PIDDINGTON, WILLIAM HENRY BURGESS, ESQUIRE:— Resignation of, as Member for Uralla-Walcha reported, 1; return of Writ, certifying to election of, reported, Mr. Piddington sworn, 6. Death of, reported, and seat declared vacant, 357. Motion expressing regret at the death of, 357.		
PIKE, ARREST OF (See "POLICE").		
PITT-STREET (See "TRAMWAYS").		
PLAGUE (See "BUBONIC PLAGUE").		
POINTS OF ORDER:— Reported from Committee of Supply, 58, 435. Reported from Committee of the Whole, 266.		
RULINGS OF SPEAKER:— That a Temporary Chairman of Committees could take the Chair, notwithstanding that the Chairman of Committees had not been appointed, 49. That debate in Committee of Supply on items in Resolution for specific services must be confined to the items submitted, 58. That the provision in clause 4 of the Darling Harbour Wharves Resumption Bill, giving power to lease or sell certain of the land, was covered by the Title and Order of Leave; Speaker quoted decision of 17th August, 1897, in reference to the Totalisator Bill, 83. That amendment, for Call of the House, on a motion proposing a new Standing Order, could be admitted, 127. That sections 12 and 13 of the Public Works Act had been complied with by the Minister in moving motion to refer the matter of removing the Public Abattoirs from Glebe Island, to the Public Works Committee, 223. That an amendment to insert words "The Sydney Harbour Trust Commissioners" in clause 2 of the Industrial Arbitration Bill, before the Commissioners were appointed, was in order, 266. That the subject of the motion for the adjournment of the House in reference to land exchanges had not been discussed on a previous motion, 286. That the Fire Brigades Bill was out of order, because clause 25 conflicted with, and was contradictory of clause 65 of the Sydney Harbour Trust Bill, passed by this House, and now before the Council, 306. That the provision in the Racing Association Bill in regard to incorporation was not beyond the Order of Leave, and that the Bill did not require to be introduced in Committee, 318. That provision in clause 7 of the Early Closing Amendment Bill, which proposes to bring hotels, &c., selling tobacco, under the same law as tobacconists' shops was within the Order of Leave, 325. That proposal to put the motion for the adjournment of the House without debate on Friday sittings was not a contravention of the Standing Orders which gave the right to Members to debate such questions, 367. That although the Public Works Committee had varied the reference made to them in reference to the proposal to construct the Belmore to Fort Macquarie Electric Tramway, he would not rule the motion to carry out the work out of order, 367. That motion for adjournment of House in reference to thoroughfare for vehicular traffic through the Botanical Gardens, could be discussed in the financial debate in Committee of Ways and Means, and was out of order, 392. That as the Order of the Day was the property of the House, the second reading of the Tied Houses Bill could be moved by any Member, 409. That an Honorable Member discussing in Committee of Supply the estimate for "Railways and Tramways—Existing Lines—Working Expenses," was not in order in commenting in detail on a report of an officer on a new line of railway, 435-6. That a Minister was permitted to present papers to Parliament at any time, notwithstanding an address passed by the House requesting the production of the papers, had not been presented to the Governor, 441. That the introduction of the Patents and Trade Marks Bill should have been preceded by a Message from the Governor, 460.		

REFERENCES TO THE VOTES AND PROCEEDINGS, VOL. I—18TH PARLIAMENT—SESSION, 1900.	PAPERS ORDERED TO BE PRINTED.	
	VOL.	PAGE.
P		
POINTS OF ORDER (<i>continued</i>):—		
RULINGS OF SPEAKER (<i>continued</i>):—		
That the motion for the adjournment of the House in reference to the Police Superannuation Fund anticipated the discussion of a motion which was already on the paper, and was out of order, 522.		
That the Federal Elections Bill was not out of order, notwithstanding the Schedule referred to in Clause 6 was not given, as the Schedules could be introduced and discussed in Committee, 541.		
That motion for adjournment on influence of Members with Federal Electorates Commissioners anticipated discussion on the Federal Elections Bill, and was out of order, 549.		
That motion approving of Government entering into a contract for the supply of steel rails should have originated in Committee of the Whole, and was out of order, 549.		
That motion for adjournment of the House in reference to contract for steel-rails anticipated the discussion of a motion given this day on the subject, and was out of order, 557.		
That in regard to the motion of adjournment in reference to consumptive patients, Liverpool Asylum, having been already discussed in Committee of Supply and being open to further discussion on the third reading of the Appropriation Bill, he thought that the item could not be discussed on the third reading of the Appropriation Bill, and he had not sufficient information as to the proceedings in supply to rule the motion out of order, 577.		
RULINGS OF DEPUTY-SPEAKER:—		
That motion for adjournment of House in reference to legalising certain Municipalities did not deal with the subject embodied in the Municipalities (Amendment) Bill, and was in order, 610.		
That certain clauses in the Municipalities (Incorporation Validating) Bill was not beyond the Order of Leave, 610.		
That the requirements of the Public Works Act had been complied with on motion to refer the work "High-level Bridge over the Hawkesbury River at Richmond" to the Public Works Committee, 615.

SPEAKER :— Reports, issue of Writs, 1 (°), 291. Reports, return of Writs, 1 (°), 6, 51, 291. Retirement of Sir Joseph Abbott, K.C.M.G., 9, 11, 26, 43. Mr. McCourt elected, 11; Presented to Governor, 11. Lays papers on Table, 12, 16, 41, 73, 96, 171, 451. Commission of, to administer the Oath of Allegiance, reported, and read by Clerk, 12. Commission of Deputy, to administer Oath of Allegiance, 69. Lays on Warrant appointing Elections and Qualifications Committee, 17; Reports Maturity of Warrant, 44; Appoints first meeting of Committee, 91. Vote of Thanks to Sir Joseph Palmer Abbott, K.C.M.G., on his retirement, 26, 43. Lays on Table Election Petition—Taylor v. Smith, Canterbury, 91. Clerk informs House of unavoidable absence of, and Deputy-Speaker took Chair, 597, 607.		
RULINGS OF :— That a Temporary Chairman of Committees could take the Chair notwithstanding the Chairman of Committees had not been appointed, 49. That Debate in Committee of Supply on items in resolution for specific services must be confined to the items submitted, 53. That the provision in clause 4 of the Darling Harbour Wharves Resumption Bill, giving power to lease or sell certain of the land, was covered by the Title and Order of Leave; Speaker quoted decision of 17th August, 1897, in reference to the Totalizator Bill, 83. That amendment, for call of the House, on a motion proposing a new Standing Order, could be admitted, 127. That sections 12 and 13 of the Public Works Act had been complied with by the Minister, in moving motion to refer the matter of removing the Public Abattoirs from Glebe Island, to the Public Works Committee, 223. That an amendment to insert words "The Sydney Harbour Trust Commissioners" in clause 2 of the Industrial Arbitration Bill, before the Commissioners were appointed, was in order, 266. That the subject of the motion for the adjournment of the House in reference to land exchanges had not been discussed on a previous motion, 286. That the Fire Brigades Bill was out of order, because clause 25 conflicted with and was contradictory of clause 65 of the Sydney Harbour Trust Bill passed by this House and now before the Council, 306.		

REFERENCES TO THE VOTES AND PROCEEDINGS, VOL. I—18TH PARLIAMENT—SESSION 1900.	PAPERS ORDERED TO BE PRINTED.	
	VOL.	PAGE.
S		
SPEAKER (<i>continued</i>):—		
RULINGS OF— <i>continued</i> :—		
That the provision in the Racing Association Bill in regard to incorporation was not beyond the Order of Leave, and that the Bill did not require to be introduced in Committee, 318.		
That provision in clause 7 of the Early Closing Amendment Bill, which proposes to bring hotels, &c., selling tobacco, under the same law as tobacconists' shops, was within the Order of Leave, 325.		
That proposal to put the motion for the adjournment of the House without debate on Friday sittings was not a contravention of the Standing Orders which gave the right to members to debate such questions, 367.		
That although the Public Works Committee had varied the reference made to them in reference to the proposal to construct the Belmore to Port Macquarie Electric Tramway, he would not rule the motion to carry out the work out of order, 367.		
That motion for adjournment of House in reference to thoroughfare for vehicular traffic, through the Botanical Gardens, could be discussed in the financial debate in Committee of Ways and Means, and was out of order, 392.		
That as the Order of the Day was the property of the House, the 2nd reading of the Tied Houses Bill could be moved by any member, 409.		
That an honorable member, discussing in Committee of Supply the estimate for "Railways and Tramways, existing lines—working Expenses," was not in order in commenting in detail on a report of an officer on a new line of railway, 435-6.		
That a Minister was permitted to present papers to Parliament at any time, notwithstanding an address passed by the House requesting the production of the papers, had not been presented to the Governor, 441.		
That the introduction of the Patents and Trade Marks Bill should have been preceded by a Message from the Governor, 460.		
That the motion for the adjournment of the House in reference to the Police Superannuation Fund anticipated the discussion of a motion which was already on the paper, and was out of order, 522.		
That the Federal Elections Bill was not out of order, notwithstanding the Schedule referred to in clause 6 was not given, as the Schedules could be introduced and discussed in Committee, 541.		
That motion for adjournment on "Influence of Members with Federal Electorates Commissioners," anticipated discussion on the Federal Elections Bill, and was out of order, 549.		
That motion approving of Government entering into a contract for the supply of steel rails should have originated in Committee of the Whole and was out of order, 549.		
That motion for adjournment of the House in reference to "Contract for Steel-rails" anticipated the discussion of a motion given this day on the subject, and was out of order, 557.		
That in regard to the motion of adjournment in reference to "Consumptive Patients Liverpool Asylum, having been already discussed in Committee of Supply, and being open to further discussion on the third reading of the Appropriation Bill," he thought that the item could not be discussed on the third reading of the Appropriation Bill, and he had not sufficient information as to the proceedings in Supply to rule the motion out of order, 577.		
RULINGS OF DEPUTY-SPEAKER:—		
That motion for adjournment of the House in reference to legalising certain Municipalities did not deal with the subject embodied in the Municipalities (Amendment) Bill, and was in order, 610.		
That certain clauses in the Municipalities (Incorporation Validating) Bill was not beyond the Order of Leave, 610.		
That the requirements of the Public Works Act had been complied with on motion to refer the work "High-level Bridge over the Hawkesbury River at Richmond" to the Public Works Committee, 615.		
DISSENT TO RULING:—		
Motion made (<i>Mr. Norton</i>) That House dissents from ruling in reference to Early Closing (Amendment) Bill, 339.

PLAN.

Glebe Island Improvements.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

GLEBE ISLAND IMPROVEMENTS.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a wharf round the Island," have, after due inquiry, resolved that it is not expedient the proposed works, as referred to the Committee, be carried out, but they recommend the carrying out of that portion of the improvements which comprises the cutting down of a part of the island, and the partial reclamation of the foreshores, at an estimated cost of £38,000; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

THE PROPOSAL AS EXPLAINED BY THE DEPARTMENT.

1. The proposed works were explained to the Committee by the Department of Public Works as consisting of two parts—(1) the scheme in a complete form, and (2) a proposal by which a portion of the works would be first carried out, the remainder being left to the future, when the Abattoirs shall have been removed from Glebe Island and the trade of the port of Sydney justifies the larger expenditure.

COMPLETE SCHEME (PART 1).

2. The complete scheme comprises the construction of 6,350 feet of wharfage, consisting of a wharf 4,000 feet in length, extending northerly from near the opening span of the new Glebe Island bridge or causeway, and thence westerly and south-westerly to the head of White Bay; and a wharf about 2,350 feet in length, inside or south of the bridge, and extending south-westerly and north-westerly in front of the Abattoirs; the reclamation of an area of 23 acres of land; the cutting down of the island, and the filling in of the area between the back of the wharfs and the shore with the material excavated; the erection of thirteen cargo-sheds, from 200 feet to 350 feet in length by 45 feet in width, seven of these being to the north of the bridge, and the remainder to the south, together with all necessary offices, fencing, &c.; the construction of wide roads, with footpaths along the back of the wharfs and sheds, connecting with the main Abattoir-road; and provision for water supply, drainage, and electric lighting.

The estimated cost of the complete scheme is as follows:—

Wharf and filling works	£187,500
Road-making and drainage	18,500
Water supply	1,600
Cargo-sheds, offices, fencing, &c....	60,500
Electric lighting	5,500
Total	£273,600

To

To alter the main road across the island, after the whole of the stone has been taken away, would cost £4,500; but as it must be very many years before so large a quantity of stone can be absorbed this amount has been omitted from the estimate.

The portion of the scheme to the south of the bridge cannot be carried out until the Abattoirs have been removed.

PARTIAL SCHEME (PART 2).

3. By the partial scheme it is proposed to carry out, for the present, only the portion of the works to the north of the Abattoir-road, viz., 4,000 feet of wharfage with the requisite cutting down, reclamation, and filling in, cargo-sheds, offices, fencing, &c., roads, water supply, drainage, and electric lighting. This extent of wharfage would provide four berths of 550 feet, three of 490 feet, and one of 330 feet.

The estimated cost of this portion of the scheme is as follows:—

Wharf and filling works	£125,000
Road-making and drainage	11,500
Water supply	1,000
Cargo-sheds, offices, fencing, &c.	37,000
Electric lighting	3,500
Total	£178,000

DETAILS OF THE PROPOSAL.

4. The island has, at present, an area above high-water mark (exclusive of the land reclaimed at the head of White Bay) of about 34 acres, and a fairly good depth of water all round, which could easily be increased by dredging, at a reasonable cost, to 28 or 30 feet, sufficient for the largest vessels coming to the port. The approach to the island would be deepened by dredging a channel from near the Colonial Sugar Works.

The areas reclaimed by the filling-in would be $14\frac{1}{4}$ acres outside the bridge, and $8\frac{3}{4}$ inside or south of the bridge, or a total of 23 acres; and as the timber wharf would cover an additional $3\frac{1}{2}$ acres outside the bridge and 2 acres inside, the total area inside the face of the wharf would be nearly 63 acres. The wharfage has been designed round the island in long straight lengths, in order to accommodate the largest vessels—sailing ships or steamers—now visiting, or likely to visit the port.

There is much more stone and other material on the island than is required for filling purposes in connection with the island works; but as the Government is constantly carrying out reclamation, wharfage, and other improvements in various parts of the harbour, requiring large quantities of stone, the surplus material can be gradually disposed of. When the whole of the stone and material has been removed, the area of land available for factories, warehouses, timber-yards, &c., after deducting that covered by the works, will be about 25 acres to the north of the Abattoir-road, and 11 acres to the south, or a total of 36 acres, being 2 acres more than the present area of the island above high-water mark.

The Engineer-in-Chief explains that 66 feet is the width necessary for road approaches to the wharf, but practically there would be a width of 200 feet levelled down in the excavation and reclamation all round, the portion in excess of the 66 feet being available for the erection of stores or warehouses thereon. Above the bridge the wharfage, when constructed, would most likely be used by a class of vessels smaller than those below it; but there is no reason, it is stated, why it should not be used by large vessels, in view of the 60-foot clear opening in the new bridge, and the requisite depth of water. The intention, however, is that the portion of the foreshores north of the bridge should be made available and brought into use first, and then, as trade demands it, the frontage south of the bridge may be made available. The construction of the wharfs would be carried out in sections, so as to make the berths available one after the other, the wharf work being done by contract, and the cutting down, excavation, and filling by day labour. The first berth would be ready, it is expected, in eighteen months or two years,

by

by which time the new bridge or causeway will also be completed. The scheme is regarded as one which requires railway connection, and a line might be constructed round the island. According to the Engineer-in-Chief for Railway Construction the connection could be with Darling Harbour or Darling Island, or with Ashfield, Petersham, or Stanmore, at an approximate cost in the case of either of the two first-mentioned of £200,000, and the others, apart from land and compensation—Ashfield, £160,000; Petersham or Stanmore, £100,000. The cheapest connection would be from Darling Island, because the resumptions would be very costly by the other routes, but by junctioning at one of the suburban stations mentioned the traffic would leave the main line sooner, and the Engineer-in-Chief prefers the Ashfield scheme. The branch line would be for goods traffic only; passenger requirements could be met by an extension of the electric tram from Harris-street.

STATEMENT AS TO COST, IN THE LEGISLATIVE ASSEMBLY.

5. The estimated cost, as before stated, is, for the partial scheme, £178,000, and for the complete scheme, £273,600, exclusive of railway connection. When explaining the matter in the Legislative Assembly, the Minister for Works inadvertently gave the cost as £38,000, and the Premier made a similar statement. The Department had been asked what could be done in the way of cutting down the island and reclaiming the foreshores without constructing any wharfage, and for an estimate of the cost, and £38,000 was the estimate given for cutting down and filling out to a certain distance. Subsequently, an estimate was prepared for carrying out all the works proposed north of the bridge, including the completion of the wharf; and with the two estimates before him in the Assembly, the Minister accidentally took up the smaller one.

WORK COVERED BY THE £38,000 ESTIMATE.

6. The work estimated to cost £38,000 would be the first to be carried out, whether the complete or the partial scheme was passed. It comprises excavation and filling, and is, as the Engineer-in-Chief describes it, all straightforward labour work. Sufficient rock would be cut down and excavated to fill out to a line 45 or 50 feet behind where the wharf would be when constructed, and as the work proceeded the foreshore of the island, north of the bridge or causeway, would be levelled and made suitable for temporary wharfage purposes—such, for instance, as those in connection with the timber trade—and ready for proceeding with the larger wharfage scheme whenever it should be considered opportune. In 1897, Parliament voted £2,500 towards cutting down the island and reclaiming around it, and that money has been spent on work chiefly in connection with the approach to the Glebe Island Bridge, and partly for the reclamation of the foreshores, the cost, up to the present, being a few pounds in excess of the £2,500 voted.

DEPARTMENTAL REASONS SUPPORTING THE PROPOSAL.

7. In support of the proposal it is explained by the Department of Public Works that the very rapid increase in the shipping visiting Sydney Harbour during the last few years makes it necessary that increased wharfage accommodation should be provided in the near future, and in view of this increase and the length of time required to construct wharves of an extensive character it is considered now desirable to select a site, determine upon a scheme of improvement, and commence a portion of the works.

All the available water-frontages owned by the Crown, and conveniently situated to the city, such as Circular Quay, Woolloomooloo Bay, and Darling Harbour, have, it is stated, already been utilised for wharfage purposes, and the only Crown land within a reasonable distance of the city which could be used for additional wharfage accommodation is at Glebe Island. This island, it is pointed out, offers splendid facilities for shipping purposes, there being a long foreshore for the construction of wharves with a deep-water frontage, easy of approach by vessels, and convenient to the city, the distance by road to the foot of Market-street being only 1 mile. Although access to wharves on the southern portion of the island must

must be through the Glebe Island Bridge, no great inconvenience, it is urged, need be felt, as the swing span of the new bridge will give two clear openings of 60 feet each, the time occupied in opening or closing being only one minute; in addition to which the under part of the bridge will be 26 feet above low-water, affording sufficient headway for the passage of launches and small vessels.

POINTS IN THE INQUIRY.

8. In dealing with the proposal the Committee visited Glebe Island, Circular Quay, Woolloomooloo Bay, Pyrmont, Darling Island, and Darling Harbour, and, in addition to the official and other witnesses, examined the Chairman and the Manager of the Sydney Wharf Association, the Manager of the Colonial Sugar Refining Company, the late Collector of Customs, who formerly was Manager of the Wharf Association, the Chairman of the Board of Exports, representatives of large steamship lines, and others specially acquainted with the trade of the port, some of whom were averse to the proposal.

Particular attention was given to the wharfage available, or under construction, the condition and progress of the shipping trade, applications for accommodation at Government wharfs, the revenue received from Government wharfs, and generally to the suitability or otherwise of Glebe Island for wharfage purposes.

WHARFAGE AT PRESENT AVAILABLE, OR UNDER CONSTRUCTION.

9. The present wharfage in the port of Sydney for the accommodation of large vessels, consists of the Government wharfs at Circular Quay, Woolloomooloo Bay, and Pyrmont; those in progress at Darling Island; and some of the private wharfs in Darling Harbour, and between Miller's and Dawes Points. Circular Quay contains thirteen berths—one or two rather small—representing 5,036 feet; Woolloomooloo Bay nine berths, with 3,156 feet of wharfage accommodation; Pyrmont, excluding some jetties and wharfage used for the discharging of timber and the shipment of coal, two berths; and Darling Island, when the works in progress there shall have been completed, six berths, giving 2,500 feet of wharf accommodation. These figures make a total for the Government wharfs of twenty-eight berths; and in Darling Harbour and between Miller's and Dawes Points, according to a return supplied by the manager of the Sydney Wharf Association, there are thirty-three berths suitable for over-sea vessels. But the majority of the berths at the private wharfs are jetty berths, while the majority of the Government berths are broadside wharfs, and the general testimony is that for large vessels broadside wharfs are incomparably the best.

Circular Quay may be said to be fully occupied, all the principal berths being leased to large steamship companies, and the remainder used by ferry and other harbour steamers, the latter being an increasing item and possibly requiring the early removal of the large ocean steamers from the south-western corner of the Quay. Sailing vessels which, a few years ago, crowded the Quay in the wool season, are now seldom or never seen there. The Quay wharfs are preferred by the agents of the large ocean-going passenger-carrying steamers such as those of the P. & O., Orient, Messageries Maritimes, Canadian-Australian, Japanese line, A. & A. Co. (the San Francisco line), E. & A. Co., and Norddeutscher-Lloyd, as, being centrally situated and easily accessible, they are the most convenient in the harbour for both passengers and cargo. The public have no difficulty in getting to and from them, and as they are close to many of the principal wool and produce stores, and other places of business, in the city, no delay arises in connection with the discharge or shipment of goods. All these steamers, therefore, discharge and load at the Quay, and if more berths of a similar kind were available, other steamship lines would at once take them up.

Woolloomooloo Bay contains our most up-to-date wharfs, but situated as it is, on the east side of the Domain and a mile or more from the city centre, with no direct tram connection, it is not nearly so accessible as the Quay. But the whole of the wharfage in the Bay may be said to be occupied. One berth of 500 feet on the eastern side is occupied by the agents of the White Star line of steamers—the "Medic," "Afric," and "Persic," and a second, adjoining the first, of 340 feet, is that

under offer to that firm. An addition of 200 feet to these two berths, by an extension at the northern end, will increase their length to 1,040 feet in all. The other berths, with the exception of two at the small jetty, used by the Government for the discharge of coal and road metal, are leased to or otherwise used by shipping companies for the discharge and loading of both steamers and sailing vessels.

The Pymont wharfage, being partly above the bridge, is hampered by the inadequate approach provided by the swing-opening, but will be more conveniently accessible after the completion of the new bridge now under construction. There are four iron jetties, each about 70 feet long, at the foot of Lackey-street, suitable for small sailing vessels, and of late years used by small timber craft; and, near these jetties, a timber wharf leased to the agents of the Federal line of steamers, who have erected refrigerating works there in connection with the shipment of frozen meat. This steamship line consists, at present, of eight steamers—seven of a dead-weight carrying capacity of 9,000 tons each, and one of 6,000 tons. Except for one steamer of that line the wharf above Pymont Bridge is unavailable, owing to the vessels being unable to get through the bridge, but with the construction of the new bridge this difficulty would disappear. Between the Federal steamers' wharf and the bridge is a wharf used by small timber vessels, and below the bridge a wharf with a good depth of water, not leased, at which frozen meat has been shipped; and there are two jetties now used for coal shipping purposes.

The present intention with regard to the wharfs now being constructed at Darling Island is that they should be used for export purposes, largely in connection with the shipment of wheat, 90,000 tons of which it was expected would be available for shipment this year, and for the storage of which, prior to shipment, a large shed is now being built on the island adjacent to the wharfs. The sum of £100,000 was recently passed by Parliament on the Loan Estimates for the erection of elevators, in relation to this trade. As, however, the Darling Island wharfs will have the advantage of railway connection, the railway lines extending to the water frontage, there is reason to believe that as opportunities offer they will be used for import trade purposes also. In most instances they will be long broadside berths, suitable for the largest steamers, with the railway close by; in their vicinity large wool and produce stores already exist, and others sooner or later will follow; and though the distance from the island to the stores and business places in the city is somewhat greater than from the Circular Quay or Woolloomooloo, the charges for cartage, the Committee are informed by master carriers who gave evidence in the inquiry, would be the same.

This statement, it will be observed, shows that of the Government wharfs in the port of Sydney, those at Circular Quay and at Woolloomooloo Bay are fully used, while at Pymont and Darling Harbour there are, or shortly will be, a number still available.

The private wharfs in Darling Harbour, and between Dawes and Miller's Points, capable of accommodating oversea vessels, are principally jetties, from 300 to 400 feet long, and 50 or 60 feet wide, fitted with commodious stores, and in close proximity to the city, but with the disadvantage that the streets which form the get-away from them are steep, and therefore inconvenient and, in respect of cartage, expensive. They are, however, capable of improvement. One, at Miller's Point, a broadside structure, about 900 feet long, described to the Committee as occupying one of the best sites in the city, and as convenient in regard to get-away as any other wharf in the harbour, except those at Circular Quay, could be improved by being added to an adjoining wharf which has a length of 300 feet. Another has been improved by the provision of a lift to take cargo up to the street level. The jetty wharfs, though somewhat narrow for the unloading of cargo from ships or steamers on either side, could, and probably would, be improved, the Committee are informed, if it were compatible with public policy to allow the wharf-owners to extend them and to have a more secure tenure.

The private wharfs are fairly well occupied in the wool season mostly by vessels of moderate size, but during much of the remainder of the year are comparatively idle. Each of the thirty-three berths at these wharfs suitable for over-sea vessels is stated to be capable of berthing two vessels a month, a rate of accommodation which would give a total of sixty-six per month, or 792 per year, of the class
which

which the wharfs can respectively accommodate,—figures far in excess of those which represent the number of ships actually accommodated. All the berths are never fully occupied, and occasionally (as was the case when the Committee visited these wharfs) almost all of them are vacant.

CONDITION AND PROGRESS OF THE SHIPPING TRADE.

10. The shipping trade of Sydney Harbour at the present day differs from what it was some years ago, by reason of the extensive substitution of steamers for sailing vessels, and the large increase which has taken place in the size and carrying capacity of some of the former. Steamers of 5,000 or 6,000 tons are now fairly numerous, but some lines are running steamships to Sydney of 9,000, 10,000, and 12,000 tons, and there is a prospect of steamers of this size increasing in number. These unusually large vessels require wharfage accommodation which will provide berths long enough for them to lie conveniently and work all hatches simultaneously, and of sufficient breadth to enable them to discharge their cargoes expeditiously. Long broadside berths are the most suitable. Jetty berths, especially if a vessel be lying on each side of the jetty, are not so convenient, because of their greater liability to become congested with cargo; and to accommodate very large vessels they would have to project to such an extent as to interfere with harbour navigation. With the exception of one wharf property in Darling Harbour, near Miller's Point, all the broadside wharfage in the port, suitable for large steamers, is owned by the Government, and as the Government wharfs are fitted with commodious and well-appointed sheds, and are conveniently situated, the berths at these wharfs are much favoured by the shipping community. These advantages, it is contended in the evidence of those representing the private wharfs, are the cause of the Government wharfs being generally fully occupied while many of the private wharfs are empty; and to the eagerness with which the Government wharfage is taken up is attributed the idea on the part of the Departmental witnesses examined that the proposed increased wharfage is justified by a growing demand arising from an increase of shipping. Statistical returns laid before the Committee show that the shipping trade of the port has increased considerably during the last ten years in both tonnage and imports and exports; but it is not apparent from the evidence that the demand for wharfage has not been adequately met by the wharfs at present in use. It is evident, however, that a great number of the existing privately-owned wharfs are unsuitable for the largest class of steamers now trading to the port, and it is probable that at some future time it will be necessary to either remodel the privately-owned wharfs or extend the Government wharfs.

APPLICATIONS FOR GOVERNMENT WHARFAGE.

11. As reasons why the proposed works at Glebe Island should be constructed, the Manager of the Government Wharfs informed the Committee that, at times, he has experienced a difficulty in finding berths for all the large steamers wanting them, and that he has now three applications to lease berths which he cannot comply with. These applications are understood to be from the representatives of the A. and A. line of steamers, the Federal line, and Houlder Brothers. Two of them, it is admitted, may be met by an extension of the wharfage in Woolloomooloo Bay, which the Committee have inquired into, and recommend, and the third, it is considered, may very well stand over until the new wharfs at Darling Island have been completed, and their commercial possibilities tested.

It is not shown by the evidence that if the wharfs at Glebe Island were constructed the steamers of these lines would use them. For the A. and A. line they would be most unsuitable, in view of the great disadvantage at which the steamers would be placed in comparison with the passenger-carrying steamers berthing at Circular Quay or Woolloomooloo Bay. At present the American boats find accommodation at the Circular Quay. Newer and larger boats connected with this line, about to be built for the trade with Sydney, may be berthed at the contemplated new wharf in Woolloomooloo Bay.

The steamers of the Federal line would not go to Glebe Island, the local agents state, for the reason that the island is too far away from the city. These steamers which, with the exception of the White Star liners, are some of the largest
of

of the cargo boats coming to Sydney, bringing as much as 5,000 tons of cargo each trip, berth at present at the Circular Quay and at one of the private wharfs in Darling Harbour for the discharge of cargo, and at one of the Pymont wharfs for the loading of frozen meat. Darling Island offers the best prospects to this company, as berthed there the steamers would be close to the refrigerating works erected at Darling Harbour.

The firm of Houlder Brothers was not represented among the witnesses examined; but as the steamers of their line are about the same size as those of the Federal line, and the two lines are worked in conjunction, the position may be said to be similar to what has just been stated.

Though these applications from large steamship lines for Government berths would appear to support the proposal to construct immediately the new wharfage at Glebe Island, yet from the evidence of witnesses well acquainted with the shipping business of the port, it seems to this Committee that the more important shipping firms would not, for some years to come, use wharfs so far away from the commercial centre of the city as Glebe Island. They would be more likely to endure any inconvenience they are now subjected to rather than go so far afield, until forced in that direction by the pressure of largely increased trade.

The Manager of the Public Wharfs does not allege any delay of a serious nature to vessels while other witnesses are unaware, except in unimportant instances, of delay of any kind. The utmost that the Harbour Master has known has been for a vessel with a miscellaneous cargo to wait for a certain berth favoured by her owners or agents for the discharge of the cargo, or for one to wait for a particular berth at which to load a cargo of wool—circumstances common to all seaports in the busy part of the year. The shipping trade of Sydney, as is the case with that of all ports, fluctuates considerably, so that while sometimes the wharfs are fully occupied, at others they are almost empty. In the busy season, which in Sydney Harbour is the season for exporting wool, there necessarily must be fewer opportunities for readily obtaining accommodation than exist when trade is not so brisk. But it does not follow that because during a comparatively small part of the year there is a rush at the wharfs, additional Government wharfage, of a very costly character, is immediately needed.

IMPORT AND EXPORT WHARFS.

12. The chief purpose to which it is intended the wharfs at Glebe Island shall be put is the discharge of general cargo, which means that the wharfs shall be import wharfs. A steamer or sailing vessel arriving from London or New York would discharge its cargo there, and afterwards proceed to Darling Island, which it is believed will provide excellent export wharfs, to take in a cargo of wool, frozen mutton, wheat, or coal. The idea has much to recommend it. Wharfs for imports and others for exports are a considerable convenience to shipping, as such a system lends itself to a much more expeditious handling of cargo than can take place where the operations of discharging and loading are carried on at one and the same wharf; and such a system exists in some of the principal ports of the world. But, according to the evidence, it may be very difficult at present to carry this out in the port of Sydney. Consignees would not, without great opposition, consent to their goods being landed so far away from the business centre of Sydney as Glebe Island, and shipowners and agents would certainly not incur the cost of moving their vessels about the harbour from one wharf to another if it could be avoided. The removal of the shipping business of the port from the existing centres can only be a work of time, and, except as far as relates to Darling Island, there does not appear to be any necessity for, at the present time, pushing it further up the harbour. Moreover, the possibilities connected with Darling Island have yet to be ascertained. The wharfs there, it is believed, may prove equal to the requirements of both imports and exports.

GLEBE ISLAND AS A CENTRE FOR THE TIMBER TRADE.

13. It was thought by the Committee that, until it was used for other purposes, Glebe Island might prove a desirable locality for the timber trade. This is very extensive, large cargoes arriving frequently from America and New Zealand, as well as considerable quantities from the northern rivers of New South Wales.

The trade has left Woolloomooloo Bay and the lower parts of the harbour generally, and has been transferred to places in the vicinity of Glebe Island; and the foreshores of the island when levelled would seem to offer facilities of great advantage to importers for the discharge and distribution of their timber supplies. All the timber merchants are said to have their own wharfs at present, but most of the vessels bringing large quantities of timber discharge their cargoes in the stream. The levelled foreshores of Glebe Island with the requisite depth of water should prove as useful in connection with the timber trade as Woolloomooloo Bay was in the past, and as Circular Quay was prior to Woolloomooloo Bay being used for this purpose.

REVENUE FROM GOVERNMENT WHARFS.

14. The revenue received from Government Wharfs at Circular Quay and Woolloomooloo is very satisfactory, providing a good return upon the expenditure. The cost of the wharfs, as given in a statement furnished by the Engineer-in-Chief for Public Works, includes that of land resumptions and reclamations, but the total amount is not credited with the proceeds of the sale of portions of the reclaimed land. If it were, the revenue, in contrast with the expenditure, would show still better results. Efforts were made by the Committee to ascertain the amounts received from sales of land and houses, as well as in rents in connection with the wharfs, but the information was only partially obtainable.

CONCLUSION ARRIVED AT.

15. After carefully considering the matter in all its bearings, the Committee have arrived at the conclusion that it is inexpedient to construct either the complete or the partial scheme of wharfage, the proposal being premature; but they are of opinion that the portion of the works covered by the £38,000 estimate of cost may be carried out with advantage, as the cutting down of the island and the reclamation of the foreshores may be made remunerative, while those improvements will at any time fit in with either the partial or the complete wharfage scheme. The Committee accordingly recommend that part of the proposal submitted to them.

Subsequent to the closing of the evidence in this inquiry, and the Committee's decision, circumstances have occurred which point to the probable resumption by the Government of the Darling Harbour wharfs. Should this take place, and should it become necessary to close a part or the whole of the Darling Harbour frontages to trade while reconstruction works were in progress, then Glebe Island might be utilised temporarily for wharfage purposes during the somewhat lengthened period that must elapse during the work of alteration, while the broadside wharfage at Darling Island could be utilised for coasting and intercolonial passenger steamers, and access thereto for passengers could be made by an extension of the tramway.

The following extract from the Minutes of Proceedings shows the resolution passed:—

Mr. Watson moved:—"That, in the opinion of the Committee, it is not expedient the proposed Glebe Island Improvements, as referred to the Committee by the Legislative Assembly, be carried out; but they recommend the carrying out of that portion of the improvements which comprises the cutting down of a part of the island, and the partial reclamation of the foreshores, at an estimated cost of £38,000."

Dr. Garran seconded the motion.

The motion was passed on the following division:—

Ayes, 5.

Dr. Garran,
Mr. Dick,
Mr. Watson,
Mr. Levien,
Mr. McFarlane.

Noes, 2.

Mr. Trickett,
Mr. Shepherd.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 27th April, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

GLEBE ISLAND IMPROVEMENTS.

WEDNESDAY, 13 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.
JOHN CHRISTIAN WATSON, Esq.

The Committee proceeded to consider the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You produce a statement? Yes, as follows:—

C. W. Darley.

13 Dec., 1899.

GLEBE ISLAND WHARFAGE IMPROVEMENTS.

THE very rapid increase which has taken place in the shipping in Sydney Harbour during the past few years makes it necessary that increased wharfage accommodation should be provided in the near future. The total tonnage for the year 1897 was over 21 per cent. greater than it was five years previously, the increase on each preceding year being 2·4, 3·5, 5·8, and 8·4 per cent. for the years 1894-5-6 and 7, respectively.

In view of the continued increase in the shipping, and the length of time required to construct works of such an extensive character, it is certainly not too soon to select a site, determine upon a scheme of improvement, and commence a portion of the works.

All the available water-frontages owned by the Crown which are conveniently situated to the city, such as Circular Quay, Woolloomooloo Bay, and Darling Harbour, have already been utilised for wharfage purposes.

The only Crown land within a reasonable distance of the city which could be used for additional wharfage accommodation is at Glebe Island. This island offers splendid facilities for a shipping-place, there being a long foreshore for the construction of wharfs with a deep-water frontage, easy of approach by vessels, and close to the city, the distance by road to the eastern end of Pyrmont Bridge being only 1 mile. Although access to the wharfs on the southern portion of the island must be through the Glebe Island Bridge, no great inconvenience need be felt, as the swing span of the new bridge will give two clear openings of 60 feet each, the time occupied in opening or closing being only one minute; in addition to which the under side of the bridge will be 26 feet above low water, giving sufficient headway for the passage of launches and small vessels. The swing span in the Pyrmont Bridge, on the road to the city, will likewise be arranged to open in one minute.

The island has at present an area above high-water mark (exclusive of the land reclaimed at the head of White Bay) of about 34 acres, and a fairly good depth of water all round, but which can easily be increased by dredging to 28 or 30 feet at a reasonable cost, and thus made to accommodate the largest vessels which may visit the port. Practically, the only uses to which this very valuable property is put at present are the killing of meat and the providing of stone for the various reclamation and other works about the harbour.

As no expenditure on land resumption would be necessary in connection with a wharfage scheme carried out at this site (as was the case with Darling Island, Woolloomooloo, and other of the Government wharfs), there should, from the first, be a return on the outlay more than sufficient for the payment of interest, cost of maintenance, &c., while very considerable profits to the Crown may be expected as the shipping of the port further increases.

The complete scheme of improvement now proposed consists in the construction of a wharf extending northerly from near the opening span of the new bridge, thence westerly and south-westerly to the head of White Bay, the length being 4,000 feet. Inside or south of the bridge the wharf will extend south-westerly and north-westerly in front of the Abattoirs over a distance of about 2,350 feet. The total length of wharfage thus provided in the complete scheme will be about 6,350 feet. The area between the back of the wharf and the shore will be filled in with material excavated from the island, the areas reclaimed in this way being $14\frac{1}{2}$ acres outside the bridge, $8\frac{1}{2}$ inside or south of the bridge, or a total of 23 acres. The timber wharf would cover an additional area of $3\frac{1}{2}$ acres outside the bridge and 2 acres inside, or a total of $5\frac{1}{2}$ acres. The total area inside the face of the wharf would therefore be nearly 63 acres. The wharf has been designed round the island in long straight lengths, and can thus be made to accommodate the largest vessels which may visit the port in the future.

The scheme also includes the erection of thirteen spacious cargo sheds from 200 feet to 350 feet in length by 45 feet in width, seven of these being to the north of the bridge, and the remainder to the south, together with all necessary offices, fencing, &c. Wide roads with footpaths will extend along the back of the wharfs and sheds, connecting with the main Abattoirs-road; the wharfs and sheds will be lighted by electricity and provided with water supply, drainage, &c., complete.

There is, on the island, much more stone and other material than is required for filling purposes, but as the Government is constantly carrying out reclamation, wharfage, and other works in various parts of the harbour, requiring large quantities of stone, this can be gradually used as required, the space excavated and that reclaimed, together, being largely in excess of what will be required for many years to come. The area of land which will then be available for factories, warehouses, timber-yards, &c., after deducting that covered by the works, is about 25 acres to the north of the Abattoirs-road, and 11 acres to the south, or a total of 36 acres, being 2 acres more than the present area of the island above high-water mark. Hereafter it may be desirable to obtain railway connection with the island, in which case there would also be ample room for lines, yards, sheds, &c.

C. W. Darley.
13 Dec., 1899.

The portion of the scheme to the south of the bridge cannot, of course, be carried out until the Abattoirs shall have been removed; but it is only a matter of time when the slaughtering, with its attendant evils and objections, must be carried on at some site away from the city altogether.

The estimated cost of the complete scheme is as follows :—

Wharf and filling works	£187,500
Road-making and drainage	18,500
Water supply ..	1,600
Cargo-sheds, offices, fencing, &c.	60,500
Electric lighting	5,500
	<hr/>
	£273,600

The cost of altering the main road across the island, after the whole of the stone shall have been removed, is £4,500, but as it must be very many years before so large a quantity could be absorbed by the works carried out in the harbour, the amount has been omitted from the above estimate.

It is only proposed to carry out at present the portion of the works to the north of the Abattoirs-road, leaving the remainder to the future, when the Abattoirs shall have been removed to some more suitable site, and the trade of the port justifies the larger expenditure. The estimated cost of this portion of the scheme is as follows :—

Wharf and filling works	£125,000
Road-making and drainage	11,500
Water supply ..	1,000
Cargo-sheds, offices, fencing, &c.	37,000
Electric lighting.....	3,500
	<hr/>
Total.....	£178,000

The resolution of Parliament, however, covers only the wharf and filling works, the estimated cost of which, as stated above, is £125,000 for the portion north of the bridge.

2. To begin with, I think you might tell the Committee what has been done with regard to this work;—some of it has been commenced, has it not? Parliament voted £2,500 for cutting down and reclaiming round the island. That money has been spent.
3. When was that voted? In 1897. That money has been spent partly on the northern end of the island, and partly on the southern end of it. Large excavations have been made underneath the old caretaker's house, and a certain amount of filling has been done, and a portion of the reclamation has been made at the back of the old bridge.
4. Was the removal of that stuff done under any system or with any special object? It was done in conjunction with the approach to Glebe Island Bridge, which, of course, I obviously omit from this, as being a separate work. The material for making the approach has been taken from the island; but it is not necessary to confuse this matter by mixing up with it the quarrying operations in connection with the approach, for that was simply taking stone from the island for making the approach—a separate matter approved by Parliament. In conjunction with that, the £2,500 voted by Parliament was spent. We had a foreman on the spot, and a lot of material, clay, and so on, not suitable to put in the approach, went to reclaiming round the island. It was convenient to go on with both works at the same time, and in this way to dispose of material not suitable to go into the approach.
5. But has more than the £2,500 voted by Parliament been expended? Practically not. Perhaps there is an excess of a few pounds. I think the Minister has authorised the work to be carried on temporarily.
6. The work may be looked upon, then, as a proposal to start from now, except as regards the £2,500? Yes. The £2,500 voted for cutting down the island and reclaiming round the island has been expended, and the Minister said he must submit the matter to the Committee before proceeding any further. I think we have exceeded that amount by a little; we have not put the men off.
7. When the matter was discussed in Parliament, and the Secretary for Public Works submitted the matter for the consideration of Parliament, he said :—

The reason for submitting this work to the Public Works Committee is because we find that there is a sum of about £38,000 yet to be expended, and as this work round the island is almost of a distinct character from the work of constructing the causeway, we have thought it only right to comply with the spirit of the Public Works Act by submitting this proposal for the consideration of the Public Works Committee.

—? I can explain that matter. I think there was a little confusion. The Minister asked the question what could be done in the way of cutting down the island and reclaiming, without committing ourselves to the wharfage. I was asked for an estimate, and I gave an estimate of £38,000 for cutting down and filling out to a certain distance back from the wharf. We could not fill out to the back of the wharf, because the stone would be in the way of driving piles afterwards, so we had to find out what distance we could get back, so that the stone would not interfere with the construction of the wharf, and we had to keep back about 45 feet at the back of the wharf, and the filling out to that will cost about £38,000. I was subsequently asked for an estimate for carrying out all the works north of the bridge, including filling and the completion of the wharf. I gave an estimate for that, and I am informed that the Minister accidentally took up the wrong paper. He had two estimates before him, and read out the £38,000. I was asked to find profitable employment for some men, and to say what that would cost, and I gave an estimate of £38,000, which could be expended without entering on the wharf question. But if you carry out the wharf and complete the filling the cost will be £125,000.

8. I suppose it would not be desirable merely to level the island without having in view the future object of utilizing the island for wharfage purposes—that is the great object in view, and the one follows naturally on the other? The one follows on the other. There is no doubt that Captain Jackson will be able to impress that more strongly on you than I can. There is a demand for wharfage in Sydney with which we can hardly keep up with. We have constructed wharfs wherever we could possibly do so, at Circular Quay and Woolloomooloo Bay, and yet there are applications for wharfage which Captain Jackson cannot comply with. There are new companies coming here and new steamers running which want wharfage accommodation, and we have not got it to give them, so I have no doubt that these berths will be leased as rapidly as we can complete them and make them available for traffic.

9. Although, according to the terms of the resolution, the whole of the work of reclaiming the foreshores and constructing wharfage round Glebe Island is apparently under the consideration of the Committee, could the work to the north of the bridge and of the Abattoirs-road be carried out as advantageously as the first instalment of that work, and leave the Abattoirs without being interfered with at the present time;—is that a feature of the scheme which you recommended? Yes, that is a feature of the scheme. They may be looked upon really as two distinct works; the one may be proceeded with and completed without entering upon or committing yourselves to the other. The Committee, of course, can deal with the whole thing. We have carefully put the estimates for the whole scheme before the Committee.
10. But I understand that, having regard to the fact that the Abattoirs are in full swing on the southern end of the island at the present time, it has been thought desirable to split the project into these two parts, so that, if this Committee and Parliament think it is desirable, the works at the northern end can be proceeded with, and the Abattoirs not be in any way interfered with until something is arranged for their future disposal? Yes; the Abattoirs will not be interfered with in any way whatever. Up to the date of the completion of the northern portion the Abattoirs need not be interfered with in the least. There are certain buildings in the occupation of the Abattoirs, such as a large tank and yards, which we will not interfere with; for, as the statement points out, there is an excess of rock over that required for these works which we cannot yet take away, but we must look to that going away by degrees in the future for other work, it being a sort of quarry to draw on for works in the harbour. There is always a demand for the stone we are taking away. We can complete this work, and make it entirely available for shipping, without in any way interfering with the Abattoirs even if they are left there for many years.
11. Supposing that the northern portion were undertaken to start with, what would be your course of procedure;—would you start first to level down the island? I should first proceed with the excavation, and fill all this area very much on the lines that I submitted to the Minister in connection with the £38,000. I should fill out to a line 45 or 50 feet behind the wharf, and let that become consolidated; and then we should have to dredge some of the mud away, in order to put the wharf in. That would be the best way to do it, for, as the filling goes out, it will push the mud in front of it; and to make the foundation for the wharfs substantial we should take off the top mud and construct the wharf, and put in a ballast-wall at the back of the wharf, and complete the filling. So the portion of the work mentioned in the estimate of £38,000 submitted to the Minister would be the first portion that we should have to do, and that is all straightforward labour work.
12. Blasting and other easy work? Yes.
13. You say that there would be a large quantity of material there in excess of present requirements for filling in, and that it could be utilised from time to time for reclamation works about the harbour;—what will you do with that—will that remain piled up on the island? We shall simply leave it there as it is, to be quarried as required. There is an excess of 848,000 cubic yards.
14. You had a lot of stuff on the end of Darling Island for some time;—was there not a great lot of stone there? When the Government resumed that island there were three large stacks of stone.
15. Have you got rid of that? I think it is nearly all gone. There are only a few stones reserved for special work.
16. I mean that your present proposal will not involve the expense of removing the stone from Glebe Island, and then moving it again? No; we shall leave it there unquarried until we want it. It is absolutely out of the way. We can quarry round the foreshores, and leave that in the centre. It will not be in the way of shipping, or in the way of utilising the wharf. It is very good stone—one bed of it is nearly as good as the Pymont stone—in fact, it is practically the same. We can go on quarrying as we require it for use. We are constantly quarrying stone there for sea-walls and reclamation works.
17. Adopting that course, what width of level land shall you have available for wharfage and cartage and approach purposes right round your wharfage? It is shown that the width necessary is 66 feet right round at the back of the wharf, which is considered sufficient in connection with wharfage. But there will be more than twice that width of land levelled down in the excavation and reclamation all round. There will be practically 200 feet all round the island clear, as a minimum, of which only 66 feet is immediately required to be reserved for road approaches to the wharf. The balance can be let for stores or utilised for warehouses.
18. Looking at this portion as being desirable for wharfage purposes, have you ample depth of water in that part of the harbour for large-sized vessels? Not at present. The average depth around the island now is from 16 to 20 feet. It is a mere matter of dredging. It is all soft dredging. There is no difficulty in obtaining water. There is no rock whatever, but only soft mud, and we can quickly carry out the dredging.
19. Is it contemplated to make this wharfage available for large-sized modern vessels? For the largest vessels.
20. And for that purpose you have to have pretty well 30 feet of water? Yes; that is what we look forward to; and by having long straight berths we can cut it off to be leased in lengths to suit the length of the ships of the various companies who will require it.
21. As regards the approach to the island, shall you have sufficient water for that;—is there sufficient depth of water for vessels to go right up, or should you have to dredge a channel from Darling Harbour? We should have to dredge a channel practically from near the Sugar Company's works.
22. That is an item, of course, which is not put down in this estimate? No; because the dredging is charged to the revenue. We keep on constantly deepening.
23. There is a general dredge vote, is there not? Yes. There is no difficulty in dredging here; it is all soft material, and can be taken out very quickly.
24. I see that in this proposal it is suggested that at some time railway communication may be made with the island;—which way would that come? I am not able to say for certain.
25. Somewhere from the suburban line? It would come, I think, from near Petersham, and down by Long Cove. I think that a trial survey was made of a line to the island a few years ago, and that it was to go down by Long Cove, at the back of Leichhardt.
26. Well, until railway communication were made, the whole of the land transactions with shipping that would come to this new wharfage would be, in going into Sydney, by means of the new bridge at Glebe Island and the Pymont Bridge? Yes.
27. Seeing that the traffic over the bridges at the present time is very heavy, do you think that it would possibly

C. W. Darley.
13 Dec., 1899.

C. W. Darley. possibly lead to inconvenience if you were to add to it the cartage and carriage in connection with this mass of shipping? The new bridges will be completed before this will be brought into active use, and they will be amply large enough for any traffic that you could possibly conceive on them, because they will both be wide bridges.

13 Dec., 1899.

28. I suppose the Department has not thought out what kind of shipping would take place at this wharfage;—would it be for wool-ships chiefly, or for intercolonial vessels, or what? I should think that what are called “tramp” steamers would go there, chiefly. The berths in Woolloomooloo Bay and the Cove are nearly all taken up by regular lines of steamers. That is a point on which Captain Jackson can speak better than I can. He told me that he has applications now for from two, if not three, companies, and he really cannot meet their requirements.

29. It occurs to me that if there is going to be a large amount of shipping around this additional water-frontage the carriage of goods to load those vessels will be very extensive indeed? You should bear in mind that all the carriage to ships in Woolloomooloo Bay and Circular Quay, where all the large ships go now, is entirely land carriage.

30. Yes, but this place is peculiar, because most of the stuff will go over these bridges, and I wonder if there will not be a congestion of traffic? No; not the least, because the new bridges will be wide. It would be a serious consideration if the traffic had to go over the existing old bridges; but the new bridges will be large and on a higher level, and they will carry the traffic even better than the streets can, because there will not be a stopping of the traffic on the bridges as there is in the streets, and in comparison with any of our city streets the new bridges will be wider.

31. But, bear in mind, they are to be span-bridges? Yes; but they will open and shut quickly, and on account of their height they will not be open and shut so often as are the existing bridges.

32. The existing road from the new bridge at Glebe Island has a pretty good grade up to the Abattoir gates? Yes; there is a very good gradient there.

33. Will that be interfered with if you carry out the scheme in portions? The existing road rises up to the Abattoir gates, the grades being, I think, 1 in 17 part of the way, and 1 in 20, and a short length of 1 in 15. The new approach, which is partly made, will cross the existing approach by an overhead bridge, and then continue round, joining it at the top of the hill near the Abattoirs. So the new approach can be completed practically without in any way interfering with the traffic of the existing approach. One object in designing it so was that the present old approach will then form a convenient permanent means of access to the shipping. We shall still want the old approach to get down to the shipping. The new approach will pass over the old approach; and if you want to get to the lower level, the new approach being 26 feet higher, you must go down the old approach. So the old road will be kept in use as a means of approach to the wharf.

34. What is the grade on the new approach? Quite an easy grade,—1 in 320,—practically level. Eventually, when the wharf on the northern portion of the island is completed the traffic will haul down, and you will have through communication round the island to Sydney.

35. So that when the work is thoroughly completed, it is intended, I suppose, that the island shall be pretty well level? It will be level. As I have explained, for a long time to come there will be a large piece of rock left in the centre.

36. This new approach will be the approach to Balmain, will it not? Yes.

37. If I remember rightly, on the other side of the island, after you pass the Abattoir gates, the descent is very easy, is it not? There is a pretty stiff hill in going down—it falls pretty quickly.

38. Could the roadway there be improved at all? Not easily at present. Of course, when the Abattoirs are removed it could be.

39. At the present time it is not intended to improve that? No.

40. The Abattoirs and the approach to the Abattoirs, and the road to Balmain, excepting the new approach from the new bridge, will be exactly as they are until you tackle the southern end of the island? Yes; you do not disturb the Abattoirs at all.

41. I suppose that there will be ample space on the northern end for the disposal of the stuff that you cut down, without wanting to place that on the southern end of the island? We shall excavate only so much of the northern end as we require to fill out to the wharf, and leave the remainder.

42. The Department, apparently, looks upon this as a remunerative work—as one that will bring in revenue in the way of wharfage dues, and so on? Well, from a conversation that I had with Captain Jackson, I know that he is of that opinion, and I really think also from figures that he gave me that it will be remunerative, if not highly remunerative.

43. Captain Jackson will be able to give us some idea of what the wharfage dues are likely to be? He told me that if we had wharfs round this island he should certainly reckon on getting £20,000 a year revenue from the shipping. I may mention that 3 per cent. on the whole expenditure of £273,600 is £8,208, and taking 3 per cent. more for management, £8,208, makes £16,416. I gave him particulars so that he could think the matter out. I asked him to look into it carefully, so that he could give the necessary information to the Committee, and he certainly, after the first discussion, estimated the revenue at £20,000 a year. Of course, I am not committing him to that; he will speak for himself.

44. So that, roughly speaking, the revenue would considerably exceed the interest and working expenses of the new work? Yes. Putting the interest down at £8,200, and the working expenses also at £8,200, that makes £16,400, and that will certainly cover interest and all working expenses. If you get £20,000 you will have something over.

45. Will that be for the northern end? That is on the whole scheme—that is taking £273,600. The wharfs already in Woolloomooloo Bay and Circular Quay are the most profitable property that the Government have. They bring in an enormous rental.

46. Coming to the southern end of the island known as the Abattoirs—they are the property of the Government, are they not, at the present time? Yes.

47. And leased to the Corporation? No; worked by the Government. The Corporation has nothing to say in the matter. The actual management of the Abattoirs is controlled by the Board of Health, which, of course, is a Government Department.

48. There are a great many old and expensive buildings there; in the event of the entire scheme being recommended, those buildings would have to be raised, I suppose, would they not? The old Abattoir buildings are of very little value outside of the purposes for which they are required.

49. They are mostly only stone walls and iron roofs? A lot are timber structures with iron roofs. C. W. Darley.
50. They are not substantial buildings? No; the only substantial building is the cold meat store. That is called the refrigerating store, but I think that at present it is being used as killing-sheds for sheep; it is quite unsuited for the business. 13 Dec., 1899.
51. The item for the destruction of these buildings is not a heavy one compared with the great advantage that you suggested would accrue by adopting the entire scheme? You may consider the buildings there have served their purpose. They are of no practical value.
52. I suppose you are not in a position to state whether anything definite is likely to be done with the Abattoirs? No; only by hearsay, and the Committee will be able to obtain authentic information on the point.
53. Which do you look upon as the more valuable of the sites for wharfage purposes, and as desirable to be taken in hand first, seeing that one is below the bridge and the other above it;—I suppose there is no doubt at all that the one below the bridge is far more valuable? Yes. Undoubtedly it is desirable to take in hand the northern end first.
54. With regard to the portion above the bridge, I suppose that that would be for vessels of a smaller class than those that would be berthed below the bridge? It is very likely that that will be used for a smaller class of vessels, but there is no reason why it should not be used by large ships, because there is a 60-foot clear opening. There are ships likely to come here before long that would not go through that opening.
55. Can you tell us the character of the trade now done above the bridge? Only small New Zealand timber and coasting ships at present—all small vessels. We have not done much dredging inside the bridge.
56. Is that by reason of the water being too shallow for large vessels? Partly that, and the opening span being such that only small vessels can get through. The span is in a bad and dangerous position. Therefore I have always opposed any extensive dredging inside—anything that would encourage larger shipping to go through. The moment we get the new span we can go on dredging and improving the bay, but it would be folly to deepen the water at present, and encourage large ships to go there, when they would only get injured in passing through the present opening span.
57. In view of the small trade done above the bridge, has the Department thought whether that portion of the wharfage to be provided would be availed of sufficiently to make that part remunerative as a part of the whole scheme? The idea is that the portion north of the bridge should be made available, and brought into use first; and then, as the trade demanded it, go to the south of the bridge, in time, as the trade developed; and if trade should develop as it has been steadily developing the last eight or ten years, the day is not far distant when we shall really require to do that.
58. And then, I suppose, the trade and tonnage of the ships would assimilate themselves to the depth of the water? We can rectify the depth of the water. It is not as though we had any expensive rock to remove. It is all straightforward dredging. The dredging is such a simple, straightforward matter there that we do not weigh it at all.
59. Taking the scheme as a whole, would it not be a very great advantage if it could be carried out in its entirety with the view of a railway running right round the island at the back of the wharfage? I do not know that that is really necessary. It is desirable that the wool should be brought near to the ships, but it must go into a store first to be dumped, when brought down by rail; and if the railway stops at the store where the dumping is done, I think that is all that is necessary, and it can be taken thence to the ships by tramways or trollies, or the most convenient way. We have no large trade in this country for the railway to load direct to the ships—no such trade is yet developed. Of course, if we become a wheat-producing country, then wheat, no doubt, will pass direct from the truck to the ship, and I anticipate that for some time to come that trade will be done at Darling Island. The Railway Commissioners are arranging it, and we are building on Darling Island a very large store for receiving wheat, in case ships are not able to receive it direct from the railway trucks.
60. As a means of exporting produce, such a railway would be of advantage, but, as a means of receiving goods and distributing them, it would not be of so great advantage? Yes. There is very little goods coming here which it is necessary to ship direct from the ship into the railway trucks. It is nearly all warehoused first.
61. But, in a scheme of this kind, where we have a bed-rock, so to speak, to work on, there would be no difficulty in designing the work in such a way that a railway could be run at any time right round the wharfage, convenient to the ships? No difficulty whatever. The scheme lends itself to railway connection.
62. If necessity arose at any time, and we had railway communication with the island, such as is suggested in your statement, the scheme could be so carried out that a railway could go right round the island at any moment? If a railway does come to the island at all it will, in all probability, come from the Leichhardt side, and the shape of the wharfage lends itself to a railway being carried right round both sides of the island. You can keep the railway at the back of the roadway.
63. *Mr. Watson.*] I understand you propose to reserve 66 feet for a roadway, and that behind that the balance of the land would be available for warehouses, or to be otherwise disposed of? Yes, or for railway purposes.
64. But, if you were to lease that land for stores, those who took it up would want a long lease, and then you would not have it available for a railway? You would lease what you would not require for a railway. There are 26 acres, of which only a small portion would be required for a railway. Of course, if goods were shipped from the railway direct into the vessels, we could take the railway on to the wharf. That is a matter of detail not worked out yet.
65. *Chairman.*] I suppose this work would take a considerable time to carry out? We would construct the wharf in sections, so as to make the berths available one after the other.
66. You would carry out work of this kind in sections—possibly by day-labour, or at so much per yard? We generally let the wharf work by contract, but carry out the excavation and filling-up by day-labour. We should let the contracts for the timber wharf.
67. This project is only for lateral wharfs, not for projecting wharfs? For straight wharfs.
68. And, as far as you have studied it, is it a work you consider a desirable one? Yes, I do, distinctly.
69. *Mr. Dick.*] With respect to this increase in the shipping, can you state in what particular lines of shipping the increase has been most apparent—is it in large steamships or general cargo ships? We have

C. W. Darley. have simply taken the tonnage. I have a return here, which I took from the official reports, and which is as follows:—

13 Dec., 1899.

Total Tonnage of Shipping, Sydney Harbour.

Year.	Tonnage.	Percentage of increase or decrease on preceding year.		Year.	Tonnage.	Percentage of increase or decrease on preceding year.	
		Increase.	Decrease.			Increase.	Decrease.
1889	tons. 3,191,998	1894	tons. 3,571,614	2·4
1890	3,001,221	6·0	1895	3,697,605	3·5
1891	3,469,862	15·6	1896	3,911,051	5·8
1892	3,490,785	0·6	1897	4,237,289	8·4
1893	3,488,122	0·1	1898	4,305,318	1·6

There was a steady increase year by year. In nine years the increase was 35 per cent.

70. Can you state what has been the increase in wharf accommodation to cope with that increase of shipping;—we have had the Woolloomooloo Bay and several other wharfage extensions carried out recently? At Woolloomooloo Bay we have reconstructed the old wharf practically, and altogether in that bay we have 3,156 feet of wharfage accommodation. We have nine berths there amounting to that. At Circular Quay there are thirteen berths—one or two rather small—amounting altogether to 5,036 feet, and at Darling Harbour there are eighteen berths, giving 5,194 feet of wharf accommodation. A good deal of that consists of small berths, not useful for large shipping at all, but which does for coast steamers; but that is the actual wharf frontage. At Darling Island, when the works are completed, we shall have six berths, giving 2,500 feet of wharf accommodation. That makes a total of 46 berths, or 15,886 feet of wharf accommodation.

71. Can you state whether that increase has been commensurate with the increase in the shipping? No, because there are applications for wharfs that we cannot supply—so Captain Jackson informs me. He says he does not know which way to turn. He has two or three applications in now, and cannot give the applicants berths.

72. Is the wharfage extension part of any general scheme with respect to the harbour, or does it stand by itself? It stands by itself. It is a complete scheme in itself.

73. Have any plans been prepared by your Department for a general reconstruction of the wharfage accommodation of the harbour? No. It has been practically reconstructed during the last few years. The accommodation in Woolloomooloo Bay has been all reconstructed, and that at Circular Quay has been almost all reconstructed.

74. Are there any plans with respect to the extension of the railway to the foreshores of the harbour? No; not other than Darling Island. The work has been carried out at Darling Island, but that is the only place.

75. I think you have stated that you do not include in your estimate the amount required for dredging all round Glebe Island to enable large vessels to use the wharf? No.

76. Why is it excluded from the estimate? We do not put that in any estimate. There is an annual dredging vote to keep the dredges employed at various places.

77. But judging from the depth of the water round this island, this work will be pretty extensive to prepare the whole of that foreshore for the reception of large vessels? It will not take very long.

78. You will require at least 14 feet dredged for a considerable distance all round the island? Yes, about 14 feet.

79. That will be rather an expensive work, will it not? We should complete it as the wharfs were extended. It would not be more than a couple of years' work.

80. I think you stated also that you proposed to force the mud out by loading the edges of the island with stone? I do not propose to do it; it will do it itself. The putting out of the stone will drive the mud out, which we will then dredge away.

81. Will you take the precaution to prevent stone from slipping into the spaces, as was done at Newcastle? We shall have wider wharfs here. The Newcastle wharfs were designed rather narrow when only 21 feet of water was required, and the cause of the slipping of stone is because the depth has been cut down to 26 or 27 feet.

82. You do not anticipate any danger of that in this instance? No. Where we have constructed wider wharfs than previously we have no trouble of that kind.

83. I notice that the new approach to the new bridge is to be 26 feet higher than the approach to the existing bridge? Yes; the approach will be about 26 feet higher, but I have not got the exact figures here.

84. In case the complete plan is carried out, it will be still necessary to preserve this elevated causeway? Yes, you must have an elevated causeway; but the new road will be made with a gradual descent to the level of the formation.

85. In that case, to remove goods from the wharf to the city, it will be necessary to follow the old road up to the back of the Abattoirs, and then go back over the new approach to the new bridge, and over the new bridge? Yes; that is, goods coming from the southern portion of the island. Coming from the northern portion they would simply join at the foot of the hill and go straight up the roads.

86. With respect to that idea, which portion of the wharf do you propose commencing first—that immediately adjacent to the bridge, or that on the northern side of the island? That adjacent to the bridge first; the portion on the eastern side of the island first.

87. I notice, too, in the corner of the northern portion of the island a cattle-shipping wharf in course of construction;—is that a Government wharf being constructed there? Yes.

88. Vessels which take cattle are, as a rule, fairly large, are they not? No; some of the coastal steamers bring cattle to the island from Newcastle and Northern rivers.

89. The wharf is for the landing of cattle, is it? Yes.

90. That wharf is not used for the export of cattle at all? No, only for landing cattle on the island—cattle brought from the North, sometimes, in steamers.

