirty years before the rust came a large quantity of wheat was grown.
2928. Why was its growth discontinued? On account of the rust.
2929. Were there any signs of rust in the crops grown recently? Not the last two years.
2930. What is about the yield? Twenty to 25 bushels to the acre; some more.
2931. Where is that wheat sent to? To Sydney principally.
2932. Have you any idea of the quantity produced in the district? No; I have no idea as regards the last two years.
2933. Have you any idea of the number of farmers who are growing wheat? From fifty to sixty, I suppose.
2934. Are any of them large holders? No; they are all small farmers.
2935. The other principal product, you say, is maize? Yes.
2936. That, I presume, is sent to Booral? Yes.
2937. And from there to Newcastle? To Newcastle, and sometimes to Sydney.
2938. What is the rate of carriage from here to Booral? 10s. per ton, and 8s. per ton from Booral wharf to Newcastle.
2939. The total cost of delivery in Newcastle is 18s. per ton? Yes.
2940. Is there much back loading in the shape of goods brought up this way? There is a good deal.
2941. What does a good deal represent? Five or 6 tons a week or more—perhaps 10 tons.
2942. Where is that principally distributed? Just around the town of Stroud. I am not talking about Copeland or Gloucester, but about the traffic that comes into Stroud.
2943. Do you find the district fairly well served by the steamer service to Booral and the road carriage from there to here? Yes.
2944. Do you think it would be possible for a railway to successfully enter into competition with the water and road carriage? I hardly think so.
2945. Your road carriage from here to Booral is 11 miles? Yes.
2946. And to the nearest point of the railway it would be 5 or 6 miles? About 4½ miles from here.
2947. That would be uphill carriage, would it not? Yes.
2948. And your road carriage from here to Booral is downhill carriage? Yes.
2949. So you would be able to take a heavier load from here to Booral than you would be able to draw uphill to the railway? I suppose the cost would be more by rail than by water.
2950. The cost of road carriage would practically be about the same. You could hardly expect to get goods conveyed from here to the railway at less cost than you would pay for conveyance from here to Booral? Oh, yes; I should think we would get them carried for half.
2951. Do you think you could get goods carried from here to the nearest point of the railway for 5s. per ton? Yes; I think so.
2952. Have you any idea of the country through which the line would pass? I have been over the greater part of it, I think.
2953. Can you give us any idea of the country lying between here and Gloucester;—the railway practically follows the course of the river, does it not? It leaves the river, but it crosses a number of creeks

2954. I want to know, first of all, the nature of the country along that water-course, and then the country lying back from it? For the first 17 or 18 miles it is nearly all taken up and occupied along the road, and further on it is reserved by the A. A. Co. for their own use. They will neither sell nor lease. J. M'Intyre.
30 May, 1898.
2955. What is the country lying to the east of the line? It is mountainous.
2956. Scrubby? Yes.
2957. And on the west side? It is mostly grazing land.
2958. As you get nearer to the coast the country becomes poorer and more mountainous, I presume? Yes.
2959. Do you look upon this as a fairly sound district? Yes, I do.
2960. Is it progressing at all? It has been at a standstill, but I think it is going ahead again.
2961. You heard the evidence given by Mr. Thomas and Mr. Andrews in regard to the prosperity of the place and its advancement, and you can practically corroborate their evidence on that point? Yes. Stroud was a more thriving township thirty or forty years ago than it is to-day. That is accounted for by so many more new roads having been made since then, and the traffic being now divided.
2962. The prosperity of the place was due in a great degree to the traffic that passed through it? Yes.
2963. I suppose that the Karuah River was the main shipping place for the district in those days? It was.
2964. But since new roads have been made in various parts of the district, and other shipping places have been made available, the traffic through here has gradually become smaller? Yes; it has drifted away into different channels. I may say that there is a great deal of trade done in poultry and eggs in the district.
2965. With regard to dairy-produce, it has been stated in evidence that there is now a movement in reference to the establishment of dairy farms on a larger scale, and there is a small factory already erected which separates the cream from the milk, and the cream is sent away to Newcastle or elsewhere? Yes.
2966. Are many people going in for that kind of business? I think that a great number of the settlers are going in for it—most of them.
2967. But the industry is practically in its infancy? Yes. It is not more than two years, I think, since it was started.
2968. Judging from what I have seen of the country I should imagine that it would be very suitable for dairying and butter-making purposes? Yes, more so than growing produce. There is not sufficient good land to enable a person to make a living from growing produce.
2969. Judging from what I have seen I should imagine that you may be able to cultivate the flats in addition to having a large area of grazing country which would enable you to have dairies established of considerable size? Yes. A lot of the hilly or grazing country would grow oats and barley, and things of that sort, which would come in for fodder.
2970. You think that would be a more profitable form of industry than that which has been followed in the past? Yes; it would pay best.
2971. And as people find that out they will go in for it? Yes.
2972. I presume the farmers are progressive, and that if they see a chance of turning their land to better use they will follow a good lead? They have been very slow, but they are waking it up now, seeing others elsewhere have done it, and they have succeeded.
2973. I should imagine that as people find the district is suitable for dairy-farming, and know it is a profitable occupation, there will be an increase of settlement? I do not think the land is available at present. It is mostly all taken up—that which is any good at all.
2974. Anything of any value is practically taken up? Yes, it is, until you get within 13 miles of Gloucester, and there the company refuse to sell their land. They keep it for a cattle run. The land there is superior to the land coming this way, and population would go there if that land were thrown open.
2975. The area of good land in the vicinity of Stroud is limited? It is all taken up.
2976. Whatever land is available is of poor quality, not sufficiently good, in fact, to induce people to go and settle upon it? Yes; they could not make a living upon it.
2977. *Temporary Chairman.*] I suppose that nearly all the goods of the district, or a very large proportion of them, pass through your hands? There are a lot of other people in business here besides myself.
2978. Can you give the Committee any idea of the quantity of stores received into the town during twelve months? I have never kept any account.
2979. Have you any idea what tonnage comes into, and goes out of, the place? No.
2980. You say the produce is principally maize and timber? Yes—timber from below.
2981. Can you give us any idea of the number of bushels of maize sent out of the district per annum? I could not; a lot of it is carted to Clarencetown.
2982. Which is your principal market? Newcastle.
2983. I suppose that your principal supplies comes from Newcastle, and your produce goes to there? Yes.
2984. Can you afford the Committee any information as to the quantity of maize sent away? No; I think that the steamer which carries it away keeps no account.
2985. If the railway were constructed, I suppose there is no possibility of its capturing the traffic that now goes to Booral? If the line were built where the survey has been made, I do not think that much of the traffic would go that way.
2986. The traffic would follow its present course—that is, by the water? Yes.
2987. *Mr. Fegan.*] Are your goods that come from Newcastle classified by steamer as they would be by rail—that is to say, if you are getting flour, or salt, or sugar, is a difference made at per ton or per cwt.? No.
2988. All one rate? Yes; excepting case goods, which are charged by measurement, but at the rate of 8s. per ton.
2989. What is the highest that you have paid? I think the highest I have paid has been about 12s. 6d.
2990. So that if the proposed railway were constructed, your goods would still go by water? I think so.

Andrew McNeill, butcher, Stroud, sworn, and examined:—

- A. McNeill. 2991. *Mr. O'Connor.*] How long have you been here? Thirty-nine years.
 2992. You have heard the evidence given this afternoon by the various witnesses? Yes.
 30 May, 1898. 2993. Would you kindly say if there is anything you would like to add to the evidence already given by the previous witnesses;—would you say if you are favourable or opposed to the construction of this railway? I fall in pretty well with their views. I may add that I think our dairying industry is on the increase, and that it will be more payable than growing maize. They have not done much in it yet, but they are improving.
 2994. You know this country well? Yes.
 2995. Do you buy your cattle? Yes.
 2996. Where do you buy it generally? Round about the place. Sometimes I go to Maitland. Maitland is our last resource.
 2997. You know the country from here to Maitland very well? Yes.
 2998. And from here towards Taree, how far? To Taree. I have been as far as Kempsey, but I know the country very well between here and Gloucester.
 2999. How would you describe the country between here and Maitland;—is it pastoral or agricultural, or both? Once you get off the river banks, there is not much agricultural country.
 3000. Do you know the route of the proposed line *via* Dungog as laid down by the Department? Yes.
 3001. What is your opinion with regard to the country, say 10 miles on either side of the proposed route? It is not of much good.
 3002. Are you speaking now with regard to the country between Stroud and Maitland or between Stroud and Taree? From Stroud to Maitland, within 10 miles of the proposed route. It is very hilly country. There is grazing land on it, but very little cultivation.
 3003. How is it north from here, towards Taree;—what is the quality of the country on either side within 10 miles of the proposed route? Very good grazing land.
 3004. Do you think that if a railway were constructed the people above this important locality would make use of it instead of utilising the rivers down to the ocean? I hardly think so.
 3005. You think it would be better for them to transport their products to the wharfs on the rivers, and send them from there in boats? I do not think they could get it done much more cheaply by rail.
 3006. You think the water-carriage would be cheaper? I fancy so.
 3007. And as a man of business and common sense it is, of course, your duty to avail yourself of the best opportunities to increase your profits, and to gain a reward for your labour? Yes.
 3008. Do you know that, according to the lowest estimate, made after very careful consideration on the part of the chief officers, the most expert men in the employ of the State, the least sum of money that would be required to construct a railway from Maitland to Taree would be nearly £1,000,000; and do you think that the country, from a national standpoint, would be justified in the construction of a line of railway which would start with an annual loss of £31,000? I do not think they would get it back for some time. If the land about Gloucester and the Barrington and further on were all thrown open, it would certainly be of great benefit to the people there, but the railway would not do us much good.
 3009. The Barrington is within 4 or 5 miles of Gloucester, is it not? Within 6 miles of Gloucester.
 3010. What are the principal industries of this district? Mostly maize and wheat-growing.
 3011. Do they produce any hay? They cannot send much away.
 3012. The productions are generally for home consumption? Yes, excepting that maize and wheat are sent away, and also live stock—pigs, fowls, and such things.
 3013. How do you send those to market? They all go by boat.
 3014. To where do you generally send them, Newcastle or Sydney? Mostly to Newcastle, but some goes to Sydney. I send my hides to Sydney. Hides and tallow go to Sydney, and maize, I think, goes to Sydney.
 3015. It is good grazing country about here? Not so good down here as it is further on upwards.
 3016. Are there any stations about here? Not within 15 or 16 miles.
 3017. North? Both ways.
 3018. What do they generally breed? Cattle. There are no sheep to speak of bred in this district—only a few for their own use.
 3019. Can you give the Committee any information as to the number of calves or pigs sent away from this district? A number of pigs are sent away, but not many calves. They do not go through here. Nearly all our stock turns off about 11 miles from Stroud, at what they call Weismantel's, and goes by Dungog to Maitland, but a number of pigs go through here. I suppose that more than 1,000 pigs a year go through from the Barrington and stations upwards.
 3020. They are sent to Booral, are they? No; they generally go to Raymond Terrace. They go down 150 or 200 in a mob, and our little boat would not be sufficient to take them.
 3021. From Raymond Terrace they go on to Newcastle? Yes; a good many go by Dungog, and also a quantity of stock from places above this town.

Thomas Sydney Magner, postal assistant, Stroud, sworn, and examined:—

- T. S. Magner. 3022. *Mr. Fegan.*] Are you acting-postmaster? Yes, at present, during the illness of the postmaster.
 30 May, 1898. 3023. How long have you been acting-postmaster? Nearly four weeks on this occasion. The postmaster has been ill nearly a month.
 3024. Have you any statistics with reference to the revenue from postage, telegrams, &c.? Yes. The revenue in 1896 was £361. In my opinion, there has been very little alteration since. The average number of letters posted would be about 21,300 per annum. There would also be about 875 registered letters besides those. I should estimate the telegraph collections at about £75 per annum.
 3025. Have you a statement of the revenue for 1897? No, I have not.
 3026. Have you a telephone in connection with your office? Yes, one.
 3027. Have you a return for that? No, I have not. We do very little in connection with it, and it would be very difficult to cull it out.
 3028. Where is your telephone? Only to Booral.
 3029. What is your charge? 1s. for a message of ten words—the ordinary telegraph rate.
 3030. Have you a Government Savings Bank attached to the Post Office? Yes.
 3031. Can you state the revenue received from that, and also the revenue received from money orders? Not separately.

Charles

Charles Westley Cripps, C.P.S. and Land Agent, Stroud, sworn, and examined:—

C. W. Cripps.

3032. *Temporary Chairman.*] Can you give the Committee any information as to the annual revenue of your office? Yes; the total revenue in the Lands Office last year was £4,476.

30 May, 1898.

3033. How much of that was obtained from conditional purchases and how much for leases? For conditional purchases there were seven applications received, and for survey fees and deposits £84 2s. 6d.

3034. What annual instalments are there on conditional purchases? £2,879 2s. 9d.

3035. And rents for leases? £473 15s. 5d.; auction sales, £208; annual leases, deposits, and rents, £522; and for homestead selections there were nine applications, and they embraced deposits and survey fees amounting to £85 in round numbers, whilst £22 was paid in regard to transfer of conditional purchases.

3036. You say there were nine homestead selections taken up? Yes.

3037. Are there any areas open now for homestead selections? There are a couple of vacant areas, that is all.

3038. Not very good land? The land is a bit too rough for the price.

3039. Are there any unalienated Crown lands in this neighbourhood available? There are none in this immediate neighbourhood.

3040. Are there any good reserves in this neighbourhood? I think the nearest is about 13 or 14 miles away.

3041. Then the A. A. Co.'s grant has simply mopped up everything? Yes; there does not seem to be anything but the Company's land about here.

3042. So there is no possibility of an increase of population by reason of the taking up of Crown lands? No.

3043. Have you any further information? I desire to hand you the following returns of the business done and the revenue received by me, both as Land Agent and as C.P.S.:—

RETURN by the Land Agent, at Stroud, to the Under Secretary for Lands, showing particulars of work performed during the year ending 31st December, 1897.

	Number.	Nature of heading.	£ s. d.
Annual leases—			
Applications received	48	Deposits	168 0 0
Annual lease auction sales			
Deposits on tender for annual leases			
Leases on which renewal rents were collected	92		354 18 8
Auction sales—			
Sales held	2	Amount collected..	208 0 0
Conditional leases—			
Applications received	11	Deposits	20 13 6
Leases on which renewal rents were collected	11	Survey fees	55 4 6
Transfers	107		473 15 5
Transfers	12		
Conditional purchases—			
Applications received	7	Deposits	53 18 9
Improvements	7	Survey fees	30 3 9
Purchases on which interest, instalment, or balance and deed fee was collected.	2		26 9 8
Fees <i>re</i> suspension of condition of payment on conditional purchases	537		2,879 2 9
Transfers	15		2 5 0
Transfers	22	Stamp duty, &c. ...	21 19 6
Homestead selections—			
Applications received	9	Deposits	58 5 11
Applications received	9	Survey fees	27 3 4
Church and school leases	15	Rents	80 5 2
Licenses—timber, quarry, &c.	45		12 10 0
Revenue—			
Miscellaneous	32		6 0 2
Paid direct to Treasury in connection with this district.....	55		200 11 2
Total	1,038		4,679 7 3
Inquiries—average per day.....	5		
Letters—despatched (Land Agents' letters only)	581		

RETURN of Business transacted by the Clerk of Petty Sessions, Registrar of the District Court, &c., &c., Stroud (exclusive of Land Agency business), and of moneys received by him in all capacities for the year ending 31st December, 1897:—

Petty Sessions Court transactions—

Number of Petty Sessions Court Cases where accused have been arrested, exclusive of arrests under Licensing Act	4
Number of Petty Sessions Court Summons Cases, exclusive of Summons Cases under the Licensing Act	15
Number of Arrests or Summons Cases under the Licensing Acts, 45 Vic. No. 14 and 46 Vic. No. 24	Nil.
Number of Cases committed for trial.....	Nil.
Number of Municipal Appeals dealt with.....	Nil.
Number of Applications for Auctioneers', Pawnbrokers', Hawkers', Coach, Fishing Boat, Fishermen's, and other Licenses	31

Licensing Court Transactions—

Number of Applications made to Licensing Court or Licensing Magistrate.....	20
---	----

Number of Bankruptcy Cases.....

	2
--	---

Small Debts Court—

Number of Plaints entered	12
Number of Garnishee Applications	1
Number of Bills of Sale registered.....	4

Miscellaneous—

Number of Tobacco Licenses issued	15
Number of Road Contract Tenders received and opened	584
Number of Receipts taken for Public Moneys disbursed	10
Number of Letters of all descriptions received in connection with all offices held by C.P.S., but excluding Applications for Electors' Rights	350
Number of Letters despatched	209

District

C. W. Cripps.
30 May, 1898.

District Registrar's Transactions—		
Number of Births, Deaths, and Marriages registered		272
Number of Certificates—Births, Deaths, and Marriages		16
Number of Cards filled up for Statistical purposes.....		272
Electoral business—		
Number of Original Rights issued		10
Number of Transferred Rights issued		2
Moneys received—		£ s. d.
Fees of Courts of Petty Sessions	5	2 8
Fees under special headings of "Other Fees of Courts of Petty Sessions".....	0	2 0

Moneys paid direct to Treasury for Land in the district	200	11 2

TUESDAY, 31 MAY, 1898.

[The Committee met at Gloucester, at 2:30 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Alexander Thomson Laurie, grazier, Rawdon Vale, near Gloucester, sworn, and examined:—

- A. T. Laurie. 3044. *Mr. Black.*] How long have you been a resident in this district? About fifty-seven years.
3045. Do you know the route of the proposed railway? Yes; I know the country intimately.
3046. Do you think that, as laid out, it would serve the country? I do; I am well acquainted with this country, and I have made myself very much conversant with the North Coast Railway scheme from the first initiation of it. I was one of the deputation who waited upon Mr. Lyne, and I have always had the project before my mind's eye throughout the whole of the time since then. I think that the railway will go far towards developing this part of the country, more especially considering that we have no other facilities for the removal of our produce to market. We have no river here which would enter into competition with any railway, and we are hampered. The country is largely in a state of nature, it is not much better than it was the first day I came to it. That fact arises from the want of facilities to remove the produce to market. It is not because we are not able to produce. I have taken the trouble to procure a report as to the capabilities of our soil which I now hand in. It is as follows:—

Sir, Department of Agriculture, Sydney, 5 April, 1898.
I have the honor to transmit herewith the report, by Mr. F. B. Guthrie, F.C.S., Analytical Chemist to the Department, on the analysis of the soil submitted by you.
Nature and depth of soil—Loam.
Reaction of soil—Strongly acid.
Capacity for water—43·66 per cent.
Absolute weight per acre, 6 inches deep—2,702,000 lb.

Mechanical Analysis.

Root fibres.....		·08 per cent.
Stones over $\frac{1}{4}$ inch diameter		·00 "
Coarse gravel, more than $\frac{1}{10}$ inch diameter	5·75	"
Fine gravel, more than $\frac{1}{20}$ inch diameter	4·58	"
Fine soil, 89·59 per cent. } Sand	50·16	"
	39·43	"

Analysis of Fine Soil.

Moisture.....		2·020 per cent.
Volatile and combustible matter, principally organic	8·103	"

Fertilising Substances soluble in hot Hydrochloric Acid of 1·1 specific gravity.

General value.

Lime (CaO), ·060 per cent., indifferent, equivalent to 1,621 lb. in an acre of soil 6 in. deep. (a)
Potash (K₂O), ·166 per cent., satisfactory, equivalent to 4,485 lb. in an acre of soil 6 in. deep. (b)
Phosphoric acid (P₂O₅), ·163 per cent., satisfactory, equivalent to 4,404 lb. in an acre of soil 6 in. deep. (c)
Nitrogen, ·245 per cent. (equal to ·297 per cent. ammonia), good, equivalent to 6,619 lb. in an acre of soil 6 in. deep. (d)
In connection with the foregoing, I have the honor to forward additional particulars, as follow:—This land should be well adapted for wheat-growing when it has been sweetened. At present it is very sour. If the sub-soil (of which I have not received a sample) is porous, the land would probably not require drainage. It will be necessary to sweeten it by thorough cultivation and a liberal application of lime. Lime is deficient in the soil, and should be applied at the rate of about 1 ton to the acre in the form of stone lime freshly slacked (see *Farmer's and Fruitgrower's Guide*, page 44, &c.) After this treatment, it should prove excellent wheat-land. Information as to manuring most suitable will be supplied if required.
I have, &c.,
D. C. McLACHLAN,
Under Secretary
(per A.F.)
That

NOTE.—(a) This amount of lime would be supplied in 1,801 lb. of quicklime, or 2,431 lb. of slaked lime, or 3,242 lb. of chalk.
(b) This amount of potash would be supplied in 8,970 lb. of commercial sulphate of potash, or 37,360 lb. of kaimit.
(c) This amount of phosphoric acid would be supplied in 17,616 lb. of commercial bone-dust, or 26,424 lb. of superphosphate.
(d) This amount of nitrogen would be supplied in 33,095 lb. of sulphate of ammonia, or 39,714 lb. of nitrate of soda.

That is from the ridge lands, not alluvial flats, and represents a fair sample of about 50 per cent. of our land. I wish it to be distinctly understood that it does not apply to our alluvial flats, but to ridge land over an extent of about 30 miles of country—portions to the east, and portions to the west; therefore it is a fair sample of the soil. That report is perfectly satisfactory to me, because it says that with that amount of line added the soil would be excellent for wheat-growing. The question asked was, was it suitable for wheat-growing? That analysis applies to one-half of the ridge land in the district. I have been, only to a limited extent, connected with agriculture for many years. My connection has been more with pastoral pursuits, but I have a limited knowledge of agriculture, and I have seen excellent wheat grown on the ridges of this district, notably at Stroud and on this side of Stroud. I do not mean on the flats or alluvial deposits. We are certain that wheat will grow there, but the wheat grown on the ridges is a better wheat.

A. T. Laurie.
31 May, 1898.

3047. Firmer grain? Yes. But I admit my knowledge of wheat-growing is only limited. The mountain land of the district is adapted to fruit-growing. Fruit can be grown very well in this district. I am the largest fruit-grower in this part of the Colony, and am a professional judge of fruits. I have judged at all the local shows, and can speak with a competent knowledge. On the ridge land I grow oranges, lemons, apricots, peaches, nectarines, persimmons, plums, and cherries. They all grow freely. They will grow better on the mountainous soil than on the lower ridges. The soil is better on the mountain sides where there has been brush. Probably you want some information with reference to the stock of the district. I am connected with stock. I am Chairman of the Pastures and Stock Board, and I have an intimate knowledge of the district in regard to stock. The means of carrying the stock to market by rail would be taken advantage of. We send stock to Maitland, and sometimes to Sydney. We have to drive them to Maitland, and thence truck them to Sydney; but if we had the means of taking them by rail from Gloucester we would take advantage of it. The difficulty of the cost would be got over, for we would get the animal to market in a better condition, because it could be delivered in a day. We have throughout the district, I think, according to returns, generally 50,000 odd head of cattle. There are no sheep; it is not a sheep district. We know very well that there are really more than that number of cattle in the district, because there is a tax applied to cattle, and they are never over-estimated. We generally have a suspicion that there are many more than are reported.

3048. What are the principal products of the district? Maize is grown in the district. I think that is the principal product. There is some wheat grown, but not a great deal.

3049. What is really the backbone of the district;—on what does it depend? I think the backbone of the district is stock, because they pay for removal. The crops of maize are generally converted into pigs, and then driven to market. It is about 66 miles from here to Raymond Terrace, and, of course, the carriage is very dear.

3050. It is, you say, a long distance to drive pigs to Raymond Terrace, and the cost of driving is an expensive item? Yes. They would certainly be sent by train from here if there were a train to put them in here, because they have to be trained when they get down there.

3051. Have you any idea as to what is the annual output of pigs in the district? No.

3052. What do they charge for taking pigs by steamer to Sydney? I cannot say, for I have never had anything to do with sending pigs to market.

3053. What do you think pigs could bear in the shape of railway carriage from here to Sydney? They could bear more than is charged for driving and conveyance by steamer, because they would be carried more quickly by rail.

3054. How much more? I should think that a pig would deteriorate in driving and carrying by steamer certainly more than 1s. 6d. I think that the pig-owners could afford to pay 3s. for railway carriage better than 1s. 6d. for driving and steamer freight, because it costs so much to take a pig to Raymond Terrace, and then there is the freight on the steamer or train afterwards. I think that I can safely say they could afford to pay twice as much if they could send it from Gloucester at once by train.

3055. Are there any large areas of land suitable for agricultural purposes which are not visible from the road as you drive along? Certainly there are. You have only seen a sample of the land, and not a very good sample, as you drove towards Gloucester. You will see better land on your way to Taree.

3056. I meant the road to Taree as well as from Gloucester? I think you will see a fair sample of the hilly country on the way to Taree to-morrow.

3057. Then I am to understand that land which is not immediately intersected by the road is, as a rule, more fit for agricultural purposes than the other? I am not prepared to say that. I show that land is adapted for wheat-growing, and I apply that to one-half of the land.

3058. Still it is not first-class land? I only say it is fit for agriculture or wheat.

3059. How many years of cropping would that land which you have had analysed stand? That depends on the way it is treated. If treated properly it could be cultivated for a great length of time.

3060. What do you mean by "treated properly"? Manuring it and putting back in the land what you take out of it, as near as possible.

3061. The farmers in this country do not do that? I know they do not.

3062. Well, if they do not do it, and it is done by farmers in other districts, they cannot compete with them? No.

3063. Then, although the analyst has deposed that this is the good wheat land, it would not bear many years' cropping until you returned to the soil some of the constituent parts the cultivation took out of it? I think that applies to every kind of land.

3064. I have seen land under cultivation eighteen years in this Colony? It must have been exceptional. It must have been an alluvial deposit.

3065. Do you think this land would stand a wheat crop for three years? I am confident it would.

3066. Four years? I am confident it would.

3067. Five years? Yes, it would; and could be used for grazing afterwards.

3068. Five years, and then require to be rested for two or three years? Yes; it would require a rest. The culture of land improves the grazing very largely, and after being rested it can be brought under cultivation again.

3069. Land that has borne a wheat crop soon becomes qualified to support stock, does it not? Yes; it is improved.

3070. I mean there is no great interval—as soon as you remove your crop, the grass and the herbage begin to spring up? Yes. You can graze it the same season after cropping it.

3071.

- A. T. Laurie. 3071. You say that the raising of stock is the staple industry of the district? It is.
- 31 May, 1898. 3072. Is the stock locally bred, or is it brought hither for fattening purposes? Immediately around here they are bred in this district, but where fattening is carried on, they are brought from a distance to the favoured spots in the district, and are fattened there; they are both bred in the district, and brought from a distance.
3073. How is the land held, generally, in the district—as freehold? A great deal of it is freehold. The better part of the land has been alienated. For instance, here is the A.A. Co.'s estate, 464,000 acres—that of course is a strip reaching through the district—and on the west a good deal of the land is alienated.
3074. What sort of land is the company's land here? So far as the flats are concerned, it is perhaps quite as good as the Church and School lands estate, which is immediately west of this town. The alluvial deposits are much the same, and the ridges are very much the same.
3075. There is, of course, a good deal of indifferent land about here? Yes, there is.
3076. Stony? Yes; some of it—mountain brush—but that could be made available with labour.
3077. Some poor hungry soil? There is some of that too. It is a mixture.
3078. How do you account for the comparative backwardness of this district? I put it down to the want of communication. I cannot put it down to anything else. I have already told you that it would not pay to carry the corn to Raymond Terrace, and that is the nearest port we have. Unless other facilities be granted, the country must remain as it is.
3079. Do you think that there is anything in the statement that the people here are idle, and that the methods of their farming are obsolete? No; I do not believe that at all. I believe that any people in any part of the Colony would rise to the occasion when they saw reason to do so. I do not think that the people here are more idle than elsewhere. Whoever made that statement was not speaking according to the facts. I believe the people here are as industrious and well-disposed as any persons could be; but that with want of communication they have not an incentive.
3080. Then you think that if the district were opened up by a railway there would be a great accession of prosperity? I think so. That is the reason why I am here to-day.
3081. In what direction would the development take place? It would take the form of growing crops instead of grazing stock.
3082. That would mean that a great deal of land would be cleared, would it not? A great deal of land would be put under crop. I may say, to guide you in your questioning, that I am the holder of certain land, and if facilities were granted I most certainly would put it under crop. Most of my land is wheat-growing land. I merely speak for myself. The Railway Commissioners, when they came along here, asked me what the company would do in the event of a railway running through their land. Of course, I could not answer the question; but I could merely say that they might do as I would do.
3083. Have you any connection with the A. A. Company? Not the slightest.
3084. Have you ever heard of any people in the districts letting their land on the halves system? No; there has been no such thing, so far as I am aware, in the district. With railway communication I, individually, certainly would immediately set about putting my land under wheat on the halves principle.
3085. How many acres have you? I am the owner of 4,000 or 5,000 acres, and I think I can safely say that I would put half of it under wheat.
3086. Is the half of it the whole quantity that is suitable for wheat cultivation? Yes; and the other portion, being stony and perhaps a little too steep, would be very good for grazing; and I would still keep it for grazing. I dedicate my land to fattening purposes. I fatten stock. My returns from stock-fattening, as near as possible, amount to 4s. per acre per annum.
3087. How many acres to the beast? I consider 5 acres sufficient to fatten a beast upon. The difference between a fat beast and a poor one is £1; therefore, I get 4s. for each acre. If I put my land under wheat on the halves system I think I would get 12 bushels, of which 6 bushels would be mine; and that, at 3s., would give me 18s.; but if I were to get only half, viz., 9s., I would be better off than I would be from grazing the land.
3088. When do you get your rain here? There is no particular season in this part of the country for it.
3089. Do you get rain at a suitable time for ploughing? Yes, generally speaking. I have never seen a drought extend over three months.
3090. I thought you had a bad drought in 1895—a winter drought? 1895 was certainly a bad year, but in that year I do not think that the drought extended over three months.
3091. Do you get a good spring rain to force the wheat through? We had not much grass just before the rain that has fallen since Christmas, and yet two months ago I pulled grass on the Church and School lands estate 6 ft. 4 in. long; it had grown so quickly.
3092. Do you generally get heavy rains about Christmas? I cannot say when they come; there is no regularity at all.
3093. But may you not get rain at a time when it may interfere with your herds, and destroy your crops? Yes. I have no knowledge of any regular rainfall here. It falls without any regularity at all.
3094. I am asking you these questions because the statistics we have with regard to the rainfall seem to my mind to imply such an excess in that direction as to render the climate rather unsuitable for wheat-growing? Of course, down on the East Coast, at Taree for instance, 60 inches of rain falls in the year, but I question if we have the same rainfall here. We are peculiarly situated.
3095. They have 58 inches at Stroud? But they are nearer to the sea there. I know the rainfall is much less here.
3096. You are not trouble with rust in the wheat here? I have known rust to be in the wheat, but not recently.
3097. How about the timber of the district;—is the cedar nearly cut out? Yes; there is not much now; most of it has been taken away.
3098. In any case, I suppose, that would hardly bear the expense of railway carriage, would it? I question if it would. It is not worth while mentioning it. People have been cutting it and taking it away for many years.
3099. If the proposed railway were constructed, do you think they would truck the cattle from here to Sydney? Most assuredly they would.
3100. You travel them along the road now to Maitland, I suppose? Yes; and thence truck them to Sydney.
3101. What does it cost to travel a bullock from here to Maitland;—I want the estimate in two portions, first, the bare cost of travelling, and secondly, the deterioration in travelling? We know intimately what it

It is likely to cost, because, in the event of my taking a mob of cattle to Maitland, and sending my man with it, if you put in a few which would not justify you in taking them yourself, I would charge you 5s. per head for driving from here to Maitland. We have done it; that is our rule.

A. T. Laurie.
31 May, 1898.

3102. There is a good stock route, is there not? Yes; but not enough of reserves—that is the trouble. I have been in communication with the Department for some years, but cannot get them to see there is any more land to reserve. We would most certainly truck our fat cattle.

3103. To what extent does a bullock deteriorate in selling quality between here and Maitland? I can fall back on the report of the Mines Department for that, and that report says that an animal travelling 300 miles falls away 100 lb. in weight, and that is the best of the meat—the most juicy part.

3104. How far is it from here to Maitland? About 80 miles. It is possible that a bullock going from here to Maitland may fall away 25 lb. or 27 lb.

3105. What would that take off its market value? It would take off so much of the best, the most juicy parts of the meat, and, moreover, it would injure the selling price also, because the beast would look so much the worse.

3106. How much? You can safely put it down at 10s.

3107. Then you may say that the cost of travelling a bullock to Maitland is about 15s.? Yes. I would rather truck bullocks and pay 15s. each for carriage to Maitland than I would drive it, because first of all I would not have to send a man with the bullocks, and secondly they would be delivered in better order.

3108. You say that you could afford to pay 15s. a head for the trucking of bullocks from here to Maitland, and could make money by doing so? I would sooner do it than drive them.

3109. It is a big sum? Yes; but I would first of all save in not having to send my man, and then, in order to put the animal on the market, I could truck it to-day, and it would be on the market to-morrow.

3110. What are bullocks worth now? At the last sales they were worth £6. We generally get about £5.

3111. When they are at that price you can bear the cost of sending them to market? Yes.

3112. But the lower the price the less able they are to bear a high rate of carriage? Of course. The lives of a great number of stock have been saved by their being brought from the plains country to places below Stroud.

3113. To which place have those cattle been trucked on the railway line? As far as Muswellbrook, and thence travelled overland to the coast country. Large numbers of cattle have been taken to there—not lately, but years ago, and now and again.

3114. Store cattle? Yes; they have been brought to there to save their lives and the people have done well by doing it, I suppose, for they have continued to do it.

3115. Then you have every faith in the ultimate prosperity of this district if the Government do something to accelerate its development? Yes.

3116. Are you aware of the estimated cost of the proposed line? Yes; I have seen a report of it.

3117. You know that for 113 miles 66 chains the estimated cost is £982,283? Yes.

3118. Or nearly £9,000 per mile? Yes; I have read the whole report.

3119. Do you know that that would entail an annual loss of about £31,000? Yes.

3120. Do you think that under such circumstances the expenditure would be justifiable? Well, it seems to me, so far as the railway is concerned, there has been a large amount of expenditure in other parts of the Colony which was barely justifiable, and we are very much handicapped, because, as the Railway Commissioners tell us, there is a deficiency in the railway revenue on certain lines amounting to something over £300,000 per annum.

3121. You think then that because we have non-paying lines in other parts of the Colony, you are justified in asking to have one here? I do not say that; but I feel that we are handicapped here—that is to say, we have to bear some of the burden, without participating in the advantages of railway communication.

3122. But do you not see that you would only intensify the burden which other people would have to bear in districts where the lines are paying? I can only fall back on my argument, that a railway running through this country would develop it. My contention in favour of the proposed railway is solely based on the probability of its developing this part of the country, and that development would justify the expenditure. If you were to settle so many people within a radius (say) of 10 miles of Gloucester, those people would be worth so much to the country.

3123. But where would you put them? I would put them on the land.

3124. What population could you settle in this district;—how many acres would support a family? It all depends on the land.

3125. I mean approximately? I think you could safely say that you could have several hundred farms on the alluvial flats within 10 miles of Gloucester, and each of those farms of 40 or 50 acres would support a family. I think the land is good enough for a man to manage a farm of 40 or 50 acres, and that would support him and his family.

3126. Then we may presume there are from 5,000 to 7,000 acres of land available for farming purposes within 10 miles? Yes; I stated before that that report and analysis apply to about half of the land of the district; but, of course, a large proportion of that half is rich alluvial flats which would carry more population in proportion to the area.

3127. Is it possible to increase the carrying capacity of the grazing land in the district? Certainly, if it were cultivated. I have shown that it will grow wheat.

3128. I meant its capacity for carrying stock? Yes. With regard to most of the country with which I am intimately acquainted or connected, I may say that it has been ringbarked, and that has increased the grazing capabilities enormously.

3129. What difference does ringbarking make in this locality? I cannot tell you; it is beyond calculation.

3130. Does it double the capacity? Yes; it quadruples it, at least. There is no comparison at all.

3131. A great deal of land has been rung? Yes; but in any case where there are small holdings it has been ringbarked. I know that the A.A. Company have been very slack in ringbarking.

3132. *Temporary Chairman.*] What is your opinion as to the average capital value of the land in this district per acre, classifying it under two heads, first for agriculture, and secondly for grazing? The best thing is to fall back upon the assessment that has been put upon it by the Government valuers. A great deal of it has been put down at from £1 to 25s. This land belonging to the A.A. Company is, I believe, put very low, because there is a lot of land towards Stroud, and even towards the Myall River, which is not very good, and they have averaged it, and I believe put it very low.

A. T. Laurie. 3133. Have you ever heard what they purchased their land at? I cannot say authoritatively. I know that the value put on the A.A. Company's land by the Government assessors, at least most of it, was from 31 May, 1898. £1, and as far as I am concerned 26s.

3134. What do you call the land along the road we came? I would not put its value very high.

3135. Would you put it at 5s. an acre? I would not buy it for that.

3136. It is not typical of the bulk of the country? No, not at all. We consider that that land is inferior. It is mostly conglomerate or pebble-stone.

3137. Would you think that the number of stock carried on land is a fair indication of its character? Yes, if the ground is good.

3138. According to the stock returns, the A.A. Company on 116,000 acres run 8,000 head of cattle, which is about one beast to 14 acres;—I suppose you would consider that that is inferior grazing land? I would consider it very lightly stocked; but, as an illustration bearing out what I contend, I may say that a friend of mine told me that, since Christmas, he passed through the company's land along here and could not see a single head of cattle, because they were lying down in the long grass, which was over their back.

3139. Mr. Tunks, of the Land Valuation Department, values the A.A. Company's land at an average of £1 an acre all through? That is a very liberal valuation.

3140. Supposing that the Government were to determine to construct a railway through this district, all the land, according to the official return, having been alienated, where is the additional settlement to take place—where are the additional people to acquire land? I think the company would be guided by common sense, and would do what would be beneficial to themselves. I should lease my land, and I think the company would do the same.

3141. Supposing that the company were determined to act the same conservative part they have hitherto acted, and shut up their land, how would the population and settlement increase sufficiently to make the railway pay? I must admit that the railway line is surveyed to pass right through the company's land, and that the company would have a very large amount of advantage, because the line would pass through the best of their land. You see the best of their land when you are at or near Gloucester.

3142. Do you think it is right to ask the taxpayers to construct a railway 40 or 50 miles through the A.A. Company's land, and almost exclusively for that company's benefit, because they would reap the principal benefit, owing to the enhanced value of their land? But I suppose that applies to almost every railway in the country.

3143. Not to the same extent; the land is more subdivided between various holders; but here is one great proprietary holding 52 miles of country through which the railway would pass? There is no doubt of that.

3144. At what price do the company sell land now, or do they ever sell any? I have never bought any from them, but I have heard that they were selling land at from £1 to £2 per acre, according to the situation.

3145. Have you any knowledge of agricultural land having been sold in this district of late years? No.

3146. So we can get nothing to guide us as to the value of the land now? No.

3147. You know that this railway is estimated to cost £982,000, and that the assessed value of the land to be resumed, outside the company's land, amounts to an additional £18,000, making the total cost £1,000,000; that the Traffic Manager went through this country, and examined the books of the steam-boat companies, and got all the information he could, and he says that the construction of this line would involve an annual loss of £31,000 per annum; he has added nearly 50 per cent. to the freight of goods now sent from the district, and he sees no possibility of that great loss being reduced for a long time to come? I know that is the officer's report.

3148. Your contention is that a railway through this district would open up the country, increase settlement, and also induce those who already occupy land here to utilise it to greater advantage than they do now, and in this way traffic would be created? Yes; that is the whole of my argument in a nutshell.

Rue Bergin, licensed surveyor, Dungog, sworn, and examined:—

R. Bergin. 3149. *Temporary Chairman.*] You are in charge of this district? Yes.

3150. *Mr. Fegan.*] How long have you been in this district? About ten years.

3151. As a licensed surveyor, how long have you represented the Government here? Ten years.

3152. How far does your district extend? It embraces four counties—Hawes, Macquarie, Durham, and Gloucester.

3153. Do you know the route of the proposed railway, as shown by this map? Yes, I do.

3154. Having had ten years' residence here, and been practising your profession, you have a thorough knowledge of the land through which the proposed railway would pass? I have.

3155. Would you mind describing that land, starting from Stroud? Leaving Stroud and proceeding northerly, the line goes through the A.A. Company's estate, which is fair grazing country, and with patches of good cultivation. About the Monkerai, it taps a belt of country which extends north-westerly, and through the Church and School lands into Crown lands. That particular belt of country is a timber reserve—the greater portion of the Crown lands. In this timber reserve is some of the finest land we have in the district.

3156. That reserve is forest reserve No. 16,050, notified 8th August, 1892? Yes.

3157. How many miles is that from the proposed line? About 20 miles from the nearest point of the line.

3158. You have a good knowledge of timber? Yes.

3159. What timber have you there? Tallowwood, ironbark, various kinds of gum, mahogany—nearly all our marketable hardwoods.

3160. Has that reserve been opened yet as a timber reserve? It is just commencing to be tapped now. A few girders for New Zealand are being taken away from it now. They are about the first timber taken out of it. That has occurred during the last six months. The Government are now allowing men with licenses to cut timber there. The whole of the belt north of the last place I described all consists of first-class lands, so far as grazing is concerned. To a great extent they are fit for agriculture—for wheat or straw crops. They are not fit for corn, but they would grow excellent wheat or straw crops. Then, proceeding further north again, and keeping still to the west of the Church and School estate, we come into

- into a large belt of brush country—unalienated; that is, west of the proposed line. There is excellent soil there, and there are large quantities of cedar in that belt of country. R. Bergin.
3161. Can you assign any reason why that large tract of country, marked "Crown lands," has not been occupied, seeing, as you say, that there is good cedar there and good soil? Yes, because the land being brush land is unsuitable for grazing, and that is the only thing that pays about here. We are too far from market to grow crops. That is the reason I assign. As you go farther north still, keeping to the west of the Church and School lands, the land may be classed altogether as grazing land. It is very fair grazing land. Immediately north of the Church and School land the unalienated Crown land is grazing land, all nearly first-class land, according to the way we classify land here. 31 May, 1898.
3162. What is the reason why it has not been taken up? It is rather far away, and a lot of it is held under lease.
3163. How far is it from water carriage? The nearest water carriage to that would be at Taree.
3164. Which would be how far away? Over 100 miles the way they would have to carry.
3165. Do you think that that description fairly covers the land on the west side of the route and within the red lines marked on the plan? That will cover it.
3166. Is that scrubby land? No; it is mostly box country. Starting again from Stroud, in a northerly direction, within the A.A. Company's boundaries, you pass through very fair to inferior grazing land, with some cultivation along the creeks and rivers. There is a good deal along the Karuah River, and also along the various creeks, such as Johnson's Creek and Ward's River. I think that what I have said about describes the whole of the country until we reach Gloucester.
3167. Outside of the A.A. Company's boundary, and within the red lines marked upon the map, will you describe those portions to the east of the A.A. Company's land? That country is rather a mixed lot; it is very good grazing land in patches, and very good cultivation in patches. A lot of it is fit only for timber reserves, which at the present time are useless, and pretty well exploited too.
3168. There is a reserve of 37,700 acres, notified 21st September, 1890, reserve No. 12,521? That is all timber country. It is not suitable for anything but timber. It is worthless from either a grazing or agricultural point of view. As regards the country to the north of that reserve and east of the railway line, all the available good land has been alienated. The parts left, coloured brown, and still Crown lands, are practically valueless.
3169. Then there is a large reserve of 43,700 acres, reserve No. 11,638? It is a forest reserve, notified 3rd April, 1886. That country is suitable only for timber.
3170. May we then say, in general terms, that the unalienated portion of the land east of the A.A. Company's property is practically very inferior land, and is only fit for timber? In general terms, you may say that of the land east of the A.A. Company's estate.
3171. Due north of the railway line there is a large tract of Crown lands within the red lines marked on the map? You can safely say that the whole of the good land in that part has been already alienated.
3172. Therefore, there is no possibility in the near future of settling a large population there? No; there is nothing to accommodate them on that particular belt of country.
3173. In your opinion, that is a fair description of the country from Stroud to Taree and north of Taree within the sphere of the proposed railway? Yes.
3174. Have you ever acted as assessor of land? Yes; I assessed the county of Durham.
3175. A portion that would come within the influence of this line? Yes.
3176. Which portion? The part south of the Williams River, west of the proposed route, to the boundary line marked on the map, to the west.
3177. None of that which you have described is the A. A. Company's property, is it? No.
3178. What is the average assessment? The average assessment price of grass lands unimproved was about 25s. per acre, whilst the cultivation ranged from £5 up to £50 per acre.
3179. Have you ever been called upon to assess lands that would be within the influence of the proposed railway over the extent of country you have mentioned? No, I have not, beyond assessing them for leasehold purposes for the Crown.
3180. What has your assessment been there? From £1 per acre up to £3 per acre for grass lands.
3181. Any under £1? No.
3182. Can you give the Committee an approximate idea of how many leaseholds there are at present? No, I cannot.
3183. *Temporary Chairman.*] There is a public-house between here and Stroud—17 miles from Stroud? Yes.
3184. What would you call the land we travelled over from that house to Gloucester? Just about that particular house there is some very fine cultivation land.
3185. I mean after you get on the hill this side of it? It is ironbark land, fit for timber. It is very suitable for timber for a few miles, until you get on the northern flats, and the whole of those flats is suitable for wheat-growing.
3186. The whole of the land in that part of the district is very poor land, is it not? Only until you get to the Avon.
3187. What do you get at the Avon? You get fair soil, loam, fit for wheat-growing.
3188. It is a class of country that would grow wheat successfully for two or three years, is it not? I think it would grow it longer, from what I know of that country.
3189. Have you any experience of wheat-growing? Yes.
3190. Do you consider that that soil would grow better wheat than table-land, where you have basaltic soil? No, I do not think so.
3191. It would not grow as much? No; but it is capable of growing 10 or 12 bushels to the acre.
3192. I noticed that that land was particularly adapted for growing light crops of the best description of wheat; but it would not grow heavy crops of wheat, nor grow it very long? Perhaps not.
3193. Can you give us any idea what land about here has been sold for;—for instance, have you measured any portion for the A.A. Company of late? Only for small assessments. In this village they are asking £18 for a $\frac{1}{2}$ -acre allotment; but that is hardly a fair criterion.
3194. Do you ever measure land for the company? No; but I have some knowledge of what they sell their land for about Ward's River, and towards Stroud. I think that about the lowest price at which they sell grass land is about £2 per acre.

- R. Bergin. 3195. Of what quality is the land on Ward's River? It is medium grass land, not first-class grazing land, but about fair. It is country that suffers considerably in a dry season.
- 31 May, 1898. 3196. And their agricultural land? From £5 to £15 per acre—that is the information I have gathered from what the settlers have told me they have paid for the land when I have had any dealings with them.
3197. *Mr. O'Connor.*] Do you know all the land belonging to the A.A. Company? I do.
3198. Can you form an estimate as to what it will be worth right through, taking one portion with another? I should say that taking it altogether as it stands at present, it would be worth from 12s. 6d. to 15s. an acre. I include in that estimate the value of the timber upon the land.

John Notley, creamery proprietor, Barrington River, sworn, and examined:—

- J. Notley. 3199. *Mr. Hassall.*] How long have you carried on business as a creamery proprietor? I opened the creamery only last February.
- 31 May, 1898. 3200. Then the establishment of your creamery, and the resulting dairy industry, are of recent date? Exactly.
3201. What were the people settled on the soil principally doing before that? Farming.
3202. Growing maize? Growing maize and wheat, and having a little pastoral land.
3203. Much wheat? There was a fair amount grown on the Barrington.
3204. Was it touched with rust at all? I am sure it was not injured by rust to any extent. They are going more extensively into wheat-growing this year.
3205. You started the creamery last February? Yes. Thirty different settlers then agreed to deliver milk to the creamery. When I first commenced operations, I am sorry to say, the district had been visited by a very severe drought—a rather unusual circumstance in this part of the country—it being well watered, and having a very good rainfall. In consequence of that drought a considerable number of the milking cows died, and it will be next spring, probably, before any considerable increase takes place in the number of cows milked and the quantity of milk delivered at the creamery.
3206. At present, how much milk is delivered there daily? None. I shut up the creamery about six weeks ago, there not being a sufficient supply to keep me going.
3207. That was the result of the drought which you previously mentioned? Exactly so. It appeared to me, in commencing operations as a creamery proprietor, that the residents of the district thought that better returns were to be obtained from that industry than from anything they had been previously engaged in; and in all probability the industry will increase year by year; in fact, I have not the remotest doubt about it.
3208. Do you consider this country is suitable for dairying purposes? I do not think there is a better district in New South Wales for dairying purposes. When I erected my establishment I fully reckoned on 1,000 gallons a day the first season, but the season set in badly and we could not get a fair start. However, I fully expect to treat 1,000 gallons a day next summer.
3209. In this particular district you have very large areas of good grazing ground, and a considerable area of cultivation land? Yes.
3210. All that is necessary, in fact, to carry on dairying operations successfully, providing that the season was anything at all favourable? Not all that is necessary, because you must understand that we are labouring under a disadvantage here compared with other people in the Colony as regards the matter of carriage.
3211. I did not mean as regards carriage; but that you have the land, the climate, and all the natural conditions necessary to enable the dairy business to be carried on successfully and profitably? Yes.
3212. Now, what about the drawback? The drawback is the cost of carriage. As a matter of fact, I have of necessity to take $\frac{1}{4}$ d. a gallon for carriage off the price of the milk that my suppliers bring to me, and my people get $\frac{1}{4}$ d. a gallon less than they would if they were living near a railway or the market. We are isolated here through the want of a railway.
3213. Why do you charge them that $\frac{1}{4}$ d. per gallon? It costs me exactly that for the carriage.
3214. Where to? To Taree I have been taking it lately. I have sent it to Dungog and Taree. The difference amounts to the same thing in regard to both places.
3215. The suppliers of milk are practically at a loss of $\frac{1}{4}$ d. a gallon on every gallon they deliver to you in consequence of your having to convey the cream a considerable distance by road, to the nearest port of shipment? Yes.
3216. Where is your cream sent to? It is manufactured into butter either at Dungog or Taree; there are butter factories in both those places.
3217. You do not think that if railway communication were more easily accessible that $\frac{1}{4}$ d. per gallon would be saved to the producer without any loss to yourself? I will not exactly go quite so far as that. Although the railway freights would amount to something, they certainly would not amount to anything like $\frac{1}{4}$ d. a gallon on milk.
3218. How many gallons of milk make 1 gallon of cream? One hundred pounds of milk are supposed to produce 10 lb. of cream.
3219. Do you think that there is any prospect of this industry being carried on successfully without a railway? Of course, when I entered into this business I had faith that I could go through with it independently of a railway, but if there were a railway here the industry would be carried on much more extensively. We have a large district, but I am confined to the river for about 5 miles for my supply. There is the Gloucester River, which is rather too far from me, and I am sure there will be creameries started there by-and-bye; in fact, the district is quite capable of supporting a factory here. But you could not possibly take butter from here to the seaboard by road.
3220. The best method you have of conveying the product to market is to send it away as cream, as you do now? Yes; I could not possibly make it into butter.
3221. You could not make it into butter and convey it for so long a distance profitably? I could not do it in any way without going in for expensive machinery. We would have to have refrigerators, and the butter would not stand the carriage, whereas the cream does. I have been an inhabitant of this district about twenty years. I am pretty well acquainted with most of the land within a radius of 20 miles of Gloucester, and I do not think that you could find a much better district in any part of the Colony.
3222. Have you any knowledge of the South Coast district? No, I have not; but I have talked to South Coast people who have come to our district, and they reckon that this is a far superior district to that.