91. *Mr. Shepherd.*] Would not much greater space have been afforded by constructing jetties instead of wharfs? A jetty is not suitable for a large ship in a narrow bay like that. C. W. Darley.
92. Would there not be ample space for constructing jetties there? We are rather limited in width there. 13 Dec., 1899.
93. Would there not be ample width in the bay there;—in Melbourne the jetties seem to afford an immense amount of accommodation? This bay is not wide enough to get a large ship into a jetty there.
94. I thought it would be much greater economy to construct jetties than to cut down the island and construct wharfs as proposed? No; the bay is not wide enough there.
95. I see you speak of these span openings only occupying one minute in opening;—they must be constructed very differently from the old Pymont Bridge opening, which took several minutes to open? Yes; they are to have modern gear. The machinery will be worked by electric power, and they will swing open very rapidly.
96. I suppose there will be ample space for the vessels to take up their positions at these wharfs without any danger? Yes.
97. Is the wharf the whole way round perfectly level? It is proposed to be.
98. Has any provision been made for landing from boats? That is a matter of detail. We always put steps at intervals on our wharfs for landing from boats.
99. I see that no shed is to be built at the north-east end;—is it not intended to utilise that end? Yes, to utilise it; but before we put a shed there we should determine how that end should be utilised.
100. With regard to depth, will it be necessary to dredge before vessels can use the wharfs? Yes; before deep vessels can use them. The dredging would go on at the same time as the construction of the wharf.
101. *Dr. Garran.*] In the first paragraph of your statement you refer to the increase of tonnage, but there has not been any great increase in the number of ships, has there? Not so much in the shipping as in the tonnage.
102. That is, the size of the ships? Yes.
103. It makes a great difference in the quantity of wharfage we want whether they are large or small ships? Yes; but some of the ships coming here now occupy twice the space vessels used to occupy.
104. But a 10,000-ton ship would require less wharfage than five ships of 2,000 tons each? Yes.
105. Your statement that the tonnage has increased does not of itself necessarily require increased length of wharfage, unless the size of the ships remained according to the old fashion? We know that the actual number of the ships is increasing also.
106. Take the ships round Circular Quay now, they would have required nearly twice that length of wharfage with the old 1,500-ton sailing vessels? Yes; they would have, of course.
107. So that per ton we do not want so much foot wharfage with the new style of ships as we should have wanted with the old? Not quite so much; but we know that as fast as we have been building the wharfs we have let them, and we have applications for more.
108. Still, the tendency is to go in for big ships now? Yes.
109. And that does not mean a proportionate increase of wharfage room? But the fact of large vessels coming here is throwing out of use a large number of wharfs formerly available, which are now of no use.
110. You refer to the increase of tonnage, but have made no allowance for the fact that a great deal of that is tonnage of large vessels? Large vessels, but they require deeper and longer wharfs, and that is throwing out of use, in several places, wharfs that have been constructed for small ships. Inside of Darling Harbour the berths are difficult to get at, and we cannot utilise them.
111. You could not utilise them for the large German liners? No.
112. There is not a berth in Darling Harbour that could be given to a big German ship? Not in Darling Harbour, at present.
113. You say you will have to deepen alongside these wharfs to get 30 feet;—what length will you have to deepen the approach—because you will have to go up Darling Harbour for some considerable distance—how far will you have to deepen the channel? We shall have to cut a channel from just below the Sugar Company's works.
114. Would you have any rocky places to cut through in that mile? No, it is all soft stuff. The greater part of the channel for that mile would have to be deepened only a few feet.
115. What width will your channel be? A great deal of this has been dredged already. I do not think there is more than one-third, or rather less than one-half, of the channel requiring to be made.
116. About how much would that dredging cost? I have not gone into that.
117. In order to give these vessels room to swing at these wharfs, you will have to make the water 30 feet deep for more than the length of a ship from the wharf? They do not swing the large vessels at the wharfs; they take them in and out.
118. But if you have to berth them along this line, you must have a depth of 30 feet for a considerable distance off the wharf? Of course, it would be dredged for a considerable distance off the wharf.
119. What I want to get at is how much we shall have to spend on the dredging to get all this scheme brought into active, successful operation;—there is a good deal of mud to be shifted? We shall have to shift that, whether we carry out this scheme or not, in order that vessels may go into Blackwattle Bay.
120. But the Blackwattle Bay craft are very small compared to this opening? Not when the new bridge is opened.
121. But you have not soft mud down to 30 feet in Blackwattle Bay? Yes; in the middle of the bay.
122. But not near the rocks? No; but it dips out very rapidly. Whether this scheme is carried out or not we shall have to do the dredging.
123. Taking the water frontage of the city of Sydney, the head of Blackwattle Bay is one end of the city boundary and the head of Rushcutters' Bay is the other? Yes.
124. Taking the whole of the city water frontage, how much belongs to the Government and how much to private persons? I have had it made up, but I cannot say from memory.
125. Do you know what the length of the Circular Quay wharfage is altogether? 5,036 feet.
126. And how much new wharfage are you going to make now, taking the whole scheme in? The whole scheme round Glebe Island would give 6,350 feet of new wharfage.
127. Then you are going to make more wharfage at Glebe Island, in the whole scheme, than the whole of the Circular Quay affords at present? Yes.

- C. W. Darley. 128. And, according to what Captain Jackson has told you, for half of that you think that there will be a fairly immediate demand? I think so.
- 13 Dec., 1899. 129. Captain Jackson would perhaps know more than you what the cost and the revenue of all the existing Government wharfs are? He can tell you what the revenue is.
130. Can you tell the cost? I can ascertain the cost of the existing Government wharfs within the city limits.
131. You say that the Abattoirs and other buildings on Glebe Island are not worth very much now—that they have nearly lived their life out? Not worth much.
132. Do you know whether they were built with borrowed money? I cannot say.
133. Do you know whether the existing Glebe Island bridge was built with borrowed money? I rather think it was.
134. Then that old bridge is going to disappear altogether, while the debentures in respect of it have not disappeared;—is that so? I think you must ask the Treasurer that question.
135. I see that you have made some wharfage in White Bay, where you have been filling up? We are building a little wharf there now.
136. And you have let two parts of the frontage to White Bay to tenants, according to the map? Yes; a portion has been leased.
137. And there is a jetty running out there in continuation of the road? Yes.
138. Is that jetty a Government jetty? Yes.
139. And the wharfs, of course, are Government wharfs? There is no wharf built there—only the jetty.
140. But you have marked on that map wharfs there, and two tenants,—you have marked Cowlishaw Brothers as lessees on one side, and J. J. Maxwell on the other? There is no wharf there, but only a retaining wall.
141. Is it used for loading timber, or anything else? There are two timber-yards, the proprietors of which land timber at the jetty, and take it from there into their yards.
142. They do not land anything on the water frontage? They have a right to use the water frontage, but there is no wharf actually constructed there, except that they may have a little temporary appliance of their own.
143. Looking at White Bay as it will be when this work is completed, do you think there will be any tendency to silt up White Bay? I do not think so. The sewage is now being more and more intercepted; the only tendency to silt up is from sewage, and we always keep a dredge working near the mouths of the sewers.
144. There are no eddies that go round there to bring silt in? No. One dredge is kept constantly going to clear away sewage matter.
145. If this wharfage is built all round Glebe Island, you are not afraid that it will silt up? No, there is no tendency to silt up there.
146. I see you have the opening of the new bridge close to Glebe Island? There will be a centre pier, and an opening on each side.
147. But that is not the centre of the whole causeway, is it? Practically the centre.
148. But the existing opening is on the Pymont end? Yes, the present opening is close to the Pymont end.
149. And you think that is the wrong end? Yes, it is wrong, because there is a rock bottom there, making it very difficult to go through.
150. Now you are going to the other end? The end of the channel, at present, as near as possible.
151. But when that is all filled in, and wharfed, as you are going to do it, that will be at the end, and not in the middle of the causeway—when all the work is completed? Yes.
152. When you have completed the reclamation, the bridge will be at the end of the causeway? Yes.
153. And you have no fear of that silting up and getting shallow? No, there is nothing to bring silt there.
154. Will you have 30 feet of water underneath that? Yes.
155. So you could take a ship of 30 feet draught inside Rozelle Bay? Yes. As a matter of fact there is a depth of 30 feet there now, through the opening span, because that has been dredged already.
156. What did you say the refrigerating sheds are being used for now? I think that they are killing sheep in them now temporarily.
157. They are not used for refrigerating purposes at all? No.
158. Then the object for which that building was put up is a failure? I believe so. It was only used for that purpose a very short time, and they sold the plant some years ago.
159. You are proposing to use this wharfage for general commercial purposes? Yes.
160. Do you think it will be as handy from the city—say from York-street—for a dray to get to this wharf as it is at present for it to get to the eastern side of Woolloomooloo Bay? Very little difference. From York-street and that side of Sydney it would be an advantage to go this way. You would save the double hill. Going across the new Pymont Bridge, and round to Pymont, the road will not be level, but the gradients will be much easier, and with no great hill.
161. And you must have some hill in getting down to Woolloomooloo Bay? Yes. You have to rise out of Sussex-street, first of all, to a considerable height.
162. So, looking at what we have to do now to reach the wharfs at Woolloomooloo Bay, this is not out of the way? Not at all.
163. But, as compared with the wharf at Circular Quay, the cartage to Glebe Island would be much more than down to Circular Quay from the city? No doubt it would be something more.
164. And it is that at present, I suppose, to Woolloomooloo Bay? I do not think that it would make much difference. I suppose that the average price charged would be the same.
165. Do you know what carters now charge to go to Woolloomooloo Bay? I have had very little to do with carting lately from ships; but when we were carting large pipes, we found that it cost 9d. a ton less to cart from Woolloomooloo Bay or from Circular Quay than from any of the back wharfs.
166. Was that because of the steepness of the gradient? Yes.
167. And here there would be no very steep gradient? No gradient at all.
168. If you go to the city you go to the foot of Market-street? Yes.
169. Well, that is a steep gradient? It depends which part of the city you are going to. If you were going to one part of the city, for instance, you would go up Harris-street, and on to Redfern, and not cross Pymont Bridge, and thus you would avoid Market-street.
170. Is it a wooden wharf you are going to make, or concrete blocks? A wooden wharf. 171.

171. Why do you prefer that to concrete blocks such as you have at Darling Island? Because of the depth, and because when you use concrete blocks you must have a good foundation. C. W. Darley.
172. How far down here would you have to go to get to the rock? Sixty or 70 feet, I suppose. 13 Dec., 1899.
173. Some time ago, when there was a dredge working near Glebe Island, I remember being told that the stuff brought up was so offensive that it was scarcely possible to live near it;—do you know anything of the character of the mud there? We have lifted a lot of the mud there, and I have never heard any complaints about it.
174. Of course, the flushings from the island and filth all used to go quietly into the water there? We dredged for that causeway a depth of about 35 feet, so as to take all the mud out, and we found nothing particularly offensive about it.
175. But you were not close under the Abattoirs there? We were close to the Abattoirs.
176. You do not anticipate any difficulty of that kind? I do not think so. I do not think that any place could possibly be so bad as Woolloomooloo Bay.
177. The Government has not to resume any land here as it had at Woolloomooloo Bay? No.
178. Therefore, the interest we have to pay is simply on the works? That is all.
179. That makes it, of course, a much cheaper business than if we had to buy land? The land for the Circular Quay wharfs, and for the Woolloomooloo Bay wharf, cost much more than the whole cost of these works.
180. *Mr. Watson.*] Do you reckon that the Woolloomooloo Bay wharfage is paying the interest on the cost, including that of land resumptions? I have not gone into the figures, but I think it is paying interest on the whole thing, or will when the rent is coming in for the extra berths.
181. *Dr. Garran.*] The Government had to give a very large sum of money for Darling Island? Yes.
182. So, when that wharf is completed, the total expenditure will be higher? Very much more costly than this.
183. Whereas here we have nothing to do except to cut the rock down and build the wharfs? That is all.
184. You say that there is some stone here which is as good for building as Pyrmont stone? Very nearly as good.
185. Of course, in quarrying you will have regard to that, and will preserve that for coming years? We shall use it for special work.
186. You will not tumble it into the reclamation? No.
187. You will preserve it? We could not afford to stack it away, but there will be a large quantity of it left.
188. There will be more of the block left than you propose to cut away? We shall so manage that any stone we require we shall quarry from that block. We are quarrying from it now.
189. You are making a road, 66 feet wide, all round, for the wharfs;—from the inner side of that road to the outer side of the wharf, what is the breadth? One hundred and forty-one feet.
190. And in tumbling in your stuff at first, how far from the edge of the wharf would it be safe for you to tip the stuff in without interfering with the future foundation for piles? We can fill in the reclamation to within 45 feet from the back of the wharf, and leave the rest to be filled in after the wharf is constructed.
191. And if, in the first instance, you do enough for that wharf and that road, you will do enough for immediate purposes? Yes, to meet the requirements of the shipping.
192. Until you go in for building big stores? Yes.
193. The scheme, as put before us, takes no account of addenda, such as road-making, water-supply, cargo-sheds, and electric light, but they must all be done? They will have to be done by degrees, as required.
194. So that they might as well be included in the Vote? I think it only right to put the whole thing before the Committee, and so I have given an estimate including all extraneous expenses.
195. What I mean is, it is only holding back facts to say that the wharf will cost £125,000, when we know that there are certain incidental expenses that must accompany it? Yes.*
196. *Mr. Watson.*] How soon do you expect the wharfs at Darling Island to be completed? We have not yet authority for building the wharfs on the western side; but the wharfs on the eastern side which give three berths will be completed in two or three months.
197. Would not those on the western side of Darling Island be more likely to be availed of than those now proposed to be constructed, the former being near the centre of the city? Yes; there are only about two berths there though.
198. Would that be all? Not more than two berths.
199. Even when they are all constructed? Not more than two large berths—three small ones and two large ones.
200. To be constructed? Yes.
201. How many berths do you reckon you will have there after the completion of the Darling Island scheme? 2,500 feet all round, which, at 500 feet for each berth, gives only five berths.
202. And you think that the revenue from five berths will be sufficient to return interest on the total cost there? I do not think it will pay all the interest on the cost there, because the land resumption was pretty costly; but, taken in conjunction with the railway, it is the only wharf we have connected with the railway, and it may be specially useful for railway purposes.
203. For export? For export, for landing railway material, and for general railway purposes it can be made specially useful, but the other wharfs are not connected with the railway.
204. And you still think that there will be room for these proposed works at Glebe Island, in addition to those at Darling Island? Yes; I think that as fast as we can get this wharfage available it will be required.
205. How soon do you think that this, or any portion of it will be available, if it is consented to? I do not think that we could get the first berth ready much under eighteen months—practically you may say it will be two years before you could take a ship alongside.
206. The bridge will be finished before that, I presume? No; practically about the same time.
207. It is of advantage to have the two projects being carried out concurrently to some extent, I should imagine? Yes; I think it would be two years before we could count on taking a ship alongside the wharf there.

FRIDAY,

* NOTE (on revision) :—£178,000 is the total cost, including all extraneous works outside the bridge.

FRIDAY, 15 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.	

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

John Jackson, Manager of Public Wharfs, made an affirmation, and was examined:—

J. Jackson.
15 Dec., 1899.

208. *Chairman.*] I will read to you the first part of the minute which has been laid before us by Mr. Darley, and which seems to affect the evidence you will be invited to give. It is in these words:—

The very rapid increase which has taken place in the shipping in Sydney Harbour during the past few years makes it necessary that increased wharfage accommodation should be provided in the near future. The total tonnage for the year 1897 was over 21 per cent. greater than it was five years previously, the increase on each preceding year being 2·4, 3·5, 5·8, and 8·4 per cent. for the years 1894–5–6 and 7 respectively.

In view of the continued increase in the shipping, and the length of time required to construct works of such an extensive character, it is certainly not too soon to select a site, determine upon a scheme of improvement, and commence a portion of the works.

All the available water frontages owned by the Crown which are conveniently situated to the city, such as Circular Quay, Woolloomooloo Bay, and Darling Harbour, have already been utilised for wharfage purposes.

Then Mr. Darley goes on to suggest that the only Crown land within reasonable distance of the city which could be used for additional wharfage accommodation is at Glebe Island;—having heard those paragraphs read, do you generally approve of those statements? I do.

209. Will you describe the wharfage now provided by the Government at Woolloomooloo Bay? The public wharfs commence at the north-east end of the eastern side of Woolloomooloo Bay and go round until they terminate opposite the Domain gates on the western side of the bay, a length of 3,494 feet. At the present time the Government propose to extend that accommodation by 600 feet, by continuing it just about up to the public baths for women.

210. On the eastern side of the bay there are a number of sheds? Yes.

211. Will you tell us the class of shipping for which that Woolloomooloo Bay wharfage is intended, what it is chiefly used for, and what sized ships generally go there, and in what lengths the Government let these wharfs? The eastern side will be used for the White Star line of steamers, each of 10,500 tons—that is the line owning the “Medic.”

212. What length of frontage does their lease cover? They have 500 feet; but it is under offer to them until February next whether they will take the whole of the 840 feet or only 500 feet.

213. What would be the length of one of their large ships? 500 feet from bow to stern.

214. They have no projections in the way of bowsprit? No.

215. So they would just about fit in? Yes.

216. You are doubtful as to whether they will take 500 feet or 840 feet? Yes.

217. Is 500 feet an exceptional length for ships? It is nearly the longest we have. There is one line of steamers with 545-foot vessels.

218. We must take it, then, that the 840 feet accommodation is a question open until February of next year? Yes; I have no doubt it will all be taken. This accommodation comprises berths Nos. 1 and 2.

219. What is the next occupation? Dangar, Gedye, & Co.’s. They have two berths—Nos. 3 and 4.

220. What frontage have they? No. 3 is 372 feet, and No. 4 is 236 feet.

221. That is an actual lease? It is an agreement to berth, under the Wharfage and Tonnage Act. It is not a lease, but it is tantamount to a lease. The Government agrees to berth all the vessels that come to the firm, inward and outward, and when they do not use the wharf we use it for any other purpose. They guarantee to berth all their vessels with us for three years.

222. What class of ships do they put there? Large steamers and sailing vessels.

223. What is next to that? No. 5. That is 400 feet long, and is leased to McArthur & Co.

224. That is used for what line of steamers? The Gulf line. Then there is No. 6—A and B—which is simply a jetty. It is used only for coal and metal, and it is better not to count it.

225. By whom is that used—private people? No, by the Government. No. 7 is 353 feet long.

226. What is that used for? For the shipping of wool, by McArthur & Co.

227. Sailing ships generally? Sailing ships and steamers. No. 8, 433 feet, is used for the same purpose by steamers and sailing vessels. Those are all the berths at Woolloomooloo Bay.

228. That brings you round to the present end of the wharf construction at Woolloomooloo Bay? Yes; opposite to the Domain gates.

229. You referred to No. 6 as a small Government jetty used for coal and metal? Yes.

230. Do you consider that Woolloomooloo Bay is wide and capacious enough for its wharfage capacity to be extended by means of jetties to be run out into the bay? No, it is not. Some years ago I was of opinion that it was, but I have altered my opinion on account of the immense vessels now coming to this port.

231. These large vessels take up too much time to manipulate in that way? Yes. It is not advisable to berth steamers at jetties at all. These large steamers, having such immense cargoes, must have a broadside berth, because they discharge out of four, five, or six hatches at the same time, and would block up a jetty in a very short time.

232. The paragraph I read states:—

All the available water frontages owned by the Crown which are conveniently situated to the city, such as Circular Quay, Woolloomooloo Bay, and Darling Harbour, have already been utilised for wharfage purposes.

—? Yes, that is true.

233. That applies especially to Woolloomooloo Bay? Yes.

234. What is not actually let you say there are applications for, and that it will doubtless be availed of at once? I have no doubt about it. This proposed new wharf in Woolloomooloo Bay will, no doubt, be used by the new boats of the San Francisco line.

235. Where do they berth their vessels now? They berth them at Circular Quay—only two vessels—the “Alameda” and the “Mariposa.”

236. With regard to the Woolloomooloo Bay wharfage, have you any figures which would indicate what has been the total cost of providing the accommodation, and what is the amount of revenue that will be obtainable from that? I have not particulars of the total cost, but I have particulars of the revenue. J. Jackson.
15 Dec., 1899.
237. What will be the total revenue, at the prices which the Government have put down for the unoccupied portions, in addition to that which is actually let? I will tell you the revenue obtained in the year ending the 1st July, 1898—that is, exclusive of berths Nos. 1 and 2, which are at present under offer. The amount was £7,268 9s. 2d.
238. What do you expect to get for Nos. 1 and 2? At a very low figure I expect to get about £8,000 a year for those.
239. Then the remainder must be let at low prices? No, they are much smaller berths; for instance, No. 4 is only 236 feet. They are not let at any fixed rental; we take the good with the bad. The more cargo the vessels bring in, and the more they take out, the more revenue we get. It depends on the cargo they bring in, and what they take away.
240. You are paid by results? Yes.
241. But in the case of Nos. 1 and 2, there is an actual lease? No; in that case also the payment is by results. There is a great advantage in that. If you were to give anyone an exclusive right to a berth, he could prevent you from putting a vessel there when he did not use it; but at any time when those berths are not being used by these vessels, I can put an outside vessel in there, and have the revenue from it.
242. But with regard to the contract with the White Star line, such as you contemplate,—they will, of course, have a prior claim? Yes; they will always have that. It is provided for in the agreement.
243. That will bring the revenue up to something over £15,000 a year at present rates? Yes.
244. With regard to the sum of £8,000, which you expect to get from Nos. 1 and 2, may we infer that wharfage accommodation for the very large vessels is very much needed, and very much in request? I am quite sure of it.
245. That is a growing requirement? Yes.
246. Can you tell the Committee what you think would be the rental that would be produced by extending the wharf, as it has been stated in the newspapers the Minister for Works intends to do, as far as the women's baths in Woolloomooloo Bay? At a low estimate, I should put it at £3,000.
247. What sized ship would that accommodate? I intend to berth the new San Francisco steamers there if I possibly can.
248. Vessels of about what tonnage? 450 feet long. They may be longer.
249. But that is about the size of the vessels they propose to run? Yes. Although the berth will be 600 feet, you must have the berth a little longer than the ship, because of lighters and other vessels coming in there.
250. How much would that revenue be? £3,000 a year.
251. From your knowledge of the shipping of Sydney at the present time, have you any doubt that when the wharfage accommodation in view in Woolloomooloo Bay—200 feet more on the north-eastern end, and 600 feet more on the western side—is completed, there will be any lack of shipping to go there? I have not the slightest doubt. Of course, shipping is always slack in the off season.
252. The accommodation will be seized upon at once? I am quite sure of it.
253. What makes you arrive at that conclusion? The "Medic" was there, because she could not go anywhere else. There is no other berth in Sydney that could accommodate that steamer.
254. *Dr. Garran.*] Supposing the Government were to find these wharfs on the western side of Woolloomooloo Bay working satisfactorily, would there be any disposition, do you think, on their part to extend the wharfs right away to Lady Macquarie's Chair? I do not think so.
255. Why not? For my part I would not recommend it, because I do not think it would be right to exclude the public from the baths.
256. You would have to shift the baths to somewhere else? Yes.
257. If there were a mercantile necessity, do you think that the Government would say, "We will find another place for the baths, because that site is too valuable now for baths; we want it for ships"? I do not think it will become necessary with the scheme proposed for Glebe Island.
258. You are going to knock the women's baths out? Yes.
259. If the women's baths are to go, why should the men's baths be more sacred? I do not think there will be any trouble about the men's baths. I do not know the Government's intention, but I would not recommend it.
260. But for all nautical reasons it would be very suitable? There is no doubt about that.
261. Quite as suitable as those in existence? Yes.
262. Even more so? Not more so, but equally.
263. You get a better wharf as you go more from the head of the bay? No. It is easier to berth a vessel at the head of the bay than it would be there, especially with a strong north-easter.
264. You think the present limit is likely to remain the limit for a long time? Yes, I think so.
265. When you make this new wharf will you take a slice off the Domain to make a roadway? No.
266. You will reclaim all you want? Yes.
267. So the Domain area will not be diminished? Not a foot of it, I understand.
268. All you want for space you will reclaim—make your own ground? Yes.
269. *Mr. Dick.*] I think you are not favourable to the idea of jetty extension? No, I am not.
270. You have at present at the head of Woolloomooloo Bay two small jetties, have you not? One.
271. It is not quite in the centre of the bay? Not quite.
272. On the ground of shipping convenience, is there any objection to an extension, right along the centre of the bay, of a wide jetty, which would afford berthing facilities on each side? I think there would be greater objection now than there was ten years ago, when I gave evidence before. I was then in favour of having a jetty right down the centre, but I am not now. I never contemplated such large vessels coming here—vessels of 500 or 600 feet—and having to be turned round. Jetties are very inconvenient for landing a great quantity of cargo out of these steamers.
273. They are long enough to allow all the hatches to be worked at once? Yes; but the difficulty is for drays to get down and take the cargo away.
274. But with a wide jetty and a good central road would not that difficulty be obviated? Yes; if you were to have a jetty 150 feet wide and a road 50 feet wide in the centre; but that would be very costly.

- J. Jackson. 275. At present the maximum depth of water in Woolloomooloo Bay is only about 27 feet? Yes; but you can have any depth you like in Woolloomooloo Bay; it is all mud.
- 15 Dec., 1899. 276. Supposing you were to have a long central jetty, could you berth your vessels and take them away from their berths as easily as you can now? Yes.
277. You do not swing the vessels at the wharfs? They could be swung outside and brought up stern first.
278. I mean you do not swing them at the wharfs at present? The pilots do. The Norddeutscher-Lloyd steamer was swung at the head of the Cove the other day.
279. You use the berths—I do not mean at the jetties, but immediately adjacent to the jetties, on the foreshore, at present? Yes; that is, No. 5.
280. And you get fairly large vessels there? Yes.
281. The "Gulf of Martaban," for instance, is on the eastern side now? Yes.
282. If there is no difficulty at present in accommodating vessels at the wharfs adjacent to the jetty, there would be no more difficulty if the jetty were extended down the centre of the bay? There would be no difficulty in berthing them.
283. Your great objection is the difficulty of disposing rapidly of the cargo? Yes.
284. Have you any experience in Sydney to guide you to that conclusion? I have. I have two jetties at Circular Quay—on the western side.
285. You find it very inconvenient in the matter of handling cargo? Yes; it is inconvenient for getting cargo away.
286. The "Nineveh" at present is at Dalgety's wharf, Miller's Point? Yes.
287. Is it found inconvenient there as regards dealing speedily with the cargo? I cannot answer that question, because I have nothing to do with it.
288. Nearly all the private wharfs where fair-sized steamers are accommodated are practically jetties, are they not? Yes; but there has been great objection to berthing large steamers at jetties of late years. There is also another objection to jetties, and that is, that you cannot have shed accommodation for the proper protection of the goods.
289. For what reason—cannot a jetty be covered the same as a wharf? Because the carts would have to go through all the sheds, and if carts go amongst cargo, that breaks the cargo up.
290. Then you do not think that that idea is one that should be followed by the Government? No, I do not.
291. *Mr. Shepherd.*] Would it not be a great economy of space if jetties could be constructed, instead of these long wharfs? Certainly it would. Of course one jetty would take two ships, one on each side; but there are other considerations that have to be thought of. It is not a fair thing for two ships with general cargo to be berthed at a jetty at the same time, because the cargo gets all mixed. I would never do it. It is not fair to the owners of the cargo, nor to the ship, nor to anyone else.
292. If the jetties were widened a little, would they not afford greater facilities for loading and unloading? You would have to have a jetty 100 feet wide to give proper access to it.
293. And even then it would be a great economy of space, would it not? But with two vessels at a jetty, even if it were 100 feet wide, you would not have space to land the immense cargo that comes out of these large steamers. Some of them have 5,000 tons of cargo to be landed. Supposing there were two steamers of this kind at a jetty, even if it were 100 feet wide, they, discharging from five hatches, perhaps, night and day, would block the jetty up, and they could not get the goods away. In the old days of sailing ships, jetties were all that was required, and they did not have to be more than 180 feet, or at the most, 200 feet long; but those days are past. It is nearly all steamers now, and they require quick despatch.
294. But is it not a fact that jetties are largely used in Melbourne for loading and unloading vessels? I think they are; but I do not think that ships there get such quick despatch as they get in Sydney.
295. I have noticed vessels loading and unloading there, and they seemed to get rid of their cargo very quickly by having trams along the jetties? Yes, that is true. In Melbourne they take it from the Sandridge Pier right into the railway trucks, which take it right up to the city.
296. I should think that where jetties could be used, you could increase the accommodation almost 400 per cent., could you not—that is, you could put four vessels at a jetty where you could put only one at an ordinary wharf? Yes; but even with that I would not advocate jetties.
297. Until of late years the whole of these wharfs were jetties, were they not? Yes, they were; but the shipping has so increased in size that the jetties would not accommodate them now.
298. You think, then, that the jetties are objectionable? Yes, I do in every way.
299. *Mr. Watson.*] You were saying that you expected to have the new 'Frisco boats berthed at Woolloomooloo Bay? I think so.
300. Do you know whether there are any other wharfs that would be suitable for those boats in the event of your not being able to give them berths at Woolloomooloo Bay? I would have to do the best I could at Circular Quay.
301. You have no room at Circular Quay for them? I have managed for the two boats the last six months.
302. But the boats to be built will be much larger than those now running? Yes; they will be 450 feet, I believe.
303. As against what? I think that the present boats are about 320 feet.
304. Then they will be more than 100 feet longer? Yes.
305. Are there any private wharfs that would be suitable for the new 'Frisco boats? There is Smith's wharf, which would accommodate them for length—that is at Miller's Point; but I think that the Aberdeen White Star line has a portion of that, and so there would be no accommodation for them there. There is a jetty at Parbury's wharf, and there might be accommodation for them there. I think that is 360 feet long.
306. Is that wharf generally well occupied now? No, I do not think it is much occupied now. The steamers that used to go there have come round to the Government wharfs.
307. What would be the largest-sized steamer that any private wharf could accommodate? I think that the only large berth in Sydney at a private wharf is at Smith's wharf, where the Aberdeen White Star Company's vessels are. I am not quite sure about the length of it. It is a broadside wharf. I do not think there are any jetties in Sydney that could accommodate those large steamers. 308.

308. Parbury's would not be big enough to take these new 'Frisco boats? No; not to take the whole length on. J. Jackson:
15 Dec., 1899.
309. Do you think that Parbury's wharf is a place where the agents of the 'Frisco boats would care to have their vessels, having in view the matter of convenience in getting passengers there, and so on? No. I am quite sure from what I know that they will either go to Circular Quay, or if there is no place for them at Circular Quay, they will come to Woolloomooloo Bay.
310. How does Woolloomooloo Bay compare with other portions of the harbour in regard to convenience;—are there any complaints from the agents as to inconvenience of getting passengers or goods there? I do not think it will be as good as Circular Quay for passengers; but as for landing goods there I have never heard any objection. Of course it is only a matter of introducing one passenger steamer there—then the rest will follow. If all the passenger boats berthed down there it would be all right, especially if a tram ran down there; for instance, through a tunnel under the Domain from Circular Quay.
311. There have been proposals in connection with the city railway to run trains round that way, I understand? They ought to.
312. Goods going to or from Circular Quay have to go through rather a congested traffic in the streets, have they not? Yes.
313. Is that element absent from the Woolloomooloo Bay approach? In a great measure it is, because they go up to Market-street.
314. They get into the city at Market-street? Yes.
315. *Chairman.*] You were asked a question with regard to the wharfage in Melbourne, and wharfs running out there in the shape of jetties;—is it not a fact that the pier at Sandridge runs out into Hobson's Bay? It used to do so; but I do not know much about Melbourne now; it is twenty years since I was there.
316. But that is the place where you saw a long jetty running out? Yes.
317. And that is into an open roadstead? Yes.
318. It would be very inconvenient for a ship to have to go right alongside a wharf there? It was in those days.
319. And the reason for the railway being there, I suppose, is that the goods have all to be taken right up to Melbourne? That was the cause of it.
320. And then they are put in the warehouses at Melbourne? Yes.
321. But here the goods are taken from the ship's side and put right into the warehouses? Yes.
322. So there is no similarity between Melbourne and here? No.
323. What is your observation, as manager of our public wharfs, of the tendency of late years with regard to vessels;—are they gradually getting larger? Yes, much larger.
324. You have no doubt of it? Not the slightest doubt. A vessel that was considered of a large size ten years ago is regarded as a small vessel now.
325. I mean, is the trade of the port evidently being supplied from year to year by increasingly large vessels? There is no doubt about it.
326. It is consequently necessary that we should provide special wharfage accommodation for those large vessels? It ought to be provided. I do not look merely at the present or next year. I think that wise people look ten years hence, and contemplate what the shipping of the port will be ten years hence.
327. From your observation, do you think that these large ships are bound to go on, or are vessels likely to become smaller again? No; I do not think they will become smaller.
328. Among shipping people, have you heard anything about vessels going to be smaller again? No. They are building them larger than ever.
329. Therefore extensive frontage for large ships is required? There is no question about it.
330. *Mr. Dick.*] Will you kindly supply us now with the same details concerning berths at Circular Quay as you have given us in regard to Woolloomooloo Bay? I will commence on the eastern side of Fort Macquarie. No. 1 berth is leased to the P. and O. Company. There is a small addition to be made to it, and it will be 620 feet long. No. 2 berth is leased to the Messageries Maritimes; it is 515 feet long. No. 3 berth is leased to the Orient Company; it is 372 feet long. No. 4 berth is leased to the Canadian and Japanese lines of steamers; it is 572 feet long. No. 5 berth is leased to the Norddeutscher Lloyd; that is on the western side; it is 512 feet long. The head of the cove is used for ferries. No. 6 berth is leased to the Eastern and Australian Steamship Company; it is 396 feet long. No. 7 berth is leased to the German-Australian Steamship Company; it is 434 feet long. No. 8 is a small jetty—No. 8A and No. 8B; one side of the jetty is 239 feet long, and the other side is 283 feet long. No. 9 is also a jetty; there are three berths at it; the principal berth is 420 feet long, one berth on the other side is 264 feet long, and a berth right up at the top of it is 137 feet long. Those are all the berths at Circular Quay. Practically there are only nine berths at Circular Quay. Those over and above nine are only in shallow water, and the berths are of little or no use.
331. What was the total revenue from the Circular Quay wharfage in the same period as you have already mentioned in regard to Woolloomooloo Bay? £33,399 18s. 11d., giving approximately £3,500 as the annual value of each berth, taking the good with the bad. That amount includes the rent of the ferries, which is about £2,000.
332. How is it that the Orient berth is short compared with the others? The vessel projects beyond two others, and the steamers overlap both ways—they overlap the French Company's wharf and No. 4.
333. Does the overlapping interfere with the rapid working of the cargo of the Orient Company? No, I believe not; I have not heard of it.
334. Is it a matter of difficulty for pilots to berth vessels at the adjacent wharf? No. It would be if the steamers at No. 4 jetty were longer, because they would have to reef inside of the Orient steamers. You could not berth very large steamers there. Besides, there is not a sufficient depth of water there.
335. As a rule, the boats berthed at the Circular Quay carry a smaller amount of cargo than do boats of similar size devoted solely to cargo, do they not? Yes. Still they carry a very large quantity. For instance, I know that the Norddeutscher Lloyd steamer landed 6,000 tons of cargo there.
336. Take the Orient boats, which discharge at the short wharf—what is the average cargo for one of those steamers? The average cargo is about 3,500 or 3,000 tons; it varies considerably.
337. The shortness of the wharf does not hamper them at all? No, I believe not.
338. What is the depth of water around the Quay? On the eastern side it is 28 feet, and on the western side it is about 32 feet. The bottom on the eastern side is all rock. 339,

- J. Jackson.** 339. Does the 28 feet allow all those big vessels to load to their full capacity? Yes, I believe so. There has been no complaint about that.
- 15 Dec., 1899. 340. *Dr. Garran.*] On the eastern side of the Quay you have this overlapping, echelon kind of wharf? Yes.
341. And on the western side the wharfs are straight? No; they are echelon there also.
342. Considering the size of the steamers now coming to this port, would it not have been more convenient if we had made both sides of these wharfs straight? Yes, it would have been. In Woolloomooloo Bay it was originally intended to have the wharfs the same shape—three berths of 300 feet each—and I objected to that, as I saw they would be of no use, and Mr. Darley altered them at my suggestion.
343. *Mr. Dick.*] The Quay is practically a point of departure for a great number of ferry boats? Yes.
344. Does that fact militate against it as a resort for large mail boats? There is the departure of a large number of ferry boats, and, in my opinion, there has been for some years a traffic in the cove which never should be there—that is, the picnic boats. I have made the recommendation, and believe it has been approved of, that two or three small jetties should be put out at the Man-o'-war Stairs, with proper accommodation for the picnic traffic. That would leave plenty of room for the ferries in the centre of the cove.
345. It would be necessary, then, to carry the tram there? If I get the jetties, the tram will no doubt run to the point.
346. Year after year, even the regular and necessary passenger traffic—apart altogether from picnic requirements at the Quay—is increasing, owing to the settlement on the northern side of the harbour? Yes.
347. As that increases, will it not make Circular Quay less desirable as a depôt for these large steamers? It will in time, there is no doubt about it, if a bridge is not put across the harbour. But I think it will be many years before the mail steamers will leave the cove.
348. Is it not a fact that the ferry boats have their whole time-table disorganised, and that the time-table of the Milson's Point Railway line also becomes disorganised, when one of these big steamers is swinging to the Quay? It has happened with the Norddeutscher Lloyd steamer; but it could be put a stop to if the Marine Board pilots turned the vessels outside the cove, and brought them up stern first.
349. The difficulty arising from that could easily be met by an improved system of pilotage? Yes.
350. Has the bringing of the electric tram down to the Quay still further added to the difficulties of taking cargo away from the wharf? No.
351. Not in any way interfered with it? No.
352. The large vessels berthed near the head of the Quay occasionally have a coal steamer placing bunker coal in one of them, whilst outside the coal steamer there is a large lighter? Yes.
353. Does not that interfere to some extent with the ferry traffic? With the North Shore ferry it does occasionally. That could be remedied. I brought it under the Treasurer's notice. If the North Shore Ferry were removed to where the Mosman's Bay Ferry is, and if the Mosman's Bay Ferry were removed to where the general ferry is, and if Prince's Stairs were removed and the present North Shore Ferry were used instead of Prince's Stairs, which would give the North Shore Ferry the centre of the cove and of the Quay, that would do away with any further difficulty.
354. Is the jetty you suggest should be used for the North Shore Ferry the one that was originally used by the rival company of the Port Jackson Company? The one I propose to use for the Mosman's Bay Ferry is the one that was used for the rival company, and I propose to take Prince's Stairs away and enlarge the Mosman's Bay Ferry.
355. Do you think that the Norddeutscher Lloyd boats are too large to go into such a small quay as that, considering all the surroundings? They are certainly large. I have given the matter considerable thought, and I intend to recommend that it be somewhat altered, if we can manage it, by getting the German-Australian boats away from the Quay to Woolloomooloo Bay or somewhere else—because they are cargo boats—and enlarge the E. and A. wharf and put the E. and A. steamers where the Norddeutscher Lloyd is now, and let the Norddeutscher Lloyd have the whole of the present E. and A. and the German-Australian berths. I think they are willing to pay for them, and they have two branch lines of steamers coming out at the beginning of next year.
356. Does the Norddeutscher Lloyd agreement extend over a long period? It has two and a half or two years to run.
357. How long has the German-Australian lease to run? I do not think that I should have much difficulty in getting them to shift, as their boats are only cargo boats. The German-Australian lease has eighteen months to run. I do not think that there will be any difficulty in getting the steamship companies to make exchanges; but I could not move the Norddeutscher Lloyd steamers further down now, because they would not fit. They are 545 feet long, and, of course, I could not put them into a berth 400 feet long.
358. Even if you were to shift the line which is further to the north away from the wharf, you would not be able to accommodate the Norddeutscher Lloyd boats then, with the wharf as it is? No.
359. Then the transfer or interchange of wharfage accommodation which you propose could not be carried out unless the wharf were altered? The wharf would have to be altered; but that would not take very much.
360. *Mr. Watson.*] Did I rightly understand you to say that the total revenue from the ferries was about £2,000? Yes.
361. That seems to be a small sum in comparison with the revenue derived from the other portion of the Quay? Very small.
362. How do you account for that? I do not think the ferry companies are paying what they ought to.
363. In what way do you calculate the charge to be made to the ferry companies? In the case of the Manly ferry, I took interest on the cost of construction—10 per cent.
364. The amount for a timber wharf would have to include a good deal for depreciation, would it not? Yes; but 10 per cent. is a large interest—that is, allowing 5 per cent. for depreciation, and a wharf like that would stand for fifty years.
365. So, practically, at that rate you are not getting much for the rent of the site? Not for the rent of the site.
366. Does that apply, roughly speaking, to the other ferries? Yes.
367. But that site cost the Government a good bit of money in reclamation and in other preparations, irrespective of the actual cost of the wharf? I do not know about that. 368.

368. The Cove was reclaimed right down to where the ferries now are, from some distance further up? *J. Jackson.*
Yes; many years ago. The head of Circular Quay is practically a public highway now.
369. In view of the rentals that you are getting from other parts of the Quay, it seems as though it would be fair to charge these ferry companies an increased rental? When the North Shore Ferry was put there first, I suggested a much higher rent than is being paid, but the Minister of the day appointed a board to assess the rent, and they assessed it at £1,000. *15 Dec., 1899.*
370. How would that compare with the cost of the jetty and other buildings? It would leave 10 per cent. on the cost of it. That jetty cost, I think, £7,000.
371. So, roughly speaking, the whole of those ferry companies are occupying the land without rental—they are practically paying for the wharfs, and the other expense the Government is put to, including something for depreciation? Yes.
372. *Chairman.*] I suppose that your objection to jetties in Woolloomooloo Bay applies with greater force to jetties at the Circular Quay where the ferry service is so large? I object to jetties anywhere for cargo vessels.
373. You object to them especially at Circular Quay? Yes.
374. With a ferry service there, it would not answer at all? No.
375. So at the Circular Quay you do not think it is at all possible to extend wharfage accommodation by the erection of jetties? No.
376. *Dr. Garran.*] Do you know of any jetty in Sydney Harbour that has lasted fifty years? I did know a wharf that lasted about fifty years. It was on the western side of Circular Quay. It was lately pulled down, and some of the piles were as good as when they were put in.
377. You mean the timber was sound? Yes, except the girders. The piles were really excellent.
378. You think they would have lasted fifty years if left alone? I think they had stood there close on fifty years. I am speaking from old tradition.
379. The original jetty there was simply for the use of the Commissariat Stores, was it not? Yes, originally it was.
380. You mean to say that the timber of that was sound? I do not think that any of the old jetty existed there when the wharf was pulled up. I know that when they pulled the old A.S.N. Co.'s wharf up it had stood sixteen or eighteen years. The wharfs that private people build are, of course, nothing like the wharfs the Government build; but that wharf had stood there for sixteen or eighteen years, and the timber was good.
381. How old was Campbell's wharf when it was pulled up? About eighteen years. That was the old A.S.N. Co.'s wharf.
382. Was there no sign of unsoundness of the timber there? Yes; cobra had got into the piles.
383. It would not have lasted much longer? Not very much longer; but the piles were small ones, and were not coppered.
384. You think that the way these piles are now coppered they are proof against that? Yes; no cobra can get into them. As a matter of fact, the wharf on the eastern side is over twenty years old. All that is required is some repairs to the decking. The underneath portion is perfectly sound.
385. *Chairman.*] Where is the next place where there are Government wharfs? The next Government wharfs commence in Darling Harbour, at the foot of Lackey-street. There are four jetties; they are small iron jetties, each about 70 feet long, and capable of accommodating some sailing vessels. I had a vessel there of about 1,000 tons some years ago.
386. Mostly sailing vessels? I never had any steamers up there.
387. Timber vessels? They used to load shale there, and discharge wood, but of late years the place has been used only by small timber vessels. The wharfs were faultily constructed, and vessels could not have ordinary despatch there. After we pass these jetties we come to a timber wharf. This projection is leased to Birt, Geddes, & Co., for the purpose of loading frozen meat.
388. What kind of vessel goes there? Large vessels could go up there, but they do not go there now, because they cannot get through the bridge.
389. When the new Pymont Bridge is erected, and the new swing made, will they be able to get up there? Yes; but, still, there is an objection to large vessels going there on account of the depth of water and the rock.
390. On the western side there, what is the depth of the water? Twenty-two feet, and the bottom is rock.
391. That will not permit of very large vessels going there? No. Lately the Works Department have deepened the water alongside the second berth south of the bridge, on the western side. The wharf between Birt's and the bridge is used only for small timber vessels, the water being shallow with a rock bottom.
392. Do you know what rental the Government gets from the Government wharfs about the Pymont Bridge? Yes. For the twelve months ending June last year the rents amounted to £1,470 0s. 10d. They are all small timber vessels that go up there.
393. Can you tell us whether the Government wharfage space above the Pymont Bridge is availed of to its fullest extent, having regard to the shallowness of the water, and the inconvenience of having to go through the bridge? It could be used more.
394. Why is it not? Because there are only small coasting vessels going up there with timber, and we get nearly all there is of it.
395. Then, for the necessities of present trade, it is used to its fullest extent? Yes. It could be used more if there were more trade.
396. But, for the purposes of large ships, is that part of the harbour likely to be used to a much greater extent? No.
397. Why not? Because of the shallowness of the water, and the unsuitableness of the place. The only vessels that would go up there would be vessels with goods to be taken away by the railway, and there is very little cargo of that kind coming into the Colony.
398. For the purposes of general cargo supplies to the port, and that kind of thing—that is not a part of the harbour suitable for that kind of trade? It is nearly useless for that purpose.
399. After passing Pymont Bridge, you come to Pymont wharf? Yes.
400. How is that occupied? It is occupied for the purpose of shipping coal and frozen meat particularly. It is an export wharf.
401. Used in connection with the Railway Service? Yes, to a great extent. 402.

- J. Jackson.
15 Dec., 1899.
402. Do you get a rental or anything else for the Government from that? Yes; we collect the wharfage and tonnage dues. The amount of wharfage and tonnage dues collected there last year was £4,302 7s. 1d. The reason why this is lower than it would be under other circumstances is that there is an arrangement with the railway authorities whereby the outward wharfage on coal exported is only 1½d. a ton, instead of 3d.—only half wharfage is charged on coal exported from Pymont wharf; otherwise the revenue would be much larger.
403. How much of the revenue do the Railway Commissioners pay? About £1,000. There are tonnage dues. For instance, there is ore landed from Noumea, on which the consignees pay dues. Next in order we come to the Government property known as Darling Island wharf, which at present is being completed. I think that that will be used solely for the export of wool, frozen meat, and grain, coming down by rail. The Darling Island wharf is being completed by having a concrete facing put round its eastern side, its end, and its western side, which, when completed, will give wharfage accommodation on the eastern side, amounting to 1,300 feet, a berth of 300 feet on the end, and wharfage accommodation on the western side amounting to 900 feet.
404. Is it occupied at the present time? No.
405. Do you know how long it will be before that will be available? I think there will be a considerable quantity of wheat shipped from it directly.
406. How long do you think it will be before it is completed? Two years.
407. When the work at Darling Island is completed we shall have a large additional wharfage frontage available? Yes.
408. Do you think that by the time it is completed we shall have ample accommodation, including the additional accommodation provided there, for the necessities of the port? The Darling Island wharf will never be an import wharf, it will be only an export wharf. They will take "tramp" steamers there for the purpose of filling them with wool and coal.
409. *Dr. Garran.*] Those vessels will go to one wharf for import and to another for export? Yes; the same as they do in every other part of the world.
410. *Chairman.*] That wharf will be used in connection with the railways for export purposes? Yes. It is contemplated to put large warehouses all round the island to suit the lessees. It has been in my mind for some years that wool will go there from the country, be exhibited, sold, and dumped and put into ships there, and thus taken out of the streets of Sydney altogether.
411. *Mr. Watson.*] I suppose that the reason why it would pay to take a vessel first to one wharf to discharge her imported goods, and afterwards to take her to another wharf to take in goods for export, is that that would save handling and haulage of the import goods from the export wharf, which might be a long distance from the warehouse? It would save all the lighterage of the cargo.
412. It would be cheaper to shift a vessel from one wharf to another than to shift the goods? Much cheaper.
413. *Mr. Dick.*] But is not that advantage almost counterbalanced by the fact that if the vessel is alongside the railway all the outer cargo that comes by the railway can be shipped almost immediately on to the vessel without any cartage at all? Yes, when she is empty. It is of great advantage to a ship when there are import and export wharfs. In London there are import and export wharfs.
414. *Dr. Garran.*] But do you imagine that the great mail steamers will leave their berths at Circular Quay to go and take in their export cargo at Darling Island? No, not the mail steamers. I never contemplated the mail steamers going there at all.
415. Only the tramps? Yes, the tramps. As a matter of fact, there are applications for berthing accommodation there now.
416. But you do not think any of the mail steamers would go there? No, I do not. I never anticipated that they would go there.
417. Then it is only for import steamers that we want additional wharfage over and above what is provided for at Darling Island? Yes, only for import purposes. It may be required for export in time, and no doubt it will be.
418. But for export purposes you think that Darling Island will furnish all we want for the present? Yes, for the present.
419. Then it is only import wharfage we need? Yes, for the present.
420. Of course these export steamers will be at that export wharf only about half the time they are in the harbour? That is all.
421. They will be at the import wharf for the first half of the time, and at the export wharf for the second half of the time? Yes. I am quite alive to the fact that by making that an export wharf it will take a certain amount of revenue from the other Government wharfs; but it will take it not only from the Government wharfs, but also from private wharfs. One great object is to get a great deal of the traffic—all the wool traffic—out of the city, and I think that will be a great thing to accomplish.
422. Of course these steamers will not pay more for the convenience of two wharfs than they would pay for the convenience of one wharf if they were to stay there all their time? No. When a vessel is discharging her cargo, she has so many free lay-days under the Act, and she might use a part of that time at Darling Island, in which case I would get only the rent for the stores and the wharfage on the produce shipped from the wharf into the vessel; but I think that would pay handsomely.
423. And you think there will be a full demand for the whole frontage at Darling Island merely for export purposes? I am quite sure of it. I could bring three customers now.
424. *Chairman.*] That is largely due to the fact of its being used in conjunction with the railways? Exactly so.
425. You spoke a little while ago about fashion with regard to trade—that if certain steamers went to certain places other steamers would follow; now, what is the fashion in the harbour with regard to cargo ships;—do they like to go further up the harbour, or do they prefer to keep down as much towards Circular Quay and Woolloomooloo Bay as possible? Passenger steamers always prefer to lie at the Circular Quay.
426. But I am speaking of cargo ships? I think I am safe in saying that all large steamers would prefer to be berthed either at Circular Quay or at Woolloomooloo in preference to being berthed at any other wharf. The reason for that is that the Government has very much better wharfage accommodation than private people have.

SATURDAY, 16 DECEMBER, 1899.

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the fore-shores, and constructing a Wharf round the Island.

John Jackson, Manager of Public Wharfs, made an affirmation, and was further examined:—

427. *Dr. Garran.*] It is rather important to this inquiry that we should have a clear idea of how far the Government expenditure upon wharfs in Sydney harbour has been a remunerative investment, because we ought to report that to Parliament if we can;—can you say, taking Woolloomooloo Bay for example, how much you have received for each wharf individually, or for the whole collectively? I was able to give you the figures yesterday for one year. J. Jackson.
16 Dec., 1899.

428. For each berth separately? No, I could not give that.

429. Then your figures would be scarcely a fair criterion, because some of the wharfs have only just come into operation? Yes; I have not estimated for those yet.

430. Only for those which have been twelve months in operation? Yes.

431. With regard to Circular Quay, can you give us the revenue from each wharf separately or only from the whole? I can give you the revenue from the whole. I could give you the particulars of each wharf, but it would take some time to take out the details from the book.

432. I understood you to say that you thought the ferry wharfs were let at too low a rent? Yes; I think that is the case with the North Shore ferry.

433. Do you think the large wharfs are let at a fair rental? Yes.

434. Are they let at a rental which is undercutting private wharfs? No.

435. You are not sure of that? Yes.

436. You think you are getting as much as private owners would get for the same property? Yes.

437. With regard to Darling Island, that is so far an incomplete work? Yes.

438. But you have had twelve months' experience of the coal-shoots at Pyrmont? Yes.

439. Can you give us the annual revenue from the head of Darling Harbour down to the coal-shoots? Yes. I did not give you yesterday the revenue above the bridge; that was omitted. Above the bridge the revenue was £1,470 10s., and below the bridge £4,302 7s. 1d.

440. Out of that £4,000 the bulk, I suppose, would be for coal? Yes.

441. Some would be for chilled meat? Yes, and various things. As I stated yesterday, it may appear rather a small revenue, but that is owing to an arrangement with the Railway Commissioners that the wharfage on coal should be only 1½d. instead of 3d.

442. The Railway Commissioners do not collect the revenue? No.

443. It is collected solely by you? Yes.

444. You fixed the tariff by agreement with them? Yes.

445. At Newcastle no wharfage, I believe, is collected? No.

446. Is there no tonnage? There is tonnage, but neither inwards nor outwards wharfage.

447. With regard to Blackwattle Bay you have only one wharf at the head of the bay there? Yes.

448. What revenue did you obtain from that? £1,011 0s. 7d.

449. Those are all the wharfs in the city with which you have any connection? Yes, excepting the wharf at White Bay.

450. You have four groups of wharfs in your charge—the Woolloomooloo wharfs, Circular Quay wharfs, the Pyrmont wharfs, and the Blackwattle and White Bay wharfs? Yes.

451. They constitute practically the whole of the Government wharfage in the city of Sydney? Yes.

452. You know nothing about the expenditure upon these wharfs? No.

453. Is the income increasing or decreasing? It is increasing.

454. At what rate? I can give you the revenue from when I took charge of the wharf fifteen years ago; it was then £10,000, and last year it was £47,930.

455. Who preceded you in the office of Manager of Public Wharfs? Mr. Bell.

456. If you turn out the Norddeutscher steamers from the corner of Circular Quay, do you know any private wharf big enough to accommodate them? No.

457. Within the next two years, before you get Darling Island finished, will you have any accommodation for such vessels? No.

458. None whatever? No.

459. And they can go only to Government wharfs? That is all. Of course they may go to private wharfs, and put up with the inconvenience.

460. I suppose the jetties at Darling Harbour are now as long as it would be safe to make them—I mean the private jetties? I do not think it would be safe to make them any longer.

461. They now project into the water as far as they ought to go? Yes.

462. Then you cannot look to the private owners to increase the accommodation for large ships? No.

463. The wharfage at Darling Harbour was invaluable to the city of Sydney in the early days, when the Government had no wharfs? Yes.

464. Private enterprise had the whole business in its own hands then? Yes, except Circular Quay.

465. And practically met all wants? Yes.

466. Now that we are coming to deal with larger ships, do you think that private enterprise can meet the demands as well as can the Government? With a very large expenditure.

467. Take Glebe Island for example—could private owners do as well with that block of land as would the Government, taking it as a whole? They might do as well; but I do not think they would do any better.

- J. Jackson. 468. You think they would only do as well if the private owners formed themselves into a company? Yes; no private individual could undertake the work.
- 16 Dec., 1899. 469. If the Government were to let the property off on ninety-nine years' leases in 500 and 600 feet lengths the accommodation, on the whole, would not be so good? No.
470. You think we have reached that stage at which, in providing for large ships, the Government had better keep the wharfage construction in its own hands? Yes. I have always had an idea that in time—perhaps in the near future—the whole of the wharfage in Sydney should be put under three commissioners.
471. You admit that in the past private enterprise has done for Darling Harbour what the Government would not have done? I am quite sure of that.
472. Do you remember the dispute which took place at Circular Quay as to whether the wharfs should be of iron, stone, or wood? That was before my time.
473. Do you think that private owners would have taken three years to decide that question? No; I am sure they would not.
474. Do you remember the time when the "Sobraon" could not find a berth at Circular Quay? Yes.
475. To accommodate that vessel a certain amount of rock was blasted away? If I remember rightly, she was berthed ultimately on the western side of the Quay, at the old timber wharf.
476. Was it merely a question of scraping away so much mud? Yes.
477. Mud only? Yes.
478. How far have you to go down to get to the rock? I think about 70 feet.
479. And on the eastern side? They are down to the rock now.
480. We could have had a bottom for concrete wharfs then if we had wanted it? Yes.
481. You told us yesterday that Darling Island, when completed, would be almost exclusively an export wharf? I think so.
482. What additional accommodation for all purposes will you want, beyond the Darling Island wharfs, when they are completed? I am not looking only a year or two ahead; I am looking ten years hence.
483. Two or three years ago the Government decided upon wharf construction at Darling Island. That work is now in hand, and it will be finished in a few years' time. You say you apprehend fresh demands for wharfage. I want you to look two years' ahead. When the Darling Island wharfs are finished, what demand will there be for wharfs which you will not be able to comply with? I think the demand can be accommodated for the next two years with Darling Island.
484. After the Darling Island works are completed, will you be short of wharfage? I do not think so. The whole of the works at Darling Island, between Pyrmont and the Island, are completed.
485. You admit that the wharfage at Darling Harbour, above the bridge, is not utilised to its capability at present? It never can be, under present conditions.
486. It has not been a good investment? No; they have been useless wharfs always.
487. It would have been just as well if they had filled up the harbour there instead of making the wharfs? I think it would have been better.
488. It would have provided accommodation for a big goods terminus? It would have been a splendid railway yard, and that will be very much wanted in the future.
489. I remember telling Mr. Moriarty that, instead of taking mud out, he ought to be putting mud in—that he ought to have reclaimed the flat for wharfage instead of deepening it;—you think that would have been a better policy? Yes.
490. How far down would you have filled the harbour up? Right down to Market-street. I would have made a circular quay.
491. Not a straight quay? No.
492. What advantage has a circular quay over a straight one? When I say I would have made it a circular quay, I mean something like Circular Quay with a roadway.
493. The head of Rushcutters' Bay is circular? Yes.
494. That is inconvenient for shipping, is it not? It is not a question of shipping there; it looks more ornamental.
495. It is rather inconvenient to shipping? Yes. As a matter of fact, Mr. Moriarty made a circular quay at Woolloomooloo, and it had to be straightened out afterwards.
496. So that for shipping purposes there is no object in making a quay circular? No.
497. You think you are right in saying that, as soon as you get possession of the Darling Island wharfs, completed according to the plans, you will not be in want of additional wharfs? Not for some years.
498. How many years will it be before you want additional wharfs? The Darling Harbour wharfs will only be export wharfs.
499. Nine-tenths of the imports coming into Sydney are destined, not for up-country, but for warehouses in Sydney; but the goods which come in for up-country do not go to the city at all? They would be an exception.
500. When the Railway Department imports locomotives, where are they unloaded? At Pyrmont wharf.
501. They will go straight on to the rails? Yes. They formerly unloaded them at Circular Quay.
502. But when the Darling Harbour wharfs are finished they will be landed there more conveniently? Yes.
503. So that Darling Island will occasionally be used for import purposes? To a small extent. My idea has been that the bringing down of wool to Darling Island will ultimately lead to the erection of large warehouses there. Wool will be brought down there for exhibition, for sale, and for dumping.
504. You are aware that the buyers of wool do not like to go over to Pyrmont? I think they will go there now.
505. Is there not a large warehouse of Goldsbrough, Mort, & Co.'s, there? Yes.
506. Do buyers like to go over there to look at the wool? I think that, in spite of the disinclination, there will eventually be warehouses at Darling Island.
507. Is it not a fact that at the present time, if you want to get wool inspected, it must be at or near Circular Quay? Yes, because the largest agents have warehouses at Circular Quay.
508. Would you not find a great difficulty in getting the agents to go over to Pyrmont to look at your wool? There might be some difficulty for a little time, though all these prejudices wear off.
509. But commerce makes ruts for itself, and is apt to stick in them for a long time? Yes. I know there is a difficulty in getting merchants out of a groove, but when persons see that they can save money by

- by making a change, the matter is different. By going to Darling Island they will save cartage and double handling. J. Jackson.
510. Supposing that is done, it will render useless all the great warehouses at Circular Quay? Yes. 16 Dec., 1899.
511. That being so, will not the owners be likely to fight against such a change as you suggest? Individually they are likely to do so, but you have to consider the public.
512. You are aware that in London, when they opened the wharfs down the river, and tried hard to get the wool sales transferred there, it was found a difficult matter to fight against the wool wharfs up the river? Yes; I am aware that there was great difficulty in utilising the Tilbury Docks.
513. They had to fight against the custom of a generation or two in a strong and powerful trade? That would not be the case in this instance.
514. You think you can show a sufficient gain financially to beat down opposition? Yes. There would be the fact of the railway going alongside the warehouses.
515. Darling Island and Pyrmont are the only wharfs in the city which have the advantage of railway communication? Yes; and it is a great advantage.
516. As a wharfinger you admit that is an enormous advantage? Yes.
517. No private wharf has this advantage at present? No.
518. Nearly all the private wharfs in Sydney are jetty wharfs? Necessarily.
519. But this is not the case at Miller's Point? Smith's wharf is not.
520. Is Towns' wharf? That is a jetty; a portion is not. The main portion is a jetty.
521. Dibbs' wharf is a jetty? There are three jetties.
522. Do you think that in time the advantage of railway communication will tell strongly in favour of Darling Island? Yes.
523. At all the seaports of the world, wherever it is possible, a railway is brought to the wharfs? Yes.
524. Is it an axiom in engineering to connect wharfs with a railway system if you possibly can? Yes.
525. You cannot do that at Darling Harbour, except by the enormous expense of a railway right down the shore of the harbour;—that would be very expensive? Yes. It has never been thought of, I think, in connection with the private wharfs.
526. Whenever it is done it will have to be done by the Government resuming the wharfs? Yes.
527. If the wharfs we are now considering were made, there would be no necessity on the part of the Government for such a work as that down the eastern side of Darling Harbour? I do not think so.
528. You think it would be better to leave the wharfs there in private hands as they are now? Yes.
529. Do you not think there is some advantage in having part of the wharfage in private hands as a check upon Government monopoly? We could not very well do without some of the private wharfs. There are the local shipping companies to be considered. They have a coastal trade, and it is absolutely necessary that they should have the wharfs in their own hands.
530. You have no facilities for that trade? No; I do not want anything coastal.
531. Do you find that private wharfs are any check upon your overcharging? They always charge the same as we charge.
532. Then you are a check upon them? Yes.
533. They are not any check upon you? We could not overcharge.
534. But you might? We could not; we have a law to administer. We should not dare to overcharge.
535. The law would prevent it? Yes.
536. The law provides fixed rates for you? Yes.
537. Do you think the Government wharfage rate in any degree cuts unfairly into the profits of private wharf-owners? No; I think the private wharf-owners are perfectly satisfied.
538. Have they ever complained? No.
539. Do you think they are doing as well now as formerly? I have no reason to think otherwise. I never heard anything to the contrary.
540. Are the private wharfs at Darling Harbour at the present time equal to the Darling Harbour trade? I know that some of the steamers have not been able to berth there, because I have had to berth them.
541. You know that the intercolonial trade has increased greatly of late years? Yes.
542. Most of it goes down to Darling Harbour? Yes.
543. Is the trade which goes there growing faster than wharfage accommodation is provided for it? I think it is growing considerably. I have frequently had vessels from private wharfs berthing with me, on account of their having no room.
544. You think the wharfs are barely equal, then, to the accommodation of the existing trade? Barely.
545. Have the owners a tenure of wharf right sufficient to justify them in spending money in improvements? They have leases from the Lands Department.
546. On a day like Saturday, when there are a great many steamers going away to intercolonial ports, the traffic in the streets leading down to the wharfs is frightfully congested? Yes.
547. Has it not struck you that the facilities for intercolonial trade in that part of the city are rather behind the times? They are just about as bad as they can be.
548. Then if things are as bad as they can be, they cannot be up to date? No.
549. On the whole then, you say that the private wharfs at Darling Harbour are not equal to the present demand? No.
550. Where else can the trade go? It will have to go somewhere else; they cannot make more room there.
551. They want to be handy to the stores in Sussex-street and Market-street? Nevertheless the trade will have to go somewhere else.
552. You think the present intercolonial trade is outgrowing the accommodation on the eastern side of Darling Harbour? Yes.
553. Which is the nearest place to which the trade can go? Somewhere up Rozelle Bay, I should think.
554. Is there sufficient depth of water above the bridge there? Sufficient water can be made. That is what I have had in my mind for some years. The cartage from Blackwattle Bay to five municipalities would be 3d. less per ton than it is from Sussex-street.
555. Suppose you made a good wharf at Blackwattle Bay, and allowed the intercolonial steamers to come there, would the cartage to the city be much more than from Darling Harbour? No.

- J. Jackson.
16 Dec., 1899.
556. It would have to go a greater distance? It would be nearer to Redfern, Darlington, Newtown, The Glebe, Annandale, and Balmain.
557. In the case of the steamers which unload on the eastern side of Darling Harbour, is a great quantity of their cargo sent direct to the railway station? No.
558. It would be mostly goods going to stores in town? Yes.
559. Then if you sent the ships to Blackwattle Bay there would be a much greater distance for cartage? They would have to erect stores there; they would come in time.
560. There is no room for stores there, because the park is on the other side of the road? There is plenty of land available there, I think.
561. There are private wharfs on both sides of Blackwattle Bay? On the Pymont side, but not on the Glebe side.
562. There is the Auckland Timber Company's wharf? Yes.
563. Speaking of the distance from the different wharfs, do you find that the cartage down to Woolloomooloo Bay is very much more expensive in the case of steamers loading there than down to Circular Quay? It is the same.
564. Do you mean to say that a man would take goods from York-street to Woolloomooloo Bay for the same price that he would take them down to Circular Quay? Yes.
565. Would he take them to Glebe Island for the same price? I think so.
566. So that having found out that the distance to Woolloomooloo Bay does not increase the cost of cartage, you are inclined to think that the distance to Glebe Island will not increase the cost of cartage either? I do not think it will.
567. We shall not be making the wharf in an out-of-the-way place in making it there? No; of course there will be good roads and bridges to cross. There is great detention on the present old bridge.
568. There will be no steep grading? No.
569. Because the gradient from Pymont Bridge is comparatively easy, and there is no stiff gradient on the rest of the road? Quite so.
570. There is nothing like the gradient which you meet coming up Market-street? No; I do not think there will be any difference in the cartage.
571. Pulling a load up Market-street is equal to double the distance on a level road? They have a trace-horse there to pull the loads up the hill.
572. But a carter would be willing, you think, to go twice the distance on a level road for the same rate? Yes. He would, of course, prefer a level road even though it was a much greater distance, because it would save the trace-horse.
573. You think the trade to be accommodated at Glebe Island is a trade of the future, and not of the present? Yes.
574. And that when Darling Island wharfs are completed people will still be crying out for Glebe Island wharfs to accommodate ships? Yes; in course of time.
575. You expect that a trade will grow up in the future to fill the wharfs there? Yes; trade must go up the harbour. It cannot go down.
576. Is there a railway at present to Glebe Island? No.
577. You think it desirable for wharfage purposes that a railway should be made? I think that in time it would be necessary.
578. Because you will have one Government wharf with good railway accommodation, and another equally good Government wharf without railway accommodation? Yes. A railway will unquestionably be necessary in course of time.
579. Even without a railway, do you think you will be able to let the frontages two years from the time Darling Island wharfs are completed? Yes.
580. At the present moment you say that you have more demand than you can supply? At present, yes.
581. How much demand is there which you cannot meet, and what is its character? It is difficult to say exactly, because I may have every berth full one week, and half of them may be empty the next week.
582. Still you say you are being pressed—by whom? Houlder Brothers have asked for a wharf, and Birt & Co.
583. They are both regular lines? Yes.
584. Then you want two wharfs for regular liners? Yes; a third is the San Francisco line.
585. Will that accommodation still be wanted when you have completed the wharfs at Woolloomooloo Bay? No, I do not think so; because if the White Star line does not take two berths on the eastern side, there will be one berth there. The new berth on the western side of the Domain will make another.
586. That will provide two wharfs out of the three for which you have been asked, with a little extra expenditure? Yes.
587. So that of the existing demand not supplied you can meet two-thirds within the next eighteen months? Yes.
588. At no great expenditure? At no great expenditure.
589. Then you have only one company to provide for? Yes.
590. You see your way to meet the present demand pretty easily? Yes; but what will it be in the near future.
591. You first say that you need new wharfs because you are over-pressed for room, and the wharfs at Glebe Island are recommended to meet the demand; but you now say that you could meet two-thirds of your present demand at Woolloomooloo Bay alone within eighteen months' time? Yes.
592. That would be a cheaper job than the job at Glebe Island? Yes; but in ten years' time we shall be badly in want of accommodation.
593. You might utilise the Norddeutscher Lloyd's if you turned them out? Yes.
594. It is the great bulk of their vessels which constitutes the inconvenience? Yes; it is very difficult to deal with them.
595. If the E. & A. Co. had that wharf there would not be so much inconvenience? No; but the other berth to the north of the Norddeutscher Lloyd berth is not large enough for these great boats.
596. Your present immediate trouble is to find a new berth for the Norddeutscher Lloyd's steamers? Yes.
597. But you could do that at Woolloomooloo Bay by making other wharfs? If they would go there. The question is whether they would, unless some other line of steamers went there first.

598. The American line has been there? Yes.

599. They now go to private wharfs? They did, up to about twelve months ago. The "Mariposa" and the "Alameda" come to Circular Quay and take their chance of a berth. If they cannot get a berth they go somewhere else. J. Jackson.
16 Dec., 1899.

600. Does any steamer have to lie at anchor at Neutral Bay the whole of the time she is here, without getting a berth? No.

601. You always manage to find a berth somewhere? Yes.

602. With the two new wharfs at Woolloomooloo Bay the steamers will be much better accommodated than they are now? Yes; but it is absolutely necessary that we should have one or two extra berths to accommodate outside vessels.

603. You propose in future to have continuous wharfs? Yes.

604. *Mr. Levien.*] I suppose a good deal of delay is occasioned by sailing vessels;—it does not arise from the steamers? I do not think there is any delay now. Very few sailing vessels berth at the public wharf.

605. Once a wharf becomes vacant a ship goes in; but in the case of sailing vessels there is an uncertainty of arrival, and this occasions delay? Yes; we always know when a steamer is coming in, and the berth is ready for her.

606. *Chairman.*] You wish to hand in some plans? Yes; some plans showing the length of the various wharfs which are located at Circular Quay and Woolloomooloo Bay; also a statement of the revenue received at the various public wharfs for the year 1898.

607. *Mr. Shepherd.*] What effect do you think Federation is likely to have upon the shipping of the port? I think it will increase the shipping business in Sydney very much. Nothing can possibly keep shipping out of this port.

Thomas Forster Knox, Chairman, Wharf Association, Sydney, sworn, and examined:—

608. *Mr. Watson.*] You are Chairman of the Wharf Association and Managing Director of the Sydney branch of Dalgety & Co., Limited? Yes. T. F. Knox.
16 Dec., 1899.

609. Is the Wharf Association a body of men who merely use the wharfs, or is it a body of men who own them? It is an association of wharf proprietors. Some of them lease the wharfs from other private individuals; but they are either wharf-owners or lessees.

610. I believe that, in addition to being lessees of private wharfs, your firm also leases wharfs from the Government? We have at present the offer of a wharf at Woolloomooloo Bay.

611. At present you have no connection with the Government wharfs? Yes; we discharged two of the White Star steamers there, and we have an offer open from the Government for a few months.

612. The Wharf Association have nothing to do with that—that is purely Dalgety & Co.'s business? Yes.

613. You are acquainted with the proposal before the Committee to construct wharfs at Glebe Island;—it is at present suggested that only the north-east portion of the scheme should be gone on with—the portion on the right of the bridge, beginning at the bridge and going right round to White Bay, with the idea subsequently, if necessary, of extending the wharfs from the bridge towards the head of Rozelle Bay;—will you favour the Committee with your opinion of that proposal? Is it with the object of providing for import or export trade.

614. The idea, so we are informed by the Department, is that the accommodation will be used principally for the import trade;—the usual wharf appurtenances, in the shape of sheds, will, of course, be erected? I do not think that any further wharf accommodation is necessary. My reason for saying that is that the Government contemplate extending the present wharfs at Woolloomooloo Bay on the eastern side by 200 feet. That would give two large berths.

615. In addition to what is now available? Yes. One of the berths is now in the occupation of the White Star line, and if the Government require another berth for another large line of steamers they could utilise the other one.

616. That would be the berth further north? Yes. Probably the White Star line will have the northern berth because the Government have made a stipulation in their offer to us that we have to take the northern berth, as they contemplate making the addition.

617. I presume the reason why they wish the White Star line to take the northern berth is that the water there could be made deeper with less trouble? They will make it all to 32 feet. On the opposite side of the bay it is proposed to erect further wharfage accommodation to the extent of 600 feet. In addition to that, all the Darling Island wharfs are empty at the present time. They are not all completed, but they are all unoccupied, and with that vast amount of wharfage accommodation unoccupied and the fact that at the present time, except in the case of very large steamers, the private wharf accommodation is very much in excess of requirements, I cannot see for what purpose the Government require further wharfage accommodation. I do not know how they are going to utilise it.

618. The private wharfs which are not fully occupied at the present time would be suitable for the larger class of vessels? The private wharfs certainly have not full occupation at the present time. As to the class of vessels to be accommodated, I was referring mainly to the deep-sea vessels. I cannot tell you very much about the intercolonial trade.

619. Confining yourself to wharfs for deep-sea vessels, when you say that private wharfs are not fully occupied, do you mean all the year round, or during the busy season;—there is a busy season, I imagine, for the wharfs; at other times do you think there is any lack of accommodation? I can only remember one instance of the Wharf Association not being able to accommodate a steamer—that is, within the last few years.

620. Allowing that there has been one instance, is it possible for the private owners to increase their accommodation for such a vessel? Yes.

621. In what way? Smith's wharf at Miller's Point is a broadside wharf of about 900 feet. It adjoins the Washington wharf, which has a further length of 300 feet. There would, therefore, be 1,200 feet available at Miller's Point alone.

622. Is not that wharfage at present occupied? It is occupied by other vessels which could be sent elsewhere. If a wharf were put there like the Government wharfs, I consider that it would be one of the best sites in Sydney.

623. Is the getaway convenient? It is as convenient as that of any of the wharfs excepting, of course, the Circular Quay.

- T. F. Knox. 624. Would it be as convenient as the Woolloomooloo Bay wharf? Much more convenient to the bonds and to town work on account of its proximity. The hill is a little bit steep; but I have never heard any complaint on that score. I would just as soon berth a steamer there as I would at Circular Quay or Woolloomooloo Bay. As a matter of fact, we berth at Smith's wharf all the George Thompson line; they are vessels 420 feet long.
- 16 Dec., 1899. 625. If you wanted to bring larger boats there you would have to take the Aberdeen line somewhere else? There would be room both for the Aberdeen line and for the White Star line at Smith's wharf if we were the lessees. If I were in the position of Smith's trustees, I should build a 900-foot wharf there. It is the only broadside wharf now in the possession of private owners.
626. As a general rule, would it pay private owners to make broadside berths, having regard to the frontage they have to acquire to enable that to be done? It would pay them certainly if they had the connection. It would certainly pay a firm like Dalgety & Co.
627. Why is it, if there is room for the two White Star lines at Smith's wharf, that it is now proposed to take a berth for the "Medic" and the "Afric," and boats of that class, at Woolloomooloo Bay? Because I could not come to terms with the Perpetual Trustee Company, who are the late Mr. Smith's trustees. I do not anticipate coming to terms with them. At the same time, I look upon Smith's wharf as the best wharf in the harbour.
628. If the White Star line could be accommodated there, I presume the Norddeutscher line could also be accommodated? Yes.
629. There would be room enough? Yes, with alterations to the wharf. The wharf is out of date, and needs improvement.
630. You think that if there were willingness on the part of the private owners to give the necessary appliances, accommodation could be found there for very large vessels? Yes. As an example of increased accommodation, you may take Parbury's expenditure recently in the provision of a lift to take cargo up to the street-level.
631. It is stated that a large proportion of privately-owned wharfs, being jetties, cannot give accommodation for quick despatch of large cargo boats;—that, it is stated, can best be done by the broadside wharfs the Government have lately been constructing? A broadside wharf certainly offers better facilities than a jetty, for the discharge of cargo; but I think the jetties are quite good enough for all the cargoes we have here. If you go down to Dibbs' wharf any day you will see American cargo being turned out at the jetties, and we have heard very few complaints. I have always had a preference for broadside berths for despatch; but it can also be given at a jetty. We have discharged on one side of a jetty and loaded the ship on the other side at the same time, without any difficulty whatever.
632. What would be the width of the jetty you are referring to? About 350 feet long by an average of 50 feet in width.
633. Can you get waggons and drays on to the jetties when the cargo is there? Yes.
634. Even although the cargo be placed on the jetty, it is wide enough to allow the traffic to and fro? Yes.
635. With the increase of late years in the size of vessels, I should think that even a small delay would be a matter of moment to the owners and other persons concerned? It depends very much upon whether the vessel simply comes to discharge cargo or to discharge and load as well. If she comes to discharge cargo and load, you can do as we did in the case of the "Afric" and "Medic." You can do a certain amount of loading at the same time, as well as taking in coal. A vessel like the "Medic" requires 4,000 tons of coal. We put that in on one side, and take out the cargo on the other.
636. Vessels belonging to regular lines which have stated times of departure are not in such necessity as to speed? No. In addition to taking in coal and cargo there is a certain amount of work to be done at the terminal port. The engines, for example, have to be overhauled, and there has never been any complaint, to my knowledge, as an agent, of want of despatch. If there be any complaint it ought to be against the agent, but we have had no difficulty in giving despatch.
637. How do you regard the general tendency of over-sea trade at the present time;—is it going to be more in the direction of large vessels? I think trading vessels have reached a size which is not likely to be exceeded.
638. When you say that, you refer to large vessels such as those of the White Star line? Yes; my reason for saying that is that you cannot build any vessel for Sydney alone. In order to make a vessel to advantage you want to provide for her going to Melbourne and other ports. In the case of Melbourne a vessel cannot go out drawing more than 27 ft. 6 in., and the same applies to Adelaide. So that it is no use exceeding the present size unless you want to build a vessel for Sydney only, and that would not answer.
639. You hardly think the trade of Sydney would be sufficient to induce the vessels to come here loaded for this port alone? No, I do not think so, although I should like to see it very much. It is a great pity we cannot bring all the cargo round, as we do in the case of Queensland.
640. You mean by intercolonial vessels transhipping it into larger ones? Yes.
641. Do you think that is economy as compared with the system of vessels calling in? Occasionally.
642. *Chairman.*] Big vessels cannot go up to Brisbane? They cannot go up to Brisbane, but they can go to Pinkenba wharf.
643. *Mr. Watson.*] You do not think the present size of vessels is likely to be exceeded? No.
644. Would that involve the doing away with smaller vessels in favour of vessels similar to those of the White Star line for cargo purposes? I do not think so, because there is a certain amount of work which these big boats are not fit for. For instance, you could not put on one of these big boats to go with a coal cargo to the coast of America, or anything of that kind. They are too large carriers. I think the smaller carriers will exist as well as the larger ones, just the same as the smaller ships of other classes are still running against the larger ones. If you sold a cargo of wheat the quantity a White Star boat could carry would be in excess of the requirements of a certain port.
645. Has there not been a tendency lately to develop over-sea shipping more or less into regular liners in preference to the old system of carrying cargo by tramping? I do not remember any line which has come here lately except the White Star line.
646. Is not the Federal line a new one? Yes, that is another.
647. They seem to have got together a number of vessels, and made regular liners of them, whereas previously the same vessels were tramping? Yes.

648. Do you think there is any advantage in having the regular liners as against tramps; suppose there were an economy in the carrying of cargo, there would be an economy all round with shippers and ship-owners;—would the tramp ship have the same chance of gathering in cargo from different holders as would steamers coming regularly? I could not say; I think it is a benefit to have both. T. F. Knox.
16 Dec., 1899.
649. It seems that a large proportion of the wharf space now available is quite suitable for sailing vessels, or for a small class of steamers? Quite.
650. Do you think sailing vessels will continue in the same proportion as exists now, having regard to the total tonnage? I think that for general cargo sailing vessels will have to give way, but for carrying whole cargoes of wheat or coal sailing vessels will continue.
651. Is that because it is wise sometimes to alter the destination of a special cargo of export goods? There is a good deal of wheat from the other colonies sold for orders which are given in the channel.
652. The vessel is told to await at a certain place orders for her eventual destination? Yes.
653. The eventual destination depending upon the place for which the wheat is sold? Yes.
654. It would not be so easy to arrange for the disposition of a large quantity in one cargo? If a sailing vessel or steamer take a cargo of one commodity she can be diverted, but if either class of vessels take a mixed cargo she sails for a fixed destination.
655. So that it seems likely that any export trade we do will to a large extent continue to be done by sailing vessels and by a small class of steamers? Yes.
656. That would apply, then, to what we are informed Darling Harbour and Pymont wharfs are at present intended for—the export of wheat, and, possibly later on, the export of wool? I should like to say, as regards the export of wool, that that will be controlled largely by the position of the stores. Most of the stores are on this side.
657. And at Circular Quay? Yes. I do not quite see how the Government are going to shift the whole of the export business to Darling Island—at all events, in the near future. I understand that they speak of leasing off the land for the building of warehouses, with the object of shipping wool direct from there. A great proportion of wool is now sold in the Colony, compared with what used to be shipped to England for sale; so that for many years to come I do not think Darling Island is likely to be utilised largely for wool export.
658. Even in the case of wool which is to be shipped to England for sale, there is the dumping to be done? Yes. They will have to have dumping appliances at Darling Island; in fact, the whole of the shipping business will have to be shifted there.
659. It has been stated by the Manager of Public Wharfs that he thought there would be a saving in the cost of handling by the transference of the wool traffic generally to Darling Island, and that this would be sufficient to induce the different companies and firms to transfer their business from Circular Quay to Darling Island; do you think this saving will be sufficient to induce them to give up their present warehouses? No; the reason being that the Railway Commissioners now deliver the wool, whether to Pymont, Circular Quay, or Miller's Point, free. It costs the Railway Commissioners about 3d. a bale to deliver. A saving of 3d. will be effected by the Commissioners.
660. You do not think there would be a saving sufficient to counterbalance the removal of the business over there and the practical abandonment of the existing warehouses and stores? I do not think so. I myself do not see any inducement held out to persons to go there. Of course, it would be the better for Sydney generally if the traffic were not interfered with so largely as it is by the wool drays; but you cannot transfer a trade like the wool trade from Circular Quay to Darling Island in a day.
661. Do you think it is likely that the wool traffic, speaking broadly, will increase very largely in the Colony, bearing in mind that the extension of the railway system and the opening up of new districts have brought a great deal of land under cultivation for wheat? I do not anticipate any large increase in wool production for many years to come.
662. You do not think it will increase beyond the point at which it stood prior to the drought? No. We had 60,000,000 sheep then; the number is now reduced to something over 30,000,000.
663. The clip of the largest number of sheep we had—over 60,000,000—was dealt with pretty easily, some from Circular Quay and the other portion at existing wharfs? It was dealt with without any difficulty, as far as shipping was concerned.
664. I take it, then, that in your opinion it is not likely that we shall have to face any great difficulty with regard to the shipping of wool? I am sure we shall not. There are sufficient warehouses and facilities at the present time for berthing a great many more steamers than would be necessary to carry away double the present production of wool.
665. That would be more than the clip of the 60,000,000 sheep a few years back amounted to? Yes; because the sheep cut better now than they used to. There has been an improvement in the class of sheep. What I meant to convey is that you will find any quantity of wharfage available for a great many years to come. I do not anticipate that our imports will increase very largely, in view of the probabilities of duties being put on, and the increased production in the country. I do not see any prospect of a great increase in our imports.
666. There will, you think, be a proportional decrease in the imports following upon the adoption of Federal Customs duties? Yes.
667. You do not think it is likely we shall continue the increase in tonnage which has been noted during the last four or five years? Not in the tonnage coming to take produce away.
668. We can assume roughly, that as our exports have not materially increased during that period, owing to drought and one thing and another, the larger proportion of the increased tonnage is due to increased imports? I could not say whether or not that is the case. I do not know what the imports are.
669. The only alternative to that assumption would be that the owners were running a great deal of tonnage without income? You must bear in mind that steamers which go away from here do not carry a full cargo from Sydney. They take a certain proportion from Sydney, and more cargo is taken in at Melbourne and Adelaide.
670. But any material increase in tonnage coming here would probably point to an increase in the amount of business done, or in the cargo carried? I do not think it is a reliable guide. I do not think you should take the tonnage of steamers as a guide to imports, or you would get astray. Take the "Medic," a steamer of 12,500 tons; she brought only 1,800 tons of cargo to Sydney, and she will appear in the tonnage list as adding 12,500 tons.

- T. F. Knox. 671. But it cannot pay to run such large vessels with a small cargo like that? A certain proportion of the cargo, of course, would be landed at Melbourne and at Adelaide. Then the steamer carries 350 passengers, and looks to having a full cargo for Home.
- 16 Dec., 1899. 672. With a new line it is quite conceivable that for the first few trips, before trade got into a different groove, there would be comparatively a small cargo? Yes. What I say is more with a view to show that the tonnage coming to the port is no guide as to imports.
673. Putting aside wool, and coming to the export of wheat, I think you have already indicated that a great proportion of the wheat export, assuming that we have any great quantity of wheat to send away, will be done by means of sailing vessels? Yes; or moderate-sized steamers.
674. In either of these alternatives you would not require very large wharfs? No. I cannot see that for the export of wheat we should require any more wharfs, excepting perhaps those at Darling Island.
675. Where there is railway communication? Yes; and you must remember that that wheat export goes only for a few months. I daresay it is all concentrated in a couple of months.
676. It is estimated that the wheat yield this year will be approximately 14,000,000 bushels, and that, it is said, will give an exportable surplus of about 90,000 tons of wheat—about 3,000,000 bushels;—do you think there would be any difficulty in dealing with that quantity at the present time by means of the Darling Island and Pymont Railway wharfs? There would be no difficulty in dealing with it.
677. How would you deal with it at private wharfs? If the Railway Commissioners would give facilities to put the wheat into lighters where the railway meets the water at Darling Island, it could be lightered away to the ships at a cost of between 1s. and 2s. per ton. I think that would be preferable to carrying the wheat by dray through the city as wool is carried now. I see no difficulty in coping with 90,000 tons. That would all be removed by lighter from the place where the railway touches the water.
678. It would be taken to regular steamers lying at other wharfs? Yes; or to sailing vessels lying at other wharfs.
679. On the south-east side the wharf is completed, and the railway line goes along for some distance? There is no reason, then, why steamers or ships taking a full cargo of wheat should not berth there.
680. And load direct from the railway trucks? Yes; but if a steamer were taking in a mixed cargo, as is done in the case of the White Star boats, we should prefer to bring the wheat round by lighter to taking the ships round there. It is a big thing to move a 550-foot ship.
681. I suppose that wheat would be a desirable cargo to some extent for stiffening purposes? Yes.
682. So that the big ships would compete for a part cargo of wheat to some extent with the ships that take wheat alone, although the wheat might have to be lightered? Yes; it is a question whether it would be cheaper to take the ships to the wheat, or bring the wheat to the ships.
683. You think that in the case of larger vessels, it would be cheaper to bring the wheat to the ship? Yes; because we can go on loading other classes of cargo at the same time.
684. Assuming that there is something like a proportionate increase in the production of wheat continued for the next five years, compared with that which has taken place during the past five years, practically doubling the production, that would leave us a much larger quantity of wheat available for export? Yes; at that rate you would have far more than 90,000 tons.
685. Do you think it would be possible to deal with that quantity of wheat from the wharfs being erected at Pymont and Darling Island? Certainly.
686. You are of opinion that the provision now being made there is sufficient to meet any probable increase in our export trade for the next five or six years? It would be far in excess of requirements for the next five or six years. With prompt delivery out of the trucks, and by means of lightering, you can shift any cargo cheaper than by dray, and wheat would not have to go into warehouses as would wool. Wool has to go there to be inspected. If you are going to put wool up for sale, you must take it to a warehouse to give buyers an opportunity to inspect it. Wheat could be sampled in trucks.
687. It does not need to be opened for sampling purposes? No. At Lyttleton, New Zealand, I have seen the wheat run right down to the ship's side. It is sampled there, and anything bad is rejected.
688. Wool would require to be dealt with in a warehouse before it was shipped; wheat does not require the same kind of treatment, and can be sent direct to the vessel's hold? There is a growing tendency on the part of growers in favour of selling wool in the colonies as against shipping it to England. I cannot myself see how you are going to divert the business which has been spoken of to Darling Island. I do not see how the wool business is going to be taken over there.
689. Arrangements could be made to take it there but for the vested interests already at Circular Quay? I think that Darling Island in future might be turned to better account if there is going to be a large wheat production such as you indicate. Darling Island would be much better suited to that export than for the handling of wool. It would be desirable to get the wool out of the streets. There is no doubt about that. Wincombe, Carson, & Co. and Goldsbrough, Mort already have stores at Pymont.
690. Leaving out of account altogether the question whether additional wharfs are necessary, do you think Glebe Island would be a sufficiently convenient place? I think consignees would prefer the delivery of their cargoes on wharfs at Darling Island, Circular Quay, or Woolloomooloo Bay. A ship discharging cargo at Glebe Island would be at a disadvantage.
691. To what extent? To this extent: there would be more expensive cartage to town, and the consignee, if he had the goods dumped down there once, would not have them put there a second time. He would not ship by any vessel going there.
692. Because of the extra expense? Yes.
693. At present all the wharfage charges are made to the consignee? Yes. The wharfage of goods is charged to the importer or exporter, as the case may be.
694. In the case of imports, the consignee has charged on to him wharfage dues? Yes.
695. And he also would have to pay the carriage of goods from Glebe Island, for example, to his store or warehouse at Sydney? Yes.
696. Do you think that pretty well all the goods would be brought to Sydney for opening up and inspection? What else could you do with them. A small quantity, perhaps, might go away direct to the country, but the main portion would come into town for distribution.
697. Is there not among large country houses an increasing tendency to indent goods direct to themselves? Yes; but the facilities are now greater for getting goods out, and consequently men do not lay in the stocks they used to lay in. They are now continually replenishing stock.

698. That would not affect the proportion indented direct to country houses and taken directly from the ship to the railway? My experience is that a very small proportion of the goods which come here goes direct to the railway. A very large proportion goes into the stores in Sydney.
699. What do you think would be the additional cost of conveyance of goods from Glebe Island as compared with Woolloomooloo Bay;—assuming that goods had to be taken to any of the houses in York-street, what would be the difference, speaking roughly? It would be only a certain class of goods which would go to York-street. A great many of the other goods go to Miller's Point or Circular Quay.
700. Could you give us an approximate idea of the difference in the cost as regards any one class of goods? No; but I daresay I could get you the information.
701. Do you know whether, at the present time, carrying companies make any distinction in the charge for bringing goods from Circular Quay as against Woolloomooloo Bay? I do not think they do. We have had no complaints whatever in the case of the "Medic" and the "Afric."
702. It would appear that the carriers take a broad zone view of the matter? Yes. Some time ago I think there was a different rate for the carriage of wool from some of the warehouses to Circular Quay and Woolloomooloo Bay, but I do not think there is any extra charge now.
703. Leaving wool out of the question, and taking import goods, can you say whether the carriers make any distinction in their charges for the conveyance of goods to York-street from Circular Quay and Woolloomooloo Bay? I do not think so at the present time. The charge would probably be greater from Glebe Island, because the bulk of the goods are warehoused about Circular Quay, Dawes' Point, and Miller's Point. You would have to add the distance from Market-street to those places.
704. Suppose the Federal Government imposed pretty heavy Customs duties, would there not be a large increase in bonded stores? No. We have more bonded stores now than are necessary. The thing was overdone a few years ago. We are about one of the largest lessees of bonded stores. For a great many years to come the stores will be able to accommodate everything that comes.
705. But with a large increase in the tariff the amount of goods bonded will be much larger than as at the present time? When we had the 10 per cent. *ad valorem* duties the bonds were never full; they were never filled to overflowing. Since then, in the boom times, more bonded stores have been built.
706. You think there will be enough to cover contingencies? Yes.
707. I thought it possible, with such an increase in the traffic as seems likely, bonds would be erected round about Woolloomooloo Bay, perhaps? It is very unremunerative work now; there is no money in it. Anyone who puts up stores for that purpose finds a difficulty in getting an adequate rent.
708. I take it that the tenor of your evidence is that there is very little probability in the first place of the increased wharfage proposed being required for many years to come? I cannot foresee any use for it.
709. You think, secondly, that if increased wharfage to that extent were necessary, within a few years Glebe Island would not be a very convenient place? I think it is not a convenient place compared with the other places we have available. Darling Island and Pymont are more convenient. Why could not the coal be taken to Darling Island, and shipped from there instead of utilising the wharfs at Pymont.
710. In that case the wharfs from the bridge down to the northern end of the Pymont wharf could be utilised for general purposes? Yes.
711. The coal trade being transferred to Darling Island? Yes; they will not have anything to occupy Darling Island for a great many years to come.
712. *Dr. Garran.*] Would you utilise the space by putting up more jetties or by making a straight wharf? I should put up more jetties. Having regard to the large area of land, I think that more might be made of the island if there were jetties. I do not think the most has been made of it. Echelon jetties might, I think, be constructed.
713. *Mr. Watson.*] If you put out jetties from Darling Island proper, on the south-east side, you might then spoil the frontage between Pymont wharf and Darling Island? If it were private property I am quite satisfied it would not be kept in its present position. I refer, of course, to Darling Island.
714. You think that greater provision in the way of jetties might be a better means of meeting any need for increased wharfage accommodation than going as far as Glebe Island? Most decidedly. Jetties for the purposes of export are every bit as good as broadside wharfs.
715. Especially for wheat export? Yes; the present arrangement is a waste of good room. No private individual would dream of using Darling Island as it has been used.
716. You think it is a waste of opportunity to use broadside wharfs for coal and wheat exports? Yes. I could not give you an idea from the map how many jetties could be put out. Only yesterday the question of a jetty at Woolloomooloo Bay was raised; but it is impossible to have it there, because the steamers have only one or two hundred feet to spare, turning in that bay. If the Committee desired evidence on that point, it might be obtained from Captain Pettit.
717. It was suggested yesterday that it was hardly necessary for a vessel to turn if she were taken in stern first? The Harbour-master could give you an opinion on that point; but I think it would be a difficult thing in Woolloomooloo Bay to bring a large vessel out stern first or to take her in stern first.
718. Coming to the general question again, do you think that in your estimate of what is necessary for the shipping of the port you have paid sufficient attention to future requirements? I think so.
719. I might point out that when some years ago this Committee was inquiring into a proposal to extend the wharfage accommodation of Woolloomooloo Bay, the Wharf Association took up an antagonistic attitude, and said they did not think the accommodation was necessary, pointing to the fact that they were able to deal with the trade; but since then a very considerable addition has been made to the accommodation at Woolloomooloo Bay, and the accommodation seems to be taken advantage of as soon as it has been provided? Private enterprise has simply been blocked by the interference of the Government. I am quite sure of this: that but for the money which has been expended at Woolloomooloo Bay, and the fear which wharf proprietors had of coming into competition with the Government, they would have spent much more money upon their own wharfs, and with the result that they would still have been equal to all requirements. We could do without Woolloomooloo Bay if there were sufficient inducement to improve existing wharfs.
720. The Government, I understand, have not undercut the Wharf Association by charging a lower tonnage rate than you do? No; the Government charge is in accordance with the Act; they can only make one charge.
721. It is open to private owners to allow a rebate? Some of them below the bridge do so. It was done, I think, in the case of McIlwraith's wharf.

T. F. Knox.
16 Dec., 1899.

T. F. Knox.
16 Dec., 1899.

722. The Government do not give any? No.

723. So that in some cases the private owners are charging less than the Government are charging in the way of wharfage dues? Yes; but the Wharf Association is not.

724. I should like you to point out what disadvantage the private owners are under as compared with the Government; leaving Circular Quay out of account, private owners generally have the best site? One disadvantage is that they can get a lease only for a limited term for the right to put out a jetty.

725. What is the limit? The last lease which came under my notice was for seven years. It is left for the Land Board in Sydney to decide. Two of our leases are falling in now. I think they were for fourteen years. The Board are trying gradually to reduce the terms. During the time you have the lease the Government have the right to remove the whole of your improvements,—the property is only held on sufferance. You may have the land right down to the water; but in order to make use of the water you have to go to the Government to get a lease which first of all must have the recommendation of a Government official. Then you have to go before the Land Board with an application to erect a jetty of 300 or 400 feet. In the case of Parbury's wharf they made an application, I believe, for 350 feet.

726. That is an incomplete jetty? Yes; they have now made application for another 100 feet to the same jetty. They may be told by the Government that it is beyond the limit line. Of course if jetties go out to any great length they block one another. You can see how private enterprise has been blocked.

727. Chiefly by short tenure? Partly by short tenure, and partly from the fact that the Government can take the property at any time. If the Government resumed the foreshore they might claim to abolish the wharfs without compensation. They probably would be liberal; but if they wanted the land for, say, a railway, they would probably take all the private wharfs without compensation. The Government have a white elephant in the shape of a freezing-house over at Darling Island. We were going to put up in one of our stores freezing appliances for shipping; but we were afraid to do it, because there was talk of the Government doing the same thing. If Woolloomooloo Bay had been left as it was we should have been going along just as happily as ever—that is if reasonable tenure had been given to wharf-owners, and they had been allowed to extend their jetties a fair distance.

728. With regard to increasing the tenure, you have to consider whether the public interests, speaking generally outside of shipping matters, might not be against it on account of the necessary resumption for railway purposes? I was merely explaining the reason why the present wharf-owners have not done more than they have done.

729. But assuming it to be impolitic to give very long tenure of frontage rights, then the disability under which private wharf-owners would suffer would continue, and thus deter them from making increased wharfage accommodation should it be necessary? I think there would be that tendency.

730. That being so, the Government would not only be justified, but would be called upon to make the necessary provision themselves? If it were necessary; but it is not necessary at the present time, nor will it be for a long time to come. With the new accommodation contemplated at Woolloomooloo Bay there will be plenty of accommodation. I saw it stated that 900 feet had been let to the White Star line. That was an error. Only room for a 550-foot ship has been provided for us.

731. You heard the evidence of Captain Jackson yesterday;—is there any point which has not been touched upon to which you would like to refer? I should like to mention one thing. Mr. Darley, in his estimate of the cost, does not appear to me to have looked at the matter from a business point of view. He has not taken into calculation the value of the land. I think that whatever proportion of the reclaimed land is used ought to be considered part of the capital.

732. He took as the value the cost of making it? Yes; but he could sell the land again.

733. Could he sell it for more than it would cost to reclaim it? The Government have reclaimed the land, and unless they put it up for sale they could sell it to the other wharf-owners and people in business. I think they have a right to take that fact into consideration.

734. What they are doing now is practically to debit the wharfs with the cost of making the land which the wharfs are to utilise; what you say is that the Government should debit the value of the land when reclaimed against the whole scheme; but suppose the value of the land when reclaimed is greater than the cost of making it;—do you think it would be so? Yes, I think it would be very much greater.

735. It is estimated that the cost of the reclamation and filling works would be £125,000;—do you think the value of the additional land made on the island would amount to that? I do, for wharfage purposes—that is, in the future, with railway communication.

736. Do you think that in the distant future with railway connection it would pay private owners to take up the land for private purposes? Not for import purposes; but if your idea of wheat-growing comes off it might pay then. I should be sorry to take the land for a great many years to come. Mr. Darley says that the Darling Island wharfs, or rather one side of them, will be ready in two or three months' time. If Glebe Island is a suitable place for dumping down imported goods, why should not Darling Island be more suitable as having a railway, and being slightly nearer the city? If the Government want berths for import ships, why not put berths at Darling Island? It cannot be used for export purposes for many years to come, and in the meantime I cannot see why it could not be used for import purposes.

737. *Chairman.*] There is one point upon which I should like you to give us information; when Mr. Benson was before the Committee in connection with the Woolloomooloo proposals, he gave us an estimate of the length of all the wharfs available in Sydney, the number of berths into which the wharfs could be divided, and the number of ships arriving, showing that, for the number of ships arriving, there was about three times the accommodation available; it was a very useful return, and it had a marked effect upon the Committee at the time? Yes; I think I gave evidence at the same time.

738. If you look at the return of that day, and the list of ships, you will see how remarkably the ships have increased in tonnage; a ship of 2,000 tons was regarded as a big ship then, now we have ships going up to 10,000 tons? I will look at that return, and will give you the information, as far as I can, as it applies to the present day.

739. *Dr. Garvan.*] Has the shipping and wharfage business of Sydney in the export and import business increased much during the past five years? I think more ships have come here, but I could not say whether they have lifted more inwards and outwards within the past five years.

740. Has the distributing business of the port increased during the past few years? That I could not say.

741. You cannot say whether the shipping business has been in any way influenced by the freetrade policy of the Colony? I could not; I am not a merchant. T. F. Knox.
742. As Federation will be accomplished within the next few years, Sydney will have no particular advantage over Melbourne;—do you think that that will lead possibly to a relative diminution of our shipping business as compared with that in Melbourne? I do not think our shipping business will be affected. It is to a great extent guided by our export business. 16 Dec., 1899.
743. And our position as a terminal port will be maintained? Yes; we have the coal, and we have the dock. It is a great advantage to steamers to come here and do their refitting.
744. When the Melbourne scheme of clearing out the Yarra is completed, will the advantages that port can offer be as great as ours? No. Ours must be the terminal port on account of the coal. It is of no use for steamers to lie idle doing nothing. A steamer here can take in coal and wool at the same time, or she can take in cargo from one side, and discharge cargo on the other. That is frequently done, both sides of the ship being worked.
745. Captain Jackson's opinion was much influenced by an increase in the demand for wharfage;—do you think there is any likelihood of that demand being kept up after Federation? I do not believe there will be an increased demand for wharfage. The Wharf Association could handle ships just as easily as they have done in the past, except, of course, steamers like some of the White Star boats.
746. But suppose the accommodation is short? I do not see how it can be short. The Government berths are all leased to different owners—the P. & O. Company, the Messageries, the Orient, the Nord-deutscher Lloyd, and so on.
747. Captain Jackson says that he is often short of accommodation, and that he takes advantage of a berth being empty to put another ship in immediately? That only happens occasionally. I do not see how he can be short of accommodation.
748. Do you think the progress of Port Jackson as a shipping port will be diminished within the next few years? I do not see how it can be otherwise; it will depend a great deal upon our exports. If we have good seasons we shall have plenty of wool; if the drought continues we shall have much less wool.
749. But there will always be a steady progressive trade? Yes.
750. *Mr. Shepherd.*] Do you consider the accommodation in Port Jackson adequate for the shipping? I consider it is more than adequate at the present time. I know of no instance of a ship that was not able to get a berth.
751. The Darling Island wharfs will be a considerable addition to the accommodation, and they have not yet been utilised? Quite so.
752. What is your opinion generally of the Glebe Island proposal? I think it is absolutely unnecessary. It would be far better to leave Glebe Island alone until we have railway communication and know for what purpose we are going to use the wharfs. We shall be building an immense number of wharfs without having any occupation for them.
753. There is a large frontage in the hands of private individuals, particularly from Dawes' Point to Miller's Point, round to the head of Darling Harbour? Yes.
754. Is the whole of that frontage utilised at the present time for wharfs and jetties? There is a dispute with reference to a frontage next to Moore's wharf. I think the Government have some claim upon it. There is another small piece between Dibbs' wharf and the Gas Company which is not utilised, and, with those exceptions, I think the whole of the frontage is utilised.
755. Chiefly by jetties? Wholly by jetties, with the exception of Washington wharf, and Smith's wharf, and the small piece upon which the Government have some claim.
756. What is the size of vessels, as a rule, that load at these jetties, more particularly between Dawes' Point and Miller's Point? At our own jetty we load all Thompson's steamers. They go up to 420 feet in length.
757. Is any inconvenience experienced? Not the slightest.
758. Neither in discharging nor in taking in cargo? No.
759. Are the vessels discharged as expeditiously as they would be at Circular Quay? Yes. The ships are discharged, and the cargo is taken away quite as expeditiously. The importers are in the habit of leaving cargo on the wharfs as long as you will allow them to do so. In the olden days, when there was a duty on everything, the cargo was run into stores by the Customs. Now there are so many things free with which the Customs do not interfere. Merchants will often leave iron on the wharf until they can effect a sale, and it is then taken away in driblets.
760. You say you prefer broadside wharfs to jetties? Yes; you can get rid of cargo more expeditiously, and can give greater satisfaction. That is, if the jetty is being used by two ships. I do not object to having a ship on only one side, but if a jetty is being used by two ships, and the discharge of cargo is at all careless, and is not made in a proper way, it is open to objection. For loading purposes, one is just as good as the other.
761. The advantage of a jetty is done away with to a certain extent, under the circumstances you mention? Yes; but if you have a property with only 120 feet frontage, it is necessary to put down a jetty in order to accommodate a ship.
762. It is simply an economy of space? Yes; you utilise the water.
763. For smaller-sized vessels, one kind of accommodation is just as convenient as the other? Yes; you could not call a 5,000-ton steamer, 420 feet in length, small, although it is small in comparison with the immense German boats and the White Star boats.
764. It would be rather inconvenient to utilise the North Shore for wharfage purposes? It would be absolutely useless, because there is no means of removing the goods to town.
765. So that we are practically confined to the south side of the harbour? I think so, for all time.
766. Are you aware of any unoccupied spaces convenient for wharfage purposes, which could be made available? Yes; but I should be very sorry to see them used. For instance, there is the western side of Woolloomooloo Bay and Farm Cove. I am sure we should all be sorry to see the Domain cut up. It was contemplated to take wharfs right up to Lady Macquarie's Chair. In addition to that, there are Dawes' Battery and the Artillery Barracks.
767. Has your Association ever found itself unable to accommodate vessels? For some years I remember only a couple of instances where we have had a large steamer, and have not had a berth available at the time. Sometimes if a big steamer arrives, when the wool season is on, it may be more advantageous to us to use the wharf for wool export, because there is a good harvest while the wool season is on. After that, we have a comparatively idle time for some months. 768.

- T. F. Knox. 768. Generally speaking, you are able to meet all requirements? Yes, excepting those of big steamers. We could not have taken the White Star boats, except at Smith's wharf.
- 16 Dec., 1899. 769. *Chairman.*] You seem to take some objection to the Government competition? I do not think so, although it has certainly had the effect of strangling enterprise in wharfs.
770. But, putting that aside, and also the short leases of wharfs, do you think that wharfs held by freeholders have been kept up to date, having regard to the increased size of the steamers coming to the port? Of course, the German steamers are provided for; they go to Circular Quay. But until the arrival of the White Star boats the wharfs were equal to the requirements of the port. It is my opinion that if any fair tenure could be given the wharfs would be built in a different way. But a man does not care about spending from £15,000 to £20,000 on a wharf, even if he leases for a fixed time of ten or fifteen years. The Government do renew the leases, but the rent is left entirely in the hands of the Land Board, and they may fix it at £500 a year if they like. That would be as good as confiscating the wharf.
771. I was referring more particularly to the old wharfs. They do not seem to me to be kept up to date? I think the public have been a little bit spoilt by the quality of the Government wharfs. They are really magnificent wharfs—better than is really necessary. If a private individual had been erecting wharfs at Woolloomooloo Bay he would have spent much less money there.
772. *Mr. Watson.*] We are told that they are a paying investment. The companies, apparently, appreciate them? I do not know if the Government have taken into consideration depreciation. If they were private wharfs we should write off 10 per cent. per annum. In order to go with the times you must make many improvements. A few years ago a low wharf was good enough, but the big steamers are a great height above the wharf, and every lift takes longer to get into the ship and to get out. The tendency now is to build wharfs much higher. All these things have to be considered, and are considered, when 8 per cent. or 10 per cent. is written off for depreciation.
773. *Chairman.*] Are we right in assuming that, with the exception of the "Afric," and the "Medic," and the German steamers, the private wharfs can accommodate the other ships which come here? With the exception of those berthed by the Government. I think the private wharfs could berth even the White Star boats. I would put the big steamers at Smith's wharf. I had one of the Shire boats there 500 feet in length. The difficulty is that we lease only portion of the wharf; the other portion is leased to Mr. Mailler. We were in negotiation, and if it had come out as we anticipated the steamers would have been left there for all time.
774. You have a general knowledge of the wharfage requirements of Sydney;—can you state whether there has been any general desire among shipowners for increased wharfage accommodation? I have not heard any dissatisfaction expressed. We have one of the largest lines—the George Thompson line—and they are perfectly satisfied; we never hear any complaint.
775. Their steamers never lie out in the stream for any inconvenient time? They have never done so.

MONDAY, 18 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The HON. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Thomas Forster Knox, Chairman, Wharf Association, Sydney, sworn, and further examined:—

- T. F. Knox. 776. *Dr. Garran.*] Do you produce a letter from Mr. W. R. Benson, manager to the Wharf Association, dated 18th December, giving a statement as to present wharfage accommodation of the port? Yes; the letter is as follows:—
- 18 Dec., 1899.

With reference to the request made by you to Mr. T. F. Knox, on Saturday, for a statement from me as to the present wharfage accommodation of the port, I have the honor to inform you that in my opinion it is more than ample for present requirements. During the last five years only one instance has occurred where the Association has been unable to supply a berth for a steamer, and I am satisfied that with the exception named no delay has been caused to shipping through being unable to obtain berthing accommodation at the Government or the Association wharfs. In fact, with the exception of during the height of the wool season, neither the Government nor the Association wharfs is fully occupied.

With reference to the White Star line of steamers, of which the "Medic" and "Afric" have been berthed at Woolloomooloo, I desire to mention that my Association was in negotiation for the berthing of these steamers at Smith's wharf, and that they would have been berthed there had it not been that I was unable to arrange terms with the lessees, as otherwise the wharf was quite capable of berthing steamers of their dimensions.

I regret that the notice has not been sufficient to enable me to complete the returns I am now engaged in preparing, showing the number of berths available and the number of ships and steamers arriving and their tonnage. This return will cover a period of three years to 30th June last.

777. What ship is referred to in the letter? The "Kent."
778. And it was only at private wharfs where she could not get berthed? Only at the Association wharfs.
779. Was there room for her at any Government wharf? Yes; she was berthed at a Government wharf.
780. Was there more than one space vacant at the Government wharf for her at that time? I should think so.
781. You cannot speak for certain? I have no doubt of it.
782. Then, although the wharfage at the disposal of the Association could not berth the "Kent," there was plenty of room in the port to berth her? Plenty of room.
783. It was not the wharfage of Port Jackson that was short? No.
784. Only that at the command of the Association? We were particularly busy at that time, and she could not have been berthed, I daresay, for forty-eight or seventy-two hours.
785. As a rule, is it a very rare thing for a ship to be kept waiting twenty-four hours? I cannot remember any occasion when a ship has had to wait. They come generally straight up to the wharf.

786.

786. Is there any port you know of where wharfage is available more promptly than in Port Jackson? I do not think there is any port in the world where there are greater facilities for discharging and loading vessels than in Sydney. T. F. Knox.
18 Dec., 1899.
787. You hear what captains say;—do you hear them complain? I never hear a complaint, and I have a good many captains to deal with.
788. They do not say that you are short of wharfage, you people in Sydney? No.
789. Do you know of any time when we have been short of wharfage? I am not aware of any occasion. I think it is extremely doubtful whether such a thing has occurred during the twenty years that I have been connected with the wharfage of the ports.
790. All that time the wharfage has been equal to the necessities of the case? Yes, more than equal.
791. We are told that the wharfage at Darling Island will add something like 2,500 feet of extra space;—is that so? 2,500 feet of broadside space.
792. How much available space is there at Circular Quay for the large steamers? 4,765 feet.
793. Then we should be getting more than 50 per cent. additional wharfage accommodation at Darling Island? I think it would be capable of a great deal more if it were in the hands of any individual.
794. You mean by the use of jetties? Yes.
795. But under the proposal of the Government to construct straightaway wharfs there would be 50 per cent. additional accommodation? Yes.
796. Do you think that 50 per cent. additional accommodation to what we have got now would be more than equal to the wants of the port? Far in excess of the requirements of the port.
797. Suppose the Government were to make one of these wharfs at Glebe Island a straight wharf—the north-east one—and the others jetty wharfs, sloping outwards, do you think that would be an advantage as compared with making straight wharfs? I think a system of echelon wharfs might be introduced, if the wharfs are going to be used for export.
798. If jetties were used on the north-west side of Glebe Island, do you think there would be room to work the ships in the bay? That I cannot say.
799. It is somewhat doubtful? I could not say, because I know nothing about the depth of the water, or whether it could be dredged or not. I think echelon wharfs would work.
800. At Darling Island, is there abundant room to work the ships if jetties are put there? Yes, there is abundant room. But the question as to jetties would be largely determined by the fact of whether you were going to use the wharfage for export or import. For export a jetty is quite as good as a broadside wharf.
801. Will you explain why? At Darling Island, in particular, all the goods for export would either go by lighters to the ships or go by rail, and they could be taken alongside, and there would be no chance of the wharf being blocked. The complaint about jetties arises from the fact that importers do not remove their goods as fast as they are put off the ship, and if people are unwise enough to go and put two ships at a jetty, discharging on each side, it is not surprising there should be trouble, because, as a rule, the jetties are not very broad.
802. You know the Melbourne wharf at Sandridge? Yes.
803. There all the goods were taken into trucks? Yes; taken into trucks right away. I do not think they deposited them on the wharfs at all.
804. The wharfs were never lumbered at all? No; they could not do it.
805. The consequence was that the whole of the cargo went straight away to Melbourne in trucks? Yes.
806. But if you once allowed the consignees to let the goods remain until they chose to take them away, that would interfere very greatly with the use of the jetties? The consignees will leave the goods as long as they can. Many of them will leave them until they can sell them and distribute them.
807. Do they not do the same in the case of broadside wharfs? Yes; but it does not matter so much, because on a broadside wharf there is more room.
808. They block up the room a great deal? But the goods are spread right along, and the drays can get to every point easily enough, while the passage up a jetty is sometimes overcrowded.
809. I have seen a lot of cargo lying on Smith's wharf? Yes; the drays back up to the wharf, and get the goods. The ship will keep the goods under cover for a reasonable time, because it is in their interest to look after the interests of the consignees as much as possible. We are not obliged to do this. All that the ship need do is to turn the goods out on the wharf.
810. It is at the risk of the consignees if they choose to leave them there? Yes.
811. If they let them lie there, can you charge them storage? If they are there for an unreasonable time they are taken to the store, at the risk and at the expense of the importer.
812. I suppose where a wharf frontage belongs to a private person, who is anxious to make the most money out of it, a jetty is the more profitable method of dealing with the frontage? It depends very much as to whether the frontage is shorter than an ordinary ship. The frontage at Dalgety's is only 120 feet. Well, we could put nothing in there, for even a coal ship is 350 feet; but if the Government would allow us to take the jetty out 500 feet, we would gladly do it.
813. But suppose you had Smith's wharf, and the Government would allow you to run out a jetty long enough for big ships, could you not put jetties out? I would not. Situated as I am now, with the agency of the White Star line and the Aberdeen line, I should put those two lines of steamers there, and I should be satisfied with what we should make out of them. But you must bear in mind that it is not everybody who has a wharf that has also a business. A man that has not a business cannot make much out of a wharf. Very often an owner puts a jetty up, and then lets it to a man with a business.
814. Would he not put two jetties up in a case like that? Most decidedly.
815. He could turn his money to better account? Yes. I am sure Captain Smith would have done it if he had had the opportunity.
816. It was only because the Government would not let him, I suppose, that he did not? Yes. Take the same space at the Central wharf, and look at the number of ships accommodated there, compared with the accommodation at Smith's wharf.
817. Take the case of Dibbs' wharf;—until it was leased there were no jetties? Dibbs' wharf is all composed of jetties.
818. It is now; but before the jetties were built it used to be a straight wharf? I do not remember that.
819. The Government, of course, can afford to make these broadside wharfs much more conveniently than
can

T. F. Knox. can private owners who have to look to their profit? Yes; because they are regardless of cost, and because of the land. Another thing is that private owners have not a tenure. The great difficulty is that if we build a jetty, or even a broadside wharf, we have only a short tenure—whatever tenure is fixed by the Land Board—and we are entirely at the mercy of the Government. They can resume these wharfs, I think, without compensation.

18 Dec., 1899.

820. Has not that shortness of tenure been due to an idea on the part of the Government that a resumption of all the Darling Harbour frontage will soon become a public work, and they do not want to be blocked by long leases? As far as I know, the present system as to tenure has been going on for about fifteen or eighteen years. It is included in one of the Land Acts.

821. But has not the scheme of resuming the whole of the Darling Harbour frontage been before the country for fifteen years? It has for a great many years.

822. Is not that the reason, and not a jealousy of private enterprise? I do not think it is a matter of jealousy; I think the Government want to preserve their rights. But they would give greater encouragement to the expenditure of money, and there would be much more money expended, if the people had a tenure.

823. If the Government were to abandon the idea of resuming the frontage on the eastern side of Darling Harbour, and contented itself with making a dozen wharfs at Darling Island and Glebe Island, and then said to private owners, "Now we will give you as much right, as regards the extension of jetties, as will not interfere with the waterway"—then, do you think private owners would make great improvements? Provided the Government were tied for all time to charge a fair rate for doing the work; but if they were to go into competition with private wharf-owners, and did the work for nothing, the private wharf-owners would have a bad time of it.

824. What length of tenure do you think would justify a private owner in making proper up-to-date wharfs—that is, with the right of resumption by the Government, with compensation? I should think twenty-one years would be a very fair thing.

825. If the Government could see its way to give twenty-one years in the case of Darling Harbour, you think private enterprise would greatly improve the wharfs there? Yes. I am sure of this, that if the Government were to give twenty-one years, even at Darling Island, and allow people to have the frontages for twenty-one years, they would put out their own jetties.

826. You think there is plenty of waterway to allow ships to project from Darling Island? Yes; I think so, with a system of echelon wharfs, perhaps.

827. Do you think if they got the right to throw out a jetty on a lease for twenty-years, private people would make more use of Darling Island than the Government would do? Yes; but private people should have the right to collect tonnage dues and wharfage. There would be no profit in erecting a jetty if the Government were to collect the dues.

828. Then you think that, though Darling Island is a very splendid work, it might be utilised more by private enterprise than in the manner proposed by the Government? Well, I think it is absurd to take all the frontage of Darling Island for six ships.

829. How many do you think it could be made to accommodate? It is difficult to say right off. I do not see why it should not accommodate three times that number.

830. Looking at the present style of ships, how close together would it be safe to put jetties? If it were for export, I should have a very narrow jetty; and if it were for import, it would be necessary to have a wide one. In addition to that, you would have to leave room between the jetties for the colliers to come in and serve the ships. You would have to regulate it according to the size of the ships likely to use the jetties, and so as to allow the coaling to be carried on. I think 200 feet would be ample between the jetties. I would put the jetty at from 40 to 50 feet—60 feet for the steamer (and that is the widest steamer I know at present) and then 60 feet for two colliers, which would make 170 feet, and then another 60 feet would bring it up to 230 feet.

831. *Mr. Watson.*] So that 250 feet frontage would be enough for each jetty? Quite.

832. *Dr. Garran.*] Then a wharf of 300 feet would be ample for a wharfinger who only wanted to throw out one jetty? Yes.

833. As a wharfinger you would not like to take a long lease of a wharf if you were limited to the export trade;—you would want to make your wharf available for either exports or imports? Yes; but I do not think the import trade could be done to as great advantage at Darling Island as it could be on this side, where all the bonds are.

834. If you were perfectly free to use the wharfage as you liked, you would still do your import trade at one wharf and your export trade at another? I would prefer to do my import trade at Miller's Point, and round towards Dawes' Battery. I should have to get a wharf on very cheap terms on Darling Island to induce me to go over there, because the wool would have to be lightered from town to the ship there. Of course, under Captain Jackson's scheme the proposal is to sell the wool on the island.

835. It would never come to the city at all then? No; but then there are a great many other things besides wool that come in to be shipped. You have to account for the tallow, which at the present moment comes to the city; and then there are hides, and also ores. These things, no doubt, could be shipped. It would only be a question of lighterage.

836. Suppose you were doing the same business as you are doing now, and getting the same profit on it as wharfingers, if you had to have a wharf there, and a wharf where you have one now, you would have to be at the expense of two wharfs to do the same trade? As things are at present.

837. And that would add to your expense without adding to your income? Yes; unless we got a wharf on very favourable terms on the other side, with a long lease and a prospective value.

838. If all the other wharfingers wanted the same terms, that would diminish the income to be get from Darling Island? Very much.

839. Do you think the Government would get as much profit by leasing the wharfs themselves as by letting them to private persons? Not if they gave the right to put up jetties.

840. Suppose they did not give that right? If they did not give that right they could not accommodate more than six ships, because most of the ships are over 400 feet. You see if you are at a jetty you can overhang 50 feet.

841. Your idea seems to be, then, that if they did not give this right, but made a broadside wharf all round, they would not make a very remunerative investment at Darling Island? They would make a very poor investment—after taking into consideration the value of the land and the improvements they have made, and also the depreciation.

842. You think they would make a better investment if they were to let suitable wharfs to private wharfingers, with permission to put out first-class jetties? Yes, to private enterprise. I do not mean wharfingers only, because a wool firm might erect a building there. They might not be in the shipping trade, but they might let off their portion—that is, if the Government could pull the wool trade to Darling Island. T. F. Knox.
18 Dec., 1899.

843. *Chairman.*] I understood you to say on Saturday that you prefer the broadside wharf? I do for imports. The goods can be got away quicker. I think it gives greater satisfaction to the consignee of the goods. It makes no difference to the ship. The ship bundles the goods out in pretty nearly the same time on a jetty as she does on a broadside wharf; but it gives greater satisfaction to the consignee, especially if you have a broadside berth that is a great deal longer than the ship, because you can move her up and down a little to suit the circumstances.

844. *Mr. Shepherd.*] You say you prefer broadside wharfs for imports;—what is the difference between exports and imports, as regards the loading or unloading of ships? The difference is this: that for export work you could comfortably handle two ships at a jetty, because the stuff would be taken delivery of by the ship as fast as it was brought down. The drays could not bring it down too fast for the ship to take delivery. On the other hand, delivery is given too fast for the importers to take the goods. They will not hurry themselves to take the stuff away.

845. So that the goods on the wharf would become congested? The wharf would become congested, and if there were two ships discharging, and goods being landed at the furthest end, the consignee would have a difficulty to get at his goods; and of course we must study the interests of the consignees, or they will not ship their goods by our steamers.

846. You say that the present wharfage accommodation is ample? It is far in excess of the requirements, for anything I can see, for years to come.

847. Taking into consideration the increase of tonnage during the last five years, for how long do you think the present accommodation will be sufficient? If the shipping goes on as it has done for the last twenty years, I cannot see any necessity for any increased accommodation for another twenty years. On this point I cannot help saying that there appears to be some misunderstanding as to what is meant by the term "shipping." I am told that Mr. Darley and Captain Jackson stated that the shipping of the port had increased 21 per cent. during the last five years. Well, what is that shipping. Is it simply that we have immense steamers coming in.

848. The tonnage has increased? But what do they bring more. The "Medic," having a tonnage of 12,500 tons—she can lift 11,000 tons—comes into port with 1,800 tons, and the "Afric" follows with 1,800 tons, although they are on their maiden voyage from Liverpool. We do not expect to bring more than 2,000 tons by these vessels at any time; yet they are put down in the shipping as representing 12,500 tons, and this is totted up at the end of the year; but they do not bring in the tonnage that could be brought in by a 4,000-ton vessel. I cannot help thinking there has been some misunderstanding about the increase in the shipping, and that the increase in the imports and exports has not been on the basis of 21 per cent. I would not like to say what it has been. Of course I do not include imports from any of the Colonies; I am only referring to the deep-sea business. In the last year or two there have been immense imports from New Zealand in the shape of feed for drought-stricken centres in this Colony. I have not included that, because it is only a chance thing; it might happen again.

849. You saw the report, I suppose, from which this increase of tonnage is taken? I did.

850. And you think the increase of tonnage does not properly represent the increase of shipping? Yes. Take the Shire line. These boats come here and discharge their cargo, and directly they do so, they go right away to Queensland to load meat, and when they have taken in a large load of meat there, they go on to New Zealand to fill up, and then go away Home. It seems absurd to describe those vessels as an increase to the shipping of the port, because they do not bring in anything more than was brought before.

851. This report states that additional wharfage accommodation is urgently required;—you do not agree with that? No; I think the writer must have been misinformed.

852. *Chairman.*] There is one point I cannot quite follow you in, and that is with regard to your views on the increased tonnage of ships during the year, as stated in the report before the Committee: If the old 1,000 or 1,500-ton ships had remained in vogue I could understand your argument; but as the ships have grown to such enormous dimensions, although they may not come fully loaded or go away fully loaded, have not the people of Sydney to provide accommodation adequate to the size of the ships, and not merely for the quantity of goods that they may bring or take away? No, I do not think so. The Shire boats are very large boats. They discharge their cargoes very rapidly. We can discharge one of these ships on a pinch in from forty-eight to seventy-two hours, so that another one can step into her place. I do not think there is any place in the world, except Sydney, where a vessel can come straight up to the wharf and get accommodation and despatch such as is given here. In the old days, as was mentioned by Dr. Garran, the "Sobraon" was stuck up, and I can remember when vessels had to wait their turn for a berth; but now-a-days a steamer expects to get prompt despatch. There is nothing they are more glad of than to get their cargo out as quickly as possible, and get away to Queensland, or some other port where they have to load meat. Three days ought to be ample to discharge a vessel like that, and then her place could be taken by another, if not of too long a length. There are only a certain number of such great length. These are the largest boats that have ever come here, and they are coming as a monthly line; but there is no indication that any more will come. In my opinion they are too large for the trade—I am referring to the White Star line. I think that a moderate-sized boat would, perhaps, pay as well. It should be borne in mind that these immense boats have to pay tonnage dues, light dues, and pilotage as per registered ton, which, of course, is a very great tax upon the owners.

853. *Mr. Dick.*] Is there not a maximum tonnage as regards pilotage and tonnage? No; not for tonnage dues. Then there is another check to these larger vessels. These boats fully laden could not go into the Melbourne harbour. The maximum draught at which a vessel could come out of Melbourne is 27 ft. 6 in. Therefore, in building a large boat like one of these, you deprive yourself of the opportunity of using her for anything except one special trade. She could not be used as a "tramp"—as it is called here—so that she could trade here to-day and somewhere else to-morrow. She would have to go to only one or two ports with a very deep draught of water, or else she would have to put up with having to go away, as our boats do, drawing considerably less than she could be put down to if the succeeding ports were as deep as Sydney. So that I do not think you can look forward to any large increase in the big tonnage.

- T. F. Knox. 854. *Mr. Shepherd.*] I suppose a vessel of, say, 2,500 tons can be much more readily dealt with, requiring less accommodation, than five vessels of 500 tons each? Certainly.
- 18 Dec., 1899. 855. So that the actual tonnage does not altogether explain the additional wharfage required? No. The tonnage dues that are collected by Act of Parliament are at the rate of $\frac{1}{4}$ d. a ton a day. With one of these large steamers you do not want to stay at the wharf any longer than you can help, for the tonnage dues run into £25 a day. Naturally you get away as quickly as you can, and make room for another. In reference to the White Star boats, the Government reserve the right to put in other steamers; but they give us the berth at any time on forty-eight hours' notice. Of course, we can give them a week or ten days' notice from Albany; but they have the right—and, I believe, have done so—to put in another steamer; so that the wharf is not absolutely tied up to the White Star line. In Circular Quay the wharfs are tied up to the Orient and the P. & O. companies, because they want to keep their vessels there as an advertisement. They are passenger boats, and it pays them possibly to do it; but they have smaller tonnage dues, being only half the size.
856. *Chairman.*] There is one fact that remains, namely, that after the completion of these Government wharfs, they are always occupied, is that not so—for instance, the wharfs at Woolloomooloo and the Quay? I do not think they are always occupied. Take the White Star wharf. There you have 850 feet. As far as I know, there have been three vessels berthed there in the last four months.
857. Then you think that in Woolloomooloo Bay the wharfage has not been availed of to the fullest extent? I do not think there has ever been any pressure—most decidedly not.
858. *Mr. Watson.*] Do you know the boats of the Federal line? Yes.
859. Do you know their length? I do not. They are pretty long boats.
860. Where are they usually berthed? The "Kent" came inwards. That was the vessel the Wharf Association did not berth. She berthed at one of the Government wharfs—I think in Woolloomooloo Bay.
861. Do they not usually berth somewhere between Dawes' Point and Miller's Point? Yes; there is no fixed berth for them, because they come in chartered to various people. I fancy they have berthed sometimes near Miller's Point.
862. Have you heard any complaint from the captains of those boats about not being able to work their full number of hatches at the jetties provided? I have not come into contact with any of the captains. I have not heard any complaint. Nothing of the sort has come under my notice. It might have been the case if the wharf were not long enough. There are not many other places where there are such facilities as there are here, and I think, really, the captains are spoilt. We accommodate them too well, I am afraid.
863. *Mr. Dick.*] Are you aware that Sydney and Newcastle are practically the cheapest ports in the world for shipping? I am sure of it. They are the cheapest ports for the service rendered.
864. Do you know the "Maori King"? I know the name.
865. Some time ago when the pilotage rates were much higher, there was an amount of £125 for pilotage to enter either Newcastle or Sydney, but at present you can only charge a maximum of £20, so that the owners make a clear gain of about £100 in pilotage alone? Yes; but there are many vessels whose captains are exempt.
866. So that, as far as the official charges are concerned, it does not matter whether the vessel is 2,500 tons or 5,000 tons? It does, in regard to tonnage dues.
867. But not wharfage? Not wharfage. The tonnage dues are charged against the ship, and the wharfage is charged against the cargo.
868. A half-penny per ton per day? Yes.
869. *Mr. Watson.*] That is only while the vessel is at the wharf? She does not lie in the stream; she comes straight to the wharf.
870. *Mr. Levien.*] What do the P. and O. Company pay? They pay £2,000 a year, and the other lines pay something similar—£2,500—in lieu of tonnage dues. To show you that that is a fair thing, I am informed that the P. and O. Company would have to pay £1,800 a year if it were calculated closely. They pay £2,000 a year to the Government for the right to these wharfs, and they pay no tonnage dues. The wharfage dues are collected by the Government in addition. In regard to the White Star line, there is a different arrangement. The Government take tonnage dues and wharfage.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

C. W. Darley. 871. *Chairman.*] You have a return showing "the cost of wharfs in Sydney Harbour, including land resumptions, &c., from 1859 to 16th December, 1899, charged to loans"? Yes; it is as follows:—

	£	s.	d.	£	s.	d.	£	s.	d.
<i>Circular Quay—</i>									
Erection of wharf, jetties, cargo-sheds, renewal of wharfs, &c., from 1859 to 16th December, 1899	307,334	1	3						Revenue, 1899.
Land resumptions	275,000	0	0						
				582,334	1	3	33,399	18	11
<i>Woolloomooloo Bay—</i>									
Construction of wharfs, jetties, cargo-sheds, &c., from 1860 to 16th December, 1899.....	114,598	6	6						
Land resumptions	224,856	11	6						
				339,454	18	0	7,268	9	2
<i>Darling Harbour—</i>									
Construction of wharfs and jetties, shipping appliances, &c., from 1864 to 16th December, 1899	155,531	3	3						
Extension of railway	19,773	19	8						
Land resumptions	495,666	11	10						
				670,971	14	9	1,470	0	10
<i>Erskine-street—</i> Construction of jetties, waiting-shed, &c.....				8,000	0	0			
<i>Blackwattle Bay—</i> Construction of wharf and wall				7,150	16	3	1,011	0	7
<i>White Bay—</i> Construction of wharf.....				1,971	2	0	120	0	5
<i>Manly Beach—</i> Construction of wharf				3,000	0	0			
<i>Dawes' Point—</i> Construction of horse-ferry, dock, wharf, and approach (in course of construction)				4,778	4	1			
				£1,617,660	16	4			

872.

872. *Mr. Watson.*] That is exclusive of dredging? Yes; we do not charge the dredging to the wharf.* C. W. Darley. The total may be divided up into these items: Land and compensation, £995,523; wharfage, £602,363; railway extension, £19,774. In regard to the revenue, I have not seen the return, but I expect there are items in it not taken into account. For instance, the sale of land in Woolloomooloo Bay realised, I believe, a considerable sum. 18 Dec., 1899.

873. The Government sold some land at Woolloomooloo Bay? Yes; the site of the Gasworks was part of the land reclaimed.

874. The cost of reclaiming that land is included in the total amount for land resumptions in the return just read? Yes. Then, again, at the head of Darling Harbour the property is worth an enormous sum of money. The Railway Commissioners have possession of it for railway yards. The cost of that is included in the amount charged.

875. Some of the wharfs at the head of Darling Harbour are practically out of use now, owing to their faulty construction or to the fact that they are above the bridge? Not so much on account of faulty construction, but because the size of the ships has outgrown them.

876. In any case, they are not revenue-producing to a large extent? No.

877. *Dr. Garran.*] You say that the sum of money raised by the sale of the land ought to cut down the cost of resumption? I presume so.

878. Do you know whether the sum which was raised by the sale of the land went into the revenue, or whether it was employed to reduce the loan? I understand that the proceeds of all land sold goes into the Consolidated Revenue.

879. Thus adding to the annual revenue of the Colony without diminishing the debt which was raised for the purpose? Yes; it went to the revenue of the Colony.

880. So that we borrowed money to make the reclamation and then put the proceeds into the general revenue? It is happening every day. You borrow money to build railways, and you put the proceeds of the railways into the general revenue. From a return placed before me by the Manager of Public Wharfs, I notice that he states that the revenues of all public wharfs during last year amounted to £47,930 12s. 10d. That is very nearly 3 per cent. on the whole expenditure.

881. *Mr. Watson.*] Notwithstanding that the wharfs are, apparently, saddled with the cost of land resumption? Yes.

882. *Chairman.*] Have you dissected the cost of dealing with the northern portion of the works, as submitted to the Committee? I have.

883. We want you to give us the detailed estimated cost of the first item—"Wharf and filling works, £125,000";—can you separate that amount? The cost of filling out to about 15 feet from the back of the wharf is £38,000.

884. That would be all round the water frontage? All round the northern portion. The cost of filling from that line out to the back of the wharf, including packing under the wharf, is estimated at £24,268. That includes completing the filling out underneath the wharf. The wharf around the same portion north of the bridge would cost £62,732. That would be for a timber wharf.

885. Could you tell us what it would cost to make a complete job of the 1,470 feet frontage on the eastern side of the island, facing Johnstone's Bay? On that portion there are three berths provided. The wharf to the extent mentioned would cost £7,700; the road and other works, £1,410; sheds and fencing, £5,285; lighting, £500; water supply, £125. The total for each berth would be £15,020. That, multiplied by three, would be £45,062.

886. That would make the complete wharf? That is exclusive of the previous item of filling, which comes to £62,268.

887. *Dr. Garran.*] We want the complete expenditure for that north-east face alone? It is rather hard to divide the cost. I have not separated the cost of filling. The whole cost of filling for the north of the island is £38,000. That is a work which must be done as a whole. It should be completed right round the island, and that work should be allowed time to settle and subside. The filling in should be done in its entirety, and then the construction of the wharfs can follow. The work of filling in, carried out in its entirety, I have estimated at £38,000.

888. We want, if possible, to get the complete cost of each wharf by itself? You could take the total cost, and divide it per foot.

889. Suppose the Committee were to say, "We want to make this particular part, comprising three wharfs, to start with," we should want to know how much expenditure we were recommending? I think that £38,000 should be spent at once on the whole work of filling in. It would be much better than doing it piecemeal.

890. *Chairman.*] I suppose you look upon it that to whatever use Glebe Island may ultimately be applied, the filling in right round would be a useful work? Yes.

891. *Mr. Dick.*] Do we rightly understand you to take this view of the case: that in order to build the wharf on the eastern side, with three berths, it would be advisable first to spend £38,000 for the purpose of cutting down and filling in all round the island? Yes, I think that would be a desirable course. The cost of cutting down and filling in all round the island would be £38,000. The cost of completing the filling out to the back of the wharf for 1,470 feet, on the east side of the island would be £8,918. The cost of the three wharfs would be £23,100, exclusive of lighting and sheds. The roads, sheds, fencing, lighting and water supply come to £21,962, making a total of £91,980. That is a little more than half the total cost of the whole scheme north of the road; but it includes the whole of the cutting down and filling for the first section.