Of

Of course you see mountains here and there, but immediately you get on the other side of those mountains agricultural and pastoral lands open out for a radius of 20 miles. For instance, there is Tiggerah, which is a large agricultural district. Their produce principally goes into Taree or Wingham on the Manning. That is just as good as any part about here; and when you go 15 miles west, to Rawdon Vale, you get into pastoral country second to none in the Colony. The cattle turned off that run brings the highest price in the Maitland market, topping it nearly every time it goes there, and that speaks well for the fattening capabilities of that country. Then if there were a railway here I think it would be only reasonable to suppose that the A. A. Co. would see that it would be to their advantage to throw open all their estate.

J. Notley.
31 May, 1898.

3223. It is practically locked up at the present time? Yes. If the company would open it up, I think we would have no trouble in getting a railway.

3224. It is almost impossible to get land from them? They have sold a lot of land, but they will not sell any land around Gloucester.

3225. So, practically, this town is hemmed in by the A. A. Co.'s estate, and, unless they do something to open up their land and make it available for settlement, the town cannot progress? Exactly so. As a matter of fact the A. A. Co. are a stumbling-block to this district, and I am inclined to think that if there were a railway through here the company would see that they could make more money out of their land by letting it in small holdings. The land following down the Avon Creek and the various water-courses in the vicinity is eminently suitable for agricultural purposes. I suppose there could be settled within 10 miles of Gloucester, on the A. A. Co.'s land alone, 600 or 700 families. Then there is the Barrington River. That goes right through the A. A. Co.'s estate. There is as good farming land there as on the Barrington. It is simply locked up. There are splendid brush lands all down the Gloucester to its junctions with the Barrington, 3 or 4 miles from here, and the Barrington goes from there to the Manning.

3226. All the alluvial flats along the banks of those rivers are splendid agricultural land, and the great pity is that they are locked up by the A. A. Co. and are not made available for closer settlement? It is a great pity.

3227. You regard the land being locked up as it is, as the greatest drawback to the advancement of the district and the increase of population? That is exactly how we regard it. It has been a by-word with us for years that the A. A. Co. has been the curse of this district, and no doubt it has, because they hold an enormous area, and there are as good agricultural lands within that area as any outside of it.

3228. *Temporary Chairman.*] Is there any other creamery besides yours in the district? No—that is, not up the Gloucester way.

3229. I mean immediately around here? No.

3230. What number of cows do you think the thirty people who have undertaken to supply you with milk will milk when in full swing? From 700 to 1,000 cows.

3231. What price do you pay them for the butter-fat? It varies according to the selling price of butter. I do not pay on butter-fat, but simply buy milk. I have paid from 2d. to 3½d., and if my operations were now going on I would pay 4½d., according to the present price of butter.

3232. You are satisfied, from your knowledge of the district and its grazing capabilities, that there is a large future before it for dairying purposes? I am.

3233. But the one drawback is the difficulty of getting your produce to market? Yes.

3234. Is there not a considerable mining population on the Barrington and around here? At Copeland and at Rawdon Vale, Burnell, and Pignabarney there is mining going on. I do not say it is very extensive.

3235. Where do those men get their supplies of butter from? The different settlers in the district make butter. All around those places, or most of them, within a mile or two, there are settlers, and they make butter and supply it to the miners.

3236. Do you know the country between here and the public-house, 15 or 16 miles along the road towards Stroud? Yes.

3237. What would you call the land along that road? I would not call the land of much account between the A. A. Company's station and within 2 miles of the Avon Creek bridge. It consists of box ridges.

3238. Do you think that those box and stringybark ridges are good pastoral country? Not as they are, but I think they would be if they were improved.

3239. You think that if they were rung they would be better? Yes.

3240. But, under any circumstances, would you call it good pastoral country? No; I would not call that particular patch good pastoral country.

3241. Along the road we have come, the last 15 or 16 miles, you consider it inferior pastoral country? There is a little good land up and down the Avon Creek, but the land you travelled over to-day in coming to Gloucester is not anything like as good as the land we have about here.

Angus Beaton, farmer, Barrington, sworn, and examined:—

3242. *Temporary Chairman.*] How long have you resided in the district? Ever since 1864.

3243. Are you a freeholder? No, a leaseholder of Church and School lands.

3244. Have you much agricultural land? About 25 acres.

3245. How much pastoral land? About 105 acres.

3246. What rent do you pay for your land? About £24 a year on about 130 acres, or a little less than 5s. an acre.

3247. Do you find that it pays you to give a rental like that for it? No, I do not.

3248. The rental is too high? Yes, it is, according to the facilities in the district to get my produce away.

3249. What class of land have you? Very fair land.

3250. Fair agricultural and fair pastoral land? Yes.

3251. Is your land of fair quality, compared with other land in the district? Yes.

3252. On those 130 acres you can make a living, I suppose? I can make a living, but I cannot say that I can do much more.

3253. You think that if better facilities were given to you, you could increase your yearly earnings? Certainly I could.

3254. What do you grow on your agricultural land? I grow wheat, but not to any extent—merely what supplies my own wants.

. Beaton.
31 May, 1898.

3255.

- A. Beaton. 3255. Is the wheat free from rust? The last few years it has been.
 3256. The wheat is clean—there is neither smut nor rust? No, there is not.
 31 May, 1898. 3257. What do you do with the maize? I generally feed pigs with it.
 3258. You grow wheat for your own use, and maize to fatten pigs? Yes.
 3259. I suppose you use the maize in that way as being the best way you can utilise it? Yes.
 3260. You can get the pigs to the seaboard on their own feet? Yes.
 3261. Would maize pay to grow in this district if there were a railway? At the prices for which maize has been selling the last few years, if a man depended solely on maize I do not think that he would get a living out of it.
 3262. Would maize, at 2s. 6d. in Sydney and 2s. here, pay you to grow it? I do not think that a man could get a living out of maize at those prices.
 3263. Could you grow wheat and make it pay? I could at present prices.
 3264. But (say) it was 2s. 6d. or 3s. in Sydney? No; I do not think there is any profit to be got out of wheat at either of those prices.
 3265. Is the land around here well suited for the growth of wheat? Yes.
 3266. What part of it? The Church and School land on the Barrington is well adapted for wheat-growing.
 3267. Is it flats or hill-sides? Apple-tree flats.
 3268. What class of soil? Black loam.
 3269. What are the hills like—any fit for the plough? Not as a general rule. There may be odd hills fit for straw crops, but not fit for maize.
 3270. More or less stony? It is rather inclined to be stony.
 3271. Do you use a plough or a hoe in sowing your maize? A plough.
 3272. Do you say that the hill-sides would not permit of ploughing very successfully? Not successfully.
 3273. We have it in evidence from Mr. Laurie that there are some bill tops, some distance back from here, consisting of very fine land, suitable for growing wheat;—do you know that country? There may be some acres here and there; but as a general rule I do not think that that would apply. The land might come in for orchards or other produce. I do not think there is a great area of it.
 3274. As a practical farmer, knowing both the cultivation and the grazing lands, what do you think this district should be classed at? A good agricultural country.
 3275. For mixed farming, I suppose? Yes.
 3276. Is there much good land in the possession of the A. A. Company? Yes; most of it is in the possession of the A. A. Company. The Church and School land has a good deal on that side; but the principal part of the agricultural land is certainly on the A. A. Company's estate.
 3277. Is there much good land on the Church and School estate? I think there are about 750 acres. There are about thirty farmers on the Church and School lands, the settlement extending about 5 miles back from the Barrington.
 3278. Yourself being one of them? Yes. I think they average about 25 acres each, more or less.
 3279. Is that not too small an area for a man to get a living on in this country? It is too small; but they do a little in stock.
 3280. Have you been over many parts of New South Wales? I have.
 3281. Have you seen any districts you liked better than this? I have. I have been up from Merimbula to the Snowy River.
 3282. Have you been through Bega? Yes, and up the Snowy River, and from there to Parkes and Bathurst, and Mudgee, and all down there; and I have been up north to the Richmond River, and through Armidale.
 3283. You have seen some country which you thought was much better than this? I did.
 3284. The estimated cost of this railway, from Maitland to Taree, is £1,000,000; the estimated traffic on it is £18,000 a year; and the working expenses, including interest, amount to £49,000 a year, leaving an annual loss of £31,000; and the Traffic Manager, who prepared the estimate after visiting the district, and examining the books of the steamships companies, says that he cannot see anything to justify him in thinking that the loss would be lessened for a number of years;—do you think that the taxpayers of the country would be justified in spending £1,000,000 in making the railway, and afterwards losing £31,000 upon it as well? Not at the present time, unless they look for future advantages.
 3285. I suppose that a future advantage is that the railway might open up the country, and induce larger settlement, and thereby gradually reduce the annual loss? Yes.

Norman Bell, farmer, Barrington, sworn, and examined:—

- N. Bell. 3286. *Mr. O'Connor.*] How long have you lived in the district? I was born on the Williams River, fifty-four years ago.
 31 May, 1898. 3287. What is the extent of your cultivation? About 25 acres.
 3288. How long have you been there? I have been on the Barrington twenty-four years.
 3289. Are there many other persons there engaged in the same line of business as yourself? Yes.
 3290. Is the Barrington an agricultural, pastoral, or mineral country? Both agricultural and pastoral.
 3291. What is the population of the district within a radius of 5 or 6 miles of the Barrington? I think there are about thirty farmers there.
 3292. Do you know anything about this proposed line of railway to connect Taree with Maitland, and the main line to Sydney? I know the country well from Dungog to Taree.
 3293. Are you aware that this line is estimated to cost nearly £1,000,000? Yes; I understand that it is estimated to cost about £1,000,000.
 3294. And that at the onset, after allowing liberally for the income as against the expenditure, it would involve a loss of about £31,000 per annum;—do you think that it would be a good thing to construct it under those conditions? Yes, I do. I think that eventually it would pay, although I am sure it would not pay at first.
 3295. What is the class of country between Dungog and Taree along the proposed route? There is both good and bad land.
 3296. Is it a pastoral or an agricultural country? Mostly pastoral.

3297. Is there some very good pastoral land along the road? Not between Gloucester and Dungog.
3298. But from Dungog to Taree? Yes, there is. Once you leave the Avon there is very good pastoral country. N. Bell.
31 May, 1898.
3299. Do you know the A.A. Company's property pretty well? Yes.
3300. If the railway were to go through that estate I suppose it would have the effect of creating large settlements? I cannot answer that, because the company might not let their land. I do not know if they would let it or sell it.
3301. Supposing that they were to sell it, and a line of railway ran through it, do you think it would lead to settlement? Yes; I am sure it would—to a large extent, too.
3302. *Temporary Chairman.*] What do you grow principally? Maize, wheat, and potatoes, &c.
3303. How many bushels of wheat and maize do you get to the acre on the average? Last season I had 30 bushels of wheat to the acre, and about the same yield of maize, but it was not a good crop.
3304. How many tons of potatoes do you get to the acre? I have grown up to about 6 tons to the acre.
3305. Have you travelled through any other part of New South Wales much? Yes; I was farming on the Tweed River for six years.
3306. How would you compare the land in this district with the land on the Tweed? I do not consider that our land here is anything like the Tweed River for maize. This is, I consider, wheat country.
3307. Do you grow wheat on the flats? Yes, we grow wheat on the flats. There are plenty of ridges that will grow splendid wheat.
3308. Are they comparatively free from stones? There may be odd stones, but I consider that many of these ridges are good wheat country.
3309. They are so far free from stones that you could grow wheat there? Yes; I consider that any land that you can plough, so long as the soil is good enough, is good enough for wheat.
3310. If dry enough? Yes.
3311. Where do you have your wheat gristed? At Dungog.
3312. What sort of flour does it make? Splendid flour. We never had a good mill until this year in Dungog, and we had splendid roller flour this year, equal to any you could get in the market.
3313. Any rust in the district now? No.
3314. Any smut? No. If you treat your wheat properly with bluestone you will have no smut; but if you sow it dry for two years you will get smut.
3315. I suppose you consider yourself a practical farmer? Yes, I do.
3316. And you think that this district will grow wheat to advantage? I do.
3317. If you were to have railway communication, do you think you could grow wheat, and successfully compete with wheat in Sydney when it was down to 2s. 6d. a bushel? I do not think that it would cost us much more to send wheat to Sydney than it costs to send it from Tamworth and other places.
3318. And therefore you think you could successfully compete with them? Yes, I do.
3319. Do you think that you could grow wheat on, say, 20,000 or 30,000 acres in the whole of this district? Yes, I do.
3320. And you could grow it sufficiently well to compete with other parts of the Colony? Yes, I think so.
3321. I suppose you are aware that there is no immediate prospect of this railway paying? I never thought there was.
3322. Do you think that if the railway were constructed very large areas of land would be taken up and cultivated? I am sure they would be.
3323. In the event of the A.A. Company not selling their land, what room is there for more people to come into the district;—what land could they get? We could use land now utilised for grazing and wheat-growing.
3324. How much land do you lease? I lease 160 acres on the farm; but I am a shareholder in a company with 6,000 or 7,000 acres.
3325. Do you think, if the railway were constructed, and you had ready means of getting your produce to market, you would cultivate a larger area of land? Yes, I do think so.

WEDNESDAY, 1 JUNE, 1898.

[The Committee met at Krambach, at 2 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

THOMAS HENRY HASSALL, Esq.

JOHN LIONEL FEGAN, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

John James Gallagher, hotel proprietor, Krambach, sworn, and examined:—

3326. *Temporary Chairman.*] How long have you been residing here? I have been in the district over twenty-two years—not in this place, but within 5 miles of it. J. J.
Gallagher.
1 June, 1898.
3327. Do you know the surveyed route of the proposed railway from Gloucester to Taree? I know two lines that were surveyed last year.
3328. Do you know the one from Gloucester? Yes.
3329. Does that come down Khoribakh Creek? Yes.
3330. *Mr. Fegan.*] Are you carrying on any other business besides that of a hotel-keeper? Yes; I am farming and grazing as well.
3331. How many acres have you? About 1,100.
3332. Where? In four separate places. This block is one of the four. They are all within about 5 miles from here.
3333. Would you name the different places? I have one place $\frac{1}{2}$ a mile up the Kundibakh Creek— $\frac{1}{2}$ a mile to the west from here; I have another place east from here about $1\frac{1}{2}$ mile; and I have another about $3\frac{1}{2}$ miles from here, south-east; and another about 5 miles from here, south.
3334. Do you know the route of the proposed line from Maitland *via* Paterson, Dungog, Gloucester, and on to Taree? Yes; I know it pretty well. 3335.

- J. J. Gallagher.
1 June, 1898.
3335. You say you know another surveyed route? Yes; I know the Bulladelah line.
3336. Do you know the country very well that a surveyed route passed through *viâ* Bulladelah? I know pretty well every mile of the country.
3337. The present proposal under notice is to take a line from Maitland *viâ* Paterson, Dungog, Gloucester and the Barrington to Taree;—having an intimate knowledge of that country, do you think that this line, if it were constructed, would meet the requirements of the district? I think it would if we could tap it about Lower Ganghat by having a platform there before crossing over the Manning, and if we had a road opened up from Belbora, about 8 miles from here, that road going in a northerly direction from Belbora to the railway. That would enable all the traffic from this neighbourhood to go out there, and would take the bulk of it in under a distance of 20 miles.
3338. Therefore, taking the whole district, that line would meet its requirements as well as any other proposed route? Yes, it would.
3339. Would you mind giving us a description of the country within a radius of 10 miles of Krumbach? All on the eastern side of the road between here and Gloucester is very good country. Most of the creeks head up there under the mountains, and there is a lot of brush land—good soil, but some of the country hilly. It is very rich soil, well adapted for fruit-growing or dairying purposes, if cleared. It would make splendid grazing country.
3340. What fruit do you grow here? Lemons and oranges grow here wild, anywhere in the bush, and peaches grow well here. If it were not for the flying-foxes we could fatten hundreds of pigs on the peaches that we could grow on the farms.
3341. Any other fruits? Grapes.
3342. The principal fruits would be oranges, lemons, grapes, and peaches? Yes; all stone fruits would grow here.
3343. Has wheat-growing been tried within the district you have mentioned? Yes; I have grown wheat myself for several years.
3344. To what extent? I have not grown it very extensively—8 or 10 acres—and I have had an average yield of over 30 bushels to the acre.
3345. You just grew that for feed, I suppose? Oh, no.
3346. To sell? Yes; I sold over 300 bushels in the Sydney market this year.
3347. Have you grown anything else? Yes; I have grown maize ever since I came to the district continuously. Pig-raising is what I have principally gone in for. It has been only on two or three occasions that I have tried wheat-growing.
3348. Any oats or barley? Yes, both. Wheat, oats, and barley all grow well here.
3349. They have all been grown here to your knowledge? Yes; I have grown them all myself.
3350. Therefore you can speak with certainty as to the utilisation of the soil by growing those crops? Yes.
3351. How did you send your wheat to Sydney? By steamer from Forster.
3352. How many miles is Forster from here? It is about 24 miles from here to Forster, but the drogher comes up the river to within 10 miles of Krumbach.
3353. How far was your wheat-land from there? It would be about 2 miles farther than from here. It is the farm farthest from here.
3354. Making the total number of miles of cartage how many? Twelve miles.
3355. What do you pay for that? I pay the steamer 1s. 6d. a bag, including drogher charges.
3356. What do you pay for road-carriage? Ninepence a bag.
3357. That would make 2s. 3d. a bag? Yes.
3358. That would be about 6½d. a bushel? Yes.
3359. That took it to the market for you? Yes.
3360. Did you get 3s. 6d. last year? I think I got 3s. 8d. for last season's crop.
3361. That would pay you very well? Yes, it would pay. The reaping, of course, is very expensive here, in consequence of the machinery. That is the only drawback in wheat-growing.
3362. Was that land virgin soil when you got it? Yes.
3363. Had you to clear it? Yes. I felled the timber all myself.
3364. And prepared the land for the plough? Yes.
3365. What did it cost you in the first place for clearing? To take a crop of wheat off does not mean clearing the ground properly. You can cultivate and grow wheat amongst the stumps when you have got the trees felled and the logs all off. The most expensive part of the clearing is taking the stumps out.
3366. Do you use a stump-jumper? No; we just plough round the stumps.
3367. What did it cost you approximately? The land I grew that wheat on I suppose cost me about £2 an acre in the way I had it cleared to grow the wheat on it.
3368. That does not include, of course, putting in your wheat and so forth? No; that had nothing to do with ploughing or preparing the land—merely taking the timber off.
3369. That includes everything in the way of clearing? Yes.
3370. How much per acre does it cost for ploughing, sowing, and reaping? About 25 or 30 shillings per acre.
3371. What is the lowest possible price for which you could grow wheat to give you, not a large, but a fair return? I consider that if I had the ground cleared, so that I could work a stripper on it, I could make wheat-growing pay at 2s. 6d. a bushel.
3372. That is the lowest rate at which you could make it pay? Yes, if it grew well, if there were no blight or rust.
3373. That is, taking into consideration about 25 bushels to the acre? Yes; that would be a reasonably fair average.
3374. Do the people living about here desire railway communication? I believe they do.
3375. You yourself, among the number, do? Certainly.
3376. And you have heard, I suppose, other people make the same remark? I have. I think they are all very anxious to get a railway.
3377. The total estimated cost of this railway from Maitland to Taree is £982,283, not inclusive of land resumption, the annual expenditure is estimated at £49,000, and the annual revenue at £18,000, leaving a deficiency of £31,000 per annum;—do you think that it would be a wise policy to construct the line under those conditions? I think so.

J. J.
Gallagher:
1 June, 1898.

3378. What are your reasons for thinking so? I think that numerous industries would spring up if the line were constructed which are not now in existence at all in this district. There are hundreds of acres of land that would hardly ever be made use of if a railway does not come along this way, but which would be cleared if a railway were passing through, for instance, the high lands back from here, farther back from navigation than we are, would be closer to the railway line, and they are well adapted for growing fruit or for dairying.

3379. Is dairying carried on extensively about here? They are just about starting it. There are not many at it yet; but they are very well satisfied with the results so far, and I think that in a very few years it will be a big industry here.

3380. Do you know how the major portion of the land about here is held—the A. A. Company's Estate does not extend so far? No. They are principally freeholders.

3381. You say the A. A. Company's land does not extend so far as this? No; it does not come to within between 10 and 12 miles from here. That is where you cross over the company's boundary.

3382. Is the major portion of the freehold land about here held by small settlers? Yes; the holdings are nearly all small ones.

3383. What is the size of the average holding? I suppose that it would be about 150 acres.

3384. How far are you from Taree? About 22 miles by road.

3385. I understood you to say that by having a railway station at Lower Ganghat, that would bring you within 8 miles of the railway? No, about 15 miles; it would be 7 or 8 miles from this road.

3386. Is there a road constructed to Ganghat now? No, there is not.

3387. So that would entail the cost of a new road? Yes, for a distance of about 7 or 8 miles.

3388. And you have a good road to Taree? Yes; but we would have to cross the river.

3389. What would the difference in distance be, supposing that you had to cross the river by means of a bridge, which I suppose would have to be constructed some day whether the railway did or did not go there? It would all depend where the railway was. If the bridge were constructed between here and Wingham, at a place where they have talked about erecting a bridge, that would lengthen the distance considerably.

3390. By going to Taree you would be going farther away from the railway, and have more haulage by road? Yes. It would be out of the question for any produce to go from here to Taree, to be sent by rail from Taree.

3391. You are very emphatic in saying that the people of the district which you have described really require more facilities to get to market, and that those facilities would be afforded by a railway? Yes. There is a lot of perishable produce here which never finds its way into the market now owing to the delay of the steamers.

3392. *Mr. Black.*] As to the clearing of your land;—do the stumps burn out well here? It all depends on the seasons. In dry seasons they burn out tolerably well, but in wet seasons it is very expensive to burn them out.

3393. Otherwise you would have to grub them? Yes.

3394. *Temporary Chairman.*] You say that the whole of the land around here is freehold? What I mean by freehold is, held under free selection and becoming freehold.

3395. I suppose the flats on the creeks are selected? Principally.

3396. Are the mountains also selected? Not many.

3397. They are held under conditional lease, I suppose? The majority of them are taken.

3398. Can you give the Committee any idea of the population within 10 miles of where we are now sitting? Within that radius there are seven schools. I cannot say what the population is, but all those schools are well attended.

3399. Half-time or Provisional schools? No, Full-time.

3400. That is, they have not less than twelve regular attendants? They range from that up to about eighty.

3401. Do you think that the schools average twenty attendants each? More than that. I do not think that any are as low as twelve, with the exception of one.

3402. Would they average thirty? I think they would average more than thirty.

3403. Well, forty? I think you would be safe in saying an average of thirty-five.

3404. That would make something like 245 children altogether? Yes, in attendance.

3405. At what would you average the families—ten to a family? Some of the families are very large.

3406. How many families would they represent—twenty-five or thirty, do you think? More than that.

3407. Are there fifty families in the district within a 10-mile radius of this place? I think there are 150 families; you can safely say that. The principal families are up the creeks.

3408. And all these people are producers, cultivators, and graziers? Yes.

James William Gossip, farmer, Rosedale, near Stroud, sworn, and examined:—

3409. *Mr. Hassall.*] How long have you been residing in the district? I came to Stroud in 1860.

J. W. Gossip.

3410. You have been living in the district thirty-eight years? Yes.

1 June, 1898

3411. You know the country pretty well? Yes, nearly all of it.

3412. The character given to it by Mr. Gallagher you can corroborate? Yes.

3413. Mountainous country intersected by water-courses, with rich flats and grassy ridges? Yes.

3414. You think that a small area is suitable for cultivation, and a considerable area for grazing? Yes; and in some places considerable areas for cultivation.

3415. It would cost a considerable amount to clear this country? Some heavy and some medium.

3416. A large area of this country is still vacant? Yes.

3417. It would require a man of considerable means to take it in hand, and lick it into shape? Yes, to take up any large area.

3418. What area do you cultivate? About 30 acres.

3419. To where do you send your produce? To the Sydney market.

3420. Which way? By steamer from Booral wharf.

3421. How far would the proposed line of railway be from your place? About 10 miles.

3422. How far do you have to send your produce to Booral? Fourteen miles.

3423. So that you would be 4 miles nearer for carriage than you are at the present time? Yes.

3424. I suppose the rates of carriage are pretty low? Yes, the present rates by steamer are.

3425.

- J. W. Gossip. 3425. What do you send away in the shape of produce? Maize, wheat, pigs, and poultry.
 1 June, 1898. 3426. What does the carriage of maize cost you a bag? Maize and wheat 1s. a bag from Booral to Newcastle.
 3427. And from your place to Booral, how much? My own teams do the carting, but I should say that about 6d. a bag would cover the cost.
 3428. That would be about 1s. 6d. a bag through to the market? Yes.
 3429. Have you started dairying yet? No, I do not do any dairying.
 3430. Do you know whether the dairying industry is on the increase? I think it is, but I cannot say for certain about the Stroud part of the district.
 3431. You think it is probable that people will go in for dairying about here? Yes.
 3432. Can you corroborate the other evidence given by Mr. Gallagher? Yes.
 3433. Have you anything you can add? Mr. Gallagher forgot to say that tobacco is grown about here and grows fairly well.
 3434. You think you can rely on a good crop of decent quality? Yes; tobacco sent from here brings the highest price in the Sydney market.
 3435. Is there a first-class road from your place to Booral? Yes.
 3436. The roads in this district are generally very good, are they not? Yes.
 3437. *Temporary Chairman.*] I suppose that, if the proposed railway were constructed, you would not patronise it for your heavy produce, would you? Yes, I think so, for the simple reason that we have a vessel in only once a week, and we are not sure of getting it then, for it is only a small coaster that runs to Newcastle.
 3438. Newcastle is your nearest market? Yes, it is; but I do not deal with Newcastle.
 3439. You deal with Sydney? Yes.
 3440. You are aware that the cost of carriage from your place to Sydney by rail would be much more than the carriage costs you now? Certainly.
 3441. But still you would patronise the railway? Yes; because I think it would be more advantageous to me.
 3442. Giving you a market whenever you want it? Yes, I would have the market, and could get the highest market prices.

THURSDAY, 2 JUNE, 1898.

[The Committee met at the Court-house, Taree, at 10 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN.)

The Hon. DANIEL O'CONNOR.
 JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

John Thomson, Mayor of Taree, sworn, and examined:—

- J. Thomson. 3443. *Temporary Chairman.*] You are president of the local railway league? Yes.
 2 June, 1898. 3444. How long have you resided here? Twenty-six years.
 3445. In business all the time? Yes.
 3446. Will you kindly make a statement in regard to the proposal before the Committee? I am of opinion that the railway as proposed, from Maitland to Taree, is in the best interests of the country so far as it represents a section of the line from Maitland to Brisbane—that is, to connect the whole of the North Coast with the capital cities of New South Wales and Queensland.
 3447. The present inquiry of the Committee is limited to the construction of a railway from Maitland to Taree? Anything that I shall say will not be as to the construction of a line north from here, but as to the now proposed line forming part of a through line to Queensland. I hold that in that respect the proposed line forms part of a national work, which, when completed, would develop the country, would open up communication between Sydney and the whole of the intermediate districts between there and Brisbane, and would have the effect of settling a very large population on what is admitted to be the richest portion of this Colony. We hold that the population now on the North Coast, in all these intermediate districts, is nothing like what the country is capable of supporting. A large part of the district on the northern rivers is already peopled to some extent, and the land is used for agricultural purposes; but we hold that a large quantity of land now used for pastoral purposes, lying a little to the westward, and out of the reach of the rivers, is particularly adapted to the growth of wheat and other products of a similar character, and that, by that means, the Government would be able to dispose of land not now alienated, and the Colony would have the benefit of having the districts more fully peopled, and consequently more developed. We think that, on that account, the line, if not a paying concern from the very start, which we think it would be, would pay in an indirect way by helping the development of the country and giving facilities for settling people on the land. We take it that this is one of the principal objects of good government, and we know from the nature of the soil, climate, and rainfall that such would be the case. Also, for defence purposes, we consider that no arrangements would be complete without a system of North Coast Railway communication, so that troops might be carried from one place to another without hindrance and without interruption. Those, I think, are the principal reasons why we argue in favour of the construction of the line from a national point of view. We also argue that, as a work for the convenience of the people now living on the land it is an absolute necessity. The people are suffering from a variety of circumstances, principally the want of regular communication between here and Sydney, to get their products to market, and also by detention of the travelling public. We daresay it may be argued—and rightly too, we admit—that railway communication might not be so cheap, on the face of it, as water-carriage; but we hold that, with the present detentions and the loss incurred by the people, they are disposed to pay even a higher rate for railway communication than they would pay for water-carriage. We are willing to admit that there are portions of the northern rivers which will not be served as well by railway communication as by water; but, on the other hand, it would develop parts of the country which

are

are away from the rivers, and from which land carriage by teams is very expensive, whilst the route which it is proposed the line shall traverse would go through districts where it will not pay to go in for agricultural pursuits if you have to convey the produce to water frontages. These are the reasons that we advance in favour of the construction of the line.

J. Thomson.
2 June, 1898.

3448. You are aware that the estimated cost of construction is £982,000, exclusive of the resumption of land, and you are probably also aware that the annual loss to the State on the proposed line to Taree is estimated by the Traffic Manager of the New South Wales Railways—who visited the whole district, and states, in his evidence before the Committee, that his estimate is a most liberal one for freight and passengers—is £31,000 per annum, and the Traffic Manager in his evidence says he sees no possible chance of that loss being reduced for a very great number of years? I am aware of that, and I should like if possible to refute the statements that have been made in that respect, particularly as to the amount of passenger traffic that is likely to be carried by the railway. I may say that I base my calculations not on any imaginary basis, but that I base the amount of passenger traffic on the actual passenger traffic now carried from this river by steamer; and I think it will be admitted by the Committee that I am well within the mark when I say that the passenger traffic by rail with the increased convenience and regularity, and if the present never-ending trouble of sea-sickness be avoided, will be very much increased.

3449. Do you know the details of the Traffic Manager's estimate? I have read them; but I have not them before me now.

3450. They are as follows:—From Taree and district he estimates produce, 4,000 tons, at 8s. 6d., £1,700; goods, &c., 1,000 tons, at 12s. 6d., £625; goods, 500 tons, at 20s., £500; live stock, 500 trucks, at 30s., £750; total, £3,577? In that estimate I am not prepared to say that he is not very near the mark; but we hold that besides that traffic in the Taree district there will be a certain amount of traffic from Maitland in this direction, and also an intermediate traffic between the two places.

3451. The Maitland people and the Paterson and Dungog people say that they see no advantage at all to be gained from the railway—that they will not use the railway, and they see no chance of trade going north to those centres? Perhaps not; but they have the convenience for ready access to market, which the people of this district have not got; but we do send produce which is sold at Maitland and Dungog, and intermediate places; and besides the horned cattle which Mr. Harper has given us credit for, our export of pigs is very large. We ship 8,000 pigs a year, and judging from the railway rates, which are not so high, or about the same as the present steamer rates, we are certain that that traffic will go by rail. We also send away about 2,000 sheep; but the passenger traffic, I think, would be the principal item. I base that opinion on the amount of traffic that now goes by steamer, and also the fact that we are told, on indisputable authority, that persons would come overland from the Hastings and the Macleay, even if they had to travel by road, and would get on the railway at Taree.

3452. Have you prepared any estimate of the number of people that you think are likely to travel by the railway? We estimate that there will be 2,000 people at single fares, and 1,000 return from Taree alone.

3453. Mr. Harper takes the entire population of the district, and estimates that the whole of the people will travel by the railway once a year; that is the system on which his estimate is based, and he finds from past experience that that is a very liberal estimate? I grant it may be a liberal estimate just for the immediate neighbourhood; but we hold, and rightly, I think, that that population basis is not a correct one, and that traffic will be afforded by population outside our neighbourhood, and outside the area from which Mr. Harper has calculated it would come.

3454. He has also reckoned on getting a lot of northern traffic, and he estimates the passenger traffic at £6,000 per annum? That is for Sydney only.

3455. He gives that as the whole estimate for the line? We are of opinion, and we base it on the present steamer traffic, that we will have at least 2,000 people who would go at single fares to Sydney and 1,000 return. We also estimate that there will be at least 500 people travelling annually from here to Maitland; and we also estimate an intermediate traffic of at least 500 people between the districts *en route* from Maitland, and we also estimate from that there will be at least 3,000 persons per annum travelling between Wingham, on the Manning, and Taree.

3456. You may tell the Committee what your impression is as to the possible competition of the water carriage with the railway; of course, you are aware that the Committee have before them the question of spending a considerable sum of money to improve the entrance to the Manning River;—do you, in view of that fact, and supposing that that work be carried out, think that there is any chance of the railway, if constructed, obtaining the heavy traffic, such as maize, timber, and so forth? I do not think that I should be right in telling the Committee that it would get the whole of that traffic. I believe that from the lower river, where a large portion of the maize is grown—and maize is nearly their only product now with the exception of dairy produce—the maize will go by the boats, for the simple reason that from Taree downwards most of the people are settled on lands which lie between two natural channels of the river, and they are better served by water than by road; but we hold that from Taree upwards the heavy traffic would go by the railway, for the simple reason that by that means the people would avoid the long haulage they now have.

3457. Are you aware what it would cost to take maize from Taree to Maitland by rail, based on the lowest railway rates? Yes.

3458. Thirteen shillings and a penny a ton? People are now paying 10s., and besides that they have haulage in many cases of from 10 to 20 miles.

3459. They would have that under any circumstances, I suppose? They would not have it on the line. Most of them would be adjacent to the line. I am speaking more particularly of the districts about Wingham, where there is a very large production of maize and a very rich bit of country; and I am disposed to think the whole of that produce would go by rail.

3460. In the event of the proposed harbour improvements being carried out, and the railway being constructed, is there not a possibility, or indeed a strong probability, of the steamer freights being considerably reduced in opposition to the railway? There is a possibility; but I am disposed to think that it will not militate against the railway, even as regards the heavy traffic, and certainly not as regards the passenger traffic.

3461. You think that with water-carriage 5s. a ton less than the railway carriage, the steamers would not capture all the traffic? I do not think that the question is likely to arise, for if you reduce the present rate by 5s., that makes it 7s. 6d.; and so far as I know there is no district served at 5s. a ton by steamer even where the railway and water compete.

- J. Thomson. 3462. The contemplated railway charge is 3s. above what you pay at the present time;—is there any possibility of the boats reducing their rates, and thus making the difference between them and the railway only 5s.? I do not think the steamers are likely to do so.
- 2 June, 1898. 3463. You are aware that the experience of the world is that water-carriage is almost always cheaper than railway-carriage, for heavy goods? But my contention is that the heavy freights you are now arguing on are those carried at very bedrock prices by the steamers; and, furthermore, I have not credited the railway with any back freights, such as store goods, on the grounds you have mentioned, because even comparing the high charges made by the boats now and what is likely to be charged for back freights on the railway, I do not think that there is any chance of those goods being carried by rail, but that they will still be sea-borne.
3464. Your contention, to put it in the shortest possible form, is that notwithstanding the possibility of competition by steamer, you think that if the railway were constructed a great deal of the traffic of the district could be captured by the railway? I am of that opinion.
3465. Almost the whole of the passenger traffic, I suppose? Yes.
3466. And the live-stock traffic? Yes.
3467. And commodities sold by the storekeepers, which are conveyed in light parcels? Yes. You will understand that I do not think that certain other goods that come by steamer, such as case-goods, sugar, and flour, are likely to be carried by rail.
3468. The heavy goods, you think, will be largely retained by the steamers both ways? I think so.
3469. But you think that there will be sufficient passenger and other traffic from the district to justify the construction of the line, if it form a section of a railway to connect the capitals of New South Wales and Queensland? I do.
3470. Putting the other aspect of the question—that the railway is to come to Taree and remain for all time at Taree as the terminus;—what is your opinion about the possibility of its paying then? My opinion is that it would not pay.
3471. You know the country between here and Maitland? I do.
3472. What do you consider it is most suitable for? I consider that a great deal of it—not exactly adjacent to the proposed line, but within easy access of it—is capable of growing wheat and other cereals.
3473. You are aware that for 52 miles the railway would pass through the estate of the A.A. Company? I am; and I may say, in justification of that, that my experience is that people prefer to be tenants of the A.A. Company rather than of the Crown.
3474. Are the terms easier? Yes, much easier; and the terms offered by the company as regards possession are very much more acceptable to the people. My statements are borne out by persons who have been tenants of the company, and are tenants now.
3475. Do you know the entire population that is to be served by the railway—that is, taking Taree and the district down to Paterson? I could not say the entire population.
3476. According to the Statistician's computation, about 11,000 people would be affected by the line; the entire population comes to 13,000 odd; but he takes off 2,000 who are already served by railway—for instance, Clarencetown, Seaham, and other places in the immediate vicinity of Maitland? I am not prepared from personal knowledge to dispute that statement.
3477. One of your arguments in favour of the construction of this line was that it would form a ready means of defence—that to effectually defend the coast districts of New South Wales they require railway communication so that they may move bodies of troops rapidly from place to place? I have been given to understand that that is desirable.
3478. What is the value of land in Taree and its neighbourhood—I mean the approximate value of agricultural land (say) on the Manning River? First-class agricultural land has been sold within the last two or three years in the neighbourhood of Taree for as high a price as £30 an acre; but, taking the river as a whole, the agricultural lands on the river banks should be worth £20 an acre.
3479. That is the river flats? Yes.
3480. Would any large area sell at that price? I think that all the available lands on the river flats have already been taken up.
3481. And are not for sale? Not on the river flats, but there other lands for sale.
3482. The back pasture lands;—what, on the average, is the value per acre of those alienated lands? The value per acre now of lands used for pastoral purposes would, I think, be from £2 to £2 10s. per acre, on the average.
3483. Is the dairying industry extending in this district? It is going along very rapidly—more rapidly, I think, in this district than in any other.
3484. The lands useless for agricultural purposes are being largely used for dairying purposes? Yes; and second-class agricultural land is also being used for dairying purposes.
3485. What is the population of Taree? In the municipal district, about 950.
3486. What is the total population of the Taree district? The population of the Manning police district, according to the last police returns, was 8,121. The electoral district is somewhat larger than the police district.
3487. We have a return from the Government Statistician, stating that the population in the county of Macquarie is 3,210? In the district of the Manning we also include a large part of the county of Gloucester. The police district of the Manning extends as far south as Wallamba, which is 18 miles from here.
3488. The population of Taree is returned by the Government Statistician as 730; Wingham, 570; Oxley Island, 365; Mitchell Island, 365; Coopernook, 320; Croki, 75; Cundletown, 330; Dumaresq Island, 240; Ghinni Ghinni, 120; and Killawarra, 95? But I submit that some of the areas mentioned there are only little villages here and there, and do not represent the whole population. There is a scattered population not mentioned there. I may be allowed to state that in a letter received from the Government Statistician, dated 21st January, 1898, he says that the estimated population up to 31st December, 1897, for the county of Macquarie was as follows:—Males, 7,675; females, 6,755; total, 14,430.
3489. I may state that the computation I have is for a distance of 10 miles outside the railway line on both sides, not for the total population; therefore, the discrepancy between your statement and this need not strike you so much, for, taking 10 miles on either side of the line, as the distance within which the people

people would be affected by the line, the population given for the county of Macquarie within that distance is 3,210? We hold that a larger radius than 10 miles would be served by the railway. Perhaps it may serve the purpose of the Committee if I submit certain figures without reading them. I now hand in a return of the population prepared from the Government Statistician's returns by the Secretary of the Railway League. I submit these figures as evidence from the League, and as compiled by the Secretary from authoritative statistics.

J. Thomson.
2 June, 1898.

3490. Taken from the Government Statistician's returns? Yes; and from police reports and other available returns:—

Population.		
County Macquarie, 1891		12,344
County Macquarie, 31st December, 1897		14,300
County Gloucester, estimated		15,000
Electorates.		
	1881.	1891.
Durham	5,945	6,733
Gloucester	5,643	6,366
Hastings and Manning	9,309	13,428
Macleay	7,123	11,530
Grafton	7,744	9,852
Clarence	6,752	8,221
Richmond	9,266	22,321
	51,782	78,451

3491. Your contention is that, while the figures of the Government Statistician may be correct within a radius of 10 miles of the railway, a population far beyond that distance will be served by the railway if it be constructed? Yes.

3492. And, therefore, the figures given to us by the Government Statistician do not at all represent the population that would be served by the railway if it were constructed? Yes; that is my contention.

3493. Do you know if there are any unalienated Crown lands within a reasonable distance that are of any value? From my own personal knowledge I am not prepared to say that there are, but I will submit evidence which I think will satisfy you on that point, evidence to you will be given by Mr. Flett who is capable of giving evidence on that point.

3494. You do not know much about the unalienated Crown lands? No; except from hearsay.

3495. But I suppose that you as an old resident do know that the lands within easy distance of water-carriage which were any good have been alienated and taken up? They have been to a great extent, but we submit that land outside the influence of water-carriage is not being used for cultivation on account of the distance that the produce would have to be conveyed to the water.

3496. I suppose that a good deal of alienated land suitable for cultivation has not been brought under cultivation by reason of the disabilities in securing transport? Yes, and further than that the land under cultivation is not cultivated to the extent it would be with better means of communication.

3497. You think that there would be more extensive cultivation if there were better means of communication? Yes. People now only grow what they think will keep, because it is not perishable stuff. I should like the Committee, in considering the probabilities of traffic, to bear in mind the traffic that is likely to accrue, and the advantages likely to be conferred on this district by our having another market—at Newcastle and intermediate places, which we do not have under existing circumstances. I am of opinion that the bulk of the produce of this district would be shipped to Newcastle, inasmuch that in some cases, and during most times of the year, the Newcastle market is a better market than Sydney. It will be noticed that the cost of transit will be so much reduced that it will make the cost of conveyance of heavy products from here to Newcastle by rail, nearly the same as we are now paying for their conveyance to Sydney by boat.

3498. Then your contention, in general terms, is that the construction of this railway will create traffic for itself which does not exist at present? Quite so.

Ernest Frederick Meares, bank manager, Taree, sworn, and examined:—

3499. *Mr. Black.*] Of what Bank are you the manager? The Commercial Bank.

E. F. Meares.
2 June, 1898.

3500. How long have you been resident here? About five years.

3501. You have a statement to make? As secretary to the Railway League I have a statement to submit, but the Mayor has, in reply to the Chairman, given the whole of it in substance, and I do not think it would be wise for me to take up your time in repeating what he has said.

3502. Do you agree with the previous witness? Yes.

3503. In every particular? As a general rule I do. The estimates were prepared by us together.

3504. You know the estimated cost of the railway—nearly £1,000,000? Yes.

3505. About £9,000 per mile would be the average cost, and in addition to that large sums might have to be paid for land required for railway purposes? Yes, I believe that is probable.

3506. You know that the probable loss on the railway, including interest on the cost of construction and maintenance expenses, apart from the money expended for resumption of land, would be about £31,000 per annum? I believe that is the estimate of the Commissioners.

3507. Do you think that, under such circumstances, the State would be justified in undertaking such a large expenditure? Not if that estimate were borne out by the facts; but I am of the opinion that that estimate is a high one, and that the estimate of traffic made by the Railway Commissioners is a small one compared with what the actual results would be.

3508. Do you think that if the railway were constructed it would be used to any large extent by the people of the district? Decidedly; for passenger traffic particularly, and for stock traffic.

3509. What is the passenger fare by boat to Sydney? Twenty-five shilling single, £2 return.

3510. Is there only one class on the boats? There is a steerage class, but very few people travel by it.

3511. Do you know the cost by steerage? No, I do not.

3512. Do you think that those who wished to travel to Newcastle and Sydney would prefer to go by train? I am absolutely certain of it. The passage by water is so uncomfortable and repugnant to the majority of the people that, as a matter of fact, no one travels by water who can possibly avoid it. I know that I myself always go overland by coach in preference to going by water.

3513.

- E. F. Meares. 3513. Do you think that there would be twenty people leaving town each day by the railway? No, I hardly think that; I mean, not for the long-distance journey. Our estimate is 2,000 single fares per annum and 1,000 return, giving a total revenue of about £5,000. Of course the railway would serve a very considerable distance farther back in the direction of the Hastings and the Macleay. In making this statement we have endeavoured to put before the Committee exactly what we conceived to be a fair estimate, without desiring to colour the matter in any way.
3514. How is the land in this neighbourhood principally used? Principally for agriculture so far, but the dairying industry is making particularly rapid strides at present.
3515. Is there any room for further development in the district? Yes; there is a very large area of ground that at present is practically used for nothing which will come into use in connection with dairying—forest land that will not fatten stock or anything of that sort, and which is held in small areas.
3516. Do you say that the forest land will not fatten stock? Yes.
3517. If it will not fatten stock, do you think it is good enough for agricultural or dairying purposes? For dairying purposes certainly. People having fattening lands on the banks of the river would require paddocks at the back blocks for their stock; it is not essential that that land should be fattening land.
3518. Are there any obstacles now existing in the way of further settlement in the district? Perhaps not in the immediate neighbourhood of Taree, but on the upper river, where grain or anything of the kind that is grown has to be brought down to the river over very hilly country. Maize and that kind of produce can only be brought in very small quantities, and it requires perhaps a day to bring down a very few bags, and it would take a man with a decent crop weeks to get it to the water's edge.
3519. Would that not be true with the railway as well as the steamer? Yes; but if the present route proposed is adopted, it will serve a large amount of country on the upper river, going within a very few miles of it, and saving them at least 15 or 16 miles of haulage, which is a very considerable item in cases of that sort.

Henry Winter Flett, grazier and farmer, Taree, sworn, and examined:—

- H. W. Flett. 3520. *Mr. O'Connor.*] How long have you been in the district? I am a native of the town, and reside immediately adjoining it.
- 2 June, 1898. 3521. How much land have you? I have none at present of my own, but I am renting land.
3522. How much land do you occupy? About 7,000 acres.
3523. What is it principally;—for cattle or sheep? Cattle.
3524. Any agricultural land? Yes; I farm a little.
3525. You know the proposal for the construction of this railway to connect Taree with Maitland? Yes.
3526. Will you kindly in your own way give the reasons why you are in favour of the construction of this line or against it? I should like to go a little further, and to say that I agree with the line, if constructed from Maitland through the whole length of the North Coast, for I believe that if that line were constructed, it would pay.
3527. Not stopping at Taree as the terminus, but an intercolonial line? Yes; I believe it was the greatest injustice that has ever been put on the North Coast to propose the railway as a line to stop at Taree.
3528. In your opinion, a railway right through to Queensland should be regarded as a national work, and it is not fair to put only this section before the Committee? Yes.
3529. Supposing that Taree were made the permanent terminus, you would not see your way clear to approve of the line, in view of the fact that it is to cost nearly 1,000,000? Certainly not, if it were to stop at Taree.
3530. You do not think that that would be a good investment? No; but if the line were continued on as an intercolonial line it would pay.
3531. Are you acquainted with the country between Taree and the Queensland Border? I am, from Gloucester to the Clarence.
3532. Would you kindly tell the Committee the quality of the land, and what it is capable of—whether it is pastoral or agricultural land, Crown land, or freehold or leasehold? It is leasehold and freehold, the same as the land you have come through, with the exception of the A.A. Company's land. The land through which the railway would pass is something similar to that which you have seen in coming here; but I should like to state further, that the present surveyed line passes through the worst portion of our North Coast district. Our best land lies practically near it, but away from it.
3533. At what distance? This line crosses the Manning River at the first place where it touches the Manning, about 10 miles above navigation. That is the first good land it touches on our rivers. Our river does not branch until immediately above where the railway crosses. The first branch of our river you met at Avon Creek, about 7 or 8 miles on the other side of Gloucester. Our river, about 6 miles above, branches again into two branches, and those rivers branch away to the north. All our land above is fair land. Our best grazing land is above where the railway touches, and all the traffic from there would be available at Woodside. Our country is all very good country, the soil in many places is suitable for the production of wheat and other cereals. It is not maize land. It is under the coast range of New England. All that produce would come to meet the railway at Woodside, for the reason that the main range running down from New England would prevent traffic from going up the ranges to the present main line. The Manning and the minor waters head almost together, overlapping the Hastings on the most southern point of New England. Of course, the greater portion of that produce would come down to Gloucester; but within a radius of 30 or 40 miles the produce would meet the railway at the crossing at Woodside. The railway could not strike that country well, because there are great ranges that run down from the main range. The first difficult range you meet is near Dungog. That is a spur from the great ranges—uneven ranges between the rivers. The next is the one you meet between here and Gloucester. Practically there is not another range which the railway would meet between here and the Clarence—nothing like the extent of range that you meet with in those two instances. Along the route between here and Port Macquarie, the land is no good. Of course, between the rivers the land is no good; but when you get from one river to another the land is good.
3534. What is the quality of the land on the other side of the Clarence? I do not know that.
3535. What area of country do you think this railway would benefit, or to what extent would it attract settlement? I am hardly prepared to say, but from my knowledge of the country, I am prepared to say that it would attract settlement.

3536. What evidence can you give us with regard to the bulk of the land between here and the suggested terminus of a line to connect New South Wales with Queensland? Our lands on the northern rivers are all pretty well similar in value—that is the good lands. H. W. Flett.
2 June, 1898.

3537. What is the quality of the land on the Macleay, the Nambucca, the Bellinger, and the Hastings? Their good lands are similar to ours.

3538. You know that the proposed railway to Taree is to cost nearly £9,000 a mile? Yes.

3539. As you said very clearly before, you cannot see your way from a national standpoint to incur an expenditure that would entail at the commencement a loss of £31,000 per annum? No.

3540. But in view of the valuable nature of the land between here and the Queensland Border, you think that the estimated loss would be much reduced; that owing to the country being of a better class the remainder of the railway will cost less to construct, and it would attract population and encourage settlement, and bring in a larger revenue? Yes.

3541. How would it be affected by the facilities afforded by the vessels going from the various rivers to Sydney? I think, as you have heard from the other witnesses, the heavy traffic on the lower parts of the river would all go by steamer, and I think that the greater portion of the passenger traffic would be carried by rail.

3542. You know that at the present time there are proposals before this Committee, and there is a Sectional Committee now taking evidence with a view of improving all your harbours at an expenditure of tens of thousands of pounds, and if those proposals be carried out, and the harbours are improved, I think you will admit that it would be very difficult for the Government to undertake the construction of the railway under those circumstances? I think that, notwithstanding that, the railway would pay.

3543. You think that the railway on its own merits, even if facilities were offered by the improvement of the harbours would pay, because land now lying idle will be utilised? Yes; lands, the produce of which must be brought to the railway. I have a knowledge of all the lands above the navigable waters, and I know what the haulage means on the cost of produce. I think that the railway would carry a very much larger quantity of stock than has been anticipated, because stock that are fattened in these districts has all to be driven overland to Maitland, and our country has natural soft grasses, and condition is put on quickly by stock, and when stock is travelled overland, the condition which has been put on quickly wastes away quickly; consequently the loss by reason of deterioration in driving stock from here to Maitland would be equal to the rates from here to Sydney. I have been dealing in stock very considerably, and I know the shrinkage that occurs in driving to Maitland, and I would rather pay the rates to Sydney than drive stock overland to Maitland. Our cattle after being driven to Maitland, are in many instances trucked on to Sydney, and I am sure that the district above us, on the Hastings, if the railway were constructed even to Taree, would send down a great many stock that have now to be driven overland. People have stopped fattening cattle in this district for the reason that the driving of the stock was so costly and the shrinkage was so much in travelling.

3544. This is a good cattle-fattening district? Yes; all above the head of navigation. There is always a splendid rainfall.

3545. The railway would afford great facilities to cattle-owners, and enable them to send their stock to market? It would.

3546. And it would pay a squatter or free selector to send his cattle by train better than to travel them? Certainly.

3547. The present loss in travelling would be saved three or four times over by avoiding the loss from shrinkage on the road? Yes.

3548. And from that source alone a large income might be derived by the railway? Much larger than is estimated. The railway would receive all the stock from the Macleay River and the Hastings.