892. *Mr. Watson.*] I notice that the length of the upper or most easterly end of the proposed work would only be 330 feet;—is it wise to put a wharf there of such a short length? I did not like to make it much wider for fear of restricting the entrance to the bay.

893. Would it not be possible that that wharf would largely go to waste in default of it being a bit longer? What I had in view was that in future it would be a very good place to run out a jetty for two berths, but I did not like to make that proposal at this stage.

894. There would be room in Johnstone's Bay for that to be done? Yes. The view I had was to run out a jetty, and it is quite wide enough for that, whereas if it were made wider it would restrict the turning in the bay. I did not like to cramp the entrance too much. It would be a very suitable spot for running a jetty out, and that could be done without interfering with the navigation.

Henry

* NOTE (on revision):—While it is not the practice to charge ordinary dredging to the Loan Votes, for wharfage in Sydney, we have so charged the cost of blasting and removing rock from the front of wharfs. A considerable cost has been incurred in Circular Quay and Darling Harbour in deepening berths through rock, all of which was charged to the Loan Votes and included in the foregoing return.

Henry Septimus Badgery (Pitt, Son, and Badgery, Ltd.), sworn, and examined:—

- H. S. Badgery. 895. *Mr. Levien.*] Have you had much to do with shipping and attending to the wharfs? Only in connection with live stock. That particular matter is not in my department.
- 18 Dec., 1899. 896. So that you know nothing as to whether the wharfage accommodation at Circular Quay is or is not sufficient for all requirements? I travel to and from Circular Quay every day, and I know that it is very much crowded.
897. Have you ever been round to Woolloomooloo Bay to see the wharfage? No, not of late years.
898. And Darling Harbour? I know a little about Darling Harbour.
899. Do you know whether the wharfage accommodation there is sufficient? It seems to be, as far as I know.
900. Do you know whether there is sufficient wharfage accommodation at Darling Harbour, Circular Quay, and Woolloomooloo Bay for all the shipping that comes into the port, or whether we want more? I could not say.
901. *Chairman.*] I understood you were favourable to the proposal before the Committee? If there is not sufficient wharf accommodation, and more can be provided, I would certainly be favourable to it, especially looking to the future, and the probable large increase in the shipping of our live stock and other products on which our prosperity depends.
902. Can you say whether the shipping of the port is likely to go up the harbour in the direction of Glebe Island—whether the necessities of the shipping trade would drive it up there? I have very little doubt that we should have to use the whole of our deep-water frontages in that part of the harbour.
903. For the shipment of the produce in which you deal, such as wool, hides, tallow, and so on, would Glebe Island be a convenient place? I do not know that there is any inconvenience in regard to the shipping of those commodities at present. But I think it would have been very much better if those large wool warehouses had not been built about Circular Quay, to have made a large wool centre where land was cheaper, and where the wool could be examined and sold in the city. Then arrangements for shipping it could have been made at whatever part of the harbour was most suitable and cheapest. If Circular Quay did not then provide sufficient accommodation for ships coming here for wool and other products, such accommodation as is now proposed would be very beneficial to the port.
904. As a matter of fact, there are large wool stores near the Darling Harbour wharfs, over by the railway sheds? Yes.
905. Are those stores utilised to their fullest extent at the present time? I cannot say. There are some very large stores there, including those of Goldsbrough, Mort, & Co., John Bridge & Co., and Hill, Clark, & Co.
906. It has been stated to us that it would be very difficult to drive the wool purchasers and others up in the direction of Darling Harbour, and on towards Glebe Island, seeing that the whole of the trade is concentrated so conveniently in the city—that there is a kind of locality which has become the wool centre of the city, and that it is not likely to get away from there—do you take that view? To a certain extent I do. No doubt it is much more convenient for the wool buyers to have the wool down near the wharfs, where it is so easy to examine it, and inexpensive to ship it from the stores. If you had the stores, for instance, at Glebe Island, the buyers would object to travel that distance to inspect the wool. They would much rather have the wool centre nearer. Although you may have equal facilities for shipping the wool from there, the nearer you can get to the business part of the city, the better for the wool buyers.
907. At present, in what direction is there a growing tendency—for wool to be sold in the Colony, or to be shipped away and sold in England? The tendency is to sell in the Colony, and it is increasing largely. The representatives of the large firms in England and on the Continent make their purchases here much more largely than was the case in the past. In years gone by our own colonists and others speculated very largely in wool, buying in this market, and sending it home to be sold in the London market. Now there is very much less of that speculation, because the manufacturers send their representatives here to buy the wool in the Colony.
908. In all modern schemes for wharfage, wharf accommodation and railway connection generally go hand in hand, with a view, chiefly, to the export of goods. Having that in view, and seeing that the bulk of the wool is sold in the Colony, it would not be an advantage to bring the wool from the wool-sheds in the country right down to the ship's side, because you say the wool has to be dealt with in the stores in Sydney, and sold there? Yes, and at Darling Harbour too.
909. Wool is a commodity of which you cannot very well avoid the two handlings—you cannot bring it right down the country and put it in the ship and send it away? No.
910. It generally has to be placed in large warehouses, for the inspection of buyers? That is so. It is brought into the warehouses and put on the show-floor, giving the best possible light. There the bales, or a large portion of them, are opened, the contents examined, and the wool is sold according to those samples. I look forward to a large export in the future of meats, alive and dead, to large centres of population in various parts of the world; and this is a matter which should engage the attention, if not of the Government, then of individuals; and if the trade is to be encouraged, proper wharf and shipping accommodation will be required.
911. Is that a matter within your branch of the business? Yes; I have to deal with stock generally.
912. How is the frozen meat to be sent away generally dealt with;—what is the course of transit from the killing places in the country to the port of destination? There is not much meat shipped that is killed in the country; it is generally killed at Glebe Island and frozen in some of the freezing establishments about the city, and then put into the ships. Then there is a large quantity of meat killed at Aberdeen, and shipped sometimes at Newcastle and sometimes at Sydney.
913. And at Riverstone? Yes; they kill at Riverstone, and they bring the meat down and chill or freeze it in Sydney, and then ship it. There is a contract now for 3,000 bullocks for South Africa, frozen.
914. The present mode of procedure is to bring all the sheep down from the country, take them to the slaughter-house to be killed, then take them from there to the freezing establishments to be frozen, and then put them on board ship, either alongside the freezing establishment, or conveyed by means of punts;—does not that seem to be a very complicated process? Yes; but the buyers prefer it, because the sheep will not suffer much injury in transit by rail, and you have the whole of the by-products at a place where they are of the greatest value—in Sydney.
915. That, you think, would be a better process than killing the sheep locally, freezing them there, and sending

H. S.
Badgery.
18 Dec., 1899.

sending them in freezing-trucks to the ship's side;—would not the latter be the better process? I think if people were allowed to do what they think is best, and if they were given opportunities and conveniences, the bulk of the trade would be done through the open market; because in many cases the people who buy for freezing and export buy a number of sheep up the country, and when these come down to Sydney, a large number of them are not fit for shipment. But when they buy in the open market, where the sheep are properly classed, they buy only those that are suitable.

916. In these days of railway communication, would not that difficulty be easily got over, and could not the buyer easily go to where the mob of sheep were? They do that now.

917. What I mean is this: Do you think it would be better that the slaughtering should be done after the sheep have been brought down to Sydney alive, having passed two or three days in the train, or that it would be better that those sheep should be killed locally, as close as possible to where they have been pastured, and then brought down dead either to the Sydney market or to the ship's side? They are never kept in the train for so long a period as two or three days, and I can only give an answer to that question by repeating what I said before. If you offer facilities for people to do their business as they please, I think the open market here is the place where the large numbers would be dealt with. As bearing upon that, I may say that the syndicate who purchased that large establishment near Rosehill are putting it into working order for the purpose of buying in the open market here.

918. *Dr. Garran.*] Suppose you could bring your sheep from Flemington to the Glebe Island Abattoirs by railway, and also your frozen carcasses, and put them straight into the ship, merely passing them from the truck to the hold of the ship, would not that immensely facilitate matters in connection with the shipping of meat? Certainly it would.

919. Because there are four or five handlings by the process you describe, while in this case the sheep would only go from the abattoir, wherever it was, and from the truck into the ship? I do not see where the difference in handling comes in, whether you have to slaughter up the country or at the Abattoirs.

920. But if you kill your sheep, and put it either straight into a truck or into a freezing-house—whichever you like as the best for the sheep,—and then from the truck into the ship, you diminish the handling? Certainly.

921. Would not that be a great improvement on anything you do now? No, because you would not have the by-products of the sheep so near to the market, where you can dispose of them to the best advantage.

922. There is one place where we can put frozen meat into the truck now, and that is at what is called the Cold Storage, at Darling Harbour, and that is the only place;—is that not more convenient, on the whole, as a place of shipment, than any other wharf in Sydney? It is natural to suppose that the nearer you can get to the ship with your frozen carcass the better.

923. The process of dealing with it at Darling Harbour is simpler than moving the meat twice in Sydney? Through the streets, of course it is.

924. So that even if we keep the Abattoirs at Glebe Island for the purpose of killing the sheep, that would be the most convenient place to ship from, for we would have the Abattoirs then close to the wharfs? I hope we will not keep them there.

925. Suppose the sheep were killed at the present Corporation slaughter-house, they could be put into a truck and sent down to Glebe Island if a railway were made? Yes.

926. And if they were killed up country, they could be put into cool trucks? If you had railway communication down to the water's side.

927. If a railway were made to Glebe Island, and facilities were given for sending the trucks laden with carcasses down there, and if from there they could be put straight into the ship, we should provide great additional facilities to what we have now? Yes, that is so.

928. We have not now a sufficiency of wharfage close to the railways for shipping any large quantity of frozen meat? I can hardly say whether we have sufficient wharfage accommodation or not, but I know that we are very much crowded at Circular Quay, and I am looking to a large trade in the future.

929. But you cannot bring your frozen meat in the trucks down to Circular Quay? No, I know that; and the sooner we can get to the water's edge with our frozen stuff the better. The less handling the better.

930. Then you will admit that, so far as shipping frozen meat is concerned, the present appliances in Sydney are not as good as they ought to be? I am safe in saying I quite agree with that, because it must be better for all parties that the railway should come alongside the ship than that the frozen meat should be carted through the streets in waggons.

931. And we have only got the one place at present where that can be done? I cannot say that. I think the Pastoral Finance Association, at the North Shore, ship direct into the ships, though the meat has to be taken over in punts to be frozen.

932. But we have only the one wharf where the railway comes close to the ship? Yes.

933. And that surely is not sufficient for a large and expanding trade? I hope not.

934. *Mr. Levien.*] Would it not be more convenient to have a line of railway brought right on to Glebe Island, where they could ship direct? I believe in shipping direct from the train at the ship's side; but it does not matter where the Abattoirs are, if you have a railway from the Abattoirs to the ship's side it is desirable.

935. If stock were taken from Homebush to the Abattoirs to be killed they could be shipped more conveniently at Glebe Island, if a line of railway were taken there? It depends upon what conveniences you provide at Glebe Island for shipping at the Abattoirs.

936. With all the modern conveniences? If you have modern conveniences for shipping the carcasses at the Abattoirs it would be just as good, or perhaps better, than having to put the carcass into the train at an abattoir some distance away, and bring it down to the ship.

937. But we are talking about shipping it from the abattoir direct;—would it not be done much more conveniently at Glebe Island than at Darling Harbour? Of course it would, unless you had a train right down.

938. *Dr. Garran.*] It has often been said that as long as we sell sheep at Flemington, and kill them at Glebe Island, it will never pay to retruck them for the short distance, because the sheep will get so knocked about? I believe that.

939. Would it not be possible to sell the sheep at Flemington in the trucks without unloading them? Yes, but you would not get the value.

H. S.
Badgery.
18 Dec., 1899.

940. Could the buyers inspect them sufficiently? No; they have to be classed.
 941. If you sell them there, you must unload? The sheep have to be taken out of the trucks and classed by experts.
 942. Could they be sold at the existing Abattoirs if room enough were made there? No, they could not.
 943. Then making a railway to the Abattoirs would not facilitate the present difficulty in any way, because you must unload in order to sell the sheep? Almost anything would be better to bring the stock from the saleyards to the Abattoirs than the existing system.
 944. But how do you make that out when you say you could not bring the stock to the Abattoirs? There would not be room.
 945. Then you must sell them either at Flemington or further up the country? I do not know why they should be sold further up the country.
 946. Then you must sell them at Flemington? I do not advocate any particular site, but I do strongly advocate having the Abattoirs and saleyards together. It would be cheaper for the butchers to feed the stock on hay than to pay for paddocks, and lose the condition they do lose without food or water.
 947. The difficulty has always been, so far as I can see, about poisoning the air of a neighbouring suburb—the getting rid of the drainage has been the trouble? There are two sites for this purpose which have always been in my mind—one is on the Parramatta River, and the other a vacant piece of land beyond Belmore, where, at a reasonable cost, you could connect the Abattoirs with the Bondi sewer.
 948. You would want a certain elevation to do that? There is sufficient elevation at the site I mentioned, which is unoccupied land.
 949. I am doubtful whether at the place you mentioned there is sufficient elevation—there would be at Potts' Hill? I think I am correct in saying that with modern appliances the site could be connected with the Bondi sewer. But I do not advocate any particular site. I only advocate the general principle of having the Abattoirs and the saleyards together. One great point in favour of that proposal is that if you have the Abattoirs and the saleyards together, a distance from the city, you can bring your meat into the city by night-trains, to be sold to the retail trade in the best possible condition; and then, if anyone chooses to kill one or 100 sheep up the country and send them into the market, they will be selling in the same market as the carcase butchers of Sydney. The trade has been killed in the past, because the Glebe Island butchers have got the retail butchers on their books, and do not allow them to buy intermittent supplies at Darling Harbour; but if you had a big central market, where all the dead meat could be sold, the country meat would stand its own chance, and if it were better than the other it would bring a better price.

TUESDAY, 19 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.	

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined.—

H. Deane.
19 Dec., 1899.

950. *Chairman.*] You are acquainted with the present proposal to level a portion of Glebe Island, and build Government wharfs round it? Yes.
 951. You have been called this afternoon with the view of explaining to the Committee, in the event of that work being carried out, what you think would be the best means of connecting Glebe Island with the railway system, for the purposes of the wharfs at Glebe Island;—will you kindly tell us that? I should like to refer the Committee to my evidence in connection with the new bridge at Glebe Island, given in June, 1897, page 30. There is very little for me to add, I think, to that evidence, if those connections that I showed then to be practicable were adopted.
 952. Will you kindly take the evidence given by you on that occasion, and, as part of your present evidence, read the portion to which you refer? Yes.

I have brought a map of Sydney, drawn on an 8-chain scale, to show what connections could be made with Glebe Island. We have surveys and explorations on the western side for connecting with the railway, but nothing has been done on the eastern side—that is, to connect it with Darling Harbour. It would be a very simple matter to make such a connection, for there are no engineering difficulties to encounter. A connection could be made with the Darling Harbour line, near the head of Darling Harbour, by tunnelling through the hill under Harris-street, and coming out on the lower ground on the Blackwattle Cove side; or a connection could be made by tunnelling from Darling Island, or from the lines which will be constructed over the newly-resumed area in Pyrmont Bay. There are no sections taken to test the practicability of it; they are not necessary, but a section would be required if an estimate were wanted. Before an estimate could be made it would be necessary to decide how the connection should be made, because the cost of connection between the lines on Darling Island and Glebe Island would be very different from that of the connection from the Darling Harbour line at the head of Darling Harbour. The distance in the latter case would be so very much greater, and that, of course, would affect the cost.

I have sent for a plan to show how some of the lines that have been laid out at Darling Island could then be taken in tunnel to the shore at Johnstone's Bay, and then taken across, by means of a bridge, to Glebe Island.

953. First give us the more expensive one—that is, from the head of Darling Harbour? This plan that I exhibit shows the sidings that have been laid down on the new land. They start from the two roads at the back of the long goods shed, and pass under Union and Murray Streets with a curve, and pass out into the various sidings visible on this plan. Two of the lines run down on the eastern side of Darling Island. On the plan they are not shown as carried further than the southern end, but they are now being laid for the whole length. The point from which any lines would have to be taken to Glebe Island would be those two lines which are shown to cross John-street—about the western boundary of the property. They could then be taken on a curve round to the left in tunnel, and when they reached Johnstone's Bay they

they could be carried across on a bridge to Glebe Island. Those lines going in tunnel would not interfere with the property on the surface of the ground. I cannot say, with any great accuracy, without having a survey made; but I think there is no doubt that provision could be made, as is done in the case of water-works, sewerage works, and so on, to construct the lines without resuming the surface, as is done under the Lands for Public Purposes Acquisition Act. That Act does not apply to railways, but I presume that by a special Act the proper right could be given.

H. Deane.
19 Dec., 1899.

954. Since your former evidence was given some of that work indicated on the plan has been carried out, has it not—I mean in relation to Darling Island? Very nearly the whole of that which is shown in red has been carried out. The two lines in the centre have not yet been carried as far as intended. I am showing where the line that would have to be carried over to Glebe Island would branch off from the actual work as laid down. These two lines are intended to be brought round eventually to the north-eastern side of Darling Island, and any line taken to Glebe Island would really branch off these. I see that in my former evidence I stated that there would be about 30 chains of tunnel. I think it would probably be a little more than that now, as those lines are laid out, because at that time I thought we should be able to branch off at a point nearer to Darling Harbour; but such lines would now interfere with the existing arrangements, and it would be necessary to branch off after passing John-street. I gave the cost of the tunnel at about £50,000 approximately. That would have to be added to by about £8,000 or £10,000. Then, as regards crossing Johnstone's Bay, it would be necessary to arrange the bridge to suit the bridge that is now being constructed. I should not like to give anything more than a very rough idea of what that bridge would cost now, without taking proper steps to get all the data for making such an estimate—borings, and so on. At the former inquiry I said, in answer to Question 803, "I think a bridge to carry a railway would cost about £130,000, with an opening in the centre." I have no doubt that that sum would more than cover the cost of it. Then, at Question 806, I was asked, "An expenditure of about £200,000, allowing £20,000 as a margin, would bring you pretty well across to the Island?" and I answered "That would do." I do not see any reason to go back on that opinion, and probably that amount might stand.

955. In round numbers, that would be about the total cost? Yes, I think so. I speak without accurate data to go upon; but I think that that allows a sufficient margin.

956. I see you were asked as to other connections—one between Petersham and Summer Hill? Yes.

957. Would the cost then given be about the same now? It would have to be increased slightly. I said "The cost of constructing the Stanmore-Petersham connection would be between £60,000 and £70,000." Perhaps I had better show those connections on the plan. This is an 8-chain plan, as I mentioned just now. This black line up and down the plan shows the existing railway. This is Stanmore station where I am now pointing, and that is Petersham station. This is Lewisham, and that Summer Hill, and that Ashfield. Surveyed lines have been run from Petersham, Stanmore, and Summer Hill; and I have also had a connection carefully examined and reported upon, and I looked at it myself afterwards, with a view of making a junction of these lines on the southern side of the railway, so as to connect with the slow-traffic lines. You see that all these other connections surveyed are taken on the northern side—that is to say, on the quick-traffic side, and are not convenient for lines which would be goods lines; and therefore in order to connect with the slow-traffic lines it is necessary to make a considerable alteration in the location. With regard to this one with a junction at Summer Hill, I found it necessary to modify it, so as to start from Ashfield, following about the course shown by the green line, and then passing underneath the Petersham viaduct.

958. That would be a line parallel with the present line? Yes; for some distance it follows a direction parallel with the existing line. It is not possible to get off at Summer Hill and drop down sufficiently to get under the Petersham viaduct. Then, that line, soon after passing underneath the Petersham viaduct, connects with the other line shown in red, and after following Long Cove for a little distance, passes from it to Rozelle Bay, and so proceeds to Glebe Island. The Petersham or Stanmore connection is dealt with in a somewhat similar way; but there, by starting from Stanmore on the southern side, we can drop down rapidly and get into tunnel, and come round under the main line, with the horseshoe curve shown on the plan, and meet the surveyed line which was taken down White's Creek, and so reach Glebe Island. Those extra connections are each estimated to cost, roughly, about £20,000 more than the lines junctioning on the northern side with the quick-traffic lines. I see that in answer to Question 814 I said, "The cost of constructing the Stanmore-Petersham connection would be between £60,000 and £70,000. The cost of constructing the Summer Hill connection, which is longer than the other, would be about £130,000." Taking the Stanmore-Petersham line at £70,000, I think that would be rather low with existing prices. You would have to add £20,000 more. That would make £90,000. I should prefer under present circumstances to make it £100,000. Then, as regards the Summer Hill connection, adding £20,000 to that would make it £150,000. In order to make the estimate pretty safe I should prefer to add a further £10,000 to that. I hope the Committee will understand that these amounts are very approximate. I should have to go into the question much more carefully if it were a railway proposal that was actually being submitted to Parliament, and that would take some time to get ready. But I think that for the purpose for which the Committee require the information now, the estimates may be taken as sufficiently accurate. I should like to add that the land resumptions are not included in these estimates. They are only for construction.

959. *Mr. Watson.*] Taking land resumptions and everything else into account in an approximate estimate, which do you think is the cheaper method of reaching Glebe Island by railway—by way of Darling Island, or from Petersham or Ashfield? The cheapest way would be from Darling Island, because resumptions would be very costly by the other routes. But it would not be sufficient to go from Darling Island, I think; for all the traffic that you would be taking to Glebe Island would have then to pass through Redfern, and go down those two lines, whereas by turning off at Ashfield, say, you would get off the main line pretty early.

960. Of course, in shipping wheat, or anything like that, you could send it direct to the ship's side? Yes. The sooner you get off the main line the better, as regards the connection with Glebe Island. There might be an advantage in having the double connection; but I do not think that the connection with Darling Harbour would serve all the purposes.

961. *Chairman.*] That means, of course, Glebe Island being worked as a concern separate from Darling Island? Yes. Probably it would become connected with Darling Island afterwards. With regard to the two schemes to connect with Ashfield and with Stanmore, I should like to point out that I think the land resumptions would be quite as expensive in the one case as in the other. Possibly in the case

- H. Deane.
19 Dec., 1899.
- case of the Stanmore connection the land resumptions would be more expensive; but the matter requires going into. Taking this route from Ashfield, it will be seen on the plan that the line follows for a considerable distance along the reclamation of Long Cove. The position of the canal there is shown in blue, and edged with green, and the land on the eastern side, which has been resumed, is shaded green. So you see a line could be carried for a considerable distance along Crown land. But I understand that the Lands Department are taking steps to alienate that land; therefore, if this connection is thought of seriously, something should be done in the matter at once.
962. Which of the two connections do you say is the better—the Petersham or the Summer Hill? I like the Summer Hill best.
963. Would you bring the whole of the traffic from Summer Hill? Yes.
964. But to get a certain portion of the traffic away you would have to have a parallel line from Ashfield, so as to bring it to Summer Hill, and then under the line at Summer Hill to go to Glebe Island? The line would pass Summer Hill station. You cannot junction with Summer Hill. You would have to junction further back. You would have to pass Summer Hill to go down under the Petersham viaduct.
965. *Dr. Garran.*] I understand you propose to leave the line at Ashfield station;—you would begin to descend there to go under the Petersham viaduct? Yes.
966. So you would really quit the line at Ashfield? Yes.
967. And that is, on the whole, the new line you prefer? It seems to me that that has superior advantages.
968. What I want is the total estimate of the mere engineering cost of the line from Ashfield to Glebe Island? I gave that—£160,000.
969. £160,000, including the present price of iron? Yes.
970. So you think it would not cost us more than £160,000 now for the works? No, it would not.
971. We have to add the cost of land resumptions? Yes.
972. You presume that all the traffic to Glebe Island would come from the country? Yes.
973. You make no provision for trains from Sydney to Glebe Island by this route; if Glebe Island becomes a great business centre there will need to be a great many visits of business people from Sydney to Glebe Island, and there will be a call for railway communication for them, and they will not all want to go out to Ashfield and be shunted back;—would it be sufficient if we were to continue the electric tram from Harris-street across the Glebe Island bridge now being made? I think so. That will be far more suitable for passenger traffic.
974. You think that would meet all necessities? Yes.
975. And that you need not trouble yourself about making railway communication for passengers? No.
976. *Mr. Watson.*] In the event of Glebe Island being reached either from Ashfield or from Petersham in the way described, would any portion of that line be available for a subsequent extension towards Long Nose Point if it were afterwards thought wise;—you have a trial survey, I think, to Long Nose Point? The original survey to Long Nose Point was along the shore line all the way. Then, in view of certain difficulties which existed as regards going along the water frontage, especially as regards the Callan Park land, I had surveys made which pass close to Glebe Island. There is a line passing the end of Glebe Island, and going thence to Long Nose Point; there is also the blue line shown on the plan, which passes immediately to the east of the Callan Park Asylum grounds, which would be a very suitable route to take, except that it cuts up a lot of water frontage. Probably the line passing near the western end of Glebe Island, and then cutting through the hill, shown in red, would really answer the purpose, and in that case the same line would be utilised for both purposes.
977. If you were to follow the later survey, the whole of the Glebe Island line could be utilised for extending the railway to Long Nose Point? Yes.

William McMillan (W. and A. McArthur, Ltd.) sworn, and examined:—

- W. McMillan.
19 Dec., 1899.
978. *Mr. Watson.*] I understand that you are prepared to make a statement giving your views in respect to some portion of the wharf accommodation? I was simply asked if I would give evidence here, and I am prepared to say what I do know. As far as I understand the scheme that is on foot, you want to do with Glebe Island pretty well what you have done with Darling Island, or are in process of doing. Of course, anybody looking at the map can see that the railway connection must be from a different direction—somewhat as Mr. Deane has been mentioning—unless you had a regular railway bridge; whereas the bridge, which I believe is projected, across to Glebe Island is not a railway bridge. The whole thing amounts to this: Is there a necessity for it at the present moment? If this were private land, and it were part of a whole wharfage scheme, and if this were a good time for purchasing, there might be some necessity for hurry; but I understand that Glebe Island is entirely public land, consequently you will be at no greater disadvantage twenty years hence than you are now. Well, looking at it from my point of view, as knowing something about shipping, and considering the fact that there are still berths unoccupied at Woolloomooloo—because I believe the White Star are not going to berth there in the future—and that the Darling Island system has been scarcely completed, with a large number of magnificent wharfs, it does seem to me to be a little premature to go into another scheme, especially as that scheme would seem to indicate dealing with the export trade which Darling Island is supposed to deal with. What I have always found fault with in these rather spasmodic attempts at wharfage improvements, is that there has been no general plan of dealing with the different classes of shipping. For instance, take a case like this: you would not want coal to be put on board ship at the same wharfs where meat might be put on board almost alongside. Then the timber trade is an absolutely distinct trade, and it is requiring large space on land such as you have belonging to the Government at Glebe Island. When I am asked my opinion about this scheme, of course I do not know whether there is a large and general scheme before the Government of extending the wharfage system of Sydney to meet the requirements of all different classes of trade; but certainly, as far as my experience goes at present, it does not seem to me to be wise to commit the Government to anything until you see to what extent what has been already done, or is in process of being done, will meet the requirements, because you may extend the wharfage up to a point, and it may be a great many years before there is another big jump. There is no doubt that shipping has increased very much of late years, but when you put into operation the whole of the Darling Island scheme.

scheme, it will give an enormous amount of accommodation, as compared with what you had previously. There is one point to which I would like to refer. I noticed that Mr. Deane spoke of Stanmore or Ashfield as a connecting point for a railway. I do not know whether this scheme will include wharfage for coal purposes. Of course, the coal for export comes entirely from the Illawarra line. There was a scheme in regard to Long Nose Point at one time. If you were at Glebe Island you could connect by rail with Long Nose Point. Part of my difficulty is that I do not know what may be a scheme of the future. If you connect for coal purposes ultimately with (say) Long Nose Point or anywhere else, it is a question whether the Ashfield connection would not be at an awkward place; but I am, of course, speaking without any technical knowledge.

W. McMillan.
19 Dec., 1899.

979. How do you regard Glebe Island from the point of view of convenience for import purposes? Very inconvenient—absolutely impossible. You must never forget that you must deal with import business in a distributing centre. As a rule, goods do not go direct to places up country. They are nearly always opened out and distributed, and, even if not always distributed, they usually go through some agency or other; and, therefore, to go away from Woolloomooloo, Circular Quay, and Darling Island, for the purposes of the import trade, would be to create tremendous inconvenience—an inconvenience, at all events, not necessary to face yet.

980. You know of the improvements made and being made at Pymont and Darling Island? Yes.

981. Do you think they will be sufficient to deal with the export trade for some little time to come? I certainly think so.

982. Including both coal and the possible export of wheat, wool, &c.? There is certainly sufficient to deal with wool and wheat—that is to say, as far as you will get people to export from there, because there are people who will not export from there just because you put wharfs there. The coal business, I think, for instance, ought to be dealt with differently. The accommodation at Pymont is absolutely inadequate, and was put there only as a makeshift. It was put there for this purpose: When the Metropolitan Coal Company projected their work down the Illawarra line, they were practically promised by the Government—there was an implied promise—that if that mine went on, and as they had no connection with the sea for wharfage purposes—such as the mines at Bulli and other places had—accommodation would be procured for them. At that time the scheme in view was the Long Nose Point scheme, and, as a sort of purely temporary scheme, the Pymont cranes were erected. They were entirely unsuitable in many ways, but it was found that for proper cranes the foundation was inadequate; therefore that was entirely a temporary scheme.

983. Do you think that there is a probability of any large export of coal from Darling Harbour if the Port Kembla works are as successful as the engineers think they will be? That does not affect one mine. There is one mine that must send to Sydney—I mean the Metropolitan mine.

984. I take it, then, shortly, that your view is that we should proceed with caution in the matter of any further extension of export wharfs until we ascertain whether Darling Island and Pymont wharfs are sufficient to deal with that class of trade? Certainly.

985. You think that Glebe Island is not suitable for import purposes? Certainly not at present—only a matter of future resort for that purpose, if the other accommodation is not sufficient.

986. Do you think that Glebe Island would be appreciably more inconvenient than Woolloomooloo Bay for import purposes? Decidedly.

987. I think that the distance between Glebe Island and the foot of Market-street is estimated at 1 mile? You cannot reckon it in that way for business purposes, because you are getting further away from your offices and your connection. The Government own Glebe Island as well as Woolloomooloo Bay, and there is no use their creating competition against themselves. Everybody knows that the nearer you are to your centre the better. As traffic increases, and inasmuch as the water frontage is only a certain quantity, you must go further; but you naturally do not go further, any more than in a mine you would go further from your shaft, until it is absolutely necessary.

988. *Dr. Garran.*] Your firm are at present large shippers of produce? Well, we hope to ship produce largely; this has not been an export colony for wheat yet; but we hope that we should ship general produce largely.

989. You are also large importers? Yes.

990. Do you consider that the shipping facilities in Port Jackson at the present time are below the needs of the present trade? It is rather difficult to answer that question. I do not think they are below the needs of the present trade; but the work is done under circumstances of great inconvenience. For instance, if I may elaborate, I consider the whole wharfage system from Pymont Bridge round Darling Harbour, right to Circular Quay, is simply a disgrace to the shipping community.

991. In what respect? In this: The whole thing wants to be dealt with on a comprehensive plan, upon which none but the Government can deal with it. Take the case of the wharfs between Pymont Bridge and the bottom of Margaret-street. It is almost impossible for any shipping firm to buy sufficient water-frontage to carry out a proper scheme, for there are bits of it owned by the Corporation, and some bits owned by people who will not sell, and so on. Burns, Philp, & Co., I understand, wanted to carry out a large scheme there for their trade, but they could not get the necessary water frontage. Then again, when you go round by the Observatory, past the gasworks, you are met with enormous natural difficulties, with which no one, except either the Government or a trust under the Government, could possibly cope. What you want is for Sussex-street to be continued all the way round our water frontage to the Circular Quay, all the natural impediments removed, and to have one continuous system. The jetty system is doomed now, with these large steamers that require to lie alongside a wharf with a proper shed into which they can rapidly empty their goods. It was right enough in the old sailing days, when ships lay there for months perhaps, and cargo was put out slowly; but now you must have a large space, you must lay your ship alongside, and you must have shed accommodation; and what is really wanted in Sydney, though it is beside this question, is this—as the Government have a large portion of the water frontage, and as I think they properly should have a limited asset of the people like that, you want to complete the whole system, and then lay out your wharfage system according to the different requirements of the trade—for coal export, timber export, grain export, meat export, and so on—and to connect the whole of your wharfage system, from one end to the other, with the railway.

992. But taking Sydney as it is, and looking at the fact that private enterprise has possession of Darling Harbour, and is carrying on the coastal and intercolonial trade there—I admit under many difficulties—
and

W. McMillan. and seeing that the Government has other water frontages of its own, would it not be better for the Government to utilise its own frontages to the utmost, rather than to attempt to reconstruct the eastern side of Darling Harbour? No, certainly not. You are adding immensely to the inconvenience. It would have been far better, originally, if the whole of the Darling Harbour foreshores had been resumed before that scheme of driving the trade right away to the western side for the railways had been projected. You must recognise the fact that all trading facilities ought to be convenient to the centre of Sydney, and you should not drive the business further away unless as a last resort—unless you have no other means of dealing with it. You have to do it in London, because they cannot get space in the centre; but when Nature has given you a harbour—water surrounding almost the whole of your city, as though it were an island—common sense would lead one to put the shipping as near as possible to the centre from which the business emanates.

19 Dec., 1899.

993. But, admitting the difficulty of the steepness of the gradient, is not all Darling Harbour near to the centre of the trade of Sydney? Yes. I think that there is plenty of accommodation at present; but there is no doubt the wharfs the Government are constructing now and the proposed works at Glebe Island are much more in keeping with modern conditions.

994. We have been told in evidence that while a broadside wharf is best for unloading, the jetty system is perfectly good for export trade where you do not block the wharf with goods? It all depends on what sort of jetty you put out. If you have sufficient fairway to put out broad jetties, they are practically wharfs. But I was referring more to that class of jetty which would take only about half of a ship, and which are very narrow, and therefore you cannot unload simultaneously at both sides.

995. We have it in evidence that the reason why those jetties in Darling Harbour are so unsatisfactory is that the owners cannot get a lease of more than seven years from the Government, and extend their jetties, because the Government are always haunted with the idea of resuming that land some day for a great trust? You mean the wharfs outside the bridge?

996. Yes? I do not know whether that was it, or whether it was the interfering with the fairway.

997. It was both? I do not know. I have always understood that the objection to the extension of the wharfs in Darling Harbour was the fact of possibly interfering with shipping in the fairway. You see that the jetties you have at Pyrmont are inside the fairway, whereas the jetties that are in Darling Harbour, especially inside the bridge, jut out towards the end—an ever-narrowing quantity.

998. But there are several places where jetties might be constructed without obstructing the fairway? Yes.

999. But it is impossible to get more than a seven years' lease? I do not know any more about that.

1000. Do you not think that the Government might do with these lessees what they do with land tenants in the country, and give them a lease of fourteen or twenty years, with the right of resumption if required? Certainly; I think it is a monstrous thing not to do it.

1001. But apparently they do not do that with wharfage? Well, the wharfage is for the benefit of the shipping, and not for the benefit of the Government.

1002. The reason why the Government do not do it is that they have the idea that they might have to resume? In any case they might have to resume for public purposes.

1003. With the very fine frontages we have at Darling Island and Glebe Island, would it not be better for the Government to utilise its own land, and leave Darling Harbour to private enterprise if it likes to come along? Well, if the shipping of the whole community begins to overcrowd itself, and is not sufficiently satisfied with the present accommodation—that is, including the recent works of the Government at Darling Island and Pyrmont—then I say it might be a question whether the Government should not provide further wharf accommodation; but, honestly, I do not think that that time has come. Of course, your wharf manager and your officials are better able to give you statistics of what is necessary than I am; but, speaking as a citizen, and, of course, from only a superficial knowledge of these things, I do not think there is any necessity for any extension at the present moment.

1004. When Darling Island is finished, we are told that we shall have additional broadside wharfage equal to one-half of the present wharfage frontage to Circular Quay;—do you think that that will meet the present needs of the trade? Darling Island, being essentially for export purposes, will not be what I call a lying-berth for the steamers. For instance, the line of steamers that my firm represent will go to Woolloomooloo as usual for our import business. Then, if we are taking large exports away from the other side, we will go there for two or three days, but will not lie there.

1005. But you will be a shorter time than you now are at the import wharf? Yes; but the time occupied by the steamers at the export wharf would not be very long. They would come and go as quickly as possible; there would be no berth taken up, as is the case with the German, Messageries, and P. and O. mail steamers.

1006. What I mean is that Darling Island, when completed, will relieve the import wharfs very considerably? Yes; and will have the essential characteristic that steamers will not lie there.

1007. Then both kinds of wharfs are sufficient if the wharfs at present used for import and export purposes will be used by a steamer only for half the time? Yes; that is true, to a certain extent.

1008. That will increase the utility of the existing wharfs? Yes, of course. But I may point out that, outside the mail steamers, while no wharfage frontage is actually leased as a permanent berth, still there is an implied understanding that, if you have a large steamer, in taking up a wharf for a week or a fortnight, and which may have to go over to Darling Island or Pyrmont for certain purposes and come back again, the Government shall not shove in another steamer during the interval. Therefore that has to be taken into consideration.

1009. But would she want to go back again? Yes, she would, and her berth would be kept. Following out the line of your own thought, I think that what you have to consider is that the large accommodation at Darling Island and Pyrmont will serve the larger purposes better than the other purposes, because the ships there will be only visitors going and coming away very quickly; therefore, the accommodation there for export would be equal to double, in many respects, what is necessary for the import business where ships lie.

1010. Then you do not think that Darling Island would so largely relieve Circular Quay or Woolloomooloo as I thought it would? No, only to the extent of putting an export berth where there is the least handling as the railway comes right alongside the wharf. Of course, I understand that that will be built upon with stores which the export stuff could go right into, and from there be shot out into the ship.

1011. If that is the case, by this Darling Island scheme we are increasing our extent of wharfage frontage without

without very materially increasing the accommodation for the shipping, except making the export easier? Yes; but you must recollect that the export is a new business, and that you are going to meet the requirements of the grain trade of the Colony very largely; and then there is the coal trade, of course, which, of late years, would have taken up a large amount of space somewhere if it had not been for the state of the coal trade, and other things generally that you understand. So, I think, the true state of affairs is this: there is going to be a much bigger impetus to the export trade of the Colony than ever previously.

W. McMillan.
19 Dec., 1899.

1012. Then we really want new wharfs to meet a new and growing trade; for instance, if we are going to export frozen meat largely, we want a new wharf for the purpose? Yes; but you are constructing new wharfs now.

1013. Then Darling Island is not premature, in your judgment? No, certainly not.

1014. The only doubt you have is whether, when we have completed Darling Island, we would want more accommodation for the present? Exactly.

1015. You think that that will meet all the requirements of the export trade? Yes, as far as I understand.

1016. And Glebe Island would be fit only for export trade, or for wharfs for timber, slate, or things of that sort? It might be used for that.

1017. You think it is not urgently wanted for export purposes? Certainly not for the regular steamer and sailer business of the port.

1018. And is not at all suitable for import purposes? Certainly not, except perhaps for a special import—not for general import purposes.

1019. It has been given in evidence before us that there is necessarily some competition between the Government as a wharf-owner and private wharf-owners? Yes.

1020. And the Manager of the Government wharfs stated in evidence that he had not space enough to satisfy all his customers, but he admitted that there was space at private wharfs; that being the case, do you think the Government are justified in spending more public money in making wharfs when private people can give the requisite accommodation? Certainly not, especially as you are going further away from the commercial centre. I will give an instance of what I mean: I do not know what depth of water there is; but there is a certain amount of Government land near the end of Circular Quay, round by General French's residence at Dawes' Battery. I should say that that frontage, if the expense would not be very enormous, could be put under the same conditions as your operative wharfage at present. At any rate, that is a thing that might be considered, if you found that there were plenty of people anxious to go to Government wharfs, but who had to go to private wharfs. I give that as an illustration, but I would point out that people who would want to go to a convenient Government wharf, such as Circular Quay or Woolloomooloo, would not go to Glebe Island. So it all depends on the question whether the wharfage is convenient at present.

1021. Do you think the Government ought to go on spending public money making new wharfs to accommodate steamers that can be already accommodated at private wharfs? Certainly not; especially at a place to which steamers would not go.

1022. It has been given in evidence before us that, notwithstanding the great increase in steamers, nobody can mention the case of a steamer which, in the last three years, has been unable to get a berth somewhere? Of course not.

1023. That shows that the appliances of the port, taken as a whole, are equal to the trade? Yes; they are equal to the trade, though the appliances themselves are bad. If you were to construct a wharf up the Parramatta River, it is not likely that steamers would go up the Parramatta River because you happened not to have the proper appliances at a wharf right in the centre of the city.

1024. But there is this to be considered: that the Government wharfs are preferred by steamship owners, because they give greater facilities, there are better gradients to them, and they are more up-to-date in their construction? The Government facilities are very small in many respects. There is not a small town in New Zealand which has not a system of cranes along its wharfs, whereas there are not a dozen cranes in the whole of Sydney, so far as I know. The Government have certainly made very convenient and well-constructed sheds, and the water frontages happen to be by nature in the parts of the city where the gradients are the easiest.

1025. I understand you to say that the wharfs at Pyrmont are unsuitable to your coal trade? Yes.

1026. The craneage is not sufficient? No.

1027. Otherwise, are they suitable? They are suitable enough if you had the right cranes; it all depends on the cranes. But we were told that they could not construct the proper cranes.

1028. The only defect is the cranes? That is all, I think; otherwise those wharfs are very convenient.

1029. They are easy of access? Yes.

1030. You can get ships there and away easily? Yes.

1031. You have plenty of water? Yes.

1032. And further jetty accommodation could be run out and increase the accommodation? Yes; there is plenty of space.

1033. Would you like your coal trade taken to Darling Island? I do not know where it should be taken to. It is purely a matter of convenience in putting it on board ship. The location of Pyrmont could not be more convenient, but on several of our ships we found that with the cranes there it was impossible to load them properly.

1034. Is that not the same wharf where frozen meat is sometimes shipped? Sometimes.

1035. Have you ever happened to see coal being shipped on one side of the jetty, and frozen meat on the other? I cannot say for certain, but I should not be surprised if such a thing did occur.

1036. That side of Pyrmont is the only place where there is a railway and wharf connected with one another? It is the only place that fulfils those conditions.

1037. You have travelled about the world a great deal, and have noticed, I suppose, that in modern places it is considered of first-class importance to get the railways to the water frontage? Certainly.

1038. We failed to do that in Sydney in the first instance in making our railways;—do you not think that an extension of the railway to Darling Island is therefore a very good attempt to recover from that mistake? Darling Island was resumed during a period when I had something to do with those things, and I always approved of it; but it was not the fault of those who resumed Darling Island that it was not immediately taken in hand and made useful.

- W. McMillan. 1039. What I mean is that it was a good thing for the Government to connect Darling Island with a railway, and increase their water frontages? Yes, if the Government take the wharfs at all.
- 19 Dec., 1899. 1040. We could make a similar extension of the railway to Glebe Island at a certain expense, and if we wharf Glebe Island, do you not think that it should be railed as well as wharfed? Yes; it would be absolutely useless without it.
1041. We have no railway communication at present with Woolloomooloo Bay;—would it be a great increase of convenience in connection with those wharfs if the railway were running along the frontage? Yes. It was to meet that difficulty that a great deal of the plans for the western side of Darling Harbour was made. The great difficulty of the meat trade at the present time, with the tremendous amount of competition from all parts of the world, is that you can do that business successfully now only by having a minimum amount of handling; and the perfection of the meat-trade operation would be a refrigerating store on the wharfage connected with the railway, so that the chilled meat from the country could come into the place where it would be frozen, and be shot out without any further handling into the steamer.
1042. Well, we could do that at Darling Island? There is no other part of our harbour where those conditions could be fulfilled.
1043. When Darling Island is finished we can add a chilled room of that kind? Other people could build, I suppose.
1044. Could we not sometimes bring the meat from the country in chilled waggons, and put the meat straight from the waggons into the ship without its going into a store at all? Well, you could at times, but only under certain conditions, because you could not always get a ship to go there at an exact time; for instance, if a ship were expected to arrive in Sydney to take in meat, she might be a day or two late, and you could not keep your waggons in the place, because the Railway Department would not let you do so unless you paid a great deal of demurrage. Therefore the plan is to have a storehouse, and the meat continuously accumulating, so that you would have your ship's cargo ready. The same remark will apply to the wheat business, in respect of which we are becoming an export country.
1045. But that might make one more handling? It is not one more handling if you have to put the chilled meat into a store to be frozen. The point is to have your freezing-store alongside the wharf, where the meat has to go under any circumstances. That constitutes the minimum of handling.
1046. You will admit that the frozen-meat trade is not well provided for in Sydney at the present time? I think that it is scarcely fair to say that, in view of the enormous enterprise on the part of certain firms; but I am willing to repeat that the only satisfactory condition of shipping meat ultimately, if we are to compete very keenly with other countries, is to have the refrigerating store alongside the deep water, so that the chilled meat may be brought into the store, and without any further handling be shot into the ship. I am willing to say that much. But, so far as the present conditions will allow, the trade is very well catered for.
1047. But still there is an unnecessary quantity of handling? There is, I suppose.
1048. And when we get Darling Island finished, we shall get rid of a good deal of that? I do not suppose that Darling Island will absolutely annihilate all the present places. No doubt that will be the ultimate outcome.
1049. *Mr. Shepherd.*] Are you of opinion that the time has arrived when additional wharfage accommodation is urgently needed? I have said already that, from my knowledge, I do not think that anything is needed for the present beyond what has been projected at Pyrmont and Darling Island.
1050. Do you approve of the Glebe Island scheme of proposed additional wharfage? No; I do not think it is necessary. There might be a certain special kind of business. I simply say it is not necessary for general import or export business; but there might be a special kind of business, such as cement or timber business, or something else of a special character, that might be handled there more conveniently. However, speaking generally, I do not think that there is any necessity at the present time to face any such enormous expenditure as has been foreshadowed, for the land belongs to the Government, and will not run away, and you can always tackle the matter.
1051. It is evident that the accommodation at Glebe Island is intended for very large steamers, and you do not think that the position is suitable for the purpose? I think that it is a magnificent place for wharfage accommodation, and, probably, will be one of the finest wharfs in Sydney in years to come. It is only a matter of time. I am speaking about whether it is opportune yet.
1052. The tonnage of shipping here is largely on the increase; during the five years up to the end of 1897 there was an addition of about 21 per cent. to the tonnage of the shipping;—do you think that that represents the additional wharfage that is required? You may have a great deal of additional tonnage without a great many additional ships; for instance, I have no doubt that the German line in five years have made an enormous increase in their tonnage, but have not put on a single additional steamer; therefore it does not follow that because you have additional tonnage you want additional wharfage accommodation.
1053. Therefore you do not think that additional wharfage accommodation to the extent of 21 per cent. more than we had five years ago is wanted to keep pace with the shipping? I cannot say from my own knowledge, but I think that the present arrangements and what is going on at Pyrmont and Darling Island—with all the land you have there accessible—will be quite sufficient for many years to come. My remarks are not against Glebe Island as a magnificent wharfage at some time or other, but they are purely to the effect that I do not think the time is ripe.
1054. Do you think that the Government frontages to the harbour are at present used to the best advantage? I think so. I think they are the best frontages of any, and I think they are very well managed on the whole, and they are always now backed up by sheds of a very superior and substantial character, such as were not known in Sydney some years ago. It seems to me that, seeing not a single railway truck has ever been run on the lines on Darling Island, practically, for the purposes of commerce—that the first shed is only now contracted for, and I do not think a day's work has been done on it—there has been no opportunity of seeing what Darling Island can do. If I were a private owner, instead of the Government being the owner, I should certainly say, "There is that land of mine at Glebe Island; it will not run away, and I want to see exactly what this new thing can do." I think all these things are very practical, and you cannot sum up in arithmetic exactly what Darling Island will do best except by actual experience. I think that until Darling Island is thoroughly proved as to its capacity, the other thing would be premature.

Edward William Knox, General Manager, Colonial Sugar Refining Company, Ltd., sworn, and examined:—

1055. *Chairman.*] I understand that you have a statement to make? Yes. I am General Manager of the Colonial Sugar Refining Company, which owns between 8 and 9 acres of water frontage opposite Glebe Island. The Company is not in any way interested in regard to the Government wharfage proposals, as our wharfs are used only in connection with our own business. I have read the statement prepared by the Works Department about the Glebe Island scheme, but do not concur in the conclusions therein expressed. It is not the case, so far as my observations goes, that the wharf accommodation now is insufficient. In the height of the wool season some of the berths have this year been empty for weeks in succession, and there has not been any attempt to utilise the wharf accommodation at Pymont, which would surely have been done had there been any demand for more berths. The statement says that there has been a great increase in the tonnage entering the port during the past three years; but it seems to me odd to ask for new wharfs for empty tonnage, and it cannot, I feel sure, be contended that, with the small increase in the population, and the great falling off in exportable produce, there has been a considerable expansion in over-sea imports. Nor is there any prospect of such increase; with a prohibitory tariff under Federation, the deep-sea trade will diminish, though the coastal trade may increase, and the employment of larger steamers will allow of the work being done with fewer berths, while the higher cost of such boats as compared with the old tramp compels the owners to unload and load them in the smallest possible working time. So far as the private wharfs are concerned, I would say that the owners of these have for a long time been greatly hampered by the difficulties thrown in their way by the Lands Department. The Engineer-in-Chief does not take an unreasonable view of proposals for enlarging and improving private wharfs, but an excessive rent is demanded for the use of the land covered by the wharf. The lessee is only a tenant at will, and when he seeks to improve the whole position by substituting concrete for timber wharfs, he is met by the demand that the Government shall have the right to resume all the reclaimed land, and then to deprive him of access to the water at any time on paying the actual cost of the reclamation. The object is presumably the ultimate acquisition of the foreshores by the Government, which would be, in my opinion, a public misfortune, and would tend to neutralise such advantage as Sydney now has by position over other Australian ports. In wharfage, as in other matters of trade, competition is necessary to ensure progress. As to the employment of Glebe Island for the import trade, I do not think that there is any chance of this business being diverted in that direction for many years, if ever. Traders will resent being asked to send to Woolloomooloo Bay for one case, and to Glebe Island for another; and if extra berthing accommodation were at any time wanted for vessels with cargoes of merchandise, this could be best provided on the Pymont and Darling Island property, which is hardly used at all now. In any case the cost of the work proposed seems to me altogether beyond the value of it when completed. I notice that this does not include the item of dredging, which would be extremely high if large vessels were to go to the Island, for the bay itself is shallow, and it is probable that at the proposed wharfs an enormous amount of rock cutting would have to be done under water, as would be the case on some of the adjoining properties, in order to get a depth of 27 feet. I do not believe that any firm here or in England would look at an offer of the 14½ acres of land and water north of the bridge for nothing if the condition of spending the £178,000 set down in the Estimates were attached to the grant—and business men can work such a property much more efficiently than Government officials; so there is not, in my opinion, any justification for the proposed expenditure.
1056. *Mr. Dick.*] You have stated that in the height of the wool season some of the berths at Pymont have this year been empty for weeks in succession—that is, for the export of wool;—is it not a fact that these wharfs have not been very long completed, and that in any case it takes some time for a new fashion to be set up in the export trade? The berth I had in view was the berth adjoining the Pymont bridge, which is never used at all by large vessels; at any rate, I think I have never seen a large vessel alongside that wharf, except at the end, for the purpose of shipping coal or horses.
1057. Would you call the "H. C. Bischoff," a four-masted ship, a large vessel? I have never seen her there.
1058. Would you kindly state in a little more detail what you mean by the remark, "It seems to me odd to ask for new wharfs for empty tonnage"? Yes; the official statement says that the tonnage has increased by 21 per cent. in three years. The increase of the amount of tonnage entering the port is no guide as to the amount of goods, and we have the wharfs for the goods, and not for the ships.
1059. But is not the increase of the tonnage a guide as to the amount of wharfage accommodation that will be necessary? No; I do not think so, because the increase in the tonnage has not brought about any increase in the number of vessels. It certainly, also, I think, has not brought about any increase in the quantity of goods imported.
1060. But if there is an increase in the tonnage, does not that require an increase in wharf accommodation in order to deal with the vessels as rapidly as before the increase took place? I do not think so.
1061. Do you think that the last three or four years, in any case, are anything like a reliable guide as to what we may expect in the way of expansion, both of export trade and import trade? I think that the import trade is going to diminish, not increase.
1062. That is your view, as a result of federation? Yes.
1063. *Chairman.*] Do you mean by that that Sydney will cease to be the great distributing centre of Australia? To a certain extent, and also because the prohibitory tariff will promote manufacturing and reduce imports.
1064. *Mr. Dick.*] You think that any general system of resuming the foreshores along Darling Harbour by the Government, with the view of doing away with the difficulties that at present exist therein dealing with our trade, would be a public misfortune? Yes.
1065. You base that statement simply on the ground that it would do away with competition? It would do away with competition, and leave a number of the wharfs to be worked by management much inferior to that which now controls them.
1066. Is it not a fact that there is an association among the private wharf-owners at the present time? Among the owners of oversea wharfs there is; but Darling Harbour is to a great extent occupied by wharfs of steamship companies that do not belong to the association.
1067. But the fact that the oversea owners' wharfs are now under an association points to the fact that that association has been brought about for the purpose of preventing undue competition? Preventing competition among themselves—yes.

E. W. Knox.
19 Dec., 1899.

E. W. Knox. 1068. In what way would the acquisition of foreshores by the Government differ from the present arrangement in the way of cutting down competition;—at present they combine to prevent competition amongst themselves, and you say it is desirable to have competition? Yes, and, therefore, it would be a mistake for the Government to acquire the foreshores.

19 Dec., 1899.

1069. Is it not a fact that in cases where the Government do invest public money for the convenience of traders, they are, as a rule, content with a fair amount of interest upon the money expended? I know of no case where private persons could not have served the public equally well for one-third less money, and with much more satisfactory results.

1070. Does that statement apply to Darling Harbour at present, where they have a chance of supplying the public at their own expense;—in other words, comparing the facilities provided in Darling Harbour by private enterprise with those provided at Circular Quay and Woolloomooloo Bay at public expense, which of the two do you think would cater for the trade in the best manner? Give the private wharf-owner a title to his improvements, and he will beat the Government out of sight.

1071. You expect no good at all from a general scheme for resuming private wharfs? I think it would be a public misfortune.

1072. Do you know that all the wharfs in the important port of Newcastle, with one exception, are at present in the hands of the Government? Yes.

1073. Have you ever heard any complaints there as to the inefficiency of the Government facilities? I do not think it is necessary to make complaints when you get the work done for nothing. I never heard of any one in Newcastle paying wharfage dues yet.

1074. It is a popular misconception that they do not pay wharfage dues in Newcastle; but they do not pay tonnage dues such as are paid in Sydney;—you do not think, speaking generally, that the requirements of this port, either now or for some time in the future, are or will be such as would justify the expenditure of any further money on wharfage accommodation at Glebe Island? I do not.

1075. *Mr. Watson.*] Are you aware that the wharfs constructed by the Government so far in this port are paying a handsome return on the money expended? I fancy that the return is handsome only because the Wharf Association keeps up the rate of wharfage.

1076. Well, the presumption is that the Wharf Association keeps up the rate to the maximum permitted by the Act, because there is enough trade at that rate to make the business pay them—that is an evidence, I should imagine, that their wharfs are fairly well occupied? I understand that the Government wharfs do not produce any revenue at all, except by way of wharfage—in other words, that the Government get no rent whatever for them.

1077. But the wharfage and tonnage returns from that source, it seems, are more than sufficient to pay interest on the cost of construction? Then why is it necessary to try to borrow money to put new pavement down on Circular Quay.

1078. It would appear, from the returns given us, that, as a matter of fact, the wharfs so far constructed are paying very well? I do not gather that from Mr. Darley's statement; that appears in the paper this morning, wherein it is reported that he stated that, roughly speaking, the Government, from £1,600,000 of expenditure, which did not include the value of much of the land, were getting between £80,000 and £90,000 a year revenue.

1079. If the report stated that, it was incorrect, because that was not the evidence given by Mr. Darley; you speak of the probability of the adoption of a general scheme of foreshore acquisition and wharfage alteration by the Government as likely to neutralise such advantages as Sydney now possesses over other Australian ports;—are you aware, in that connection, that in nearly every instance in the other colonies the Governments, or other public bodies, do possess the wharfs? I know that; but I draw a wide line of distinction between the Government possessing wharfage property and other public bodies possessing it.

1080. I was about to ask you whether your objection to the Government managing the wharfs and the wharfage system would apply equally to a body representative, say, of the metropolis, in the shape of a harbour trust, which might be created? Not if it were entirely independent of the Government, and, unlike the Water and Sewerage Board, were compelled to have a sinking fund for its debts.

1081. So you would appear to be of the opinion that it would be quite possible for a body controlling as a whole the wharfage interests of Sydney to deal, because in a comprehensive, therefore in a more satisfactory way with the wharfage system? I think that in small and narrow waters it is absolutely essential that you should have a body of that sort controlling the wharfage system; but in a harbour like Sydney, where there is such an enormous coast line, I think it would be a mistake.

1082. But, taking Darling Harbour, is it not a fact, apparently, that although we have a great deal of water frontage yet the water-way is narrow, and therefore not suitable for any large projection of jetties towards the centre of the bay? But Darling Harbour is only one of four places, all suitable and available for wharfage.

1083. Between Miller's Point and Dawes' Point it is quite possible that some restriction will be necessary on the length to which jetties might be taken out into the stream? Oh, yes.

1084. Your idea is that you could not rely on private owners dealing satisfactorily with the wharfage accommodation? Private owners require to be controlled, but they might be controlled and assisted, instead of being controlled and thwarted as they are now.

1085. Do you think that it is likely that private owners, even with a longer tenure, would be willing, practically, to destroy a lot of the property they have now, which, admittedly, is not sufficient to give convenience to the larger class vessels that are lately coming here, with a view of providing for that class of vessels—their present wharfs are largely inconvenient for the newer vessels, and is it likely that they will destroy those wharfs and put up new ones, even if a longer tenure were given to them? I think they would, because they have very large sums invested in the shore wharfs and the buildings connected with the jetties.

1086. *Chairman.*] Do I understand that your objections to a work of this kind go so far as to say that this Government should not do anything more in the way of wharfage additions for Sydney? I think it was from the first a mistake for the Government to interfere in the matter, and I think that the trade does not justify any additions now.

1087. Seeing that the Government railways are managed really by the Government, do you think that the acquisition of a place like Darling Island to be now worked by the Government, in conjunction with the railway system for export purposes, is desirable? It is very desirable. The railway ought to have an outlet to the deep water.

1088.

1088. Then, having a view of the future, and seeing that Glebe Island may, or will according to the Government statement, in a few years to come be required for somewhat similar purposes, do you think it is too early, or that it is undesirable, to attempt to improve that island so as to increase the railway facilities in conjunction with wharfage? I think it is quite unnecessary, in the first case, so far as the next five years at any rate are concerned. I understand that no attempt has been made to devise any scheme to bring the railway to the island, and I am pretty certain that a survey of the bay would show that it is almost impracticable to ever take a 27-foot ship up there, unless an extraordinary outlay for dredging is undertaken.

E. W. Knox.
19 Dec., 1899.

1089. *Dr. Garran.*] You have no personal knowledge of the shelving of the water across to Glebe Island? No.

1090. *Chairman.*] You take this view of the matter: that although it might in years to come be necessary to make Glebe Island an addition, so to speak, to Darling Island, to be worked in connection with the railway, you think that at the present time it is not desirable or necessary? Yes.

1091. *Dr. Garran.*] The reason given in the official statement for extra wharfage is that the tonnage entering the port is increasing;—I understand you to say that that is a deceptive statement? Yes.

1092. A ship like the "Medic" may, and I believe does, come in with only 1,800 tons of cargo to Sydney, and yet she is entered as of 10,000 tonnage? Yes.

1093. All the ships that come here and make this their terminal port put out cargo at Adelaide and Melbourne before they come to Sydney? Yes.

1094. So they bring only a little to this port? Yes.

1095. And yet they are entered at their full tonnage? Yes.

1096. But, after all, they want to be berthed whether they have little or much cargo? Yes.

1097. Therefore wharfage accommodation must be provided for them whether they have a full cargo or merely an empty ship? Yes; but it is probable that if the number of vessels at the wharfs were counted now and five years ago it would be found that there are fewer vessels now than there were five years ago.

1098. But larger vessels? Yes.

1099. They want smaller space of wharfage per ton, I presume, because a large ship of 5,000 tons will want less lineal feet of wharfage than two vessels of 2,500 tons each? Yes.

1100. So that, although these large ships require greater depth of water, they do not require the same lineal feet of wharfage? No.

1101. Then the need for wharfage per foot is rather diminishing in consequence of the large shipping that now comes here? Yes.

1102. Therefore, the proper calculation would be to see how much the present class of vessels require as to extent of wharfage? Yes.

1103. And that particular information is not given in the official statement? No.

1104. Do you know whether it could be given at all by anybody? I think that the proper people to express an opinion on such a matter are the agents for the steamers.

1105. You have been engaged in trade here for many years;—do you remember during the last few years any case where a large steamer could not get accommodated? I never heard of it.

1106. Are your wharfs fully occupied? No; for five or six months of the year they are generally empty.

1107. And they could be available for general trade if they were wanted? Yes, for vessels of small size.

1108. But for vessels of that size there is plenty of berthing? Yes. I have not had any applications for berths for vessels during the time our wharfs have been unoccupied.

1109. You will see that the Government improvements are to provide for ships of the larger class? Yes.

1110. Is not there a need for extra accommodation for vessels of that class? I think not.

1111. Could the private frontages give the accommodation that is wanted? Yes; if their owners were to get a decent tenure.

1112. Is there anywhere in Darling Harbour where there is not a terrifically steep gradient up from the wharf to York-street? I think that from Dibbs' and Smith's wharfs the gradient is not very steep.

1113. Do you not think that it is a great disadvantage to the Darling Harbour frontage that there is such a big climb? I think it is a great disadvantage to the port of Sydney, and this is evidenced by the fact that the cartage rates in Melbourne for the same distance are much lower than they are here.

1114. Speaking of cartage rates, do you know whether the cartage rates to Woolloomooloo Bay are greater than those to Circular Quay? No, I do not.

1115. Do you pay the same rate for goods brought to your store from Circular Quay as would be paid from Woolloomooloo Bay? We lighter all our goods from other wharfs.

1116. Do you think that at present what the Government has done in the way of public wharfage has been to any extent an unfair competition with private enterprise? Yes, because private enterprise has been hampered by the Government regulations.

1117. You think that if the Government did not sit on the wharf-owners, but would give them reasonable facilities for improving their properties, they would be more than equal to meeting the demand? Yes.

1118. So they do not have a fair chance in the strife? No. That remark applies equally to wharfingers and to factories having a water frontage.

1119. If the Government complete this work at Glebe Island, and I suppose also at Darling Island, there is a proposal to lease the frontages to private companies or persons;—would not that be as good for private enterprise as if the land were leased, and the people were allowed to make the wharfs themselves? Yes; but I appear here as a taxpayer, not as a man to who wants to lease a wharf.

1120. Still I mean that the competition, so far as ships are concerned, would be as great if the Government were to lease the wharf to private people as it would be if the Government leased the water frontages? No, because the Government exacts the full wharfage rate.

1121. *Mr. Watson.*] The Wharf Association does that too, does it not? Yes, I think unwisely.

1122. *Dr. Garran.*] You mean that the Government compels those people to pay the full wharfage rate, and, therefore, the tenant must levy that on the consumer? I mean that here the consignee really pays the full wharfage rate, whereas I think there should be competition between the Government and the private wharf-owner for the trade of the consignee.

1123. You mean to say that the leasing, say, of Darling Island and Glebe Island wharfs, will not give the maximum of competition? No, it will not.

WEDNESDAY,

WEDNESDAY, 20 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.	

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

James McMahon, carrier, sworn, and examined:—

- J. McMahon. 1124. *Mr. Levien.*] You are a carrier in a very large way of business? Yes.
 1125. You have contracts with the Government? Yes, I have.
 1126. Contracts for the removal of all goods and merchandise from Darling Harbour and Redfern? Yes.
 1127. You also contract with a number of the merchants in Sydney? Yes.
 1128. You are also a station-holder yourself? Yes.
 1129. You have seen the plan of the proposed works at Glebe Island? Yes.
 1130. Supposing that wharfs were constructed there, and considering that the Government are erecting a new bridge at Glebe Island, and also one at Pyrmont, do you think that Glebe Island would be an inconvenient distance from the city? I do not think it would. So far as my experience of carting is concerned, five or seven minutes will take you that distance, and you would not feel the loss of five or seven minutes compared with the inconvenience that you suffer now. The principal matter is the detention, not the time occupied in going from any place to the city, because there are any number of stores in Pyrmont now.
 1131. And there is space there for the erection of more stores all along the wharfs? Yes; and a great deal of the goods will be brought into the stores at Pyrmont.
 1132. In your opinion it would cause no inconvenience, so far as time is concerned, in having to convey goods from Glebe Island to the city stores? Very little.
 1133. You say that most of the time is lost because of the inconvenience connected with loading and unloading at the present wharfs? Yes; there is a great deal of inconvenience, because there is not sufficient accommodation on the narrow jetties, and I have often been an hour and a half loaded on the jetty before I could get out.
 1134. From that observation of yours, I take it that you approve more of wharfs than of jetties? I do.
 1135. They are more modern and more accommodating? Yes; so far as the wool traffic is concerned, at Pyrmont you get considerably more than one-third, or about that, of the wool traffic at the present moment.
 1136. Are the stores at Pyrmont fully utilised? Yes, during the wool season. For instance, Winchcombe, Carson, & Co.'s store, I take it, gets about 40,000 or 45,000 bales in the season; John Bridge & Co.'s store, I think, gets something similar; Goldsbrough, Mort, & Co., the New Zealand Loan Company, Hill, Clark, & Co., and Wyly, Trenchard, & Co., each have a store there. This year there has been a decrease in the number of bales of wool; but if you have 420,000 or 430,000 bales of wool coming by the railway, fully one-third of that goes to Pyrmont.
 1137. With reference to produce other than wool, does much of it go to Pyrmont? Yes; a good deal of the wheat goes to Goldsbrough, Mort, & Co.'s, the New Zealand Loan Company, Hill, Clark, & Co.'s, and Wyly, Trenchard, & Co.'s.
 1138. Now that a great deal of wheat is grown on the halves-system by the large squatters, I suppose they mostly trade through these companies—Goldsbrough, Mort, & Co., and Hill, Clark, & Co., and others? Yes; they do, excepting what they sell down here and which goes to the millers. Anything that is stored for shipping, or to wait for sales here, goes into the stores.
 1139. And you say that most of it goes to Pyrmont at the present time? Yes.
 1140. You mean that railway-carried produce that is to be shipped for export goes into these stores? Yes.
 1141. What is your opinion as to the wharfage accommodation for the shipping generally? My opinion is that a great many of the private jetties are too small.
 1142. In length or width? In width.
 1143. That is to say, if there is a ship at each side of them, they are not sufficiently wide for proper unloading? Yes; or if two hatches are being discharged from on to the one jetty, there is not sufficient width. Supposing that all you gentlemen are merchants, and I am your carter. Each of you will want a load as soon as possible when he is paying for it. In every sling of goods that comes out there may be a package for each one of you; consequently there will have to be so many loads on the wharf before you can take one, and when these are lying on the wharf they block it up; but if there were proper warehouses on the wharfs, and goods could be taken from the sling and loaded into the truck and run into the warehouse, you might have proper discharge; whereas at the present time the cargo has to be bundled out as best it can.
 1144. On the broadside wharfs any amount of accommodation in the way of stores could be erected, so that the goods could be carted away quickly and save delay? Yes; at the Woolloomooloo wharfs there is a certain amount of accommodation at the sheds; but they have their bad points. You have to work with so many doors in the sheds, and you cannot get at your goods well enough.
 1145. I see that on a former inquiry, you gave evidence almost similar to what you are now giving when you said that the Woolloomooloo Bay wharf was quite as accessible as any other wharf in the city? Yes, and more so at the present time.
 1146. On account of the stores? Yes, and the outlet you have from there.
 1147. You have to drive your drays right on to the jetties? Yes.
 1148. And it is almost impossible for two drays to go along at the one time? If there are any goods on the jetties it is.
 1149. You often have to take your drays right along the jetties to unload or load them? Yes.
 1150. So there is great inconvenience in that way at times? Yes, very great inconvenience.

1151.

1151. Do you think that we have sufficient wharfage accommodation, or do you think it is advisable to have more accommodation at Glebe Island, as proposed by the Government? I think you have a great deal of wharf accommodation at the present time, but "A" gets three or four ships sent to him; he has a special wharf to which he sends his vessels, and two or three of them may be discharging at two jetties, whilst, perhaps, the rest of the wharfs are almost empty. Woolloomooloo Bay wharf, except at certain times, is not occupied. J. McMahon.
20 Dec., 1899.

1152. But do you think we require more wharf accommodation? Yes; I think you require more wharf accommodation.

1153. What is your opinion of this scheme of the Government as regards the increased accommodation they propose to have at Glebe Island? I think it is a very good idea.

1154. Do you think that the work is a desirable one? I do.

1155. Do you ever suffer any delays yourself in the detention of your own teams when you want to get them away? That is what I am complaining of. The delay is tremendous, but it is caused by the way I have already described.

1156. You are entirely opposed to the jetty system? Yes.

1157. You think it is far better to have the broadside-wharf system than the jetty system? I do.

1158. I suppose that these jetties are suitable for small vessels? Yes, they are suitable for small vessels, or even for large vessels, provided that they discharge from only one hatch, and have only one vessel at the jetty at one time.

1159. But that would cause delay in unloading the ship? Yes. You have more facilities at a broadside wharf, of course, than you have at a narrow jetty.

1160. Do you think that if they were to widen the jetties it would be more convenient? Of course, if they were to widen the jetties they would give more convenience, but you have not room to widen any of the private jetties, because they are so close together.

1161. Then the accommodation proposed by the Government at Glebe Island is one that you can favour? Yes.

1162. And no inconvenience whatever would be suffered in consequence of the slight delay in passing from there to the city, or from the wharfs there to Pyrmont? Not a great deal.

1163. Supposing that the unloading were to go there, do you think that it would in any way affect the wool trade;—you are a station-holder and you ought to have a knowledge as to whether it would, in any way, affect the sale of the wool, or whether the wool could be sold on the Pyrmont side as well as on this side? All the wool is sold at the Exchange, but samples are taken on the Pyrmont side. In all the stores that I mentioned to you they have their sample-rooms, and samples are taken there, and then Brown, Jones, Smith, and Robinson put their valuation on the various wools, and then purchase at the Exchange according to their own ideas.

1164. So if we are told that there would be inconvenience, you say there would be no inconvenience as far as the sampling of wool is concerned? No. Wool is sampled there, and I suppose that next season you would have an addition of 30,000 bales at Pyrmont over and above what you have had there this season. The Co-operative Company are building a new store in Pyrmont.

1165. *Chairman.*] For this wool business, do they fill the stores near Circular Quay before they go to Pyrmont? No. For instance, all Winchcombe, Carson, & Co.'s wool is stored at Pyrmont. They have no city stores. Pretty well all John Bridge & Co.'s wool is also stored at Pyrmont; and Hill, Clark, & Co.'s large store is at Pyrmont. The New Zealand Loan Company have rented a portion of Goldsbrough, Mort, & Co.'s place, and all their stores are in Pyrmont. Goldsbrough, Mort, & Co. have as large a store in Pyrmont as they have near Circular Quay.

1166. Which do they fill up first? The Circular Quay store.

1167. *Mr. Levien.*] Supposing the Abattoirs were removed to Homebush or Blacktown, would it not be more convenient to bring the frozen-meat by rail, *via* Darling Harbour, to Glebe Island than to bring it as it is brought now? Yes, I think so, because it would go direct to Glebe Island. The only difficulty is that the P. and O., and the Orient, and the Messageries Maritimes Companies have all the eastern side of Circular Quay, and it would be inconvenient for them to take their steamers to Glebe Island.

1168. *Chairman.*] Does the bulk of the frozen meat go away from here by the regular traders you have mentioned or by specially-constructed vessels? By the regular traders.

1169. Most of the frozen meat export trade is carried on by the P. and O. and Orient steamers? Yes.

1170. *Mr. Watson.*] The Pastoral Finance people send their frozen meat away by another line of steamers—a cargo line? Yes.

1171. And then the "Shire" line takes away a large quantity of meat? Yes.

1172. Therefore, a large quantity of meat goes away in addition to what is taken away by the mail steamers? Yes.

1173. *Chairman.*] But the mail steamers take the bulk of it? As far as what I see shipped is concerned, I think the mail steamers take the bulk of it.

1174. *Mr. Levien.*] But if the Abattoirs were at Blacktown or Homebush, and the meat were frozen there and sent down by rail, it would be more convenient to take it to Glebe Island and load it there? In removing vessels from here to there, you have to pay a certain amount of pilotage or removal dues, and it might be as convenient to have the meat brought down here as to remove a vessel to Glebe Island.

1175. Have you heard any complaints of the wharfage accommodation? No, I cannot say that I have.

1176. How long have you had your drays blocked, which could not load at all, in consequence of the inconvenience of the jetties? Sometimes as long as an hour and a half or two hours.

1177. What number of drays? A dozen or two dozen.

1178. Delayed all that time for want of accommodation, and quick facilities for loading and unloading? Yes. But that will be so long as you concentrate the loading and unloading at one given point, and have the jetty system. As regards the Sussex-street wharfs we are delayed three, four, or five hours in getting to or from a wharf. The deep-sea ships are not so bad as the coasters.

1179. *Chairman.*] Seeing that you have a large knowledge of the shipping of the port, both as a carrier and from observation, do you know any case where ships have not been able to get berths at wharfs in Sydney? No, I do not.

1180. If there had been any trouble in that direction, do you think that you would have heard of it? To the best of my belief such a thing has never occurred here yet—that is, for deep-sea vessels.

1181.

- J. McMahon. 1181. Does that not rather point to the fact that we have sufficient accommodation for ships in the way of wharfage at the present time? So you have if the wharfs were properly handled; but as I have explained, a gentleman may be an agent for vessels, and through some unforeseen circumstances one vessel may be ninety days, another 110 days, and another seventy days in coming out, but the seventy-day vessel makes a good passage, and the three come in together. You get a certain amount of percentage out of the wharf, and you send your vessels to a jetty the best way you can, and the traffic is so blocked up that you can hardly work it. But if the agent were to apply for a berth at a Government wharf, or any other wharf, I think he could get it.
1182. Then with regard to the private wharfs, it would seem that they want reorganising a little, so as to come up to modern requirements;—is that what it amounts to? It is a matter of demand and supply. There are so many wharfs in what is called the Association, and there are so many out of the Association. When the Association vessels come in they put them at their own wharfs, and then the non-associated wharfs are lying idle. At the present time there are a good many of the associated wharfs taken up, but there is room, even at the back wharfs, for ten deep-sea ships, or even twelve.
1183. Large ships? Going from 1,000 to 4,000 or 5,000 tons.
1184. You said just now that some of the wharfs are very often idle; that would be the case almost in any port, would it not; trade does not come in such a way that the wharfs can be constantly used for shipping, especially where we export wool largely as we do here—there is bound to be a time when the wharfs are more fully occupied than at other times? Yes; but you asked me if I ever knew of there being insufficient accommodation for vessels coming into the harbour, and I said “No,” and I told you then how some of the wharf accommodation is sometimes blocked, whilst the rest is lying idle.
1185. There is a pressure of ships, owing to one making a quicker passage and another being longer, and the agents having to crowd up their wharfs? The most I have seen of deep-sea ships discharging here so far at one time is seventeen. You could accommodate double that number if the wharf-owners were to pull together; if they were all in the Association you could accommodate forty big sea-ships.
1186. You must have observed that of late years the steamers have gone on growing very largely in their tonnage? Yes.
1187. Looking at Woolloomooloo Bay, which is being improved very much, and brought up to date in regard to wharfage, do you not think that, without Woolloomooloo Bay, ships in this port would have been very greatly inconvenienced? Those large ships would have been.
1188. And though Woolloomooloo Bay a few years ago might have been looked upon as an undesirable place at which to build new wharfs, experience has shown that it was a step in the right direction, and has provided for a necessity? There is no doubt about that. Of course this year, last year, and the previous year were what I term bad years; but when you take such a year as 1892 or 1893, when you had 100,000 or 120,000 bales of wool in excess of what you have this year, it makes a great deal of difference. If the wool clip goes back to what it was a few years ago, it will be as much as the wharfs can cope with.
1189. With better seasons, and a much larger wool clip, our wharfs will be kept pretty busy? Yes; I think that the Darling Harbour railway wharf above the bridge is no good to anybody, because a big vessel would be as much blocked there as it would be at a narrow jetty. The water is plentiful there, but that wharf was built on the half-moon principle, and you have a long curve where you cannot either discharge or take in goods.
1190. With regard to the Glebe Island proposal, do you think that Glebe Island would be a convenient place for imported goods, it being so far away from the city? All the merchants in Sydney have their warehouses built along York-street, Kent-street, or Clarence-street; consequently it would be further to bring the goods from Glebe Island, but I do not think it would cost much more. Those merchants having their stores in those streets, it would be very inconvenient for them to have to remove to Pymont, and as you know hundreds of thousands of pounds have been laid out in providing storage accommodation here.
1191. If this scheme be carried out, it is proposed to erect large storage-sheds at Glebe Island;—do you think that merchants in Sydney, importing large lines of goods, which they require for every day supply—to go up the country, and so on—would rent those sheds at Glebe Island? I do not think that they would, because, as regards the imported goods that are sent to the western and southern districts, I do not suppose that you have a merchant in the whole kit who will send a truck load, consequently they have to get their goods into the store, and sort them there, and send various consignments out to the merchants up country. The direct importation to the south or west is very little indeed. There are a couple of firms in the north who do import pretty largely.
1192. Therefore the merchant who sends goods up the country wants to have his goods alongside his office, or as near as possible to it, in order to fulfil his orders? Yes; I take it that that is the reason why they have built those stores so large—so as to give themselves such accommodation alongside their offices, and where they can sort their goods as they please, and carry out their country orders.
1193. You said in regard to the expense of carting goods from Glebe Island that there would be very little extra charge? I did.
1194. To what extent would the increased cost be? I suppose it might be 15 or 20 per cent.
1195. Supposing that a shipment of goods were landed at Woolloomooloo Bay, can you tell us what the rate of cartage would be to a warehouse in York-street? About 2s. per ton load.
1196. And from Circular Quay? The same; also to any place within the city of Sydney. For instance, if you employ me to take a load, I would take it from Woolloomooloo Bay to Pymont bridge at the same price as I would take it to York-street, although I should have nearly three times the distance to travel. The city runs to the Balmain bridge.
1197. Then from Glebe Island, instead of the cost being 2s., it would be about 2s. 6d.? Yes.
1198. Are you able to say whether the tendency of the shipping is to go up the harbour at the present time or do the vessels prefer to keep down this way? I take it that they prefer to keep down this way, and I also think that they would prefer, by long chalks, to go to Rushcutter's Bay rather than to go up there. At one time you had not as much expectation of having Woolloomooloo Bay utilised for wharfage as you now have of Rushcutter's Bay being used for that purpose.
1199. With Glebe Island improved as suggested, I suppose you would recognise that it would be necessary to connect it with the railway system of the Colony? I have no doubt that it should be.

1200. Are you able to say, whether Glebe Island, if the proposed works were carried out, would be used for the timber trade to any great extent? That is what it will be used for principally. J. McMahon.
1201. Do you know whether there is a want of accommodation for the timber trade at the present time? I believe that the greatest want is for the timber traffic. 20 Dec., 1899.
1202. It is a trade that requires a considerable amount of space? Yes.
1203. *Dr. Garran.*] We have been told that, for import purposes, a ship unloads most conveniently at a broadside wharf, because she can open all her hatches at the same time and put her goods out on a wide wharf, where the drays can easily move about;—as a carrier, do you agree with that? Yes.
1204. But we are also told that, for export purposes, where the goods come down on the railway trucks, and are run alongside the ship, and the goods are put out from the truck direct into the ship, a strong jetty is just as good as a broadside wharf, because the jetty never gets lumbered, and there are no carts on it? I have no knowledge of any such place in Sydney, but I have been making inquiries about that matter from a gentleman who had to do with the Great Northern and Western Railways in England, and he told me that they did all they could to do away with the carting, and they could not get the work done so well or so cheaply by any railway system as they could by carting.
1205. Do you refer to import work or to export work? Both import and export work.
1206. For import purposes you want your wharf as near as possible to your stores? Yes, provided that you have your stores there.
1207. Because nearly all our imports have to go into store before they are distributed through the country? Yes.
1208. Therefore Circular Quay, Woolloomooloo Bay, and Darling Harbour are all very well situated for that purpose? Yes, for imports.
1209. But would Glebe Island be suitable for import purposes? I do not think it would be as suitable as those places would. As far as exports are concerned, if you run a railway round to any wharf you please where they press wool, and say "I will deliver at the front of that wharf," it is cheaper for the owner of the stores to employ carts to bring that wool on to another street, and work from a high level, than it is for him to lift it. We have had trials of that in several stores here. There are several stores who work from what is termed a high level. They roll their wool in, and it is pressed on the next floor, and so on, until it goes to the ship's side. They would have to raise that wool in any case to have it pressed. As regards shipping wheat, I think that to-day we have had the first trial of shipping wheat direct.
1210. At which wharf? At Darling Island. They cannot work the engines satisfactorily there to-day.
1211. What engines do you mean? The railway engines.
1212. At the cranes do you mean? No. The wheat is taken out direct from the trucks, and put on board the vessel.
1213. You mean the locomotive engines? Yes. It is too expensive. They would have to keep the engines there for a certain time, and the expense of the engines, firemen, and all that is too great, and so they have to use horse-power. I went purposely to have a look at what was being done between 12 and 1 o'clock, and I have just come from there.
1214. Difficulties of that kind are difficulties of detail? Yes.
1215. A smaller engine—a shunting engine—would answer the purpose, would it not; that is a small affair; but for an export wharf in Sydney, do you not think it is an almost essential now that it should be a railway wharf? No; because you press all your wool.
1216. You are thinking of wool; I am thinking more of grain, meat frozen up the country, and things of that kind? With frozen meat it is a different thing; but that, at present, is only a small item compared with what, I take it, the export will be, and that is only for a certain time, and certain vessels are brought here for the occasion; but if you are exporting wheat, it is a different thing.
1217. In regard to export wool, even if we have a railway to Darling Island, as we have, do you think the wool will be still carried in drays to the ship's side? I do.
1218. They will not put the wool into the trucks? No.
1219. At Goldsbrough, Mort, & Co's. place they have a truck running right into the warehouse? Yes; they have; but they could not make that pay. I happen to be a shareholder there, and I have seen it tried a long time.
1220. The wool goes into the warehouse, I think, to be unloaded when it comes from the country, does it not? No. It goes to within 66 feet to the warehouse; but they still unload it into drays, and then take it across, instead of the truck going right into the warehouse. I take it into a certain street above that, at a very small amount per bale. I drop it down there, and it goes from floor to floor, and is classed, and otherwise dealt with as it goes down.
1221. Then you say it is a mistake to bring wool in at the ground-floor level of the warehouse? Yes, because it all has to be lifted up to the top storey.
1222. The mistake in Goldsbrough, Mort, & Co's. was in making the trucks deliver the wool on the ground floor? Yes.
1223. If they had had a railway on a higher level, that would have been all right? Yes. These stores down here were built at a time when they had no idea of running trucks into warehouses. At one time all the wool that came into the Colony was dealt with in four or five little stores at the Quay.
1224. Then you mean to say that even with those warehouses, and a railway to the premises, they would have to dray the wool into the warehouses and out again into the ship? Yes. Take Dalgety's case. They get their wool sometimes by steamers, and sometimes by lighter. They dray that wool up to the high level, and afterwards dray it to the ship's side again. That is done even when the wool comes from a steamer. It is all a question of £. s. d.
1225. We have been told that to which your evidence is somewhat opposed, viz., that it is very difficult indeed to get the buyers of wool to go over to Pyrmont to examine it, because they are all so much wedded to the Circular Quay business;—is that so? I am not amongst the buyers, and I cannot tell you. I can only tell you that most of the wool sold in the Colony is sampled at Pyrmont. The first portion of wool that comes down belongs to the large squatter and direct shipper, and he sends it from the railway direct to the ship. But the greater portion of the wool that is for sale in the Colony is sampled at Pyrmont and sold at the Exchange. Whether there is, or is not, a difficulty in getting buyers to go to Pyrmont, I do not know.

- J. McMahon. 1226. One great element in the project of Glebe Island, as well as in that of Darling Island, is that ultimately the whole of the wool for export will be shipped from there, and that will be made, so to speak, the heart of the trade, and this will cease to be the wool centre? That idea may be the idea of those people who do not thoroughly understand the matter, but it would take the whole of Darling Island, with warehouses ten stories high, to accommodate the quantity of wool there is for sale in one week.
- 20 Dec., 1899. 1227. Then, according to your evidence, a railway to an export wharf is not of very great importance after all;—they do not use it? No, they do not use it.
1228. And you seem to think that it would not be used? It might make the charges for carting less than they otherwise would be.
1229. Supposing that Glebe Island were made a wharf to-morrow, would it be of any use without a railway to it? I do not say that it would; and I do not say that it would be of any use, except for frozen meat and timber, even with a railway to it.
1230. Darling Island is not yet in full occupation—it is only just beginning? Yes, it is beginning to-day.
1231. When that is quite completed and all available, do you think that that will materially add to the wharfage conveniences of Sydney? It must.
1232. Do you think that it will be such a great improvement, and add so much to the wharfage conveniences, as to make it unnecessary to spend any money for a few years to come at Glebe Island? I do.
1233. You do not think it will be necessary to put the Glebe Island business in hand if we have the whole of Darling Island at work? Not for some years—not in the lifetime of any of us.
1234. You think the wants of the port would be sufficiently met? I do.
1235. Where is the wool that is sold at Pymont now shipped? At the various wharfs in Sydney.
1236. All round? Yes. There are eight dumping sheds. You may prefer to send to one dumping shed, and I to another, and this gentleman to another, and that gentleman to another; we each have our friends and admirers.
1237. And that is all carted from Pymont to the ship's side at 2s. a ton? Yes.
1238. So, although it is sold over there, it has to come back to this side to be shipped? Yes.
1239. Is that done by lighterage, or by cartage to the ship's side? What goes to the North Shore is taken by lighters.
1240. All their wool comes down by railway to Pymont, I suppose? Yes.
1241. And it is mostly lightered across? Yes. If there were a bridge across the harbour, and we had anything like proper accommodation by means of the bridge, we could cart it more cheaply to their warehouse at North Shore than they can lighter it. One half-penny more, and I could do it now.
1242. You mean without the punt? It is not what I would have to pay for the punt, but the delay I should have.
1243. You spoke about the Government wharf in Darling Harbour above the bridge; and I gathered from what you said that you think that the Government expenditure on the whole of that wharf is money absolutely thrown away? Yes.
1244. Would it have been better if we had filled up the head of Darling Harbour, instead of building that wharf? I think so; but at the time that wharf was built, vessels such as the "Woolloomooloo"—vessels of from 600 to 1,000 tons—were the principal vessels we had in here, and they could be accommodated at that wharf, which, I suppose, is from 180 to 200 feet long; but when you get a vessel between 300 and 400 feet in length, it makes a great deal of difference.
1245. The shipping has out-grown those in-and-out wharfs? Yes.
1246. Then the wooden wharf which reaches from the iron wharf down to the bridge, we are told is very little used? They can accommodate any vessel you like there. I have seen a 3,000-ton rail ship go alongside that wharf.
1247. But is it much used? No.
1248. Why is it not? Simply because that is all Government property, and they utilise it pretty well for the railway, and they cannot give the public the accommodation they would require to discharge vessels there; but there is nothing at all wrong in that.
1249. There is no proper room for your drays? No, there is not; but that is the Commissioners' property, and they will not be interfered with.
1250. What is the use of building a long wharf, if you cannot use it? The Commissioners use it.
1251. Only for their own purposes? Yes.
1252. You know the wharf which is below the bridge, which used to be Goodlet and Smith's wharf? Yes.
1253. We are told that there is hardly ever a ship sent there;—do you do much business from that wharf? There are no vessels going up there.
1254. Why not? Simply because the Government cannot get them to go there.
1255. Why cannot the Government get them to go there? For the simple reason that if a ship comes in here, the Government will not give the rebate that a private wharf-owner will.
1256. And you can do what you want more cheaply at a private wharf? Yes.
1257. For a particular class of ship? That wharf will accommodate any vessel.
1258. Then that is another Government wharf thrown away? Just so. You would not have the Government competing with private enterprise, would you?
1259. Is the depth of water there adequate? Yes. I have seen vessels there drawing 22 or 23 feet.
1260. Then those two jetties close to it, and just beyond where coal is shipped, are very good jetties? Yes.
1261. But you have hardly any business there, I suppose? That belongs to the Government, and the Commissioners use it for their own purposes.
1262. Then practically the Commissioners have the whole of the western side of Pymont down to those jetties? Exactly so.
1263. And the Government get no revenue, except what they get from the Commissioners? Yes.
1264. Do you think that money has been well invested? I happen to be a servant of the Commissioners, and it is not for me to criticise them. I may tell you that in one week alone there are 390,000 cubic feet of wool storage required. That will give you an idea of the stores you would have to erect at Darling Island.

John Meloy, carrier, sworn, and examined:—

1265. *Mr. Shepherd.*] I believe you have largely engaged in carrying cargoes to and from vessels? Yes.

1266. Have you ever experienced much difficulty through the overcrowding of wharfs? On several occasions, and I must if you get too many ships at one wharf.

1267. Has any very great delay been occasioned? Not very often with me. You can generally get out your goods; but sometimes you may have to employ extra labour to get the goods away.

1268. Do you attribute that to the want of accommodation in the way of wharfage? It is not the want of accommodation; but it is putting too many ships at one wharf. There is any amount of accommodation. But, for instance, if you get four ships at the Federal wharf, or two at Saywell's wharf, that causes delay, although, very often, at the same time you have three or four wharfs with no ships at them. That is what causes all the trouble.

1269. Does that arise from want of judgment? It comes very often from the rebate. There are the Government wharfs, the Wharf Association wharfs, and also what are called the free wharfs. A captain brings his vessel into port, and he will accept the wharf at which he can get most rebate, even if there is not as much accommodation there. The trouble arises, not from want of wharfage, but from want of co-operation. There is any amount of accommodation if the ships were so regulated that they would go to the proper wharfs; but the trouble is caused, very often, by the rebate business.

1270. Having seen the plan of the proposed works at Glebe Island, do you think that Glebe Island would be a suitable position for wharfs for large vessels? You might make it suitable enough, but there would be extra expense on the merchants for cartage, &c. Say that a vessel has 3,000 tons of cargo, the consignees will object to the ship being sent there—they will object on account of the extra charge. We should have to charge extra to go there and do the same amount of work. It would require double the number of horses to do work from Balmain as it would to bring goods from the wharfs at Circular Quay or Miller's Point. The bulk of our bonds are situated near Miller's Point.

1271. You think that the position at Glebe Island would be very inconvenient? That is my opinion. It would entail more expense on the merchants for cartage. We could not cart from there for the same prices we would cart from Circular Quay, or other wharfs.

1272. Do you think it would be inconvenient for all shippers, or for any particular class of shippers? I do not think it would suit anybody, except people like Lever Brothers, or others with works at Balmain.

1273. I suppose you would consider it almost compulsory to have this scheme in connection with the railways—that is, it would be necessary to run a railway to the Island to make it thoroughly available? No doubt that would be the only way to make it available. The Market-street wharf causes much trouble in the city; it belongs to the Corporation, and cuts against the Government and the Association. Thousands of cases of spirits are landed there after being lightered from different places. You have sometimes to wait there with your drays until 5 o'clock, and it is inconvenient to get your goods away then.

1274. That is in consequence of overcrowding, I suppose? It is in consequence of the rebate. From Woolloomooloo and other wharfs the goods are very often lightered right round.

1275. Are you aware of the scheme for wharfage being carried out at Darling Island? I have seen the men at work there, but I have not been right through the place.

1276. There are two jetties, and a very broad jetty; do you think that would be a convenient position? I should think it would be much better than at Balmain.

1277. Is it being used at all? I do not think they have used the new jetty at all yet. The other jetty is occupied by the Railway Department, and I think they are useful jetties. Goods are taken by lighters to the railway trucks there.

1278. It would be convenient for goods coming by railway? Yes; to be delivered at the ship's side.

1279. Have you had much experience in loading and unloading at jetties? Yes, for the last twenty years.

1280. Do you think that the jetties are much more inconvenient than the broadside wharfs? No, I cannot say they are much different, so long as you do not get your jetty crowded; but if you get too many vehicles on the jetty you are very often blocked. The traffic wants regulating. In the old days, we had only jetties to work on. No doubt, for a large cargo, the broadside wharfs are the best.

1281. Have you heard any complaints of the want of additional wharfage? None whatever.

1282. Are you of opinion that the shipping is fairly well provided now with wharfage accommodation? Yes; I think we have very often more wharfs than are occupied. That is the trouble. If they were regulated properly, and every wharf got a fair share of the shipping, they would not be overcrowded.

1283. Do you think that the wharfage accommodation has been judiciously utilised so far, or could more be made of it than has yet been made of it? Yes, much more, by better management. The Wharf Association regulate their ships, but private wharfs, where a rebate is obtained, take as many ships as they possibly can, and that causes the trouble.

1284. Taking all these matters into consideration, do you think it is desirable that this Glebe Island scheme should be carried out? I do not think it is necessary.

1285. You do not think it is required? I do not think so, unless we get much more shipping than we have had during the last few years.

1286. There has been a large increase in the tonnage of vessels; in five years immediately prior to 1897, there was an increase of about 21 per cent.; in view of the vessels being largely increased in size, do you think that the necessity for wharfage accommodation has increased in the same ratio? Of course we have the Woolloomooloo wharfs, and I suppose that two of the wharfs there could each accommodate any vessel afloat.

1287. Supposing that there is 21 per cent. more tonnage than there was five years previously, has the necessity for extra wharfage increased in the same ratio; if there were a large vessel of 5,000 tons, and 10 vessels of 500 tons each, would those 10 vessels require more accommodation than the 5,000-ton vessel? No doubt they would if they all came into port at the same time, or one after another before the others had discharged. It is two vessels discharging at one wharf different brands of cargo which blocks the wharf.

1288. Would one vessel of 5,000 tons require as much room as 10 vessels of 500 tons each? Not at all.

1289. What would be the proportion, do you think? I should not like to say without going into the matter.

1290. We require that information to show what extra wharfage accommodation is required; we are merely

J. Meloy.

20 Dec., 1899.

J. Meloy. merely told that the tonnage has increased so much in so many years, and the vessels are therefore so much larger, but they do not require so much more room according to their tonnage as vessels of smaller tonnage would each require? No doubt they do not, because you have to berth only one vessel where you would have to berth five vessels.

20 Dec., 1899.

1291. What class of goods do you think the Darling Island accommodation would be the most suitable for—general merchandise or wool or frozen meat? I should think it would be a capital wharf for frozen meat. If you had a frontage there for frozen meat, you could not beat that. You could run your cars right alongside the wharf, the same as is done at Newcastle.

1292. For general merchandise, I suppose that Circular Quay is considered the most convenient? No doubt it is the most convenient wharf, because you have no "pull" in getting away—you can load your horses more heavily and have a good get-away.

1293. *Mr. Watson.*] You say you think it is possible, with a better arrangement of the existing wharfs, to deal with the traffic we have now satisfactorily? Yes. We have any amount of wharfage for the traffic we have at present.

1294. Do you think that, even with such an arrangement as you speak of, the private wharfs—some of them being narrow and not very long—could give sufficiently expeditious despatch to the larger class of vessels which are being used more and more for the carriage of cargo? Yes, if you put all your large vessels at suitable wharfs.

1295. But in that case you would want an agreement amongst the owners, such as you have indicated? That is all that is wanted.

1296. The other aspect of the question is, if such an arrangement were possible, and a consequent satisfaction could be obtained in regard to present requirements, do you think that the existing wharfs would be sufficient to carry us over several years ahead? I think so. I think for our time we have enough accommodation.

1297. It has been suggested that within a few years we may have a very considerable increase in our export of wheat, for instance, and possibly in some other lines; do you think it would be advisable to make any additional preparation for a contingency of that sort, or do you think that Darling Island and the Pymont wharf would be sufficient to deal with it? I think so. You have quite enough wharfage to take all the produce you could fetch by rail.

1298. Even allowing for a large increase? Yes. You have wharfs at Darling Island where you can run your trucks right alongside the vessels, and you have also the Pymont wharfs, which, however, are not so handy, because you cannot bring your produce right alongside the vessel there, but have to land the produce on the jetty first, in many cases, before you can put it into the ship's slings. I mean you do not get your drays right on to the projecting wharfs at Darling Harbour.

1299. But we are assuming that they would run the railway trucks right to the ship's side with wheat and similar produce? That would be very handy.

1300. You know that during the last year or so, as compared with four or five years ago, there has been a serious deficiency in the quantity of wool available for export? No doubt.

1301. Was your estimate of the capacity of the existing wharfs based on our present wool clip; or on what it was a little while ago, and what we might reasonably expect it to be once more with fair seasons; you said we could deal satisfactorily with everything that came along, if proper arrangements were made—was that opinion based on the quantity of wool we have received during the last two years, or upon a possible getting back once more to our clip of say, 1895 or 1896? I look forward to getting back to the old clip again.

1302. If we get back to that clip, meaning an addition of 100,000 bales, do you think we could deal with it satisfactorily? Yes.

1303. What difference in price do you think you would require to charge as a carrier for bringing goods from Glebe Island to York-street, for instance, as compared with either Woolloomooloo Bay or Circular Quay to York-street? You must not take York-street as the leading part of the storage.

1304. Which is the leading part? I think the bonds round the wharfs. The proportion of goods delivered in York-street is very small in proportion to the goods handled in other parts of the city—for instance, say you start at Parbury's bond, and go right round to Saywell's bond, Dalton's bond, 'Towns' bond, Dalgety's new bond, the Adelaide bond, and the Grafton bond.

1305. They are all close to Miller's Point? Yes, and the bulk of our cargo goes to those bonds.

1306. But the goods taken to those bonds have subsequently to be taken to warehouses in the city? Some of it; but lots of it is exported, or sent to the railway.

1307. Assuming a higher general tariff were put on imports under Federation, it would not be impossible at any point, such as Glebe Island or Woolloomooloo, to have bonds erected for the convenience of importers? It is very hard to tell. That would depend upon the demand for warehouses. But in my opinion, if you were going to build them, Woolloomooloo would be the most suitable place.

1308. Assuming that you had a lot of goods that were not going into bond in the meantime, can you give us an idea of what would be a fair additional charge for the extra distance in coming from Glebe Island, instead of from Woolloomooloo Bay? It would be 2s. a ton more.

1309. That would be practically double what is charged now? Yes. In fact, from Glebe Island we charge 5s per ton, and could not do it for less than 4s. a ton. It takes double the number of horses to do the work from Glebe Island as from this end. From the Quay I can do as much with six waggons as I can do from Balmain with twelve waggons.

1310. Would the gradients between Glebe Island and the city be heavier than those between Woolloomooloo Bay and the city? There is very little difference, I think, in the pull. I think that Market-street, coming up from Pymont Bridge, is as heavy a pinch, if not heavier, than the other.

THURSDAY, 21 DECEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The Hon. ANDREW GARRAN, LL.D.

ROBERT HENRY LEVIEN, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Edmund Charles Beckett, Acting Secretary, Birt & Co., Ltd., steamship agents, sworn, and examined:—

1311. *Chairman.*] Being acquainted with the scheme before us, especially that portion of it dealing with the northern end of Glebe Island, would you give us your views upon it, in the first place as to whether you think extra wharfage accommodation is necessary for the port of Sydney? We are agents for the Federal Steam Navigation Co. We have in that line eight very large steamers, going up to 9,000 tons dead-weight carrying capacity. There are seven vessels of that size, and one of 6,000 tons dead-weight. They are all engaged in the trade between Australia and London, carrying refrigerated and general cargo, and bringing out goods from London and New York. These steamers sometimes carry from 10,000 to 11,000 tons of measurement cargo from New York. We find a difficulty in the discharging of these steamers at the present wharfs in Sydney. Say that 5,000 tons of the whole of the cargo on board a steamer are put out at Sydney, we start discharging, we go on discharging for two days, and after the two days the wharf is absolutely blocked, and we have to stop discharging until part of that cargo has been removed by the carters, which means a consequent loss of time and of money to the company. Of course, loss of time in connection with ships of that capacity is very serious. The ships are worth £70 a day to us. That is a very serious item; and we want to find a wharf where we can go on continuously discharging the cargo of the steamer, and get her away in the quickest time possible. We consider that at the present time we have not found such a wharf in Sydney.

E. C. Beckett.
21 Dec., 1899.

1312. Would you have any objection to state where the wharf is where you suffer this inconvenience? We generally berth at Parbury's, Dawes' Point. That is the most suitable wharf available for our steamers.

1313. Is that a jetty or a wharf? It is a jetty. Of course, some of the steamers have discharged at Circular Quay. The last steamer, the "Devon," discharged at Circular Quay—at Flood's wharf—and we found the same difficulty there as we have found at any other wharf. That is one of the Government jetties, at the north-west end of the Circular Quay—the jetty that the A.S.N. Co. built.

1314. You find the same inconvenience there? Exactly; and we do not know any other place in Sydney where we would not find the same inconvenience.

1315. Are there any jetties which you have tried without similar inconvenience? No; we have not put our steamers at any other wharfs, because they are not long enough, and not large enough to put the cargo upon.

1316. Is that a difficulty which would be got over if the jetties were wider than they are at the present time? You might get over it in that way. The jetties are long enough. The boats are 420 feet long, and you want a wharf at least 500 feet long to accommodate a ship of that length.

1317. How do you manage for your wharfage requirements;—you have to make arrangements, I suppose, before the ship arrives? Yes. We generally give notice to the owners of Parbury's wharf that our steamer will be in on such a date, and they reserve us the accommodation.

1318. Is Parbury's one of the associated wharfs? I believe so.

1319. Has that inconvenience occurred frequently? Every steamer that we have here—that is, of the larger class of steamers. We have only one small steamer. All the others are of the same size.

1320. Your difficulty occurs, not in getting a berth at a wharf, but owing to the faulty construction of the wharf? You might not say it is faulty construction, but there is not enough accommodation.

1321. Not enough floor space on the wharf? Decking, or shed accommodation.

1322. When you have had one of your ships at these jetties, has there generally been a ship on the other side? No; a ship on the other side would make it worse still.

1323. It is as bad as that—that even when you have the whole width of the jetty you are impeded in the discharge of your goods? Yes.

1324. Have these jetties any rails laid and trucks running on them? No; the carts are brought right on to the jetty.

1325. Do you think if there were trucks running along the jetties, that would assist you? That would not make any difference, because, when you start discharging a vessel, you commence by taking the cargo to the back part of the wharf, and as the packages come out you go closer to the end of the jetty, and gradually fill the whole of the jetty up.

1326. But if you were to unload right away into trucks, and were to send them into stores on the wharf, would that not be a convenience, or do your goods generally go right away to their destination? They generally go right away to their destination. A very small proportion of them is put into bond or stores. We have to give the consignees forty-eight hours' notice to remove their goods. We cannot store them before the lapse of forty-eight hours.

1327. So you deposit them on the ends of the wharf? Yes, and stack them up. It costs us a lot of money stacking the cargo.

1328. Can you tell us what the width of one of these jetties is which you get crowded up in this way? I think Parbury's wharf is about 60 feet wide, but I am not certain as to that.

1329. How many hatches do you work at once? If the cargo is in all the hatches, we, if possible, work the lot. Sometimes we have to get these steamers away in a very short time. They are wanted for other employment, and we work night and day.

1330. Is it a universal practice for the goods to be landed on the wharf and then put on drays and taken to their destination? Yes.

1331. None of it is taken from the ship's side? Some of the goods are lightered. The lighters come alongside on the outside of the steamer.

1332. Punts? Yes

1333.

- E. C. Beckett. 1333. But are the goods which are carted away first deposited at the head of the wharf and then carted away? They are first deposited on some portion of the wharf, it may not be at the head; it may be any part of the wharf. The carter comes along and presents his order to the delivery clerk who tells the carter to go and find his cases.
- 21 Dec., 1899. 1334. So that really there are two handlings from the ship's hold, before the goods get to the consignees? Yes.
1335. There is no way of avoiding that? No, you could not possibly avoid that, because the cargo is stacked in all parts of the ship.
1336. What remedy do you see for that state of things? We want larger space on the wharf itself. That is the only remedy we can see.
1337. Do you think that these jetties are better than the broadside wharfs? No, we favour the broadside wharfs.
1338. But you have not been able to get one? Well, there is one at Woolloomooloo, but we do not think that that accommodation would be any better than what we have at present.
1339. But there is a big broadside wharf at Woolloomooloo? Yes.
1340. Why would not that be better? I do not think we would get over the difficulty of the blocking, in connection with the discharge of the cargo.
1341. Do you mean the new wharfs on the eastern side? Where the White Star Line is.
1342. What is the defect—are they not broad enough? We are closely connected with the steamers owned by Houlder Brothers which are about the same size as, and are worked in conjunction with, our line of steamers. The steamer "Langton Grange" belonging to Houlder Brothers discharged there lately, and from what I learned from Mr. Houlder, I do not think that any more satisfaction was given than was given at Parbury's Wharf.
1343. You seem to be rather in a difficulty; the old-fashioned jetties are not good enough, and the new fashioned Government jetties are not good enough? We think the broadside jetties could be made good enough, with a big shed.
1344. Are not those sheds at Woolloomooloo big enough? They would be in many cases, but there are cases in which you would have to stop discharging; and, of course, Woolloomooloo is a long way out of the city.
1345. Mr. McMahon told us yesterday that the cartage from Woolloomooloo Bay would be just the same as from Circular Quay? The charge is no more.
1346. But you think it is inconvenient, by reason of its being away from the warehouses? Yes.
1347. Then, supposing that a wharf at Woolloomooloo Bay were available for you to-day, and you could go and make arrangements for it with the Government, would it not suit you for your big vessels to hire one of those wharfs? No; because it is not suitable for our refrigerated cargo. We have to load our refrigerated cargo from the stores at Darling Harbour, and we have always to shift up to Pymont, after we have discharged the inward cargo, to load the refrigerated cargo.
1348. We have had some evidence on that phase of the question, and it seems to be the case that very often you have to discharge at one wharf and load at another? We have always to do that in the case of our steamers.
1349. That will always be the case until we get perfection in wharfage? Not in the case of a wharf at Darling Island, for instance.
1350. But it is hardly contemplated, I think, to use those wharfs for import purposes; they are designed chiefly for export purposes? Sheds are not to be erected, then.
1351. No, there will not be sufficient room; do you know any better accommodation in the other colonies where your ships go to for dealing with ships' cargoes? I do not. I have not seen the Melbourne wharfs, but I understand from some of our captains that some of the Melbourne Government wharfs are very suitable, simply from the fact that they put everything into a large shed, and that shed is locked up at night, and the result of that is a very small percentage of claims.
1352. Are those the berths up the river Yarra? At Williamstown.
1353. Are those broadside wharfs? I do not know.
1354. Could you have a wharf which would work the two purposes—the import and the export—without very great expense? We think so. We do not see any reason why those wharfs at Darling Island should not be made to work both. That is what we should like, because it is very costly shifting these large ships about the harbour. We generally have to employ two tugs and a pilot.
1355. Do you think there would be any difficulty in having cranes and other things on the wharf for putting cargo into ships, and at the same time having large sheds there for storing goods which were landed? No; because the ships use all their own gear for loading and unloading.
1356. Do they for loading? Yes, our steamers use all their own gear.
1357. Have you ever thought that at Darling Island it would be advisable to have large sheds erected for the locking up of goods until they are moved away? We want to keep a perfectly open mind on the subject, but we have been looking around, and as far as we can see they are the most suitable wharfs we have yet seen for our purposes. Of course, they might not suit somebody else.
1358. Would they suit you in their present state for unloading purposes? No, they would not.
1359. What would be required to make them suitable for unloading purposes—would you have to have large sheds there? We should have to have sheds there.
1360. So that your goods could be locked up for protection from robbery? Yes, and for protection from the weather, whilst waiting there to be taken away.
1361. That is an absolute necessity for any large import wharfs? Yes.
1362. *Mr. Dick.*] Your boats are engaged in the frozen meat export trade? Yes, very largely.
1363. Do you take much away from New South Wales? Yes; we take very large quantities of mutton from Sydney.
1364. Where are your refrigerating works? At Darling Harbour.
1365. Do you load alongside there? We load generally on this side of the bridge. We have a wharf on the inner side allotted to us, connected with an overhead tramway into our works, but we cannot use that at the present time owing to the steamers being unable to get through the Pymont Bridge. The steamers are too large, and until the new Pymont Bridge has been built we shall not be able to utilise that wharf at all, except for one steamer.

1366. How do you convey the meat from your works? We cart it in louvred vans from the works to the steamers. E. C. Beckett.
1367. Are you aware that there is a proposal to extend the railway round to the end wharf at Darling Island? Yes. 21 Dec., 1899.
1368. Do you think that if that were done it would offer better facilities for the shipment of frozen meat than exist at present, or would it be necessary still to do a certain amount of carting? Yes, I think that would be necessary, because you might have only a small quantity of mutton going and would not want to load a refrigerator car. The railway runs right into our works, and you could load the meat in a better condition by putting it into the refrigerator cars and running it to Darling Island.
1369. What is the present practice in regard to the shipping of meat—do you keep a fairly large stock of frozen meat at your works, or do you get it down in anticipation of a vessel coming in? It varies very considerably. Sometimes we will have only a few thousand sheep in store, and at other times we will have 30,000. A great deal depends on the way the vessels are running, and also of course as to the extent to which we are buying.
1370. Are those sheep killed and chilled in the country and then sent to your works and frozen there? No, the principal number are killed at Glebe Island. We get a few killed from the country.
1371. But you do the whole of the freezing yourselves? Yes.
1372. Do you think that is a practice that is likely to obtain if the trade should greatly develop—will the killing take place in Sydney or up the country? At the present time we are erecting very large slaughtering works near Blacktown—at Schofield's Siding—and we hope to have those works in operation in about nine months. Then we shall kill nothing at Glebe Island. We do not consider Glebe Island at all suitable for the slaughtering of export mutton.
1373. Will you kill and chill up there and freeze in Sydney, or will you perform the whole operation at Blacktown? We shall simply kill at Blacktown. We shall not chill, and we shall do all the freezing in Sydney. The mutton comes down in louvred cars, and there is no necessity to chill it up there. It would be only a waste of money and time.
1374. Supposing that you were starting absolutely new works of this kind for yourselves, do you think that it would pay you better to erect refrigerating works alongside the export wharfs and get your meat simply chilled from the country to be frozen at the works and then placed straight aboard, or to cart it out as you do at present? Of course there is always an advantage in having works alongside the ship, because it saves handling of the meat in the way of cartage, and so saves you expense. The fewer handlings you give meat the better colour it retains, and you get a better sale for it; but as regards your question about chilling, there is nothing at all in that with respect to mutton, because you can freeze mutton straight away, and you do not want to chill it. If you put fresh mutton into the freezing-room it freezes in three days.
1375. *Mr. Watson.*] At works far back in the country, where sheep are killed for export, do they chill the sheep before sending them to Sydney? Yes; because they would be bad upon arrival unless they chilled them.
1376. *Dr. Garran.*] How long does it take to chill them? You can chill them in about eighteen hours, but it is very detrimental to mutton to chill it in the country and send it down for freezing.
1377. Why? Because the legs go black on the way down, and it spoils the appearance of the mutton, and you cannot sell it for such a high price as the freshly killed mutton.
1378. *Mr. Dick.*] With respect to beef, does the same thing hold, or is it necessary at first to freeze that right off? It is better to chill beef if possible, but there is no compulsion in the matter. If you can chill beef at the slaughter works, it is preferable.
1379. How long does it take to chill beef? It would take about twenty-four hours, I suppose. It takes five days to freeze beef hard.
1380. In view of those facts, do you think Darling Island, above any other wharf, offers exceptional facilities for the erection of refrigerating works and for the export of frozen beef and mutton? No, I do not think there is anything special about that. If you have a wharf at Darling Island you can export mutton from our place, or from the Fresh Food and Ice Company's works, just as well as you can from the island.
1381. Do you know the way they ship frozen meat in Newcastle? Yes.
1382. It is frozen up the country and shipped straight from the refrigerating cars into the vessel? Yes.
1383. Do you think that it is a desirable method? No, it is very undesirable, for in the summer you often get a train-load of meat down soft, and I have known cases where the meat has all had to go back to the freezing works. The ships will not take it when it is soft, for if they put it into their holds in that condition it turns out in London damaged.
1384. Does it do the meat much harm to get soft and be sent back to the freezing works to be hardened? Supposing that soft meat were put into a ship's hold, as you commenced to stack, the bottom tiers would become misshapen, and would be almost unsaleable. If you take it back as it is in the cars and unload it in the works, it is not so much damaged, but there is always a certain amount of damage. We tried to load meat last summer from our works at Darling Harbour into our steamer at Parbury's Wharf, and we could not do it. The meat got too soft on the way across.
1385. Do you have a special vehicle for carting frozen meat? No; the ordinary meat car that you see in the town.
1386. Ventilated? Yes.
1387. Can you offer any suggestion for improving either the import or the export facilities at present given in this harbour;—can you suggest any improvement which might be made, apart from that of building sheds; is it a fact that the spaces immediately adjoining our public wharfs are too constricted? I do not think that is the case. We look at this matter only from the point of view of our steamers, which, with the exception of the new White Star boats, are the largest which come here. I am speaking of cargo steamers now, and we have found that we want a suitable wharf in Sydney, and have been looking around and do not see one which suits us at the present time.
1388. Can you give the Committee any idea of what you would consider a suitable wharf—that is, what size, what facilities, what appurtenances, and where you think it could be best built? We rather think, without committing ourselves definitely—because we want to keep quite an open mind on the matter—that one of the Darling Island wharfs would suit us at the present time, provided that we had sheds built there

- E. C. Beckett. there for the import cargo, and communication established with the city. Of course there is no roadway there now.
- 21 Dec., 1899. 1389. That will be done? We want that, and then we want a wharf at least 500 feet long, and we want a depth of water of 27 or 28 feet.
1390. What shed storage would you require? A shed to take 5,000 tons of cargo.
1391. Have you ever unloaded 5,000 tons from one vessel? Yes, nearly every steamer of ours that comes from New York brings 5,000 tons of cargo. For instance, we have the steamer "Surrey" coming along now. She will be here early in January, and I think she has on board 4,500 tons, and the "Devon," which came in the other day and was unloaded at the Government wharf we use at Circular Quay, had just over 5,000 tons of cargo.
1392. I take it that you do not think that there is much advantage in separating the import wharfs from the export wharfs, but you would prefer to have one wharf to serve the double purpose? We should certainly, for our business.
1393. Would that hold good in regard to other large firms besides yours? Yes, I think it would hold good all round.
1394. How long would it take you to unload 5,000 tons from a vessel, working the usual working day? It would take us seven or eight days.
1395. Could the carts take the cargo away as fast as you got it out of the vessel? No, they cannot do that. That is why we want a wharf to stack the cargo on.
1396. How long, compared with the time you take to put the cargo out, does it take them to cart it away—twice the time? Yes; it is nearly a week after the vessel has gone before the wharf is cleared.
1397. Then, supposing another vessel comes in immediately after the one you have discharged, there must be a mess? Then we have to give notice to the consignees that unless they move their goods we will store them and charge them storage; but it is very seldom we have steamers so close together as that.
1398. Could the difficulty of having cargo on the wharf, and thus blocking it up, be got over by considerably increasing the capacity of the present sheds? I do not think so. If you have your shed full because the carters have not taken the cargo away, you want another shed for the next steamer, or you have to take the cargo out of that shed and put it into stores in town before you can start unloading another steamer.
1399. You know the proposal to construct wharfs round Glebe Island? Yes.
1400. With that proposal there is another—to connect Glebe Island with the railway by means of a line coming from somewhere about Ashfield. With that island cut down and the wharfs constructed as proposed, and with railway communication, do you think that those wharfs would be taken up by large shipping firms, as is the case at Circular Quay and Woolloomooloo Bay now? I think there is a probability of it, seeing that the trade of Sydney is increasing so rapidly.
1401. You have had a difficulty yourselves in getting a suitable wharf? Yes, we have.
1402. It is mainly on account of the distance from your works that the Woolloomooloo Bay wharf would not suit you? Yes.
1403. Would Glebe Island be any more suitable for you? No, I am afraid it would not.
1404. Do you think it would pay other firms, when the island has been levelled, to erect works at Glebe Island for the meat export trade, of course with railway communication to Glebe Island? It is rather difficult to answer that question.
1405. With a prospect of obtaining trade in that way, would they just as soon start their works at Glebe Island as at Darling Harbour? Yes; I think it would be preferable, because Darling Harbour is so congested at the present time.
1406. How long does it take you at present to take your meat in those louvred vans from your works to the ship's side? It all depends where the ship is being loaded. We generally load meat at Pymont, just on the other side of Pymont Bridge, and it takes us ten minutes or a quarter of an hour to take the meat from our works to that place.
1407. How much longer do you think it would take to send your goods round to Glebe Island, a distance of about a mile further, instead of sending them to the Pymont wharf? It would take us over half-an-hour to get to Glebe Island from our works.
1408. Would the difference between ten minutes and half-an-hour be a serious thing for the meat? Yes; because when you have it at the ship's side you have not got it unloaded. The van stands there sometimes for ten minutes before the meat is put into the hold.
1409. But that is so in each case, is it not? Yes.
1410. I mean, would the difference in the time involved in the difference of distance be a serious thing? Yes, it would. We should not think of doing it if we could possibly avoid it.
1411. With respect to the import trade, presuming that you had large shed accommodation and means of getting your goods away, as there will be at Glebe Island, would that be a suitable wharf for the discharging of your vessels? No, we do not think Glebe Island would suit us at all. It is too far away from the city, in the first place, and the consignees would object very strongly at present if we thought of sending one of our steamers to Glebe Island to discharge.
1412. Do you know what difference it would make in the cost of cartage? No, I cannot say that; but I think it would be at least 1s. 6d. or 2s. per ton. We pay for the cartage of our meat from Glebe Island to the works at the rate of 2s. 6d. per ton.
1413. Where are the principal centres to which you send your import goods after discharging them from the vessel? The centre of the city—warehouses in the city.
1414. Where are the stores mostly situated? For instance, Lassetter's in York-street. They are very large importers. There are very large imports of grain from New York, and they are distributed about Sussex-street. There are very large imports of barbed wire which go into the warehouses in and about York-street.
1415. Looking at the map, there does not seem to be much difference between the distance from Glebe Island to those various stores and hardware establishments, and the distance from Circular Quay or Woolloomooloo Bay to them; so, on that ground, they appear to be equally handy? There does not seem to be much difference; but I think you would find that they would object very strongly to it at present though they might not later on when they got used to the thing.
1416. Of course fashion and prejudice have a great deal to do with these things? Yes.
1417. I think it is proposed to have 27 feet of water round Glebe Island;—do you think 27 feet would be sufficient? Yes, I think so. Our steamers draw from 26 to 28 feet when fully loaded.

1418. *Dr. Garran.*] You can unload twice as fast as the carters can take the goods away? Yes. E. C. Beckett.
1419. Then you have put your finger on the weak point of our system,—that our get-away is not equal to the necessities of the case? That is true. 21 Dec., 1899.
1420. Can you point out how that is to be remedied? I cannot see how we can remedy it. You never get the goods away from the wharf as fast as the ship can put them out. I do not think you ever will do that.
1421. Because it is the custom for the consignees to fetch away the goods, and all the goods have to be sorted on the wharf? Yes.
1422. And they are very often not in a hurry to do it? That is true.
1423. They sometimes want to sell them before they remove them? Yes.
1424. They have not room in their stores for them? No.
1425. And they want to keep them on the wharf? Yes.
1426. And sometimes the carters have to pick out packages for six or seven different firms, and this causes delay? Yes.
1427. How can we possibly remedy those defects? I do not see how we can. A carter goes with an order for the delivery of a certain package and has to find that package on the wharf among a large miscellaneous cargo.
1428. Among 3,000 or 4,000 tons of cargo, perhaps? Yes, and it is, perhaps, days before he can get it, because it is covered by other goods.
1429. So the carters waste a good deal of time on the wharf? There is no doubt of it. If you go to some of the wharfs you can see them waiting perhaps half a day—waiting for their turn to get their goods.
1430. According to your description, it seems to me that we ought to have two warehouses each of 5,000 tons capacity on the wharf? Well, that would be all the better.
1431. Then you could bundle your cargo into one of them, and the other would be ready for any ship that came along the moment you had gone? Yes.
1432. But we have not room on our wharfs for anything of that sort? No.
1433. It seems to me that Glebe Island is the sort of place you want, where there is plenty of room behind? The more room the better.
1434. You told us the complaints you have in regard to Sydney; are you better served either at Fremantle, or Port Adelaide, or Port Melbourne, or Brisbane, than you are in Sydney? On the whole, I do not suppose we are.
1435. You could make as big complaints of any of those ports? Yes, I think so; but, of course, the quantity of cargo to be discharged at those ports is not as heavy as it is at Sydney. Sydney has generally the largest portion of the ship's cargo.
1436. That has been the case hitherto with you? Yes.
1437. Although you call at three of the other ports the bulk of your cargo is put out here? Yes. The largest portion is for Sydney, the next for Melbourne, and the smallest for Brisbane.
1438. You do not call at Port Adelaide? Sometimes, but not often.
1439. Where do you go to at Brisbane? To our own wharf—Musgrave wharf.
1440. Right up the river? Yes. We have our refrigerating stores built right on the edge of the wharf. We have a very fine wharf there, 500 feet long, but we have only 22 feet of water there.
1441. It seems to me that the only objection you have to Glebe Island is on account of its distance from the city? Yes.
1442. If it were as close as Darling Island it would be an admirable site? Yes, as far as I can see, it would. There is no doubt it will be wanted in time.
1443. Would not that difficulty be partly got over by having a branch railway to Glebe Island? Then you would have to handle the goods a second time—discharge them at Darling Harbour, and cart them into the town.
1444. It would not pay to lighter them from Glebe Island to Circular Quay? There would be the same difficulty then.
1445. You really do not see how we are to effect a reform that will absolutely satisfy all your wants? Not at Glebe Island.
1446. And you will not be satisfied with the Woolloomooloo wharf? We do not think that will suit us.
1447. That is too cramped? Our main objection is that it is too far away for our refrigerated cargo.
1448. And also too cramped for your imported goods? I dare say it could be made suitable for them.
1449. You think the space is small? Yes.
1450. You think that an import wharf ought to be larger? Yes.
1451. You say that for these large steamers the wharf area is not large enough? That is what I have heard from our people.
1452. And the shed room is not large enough? Well, in many cases it might be large enough; but there might be a cargo for which it would not be large enough.
1453. And at Circular Quay none of the jetties are large enough for your steamers? Nothing like large enough there.
1454. But if you could get a permanent wharf there, none of them are big enough for you? No.
1455. And they are all too far from your refrigerating works? That is true.
1456. Do you load your meat at Pyrmont, close to where the coal is loaded? Yes, at the same jetty.
1457. Do you use the crane that is there? No; we use our ships' winches.
1458. Supposing a coal ship happened to be there taking in coal from the Metropolitan Coal Co., would that be in your way? I suppose it would be loaded at another berth. There are several berths there.
1459. Would you object to take frozen meat on board if a coal ship were being loaded within 100 yards? It all depends on the direction of the wind and the circumstances at the time. If there were any fear of coal-dust getting on to our meat, we would stop at once.
1460. It would not do to have the coal-dust mixed up with your meat? No. We cannot coal steamers and load meat at the same time, even if we are coaling aft and loading forward.
1461. Then it is a drawback to those wharfs that there is a risk of a coal steamer being loaded when you want to be there? Yes; and there is the great drawback of the want of cartage room. You can only get one cart along at a time, because of the rails there.
1462. There is a wharf that goes right up to the bridge? Yes.

- E. C. Beckett. 1463. Can you lie there? If there is enough water there. I do not know how much there is.
- 21 Dec., 1899. 1464. You have never loaded any of your ships there? No; we have done that generally at the other berths.
1465. There would be plenty of carting room at that wharf? Yes.
1466. If there is water enough, that would suit you? It would be better than the other.
1467. But you would be still rather too near the coal? Yes.
1468. So, in your opinion, the Government ought not to allow coal to be shipped at or near the same wharf where a ship is taking in frozen meat? That is, if the steamers are loading together.
1469. If we are going to ship frozen meat at Darling Island, we ought not to think of having any coal stages there? No, I do not think it is advisable.
1470. We are told that the appliances for the shipment of coal are insufficient, and, therefore, the Government may be looking out for another place;—you think it would be very undesirable to have it at Darling Island, if we are going to ship frozen meat from there? Yes, unless it were a good distance away; on the other side, for instance.
1471. How far;—fine coal-dust will travel a long way? One-eighth of a mile.
1472. *Mr. Watson.*] You said you thought that Glebe Island might be useful from a wharfage standpoint in the future, even if not immediately;—in that connection, do you think the trade of the port, from your experience of it, is likely to be increasing to any material degree during the next five years? If we are to take any guide from the past, I should say it would very materially.
1473. Leaving out of account tonnage inwards and outwards, you think there has been a total increase in the amount of cargo carried;—do you think there has been a large increase of that lately? A good deal depends, of course, on the season with regard to the exports, and, of course, that governs the imports a good deal. It is very difficult to say.
1474. Does your firm contemplate dealing with wheat in the event of the Colony becoming a large wheat-producer? Certainly.
1475. Have you had any experience yet of exporting wheat? Not from Sydney.
1476. From any other place? I dare say our people have in other parts of the world.
1477. Taking, for instance, the export of wheat, in that case you would allow the railway trucks to go right to the ship's side, I should imagine? Yes.
1478. And discharge directly from them into the hold? Yes.
1479. So in that instance you would require to have the railway right down to the wharf? Yes.
1480. It is estimated that this year we shall have an exportable surplus of about 90,000 tons of wheat? Yes.
1481. Do you think that could easily be dealt with at the existing wharfs at Pymont? No, I am afraid that when this wheat comes in the Railway Commissioners will find they have a very big job to get rid of it. I am afraid there will be considerable trouble if there should be the large surplus anticipated. I think there will be considerable trouble in handling that.
1482. And if, as some people anticipate, the opening of new railway lines should lead to the putting of much larger areas under wheat, and a consequent increase of production, with fair seasons, you will probably require, to deal with the then surplus, the whole of the Pymont and Darling Island wharfs, and the railway connection, during the wheat season at any rate, for that purpose alone? Yes.
1483. I take it that the tenor of your evidence is that although it would not suit your firm to take a berth for its present trade at Glebe Island, owing to the distance it would be from your own works, you think it would be well to make some effort to provide wharfage there for the future? Yes, I think it will be wanted in the future.
1484. *Mr. Shepherd.*] Have you had any experience in loading and unloading ships otherwise than in Sydney? Only a small experience in Brisbane.
1485. You said you thought that one of these jetties where you load or unload was about 60 feet wide, and that you were hampered even with only one vessel at the jetty? Yes.
1486. What width do you think would be sufficient for a jetty at which to load or unload—whichever you think requires the greatest width—two ships, one on each side? It is very difficult to say right off, but I should say that we should want at least 120 feet, and also very large shed accommodation. Of course, the shed would be on the wharf.
1487. Have you had anything to do with loading or unloading large vessels at any of these jetties? Yes, the Federal line of steamers.
1488. The jetties I suppose are hardly long enough; you cannot get to all the hatches at once, supposing there are three or four? At Parbury's we can get to all the hatches, just about, but you want a jetty at least 500 feet long to work a ship properly.
1489. Do you think that the wharfage accommodation could be made more convenient than it is with the same space as we have now—do you think it is badly managed in that way? I do not say that, because with the facilities there are I think nothing better could be done.
1490. But I gather from your evidence that you are rather dissatisfied with the wharfage accommodation in Sydney? Yes, we are dissatisfied; but I understood you to say that the working of the present wharfs was unsatisfactory. Of course, the Government have only certain material to work, and I suppose the officers work it to the best of their ability. But that was not the point. We say that the point is, that there is no wharf suitable for our trade at the present time.
1491. What improvement can you suggest to make the wharfs more suitable for your purposes? The present wharfs we could not make suitable for our purposes. We want a new wharf altogether.
1492. Can you explain to the Committee how you would propose to construct the wharfs if we were to have new wharfs altogether; in the case of Glebe Island, it is proposed to construct new wharfs, and if you can make any suggestion as to improvement there, it might be valuable to the Committee. As I stated, we favour a longitudinal wharf—not a jetty, but a berth, with plenty of space from the water-side back—sufficient space to at least unload 5,000 tons of cargo and work all the hatches at once, generally five hatches.
1493. Do you consider that there is not sufficient space given at Circular Quay? Yes; we have proved that over and over again.
1494. I thought you had a complaint to make of the whole of our wharfage accommodation here? No; excepting that we have not anything suitable for our steamers, I have no complaint to make about the wharfs as they are.
- 1495.

1495. Do you mean that you have not sufficient length of water, or not sufficient depth from the wharf? *E. C. Beckett.*
It is depth principally.

1496. You require more room for discharging or taking in cargo? *Yes.*

21 Dec., 1899.

1497. I want to ascertain the width you think would be a suitable width from the vessel for every convenience? It is very difficult to say off-hand; but I should say that we would want from 100 to 120 feet.

1498. *Chairman.*] Would that include shed space as well? *Yes, sheds on them.*

1499. Do I correctly understand that you applied to the Government for wharf space for your ships, and could not get it? We have been having some negotiations with Captain Jackson for a suitable wharf to be allotted to us, and wherever we take up a wharf our friends, Houlder Brothers, will probably join in with us, and berth their steamers at the same wharf. Captain Jackson, and our general manager, and Mr. Houlder have been round inspecting the wharfs at Woolloomooloo, and Parbury's, and at Darling Island. We could not agree to anything suitable at Woolloomooloo or at Parbury's, and our idea at present is that Darling Island will suit us best; but if we can have anything put before us which we think will be better, then of course we are willing to enter into negotiations.

1500. Then you have had difficulty in getting suitable wharfage accommodation? *Yes, we have had great difficulty.*

1501. It has been stated by other witnesses that although the tonnage in and out of Sydney has largely increased during late years, the increase has been only in the tonnage, and that ships come here and go away only partly filled with cargo,—is that true? *Yes, that is true.*

1502. But even if that is the case, it occurs to me that the necessity still exists for wharfage accommodation for these big ships? *Yes.*

1503. The small old wharf is no good for the present ships? *No, it is not.*

1504. The question is not altogether as to the number of wharfs or their locality, but what is wanted at the present time is large straight wharfage accommodation for the modern large ships? *Yes, that is the point.*

1505. And whether they come half full or fully loaded you must get those ships alongside a wharf, and the cargo is distributed among their holds although each hold may not be full, and you want sufficient space to work all the holds at once? *Yes, that is what we must have.*

James Powell, late Collector of Customs, Sydney, sworn, and examined:—

1506. *Chairman.*] You were for many years Collector of Customs in the City of Sydney? *Yes. I was* *J. Powell.*
Manager of the Wharf Association also for some years.

21 Dec., 1899.

1507. I understand you have a statement to make? *Yes; I did not receive an invitation to attend before this Committee until 6 o'clock on yesterday evening, and I regret to say that I am very ill-prepared to undergo a searching examination in respect to any general statements I may make. I regret that my statement is of necessity general, because I am retired from official life, and I have not the access to official papers which would enable me to test or to support such opinions as I may have formed in the past respecting wharfage accommodation in Sydney. I was examined some years since on the same subject by this Committee, and I then, I think, hazarded the opinion that the wharfage of that date was not only equal to the wants of that time, but that the accommodation then existing was sufficient generally to suffice for any reasonable time later on. How much the conditions have changed we all know, but, speaking after consideration and with great deference for the opinion of those whose opportunities to gather facts and figures are greater than those now at my command, I hold that the opinion I expressed when I was previously examined is maintained, and I still hold that the wharfage accommodation for the trade of Sydney is in full advance of the requirements of trade. Mr. Coghlan shows that the increase of steam tonnage for the nineteen years ending 1895 was 387 per cent. In the advertising columns of the daily Sydney journals of yesterday, four steam companies advertise vessels trading from Sydney to Europe representing a carrying cargo capacity of over 180,000 registered tons. This tonnage is the tonnage of twenty-seven vessels continually trading to this port, and the whole of the vessels are accommodated at the Circular Quay, and I may say that the berths are almost constantly filled by the vessels I refer to. Another feature is that, in yesterday's paper the vessels advertised for London are all steam vessels, and not one sailing vessel was advertised on the berth to load for London or for any port in Europe. There are old colonists on this Committee whose memories will recall the daily advertisements of sailing ships in the back time, and the long string of names, such as the Phœnician, Walter Hood, Vimiera, Dunbar, Parramatta, Light of the Age, and a host of others—but this reminiscence would be an impertinent waste of your time if I did not intend to endeavour to found an argument upon it. I ask myself how many sailing ships have these steamers displaced? It would require a sailing fleet of 150 vessels of 1,200 tons each to take the place of the steamers now doing the Sydney and London trade:—From Great Britain, 1897, inward, 50 ships, 83,679 tons; 125 steamers, 350,992 tons; outward, 42 ships, 69,219 tons; 120 steamers, 337,737 tons. Many years ago the trading sailing vessels were principally berthed at the Circular Quay for loading, and a great number of them discharged their inward cargo at the (so called) back wharfs. Now it is all changed. The steamers have the trade to Europe, and they are nearly all at the Circular Quay; the sailing vessels as between London and Sydney have almost disappeared, and the back wharfs are frequently vacant. In this way I still contend then that the accommodation for shipping is sufficient for the trade of the port, but then it is a question of the nature and character of the accommodation offered. I am sure that any person visiting Darling Harbour must feel that, if it were not for the great intercolonial trade—and I may add, the greatest and the most important carrying trade we have—Darling Harbour would be almost deserted by shipping. Empty berths are now the order of the day. The facts are that the Circular Quay is the place of places for the grand steamers and that it will long remain so. It has always appeared to me, that if it is desirable in the interests of the public to increase wharfage accommodation, that end would be best attained by the resumption of private wharfs. I speak as an entirely disinterested person, and I have always felt that the Government should resume private wharfs rather than enter upon expensive projects in anticipation of a trade which may be quite as much revolutionised in the future as it has been in the past. Just as certainly as that twenty years ago it might have been found difficult to berth the "Great Eastern" at the Circular Quay, so certain is it that in future years the over accommodation now suggested may not be found*

J. Powell. found up to date. The idea of levelling the Glebe Island and making wharf frontages is a grand one, but it is, I think, premature, and under existing conditions and with the great wharf extensions now approaching completion on the west side of Darling Harbour it would be well to wait a few years and see the outcome of the latest additions before attempting any new works of a costly character. Another matter I wish to refer to is the extension of the wharfage area. It does not appear to me desirable to get too much away from the present trade centres. If it be granted, as I suppose it will be, that there is more than ample accommodation for the discharge of all the sailing vessels to the port, it follows that the proposition to utilise Glebe Island is with a view to the export trade of the colony mainly, and, if so, the experience of that trade is that the place of shipment in the harbour will be influenced in various ways, and that it would perhaps be cheaper to load wool ships in the stream than to punt wool to Glebe Island. I think it would be wise to take a calm view of this wharf question. The questions—Does the present system pay? Will the proposed addition pay?—should form part of the inquiry. The value of the sites occupied, the amount spent in construction from the introduction of responsible Government to the present time are questions to be considered in the attempt to bring the wharfage question within the range of commercial criticism. The telegram I received from the Secretary invited me to give you my views on the wharfage question and trade of Sydney. This must be my excuse for going over old ground, which some of you may regard as tedious.