3549. *Mr. Fegan.*] I think you said that the proposed route does not go through the best portion of the country? Yes; I said that.

3550. Can you suggest a better route? No; I believe it is the best route, but it does not touch exactly the best of the land, because the difficulties are so great.

3551. The difficulties from an engineering point of view are so great that it would be almost impossible to go by any other route? I believe that.

3552. Therefore, considering all things, the route which the present survey traverses is the best route, so far as you know? I believe so.

3553. Therefore, you have no fault to find with the route? No.

3554. With reference to the land on either side, do you not think that the great portion of the land that the surveyed line goes through is very similar country to that on the other side of the route? No; not to the land that I have described. There is a great proportion of that land, but the land on all of these water-courses I have described is of a different nature altogether.

3555. Up to Gloucester we have got correct information as to the character of the country, and from Gloucester to Krambach we have a fair intimation of the nature of the country. The greater portion of that blue strip of country is the A. A. Co.'s Estate? I see that the line does not go through Crown lands, but goes down the Barrington. The lands I mentioned are all along up the tributaries of the Manning—all up above that.

3556. We have evidence as to the quality and character of the land as far as Krambach, and we have also got a description of the land on the north-west of the plan. The land marked brown, unalienated Crown land, we have been informed, is inferior land? Yes; it embraces the mountain spurs lying between the water-courses. The first is between the Dingo, which is a tributary of the Manning, and the Manning. Some of those lands on the tops of the mountains are table-lands, and good land.

3557. And yet, with all their goodness, they are not occupied? They are not, for the simple reason that they are too far from carriage. The Manning divides into several branches, the first, lying farthest to the south, is the Gloucester River, the next is the Bowman. You have seen none of the country on those rivers except just at Gloucester. The next is the Barrington, and then the Little Manning, the Barnet, the Nowendoc, and the No. 1 River. Those are all tributaries of the Manning, but there are other tributaries running into those rivers.

3558. You say that the summits of those mountains are unoccupied? Yes.

3559. And the reason that they are unoccupied is because the people there would at present have no facilities to get their produce to market;—I ask you now how far are those lands from the waters of the Manning, or any other navigable river? About 20 miles, I think. 3560.

- H. W. Flett. 3560. Is it a fact that in this country 20 miles is too far for the settlers to take their produce to market? No. it is not; but they have other difficulties.
- 2 June, 1898. 3561. If the summits of those mountains are such good land, the distance of 20 miles is surely not a block in the way of people reaching the market, and somebody would occupy those lands, considering that so many people want land? But it is only of recent years that similar lands have been taken up on the Richmond.
3562. But a large number of men who want land have about an equal knowledge of this country to yourself? Yes.
3563. And they wanting land so badly, do you not think that if there were such good land there they would occupy it, seeing that there is so little unalienated country about here;—is that not a fair way to put it? Yes; but I do not think that those lands will remain unoccupied very long now. I am satisfied as to the good quality of the soil there.
3564. You think, therefore, in the near future all those good table-lands would be occupied? Yes.
3565. You say that they are 20 miles from water-carriage? Yes.
3566. What is the nearest river affording water-carriage for those lands? About 3 miles below Kendal, or perhaps at Kendal there is navigable water for them.
3567. You think then that if a railway were constructed to Taree it would give them better facilities than they have already? Not if the railway is going to end at Taree.
3568. If the terminus is to be at Taree you say that those people will not be in a much better position? Not much better.
3569. Therefore, with the proposed work which is now before the Committee to give better access to the Manning, do you think that would facilitate the trade of the people here? It must benefit them.
3570. Considerably? Certainly.
3571. *Mr. Black.*] What does it cost you to drive your cattle to Maitland? That just depends on how many you take and the number of hands you have to employ in driving. I estimate the cost at 5s. per head.
3572. At what do you estimate the loss of quality in driving them to Maitland? I should say that the shrinkage of flesh is between 50 lb. and 1 cwt. on a beast in comparison with trucking.
3573. What difference would that make in the selling price of meat? The loss would be about 10s., more or less.
3574. *Mr. Hassall.*] With regard to the summits of those mountains, for what kind of occupation are they suitable for? They are suitable for dairying or agriculture. The land is good brush soil. I am speaking of the country immediately back from here—our coast range.
3575. Is it densely timbered? Yes, with black scrub.
3576. What would it cost to clear it? That would not be a very heavy item, because the timber is not big and it is all brushwood. To clear it properly if a person went in to clear it straight off the cost would be between £2 and £3 an acre, but if the timber were felled and burnt off it would not cost that amount by some degrees.
3577. You do not think that the cost of clearing it and making it suitable for occupation would be prohibitive? I do not.
3578. But still, at the same time you think that if they were cleared the present mode of carriage would suit the people there almost as well as the railway—they would not be any nearer to the railway? No; I think they would not.
3579. What would be the principal kind of stock shipped from here;—fats or stores? Principally fats. I think that the store stock would generally go on its own feet unless it were poor stock coming from a distance in times of drought to be fattened on our rivers.
3580. As a rule store stock will not bear the cost of carriage? No.
3581. It is much cheaper to drive them? Yes.
3582. You could not, therefore, look to store stock for any railway revenue? No, only fat stock.
3583. With regard to fat stock, how many trucks do you think would be sent from here in a year? I have no idea. A truck carries about ten head. Until late years I used to send in from 200 to 500 a year myself to Maitland.
3584. Would 100 cattle a week be sent from here? Not from the Manning alone, but I think that, we being so near the head of the Hastings and the Macleay, cattle from those places would be trucked from here if the railway were to stop here.
3585. The estimate is 500 trucks a week, and ten trucks would take 100 head of cattle; therefore, the estimate cannot be very far astray? Yes; I think the estimate is approximately correct.
3586. *Temporary Chairman.*] I think that Mr. Harper makes provision for 1,300 trucks a year between here and Maitland representing 13,000 head of stock; do you not think that that is a very liberal estimate of the quantity of stock to be trucked along the whole length of the line between here and Maitland? Yes, I think it is.
3587. As regards those lands shown to the east of the proposed railway, and to the north and the north-west—that land is unalienated? Yes.
3588. If those mountain tops are suitable for agriculture and are rich lands they would be suitable for grazing also? Yes, they would.
3589. Can you tell me why they have not been taken up, for we are told not only that they have not been taken up, but, also that a portion of that land to the north and north-west of Taree is open to lease as what are called waste lands, a lease of 20,000 acres being obtainable for twenty-one years for £12 per annum, and yet no one applies for it; if that is so, is it not pretty conclusive proof that that is very inferior land? I am trying to think where the situation is.
3590. A great deal of it is shown by that brown colour on the map, land not occupied? There is a large portion there which is one of the main spurs that come down from New England, and that goes to the head of the Dingo. That is all rocks. I am not speaking of soil of that nature. That soil is no good at all.
3591. And that represents a large part of that brown-coloured portion? Yes.
3592. You see the brown-coloured portion on the east side of the line towards the ocean—that is also represented to the Committee by the Crown Lands Department as being absolutely valueless, and no one will either buy it or lease it? Certainly. That is another main spur—the spur you come through when coming from Gloucester. It runs along the A. A. Company's boundary line.

3593. A further representation made to the Committee is that nearly the whole of the unalienated Crown lands are of very little value, and that being so, I want to know what scope there is for an expansion of the population? I am aware that that portion is no good. I did the assessment of that district. H. W. Flett.
2 June, 1898.
3594. If a certain area of the land is alienated and utilised by the present inhabitants, and there is no other land available for increased settlement, how is that settlement going to obtain subsistence from the soil? On those two portions you have asked me about I do not think there is any land available, but immediately behind that mountain land there is good soil and good level country.
3595. Beyond the mountain there are still good Crown lands in the district suitable for agriculture, and on which population would settle if proper facilities were given? Yes; it would carry a large population.

Peter Anthony Muscio, farmer, Purfleet, near Taree, sworn, and examined:—

3596. *Mr. Fegan.*] In which direction do you live from here? I am living on the south side of the Manning River, and opposite Taree. P. A. Muscio.
2 June, 1898.
3597. What is your area? I own only 44 acres of land, and the rest of my property I lease.
3598. Altogether how much land have you? About 144 acres of what is called river-flat land.
3599. How long have you been in this country? Forty-four years.
3600. Therefore you have a thorough knowledge of the character of the land and the requirements of the district? I have a very fair knowledge of the nature of the district, and what it is adapted for.
3601. If the proposed line were constructed, how far would the nearest point of it be to where you live? A mile.
3602. What is the nearest point of water-carriage to where you live? We carry our maize from the barn to the river, and shoot it down into the drogher.
3603. Therefore, as far as water-carriage is concerned, you are as near as you could get to it? We could not be better suited.
3604. What do you grow? We grow maize. We have been growing maize almost exclusively, but now we are growing orange-trees extensively. We are trying to raise a large orchard, with the object of supplying the English market.
3605. How many trees have you? About 1,000 trees, and my brother has about the same number. We have commenced the dairying business, and expect it will increase.
3606. Have you many trees bearing fruit at present? About fifty trees have been bearing for the last forty years.
3607. And you have been selling the fruit locally, I suppose? We have been sending it the best way we could to Sydney and elsewhere, and sometimes we have had the fruit rot on the way to Sydney—the steamers having been too long in getting there.
3608. What is the longest time that elapses between the shipping of the oranges here and their reaching their destination in Sydney? A fortnight, but that is not always the case.
3609. What is the average time? The average time, everything going all right, would be about three days from the time they are pulled and put into the case. The other day the steamer went straight away after the oranges were put on board, and they were landed in Sydney in three days. Sometimes the steamers land them in less than three days.
3610. Should not oranges keep longer than a fortnight? There is one kind that will keep longer than a fortnight, but there is one variety that will not keep a fortnight after being pulled. Mandarins will not keep more than a week without being damaged more or less.
3611. And if they are damaged that considerably reduces the price? Decidedly. So many have been damaged sometimes that what were left would not pay the freight.
3612. I suppose you send them always in cases? Yes.
3613. What do you pay? One shilling to Sydney per gin-case.
3614. How many dozen in a gin-case? About 16 dozen.
3615. So that is $\frac{1}{4}$ d. a dozen? Yes.
3616. That is not very expensive? It is too expensive for the price which the oranges realise in Sydney.
3617. What do they bring in Sydney? Sometimes 4s. 6d. a case, but more frequently 2s. 6d. per case.
3618. Then the people who buy the oranges get them much more cheaply than they sell them? I do not know what they sell them at.
3619. You send them to agents? Yes.
3620. You get about 2d. a dozen for them? We seldom get that; there is all the expense to be taken out of that.
3621. Have you tried the Newcastle market? No; we cannot try it; it is out of our reach, for the freight to Sydney and back to Newcastle would swallow up everything.
3622. Do you grow any lemons? No. We have tried, but so far we have been unsuccessful. The climate does not appear to suit them.
3623. Could not oranges be cured like lemons? Not exactly. The Lisbon lemons with very little trouble can be preserved for almost any length of time. We have not been able to preserve oranges by any means. We have seen receipts in the paper suggesting the best way to preserve oranges, and we have adopted the plan for the purpose of having oranges for ourselves in the summer, but we have always failed.
3624. But is it not a fact that it is done in countries like France and Spain? Well, it is not known to us.
3625. They send out oranges from Europe sometimes to this country? Yes. There is another thing— oranges will not stay on the trees long, and if they fall off they are worthless.
3626. You pull them when they are ripe? Yes.
3627. But if they were pulled when green, could you not keep them;—would they not ripen? We pull them in reality before they are ripe, so that they will fetch the highest price in the Sydney market. If we could find out how to preserve oranges, growing them might be a very big industry here.
3628. You say that up to the present time you have not been successful in keeping oranges more than a fortnight at a time? No; we have not.
3629. What else do you grow? We are dairying, and we shall soon be dairying extensively. We have been dairying about eighteen months, and we are pushing on the dairying business to the utmost of our power.

- P. A. Muscio. 3630. Have you a butter factory here? We have a factory almost at the door, and a very extensive creamery as well.
- 2 June, 1898. 3631. Is it a co-operative society of the farmers themselves? No; it is a private company.
3632. You send your milk to the factory? Yes.
3633. They have separators, and everything necessary to complete their work? Yes; the butter is made in the factory for the English market chiefly, and is exported.
3634. How many milking cows have you? Twenty just now, and we intend to increase the number considerably. We are laying our land down with grass chiefly for that purpose.
3635. What have you been doing with your land prior to this? We have been growing maize almost exclusively.
3636. You think that the dairying will pay you better? Yes; it will pay us better than maize. For one reason, land that has been growing maize for nearly fifty years has become exhausted for that cereal, and it has been proved by experience, as every farmer knows, that after land has been growing grass for some time it becomes again as fertile as ever.
3637. Will the difference be of so much importance as to make you place all your land under oranges and grass rather than under maize? Yes; the difference is of considerable importance.
3638. You are so satisfied with the difference that you have made the change? I will explain the difference in this way. One acre of orange-trees when in full bearing (say) when 10 or 12 years old, would remunerate the grower £50 per acre, even at the prices we are getting now.
3639. If that be so, why should you say it is better to give them to the cows, and not pull them? We cannot sell them at the present time. The price is not always the thing that is in our way.
3640. Even getting 2s. 6d. a case, if you had a market, you would be alright? Not for all the year round.
3641. Then take 3s. for an average? Yes; with 3s. for an average I believe it would pay us.
3642. In preference to maize? Decidedly.
3643. You are perfectly satisfied that dairying will pay you much better? Quite certain.
3644. Do you pay the freight and everything else out of the 2s. 6d. a case? Yes; we have to pay all charges—freight, cartage, and commission; everything comes out of that. It does not really pay us at 2s. 6d. a case.
3645. But take an average of 3s. a case? That would pay us well.
3646. How would the railway assist you in the development of either the orange-growing industry or dairying? Doubtless the railway would assist us very much in the development of the orange-growing industry.
3647. You have a butter factory almost next door to you? Exactly.
3648. Therefore, we have to dispense, so far as you are concerned, with the dairying industry? Yes.
3649. What about the orange-growing industry? The railway would benefit us in this way: We would have the Sydney market at our command; we would be able to ship oranges there with punctuality whenever we thought fit without any delay. It is not so now. We have often pulled the oranges several days before they could leave the Manning—often nine days—when there has been any rough weather. We must of necessity get the oranges ready before the steamer comes into the river, and when the weather is fine and everything favourable, so that they can get away, we perhaps make a good shot so far as the steamer is concerned. We get the oranges to Sydney in good order; but, in the event of a steamer being delayed, as often happens, especially at those times of the year when the weather is very unsettled, they get damaged more or less by the delay. As regards oranges, we think that if the railway were available, oranges at any rate could be sent to the market whenever we thought proper to send them, without let or hindrance in any way.
3650. What is your freight per case to Sydney? One shilling.
3651. What is the weight of a case? I think it would weigh about $\frac{1}{2}$ cwt.
3652. Do you think that by rail you would get it carried for 1s. 6d. a case? I could not say.
3653. Whether you would send it by boat or by railway would depend on which would be the cheaper way to send it. We would not stand so much on the question of cheapness. Our object with oranges would be to get them to the market in as good order as possible, and as soon as possible.
3654. If, instead of paying 1s. a case by boat, the railway wished to charge you 2s. a case, it would be impossible for you to send them by rail? Yes; it would.
3655. But anything within reason would pay you better than having to wait so long for the transit of oranges, which are perishable goods? Yes.
3656. So if the railway were to take them for 1s. 3d. it would pay you better to pay that 1s. 3d. for quick despatch, than 1s. with waiting? It would.
3657. Knowing the train would leave the station at the time advertised, you would be able to arrange your time for pulling the oranges better than now? Yes.
3658. Owing to the uncertainty of the time when the boats will start, and the possible delay at the bar, if you have a large number of oranges ready, they may have to remain in the cases three or four days before they are sent on board, and may take three days in transit, and that makes a great difference in the value of your oranges? Yes.
3659. And sometimes you lose the market? That is a common occurrence. We lose the market almost once every fortnight.
3660. If the proposed railway were constructed, it would give more encouragement for the production of produce, more especially perishable goods? Decidedly. I believe, also, that the land in the various localities along the line is exceedingly well adapted for the cultivation of fruit. Even on the Manning itself the fruit-growing industry would be greatly increased if the means of transit were better than they now are. Few people care about being bothered with anything that is surrounded by considerable uncertainty. The climate seems to be well adapted to fruit-growing, and if proper means of transit were given I am sure that the industry would increase. I believe, also, that if the railway were an established fact it would cause a great development to take place in various branches of the agricultural industry. There is a great quantity of land which is capable of growing good wheat crops, and if the proposed line were constructed, it would be within a reasonable distance of the line. A great many of the people of this Colony who commence farming, as we call it, are very poor people. In many cases they, with some difficulty, manage to get together sufficient money to enable them to select their land, and after that they have to struggle along for years before they can be much better off. In a great many cases they have not the means

means to buy themselves teams to convey their produce from their land for any great distance, they are so poor. I am of opinion that the line, in a great many places, would be so close to land which is capable of maintaining a population that the difficulty of land-carriage, to a very great extent, would be done away with. The fact that this section of the line is only to come to Taree is a very great drawback,—for in reality the wealth of the North Coast commences only when you get here. The proposal to construct the line only to Taree is a great disappointment after we have agitated so much for a North Coast railway. I am sorry that you are not in a position to take evidence in regard to a line farther north than Taree; but of course in building a castle we must have a foundation first.

3661. You think that this first section would be a good foundation? It would be a good foundation for one of the biggest national undertakings in the Colony. If we were to get this far, I have not the slightest doubt that it would eventually go all the way through to the Queensland Border.

3662. *Mr. Hassall.*] In dealing with this proposal for the construction of a railway from Maitland to Taree, and knowing that it would result in a loss of over £30,000 per annum, would you care to be a shareholder in the concern? No, I would not. My reason for saying that is, that not very long ago I bought a piece of land, and it will never pay me. All the privilege I have had is to buy and pay for it; but I expect my children will receive the profit of it. It will be exactly the same in connection with this railway. I am of opinion that this line will not pay us for the present, and I should be very sorry to agitate for it if I did not see a bright prospect that in the course of time, by going further, it will pay, and become one of the best paying lines in the Colony. I have not the slightest doubt about that.

3663. You look to the little speculation you have entered into in land to be profitable to your descendants? Decidedly; that was my object.

3664. The loss on the railway would have to be made up in some way;—do you think it would be fair to the people of this district to impose an additional burden of taxation on every acre of land they hold in order to make good that loss? I do believe that. There is an old saying, "that if you want to travel you must grease the wheels," and, personally, I would not object to increased taxation in order to get this blessing of the railway, for, I think, it would only be a matter of time when it would pay for itself, that is provided it went further than Taree.

3665. But you think that as a national work, and one that should be made reproductive, the line should not stop at Taree, but should extend right along the North Coast? That is my opinion, and I can give substantial reasons for saying so.

3666. You think it is not good policy to bring a railway from West Maitland to Taree and let it stay here, but that it should form part of a railway system which would connect the North Coast with the Metropolis of the Colony? That is my object, and it has been from the very beginning, but there must be a beginning with everything, and so we have made this movement, but I think we made a mistake when we did not ask for more at first.

3667. *Temporary Chairman.*] Have you a large family? Yes—ten children.

3668. How much land do you farm? I own 140 odd acres of what are known as river flats, and my two sons are occupying my land on the Hastings, 120 odd acres.

3669. You work this land yourself? Yes; I and my family.

3670. Can you give the Committee any idea what size are the average holdings of the farmers on the banks of the river Manning? I should say that 100 acres should be a good average.

3671. All the land is tilled at the present time? Yes; on the banks of the Manning River.

3672. Can a good, working, practical farmer, with his family, get a good living off 100 acres on this river? A man who understood his business could with his family get a good living off 30 acres.

3673. If the lands were further subdivided this river could sustain a very much larger farming population compared with that which is now on the land being farmed? When I say that 30 acres will support a family, of course, I speak of the choicest land—the first quality land. As regards the average of holdings, whilst a man may hold 100 or 150 acres, a great deal of it is not first class land, and therefore is not so productive.

3674. Supposing that the average holdings on the river are 150 acres, do you think 150 acres would support two families? That all depends on the quality of the land.

3675. I am speaking generally of the agricultural land on the river flats? 150 acres of agricultural land would support two families, but all the land is not fit for agriculture.

3676. I want to know from you what is the average size of the farms on the river that you consider good farming land;—do you think they are 100 or 150 acres? No; I do not think so. I think that the average farm on the Manning, of good alluvial soil, would not be 40 acres.

3677. Then there is no room for increased population on the river banks? I do not think there is much room for increased population on the river banks.

3678. But you believe that there is room farther back for a large population? I do; I am quite satisfied on that point.

Thomas Burnham Boyce, journalist, Taree, sworn, and examined:—

3679. *Mr. Hassall.*] With regard to this proposal, would you care to make a statement giving reasons why you think the construction of this line is justifiable? Perhaps I had better do so to start with. I may say that I have been a resident in this district for about twelve years, and during that period the district has made very rapid advances. I listened attentively to the figures and evidence given by the Mayor, and Mr. Meares, and other witnesses, and I fully believe that what they stated is absolutely correct.

3680. You substantially corroborate the evidence that has already been given? Yes; especially the evidence given by the Mayor and Mr. Meares. The figures given by the Mayor were carefully prepared, and they give a truthful representation of the case so far as Taree is concerned. I was a resident on the Great Northern line of railway for some eight years, at Murrurundi and Singleton, and from my knowledge of that line and my knowledge of the country along the North Coast, and of this district in particular, I believe that this proposed line would pay handsomely.

3681. Even at the estimate of cost prepared by the railway constructing authorities? Yes, even at that. I myself am of the opinion that the amount of revenue stated as likely to be derived from the line is underestimated. In fact, I think it would be a matter of impossibility, so far as the passenger traffic is concerned,

- T. B. Boyce. concerned, to estimate it, and in saying that I am guided by what I hear residents say and by my own case. I take my own case as, perhaps, a fair sample. Whereas now I visit Sydney, perhaps, once only in four or five years, I should go, perhaps, at least once in three months by railway. It would pay me to go to Sydney frequently by rail instead of risking a trip by sea with all its unpleasantness, and at times not knowing when I might be able to return, which prevents my going more frequently by boat. I prefer to suffer loss in business rather than to undertake the sea trip. If there were a railway here I could jump into the train and be certain that I would get back within a stipulated time to carry on my business, whereas if I were to go by steamer I would not know, to a few days, when I might be back.
- 2 June, 1898. 3682. That is to say, that the facilities afforded for quick transit make traffic? Yes; in this case the facilities would increase the demand. Then it would not only apply to this district. It is not an unusual thing for passengers to come over even from the Hastings now to go by steamer from this river. When we had the "Electra" running here—a superior boat to the one we have here now—it was a very ordinary thing for passengers to come from Port Macquarie and other places on the Hastings to go by the "Electra" to Sydney, because it was a shorter and quicker voyage than by their own steamer, and I am sure that in the case of a railway that would operate to a much larger extent.
3683. With regard to the country on the Manning which would be served by the proposed railway, the agricultural land is practically confined to the valley of the river and its tributaries, is it not? Yes.
3684. Can you give us any idea how far the river or the various branches of the river are navigable towards the heights? It is navigable up to Wingham.
3685. Does any produce come by drogher from beyond Wingham either on the main river or its tributaries? No; there is no river traffic above Wingham. All the produce is brought down by team from beyond Wingham. The Lansdowne, which is a tributary of the Manning, and empties itself below Croki, is navigable by the river steamers for some distance, but not to any very great extent. There is splendid country running up there right to the ranges.
3686. Can you give the Committee any idea of the average width of the river or creek flats? No; they vary in different places.
3687. With regard to the construction of the line as far as Taree, do you agree with the evidence given by previous witnesses that an extension from West Maitland to Taree should be looked upon only as a section of a North Coast railway? Yes.
3688. Do you corroborate the evidence given by them that there will be no justification for constructing a line from West Maitland to Taree, and leaving the terminus here? I could not fancy such a thing.
3689. Do you think that if it came to Taree it would be far enough? No; I am sure that if it came to Taree it would be carried on further. As the last witness said, in coming to Taree you just get to the better part of the country. There are centres of population all the way between here and Maitland. I know that the A. A. Company's Estate is a bar, that estate not being at all thickly populated; but if a railway were carried through that estate I believe that the land would be leased or sold, and a thick population would be settled there. I have a knowledge of the country from here to the Clarence. There are centres of population in every direction you go that way. There are not only large centres immediately along the coast or immediately where the line would go, but also in every direction; and it is the same in this district. You cannot go to any part of this district without striking population everywhere.
3690. Small centres of population? Yes.
3691. With regard to the land along the North Coast, from Taree, it appears in the course of this inquiry that some of the traffic would be served by a line from Taree to West Maitland; but is it not a fact that the coastal land is fairly intersected by rivers, on which large sums of public money have been spent to make navigation practicable, and it is contemplated to spend still further large sums to improve the entrances to the various rivers? Yes.
3692. Do you think it would be justifiable to spend large sums of money on the improvement of the various rivers along the North Coast, and also to construct a railway which would enter into competition with the traffic by water;—do you think it would be a sensible policy? Yes; I do. I think the Government would be perfectly justified.
3693. In what way would they be justified? All these rivers require properly opening up for navigation; there is no doubt about that; and the steamers would provide for the produce of the lower river, or for the bulk of it, as has been stated in evidence here; but I believe that the bulk of the passenger traffic would go by rail; and the railway travelling for the most part above the navigable portions of the rivers—for it would only touch the rivers at certain places, and then go away from them—would serve a population who now have to cart their produce for a great many miles.
3694. Is there much population there? As I have said, you cannot ride in any direction without seeing farms everywhere. There is one great advantage about a railway on the North Coast. The railway traffic would always be constant—different from that in some districts, where there is only a busy season during the wool season, and a lull during the rest of the year. Here the traffic would be constant from one end of the year to the other.
3695. With a line of railway skirting the coast or running through the North Coast district, and just going to the head of navigation—for it would have to cross the rivers at some point or other—the settlers living between it and the New England Ranges would have to bring their produce by road to reach the railway, as they have to bring it by road now to reach the navigable water;—where would the benefit come in? That depends. In the case of the line crossing the river just above Wingham, the settlers, instead of having to bring their produce down to Wingham—perhaps 20 miles—as some now have to do, would have to bring it only 4 or 5 miles to strike the railway.
3696. The line running right through Wingham, you would have both the railway and the head of navigation at Wingham? But the line strikes the river a good deal higher up than Wingham. It crosses the river near Woodside. Now people have to bring produce perhaps 16 miles, but there they would have the railway at their door.
3697. Is there much difficulty in getting in and out of the Manning River at the present time? At the present time I believe that the bar is very fair, but the "narrows" are shallow.
3698. The entrance is not very good? No.
3699. Which do you think would be the most serviceable to the district—the railway or improved means of navigation; supposing that the river were neglected and the entrance were allowed to take care of itself, and the whole of the residents on the lower river were blocked from getting produce taken from
the

the river as they are accustomed to do, and supposing the railway were constructed, which do you think would be the most serviceable to the district? I hardly think that is a fair question. That would depend entirely on the way the residents were served. For one portion of the district the railway would be the better, but for the other portion the river would be.

T. B. Boyce.
2 June, 1898.

3700. So that practically you want both? Yes; and we hope to get both. I may state that in going beyond Taree there is a splendid piece of country that the railway would open up—Mr. Flett touched upon it in his evidence—the Comboyne reserve. It is on the table-land above Camden Haven. At the present time there are settlers from the Manning going there and inspecting it with the idea of taking it up.

3701. *Temporary Chairman.*] It has been sworn before this Committee that the people situated 20 miles from means of transport are too far off to enable them to grow maize successfully, and seeing that the Comboyne would be 20 miles from the railway, would not the people there be too far off to send their produce by the railway? I do not think it would be 20 miles off the railway; it would if the line stopped at Taree, but not if a North Coast line were constructed.

3702. The Comboyne reserve would not come within the sphere of the proposed line from Maitland to Taree? No.

3703. This district is a very fertile one, with an abundant rainfall? Yes.

3704. And you maintain that it is capable of sustaining a very much larger population than it does at present? Yes.

3705. But you cannot shut your eyes to the fact that the estimates of the traffic manager are based on the existing population, and after making a liberal allowance he anticipates an annual loss of £31,000, and he sees no possibility of that loss being reduced for a number of years; your contention, however, is that his figures are an under-estimate, and, in addition to that, you say that the construction of the proposed railway would induce much larger settlement and increase the cultivation;—is that the position you take up? Yes.

3706. Therefore on that ground, as a resident of this district and a representative man, you urge the construction of this line irrespective of the immediate loss upon it? Yes. I doubt if there would be anything like that loss, and I look upon the railway as a national undertaking.

3707. Even admitting that the figures are substantially correct, you think that the increase of population brought about by that railway would largely diminish that loss? Yes. I arrive at my conclusion generally in this way. There are large business establishments, not only in Taree, which is only one place out of many, but also all over the district, for I believe that in some of the other towns they are doing a business equal to what is being done in Taree. I believe that there are firms in this town who are turning over £10,000 and £12,000 a year. To estimate the whole of the revenue of the railway at £18,000 a year seems to me to be a very small matter.

3708. Mr. Harper, in his sworn evidence, states that he has visited the district, has made the most careful computations he could, has had the books of the steamship proprietors open to him, has ascertained the total tonnage for the district from the various shipowners, and has added considerably to it; and I do not think that anybody could have gone to more pains to obtain his figures and facts than the Traffic Manager has, and he has obtained his information from all possible sources from which it could have been obtained? Yes; but there are many things that would be sent by rail that are not sent by steamer, and he could not have estimated also for the increased passenger traffic.

FRIDAY, 3 JUNE, 1898.

[The Committee met at Cundletown, at 10.30 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed railway from Maitland to Taree.

Robert Cox, Cundletown, sworn, and examined:—

3709. *Temporary Chairman.*] Can you give the Committee any information in regard to the proposal to construct a railway from Maitland to Taree? I have been residing in Cundletown, and within a mile of Cundletown, for forty-eight years. When I came to Cundletown there were only three white men living there.

R. Cox.
3 June, 1898.

3710. Have you been in business in past years, or have you been a farmer? I was a farmer.

3711. Will you kindly tell the Committee what you think of this proposal? I do not know whether the railway will or will not pay. I am not a judge of that matter, but I know the district is a good one.

3712. You know the district is fertile? Yes.

3713. And fairly populated? Yes.

3714. The estimated cost of the proposed railway is £982,000, exclusive of the resumption of land, and the Railway Traffic Manager, who has been in this district, has made the fullest inquiries, has seen the books of the shipping companies, and knows the whole of the freight that goes from the district, estimates that the annual loss on the railway will be £31,000, and he says in his report that he has made a liberal allowance for everything, and he sees no possibility of that large loss being reduced for a great number of years;—do you think, in view of those facts, that the country would be justified in spending nearly £1,000,000 in constructing a railway which would entail on the taxpayers a loss of upwards of £30,000 a year? At the first commencement I think that the railway might not pay, but in time the country would be opened up much more, and the railway might then pay interest on the capital outlay.

3715. The view you take is that although the railway might not pay at first, the further development of the district and increase of population would eventually make it a paying concern? Yes.

3716. Do you know the country between here and Maitland? I do.

3717. What class of country do you call it? Between this and Gloucester it seems to be pretty good country. There is a lot of the A. A. Company's land, which is very fertile.

3718.

R. Cox.
3 June, 1898.

3718. Which part of it? On the Barrington there is good land.
3719. Immediately around Gloucester, I believe, there is very good land? Yes.
3720. Do you know the country between Stroud and Gloucester? Yes; that is not quite such good country. It is a kind of sandy soil.
3721. There is one feature in connection with this railway of which you perhaps are not aware; the railway would run for 52 miles through the estate belonging to the A. A. Co., and any direct advantage that might be gained from the construction of a railway through that estate would not be to the taxpayers of New South Wales, but to that large private corporation who would gain a great advantage by the increased value of their land? Will they not pay accordingly towards the construction of the line?
3722. No, they will pay nothing, but they would derive great benefit from it; around Gloucester, Stroud, and Dungog, there is the general feeling that no railway should be constructed through that estate unless some arrangement were made by the Government to buy that land from the company, and take it over with the view of selling it at a profit;—do you think that is a reasonable suggestion? Yes; I do; for the A. A. Co.'s grant is keeping back Gloucester and other adjoining places.
3723. That grant effectually shuts up the whole country? Yes.
3724. Do you agree with the Stroud people that before the railway should be constructed, the Government should either resume or buy all the A. A. Co.'s land? I think that would be a wise thing to do.
3725. If the railway be constructed, what chance is there of increased settlement on the Manning River? There are a good many people living in the back country at the present time who are far away from shipping, and there are a good many more who would take up selections if the railway were to come this way.
3726. Where would they take them up? There are places out in the back parts that could be taken up within 20 miles of the railway. A good deal of the mountain land in this district is good land, and could be used as orchards and vineyards, but it is isolated now.
3727. But would the railway have any effect in promoting settlement on that land? I daresay it would.
3728. You are aware that there is a proposal before the Committee to spend £100,000 in improving the entrance to the Manning River by constructing works there to deepen the channel, and remove the bar? Yes.
3729. Do you think it is right that both these works should be carried out—a railway to cost nearly £1,000,000, and harbour works, the first cost of which will be £100,000, with a possible £120,000 on the top of that to complete the works? I think that if the bar were properly attended to, it would be better than the railway.
3730. The proposal of the Harbours and Rivers Department is to make from 12 feet to 15 feet of water on the bar, and dredge out the channel, and make a good waterway, and you think that if that were done it would be better for the people than the railway? I do, at present.
3731. The bulk of the best land is on the river banks? Yes.
3732. And, therefore, if a good harbour were made, and also a railway, I suppose that the bulk of the produce would still go by water? I daresay it would.
3733. You are aware that the cost of conveying goods to and from the Manning by rail would be very much more than the water-carriage—for ordinary storekeepers' goods the cost would be from 65s. to 70s. per ton;—do you think the railway could compete with the water-carriage? No.
3734. Do you think that if the railway were constructed, and the navigation of the river were improved, the steamship companies would not very likely reduce their freight in opposition to the railway? I think they would.
3735. If the question were fairly put to the people of this district: "Will you have a railway that will cost you more to send your goods by, or will you have an improved bar and an improved river—select which you would like";—which do you think the people would go for? I think they would go for the improved river.
3736. I suppose that the land on the upper portions of the river would be in much closer proximity to the railway than they are to navigation? Yes.
3737. Therefore, the people there might utilise the railway to a certain extent? Yes; especially for passenger traffic.
3738. Passenger traffic and light parcels would no doubt go by train? Yes, and live stock.
3739. But the bulk of the goods—heavy goods—would, I suppose, under all the circumstances, continue to go by water? Yes; I think so.

James Levick, retired builder, Dumaresq Island, sworn, and examined:—

J. Levick.
3 June, 1898.

3740. *Mr. Fegan.*] How long have you been in the district? Forty-one years.
3741. So that you have seen the rise and progress of the district? Yes.
3742. Have you ever farmed? Yes; a little.
3743. Would you mind describing the character of the country 5 or 6 miles on either side of Cundletown? I do not know much about the country farther than, perhaps, 20 miles beyond Tinonee, and I think that any of the land which is any good has all been alienated and taken up.
3744. So the railway, if it were constructed, would not lead to a much greater settlement there than there is at the present time? Not much greater.
3745. You heard the Chairman refer to the estimated loss on the proposed railway, viz., about £31,000, and you, having an intimate knowledge of the facilities to get produce to market, which would you prefer, a railway or an improved river? An improved river, I think.
3746. For what reasons? Because the produce of this district is grown principally on the river banks.
3747. Mr. Harper, who is now Chief Traffic Manager, and who was formerly Goods Superintendent, in his report on this proposed railway, says:—"Again, on the Manning, which carries the largest population, and is the most productive of any of the districts through which the line passes, the ocean-going steamers and vessels call at all the principal towns to which, even if a railway were constructed, the great bulk of the trade of the outlying settlements must converge. The present rate of carriage (again, without competition) is 12s. 6d. per ton to Sydney; our lowest freight (for their staple, maize) over this mileage would be to Newcastle 9s. 8d. per ton, and to Sydney 13s. 4d. per ton, average freight at 3d. per ton per mile would be to Newcastle, 31s. 3d. per ton, and to Sydney 58s."; considering that, do you think it would be impossible for the railway to compete with the water-carriage? I do.

3748.

3748. Has the district been going ahead lately? I cannot say it has gone ahead very much lately, but it appears now to be moving ahead a little, since the dairying business has come into operation. People seem to be getting more produce, and going in for dairying all through the district; and there is no doubt that, through this dairying, many blocks of land will be taken up which otherwise would lie waste. J. Levick.
3 June, 1898.
3749. Is there any reason why the district has not gone more ahead;—is its land inferior? The principal part of the land which is in any way handy to the shipping place, or within some miles of it, in fact, seems to me to be taken up.
3750. It is good land? Yes.
3751. Having such good land and such an outlet, with cheap carriage, as the Manning River gives you, what is the reason that the district has not gone ahead more? I do not know any particular reason.
3752. It is not from lack of energy, is it? No.
3753. If there are good roads, good water-carriage, and good land, and even a good market for your produce, you would think that the district ought to have gone ahead a little more? I would think so.
3754. However, you say you do not know any reason? I do not.
3755. What was the principal product about here before dairying was commenced? Maize. Many are going in for wheat-growing now. Last season there were good plots of wheat put in.
3756. Have you ever tried wheat? Some years ago.
3757. Is it a fact that wheat-growing was given up on account of rust appearing so much? Yes.
3758. What is the extent of the dairying industry here now? I have not any idea.
3759. *Temporary Chairman.*] The river flats are all alienated? Yes.
3760. All the good land? Yes.
3761. What size are the holdings on the river-frontages? From 40 to 100 acres.
3762. Are they farmed to their fullest extent? I think so—that is any that I know.
3763. Therefore, there is no room for increased population on the river banks? I do not think so.
3764. The good land has been taken up, and is being farmed pretty well to its maximum extent? Yes.
3765. That being the case, the Committee have no right to assume that if further facilities were given to the people, population would increase on the river itself? I think not.
3766. The only increase likely to occur would be on the land up on the mountains? Yes.
3767. *Mr. Black.*] What is the width of the strip of good country on the bank of the river? Some goes from 20 to 40 chains from the river bank, but others perhaps will not go 1 chain.
3768. There is no very great width of good soil? No.
3769. You strike the poor soil, say, a mile or so back? The Taree Estate, I think, is about as good as any, taking it altogether. The Cundle Estate, if it were cut up into small holdings and sold to people, would make very good farms—plenty of it. It is just shut up.
3770. Still there is no great area of good country? No, there is not.

Henry John Cornish, dispenser of medicine, Cundletown, sworn, and examined:—

3771. *Mr. Black.*] How long have you been a resident in the district? Forty-two years. H. J. Cornish.
3 June, 1898.
3772. Have you heard anything about the proposed railway scheme? I have heard about it.
3773. Do you know that the proposed railway would cost nearly £1,000,000? I am aware that it would cost a great deal.
3774. About £9,000 per mile, independently of land resumption, which would cost a very heavy additional sum;—are you aware that that would involve an annual loss including interest on the cost of construction and expenses of maintenance, of about £31,000 per annum? It would cost a great deal, but I cannot say what it would amount to.
3775. Under such circumstances, do you think it would be a justifiable expenditure on the part of the country in constructing the railway? I do not think it would be.
3776. Do you think that, if it were constructed, the railway would be able to supersede the sea-borne traffic? It would not be able to compete with it.
3777. I suppose you are aware that they could carry goods to Sydney by steamer from here for about one-third or one-fourth of the cost by the railway? Yes.
3778. Under such circumstances, would not the people generally use the steamer as they do now? Yes, because it would cost them less money.
3779. Well then, the railway would be used only in remote cases—perhaps for a little passenger traffic? Passenger traffic, and a little live stock, but not for the general run of cargo.
3780. Then you may say that the railway would fail in its object? I consider it would; there is not sufficient population.
3781. Do you consider that the character of the country, is such, that if the railway were constructed there would be any great accession to the settlement of the district? I cannot say there would.
3782. Along the Manning River there is not a very wide area of good agricultural land? There is a good deal of agricultural land.
3783. But there is not a very wide area—it does not extend very far back from the river? There is very good land 8 miles to Lansdowne. The estate on which Cundletown is has been very much locked up.
3784. Lansdowne is directly north of Cundletown? Yes.
3785. And you say that from Cundletown to the estate known as the Lansdowne Estate, there are 8 miles of good agricultural land? Yes; it is second-class land, but it is very good; it is far better than any that can be selected.
3786. That land is all alienated? It is in the hands of absentees.
3787. That land is all alienated until you come to the Lansdowne, which is a reserve? It goes right out on both sides.
3788. Nearly all the land is alienated—that is to say, it is either leased or freehold? It is freehold.
3789. It is not open to selection? No.
3790. I see that Lansdowne is marked "T.R.," which means timber reserve. How far to the west is there good land; would you say it is all good land between here and Taree, for instance? I could only call it second-class land.
3791. How far beyond Taree is it good? The Taree Estate is all good land; it extends up to Woola, and there is good land there.
3792. How far back from the river is the land good? About 1 mile. 3793.

- H. J. Cornish. 3793. In what direction is there likely to be any development in the district;—what is likely to be the staple industry here in the future—dairying? Yes; dairying.
 3 June, 1898. 3794. And provided that the entrance to your river were so improved that vessels drawing about 12 feet or 14 feet could come up the river to Taree, do you think that that service would be sufficient for the wants of the district? I consider it would be.
 3795. *Mr. Fegan.*] Being a dispenser of medicine, you get your medicine, I presume, from Sydney? Yes.
 3796. I suppose you get it chiefly in case or bottle? I get it in all sorts of ways. I believe extensively in the herbal medicines; but I get both kinds.
 3797. Do you carry on business as a chemist? I am not strictly a chemist, for I hold only a certificate as a dispenser of medicine; but I am not altogether dependent on that.
 3798. What rate do you pay for the carriage of your goods? I get so very little that the carriage is a very small item, and cannot be taken into consideration.

James Collins, farmer, Dumaresq Island, sworn, and examined:—

- J. Collins. 3799. *Mr. Hassall.*] How long have you been on Dumaresq Island? About thirty-five years.
 3 June, 1898. 3800. Does the land keep up its fertility naturally, or do you have to feed it? We have to feed it. A quantity of it is worn out.
 3801. But it is pretty good land, is it not? Yes, naturally.
 3802. You have heard the evidence given by those gentlemen who have been previously examined? Yes.
 3803. Can you corroborate the evidence given by them? Mainly.
 3804. What is about the size of the farms held in the district—the good agricultural land? From 25 to 60 acres.
 3805. Is 60 acres looked upon as a decent holding? Yes.
 3806. Will it support a man and his family fairly well? Yes.
 3807. With regard to the good agricultural land, is it not principally along the courses of the rivers, and the various creeks? Yes.
 3808. If you go back from the rivers, what are you in? I would not go at all.
 3809. You are a practical farmer of over thirty-five years standing, and you tell me that if you could not get land along the banks of the rivers or creeks you would not try to farm here at all? I would not. I do not know anywhere I would try it.
 3810. We have heard it said that there is splendid land lying back some distance from the river, and that the proposed railway would make everybody's fortune;—do you know any good land of any description there? I do not.
 3811. Have you looked for any? Yes; I have looked about a mile back.
 3812. When you found your own land was getting exhausted you looked around to see if there were other good lands, so as to give yours a spell? Yes; I should like to have bought some, but I do not know any good land in the district not taken up.
 3813. Do you know any good land towards the Lansdowne, back from the creeks? I do not know any that is not taken up.
 3814. So the fact of the matter is, that the whole of the good land along the water-courses which is accessible has been taken up—is now held by private individuals—and the land that is marked as Crown lands—those places coloured yellow on the map—is not worth taking up for farming purposes? As far as I know it is not.
 3815. I suppose you send your produce away by boat? Yes.
 3816. And the generality of the farmers around here do the same? Yes.
 3817. And they find that they are fairly well served under existing conditions? Yes.
 3818. Do you think that the proposed railway, if it came to Taree, and stopped there, would be of any benefit to them? I do not think it would be any benefit at all to them as regards the carriage of general produce—maize, and that sort of thing.
 3819. Maize is not a thing that will bear any great cost of carriage? No.
 3820. You could not afford to pay four times as much by rail as by boat? No.
 3821. Taking into consideration the fact that the construction of the proposed railway would mean a loss of £31,000 a year, and that any man who held a little land might be called upon to pay additional taxation to make up the loss, it would not be an unmixed benefit? It would not, indeed, and I would not like to be one who helped to pay for it.
 3822. There is a proposal to improve the entrance to the river? Yes.
 3823. If that were done, and this river were made accessible by the steamers at any time, that, I presume, would be of great benefit to all the farmers settled along the river? It would indeed be of very great benefit to them.
 3824. Do you suffer any inconvenience or delay at times through the boat being bar-bound? Yes, we do.
 3825. The farmers find it difficult to get their produce away to market? Yes.
 3826. So that the improvement of the entrance to the river would benefit you individually and every other farmer in a similar degree, perhaps? Everyone about here.
 3827. So, as a practical man, you would give the preference to the scheme for the improvement of the river instead of wasting money in building a railway at such an enormous cost? I would.
 3828. *Temporary Chairman.*] Supposing that the people of the district had an alternative put before them—either a railway or an improved river—a river with a bar sufficiently deep to admit vessels at all times of the size of the “Electra,” which would they go for? The river improvement, most decidedly.

William George Everingham Smith, farmer, Dumaresq Island, sworn, and examined:—

- W. G. E. Smith. 3829. *Temporary Chairman.*] You have heard the evidence given by Mr. Collins? Yes.
 3 June, 1898. 3830. Do you support that evidence? Yes; fairly well.
 3831. You think that Mr. Collins was correct in the views which he enunciated about the river and the railway? Yes; I do.
 3832. And also in saying that all the good land in the district is already alienated? Yes.
 3833. You have no knowledge yourself of any good Crown land that could now be taken up? No really good land like that on the river bank. 3834.

3834. If I wanted to select in the Manning River district you could not put me on to 100 or 200 acres of good agricultural land? I could not.
3835. Could you put me on to a good farm that I could buy? There are a few advertised.
3836. What is the value of the agricultural land on the river banks? It varies from £15 to £20 an acre.
3837. That is good land? Yes.
3838. So we may come to the conclusion that a man holding 40 acres or 50 acres can make a very good living off it? I believe he can.
3839. Is there any room for increased population;—could each of the present farms be divided into two farms, and produce more than it produces at the present time? I think there is an opening for more population on the agricultural lands of the Manning.
3840. You mean that better facilities and cheaper transport of the produce would very likely tend to increase the population somewhat? Yes.
3841. But not largely? No; I could not say largely, but I think it would increase the population.
3842. Do you think that the taxpayers of the country would be justified in spending £1,000,000 to construct a railway to Taree, which would entail on the country a loss of £31,000 every year? I do not, at the present time.
3843. *Mr. Fegan.*] Is it not a general rule that when a railway is constructed it does open up the country and increase the population? In time it does, I admit.
3844. *Temporary Chairman.*] The Traffic Manager in making his estimate of the loss of £31,000, says in his evidence before the Committee that he has made a very liberal allowance for freight and all charges, and he can see no possibility of that loss being reduced for a very long time to come, and in view of that fact you do not think the Government would be justified in constructing the proposed railway? Not at present. I believe that in time it would pay, but I do not know whether it would pay in my time or my children's time.
3845. As further development takes place and population increases, you think that it is a work that might be carried out? Yes, in time to come, but not at present.
3846. *Mr. Fegan.*] Of course your position here is entirely different from that of people in some portions of the Colony where the people have no water-carriage, but have to depend perhaps on the worst kind of roads, whereas you have cheap transit by water, which is the cheapest kind of transit you could have, and, therefore, there is not the same necessity for a railway in this district as there is in other places where the people are without water-carriage? If we had proper water-carriage.
3847. Do you send your produce by the river boat? Yes.
3848. What are the longest delays that have occurred within your own knowledge? I have had maize in the barn ready to go for three weeks and could not get it away.
3849. Why? I do not know whether the bar was bound or the narrows were shoaled up.
3850. But there was something wrong? Yes.
3851. Was it on account of the boat having too much trade? No; she has been bar-bound.
3852. Therefore it was on account of the bad entrance, rough weather, and so forth, that you were delayed three weeks? Yes.
3853. Such delay must have a great effect on the price you would obtain in the market? Yes.
3854. If you could get your produce into the market when prices were high it would be very much better for you? Yes.
3855. Therefore what you want, if not a railway, are better facilities as regards water-carriage? Ye.
3856. So that such a loss of time as three weeks would not be possible? Yes.
3857. Do you think that improved facilities for water-carriage would meet all the requirements of the people of the district? I think they would be very well satisfied if they could get that.

W. G. E.
Smith.
3 June, 1898.

Moritz Ahronson, storekeeper, Cundletown, sworn, and examined:—

3858. *Mr. Fegan.*] How long have you been in business in Cundletown? Seven years personally, but M. Ahronson, my father was here many years before.
3859. So that the business of your family here has extended over a number of years? Yes.
3860. Where is your market for buying? Sydney and Newcastle.
3861. Do you buy produce from farmers and send it down to Sydney? Sometimes, in a small way, I do.
3862. In your business do the steamboats recognise different classes of goods the same as the railway—that is to say, 1st, 2nd, and 3rd class? They have different classes—some goods by weight and some by measurement.
3863. What do you pay per ton? Twelve shillings and sixpence.
3864. Do you get all your goods carried for 12s. 6d. a ton? The heavy stuff we get carried at 12s. 6d., and the other by measurement.
3865. Would $\frac{1}{2}$ a ton by measurement be 6s. 3d.? No, 6s. 6d.
3866. There is really no difference between measurement and ordinary tonnage, which is 12s. 6d. a ton? Yes.
3867. You would not get goods carried for that on the railway from Sydney to here? I am not aware what the charge would be.
3868. If you could get your goods more cheaply by steamer than by railway you would not use the railway? I would certainly get them by the cheaper way.
3869. Considering your nearness to water-carriage, and the facilities which are afforded, and are also to be given by the harbour improvements, do you think there is any necessity to construct a railway to Taree? Not so far as Cundletown is concerned; but there is other country which would be opened up.
3870. Do you know that country well? No.
3871. How then do you know that other country would be opened up? Only from hearsay.
3872. Your evidence is to the effect that whilst you can get goods from Sydney at the rate of 12s. 6d. per ton you would not pay any more even if you had railway facilities? Not under ordinary circumstances.
3873. If the proposed railway were constructed, do you think that the steamers would reduce their rates in order to get the trade? Certainly.
3874. Therefore, if the railway were constructed 113 $\frac{1}{2}$ miles, there does not seem to be a great deal of prospect of its paying? I have not gone into that question.

3 June, 1898.

3875.

- M. Ahronson. 3875. According to the Good's Superintendent's report the charge on the railway would be more than double 12s. 6d. a ton; it is not likely you would pay that? Certainly not.
- 3 June, 1898. 3876. What within your knowledge has been the longest delay that has taken place in the transit of goods by steamer? The longest delay, I think, has been about a week so far as my goods are concerned.
3877. Of course, as regards perishable goods, such a delay would have a detrimental effect? Yes; even if goods were landed by rail at Taree I would have to bring them to Cundletown, and that would increase the cost.

MONDAY, 6 JUNE, 1898.