21 Dec., 1899.

1508. There is one feature of your remarks with which I do not seem to quite agree—that is, in regard to Circular Quay;—you seem to think that Circular Quay will always be the great centre wharfage for our large vessels; does it not occur to you that Circular Quay is every day becoming more a place for the ferry traffic of the city? There is no doubt of it.

1509. And it would appear, as far as we can see, that the ferry traffic is pushing out the big steamer traffic, especially on the southern end of the Quay and the south-western portion of it;—is that not so? I scarcely think that the ferry traffic will ever be worth what the present dues give to the Government from the discharging and loading of ships.

1510. It is not a matter of value, but of utility? If it is not a matter of the value of money, or of making the thing pay, I have nothing more to say. It has always appeared to me that the big ships wish to be at the Circular Quay because it is a good advertisement for them in getting passengers. That place has always been a favourite place. Even in the old days of nearly fifty years ago we know that the passenger ships always endeavoured to get the best berths they could at the Circular Quay. Of course, it was a very small quay at that time.

1511. But have they not been gradually pushed out. Within your memory and mine, and that of most of us round this table, the whole of the southern end of the quay was occupied by a string of large passenger sailing vessels; where are they to-day? They have disappeared.

1512. And the ferry steamers have taken their place? The ferry steamers have taken the head of the cove, no doubt; but of course the extensions have been made where the P. and O. boats are, and below that to the point, and all round that. At one time that was a kind of picnicking place.

1513. At the present day you must have noticed in regard to the large German steamers which berth at the south-western corner of the Quay, there is a kind of movement to get them away from there because the space is required for the ferry traffic? That is the larger giving way to the smaller, if it be desirable.

1514. I agree with you that for a certain class of steamer, such as the large mail boats, the Quay will always be popular, but in this inquiry we have had brought prominently under our notice the large vessels known as "tramps" and the very large lines of steamers such as the White Star Line, vessels of 10,000 tons each; those are the steamers which seem to require special wharfage accommodation, and where do you think they would find their resting-place? I do not think they would find it at Glebe Island.

1515. I do not want to know where they will not go, but where will they go? They would be very well served in the stream.

1516. But they bring general merchandise for warehousemen, and so on, and do you think it is desirable they should discharge their goods in the stream? It has been done again and again in the case of large ships.

1517. But is that up-to-date? No, I do not think it is. Then the question is, are we going to get all vessels of that class and character?

1518. We do not know what we are going to get, but we know what we have at the present time, and these vessels are a very large factor in our trade at the present time? No doubt.

1519. And those are the ships that we want to see if we can better convenience them to-day, and not only to-day, but in a few years to come;—do you think that, for many years to come—with Woolloomooloo Bay, with Circular Quay, with the wharfs commencing at Parbury's and going round to Moore's Wharf, and with Darling Harbour and Darling Island—we have plenty of wharfage for years to come? If you take in what are known as the private wharfs, I say unhesitatingly yes; but if you leave those altogether out of consideration, and say they are past their time, then I agree with you that you will have to provide accommodation somewhere else.

1520. I do not wish to put aside the private wharfs for one moment, I mean to take the whole thing together—the Government wharfs and private wharfs, commencing at Woolloomooloo Bay and going right round to Darling Island;—do you think that there is ample accommodation for shipping to-day and for a good many years to come? Taking in the railway jetties on the west side, I think there is ample accommodation, because you have not commenced to use Darling Island yet.

1521. Although the quantity of wharfage accommodation may be sufficient in the space just mentioned, are the facilities afforded at those wharfs up to date for the present shipping necessities;—have you been round lately sufficiently to say? Speaking generally, I would say that, with certain exceptions, there is no doubt that the Government wharfs are superior to the private wharfs, both in position and also in material and approach.

1522. Then your evidence amounts, I think, to this—that, taking the present available wharfage, starting on the south-eastern end of Woolloomooloo Bay, and working gradually right round to Darling Island, bring all those wharfs up to date, and then there is ample accommodation for the shipping of the port to-day and for a good many years to come? That is my opinion.

TUESDAY, 9 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

William Robson Benson, Manager, Wharf Association, Sydney, sworn, and examined:—

1523. *Chairman.*] You are manager of the Wharf Association? Yes.

1524. The chairman of that association has already given evidence before the Committee, and you now supply some figures which he promised to furnish? Yes. I have the information in the form of a letter. It is as follows:—

W. R. Benson.
9 Jan., 1900.

To the Chairman, Parliamentary Standing Committee on Public Works,—

Dear Sir,

Sydney, 6 January, 1900.

Following my communication under date 18th December last, I now have the pleasure of handing you herewith returns then promised:—

Firstly:—The number of berths available to berth oversea vessels, excluding those provided for at Government wharfs;

Secondly:—The number of oversea vessels which have arrived during three years, commencing from 1st July, 1896, and ending 30th June, 1899, and their respective tonnage.

I would point out that the berths available for berthing oversea shipping at private wharfs number thirty-three.

During the past three years (*vide* returns) the number of steamers and ships which have arrived numbered—steamers, 196; sailers, 253; total, 449.

Taking into consideration the knowledge that the following shipping firms berth their vessels at wharfs under control of the Government:—White Star line, Dangar, Gedye, & Co., A. McArthur & Co. (Limited), P. & O. S.S. Co., Orient S.N. Co., M.M.S.N. Co., Burns, Philp, & Co. (Limited), Gibbs, Bright, & Co., North-German Lloyd Co., German Australian Co., E. & A.S.S. Co., and that intercolonial steamers, vessels, timber-laden ships, are specially provided for, there are available thirty-three berths, capable of berthing on an average, say two vessels each a month (sixty-six), or 792 a year. Now, taking into consideration that only 449 over-sea vessels—other than those provided for at Government wharfs—have visited the port during three years from 1st July, 1896, to 30th June, 1899, it means the average a year, numbers, say, 150. As previously stated, there are thirty-three berths, each capable of berthing two vessels a month, which equals sixty-six a month, or 792 a year. These figures show that, outside Circular Quay and Woolloomooloo Bay wharfage accommodation, there is absolutely an excess of accommodation over and above that required to meet the shipping business of the port, inasmuch as the private wharfs are capable of berthing 642 vessels over and above what they are now doing.

I would also direct your attention to the fact that five broadside berths, each 500 feet long, could be made available for shipping purposes at Darling Island, and that on eastern side of Woolloomooloo Bay there is a berth in course of construction, and a proposal to construct two more berths—900 feet—on western side. This means, together with Darling Island, an additional eight berths, and, according to my previous statement, that a berth is capable of turning round two ships a month, there are then forty-one berths capable of berthing eighty-two vessels per month, or 984 a year, as against the average number of arrivals unprovided for, viz., 150 a year.

In conclusion, I would say that the wharf occasionally occupied by the White Star line of steamers is not always occupied. This observation would also apply to several berths at Circular Quay.

Yours, &c.,

W. R. BENSON,

Manager, Wharf Association.

P.S.—I would desire you to note that all steamers are only partly laden. That the term over-sea vessels applies to all vessels arriving from ports outside Australasia.

I have also a return showing the number of inward cargo ships and steamers over-sea berthed at wharfs, exclusive of those controlled by the Government, from 1st July, 1896, to 30th June, 1899. According to this return, the number of steamers is 196, and the number of ships 253. [*Vide Appendix.*] I have another return showing the berths capable of berthing over-sea vessels. It is as follows:—

RETURN showing Berths capable of berthing Over-sea Vessels:—

Association.	Berths.	Private Wharfs.	Berths.
Dalgety's New	4	Hoffnung's	2
Smith's	3	Parbury's	2
Adelaide	1	Walker's	1
Moore's	3	Grafton	2
Town's	1	Reid's Federal	3
Dalgety's	2	Russell's	1
Central	4	McLean's	1
Dalton's	3		
		Total	33

In making the estimate contained in this last return, I have acted liberally, because I have not included Burns, Philp's wharf, and one or two others.

1525. You remember giving evidence before the Committee in November, 1888, when the question of running a wharf out into the middle of Woolloomooloo Bay was considered? Yes.

1526. You then gave evidence as to the wharfage accommodation of Sydney, and contended that there was ample accommodation for all purposes without the erection of the proposed jetty;—between 1888 and the present time, have the private wharf-owners kept the wharf accommodation up to date, so as to meet the requirements of the steamers which have so largely increased in size, and which now visit this port regularly? Yes, excepting large steamers, such as the P. & O., the Orient, the Norddeutscher-Lloyd, and the White Star line. I may mention, however, that it is very hard indeed for private individuals to compete against the Government. Private individuals are continually handicapped. In the first place, they are limited in the construction of a jetty to a certain length, and there is also no fixity of tenure. The Government fix a limit line, and beyond that line you cannot construct a jetty. The line varies in different directions, but you cannot extend beyond it. If you do get permission they charge you a rental for the use of the water. Now, the Government themselves have no limit-line for their own constructions, and they pay no rental for the use of the water. You can see, therefore, how private wharf-owners are handicapped. Taking it all round you may say that the private wharf-owner is simply strangled by the Government competition. Even if a private wharf-owner made good accommodation the Government might at any time come in and give better.

1527.

W. R. Benson. 1527. Your observations as to the extension of jetties, and fixity of tenure would not apply to cases where the wharf-owners have the fee-simple? I do not know of any owners at Darling Harbour who have the fee-simple.

9 Jan., 1900.

1528. Take the bight round from Dawes' Point to Smith's wharf, are the wharfs there not largely in the hands of private owners? I think they all pay the Government for the right of construction.

1529. Is not Dalton's wharf a modern wharf? Yes, though the jetty is not very long; but I think they have a right to extend another 100 feet.

1530. Is it a serviceable wharf? For a certain class of trade.

1531. I mention Dalton's wharf, because from my observation it is generally occupied by vessels? Not so much I fancy as one or two other wharfs. The best occupied wharf is, I think, Dalgety's new wharf—that is, Dibbs' old wharf.

1532. Do you think that with an improved tenure the wharf-owners would improve their properties more? I am quite certain of it.

1533. Your statement is to the effect that the ships are not in continuous occupation of the wharfs;—is not that the inevitable result of steamers overtaking sailing vessels in the import and export of goods? Of course, as regards steamers, we know exactly when they will arrive, and in the case of sailing vessels we do not know the date. Suppose a White Star liner comes alongside a wharf, bringing about 2,000 tons of cargo, it is discharged in two days, and she then leaves for another port. The same rule also applies to the Tyser line of steamers and other cargo steamers. Where you can berth two sailing vessels in a month you can berth three or four steamers.

1534. In the case of steamers there is not likely to be such a continuous occupation of wharfs as in the case of sailing vessels? Excepting steamers like the P. & O. and the Orient Companies' boats, which are purely passenger ships, and which wait for their regular days of sailing.

1535. In the present state of things the occasional vacancy of wharfs may be looked upon as inevitable? Yes; you will never have all the berths fully occupied. It is absolutely impossible.

1536. It is a necessity of the trade, by reason of the frequent and regular despatch of large steamers, that the wharfs are sometimes empty;—it may be described as an incident of the trade of the port? Exactly.

1537. It must not be taken as a reason for the non-necessity for increased wharfage accommodation? Quite so. A ship like the "Medic" may occupy a berth for three days, and for the balance of the month the wharf may be idle.

1538. The tendency of trade indicates that there will be frequent vacancies at the wharfs? Yes; it is only when it is found impossible to berth ships that there may be said to be a necessity for increasing accommodation.

1539. Do you know of any cases where ships have been delayed and have not been able to come alongside the wharfs through the want of accommodation on their arrival? As far as my recollection serves me, speaking of the past two years, and perhaps going even further back than that, I can think of only one steamer, the "Kent," which was so situated. We could have berthed that steamer ourselves, but we were very fully occupied by other large steamers, and we had to refuse her. I think that without any delay she went alongside the Circular Quay. That is the only case of the kind I can recollect.

1540. Can you say from your general knowledge whether there are frequently occasions when ships cannot get berths? That is not the case to my knowledge.

1541. We are informed that the White Star line are in treaty for the north-east berth at Woolloomooloo Bay for the use of the "Medic," the "Afric," and the "Persic";—is that arrangement completed? There is a private arrangement between Dalgety's Company and the Manager of Public Wharfs, I think. It was possible that we could have berthed their steamers at Smith's wharf; but the negotiations I had in hand fell through. Then Dalgety's took the matter in hand, and secured accommodation at Woolloomooloo Bay.

1542. Why could you not arrange for the steamers to be berthed at Smith's wharf? If we had been able to make arrangements with adjoining owners we should have had a berth of about 700 feet; but we could not come to arrangements with a certain company.

1543. Does not a case of that kind show the necessity for the provision of other wharfage for these large ships? It is very possible that in the near future it will be possible to berth them at Smith's wharf. There are close upon 1,200 feet of broadside frontage there, and I think it is more than probable that in the near future it will be converted into two wharfs capable of berthing the White Star line and another steam line.

1544. The state of affairs you indicate would seem to point to the necessity for some entire wharfage association—that is, an association covering the whole of the wharfs;—that would overcome the difficulty of adjoining owners being unable to come to an agreement? I think the difficulty to which I referred just now will be overcome in a very short time. I am under that impression.

1545. Do you think there is a tendency to still further increase the tonnage of vessels coming to this port? It is very hard to determine the maximum limit of steamers, but I fancy the limit has been practically reached at the present time. Take the "Medic," for example: If she drew one foot more water, she could not come up the port beyond the Spit. She could not get into Adelaide or Melbourne either, alongside the wharf, leaving Brisbane out of the question. Therefore, I think, we are not likely to have larger steamers. Of course larger steamers go from England to New York, but they are purely passenger boats. We could not fill steamers like the "Medic" and "Afric" from New South Wales alone, and it would not pay them to bring cargo out to one Colony only. Trade will adjust itself to conditions, and I think you will find that the smaller class of steamers will always have a certain amount of work.

1546. You have, no doubt, given the Darling Island works some consideration;—the wharfs there are just about being brought into operation, and seeing that the railway system of the Colony is in the hands of the Government, and that we are likely to become exporters of wheat as well as frozen meat, do you not think it is desirable that the shipping should be worked hand-in-hand with railway transit? The export shipping is another question altogether. Take wheat for example. It can always be brought down from the country and discharged direct from the railway into the ship's hold. It can be easily tested in the trucks, but that is not the case with a bale of wool. A bale of wool must be opened out, and samples must be taken away. You must have specially adapted warehouses with a certain light, so that you can see the texture of the wool. You can ship wheat from the railway truck into the hold, but you will never be able to do that with wool.

1547. We have been told that wool warehouses would be better, if they were so arranged as to admit of loading from the top;—is that your opinion? It would be a great convenience; it would save all the hoisting.

W. R. Benson.
9 Jan., 1900.

1548. You have, I suppose, thought out the proposed improvements at Glebe Island? Yes; I know the place very well.

1549. Do you think it is necessary to provide more wharfage there? If I might speak plainly, I think it would be an extravagant waste of money. In the first place, you have three or four splendid berths at Pymont; they are adjacent to the city, and when you get a new bridge over there, the existing inconvenience will disappear in respect of traffic. The wharfs are, as I say, near to the heart of the city, and I should think it would be practicable to berth there three of the largest steamers coming to the port. I would take the coal traffic away from the wharfs at Pymont; they are used now only for the shipping of coal and the landing of ballast. I would transfer that trade to Darling Island, and would use the Pymont wharfs simply for the import business. Outside of Circular Quay, I take the wharfs at Pymont to be the finest site in the harbour. You could carry on a big import trade there without any congestion of traffic.

1550. And you would take the coal traffic round to Darling Island? Yes, I would make it altogether a place of export. I might explain also, with regard to Glebe Island, that you have in Johnstone's Bay only 15 or 16 feet of water at low tide. If you were contemplating an import trade there you would have consignees of goods writing to their agents in London asking them not to ship by vessels discharging at that place. In the first place there would be $1\frac{1}{2}$ mile or about 2 miles of extra cartage. We have already had consignees writing home requesting their representatives in London not to ship by certain vessels discharging at certain wharfs, and I am sure they would do that in the case of Glebe Island.

1551. We have had the evidence of carriers as to the charges from that point, and it would appear that there would be a little extra charge? I should say there would certainly be an extra charge, owing to the difference in distance.

1552. You object to the place on the ground of inconvenience? On the ground of the delay and the extra cost. You would have two bridges to cross, and a big grade on the other side.

1553. The tenor of your evidence is that private wharf-owners should have a fair show in the way of long tenure of their frontages, and that if they had that they would so construct their wharfs as to meet the requirements of the port, providing ample accommodation for many years to come? Yes; excepting accommodation for exceptionally large steamers. Take Parbury's wharf: that wharf at the present time is 350 feet long. They have applied for another 100 feet. That would give them 450 feet. In the case of jetties you can overhang a little. You can suit a ship according to her hatches; therefore, the 450 feet would really mean about 500 feet. Then there is the Central wharf: they have a right to extend 100 feet, and they are now out about 320 feet. That would give them over 400 feet. All the large ships, such as the "Medic" and the "Friederich der Grosse" are already provided for. We have to provide only for outsiders, and that we can do at the present time. We can make more than ample provision.

1554. What width should a jetty be at which vessels could load or unload on either side? As a rule, we do not discharge two ships at a jetty; we discharge one and load the other. In our Association we pay particular attention to stevedoring. If you had a width of 200 feet, with only one ship unloading, without supervision over the stevedoring you would be liable to be blocked. At several of our wharfs we do the stevedoring ourselves, and we assort all the consignees' marks, so that if a consignee should send a dray down for his goods he can find them in a certain stack, and there is no delay. In many instances, where ships discharge at a figure below which it may not pay the stevedore to do the work, the goods are simply tumbled out of the slings, and there is no assortment of the cargo. In those cases any jetty must get blocked, but that is not the case with several of our jetties.

1555. With proper stevedoring, and with ships arranged in the way you suggest—that is, one unloading on one side, and another loading on the other—what would be an ample width? About 60 feet.

1556. You think that would be ample for all purposes? Yes; if one stevedore does the loading and unloading.

1557. Do I understand that you are opposed to the Government having wharfs? Not in any shape or form. All that I desired to point out was that the Government enjoy privileges that private wharf-owners do not enjoy, and I gave you illustrations.

1558. Upon equal terms the private wharf-owners can give as good accommodation as can the Government? Yes; but in several respects the Government wharfs are in a different position. Take Woolloomooloo Bay for example. In the case of some of the land the Government resumed there they paid from £180 to £200 a foot. If you have a berth 500 feet in length, and pay £200 a foot, that means £100,000. In constructing their wharfs the Government put no value on the foreshores, outside the construction of the wharfs. Take the Challis property; about £200 a foot was given, and for Hill's property about £170 or £180. The Government take no notice at all of that. They have to reclaim a lot of land and to fill in, and they make no charge for it. A private individual will have to charge for that, and the Government, in estimating the revenue from their wharfs, leave that out of the question. Then, again, in our Association we allow something for wear and tear. A planked wharf needs constant attention. You must spend so much a year in order to keep it in proper order. A plank will wear out, or a pile will want renewing.

1559. You think, then, that in this respect the Government have a pull over private owners? Yes; they do not charge themselves with the freehold at all, and we have to take that into consideration.

1560. *Mr. McFarlane.*] You think there is sufficient wharfage accommodation at the present time for the numerous lines of steamers visiting this port? Yes; taking into consideration the fact that there is a proposal to make another berth at Woolloomooloo Bay, I do not think any more accommodation is necessary. There are the Pymont wharfs.

1561. Suppose a new line of steamers was established, would it be easy for the owners to get wharfage accommodation without the erection of new wharfs? Yes. In addition to the accommodation at Woolloomooloo Bay, I estimate that at Pymont we have accommodation for three of the biggest ships that could enter the port.

1562. You are not aware of any difficulty in getting wharfage accommodation experienced by a new line of steamers establishing trade here? I am not aware of it.

W. R.
Benson.
9 Jan., 1900.

1563. You seem to anticipate that if wharfs are erected at Glebe Island there will be a considerable increase in the cost of cartage to the warehouses? That is my belief.
1564. Are you aware of any delay to shipping owing to insufficient facilities at the wharfs;—take Howard Smith's wharf, for example? You are referring to the intercolonial trade; my remarks have applied exclusively to the oversea trade.
1565. But with regard to the intercolonial trade, do you not think increased wharfage accommodation is necessary? Under existing conditions I think they manage their business very well. Some people expect too much for what they pay. In the port of Sydney we have been in the habit of giving too much altogether. There is no port in the world which gives so much and receives so little.
1566. My reason for asking the question is that it is generally known that on the days of departure of intercolonial steamers there is great difficulty in getting the drays to the wharfs to load;—there is a similar difficulty in discharging cargo? I am not prepared to give evidence as to the intercolonial trade. I have been dealing exclusively with oversea ships. I admit that in the intercolonial trade there is a certain amount of delay, but I think it might be obviated, in a great measure, by better inspection of the traffic.
1567. I have seen a line of drays extending nearly half a mile waiting for their turn to get to the wharfs? In the intercolonial trade, people, as a rule, rush their goods down at the last moment, and that leads to congestion.
1568. Would not increased facilities do away with that congestion? I do not think so. I think the shippers are to a great extent to blame for it.
1569. Perhaps they do not get their orders until the last moment? That also may have something to do with it.
1570. You do not think there is any likelihood of larger over-sea ships trading to this port? I should imagine that the "Medic," the "Afric," and the "Persic," are about the largest steamers likely to come here. A ship drawing over 27 feet of water could not get up the harbour over the sand-bar. In Adelaide and Melbourne also she would have to lighten her cargo, and that would mean additional cost. It would not pay to build larger vessels for one port alone.
1571. Could they not dredge the harbour? It is not at all likely, I think, that the Government would expend hundreds of thousands of pounds in dredging for the benefit of one company.
1572. Is it not a fact that for the past twenty years every steamer which has been built for existing lines has been of larger dimensions than the steamer she has replaced? No doubt that has been the case.
1573. Is there not, then, reason to suppose that the ships would increase in size, with the increased volume of trade? You must take into consideration the suitability of the ship for the trade she is to follow. As I have already pointed out, bigger ships than those of the White Star line could not enter the port. If ships coming to the port had to lighten their goods it would take a lot of gilt off the freight.
1574. It is fair to assume that the companies would not build their boats of larger dimensions unless the trade warranted it? I think it will be many years before the trade will warrant larger ships than the White Star liners coming here.
1575. At the present time some of the liners cannot get alongside the wharfs at Adelaide? That is so. I do not think they can get to Brisbane at all. There is a wharf at a considerable distance from Brisbane which some of them might get alongside.
1576. Your evidence refers mainly to over-sea ships? Yes.
1577. And the arguments applied to those ships would not apply to intercolonial trade? No.
1578. *Mr. Shepherd.*] I think you said that 60 feet would be an ample width for two vessels at a jetty—one loading and the other unloading? Providing there were one stevedore. We have the control of the stevedores. One stevedore loads and unloads; therefore we have everything under our control, and we take care there is no block.
1579. In giving evidence in 1888 you said you thought that a width of from 150 to 200 feet would be required? Yes. At that time the circumstances were different. It was proposed to construct a jetty 700 feet long, and to put two or three ships on each side. The effect of that would be that the ship at the extreme end would be blocked by the ships in-shore. You would require an extra width in that case.
1580. Your width of 60 feet applies to only one vessel on each side? Yes.
1581. Is it your opinion that additional wharfage is absolutely necessary in Sydney? I think not.
1582. How many ships do you say can be accommodated at Pymont? I should think about three. You have one wharf there with a length of 1,070 feet.
1583. Do you think the piers there are wide enough to accommodate one vessel on each side? Yes; one is apparently 70 feet in width, and to the westward you have a width of about 80 feet or 90 feet.
1584. Even with the accommodation there and at Woolloomooloo you think the shipping is already fairly provided for? Yes.
1585. *Mr. Watson.*] You do not favour the construction of any more wharfage accommodation by the Government at the present time? Excepting the wharfs in contemplation at Woolloomooloo. I am particularly opposed to the construction of wharfage at Glebe Island, when you have such jetties as those at Pymont.
1586. Your Association has been opposed for many years past to any proposal to increase the wharfage accommodation of Sydney? I do not think so. I am advocating the use of the jetties at Pymont purely in a public spirit. They would be the biggest factor, by way of opposition, we could possibly have.
1587. Did not your Association oppose the construction of the wharfs at Darling Island? I do not think I gave evidence as to that proposal.
1588. I think that you yourself and the chairman of the Association have opposed each proposed extension of wharfage by the Government? I do not think we have taken up that position. What I now say is that for the import business the Pymont wharfs are infinitely superior to the Darling Island wharfs. You might make Darling Island an emporium for the export trade. I do not think we have ever opposed the wharfs there in any shape or form.
1589. Are you aware that at the present time, even allowing for the various wharfs owned by the Government being debited with the cost of land resumption, which has in some cases been recouped to a certain extent, they are still paying a fair percentage on the outlay—between 3 and 4 per cent.? Nothing is written off for maintenance or depreciation, and a jetty will last only about twenty-one years—I mean, of course, a pile jetty.

1590. A great number of the Government wharfs are not pile jetties;—what about the wharfs at Darling Island? Nearly all the Government wharfs are pile wharfs, with decking. W.R. Benson.
1591. You think that twenty-one years is the limit of life of those constructions? I think so. I think you will find that Mr. Darley will support what I say. 9 Jan., 1900.
1592. Have the jetties under your control been reconstructed in twenty-one years? Yes; we are reconstructing portions of them every twelve months. Piles require to be pulled up and new ones put down, and the decking has to be renewed.
1593. Captain Jackson estimated the life of the wharfs at Circular Quay at nearly fifty years? I am under the impression that Mr. Darley at one time quite agreed with us that the life of a jetty—I am speaking only from memory—was about twenty-one years.
1594. *Mr. Dick.*] In your statement you said you had thirty-three berths, accommodating on the average two vessels per month;—to complete that information, and make it more valuable, could you give us any idea of the average length of the berths? They would go from 400 feet down to 200 feet. The 200-foot berths would be few in number. There would be, perhaps, not more than four of them. They would be suitable for the Hamburg and New York ships. We take a great many sailing vessels of comparatively small tonnage. They vary from 3,000 tons to 1,200 tons. We have Glasgow, Hamburg and New York ships of only 1,200 tons.
1595. *Chairman.*] Some of the witnesses opposed to this proposal seem to think that the extra tonnage of the port does not necessarily carry with it the necessity for increased wharfage accommodation;—do you agree with that suggestion? I can quite understand that extra tonnage does not involve a proportionate increase in imports; but quite apart from that, the ships of larger size require a certain space at the wharfs.
1596. For example, a 10,000 ton ship may deposit only 1,200 tons of cargo, and yet will require a great deal of space? Quite so.

John James Booth, Manager, John Booth & Co., Ltd., timber merchants, sworn, and examined:—

1597. *Mr. Dick.*] You are acquainted with the general outlines of the proposal to provide wharfage accommodation at Glebe Island? Yes. J.J. Booth.
1598. Do you think the wharfs there are likely to prove a good asset, or do you think they are likely to be a bad investment for the Government? I think they will be a very good asset. 9 Jan., 1900.
1599. You are pretty well acquainted with that part of the harbour? Yes.
1600. Your own yards are directly opposite? Yes.
1601. What particular advantages do you think that site possesses for wharfage accommodation? It would be advantageous both for export and import trade if there were a railway there.
1602. Do you think it possesses a special advantage by reason of its proximity to the city and suburbs? It has the advantage of being on the fringe of the city and suburbs, and has a deep-water frontage. Ships could come up right alongside and discharge their cargo.
1603. Do you think persons engaged in the timber trade would take up the wharfs there for their business if there were a railway? I think so. I cannot tell what the trade is likely to be; but all the timber merchants have their own wharfs at present.
1604. Supposing you were starting business, and had no connection with an existing business, would a wharf at Glebe Island be a good situation for you? In a splendid situation.
1605. I suppose a good deal of the timber imported is used in the interior? A lot of it.
1606. Then, for the purpose of the timber trade, it is highly important that Glebe Island should be connected with the railway system of the Colony? Yes.
1607. Could you offer an opinion as to the best method of utilising the foreshores of Glebe Island for wharfs;—do you think the proposed scheme makes the best use of the foreshores? That is more an engineering question, but I think the jetties might very well be constructed upon the echelon principle.
1608. The advantage being that ships could overlap each other and would take up a comparatively small portion of the wharf? Yes; and they would not foul one another in drawing out, or if they were pulled out hurriedly in case of fire.
1609. It is proposed to have four berths on the northern side, each of 550 feet;—do you think that if the echelon principle were adopted they could obtain another berth there? I think they would get better results in every way.
1610. You think that as matters stand at present there is sufficient wharf accommodation for the timber trade? At present; but I do not know about the future.
1611. The construction of these wharfs would offer exceptional advantages to anyone starting in the timber trade? Yes.
1612. Have you anything to say upon the question of the Government entering into competition with private wharf-owners? I think that if they do the reclamation they should lease by public auction or tender.
1613. You mean lease the wharfs? Yes.
1614. Do you know what is the present practice? I do not, but I think the wharfs are let privately. They should be let in the open market, I think.
1615. As a general rule, those importing timber do not berth the vessels at their own wharfs? That is through the want of facilities.
1616. What facilities do you mean? There are not the necessary depths of water and wharfage.
1617. The general practice is to discharge the cargo into the water, and tow the timber up to the wharfs? Yes, on account of there not being facilities to bring the ships alongside.
1618. That means that the timber is handled more often, and the expense is greater than if you brought the vessel straight up to the wharf, and delivered your timber direct? Yes.
1619. Glebe Island, when cut down, will be fairly roomy;—I suppose that would be another advantage from the point of view of timber storage? Yes, if the island were level.
1620. You think it would offer exceptional advantages to the trade, especially if you had railway communication? Yes.
1621. It would be a decided improvement upon anything which the private owners are able to do for themselves just now? Yes.
1622. Have you any suggestion to make with reference to the proposed work? Yes; I should like to see Johnstone's Bay deepened.

- J. J. Booth.
9 Jan., 1900.
1623. What depth of water have you on your side? Alongside of our wharf there are not more than 17 feet at high water. It is all mud, and it could be easily dredged out. I think that in the early days the Government dumped down the dredgings from Circular Quay at Johnstone's Bay.
1624. *Mr. Levien.*] Have you heard any complaints as to the want of wharfage accommodation in that direction? I have not heard any. Of course, the timber trade had gone through a very serious depression through competition and bad times.
1625. Do you think there would be much increase in the cost of cartage from Glebe Island to the city? We cart at present from our yard to Darling Harbour. Only yesterday we sent a lot of redwood away to Armidale; it was sent round to Darling Harbour by our own carts. It costs us about 6d. per 100 superficial feet.
1626. In what direction do you generally cart? Right around by Glebe Island Bridge.
1627. *Mr. Shepherd.*] I suppose that your experience is mainly in connection with your own wharfs? Yes.
1628. What is the average tonnage of the vessels discharging at your wharf? The American ships cannot get alongside, because there is not sufficient depth of water. They would be from 1,500 to 2,000 tons.
1629. Do you get vessels of greater tonnage bringing timber here? Sometimes.
1630. In those cases they cannot discharge at your wharf? No, they have to lie out in the stream and discharge into a punt, and the timber is taken from the punt on to the wharf. If they could get alongside we should save all that labour and expense.
1631. Have you studied the question of wharfage accommodation at Glebe Island? I have always thought that would be a very valuable asset to the Government.
1632. Do you think the proposed accommodation is urgently required? I should think it would be by-and-by as the tonnage of the port increases. It would relieve the congested state of Circular Quay and other places.
1633. The tendency is to increase the tonnage of vessels trading to the port? Yes.
1634. Having these very large vessels, they would not require the same accommodation as a number of smaller vessels coming up to the same tonnage;—suppose you had one vessel of 5,000 tons, and ten vessels of 500 tons each, the ten vessels would require a good deal more wharfage accommodation than would the one vessel of 5,000 tons? Yes; but the bigger the ship the bigger the space required. Not so many years ago an Oregon ship, which brought in 500,000 feet of timber, was considered a big ship; now they are bringing from 1,500,000 to 2,000,000, and I believe there is a steam-boat chartered now with 3,000,000 feet on board. My firm have a steamer coming now with 1,000,000 feet.
1635. Have you heard any complaints of inconvenience from want of accommodation? I have not heard of any direct complaints, but the proposed wharfage would save vessels lying out in the stream and discharging their cargo there.
1636. Do the vessels going to the private timber wharfs generally discharge in the stream? Yes; they all discharge in the stream, except those going to Goodlet and Smith's wharf.
1637. Have you heard of vessels being delayed for days through the want of accommodation? I remember hearing the captain of an American vessel complaining of the delay occasioned through the timber trade not taking the cargo away quickly enough.
1638. *Chairman.*] How long have you been in the timber trade? Our establishment has been in existence about forty-seven years.
1639. You have always had your place of business at Johnstone's Bay? Yes.
1640. You must have observed that the timber trade at Woolloomooloo Bay and Circular Quay has been gradually displaced, and has all found its way up the harbour? Yes.
1641. Where are the principal timber establishments at the present time? At Blackwattle Bay and at Johnstone's Bay.
1642. All up in the direction of Glebe Island? Yes.
1643. The timber trade is one which necessarily requires a large space? Yes.
1644. What depth have the ships which generally bring your timber? From 20 to 23 feet.
1645. There is that depth of water in the middle of Johnstone's Bay? It is about 27 feet, I think, out in the middle.
1646. You say that the whole of the bay has a mud bottom, and that it is only a question of dredging to deepen it? Yes; Lever Brothers deepened a portion out to 22 feet.
1647. The timber trade may be regarded as an established trade here? Yes.
1648. What classes of timbers are always likely to be imported? Oregon, redwood, Baltic, and kauri.
1649. Timbers which are not produced in this Colony, but which are absolutely necessary for most buildings? Yes.
1650. Have all the timber traders their own property, do you know? At present a number of them are let; some of them are let from the Harris estate. The Government have also leased some at the head of Johnstone's Bay and some between the Glebe and Annandale.
1651. What space do your yards and sheds cover? Three and a half acres.
1652. Do you utilise the whole of that space? Yes.
1653. Yours is one of the largest establishments in Sydney? Yes.
1654. And you think that Glebe Island, having regard to its good water frontage, would be particularly suitable for the timber trade? Yes.
1655. You think the timber trade is one which is likely to increase with extra population? Yes.
1656. I suppose that Goodlet and Smith are at an advantage, compared with yourself, in being able to get their timber unloaded alongside their wharf? Yes; we manage to get some vessels alongside drawing (say) 17 feet.

WEDNESDAY, 10 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

William Henry Wilks, Esq., M.P., sworn, and examined:—

1657. *Chairman.*] You are the Member for the Electorate of Balmain North in the Legislative Assembly? Yes.

1658. *Mr. Watson.*] You are acquainted with the general outline of the proposal before the Committee? I am well acquainted with it. I have looked at the map.

1659. What is your opinion as to the advisableness of the Government constructing the proposed wharfage accommodation from the point of view of the general convenience of the port? I regard Johnstone's Bay, Rozelle Bay, and White Bay, as the most important inlets in Port Jackson next to Circular Quay and Darling Harbour. That is generally known to anyone with a knowledge of the port and associated with its commercial life.

1660. From that point of view you think that the proposed extension of the wharfage is justifiable? I think it is very desirable that these important inlets should be utilised. Private owners and the Government have been reclaiming land for years past on the foreshores in that direction, and as fast as the land has been reclaimed it has been leased.

1661. For what class of trade have the foreshores to which you refer been leased? So far as they have been leased, more particularly for hardwood timber and metal; but during recent years there has been a development in the softwood trade.

1662. Do you think that trade is likely to largely increase? I think that is a self-evident proposition. The necessities of the city and suburbs must create a demand for timber. The inclination of the timber merchants is also towards the locality to which I am referring.

1663. Do you think that if the proposed wharfage accommodation were afforded it would be availed of for purposes other than those of the timber trade? It was stated by the Government a fortnight ago that they had decided to remove the Abattoirs. There has been a very heavy expenditure upon the causeway, which is now nearly completed—something like £100,000, I think; and on the ground of that expenditure alone I take it that the Government, in the public interest, would utilise the island for some purpose if the Abattoirs were removed. The only other purpose which occurs to me is the formation of an export depôt.

1664. It would appear from the evidence taken by the Committee that, for the purposes of the export trade, it would be necessary to have railway connection? That may be the case, but if you look at the map you will see how close the island is to the main line, either at Petersham or Strathfield.

1665. The Engineer-in-Chief for Railway Construction led the Committee to believe that if a line were brought from the trunk-line towards Glebe Island it could be utilised as a portion of the projected line towards Long Nose Point? That is a proposal which has received consideration for some years past, but I can perhaps give the Committee more recent information on the subject. On the Johnstone's Bay side, contiguous to the island, there are various works, such as Lever Brothers, and two years ago that firm were in treaty with myself in connection with a proposition to construct a private railway connected with the trunk-line. It was allowed to drop under the belief that the Government would utilise the island and extend the railway there. That one industry to which I have referred has £100,000 expended there.

1666. Lever Brothers' works, you say, are close to Glebe Island? They are right opposite the point on the Balmain shore. There are many other important business places there.

1667. You say that Lever Brothers considered railway connection of so much importance that they considered the advisableness of themselves constructing a railway? Yes; the matter was discussed, and they got to the point of having rough plans drawn.

1668. So that if the works at Glebe Island were constructed, and railway connection were made for purposes of export, the line would be used by firms not doing business on the island itself? Exactly. Then there is coal in the locality. As the Committee are aware, they are now making a shaft. I think it is generally recognised that the foreshores of Balmain will be used for manufacturing purposes.

1669. To what depth has the shaft been taken? From 1,400 to 1,500 feet.

1670. The bore has been taken deeper? Yes; to 2,800 feet.

1671. It has been objected that, for general import purposes, Glebe Island is rather far from the main centre of trade in the city? I do not know how that contention can be sustained. If you look at the position of the island you will see that it is quite close to Redfern, Camperdown, and Leichhardt. Then there are the suburbs of Balmain, the Glebe, and other places in the immediate vicinity.

1672. But in the import trade the goods will require to be taken to the warehouses for sorting and for distribution generally, and the warehouses are nearly all within the city proper? I think Darling Island is very suitable for the import trade, and there is ample room there for the erection of warehouses. Exclusive of its use for timber and metal imports, Glebe Island could be used for export purposes, and Darling Island for import purposes.

1673. Do you know of any considerable trade being done directly with Balmain;—are many of the importers or merchants there in the habit of importing direct? I do not think so, at the present time; but I take it that the proposed wharfage will be constructed in view of future requirements. At the present time all the available wharfage accommodation, as far as leasing is concerned, is occupied. If you have regard only to the present moment, of course it may be said that the port of Sydney is very well served with wharfage accommodation.

1674. You think the scheme is justifiable from the standpoint of future possibilities? I do, particularly at the present juncture. I do not think the work could be carried out more cheaply than just now.

1675.

W. H.
Wilks, Esq.,
M.P.
10 Jan., 1900.

W. H.
Wilks, Esq.,
M.P.
10 Jan., 1900.

1675. From what point of view do you say that? From the point of view of labour. A great deal of the work could be carried on by quarrymen and others who are now in want of employment.

1676. *Dr. Garran.*] Have you made any inquiry as to the sufficiency of the present wharfage of Sydney? I have made no special inquiry. I am speaking from what I myself have observed, and from my knowledge of the growth of the port.

1677. I judge from your remarks just now, that, although you look upon Glebe Island as evidently destined for use for wharfage purposes, you do not think there is any pressing urgency for the proposed works? I regard the utilisation of the island as almost necessary, having regard to the large amount of money which, as I pointed out, has been expended upon the causeway. If the Abattoirs are to be removed, I take it that the Government will want some return for the money they have expended there; therefore some use must be made of the island.

1678. But the Government have not yet removed the Abattoirs? I waited upon the Premier with a deputation a fortnight ago and he said that the Government intended to remove them. I understood him to say that the matter would be decided within a month.

1679. But is there any place which could replace the Abattoirs within a month? I understood that it was intended to decide the question within a month.

1680. But before the Abattoirs are removed some substitute must be found? Mr. Lyne explained at the time what the substitute would be.

1681. You know that at the present time the Government have a magnificent series of wharfs at Darling Island nearly ready;—would you, as the representative of a constituency, having charge of the people's taxation, recommend that the Government should immediately expend a large sum of money at Glebe Island before finding out how far the new wharfs at Darling Island would meet the demand? I understood that the demands of persons engaged in the import trade had practically filled the wharfage at Darling Island.

1682. The Committee have not had any evidence to that effect? That I think is the general idea.

1683. Do you not think it would be well to get Darling Island into work and see how it answers as an export wharf before spending such a large sum of money upon what would be practically a second edition of the works there? I am not prepared to answer that question. There are public officials, I presume, who could give you information as to the development of the port.

1684. Suppose you were a private wharfinger, and owned those two splendid properties—Darling Island and Glebe Island—and that having put Darling Island into a condition to supply shipping, the suggestion were made that you should spend hundreds of thousands of pounds upon Glebe Island before you had discovered whether Darling Island would satisfy the market, would you entertain it? Certainly, if I were a private owner, I should restrict my wharfage as much as possible with a view to obtaining a higher rate.

1685. Having regard to the present state of things, do you think it would be wise to practically duplicate Darling Island before finding out how the works there answered requirements? That is a question I have some difficulty in answering. My idea is that the development of the port is proceeding at such a rate that although there may not be an immediate necessity for the works at Glebe Island, they would nevertheless be a good work to undertake at the present moment.

1686. The Manager of Public Wharfs says he wants three new wharfs at the present time, and that he can satisfy two of these to-morrow if he has the projected wharf at Woolloomooloo Bay; he will then have only one demand to meet;—do you think that, seeing that there is an immediate necessity for only one wharf, there is any great hurry to add the Glebe Island works to the Darling Island works? If the Manager of Public Wharfs has said that, it is at variance with the views he expressed when giving evidence upon the construction of the causeway. He then said that there was no better place for wharfage than Glebe Island.

1687. According to your views, the expenditure upon the new causeway there was rather premature? When that expenditure was undertaken it was supposed that the Abattoirs would continue upon the island. I do not say for one moment that the expenditure will be justified unless the Government intend to use the island for some other purpose.

1688. But having regard to what the Manager of Public Wharfs now informs the Committee, as to his requirements, do you think this large expenditure at Glebe Island is really necessary? If I were in a similar position to yourself, and heard the whole of the evidence, I should be better able to answer that question. As I say, my observation has been that every wharfage accommodation is taken up immediately it is supplied. I think the work at Glebe Island would be a good speculation for the Government.

1689. We are told that the wharfage there would be useful only for export and for the landing of building material, that it will not supersede the Circular Quay wharfs, or answer a similar purpose—in other words, that it is not at all suitable for import purposes? I think the general opinion is that the wharfs at Glebe Island would be very suitable for export.

1690. Up to the present time we have never entirely separated our export from our import wharfs;—we are now going to make an experiment at Darling Island in that direction, and to bring goods down the country by rail alongside the ship;—you understand, I suppose, that is an experiment? Yes.

1691. Then do you not think it would be a good thing to do, before you duplicate that experiment, to see how it answers? That might be a reason for postponing the inquiry altogether; but I presume, from the reference of the works to the Committee, that it is considered by the Public Works Department that the time has arrived for constructing wharfage at Glebe Island.

1692. The view of the Public Works Department is that what has been already done at the island is all to the good, and that a certain amount of space can very advantageously be filled in;—but it does not necessarily follow that the whole of the wharfage around the island should be immediately completed? I suppose that is a matter which the Public Works Department must have considered before submitting this proposal. I take it that the submission of the proposal as it stands before the Committee is an indication that they considered the time ripe for the work.

1693. Still, the Committee have to inquire whether there is really a demand for such large additional wharfage, having regard to the commerce of the city? Commercial people are not always the best authorities upon a question of this kind. They may be interested in wharfs themselves.

1694. Then there are agents of ships who have no wharfs, and whose interests it is to multiply wharfs unnecessarily, in order that they may obtain their use cheaply? Of course there are other interests to be considered apart from the commercial interests.

1695.

1695. You think it is necessary to construct a railway to Glebe Island to make it useful? I think that at some time a railway will be a necessity.

1696. So that the cost of a railway would have to be added to the cost of the work now before the Committee? Certainly the cold meat storage could not be carried out at the island without a railway.

1697. That means an expenditure of another £160,000 without estimating the resumption of the land;—that would be a line from Ashfield? I thought the original proposal was to take the line from Strathfield.

1698. More recently it has been proposed to bring a line from Ashfield? I take it that that railway would serve other purposes than those of Glebe Island.

1699. The serving of Glebe Island would be the principal idea? I think that a railway scheme might be presented independently of Glebe Island altogether. I do not think the cost of a railway should be considered in connection with the proposed works at the island.

1700. But it would be necessary to do that if a railway must be made to render the works at the island useful? I regard the site as such a valuable one that the Government must make some use of it; they cannot afford to tinker with it. Some scheme must be submitted as a whole so as to make the island a paying concern.

1701. *Mr. McFarlane.*] You have represented Balmain North for a considerable time, and you have also resided there for some years? About twenty-five years.

1702. You have a fair general knowledge of the shipping requirements of Balmain and the adjacent locality? Yes.

1703. Speaking of the shipping trade generally, are you of opinion that the present wharfage accommodation is sufficient for the trade? I should not like to express an opinion upon that point. The only indication I have is the rapidity with which the leases are taken up when fresh wharfs are established.

1704. Have you heard of any complaints from newly-established companies to the effect that they have difficulty in entering into trade on account of the scarcity of wharfs? I have heard some persons complain very bitterly about the high rates. Then, again, you may have a lot of wharfage accommodation which is not suitable for the requirements of a certain trade.

1705. If the wharfage accommodation is extended, lower rates will prevail? Yes.

1706. From your knowledge of the requirements of Balmain, do you think that, in the event of the proposed wharfs being constructed, a fair proportion of trade will go in that direction? Unmistakably. Although it is proposed to remove the Abattoirs, the pigs would still be landed at Glebe Island. They arrive chiefly by coastal steamer. While the Abattoirs generally might be removed, portion of the island might be put into use for the killing of pigs. There is an objection to driving them. The pig trade would have to remain where it is, I take it, and that is done by coastal steamer.

1707. I daresay it is within your knowledge that a large number of cattle from the northern districts are brought to the port by steamer? Yes; they are being unloaded from the boats at the island at the present time.

1708. The proposed wharfs would give greater facilities for that trade? Easier and better facilities.

1709. There is also a number of timber companies established in that direction? Yes; the number is growing every year. You will probably be aware, from your contact with commerce, that they are now developing other lines of trade in timber. The Kauri Timber Company, for example, are established there.

1710. How do the timber companies manage at the present time with the wharfage accommodation;—is there any difficulty? Yes; they have to punt the timber from the vessel's side. The vessel lies out in the stream. There are two or three handlings of the timber. There are many places there where you would get a depth of about 25 feet of water, and I daresay that by dredging you would get 28 or 29 feet; but that would be in the southern portion of the bay.

1711. The proposed wharfs would minimise the expense now incurred in punting? Yes; as far as the timber trade is concerned.

1712. Do you know of any other industries, apart from timber and cattle, likely to use the wharf? Yes; there is the metal trade. For years all the western suburbs—Leichhardt, Camperdown, and Redfern—have landed their metal there from Wollongong.

1713. In view of the present increase in trade, speaking in a general way, do you think the construction of the wharfs is justifiable? That is my opinion. I do not say that immediately they are constructed they will return interest upon the expenditure. I do not think there will be an immediate demand for all the wharfage space there.

1714. Have you any personal knowledge of the timber trade? I used to have.

1715. It has met with a serious reverse during the past eight or ten years? Yes.

1716. I understand that the trade is now rapidly increasing? Yes; in hardwood particularly. There has been a great increase in the hardwood trade during the last few years.

1717. All things considered, you think the proposed works are justifiable? Yes, having regard to the future developments of the port, I think that in the course of a very few years all the proposed wharfage accommodation would be utilised.

1718. *Chairman.*] The Minister, in submitting this proposal to Parliament, and the Department since, have, so to speak, dissected it—that is, they have divided it into various portions; Mr. Darley's idea is that the first portion of the work would be the cutting down of a sufficient portion of the island to fill out to about 15 feet from the back of where the wharfs will be; that is to cost a sum of £38,000;—seeing that the utilisation of the wharfs is a matter of the future, do you think the preliminary expenditure will be sufficient for the present? That is a question I am not prepared to answer. Some use must certainly be made of the island. Too much money has been expended there to admit of its lying idle.

1719. The expenditure to which I refer would be in the direction of getting the island ready to be utilised for whatever class of wharf might be considered necessary hereafter? I think it would be absurd merely to go through the preparatory stage and then leave the island as it is. If the Government touch the matter they ought to complete the work, so that it will return some revenue to the country. If they merely carried out the preparatory stage, the island might be left at that stage for a number of years. Looked at from that point of view, the expenditure would merely be for a relief work, to meet the exigencies of the moment.

1720. Without a knowledge of the whole question of wharfage requirements, you would not like to give an answer to my question? No.

1721. As to the Abattoirs, are you able to say whether the people of your electorate are favourable to their

W. H.
Wilks, Esq.,
M.P.
10 Jan., 1900.

their removal? So far as my electorate is concerned, it does not adjoin Glebe Island; it is at this end of Balmain, and the people have very little interest in the continuance of the Abattoirs. But, speaking generally for the people of Balmain, they consider that if the Abattoirs are removed their properties will be improved in value. They would like, however, to see some other work put in their place; they would not like to see the island thrown altogether out of use.

1722. So far as your observation of the island has gone, can you think of any other use to which it could be put except for wharfage;—is it not particularly suitable for wharfage purposes, having so many wharfage frontages? Yes, and the contour of the ground is admirably adapted for wharfage; they could run out stages with mechanical devices for loading vessels very quickly.

1723. With regard to the timber trade, would it not be a great advantage for ships to be able to come alongside to unload their cargo? It would be a very great advantage to the timber trade.

George Pile, auctioneer and estate agent, sworn, and examined:—

G. Pile.
10 Jan., 1900.

1724. *Mr. Shepherd.*] You are a resident of Balmain? Yes.

1725. You have given the matter of wharfage accommodation considerable attention? I have, for a great many years.

1726. Are you fully seized of the proposal before the Committee? I have seen the plans.

1727. The portion of the work immediately before the Committee is that portion to the north of the roadway? I may say that over ten years ago I wrote a long and carefully considered letter to the late Sir Henry Parkes, recommending what is now proposed—that is, the removal of the Abattoirs. Before writing that letter I visited the island and estimated the water frontage which would be gained for the purposes of commerce.

1728. Will you explain exactly what your proposal was? It was that the Government should remove the Abattoirs and should utilise the whole of the island, which I thought would give about one mile of water frontage for the purposes of commerce, more especially as the Government at that time, as has happened since, were taking possession of the western shores of Darling Harbour for railway works, and were removing the timber yards and factories from that side, leaving the proprietors to shift for themselves—Goodlet and Smith, for example.

1729. Is it your opinion that the proposed additional wharfage accommodation is required? Not for foreign ships, but for the timber trade, and also for those manufactures which are most advantageously carried on with a water frontage. I did not think formerly, nor do I think now, that there is any great demand for additional accommodation in that direction for the foreign shipping trade.

1730. Is the timber trade not well provided for already? I have noticed that every piece of available land is being absorbed; land at Rozelle Bay has been taken, and there is also a piece let at the head of White Bay. Then Langdon, Hopkins, and Langdon, have water frontage works at the head of Rozelle Bay. There is a growing demand for centrally situated water frontage sites.

1731. You recommend this scheme chiefly in the interests of the timber trade? And also for such factories as can be most advantageously carried on with a water frontage.

1732. What is your opinion of the scheme, having regard to the requirements of over-sea shipping? There are the Government wharfs at Darling Island, and large private wharfs, which are so much nearer the city that, I think, they would have the pull in competition with wharfs at Glebe Island.

1733. You think it would be inconvenient for the larger ships to load or unload at Glebe Island? It would involve an extra mile of cartage.

1734. You think that would be objectionable? Of course it would add to the cost. It is better to have the wharfs handier to the warehouses. You cannot disturb the course of trade by putting up a fresh wharf, unless other advantages are offered also.

1735. Are you aware of any inconvenience being caused to large ships in getting berths? That would not come under my notice very much. It would only come under the notice of those engaged in the shipping business.

1736. Are you aware that many of the timber wharfs have not sufficient water to unload some of the larger vessels coming in, and that the vessels are obliged to unload in the stream? I have noticed that. It must add considerably to the cost of the import timber trade. I notice every day when crossing the harbour that what you say is the case.

1737. At Glebe Island there would be ample water for the largest timber ships? Yes; you have also to consider that the western suburbs are the most rapidly-growing suburbs, and Glebe Island is particularly well situated for the supply of the western suburbs with timber and other things.

1738. I suppose you are of opinion that the island should be connected with the railway system of the Colony? I am not taking that into account, but I daresay it would be done if it could be shown to be justifiable. I have taken into consideration simply the roadway facilities.

1739. You think that, on the whole, the proposed expenditure at Glebe Island would be justified? I think the work should be justified. I do not know what the proposed expenditure is, however.

1740. The total expenditure would be £178,000, including everything? I am quite certain that ultimately that expenditure would be justified. You would have a magnificent property with a mile of water frontage.

1741. But it would be only in the event of the wharfage being required that the expenditure would be justified? I think the Government might take the work in hand at once, and proceed with it by degrees. When the work was finished it would be found, I think, that there would be a demand at a fair price for the whole of the frontage.

1742. Do you know whether the rates charged by the Government wharfs are objected to? I know that persons engaged in commerce in other towns have always said that the expenses upon the shipping trade of Sydney are remarkably light.

1743. The timber trade is generally carried on at private wharfs and at leased wharfs? It is all done, so far as I know, at private wharfs.

1744. So that, as far as timber is concerned, the Government charges would not apply? No.

1745. *Dr. Garran.*] Do you think the proposed work at Glebe Island would be remunerative at the outset? Yes; I think that, as the Government completed the works, they would find tenants at remunerative rates.

1746. We are told that there would be not only the expenditure of £178,000 to be considered, but that another

another £160,000 will have to be expended upon the railway before the island will be of great service? I disagree with that view entirely. I can see in my mind's eye, with a full knowledge of the growth of Sydney, no justification at all for a railway, at present.

G. Pile.
10 Jan., 1900.

1747. We are told that if the island is to be used for the oversea ships, there must be a railway in order to bring the produce to the ship's side? I take it that when the oversea ships come there, it will be time enough to talk of a railway.

1748. It is said that the oversea ships will not come there until there is a railway? I think that for a good many years to come, the present facilities, including those at Woolloomooloo Bay, will be sufficient for oversea ships. No railway goes to Woolloomooloo Bay now, and Woolloomooloo Bay is not much nearer, if any nearer, for a large portion of the traffic of Sydney than is Glebe Island.

1749. We have it from some witnesses that it is a mile further from the centre of business; we are also told that it is a great convenience for the wharfs to be as near the centre of business as possible, and that Sydney up to the present has been very fortunately situated in that respect, the only drawback being the extreme narrowness and steepness of the streets leading up from Darling Harbour? Quite so. That is a matter which ought to have been looked into years ago by the Sydney Corporation. I wrote to the City Council ten years ago recommending a tunnel from the end of Sussex-street into George-street.

1750. The Government property at Circular Quay has the advantage of the easiest gradient to the city? That is rapidly becoming a show place for mail steamships, principally.

1751. But those steamers carry a large cargo sometimes? Yes.

1752. And the carriers have easier access? Yes.

1753. There is, in fact, no place in the harbour to beat it? No.

1754. Neither Darling Island nor Glebe Island will present, for import purposes, anything like the accommodation provided by Circular Quay? A large proportion of the import trade is done at wharfs at Darling Harbour, at the Grafton wharf, and at Dibbs' wharf. Of course, they have to come up the hill in Sussex-street. I do not know what you would call the centre of trade; but I should think it would be somewhere about the intersection of York and Market Streets.

1755. Some witnesses say that the principal goods go into bond, and that we must have regard to the situation of the bonded stores; then there is the soft goods trade in York-street to be considered, and the hardware trade goes elsewhere; so that you cannot fix upon one point as the centre for the whole of the trade? I was comparing Glebe Island with Woolloomooloo Bay. The distances from the intersection of York and Market Streets to Woolloomooloo wharf is not much less than the distance to that point from Glebe Island.

1756. The carriers say that they only charge the same from Woolloomooloo Bay as from Circular Quay; but they would have to charge more from Glebe Island? I do not think that would be the case in practice, to any extent? There would be the same loading and unloading, and the same delay; and delay after all is a considerable item.

1757. Of course, in looking at Glebe Island one cannot fail to be struck with its natural fitness for wharfage purposes; the only question is when the work should be done—whether it is wanted immediately or whether it will be wanted five or ten years hence? My opinion is that the first great demand would be for timber wharfs, and that the island might be afterwards used as the trade of the port became larger for over-sea ships.

1758. Is not the hardwood trade done by small coasting vessels? Yes; but the Oregon trade is done by large American schooners, and they have to lighter.

1759. The timber merchants generally have not wharfs which would admit of a four-masted sailing vessel coming alongside? That is quite true.

1760. Do you consider that there is any danger to the city from fire from having a large number of timber wharfs so near it? I do not. I have seen several fires down at Balmain, and they have never spread. Booth's fire I think was the largest.

1761. Do you know of any large fires on the timber wharfs? I think there was one at Langdon, Hopkins, and Langdon's some years ago.

1762. But they have not been very numerous? No.

1763. As a matter of fact there has been no danger to the city? That, I think, is only a myth.

1764. There is no reason on the score of danger to the city for taking the timber people away from their present position? No; but no doubt the wharfage will ultimately become too valuable for timber purposes, and it can then be taken for something else.

1765. It is said that Glebe Island, from its roominess, would be a nice place at which to land building material; but would it not be inconvenient to land it so far away from business premises? I think not. The place is well situated, and there is a level road. It is very little further than Goodlet and Smith's from the city. Glebe Island would be handy to Petersham and Newtown—quite as handy as Goodlet and Smith's.

1766. Is the market where timber is finally used more in the city or in the suburbs? It is very hard to say; I think it is used as much in one direction as in the other.

1767. When Goodlet and Smith's were turned out of Pymont they did not go very far away from their old place of business;—would not that seem to show that they were clinging to what they considered the centre of business? Mr. Goodlet has bitterly complained to me of the place where he has since been.

1768. On what grounds? Their former place was in every way better situated. It was closer to traffic, and everyone coming up the harbour could see Goodlet and Smith's place.

1769. Their present premises are not so good for advertising purposes? No.

1770. But how are they situated, having regard to the convenience of trade? It is steeper going up the hill, and the drays will not take such large loads. A larger proportion of Goodlet and Smith's drays go up Harris-street, towards the railway, than go across to Pymont bridge, I think.

1771. Still it is clear that Goodlet and Smith tried to keep as near to their old place of business as they could? They got the only piece of ground they could get below the Glebe Island bridge—that is, between Darling Island and the Glebe Island bridge. Every piece of water frontage is taken up there, and is in occupation.

1772. Suppose Glebe Island were ready, and were thrown open to the timber trade on easy terms, do you think that any existing timber wharfingers would send their ships to the island? I am considering the rapidly-growing trade of the port. Directly the reclamation was carried out at the head of Rozelle Bay, between

- G. Pile. between the Glebe and Annandale, that space was occupied by timber wharfs. I am referring to the space between the head of Rozelle Bay, at Gordon-street, and Glebe Point.
- 10 Jan., 1900. 1773. You think Glebe Island would be more suitable for the building trade than for oversea ships? No doubt it would be first occupied by the timber trade; but afterwards, as the trade of the port increased, and the land became more valuable, it would be used for the oversea trade. How long that will be in coming about it is impossible to say.
1774. But there is no peremptory demand for increased accommodation for the oversea shipping? No, I think not.
1775. *Chairman.*] You understand that the Committee are now only dealing with the portion of the proposed work at the island to the north of the Glebe Island Bridge road? Yes.
1776. Do you think the works would go on on the northern end of the island irrespective of whether the Abattoirs are removed or not? I think so.
1777. You have given this matter a great deal of consideration;—have you not observed that the timber trade has year by year moved from Circular Quay and Woolloomooloo Bay towards Balmain and Johnstone's Bay? Yes.
1778. The timber trade is now entirely concentrated in that locality? Yes, at least to a very large extent.

Francis Kirkpatrick, Under Secretary for Finance and Trade, Department of the Treasury, sworn, and examined:—

- F. Kirkpatrick. 1779. *Chairman.*] You are aware of the proposal before the Committee—to cut down the northern portion of Glebe Island and to utilise it for wharfage purposes? You have just informed me of the fact, otherwise I was not aware of it. I was aware that the Committee was considering some proposal in connection with Glebe Island, but I did not know the exact nature of it.
- 10 Jan., 1900. 1780. The proposal is to deal with the northern portion of the island at present—that is, to cut down the island and to construct wharfs around it;—in connection with our inquiry we wish you to state what is within your own knowledge as to the Minister's intention with regard to the removal of the Abattoirs? As soon as I received a letter from the Secretary to the Committee asking me to attend I submitted his letter to the Minister for instructions, and he wrote upon it, "It is intended to remove the Abattoirs.—W.J.L., 8/1/1900."
1781. I suppose that, in connection with this question, you have observed that the Minister stated, in answer to a deputation, that the Abattoirs are to be removed at an early date? He has stated that the Abattoirs are to be removed.
1782. He stated yesterday, I believe, that the question would be decided at an early date? I was not present at the deputation yesterday, but I know that that is the Minister's intention. He has taken action in that direction.

FRIDAY, 12 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Henry Petitt, Harbour Master, Sydney, sworn, and examined:—

- H. Petitt. 1783. *Chairman.*] You are Harbour Master in Sydney, and have occupied that position for a great many years? Yes.
- 12 Jan., 1900. 1784. *Mr. Levien.*] What are your duties? The berthing of the ships at the different wharfs, and the keeping of the fairway in the harbour clear. I also attend to the buoys and beacons.
1785. Is Captain Jackson your superior officer? He is not in the same Department; I am under the Marine Board.
1786. You have nothing to do with Captain Jackson? No; any vessel berthing at a Government wharf would make its arrangements with Captain Jackson as far as wharfage is concerned. After they have secured their berths from Captain Jackson, the ships obtain a pilot if they have not an exempt master.
1787. Does Captain Jackson notify you of the berths to which certain ships are to go? Yes. For example, there are several berths at Pyrmont, and if a ship is not clear as to which of the wharfs she is to go, we ring up the Public Wharfs office to know which of the berths Captain Jackson has let.
1788. So that most of the berthing comes under your supervision ultimately? Yes.
1789. Have you ever known deep-sea ships to remain long in the harbour without being berthed? I have known vessels with miscellaneous cargo from Home to wait for a certain berth to be vacant. It may be to the interests of the owners to send their vessel to a particular berth. For instance, she may be going to Reid's Federal wharf, and there may be three or four berths there occupied. If it is imperative that the vessel should go to that wharf she would wait perhaps for two or three days for a berth. It might be to her interest to do so.
1790. Have you known ships to come into the harbour wanting wharfage, and being unable to find accommodation for some time? I have not known that to happen for many years now. Of course the shipping in the harbour fluctuates very much. Sometimes the harbour will be full of shipping, and at other times there will be very little. We have just got through the bulk of the wool season, and now the wharfs present an empty appearance. In a fortnight or three weeks time they may be fully occupied again.
1791. Trade is done mostly by steamboats? Both steamboats and sailing vessels are very quickly handled now by steam appliances.
1792. The Committee yesterday paid a visit of inspection to the different wharfs in the harbour, and they saw a great many of them vacant;—can you account for that? The wharfs a month ago were nearly all fully occupied, from Dawes' Point round to Miller's Point. The wool is pressed, and stowed at some of the wharfs, and these wharfs are very busy during the wool season. I have frequently known vessels to have to wait until another vessel has been loaded before coming in.
- 1793.