[The Committee met at Tinonee at 11 a.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).
 The Hon. DANIEL O'CONNOR. | JOHN LIONEL FEGAN, Esq.
 THOMAS THOMSON EWING, Esq. | THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Hector Gollan, Tinonee, sworn, and examined:—

- H. Gollan. 3878. *Temporary Chairman.*] What are you by occupation? I am a retired shipbuilder.
- 6 June, 1898. 3879. How long have you been residing on the Manning River? Forty-six years, next August.
3880. I presume you know the district thoroughly? Yes.
3881. You know the scheme before the Committee to construct a railway from Maitland to Taree? Yes; I have read a good deal on the matter.
3882. Will you make a statement as to the necessity for the railway and the benefits likely to accrue from it? I think it would be of great benefit, as part of the scheme of a North Coast railway, in a great many ways.
3883. We are dealing with it simply as it stands—from Maitland to Taree? Yes, of course; but I am speaking generally, as far as the railway is concerned. There is a matter that would warrant the Committee's looking into it. So far as my knowledge of the measured line at present is concerned, I understand it is proposed to cross at a place called the Washpool. If the line were deviated and came down on this side of the river, I think it would serve a large percentage of the population of the district, as far as Kimbriki, and a great tract of country at the head of the Wallumba, and right across to the fertile land at Wallan and Gooloongoolook, and that part of the district, whereas if the railway went in the way the line is measured at present it would not serve that district, for it would be cut off from it.
3884. Where would you propose to deviate from the existing survey—at Bulladelah? No; to come down the same surveyed line, but instead of crossing at the Washpool, to cross lower down and come down on this side of the river, and then the railway would serve Kimbriki and Krambach, and that large district. The present measured line crosses about Woodside.
3885. You think it ought to come down on the same side of the river? Yes; and then cross over to the Wingham side.
3886. At Wingham? No; still above Wingham. It would serve a better tract of the country if it were to come down a little lower than is proposed.
3887. Are you aware that a number of surveys have been made, and also a very careful inspection of the country, and that the surveyors say they have selected the most practicable route that could be got? From my experience of the country I do not doubt that a little variation of the proposed route would make it take in an enormous amount of good country.
3888. Do you know that the estimated cost of the railway is about £1,000,000, without anything for resumption of land? Yes.
3889. Mr. Harper has gone over the country and obtained all the information he could as to the products. He has had access to the books of the steamship companies, and after making a most liberal allowance for a largely increased traffic from the district, he estimates that the annual loss on the railway would be £31,000? I do not doubt that there would be a loss on this line so far as Taree and this district is concerned, but the railway should be regarded as a national line.
3890. But, unfortunately, this inquiry is limited to a railway from Maitland to Taree. However, from your remarks I gather that you think that if the line be looked upon as part of the North Coast railway, to connect with Queensland, it would be justifiable? Yes; I think that, because I know it must be profitable, owing to the area of country it would go through, which is the heart of New South Wales.
3891. Do you know the country between here and Dungog? I know a good deal of it, but the country between here and Dungog is not much. There is a good deal of barren country.
3892. Do you know that the railway would pass for 52 miles through the estate of the A. A. Company? Yes.
3893. Many people along the route have thought that the railway should not be constructed until some arrangement had been made between the Government and the A. A. Company for the Government to acquire their land? Most decidedly I would advocate that.
3894. You believe, with others, that the occupation of that great block of country by the A. A. Company is detrimental to settlement, and is shutting up the country? Most decidedly.
3895. What effect do you think the construction of the railway would have on the trade of the Manning River itself? I do not think it would have a great effect, except as regards the passenger traffic and live-stock and perishable goods. I think it would enhance the value of perishable goods a great deal, because more would be done with them than under the present system.
3896. There would be no chance of the railway capturing the heavy traffic? Yes; the heavy traffic most decidedly above the navigation.
3897. You think that some of that traffic would be secured by the railway? Most decidedly it would, because no person would cart stuff 12, 14, or 20 miles to water-carriage if he had the railway close at hand.

H. Gollan.
6 June, 1898.

3898. You are aware that railway-carriage would be much higher than water-carriage? Yes.
3899. For ordinary store-goods the rate would be from 30s. to 75s. a ton from Sydney to here? To many parts now it is over that.
3900. But people would still have to cart if the railway were constructed, would they not;—the railway would not go right to their doors? It would not go right to their doors; but now the back freight is over £2 a ton.
3901. What do you pay for sugar, salt, and things of that kind from Sydney to Wingham? They call it 12s. 6d.; but on most other things we have to pay up for that.
3902. Why do you say they "call" it 12s. 6d.;—do they charge more? I do not care about interfering with other people's business.
3903. You are aware that it is proposed to spend £100,000 in improving the entrance to the Manning River? Yes.
3904. Do you look upon that as unnecessary work? I do.
3905. If the construction of the proposed harbour works would secure for all time a depth of from 12 feet to 15 feet of water on the bar, and if the shallows inside are scoured, do you think that the Manning district would be fairly well served? I think it would be served in that way. There is no doubt about that.
3906. The only outlet for its trade is by sea, is it not? Yes; for ordinary trade the outlet is by sea.
3907. If the people of the Manning were offered the alternative of a railway from Maitland to Taree, and nothing to be spent on the harbour, or the proposed expenditure on the harbour to make it a good port, which do you think they would go for? I think they would be divided.
3908. That is, the people on the river from this place down would go for the harbour, and the people on the upper portion of the river would go for the railway? Yes; that is how it would stand.
3909. Are there any farms in the upper portion of the district, far back from the river? Yes.
3910. Much good land? Yes.
3911. Is there much scope for settlement here? There is more scope along the proposed line—that is, including the A.A. Co.'s estate.
3912. But that is not available;—there is 52 miles of country there shut up? There is land at the head of the river which is not being utilised at present.
3913. What class of land? First class.
3914. You see the portions coloured brown on that map north and north-west of the river; that is all Crown land, and that land is said to be actually valueless; all the good land along the creeks marked blue has been taken up;—would you be astonished if I were to tell you that you can get portions of that land—20,000 acres, at £12 a year, with a lease of twenty-one years, and yet it is not taken up; that land can be leased under an Act known as Waste Lands Act, and hardly any of it is occupied now, or rent being paid for it? But the heart has been taken out of that.
3915. There is practically no room for settlement, because the land is so worthless that people will not take it up, and if they did take it up, they would be a considerable distance from the railway; then, again, the brown patch on the east towards the coast is also very poor land; do you think that the population on the river would largely increase if additional facilities were given to the people;—would there be more cultivation on the banks of the river, say, between the head of navigation and the sea? I think there would be more orchards and the like of that. Land that is not fit for cultivation would make splendid orchards.
3916. But what would the people do with their products? I mean, if the railway were in existence there would be a great deal of fruit grown in this district. A great deal of the land here is well adapted for fruit-trees.
3917. But fruit-growing does not pay railways very much? No.
3918. Unless the railway could capture a large portion of the traffic that now goes by sea, is there, in your opinion, the slightest likelihood of its paying? I do not think the railway would pay.
3919. Are you inclined to take the figures placed before the Committee by the Traffic Manager, who has gone to an immense amount of trouble to get his data, and says that he has made a liberal allowance for everything, yet estimates an annual loss of £31,000 on the line? I think he has the best opportunity to arrive at correct figures.
3920. You are not disposed to dispute his figures? Not at all.
3921. Can you give the Committee any idea of what the passenger traffic would be likely to be? The passenger traffic would be increased to a great extent; there is no question about that. If I could go to Sydney by the railway I would go ten times to the one time I go now.
3922. Although the passenger traffic is at present limited, you think that with railway communication it would be very largely increased? Most decidedly.
3923. People would travel much more frequently than they do now? They would.
3924. I suppose there are a number of people in the district who never go to Sydney? Yes; and only sheer necessity takes any people to Sydney by sea, especially those who are liable to sea-sickness.
3925. You think that railway communication would result in more frequent trips to Sydney by people living in this district? I think so.
3926. What effect would a railway have on the business of the district? It would increase the business, because there would be more travelling and business done with the metropolis than is done at present.
3927. You know the experience of some other places is that the opening of a railway to them sometimes decreases the local business, because people go to Sydney, and buy their parcels of goods there? If it would not be beneficial in one way it would be beneficial in the other.
3928. You mean that while it might injure the storekeeper it would benefit the people? I do not think it would injure the storekeeper a great deal.
3929. Your evidence summed up amounts to this: You do not think the country would be justified in constructing a railway to Taree if Taree were to be its ultimate destination, but if on the other hand the railway is to run along the North Coast to connect Brisbane with Sydney you think that this portion of the line is perfectly justifiable? Yes, that sums up all my evidence.
3930. *Mr. Hassall.*] Do you think that the country would be justified in carrying out both works—the harbour works and the railway;—is there sufficient trade or traffic in this district to justify the construction of both those works? Well, as far as the two works combined together go, I would not say anything on the matter. But the harbour works must be done.
3931. You think they are a necessity? Yes.

William Smith, saw-mill proprietor, Tinonee, sworn, and examined:—

- W. Smith.
6 June, 1898.
3932. *Mr. Fegan.*] Have you any knowledge of the proposed railway that is now before the Committee? No; I am not interested in the subject much at all.
3933. Do you think that it is expedient to construct a railway to Taree, considering that you have such a fine river as the Manning? Commercially, I think it would be a loss, but I think it is right that it should be constructed.
3934. Do you think there is a probability in the near future of getting anything near as much as would cover the annual loss, estimated at £31,000? What do you mean by the "near" future.
3935. Well, say within five or ten years? Put it at twenty, and you might.
3936. Your opinion is that the improvement of the bar is far more important than the railway at present? Most decidedly.
3937. And, as far as the people of Tinonee are concerned, they would be more satisfied with greater facilities on the river than they have at present, rather than have the railway? I am fully of that opinion. I think that the harbour improvements are a work of necessity, and should be carried out.
3938. You agree to a great extent with the evidence of the previous witness? Yes. With the proposed railway I have very little sympathy; but, at the same time, I am of opinion it should be constructed. But the harbour improvements I am very much in earnest about, and I think they should be carried out. As a business man, I know we at present suffer from a terrible block. We, for instance, have been almost begged to send cargoes of timber around to Western Australia, and we could not do it because of the transhipment that would have to be done in Sydney, which would make it too costly, we having to send the timber in little ketches to Sydney and tranship it there. We have had three letters begging us to send cargoes of timber to Western Australia, and we could not.
3939. You heard the previous witness say there was a greater charge than 12s. 6d. a ton? Yes.
3940. Can you tell the Committee the details that bring the charge up to more than 12s. 6d. a ton? I do not know what the real cost is. It seems to me to vary very considerably. Personally, I have been charged as high as £6 for 28 cwt.
3941. What was that for? A machine that we use in the mill.
3942. That was by measurement, I suppose? They said measurement, but their schedule says, "Machinery, 30s. per ton," and we were charged £6 for 1 ton 8 cwt.; and then they work on the parcels rate a good deal, and that makes it very heavy. But I do not see how the railway could compete with the steamer except as regards passengers. I do not go to Sydney now once in three years, but I would be very glad to go often by railway.
3943. The railway would be quicker, surer, and more convenient? Yes. It is a week's job now if you wish to go to Sydney overland.
3944. You think that sufficient facilities for trade would be given if the harbour works were carried out as proposed? Yes, I am fully of that opinion.
3945. *Temporary Chairman.*] In speaking about the freight by steamer just now, I suppose you meant that they charge practically what they like? Yes.
3946. You are in their hands? Yes.
3947. Are there good timber forests in this part of the country? They are pretty well cleared out I think—that is to say, there is not sufficient timber about here to carry on any export trade; in fact, there is not in the whole Colony for the matter of that, but I am dealing now with this part.
3948. Where are your mills situated? In Tinonee.
3949. Are there any large timber reserves at the back of Cooperook? Well, they call them large, but they are not.
3950. They are not large? I do not call them large. If a good mill were to be established there it would cut them out in a year or two.
3951. Therefore the prospect for the timber trade is a comparatively short life? I think so.
3952. But apart from the timber trade, you recognise the importance of a district like the Manning having good facilities for outside commerce, either by water or by rail? Yes.
3953. And you think that the expenditure of £100,000 at the Heads would be perfectly justifiable? I am fully of that opinion.
3954. We are told by the professional staff that with that expenditure they can obtain a constant depth on the bar of not less than 12 feet of water;—would that, in your opinion, admit vessels of sufficient carrying capacity to meet the wants of the district? Yes.
3955. There is a possible contingency after that £100,000 has been spent an additional £120,000 might have to be spent to carry out the breakwater still farther? I think those works are perfectly justifiable.

MONDAY, 6 JUNE, 1898.

[The Committee met at the Court-house, Wingham, at 2:30 p.m.]

Present:—

FRANCIS AUGUSTUS WRIGHT, Esq. (TEMPORARY CHAIRMAN).

The Hon. DANIEL O'CONNOR.

THOMAS THOMSON EWING, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Harry Josling Hammond, storekeeper, Wingham, sworn, and examined:—

- H. J. Hammond.
6 June, 1898.
3956. *Mr. Black.*] Are you familiar with the route of the proposed railway? I have been over the whole of it, with the exception of the part from the Washpool to Gloucester; that is where it goes down the Barrington.
3957. You know what direction it takes in regard to Wingham? Yes.
3958. Does the route recommend itself to you? Yes; I do not think there is any better route; it comes through a lot of very good country.

3959.

H. J.
Hammond.
6 June, 1898.

3959. Will it be of any service to the people of this town and district? Yes; I think it will be of great service to this town and district, if there be railway communication with the metropolis, for several reasons. At the present time there is a large quantity of perishable articles, and a large number of live stock sent to Sydney, on which we lose heavily, both in the way of freight, and the price they fetch in Sydney. If the produce got to the market fresh, it would fetch far more than it does now. We now lose sometimes as much as 50 per cent. on the value.

3960. You say you lose on the freight? Yes.

3961. You refer to pigs and fowls, I believe? Yes.

3962. What do steamers charge you per head for pigs? From 1s. 6d. to 3s. 6d., I think, and for every day they are on the steamer, we pay 2d. per head for food, and that runs into a big item when the steamer is detained eight or nine days, and a pig loses considerably in value. The same with poultry. The freight by train would be 2d. per pair more than by steamer, but at the same time we have to pay for the feeding, and they sell at about half-price, and the same with eggs. People with railway communication receive 1s. 10d. or 1s. 11d. I have plenty in hand each summer, and mine have been sold for 11½d. and 12½d. There is always, at any rate, a difference of 1½d. in the price realised for steamer-carried eggs and railway-carried eggs.

3963. Then your argument is that you lose on shipments of perishable goods, because of delays in consequence of the intervals between trips, and the length of time occupied in making the journey? Yes; and the heavy expenses of feeding.

3964. If the journey were not long, the expense of feeding would not be great: that is, therefore, included in the other item; if something were done which could insure you against the loss that is occasioned through vessels being unable to put to sea, and also to insure you a more regular service—say every other day—and a quicker passage, a great deal of the necessity, or what you consider the necessity for a railway would disappear, would it not? It would, to a certain degree.

3965. Have you a steamer trading to this town? Yes; on and off.

3966. Does the "Coraki" come up to this town? At times, but she does not come regularly. She is not coming now for three trips ahead.

3967. How often does she come? Just when it suits her.

3968. Then there is enough traffic to pay a steamer coming about once a fortnight; do you think there would be enough to pay the railway, which would be running every day? An immense quantity of stuff would, I believe, go by railway. I know nothing about the expense of running the railway, nor the expense of running the steamer, and therefore I do not know if the railway would pay.

3969. I suppose that for £20,000 of capital you could lay down a steamer, or possibly a couple or three steamers, to trade between this port and Sydney, but it is estimated that the construction of this railway would cost £1,000,000, and the difference between £1,000,000 and £20,000 or £30,000 is very considerable; are you aware that the annual loss on this railway at the lowest estimate would be £31,000? I have read so; that is all I know about it. At the same time there is a lot of stuff which the steamer does not take. For instance, 8,000 or 9,000 head of cattle went down during the last twelve months. None of those went by the steamer, but they were driven to Maitland.

3970. I suppose that a train a fortnight would take 8,000 cattle to Sydney per annum, and that would not pay the railway; have you heard anything about the proposed improvements to the bar? I have read of them—that is the only thing.

3971. Do you know it is proposed, at a cost of £100,000, to make the entrance easy in all weathers unless in the case of a gale—to remove the bar and what is known as the crossing, and to create a channel which, with a little dredging, and by means of the increased scour, will keep the river permanently open as far as Wingham? I have read of it.

3972. Do you know that that will result in a permanent depth of from 12 to 14 feet of water in the river except under exceptional circumstances? I have read that it will do so, but I cannot say whether it will or will not.

3973. If you had that depth of water, and vessels of increased tonnage and greater speed and power were enabled thereby to trade on the Manning, would not that reconcile you to many of the disadvantages with which your trade appears now to be surrounded? I have no doubt it would facilitate the getting away of produce of all kinds, and might cause opposition which would result in the reduction of freights. I think it would be bound to reduce freights, because a heavy item now with the steamship company is insurance, because of the dangerous entrance, and there would be a very large reduction in that way.

3974. Have you lived long in this locality? Seventeen years in Wingham, and all my life on the Manning, excepting a few years.

3975. Has there been much growth of the district during the last few years? Yes; it has been continually growing.

3976. Is there any room for much greater development? There is a big development taking place at the present time; they are opening up what you may almost term useless lands, which are now being used in connection with the dairying business; and that is a business which requires quick transit with Sydney. If there were a way of getting pigs and calves to market properly the export of pigs and calves would be largely increased, and there is no telling what the butter trade might reach in the course of nine or ten years. It has made rapid strides during the last two years.

3977. Do you think that the Government would be justified in spending £1,000,000 in the construction of a railway from Maitland to Taree, considering that it would involve an annual loss of about £31,000? That is a big sum, of course, to lose; but at the same time I think that a lot of it would be recouped by the opening up of fresh country. I do not look upon the country as merely from Maitland to Taree, but as a section of a line that will go farther on.

3978. We are not considering that now? Still, we always have done.

3979. You speak about opening up fresh country;—how is that country held at present? A lot of it consists of free-selections and freeholds, and the other parts would be taken up. Nothing was done in the dairying industry on the Manning River until the last couple of years.

3980. How is the free-selected land being used? There is grazing on most of it, and some is being cultivated. We do not grow maize and that sort of thing more than 15 miles from here now, where the railway would cross; and if the railway were to cross there there would be a platform, and it would pay to grow maize 15 or 20 miles farther on, where there is nothing but grazing at the present time. The railway

H. J.
Hammond.
6 June, 1898.

railway would cross at the Washpool, and that is as far up as it pays to grow maize; but if there were a siding there, to take away the maize and other products, people would grow maize 15 miles further up the river. They grow nothing up there now except tobacco, or what brings a big price for a small weight; and they principally raise cattle, which they can drive to Maitland.

3981. You think that the ultimate tendency of this district will be towards dairying? A big portion of it, I think.

3982. Is there much timber cut in this district now? Yes; there is a large quantity of timber being cut. There are so many orders in hand now that they cannot get enough teams to draw it in.

3983. How long do you think it will be before the district timber will be cut out? It is like everything else—it is a matter of price. The price is a paying price now, although it has not been for a little time back; and the whole timber industry of the Colony seems to have taken a rapid jump.

3984. Providing the prices continue as they are now, how long will it take to cut the district timber out? I hardly think that they would ever cut it out. It gets thicker the longer it stands. The timber grows so freely that it is a great drawback to portions of the country.

3985. If the axe is put to it it will not stand? Almost forty years ago they were cutting away on the Lower Manning, and had a number of saw-mills; and they are cutting yet, and timber is thicker now than when they commenced to cut it. It is growing up, and if you were in some of the forests you would wonder how they would get out of them when the trees mature. You can hardly get through the timber now. Some of the trees are small, and do not make good mill-logs to be cut up into sawn timber.

3986. Was this land naturally open country, or had it been cleared? The only theory I heard put forward was that in olden times, when there was little stock, big bush-fires swept all the undergrowth out, and since the place has been overstocked the undergrowth has never been burnt out. It has never had a check. Whether that theory is right or wrong I cannot say.

3987. The grass is pretty well eaten down, and there is no danger of fire? The place is overstocked. In some cases where they ringbark the country it is cleared, and they never seem to have any more trouble; but here, if they ringbark one tree a dozen comes up in its place, and that makes the country worse than ever.

3988. Is much fruit grown in this district? There is a good deal of fruit grown, but there is an uncertainty as to getting it away. The only fruit exported is oranges, they being the only fruit that will keep.

3989. How does the soil here compare with the soil lower down the river? I think it is far better for fruit in the upper part because it is more hilly and is better drained.

3990. But, generally, is it not better soil here for all purposes? Yes; I think there is a greater depth of agricultural soil up here, and the grazing land, of course, is not flooded with water, the same as it is on the lower portion of the river.

3991. The banks of the river are higher here? Yes.

3992. Does the river ever go over the top of these banks;—only in places, I suppose? I think the greatest height is about 40 feet—at Wingham—but rises higher the further you go up the river. I think it is about 70 feet or 72 feet at Woodside; the farther you go up the higher it rises, and the farther you go down the less it rises, and the more the river spreads out.

3993. You were saying that you thought you could get your produce to market more cheaply by railway; have you ever sent or had goods brought by railway? I have never been personally connected with sending goods by railway, though I lived in Tamworth for some time. Taking the prices per ton, I think that with the exception of flour, sugar, and salt, we pay from 30s. to 50s. a ton dead weight. For a case of goods, 40 lb. or 50 lb., we pay 1s.

3994. That goes by measurement, does it not? No; they have a schedule rate for that.

3995. Do you not pay for dead-weight, as a rule, from 12s. 6d. to 15s. a ton? Salt, sugar, and flour are the only things that come under the dead-weight price by the steamer.

3996. Do you know what they charge per ton on the railway? No.

3997. Would you be surprised to know that they charge three or four times as much; supposing that for the goods which you get brought for 12s. 6d. or 15s. a ton by steamer the railway authorities wanted to charge you £3 or £2 10s.;—if you had a railway here would you have your goods brought by the boat or by the railway? By the cheaper route most likely. But do they charge £3 or £2 10s. per ton?

3998. They do in other places, and I do not think they would make an exception here; they would charge special rates on this line, at any rate, for a time, and not rates as low as those on the main trunk line? I do not know what freight my employer used to pay when I was living at Tamworth, but I have paid here £4 15s. a ton for identically the same goods as he had, and when I came here I found that I had to sell such goods for the same price as he did.

3999. *Mr. Hassall.*] Have you any return of the quantity of goods received here or the produce despatched? No; I have only my own. I pay about £200 a year freight on goods, with the exception of maize. That amount does not include maize. I have no returns of what I do pay on maize, but I have returns for the others, and I reckon there are five business men in town who do about the same amount of business as I do.

4000. How many tons of goods would that amount to? I have never worked it out in weight, but only have my freight lists.

4001. Your average yearly freight is about £200? Yes; to and fro, but that does not include the maize, of which I have not any account.

4002. The Secretary of the N.C.S.S. Co. says that their freight per ton from the Manning to Sydney is 12s. 6d. for dead weight or measurement, and the maize is carried at about 10s. a ton;—do you think that the railway could compete successfully with the water carriage? Not unless the railway carried at about the same prices, but the steamers do not carry goods, with the exception of sugar, flour, salt, and maize, at 12s. 6d. or 15s. a ton.

4003. That is his statement to the Committee. I presume that as a business man you would take the cheapest freights offered, whether by steamer or by a railway? Yes.

4004. If the steamers were able to undercut the railway, you would patronise the steamer presumably, if the river navigation were improved? Take 1 cwt. of soap, which is carried as dead weight. If you put anything else besides soap in the same box they charge you 1s. 6d.

4005. Have they a minimum charge for packages of that description? That is the freight I have always paid. I cannot say what they charge other men. I make their tonnage rate out for a lot of goods to be from 30s. to 50s. a ton.

4006. Mr. Cooke says they have a package rate for anything below $\frac{1}{2}$ ton, but that for parcels they get 1s., which at a tonnage rate might come to £2 or £3 per ton; but he says that two-thirds of the goods carried to the river go at the 12s. 6d. rate—that is, flour, sugar, and similar lines? Flour, sugar, and salt go at the 12s. 6d. rate if you have a ton weight, but otherwise you have to pay more.

4007. *Temporary Chairman.*] The minimum charge from Sydney to here for a package by rail would be 3s. 6d. up to 112 lb. You pay 1s. a bag for maize. The railway charge would be 13s. 4d. per ton; for timber, logs and girders, 17s. 6d. a ton; for sawn or split timber, £1 0s. 5d. a ton; for certain ores and minerals, 17s. 8d. per ton; for salt, £1 0s. 5d.; for bar iron, galvanised iron, £1 4s. 7d. a ton; for sugar and many other things, £3 12s. 9d. a ton; for groceries of all description and packed ironmongery, £4 10s. 4d. a ton; and for other things, £6 5s. 5d. per ton. That is according to the scale of railway charges on the main lines throughout the Colony. The only concession that the Railway Department offer is that they carry goods at per truck, and if you had the truck system here they would charge, I suppose, the same as on the Northern line, viz., £5 a ton, or £25 for a truck of 5 tons; for stock they would charge £6 17s. 3d. a truck, or 13s. 8d. per head; for butter, eggs, honey, and sundries of that kind, the minimum charge would be 2s. 9d. for a package of 56 lb. or under, and double that if over 56 lb. and under 112 lb., 112 lb. being the maximum package weight; therefore that rate very largely exceeds your steamer package rate;—do you think, in view of the facts I have just mentioned, and which I have extracted from the Government Railways rate-book, if those rates were charged to the people of this district they would patronise the railway for the conveyance of their goods either to or from Sydney? For the carriage of maize and of stock I believe they would.

4008. For anything else? And for pigs also, I suppose.

4009. For pigs the railway would charge £6 17s. 6d. a truck, and you could put as many in a truck as you could cram in, but you know pigs are animals that will not carry safely in large numbers, confined in a small space; they are not fed or watered whilst on the railway; a truck is supposed to carry ten horned cattle or nine horses, and from eighty to 110 sheep, according to their size and condition;—do you think that, with the prices I have quoted, the people of the district would be likely to patronise the railway? For some of those lines, of course, they could not.

4010. For your ordinary store goods you would have to pay no less than £4 10s. 4d. a ton, and for sugar £3 12s. 9d. per ton; those charges, remember, are for a ton or more; if the quantity were less the charges would be still higher;—you think, at the prices I have quoted, the railway would not capture the traffic of the district? Not the whole of it.

4011. You are aware that it is proposed to spend a considerable sum of money to improve the entrance to the Manning River, and the Departmental officers tell us that if the Committee recommend the expenditure of £100,000, in addition to the £23,000 already spent, they can guarantee for all time no less than 12 feet of water on the bar, and a corresponding depth in the river, and that would admit boats carrying 500 or 600 tons;—which do you think would be the most beneficial to the people of the Manning—the construction of a railway costing £1,000,000, or the making of a good harbour at one-tenth of that cost? If all the railway freights were at the rates you have mentioned, the steamer communication would be the better.

4012. If I have correctly quoted the railway rates to you, do you think that the making of a good harbour would be preferable in the interests of the district to the making of a railway? With the exception of live stock and maize and passengers.

4013. Live stock and passengers, of course, are more easily conveyed by rail than anything else, but this district does not live on live stock, nor by passengers who travel to and fro; it lives on the products of its soil, and that is the thing you have to consider;—as a storekeeper, supposing the railway were constructed, would you pay the N.C.S.N. Co. 12s. 6d. for sugar, or would you prefer to pay the railway £3 12s. 9d. a ton? I would patronise the steamer.

4014. As a matter of fact, as a business man, you would get your goods by the route that suited you best as to price, speed, &c.? Yes.

4015. Mr. Black has pointed out to you that the railway, if it were constructed, would involve an expenditure of £1,000,000; the estimate put before this Committee by the Traffic Manager was prepared by him after a visit to the district; he inspected the books of the shipping companies, and saw the total tonnage in and out of the district; he has had years of experience, and after making the most liberal allowance for increased freight and increase of population, he says that he cannot see that there would be a less loss than £31,000 a year for a very long time on the railway;—I want to put a straight question to you: Do you think the taxpayers of this country would be justified in spending £1,000,000 in building a railway by which they would lose £31,000 per year for the benefit of this district? I do not think they would be justified. At the same time, unless the Harbours and Rivers Department officers are sure that the expenditure of £100,000 at the Heads will improve the bar, that money might as well be spent on the railway.

4016. But, while you have doubt about the wisdom of constructing the railway, you approve of public money being spent on the Manning River to make it a good river for navigation purposes, by its being possible for boats to come in and go out at any time they please? Yes; I approve of that.

William Wallace Stewart, contractor, Wingham, sworn, and examined:—

4017. *Mr. Hassall.*] How long have you resided in this district? In the Manning River district about eleven years.

4018. Carrying on business as a contractor all that time? Not all that time—principally farming.

4019. What does your contract work consist of now—have you any contract in hand? I have not at the present moment. I have just completed a large contract for the Wingham Council.

4020. With reference to the proposal now before the Committee, have you any opinion to offer upon it? Yes, I have. Mr. Hammond was asked about the opening up of the country, and he spoke about selections and grazing country that might be opened up. I think that his evidence had reference principally to the frontages. I am quite satisfied there is a great deal of country which might be opened up that is not

H. J.
Hammond.

6 June, 1898.

W. W.
Stewart.

6 June, 1898.

W. W.
Stewart.
6 June, 1898.

- not near the frontages at all, but is back country. Mr. Black asked Mr. Hammond a question in reference to fruit-growing. I am aware that there are thousands of acres of land that might be taken up, that would grow fruit or vegetables, or almost anything that one might like to plant, with the exception of maize, and that there is room on such land as I have mentioned for hundreds of people to make a living, and although I do not say that the freights on those products would be perhaps the means of getting a large revenue for a railway, still people could live by producing those things on those lands, and opening up the country in that way, who themselves would have to use the railway. I also noticed some remark as to the timber, and how long it would take to cut it out. No person cannot have any idea of the timber in this district unless they see it. It is to be found in the high-lands or table-lands of the district all the way along the North Coast, and within a few miles of where the railway would pass, if it went by the route which is proposed, by the Washpool and through Gloucester. The value of the timber alone is enough to pay for the building of a railway all the way from there to Taree. With regard to the price of live stock, I notice that the Chairman said that to carry a beast would cost about 13s. 4d. by the truck. Well, it costs 30s. to send a horse to Sydney by the steamer.
4021. Do you do a big trade in horses from here to Sydney? Not very big, but if a person could get horses carried for 13s. 4d. a head he might do a big trade.
4022. Have you any idea how many trucks of cattle or horses are sent during the course of twelve months? From 10,000 to 12,000 head of cattle, I daresay, go along annually, and I have no doubt, if they could be sent in in good condition, as they could be by railway, there would be a great deal more sent.
4023. Where is your fattening country? Inland—off the coast—at the heads of all the northern rivers.
4024. Mr. Harper estimates the number of live stock from Taree and district at 500 trucks, and putting ten head into a truck would give you 5,000 head of fat cattle for the year, or an equivalent number of horses? But Mr. Harper's estimate is based on what has gone, and not on what would go.
4025. But you must base your estimate on what you know is available; with regard to opening up the back country for dairying, would you open that up for dairying purposes? Certainly for fruit or vegetables—such things as potatoes.
4026. In any case, if that back country were opened up, I suppose the settlers would have a considerable distance to travel to strike the railway? Not very far.
4027. Is all the good country, then, adjacent to the proposed route of the railway? It would be.
4028. If that country is good, and it is stated repeatedly that there is a great demand for good land all through the Colony, how is it that we have so much vacant land adjacent to the proposed route of the railway; you see the map on the wall; you notice some portions marked yellow, those are all vacant Crown lands, which are available, and much of that land is right alongside the proposed route of the railway, and other portions of it are adjacent to the roads running down to Wingham, so they have means of access? Just so; but a great deal of that land will not produce things that are not perishable.
4029. Is the land scrubby? Yes.
4030. It would cost a considerable amount of money to clear it? It would.
4031. Then it would not be a good thing for a man with limited means to settle down upon it? A man with limited means does often go upon it, and finds that he was a fool in doing so, because he has no way of getting away perishable articles.
4032. If he has only small means, and has to commence on a small scale, that handicaps him? Yes, it does; but he often finds, after producing perishable things, that he cannot get them to market.
4033. You heard the evidence given in regard to the estimated cost of the proposed line? I did.
4034. One matter not mentioned was that this railway would run through 52 miles of the A.A. Co.'s estate? I am aware of that.
4035. And the A.A. Co. will not sell their land, which is any good, such as the land round Gloucester;—do you think that this country would be justified in spending £1,000,000 in constructing a railway from West Maitland to Taree, and running over 50 miles of it through the estate of a private company, and enhancing its value at the cost of the general public? I certainly do not think that would be a reasonable thing to do.
4036. Do you think that railway extension from West Maitland to Taree would be justifiable, the line to stop at Taree, or that it should only be constructed as part of the North Coast railway system? Most decidedly, as part of the North Coast railway. The better country is beyond Taree; for instance, on the Tweed. I know every foot of the country from here to the Tweed, and I am sure there is very much better country at that end.
4037. Practically, then, you are traversing the worst portion of the country from Dungog to Taree? Yes, undoubtedly.
4038. And beyond that the country improves? Very much.
4039. Therefore, you are of opinion that the proposal should be to construct a railway through all the North Coast, and that this line should form only a portion of that railway system? Unquestionably, that is my idea.
4040. *Temporary Chairman.*] The answer that you gave to Mr. Hassall's last question sums up the whole case;—you think that the capitals of New South Wales and Queensland should be connected by railway along the coast, and that this line should form a portion of that railway? That is my idea.
4041. But supposing that that is left out of the question, and Taree is for all time to be the objective point, do you think that the railway should be constructed? I should not advocate the construction of a railway to Taree alone.
4042. On the timber question, we were informed by a saw-mill proprietor, only a few miles from here, that all the good timber of the district was cut out? Then he does not know anything about it. No one can have any idea without seeing it what is the value of the timber in this country within a few miles of Wingham.
4043. I suppose that the other gentleman meant by his statement that the timber that used to be immediately available was cut out, and you mean that there is abundance of timber on the ridges which has never been touched—is that so? Yes; hundreds of thousands of pounds worth.
4044. Do you know the Hanging Rock? Yes; on the road to the Lansdowne.
4045. Does the timber in that locality give you a fair illustration of what the timber on the ridges is like? Yes; except that there is a great deal more of it on the ridges than there is about the Hanging Rock.

4046. In which direction do those timber ranges lie? About north-west from Wingham.
 4047. How far from Wingham? Within 20 miles of Wingham and less.
 4048. Therefore they are practically within 20 miles of water-carriage? Yes; and if the railway were running inland beyond Taree—from here to the Lansdowne, as it were—the distance would be very much less.

W. W.
Stewart.
6 June, 1898.

William Fotheringham, hotelkeeper, and Mayor of Wingham, sworn, and examined:—

4049. *Mr. O'Connor.*] How long have you been in this district? About fifteen years in the upper portion of the Manning district.
 4050. How long in the Manning district? About thirty-four years.
 4051. You know the proposal to construct this railway, and you also know the proposal to improve the entrance to the harbour? Yes.
 4052. You have heard gentlemen giving evidence this afternoon? Yes.
 4053. Do you approve of the evidence given by them? Some of it.
 4054. Will you kindly tell the Committee where you agree, and where you disagree? As regards the freight for maize, the proposed line would run through the biggest portion of the country from which the maize, which goes from the wharf here, comes. The maize is brought in a distance of about 14 miles, and the maize-growers have to pay 1s. a bag for its conveyance to the wharf at Wingham.
 4055. The proposed railway would go right through that country? Yes.
 4056. And that 1s. a bag would be saved? Yes. They would not send the maize by steamer if they could get it taken away from near their own door by railway, even if they had to pay a little extra for railway freight. If the railway is going to stop at Taree, I do not consider it right to spend so much money on the line, but considering that we have to pay taxes for other railways, I think it is only a fair thing that this railway should go on to the Queensland border, even supposing it did not pay to Taree at first.
 4057. Then, you look upon a railway to Taree merely as a section of an extension to be carried out later on to the Queensland border? That is all.
 4058. Supposing it were an alternative that you should have the railway or harbour works—which do you think would benefit this district most? The railway, for the people here and above Wingham.
 4059. That is from Wingham westward? Yes. People on this end of the river are handicapped, they being charged for drogherage.
 4060. Do you know the country between Taree and the Queensland border? It is a good many years since I was on the Macleay or the Clarence, and I can only say that it is good maize-producing country.
 4061. It is pastoral or agricultural country? It is all agricultural country along the North Coast right away to the Clarence, which is as far as I have been.
 4062. Is there much land unoccupied there at the present time—not utilised—I do not mean merely taken up? I could not tell you.
 4063. What is the land that has been taken up and its extent, and are there any Crown lands there? I have no idea of any Crown lands available along the coast. As regards the back freight, I do not know what the steamers charge storekeepers, but I know that they charge us extraordinary rates.
 4064. What do they charge? One shilling and sixpence for a case of whisky or case of brandy, that is 9d. a gallon, in a case, for whisky, wine, or anything of that sort.
 4065. *Temporary Chairman.*] I think that all private companies of railway carriers charge a minimum rate for packages? Yes. It is all the same if you get twenty packages, which we generally do.
 4066. *Mr. Fegan.*] Do you mean to say that you would have to pay 1s. 6d. a package if you got 100 packages? Yes. They promised to make a concession if we took a dozen, but they will not do so. I have asked them, but they will not reduce the charge.
 4067. *Mr. Black.*] Are many horses bred in the district? A few.
 4068. Have you any idea how many? No; I have not.
 4069. Where do you find a market for them? They go to Maitland and to other places.
 4070. But if in any number, I suppose Maitland is the market? Yes, or Sydney. They drive them to Sydney sometimes.
 4071. What does it cost to travel them to Maitland? I do not know.
 4072. How long does it take to get them there? I cannot tell you.
 4073. *Temporary Chairman.*] How long have you lived here? Fifteen years here; but I was ten years on the lower part of the river.
 4074. Then you know the river and the district pretty well? I do, well.
 4075. Is there any scope for a largely-increased population on the Manning beyond what is already on it? I do not suppose there is very much scope from here to the Heads.
 4076. Have you had any experience of farming? No.
 4077. From what knowledge you have, do you consider that the lands between here and the Heads are fully occupied for agricultural purposes? I do not know that there is any land available. I cannot say if there is or not.
 4078. Would the land in the hands of private people support a larger population than it supports at the present time? Certainly it would.
 4079. So the lands are not utilised to their full extent? I am sure they are not.
 4080. Therefore, if better facilities were given to the district there is a chance of the district carrying a much larger population than it carries at the present time? Yes.

W. Fother-
ingham.
6 June, 1898.

Andrew Peter Gillogly, farmer, Marlee, near Wingham, sworn, and examined:—

4081. *Mr. Fegan.*] How long have you been in the district? About twenty-five years.
 4082. Therefore, you have a thorough knowledge not only of agriculture, but also of other branches of industry? Yes.
 4083. What have you followed beside ordinary farming? Stock-grazing in a small way—cattle, horses, and pigs.
 4084. What is the area of your holding? I have an interest in about 2,000 acres.
 4085. Have you any knowledge of timber-getting or its quality? I know a good deal about timber. I think I can endorse what Mr. Stewart said. It is astonishing the rapidity with which timber develops again where it has been cut. The timber in this district is of enormous growth.

A. P.
Gillogly.
6 June, 1898.

A. P.
Gilligly.
6 June, 1898.

4086. We have evidence in reference to the timber of the district from Mr. Walters, and his evidence is to the effect that there are large belts of timber equal to those in any other portions of the Colony;—as far as the timber industry is concerned, you endorse the evidence given by Mr. Stewart? I can endorse it.

4087. In reference to your farming, to where do you send your pigs and cattle? The pigs principally to Sydney.

4088. How much do you pay? It would be very difficult to tell what we pay; but the freight is supposed to be from 1s. 6d. to 3s. 6d., according to the size of the pig; but owing to the great losses we incur very often in transit to Sydney, the freight, you may say, is 8s., and even double that per head in some cases.

4089. But is there not an agreement between you and the directors of the company as to the selling price of pigs in the market? Certainly; the freight is arranged according to the selling prices.

4090. Would you give us information as to the agreement between you and them—I suppose you have entered into an agreement with them? There is no direct agreement. We get the freight from the commission agent, and have to pay, whether it is 1s. 6d., 2s. 6d., or 3s. 6d.

4091. Will you give us, as well as you can, an idea of the custom—perhaps that is the better word? I fancy they go more by the size of a pig than by the price, when I come to think of it, for I have paid 3s. 6d. for a pig that sold for only 32s. 6d. It was the dead-pig fund that was running in my mind. I got a little mixed. I think it is the dead-pig fund that is paid for according to the selling price. It is 1s., I think, if a pig sells beyond 25s.

4092. How does the dead-pig fund come in—for instance, supposing that there are a number of pigs sent down, and some die on the voyage? I mean the seized pig fund. It is to bear the expense of the Health Act. Very often the pigs get diseased owing to the usage they get. I do not mean from direct ill-usage on the vessel, though there may be some of that; but the roughness they have to stand on the sea, in getting to Sydney, is the cause of it, and there is bad usage too.

4093. Shall I take it, then, that the average freight per pig is 2s. 6d. per head? Yes; I think that would meet it.

4094. I suppose you buy all your stores locally—you do not get them from Sydney? Part locally, and a good part from Sydney.

4095. I suppose you get them up here for 12s. 6d. a ton generally? It is mostly more than that from Sydney. In getting articles separately, I believe it is not too much to say that we have to pay at the rate of £3 or £4 or £5 a ton. We have had to pay 5s. on an article that would not, I believe, weigh much over 64 lb.

4096. Are you dairying on any part of your land? We do milk some cows, but we are not in the dairying business.

4097. You have not gone in for that yet? No.

4098. How near is the nearest butter factory from here? About 9 miles, I think. There are creameries much closer. Some of my land is in the Wallamba district, and the other about 11 miles in a north-westerly direction from Wingham.

4099. What produce do you grow? I go in for mixed farming—corn, tobacco, and a little fruit, which I would increase if we had the advantage of a railway.

4100. Supposing that this Committee were to recommend that this railway should be constructed, do you not think that there is a possibility of the steamship company reducing their freight considerably so as to retain the trade? I do not think it.

4101. Why? One reason is because we have been agitating as regards more conveniences between this and the metropolis as long as I can remember. We had a great job to get the present freights; in fact, we have never been served so well before as we are now.

4102. The freights have been much higher than they are now? Much higher.

4103. On account of no competition? No doubt that was responsible for some of it; but they have been making excuses about bad bars all along the North Coast, even much further than the Manning.

4104. It is proposed to spend £100,000 to complete the harbour works at the entrance to the Manning, to make a channel of 12 feet in depth, and also to take away the crossing where steamers ground so often; if that work were to be carried out, do you not think that that would take away their excuse, and give you greater weight with them when you ask them to reduce the freight? No doubt it would have an influence that way, if the improvements to the bar can be made perfect; but even so, I would say that it will never give the North Coast the lead that the railway would give it, for the railway would open up a lot of that country which is now pretty well in its original state, and there would be a dense population along this North Coast district.

4105. Taking from Maitland to the Manning Heads, do you think that this country is of such great importance that £100,000 should be spent upon harbour works and £1,000,000 on a railway from Maitland to Taree? I would not be inclined to spend so much on the bar—that is, if the cost would be too great for the two matters—for all along the North Coast I think it would take an enormous outlay to improve the bad bars. It is nearly the same thing on all the northern rivers. There is a river between Sydney and the Manning called the Wallamba, which has a very bad bar. There is rich land in that part of the district right up to the sea, and I have no doubt that the railway would be of great benefit even to that part, as well as to the Manning and the North Coast generally; for even if the railway did not go near enough to reach the farthest end of that locality, it would be inexpensive to construct a feeder—a small branch line—to reach the extremity.

4106. That would add additional cost of nearly £1,200,000 in order to have a feeder just to serve a small part of the district; if the harbour improvements be carried out, do you not think that the company would employ larger steamers than they do at present? I suppose that that would follow.

4107. Therefore, if the proposed railway were constructed competition would set in at once on the part of the steamers; and by employing a steamer twice the capacity of the present one, do you not think that the company would take produce much more cheaply than the railway could take it? They might take it more cheaply, but the steamer would not suit perishable products as well as the railway would. For the carriage of pigs I would rather give 3s. or 4s. to the railway than let the steamer take them for nothing; I would be in pocket.

4108. Have you come across many people like yourself? If people had to do with live stock I think a good many would be like me. I have done a good deal in the way of maize-growing, but have turned my attention principally to the raising of fat pigs.

4109. Do you find it pays you better? Yes; the difference between the railway freight and the steamer freight as regards pigs would not be very much; it would not be so much more on the railway as not to make it worth our while to patronise it.

4110. Especially as the river is at present; we are aware that you do not know when you will be able to load or unload, and you do not know when you can get a return trip; therefore, you suffer from uncertainty? Yes.

4111. But on the railway, the trains would leave according to time-table, and return at certain times; and for this reason, you say, you would prefer to pay a higher rate for the carriage of your live stock by rail than by boat? Yes.

4112. As regards maize, you would send it to the steamship company, who would carry it more cheaply, because you cannot count maize amongst perishable articles? Unless there were a great difference in freight I would much prefer the railway, for we have another great disadvantage in steam communication—we do not know that the vessel will not be detained in going to the metropolis. She may have to put in at some port if it is rough weather, and very likely we may lose a lot of the price. All along the North Coast, right to the Macleay and further, during the last few years, we have been blocked from the great market—the metropolis—for, owing to the bad bars we have not been able to reach the market before cargoes from America reached it. Grain was at a good price in Sydney, but we could not reach the market until grain had come from across the seas.

4113. Quick transit would give you the advantage of a good market? Yes.

4114. By rail you know exactly the time when your produce will arrive in the market, and knowing the market price for the produce, you can send it down accordingly, and take advantage of the market? Quite so. As regards fruit, I take a great interest. I have a very high idea of what could be done in the North Coast district in the way of fruit.

4115. How many acres have you under cultivation with fruit? I have not a great deal. We have a few young orange-trees. The want of a railway has kept the fruit industry very much back. A great many people would freely go into that industry if they had railway communication. This district is admirably suited for a variety of fruits. Oranges, all citrus fruits, apples, pears, persimmons, and Japanese date-plums, all flourish.

4116. Have you tried them? Yes; I know from experience that they will all grow first-class in this district, and there are tens of thousands of acres of unalienated land which, if we had the advantage of railway transit, I feel sure, would be opened up, but which, in the absence of a railway, will remain pretty well as it is now; in fact, I do not think there is any belt of country in the Colony that compares with the country lying between the sea and the Dividing Range along the North Coast. Taking into account our rainfall, and the variety of products that could be raised in this district, I think we can challenge competition, not only in the Colony, but also in any other part of the world; for even rainfalls, I think there is hardly a place in the world that could beat the North Coast district from about the Myall to the Richmond.

John Abbott, retired farmer, Woolla Woolla, near Wingham, sworn, and examined:—

4117. *Temporary Chairman.*] Where do you reside? Midway between Wingham and Taree.

4118. You have heard the evidence given by the various witnesses? Yes.

4119. Would you like to make a statement to the Committee either confirming or disapproving of any of the evidence you have heard? There has been nothing said of which I disapprove. I heartily concur in all that has been said, but I may add that if the railway were run to Taree the passenger traffic would considerably increase between the Manning and Sydney, because at present it is only real necessity that compels people to go from Taree to Sydney. Many men, and ladies and children especially, dread seasickness, and therefore drive overland rather than go by water. As to going to Sydney on pleasure trips, that is out of the question now, but if there were a railway here the passenger traffic would be more than quadrupled.

4120. Can you give us an approximate idea of the number of people you think would be likely to travel by the railway per annum? I think at least 1,000 per annum would travel from the Manning to Sydney, and *vice versa*.

4121. Mr. Harper allows £6,300 per annum for passengers? I do not know what the fares would be. I suppose the return fare from here to Sydney would be something like 50s. or £2.

4122. First-class would be about £2 and second-class 28s.? I also think that the produce of the district might be added to considerably by hay-growing, which is not gone into very much at present, except for local purposes, because we have not a market for it. We cannot get it to Sydney. We have only a small steamer trading between Sydney and the Manning, and it is not able to take cargo of that sort. There are thousands of acres not now cultivated that would grow lucerne and oaten hay, which is the best of hay.

4123. I suppose you could grow lucerne here? Yes; we have land fit to grow lucerne to any amount. We can grow vegetables and fruit of any description, and we only want a market for them. We have no market for perishable goods.

4124. What is embraced under the head of "perishable goods"? Fruits, and sometimes you may call pigs perishable. We are very often at considerable loss through having pigs bar-bound for several days. Perishable goods include oranges, apples, citrons, and lemons—we can grow any quantity of lemons—tomatoes, and many other fruits I cannot now enumerate. I have sent oranges to Sydney, and not received a tenth part of the price of them. People not in a position to have large farms could take up small farms, and go in for fruit and vegetable growing, amongst other things. A very small piece of land will keep a family by successfully growing fruit and vegetables.

4125. Is there much room in the district for an expansion of the population? There is a very great capacity for that.

4126. Could not the land sustain a much larger population than is now settled upon it? Yes; more than double. I have been on the river forty years. Twenty-five years ago the people thought the land was all occupied, and that there was not room for any more people; but the population has been increasing by births and migration, and the population is more than double, and there is room for as many more.

4127. As population increases, the land becomes subdivided? Yes; and more productive.

4128. And it will be still further subdivided as population further increases? Yes. There is plenty of room for subdivision, for half the land is not cultivated, but only scraped or tickled.

- J. Abbott. 4129. As regards the improvements at the Heads, £23,000 have been spent, and it is proposed now to spend £100,000 more;—do you think the country is justified in going to that expense to make a good harbour? In my humble opinion, it is not; because I do not think that they will ever make a good job of it.
- 6 June, 1898. 4130. The experts tell us that when the work is completed there will be 12 feet of water on the bar, and the same on the flats up the river? That is only imaginary. I do not think that any man could guarantee that depth of water.
4131. Assuming they are correct, do you think the money would be well spent? Yes, if they are correct; but my opinion is, they are not correct.
4132. Have you had any experience of such works? No; but I have watched the Heads for the last forty years. The bar is a shifting one.
4133. That work is designed to prevent a bar from accumulating at all—to remove it permanently? It will cost more than they anticipate to do that; and I do not think they will ever get rid of The Narrows.
4134. At all events, I suppose you think that something should be done to improve the harbour? Certainly.
4135. And if what the engineers say can be obtained, the Manning district, so far as water carriage is concerned, will be fairly well served? Yes.
4136. But your contention is that, notwithstanding the harbour, the railway should come here? That is my honest opinion.
4137. You have heard the amount of expenditure in the first instance—£1,000,000—with an annual loss of £31,000 afterwards; and, notwithstanding those facts, you believe that the district is of sufficient importance to justify the Government in spending that money? If this would be the only line in the country that did not pay, I should say that it would be wrong to construct it; but there are many other lines that do not pay, and as we contributed to the cost of building those lines, I certainly think that we should have a little share of the losses as well as other people.
4138. What you mean is, that you are entitled to share in the benefit, because you have to share in the losses? Yes.
4139. *Mr. Black.*] Would not that be a capital argument for building a railway everywhere? Some people make a capital argument of it if they want a railway at their own door.
4140. *Temporary Chairman.*] Supposing that Taree were the objective point of the railway, and that it were intended to end there for all time, and there was no talk of a North Coast line, would you, under those circumstances, feel justified in recommending this expenditure? Certainly I would not, because you only begin to get into the good country when you reach the Manning. I look upon this line as the first section of a railway going further on. The farther it goes along the coast the better it will be.
4141. Your contention is that if this line be constructed the force of public opinion will compel the Government to gradually extend it along the North Coast? I think so.
4142. And you believe it would then pay? I believe it would pay well.

TUESDAY, 7 JUNE, 1898.