1793. But can you account for so many wharfs being just now vacant? The rush of the wool season is over, and there have not been many ships in lately. H. Pettit.
1794. Is there not a lot of wool in the stores ready for shipment? There may be some waiting for particular vessels to come in; for instance, there may be 5,000 bales ready for a certain ship. The large steamers which come to this port take freight at the different colonies—1,000 tons here, and 1,000 tons there, to fill up, and so on. 12 Jan., 1900.
1795. Do you think that there is enough wharfage accommodation independently of the proposal before the Committee? The Government wharfs are not yet completed. The Woolloomooloo Bay wharf is well on towards completion. In the Pyrmont bight the concrete wharf is not completed, and sheds are in course of erection. This accommodation will be ready directly. It is not yet fit for the discharge of ships' cargo.
1796. Do you think the proposed works should be carried out? I do not think the works at Glebe Island would be very remunerative for some years to come. They would be regarded as an outside place for shipping to go to. It would mean a lot of extra cartage.
1797. The Committee have been informed that there would be very little difference in the cartage charges from Glebe Island? These matters are considered very closely, and if it is found that extra expense is incurred by going to a certain wharf vessels will not go there. At the same time the trade has increased very much during the past fifteen or twenty years. The trade is being done now by an entirely different class of ships, and a different class of accommodation is necessary; the ships are larger.
1798. You do not think the works at Glebe Island will be necessary, then, for some time to come? I think that eventually there will be a demand for wharfage at that place. No doubt if the accommodation is there vessels will eventually go there. I do not say they are likely to do so for perhaps the next three or four, or perhaps five, years.
1799. Are you in favour of the construction of jetties or of wharfs? It depends largely upon the position in which the accommodation is to be afforded. Jetties give the most accommodation—that is, in and out jetties, with berths between. If you have a long broadside frontage it does not take many 500 feet ships to fill it up, but if you have jetties ships can lie side by side in and out. They give a great deal more accommodation, although they are not suitable for some of the larger ships coming to the port.
1800. Generally speaking jetties economise space? Yes.
1801. But you think they should be placed only where there is a large area admitting of vessels being turned? That is a very important point. If you were dealing with a bay or inlet you could run out jetties for some length without interfering with the recognised fairway of the harbour. You would still allow plenty of space in which to work traffic; but if you were providing accommodation at the extreme ends of the bay, you would have to be very careful in extending your jetties because of the interference with the fairway.
1802. You are acquainted with most of the jetties in the harbour? Yes.
1803. Do you think they are built up to modern requirements—that they are wide enough, and have all the necessary accommodation? If you had two large cargo steamers of the present type alongside a jetty, and if they were provided with steam derricks for the quick discharge of cargo you would require a considerable space to relieve the wharf.
1804. But do you think that, as a whole, the present jetties are large enough? Parbury's jetties are, I think, the widest; they are out, I think, about 350 feet, and I think the jetty is nearly 100 feet wide. That would give a good space for the discharge of two ships, one on each side, with a passage down the centre for drays to come in and relieve the wharf when it is full. The other jetties, as a rule, are too narrow.
1805. They are not up to modern requirements? Certainly not.
1806. I have noticed a great many deep-sea ships remaining at Elizabeth Bay for some days; is that through the want of wharfs? No; sailing ships coming in with merchandise lie there while their agents make the necessary arrangements before they go to the wharfs. It is a recognised anchorage out of the fairway for these ships, and it is used also by the powder ships.
1807. I remember seeing ships remaining there for some days? It depends upon what they are waiting for. As a rule they remain there while the agents make the necessary arrangements.
1808. I suppose that, as a matter of fact, their wharfage is arranged for before they enter the port? Yes; a certain wharf is arranged for, and they have to go to it. They may cry out sometimes about their detention, but they must knuckle down to it until the wharf taken for them is clear.
1809. I believe the timber trade of the harbour is increasing greatly? Yes, very much.
1810. You notice a number of American ships unloading here? Yes.
1811. Would not Glebe Island be very useful indeed for that class of trade? It would be a splendid place for it; but there are no timber yards just in that vicinity. All the principal timber yards are above Glebe Island Bridge in Rozelle and Blackwattle Bays. If the ships went to Glebe Island cartage would be wanted from the ships to the timber wharfs. At the present time they make a raft, and they take large quantities of timber round to the wharfs in that way. The rafts are taken through the present Glebe Island Bridge to Langdon, Hopkins, and Langdon's, and other wharfs further up.
1812. Are these rafts an inconvenience to incoming ships? When there is sufficient timber on the rafts they are taken away at a suitable time. I do not think there is any interruption to traffic.
1813. Have you heard any complaints from captains visiting the port of the want of accommodation? No.
1814. Would you be likely to hear complaints from them? They would not carry that kind of grievance to us; they would take it to their agents or to the Government wharfinger.
1815. You would have no personal knowledge of such complaints? No.
1816. You are speaking now only of what you have observed? Yes; I am giving you my actual experience.
1817. You have noticed the great advance in the commercial life of this country within the last few years? A very great one indeed.
1818. More shipping is coming to the port? There is a wonderful difference. All the eastern shore of Woolloomooloo Bay not long back was a flotilla of small boats, and there was shallow water. Now vessels like the "Medic" and the "Afric" go there. I daresay there are times when Captain Jackson is at his wits' end to know how to accommodate the ships. The shipping business of the port fluctuates very much from time to time. At times we are inundated with ships; at other times we are slack.

H. Petitt. When there is a rush of shipping there may be a little difficulty at times in finding accommodation. Then the wharfs may lie idle for a week or two. Captain Jackson is hampered of course chiefly in the wool season.

12 Jan., 1900.

1819. Do you not think that the wharfs at Darling Harbour, considering the possibilities of railway communication, will be an excellent place for the loading of wool ships? I think it will be a splendid place; the gradient is very easy. There is no steep ascent. The wharfs are good, and there is nothing to interfere with the traffic. You could not have finer wharfs than the new Pyrmont wharfs.

1820. It would be a good place for the loading of chilled meat? It would be a capital place for that purpose.

1821. It would be more convenient than coming to Circular Quay and to other wharfs in that direction? I think it would be far better.

1822. *Mr. Dick.*] I understood you to say that there are times when Captain Jackson is at his wits' ends to provide accommodation for shipping? I have known that to be the case.

1823. Does that happen every year? No; only on very rare occasions.

1824. In making provision for shipping, is it not usual to make it large enough to accommodate the general run of vessels which come into the port in the busy season? It is generally foreseen what accommodation will be required; but, notwithstanding all the knowledge possessed by the port authorities, they cannot sometimes help two or three ships coming in together and wanting berths. There may be at times a little difficulty in that respect. Captain Jackson has said as much to me on some occasions.

1825. Have you had experience of other ports? Although I am acquainted with Melbourne and other ports on the coast, my experience has been gained entirely during the forty years I have been connected with Port Jackson.

1826. We are told that most of the berths at private wharfs run from a maximum of 400 feet down to 200 feet? That would be about the size.

1827. That being the case, do you think that private owners would be able with their appliances to cope with the larger class of vessels visiting the port? All the larger class of wharfs at Darling Harbour, Parbury's wharf, and Saywell's wharf, for example, have applied for an extension in order to provide more accommodation for the large steamers. I know that Saywell's wharf is now on a line with Parbury's wharf, and I have heard that Parbury has put in an application for an extension of another 100 feet.

1828. Does not that indicate that the present appliances in the hands of private owners are not sufficient? The character of the ships coming to the port is very different from what it used to be. They are now building vessels from 450 to 500 feet long as cargo carriers, and the short jetties involve a lot of trouble in swinging the ships; there is also a certain amount of risk of damage to the ship. The wharfs must be made longer in order to accommodate the four or five hatches from which cargo is unloaded in the case of some of the big steamers.

1829. Is it not the general view that the present appliances are not satisfactory, having regard to the trade of the port? I have not seen much stoppage by reason of the want of wharf accommodation. Captain Jackson would be the best to judge of that. The ships make their arrangements with him. My impression is that eventually the wharfs at Glebe Island would be used.

1830. Do you mean in the near future? I should say that in the course of ten years the proposed wharfs at Glebe Island would be well occupied.

1831. Considering that it would take three or four years to complete the wharfs, and make them ready for occupation, do you not think that if the trade of the port increases in the proportion in which it has increased recently, we should be very far ahead of requirements in commencing to construct the wharfs there at the present time? I do not think we should. There is a good deal of room for improvement in all those back places.

1832. Do you think that if the private wharf-owners were allowed the extensions for which they are now asking, they would be able to accommodate the larger class of vessels coming to our port? There are very few of the wharfs which could do it. It is only in a bight such as that between Dawes' Point and Miller's Point that you could give an extension. You could not give it at the A.U.S.N. Co.'s wharf, because the channel there is already very narrow, and you would leave no fairway from which to work the ships. If you extended the jetty at that point you would block the thoroughfare altogether.

1833. Do you think that, apart from the size of the jetty, the privately-owned wharfs are up to date? No; I do not think they are. They have to put up with great inconvenience at the Central wharf; there is no room frequently for lighters to get in between the ships. For instance, it is the practice when a certain portion of a cargo has been discharged to put on a lighter on the other side in order to put in stiffening. At present the ships lie so close that it is impossible for the lighters to get in.

1834. What would you say would be the necessary width for a jetty? If the cargo is tumbled out of a ship from four or five hatches you would want a considerable space to relieve the wharf. At the present time a jetty gets very rapidly filled up, and when there is a ship on each side the cargo is apt to get intermixed.

1835. I believe that the widest of the privately-owned jetties is 60 feet? I should say that at Parbury's there is a width of at least 75 feet; but that is the largest of the jetties. If you had two vessels such as the "Medic" or the "Afric" alongside one of these small jetties, they would practically extinguish the jetty.

1836. It is quite evident that the private wharfs have not sufficient appliances to cope with the larger kind of vessel now coming to the port? No; they are very far behind the times.

1837. If there is likely to be an increase in that class of shipping it is necessary to look ahead a bit, and to provide more wharfage accommodation, you think? Yes.

1838. Do you think any general plan could be formed with reference to the Government wharfs in the port under which a certain number could be used for import and a certain number for export? People like to combine the two things as much as possible. As they discharge cargo they frequently like to take in export goods. Sometimes they work night and day at a ship in order to get her away, and as the space is cleared down below the export stuff is put on board.

1839. *Mr. Shepherd.*] Does it not sometimes happen that a vessel requiring a particular berth will wait a short time for it rather than go to another berth? Yes.

1840. That may sometimes account for the reports that vessels are kept waiting for berths? Yes. It often

often happens that a vessel is kept waiting for a certain berth which has been engaged for her. The private wharfs give rebates and all sort of advantages, and it pays the owners to wait for some of these wharfs.

H. Petitt.
12 Jan., 1900.

1841. It is not from the want of accommodation that vessels are sometimes seen to be waiting? No; they frequently wait to suit their own convenience.

1842. Do you think it desirable that a division should be made between the export and import wharfs; would not vessels rather discharge and take in cargo at the same wharf? Yes; it entails a certain amount of expense to shift a large ship from wharf to wharf: she has to engage a pilot and two or three tugs, and there is loss of time. In some cases they might have to wait for an opportunity to remove her.

1843. What would be the length of wharf required for the largest ship visiting the port, for the comfortable discharge or taking in of cargo? The largest ship with which we have had to do, the "Medic," is, I think, 550 feet long in her overall, or 550 feet between the perpendiculars. Lying at Woolloomooloo wharf she discharged at all her hatches taking in coal on the off-side. She took up 600 feet of frontage.

1844. Would she require the whole of that frontage;—suppose she were lying at a pier, could she not overlap it for a certain distance without inconvenience? If she were to do that she perhaps would be unable to accommodate the whole of her hatches.

1845. To what extent do you suppose she could overlap the pier without inconvenience? Some of these cargo-carriers have their hatches as far forward as the fore-castle deck. You will see, therefore, that they could not overlap to any extent without interfering with the discharge forward. If the vessel were lying stern in you would interfere with the discharge of the cargo forward.

1846. But could not the bow project beyond the pier without inconvenience to the vessel;—you would not require the whole 550 feet? She might if she were to discharge from the whole of her hatches.

1847. How long would a vessel of that character remain at a wharf? As a rule, these vessels have a certain amount of cargo for Adelaide and Melbourne as well as Sydney. Suppose she had 2,000 or 3,000 tons of cargo for Sydney, while that was being taken out they would be putting in coal or stiffening in the shape of lead bullion on the other side. The time she would be at the wharf would depend upon whether they were working night and day or only during the day. If they were working night and day the vessel would be likely to be at the wharf for two or three days.

1848. What would be the average time? I should say the average would be about five days. The vessel might be taking in cargo for some time after all her outward cargo was discharged. She might be taking in a lot of wool, tallow, and hides, and it might be necessary to keep her at the wharf for another day or two for that purpose. The period of detention is quite uncertain. Another vessel may go to Newcastle and take in her bunker coal there; she may then return to Sydney and take in additional cargo, and at various other ports along the coast filling up. You will see, therefore, that the period she is at the wharf is very uncertain.

1849. *Chairman.*] Taking the whole year, would a wharf be occupied or unoccupied during the greater portion? The Woolloomooloo wharf has not been fully occupied this year. It was hurried on to completion for the accommodation of the large steamers. There is a ship lying there now I believe, but the berth has not been fully occupied since it was completed.

1850. Having regard to the character of the oversea traffic in Sydney harbour, is it not necessary that there should be more actual wharfage accommodation than is required for the ships at any time in port? Yes, you must have a surplus.

1851. *Mr. Shepherd.*] Are the berths left open for any length of time? No. Sometimes a wharf may be idle for some days; no ship may require a berth. You may go down to Circular Quay, for example, early in the week and see no shipping there at all; in another day or two you will see every berth filled. It is very difficult to get the actual number of days a berth is unoccupied.

1852. Do you consider that the space between Dawes' Point and Miller's Point is occupied to the best advantage? In some cases there is actually more accommodation put in than there ought to be; it does not allow of sufficient room for ships to berth; the space left is too narrow and confined.

1853. You think the accommodation can be improved upon? Certainly.

1854. Do you think the jetties there could be extended out to a line between the two points without interfering with the fairway? In an indent of that kind if you extend some of the jetties you are likely to interfere with the ingress to, and egress from, other properties. Take the Central wharf and Dalton's wharf, for example.

1855. But could not the wharfs in the centre of the bight be considerably extended without inconvenience to the shipping? If you ran out Parbury's wharf and Saywell's wharf you would interfere with other wharfs. I do not think there is any too much room now for the handling of large ships.

1856. When the Committee passed that spot yesterday they noticed that one large vessel was overlapping one of the piers to the extent of, say, 100 feet? That would probably be one of the China boats.

1857. Although she was such a large vessel she did not nearly come out to the line between the two points;—could not some of the centre jetties, therefore, be considerably extended so as to accommodate ships of that character without inconvenience to the fairway? I do not think so; you could not extend Dalton's or the Central wharf without interfering with the other wharfs in the bowl of the bay, so to speak.

1858. But could not some of the wharfs in the centre of the bay be extended? I am afraid that if you gave permission to extend them the other wharfs would be placed at a great disadvantage; they would be quite unworkable. It would be impossible to get large ships into them.

1859. It is pointed out that cargo often gets intermixed on a jetty;—is not that due to the want of proper facilities for getting the cargo away? The confusion arises in this way: You may have two ships, one on each side of the jetty, discharging a similar cargo; the jetty is so narrow that the cargo becomes intermixed; the marks and numbers on the cargo are very much alike.

1860. Is that not due to the want of proper management? It happens because there is not sufficient space on the jetty.

1861. But if there were better facilities for moving away the cargo directly it was put out of the ship's hold, the confusion would not arise? I daresay that would make some difference.

1862. Have you considered the advantage of constructing piers upon the echelon principle, with a view to economy of space? I am afraid that if you did that you would not be able to get all the hatches in alongside the wharf. Some portion of the ship would overlap.

- H. Petitt.
12 Jan., 1900.
1863. But you could make the wharfs just as long as upon the other principle;—the only difference would be that the jetties would not project so far out into the bay as if they came straight out? You see at Circular Quay, I think, something like the formation you describe. One boat there overlaps the other, and there are a series of steps with a view to the economy of space. I cannot see how by any other method you could get more accommodation than you have on the eastern side of the Quay.
1864. But you think there is a distinct advantage in the way in which the ships are now accommodated there? Yes.
1865. Coming back to the Glebe Island proposal, do you think the wharfage proposed to be constructed there is really wanted? I daresay it could be utilised by the Government by the time the works were finished. I think we shall have to come to that; the shipping cannot go any further in the direction of Woolloomooloo Bay; it must come up the harbour. I am not prepared to say that the accommodation at Glebe Island would be immediately occupied, but we shall have to provide accommodation in that direction, I think.
1866. You think that, at no distant date, it will be necessary to provide extra accommodation in that direction? I think it will be a great advantage.
1867. *Mr. McFarlane.*] I presume you have a good personal knowledge of the private wharfs in the harbour? Yes.
1868. Has there been any increase in the number of those wharfs during the past ten years? Parbury's wharf is a perfectly new wharf; it has been only up for about two years. Saywell's wharf has been there for some years, but there has been an addition of 50 feet, and a shed has also been erected; so that you may call that a new wharf.
1869. But has there been any material increase in the number of private wharfs? There has been a good deal of improvements.
1870. Has there been any increase in the actual number of private wharfs during the past eight or ten years? There have been great alterations during the last ten years. In addition to the alterations I have already mentioned, there are new wharfs above the Pyrmont Bridge; for instance, there is McIlwraith's wharf, which is now called Reid's Federal wharf; that will accommodate four ships.
1871. Did not that wharf replace an old wharf? There was accommodation there for small vessels.
1872. You say there has been a marked increase in the shipping during the past three years? More in the size of the ships than in the number.
1873. There has been a marked increase in tonnage? Yes.
1874. Has the increase in the wharfage accommodation during the past ten years kept pace with the increase in the tonnage? No, it has not. The tonnage of the shipping has been growing more quickly than the accommodation.
1875. If the wharfage accommodation ten years ago was fit only for the accommodation of the shipping at that time there must be a great necessity for increased wharfage accommodation now? Yes; looking at the matter from that point of view.
1876. Is the tonnage of vessels likely to increase, do you think? It is difficult to say what it will be; it has increased very much during the last twenty years.
1877. Supposing that proportionate increase continues, then by the time the proposed works at Glebe Island are carried out they will be absolutely required? There are only a few wharfs which could keep pace with the increased tonnage. You would have to add materially to the Circular Quay accommodation if the tonnage of the ships were to increase as it has done. You have accommodation only enough there now for the P. and O., and Orient, and other large boats. If those boats increased in tonnage in the proportion in which they have increased during the past ten years, you could not accommodate the whole of them at Circular Quay.
1878. Are there any private wharfs which could accommodate such ships? No; they could only be accommodated by overlapping a great deal. Parbury's wharf is the only one I know of which would be of any use, and that is too short. It is only about half the necessary length. I do not think there are more than 350 feet available, and some of the ships are nearly 600 feet long at present.
1879. You have noticed a gradual increase in the size of steamers which have been built to replace the regular liners? The tendency is towards larger ships.
1880. Do you think it is likely to continue? Fifteen years ago we were wondering whether the limit had not been nearly reached, but the ships are still increasing in size, and where it will stop one cannot say.
1881. If trade increased so as to provide cargo for larger steamers they would be likely to still further increase in size? They find at present that larger ships pay better than small ones. If the owners found that increase in size paid they would give us still bigger ships. Only one master is required, and very little additional crew, so that the most economical thing is to make the ships larger.
1882. Would the depth of water in the harbour admit of their coming in? As they are building them now they are curtailing the draught of water and giving the ships more beam.
1883. If there is no chance of increasing the length and width of existing private wharfs, and if there is to be an increase in the size of deep-sea ships coming here, we shall soon have no wharfs with which to accommodate them? They certainly could not be accommodated at the private wharfs.
1884. In that case the shipping would have to depend upon the Government wharfs? Yes. Many ships which now go to Government wharfs would not go there if they could get private wharfs to accommodate them.
1885. *Chairman.*] There is no preference for Government wharfs;—that ships go there as a matter of necessity? Yes. They could get better terms with private wharfs than with the Government. There is a fixed charge in the case of Government wharfs, and there are no concessions such as are obtained from private wharfs.
1886. If the Government had not largely extended their wharfage accommodation in Sydney harbour, and if the private wharfs had remained as they were, trade would have stagnated? It might have been carried on, but it would have been at a great disadvantage to the shipping.
1887. When Darling Island is ready for use, it will afford a great deal of extra accommodation for shipping? Yes.
1888. Do you think it will be likely to supply requirements for some time to come? It will, to some extent, but the shipping will not take the Darling Island wharfs as long as they can get wharfs nearer the centre of

of traffic. The ships would not go there if they could get a berth at the Central wharf or other places nearer the centre of traffic. H. Petitt.

1889. There would appear to be a fashion in the use of wharfs, then? Ships go to certain wharfs because they are near the centre of business; but the shipping is extending in the direction of Darling Harbour, and there can be no doubt that by-and-by Darling Island and other places up in that direction will be extensively used for wharfage purposes. 12 Jan., 1900.

1890. Especially for export purposes? Yes.

Thomas Henley (Drummoyne, West Balmain, and Leichhardt Ferry Company), sworn, and examined:—

1891. *Chairman.*] You reside at Drummoyne, and are connected with the West Balmain Ferry Company? Yes; I am a builder and contractor by profession, but I am proprietor of the Drummoyne, West Balmain, and Leichhardt Ferry Company. T. Henley.
12 Jan., 1900.

1892. You have a knowledge of the trade of the port, more especially of Darling Harbour? Yes, I have watched it most carefully for the past fifteen years. I have taken a great interest in the Abattoirs question.

1893. You are acquainted with the details of the proposal before the Committee? Yes.

1894. I understand that you are favourable to the project? Yes. I think it will be the best work the Government has undertaken for a long time past. My reasons for advocating the work are set out in the following letter, which I may as well read:—

Dear Sir,

Drummoyne, 6 January, 1900.

If desired, I shall be glad to give evidence in favour of levelling Glebe Island and constructing wharfs thereat; mainly, my evidence would be in favour of reserving a large portion of the island and its wharfage—(1.) For a central meat market. (2.) For the erection of cold storage rooms. (a) For home consumption; (b) for export; (c) receiving house for intercolonial imports of meat and all perishable goods requiring inspection. (3.) Site for official headquarters and stores for the Board of Exports. (4.) I should object to any portion of the island being sold or leased for a long term—the whole will be required for local government purposes, such as electric light station, docks for the harbour ferries, manufacturing and repairing sheds for the electric tram cars, and other services such as must eventually come under the control of a county council—Greater Sydney—or similar body. (5.) The island, to be of real service, must be connected with the railway system of the Colony; a portion of the island will, therefore, be required for shunting purposes. The Secretary, Public Works Committee.

So far as the question of a central meat market is concerned, I am strongly of opinion that the Abattoirs should be shifted out to within a few miles of the cattle sale-yards. That being done, you could have no better place than Glebe Island for a central meat mart. The whole of the meat from the Abattoirs could be conveyed there both for home use and for export. With railway communication the whole of the meat could be conveyed to the island within an hour of its being killed. It could there be thoroughly inspected. At the present time there is reason to fear that that is not the case. Not only could meat from our own Abattoirs be taken there, but also meat coming into the harbour from other places; and it could be properly inspected. The complaint has been made that bad meat has got into consumption, which has been forthcoming not from our own Abattoirs, but which has been imported from other places. Glebe Island is also particularly suitable for cold meat storage, and for a central meat market, also, because it would be removed from the dust of the city, and on account of the good water frontage the meat could be expeditiously handled. There can be no doubt that in a very short time when the local market has been supplied there will be an enormous quantity of meat available for export, and good shipping facilities are, therefore, a very important consideration. I am under the impression that the whole of the island on the northern side of the road would be required for a central meat market, and for cold storage purposes. The Board of Exports might also deal there with perishable goods. That is a very large business, and, I think, it will grow to proportions which it is at present difficult to realise. The city and suburbs stand upon 142 square miles, and they had a population of 417,000 two years back (1898) so that the local market itself is a very large one, and we should no doubt be opening up markets in other parts of the world. I do not know of any place so suitable as Glebe Island for an emporium for this portion of the Colony's trade. You could not find any place so suitable for the erection of up-to-date machinery for the handling of meat. My opinion is that at the present time great harm is done to the country through the want of proper appliances at the wharfs for dealing with our produce. I should strongly object to any portion of the island being used for any other purpose than the storage of perishable goods, and the erection of suitable wharfs for export purposes.

1895. Would it not be inconvenient to have the handling and dealing with your dead meat so far away from the Abattoirs;—would it not mean practically two establishments? If there were railway communication between the Abattoirs and the island, your meat could be landed there within an hour of its being killed. I take it that the railway from (say) Summer Hill would be part of the projected Long Nose Point route.

1896. Still that would involve two handlings;—you would first have to kill your meat, and then have to put it in the railway trucks, in order to bring it to Glebe Island? You would have two handlings, even if your cold stores were next door to the place where the beasts were slaughtered.

1897. You do not think that would be an objection? Not the slightest. I would not allow anything to be done at Glebe Island which would interfere with this important industry. One great advantage attaching to the arrangement would be that the whole of the produce, whether imported or local, would easily come under the notice of the Government before being placed upon the market.

1898. *Mr. Watson.*] You would include imports of a general character? Yes; I think all perishable goods should be taken to the island. The Government could expeditiously and cheaply have everything under their observation. Another advantage would be this: Suppose you had cold stores, such as those at North Shore, trucks could go straight on to punts to the island, and be taken there without any trans-shipment.

1899. They do it now at Pyrmont? Yes; I am anticipating also that some day a body such as the London County Council will come into existence here, and that body will probably take charge of the shipping and the tramway and the harbour ferry traffic. This is now providing a large revenue, but is contributing very little to the maintenance of the city. In the event of these matters being dealt with by a local authority under an extensive system of local government, it would be a great advantage to have the whole of the arrangements in connection with the harbour ferry traffic concentrated at one point. My impression,

T. Henley. impression, however, is that the growth of the export trade of the Colony will ultimately lead to the occupation of the whole of the island, and in that case the provision I suggest in connection with the harbour ferries will have to be removed elsewhere. Our rural settlement has more than doubled in twenty years; twenty years ago it stood at 21,471,596 acres; it is now 43,518,921 acres.* Then we have also made great strides with irrigation during the last few years. I find that the Government have now forty-four bores yielding 25,000,000 gallons daily. If you go in for irrigation and the raising of cattle that will have an important effect upon our export trade. We have also a large number of private bores yielding 40,000,000 gallons per day. If we are going to raise stock and deal with it properly we must have ample facilities for export. So far as the need for the extension of wharfage is concerned, I notice that during the past few years the whole of the wharfage on the Glebe-road, in front of the Pyrmont quarry, has been taken up for timber yards. Whenever a piece of land has been reclaimed it has been immediately let by the Government, or taken up in some form. I should object to any portion of Glebe Island being used for any other purposes than those which I have indicated. At the present time thousands of pounds are lost to the Colony through the cruel way in which the cattle are driven. I have no hesitation in saying that the construction of the proposed wharfs should be taken in hand at once. From the point of view of receiving meat from the Abattoirs alone I think the work is exceedingly desirable. 1900. You regard it as a necessity that the work should be connected with the railway system of the Colony;—the railways being in the hands of the Government it is desirable from every point of view that the facilities for export should be connected with the railway system? Decidedly. The Government should certainly provide up-to-date wharfage accommodation so that our export trade may be dealt with as cheaply as possible. Our producers want as good a return as they can get, and I regard the present wharfage accommodation at Sussex-street as a disgrace to a city. 1901. What you have in view is an enlargement of what the Government are already doing at Darling Island? Yes; Darling Island, I think, should be treated eventually as a large granary. 1902. The principle is the same in both cases? Yes. I would have at Darling Island the latest appliances for dealing with a large quantity of grain, and I would have at Glebe Island the latest appliances for dealing with meat and other produce.

TUESDAY, 16 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Arthur Grey Kenway, sworn, and examined:—

A. G. Kenway. 1903. *Chairman.*] You are a resident of Croydon, and were formerly connected with the Glebe Island Abattoirs in the capacity of superintendent? Yes. Prior to that I was the officer in charge of the work of improvements to Glebe Island. 16 Jan., 1900. 1904. When did you leave that position? In 1895. 1905. *Dr. Garran.*] Whom did you succeed at Glebe Island? Mr. Jager. 1906. And he succeeded Mr. Oatley? Yes. 1907. When you were superintendent, did you fill the same position as did Mr. Oatley? Yes. For six years before I left. Previous to that I was simply the officer in charge of the improvement works at the island. 1908. Were you there in Mr. Oatley's time? Yes. 1909. At the time Mr. Oatley was superintendent, were you, as the officer in charge of the improvements, satisfied with the state of things at the island? No; not as regards the sanitary state of the establishment. 1910. Had you recommended any improvements? A great many. 1911. To whom? To succeeding Ministers. Some improvements were made upon the recommendations of the Noxious Trades Commission, but they were not carried out in their entirety. 1912. What view do you wish to impress upon the Committee to-day;—you have offered to give evidence? I wish to speak as to the future use of the island. I thought my opinion might be of some value. 1913. Regarded as a site for the Abattoirs, do you consider Glebe Island convenient? I do—for abattoirs purely and simply; but there are larger questions connected with such an establishment. For example, there is the utilising of the waste products, and the sanitary conditions of the cognate trades. Having regard to some of those questions, I think that Glebe Island is not a proper place. 1914. At the time the site was fixed upon by Sir Edward Deas-Thomson it was completely out of town, so to speak? Yes. 1915. Since then a dense population has grown up around the place? Yes. 1916. Have you been able to reduce the nuisance arising from the Abattoirs practically to a minimum? Not to a minimum. 1917. You may know that there are abattoirs in some of the large cities on the Continent in connection with which there is no nuisance at all? I cannot say that. I suppose people put up with a certain amount of nuisance. 1918. I have read that in Vienna you may pass a building and not know that you are passing the abattoirs? I believe that some people, knowing of the situation of the Abattoirs, have been astonished that there is so little nuisance arising from them; still I would prefer to see them elsewhere. 1919. Suppose the Government removed them to the site for the sale of stock near Flemington, to save the driving of cattle through the streets, how would the butchers be able to get their meat into Sydney with the same convenience with which they now obtain it? That opens up a large question. At the time when we were dealing simply with fresh meat it was vital that the Abattoirs should be in the centre of

* NOTE on revision):—There were then 37,887 holdings held under rural settlement; in 1893 there were 65,298 holdings.

A. G.
Kenway.
16 Jan., 1900.

of the town to enable the meat to reach the consumer in proper condition. In these days of chilled and refrigerated meat, that consideration is to some extent lost sight of. There will still be an inconvenience to those engaged in the trade arising from distance; but that would not affect the question of the supply of meat in proper condition.

1920. Supposing that the animals are killed somewhere near Flemington, as it is said the present Government propose, will not the meat have to come into Sydney in railway trucks? The existence of such Abattoirs involves a metropolitan meat market. The surroundings of the trade force the concentration of the meat into a central market, which must be in town. That would mean that the meat would have to be brought into the town, not by butchers' vans, but by railway trucks.

1921. Would the meat be taken direct by the butchers, or would it be put into a cool chamber? There could be a cool chamber at the metropolitan abattoirs.

1922. What I want to know is whether the butchers would buy their carcasses at the abattoirs near Flemington or whether they would buy them at the dépôt in Sydney? At both places, I take it. It would be advantageous to some to purchase at Flemington. It is dangerous to assume, I think, that the abattoirs will be at Flemington. For reasons of area I do not think they are likely to be there. Still, if they were, some of the suburban butchers would find it advantageous to purchase there; the bulk of the trade would be done in the city.

1923. Then there must necessarily be a receiving-house for the meat in the metropolis, which will have to be cool in order to keep the meat? Not necessarily. The question arises upon whom the duty should fall of keeping the meat. If the meat is delivered in a cool state, at a certain time in the morning, it will be sold by auction, received by the purchasers, and by them be stored.

1924. Will the shifting of the Abattoirs from Glebe Island revolutionise altogether the method of selling meat in Sydney? Largely, but not entirely so. The Riverstone Meat Company affords an illustration.

1925. Do they send their meat in cool vans down to Sydney? No; but they send it at such a time that cool vans are not necessary.

1926. It travels at night? Yes.

1927. In louvered vans? Yes.

1928. They reach Sydney early in the morning, I suppose? Yes. I am speaking from memory entirely; I have engaged in so many occupations since I was at the Abattoirs.

1929. From Riverstone to Sydney is a longer journey than from Flemington to Sydney—much longer? Yes, and if the meat can come from Riverstone without injury in the hot weather it can come from Flemington without injury—even on a hot night. It can come from any place on the mountains at night.

1930. Then you see no difficulty at all in dispensing with the cool chambers, even if the Abattoirs are as near as Flemington? There is this difficulty: if the meat arrives at Sydney and is unprotected by a cool chamber it must be sold at any sacrifice. It would be advisable to have a cool chamber into which to receive the unsold meat.

1931. What we should like to know is, whether there is any absolute necessity for removing the Abattoirs at once;—you think there is? There are many reasons for and against it. I have made a few notes from which I should like to speak.

1932. Have you prepared a statement? No, but I have notes from which I can make one. I find that if the island is cut down, and if the adjoining land is utilised, 50 acres will be available. That would permit of the erection of model abattoirs, as regards the abattoirs only. There would be very cramped sale-yards, and I do not think the abattoirs can continue to exist without the sale-yards being adjacent. There would be no resting paddocks, neither would there be accommodation for any noxious trades—fellmongering and trades of that sort. You would not be able, either, to utilise the waste product on the land. Then, again, your abattoirs should be on an elevated site, and in levelling the island you would be robbing yourselves of that advantage. It is of vital importance that your abattoirs should have free natural ventilation, so that the animal heat can be abstracted readily before artificial refrigeration is applied; otherwise bone-stink and other evils might result. No one who wishes to turn out good meat will put it into a chilling room until the animal heat has escaped by radiation, and also by being conveyed away by natural currents of air. You will see that the question of levelling the island is of some importance from that point of view.

1933. It has been put forward by several witnesses that to make the Abattoirs effective where they are the beasts should be conveyed there by a railway;—you cannot provide for their sale in the limited space now available? That is an impossibility.

1934. If that is the case there must still be the traffic from Homebush to Glebe Island? Yes.

1935. Perpetuating the very nuisance which everyone is anxious to get rid of? It is an outrageous nuisance.

1936. It ought not to continue, you think, one day longer than necessary;—it makes the roads quite unsafe? Yes.

1937. All witnesses are agreed that it will not do to retruck the beasts? Absolutely not.

1938. Then does not that strengthen the conclusion that the selling yards and the killing place must be close together? Yes.

1939. Can they be close together at Glebe Island? Under very crowded conditions, even if the extended area is provided, and still leaving the Abattoirs on an elevated site.

1940. Suppose you left the Abattoirs as they are now, would there be room enough for the yarding and sale of a number of beasts? You might provide altogether about 50 acres; that would mean the taking in of White Bay. If you took in Rozelle Bay you would have a further extension. The beasts would then have to be killed upon arrival; you would have no room to rest or to feed them.

1941. It is the custom now to keep the beasts almost without food or water after their arrival until they are wanted to be killed? Yes.

1942. Would it not be better to kill them directly they come, and put the meat into a cool chamber? No; the beasts would be in too fevered a condition whether they were driven or whether they arrived by railway. The condition of the meat supplied by the Riverstone Company as compared with that killed at Glebe Island fully illustrates the importance of that point.

1943. How long do they keep their beasts before killing them? They are in a position to control the condition of the stock at the time of its slaughter. If some of it were fit to be killed it would be killed immediately; other beasts would be allowed to rest until they were fit.

1944. According to your evidence we could not make Glebe Island available for abattoirs unless we acquired a good deal of the adjoining land? No.

1945.

A. G.
Kenway.
16 Jan., 1900.

1945. That would mean a large expense by way of resumption? Yes.
1946. Have you any idea where the Abattoirs should be placed? I have inspected many sites. There is the celebrated site at Blacktown, and there is also the site at Belmont, which is a comparatively good good one. I have inspected sites all round Homebush Bay and at Flemington, but I have not been able to discover there a sufficient area. Between Parramatta and Penrith there are many available sites in connection with which the necessary cheap land could be obtained. In estimating the area I have regard to future as well as present requirements.
1947. But would it not be an inconvenience for the butchers to go out that distance? That is one of the difficulties.
1948. Would the Homebush property be large enough? I think 2,000 acres is the smallest area you should allow for successful model abattoirs, having regard to future requirements—that is, to carry out my ideas of what abattoirs should be.
1949. That would be for selling yards and for abattoirs, and also for utilising the waste products? It would include the utilisation of waste products, and the accommodation of all the noxious trades, which is more important than appears on the surface.
1950. Does not a good deal of the noxious trades consist of the treating of bad meat which is collected from the butchers' shops in town? Yes.
1951. Would you send that out to the slaughter-houses? No.
1952. You would have a separate place for that? Yes; that is a municipal matter.
1953. Then, in the main, you are against preserving the establishment now used for the Abattoirs for that purpose? Yes. I should also like to suggest that it is a question in the near future whether there should not be a high-level railway or roadway connection from Sydney across Darling Harbour and again to Balmain and the western suburbs. This is one of the points which ought to be considered when the question of lowering Glebe Island is proposed. It remains to be seen whether we should not be robbing ourselves of a distinct advantage, supposing there is to be the high-level connection I speak of. I do not know what importance the Committee may attach to that question, but I regard it as one of the possibilities of the future. Then, again, supposing it is settled that the Abattoirs are to be sent away from the island and that it is to be utilised for other purposes, it may not be advantageous for all purposes that it should be cut down to a dead level. For instance, it might be used for coal staiths or for the shipment of ores. A dead level is not always advantageous for the economical discharge of certain classes of goods, where every halfpenny per ton is a consideration.
1954. You mean it would be cheaper to have the staiths at an elevation? Yes, partly so. Another question is whether the position of the island would induce the general use of the extended wharfage before other more easily approached sites are further developed.
1955. You mean that the intervening foreshores will probably get the first chance? I think it is extremely likely that more convenient wharfs would be used in preference to going out of the way to obtain perhaps less convenient wharfs.
1956. But the properties to which you refer will be in private hands, whereas Glebe Island is a Government property? I am speaking only of the island. It is not for me to consider whether it is in public hands or private hands. It is a question of trade requirements.
1957. Trade, you think, ought to grow gradually, and we ought not to make a sudden jump from the city to Glebe Island? I was considering how trade would be likely to develop. There have been certain trades brought to that neighbourhood. For example, there is the timber trade. That necessitates the use of large areas at comparatively cheap rents. There are certain trades for which it will pay persons to give high rents such as are paid at Circular Quay and Woolloomooloo, and these consequently justify a large expenditure for wharfage. I doubt whether for some time to come very large expenditure would be justified at Glebe Island in the provision of wharfage. When Sir George Dibbs, as Colonial Treasurer, closed the refrigerating accommodation at the Abattoirs and gave three months' notice to all the lessees that he was going to close the establishment, leaving the trade to find new accommodation for itself, nothing eventuated except the continued existence of the Abattoirs. It was quite evident that there were very large interests involved in the dead-meat trade. There are, in fact, so many vested interests concerned in the meat market that it becomes a very difficult question to determine. If you associate the idea of a meat market with your Abattoirs, the question becomes very complex. The raising of stock is a national industry, and that industry is naturally concerned in a proper market for the disposal of its produce. I cannot enlarge at this moment upon all the various interests concerned, but there are many things to be considered before we commit ourselves to the levelling of the island.
1958. You were on the island when the refrigerating establishment was in operation? Yes.
1959. Was it a financial success? No.
1960. Was it a real convenience to the butchers? They thought not.
1961. It kept the meat, however, and enabled it to get tender? Yes.
1962. The consumer would have continued to get somewhat better meat had the refrigerating establishment continued in existence? Yes; but it was not fairly worked. The butchers put meat in in the hottest condition, and gave it the worst possible chance. They killed their meat and brought it into the chilled room directly it was killed.
1963. They were hostile to the establishment—they tried to make it fail and they succeeded? They succeeded in closing the cool room.
1964. But looking at it in the abstract, as a scientific arrangement, it might have been made a success? That is more than I could say.
1965. If everyone had been willing could it have been made a success? I do not think any company has yet made such a success of the business as could be made of it.
1966. If you are going to kill meat at a distance from Sydney, it becomes of essential value that you should have some cool room in Sydney in which to keep your surplus? That is a *sine qua non*.
1967. Do you think that such a room could be made a success? Yes; chiefly to act as a buffer between supply and demand.
1968. If it were used merely for the surplus meat, the cost of chilling would lie upon the shoulders of those who could not sell their meat, and who wanted it kept? Yes.
1969. Do you think they could afford to keep it? Yes.
1970. Have you anything to add to your statement? It is important to consider how long it will take to erect

erect new abattoirs when you have settled the question of levelling the island, and the removal of the Abattoirs from that place. It has now taken twenty years of debate, and the question is not yet finally settled.

A. G.
Kenway.
16 Jan., 1900.

1971. How many years ago is it since the present buildings were erected? I think they were built in 1840; I am speaking from memory. The question of removing the Abattoirs was considered by a Select Committee in 1879, and it has been under consideration ever since. I think that before the island is levelled, a complete plan of the future dealing with it should be arrived at, otherwise there may be a great deal of difficulty in adapting the island to future requirements. It should be definitely ascertained what the site is to accommodate, whether the coal trade, the ore trade, or the timber trade, or whether it is to be used merely for general wharfage, or for manufacturing purposes.

1972. Your experience upon the island is that the Abattoirs have been there quite long enough? Yes; I think they have been there too long; they have been endangering the public health.

1973. And it is desirable in the public interests, you think, that they should be shifted? Yes.

1974. *Mr. Shepherd.*] You say you have made recommendations to various Ministers with regard to the Abattoirs? Yes.

1975. What were they? I should first explain that I was appointed officer in charge of the work of improvement of the Abattoirs. Certain improvements were recommended by the Committee which sat to inquire into the condition of the Abattoirs in 1879. The Honorable James Watson, when Colonial Treasurer, carried out certain improvements; but they did not comprise the whole of those recommended by the Committee. I repeatedly recommended the completion of the improvements—not only of those already undertaken; but of the original recommendations of the Committee. When Mr. McMillan was Colonial Treasurer I went over the whole establishment and measured up all the dilapidations, and all the necessary improvements including the completion of the improvements originally recommended, and I estimated they would cost £60,000. That amount was not granted. Mr. McMillan found money to make certain improvements which enabled us to carry on with an insufficiency. All through my tenure of office I had to struggle to get money to enable us to carry on without actually stopping, waiting for the time for the Abattoirs to be removed. That is the history of the island in a nutshell, since 1881.

1976. Are those the whole of the improvements you recommended? No; other improvements of a temporary character were recommended and executed; but they were all carried out with a view to the future removal of the Abattoirs.

1977. I understand that the whole of your recommendations have not been carried out? Very few of them.

1978. Could you explain the whole of the improvements you have suggested to the Committee? That would take too long a time; I would have to refer to official papers.

1979. You said you thought that 2,000 acres would be required for abattoirs;—how do you propose to utilise that space? The actual abattoir buildings for a city of this size would occupy about 15 acres; adjoining that there would be the necessary sale-yards, with their roadways, occupying, say, another 35 acres. Outside of that there would be the site for all the noxious trades, such as fellmongers and glue manufacturers, and fat-boiling establishments. You would want at least another 200 acres for those various works. Then there is the utilisation of the waste products on the land, and you must allow for the resting of the stock, and for orchards and crop raising. You would utilise the waste products in that way. I estimate that the smallest area with which you could do would be 2,000 acres, if my idea of a perfect establishment were carried out. If you had 5,000 acres it would be all the better. I do not know what extent of ground the Riverstone Meat Company have, but I do not think it is less than 3,000 acres; they can profitably use the whole of that area for their business. Public abattoirs, conducting their business in the same way as the Riverstone Meat Company conduct theirs, could use 10,000 acres advantageously.

1980. Your idea is to utilise the whole of the offal and other refuse on the adjacent land? Yes; nothing noxious should escape from abattoirs; it should all be utilised in a natural manner. That which it will pay best to dry is best dried. What would otherwise run away in a sewer or river should be utilised on the land.

1981. *Chairman.*] What opinion have you formed upon the broad question whether the meat required for a large city such as Sydney should be slaughtered at centres of the country and sent dead to market, or whether the whole of the meat required for the city should be sent down to it alive, by railway, and slaughtered at some centre in the suburbs, such as you suggest? Stock which can be killed adjacent to its pastures can be killed in its prime condition, and the meat is consequently superior. If that can be done, and the oddments can be commercially utilised, a great advantage is gained. It is no advantage to deliver fresh killed meat directly to the consumer. It is an advantage to chill the meat—I do not say freeze it—before it reaches him. If you first extract the animal heat and then reduce the temperature in a refrigerating room you can afterwards keep the meat for two or three days in the hottest weather. I say that from experience.

1982. So that, where practicable, you think that local slaughtering would be better than sending the stock down to Sydney? There are other questions involved. Take Bourke, for instance. With the dry heat there refrigerating can be made a perfect success. The meat can be slaughtered and killed advantageously, but if you have a moist muggy climate, such as you have at the Clarence, it would be impossible to carry out such operations satisfactorily.

1983. But you would not think of slaughtering meat on the Clarence with a view of sending it down by steamer to Sydney? I think that time will come.

1984. But at present we are interested more in the large centres upon our railway lines? I think the time will come when we shall be able to convey meat over the whole of our colonial distances economically. I think it will pay better to carry dead meat than live stock over these distances.

1985. You are thinking of a system under which there would be local slaughtering invariably? That will never be done entirely. There must of necessity be a metropolitan centre for live stock. The two trades will exist one alongside the other.

1986. Do you think metropolitan slaughtering will increase or decrease? I think it will decrease.

1987. Your experience points to the fact that meat slaughtered in the country, chilled, and sent to Sydney, is better for the consumer than is meat which is killed at the Abattoirs after being conveyed over a long railway journey? Decidedly so.

1988. *Mr. Levien.*] Do you not think there will be in the future more meat killed in the country? I think the country trade will grow naturally.

- A. G. Kenway.
16 Jan., 1900.
1989. Then will there be any necessity for such a large area for abattoirs as you have suggested? Our population will grow, and, as I have pointed out, the two trades will continue alongside one another. Metropolitan killing will, no doubt, decrease *pro rata*; but there will always be a certain amount of killing in the metropolis.
1990. You do not think mobs of cattle will be brought down for slaughter in the metropolis as at present? I think so, until the various export and big meat companies find it pays better to deal with their stock in another way. They find at present that it is more advantageous to them to bring it down to the metropolitan sale-yards, and to run all the risks.
- 1991-2. On account of the larger buyers and larger population being here? Not only that; I have known stock to come from Goulburn to be sold at Homebush, and to go back to Goulburn. That, of course, has been an accident of the trade. There will always be a central live-stock market, and a central dead-meat market side by side; but country killing will, I think, increase.

Robert Langley, shipowner, sworn, and examined:—

- R. Langley.
16 Jan., 1900.
1993. *Mr. McFarlane.*] You have had some experience in the shipping trade with the northern rivers? Yes.
1994. Have you had any experience in the intercolonial trade? No; my experience is confined to sailing vessels trading with the northern rivers. I have been engaged in that business for the last twenty-eight or thirty years.
1995. Have you had experience in the timber trade? A good deal; we have timber-mills on the Manning at the present time, and we are bringing hardwood down from them by two or three vessels which are constantly running to Sydney.
1996. Where is that timber principally discharged? At Pymont. Some of it has been going to New Zealand, and that has been transhipped at Sydney. We also execute orders for contractors in Sydney, and the timber is landed at various wharfs, and carted to places of business. It is landed mostly at Pymont, where, at the present time, there is very little accommodation. Almost all the land up to the Glebe Island Bridge is leased by timber merchants, and there is no available wharfage accommodation.
1997. Is not some of the imported timber also landed there? Yes.
1998. As a rule where is the imported timber landed? At Johnstone's Bay, and at White Bay; it is generally put into the water or on to punts.
1999. What is the cause of that? There are no wharfs alongside of which the vessels can be taken. Mr. Ellis had a big place at Pymont where he used to land timber, but the Government took that for railway purposes; he has a place at the head of White Bay now, but I think he lands only Baltic there—no Oregon.
2000. Is there a sufficient depth of water at the existing wharfs at Pymont to accommodate the timber ships? Not the big ships; some of the smaller vessels land their cargoes at Blackwattle Bay, but all the big ships go to Johnstone's Bay.
2001. Have you yourself experienced any difficulty in getting wharfage accommodation? Not until lately. At one time we used to deliver at Woolloomooloo Bay and at places we could get at Pymont, but other timber merchants have got there and it is rather difficult to get a landing-place.
2002. To what do you attribute the difficulty of getting wharfage accommodation? The increase of trade. The companies have monopolised the wharfs. The only public wharf in Sydney to which we could go would be the Market wharf at the foot of Market-street. But there is a difficulty in landing timber there; it is too central and expensive. You cannot afford to pay a very big price for landing timber.
2003. Has the timber trade increased during the past few years? Considerably.
2004. I believe that a few years ago it underwent some depression? Yes; there was not sufficient demand for it to keep some of the mills on the northern rivers going; but now they are all in full swing.
2005. Is the increased trade likely to continue? I think so; prices are going up.
2006. Are you aware of any particular reason for the depression in the timber trade? I think it was due to the general depression; building was almost completely stopped.
2007. Does the increased trade include imported as well as colonial timber? Yes; there is more timber used in Sydney now, both hard and soft wood, than has been the case for many years.
2008. Does a considerable portion of the timber go into the country along the different railway lines? Yes.
2009. Is that trade increasing? Yes; and a good deal of timber is used for Government bridges and other works of that sort.
2010. That timber would come *via* Sydney? A lot of it. I am referring to ironbark girders, piles, and planking.
2011. Have you heard of others besides yourself engaged in the timber trade who have had a difficulty in getting suitable wharfage accommodation? I do not think there is suitable wharfage at the present time for small coasting vessels in the timber trade.
2012. The private wharfs in the city are used by their owners' steamers? Yes.
2013. They are not available for your trade? No; only the Market wharf.
2014. Suppose a new company were commencing in Sydney, would they have any difficulty in getting suitable wharf accommodation? I do not know where they would get it.
2015. Could any be obtained for the intercolonial or deep-sea vessels? Yes; I think so; but there is no accommodation for small vessels engaged in the coast trade. They might get a berth here and there from some of the timber merchants; but they might at any time have difficulty.
2016. Such berths would be suitable for only small ships? Yes.
2017. The coasting and intercolonial steamers try to get wharfage accommodation as near as possible to Sussex-street? Yes.
2018. And there is often a difficulty in getting goods on board the steamers at the time of their sailing? Yes; there is often not room to move in Erskine-street, King-street, and Market-street. That is often the case on a Saturday morning.
2019. Have you had any personal experience in shipping at that place? No; but I have often noticed the block of traffic there, and I have been detained myself for a quarter of an hour.
2020. Have you any knowledge of the proposed works at Glebe Island? I have seen the plans.
2021. Have you a knowledge of the locality? I have known it since I was a boy.
2022. If the proposed works were carried out, they would add considerably to the present facilities for shipping

- shipping? No doubt. If you were providing, however, for only the coast trade, less expensive accommodation would do. R. Langley.
2023. But the wharfs would be available for deep-sea ships as well? I daresay they would gradually be used for that trade, and in that case the smaller vessels would have to go further back again. 16 Jan., 1900.
2024. From your knowledge of the shipping trade during the past few years, and having regard to its future prospects, do you think that the proposed expenditure is warranted? I think the accommodation will be wanted in a short time.
2025. Would the berths be taken up do you think, if the wharfs were constructed? I can hardly say that at the present time.
2026. You say that there is insufficient wharfage accommodation at present? Yes.
2027. If the proposed wharfs were constructed, would not those who are now seeking wharfage accommodation take advantage of them? Some of them might do so.
2028. Have you considered the position of the wharfs with regard to the centre of trade of the metropolis? I think they are about as near to the city as you could get at the present time.
2029. Would there be much difference in the cartage? I suppose there would be a slight increase.
2030. But with reference to goods consigned to the interior, how would the wharfs answer? The charge would be lighter for goods going to Petersham, or Ashfield, or other places on the suburban line; it would be shorter than coming to Sydney. Goods could be put upon the trucks at Darling Harbour.
2031. *Mr. Watson.*] In what way do you think the carrying out of the proposal, which, admittedly, is mainly for the accommodation of the larger class of vessels, help the difficulty you speak of, arising from the want of accommodation for small vessels? I think that part of the accommodation proposed to be provided might be for a small class of vessels. They might be accommodated at this end of the island, just through the bridge.
2032. You are hopeful that some provision will be made there for small vessels? Yes.
2033. If greater facilities were given for larger vessels to go to a place like that, it would leave vacant wharfs which they at present use, and which are not altogether suitable for them? I do not think it is likely they would leave their present wharfs at Darling Harbour to go to Glebe Island.
2034. Not even if the wharfs there were better fitted with unloading appliances? Some of the companies might do so.
2035. You are referring more to the intercolonial boats? Yes. Some of the coasting boats might also go there.
2036. Would it not be possible that some of the wharfs between Miller's Point and Dawes' Point would be abandoned by the larger class of vessels? Yes.
2037. If that were done it would materially relieve the congestion of traffic in Sussex-street? Yes.
2038. If it were possible for the intercolonial and coasting companies generally to get possession of some of the wharfs between Miller's Point and Dawes' Point, do you think they would be suitable? Yes.
2039. They could then get round into George-street, if they liked, by the other route? Yes.
2040. For what purposes is the timber brought down by the coasting vessels used generally? It is largely used in bridge work. It is chiefly hardwood timber. Our vessels carry about 150 tons.
2041. How do you account for the falling off in the demand for that class of timber a few years ago;—I suppose the Governmental expenditure was as large then as it is now? Nothing like it; there were no Government works going on then in comparison with what are going on now.
2042. Some of the trade you spoke of, mostly in hardwood, is largely dependent, then, upon the Government demand? Yes; for bridges, and such work.
2043. Have you had any experience in the soft-wood trade? Very little.
2044. Do you think it is likely that that trade would take advantage of the wharfage accommodation at Glebe Island? I think so, because if they had to punt that must cost more than the wharfage.
2045. Do they not require a large area of land adjoining the wharf if they want to save lightering? Not so very large.
2046. They would want to store their timber there until customers came to take it away? It would be far better for them to cart it than to punt it.
2047. But what area would they want adjoining the wharf? Very few of them have more than 2 acres. The Kauri Timber Company and John Booth & Co. would have more; but the others could do with 2 acres. It is not always that one of the big ships is consigned to one firm.
2048. Would the wharfs proposed to be constructed under this scheme be suitable for small vessels as well as for large ones? They would not be so suitable for small as for large vessels; they are to be built, I understand, for large vessels.
2049. Could not small vessels use them as well? Yes; but I would suggest that portion of the work should be constructed for timber vessels.
2050. You mean the southern portion, just inside the Glebe Island bridge? Yes.
2051. Where would you require to take the timber, supposing it were put ashore on the southern portion? Some would be taken to Sydney and some to Petersham, and other western suburbs; it would be carted in any case.
2052. Where do you take the timber at the present time? It is landed at the railway at Darling Harbour; some of it has to go a considerable distance up country.
2053. Are the iron wharfs at Darling Harbour suitable for small vessels? Yes; they are very handy wharfs.
2054. So that for some of the timber which has to go by rail, including most of the Government orders, the iron wharfs would be sufficiently convenient? Yes.
2055. You do not require much additional accommodation from that standpoint? No.
2056. Where you think there is a lack of accommodation is in respect of the trade in private timber, which is mostly softwood? Yes; increased accommodation is also required for the hardwood trade.
2057. *Chairman.*] Where is your place of business? In Sussex-street.
2058. Have you a wharf of your own? No.
2059. You supply the timber, and land it were it is required? Yes, we sell it mostly to timber merchants.
2060. You said in answer to Mr. Watson that you thought that in the bight between Dawes' Point and Miller's Point the intercolonial steamers might be accommodated? Some of them might.
2061. Is not all that bay owned chiefly by private persons, who have wool establishments of their own there? Yes.
- 2062.

- R. Langley. 2062. Is it not likely that they will remain there for a good many years? They will remain there as long as they can; there is a lot of vacant frontage near the Gas Company's works; but it is impossible to get to it.
- 16 Jan., 1900. 2063. The congestion which occurs at Darling Harbour in connection with the intercolonial traffic is not a matter so much of wharf accommodation, as of street accommodation, for getting goods to and fro? The wharfs are all too small; they can only handle one or two drays at a time, instead of being able to handle a dozen.
2064. It is not only in Sussex-street that the congestion occurs, but on the wharfs themselves? Yes; the drays have to go in and come out the same way.
2065. Can you see any escape from that difficulty? No; a lot of time is also lost in going from one wharf to another; it is not like one big quay along which you can drive. You have to go through a series of streets in order to reach one wharf from another.
2066. The intercolonial trade is bound to keep as close to the city as it can? Yes.
2067. Do you think that if these improvements were made at Glebe Island they would be used chiefly for the timber trade? Yes; at present.
2068. Would you yourself rent a wharf there? Not at present.
2069. Why not? Our trade is not big enough.

Bartholomew Martin Corrigan, shipowner, sworn, and examined:—

- B. M. Corrigan. 2070. *Chairman.*] Where is your place of business? At what is called Wharf-street, near the foot of Market-street.
- 16 Jan., 1900. 2071. You trade between Sydney and the northern rivers? Yes.
2072. Do you do any timber trade? Not much of that trade. I generally carry coal and sugar for the Colonial Sugar Company.
2073. *Mr. Dick.*] You are acquainted with the scheme before the Committee? I have a little knowledge of it.
2074. From your general knowledge of the shipping facilities of the port, would you say that the proposed expenditure was justified? I think it would be a very good thing.
2075. What leads you to that conclusion? The wharfage accommodation of Sydney at the present time is very limited. If you wanted in a hurry a berth for a vessel you might have to wait for some days for it. I have been myself looking for some days for wharfage accommodation to suit my purposes.
2076. Do you know of other persons who have experienced a similar delay? Yes; there is very little wharfage accommodation for outsiders at the present time in Sydney.
2077. You mean that as far as the private wharfs are concerned they are monopolised by the larger lines of vessels, and that the public wharfs are nearly always full? Yes; the sooner we have more wharfage accommodation the better for the public.
2078. Will you give us an instance of the delay which has occurred in your own case in obtaining wharfage accommodation? The last case occurred a little over six months ago.
2079. How long had you to wait on that occasion? I had not to wait too long, but I had to take the best I could get at great inconvenience. Another person had the wharf engaged, and he said, "Any time my vessel is not here you can have the wharf, but when my vessel comes in you will have to get out of the way."
2080. What was the vessel you wanted to accommodate? The steamer "Coomonderry." She goes to the South Coast.
2081. Is it not a fact that a good many private wharfs are practically unused for half the year? I am not aware of it. I think the private wharfs are always used. Of course the demand fluctuates. You might go round to-day and see few wharfs occupied; to-morrow you might see them all full.
2082. You do not think the present wharfage in the port is sufficient to reasonably accommodate the rush of shipping that may take place at any time? No; if there were more accommodation I think it would be better for everyone. Some persons might think that the proposed wharfs at Glebe Island are a little out of the road, but much the same thing was said of Woolloomooloo Bay a few years ago. It was said that no large ships would be induced to go there, but they do go there, and they use the accommodation without any complaint. It would be fairly near the heart of the city; it is not far from the Sugar Company's wharf, and from Goodlet and Smith's wharf.
2083. You think that if the wharfs were constructed they would be asked for? Yes; not for timber alone, but for other purposes. I know some coal merchants who are hampered for wharfage accommodation.
2084. Have they not sufficient accommodation at the Pymont wharfs? They have not. That is only for running coal down from the southern mines. They could not get accommodation for coal-yards there.
2085. You think that an import coal wharf is wanted? Yes; a place where they can land coal and cart it away as it is wanted; there is nothing of that sort at Pymont.
2086. Do you think Glebe Island would be suitable for that class of trade? Or for any other class; it is very easily got at. Look at the Colonial Sugar Company's wharf and Goodlet and Smith's. They carry on a large business there, and they have a good stiff hill to climb.
2087. The Colonial Sugar Company have their own wharfs? Yes; but the proposed wharfs would not be far from their wharf, and, as I say, they have a good hill to climb. They do a lot of business there.
2088. What you mean to say is that Glebe Island would be very little further away, and would have advantages which would make it just as useful as the Colonial Sugar Company's wharf or Goodlet and Smith's wharf? Yes.
2089. Do you think the island would offer greater facilities as a place of export or as a place of import? It would be good for either. I take it that by-and-by there will be a railway constructed to the island. That would be right into the hands of the shipping.
2090. You do not think the proposed works are premature? I think the works to the north of the island should be carried out at once. It will then be seen whether further accommodation is required; there is plenty of stuff on the island to do the necessary filling, and at the present time the island is of no earthly use.
2091. *Mr. Levien.*] You would sooner have wharfs than jetties? Yes. You do not want jetties there blocking up the harbour; wharfs are much better in a place like that where you have plenty of ground.
- 2092.

2092. *Mr. Shepherd.*] You say you have been inconvenienced through want of wharfage accommodation? Yes.
2093. Was that because you wanted to go to a particular spot, or because there was no berth available? Because there was no berth available. I tried to get a berth at the Market wharf and other places on the occasion I have spoken of.
2094. Can you call to mind any case of any vessel besides your own being inconvenienced through want of a berth? I have heard other persons talking about having to wait for a berth, owners of timber vessels particularly.
2095. You think that frequently happens? Yes.
2096. What description of vessels would they be? Coasters.
2097. Have you heard any complaint of oversea vessels waiting for berths? The American or New Zealand vessels generally put their timber into the water or in a punt. The Kauri Company, of course, could not take a vessel up to their place, because you could not get a vessel over 30 feet wide through the Glebe Island bridge.
2098. Do you generally load and unload at the same wharf? No; I frequently have to discharge cargo at one wharf and to take it in at another.
2099. Is not that inconvenient? It is often a necessity of my business.
2100. What is the average tonnage of your vessel? About 150 tons register and 200 tons capacity.
2101. They are more easily moved about than oversea vessels would be? Yes.
2102. So that the inconvenience of moving from wharf to wharf would not be so great? No.
2103. Do you think the northern portion of Glebe Island would be convenient for oversea vessels as well as for the smaller class? I am quite satisfied of it.
2104. Would not the extra cartage be inconvenient? No; I think not.
2105. Would there not be an extra charge as compared with Circular Quay? Very little. To my mind the difference would not be more than 6d. a ton, even if it amounted to that. If I had a contract with carriers for any quantity of stuff I am satisfied that the difference would not amount to 6d. a ton.
2106. *Chairman.*] Do you know the Sugar Company's wharf? Yes.
2107. Is it a wharf suitable for ordinary use? Yes.
2108. Suppose you had a cargo to discharge, would it be a suitable place for you? If I could get any wharf more suitable I would not go to the Sugar Company's wharf on account of the hill there.
2109. That is the drawback to the use of that wharf? Yes.
2110. The reason I asked the question is that Mr. Knox, when he was asked about this scheme, said that his wharfs were not fully occupied for five or six months, and that they could be made available for the general trade if they were wanted during that period for vessels of small size;—when you have been hard pushed for wharfage accommodation why have you not gone to the Sugar Company's wharf? I was always under the impression that the Sugar Company would not allow any but their own vessels to go to their wharf; they have very valuable stuff stored there, and I did not think they would care for other vessels to go there.
2111. It is not a wharf which is generally looked upon as available? No.
2112. *Mr. Watson.*] Even if the wharf were available it would be inconvenient to get away from it owing to the hill? If you were stuck up for wharfage accommodation you would put up with that inconvenience rather than wait a week or some days.
2113. *Dr. Garran.*] Is the hill at Harris-street worse than the hill at Market-street? I believe it is as bad, if not worse. I do not think one horse would take a full load from Goodlet and Smith's to the top of the hill. I always notice them using two horses to take a one-horse load to the top of the hill.
2114. Is it worse than the Druitt-street hill? I believe it is.
2115. Do you think it likely that Glebe Island would be used particularly for the timber trade? No doubt coal merchants would be glad to make use of it; their accommodation just now is pretty limited. Mr. Warburton, for example, wants accommodation. The railway has been taken through his yard, and he has been hampered for room. Glebe Island will be very convenient for him. I do not know where he intends to go; he will have to leave his present place very soon.
2116. Have you considered the large amount of Government wharfage which will shortly be available at Darling Island when you say that the proposed wharfs at Glebe Island will also be required? Yes; but you will want Darling Island for the export trade brought down by the railway; there will be small enough space for all that business there.
2117. You think Glebe Island will also require to be connected with the railway system? It would be of great assistance; a number of big ships would go there, particularly in the wool season. There is more land there than there is at Darling Island.
2118. You say there is some deficiency in wharfage for vessels of small tonnage? Yes.
2119. How many new wharfs would be necessary to meet the demand? I could not answer that question.
2120. Suppose two new wharfs were available for you, and others wanting a berth occasionally, would that substantially meet the demand? The demand varies very much; I cannot say.
2121. Instead of being a shipowner who wants a wharf, suppose you were a wharfowner who provided room for ships, and some complaint were made to you of the want of wharfage, how much additional wharfage would you feel it necessary to supply to meet the present demand? I could not answer that question.
2122. It is a question of how much expenditure we ought to incur to meet the demand? It is difficult to say; the shipping comes in a rush.
2123. Still, you have not had a want for six months? No.
2124. How many times in the previous six months were you in want of accommodation? Not at any time.
2125. Although it may be desirable to give the proposed increased accommodation, it is possible for the Government to pay too much for their whistle;—we are told that the complete scheme will cost £178,000, the suggested railway will cost another £160,000, and another large sum will require to be expended upon the necessary resumption of land between Ashfield and Glebe Island;—the total sum will come to close upon £500,000;—do you think that, to meet the requirements you speak of, that would be a wise expenditure of public money? I should not like to answer that question. That is a matter for the Committee to determine.
2126. *Mr. Watson.*] I do not understand you to say that you think these wharfs would be used only by the class of shipping with which you are connected? No; by all classes of vessels.

B. M.
Corrigan.
16 Jan., 1900.

- B. M. Corrigan.
16 Jan., 1900.
2127. So that you were misunderstood if it was thought that you said the wharfs would be used only by a small class of vessels? Yes; they would be used, in my opinion, by all classes.
2128. Whatever expenditure might be involved, it would be only partly for the deficiency you yourself know of? Yes.
2129. *Mr. McFarlane.*] How long have you been engaged in the shipping trade? About thirty-five years.
2130. Do you know Yeager's wharf? Yes.
2131. Had he a line of steamers running to the northern rivers? Yes.
2132. They used to land their cargo originally at his wharf? Yes.
2133. How far would that be from the Colonial Sugar Company's wharf? I suppose about a quarter of a mile.
2134. Were there any complaints about the distance in that case? No.
2135. You were interested in a shipping company trading to the northern rivers? Yes.
2136. They used to land their cargo at various wharfs? Market wharf, I think, was the principal one; but if we had cargo to land at other wharfs, of course we went there.
2137. With regard to Pymont, the wharfs there are used not only for timber, but all kinds of merchandise? Yes.
2138. As to Yeager's wharf, if a number of warehouses were shipping by his line of steamers to the Richmond, they would convey their goods from the warehouses to the wharf for shipment? Yes.
2139. Have you heard any complaint from them as to the distance and the additional expense of cartage? No; I do not think it will be found that there was any additional cartage to be paid.