[The Committee met at Harrington, at 5 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Henry Deane Walsh, district engineer, Newcastle, sworn, and examined:—

- H. D. Walsh. 4143. *Chairman.*] What is the head of deepwater on the Paterson River? Paterson township.
- 7 June, 1898. 4144. What depth of water is there there? At Paterson wharf there is 12 feet.
4145. And immediately above Paterson? Above Paterson wharf, about half a mile, there is a waterfall—rocks—which permanently obstruct navigation. There are two companies trading there—the “Balmain,” line and the Newcastle and Hunter River Company—one up and one down each day. There is also a cream boat running to Duckenfield.
4146. You do not know anything about the trade? No.
4147. What is the draught of the boats going up there? The “Marie” draws 5 ft. 6 in. or 6 feet; they could not get any larger boat than the “Marie” up to Paterson. There are sharp bends which prevent a larger boat from going up.
4148. The nearest shipping place to Dungog is Clarencetown? Yes; it is 15 miles by road from Dungog to Clarencetown. There is deep water at Clarencetown. There is a shallow just above Clarencetown at the Bridge; therefore, Clarencetown is the head of navigation on the Williams, and the water-carriage would compete with the railway at that point.
4149. What kind of boat goes to Clarencetown? Boats drawing 10 feet go up to Clarencetown. There is a boat twice or three times a week going there, and there are timber vessels—schooners and vessels of that class.
4150. The boats run every second day, barring Sunday? Yes, three times a week; and there are timber-trade schooners.
4151. The next place is Stroud? Yes; the water carriage for Stroud is by the Karuah River—up to Karuah wharf about 10 miles below Stroud. The “Williams” draws about 5 ft. 6 in. loaded.
4152. Is there any probability of boats getting past Stroud? No; there is a rocky bar about half-a-mile above Karuah wharf. There are two or three boats; the “Tahlee” goes about once or twice a week, and also the “Williams.” Krambach is about 11 miles from Bullock wharf on the Wallamba River. Bullock wharf is the head of deep water, and it is chiefly droghers that go there now.

4153.

4153. How many go up? A good deal depends on the trade. I think there is a trader twice a week. The Breckenridge punts and the Bullock wharf saw-mill punts also go up there. Bullock wharf is a Government wharf. I do not think you can go up any further. H. D. Walsh.
7 June, 1898.
4154. What are you doing at the entrance to the Wallumba, near Forster? We have a sand-pump dredge at present working at the mouth of the Wallumba River. I expect to have 6 feet or 7 feet depth of water eventually at the wharf. There is a rocky bar near Failfort, with 4 ft. 6 in. on it. That could be easily removed. I have a vote of £5,000, to improve the entrance to the river Wallumba at Cape Hawke. I expect then that a boat of 6 ft. 6 in. or 7 ft. will be able to go up, and eventually an ocean-going boat will probably be able to go up to Bullock wharf.

THURSDAY, 9 JUNE, 1898.

[The Committee met at Kew, at 10:30 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR,
JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Maitland to Taree.

Michael Fagan, landowner, Kendall, sworn, and examined:—

4155. *Chairman.*] How long have you been a resident in the district? I came here in 1873 and remained here ten years. I was away then a little while, but I have been a resident here about fourteen years altogether. M. Fagan.
9 June, 1898.
4156. Have you a good knowledge of the district? Yes. When I came here in 1873, there were at the most twenty residents on the River Camden Haven, from this end of it down to the Heads.
4157. How many are there now? I do not know exactly; but the number has materially increased.
4158. What is the occupation of the people here? Principally the timber industry and farming.
4159. What timber is there, and what do you do with it? There are five powerful saw-mills working here.
4160. Turning out how much? I suppose they would average fully 35,000 feet for each mill per week.
4161. Where does the timber go to? Sydney and Newcastle—principally to Sydney.
4162. Is there a large supply of timber yet remaining uncut? Yes; the choicest convenient timber has been taken, but a great quantity can be obtained yet by extending the tramways further back.
4163. Do you send any timber to England? They do not ship directly from here to England; there is not water enough on the bar.
4164. Is the timber eventually shipped to England? Yes; there are a great many orders received here.
4165. What form does it take? A great deal is cut for woodblocking. The kinds of timber are tallow-wood, blackbutt, red mahogany, turpentine, ironbark—in fact, almost any kind of good hardwood timber can be obtained here.
4166. Is the hickory of any value? There is no great quantity to be cut here. The timber is taken in log to the mill, and then it is cut. Thence it is shipped in coasting vessels drawing about 7 feet of water, and they take it direct to Sydney. Of the subsequent operations I have no knowledge in detail.
4167. Is any farm produce sent away from here? Yes; and there is a great deal consumed in the district.
4168. What do the farmers produce? Principally maize.
4169. And, of course, pigs and eggs, and that sort of thing? Yes.
4170. Does any quantity of maize go to Sydney? The local consumption here is very great. Seeing that there are five saw-mills at work, a great number of bullocks have to be used in drawing the timber, and these are principally fed with maize in the winter. Some of the maize is exported, and a great quantity is used by the bullock teams. Wheat, barley, and so on are shipped to Sydney.
4171. Do you advocate the construction of a North Coast railway? Yes; I am in favour of a North Coast line.
4172. Would you say what benefit it would be to you? I do not think that a railway would be a paying concern if it were taken merely from Maitland to Taree, and no further. That line must be a portion of the whole North Coast railway. I think this district would be largely benefited by a line passing the different places. There is an enormous area of land at the head of this river, called the Comboyne Scrub. I have never been right through that scrub, but I have heard it stated that it is about 15 miles square. I have had large experience in the big scrub on the Richmond River. I have seen it in its virgin state, and as it is at present, and I do not think that the land in the Comboyne Scrub is inferior to it; in fact, I think it is superior to it, in this respect—it has a more temperate climate, owing to being further south than the Richmond River, and also at a very great altitude. I believe that that scrub will be the future home of dairy-farming in this district.
4173. How far from here? Fifteen miles from Kendall, and Kendall is about 1 mile from here.
4174. There is 7 feet of water at Kendall wharf? Yes. If there should be dairy-farming at the Comboyne Scrub, the production of butter there will be a great industry, and butter is a product that requires a ready means of getting it away to market, and the butter-makers would, of course, prefer railway to sea carriage.
4175. Is the Comboyne Scrub alienated? I think that one portion at one side was taken up years ago, and that it has been sown with prairie and other grass seed, but I do not think there is any inhabitant there at the present time. If the Comboyne Scrub were thrown open in suitable blocks of 100 acres each, I think it would be quickly taken up.
4176. *Mr. Wright.*] Is it open now to conditional purchase? I am not quite sure that it is. There are some surveyed blocks of 300 acres and 400 acres, which were surveyed many years ago, and those were open to homestead selection some years ago; but I do not know whether they were or were not taken up. I think that the chief objection to taking them up would be on account of the largeness of the areas.
- 4177.

- M. Fagan. 4177. *Chairman.*] Is there a road up to it? Yes, *via* Kendall.
 9 June, 1898. 4178. A fairly good road? Yes; and it is very favourably situated. There is a gentle slope the last 5 miles, until you get into the Comboyne Scrub. I believe that that place will yet be valuable as a health resort on account of its high elevation.

John Moore, farmer and grazier, Kendall, sworn, and examined:—

- J. Moore. 4179. *Mr. Wright.*] Have you lived long in the district? About twenty-six years.
 9 June, 1898. 4180. Do you know it pretty well? Yes.
 4181. Have you heard Mr. Fagan's evidence? Yes.
 4182. Do you concur with what he said? Yes.
 4183. What benefit do you think a railway through this district would give to the people of the district? I consider that the benefit would be quicker transit to Sydney.
 4184. Do you think that the produce of the district would be carried by the railway if one were constructed? The biggest portion of it would be.
 4185. What portion of it would go by rail? All the perishable goods would go by rail quicker than by water, such as fruits and vegetables.
 4186. That would be a very small amount of freight for a railway; timber would not be carried by rail, I suppose? I think not.
 4187. Nor maize? Yes; I think maize would. Light timbers might also go by rail, such as cedar or beech.
 4188. Is there much cedar left in the district? Not a great deal, but there is a good deal of beech.
 4189. Do you think the maize would go by rail? Yes; I think so.
 4190. Do you think the advent of the railway would open up the country very much? Yes. With a railway the people would have a "show" of getting their grain away; now they cannot do so. They have to impose on some of the vessels taking timber away, and the millowners do not like their vessels to carry corn when they have timber to carry.
 4191. Are the vessels that come here owned by the timber merchants? They are chartered by them, and carry timber only as a rule.
 4192. It is a matter of favour for them to take any produce away? Yes.
 4193. Where is the good country in this district? Two or 3 miles back from the line.
 4194. What do you class the country we come along as? About the poorest.
 4195. On the creek frontages and flats, I suppose there is good land? Yes, and then it goes back into scrubby ridges.
 4196. Any good? The ridges are good for grazing if cleared. Along the line you travel about 12 miles through very good country, but by going 3 miles back you can travel through 30 miles of very good country—through the scrub from Lansdowne to The Hastings. That is all creeks and ridges.
 4197. Only suitable for grazing, is it? Little patches are suitable for agriculture.
 4198. But the bulk is suitable for grazing only? Yes.
 4199. Do you think that if the whole country were taken up for grazing purposes it would support a railway? It would go a great deal towards it.
 4200. The estimated cost of the railway to Taree alone is £1,000,000, and allowing the utmost margin for traffic, and increasing the present traffic of the district by 50 per cent., the Traffic Manager says that the loss would be £31,000 per annum, and he sees no possibility of that loss being decreased, at any rate for a very long time? I cannot say anything in regard to that, but I remember the time when the railway started from Newcastle to Maitland, and I have seen a train go up and come back empty.
 4201. But you have the Hunter River there? Surely The Hastings and the Manning ought to be able to compete with the Hunter.
 4202. Notwithstanding the very large cost and the large annual loss, you think the country would be justified in constructing the railway? Yes; I think so.
 4203. And also in constructing extensive harbour works at Port Macquarie and the Manning? I think that the harbour works, if they would stand, would be very good; but if they should not stand, where would we be then?
 4204. Supposing that the people of the district had their choice of a railway from Maitland to Taree, or improved navigation by means of these harbours, which would they prefer? Most of them would prefer the cheaper route.
 4205. The water route? Yes.
 4206. Do you know that to get store goods by rail would cost between £6 and £7 per ton, and sugar about £3 10s. a ton? The water carriage beats that a long way.
 4207. *Mr. O'Connor.*] That is to say, the water carriage is less? Yes, it would be cheaper than that.

William McGrath, Port Macquarie, sworn, and examined:—

- W. McGrath. 4208. *Mr. O'Connor.*] How long have you been in the district? On and off about seventeen years.
 9 June, 1898. 4209. You have heard the evidence of the two previous witnesses? Yes. I agree with something of what Mr. Fagan and Mr. Moore said, but not with all they said, for my firm opinion is that a North Coast railway will not pay for the next hundred years, especially where it is surveyed at the present time.
 4210. Will you tell us the reason why? I know the North Coast from Gloucester to the Nambucca; and where the railway is surveyed at present, I think that the only place where it crosses good land is about Wingham, on the Manning River. It goes through the Lansdowne and on to here, and runs through the poorest part of the North Coast, and I do not think that you would open up any fresh country by having the railway there. I do not see how any benefit from the railway would come to the people living here, for they would not support it, on account of water carriage being so cheap. Water carriage is now cheap, and it would be still cheaper if there were a railway here, for it would pay the steamship companies to carry freights from these rivers at about half for what they are carrying it now. I have had a good deal of experience in steamers. I have worked for the North Coast Company and for John See & Co., and I know what they charged for freight in olden times and considered it did not pay them, and yet now they are carrying at half the cost. I think the freight on timber from here would average about 2s. 9d. per 100 feet.

4211. Does that mean from Camden Haven? That is the freight from the whole river. There are some mills they charge 2s. 9d. and 3s., and then there are mills at Laurieton where they charge 2s. 6d., for they save towage. Kew and Kendall are as far as the vessels go. The freight on maize, I think, is 12s. 6d. a ton by steamer from Port Macquarie to Sydney, and I think it is cheaper from the Manning. I think it is 1s. a bag from the Manning, and a little more from Port Macquarie.
4212. Have you any idea what the distance is from Wingham to the Nambucca? I think about 160 miles.
4213. Are you acquainted with that country? I am, within a radius of 10 or 15 miles on each side of the line.
4214. And you maintain that the land is of such an impoverished character that it has no indications of being an agricultural country? Yes, where the line is at present surveyed.
4215. That opinion is based on your personal knowledge? Yes. You will strike good country on the Macleay, where the railway is to go. You must strike good country in crossing the Manning or the Macleay, because the whole of the river flats are good.
4216. Do you know the country north of the Macleay? I am not very well acquainted with it, but I have been through to the Bellinger.
4217. What distance would that be from the Nambucca? I think about 70 miles from Kempsey, north.
4218. And the land is very poor? The land you will travel through, and where the railway is going through is about the same as from the Manning River to here—similar all the way from here to Grafton.
4219. Well, as a matter of fact, you mean that it is not an agricultural country? Not where you are travelling it is not.
4220. I mean the proposed line of railway? It is not.
4221. It is principally forest? It is principally a barren poor country, no good to anyone.
4222. Is it good for timber? Yes; it would cost perhaps £20 an acre to clear and stump it, and when you had it cleared it would not be worth £1 an acre for agriculture. My experience of the North Coast district is that the only place where there is good land is on the banks of the rivers, and that between all the rivers it is no good at all.
4223. And on the rivers the people have the facilities of water carriage, and if a railway were constructed to-morrow they would not use it? They would not support the railway.
4224. And the only thing the Government could look to for a return on their large outlay, which would be £1,000,000 alone to Taree, and would be multiplied proportionately according to extra distance, would be people going to Sydney now and again on pleasure or business? Yes.
4225. I suppose the population is limited? It has increased wonderfully since I came to Camden Haven. There was not one-fourth of the present population when I came to this district. I think that a train once a year would accommodate the people so far as passenger traffic is concerned.

W. McGrath.
9 June, 1898

Henry James Perrett, saw-miller, Kendall, sworn, and examined:—

4226. *Mr. Hassall.*] With regard to the evidence previously given, do you agree or disagree with it? I disagree with some of it, and I agree with other portions.
4227. What do you agree with? I agree with what Mr. Fagan and Mr. Moore said.
4228. The desirability of constructing a railway through this country? Yes.
4229. You do not agree with the evidence of the last witness, who says that he does not think it would be justifiable? No, I do not.
4230. In dealing with your own business, can you give the Committee some good reasons why you think a railway should be constructed here? Because it would open up a lot of country and locate a lot of families here.
4231. What country would it open up? It would open up thousands of acres this side of the Comboyne, from Kendall up.
4232. What description of country? Good country for grazing, and some for agriculture.
4233. What is the character of the country? Scrubby ridges.
4234. That would necessitate a considerable amount of expenditure in clearing to make them capable of being profitably occupied? Not a great deal. I have cleared a lot of it, and know what it costs.
4235. What does it cost? About £2 10s. an acre to bring it into grass.
4236. That means practically ringbarking the trees and scrubbing the undergrowth so as to give the grass a chance, and make it profitable for grazing? Yes; you can make it fit for the use of cattle for £2 10s. an acre.
4237. You say there is a very large area of that country? Yes.
4238. Extending how far? I suppose it extends 20 or 30 miles.
4239. Twenty or 30 miles square, or in length? In length.
4240. By what width? Six or 7 miles.
4241. That includes the Comboyne country? Yes.
4242. Are there any farmers settled about this country? Towards the Comboyne here are, but not on the Comboyne; there are, 9 or 10 miles up—within 5 or 6 miles of the Comboyne.
4243. On what watercourses? On the Camden Haven River.
4244. Are there many settlers? A good few.
4245. What do they produce? Corn, pigs—general farm produce.
4246. Can you say whether most of that produce is consumed locally? A great deal of it is. It depends on the season.
4247. If there are a number of farmers here, and they produce a great deal, how is it that there is no boat trading here to take the produce away? Because a great deal of it is consumed here, and sometimes we ship it in our vessels for them.
4248. I allude to the evidence of the previous witnesses, who said that they were dependant on the timber vessels to take the produce away? That is correct; there is not enough to keep a boat constantly going.
4249. Do you think there is enough to keep a train going? By opening up the country, I do.
4250. With regard to the despatch of your own timber to Sydney—how do you get it away? By sailing vessels.
4251. From your own wharf to Sydney? Yes.

H. J. Perrett.
9 June, 1898.

- H. J. Perrett. 4252. Do you charter those vessels? Yes; we charter at so much per 100 feet.
4253. What is the rate of freight? Two shillings and ninepence per 100 feet, at present,
- 9 June, 1898. 4254. How much would that be in tons? There are 3 tons in 1,000 feet of timber.
4255. That would be 27s. 6d. for 3 tons? Yes; that is, on timber to Sydney.
4256. Seeing that you can convey your timber at about 9s. per ton from here to Sydney, and the approximate rate by railway would be something like 27s. a ton, which mode of conveyance would you patronise? I would certainly patronise the cheaper route; but it would depend where the timber was going to. If it were going to Maitland we would probably send some by railway, because that would save double freight.
4257. I do not think you could compete with timber grown nearer to Maitland or Newcastle? I am cutting some now for the Gunnedah bridge, over the Namoi.
4258. You will always adopt the cheapest mode of conveyance you can for your timber? Most certainly.
4259. Because timber is not a product that will bear an expensive rate of carriage? No; it is not.
4260. You are bound, as a business man, to adopt the cheapest? Only in certain cases would the timber go by rail.
4261. With regard to the other timber businesses in the district, I presume that they carry on operations in much the same way as yourself? Exactly.
4262. So practically in giving evidence for yourself you are also doing so for everyone in a similar line of business? Exactly.
4263. And I presume they would do as you would, that is, take the cheapest mode of carriage to the market they would wish to reach? Yes; as business men they undoubtedly would.
4264. In sending timber you would undoubtedly send it by water? Yes, if it were the cheaper; but if the railway were the cheaper we would send it by the railway.
4265. You would patronise whichever was the cheaper? Exactly.
4266. How far back have you to go for good timber now? About 4 or 5 miles, and even further.
4267. What is the farthest distance you have penetrated into the scrub? I think 7 or 8 miles.
4268. You draw timber for a distance of 7 or 8 miles? Yes.
4269. What is the supply like? Practically inexhaustible—that is west from here.
4270. Does that timber run through the belt of country you described, at the Comboyne? It runs towards it. There is no hardwood on the Comboyne.
4271. It is on a belt of country lying between here and the Comboyne? Yes.
4272. How many miles in width? Thirty or 40 miles.
4273. The length you cannot estimate? No; I cannot.
4274. It practically follows the coastal range? Yes.
4275. You look upon the timber industry as the principal industry of this district? At present, but not in the future.
4276. What do you look for in the future? Dairying, and the agricultural business.
4277. In the event of the country being opened up for dairying I presume that creameries and butter factories will be established here, as they have been in the South Coast district? Undoubtedly.
4278. Then butter would be the principal product sent away from the dairy farms? Yes, and pigs and calves—the outcome of good dairy farming.
4279. In view of the fact that butter is a product that can be conveyed by steamer or other boat almost equally as well as by railway, do you not think that the butter-makers would adopt that as being the cheaper method of transit? I question that, because the sooner you get that kind of article to market the better.
4280. In opening up this country, is it not probable that butter factories would be established on the navigable water? Very probably.
4281. What are the facilities for shipping from here? Only by sailing vessel, which is very erratic. They have an auxiliary boat—a small steamer called the “Billie Barlow,” but her movements are most erratic.
4282. With what draught can a vessel come in and out here over the bar? About 7 ft. 6 in.
4283. Do you think that if the entrance to the Camden Haven were improved a larger and better class of vessels might easily come in? Of course I do, if you improve it. The entrance is being improved at the present time.
4284. Do you think that the improvement of the entrance will have a beneficial effect on the trade of the district? That remains to be seen.
4285. A problem—like the railway? Yes.
4286. Do you think that by improving the entrance, so that a better class of vessels could come in, an increased trade might result? Undoubtedly, trade is increasing every day.
4287. A better class of timber vessel could come in? You might get a larger vessel, but I think the draught would be about the same. Home vessels never come here.
4288. Therefore, you practically look to Sydney or Newcastle as the place to which you can send your timber either for consumption in that market or for transhipment to other places by larger vessels? Yes. At the present time we are cutting timber for export, but have to tranship it, and if we had vessels trading directly here for it it could be sold more reasonably, and we could get a better profit, but we are not likely to have that.
4289. What is the return freight—freight per ton from Sydney to here? About 15s.
4290. And the rate of produce, I presume about the same from here to Sydney? Yes.
4291. And the passenger rates? We go to the Manning or Port Macquarie, so whatever the passenger rates from either of those places are they are our rates.
4292. *Mr. Wright.*] The rate for second-class goods on the railway, which would embrace a great many of the heavy goods you use, would be £4 10s. per ton, and second-class goods £5 a ton; do you think there is any possibility of that competing against your water-carriage? Not at all.
4293. That rate is based on the main line rates, and very likely the Railway Commissioners would expect a local rate, a higher rate; therefore, there is no chance of those goods being sent by this railway? Of course, we would patronise the cheaper route.
4294. The minimum rate for parcels would be 3s. 9d. for this district? Yes.
4295. There would be no chance of a railway competing with vessels in regard to them? No.

David Laughlin, farmer, Camden Haven, sworn, and examined :—

D. Laughlin,

9 June, 1898.

4296. *Mr. Fegan.*] How far from here do you live? About 1 mile.
4297. And how far from the river? On the bank of the river.
4298. Do you know the route for the proposed railway from Maitland to Taree, and would that serve you, as a farmer, in any way? I should like to speak locally. I have been a resident here for over twenty years. I concur in some of the evidence that has been given; but there is one point which seems to me to have been lost sight of.
4299. Do you agree with Mr. McGrath? No.
4300. In whose evidence do you concur? The evidence as regards freights and other things; but I think the country has been described by Mr. McGrath in a wrong way. I know the district around here pretty well, and I believe that the railway would do a great deal of good. One of the great disadvantages of the people on this river has been from saw-millers controlling the whole of the river. The people have been compelled to settle on the banks; and the reason why there is not much farming done on the river is because of the disadvantages in getting produce away from the river.
4301. Have steamers refused to take your produce to market? It is only lately we have had a steamer.
4302. Well, have vessels refused to take your produce to market? Yes.
4303. Since the introduction of the steam service so far have the steamers refused to take your produce to market? The people have had no encouragement to grow anything, and that steamer itself is now under charter by the saw-millers to take timber.
4304. Have they refused to take your produce to market? Not yet.
4305. So the time of refusal is yet to come? Yes. Over the ridges there are many patches of land which is really good, which would draw the people from the river banks; and I believe that comfortable homes could be made up on the banks of the Camden Haven by means of this railway. I am not speaking of the Comboyne at all, but between here and the Manning. The production of the district would be much increased by the railway.
4306. Did you ever know a steamship company refuse to supply people with means of communication if they saw a good prospect of a fair trade? I have been shown a letter, in which Mr. John See offered to send a boat here if the saw-millers would support him partly, and if the farmers would also. I have reason to believe that that letter was never shown to the farmers, and the boat was never sent.
4307. Therefore, if the farmers were to agree to assist that boat it would be of no use talking about a railway service here, would it? Only for the patches I have spoken of, which would be off the rivers.
4308. But supposing the farmers were to agree to support the boat promised by Mr. John See on the condition that some of the saw-mill proprietors would accept their share of responsibility in the way of support, do you not think that that would give sufficient means of transit to the people of this district? I believe it would still leave them in about the same position as they are in at the present time.
4309. If they were to give a promise to Mr. See that they would send their produce to market by his boats, how could they give any trade to the railway then? The railway would be an independent thing, apart from private companies.
4310. Mr. See will not send the steamer up here unless he gets a guarantee from the farmers, along with some of the saw-mill proprietors, but as soon as he gets that guarantee he will send his vessel. If a railway were constructed would it be honorable for those men to break that guarantee, after giving it to Mr. See to use his vessel? But I think that when you are constructing a railway you do not consider such things. A number of small settlements might be opened up which would not be bound up with the agreement at all. For instance, people on the Comboyne, and those with dairy factories, who would be foolish to bind themselves at all.
4311. While you agree chiefly with the evidence given by the other witnesses, but disagree very materially with the evidence given by Mr. McGrath, do you think that the chief reason why the railway should be constructed here is that you believe it would open up a large tract of country? Yes; and give homes to the people.
4312. What do you grow as a farmer? Maize is the chief thing.
4313. Where do you send your maize to? We sell it to the bullock-drivers, they being our best customers on account of the disadvantages in getting it away.
4314. Have you sent any to Sydney? I have never sent any.
4315. How long have you been growing it? Only for about a year or so, but my father before that grew it, and used to send some of it to Sydney.
4316. You find that in selling it to the bullock-drivers, you get a better price than you would get in sending it to market? Yes.
4317. And there is less trouble and less anxiety? Yes.
4318. What is the difference between the price you would get at Sydney and the price you get from the teamsters? I can scarcely say. I think it takes nearly half of it to pay the expenses to Sydney, and it would largely depend on the market price. If 2s. 6d. were the price of corn in Sydney you might get 1s. 6d.
4319. Do you get 1s. 6d. from the teamsters? We get 2s. 6d. a bag for the cob corn.
4320. Does 2s. 6d. pay you to grow it? Yes.
4321. So you do not want any kind of communication? We want to extend a little faster than we are doing. It is a long time since we were extending.
4322. How many acres have you? 161 acres.
4323. How many under crop at present? I have none under crop just now, but part of it I am grazing.
4324. What do you graze? Cattle.
4325. How many acres per head? Twenty-three head on about 140 acres.
4326. About 5 or 6 acres to a beast? Yes. I hope that you will take into consideration that there is a quantity of land between here and the Manning that might be opened up for homes.

Alfred Brooks, resident engineer, Camden Haven, sworn, and examined :—

4327. *Chairman.*] You are at present in charge of the works being carried out at Port Macquarie? Yes, and also at Camden Haven. A. Brooks.

4328. *Mr. Black.*] Have you a statement to make? The natural entrance to Camden Haven is very circuitous. It passes with a southerly turn round an island and immediately in an undesirable direction to

to

9 June, 1898.

A. Brooks. to sea. We are putting a cut through a neck of land which will give it a direct exit, and I think it is probable that we will have 12 feet or 14 feet of water, whereas at present we have not much. Six feet is a fair average, and at times it is as low as 4 feet, and the crossing inside also furnishes some obstruction. It is about 18 inches shallower than the bar. The scheme I am at present carrying out is a southern guide-wall. I have already explained about the cut through the headland. To the north of that again, a distance of some 400 feet or more, is the northern wall. No breakwaters are necessary, because the long headland shown on the south of the map furnishes us with reasonable protection. The estimated cost of the works is £5,000.

9 June, 1898.

4329. I suppose you have some protection on the north from the granite head? It is a slight protection.

4330. There is no well-defined headland on the north? No, just a sandspit. The north wall will run to the eastward of the sandspit.

4331. Do you think that will be sufficient to prevent the silting up of the entrance? I do not see how there could be any silting up then. It will be a straight scour, and the waters will be so much confined. I believe that there will be no serious danger from the shoaling of the bay—that the littoral current will in all probability be sufficient to remove any stuff that comes down.

4332. I suppose that is an easy harbour to make in south-easterly weather? Yes. In the "Maitland" gale a vessel could have remained at anchor safely at sea under the headland.

4333. How about a northerly? We have very heavy gales from the north, but the southerly gales generally veer round to the eastward, and vessels would be unprotected.

4334. In case of northerly or easterly weather would not the northern breakwater be a protection to vessels making the harbour? There are no heavy gales from the north. More than three-fourths of the gales are from the south-east. It would cost a large amount of money to make a wall to give protection from northerly weather.

4335. Above your proposed training-banks is the river fairly open? No. There has been a lot of dredging done on the river. Queen's Lake is practically open to navigation only by droghers drawing 2 ft. 6 in. of water.

4336. It is salt water? Yes; but the rise and the fall of the tide is not more than 15 to 18 inches at Taylor's Lake, at high spring tides.

4337. How is the land about the shores there? It is very poor soil, but good timber land.

4338. Sandy rocky country? To the north of it is barren heavy country, and to the south it is good hardwood ridges, but, in my opinion, not suitable for cultivation. It would not feed a bandicoot.

4339. Do you think that if a railway were constructed there would be any amount of settlement there? Of course, railways always lead to settlement.

4340. Not always? Well, generally. I am not competent to speak on that question. I have been there only eight months.

4341. *Mr. O'Connor.*] What is the width of the entrance? 400 feet between the proposed walls.

4342. *Mr. Black.*] From the western side of the training-wall to where the river opens out into the lake, what depth of water is there? I think I am justified in saying there would be 9 feet.

4343. And across the lake what depth? Four feet 6 inches at high water. The channel has all been dredged. There is a depth of 9 feet from the end of the training-wall to the other side of the lake at the Devil's Elbow. From the remainder of Watson Taylor's lake to the wharf at the John's River the average depth is 4 feet 6 inches. From the Devil's Elbow, going up to Kendall, at spring tides there is 7 feet.

4344. What streams run into Watson Taylor's lake? The John's River is the principal river—in fact, the only one of any importance—and the Camden Haven River also runs into it. The latter stream is navigable up to Kendall for vessels drawing 6 feet of water.

4345. How far is the John's River navigable? About 2½ miles.

4346. What about Queen's Lake? It was fordable some years ago, but there is a channel that runs into it. Several creeks, including Heron's Creek, Bob's Creek, and Limeburner's Creek run into it.

4347. There is no traffic through it? Only the saw-mill droghers.

4348. Flat-bottomed, I suppose? It is only navigable by flat-bottomed timber scows.

4349. Then you do not think that either with a railway or without a railway there is any great future for the country in the vicinity of those lakes, do you? Not agricultural.

4350. What do you think will happen when the timber is cut out? The land will all be fit for grazing then.

4351. But a grazing country does not carry so large a population as a timber-cutting country, does it? No.

4352. Then the effect of the destruction of the forest, which means the handing over of the land to pastoral purposes, will be a reduction of the population? Yes.

4353. In that case, in the absence of agricultural land, it is hardly likely that the construction of the railway will lead to much closer settlement? No; I think not.

4354. Do you know of any good agricultural land in any quantity in the vicinity of those streams of which you have been speaking? Not of my own knowledge.

4355. If this proposed improvement to the Camden Haven inlet be carried out, is it your opinion that, with a safer entrance and a deeper stream, the facilities of the district for getting produce to market will be equal to its requirements? I should think so.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Maitland to Taree.

APPENDIX.

SWORN STATEMENT BY THOMAS DYKES, COOPERNOOK.

Re North Coast Railway.

I HAVE been a resident of the Manning about thirty years, and during that time have been engaged as a farmer, grazier, storekeeper, auctioneer, and valuator, and am the owner of 231 acres of land in this district. I would be in favour of the North Coast Railway if it went right through the North Coast districts, and formed a line to the Queensland border. But I do not think that a railway from Maitland to Taree only would pay, because, by stopping there it would not tap sufficient agricultural land south of Taree to make it pay; and also in consequence of the cheaper water-carriage here, especially as all the townships of the Manning, and most of the settlers, too, are either on or close to the banks of the river, and the steamers take the produce from, and leave the back freights at or near their doors, and the rates of freight per rail would in most instances be higher than by steamship, and the carriage from the several railway terminuses would be a considerable item of further expense. Nor can I agree that all the Upper Manning farmers would be such a great help to the railway, as the dairying industry is now taking the place of maize-growing. And when we consider the prices of maize and butter ruling to-day, viz., the former at 2s. 3d. per bushel, and the latter at 1s. 2d. per lb., I find that it will take (after the usual expenses are paid upon both articles) 34 tons or 1,370 bushels of maize to realize the same amount of money as 1 ton of butter. I have, therefore, every reason to believe that before very long most of those farmers will give up a large percentage of their maize-growing, and go strongly into dairying, get separators of their own (if there is not a separating station handy), and send their cream to a central factory on the banks of this river. And with a safe entrance to the river and cool chambers on the steamers, I believe the bulk of the butter would go to Sydney by water. There would, therefore, be very little more than the passenger, live stock, and fruit trade for the railway, as far as this district is concerned. But if the railway were extended right through all the North Coast districts it would pay very much better, because there would be a lot of intermediate traffic beside the traffic to the metropolis, and also because it would tap very much better land north of Taree than south of it, and the more thickly-populated and richer-producing centres up north would help to pay for the thinly-populated and smaller-producing centres down south. And to open up this North Coast Railway would be the means of settling a large number of people upon a vast area of land that could be converted into wheat-growing, dairying, and fruit-growing, upon a remunerative scale, which is now lying idle on account of the long distance of haulage to a shipping port. We have in the Coopernook forest alone (which at the furthest point is within 3 miles of the surveyed railway line) some thousands of acres of Crown lands, which, it has been proved, cannot be beaten in the Colony as orchard and vineyard land, and upon which some very fine patches of wheat, tobacco, &c., have been grown. And the most of the forest lands north of the Manning are similar in quality to the Coopernook forest, upon which a lot of money could be made upon fruit alone if the railway were constructed, so that the settlers thereon could be sure of getting their produce to market in a marketable condition. I admit and recognize the fact that it would take from seven to ten years (according to the different kinds of fruit) for the land to be cleared and the trees in full bearing. But the settlers in the meantime could be growing tobacco, wheat, oats, potatoes, and all kinds of vegetables, and raising pigs, poultry, &c., for market, while their trees were maturing.

Hitherto, it has been the practice of the Government to wait till the people went out and opened up the country, and underwent the privations of getting their produce to a market as best they could for a number of years, before they would assist those settlers with roads or bridges, which has greatly retarded the agricultural progress of the Colony. And although the North Coast Railway would not be a paying concern for the first few years, yet I consider it a national work which the country is entitled to for very many reasons. And I feel confident that it would, if constructed as above stated, open up a vast area of new country, and be the means of settling a large population upon the land which is now lying idle, and, I believe, would eventually pay a satisfactory return.

(Signed) THOS. DYKES.

Coopernook, 9/6/98.

Sworn before me, at Coopernook, 15th June, 1898,—
F. A. WRIGHT, J.P.

1898.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

DEPARTMENT OF LANDS.

(EIGHTEENTH ANNUAL REPORT.)

Printed under No. 1 Report from Printing Committee, 30 June, 1898.

To the Honorable J. H. Carruthers, Esq., M.P., Secretary for Lands.

Sir,

Department of Lands, Sydney, 2nd May, 1898.

I have the honor to submit for your information the eighteenth Annual Report of the business of the Department, being that for the year 1897.

Land continues to be largely sought after under the new tenures created by the Act of 1895, 71 per cent. of the total area made available for homestead selection and 57 per cent. of that made available for settlement lease since 1895 having already been taken up. These percentages would, however, be much higher if certain districts were eliminated in which there was no expectation of any immediate demand for land from the outset. Up to the end of 1897, 1,919 homestead selections and 529 settlement leases were secured by applicants, the former representing an area of 692,255 acres, and the latter an area of 1,469,311 acres. The activity displayed in these directions is noticeable in comparison with the few conditional purchases which, during recent years, have been applied for (the year 1897 showing the smallest record next to the year 1896 since the Crown Lands Act of 1884 came into operation), although, in considering this fact, the effect of setting apart land for a particular class of holding must not, of course, be lost sight of. As an instance, however, of the keen demand for land under homestead selection and settlement lease it may be mentioned that on the 5th August last, after land had, in consequence of the drought, been held back for two months, 2,137 applicants presented themselves for 179 blocks, while at Corowa alone there were no fewer than 1,366 applicants for 8 blocks which had been thrown open in that particular district.

During the year the following important measures were added to the Statute Book:—

- The Church and School Lands Act, 1897.
- The Public Roads Act of 1897.
- The Public Trusts Act, 1897.
- The Real Property (Crown Lands) Act, 1897.

The Church and School Lands Act had to take into account that, under the previously existing Acts, a number of leases had been granted for agricultural, pastoral, and mining purposes respectively, limited to a certain number of years, without any provision for disposal of the land upon their expiration; and that the occupants of the land had been anxiously awaiting legislation of a remedial character such as the present Act now affords. The new Act repealed the former Acts, and provided that, in future, the land should come within the category of Crown lands;

that the revenues derivable from it should be paid into the Consolidated Revenue Fund, instead of being devoted to Public School purposes; and that the Public Instruction Endowment Account should be closed, but all moneys to the credit of it, after meeting any claims upon the account, should be applied towards the erection and maintenance of Public School buildings. Holders of existing leases are afforded the opportunity of converting them into such holdings under the Crown Lands Acts as homestead selections, settlement leases, special leases, and improvement leases. Where the areas are small, and comprise town or suburban lots, the leases may be converted into special purchases under the provisions of section 66 of the Crown Lands Act of 1884. The privilege of conversion is, however, left to the option of the lessees, who, notwithstanding that they may not avail themselves of it, are entitled to apply for a reappraisalment of their rents, and are given tenant-right in improvements when their leases expire by effluxion of time. Mining leases may be brought under the provisions of the Mining Acts relating to ordinary Crown lands.

The Public Roads Act of 1897 almost entirely supersedes the Public Roads Act 4 William IV No. XI, which became law so far back as the year 1833, and has remained in existence ever since. The new Act is not only of a very comprehensive character, containing as it does no fewer than twenty-nine clauses, but is framed on more modern lines, and with the appreciation of the legislation that has taken place during the long interval referred to. Apart from this, the Act is more liberal and elastic in its general provisions, and differs from previous legislation in containing a clear recognition of the right to compensation where roads are taken through freehold and other lands.

The Public Trusts Act has introduced some very necessary provisions and amendments, the absence of which had occasioned a good deal of inconvenience, such as the power to appoint trustees for lands temporarily reserved from sale, to appoint Municipal Councils and corporate bodies as trustees, and to in part revoke a dedication without, as heretofore, the necessity of revoking the dedication altogether. The Act also invests the Minister with the very desirable power of directing an inspection of dedicated lands and an audit of the trustees' books, and of requiring trustees to furnish accounts showing how moneys granted by the Crown have been expended.

The Real Property (Crown Lands) Act of 1897 gives an executor, trustee, or administrator power to exchange private lands for Crown lands, subject, in the case of an administrator, to the consent of all persons beneficially interested, or to the order of the Court. This provision was requisite, as the representatives of deceased persons found themselves unnecessarily limited so far as regards certain powers, the exercise of which they might consider to be of large advantage to the beneficiaries. The Act also allows the Registrar-General to exercise the same powers for the purpose of correcting errors in Crown grants registered under the Real Property Act as he possesses under that Act with respect to certificates of title.

Work in connection with the Land Tax.—The fact that each of the District Surveyors was appointed a District Commissioner under the Land and Income Tax Assessment Act necessarily threw a large amount of extra responsibility on this Department, and in order to keep pace with the demand for land for settlement purposes it was found necessary last year to strengthen some of the District Offices. The appointment was, however, a very desirable and convenient one both to the Crown and to the parties interested, and it is satisfactory to feel that the dual and onerous responsibilities which it occasioned have been adequately discharged.

Transfer of Forest Branch.—The administration of that part of the Crown Lands Acts and Regulations which deals with State forests, timber reserves, the conservation of timber, and issue of timber and other licenses was, together with the administration of the Prickly Pear Act, transferred on the 1st October last from the Department of Mines and Agriculture to this Department. This change, which was not made until after an inquiry by the Public Service Board, will no doubt prove an advantageous one, inasmuch as the work is more closely related to this than to any other Department, and the matters dealt with affect questions relating to Crown lands.

Norfolk Island.—Since the 23rd March, 1897, all Ministerial functions in connection with the affairs of Norfolk Island have been performed by the Secretary for Lands, to whom they were duly committed by His Excellency the Governor, with the advice of the Executive Council.

Judicial

Judicial Decisions.

A brief epitome of cases decided by the Supreme Court which affect the administration of the Crown Lands Acts is given hereunder:—

Attorney-General v. Perpetual Trustee Company.—This was an action in the nature of a writ of intrusion, brought by the Attorney-General against the Perpetual Trustee Company, to recover possession of the 100-foot reservation above high water mark along the water frontage of a parcel of land containing 70 acres, situated at Stockton, near Newcastle. This land, which was granted in the year 1835, formed part of the Quigley Estate, for which the defendant company was trustee. It was alleged, on behalf of the Crown, that the defendant company, as trustees, had trespassed upon the 100-foot reservation, and illegally entered into possession of the water frontage. Defendants denied the trespass, and contended that the original high water mark had so altered and shifted since the date of the grant that it was impossible to locate it, or to determine whether any encroachment had been made upon the reservation. The question involved was merely one of fact, which the jury decided in favour of the Crown.—*S. M. Herald*, 18th September, 1897.

J. A. Gardiner v. the Minister for Lands.—This was a special case stated by the Land Appeal Court for decision. On the 4th April, 1889, J. A. Gardiner made application for a conditional purchase of 640 acres, which was confirmed by the Land Board on the 26th May, 1892. On the 16th April, 1896, the Land Board held an inquiry, and found, on the evidence of the selector (the only evidence which was before it), that all conditions, except that of payment of balance of instalments, had been duly complied with in respect of the said conditional purchase, and directed a certificate to that effect to be issued. On the 14th May, 1896, the Minister, in accordance with what were thought to be the provisions of section 59 of the Crown Lands Act of 1895, referred the matter to the Land Appeal Court, for the following reasons:—

That the Land Board had failed or neglected to discharge its duty, according to law, by deciding, on the selector's evidence alone, that the conditions of residence had been fulfilled, when it was apparent that the land was frequently under water, and it having transpired that the selector's wife and family resided elsewhere—the whole facts pointing to a mere perfunctory compliance with the residence condition. The Land Appeal Court decided to remit the case to the Land Board for further evidence, intimating, however, that it was not to be implied that the Court, on the evidence before it, considered that the Land Board had failed or neglected to duly discharge its duty according to law.

Subsequently the Land Appeal Court was required to state a case for the decision of the Supreme Court, the principal questions for decision being:

- 1st. Whether, under the circumstances above set forth, the Land Appeal Court had any jurisdiction to remit the case to the Land Board.
- 2nd. Whether the document under the Minister's hand, dated 14th May, 1896, was a reference under section 59 of the Crown Lands Act of 1895.

The Supreme Court was of opinion that the Minister might, under section 7 of the Crown Lands Act of 1889, have appealed against the granting of the certificate of conformity which the Land Board directed to issue on the 16th April, 1896, but held that the provisions of section 59 were not intended to apply to such a case as this, inasmuch as the Land Board having decided on the only evidence before it, the charge of failure or neglect to discharge its duty according to law (which the Supreme Court regarded as a charge of a serious nature) could not be sustained. (*N.S.W.L.R.*, Vol. xviii, p. 182.)

In re J. R. Jones.—In November, 1878, J. R. Jones acquired a conditional purchase of 200 acres, No. 78-125; in March, 1883, he obtained an additional conditional purchase of 394½ acres, No. 83-18; and certificates of fulfilment of all conditions except payment of balance of purchase money were subsequently issued in respect of these conditional purchases.

On the 30th April, 1891, the said J. R. Jones applied for an additional conditional purchase of 45½ acres, No. 91-32, Bingara, in virtue of the before-mentioned conditional purchases, and on the same date applied for a conditional lease of 102 acres

acres in virtue of the additional conditional purchase No. 91-32. These applications of the 30th April, 1891, were duly confirmed by the Land Board on the 22nd December, 1891. On the 16th March, 1892, application was made, and permission obtained, under section 4 of 52 Vic. No. 7, to substitute other improvements in lieu of fencing on the said additional conditional purchase of $45\frac{1}{2}$ acres. On the 26th July, 1895, the Land Board held an inquiry as to whether the condition of improvements had been fulfilled on the said additional conditional purchase No. 91-32, and found (1st) that on the expiration of three years from the date of confirmation, improvements to the value of 9s. only had been effected on additional conditional purchase 91-32; to the value of £4 1s. 3d. on the conditional lease; and to the value of £212 10s. on conditional purchases 78-125 and 83-18; (2nd) that improvements to the value of £52 10s. (included in the above amount of £212 10s.) had been effected on conditional purchases 78-125 and 83-18 during the period of three years after the confirmation of additional conditional purchase 91-32. On these facts, and in view of the proviso in section 5 of 52 Vic. No. 7, that, in cases where substitution is granted, the land should be improved to the value of 6s. per acre within three years from date of confirmation, the Land Board referred to the Land Appeal Court the question whether the condition of improvements on additional conditional purchase 91-32 had been fulfilled. The Land Appeal Court decided (by majority) that the condition of improvements had not been fulfilled, inasmuch as the improvements in lieu of fencing had not been placed on that conditional purchase; but having regard to the importance of the decision as affecting a large number of cases, and to the fact that such decision was dissented from by one member of the Court, on its own motion stated the case for the opinion of the Supreme Court on the following points:—

- 1st. Whether, under the circumstances herein set out, the Land Appeal Court was right in holding that the condition of improvements had not been fulfilled in regard to additional conditional purchase 91-32.
- 2nd. Whether the Land Appeal Court was right in holding that when permission has been granted to substitute improvements in lieu of fencing on any conditional purchase, such improvements must be placed on that particular conditional purchase, and cannot be placed on any part of the holding.

Both questions were answered by the Supreme Court in the negative. (N.S.W. L.R., Vol. XVIII, p. 83.)

Nelson v. Lumby.—This was a special case stated by the Land Appeal Court of its own motion. It appeared from the special case that the Land Appeal Court heard the case; but, without giving any decision upon it, submitted certain points for the determination of the Full Court. The Court held that the case could not be entertained until the Land Appeal Court had itself given a decision in the matter. (N.S.W. L.R., Vol. XVIII, p. 180.)*

In re Rixon.—The question in this case was whether land within a population area could be set apart and become available for homestead selection under the Crown Lands Act of 1895, a doubt having arisen whether such land was not barred from homestead selection equally as from conditional purchase by sub-section 7 of section 21 of the Crown Lands Act of 1884.

The Land Appeal Court (to which the question was referred by the Local Land Board) was of opinion the land was not open to homestead selection, but the Supreme Court arrived at an opposite conclusion, holding that section 21 of the Act of 1884 is limited to conditional purchases. (N.S.W., W.N., vol. XIV, p. 37.)

Harrington v. Minister for Lands.—In this case certain lands comprised in a reserve from sale for access were, by notice in the *Gazette* of the 9th January, 1897, set apart (under sections 10 and 13 of the Crown Lands Act of 1895) for homestead selection. The notice set forth that the land would not be available for homestead selection until the 11th of March. On the day the notice appeared (*i.e.*, on the 9th of January) the reserve was revoked, and the assumption was, having regard to the provisions of section 102 of the Crown Lands Act of 1884, that the land could not be conditionally purchased under section 11 of the Act of 1895 during sixty days after the date of notice of revocation of the reserve. The

* The case itself has since been decided by the Supreme Court. W.N. XIV, p. 137.

The period of forty days within which the provisions of section 11 referred to may be availed of ran from the 9th of January, 1897, the date the lands were set apart, not from the 11th of March, the date the land was open to homestead selection. These forty days, and the sixty days given for the revocation of the reserve to mature, therefore, both commenced on one and the same date, so that the period limited by section 11 for making application for conditional purchase would expire before the revocation of the reserve was thought to take effect.

On the 11th of February (*i.e.*, during the forty days in question), J. Harrington made application for an additional conditional purchase. The Local Land Board disallowed his application, on the ground that it was made for land within a reserve before the expiry of sixty days from the date of notice of revocation of the reserve, and the Land Appeal Court, before which the case came on in appeal, upheld the Board's action.

On appeal to the Supreme Court, that Court reversed the Land Appeal Court's decision, holding that section 102 of the Act of 1884 is overridden by section 11 of the Act of 1895 so far as the latter section gives the right to make an additional conditional purchase within the forty days after the notification. (N.S.W. W.N., Vol. XIV, p. 87.)

In this case an appeal has been made to the Privy Council.

Pratt v. Goldsbrough, Mort, & Co.—The question in this case was, whether the waiver and reversal of forfeiture of a conditional lease subsequently to an application for an additional conditional purchase within that conditional lease rendered the additional conditional purchase valid, notwithstanding such additional conditional purchase was applied for at a time when forfeiture of the lease had already been incurred, and before either the waiver or reversal of forfeiture had been approved. In other words, whether the waiver and reversal of forfeiture had a retrospective effect, so as to validate the additional conditional purchase which, when made, was clearly invalid, seeing that at the time it was applied for, forfeiture of the lease, in which it was taken up, had been incurred. The main facts are, that Goldsbrough, Mort, & Co. held a conditional lease, and in 1892 applied, under section 25 of the Crown Lands Act of 1889 for an additional conditional purchase of land comprised within it. In February, 1893, the Land Board, after inquiry, found that, as the fencing condition attached to the lease had not been fulfilled, forfeiture of the lease had been incurred. In December, 1893, the Minister provisionally waived the forfeiture, and in March, 1894, waived it absolutely.

The Supreme Court held that the waiver and reversal did not validate the additional conditional purchase application made in 1892, but that it gave the land back to the persons incurring the forfeiture, and enabled a future additional conditional purchase application to be made. (N.S.W. L.R., Vol. XVIII, p. 187.)

Coffey v. Battye.—In 1889 Battye made a conditional purchase, and in virtue thereof, in 1893, he made two additional conditional purchases, to which a condition of residence was attached. In 1894, whilst possessed of both the original and the additional conditional purchases he mortgaged the original. Under this mortgage Coffey claimed the original, and brought an action of ejectment. This case involved an interpretation of the provisions of section 117 of the Crown Lands Act of 1884. That section provides that conditional and additional conditional purchases may be transferred after the condition of residence has been fulfilled, but that original conditional purchases and additional conditional purchases shall not be transferred separately until all the conditions applicable to the whole area, except that of payment of balance of purchase money or of instalments thereof, shall have been duly fulfilled.

In this case the original conditional purchase was transferred separately from the additional conditional purchases, and before the conditions attached to the latter purchases had been fulfilled. The Court held that, by reason of the operation of section 117, the legal estate was not vested in the plaintiff, but remained in the defendant; that Battye made and Coffey accepted a transfer, which the Act says cannot be made; and that nothing passed by the transfer. (N.S.W. L.R., Vol. XVIII, p. 263.)

Kiddle v. The Minister for Lands.—On the 1st February, 1894, William Kiddle applied for an additional conditional purchase of 223 acres by virtue of a conditional purchase made by James Duff on which the balance of purchase money had been paid and the deed of grant of which had issued. In June, 1894, the application was disallowed by the Local Land Board on the ground that the basal conditional purchase had been converted into a freehold prior to the date of the application. In July, 1894, Kiddle appealed to the Land Appeal Court against such disallowance. On the 1st June, 1895, the Crown Lands Act of 1895 came into force. In September, 1896, the appeal came before the Land Appeal Court, which Court decided, in December, 1896, that the provisions of section 31 of the Crown Lands Act of 1895 did not apply to the application in question. A special case was thereupon stated for the decision of the Supreme Court on the following points:—

- 1st. Whether an accrued right within the meaning of Section 2 of the Crown Lands Act of 1884 was in Kiddle to make the additional conditional purchase.
- 2nd. Whether, on the 1st February, 1894, Kiddle was the holder of a conditional purchase within the meaning of section 42 of the Crown Lands Act of 1884, so as to enable him to make the additional conditional purchase applied for on that date.
- 3rd. Whether the Land Appeal Court was right in holding that the provisions of section 31 of the Crown Lands Act of 1895 did not apply to Kiddle's application.
- 4th. Whether Kiddle was entitled to make the additional conditional purchase.

The principal question for decision was whether section 31 of the Crown Lands Act of 1895 (which makes provision for the making of future applications in right of conditional purchases converted into freeholds, and which validates additional conditional purchases confirmed prior to the passing of that Act) validated Kiddle's application of the 1st February, 1894. The Supreme Court held that the section in question did not operate to revive such an application as that of Kiddle's, which was invalid when made. (N.S.W. L.R., Vol. xviii, p. 335.)

Dennis v. Cooper.—In January, 1896, John Dennis being at the time the holder of 1,280 acres of land in the Eastern Division (320 acres conditional purchase and 960 acres conditional lease) applied for a homestead selection of 640 acres situated in the Central Division. The Land Board disallowed the application for the homestead selection on the ground that Dennis was disqualified by being already the owner of 1,280 acres. From this decision Dennis appealed to the Land Appeal Court, on the ground that there is no maximum area fixed by law for a homestead selection. The Land Appeal Court dismissed the appeal, holding that a maximum area was prescribed by law for a homestead selection, and that such maximum area was exceeded by the appellant's application. Against this decision Dennis appealed to the Supreme Court, which Court upheld the decision of the Land Appeal Court, and ruled that, although section 13 subsection (1) of the Crown Lands Act of 1895 does not fix the maximum area in such precise terms as are used with reference to ordinary selections, the effect is the same, as no block is to exceed 1,280 acres, and under section 14 of that Act a person cannot apply for more than one block, and then only if he is not disqualified by section 41 of the Act of 1895, which (by providing that the owner of an area of land which, added to the area of the holding applied for, will exceed the maximum permitted by law to the class of holding applied for) rendered Dennis incompetent to apply for a homestead selection, the area of which, added to the land he held already, would exceed 1,280 acres. (N.S.W. W.N., Vol. xiv, p. 185.)

Minister for Lands v. Thorley.—Thorley took up a conditional purchase in 1890. In 1893 the Minister, in pursuance of section 20, Crown Lands Act, 1884, referred to the Local Land Board the question whether any statements in the declaration lodged by Thorley with his application, having reference to his intention to use the land solely for his own use and benefit, were false. After inquiry (at which Thorley gave evidence and called witnesses) the Local Land Board were unable to find that any of the said statements were false within the meaning of section 26.

In

In 1896 the Minister again sent the case to the Land Board, in pursuance of the 20th section of the Crown Lands Act of 1884, for inquiry as to whether any evidence given on oath before the Land Board in 1893 was given for the purpose of misleading any officer, authority, or person, or wilfully misrepresented facts within the meaning of section 135 of the Act of 1884, and whether, by reason thereof, the conditional purchase was forfeitable.

In view of the inquiry held in 1893, the Land Board referred the matter to the Land Appeal Court for decision as to whether they were entitled to proceed with the second inquiry directed by the Minister. The Land Appeal Court decided that the Board was not entitled to proceed with the reference, and the Minister for Lands then appealed against the decision. The Supreme Court held that the Minister might, in 1893, have referred the case for inquiry under section 135; but inasmuch as he saw fit to refer it under section 20 of the Crown Lands Act of 1884—under which section the decision of the Land Board is final unless appealed from—he is bound by the decision arrived at by the Board. (N.S.W. L.R., Vol. xviii, page 328.)

Minister for Lands v. Colless.—In this case the land in question formed part of a leasehold area, the pastoral lease of which expired on the 10th July, 1895. On the 4th of that month a preferential occupation license of the said leasehold area was granted under the provisions of section 4 of the Crown Lands Act of 1895; but the leasehold area was not declared to be a resumed area, in terms of section 5 of that Act, until the 25th January, 1896. The land, after being subdivided into farms, was by notification in the *Gazette* of 18th December, 1895, set apart for settlement lease to become available on the 30th January, 1896. Part of one of the farms was, by virtue of the provisions of section 11 of the Act of 1895, applied for by H. E. Colless as a conditional lease on the 23rd January, 1896, and on the 30th of the same month J. M. Gordon made application under section 24 of the Crown Lands Act of 1895 for a settlement lease of the same farm. The forty-days period prescribed by section 11 of the Act of 1895 expired on the 27th January, 1896, and the last Thursday within this period expired on the 23rd January, the day Colless applied. He therefore applied before the leasehold area was declared a resumed area; but had he waited until after this event, he would not have been within the forty-days period referred to. There being conflicting applications for a settlement lease of the farm, the Crown Land Agent held a ballot to determine the priority of the several applications received, and he included in the ballot Colless's application, but under protest by Colless. The result of the ballot was that Gordon's application came out No. 1, and Colless's application No. 2.

When the applications came before the Land Board, Gordon's application for a settlement lease was confirmed, and Colless's application was disallowed, as the land applied for was not available. From this decision Colless appealed to the Land Appeal Court, which Court sustained the appeal, and directed the Local Land Board to disallow Gordon's application, and to confirm Colless's application. The Minister for Lands then required the Land Appeal Court to state and submit the case for the decision of the Supreme Court, the principal points for decision being:—

- 1st. Whether the land applied for by Colless as a conditional lease was available for the purposes of that application when made.
- 2nd. Whether, under the circumstances set forth, the application was a valid one, and constituted a continuing offer capable of subsequent acceptance.
- 3rd. Whether Colless's application was entitled to priority over Gordon's.

The Supreme Court held that section 11 of the Act of 1895 did not confer any preferent right on Colless, but merely a concurrent right with applicants for a settlement lease, and that after the forty days any right he might have had went for ever; and although the pastoral lease expired on the 10th July, 1895, and a preferential occupation license was granted, yet in view of the provisions of section 5 of the Crown Lands Act of 1895, the land still continued to be leasehold area, and as such was not available for conditional lease until the 25th January, 1896, when it was notified as a resumed area.

Colless's application, therefore, having been lodged on the 23rd January, or two days before the land became a resumed area, and therefore before it became available for conditional lease, was invalid. (N.S.W. L.R., Vol. xviii, p. 91.)

At the instance of Colless this case has been referred to the Privy Council for decision.

Information

Information Bureau.

This branch has now entered upon the third year of its existence, and, judging from the volume of work that has been transacted during 1897 and preceding years, there is very little reason to question its usefulness or popularity, and its recognition by the general public as a distributing centre from which all information regarding Crown lands emanates, may now be regarded as an established fact.

During 1897 the general correspondence has been considerable. In 1896, letters to the number of 1,976 were written, and in 1897 a practically identical record was reached, the number despatched during the year amounting to 1,965. It may be as well to state that correspondence received in this branch is always treated as of an urgent nature, and promptness in answering is recognised as not only desirable, but absolutely necessary. Information has been regularly supplied to the Press, giving particulars regarding lands that are on the point of being thrown open for homestead selection, settlement, or improvement lease.

The publication of two editions of the "Homestead Selection and Settlement Lease Pamphlet" has also been attended to during the year. These pamphlets contain full particulars of the various lands that have been thrown open, and that are still available for homestead selection and settlement lease. It is found that this publication is in considerable demand, now that its existence is becoming more widely known, and the public generally, both in this and the neighbouring Colonies, evidently appreciate the advantages it offers.

The Lands Department Weekly Gazette has now become a recognised factor in providing intending settlers with early information regarding Crown lands that are being made available under the several tenures resulting from the operations of the present Land Laws.

The advantages of this special issue are not, however, confined to the general public, as for departmental purposes alone the avoidance of all the extraneous matter which appears in the ordinary *Gazette* is of some moment, and experience has shown that the facilities afforded by the fact of all notifications issued by this department being retained in a compact form readily available for reference are considerable.

At the close of 1897 the regular subscribers to this issue were 108 in number, irrespective of many who only subscribe for short periods until they find particulars of subdivisions suited to their requirements.

During the year a pamphlet entitled "Synopsis of the Laws relating to Crown Lands" has been published, together with a descriptive account of the characteristics and resources of the Colony generally, as divided into the several Land Board Districts. The various publications issued by the Bureau have proved of great assistance in many ways, more especially perhaps, in corresponding with people whose knowledge of the conditions under which they can settle on Crown lands is more or less limited.

Inquiry Branch.—The advantages which this division of the Information Bureau offers to the general public are many in number, and it is gratifying to note that two other departments have seen fit to establish similar branches. Questions of all descriptions relating to the general business of the department are answered here. Searches against conditional purchases and leases are carried out at the instance of solicitors, Banks, private land agents, and financial companies, who wish to be assured that no forfeiture is impending and that no other defects exist which might in any way be prejudicial to the title. A small fee is charged for information of this kind, which produced in 1897 a revenue of £358 8s. 6d., as compared with the amount of £326 12s. 3d., collected in 1896. The number of individual searches, which in 1896 amounted to 13,000, reached a total of 14,320 during 1897. Inquiry memos. to the number of 5,000 were lodged and answered, in addition to a large number of personal inquiries to which verbal answers were given.

The work of the branch as a whole shows a decided increase over that of the previous year.

The Map Sales Branch.—The work in this division of the Bureau has proceeded satisfactorily during the year, and steps have been taken to simplify the system of records hitherto used in connection with the issue and receipt of lithographs. In order to place matters on a satisfactory basis it was decided to take stock, and this work is proceeding at the present time. During 1897, 46,030 lithographs were received into

into stock, and 31,075 issued to Crown Land Agents, District Survey Offices, and to other departments, including also those required by the various branches in the head office. The receipts during the preceding year, 1896, amounted to 44,739 lithographs, and the issues to 37,314. Maps are also sold to the public, and exclusive of those disposed of by Crown Lands Agents the number sold during 1897 amounted to 3,340, producing a revenue of £228 19s. 1d. The sales of the previous year amounted to 3,449 lithographs, the receipts reaching the sum of £265 6s. 6d.

Rabbit Branch.

It is very satisfactory to report that during the year 1897 there was a remarkable scarcity of rabbits in many districts that had previously been the most thickly infested. The reason is not far to seek, for with the exception of portion of the Land Board District of Wagga Wagga, where the pest admittedly is steadily on the increase, there can be no question that the almost unbroken succession of long periods of drought has proved the most important of all hitherto known factors in the work of rabbit extermination.

The work of erecting a rabbit-proof fence from Mungindi, on the Queensland Border, to the Namoi River, at Bugilbone, a distance of about 115 miles, which had been commenced during the previous year, was completed in March, 1897, at a net cost of £6,299 14s. 4d., or £54 14s. 3½d. per mile.

The proposal to erect this line of barrier fencing emanated from the Queensland Government, and before commencing operations it was agreed that the expense of the undertaking should be equally divided between the two Colonies.

In accordance with this agreement, a first instalment of £1,918 8s. 8d. has already been paid by the Queensland Government in satisfaction of a claim for that amount, leaving a balance of £1,231 8s. 6d. still to be adjusted.

Suggestions have been made for the continuation of this fence, on the share and share alike principle, from its termination at Bugilbone, either in an easterly direction to Narrabri, or southerly to the rabbit-proof fence on the boundary of Wingadee pastoral holding, and the matter is now under consideration. The erection of the latter line of fencing, and the bridging of a gap which separates the netting fences on the boundaries of Goorianawa and Goolhi pastoral holdings, would bring into existence an additional barrier, some hundreds of miles in length, which would protect nearly the whole of the counties of White and Baradine, including the well-known Pilliga Scrub, and practically render the greater part of the north-eastern portion of the Colony free from the inroads of the pest.

In consequence of the great diversity of opinion that prevailed respecting the Rabbit Destruction Bill, introduced into Parliament in August, 1896, and which embodied the recommendations of the Rabbit Conference held in April of the preceding year, a number of delegates were invited to attend a conference in Sydney for the purpose of discussing the provisions of the Bill, with a view to making fresh recommendations on which to base an amended Bill.

The sitting lasted from the 9th to the 17th March, and the deliberations of the delegates resulted in the presentation of an amended Bill, which was submitted to the Minister for approval.

After careful criticism of the proposed measure, it was apparent that the recommendations of the conference could not be adopted in their entirety, and that certain alterations must be substituted.

A fresh Bill was, therefore, prepared, and, together with a short Bill to amend the "Diseases in Sheep Acts Amendment Act of 1878," which the constitution of the proposed Rabbit Boards rendered necessary, was read the first time on the 13th of May last. Representations have been received from various quarters urging that an opportunity may be found for bringing them forward again before the dissolution of the present Parliament.

The salient features of the new Rabbit Bill are the formation of rabbit districts, conterminous with the existing sheep districts; the appointment of Rabbit Boards for such districts, with power to levy rates for administrative purposes; the construction, maintenance, and repair of barrier fences by the Rabbit Boards; the

supply by the Crown to Rabbit Boards and private owners of the necessary material for the erection of rabbit-proof fences and the destruction of rabbits; and the acceptance by the Crown of its responsibility for the destruction of rabbits on public lands.

Advantage was taken of the presence of the delegates to hold a second conference, which was convened with the object of dealing with the question of noxious weeds.

A Draft Bill was submitted, and the conference asked to discuss its provisions, with a view to making fresh recommendations on which to base an amended Bill. The conference sat on the 16th, 17th, 18th, and 19th of March, and passed a series of resolutions, which were submitted to the Minister for consideration, and these, after certain modifications and amendments, were embodied in a fresh Bill, which was introduced into Parliament, and passed its first reading on the 12th May last.

During the period under review the number of proponents of schemes for the extermination of rabbits has been less than in any preceding year, only twenty-four correspondents having favoured the department with an exposition of their projects for the accomplishment of that object, and securing the long-ago withdrawn reward of £25,000. It was found, however, that none of the methods propounded possessed any special merit that would entitle them to more than passing consideration.

Owing to the successful results that had attended the enforced destruction of rabbits in a limited portion of the counties of Urana and Denison, it was decided, at the earnest solicitation of the bulk of the resident landowners, to extend the operation of the compulsory clauses of the Rabbit Act to the whole of the sheep district of Urana, and to Boree Creek pastoral holding; and a proclamation was accordingly issued on the 23rd February, 1897, giving the petitioners the relief they sought.

The inauguration of this policy would appear to be fully warranted by the benefits that have accrued.

Various requests to extend the compulsory provisions of the Rabbit Act to other localities have been received during the year; but owing to the fact of their not being of a sufficiently representative character, it was not considered expedient to comply with them.

The area of the rabbit-infested districts was extended during the year by the inclusion of the resumed area of Bygaloree pastoral holding and the population area of Deniliquin, though the consideration of several applications having such extensions in view has been postponed until it can be shown that the majority of the landowners interested are unanimous in the desire to have their district so declared.

The aggregate number of miles of rabbit-proof fencing erected in the Colony, as reported to the Department, has increased to 17,280, though it is believed that many more miles have been erected of which there is no official record.

Five applications under the 41st section of the Rabbit Act for permission to keep live rabbits were received from various persons, particulars of which are given below:—

Name.	Place.	Period.
Hugh O'Neill... ..	Agricultural Society's Grounds, Moore Park	7 days.
J. McGarvie Smith	Denison-street, Woollahra	12 months.
Eugene Rougier, M.D.	The Hermitage, Double Bay	12 "
Sydney Jamieson, M.B.	Pathological Department, Sydney Hospital	12 "
Charles Morrit	117, Phillip-street and Palace Theatre	12 "

Animals Infectious Diseases Act.

Fresh licenses, under the 6th and 7th sections of this Act, have been granted to several persons who had previously availed themselves of its benefits; the only new applicants being Dr. W. H. Goode, of the Medical School of the Sydney University, and Dr. Sydney Jamieson, of the Pathological Department of the Sydney Hospital.

Until

Until a comparatively recent date, few were aware of the wide-spread ramifications of the scourge known as anthrax, or Cumberland Disease, and it is to the firm of Messrs. McGarvie Smith and Gunn that the Department is largely indebted for much useful information on the subject. The members of that firm, who, with their assistants, are licensees under the Act, have reported the successful inoculation of no less than $2\frac{1}{4}$ millions of sheep during the past three years, the vaccine which is used for the operation being manufactured and distributed by them in accordance with the conditions specified in their licenses.

Labour Settlements.

Wilberforce.—The administration of the affairs of the Labour Settlement at this place is vested in a Board of Control, composed of residents of the district and members of the Settlement; and as it has been considered that that body is quite competent to manage its own business, the relations between it and the Department are not of a very frequent or intimate character.

Owing to desertions, the removal of unsuitable settlers, and other causes, the Settlement, which originally consisted of 37 enrolled members, is now reduced to 16 members, two of whom are unmarried men. A visit of inspection paid to the Settlement by an officer of this department during the early part of this year, disclosed that, although many of these people had been subjected to considerable hardship, and even privation, owing mainly to the losses occasioned by unfavourable seasons, they had yet managed, by obtaining occasional employment elsewhere, to earn a living, and did not despair, as their land improved and their orchards commenced to bear, of eventually being able to support themselves and their families without having to supplement their income by recourse to outside employment.

Bega.—Established as it was under far more favourable auspices than its contemporaries at Wilberforce and Pitt Town, the success of the Bega Labour Settlement may now be regarded as assured. In common with other occupiers of the land in many parts of the Colony, its members have had to contend against unpropitious seasons, and the difficulties that beset the pioneer; but these would appear to have been surmounted, and the indications of approaching prosperity cannot be misunderstood.

The community now consists of 29 families, 9 additional members having been enrolled in the course of the year. The new settlers are likely to prove a valuable acquisition to the Settlement, as the reports that have been received respecting their eligibility as settlers are of an eminently satisfactory nature. The improvement of the settlement area by the construction of roads and culverts is still vigorously carried out by communal labour, and the acquisition of dairy stock by many of the settlers, in conjunction with the establishment of a creamery on the estate, should no doubt contribute materially towards the prosperous development of the dairying industry in this district.

Expenditure.

The total expenditure for all services in 1897 amounted to £361,345 16s. 1d., made up as follows:—For services paid from Consolidated Revenue Votes, &c., £286,083 7s. 8d.; for services paid from Loan Votes, £74,332 17s. 6d.; and for the Church and School Lands Branch, £929 10s. 11d.; the total expenditure in 1896 being £341,049 6s. 11d. The expenditure in 1897, therefore, shows an increase of £20,296 9s. 2d. Taking, however, the expenses of the department that were purely in connection with the administration of the Land Laws, which amounted in 1897 to £275,077 16s. 6d., a decrease of £23,446 3s. 10d., is the result as compared with 1896; salaries being responsible for £8,852 18s. and Contingencies £14,593 5s. 10d. Respecting the latter, expenditure under the different heads of service shows a general decrease throughout, the only substantial increase apparent being for survey fees. Under this head, £3,097 12s. 6d. more was paid during the year than in 1896, consequent upon the increased subdivision of lands to meet demands for settlement under the Crown Lands Act of 1895.

With regard to the increase in the total expenditure, as shown above, a reference to the comparative statement, Schedule III, will show that the erection of Local Land Board and District Survey Offices, scrub clearing, Terragong Swamp drainage,

drainage, forest thinning, and advances to the Hay Irrigation trust (all paid out of Loan Votes), were responsible for a total expenditure of £74,332 17s. 6d., as against £13,873 11s. 4d. for the previous year—an increase of £60,459 6s. 2d.

The transfer of the Forest Branch from the Department of Mines and Agriculture, as from the 1st October, is responsible for an increase to the staff of twenty-three officers, and an annual expenditure of £2,783 for salaries. Contingencies in connection with the administration amount to an estimated annual expenditure of about £1,000. Forest-thinning, paid from Loans, for the three months ended the 31st December, cost £3,331 3s. 7d.

With regard to Crown Land Agents, all with the exception of five—receiving salaries amounting in the aggregate to £1,565—were graded by the Public Service Board as officers of the Department of Justice as from the 1st July, 1896, the reason being that their duties were combined with those of Clerks of Petty Sessions; but on the 1st July, 1897, twenty-eight were retransferred to the control of this Department, in accordance with an arrangement previously entered into, on the principle that each Department should be charged as near as possible with the value of the services rendered to it by officers holding the dual positions.

The number of accounts registered during the year was 9,418, and the separate payments by cheques drawn in the Account Branch numbered 16,132.

Schedules II to VII and XCVIII show respectively expenditure for all services, comparative statement of expenditure for 1896 and 1897, salaries paid in the year, strength of the staff, and the annual rate of salaries as on the 31st December, 1896 and 1897; travelling expenses and fees in connection with Local Land Board meetings; revenue and expenditure for the years 1886 to 1897, showing the percentage of the latter to revenue, and cost of measuring classified areas by licensed surveyors.

Revenue.

The revenue and receipts for the year, particulars of which are shown on Schedule I, amounted to £1,891,907, being an increase of £9,050 on total receipts in 1896, and in excess of the estimate in Ways and Means.

Inspection of Accounts.

During the year the accounts were subjected to an independent audit by an Inspector of Public Accounts.

Land Appeal Court.

During the year 1897 the Court heard and disposed of 544 cases, comprising 353 appeals and 191 references. Of these cases 366 were dealt with in Sydney, and 178 at the various sittings in the country. The Court held sittings in Sydney on thirteen different occasions, and in the country as follows:—Bourke, 1; Dubbo, 2; Tamworth, 2; Wagga Wagga, 3.

During 1897 the Land Appeal Court was asked to state special cases for the decision of the Supreme Court in twenty-two instances, two of which were struck out for non-compliance with the Rules of the Court. In two other applications the Court declined to state a case, and one of these (*In re Campbell*, L.C.C. 4,733) is now the subject of an application for mandamus to the Supreme Court, for which a *rule nisi* has been obtained, but the rule has not yet been made absolute.

Of the remaining eighteen, ten (10) were duly stated and forwarded to the Prothonotary.

The following are the ten cases referred to:—

3,186	<i>re</i> Wm. Kiddle.
3,731	„ J. R. Jones.
4,284	„ James Wilson.
4,462	„ Kerwin Rixon.
4,583	„ James Nelson.
4,583	„ Minister for Lands.
4,597	„ A. G. Thorley.
4,828	„ A. P. Stair.
4,830A	„ J. Harrington.
4,862	„ W. Chapman.

In

In cases 3,186 and 4,597 the Land Appeal Court's decision was confirmed, and in cases 3,731, 4,462, and 4,830A it was reversed. (It is understood that leave has been granted to the Minister for Lands to appeal to Her Majesty's Privy Council against the decision of the Full Court in case 4,830A.) Of the remaining cases, No. 4,284 (Mercadool) has been returned to the Land Appeal Court for re-statement, and cases 4,583 (2), 4,828, and 4,862 are still before the Supreme Court.

The following cases remain with the Land Appeal Court for final settlement preparatory to sending on to the Prothonotary:—

4,757A *re* A. A. Sampson.
 4,831 ,, J. Willmott.
 4,864 ,, Trida R.A.
 4,865 ,, Coan Downs L.A.
 4,866 ,, Wyadra L.A.
 4,867 ,, Tibora L.A.
 4,868 ,, Willandra L.A.

Case 4,757A was allowed to stand over pending an appeal to the Supreme Court in *Greene v. Hargrave*; but as no appeal has been made in that case the question of stating a case for the decision of the Supreme Court in Sampson's case will again be brought forward for consideration.

One other case, No. 4,907, *re* Rigney, stands over pending action of the Supreme Court on the mandamus applied for in Campbell's case, No. 4,733.

Forest Branch.

The report on this Branch, which is now attached to the Department of Lands, will be found for the half-yearly period ending 30th June, 1897, under the Annual Report for that year of the Department of Mines and Agriculture, the Forests administration having been vested in the Secretary for Lands from the 1st of October, 1897.

This change was effected after inquiry had been made by, and upon the recommendation of, the Public Service Board.

The increased activity in coastal timber operations continues, and, as most of the mills are working full time, there has been no lack of employment for timber-getters. In some districts the supply of matured timbers in the vicinity of shipping ports has been cut out, and proprietors of saw mills have been compelled to seek supply from back lands; but the increased distance of transport, and the difficulties of haulage, have been met by the construction of tram-lines, some of which now extend back for distances of from 10 to 20 miles. A large proportion of the coastal timber is now cut to export orders, and there is little doubt that this trade is a growing one.

The difficulties of adequate supervision of forest operations referred to in last Report have not yet been entirely overcome; but steps are being taken to strengthen it wherever experience in working shows the necessity. In this connection it may be remarked that, although the number of royalty-permits issued for the half year under report is nearly double that for the preceding period, the quantity of timber felled is returned some 820,000 superficial feet less, the shortage in royalty thereon amounting to nearly £900.

The return of prosecutions for illegal offences in comparison with the preceding half year, are as follows, viz.: half year ending 30 June, 1897, 71 prosecutions, 63 convictions, and £65 amount of penalties, with 42 seizures (39 being upheld); whilst for the half year in question there were 78 prosecutions, 71 convictions, £84 2s. 6d. amount of penalties, with 76 seizures (67 being upheld). The sales of material confiscated realised £250 12s.

Office Work and Records.—In administration, attention was devoted to the question of royalty charges with the object of applying them in a more equitable and uniform manner, and a scheme for effecting this was proposed, the basis being a fixed maximum and minimum rate for each class of timber according to its commercial value. Where districts happened to be at a disadvantage through inaccessibility, inferiority of timber, or difficulties of haulage, rates below the maximum would be charged. As, however, a Forestry Bill is in contemplation, it was thought expedient to postpone the matter pending new legislation.

A careful revision has also been made of the quarry lands of the State and reports have been obtained bearing upon the character and quality of materials contained therein with a view to their being classed for operation and allotted a special supervision. The distribution of plans and information to issuers of licenses and the Police Force, specially referred to in last report has been continued; and besides assisting supervision, this work has afforded convenience to the public in ascertaining locally the classification and rates for operation allotted to forest areas.

Museum.—The arrangement and conduct of the Museum, including the receipt and classification of timber and herbarium specimens has been attended to in an efficient manner, and the exhibits appear to be appreciated by the public.

The following table indicates the extent of distribution of samples from: 1st July to 31st December, 1897:—

Description of Samples.	Local Distribution.	London.	Germany.	India.	Totals.
General Specimens	340	48	28	28	444
Paving Blocks (new)	25	6	6	7	44
Paving Blocks (old)	13	6	6	7	32
	378	60	40	42	520

Forest Improvement—Planting and Thinning.—As previously stated, planting operations for the period included only an experimental plot of silky-oak and sugar-gums planted on Forest Reserve 1,833 county of Urana. In carrying out this experiment, a natural clearing in pine forest was selected and enclosed with wire netting, the site being capable of extension if desired. The seedlings planted out therein consisted of 944 silky-oak (*Grevillia robusta*), 6 sugar-gum (*Eucalyptus corynocalyx*), 12 ironbark (*Eucalyptus siderophloia*), 6 Californian Cypress (*Cupressus macrocarpa*), 12 ironbark (*Eucalyptus paniculata*) 12 pine (*Pinus contorta*), a total of 992 plants, at a cost of £15, the main object of the experiment being to test the capacity and value of silky-oak as a timber-tree in the drier portions of the Colony.

Thinning operations have been confined to the Murray River red-gum and to pine forests in the vicinity of Narrandera, small parties of men on day rates, and under competent overseers, having been employed on this work in each district. Details of the extent and cost of work performed are supplied in the following table, the total expenditure for the period being £4,895 19s. 8d.

MURRAY RIVER DISTRICT—(Red-gum Forests).

Forest.	Number of Reserve and County.	Area improved.	Average cost per acre.	Total cost.	Remarks
Millewa ...	3,265, Townsend	acres. 1,000 5,000	(Estimated) 15s. " 5s. 11d.	£2,455 14 8	Thinned and cleaned up; very heavy work. Second thinning and cleaned up. Thinnings burnt off. Second thinning and cleaned up.
Gulpa Island	3,263, "	250 750	" 0s. 3d. " 5s. 11d.		

NARRANDERA DISTRICT—(Pine Forests).

Morundah ...	1,833, Urana ...	10,480	3s. 7d.	£1,917 0 0	Thinned and stacked for burning.
Gaurnain ...	2,652, Bourke...	10,900	} (Estimated) 9d.	523 5 0	Suckered, burnt off, and cleaned up.
Gillenbah ...	1,890, Mitchell	3,000			

Total expenditure, £4,895 19s. 8d.

Gosford State Forest Nursery.—With the small staff available at this establishment, viz., the foreman and one labourer, some difficulty has been experienced in keeping the Nursery in order. In ordinary work 2,000 young trees were planted out in beds from cuttings and seedlings, and 17,265 plants were distributed for the half year, particulars of distribution being as follows:—

To plantations, artesian bores, and experimental farms ...	8,700
To public bodies, charitable institutions, &c. ...	5,230
To farmers, settlers, &c., as trees for shade and shelter ...	3,335

Total 17,265

The

The expenditure has been kept down to the lowest possible limit compatible with efficiency in working, the cost for the period being for salaries, wages, and incidental expenses £203 5s. 5d. The stock of plants at the Nursery, including all varieties, on 31st December, 1897, amounted to 88,610.

Revenue and Expenditure.—The revenue for the first half of the year 1897 will be found, on reference to the prior report, to be £5,013 13s., and for the latter half, £3,746 12s. 4d., so that the total revenue for the year is £8,760 5s. 4d., and a difference of £1,267 0s. 8d. is indicated between the collections for the first and last half years of 1897. For details of revenue received during the half year ended 31st December, 1897, see Schedule XCIX.

Class and Area of Forest Reserves.—On the 31st December, 1897, the total area of reserved forest land was 5,610,184 acres. These reserves are divided into three classes—A, B and C, the two first being under fixed license fees, and the latter under license fee with royalty on the quantity of timber felled. The totals of the areas under each class are as follows:—

Class A	2,786,729	acres.
„ B	154,583	„
„ C	2,668,872	„
Total	5,610,184	„

On the same date the areas exempted from the operation of licenses were as follows:—

- (1.) From the operation of ordinary licenses 772,882 acres of Crown land not embraced within forest reserves.
- (2.) From the operation of all licenses and permits (closed areas) 50,567 acres, being principally special lands comprised within forest and other reserves.

By comparison with the figures given in the preceding report it is found that the total area of land reserved for forestry has been increased by 13,663 acres during the half year under report.

Prickly-pear Extermination.—Under the provisions of the Prickly-pear Act, 31,626 acres of Crown land were held under lease on the 31st December, 1897, yielding an annual rental of £439 7s. 7d., or, roughly, £8 $\frac{3}{4}$ per section of 640 acres.

The transactions in regard to these leases must be considered as very satisfactory, inasmuch as the spread of the pest is checked, whilst at the same time a fair rental for the area leased is obtained. Failure to eradicate the pear or to keep the land clear of same involves forfeiture of lease. In the settled districts, the work of eradication by private owners has been enforced, with favourable results, but in the outlying districts, particularly in the north-west, the work of destruction is at a standstill, and it is feared the pest is spreading unchecked. In districts such as this the want of proper supervision, the incompleteness of the Act in some respects, and the fact that the State makes no provision for the extinction of the pear on Crown lands, add greatly to the difficulties of dealing with the pest. The Crown lands referred to consist principally of travelling stock and camping reserves. As the leasing of these reserves for lengthened periods is against the interests of travelling stock, the problem of dealing with them is a difficult one, especially as the cost of clearing the prickly-pear upon many of them would be enormous even at the present time.

Botanical.—Reports were issued on the Cork Oak, on the cultivation of the Quandong-tree, on the general question of Indiarubber-trees, on the poisonous nature of the seeds of white cedar, and also a revised edition of the report of the committee appointed to inquire into the merits of the timber of the tree known as Spotted Gum (*Eucalyptus maculata*), more particularly with reference to its value for wood-paving.

Forestry Prospects.—In view of the interests of forestry receiving wider consideration, and the support of special legislation, the following remarks in conclusion are submitted upon its present position, its prospects and requirements. The difficulties of timber production in this Colony with a semi-tropical climate are

very

very slight compared with those experienced in frigid climates, for here, speaking generally, the natural regeneration in most of the indigenous species is so rapid and abundant that the labour and cost of replanting is barely necessary, and in insuring maturity of crops the less expensive treatment of destroying the superabundant is all that is called for—of course there are varieties which do not reproduce naturally and rapidly, and which require replanting and skilful handling before they will even establish, but these are the minimum in the list of our commercial timbers.

Viewing then these facts, the future supply of most of our indigenous hardwoods can be simply and economically assured by (1) providing sufficient land for them to reproduce upon, (2) by enacting stringent laws to prevent interference by man with crops whilst in the immature stages, and (3) by assisting them towards maturity by the least costly of all methods, viz. :—destroying the superabundant and useless timbers and providing air and light for the best and healthiest stocks which are to be allowed to remain and perfect themselves.

Of course, from an economic standpoint and to attain forest culture in its higher stages, the growth and production of many non-indigenous timbers which now figure largely in our import trades must also be attempted; but this will be entering upon ground that is entirely new and foreign to surrounding conditions; and, before approaching this phase of forestry, much work of an entirely experimental character must be effected.

Auction Sales.

Town Lands.—During the year 3,190 lots, comprising an area of 1,272 acres 1 rood 21 perches, were offered for sale, of which 722 lots, containing 289 acres 1 rood 20 perches, were sold, realising the sum of £10,327 13s. 1d., or an average of £35 13s. 9½d. per acre.

Suburban Lands.—1,330 lots, containing an area of 6,764 acres 1 rood 11½ perches were offered for sale, of which 358 lots, comprising 1,600 acres 3 roods 24 perches, were sold, realising £6,772 10s. 1d., or an average price of £4 4s. 7¼d. per acre.

Country Lands.—The country lots offered were 1,059 in number, representing an area of 47,038 acres 2 roods 36¼ perches. 423 lots containing 21,820 acres 1 rood 19½ perches were sold, realising £37,716 11s. 11d., or an average of £1 14s. 6¾d. per acre.

It will thus be seen that the total area of all classes offered for sale during 1897 amounted to 55,075 acres 1 rood 28¾ perches, comprised within 5,579 lots, and that the total area sold was 23,710 acres 2 roods 23½ perches, embracing 1,503 lots, the amount realised being £54,816 15s. 1d.

A comparison of the transactions under this class of sales for the years 1896 and 1897, is supplied in the following Schedule :—

		Year.	No. of lots offered.	Area offered.			No. of lots sold.	Area sold.			Amount realised.			Average price per acre.		
				a.	r.	p.		a.	r.	p.	£	s.	d.	£	s.	d.
Town	...	1896	1,447	601	1	25½	488	188	3	1½	5,739	11	0	30	8	1¾
		1897	3,190	1,272	1	21	722	289	1	20	10,327	13	1	35	13	9½
Suburban	...	1896	719	2,863	1	29¼	244	688	2	5	3,702	19	6	5	7	6¼
		1897	1,330	6,764	1	11½	358	1,600	3	24	6,772	10	1	4	4	7¼
Country	...	1896	971	29,084	2	1¼	325	11,214	3	6	25,751	8	10	2	5	11
		1897	1,059	47,038	2	36¼	423	21,820	1	19½	37,716	11	11	1	14	6¾

It will be observed that about 23 per cent. of town lands, 24 per cent. of suburban lands, and 46 per cent. of country lands offered, were sold, as compared with 31 per cent., 24 per cent., and 39 per cent. respectively, in 1896.

Though the revenue derived from auction sales during the past year (£54,816 15s. 1d.) is in excess of that obtained in 1896, yet it is a mere fraction of the amounts received from this source in former years. As recently as 1892 the auction sales represented a sum of £310,716. For particulars of areas offered and sold see Schedule XXXIII.

After

After Auction Sales.

During the year 588 applications were received, 68 were refused, while 536, comprising 688 lots, were granted.

An area of 1,744 acres 2 roods 17 perches was thus sold, the amount realised in connection therewith being £10,365 19s. 5d. The average prices obtained per acre were as follows:—For town lands, £23 3s. 0½d.; for suburban lands, £4 0s. 4½d.; and for country lands within population areas, £3 15s. 4¼d. Further details will be found in Schedule XXXIV.

Forfeiture of Auction Purchases.

For non-payment of the balance of the purchase money within the specified time 205 lots were forfeited during the year, representing an area of 404 acres 2 roods 28½ perches, and the deposits paid in connection therewith, amounting to £982 12s. 5d., were forfeited to the Crown. Further particulars will be found in Schedule XXXV.

In cases where purchasers of Crown land are entitled to the improvements existing thereon the value of the improvements is added to the upset price of the land, and, subsequently, remitted. In this way a sum of £419 8s. 7d. was refunded and other payments which had been made in excess, to the amount of £308 6s. 6d., were also refunded during the year.

Homestead Selections.

In view of the fact that the first areas set apart for homestead selection did not become available till September, 1895, the year 1897 may be looked upon as practically the second year of settlement under this class of holding, and it will be seen that the transactions for that year were of a very satisfactory nature.

From Schedule XXII it will be observed that 896 blocks, comprising an area of 367,290 acres 2 roods 15 perches, were applied for during the year.

Including the applications outstanding at the close of the year 1896, the Local Land Boards dealt with 996 homestead selections during 1897. Of these 697, for an area of 306,263 acres 2 roods 21 perches, were confirmed, whilst 299 were either disallowed or withdrawn. The number of applications outstanding at the end of the year was 207.

From Schedule XXIII it will be seen that the number of homestead selections confirmed to the 31st December, 1897, was 1,797, comprising an area of 631,106 acres 1 rood 3 perches; but as 63 of these, containing 10,692 acres and 15 perches, were forfeited during the year, the total number in existence at the close of the year, exclusive of the applications outstanding, was 1,734, representing an area of 620,414 acres.

From Schedule LXXXIII it will be observed that 1,025 blocks, containing an area of 477,668 acres 0 roods 39 perches, were notified during the year as being set apart for homestead selection.

During the year twenty-four applications were made to convert conditional purchases and conditional leases into homestead selections. These applications included 33 conditional purchases and 8 conditional leases, the area represented being 9,462 acres 2 roods. The total number of conditional purchases and conditional leases, so converted, since the Crown Lands Act of 1895 came into operation, to the 31st December, 1897, is 103, the area comprised being 22,437 acres 3 roods 30 perches. (For further details, *see* Schedule XXVI.)

Sixty-three homestead selections, containing an area of 10,692 acres and 15 perches, were forfeited during the year for non-fulfilment of the required conditions. (For particulars, *see* Schedule XXIV.)

From Schedule XXV, which gives full particulars regarding the notification and disposal of homestead selection areas since the Crown Lands Act of 1895 came into operation, it will be observed that up to the 31st December, 1897, 3,585 blocks, comprising an area of 1,074,679 acres 1 rood 36 perches, had been set apart for homestead selection. As, however, 368 blocks, containing 103,888 acres 1 rood 27 perches, had been reserved or did not become available during the year, the actual

area available for selection up to the end of the year was only 970,791 acres 0 roods 9½ perches, comprised within 3,217 blocks. Of this area, 1,919 blocks, embracing an area of 692,255 acres 2 roods 31 perches, were selected, or 71 per cent. of the area available. The capital value represented by the land selected is £995,206 5s. 9d. A synopsis of the transactions in each of the Land Board Districts is furnished in the appended summary taken from Schedule XXV :—

Land Board District.	Quantity of land available.			Area selected.			Area unselected on 31st December, 1897.			Capital value represented by land selected.

Conditional Purchases.

The transactions in regard to this class of holding have been on the same restricted scale as in 1896.

The area applied for during 1897 was 241,789 acres 1 rood 4½ perches under 1,306 applications, whilst in the preceding year the area was 199,449 acres 3 roods 37 perches, and the number of applications 1,279.

From Schedules VIII and IX and the subjoined Summary it will be seen that of the applications received, 769 were for original conditional purchases, 513 for additional, and 24 for non-residential conditional purchases. The distribution of these applications in the various divisions into which the Colony is divided was as follows :—Eastern Division, 876 applications for 90,107 acres 0 roods 26½ perches; Central Division, 430 applications for 151,682 acres 0 roods 18 perches; and none in the Western Division.

Particulars relating to the number of applications received during the year for land within special areas, and for ordinary lands, also respecting the number and area of conditional purchases applied for from 1862 up to the present time, are furnished in Schedule X.

Of the applications made during the year, 619 were confirmed, for an area of 124,904 acres 0 roods 30 perches, and 217 were disallowed. Including the applications that were outstanding on the 1st January, 1897, the total number confirmed during the year was 1,033, for an area of 184,375 acres 1 rood 25 perches, and 321 were disallowed. (For further details, see Schedule XI.)

The incomplete conditional purchases current at the end of the year numbered 147,715, and embraced an area of 20,240,735 acres .0 roods 38½ perches, and the number of conditional purchases for which deeds of grant had been issued numbered 24,131, the total area so alienated being 2,882,662 acres 0 roods 21 perches. (See Schedule XXI.)

Only two hundred and fifty-four conditional purchases, representing an area of 35,768 acres 3 roods 4½ perches, were forfeited during the year, as against 443, containing 54,689 acres 0 roods 12 perches, for the preceding year. From Schedules XVIII and XIX it will be observed that of the total forfeitures 113 were due to non-payment of balance, interest, or instalment of purchase money, and 141 to non-fulfilment of the required conditions.

Under the provisions of the Crown Lands Act Amendment Act of 1891, forfeiture was conditionally waived in 223 instances, and absolutely waived in 322.

Extensions of time for payment of instalments were granted to the holders of 1,940 conditional purchases, the total area represented being 223,012 acres.

The provisions of Section 28, Crown Lands Act of 1895, by virtue of which resident conditional purchasers are enabled to obtain suspension of payment of instalments for a period of twelve months, were not nearly so largely availed of during the past year as in 1896. Applications were complied with in respect of 704 conditional purchases, containing 143,363 acres, and 142 applications were refused as compared with 2,027 granted and 353 refused in 1896.

The transactions under the Conditional Purchasers' Relief Act of 1896 show that its provisions have been largely availed of during the year under review. Relief was granted in connection with 1,252 applications, representing 3,448 conditional purchases, the difference between the original amount of annual instalments payable and the reduced amount being £9,844 4s. 3d. (For details, see Schedule XIV.)

	Number of Applications.	Number of Conditional Purchases.	Original Amount of Annual Instalment.			Reduced Amount of Annual Instalment.			Difference between Original and Reduced Amount.		
			£	s.	d.	£	s.	d.	£	s.	d.

Totals... ..	1,252	3,448	26,418	0	11	16,573	16	8	9,844	4	3

Full particulars relating to transfers received and dealt with during the year will be found in Schedules XVI and XVII. The number received was 8,854, and 9,299 were dealt with, representing 17,637 conditional purchases; but as the number of these purchases actually affected was only 11,896, a large proportion of them must have been transferred more than once.

Stamp duty was paid in connection with 3,342 transfers, the revenue received therefrom being £6,303 2s.

Six conditional purchases containing 1,012½ acres, and one conditional lease of 374 acres, were validated under the provisions of the 138th section of the Crown Lands Act of 1884 and the 44th section of the Crown Lands Act of 1889 during the year. (For details, see Schedule XX.)

The usual information relating to instructions issued to, and reports received from, conditional purchase inspectors is given in Schedule XCII. The total number of instructions issued was 13,454, and 12,830 reports were received.

No land was resumed from conditional purchases or conditional leases on account of its being auriferous. *Special*

Special Areas.

Two hundred and thirty-three special areas, embracing an area of 62,626 acres 3 roods 33 perches, were proclaimed during the year, as compared with 120, containing an area of 32,811 acres 2 roods 39 perches, proclaimed in 1896; 136 of these special areas included 53,700 acres 2 roods 38 perches of country lands, and the remainder, 97, containing 8,926 acres 0 roods 35 perches, comprised lands within population or suburban areas. (For further particulars, see Schedule LXXXII.)

From Schedule XII it will be observed that of a total available area of 136,907 acres 3 roods 21 perches of suburban or population area lands, 98,582 acres 0 roods 12 perches have been selected, and that of an area of 930,524 acres 1 rood 34 perches of country lands, no less than 815,814 acres 1 rood 27 perches have been selected. The area still available for selection on the 31st December, 1897, was 153,035 acres 3 roods 16 perches.

The transactions in each of the Land Board Districts since 1st January, 1885, is set forth in the appended summary, taken from Schedule XII:—

Land Board District.	Class of Land.	Quantity of Land Available.			Area selected.			Area unselected.

Schedule XIII supplies details relating to appraisements under the provisions of the 36th section of the Crown Lands Act of 1895 of the values of special area conditional purchases.

The total area covered by the applications to appraise was 597,011 acres 2 roods 17½ perches, and the values have been finally determined in respect of 577,501 acres 3 roods 18½ perches. The capital value of the latter area prior to appraisement was £1,152,495 8s. 1½d.; but as determined by appraisement is only £814,820 7s. 0½d., thus showing a reduction in capital value of £337,675 1s. 1d., which necessarily carries with it a proportionate diminution in the amount of the annual instalments payable. It may be stated that, prior to the appraisement, the annual instalments payable in respect of the 577,501 acres 3 roods 18½ perches, referred to, amounted to £57,625 15s. 5½d., whereas under the recently appraised values they will only amount to £40,741 0s. 4d., thus showing an annual loss of £16,883 15s. 1½d. It is anticipated that the appraisement of the balance of the area covered by the applications will also result in a reduction in the capital value.

The

The appended summary will serve to show the transactions in each of the Land Board Districts :—

SUMMARY.

Improvement Purchases.

The area of land within proclaimed gold-fields applied for to purchase in virtue of improvements, under section 46 of the Crown Lands Act of 1884, shows an advance on the previous year. The number of applications received during 1897 was 192, the number approved was 96, whilst 22 were refused, and 1 allowed to lapse. The area alienated amounted to 92 acres 0 roods 17¼ perches, comprised within 115 lots, the price realised being £1,543 3s. (For further particulars, see Schedule XXXVI.)

Special Purchases.

The transactions in connection with this class of alienations include applications for rescission of water frontage reservations (section 12, Act of 1861, and section 63, Act of 1884), for permission to reclaim and purchase land (section 64, Act of 1884), for the purchase of small, isolated areas, &c. (section 66, Act of 1884), for permission to close and purchase unnecessary roads (section 67, Act of 1884), and also for the granting of Crown lands in lieu of land resumed for roads (section 42, Act of 1889).

The number of applications received during the year was 105, of which 7 were under section 63, Act of 1884; 22 under section 64, Act of 1884; 10 under section 66, Act of 1884; 27 under section 67, Act of 1884; and 39 under the Public Roads Act of 1897.

The area alienated amounted to 1,145 acres 0 roods 16 perches, the purchase money received being £7,398 16s. 7d. The area disposed of in the year 1896 under these sections was 262 acres 0 roods 4 perches, the sum realised being £4,032 15s.

Under the 42nd section, Act of 1889, 114 cases were completed during the year, the area granted being 865 acres 0 roods 21¼ perches.

Further details will be found in Schedule XXXVII; but the Summary hereunder presents the year's transactions in a condensed form for reference :—

Section	Area sold.			Purchase Money.

Surrenders and Exchanges.

If a comparison of the transactions under this heading for the past year be made with those for the year 1896, it will be observed that the volume of business has been well maintained. One hundred and eighty-one applications were received during the year under review, as against 177 in 1896. Sixty-seven applications were refused or withdrawn, and 366 were outstanding at the close of the year. It may be explained

explained that the large number of cases outstanding is mainly due to the magnitude of the transactions, the importance of the interests involved, and to the protracted negotiations which are usually necessary before a proper basis of exchange can be arranged for the local Land Boards to inquire into.

During the year 63 cases, representing an area of 312,408 acres, 1 rood 39 perches were finally completed, and the surrenders accepted by the Governor-in-Council. (*See Schedule XXXVIII.*)

Among the more important of the exchanges completed during the year the following may be mentioned, viz. :—Yanga, Stonehenge, Cooma, and Baan Baa, in connection with which 35,678 acres were surrendered to the Crown. Boorooma, 39,692 acres; Beremegad, 14,710 acres; Tubbo, 14,027 acres; Coree, 12,303 acres; Gonn, 10,842 acres; Yarrawin, 10,829 acres; Bland, 9,827 acres; Narromine, 7,375 acres; and Berida, 7,261 acres.

On completion of the surrenders the land, if not within a leasehold area, is at once classified and thrown open to selection, or if too limited in extent for new settlement, is added to adjoining selections.

Deeds of Grant.

Two thousand and ninety-nine deeds of grant were prepared during the year, the area represented being 262,391 acres 1 rood $16\frac{11}{20}$ perches. These figures show a slight decrease on those for the year 1896, in which year 2,168 deeds were prepared, for an area of 296,438 acres 1 rood $33\frac{3}{4}$ perches. (*See Schedule XXXIX.*)

Although the number of deeds prepared is less than for the year 1896, still the work performed during the year 1897 was quite as great, if not greater, than in the preceding year. As indicated in the report for 1896, the amount of detail work in connection with the preparation of deeds in exchange cases is very much greater than in ordinary cases, more particularly with regard to investigation of the titles to the lands to be surrendered, many of which are of a very complicated nature, necessitating the utmost care and attention in dealing with them.

Volunteer Land Order Applications.

During the year 2 of these applications were received, 1 being for land within the Tamworth Land District and 1 for land in the Windsor District. Four applications, representing an area of 200 acres, were granted.

The number of these applications received in the year 1896 was 12.

Settlement Leases.

From Schedule LXXXIV it will be seen that the settlement lease areas notified during the year 1897 contained 367 farms, embracing an area of 1,046,999 acres.

The number of leases applied for during the year was 326, the area embraced being 902,389 acres, and the annual rental £10,314 15s. 11d. Applications for 225 farms, containing $619,461\frac{1}{4}$ acres, were confirmed, and applications for 71 farms were outstanding at the close of the year. (For further particulars, *see* Schedule LVII.)

The total number of leases executed and issued from the date the Crown Lands Act of 1895 came into operation to the end of the year 1897 was 427, embracing an area of 1,174,207 acres. The rental returned by this area was £13,988 14s., or an average of about 3d. per acre. (For further details, *see* Schedule LVIII.)

During the year 5 leases, containing an area of 12,294 acres, to which a rental of £146 5s. 2d. was attached, were declared null and void, and 3 leases, comprising an area of 8,355 acres, and returning an annual rental of £104 8s. 9d., were declared forfeited. (*See* Schedule LIX.)

In Schedule LX full particulars are furnished regarding the notification and disposal of settlement lease areas since the Crown Lands Act of 1895 came into operation. From this Schedule it will be seen that up to the 31st December, 1897, an area of $3,139,454\frac{1}{4}$ acres, comprised within 996 farms, had been set apart for settlement lease. Of this area, however, only 803 farms, containing in all 2,578,652 acres 3 roods, became available for selection before the close of the year, and of these farms, 529, embracing an area of 1,469,311 acres 2 roods, had been selected, thus showing that of the area available for selection 57 per cent. had been applied for. The capital value of the land selected was £1,464,678 8s. 10d. The

The appended summary of the transactions in each of the Land Board Districts is extracted from Schedule LX :—

Annual Leases.

At the close of the year 1897, 10,070 annual leases, containing 5,960,604 acres 2 roods 2 perches, were in existence, the revenue derived therefrom being £41,287 13s. 10d. per annum. (See Schedule LXXIII.)

The following table shows the number, area, and rental of the leases in existence in each Division of the Colony at the end of 1897 :—

Division.	Number.	Area.	Rent.
		a. r. p.	£ s. d.
Eastern	8,903	5,090,328 2 2	33,606 18 5
Central	1,090	797,250 0 0	7,047 16 1
Western	77	73,026 0 0	632 19 4
	10,070	5,960,604 2 2	41,287 13 10

Twelve hundred and twenty-three leases lapsed during the year, the area being 780,464 acres 1 rood 6 perches, and the rental £5,622 11s. 3d. The cancellations numbered 67, the area covered being 101,188 acres 3 roods, to which a rental of £252 8s. 11d. was attached. (Schedule LXXII.)

The number of applications disposed of during the year was 2,586, of which 2,155 were granted, and 431 either disallowed or withdrawn. Some of these applications were lodged prior to 1897. The area leased in satisfaction of the applications granted was 1,232,251 acres 3 roods 19½ perches, the rental derived therefrom being £7,717 17s. 2d. (Vide Schedule LXX.)

The area offered for lease by auction during 1897 was 77,571 acres 1 rood, of which 33,232 acres 1 rood were sold, the annual rent realised being £617 18s. 5d. (Schedule LXXI.)

The following table extracted from Schedules LXX and LXXI gives the number of applications made, the area applied for, and the area leased by auction during the past five years :—

Year.	Applications made.	Area applied for.	Area leased by auction.
		a. r. p.	a. r. p.
1893	2,130	1,390,212 1 13	10,709 0 0
1894	1,779	1,018,615 0 0	11,042 0 0
1895	2,444	1,458,627 2 0	6,929 3 0
1896	1,928	1,072,830 0 35½	8,689 2 0
1897	2,322	1,473,680 1 24	33,232 1 0

If a comparison of the transactions of the past year be made with those of 1896 a substantial increase will be observed both in regard to the applications made and the area applied for. *Conditional*

Conditional Leases.

The number of applications received in 1897 was 713, for an area of 298,819 acres.

From the appended schedule it will be noticed that the decline in the transactions relating to this class of lease as compared with those of past years still continues. As pointed out in the Annual Report for 1896 the diminution in the number of applications made is in a large measure due to the residence conditions imposed by the Crown Lands Act of 1895, and to the popularity of the classes of holding created by that Act.

Full details regarding the applications received during 1897 will be found in Schedule XXVII; and a summary of those received annually since 1885, the year in which this class of holding was introduced, is shown hereunder.

Year.	Number.	Area.			Deposits.		
		a.	r.	p.	£	s.	d.
1885	3,816*	2,547,045	0	15*	21,225	7	6
1886	2,500	1,207,953	0	8	10,066	5	6
1887	2,228	1,242,380	0	0	10,353	3	4

1894	1,338	528,612	2	30	4,409	9	10
1895	1,120	478,301	3	20	3,985	1	8
1896	736	335,101	1	30	2,783	7	5
1897	713	298,819	0	0	2,498	11	9

* This includes 1,994 applications, made under 54th section of the Act of 1884, representing an area of 1,198,617 acres 0 roods 30 perches.

During the year 767 applications were dealt with, 540 being confirmed, for an area of 212,093 acres 3 roods 18 perches, and 247 disallowed. Of the applications confirmed, 249 were made during 1897, and embraced an area of 93,197½ acres; and of the applications disallowed, 157 were lodged during that year. Further particulars will be found in Schedule XXVIII.

Two thousand eight hundred and thirty-two transfers were passed during 1897, the number of leases affected being 1,973, representing an area of 1,444,847 acres 2 roods. (See Schedule XXIX.)

During the year there were 167 conversions of conditional leases into conditional purchases under the provisions of section 25 of the Crown Lands Act of 1889. The whole of the leases were converted in 91 cases, whilst only parts of the leases were converted in the remainder of the cases. The total area so converted amounted to 51,278 acres 3 roods 30 perches, to which a rental of £682 1s. 9d. formerly attached. (For details, see Schedule XXXI.)

In 593 cases the rents recommended by the Local Land Boards were approved by the Minister, and no references were made to the Land Appeal Court.

Extension of time for the payment of rent was granted in 387 cases, the amount thus deferred being £5,020 1s. 4d. Forfeiture was provisionally waived in 169 instances, and absolutely waived in 202 cases.

The number of leases gazetted as approved during the year was 593, containing 239,702 acres 2 roods 18 perches, the rental represented being £2,664 1s. 7d. The total number of gazetted leases in existence at the end of the year was 22,297, containing 12,690,078 acres 0 rood 32½ perches, and returning an annual rental of £151,284 12s. 6d. Full details will be found in Schedule XXXII.

One hundred and seventy two leases were gazetted as forfeited during the year. These embraced an area of 75,293 acres, and the rental attached thereto was £867 18s. 6d. (Schedule XXX.)

Since December, 1885, an area of 9,988 acres 0 roods 37 perches has been cancelled, out of 19 leases, on account of the land being auriferous.

Pastoral

Pastoral Leases.

The pastoral leases current on 31st December, 1897, were 744 in number, containing a total area of 52,718,545 acres, and returning an annual rental of £271,903 11s. 3d. Of these leases, 436 were situated in the Central and 308 in the Western Division. The appended Schedule gives the area leased in each division and the rental obtained. (For further details, *see* Schedule XL.)

No. of Leases.	Division of Colony.	Area.	Rent.
436	Central	acres. 12,623,807	£ s. d. 135,548 7 5
308	Western	40,094,738	136,355 3 10
744		52,718,545	271,903 11 3

One forfeiture occurred during the year. (Schedule XLVII.)

An area of 385,199 acres was withdrawn from pastoral lease for public purposes during the year. This area was distributed over 89 leaseholds, and the sum of £2,160 12s. 9d. was refunded to the lessees on account of rent paid in advance upon the area so withdrawn. (Schedule XLI.)

Seventy-five pastoral leases were transferred during the year; of these, 40 were situated in the Central and 35 in the Western Division. (Schedule XLII.)

The reappraisements, under section 9 of the Crown Lands Act of 1895, of pastoral leases in the Western Division were finally completed during the year. The total number of leases appraised under this section was 263, representing an area of 34,749,955 acres. The original rental derived from this area was £165,584 9s. 11d., whilst the rental as determined by the reappraisal is £118,137 11s. 2d., showing a reduction of £47,446 18s. 9d. per annum. The average rate per acre, according to the original rental, was $1\frac{1}{100}$ d., whilst under the recently-appraised rental the average rate per acre is $\frac{8}{100}$ d. The difference between the two rentals represents a diminution of 27 per cent. on the original rate. (For further details, *see* Schedule XLV.)

During the year the reappraisements, under section 29 of the Crown Lands Act of 1889, of 21 pastoral leases in the Western Division was also completed. The area comprised was 1,288,418 acres, which formerly returned a rental of £7,730 5s. 10d. per annum. The rentals, as reappraised, show a slight reduction on former rates. The subjoined statement gives full particulars as to areas, rentals, &c.:—

Local Land Board District.	No. of Leases.	Area.	Rent according to original Rate.	Rent according to New Rate.
		acres.	£ s. d.	£ s. d.

	21	1,288,418	7,730 5 10	7,499 2 9
Average rate per acre	$1\frac{4}{100}$ pence.	$1\frac{3}{100}$ pence.

During the year 1897, 11 applications were made under section 8 of the Crown Lands Act of 1895 for the attachment of resumed areas to their respective leasehold areas. The area covered by these applications was 1,660,294 acres. Twenty applications, for a total area of 1,973,289 acres, were approved, and 8, for an area of 1,024,170 acres, were either refused or withdrawn. (For further details, *see* Schedule XLIII.)

The names and numbers of the pastoral leases that expired during 1897 will be found in Schedule XLIX, and details of those which will expire in 1898 will be found in Schedule XLVIII.

The area gazetted as withdrawn from pastoral lease during the year, under the provisions of sections 3 and 6 of the Crown Lands Act of 1895, to meet the demand for land for closer settlement, was 547,567 acres, of which 514,867 acres were situated in the Central Division, and 32,700 acres in the Western Division. Preliminary notification of the intention to withdraw was gazetted in respect of 11 other holdings, all of which are situated in the Central Division. (For particulars of areas withdrawn, and for the names of the holdings from which it is proposed to withdraw land, *see* Schedule L.)

The undermentioned pastoral leases situated in the Central Division were declared scrub land under the 35th section of the Crown Lands Act of 1889, and brought under the West Bogan agreement:—

No. of Pastoral Leases.	Name of Pastoral Leases.
753 Buddabudah.
754 Euambeline.

Occupation Licenses.

The licenses in force during 1897 numbered 1,713, covering an area of 36,960,446 acres, and returning an annual rental of £100,529 9s. 4d. (Schedule XL.)

It will be observed from the Table appended that the licenses current during the year show a slight increase in point of numbers when compared with those held in 1896, but the acreage and rental both show decreases.

Current on 31st December, 1896.				Current on 31st December, 1897.

Of 156 licenses, containing 1,727,464 acres, which were offered for sale by action or tender, 64, embracing an area of 863,680 acres, were disposed of. The number and area of those sold in 1896 was 104, containing 1,478,202 acres. (For further details, *see* Schedule XLIV.)

Twenty-five preferential occupation licenses were not renewed for 1897. Of these, 11 are situated in the Eastern and 14 in the Central Division; whilst of ordinary occupation licenses, 35 were not renewed, 15 of which were within the Eastern, 18 within the Central, and 2 within the Western Division. (*See* Schedule XLVII for further details.)

Thirty-seven preferential and 81 ordinary occupation licenses were transferred during the year. (*See* Schedule XLII.)

An area of 2,167,636 acres was withdrawn from 417 occupation licenses during the year for purposes of alienation, reservation, &c.; and as the rent is paid in advance, the withdrawal of this area necessitated the refund to licensees of the sum of £9,903 5s. (*See* Schedule XLI.)

The license fees of 26 resumed areas were reappraised and gazetted during the year under the provisions of the 81st section of the Crown Lands Act of 1884. (For names of areas and other details, *see* Schedule XLVI.)

Information relating to the attachment of resumed areas to leasehold areas will be found in the chapter dealing with Pastoral Leases and in Schedule XLIII.

In connection with the reappraisements under section 9 of the Crown Lands Act of 1895 of occupation licenses in the Western Division, 144 applications in all were received, and action has been completed in respect of the whole of them. The area reappraised was 17,334,681 acres, which formerly produced a revenue of £34,448 7s. 2d. per annum; the rental, as determined by the reappraisements, amounts

amounts to £16,497 4s. 10d., thus showing a reduction on the former rental of £17,951 2s. 4d., being a decrease of 52 per cent. The average rate per acre, according to the original rental, was 48d., whilst under the recently appraised rental the rate is 23d. (For details, *see* Schedule XLV.)

In Schedule LI will be found details respecting areas and rentals of certain preferential occupation licenses, embracing expired leaseholds in the Central Division which were appraised during the year under review.

Homestead Leases.

The number of homestead leases in existence on the 31st December, 1897, was 1,243, containing an area of 10,381,324 acres, and producing a rental of £56,177 19s. 8d.

As pointed out in previous Reports, these leases are only granted in the Western Division, and are situated within the Land Board Districts of Bourke, Hay, and Moree. The Bourke District is credited with 790 leases, embracing 6,726,065 acres, yielding a rental of £34,602 11s. 7d., the average rate per acre being 1.23d.; Hay, with 330 leases, containing 2,621,874 acres, yielding a rental of £13,050 15s. 7d., the average rate per acre being 1.19d.; and Moree, with 123 leases, containing 1,030,385 acres, producing a rental of £8,524 12s. 6d., the average rate per acre being 1.98d. (Further details will be found in Schedule LVI.)

The number of applications lodged during the year was 78, as against 89 in the year 1896.

The details furnished in the subjoined Schedule will afford a means of comparing the number of applications, area applied for, &c., during the last thirteen years. (For full particulars, *see* Schedule LII.)

Year.	No. of Applications.	Area applied for.	Deposits lodged.		
		acres.	£	s.	d.
1885	391	3,823,235	15,880	2	11
1886	121	1,141,963	4,758	3	7
1887	128	1,198,286	4,992	17	2
1888	141	1,332,691	5,511	15	7
1889	238	2,187,837	9,113	19	9
1890	310	2,620,959	10,920	13	3
1891	191	1,515,629	6,278	2	1
1892	176	1,214,447	5,648	16	6
1893	135	870,044	3,582	10	4
1894	110	692,515	2,885	9	7
1895	106	613,723	2,557	3	7
1896	89	605,146	2,521	8	10
1897	78	494,680	2,055	4	11

The number of homestead leases granted during the year was 61, representing an area of 419,840 acres and a rental of £1,246 18s. 11d., as against 79, containing 459,453 acres, and returning a revenue of £1,383 4s. 3d., granted in 1896. The average rental per acre of the area leased in 1897 was 7d., practically the same average as for the year 1896.

Thirty-five applications were either refused or permitted to be withdrawn, and 60 were outstanding at the close of the year. (For fuller details, *see* Schedule LIII.)

Forty-five leases, embracing an area of 311,830 acres, and representing a rental of £1,270 0s. 10d., were forfeited during the year. (Further particulars will be found in Schedule LIV.)

The reappraisal under section 9 of the Crown Lands Act of 1895 of the rentals of homestead leases was completed during the year. Applications for reappraisal were made in connection with 730 leases; but, as 18 applications were withdrawn, the total number of leases dealt with was 712. From Schedule LV it will be observed that the total area reappraised was 6,612,077 acres, which formerly returned an annual rental of £47,258 12s. 8d. The rental, as determined by the reappraisal, however, only amounts to £35,322 14s. 2d., thus showing a reduction of slightly over 25 per cent. The average rate per acre, according to the original rental, was 1 $\frac{7}{100}$ d., whilst, according to the new rate, it is only 1 $\frac{2}{100}$ d. per acre.

During

During the year the reappraisements made under section 29 of the Crown Lands Act of 1889 of 90 Homestead Leases were also completed. These leases comprised an area of 658,697 acres, which formerly returned a rental of £5,232 12s. 3d. The rental as determined by the reappraisements is £4,537 17s. 0d., showing a reduction of £694 15s. 3d. on the former rent. (For further details, *see* Schedule appended.)

Average rate per acre			1 13 ¹ / ₁₀ d.			1 13 ¹ / ₁₀ d.		

172 transfers were completed during the year, and 37 were outstanding at the close of the year.

Special Leases.

The applications received for special leases show a very marked increase on the year 1896, being 514 as against 275. As 286 applications were pending on the 31st December, 1896, the total number requiring action during the year was 800. Of these 398 were dealt with, 184 being declined, withdrawn, &c., and 214 granted. The granted leases represent an area of 8,748 acres 3 roods 10³/₄ perches, the annual rental produced being £3,009 9s. 10d. The applications pending at the close of the year numbered 424. (Further details will be found in Schedule LXII.)

Forfeitures of these leases were more numerous than in the previous year, the number forfeited during 1897 being 28, embracing an area of 1,015 acres 1 rood 36¹/₂ perches, with an annual rental of £271 12s., as against 12, containing 491 acres 3 roods 12 perches, and producing a revenue of £184 10s. in the year 1896. (For full details, *see* Schedule LXIII.)

Including the leases which terminated by effluxion of time on the 31st December, 1897, the number of leases current on that date was 804, comprising an area of 25,695 acres 1 rood, and producing an annual rental of £16,332 0s. 2d. Sixty-three leases, covering an area of 956 acres 1 rood 24¹/₄ perches, expired by effluxion of time during the year. (For further details, *see* Schedules LXIV and LXV.)

Special leases are granted under the provisions of sections 89, 90, and 92, of the Crown Lands Act of 1884, and section 46 of the Crown Lands Act of 1895, for the various purposes specified hereunder:—

Under section 89—

Floating docks, jetties, piers, and wharfs below high-water mark.

Under section 90—

Accommodation house.	Freezing works.	Sericulture.
Accommodation paddock.	Gravel (to obtain).	Shells (to obtain).
Agriculture.	Grazing.	Ships (building or repairing).
Bakery.	Guano (to obtain).	Skin-drying and packing.
Ballast (to obtain).	Inn.	Slaughter-houses.
Bathing places.	Irrigation.	Smelting-works.
Bee and Poultry Farm.	Landing-places.	Smithy.
Boats (building and repairing)	Lime-kilns.	Stables and accommodation paddocks.
Boiling-down works.	Limestone (to obtain).	Store.
Brick earth (to obtain).	Loam (to obtain).	Sugar-cane growing.
Brick-kiln.	Machinery (erection of).	Storage purposes.
Bridges.	Mail stations in sparsely-populated districts.	Tanks.
Cricket.	Pipe-line.	Tanneries.
Dairying.	Public recreation and Show Ground.	Tobacco growing.
Dams.	Punt-houses.	Vegetable garden.
Drainage.	Quarries.	Village settlement.
Eucalyptus (cultivation of).	Railway station and dépôt.	Wattle-growing.
Explosives (sites for storage of).	Recreation.	Well.
Factory.	Residence.	Wharfs (above high-water mark).
Ferries.	Saw-mills.	Wool-washing establishments.
Fisheries.		Working mineral springs.

Under section 92—

Irrigation works and tramway purposes.

Under section 46, Crown Lands Act of 1895—

Business purposes.

Erection of buildings.

Artesian

Artesian Well Leases.

During the year one artesian well lease was gazetted as approved, representing an area of 10,240 acres, with a rental of £16 per annum. The total number of these leases current at the close of the year 1897 was 36, comprising an area of 368,611 acres, with an annual rental of £1,013 18s. 7d.

Improvement Leases.

This class of holding was brought into existence to provide for the occupation and improvement of large tracts of vacant Crown lands which by reason of their inferior quality could not be profitably held under any of the ordinary forms of tenure. These leases can be acquired either at auction or by tender, long tenure and nominal rental being the inducements offered; they are, however, as their designation indicates, subject to a condition of improvement, a condition which is strictly enforced.

On reference to Schedule LXI, Part A, it will be seen that during the year 81 leases, of a total area of 880,820 acres, were sold by auction, the annual rental realised being £1,707 12s. 8d.; and tenders were accepted for 32 others, containing an area of 464,498 acres, representing an annual rental of £423 1s. 4d. From Part B of Schedule LXI it will be seen that on the 31st December, 1897, the number of these leases in existence was 218, embracing an area of 2,286,248 $\frac{1}{4}$ acres, producing a revenue of £2,955 8s. 4d., an average of .24d. per acre; and that 19 leases aggregating 288,322 acres, were declared void during the year 1897, the rental represented being £277 7s. 9d.

Scrub Leases.

A substantial increase in the number of applications for this class of lease is noticeable; the number received during the year 1897 being 36, aggregating 554,690 $\frac{1}{2}$ acres, and in addition to these 21 applications, representing an area of 547,288 acres, were outstanding at the close of 1896, making a total of 55 leases requiring action during the year. Of these 4 were granted embracing an area of 17,312 $\frac{1}{2}$ acres, the annual rental represented being £40 19s. 9d., and 9 were disallowed or withdrawn.

No leases expired during the year, but two were forfeited covering an area of 12,107 $\frac{1}{2}$ acres, representing a rental of £48 18s. The number of leases current at the end of the year was 40, containing an area of 222,298 acres, returning an annual rental of £327 3s. 6d. (Full details will be found in Schedule LXVI.)

Leases of Inferior Lands.

No leases were granted during the year, but two were declared forfeited, the area and rental being respectively 4,950 acres and £3.

The number of leases current at the close of the year was 37, containing an area of 422,275 acres, and returning a rental of £354 0s. 7d. per annum. (Schedule LXVII.)

Residential Leases.

The transactions in connection with these leases show a decided increase when compared with the year 1896. The applications received during the year numbered 101, and these, added to 82 outstanding at the close of 1896, give a total of 183 that were under action during 1897. Nineteen applications were either disallowed or withdrawn, and 47 were granted for an area of 699 acres 3 roods 4 perches, at a rental of £73 8s.

The forfeitures for the year numbered 12, representing an area and rental of 93 acres 0 roods 21 $\frac{1}{4}$ perches and £15 1s. 6d. respectively.

The number of leases current at the close of the year was 211, covering an area of 2,293 acres 1 rood 35 perches, and producing an annual revenue of £322 4s. 11d. (For further particulars, see Schedule LXVIII.)

Snow Leases.

One of these leases, embracing an area of 7,002 acres, was granted during the year, at a rental of £43 15s. 3d., and five containing 24,685 acres, which returned a rental of £240 2s. 3d., were forfeited.

The leases current on the 31st December, 1897, were 21 in number, containing an area of 94,997 acres, and producing an annual rental of £577 11s. 4d. (Schedule LXIX.)

Dedications—

Dedications—Reserves—Resumptions.

The number of reserves from sale notified during the year was 1,247, embracing an area of 961,281 acres, and the reserves from sale revoked numbered 1,878, representing an area of 2,634,829 acres. (Schedules LXXVII and LXXVIII.)

Reserves from lease and license, annual lease, &c., notified in 1897, were 314 in number, comprising 1,703,567 acres. The revocations of similar reserves during the year reached a total of 343, the area contained therein being 631,291 acres. (Schedules LXXIX and LXXX.)

The dedications for religious and public purposes during the year were 188 in number, representing an area of 3,645 acres 2 roods 16 $\frac{3}{10}$ perches. Particulars as to the respective purposes for which these lands were dedicated will be found in Schedule LXXXI.

During the year 1897 the area resumed under the provisions of the 105th section of the Act of 1884, the 41st section of the Act of 1889, and section 7 of the Public Trusts Act of 1897, was 403 acres 1 rood 17 perches. Full particulars of the land so resumed may be found in Schedule LXXVI.

Newcastle Pasturage Reserve.

There are 579 holdings under the Newcastle Pasturage Reserve Act on which the payment of purchase money is still proceeding. During the year the balances on 17 purchases were paid, making the total number of holdings fully paid up 319, representing a capital value of £19,474 4s. 3d. Further particulars are contained in Schedule LXXV.

Cases of Trespass on Crown Land.

Four hundred and three cases of trespass on Crown lands were reported during the year; and as 321 cases had not been dealt with at the end of 1896, the total number requiring action during the year was 724. From Schedule LXXXV it will be observed that 379 cases were dealt with in various ways, leaving a balance of 345 on which action had not been completed at the close of the year.

Applications for permission to Ringbark.

During the year, 179 applications were received, covering an area of 1,198,379 $\frac{3}{4}$ acres, the fees lodged in connection therewith amounting to £501. Of the applications received prior to 1897, 71 were granted, also 101 of those received during the year, making a total of 172, representing an area of 1,064,411 acres. During the year, 29 applications were disallowed, and at the close thereof 63 were outstanding. (For further details respecting these transactions, see Schedule XCIII.)

Permissive Occupancies.

On the 31st December, 1897, 547 permissive occupancies were in existence, the area included being 50,739 acres 2 roods 26 perches, and the rental derived £984 2s. 10d. (For further details, see Schedule LXXIV.)

Cases dealt with by Local Land Boards.

During the year under review, 18,952 cases were considered by the Local Land Boards, of which 1,355 were adjourned. A comparative statement for the past five years is appended, and further details will be found in Schedule XCI.

1893	30,910 cases considered;	2,830 cases adjourned;	1,449 $\frac{1}{2}$ days occupied.
1894	25,988	2,055	1,438
1895	21,436	1,970	1,236 $\frac{1}{2}$
1896	22,067	2,308	1,697
1897	17,597	1,355	1,266

Correspondence.

Correspondence.

The number of documents received and registered in the Head Office during the year was 128,117, representing an increase of 3,079 as compared with 1896. (Schedule XCIV.)

During the year, 171,331 printed and manuscript letters, schedules, parcels, &c., were despatched, in addition to which 2,090 telegrams were sent and 94 circulars were issued. (See Schedule XCV.)

112,004 letters were received at the various Local Land Board Offices during the year, as against 115,690 received in 1896; 112,730 manuscript and printed letters, parcels, &c., were despatched. Further particulars will be found in Schedule XCVI.

Church and School Lands.

From Part A of Schedule LXXXVI it will be seen that the number of pastoral leases granted under the Church and School Lands Dedication Act of 1880, current on the 31st December, 1897, was 342, comprising an area of 254,600 acres 3 roods 7 perches, and returning a rental of £6,199 9s. 7d. per annum.

From Part B of Schedule LXXXVI it will be observed that the agricultural leases current on that date numbered 334, containing an area of 10,536 acres 2 roods 7 perches, the revenue derived being £1,750 6s. per annum.

From Part A of Schedule LXXXIX it will be seen that 21 pastoral leases were offered at auction, of which 11 containing 6,309½ acres were sold, the annual rental derived being £340 14s., and 2 comprising an area of 2,700 acres were let by tender at a rental of £23 per annum. Of agricultural leases 105 were offered at auction, of which 5 embracing an area of 72 acres 3 roods 6 perches were sold realising a rental of £11 per annum, and 3 containing 10 acres were let by tender at an annual rental of £3 5s. For further details see Schedule LXXXIX, Part B.

Seven applications for mineral leases covering an area of 305 acres were lodged during the year. As 14 applications were outstanding on the 31st December, 1896, the total number requiring action during the year was 21. Of these 19 were granted for an area of 1,125 acres at a rental of £271 5s. One lease of 20 acres was cancelled. The number of these leases current on the 31st December, 1897, was 25; the area included 1,349 acres 0 roods 1 perch, and the rental derived £334 3s. 8d. See Part A of Schedule LXXXVII.

For gold leases, 15 applications were received. Including the applications outstanding at the close of the year 1896, the number requiring action was 31. Twenty were granted, leaving 11 on which action had not been completed. The 20 leases that were granted comprised an area of 149 acres 3 roods 30 perches, the rental obtained being £150. The leases cancelled during the year numbered 20, containing 120 acres 3 roods 26 perches, and 1 lease comprising 5 acres expired. The gold leases current on the 31st December, 1897, numbered 95, the area included being 636 acres 3 roods 33 perches, and the rental obtained £702 16s. 0d. (For further details, see Part B of Schedule LXXXVII.)

The leases current on the 31st December, 1897, which have been granted for building and similar purposes, for specified periods, numbered 44, representing an area of 27 acres 2 roods 8¼ perches, the rental derived being £554 15s. (See Schedule LXXXVIII.)

Three leases of a miscellaneous character, containing 28 acres 1 rood 28 perches, and returning a rental of £10 15s., were also current at the close of the year. (Schedule XC.)

Cost of Survey.

Particulars as to cost of the various classes of measurements effected during the year 1897 by licensed surveyors paid on fees will be found in Schedule XCVIII.

Chief Surveyor.

The Report of the Chief Surveyor and Director of Trigonometrical Survey is appended hereto.

WM. HOUSTON,
Under Secretary.

SCHEDULE XCIX.

STATEMENT showing revenue received by the Forest Branch for the half year ended 31st December, 1897.

Particulars.	Amount.	Totals.
	£ s. d.	£ s. d.
Royalty—"Class C," at per 100 sup. feet—2,000,000 ft.	1,040 1 7	
„ Under tree permit at per tree	103 8 6	
„ Miscellaneous	16 14 0	1,160 4 1
Licenses—Forest Reserves—		
„ Class C, with royalty	149 10 0	
„ Classes A and B, without royalty	405 0 0	
„ Wattle Bark	51 0 0	
„ Saw-mill sites	31 0 0	636 10 0
Licenses—Crown Lands—		
„ Cedar, 333 issued	185 10 0	
„ Quarry, 105 issued	75 0 0	
„ Wood-cutters, 3,700 issued	920 0 0	
„ Fuel, 1,510 issued	215 0 0	1,395 10 0
Miscellaneous Revenue—		
Rent of prickly-pear leases	219 13 9	
Sales of confiscated material	250 12 0	
Penalties	84 2 6	554 8 3
Total revenue for the half year ending 31st December, 1897		3,746 12 4

Report of the Acting Chief Surveyor to The Under Secretary for Lands.

Sir,

Department of Lands, Sydney, 5 February, 1898.

I do myself the honor to submit for your information the annual report of the services carried out in this branch of the Department, being for the year 1897.

Permanent field staff.

The field staff permanently attached to the Department comprised 64 officers with the following classification, namely :—13 district surveyors, 36 salaried surveyors, 9 assistant surveyors, and 4 field assistants.

Promotions.

Mr. Assistant Surveyor A. E. Roberts, who had been for some time carrying out the duties of a staff surveyor, was promoted to the position of a surveyor on the permanent establishment.

Examination and appointment.

At the instance of the Public Service Board an examination was held to determine the qualifications of candidates for a vacancy on the permanent staff of this Department for an assistant surveyor. Messrs. E. Twynam, Chief Surveyor, T. F. Furber, Dr. R. N. Morris, H. R. Carleton, and J. J. K. Bradfield were constituted the Board for the purpose. Mr. H. B. Mathews, one of the junior licensed surveyors, was found to be qualified for the position and received the appointment. It may be mentioned that the same Board was charged with the examination of candidates for positions as engineering draftsmen and assistant surveyors in the Department of Public Works.

Resignations.

There were three resignations from the permanent field staff, namely, two assistant surveyors and one field assistant.

Contract surveyors.

Seventy-nine surveyors were engaged on contract surveys; their total earnings amounted to £41,305.

Inspection of contract surveys.

Forty-eight reports on examination of surveys carried out by licensed surveyors on fees were received. In seven cases only were the surveys reported as not being up to the standard required by the survey regulations of the Department.

Licenses under the Real Property Act.

Two meetings of the Board for granting annual licenses under the Real Property Act were held, at which ninety-one renewals were approved of. The annual fee of £1 1s. was received for each license, except in three cases in which, owing to the special circumstances under which they were issued, the fee was not demanded.

Investigations for the Registrar-General.

Thirty-two cases relating to applications for certificates of title under the Real Property Act, and eleven cases relating to alleged errors in surveys were referred by the Registrar-General to this Department for report. After investigation in this office the Registrar-General was informed of the result in each case.

BOARD OF EXAMINERS OF CANDIDATES FOR LICENSE TO SURVEY CROWN LANDS.

As in the previous year, the five colonies, Queensland, New South Wales, Victoria, South Australia, and West Australia, have co-operated in respect to examinations for surveyors, simultaneous and identical examinations being now held where needed throughout the colonies named. As in the previous year Mr. T. F. Furber, F.R.A.S., acted as the representative of this Board in the preparation of papers for examinations in March and September. The March examination was not, however, held in this colony, there not being a sufficient number of candidates to warrant it.

At the examination held in Sydney in September six candidates presented themselves, of whom the following were found qualified, viz. :—

Francis Edmund Wickham.
Frank Chapman.

TRIGONOMETRICAL

TRIGONOMETRICAL SURVEY.

Mr. J. Brooks, F.R.A.S., F.R.G.S., Surveyor-in-charge of Field Operations, reports that the weather during the past year was on the whole fairly satisfactory for horizontal observations. Mr. Brooks' service.

The main triangulation has been extended southerly along the coast to Wolumla Station, thence westerly to Coolangubra (new) and Bukalong Stations, and northerly to Glenbog Station. The 18-in. altazimuth was used at those stations and also at Cooma Station. Astronomical observations were made for determining latitude and azimuth at Wolumla, Glenbog, and Cooma Stations; 2,181 horizontal angles were measured, 184 stars were observed for latitude, 184 stars for azimuth; and 23 stars for time.

The 10-inch theodolite was used for second-class work at Cathcart, Stannard, Wangrah, and Cosgrove Stations, and 1,167 horizontal and 648 vertical angles were measured. Magnetic observations were also made at those stations.

Reserves for protection of stations were measured at Bimmil, Wolumla, Cathcart, Glenbog, and Stannard.

A series of check levels was run between Bimmil Station and a bench mark on the trial survey for a railway line between Bega and Eden.

Mr. Surveyor Gregson, using a 10-inch theodolite, carried out observations at Wadbilliga, Bemboka, Burragate, Imlay, Skelton, Mowwarry, and Nagha Stations; 1,942 horizontal angles and 491 vertical angles were measured. Magnetic observations were also made at these stations. Mr. Gregson's service.

Reserves for the protection of fifteen stations were measured and marked, and seven connection surveys were carried out by Mr. Gregson.

Mr. Healy, Piling Overseer, piled and cleared twenty new stations in Counties of Buccleuch, Harden, and Wynyard, measuring reserves and connections where necessary. Preliminary work.

Mr. Gordon, Piling Overseer, formed twenty-five new stations in Counties Cowley, Buccleuch, Wallace, and Wellesley, measuring the necessary reserves and connections.

TRIGONOMETRICAL COMPUTING BRANCH.

Field books of angles at the following Stations have been received, viz.:—Wolumla, Coolangubra (new), Bukalong, Glenbog, and Cooma, observed at with 18-inch theodolite, and at Umaralla, Wadbilliga, Bemboka, Burragate, Imlay, Skelton, Mowwarry, Cathcart, Stannard, Wangrah, Nagha, and Cosgrove measured with 10-inch theodolite. The details of these observations have been reduced and entered in the record books, and the whole of the computations were carried to as forward a state as was practicable, reduction in some cases being made in advance of completion of the field work, demand for provisional information being anticipated.

The computations connected with the triangulation of the County of St. Vincent have been entered in the records in duplicate. The triangulation of the County of Dampier has been calculated, and the details have been similarly entered, while provisional positions have been obtained for the stations in the County of Auckland; all information regarding these three counties being referred to stations Tianjara, Dromedary, and Wolumla respectively as points of origin. A re-computation of the survey of the county of Camden has been commenced, the recent survey to the south making a more satisfactory reduction possible than had before been the case.

Notes of astronomical observations of azimuth and latitude at the following stations have been received, viz.:—Mumbulla, Wolumla, and Glenbog; notes of astronomical observations of azimuth at stations Tathra and Cooma being also received. The observations at Mumbulla and Tathra have been computed, and those at the other stations are now being proceeded with.

Further discussion has been made of the values of micrometer revolutions and level divisions; and tables of certain constants serving to facilitate future reduction of geodetic results have been constructed.

Anticipating that the observations of zenith distance at the stations of the south meridian series will be shortly available, preparation has been made for the calculation of the heights of the stations in the extreme southern part of the survey. For the purpose of determining the coefficient of refraction on the south coast, reciprocal observations on nearly one hundred lines have been discussed, and some interesting results have been obtained.

The extension of the triangulation during the year will be seen by comparison of the accompanying map with that appended to last annual report.

The stock of surveying and scientific instruments belonging to the Department may be reported to be in good condition, such repairs as were found needed having been made to instruments returned in a defective state. In view of the need for shortly renewing the stock of arithmometers which have now been in use for many years, one of new form and comparatively low cost has been obtained, and is being tested upon the actual work of the Branch. It appears to work well, and to be likely to last; a trial over a longer time will be needed to determine the latter point.

The *personnel* of the Branch has been slightly changed during the year by the Assistant Computer, Mr. J. B. Trivett, being temporarily removed from August to the end of the year for other work. His work has, however, been taken up by Mr. R. P. Sellors, of the Observatory staff.

MISCELLANEOUS CHARTING BRANCH.

In all the principal classes of work dealt with in the Charting Branch during the year 1897 an increase is shown over that disposed of during 1896.

A further increase in connection with exchanges has occurred, the number of papers dealt with being 1,454 as against 1,220 in 1896.

658 auction cases were disposed of, and an area of 65,379 acres was scheduled as against 46,949 acres in 1896.

3,140 plans and tracings were charted on office maps by contract at a cost of £216 15s.

Steady

Steady progress has been made with the disposal for settlement purposes of the expiring pastoral leases in the Central Division. Of 280 which fell in up to the end of 1897 there still remain 55 to be finally dealt with. The delay in most of these cases is due to exchange proposals being under consideration to improve the form of subdivision for settlement purposes. All the leasehold areas the leases of which expire up to the end of 1899 are now in hand, and instructions have been issued to the respective District Surveyors for the preparation of designs, &c., for the disposal of the available lands.

Besides the current work in connection with the proclamation of the boundaries for Municipalities, Police, District Court, Petty Sessions, Licensing, and Circuit Court Districts, the Police and various Court District boundaries of the Colony have been revised, and adjusted so as to make the several boundaries, as far as possible, coincident. This work, which was commenced in 1896, involved the preparation of 102 illustrative diagrams, together with necessary descriptions, and the charting of the proposed boundaries of the different districts on a large scale map of the Colony. The Justice Department is now taking steps to have the Police and Licensing Districts gazetted. The attention of the Attorney-General's Department has been invited to the desirableness of gazetting the other boundaries, and it is understood that action with this end in view is awaiting reports from the District Court Judges.

Work incidental to the proclamation of districts, &c., under the "Public Health Act of 1895" is also being carried out in the Branch.

It is gratifying to be able to record the completion of the new register of Reserves, which was begun in 1894, and has since been proceeded with intermittently as the exigencies of the Branch have permitted; sixty-nine books and a comprehensive index have been prepared. All the books are now in office use. The index is being type-written and will be available shortly. It is anticipated that all who have occasion to seek information regarding reserve matters will find their work much facilitated by having access to the new books. The index is also likely to prove very useful, as it shows, under counties and in order of dates, all the reserves, which have been published in the *Government Gazette* from the earliest dates.

The work dealt with under the different headings during 1896 and 1897 is as follows:—

	1896.	1897.
Miscellaneous papers in Branch	376	1,028
Auction cases... ..	88	461
Exchange cases dealt with	1,220	1,454
Plans and tracings charted	2,921	3,140
Area scheduled for auction	46,949 acres	65,379 acres
Papers disposed of, inclusive of auction	9,356	10,788
Auction cases dealt with	631	658

COMPILING BRANCH.

Miscellaneous Division.—The compilation of both County and Town Maps, except in a few special cases, has been in abeyance for about half the year. Owing to the pressing demand for parish map lithographs it was decided to employ almost the whole of the staff of this Division in compilation of Parish Maps for a time.

The revision of proofs of the new colony map has been completed during the year, and the necessary corrections upon the stone made. The photo-lithographic edition of this map will, therefore, very shortly be published. As a matter of public interest a few particulars of the new map may be here mentioned. The construction is on a conical projection, and is based upon points determined by astronomical observation at stations upon the main telegraphic lines, with which is incorporated the triangulation as far as it has extended. The last authentic determination of Sydney longitude is used. In order that the map shall be immediately available for public information, and for the multifarious purposes of administration, it has been photo-lithographed to the same scale, which is 8 miles to the inch; when mounted on rollers the size will be 9 feet 6 inches by 7 feet 6 inches, and copies will be sold to the public at a reasonable price. It may be stated that it was intended to have the map engraved; but as the process will take a long period, and is costly, it was decided to adopt a more expeditious mode of reproduction to meet immediate requirements.

New compilations of the following county maps have been completed:—Bathurst, Finch, Baradine, Gresham, Roxburgh.

Standard maps prepared for new editions:—Canbelego, Cooper, Cowper, Robinson (with new reference), Urana.

Compilation of the following county maps were in hand at the end of the year:—Narran, Tandora. Compilations commenced of the following county maps are in abeyance for a time to give preference to parish map compilations:—Ashburnham, Denison (from standard), Georgiana, Goulburn, Gough, Hardinge, Hume, King, Monteagle, Pottinger, Phillip, Wellington.

Maps of the villages of Coff's Harbour, Dapville, Gilgunnia, and The Peak have been compiled and drawn, and there were in hand at end of year maps of the town of Forbes and village of Manildra.

Maps have been prepared from surveyors' plans of the villages of Airly, Bodangora, Boomi, Carpina, Horton, Isis, Lockhardt, McMahon, Mullally, Sancrox, and Ulan, and standards have been prepared for new editions of village maps of Fiefield, Gladstone, and Wrightville.

Lithograph proofs of Land Board District Maps of Moree and Goulburn have been revised. Since 1st June, 1897, sixty-one parish maps have been compiled and drawn.

Twenty-nine plans, representing 158 miles of feature and connection surveys, have been charted.

A large quantity of miscellaneous work has been done in addition to the above, including 12 maps for the Parliamentary Standing Committee on Public Works, to show tenure of land within the scope of proposed new lines of railway, preparation of map of Port Stephens for the Fisheries Department, &c.

Parish Map Division.—In this division there have been 301 new compilations made, and 119 standard maps have been charted up for new editions. Owing to absence of draftsmen at certain offices, &c., neither of these divisions of the Compiling Branch has had the advantage of the continuous service of the full staff during the year.

LITHOGRAPHIC

LITHOGRAPHIC BRANCH.

The general desire for settlement on the lands of the colony, under the liberal forms of tenure provided by the Act of 1895, having continued throughout the year, the preparation of a large number of printed plans, numbering 351, has been necessary for issue to intending settlers, simultaneously with the proclamations of classified areas in the *Government Gazette*.

The publication by this Department of the sheets of the detail survey of city of Sydney and suburbs, and of other towns and municipalities, for the purposes of sewerage construction, ceased during the year, after having been in progress about fifteen years. The number of maps published during that period was 846.

The photolithograph of the recent compilation of the colony map on a scale of 8 miles to an inch, is now in the press, and copies will be available in about three months for official use and public sale.

The following returns show the details of lithographic operations for the year.

Counties.

County maps show measured areas, roads, reserves, features, and all other information which is capable of delineation on a scale of 2 miles to an inch; they are published at 5s. per copy.

Twenty-four county maps were lithographed during the year, comprising 4,956 printed copies:—

Bathurst	Evelyn	Hunter	Ularara
Bland	Evelyn*	Hunter*	Urana
Bland*	Flinders	Leichhardt	Windeyer
Bucceleuch	Forbes	Narromine*	Windeyer*
Cumberland	Forbes*	Perry	Wynyard
Cunningham	Harden*	Perry*	Yungnulgra*

Of these maps, those indicated by the asterisk are printed on the scale 8 miles to an inch, for use in this office, but not for publication.

Towns.

Town maps show the general design, measured lands, and names of purchasers thereof, reserves and dedications within town and suburban limits. They are usually photo-lithographed from compilations prepared at this office or from the surveyors' original plans, to the scale of 4 or 8 chains to an inch, and sold at 1s. per copy.

Twenty town maps were lithographed during the year, comprising 2,200 printed copies:—

Ællalong	Corowa	Lockhart	Sancrox
Airly	Gilgunnia	Mount Allen	Ulan
Bathurst	Gladstone	Mullally	Uralla
Boomi	Horton	New Bendigo	Wrightville
Coff's Harbour	Isis	Reefton	Wyalong

Parishes.

Parish maps are compiled to a scale of 20 chains to an inch for office use, and then, with few exceptions, reduced to 40 chains scale for publication and sale at 1s. per copy.

Three hundred and seventy-five parishes were lithographed during the year, comprising 32,171 printed copies.

Auction Sale and Surveyors' Plans.

Lithographs of lands measured for auction are generally printed for use at auction sales.

One hundred and eighty-four plans were lithographed during the year, comprising 7,208 printed copies.

Miscellaneous.

This class of work principally comprised the following items, viz:—82 sheets of the detail survey for sewerage purposes in the cities of Sydney and Newcastle, and municipalities of Alexandria, Balmain, Darlington, Erskineville, Marrickville, Newtown, Petersham, Redfern, and Waterloo, also the Asylum for the Deaf and Dumb and the Blind; 351 plans for homestead selection, settlement lease, improvement lease, and snow lease purposes; 28 maps in connection with scrub-clearing operations in the West Bogan country; 5 maps of Land Board Districts; 7 maps showing parts of travelling stock routes, Bogabri to Rylstone, and Walgett to Uarbry; map of New South Wales showing railways, with coach routes; maps of New South Wales showing all divisions for purposes of the Crown Lands Acts; and 7 maps illustrating annual report of the Department of Lands for 1896. Four hundred and ninety-three miscellaneous maps and plans were lithographed during the year, comprising 105,023 printed copies.

Other Departments.

Maps, plans, and diagrams have been printed for the Departments of Chief Secretary, Public Works, and Railway Commissioners, comprising maps of New South Wales, city of Sydney, Port Jackson; 5 diagrams of truss and timber bridges; railway guide maps, Wentworth Falls and Katoomba District; map of National Park; military maps, 2 inches to 1 mile, and 1 inch to a mile scales, &c., &c.

Twenty-three maps, plans, and diagrams were lithographed during the year, comprising 42,559 printed copies.

Official Forms.

These forms comprise circulars, decisions, forms, and memoranda required for use at head quarters and at country offices, and are printed in this branch, with the exception of those which can be more economically produced at the Government Printing Office.

Eighty-six official forms were lithographed during the year, comprising 51,335 printed copies.

ROADS BRANCH.

The Roads Branch inquires into applications for survey and opening of roads through alienated land and Crown land held under lease, and deals with correspondence relating to roads and streets, matters in general—*e. g.*, complaints of obstruction of roads, objections to proposed roads, and claims to compensation. The plans of roads are examined, catalogued, and approved in the district offices, and then forwarded to this branch, where proceedings are taken for proclamation under the Public Roads Act, or for resumption under the Crown Lands Act of 1889.

The Public Roads Act of 1897, which became law on 30th June, repealed previous Acts relating to the opening and closing of roads, the granting of compensation, &c., &c., and since the date named all new cases which come within the scope of that Act have been begun and proceeded with under its provisions. Afterwards the roads are charted upon office plans and maps, and fully noted copies of the plans are furnished to the Department of Public Works and to the Registrar-General.

Land Boards' appraisements of compensation, consequent on the opening of roads, are dealt with, and action taken in respect of granting Crown land or unnecessary roads in lieu of land resumed.

Plans of streets surveyed for alignment on the applications of municipal councils are examined, catalogued, and approved in District Survey Offices, then forwarded to this branch, where the cases are prepared for submission to His Excellency the Governor for approval of the proposed alignments. The Public Roads Act of 1897 legalises the performance of alignment surveys by the Crown on application being made by municipal councils, the establishment of alignment under the Governor's authority, and it also gives power to alter the alignment of streets which have previously been aligned.

Applications for permission to erect public gates under Act 39 Victoria No. 10 are considered and dealt with. The powers of the Public Gates Act have been extended by the Public Roads Act of 1897.

Applications under section 67 of the Crown Lands Act, 48 Victoria No. 18, for purchase of unnecessary roads receive preliminary consideration, and when purchase has been completed all maps and office plans are noted. The Public Roads Act of 1897 repealed the 67 section of the Crown Lands Act of 1884, and, since the 30th June, action to close and alienate unnecessary roads has been taken under the Public Roads Act.

During the year 463 applications for survey of roads and streets were received and dealt with; also 313 surveyors' reports (exclusive of reports transmitting plans of surveys); 257 road plans, showing 504 miles of road surveyed; 15 alignment plans, showing 44 streets as marked for alignment of carriage-ways and foot-ways; 48 applications for permission to erect 78 public gates; 84 applications for purchase of 146 unnecessary roads; and 375 objections and claims with regard to road and street surveys.

Information has been furnished for 3,388 letters in reply to communications and inquiries from members of the public with regard to roads and streets matters. There were 7,009 papers registered during the year, which, together with 809 papers relating to roads registered in other branches, make a total of 7,818 papers received and dealt with. In 177 cases action has been taken to grant Crown land or unnecessary roads in compensation for land resumed under 42nd section of the Crown Lands Act of 1889 and Public Roads Act of 1897.

OCCUPATION DRAFTING BRANCH.

The work performed by this branch shows a slight increase on that transacted during the year 1896.

Drafting work required by the Fisheries Commissioners in connection with oyster leases is now done in this branch.

A considerable amount of business in connection with offering for improvement leases an area of 164,607 acres of the West Bogan country cleared by the Government, has been carried out by this branch.

The number of surveys dealt with under the 143rd section is in excess of those completed in 1896.

Eleven cases have been investigated, representing the survey of 74 miles 27 chains of holding boundaries and dividing lines, towards the cost of which the lessees contributed £74 6s. 4d.

Notifications of withdrawals from twenty-eight leaseholds in the Central Division, and two in the Western, were published in the *Government Gazette*, covering an area of 547,567 acres, of which 403,361 acres were withdrawn from twenty leaseholds in the Central, and one in the Western Division during the year. Withdrawal from the remaining eight in the Central, and one in the Western will not take effect until the year 1898. The total area actually withdrawn during the year for settlement purposes in the Central Division was 387,661 acres, and 15,700 acres in the Western.

There is a slight decrease in the number of adjustments made during the year in connection with areas of occupation licenses and pastoral leases affected by withdrawals or reversions. It has been found necessary in 109 cases to make a thorough investigation of the area under review.

Two hundred and thirty one homestead, improvement, and other leases have been charted on the office maps, and 384 plans noted.

Two hundred and ninety seven tracings and lithographs have been prepared for appraisalment and other purposes.

One hundred and fifteen new occupation licenses have been charted on office maps.

Sixty plans of abandoned resumed areas have been charted up and forwarded to the District Surveyors for report as to best means of disposal.

One hundred and eighty four lots of vacant Crown lands, proposed to be offered by auction or tender for occupation license, have been dealt with.

MISCELLANEOUS CONTRACT BRANCH.

There were 4,233 lithographs and tracings prepared and issued from this branch, being thirty-one in excess of the previous year. Three hundred and thirty of these were maps of areas set apart for settlement under the provisions of the Act of 1895; 341 for illustration of exchange proposals; 247 standard tracings of plans of roads and streets, and forty-one plans for notation purposes. A large number of sketches and tracings were also prepared in connection with the Conditional Purchasers Relief Act.

CORRESPONDENCE AND RECORD BRANCH.

The following tabulated statement shows the services performed during the year in this branch:—

Papers received from other branches and dealt with	12,366
Papers, plans, tracings, &c., received by post	1,177
Instructions recorded and issued to surveyors	1,475
Reports received from surveyors and recorded	1,330
Letters written and despatched	980
Memoranda, tracings, lithographs, plans, &c., sent to surveyors	6,789
Minutes written to the Under Secretary	830
Ministerial decisions noted	300
Telegrams written and despatched	90

Leave registers showing all leave taken by officers of the Survey Branch, field and office staffs, are kept in this branch.

PLAN RECORD BRANCH.

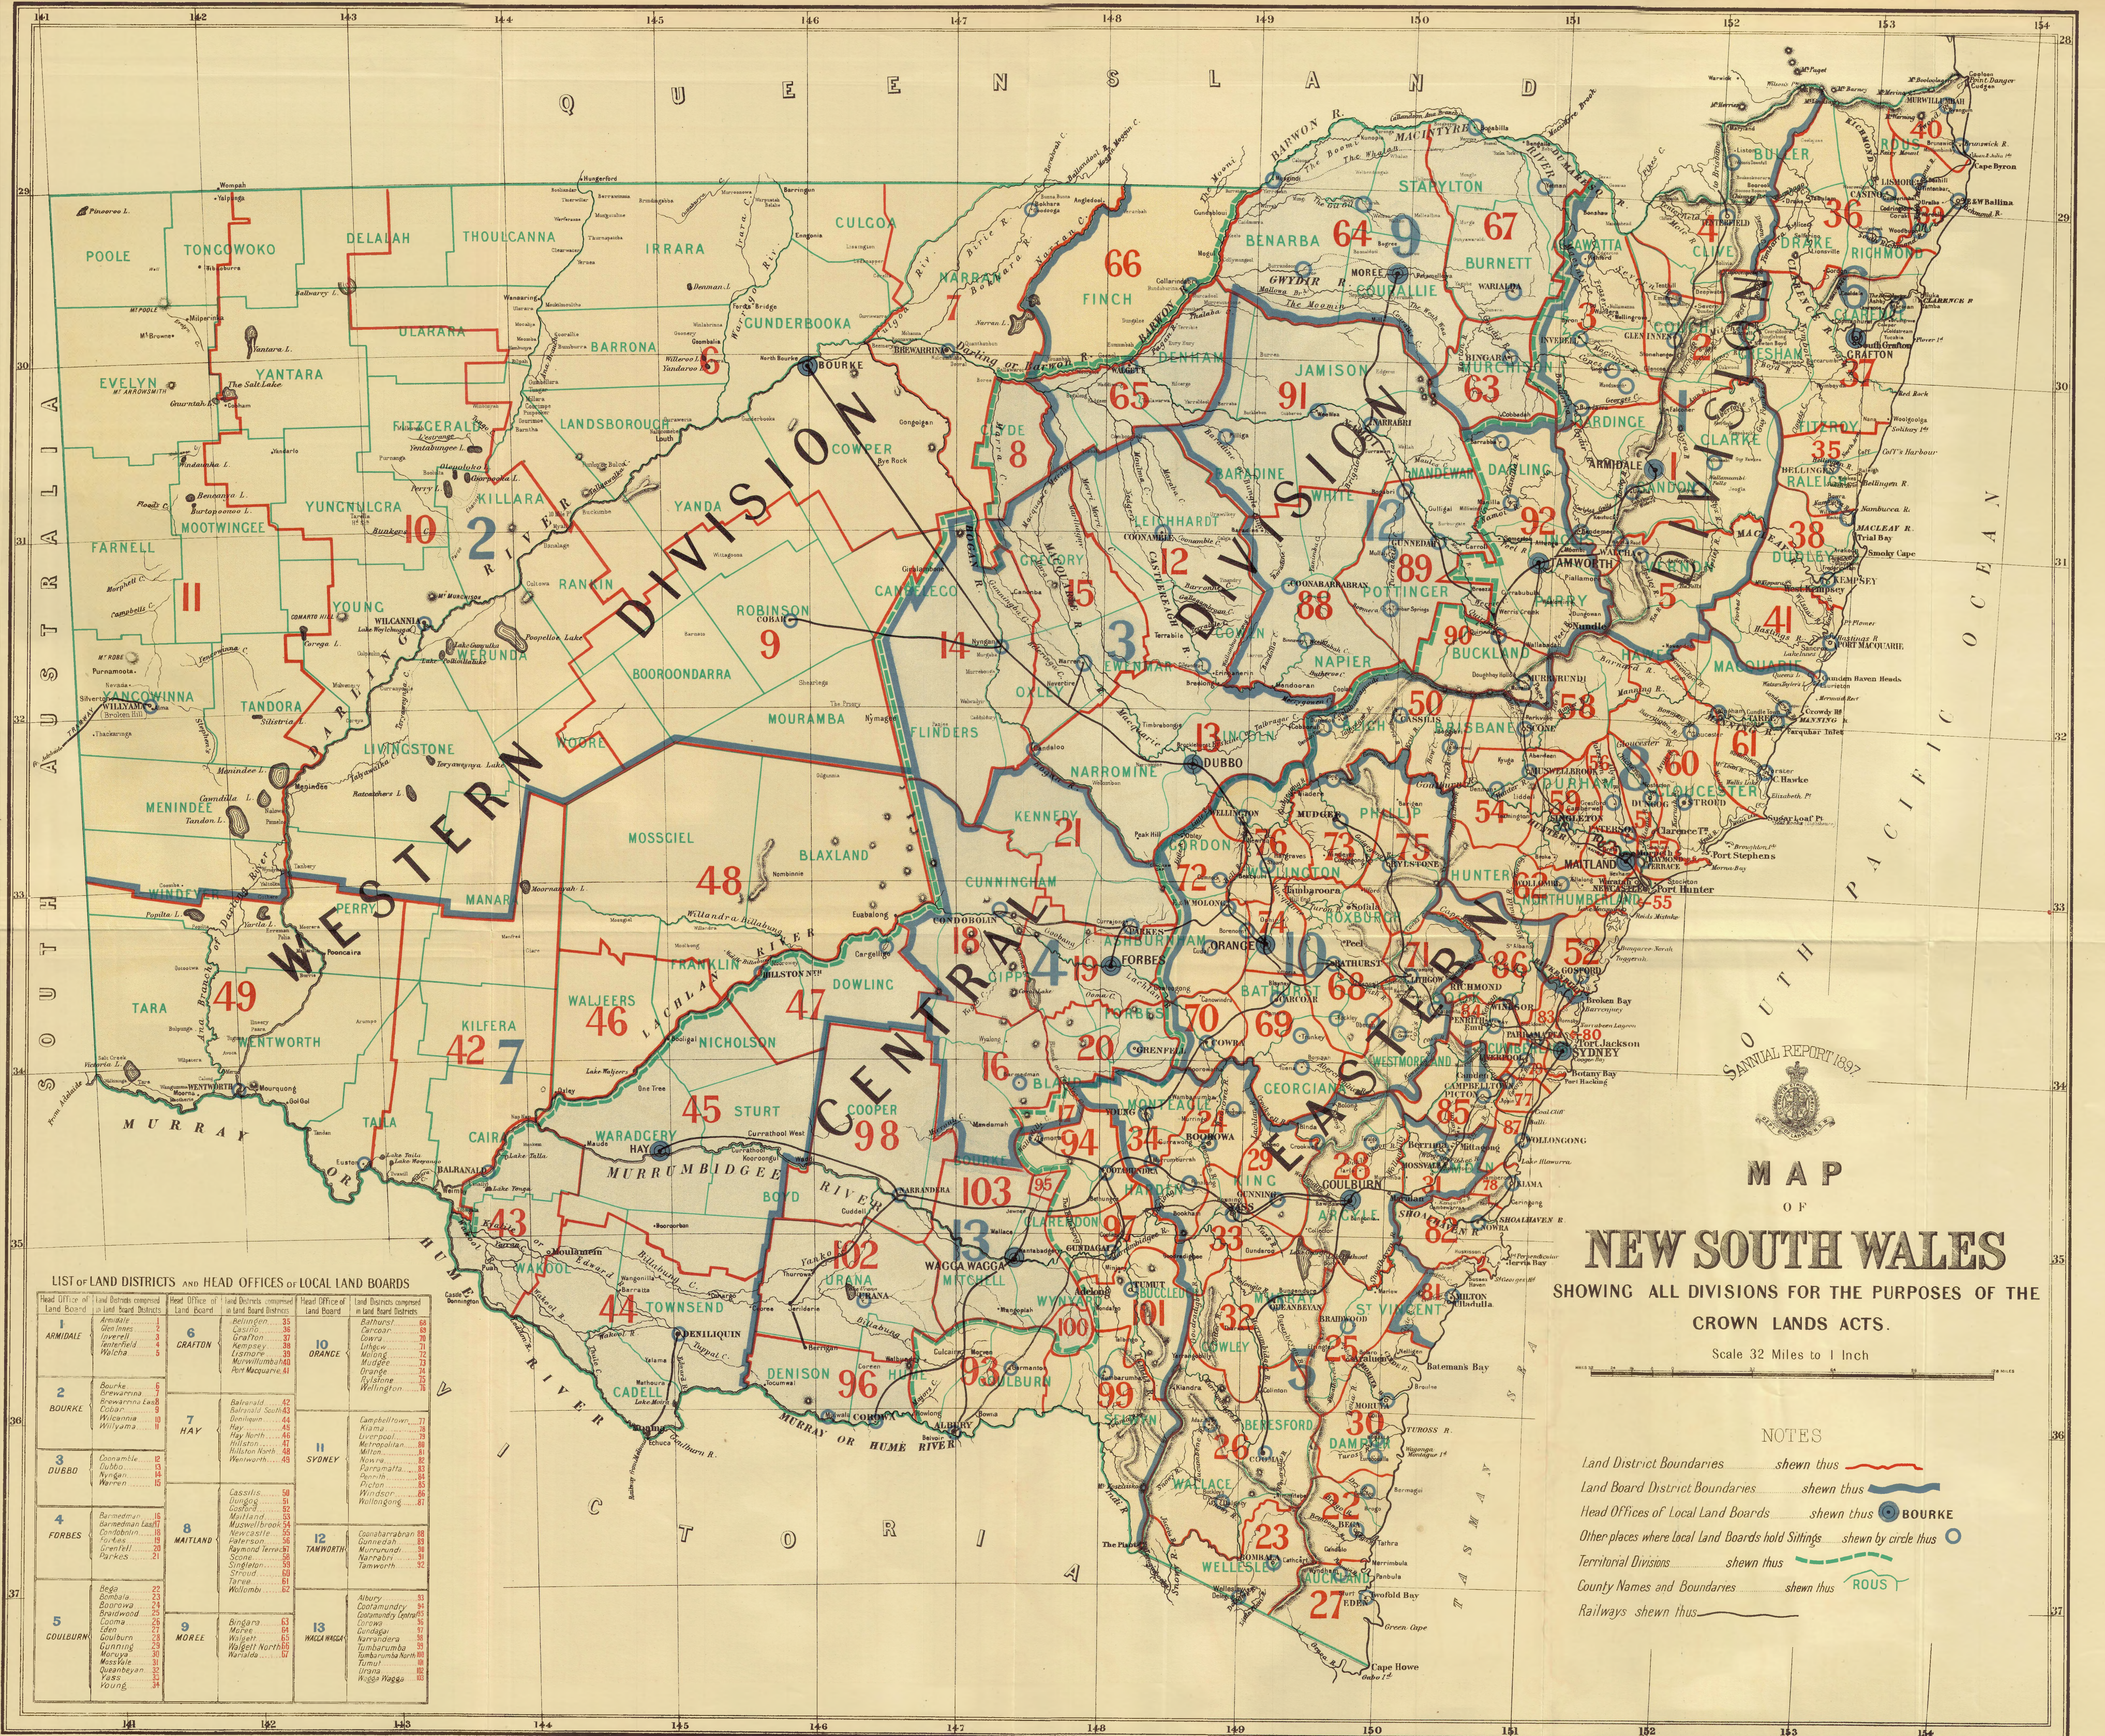

Approximate number of plans entered in books at end of the year	277,318
Approximate number of plans issued to and returned from officers in Metropolitan District Survey Office, Head Office, and Mines Department	134,154
Cancelled maps received	767
Plans sent to plan-mounter	3,902
issued to Inquiry Branch	563
exhibited at counter	6,834
despatched to District Survey Offices	15,091
returned from District Survey Offices	14,975
Applications from District Survey Offices (registered)	3,097
Memoranda returning plans from District Survey Offices (registered)	1,350
Draftsmen's memoranda to District Survey Offices for plans	1,401
Certified copies received from District Survey Offices	3,239
Surveyors' field-books in custody	7,239

PLAN-MOUNTING BRANCH.

The work performed comprises:—Plan-mounting, 15,302 pieces; rollers, varnishing, corners, lists, and miscellaneous, 1,325 pieces; binding, 313 pieces; parcels post, 909; total, 17,849 pieces. The total for the year 1896, was 20,307 pieces.

J. WITTER ALLWORTH,
Acting Chief Surveyor.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MILITARY.

(REPORT ON RIFLE-SHOOTING UNDER ACTIVE SERVICE CONDITIONS.)

Printed under No. 2 Report from Printing Committee, 6 July, 1898.

REPORT of a Committee, appointed by the General Officer Commanding the Military Forces of New South Wales, to report upon the subject of "Rifle-shooting under Active Service conditions," in connection with a Question asked in Parliament by Mr. Price, M.P., on the 9th December, 1897.

THE Committee, having carefully considered the subject, submit the following Report for the consideration of the General Officer Commanding :—

I.—GOVERNMENT GRANTS FOR RIFLE-SHOOTING.

We find that the Government grants for the encouragement of rifle-shooting in New South Wales, outside the ammunition supplied for annual musketry courses, are as follows :—

- (1.) Free ammunition to "efficient" of the Defence Forces for practice purposes, not exceeding 50 rounds per efficient soldier annually.
- (2.) Free grants of ammunition to reservists, not exceeding 150 rounds per efficient reservist, and a bonus of 200 rounds to each during his first year of service.
- (3.) Monetary grants annually to the National Rifle Association, and the Northern, Western, and Southern Rifle Associations, of £1,750, railway passes to the value of £675, and free ammunition costing £882.

These Associations are further assisted by the free use of Government ranges and equipment (where available), as well as the services of any supervising staff they may require.

II.—MODERN FIRE-DISCIPLINE.

The experience of modern warfare shows that when troops become engaged the result of the combat almost entirely depends upon the better "fire-discipline" maintained on either side.

"Of all the incidents of a modern fight, that of which it is the hardest to give any conception to anyone who has not seen infantry possessed of the enormous facilities for firing, which are supplied by modern arms, is the intense absorption, in the mere fact of firing, which, almost like a catalepsy, takes possession of the man who is using his weapon against an enemy, or, as may often happen, in close country against nothing at all. We want to educate men so that they do not fire under the conditions of catalepsy. Experience has shown that this can only be done by having men, who are not themselves firing, trained to look after those who are firing, so that the fire may be regulated. The men themselves must be trained only to fire under orders, and never under the influence of a tendency to relieve their feelings. We cannot put better what is involved in these necessities than in the words of Colonel J. H. A. Macdonald of the Queen's Edinburgh Rifle Volunteer Brigade (now Lord Kingsburgh). How is this to be done? How, but by so regularly, consistently, and persistently putting the soldier through the action of firing by orders, that it shall be a second nature to fire only under control of his superior, and not otherwise. What is wanted is the conviction in the mind of every instructor, from the highest to the lowest, that his men should never leave a parade without having gained something in fire discipline—that is, that fire control drill be one of the main points in view as a necessary part of the work to be performed on every occasion when men are being drilled, exercised, or inspected, from the moment that they know the rifle exercises, until the day when they leave the Service. Let some of the time which formerly was spent in a perpetual form drill to produce a military machine, that had a steadiness in formation which nothing could shake, be now spent in producing, by a perpetual control drill, a fire organism which shall have a steadiness in the use of fire which nothing can shake. The troops that shall be found most in the hands of the commander in the matter of fire will, *cæteris paribus*, be invincible." (From the article "War" in the *Encyclopædia Britannica*, by General Maurice, late Professor of Military Art and History, Royal Staff College.)

It

It has been found in every war since 1870 that the natural tendency of the troops engaged is to expend vast quantities of ammunition in wild *uncontrolled fire*, and that this kind of fire, when once begun, is most difficult, if not impossible, to check, produces a minimum effect, is demoralising to troops using it, and encouraging to the enemy.

In order to subdue this state of indiscipline, every endeavour is now made, by peace organisation and training, to accustom men to fire by word of command, until by constant habit it becomes a second nature. It is further recognised that control is more difficult, and is yet more important, when troops come into closer contact, hence fire-groups of fifteen to twenty men have been organised, this being the largest number that can be directly kept in hand by one commander during the later and decisive period of the fight. On these principles the independent fire of individuals is not only discouraged but prohibited, and is only practised in peace training in order that, when it is no longer possible to prevent it, it may be regulated to a certain extent. (In Appendix A the comparison between the effect of controlled and uncontrolled fire is more fully explained.)

III.—MUSKETRY PROGRESS IN RECENT YEARS.

It should be borne in mind that, when Rifle Associations were first formed, musketry training was not only generally regarded as quite distinct from drill, but even as a troublesome adjunct to a soldier's routine work, and it was almost entirely left to these Associations to endeavour to popularise rifle-shooting.

"The whole of our old system of musketry (1877) was based on the assumption that every man with good eyesight could be made a good shot, and the individual fire of a single man was accordingly raised to the highest place. The falseness of this hypothesis was amply proved in our late campaigns, where our shooting is reported to have been as bad as it could possibly be." (This was written in 1888.) "The fact of the matter is that only *very few men are individually good shots*, especially when under fire, and those that are such have *their skill nullified* in the field by the excitement of the fight and by *not knowing the ranges exactly*, the almost *all-important point* for accurate shooting." (*Mayne's Infantry Fire Tactics*.)

Considerable progress has been made during recent years in musketry instruction in the British Army, and, following continental precedent, the various courses for the recruit and trained soldier have been amended, in order to bring the shooting as nearly as possible up to modern conditions of warfare. Thus, whereas in former days individual fire was considered all that was necessary for a soldier to learn, it is now recognised that this portion of his training can only be regarded as preliminary to his further instruction in controlled fire and shooting under varying and difficult conditions.

We have to consider, therefore, whether the assistance given by the Government in the present day towards the encouragement of rifle-shooting is expended in conformity with these modern principles.

Up to 1887 the Imperial musketry course consisted almost entirely in individual deliberate shooting, and this was the class of shooting carried out by the National and other Rifle Associations.

The musketry training which came into force in 1892 introduced essential changes, the recruit was allowed to fire only 84 out of 200 rounds in individual deliberate shooting, and the trained soldier only 45 out of 200.

A still greater proportion of the rounds fired by the Imperial soldier is now devoted to controlled fire and rapid shooting, and it is yet in contemplation by the Imperial authorities that this proportion shall be further increased.

Following the Imperial Regulations, the military authorities of New South Wales have directed that only 49 rounds out of 151 are to be expended in deliberate uncontrolled fire, *i.e.*, to teach the soldier to readily adopt the various military positions in firing, standing, kneeling, and lying down, and to give him, by aiming deliberately at a fixed target, sufficient confidence in the accuracy of his rifle. The whole of the remaining rounds are now expended in instruction in rapid, controlled, and collective firing—that is, under conditions resembling those to which a rifleman would be subject in the face of an enemy.

There being no prizes in connection with the annual musketry courses as obtains in the Imperial Service, it naturally follows that the nature of the shooting conducted by Company, Regimental, and Civilian Rifle Clubs is confined almost wholly to the one class of match which is encouraged by the various Rifle Associations. It is to be regretted that these bodies, who it will be seen (para. 1) monopolise Government aid, not only in respect to cash subsidies, but also in the matter of free railway passes, and who, being thus favoured, are also endowed with the greatest responsibility—should virtually be quite beyond any control by the Military Department.

IV.—RIFLE MEETINGS OF TO-DAY.

Until the year 1887 the deliberate individual firing carried out at the meetings of the several Rifle Associations could hardly be considered other than in conformity with the authorised musketry course then laid down by regulations. On the other hand, it must be recognised that in continuing to devote nearly the whole of their meetings to very deliberate individual fire these bodies are not now at all in touch with the later principles, which regulate the peace training of a soldier in the use of his rifle for war purposes.

In order that this distinction may be clear, it is necessary to point out in what essential ways the matches now conducted at Rifle meetings are not of the character required by a soldier in peace training.

(1.) *Slow Aiming.*

Excepting the five so-called service matches, the whole of the ammunition expended is in slow shooting, *i.e.*, within their time limit of one round per minute, *vide* General Regulations of the National Rifle Association, 13 (e).

Until a soldier understands the elementary principles of shooting, it is necessary that he should have *ample time*, not only to aim, but to fire. This, however, is a matter for *recruit instruction*.

On the other hand, as soon as his preparatory training is complete, and he becomes a portion of a fire-unit, *i.e.*, a number of men firing by one man's word of command, the soldier's individuality must give place to disciplinary action, his will being entirely subordinated to that of his commander, otherwise he becomes not only useless, but an encumbrance and a source of danger to his comrades.

A soldier, therefore, who habitually takes very deliberate aim, is quite unable to comply with service conditions, which require instant obedience and immediate action. It is very seldom, indeed, that a man who is successful as a deliberate firer shows to advantage in rapid shooting.

"I am certain that in practice the well-trained man, the ordinary shot of the battalion, is, in action, every bit as useful and good as is the marksman. I have tried it practically. I have taken sections of marksmen and tried them against sections of ordinary shots in the field under service conditions. The difference is nothing."—Sir J. De Hoghton, Bart., late D.A.A.G. at the School of Musketry, Hythe.

In fact the slow aimer refuses almost invariably to compete in rapid-firing matches, because he knows that constant practice in the former not only avails him nothing in the latter, but even unfits him for the change.

However, pleasing it may be to the old and conservative rifle-shot to take his own time in aiming and pressing the trigger, his peaceful effort cannot, by any stretch of imagination, be taken to represent a rifleman's duty when faced by an impatient foe. This manner of shooting is of course not practicable in war. At the last meeting of the National Rifle Association, in the rapid-firing match, about two-thirds of the prize money went to men who had been altogether unsuccessful in the deliberate competitions, although opposed by many of the so-called "crack shots" of *six colonies*.

Out of 124 rounds fired in individual competitions, 112 rounds were fired in slow shooting, and twelve rounds in rapid.

Out of £2,015 5s., allotted for prizes in individual competitions, £1,937 5s. were for slow shooting, and £78 for rapid.

This unsoldierly condition of shooting which prevails at Association meetings, viz., slow aiming (that is an allowance of one minute for each round fired) has further reduced the nature of shooting to a gallery science, in which artificial aids have been introduced, in order to make the result of each shot more profitable to the firer. The slow aim and artificial aids are equally impossible from a military point of view

(2.) *Artificial Aids.*

A permanent rest for his rifle not being allowed, the match rifleman adopts every other contrivance that will assist him regardless of its applicability, not only in war, but even in shooting game.

Thus, not satisfied with the weapon issued to him, notwithstanding that it has passed the most severe tests and been adopted by experts as best fulfilling a soldier's requirements, the match rifleman is invariably accompanied by the following elaborate paraphernalia:—A cedar box or leather case containing cartridge-racks, grease-pot to oil his cartridges, black and white paints with camel-hair brushes to nullify the effect of the varying natural conditions of light and atmosphere upon his sights; chalk pencils by which, with the aid of a mathematical instrument, known as a *ventometer*, he marks a new sight upon his rifle, gauged to one-hundredth part of an inch as an allowance for the strength of the breeze; a *vernier*, similarly accurately gauged to give the elevation to a minute fraction; a *blow-tube*, with which he moistens his barrel after each shot; an *orthoptic*, or specially-constructed metal screen to concentrate his vision on the target; coloured glasses to protect his eyes from the strain of ordinary daylight; and a *temporary rest* to support his elaborately garnished weapon between rounds, and to prevent it from undue contact, which, by accident or otherwise, would derange its minute appointments, and result in the discomfiture of the "crack shot."

With all these aids, the match rifleman, under regulations laid down by his own representatives on the Rifle Association's councils, objects to shoot in any but the "prone" or lying-down position at all ranges, notwithstanding that the Musketry Regulations forbid this position, except at ranges over 500 yards. He, as a matter of course, vilifies any unfortunate comrade whose passing shadow may derange his equanimity, and a range official further protects his nerves from desultory conversation in his vicinity.

Is it likely that a soldier, imbued with a knowledge of what will be required of him on service, will consent to have recourse to these utterly impossible conditions and adjuncts, except with a view to monetary advantage?

Can such pastime, which is unworthy of the name of sport, appeal to the soldier as either worthy of his time and attention, or calculated to improve him as a part of a military machine? The kangaroo-shooter is infinitely more entitled to Government aid.

Constantly firing with a slow aim, and relying upon artificial aids, renders a soldier unfit to cope with the varying conditions which he must meet with on service, and to which he should endeavour to be accustomed by peace practices.

V.—SERVICE MATCHES.

In the annual meetings of the various Rifle Associations in New South Wales we notice that service matches are in a very undue minority.

They are even acknowledged by the governing bodies as undesirable, because, to them, unprofitable items. Thus, at the last meeting of the National Rifle Association in 1897, out of a total of twenty-seven competitions, only *five* (viz., the regimental bugle, battle firing, "Duff" rapid firing, and running-man events) could be considered as approaching service conditions, and three of these were service matches rather in name than reality, inasmuch as they were conducted under conditions and with accessories impossible to a soldier in war.

In the regimental bugle match a bull's eye target was employed instead of a figure; slow aiming and artificial aids to the rifle were permitted.

In the rapid-firing match a bull's eye target was employed, and artificial aids were permitted.

In the running-man match artificial aids were also permitted. Even the remaining two events, under so-called service conditions, viz., the "Duff" and battle-firing matches, were not under service conditions in many respects. The ranges were known in the latter, and it was conducted with a deliberation, 45 seconds for two volleys, which would have been suicidal to men under fire; the targets in both cases were stationary; fire concentration, casualties, and delegation of command were not practised, and in the "Duff" the target (6 feet x 6 feet, bull's eye, &c.) was arranged as for slow individual fire, and could not be conceived to represent any enemy, either in size or position.

Out of a total of at least £2,483, distributed in prizes (excluding continuous matches) at the 1897 meeting of the National Rifle Association, the council saw fit to devote only £286 to the matches approaching service conditions.

Thus the kind of shooting that should have formed the main portion of the meeting was valued at only one-ninth ($\frac{1}{9}$) of the whole.

It

It will further be noted that in the matches arranged by the council of the National Rifle Association, there is an abnormal disproportion between the amounts which it is open to an *individual* to win as first prize in the individual slow-shooting contests, as compared with those under so-called service conditions.

The total amount devoted to each of these events is also worthy of comparison :—

Slow Individual Matches.	First Prize.	Total Prizes.	So-called Service Matches.	First Prize.	Total Prizes.
<i>A Series.</i>					
Randwick	£ 6	£ 70	Regimental Bugle, Teams	£ 2/10/-	£ 90
Paddington	7	85	Battle-firing, Teams.....	3/10/-	96
Sydney	8	100	“Duff” Teams	2	20
Association, Aggregate	15	200	Rapid-firing	8	78
Members	10	100	Running-man, Continuous	1	50 per cent. of entrance fees.
Jaques	10	110			
Manning.....	10	115			
Dangar	25	130			
Queen's, Aggregate	50	650			
<i>B Series.</i>					
Nursery	5	50			
Sheridan.....	6	60			
Lewington	7	70			
Richardson, Aggregate	10	125/5/-			
Tyro	5	40			
Rifle Clubs.....	8	250			
Parliamentary	3	7			
Affiliated Clubs.....	5	25			
Continuous	1	50 per cent. of entrance fees.			

Thus one individual can in the individual slow-shooting matches win a total sum of £187 (exclusive of continuous matches), or if ineligible, by former successes, for the B series, a total of £152, whereas in the service matches the highest possible total is £16 (exclusive of continuous), the proportion being again as 9 to 1.

Quoting from the results of the annual meetings of the National Rifle Association, we find that, in :—

1896.	£	1897.	£
24 of the competitors won...	693	19 of the competitors won...	537
1st man won	119	1st man won	72
2nd man won	81	2nd man won	51
3rd man won	51	3rd man won	42

It will be found that certain individuals continue to win large sums from year to year, e.g., Lieutenant * * * at the annual meetings of the National Rifle Association in 1895-96-97, and exclusive of prizes won by him at Association meetings in the country districts and other colonies, won £49, £81, and £51, a total of £181, averaging £60 a year.

The following may be taken as instances of the large amounts that have been won since 1891, by individuals at single meetings of this Association :—£143, £119, and £106.

The whole of the above figures exclude prizes in the continuous and some of the teams matches.

Is it intended that the Government should subsidise individuals, who have apparently long since acquired all that can be learnt about this kind of shooting?

It has often been stated by members of the council of the National Rifle Association, as a reason why they devote so small a portion of their meetings to service matches, that, as compared with other events, the receipts for entrance fees in the former do not realise so large a proportion of the prize money. This may be so, but can a large number of entries be expected for a series of matches, the prize money of which is so out of proportion to that given for shooting under the slow-aiming and unsoldierly regulations of the National Rifle Association, especially when the style of shooting is so absolutely different, as almost to debar a good “service” shot from any chance of winning distinction in these gallery practices?

It is worthy of note that the soldier is further impeded in his effort to win the small prizes offered for service matches, by the refusal of the National Rifle Association to issue him a railway pass, until he has expended a sum of at least 15s. in entrance fees for the individual slow-shooting matches, in which, as already pointed out, he can hope to meet with small, if any, success.

This disability is so pronounced as almost to be prohibitive in the case of the country units of the mounted troops. Thus, a team of four men, belonging to the cavalry, who desire to enter for the “Duff” competition, which is the only match in which their own firearm (the carbine) is used, are either refused railway passes, or compelled, in order to obtain them, to enter three men for *at least* the series of matches included in the “Richardson Aggregate.” This means that, in addition to the entrance fee of 10s. for the “Duff,” a further sum of at least £2 5s. must be paid, attendance and shooting for an extra day and half is rendered compulsory, and the cavalry soldier is expected to compete under disadvantageous conditions with men armed with rifles, and aided by the many contrivances so repugnant to a service shot.

Under the same rules a team of infantry, desiring to shoot in their special event, the battle-firing match, must pay, in addition to the entrance fee of £1, a similar additional sum of at least £5 5s., or pay their own railway fares.

At the last meeting of the National Rifle Association twenty-seven men of two country companies of the Second Infantry Regiment were refused railway passes in this way, and obliged to pay their own fares to and from Sydney. How many others were debarred from attending for the same reason?

Would not the expenditure in bringing a professional shot from the Victorian Border to Sydney be laid out to more advantage by the issue of railway passes to a number of our own men, resident within the Colony?

It militates greatly, moreover, against the number of entries in service matches, that general attention is concentrated upon the results of the other matches by means of “aggregate” prizes, and that service

service matches are set down for a time when the other matches are in progress, with the result that, as men have to fire in the latter or stand out of the aggregates, they are naturally led to pass by the service matches, which have thus been rendered a sort of side-show.

It is not always impossible, certainly, for men to shoot in both classes of match, but the conditions are so inconvenient as to prejudice a man's chances in both, and cause him to declare, as has often been heard lately, that he would avoid any service matches in future.

VI. AGGREGATES.

The Committee are of opinion that the so-called competitions, which appear under the name of aggregates, are undesirable and quite unworthy of Government support. Generally, their views are expressed in the following quotation from a letter by "Smallbore," published in the *Sydney Daily Telegraph* of the 2nd December, 1897:—

"I find that the New South Wales Rifle Association set apart the sum of £850 to two competitions (for which they charge entrance fees) viz., the 'Association aggregate' and the 'Queen's champion aggregate.' As a matter of fact, not a single shot is fired in these two competitions, but the sum named is divided exclusively among those riflemen who have scored successfully in previous matches during the meeting. It is claimed by the Association that these aggregate prizes are intended to reach such steady shots as have not secured prize places in matches, but who have shot up to a good average standard. A little investigation, however, will show that this large sum of money is merely an additional inducement to our so-called crack shots. In the association aggregate this year only £11 out of £200 was awarded to men who had not already profited by previous prizes. The Queen's champion aggregate of £650, which is only open to the 150 highest scorers in previous matches, and in which those who have already profited in the Association aggregate are allowed to participate, I notice that only £21 went to men who had not already gained considerable sums individually at the meeting."

The system thus alluded to of giving additional bonuses to individuals who have, in the opinion of the Committee, already won enough money in the single matches, appears to be quite unwarranted, and even without reason, unless it is assumed that the council of the National Rifle Association find the Government subsidy (together with entrance fees, &c.) amounts to a much larger sum than they require as prize money for the number of matches they can get through in a week. Even if this is so, is the National Rifle Association justified in distributing any surplus money among the so-called crack shots, when this amount could be well devoted, even under their own system, to reducing entrance fees or multiplying the small prizes? *The inducement to the so-called crack shots to attend would be less*, but their presence does not appear to the Committee to be of any importance from a national point of view.

VII. ADMISSION OF RIFLEMEN FROM OTHER COLONIES, AT THE MEETINGS OF THE RIFLE ASSOCIATIONS OF NEW SOUTH WALES.

The inducement to riflemen of other colonies to compete against those in New South Wales is no encouragement to the young shots of those colonies, and, on the other hand (on account of the expense involved in attendance), serves merely as an annual attraction to the ubiquitous and professional pot-hunter. The Committee are furthermore of opinion, that outside competition of this nature, eventuates only in the discouragement of our own inexperienced men, and is of no profit to the Colony. Out of about £2,483, paid in prize money at the last annual meeting of the National Rifle Association, at least £654 was won by riflemen from other colonies, *i.e.*, considerably more than one-fourth ($\frac{1}{4}$) of the total, and one-third of the amount in prize money offered for those competitions which were open to them.

VIII. HANDICAPS.

From the point of view that the Government grants in money, &c., to Rifle Associations are with the object of some return being given, in the improvement of rifle-shooting *generally*, throughout the Colony, rather than, as in sporting competitions, when, for spectacular purposes, it pays to offer large sums to induce champions to give an exhibition of their prowess, it appears to the Committee that every reasonable encouragement should be afforded to the largest number; first, in order that beginners may be induced to enter, and second, that the medium men may have opportunity to improve. With a view to popularity, and to attract large numbers, the medium and young shots must be given an equal chance with those who have had greater experience.

This can only be done, in individual matches, by a judicious system of handicapping competitors by their previous performances.

IX. THE "RESPONSIBILITY" OF THE NATIONAL AND OTHER RIFLE ASSOCIATIONS.

As already explained, it is absolutely necessary that radical changes be made before match-shooting can be considered to be of any military value. The Committee can conceive no justification for the large annual expenditure (£3,307), which now keeps in existence the various Rifle Associations of the Colony, unless these bodies are prepared to recognise the grave responsibility devolving upon them as national institutions.

They must, moreover, be prepared and able, by an entire reformation of their present system, to elevate what they themselves regard as a "pastime," to the status of a valuable adjunct to the peace training of our soldiers.

The Committee regret that they cannot hope to see the needed reforms carried out by the existing councils of the Rifle Associations of New South Wales.

This opinion is based upon the present constitution of these governing bodies, their responsibility in reality to the voters who have elected them, and their actual personnel. The last point, although but the natural result of the two former, is of such importance as to call for special analysis.

The council of the National Rifle Association at present consists of 20 members, of whom—1 is an active member of the N.S.W. Mounted Rifles, 3 are active members of the N.S.W. Infantry, 5 are active members of the N.S.W. Naval Forces, 8 are civilians or members of Civilian Rifle Clubs, and 3 are retired officers of the N.S.W. Military Forces. Thus

Thus it will be seen at a glance that those branches of the land forces (Cavalry, Mounted Rifles, and Infantry) which are pre-eminently expected to be expert with the rifle or carbine, and who, numbering 6,000, form two-thirds of the whole defence force, are represented on the Council by only four out of twenty members.

Again, the Naval Forces, numbering under *six hundred*, are represented by five members, as compared with four from the *six thousand* (6,000) before mentioned.

It is most inadvisable, too, that an association formed "for the encouragement of rifle shooting in the Defence Forces of the Colony," *eight* out of the *twenty* members (nearly half the Council) should be civilians.

The three retired officers can scarcely be taken to represent any section of the present Defence Force; and, however enthusiastic they may be individually, it is a question whether officers, who have ceased to be active members of the force for several years and are inexperienced in the progress of later reorganisation, can be expected to be in touch with the present requirements of military training.

It is not, under such circumstances, difficult to understand the repudiation by this body of their responsibility for the soldier's training in shooting.

The Committee are of opinion that, in the best interests of the Colony and to ensure a proper return to the Government for the public money devoted to rifle shooting, one-half of the members of the Council should, to ensure expert knowledge and experience, be appointed by the General Officer Commanding the Military Forces of New South Wales, the remainder to be elected by the members of the association as heretofore.

Under any circumstances, the Committee consider that a portion (say £500) of the aid, at present granted to rifle shooting, should be devoted to a rifle meeting of an entirely service character.

X.—SUMMARY.

It appears to the Committee that the prejudicial conditions which obtain in the present system of match-shooting may be summarised as follows:—

- (1.) Irresponsibility of rifle associations to the military authorities.
- (2.) Defective constitution of the councils of these associations.
- (3.) Absence of any control over the expenditure of Government aid to rifle associations.
- (4.) Failure of rifle associations to keep pace with the progress of military training.
- (5.) Almost entire neglect of controlled and collective fire.
- (6.) A general absence of a proper attempt to shoot under service conditions.
- (7.) The almost universal adoption of a most pernicious system of slow aiming.
- (8.) Habitual reliance upon ridiculous and unserviceable adjuncts to the rifle.
- (9.) The disproportionate appropriation of prize money to matches for professional shots, as compared with those for beginners, and also those under service conditions.
- (10.) Unsatisfactory method of distributing railway passes.
- (11.) The encouragement of professional shots from other Colonies to the discouragement of our own beginners.
- (12.) Denial by rifle associations of any encouragement to young shots by a judicious system of handicapping.

XI.—PRIZES FOR MUSKETRY.

In the Imperial Service regiments are granted 2s. 6d. for each soldier who fires through his musketry, and 1s. for each recruit so exercised. The total sum thus obtained is distributed throughout the regiment in prizes, for the encouragement of shooting generally, as the Commanding Officer thinks best, but it is directed that *at least one-half* of the total is to be devoted to the encouragement of shooting in *sectional practices*—that is, controlled fire and other means of improving fire-discipline. Even the balance must not be wholly devoted to individual shooting, but is also to include rapid individual fire and moving target practice.

The Committee are strongly of opinion that if such grants were made in New South Wales the annual musketry course would be popularised, and an interesting means of further instruction and competition provided. If a portion of the sums annually granted to Rifle Associations were devoted to this purpose, it is considered that from a military point of view, the result would be out of all proportion greater than that now secured.

XII.—SUGGESTED MILITARY RIFLE MEETING.

As an immediate step towards the encouragement of useful rifle shooting, the Committee suggest that a rifle meeting should be held, of an entirely military character, and arranged by the military authorities.

With a view to avoiding additional railway expenses, this meeting should take place immediately after the encampment at Easter; and, to obviate unnecessary transport and loss of time, somewhere in the vicinity of the selected camping ground, by preference on a Government site. The Committee do not anticipate any difficulty in securing ground suitable for such purpose.

While the date suggested is probably well suited to country troops, it may be that some of those employed in the metropolis will have some difficulty in prolonging their absence from work.

This could be met, if found advisable, by holding a meeting on subsequent and more convenient dates, specially for metropolitan men. The expenses of the latter meeting, at which tentage, rations, and forage would not be required, would be so small as probably to render it self-supporting.

A fatigue party of sufficient strength would be required, which might be furnished by the New South Wales Artillery, to carry out preliminary arrangements (fix targets, tentage, &c.), as also during the meeting to find the necessary picquets and fatigues.

The

The arrangements which obtain at Shoeburyness Rifle Meetings might be taken as a guide in these details.

Discipline should be maintained under regimental and corps administration.

The additional cost of rations and forage would be inconsiderable.

It is believed that the programme submitted could be carried out in two days, and that a variety of interesting and instructive competitions, of a tournament character, could be included for the benefit of men when not actually engaged in shooting.

PROGRAMME SUGGESTED.

No.	Name of Match.	Nature of Fire.	No. of Rounds	Distance in Yards.	Time.	Position.	Nature of Target.
1	Beginners...	Individual deliberate.....	10	400 and 500	1 minute per round.	Lying down	Second-class Musketry target, 6 ft. x 6 ft. bull's eye, &c.
2	Do ...	do do (carbine)	10	400 and 500	do do ...	do	do do
3	French ...	Individual deliberate	6	800	2 minutes...	do	Three standing men.
4	Do ...	do do (carbine)	6	600	do ...	do	do do
5	Roberts ...	Individual rapid.....	7	500	70 seconds..	Kneeling ...	Three kneeling men.
6	Do ...	do do (carbine)	7	500	do ...	Sitting	do do
7	Scouts	Individual	5	Unknown, 800 to 500	4 minutes...	Any military	Kneeling and lying men.
8	Darghai ...	Section deliberate volleys...	6	Unknown, 800 to 600	2 minutes...	Lying down	Three standing men.
9	Ulundi	do rapid volleys.....	7	Unknown, 700 to 400	70 seconds..	Any military	A Company in column.
10	Coomassie..	do attack.....	15	Unknown, 700 to 250	As laid down	Kneeling men disappearing.
11	Duff	do attack mounted ...	15	Unknown, 600 to 200	do	Three kneeling men.
12	Malakand..	Company attack.....	15	Unknown, 800 to 300	do	Disappearing targets.
13	Hutton	Controlled fire mounted ...	15	Unknown, 600 to 200	do	Three kneeling men.
14	Luck	Mounted pistol practice ...	6	25	At gallop	One standing man (vitals to count 2, rest 1 point).
15	Burnaby ...	Dismounted pistol practice	12	25	Standing ...	do

Details of Matches.

- No. 1. *Beginners*.—Open to members of the Defence Forces who have not fired through Table B in musketry, or who are 3rd-class shots. To be fired under musketry conditions, 5 rounds each at 400 and 500 yards. Target and scoring as in musketry.
- No. 2. Same name and conditions as No. 1, but for carbine only.
- No. 3. *French*.—This match represents the fire of selected shots on outpost duty, firing at an enemy's patrol, the approximate range having been obtained by the range-finder. Six shots will be fired at about 800 yards, in 2 minutes, at a target representing 3 standing men, from a lying down position. Other conditions as in musketry.
- No. 4. Same name and conditions as No. 3, but for carbine only, and at 600 yards.
- No. 5. *Roberts*.—This match will instruct a soldier to load rapidly and fire as he would have to do against an enemy at decisive ranges. Seven rounds will be fired in 70 seconds, kneeling, at about 500 yards, the target representing 3 kneeling men.
- No. 6. Same name and conditions as No. 5, but for carbine only, and in a sitting position.
- No. 7. *Scouts*.—This match displays the fire of men selected for scouting duty, on account of their aptitude as field shots and in estimating ranges. Five shots will be fired at selected points, the ranges being unknown and between 800 and 500 yards, in 4 minutes, from any military position and at targets representing kneeling and lying men. Other conditions as in musketry.
- No. 8. *Darghai*.—This consists of section deliberate volleys, such as would be employed for the covering fire of Infantry against an enemy in position, at an unknown range. Six volleys will be fired as in musketry, at unknown ranges between 800 and 600 yards, in 2 minutes, at 3 standing men.
- No. 9. *Ulundi*.—Section rapid volleys. These would be employed at any time against an unusually exposed enemy, if within reasonable range. Seven volleys will be fired in 70 seconds at unknown distances between 700 and 400 yards, position as laid down for the distance. The target will be standing men arranged as a Company of Infantry in column.
- No. 10. *Coomassie*.—Section attack—representing the advance of assaulting Infantry within decisive ranges. To be carried out as in musketry; distances unknown and between 700 and 250 yards; targets, kneeling men disappearing, and with 15 rounds per man; teams of 8 men and a commander. There is no time limit, but a certain number of points will be deducted from the score for each appearance of the target.
- No. 11. *Duff*.—In accordance with musketry instruction for Martini Henry rifle, 1894, section 138. Conditions as at National Rifle Association meeting, but 50 points for time, and kneeling men targets.
- No. 12. *Malakand*.—Similar to section attack, except that the Company commences the advance beyond decisive ranges, and it is therefore left to the Company Commander to determine when he is justified in opening fire. Ten rounds to be carried by the men, and five per man by ammunition carriers, who will not start before the first line reach 600 yards range, nature of fire to be at discretion of the commander. Four sections will be in the firing line throughout. Otherwise as for No. 10. Points will be deducted for unnecessary exposure of individuals or part of the command. (It is hoped in future years to include supports, casualties, &c.)
- No. 14. *Luck*.—Mounted pistol practice. Three targets, standing men; three shots to be fired to the right advancing and three to the left returning at these. Distance 25 yards.
- No. 15. *Burnaby*.—Dismounted pistol practice. To run 100 yards, and load and fire 6 rounds with each hand as in musketry instructions.

APPENDIX A.

ACCORDING to Captain Mayne (Infantry Fire Tactics), "there are two methods of allowing men to fire:—

1. *Uncontrolled or independent fire*, in which each man fires at his own convenience and judgment as to range and objective.
2. *Controlled or collective fire*, in which the independency of the fire of the individual man is *controlled and directed* according to the will of their commander.

Controlled fire can only be executed when the men are collected into organised tactical groups . . . as "units of fire," because under an enemy's fire one leader alone cannot control a large number of individual men, although he can a smaller number of organised groups, each under a recognised subordinate leader.

Uncontrolled individual fire is naturally independent fire, and anything *independent* should be avoided in war as much as possible. Practically, it has been found that uncontrolled fire is very pernicious, is conducive to great waste of ammunition, and, what is far worse, to great loss of moral force in the men using it.

1. Uncontrolled fire, when once begun, especially when near the enemy, can neither be regulated nor moderated.

The late Colonel Brackenbury, describing the action of Iscambio, in the Ashantee war, 1873, writes (p. 274):—"For some time all proceeded favourably, but a few shots fired by the enemy upon the left flank immediately drew a most terrific fusillade from the Cape Coast allies, which the officers vainly endeavoured to stop, and in which Abrahms soon joined. Fire of this nature once commenced spreads rapidly, and both Houssas and Kossoos, as well as the others, had soon expended nearly all their ammunition (p. 275). We subsequently heard that as many as fifty of the Cape Coast allies were missing after this action; if so, it is probable that a large number of the casualties among them were due to their own fire."

Captain Bromhead, being ordered to remain in the track of the Ashantis, found it quite impossible to do so. "In the first place, in a two hours' action his men had fired away all their ammunition; and in the next place, in their wretchedly demoralised condition, it would have been impossible to keep them close upon the trail of the enemy."

"In Ashanti, our men in the bush-fighting sometimes fired away 100 to 150 rounds with independent firing, with very small result—that is, they fired away more ammunition individually than in some of the most hotly contested European battles."—(Mayne, p. 416.)

2. Further, in uncontrolled fire there is no check as to what the men are firing at, if they are using the proper sights, or even if they are aiming.

After the action on Majuba Hill, in the Boer war (1881), many of our men's rifles were found to have been sighted for 800 yards, yet the fight really began under 100 yards. The English fired independently throughout.

3. It soon produces in front of stationary men such a thick smoke that the object fired at is completely hidden.
4. It renders any offensive advance almost impossible.
5. It has a very bad effect on the moral spirit of the men, as it tends to increase the excitement by causing an impression that danger is near, and as the ammunition decreases so does the courage of the men engaged.
6. The fire cannot be readily directed from one object to another, and therefore the power of concentration is lost.
7. It is the least terrifying to an enemy, especially at the longer ranges, both because it gives poor results, and also because it is scattered.
8. Its efficacious use at all ranges requires a higher state of discipline and training than is usually possible.

Prince Kraft, in "Letters on Infantry," p. 78, says:—"It seems to me that a line of skirmishers which, during a hot fight, pays so much attention to the shrill whistle of the lieutenant that it ceases firing for a moment, looks towards him, and obeys his sign to rise and rush on, or his order to fire on another object, or with another sight, *proves at once that it has attained to a high degree of fire discipline.*"

9. Once an uncontrolled fire is allowed to begin, especially if the enemy is near at hand, it will continue unchecked until the last round has been spent, from the natural tendency of the men to fire as hard as they can.
10. In very heavy firing neither bugle nor voice can be heard to put a stop to it.

"When once the fire of skirmishers has grown hot it is no longer possible to exercise any influence over it. . . . When the fighting-lines have got so close to each other that each individual skirmisher can see his enemy aiming at him, when losses begin to get heavy, and when certain sections have lost their leaders, then, at first in these sections, but soon along the whole front, a hot fire begins to 'roll,' as those men say who have experienced it. Then all directions with regard to economy in ammunition cease, since no word of command can be heard above the noise of battle. I do not wish to say anything against the courage of our excellent infantry soldiers, but there are always some among them who are but too glad to keep up their pluck by a noise, for no one wants to be killed, and most men feel the need of silencing the fear of death by a shock of some other kind, such as a great noise. At times, when it would be premature to charge in with a cheer, this uproar will continue, in order that the excitement created by it may compensate for the chilling effect of the fear of death."—(Kraft).

11. To practice independent fire at drill is considered by some writers not only needless but positively harmful. At short ranges, in close contact with the enemy, controlled fire will of itself degenerate into rapid uncontrolled fire; the men will no longer pay any attention to orders for control. There is no need to order independent fire, for no prohibition will prevent it.

On the other hand, by the use of *controlled fire*—

1. Not a round of ammunition can be fired without orders.
2. It gives the means of seeing that all the rifles are directed on the same spot, and that the men use the sights ordered, and the fire can be rapidly directed from one object to another.
3. The fire can be stopped to allow the smoke to clear off, and the pauses in the fire can be as long as the commander pleases.
4. The pauses have a quietening effect upon the men when they are getting out of hand.
5. As the fire can be stopped at will on an order, an immediate offensive advance can be conducted.
6. It gives a better result at *all* ranges.
7. It has a very terrifying effect on the enemy when the range is found and the fire is well delivered, as it suddenly pours in at once a searching, concentrated mass of bullets at one spot, while uncontrolled fire cannot be concentrated, and so the bullets fall here and there.
8. It shakes the moral force of the enemy by the sudden loss of a number of men.
9. It requires less discipline and training on the part of the men to get good results.

“All the advantages of volley-firing must not be expected in war. It is none the less certain that the more troops have been trained in time of peace to pay attention to the slightest sign or gesture of their leaders, the greater will be the discipline and power of control in the fight. *It is a matter of peace-training and constant practice.*”

Troops which have not been broken in to it will not possess fire discipline, however much they may have been disciplined in other respects.

These statements are not the outcome of theoretical conjecture. They are based on the experiences of modern warfare, and supported by the musketry regulations of the leading armies of Europe. Prince Kraft, one of the most experienced soldiers of the present day, says (p. 74):—“I have very often observed how in battle, in the presence of danger, troops which are not properly instructed do not aim—they do not even shoot—they simply make a noise. Even before I had ever seen an action, men with experience of war assured me that it was a proof of a certain standard of training in infantry if, in a hot fight, they put their rifles to their shoulders before firing. During the battle of Koeniggratz I witnessed some most irregular fire, which, as the rifles were held vertical, all went up into the air.”

It is quoted as an instance of extraordinary presence of mind that, in one of the actions in the 1870 war, a non-commissioned officer was observed, throughout an attack, to caution his men, from time to time, how to adjust their sights.

“In the battle of the Solferino it is estimated that 8,400,000 shots were fired by the Austrians, occasioning a loss to the French and Sardinian troops of 2,000 killed and 10,000 wounded, so that 4,200 shots were required to kill and wound *one man*, showing an expenditure of 278 lb. of lead for each man killed. In the Franco-German war, however, the Germans appear to have shot much better, for the average number of shots required to kill a Frenchman was reduced to 1,300.”

Can we Australians arrogate to ourselves any superiority over the German or any other nation in respect to fire discipline? If not, by all means let us remember that it will take a good many more than a handful of our crack shots to account for a single company of the enemy.

“At present our men, and non-commissioned officers, and even officers do not know the true necessity for working in groups. It has not been impressed on them by fire experiments, as is done abroad, and the whole duty of fire direction may be said to be almost unknown among us, as the question of infantry fire tactics has been sadly neglected in England. (This was written in 1888.) *Now that such a system has been instituted, let us hope that it will be rigorously insisted on, and then it will be found that wild firing will cease, or, at least, be minimised.*”

“The whole of our old system of musketry (1877) was based on the assumption that every man with good eyesight could be made a good shot, and the individual fire of a single man was accordingly raised to the highest place. The falseness of this hypothesis was amply proved in our late campaigns, where our shooting is reported to have been as bad as it could possibly be. The fact of the matter is that *only very few men are individually good shots*, especially when under fire, and those that are such have *their skill nullified* in the field by the excitement of the fight, and *by not knowing the ranges exactly*, the almost *all-important point* for accurate shooting.”

Lord Wolseley has said that he does not believe 10 per cent. of the soldiers of any army can see at 1,000 yards, much less hit an object at that distance.

“In Afghanistan our troops, as a rule, opened an independent fire at ranges between 700 and 900 yards (as we had not then any such thing as fire discipline in our service), and killed very few for the number of rounds fired.”

“One notable instance was at Del Sarak, when 28,000 rounds were expended on fifty killed, at ranges under 400 yards.”

“Two hundred of the enemy were really killed that day, but 100 were shot down by a *single volley* from one company at about 100 yards range, and another fifty were killed in a cavalry charge. Except the one volley, this was wholly independent firing.”

“In this action there was no fire discipline, control, or direction. Officers were to be seen taking rifles from the men and making practice for themselves. The result was that the whole of the ammunition with the force was fired away, and the troops had to retire back to camp for want of ammunition, followed up by the enemy the whole way.”

“When our troops were shut up in Sherpur, on several occasions when independent fire began, it increased to such a pitch that neither bugle nor voice could be heard, and the men did not stop until they had fired their last round.”

“In Egypt, in 1882, complaints invariably came after every action of the bad shooting of our troops, and why? Because it was independent, unconcentrated fire.”

Six hundred and ninety-three men were engaged in the action on Majuba Hill, every man having received seventy rounds of ammunition. The official statement of the affair makes no reference to the Boer casualties, who, however, acknowledge to have lost *one* man killed, and *five* wounded.

About 1,000 British troops attacked the Boer position at Lang's Nek. The Boer casualties are estimated at sixteen killed, and twenty-four wounded.

At the Ingogo River about 550 men, after fighting from mid-day to 7 p.m., accounted for nine Boers.

9

Certainly, in the Zulu war, our men made better shooting ; but no one would claim that the Zulus, however brave, were a well-armed body.

Numerous instances of individual bravery and traditional British pluck have been recorded in every recent war in which our troops have been engaged. May we not accept this as an indication that it is to the system of peace-training adopted in past years, and recently revised, rather than to the men themselves, we should attribute our reverses.

"The independent firing of the French in 1870, and of the Turks in 1877, may be taken to heart by all as a warning of how not to act."

Let us see then what our regulations say on this all-important subject of fire-discipline—

(Infantry Drill, 1889, p. 338) :—"To ensure that fire is always under control, *independent firing* will be *deferred* as long as possible. The march before the fight, the subsequent rapid advances, and the fatigues of frequent firing, will tax to the utmost the physical strength, endurance, and courage of all concerned. It is, therefore, evident that prompt obedience to orders, and strict fire discipline are of *paramount importance*. These ends can only be obtained by *constant practice during peace*."

(Infantry Drill, 1889, p. 205) :—"The more carefully troops are trained to do during peace what will be required of them in time of war, the more efficient they will prove when they take the field."

(Infantry Drill, 1892, p. 177) :—"No time should be wasted by attention to details which are not of practical use in the field, and the aim of teaching should be to imbue all ranks with a knowledge of the principles upon which movements under fire are conducted."

Signed this 20th day of January, 1898, at Victoria Barracks, Sydney, New South Wales.