THURSDAY, 18 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	JOHN CHRISTIAN WATSON, Esq.
The Hon. ANDREW GARRAN, LL.D.	ROBERT HENRY LEVIEN, Esq.
	JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Francis John Thomas, General Manager, Newcastle and Hunter River Steam Navigation Co., Ltd., sworn, and examined:—

- F. J. Thomas.
18 Jan., 1900.
2140. *Chairman.*] You are manager of the Newcastle and Hunter River Steam Navigation Co., Ltd., and have been connected with it for the last forty years? Yes; I have had forty years' experience of shipping in Darling Harbour.
2141. You are acquainted with the proposal of the Government to deal with Glebe Island;—do you think the further wharfage accommodation proposed is necessary? I think the proposed wharfage would be utilised, although, perhaps, not immediately.
2142. The Newcastle and Hunter River steamers' wharf is at Darling Harbour, a little to the north of Pymont Bridge? Yes; on the Market wharf side.
2143. What is your water frontage? I have not the exact figures; but I suppose we have about 220 feet.
2144. Your premises run back to the thoroughfare which is known as Wharf-street? Yes.
2145. What is the depth of your land from the water's edge to Wharf-street? About 200 feet, speaking roughly.
2146. Excepting the jetty portion, and the narrow strip used by passengers, the whole of your premises are covered by sheds? Yes.
2147. What jetty accommodation have you? We have a large jetty, capable of accommodating two large vessels; it would be about 200 or 230 feet in length.
2148. That extends at right-angles to the water frontage? Yes, it accommodates one vessel on each side; the width, however, is not more than from 22 to 25 feet. There is a small jetty on the northern side which has not been extended to any distance into the harbour. It just serves to show our boundary. We have accommodation at that jetty for a small steamer.
2149. Is there not a top-deck over your long jetty? Yes.
2150. That is used for discharging cargo? Yes.
2151. What kind of cargo? Wool and hay is principally taken on to the upper storey; the other cargo is generally taken below.
2152. Do you generally have two steamers at the big jetty? During the summer season, extending over about five months, we mostly have two steamers in and two steamers out every day excepting Sundays.
2153. What are your steamers? The "Namoi," 1,414 tons; the "Newcastle," with less register (1,251 tons), but a longer and larger vessel; the "Sydney," about 600 or 700 tons; and the "Lubra," about 500 tons.
2154. For the purposes of your own accommodation is your wharfage sufficient? No; we have endeavoured to get extra accommodation, but without success.
2155. Is it sufficient for two of your larger steamers and the "Lubra"? It is not enough for the bigger steamers. We tried to get accommodation at the Market wharf, but the lessees refused us.
2156. If you had more wharfage would you employ more steamers? No; but we require the space for cargo; we require a very large storage accommodation.
2157. Your cargo consists largely of lucerne hay? Yes, with wool and bagged stuff besides.
2158. How does the inconvenience arise;—is it from your cargo blocking the wharfs where it is landed? It is principally through the want of storage accommodation. We could carry on our trade, if it did not increase, with the berthage we have at present, but we want more storage accommodation.
2159. The wharf itself does not get congested, because the cargo is run right away into the shed when it is landed? The wharf gets congested from the want of accommodation both above and below. There is at times a great deal of inconvenience.
2160. What you want is shed accommodation at the back of the wharf, rather than more wharf accommodation? We want nearly 50 per cent. more accommodation than we have at present.

2161.

2161. Are there any premises adjoining your wharf which are available? The Market wharf is F. J. Thomas, situated on the south side next to the Pymont Bridge. That is now under offer to Mr. Kethel, I understand. We tendered for the Market wharf on the last occasion, but Mr. Kethel was the successful tenderer. There is no property but that near us which would be of use to us. 18 Jan., 1900.

2162. As regards the coming in and going out of steamers, is there much inconvenience;—are you inconvenienced, for example, by steamers going to adjacent wharfs? I cannot say that there is any blocking; but the channel gets narrow near the Pymont Bridge, and a great deal of care requires to be exercised in getting steamers in and out. There are no steamers of any consequence going in between us and the Pymont Bridge, consequently we have not much to contend with until we get into mid-channel, and meet the ferry steamers crossing; but that is an incident of all steamers coming in and going out of the harbour. A certain amount of inconvenience arises in berthing at our wharf from the narrowness of the channel, but that is all.

2163. Generally, can you say whether there is any inconvenience to shipowners by reason of their not being able to get wharf accommodation in Darling Harbour between the Gas-works and Pymont Bridge? I should say that all the way from Miller's Point to Pymont Bridge there is great inconvenience in that respect. If there were any new enterprise starting they would find it difficult to obtain suitable wharfage accommodation where the public would be likely to send cargo. There is practically a monopoly between the points to which I refer.

2164. That is to say, the wharfs between Miller's Point and Pymont Bridge are mostly privately owned? Yes; persons are very anxious to obtain wharf accommodation there.

2165. Those wharfs are used in connection with certain lines of steamers? Yes.

2166. The whole of the available space, excepting the bit of frontage near the Gasworks, is pretty well occupied? Yes; the space between the Gasworks and Pymont Bridge has been all taken up. No extra room can be obtained there if it is required. On the north side we are hemmed in by Howard Smith's wharf, and they will not give us any accommodation; and on the south side we have the Market wharf, from which also we can get no accommodation.

2167. The whole of the steamers going to those wharfs are either coastal or intercolonial? Yes.

2168. Do you look upon that part of the city as most convenient for the coastal and intercolonial trade? Yes. In illustration of that I may mention that when the A.S.N. Co. took their business to Circular Quay they lost a good deal of trade by abandoning their position.

2169. The succeeding company—the A.U.S.N. Co.—were careful to come back to Darling Harbour again? Yes.

2170. They did not continue the use of the wharf at Lower George street? No; no doubt Darling Harbour is the best place in the harbour for carrying on the intercolonial and coastal trade.

2171. From your evidence, it would appear that there is not really at the present time any room for the extension of that trade in Darling Harbour? No; there is hardly any room for a competitor to come in.

2172. If the trade largely increased and competitors came in, what would they do? It is difficult to know what they would do. The present companies have utilised their wharfage accommodation in the most advantageous manner. Jetties have been extended, and it is impossible to accommodate more tonnage than is now accommodated on the jetty principle. If you were to adopt the broadside principle you would get much less berthing accommodation than you have now. Everyone must adopt the jetty system in order to get as much accommodation as possible upon a limited frontage. Of course you cannot extend them very far out into the harbour without interfering with navigation.

2173. If there were a large increase in the trade, what would the intercolonial shipping do—would it go to the south of Pymont Bridge? It has already extended in that direction by securing overflow wharfs. The Union Company and the A.U.S.N. Company have secured wharfs up at the head of Darling Harbour to be used as overflow wharfs. Cargo which is not immediately wanted will be sent there.

2174. Is there a fair depth of water there? The depth of water there is comparatively small. The harbour has filled up very much during the past year or so. The water there requires constant dredging.

2175. Would there be sufficient depth of water there for the largest of the Union Companies steamers? I do not know that there would be sufficient for the largest; but there would be enough for some of their steamers.

2176. Take, for example, the "Mararora"? She would require to have a very light draught. The harbour shoals considerably as you go up; there is none too much water where we are.

2177. With an improved Pymont Bridge, and a quickly worked opening, that portion of the harbour would not be so inconvenient? No; the new bridge would tend to improve it very much in regard to the going in and coming out of vessels; but that would not affect the wharfage accommodation.

2178. Do you yourself see any remedy for the congested shed and wharfage accommodation which now exists? No. The only thing the companies can do is to go further afield and establish overflow wharfs as the Union Company and the A.U.S.N. Company have done.

2179. Do you do all your loading or unloading at one wharf? We get relieved of a considerable quantity by transhipping. That relieves our wharfs a good deal.

2180. You know very well the Pymont jetties, and also the large wharfage space known as Darling Island? Yes.

2181. Have you thought out the question whether the establishment of the proposed wharfs will in any way relieve your portion of the coasting trade? It may have some tendency that way. I think, however, it would chiefly tend to relieve the oversea vessels. People connected with the coastal business prefer to do it on the Sydney side of Darling Harbour.

2182. Do you get any great accumulation of wool and hay on your premises? We get a large accumulation of agricultural produce, and we have to try to force it away by charging a higher rate than we generally charge for storage.

2183. That would be chiefly lucerne? Agricultural produce generally.

2184. Is it intended that Darling Island should be used largely for export purposes, being connected with the Railway system of the Colony;—do you think that for wool and wheat export it will be a suitable place? I think it will be a very valuable property.

2185. Especially if it is connected with the Railway system? Yes.

2186.

- F. J. Thomas. 2186. With a sufficient depth of water you think that large vessels would go there to trade? Yes; in the course of time, I think, they would.
- 18 Jan., 1900. 2187. Being so long connected with the shipping of the port, you have observed its growth;—are you able to say whether, at the present time, it would be advisable that the Government should carry out such large works as are contemplated at the northern end of Glebe Island, at a cost of about £170,000, looking, of course, not to immediate necessities but to the future? I think that although the wharfage accommodation there would not be immediately required, the expenditure you mention would be a good investment on the part of the Government, considering that they own Glebe Island, and that it is proposed to remove the Abattoirs. For wharfage purposes alone it would be a very useful expenditure, and will afford a good return in about three or four years' time. I think there can be no doubt the trade will shortly expand sufficiently to make the expenditure a thoroughly good investment. There are various purposes besides wharfage for which the island could be utilised. I understand that it is proposed at present to provide wharfage accommodation on the northern side of the road. When that accommodation has been provided it can be seen what other expenditure it may be advisable to incur on the island.
2188. It is contemplated, if the wharfage scheme is carried out, that the island shall be connected with the railway system of the Colony, either by means of Darling Island or at Croydon, Ashfield, or Homebush? I think that eventually it will be found necessary to make both connections, because a great deal of the trade done at Darling Island might eventually be done at Glebe Island, and it might be advisable to connect them both. A line to Glebe Island would save coming round to Sydney.
2189. If railway connection were carried out it would seem that money would be well expended in making a level space enabling the trucks to be taken right down to the vessel's side? Certainly. I think the expenditure at Darling Island is a very wise one, and that it would be wise to make the necessary expenditure at Glebe Island.
2190. Some witnesses think it would be a mistake to cut down the island, because elevated ground might be required for the loading of certain vessels;—can you see any force in a statement of that kind, seeing that it is intended to bring the railway down to the island? It might be wise to limit the expenditure until it is seen what had best be done to the middle of the island. I have not gone into the matter sufficiently to enable me to sketch out any useful suggestions.
2191. The island having a deep-water frontage, it would be peculiarly suitable for wharfage purposes? Yes.
2192. Suppose that the wharfs were constructed on the broadside principle, there would be nothing to prevent jetties being run out if the space became more valuable? Just so. I think it would be advisable to afford the accommodation at first upon the broadside principle.
2193. The Committee recently inspected the wharfage accommodation in the harbour, and they were struck with the almost barren state of the wharfs as regards shipping? That is inevitable as the wool season tails off. A short time ago, when the wool ships were filling for England, the wharfs presented a very different appearance. I think you will find that the whole of the wharfage is reasonably occupied at the present time.
2194. It is an inevitable incident of our shipping trade that the wharfs will at times be comparatively empty? Yes; you will see the same thing in any harbour—at Newcastle, for example.
2195. It would never do to have accommodation for a limited amount of shipping; you must have accommodation for a sudden influx of shipping in any large port? Yes. I think that, looking forward a few years, and seeing that the Government possess Glebe Island, they could not put it to any better use than that proposed.
2196. Having a wide experience of the port, and having observed its progress for some years, you think that the proposed expenditure at the island might very well be started at the present time? I think so; I presume the works will not be completed within the next three or four years.
2197. *Mr. Watson.*] I understand the tenor of your evidence to be that the possibilities of traffic between Miller's Point and the Pyrmont Bridge have about reached their limit? I think so.
2198. Some companies, you say, have taken overflow wharfs above the bridge? Yes; some of the companies are going into extensive operations at Darling Harbour. Howard Smith, & Co., who are next to us, are spending a great deal of money, even upon leasehold premises.
2199. You mean to the south of the bridge? To the north of the bridge—on their main premises.
2200. What is the nature of the improvements? They are extending their jetties as far as possible out into the stream, and where it is expedient, they are widening them, and are covering over the tops of the jetties to provide storage accommodation, right out into the water.
2201. It has been suggested that if the oversea ships were accommodated elsewhere, the space between Dawes' Point and Miller's Point might become available, and would be suitable for the intercolonial trade;—what do you think of that suggestion? Any place between Miller's Point and Pyrmont Bridge would be favoured in that respect.
2202. It has been, and would be, the best place at which to carry on the intercolonial trade? Yes; it would be preferable to going to the other side of the harbour.
2203. If there were any extension on the eastern shore of Darling Harbour, it would probably be in the direction of Dawes' Point? Yes; if the big companies were removed from there, there would be room for the intercolonial companies to come in.
2204. Between the points we are considering there is a number of large companies who have established certain interests, and it might be somewhat difficult to arrange for the transfer of their businesses to other parts of the harbour? Yes; they have expended a good deal of capital in stores and other buildings there.
2205. Companies of that description do not, however, occupy the whole of the space between Dawes' Point and Miller's Point? I think it is occupied chiefly by companies of that description. Some improvements might be made from Miller's Point to the Gasworks in the wharfage accommodation for the coastal and intercolonial trade before resorting to the removal of companies who are now accommodated between Miller's Point and Dawes' Point.
2206. Do you think wharfs on the Gasworks side of Miller's Point would be suitable—would the get-away be easy? The gradient is, of course, heavy; but I think some combined effort might be made, and that a common gradient might be secured for use by the whole of the wharfs there.
2207. No persons at present have sufficient community of interests to undertake anything of the sort?

I was merely saying that it would perhaps be the best thing to do. I do not know whether the owners would join together to carry out the work, or whether they would make some practicable proposal to the City Corporation for a common road.

F. J. Thomas.
18 Jan., 1900.

2208. *Mr. Shepherd.*] What is your total water frontage? I think from 220 to 250 feet.
2209. With a broadside wharf, then, you could accommodate only one vessel? Yes; either the "Namoi" or the "Newcastle" would occupy the whole of the frontage, and then they would overlap at one end.
2210. The jetties give you largely increased accommodation? Yes; we get three berths instead of one.
2211. You say your jetty is not more than from 22 to 25 feet wide? No.
2212. Have you ever found cargo congested there? Yes; the jetty is piled up with cargo sometimes. We have a difficulty in widening the jetty, because we should lessen our water frontage.
2213. Do you think a jetty 60 feet wide would give you ample room for work? Yes; if our water frontage could be increased we could increase the width of the jetty.
2214. About what time do your larger vessels take to discharge and to take in cargo? They take the whole of the day to discharge and load; they come in about 5 o'clock in the morning, and they get away at 11 o'clock at night; sometimes they have trouble in getting through in the time.
2215. Are they generally fully loaded? Yes; in the summer season. In the winter season the trade is slacker, and we do not run so many steamers. We do not run two in and two out all the year round. In the winter season we run only three steamers.*
2216. You know the water frontage between Miller's Point and your wharf? Yes, very well.
2217. Is that space utilised to the best possible advantage? No; I think it could be improved upon greatly. I think the portion right up to the Gasworks is utilised to the utmost advantage as regards the berthing of ships. If you take the portion from the Gasworks up to Miller's Point, I think considerable improvement might be made by the private owners. I think they might do more in the way of accommodating vessels.
2218. The difficulty there is the height to the street from the water? Yes.
2219. Do you think that difficulty could be overcome? I think so. I have not studied the question; but there are various methods of getting rid of it.
2220. If the property were in the hands of the Government they could make a zigzag road? Yes; or the owners themselves might combine with the City Corporation.
2221. Is it not likely that something would have been done to utilise that property had there been any great want of wharfage accommodation? I do not think there is any great pressure at that particular spot; but from the Gasworks to Pymont Bridge the space is much coveted, and it is almost impossible to get in. If you have to conduct a private enterprise, to be supported by the public, you have to go where they will send their goods, and where passengers will go.
2222. The various kinds of trade are generally concentrated as much as possible; for instance, timber will go to one part of the harbour and other traffic to another portion? Yes; there seems to be a tendency to concentrate the coastal and intercolonial trade also at the one place; it happens to be suitable.
2223. In the event of wharfs being constructed at Glebe Island, what description of trade do you suppose will go there? There might not be an immediate demand for the wharfs, but I think it would grow. I think the timber and the metal trade would go there very soon. In the future there would also be a tendency to do a good deal of the export trade from Darling Island and from Glebe Island.
2224. Do you find that there is a general expansion of trade? There is undoubtedly in the coastal and intercolonial trade. I speak from my own knowledge and observation.
2225. Have you ever tried to think out what influence Federation will be likely to exercise upon the port? There will be free-trade between the colonies. I do not see how trade can be lessened by Federation.
2226. You think Federation will be likely to increase rather than diminish our trade? I think so. Sydney will always command the premier position as a shipping port.
2227. *Mr. McFarlane.*] Your boats ply between Sydney and Newcastle? Yes.
2228. Principally in agricultural produce? Yes, and bagged stuff of various kinds.
2229. Do you find any difficulty in getting cargo away from the wharfs by reason of there being insufficient room for drays and trollies? There is rather a bad inlet to, and outlet from, our wharf, and there is often a block.
2230. In the event of additional wharfage accommodation being provided, you would prefer the space between Miller's Point and Pymont Bridge as being more convenient for the landing of the sort of produce you carry? We should prefer to stay where we are, if we could get accommodation to the north and to the south.
2231. Would not a space above the bridge be suitable? It would not be so suitable for our business as it would for other portions of the coastal trade.
2232. Is there another line of steamers running to Newcastle? None at the present time. Most of the intercolonial lines run to Newcastle, but we do not get much passenger competition from them; they do not run at times which are suitable.
2233. One line of steamers has wharfs above the bridge? Yes.
2234. They were carrying a trade similar to that which your steamers carry? Yes; but the space is too limited for the carrying on of a large trade. They would have required the adjoining premises to enable them to go on.
2235. In the event of the proposed wharf extension being carried, do you think that in time it would be used for cargoes such as yours? Not for cargoes such as ours. I think that trade will stop where it is.
2236. Would it not drift in that direction, in view of the facilities afforded? It might go there in time, but there is a long cartage into Sydney.
2237. It is proposed to connect the wharfs with the railway system;—you understand that? That would be

* NOTE (on revision):—The water frontage to Darling Harbour occupied by the Newcastle and Hunter River Steamship Company's steamers is 179 feet; depth to Wharf-street, 173 feet. Additional storage spaces occupied on east side of Wharf-street, 102 feet x 23 feet, 63 feet x 58 feet, and 43 feet x 27½ feet. Jetties—Main jetty, with berthing accommodation on both sides, 240 feet long by 36 feet at base, tapering to 19 feet at west end; northern jetty, on boundary, 86 feet long by 20 feet at base, tapering to 11 feet at west end. Company's steamships employed—"Newcastle," 264½ feet long, 1,251 tons register; "Namoi," 245 feet long, 1,414 tons register; "Sydney," 231 feet long, 634 tons register; "Lubra," 173½ feet long, 467 tons register.

- F. J. Thomas. be all very well for cargo ships pure and simple; but our trade is a combined cargo and passenger trade. We should prefer some place such as that where we now are. If we were engaged only in a cargo trade of a different nature, I would not mind going to Glebe Island or to a similar place.
- 18 Jan., 1900.
2238. A considerable quantity of produce from the Hunter is sent up the country by rail? Yes.
2239. If that produce were landed at Glebe Island, that place would be even more suitable than wharfs adjacent to Sussex-street? No doubt. In course of time storage at Darling Harbour will become much too expensive, and certain kinds of produce will have to be stored at other places.
2240. A considerable quantity of produce also comes down to the harbour by rail? Yes.
2241. That is sold at Redfern? Yes.
2242. Suppose the proposed wharfage were carried out at Glebe Island, and the deep-sea shipping went there, would not that relieve the portion between Miller's Point and Pymont? Undoubtedly.
2243. That would leave more accommodation available for the intercolonial and coastal steamers? Yes. You would have the accommodation provided also in a place suitable for the coastal trade.
2244. *Dr. Garran.*] You like your present place of business because you are so close to Sussex-street? Yes.
2245. That is the street in which the agents and dealers have their stores? Yes.
2246. Most of your stuff goes to those stores? No. The produce agents have no stores themselves. We store all the produce. They have their offices in Sussex-street, and we store the produce on the wharfs.
2247. But there are some stores there? There are certain local people who buy produce as a speculation. Most of the produce agents generally buy or sell on commission, and have no stores of their own.
2248. If you do not send your produce to Sussex-street, where is the need for you to be so close to that thoroughfare? Because if we abandoned Sussex-street and went over to Pymont, any other company in opposition to us would command the major portion of our trade. It is a favoured locality for the carrying on of that class of business.
2249. Granting that that part of Darling Harbour between the Gasworks and the bridge is extremely convenient for the coasting trade, could not the intercolonial trade be almost as well accommodated in that bight to which Mr. Trickett referred between Miller's Point and Dawes' Point? Yes; but the shipping there would probably try to stop where they are. No doubt the intercolonial trade could be accommodated there.
2250. It is not so dependent upon being close to a particular street? No.
2251. If the access were made by lift, so that the heavy goods could be taken easily from the wharf level to the Kent-street level, would not that bight be as suitable for the intercolonial trade as the place where it now is? I think that portion of the harbour has a great future before it, if it were properly utilised.
2252. Could not the intercolonial traffic be advantageously shifted, and put where Dalton's wharf and the Central wharf now are? Yes; but you would have to do it with the strong arm of the Government. The intercolonial people like to stick to us as closely as possible.
2253. Because they interchange cargo with you occasionally? Because they are more convenient to the centre of the city.
2254. Still, if the passengers were lifted at once to Kent-street they would have no great hill to climb? The passengers would have to take a cab to get from Howard Smith's or the A.U.S.N. Company's wharf, and they might just as well go a little further.
2255. If it were proposed to take the tramway from Dawes' Point to Miller's Point, would not that get over the difficulty of conveyance? There would be no difficulty in providing all the necessary accommodation if that were once settled.
2256. Darling Harbour was good enough for the early days, but it is now overcrowded, because the intercolonial steamers and the coastal steamers have jammed themselves together within a comparatively short length of the harbour;—suppose the Government resumed the whole place, took possession of it, and gave everything between the Gasworks and the bridge to the coastal steamers, and put the intercolonial boats between Miller's Point and Dawes' Point, would there not be room enough there? I do not think there would be any great advantage in the Government resuming the properties. It might do for a time for the trades to which you refer, but eventually it would need expansion.
2257. At some distant time? At no distant time, I think.
2258. As far as you have watched the deep-sea business, you think it is fairly accommodated? I think so.
2259. You think the want of accommodation is principally in connection with the intercolonial and coastal trade? Yes.
2260. More in the coastal than in the intercolonial trade? The coastal trade has more limited accommodation.
2261. Suppose the proposed wharfs at Glebe Island were finished, would the deep-sea vessels migrate to them? Not if they could help it, I think.
2262. Nearness to the city is regarded as of great convenience to them? Yes.
2263. They will not go, you think, until they are obliged? Just so. They have large premises where they are, and I think they are likely to stay there until they are obliged to move.
2264. One point we have to consider is whether, if we make new and magnificent wharfs at a great distance from the city, they will induce migration from existing wharfs nearer the city;—you think they will not have that effect? The intercolonial and coastal trade, I think, will remain as near to Sydney as possible, but the over-sea vessels can go pretty well where they like.
2265. You think the new large wharfs will suit them better than they will suit the smaller traders? Yes.
2266. Do you think that ships carrying timber will be likely to get nearer the city, or to go to Glebe Island? I do not think it matters very much in the timber trade where they go. It would be no drawback to them to land timber at Glebe Island, and there are many trades of a similar nature.
2267. You think that all persons who have trade in assorted goods will like to remain near the city? Yes.
2268. Do you think there is a deficiency of accommodation at Darling Harbour for the smaller class of vessels? I think so. We have no place to which we can go unless we can engage a wharf at some out of the way place, as an overflow wharf.
2269. Do you know of any part where the smaller vessels could be conveniently accommodated? I do not, unless we got the frontage between Pymont Bridge and the head of Darling Harbour.
2270. We have been informed that above the bridge the Government wharfage, from the beginning of the iron wharf down to the bridge on the west side, is not half utilised;—could not that be made available for the coastal trade to some extent? I daresay it could; but it is rather inconvenient. 2271.

2271. It is too far away from Sussex-street? Yes.

2272. Is there not a deficiency of shed-room? It is not so much the shed-room as that the iron wharfs are badly built for large ships.

F. J. Thomas.
18 Jan., 1900.

2273. Is the railway too near the wharfs to make them convenient? I have never inquired into the cause of the want of traffic at these wharfs; but so far as the coastal trade is concerned there is a great tendency for it to get on to the eastern side of Darling Harbour.

2274. Still the head of the harbour would not be a bad place for that trade? It might be a good place for some purposes. I am not acquainted with the conditions of other coastal traders sufficiently to say to what extent the place would suit them.

2275. Suppose you could rent one of these iron wharfs for a relief place, your distance from Sussex-street would not be greater than your distance from Redfern? It might suit us, but we should have to go to great expense to build sheds there. We should only go there for purposes of storage.

2276. Do you think that part of the reason why the Government have so little custom for these wharfs is that they have not provided shed-room? That would be the reason in our case. It would never do to put our cargo on the wharfs and to come away and leave it there. We should have to build sheds at our own expense, and get a lease sufficient to justify us in expending several thousand pounds.

2277. You think trade is not at all likely to extend in that direction until the Government erect sheds on the wharfs? Quite so.

John Jackson, Manager of Public Wharfs, made an affirmation, and was further examined:—

2278. *Mr. Watson.* You have read Mr. Knox's evidence? Yes.

2279. You have noticed that he is very much opposed to the scheme now under consideration, stating that, in his opinion, and that of others connected with the Wharf Association, there is rather more than sufficient accommodation for the amount of trade now done or likely to be done for a few years to come at this port? The same thing was said ten years ago by myself and others; but I have since altered my opinion. There is ample wharfage accommodation in Sydney, such as it is; but nearly the whole of the private wharfage accommodation—that is, the jetties—is unsuitable for the large ships which now come to the port.

J. Jackson.
18 Jan., 1900.

2280. That applies to the greater number of the private jetties? Yes.

2281. Mr. Knox instanced Smith's wharf as one at which it would be possible to berth some of the large steamers? With a large amount of expenditure.

2282. In what relation? You would have to pull up the old wharf and make a new wharf.

2283. Practically, then, the wharf does not exist to accommodate the large steamers? It comes to that. I went round all the private wharfs the other day to refresh my memory in regard to them. I do not go much on them as a rule, because my business does not take me there, but I noticed that on the whole of the wharfs, from Dawes' Point down to Miller's Point, there is no shed accommodation for the protection of any cargo. The cargo is thrown out loose on to the wharf, which means considerable damage to goods if there is rain.

2284. Are they not stored in many of the places there? At the back; but the stores are not available for the ordinary consignees; they are only available for goods which lie over their time on the wharf, or in regard to which a special arrangement has been made, or for which storage is charged.

2285. Do you charge for storage on the Government wharfs? No; we never charge storage. The sheds are put there by the Government to protect cargo, and although the Government are not legally responsible, I have always held that, with the large revenue they are receiving, they are morally responsible. I think it is only fair that when a ship discharges 5,000 or 6,000 tons of valuable goods at a wharf, for which the Government receive about £500, they should protect the goods in some way.

2286. I suppose there is some limit to time for storage? Forty-eight hours.

2287. Take the case of a private wharf,—would they charge if the goods were placed on for that period? The goods can lie on the wharf for forty-eight hours, on the Government wharfs.

2288. In what other respects would you say the private wharfs were deficient? With the exception of Smith's wharf and the Washington wharf, they are only jetties, and jetties are totally unsuited for the discharging of large quantities of inward cargo.

2289. Do you find that opinion borne out by the preference of shipmasters? I can only give you the practice. Take the New York boats, belonging to the Federal Company and to the Houlders—to all except Dangar, Gedye, & Co. These boats used to berth at Parbury's wharf and other private wharfs, but they have all come to berths at Circular Quay, where there is no rebate. They had a rebate of 50 per cent. at the private wharfs.

2290. They pay the Government double what they paid elsewhere? Yes; they used to get a refund from the wharf-owners of one-half the wharfage.

2291. The consignee, I understand, pays the full rate, but the owners of the vessel, in addition to the ordinary freight, get half of the wharfage refunded? Yes, or the agents.

2292. Notwithstanding this inducement, masters of ships have transferred them to the Government wharfs? Yes.

2293. At the Circular Quay these vessels have to berth at Government jetties? Steamers consigned to Gibbs, Bright, & Co. have an agreement in respect of the jetty at the northern end on the western side.

2294. That is a jetty? Yes, a large one.

2295. But have they storage accommodation there? Yes; there is accommodation there for the storage of 3,000 tons.

2296. Where would the other liners go to? I have hitherto berthed them where I best could. The last two I managed to berth at Woolloomooloo, at what will be the White Star Company's liners' berth. I, fortunately, had an opportunity to berth the last two New York steamers there, otherwise I could not have berthed them.

2297. You have mentioned two deficiencies of the private jetties; is there any other point of difference? Yes. Some of the large steamers could not get all their hatches alongside; the jetties are so short. Suppose you have a 350-foot jetty and a vessel is 450 feet long. The modern steamers, you must remember, have hatches right forward and right aft,—some of them have as many as five or six hatches.

2298. How many of these hatches would a large steamer work at one time if she were at a private jetty 350 feet long? I should say about three hatches out of the five. 2299.

- J. Jackson. 2299. As to the other two hatches, the steamer would have to be hauled out and turned round? Yes.
- 18 Jan., 1900. 2300. That means delay and expense? Certainly; and despatch to a steamer is everything.
2301. It means the lying at the wharf for an extra day or two, and that is a matter of moment to the owner? Yes; I daresay it would cost £70 or £80 a day to a large steamer, including the wages of the crew.
2302. From all these points of view you say that private wharfs are not up to the requirements as regards the larger class of vessels? I am quite sure of it.
2303. Is there anything in the contention that the present deficient condition of the private wharfs is due to the manner in which they have been kept back by the Government? I have never heard of it until I read it to-day.
2304. Mr. Knox complained that applications to extend wharfs had been refused, and that the tenure is too short to admit of ample improvements? I do not know it of my own knowledge, but I should think it would be very likely that some extensions would be refused, because the jetties might interfere with the fairway. I do not think they would be refused for any other reason.
2305. As to cases where the Land Board consider applications for a renewal of lease, do they take your advice? No.
2306. Do they not seek your advice in any way? I suppose that in the fifteen years I have been in charge of the wharfs I have given evidence two or three times; I think not more frequently. I see that Mr. Knox says that I have to recommend the renewal of a lease; that is an error.
2307. The Land Board are free to recommend what renewals they please? Yes. I think they go greatly by the advice of the District Surveyor—naturally they would.
2308. They evidently consider that it would be a wrong policy to give a long tenure, in view of possible action by the Government of a comprehensive nature? That, probably, would be their reason.
2309. When you were last here you said that arrangements were in progress for the berthing of the White Star liners at Woolloomooloo;—has anything further been done in that matter? A decision must be arrived at on the 11th February next.
2310. Have you had any applications for, or have you in view any method of utilising, the additional berths on the eastern side of Woolloomooloo Bay? They are both under offer to Dalgety's until the 11th February. If they do not take the berths, I can very soon use them.
2311. Is there any suggestion to go beyond the present terminus on the eastern side of Woolloomooloo Bay? Yes. The berthing there is at present 840 feet. That would be too long for one large ship, and it would be too short for two. I have suggested that 200 feet should be added, so that there will be accommodation for two 500-foot ships.
2312. The extension you recommend would be in a line with existing wharfs? Yes.
2313. All that you would resume would be enough to make a roadway and shed accommodation? Yes.
2314. What area would it be necessary to resume? I could not say.
2315. The Committee have had referred to them another proposal to construct wharfs on the western side of the bay;—is it expected that that wharfage would be occupied by larger vessels? I have applications for the wharfage if it is carried out. The Houlders and the Federal Company are prepared to take it. I have also to make accommodation for the new San Francisco line.
2316. With regard to Darling Island you have not any understanding with any persons as to the wharfs just constructed there? We cannot have an understanding because the Government have not decided what they are going to do with the land between the railway and the wharfs; the wharfs will be practically useless without stores on the land between them and the railway.
2317. You cannot make any arrangement until you know from the Government what they are going to do? No; but I may say that, under the Wharfage and Tonnage Act, the Government could not lease the land there for more than three years.
2318. No matter how far from the frontage it is? No; the Government have no right to lease land they have resumed for wharfage for more than three years at a time. No one would expend, say, £10,000 upon a lease like that. That is the Crown Solicitor's decision. I suggested to the Government that a short Bill should be got through Parliament authorising them to lease for twenty-five years.
2319. In view of the uncertainty in that connection, you are unable to give us definite information as to what it is proposed to do with Darling Harbour? Yes.
2320. The uncertainty as to the leasehold would not interfere with the wharfage accommodation being used by the Government or by private individuals? The wharfage is being actually used at the present time.
2321. It could be used for export purposes, but the uncertainty you speak of would be an objection to a settlement, in a definite way, of the future of the island? Yes; the Department are putting up sheds there now.
2322. Merely for the reception of cargo temporarily? Yes.
2323. But beyond that shed there would be space available for stores of a large character? Yes.
2324. It is with reference to those that the uncertainty exists? Yes.
2325. What is your own idea as to the disposition of Darling Island? My idea is a very definite one. I have had it for many years. I think you should do one of two things: either the land should be leased to a solid firm—and great care should be taken as to the leasing—upon the understanding that they should expend £10,000 within five years in buildings, approved by the Government, to suit their own particular trade. A lease should be given for twenty-five years, and at its expiration the property would belong to the Crown; the Government in the meantime to collect all the wharfage and tonnage dues. Either that, or the Government should build stores to suit the intending lessees and charge them a rent for twenty-five years at the rate of 5 per cent. on the cost of the buildings, and collect all the wharfage and tonnage dues upon the goods coming in or going out of the stores.
2326. You would expect the wharfage and tonnage rates to compensate for the wharf construction, and the income from the lease to make good, to some extent, the cost of resumption? Yes.
2327. You have the idea of export principally in your mind? Yes. I feel very strongly on that point. I never expect anything but export from that island. I think we shall have nearly all the export trade there in a few years.
2328. It has been suggested that the meat and coal export do not go very well together at Pymont? No; the meat export should be taken to Darling Island.

2329. Leaving the coal export where it is? Yes; the meat and grain might be taken to Darling Island. J. Jackson.
2330. Can you tell us why that length of wharf immediately to the north of the Pymont bridge, on the western side of Darling Harbour, is not utilised to any great extent? It is not used by large vessels; but it is very much used by small vessels and lighters—in fact, it is the only place to be got by lighters. You could not put large vessels up there; there is only from 14 to 16 feet of water. 18 Jan., 1900.
2331. I understand that two or three years ago it was proposed to blast away rock there, giving a depth of 28 feet? It was deepened about half way up from the base of the jetty. A depth of 26 or 27 feet was obtaining up to a certain point, and from there up to the bridge the wharfage has been used for small vessels. I think it would be a waste of money to blast out more rock there.
2332. Is there not room to accommodate the small class of vessels to which you refer on the southern side of the bridge, going along towards the iron wharfs? There is not now. It is used by the contractors for the new bridge.
2333. What is that space being used for? In connection with the construction of the Pymont bridge.
2334. Ordinarily it would be available? It has been used as the course of trade required.
2335. The vessels now going north of Pymont Bridge have been transferred from the southward since the bridge work was started? Some go there and others go up to the iron wharfs.
2336. Would the space which you say has been deepened up to 26 or 27 feet be enough for the accommodation of large vessels? For a distance of 300 feet immediately south from the bridge the depth is only 15 or 16 feet; but northward again from that it is about 28 or 29 feet.
2337. Why did you not continue to deepen to the extent of 26 or 27 feet right along? It is an expensive operation, and it would take a long time. I think they were twelve or eighteen months going from a depth of 14 to 28 feet in the length of 300 feet.
2338. With respect to that frontage, why is it not more used by large vessels? It is always used.
2339. We were informed that it was seldom used? Persons who gave you that information must have happened to be there on a day when there were no ships. Wharfage business fluctuates very much. One day there will be no ships, and the next week you will have more shipping than you can accommodate. You will see the same thing happening in London, and elsewhere.
2340. Could not the smaller vessels and lighters be accommodated to greater advantage at the iron wharfs at the head of Darling Harbour? No; those wharfs have always been a nuisance. They are too high, and the lighters have not derricks to hoist up on to them.
2341. It seems a pity to allow that frontage to go to waste? We use it for small timber vessels. That is the only purpose, I think, for which it is now used.
2342. Would it not be advisable to make it more convenient? I do not know how that would suit the Railway people.
2343. Do the Commissioners use the wharfs to any great extent? The wharfs are on a level with the top of the trucks, so that the goods on the wharfs can be shunted direct into the trucks. The Railway Commissioners have used the wharfs largely for railway iron.
2344. Are they not available to the public to any great extent? I do not think the Commissioners use them very much now; they are taking their railway iron somewhere else.
2345. If the wharfs at Pymont are being used as extensively as you just now said, how is it that the amount of revenue received from them is so small;—last year it amounted to only £1,420? That would be the revenue from above the bridge. The revenue from the two jetties was £4,302. That was partly owing to a concession which was given to the Railway Commissioners. We charged only half wharfage on the coal exported from there; instead of 3d. we charged only 1½d. The Commissioners pay the wharfage on a large quantity of the coal.
2346. Was any concession made in respect of wheat which was taken from there? No; only in respect of coal.
2347. Are the Pymont jetties suitable for shipping anything but coal;—is the decking flush with the rails? No; the rails are above the decking.
2348. Making the place unsuitable for the discharge of cargo? Yes.
2349. The jetties must be confined to the export trade? Yes.
2350. If the rails were flush with the decking could the jetties be used for both purposes? I do not think so.
2351. In other places the wharfs are used for both purposes? Yes; but you would interfere with and hamper the railway traffic if there were a number of drays there. You could not discharge inward cargo. To discharge a large cargo of general merchandise you want plenty of space.
2352. Do all the vessels which use the Pymont jetties go there for export purposes? Not all. A large quantity of ore is landed right from the ships into the railway trucks.
2353. *Dr. Garran.*] We were told by a witness the other day that there had been an experiment in the loading of grain at the new Darling Island wharfs, and that it had not been a very great success? I think something very practical was done; 1,000 tons were loaded. The wheat was not loaded from Darling Island, but from Pymont wharf.
2354. One of the carriers told us that there was rather a muddle? It was a matter for the Railway people. I did not interfere, but I think there was a little muddle. I saw what was being done, and suggested what they should do.
2355. It was the first shipment there? Yes; at one of the jetties—Pymont wharf.
2356. You do not think it afforded any indication of the fitness of the wharfs for export purposes? No; all that is required is that the line of rails should be put a little nearer to the edge of the wharf. The trucks were a few feet too far away from the ship.
2357. You know the frontage to Dawes' Point? Yes.
2358. Would it be possible to make a wharf there? I did suggest it, but Mr. Darley said that it was all rock there, and it would be too expensive, seeing that we could not get a berth of more than 420 feet.
2359. The reason I ask the question is, that the property is to be dedicated as a permanent reserve, and I wanted to ask you whether there ought to be a reservation of the frontage for wharf purposes—whether it might be considered expedient hereafter to make a wharf there? No; I think the public should have the place entirely. It is a beautiful spot; there is no sewage, and the water there is perfectly clean all round.
2360. You have described the Circular Quay frontage as the best in Port Jackson? Yes.
2361. If you can get 500 feet of wharfage at Dawes Point, then, would it not be a very good thing for you? We should get only 400 feet.
2362. But that would make a very fine wharf? For a certain class of vessels. 2363.

- J. Jackson. 2363. Do you think a jetty there would come out far enough to affect the entrance at Circular Quay?
No.
- 18 Jan., 1900. 2364. It would not hinder the manœuvring of ships there? No.
2365. The only objection to the provision of wharfage accommodation there would be the taking away a part of a popular reserve, and the cost of the work? Yes.
2366. Mr. Watson asked you about the Pyrmont wharfs; would it not have been cheaper to deepen the remaining portion of the wharf to which you referred—would it not have been better to have one magnificent line of frontage than to spend an equal sum of money in making a wharf elsewhere? I do not think so. You could not have obtained berths there for three large vessels, and sometimes it is better to have a number of small ones. Besides, we must have accommodation for a certain number of small vessels somewhere.
2367. But you need not put small vessels in the best part of the harbour;—do you know of any better line of wharfs than you have there? No.
2368. Yet part of the frontage was not deepened, because you say it would cost too much money;—if you had had the front of the wharf deepened to the bridge you could have put the “Medic” there at any time? She could not discharge there, because of the Railway.
2369. She could only take in cargo there? Yes.
2370. One of the witnesses said it was understood that the White Star Line were not going to take the berths at Woolloomooloo Bay? I should be rather glad if it were the case.
2371. Where would they be able to go to if they did not go to Woolloomooloo Bay? I do not know.
2372. They could go only to Smith’s wharf? Yes; if they do not go to Woolloomooloo; the Norddeutscher Lloyd’s boats will go there.
2373. You have just now more steamers than you want, and you will be glad to get rid of one of them? I can afford to get rid of the White Star line.
2374. Did you find any difficulty in respect of distance from the city in regard to the wharfs on the eastern side of Woolloomooloo Bay? Yes, as regards passengers. I have been thinking over that matter, and to my mind the time will come when some other approach will have to be made to Woolloomooloo. In the event of the berth on the Domain side being constructed, I believe it will be advisable to take the tunnel through from Circular Quay under the Domain. The electric tramway could then be continued through to Woolloomooloo, and you would have plenty of material for the filling in in connection with the wharfs.
2375. You think that it will be a very valuable wharf frontage, and that all that is wanted is better access? Yes.
2376. The extension of the electric tramway to that point would help the difficulty? Yes.
2377. But it would not be so good as the making of a tunnel? No; a tunnel would also supply material for the filling in of the wharfs and a good roadway for drays.
2378. Where would you make the tunnel? I would take it at an angle from the Water Police Station, to come out on the western side of Woolloomooloo.
2379. Under the Domain? Yes; it would not be necessary to resume a foot of land.
2380. That route has been suggested for a railway? I do not think the railway is likely to go there, but the tramway might be extended.
2381. Do you think it would pay? Yes.
2382. Do you know what it will be likely to cost? No; but if a large property like Woolloomooloo is to be made to pay every facility must be afforded.
2383. You wish to let the wharfs at Woolloomooloo to advantage; you recognise that there is a difficulty of access, and you think that a tunnel would be the easiest method if the Government would go to the expense? Yes; and, instead of taking the filling from Darling Island or from Glebe Island, they might take it from the tunnel.
2384. You have no immediate use for the material in the neighbourhood? No; the tunnel need not be cut right through now, but it could be commenced.
2385. *Mr. Shepherd.*] About what width would one of the largest steamers occupy upon a jetty? About 60 feet.
2386. And she would be about 550 feet long? Yes.
2387. What is the depth from where one of the largest steamers discharges to the back of the shed or wharf? The shed at the Government wharfs is about 30 feet in from the edge of the wharf; that gives room for cargo to be lifted out by derricks in front of the shed.
2388. Supposing you wanted 100 feet for the discharge of a ship, and that your jetty were 200 feet wide, and you put up a division in the centre, you would then have ample room on each side? That would be practically a broadside berth, and it would be a very costly undertaking. I recommended something of the kind some years ago at Woolloomooloo Bay, with a width of 150 feet. That was intended to berth four sailing vessels, and it would cost something like £27,000.
2389. My idea was that you would economise space; if you wanted 550 feet for one vessel at a broadside wharf, could you not get four vessels by constructing your piers longer, with sufficient breadth? I am afraid that if you ran your jetties out that distance into the fairway you would be obstructing the traffic. The structure you describe would be an enormous concern—practically a little island. It might be possible to construct it in some places.
2390. What distance from the stem of a ship is the first hatch? It varies very much. Sometimes it is 15 feet; in other cases it is 50 feet.
2391. Are there any cases in which it is as near as 15 feet? Yes; sometimes there is a hatch right down through the cabin.
2392. Then there would be no saving in putting a vessel in bow first for discharge? No.
2393. *Chairman.*] With regard to the increased tonnage of the port, several witnesses stated that although there has been a large amount of extra tonnage coming to the port, it has been empty tonnage; that is to say, that large ships have come here with very little cargo, and that it is now proposed to provide wharfage for empty tonnage? I do not know of any empty tonnage.
2394. The “Medic,” for example, which berthed at Woolloomooloo, did not come here full of goods? No steamer ever comes to Sydney with a full cargo.
2395. You said some time ago that there had been a great increase in tonnage during the past few years, and that it led you to ask for new wharfage? You forget that the steamers have to take outward tonnage.

2396. Your increase in tonnage is based upon the actual tonnage brought in by the vessels? Yes.
2397. Mr. Knox said that your increase was based only on the tonnage of the vessel; whereas it is based on the actual goods imported? Yes, and landed at the public wharf.
2398. It was also stated that during the height of the wool season some of the berths this year had been empty for weeks in succession;—is that correct? Yes.
2399. Why was that? Because there has been a great decrease in the wool export.
2400. There has been a large falling off in the wool clip? Yes; it has fallen off fully one-third.
2401. Do you know the depth of water at the approaches of Glebe Island? Yes; between 23 and 25 feet.
2402. Is it rocky underneath that? No; it is soft.
2403. Mr. Knox said that he thought the estimated cost of the works was beyond their value when completed, and that it did not include the cost of dredging, which would be extremely higher; he also said there was an enormous amount of rock-cutting to be done to get to the requisite depth? I do not know of any rocks there. As far as I know, it is all soft ground. I know that White Bay is all mud.
2404. Mr. Knox states that the wharfage at the Sugar Company's wharf was never taken up by any shipowners;—did you ever hear of the Sugar Company's wharf being available for purposes outside of their own business? No.
2405. You never heard of its being advertised or offered for public use? No.

J. Jackson.
18 Jan., 1900.

FRIDAY, 19 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Francis Henry Wilson, Chief Clerk, and Acting Chairman of the Metropolitan Land Board, Department of Lands, sworn, and examined:—

2406. *Mr. Dick.*] During the course of our inquiry several witnesses have stated that they found great difficulty in getting anything like fair terms from the Government in respect of the so-called private wharfs;—they state that they are hampered, and that difficulties are thrown in their way by the Department of Lands;—will you kindly detail the method in which their applications are received and dealt with by your Department? The applications are sent in the first instance to the Metropolitan Land Board, who refer them to the District Surveyor and the Harbours and Rivers Branch for report. After the reports have been received it comes before the Land Board for inquiry, and the parties give evidence, if they like, as to what the cost of erecting wharfs would be. The officers of the Department also give any evidence in their power. Expert evidence is brought as to what ought to be the rent of a wharf of the value proposed by the would-be lessees. The Board then, taking all things into their consideration, recommend the lease. Under the 89th section of the Act of 1884, the lease must be for fifteen years only.

2407. *Mr. Watson.*] Is that the maximum? By the 46th section of the Act of 1895 the term of the lease was extended to twenty-eight years. The Metropolitan Land Board, as a rule, now recommend all large leases for twenty-eight years, with a proviso that the rent shall be appraised every seven years. The Board make a recommendation to the Minister to that effect, and the papers are sent over to the head office. They are put before the Minister. There are certain conditions which have been fixed for some years attaching to leases in Darling Harbour. I will read them to the Committee. They are so drawn as to apply to individual lessees or to companies. That is the only variation in the forms. Form A is as follows:—

The lessee is to remove the structure at his own cost, and without compensation, within six months of determination of the lease, should he be required in writing by the Government to do so. A good and substantial structure is to be erected, within six months from this date, upon the land leased, to the satisfaction of the Harbours and Rivers Department, and such structure is to be kept in good and efficient condition, and in a thorough state of repair throughout the currency of the lease. The right is reserved to terminate the lease at any time during its currency, should the land be required for public wharfs, railways, or other public purposes, by giving not less than six months' notice in writing to that effect. Should the land be required by the Government for any public purpose during the currency of the lease, any erection upon it may be retained without compensation beyond the cost price, less a sum for deterioration.

I am not aware that the Crown has ever exercised the right referred to—that is, for some years. I believe it was exercised by the Railway Department at Pymont at one time.

2408. *Mr. Dick.*] When were these conditions framed? Many years ago; long before I had anything to do with the matter.

2409. Any person or company taking up a lease is thoroughly aware of these conditions? Yes.

2410. The experts who give evidence as to the rent per annum of the leases are also aware of the conditions? Yes.

2411. Do you think the conditions enter into the computation of the annual rent to be paid for the leases;—the fact that the Government may take the property at any time must have some effect in determining the value? The rents are not very high; the highest, I think, is about £300.

2412. You do not think, then, that the statements of Mr. Knox are true, and that the Engineer-in-Chief for Works takes an unreasonable view of proposals for enlarging or improving the wharfs;—you do not think an excessive rent is demanded for the land leased for wharfs? We do not think so.

2413. *Mr. Levien.*] The rentals referred to by Mr. Knox may have been assessed before these leases were dealt with under the Land Act? Quite so. I think the highest rental is only about £300 a year; I am not aware of any higher.

2414. You had nothing to do with the fixing of the rent in the case of Dalgety's lease? No; the case of the next wharf—the Central wharf—is coming before the Land Board at its next meeting. It will come up for reappraisal.

2415.

- F. H. Wilson. 2415. *Mr. Dick.*] What has been the general result of reappraisal in these cases? Generally, the same rent has been fixed; it is only where the length of a jetty has been increased that additional rent is asked, as a rule.
- 19 Jan., 1900.
2416. Have the lessees carried out the condition as to the erection of good and substantial structures, and the keeping of them in good order during the course of their leases? The Harbours and Rivers Department look after them; that is not part of the duty of the Lands Department.
2417. What is it, then, that you actually lease? The Government grant permission to erect wharfs on land under the water.
2418. Generally in front of a freehold? If it is not in front of the applicant's own freehold he will have in his application to prove the consent of the owner of the freehold to a special lease being granted.
2419. Is it true as stated that when the lessees ask to improve their position by substituting concrete for timber wharfs they are obstructed? I do not think that is so.
2420. It is said that the Government demand the right to resume all the reclaimed land, and the right of access to the water at any time, on paying the actual cost of the reclamation? I do not know of anything of the kind. We do not know anything about those matters. The reclamation has to be effected to the satisfaction of the Public Works Department in every case; we have nothing to do with that.
2421. Would that be included in the conditions of a lease;—supposing a man desires to make a concrete wharf? I do not know of any case of the kind which has arisen.
2422. You think that is a purely hypothetical statement? Yes; I do not know of any case.
2423. What limit do you generally impose as regards the length of jetties? That is determined by the Harbours and Rivers Department. They lay down the limit-line for the jetties, and we do not grant leases beyond that line. I may mention that a short time ago one of the companies did run out their wharf beyond the limit-line, and on representations being made to the Harbours and Rivers Department, they shifted the limit-line out to the end of the wharf.
2424. Who, as a rule, apply for the leases? Either the companies or private proprietors. We have applications from Huddart, Parker; Howard Smith, and other companies.
2425. When you say proprietors, do you mean the owners of the freehold? Either the owner or the lessee of the freehold, with the consent of the owner.
2426. Do you find much competition among that section of the community for these wharf frontages? We hear a great many complaints that they cannot let their wharfs as readily as they used to do owing to the competition amongst the wharf-owners themselves.
2427. *Mr. Watson.*] But there is no competition for particular sites? The leases are restricted to the owners or lessees of the freehold. There can be no competition.
2428. *Mr. Dick.*] In the case of resumed land on the foreshores, is it a fact that you can give no lease for a private wharf for a period beyond three years? The case of resumed land would be dealt with by the Treasury. We have no cases of that sort coming before us.
2429. Taking a general view of the conditions imposed upon the lessees, you do not think they can be said to be harassing to them? I think the tenure is very uncertain. The Government may want to resume at any time.
2430. Is that not taken into consideration when the value of the lease is estimated? Yes; but a jetty can all be pulled up at a moment's notice.
2431. Do you know of any cases where improvements have been checked on account of the uncertainty of tenure? No.
2432. Those who have taken up these leases have availed themselves to the full of the facilities provided? I think so.
2433. With respect to the clause giving the Government power of resumption at six months' notice, have any cases of resumption occurred? I do not know of any.
2434. Do you think that condition has in view a general resumption of all the private wharfs, rather than of any particular resumption? I think so.
2435. Until some complete scheme is formulated there is not much likelihood of any wharfs being resumed? I do not think so. I might add that the same proviso attaches to all private bathing-places in the harbour.
2436. Have you or your Board made any recommendation to the authorities with regard to the improvement of the conditions of the leases or do you think they are fairly satisfactory? We have made no recommendation.
2437. It is to be presumed then that you think the conditions fairly satisfactory? We have to carry out the conditions as imposed by the Minister for the time being; but we think that the tenure ought to be more certain.
2438. In what way? We think that Clause A ought not to be inserted in the conditions.
2439. Have you made any recommendation of that character? No; that is only our personal opinion.
2440. But the uncertainty of tenure must enter into the calculation when the rents are being fixed? No doubt it does.
2441. *Dr. Garran.*] Is it not a fact that the jetties recently built have been of first-class quality—good strong useful jetties? Yes, I think so; some of them have been erected at a cost of about £4,000.
2442. The lessees who have undertaken to build these jetties have done justice to their tenure? Yes.
2443. Is not that in itself a reasonable presumption that they think their tenure a good one? I suppose it is.
2444. Would not any practical man of business say so? I think so.
2445. They feel that they can trust the Government not to behave unfairly to them? I think they feel that the land will not be taken unless a public necessity arises.
2446. And that then they will get their money back, less the depreciation; they cannot complain of that? No.
2447. Many of the older wharfs are of a very inferior description? Yes.
2448. Your Board have no power to improve them, I suppose? No.
2449. When these leases fall in, can you stipulate that there shall be any improvement;—suppose they do not ask for anything fresh, but only for a renewal of the lease? In some cases I know we have insisted upon new piles being driven where the old ones have been eaten through by cobra.
2450. Do you get reports from an engineer as to the state of the wharfs? In a great many cases I go down and look at the piles myself.
- 2451.

2451. If the lessee applies to lengthen or to broaden, then you can put in all the conditions you like, F. H. Wilson, and you do? The Harbours and Rivers Department have to be satisfied as to those matters.
2452. The old wharfs are no further under your power or under that of the Harbours and Rivers Department than to see that the structures are safe? That they are safe and sound; that is the duty of the Harbours and Rivers Department. 19 Jan., 1900.
2453. You do not stipulate for any improvements in consideration of a lengthened lease? No.
2454. From what you know of all this land at Darling Harbour which has been so closely under your observation, do you think that those who trade in that part of the harbour are fairly satisfied? I do not know; some of the companies have been complaining that, owing to the immense length of the steamers at the present time, all the traffic up the centre of the stream will be destroyed.
2455. That is not a complaint by wharf-owners, is it? Yes. One company came the other day and said, "If we do not get our wharf out a little further, we shall have to unload half the cargo and then take the steamer out into the stream and turn her round before we can unload the other half."
2456. That is because the steamer would have four or five hatches when there is room to unload only three? Yes, they say that owing to the Government wharf where Goodlet's wharf was the harbour is much restricted.
2457. But if they placed their wharfs further out they would restrict the fairway still more? The Harbours and Rivers Department do not allow them to do that.
2458. I gather, from what I have seen of the plans of the Harbours and Rivers Department, that they draw a line from point to point and will not allow a wharf to project beyond that line? No wharf is allowed to project beyond it; but sometimes a vessel would project nearly 100 feet.
2459. There is no limit to that? No.
2460. Then a vessel may poke her nose out 50 feet in the fairway so long as the stern is against the end of the wharf? Yes.
2461. She can obstruct the stream as much in that way as if the wharf were run out? Yes.
2462. I suppose the real difficulty arises from the fact that the ships have grown whereas the wharfs have not? I think so.
2463. The wharfs were long enough originally for the ships they were intended to accommodate? Yes; several have been lengthened to the extent of 30 feet or 40 feet within the last year.
2464. But with ships of a length of 500 feet the longest private jetty in Sydney would not provide the accommodation? No.
2465. When you hear of the competition you speak of, is it the competition of the other wharfingers or the competition of the Government that is most complained of? They complain mostly to the Board of the competition of the Government.
2466. The construction by the Government of such wharfs as those at Circular Quay must necessarily have taken the ships away from other wharfs? I suppose so.
2467. Would any private wharfs, or all of them together, give the accommodation which the Government are giving at Circular Quay? I do not think so.
2468. If an earthquake were to silt up Circular Quay to-morrow, could the ships berthed there find accommodation at private wharfs? I do not think so.
2469. Then the competition of the Government has come in to fulfil a real want, has it not? I suppose so.
2470. We could not now do without Circular Quay? No.
2471. Or the Woolloomooloo berths either just now? No.
2472. So that the Government up to the present time has not oversupplied the needs of large steamers;—do you think it has? No; I know that Government officers have said that they would have to resume all the western side of Woolloomooloo Bay. It was reported to the Board only a few months ago that they must have more accommodation.
2473. Under these circumstances can it be fairly said that the competition of the Government has been up to the present time excessive? I am only telling you what the officers have said. I do not profess to be a judge.
2474. The private wharf-owners could not possibly have accommodated the vessels which have been accommodated by the Government? No.
2475. When we are considering a scheme of still further increases to the Government wharfs, we have to consider whether that increase will be going too far, and will be entering into unnecessary competition with private owners? I do not know of any private wharfs which could take in vessels like the "Medic" or the "Afric."
2476. The Darling Island wharfs will be ready in a short time for shipping;—even when they are all in use do you think the Government will have supplied excessively the needs of shipping? I am not a judge.
2477. As far as you can see, the terms and conditions upon which the Government insist are not, all things considered, unreasonable? No.
2478. They are not, so far as you know, checking the improvement of wharfs? No.
2479. *Mr. Shepherd.*] In the event of a company or an individual applying to extend, what course do they adopt? They would apply for an extension. The papers would be sent to the Harbours and Rivers Department to inquire if there were any objection, and if there were no objection the extension would be allowed as a matter of course. That is to say, the Land Board would recommend it. The Harbours and Rivers Department are the persons to determine the limit-line of wharfs.
2480. *Chairman.*] Do you know of any instances in the harbour, where the water frontage has to be leased by the Government, where there have not been renewal applications; are there any water frontages vacant at the present time? The only frontage I know of at present is what is called Flood's wharf, on the south side of Pyrmont Bridge; it was lately resumed by the Government for an approach to Pyrmont Bridge. That is about the only one I know of. It has been resumed very lately.
2481. All the other wharf frontages are readily availed of? I think they are.

Hon. Alexander Kethel, M.L.C., sworn, and examined:—

2482. *Chairman.*] You are a Member of the Legislative Council of New South Wales? Yes.

2483. You are also a wharf-owner? A wharfinger.

2484. *Mr. Levien.*] Are you a lessee from the Crown? No; from the Municipal Council.

6—N

Hon.
A. Kethel,
M.L.C.

2485. 19 Jan., 1900.

- Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.
2485. How long have you been a lessee? I have leased the property I occupy now from the Council for twenty-three years.
2486. What have you—jetties or side wharfs? We have three parallel jetties, and one running out to a point—a smaller one altogether. I am now reconstructing the buildings, and putting in new jetties.
2487. Are you extending them in length or width? Both ways.
2488. Have you to apply to the Corporation for leave to extend? I applied to the Corporation to back my application to the Department of Lands, which they did. The Department of Lands could not issue a lease to me, but they must, according to the 87th section of the Act of 1884, give it to the owner in fee-simple, or to someone else with his consent. The Municipal Council gave their consent to my application, which was referred to the Engineer-in-Chief for Public Works, and approved of by him. My original application was slightly modified, and was finally granted by the Department of Lands.
2489. Did the matter come before the Land Board? No.
2490. The Minister granted your application? Yes; it was a reconstruction, not an original application for a lease.
2491. You pay the Government nothing? No; the rental is paid to the Government by the Corporation.
2492. What frontage have you? I think it is about 270 feet.
2493. What is the length of your longest jetty? I am putting out two jetties; one will be 280 feet long, with a width of 41 feet, and the second will be 280 feet long, with a width of 31 feet.
2494. For what kind of merchandise are your jetties chiefly used? Chiefly for produce, either coastal or intercolonial.
2495. All kinds of produce? Yes; agricultural produce mainly.
2496. Do you find any difficulty in loading and unloading two vessels, one on each side of your jetties? I have had, under the old system, because the jetties were too restricted for the expanding trade, and the larger size of the ships. That is why I had to pull them to pieces. I am proceeding to build others to give me more scope to handle cargoes.
2497. Taking the wider jetty of the two you have mentioned, if you were unloading and loading two ships at it, I suppose you could not take one vehicle up, and another vehicle down the jetty;—they could not pass one another? They could do so comfortably. Forty-one feet is a considerable width.
2498. Loading and unloading two vessels at the same time? Yes.
2499. You think that is a sufficient width? For the class of work we have to do. We have, as a rule, at Darling Harbour to give ten days' grace. The consignees leave the stuff on the jetties for ten days without any charge. The Government Regulation prescribes forty-eight hours I believe; but we have to give our customers greater concessions. I have stuff at my wharf which was landed there in the first week in November, and it has not yet been removed by the consignee.
2500. Do you make a charge for that? If I did the consignee would send his consignment to another wharf next time; so that I have to eat the leek, so to speak.
2501. Have you sheds on your jetties? I have considerable accommodation of that sort. Part of my reconstruction scheme is to cover the whole of the space so that it will be sheltered from the weather; every part of the Market wharf will be covered in.
2502. I suppose you have a knowledge of all the wharfage about the city? A general knowledge.
2503. Do you think there is sufficient for all the ships coming into the port, or have you heard of complaints of the want of accommodation? I have not heard of any complaints of the want of wharfage accommodation; but last winter there was an immense glut of produce coming in in consequence of the failure of our grass in the country, and there was not room enough to store the chaff, hay, bran, and other stuff which came in. I had to refuse wharfage for about 20,000 tons of goods last year. They did not require space to land them, but simply space in which to keep them after they were landed. I have never, excepting on one or two occasions in ten years, had every berth at the Market wharf filled at one time.
2504. You think there is always plenty of wharfage accommodation? Yes; the space required is to keep the stuff in after it has been landed from the vessels.
2505. Have you seen the plan of the proposed works at Glebe Island? Yes. Mr. Lyne, the Secretary to the Committee, sent me a tracing the other day. It makes a very pretty picture, that is all I can say.
2506. What is your opinion of the scheme? To be candid, I do not believe in it at all.
2507. What is your reason for saying that? In the first place, it is away out of the city; it is too far away for general merchandise. No merchant would allow goods to go there if he could stop it.
2508. Your principal objection to the proposal is that the wharfs would be too far away for the ships? Yes.
2509. Suppose the railway were extended to the island, what would you say to that? I will reserve my opinion until I see the railway there. If I were going to bring goods from there to Darling Harbour it would simply be using a lot of wharfage space. I should prefer to have my goods landed at Darling Harbour in the first instance.
2510. Suppose you were loading chilled meat for the English market, and you could bring it right from the Abattoirs on to the wharf, would not that be very convenient? No, decidedly not. As the Chairman of the Board of Exports, I recommended to the Government that they should construct chilling rooms and grain stores on Darling Island, which, without exception, is the finest site in Australia for the purpose. The Darling Island scheme is being carried out by the Government chiefly with the object of making it the export centre of the Colony, and I think it would be a piece of false policy on the part of any authorities to condemn the Darling Island scheme and then to commence an opposition scheme at Glebe Island.
2511. No one condemns the Darling Island scheme; but do you think that with the growing trade the Glebe Island works would be utilised;—do you think there is any necessity for them? They may be of use when our great grandchildren are as old as we are, but not until then or nearly then.
2512. You think the works are being undertaken many years before they are required, even for wharfage accommodation? Yes; I do not know for what kind of goods it is supposed the wharfage will be utilised.
2513. Some witnesses have expressed the opinion that it would be a splendid place at which to load or unload timber? I know the timber trade thoroughly, and I say that it would be perfect folly to entertain any such idea. My reasons for saying so are these: Within the past fifteen years the timber trade in Sydney has been entirely revolutionised. At one time the great bulk of the imported timber was landed

Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.

landed either at Dibbs' wharf, the eastern wing of Circular Quay, or, latterly, at Woolloomooloo. Since then the system of importation has entirely changed its character, and the ships do not discharge their cargo at any public wharf. I do not think there has been a cargo of timber discharged at a public wharf for the last five or six years. The ships anchor at Johnstone's Bay, and the timber is taken direct from them to the wharfs of the consignees. I believe that some of Goodlet and Smith's timber goes up to their wharf; but in the case of Langdon, Hopkins, and Langdon, the Kauri Company, and John Booth & Co., although they have water frontages there is not sufficient depth for the ocean ships to go up to them. The ships anchor as nearly as possible to wharfs, and the timber is put into punts or lighters and is conveyed in them from the ship's side to the wharf; the merchants pay no wharfage to the Government. No timber is landed at the Government wharfs except that which is landed at Darling Harbour to go away by train into the country, or to suburban centres. I am sure no timber would be landed at Glebe Island. Another reason I speak so emphatically is that the land there is of a rocky and precipitous nature, and it would be useless for a storage-yard unless it were made nearly level with the proposed wharfs.

2514. You are aware that it is proposed to cut down the island? It would take a very long time to do that, and it will cost an immense amount of money. No timber merchants could afford to pay sufficient rental to pay the interest upon the cost of converting Glebe Island into a timber-yard. I might refer to the rental paid by Cowlshaw Brothers, and by Maxwell, for the land resumed at White Bay. That would not pay anything like interest on the amount required to form an equal portion of Glebe Island into a timber-yard.

2515. You are entirely opposed to the scheme, then;—you do not think it a suitable place for the suggested improvements, and you do not think there is sufficient trade at present to warrant the proposed expenditure? And it would not bring in revenue to pay interest on the cost of construction. I may say that my little wharf—the Market wharf—cannot be in any way benefited or prejudiced by the proposed work. The class of trade which comes my way is of an entirely distinct character.

2516. You are constantly moving about in shipping circles; have you ever heard any complaint of the want of wharfage accommodation? No; but I know that if it is reported that a ship is coming here from any part of the world, excepting ships of over 4,000 tons burden, not only the Government wharfinger, but a half-dozen private wharfingers, immediately hunt up the agents or consignees. This is done months before the ships come in, and in some cases as high a rebate as 75 per cent. is offered, in order to get the ship. That has been my experience.

2517. With reference to Darling Island, do you think it would be used by deep-sea ships? Yes, undoubtedly; because they could discharge their inward cargo, haul round and take their cargo straight out of the cold stores on the wharf without the produce being carted as it is at present through the streets of the city, where it is liable to all sorts of accidents on a hot or sultry day.

2518. You think there is sufficient wharfage accommodation for all the ships that are likely to come here for some years to come, even exclusive of the works at Darling Island? I believe in the Darling Island works chiefly on account of the facilities which will be afforded for the export of produce.

2519. But suppose we left those wharfs out of the question, and that ships were to go to other wharfs, do you think there would be sufficient accommodation? Yes; the only exception I would make would be in a case like that of the "Afric," the "Medic," and "Frederich der Grosse." They could be as well accommodated anywhere as at the Government wharfs; some of them could be accommodated at Darling Island. It has a $1\frac{1}{2}$ mile of wharfage frontage, with a depth of 28 feet.

2520. *Mr. Shepherd.*] I think you said that one of your jetties would be 41 feet in width, and the other 31 feet? Yes.

2521. You would be able, you say, to load and unload two vessels at one of those piers at the same time? Yes.

2522. Will you be able to do that without any great confusion? Yes; because we should not allow the cargo to remain on the jetty. I will have the cargo removed from the jetty directly it is released from the ship's slings; I would insist on the consignees removing the cargo at once, leaving the jetty clear for working.

2523. What is the average size of the vessels you employ? I have not yet got my jetties into working order; but last year I berthed ships up to 1,500 tons, and with our old appliances I was able to put out 16,000 sacks of produce in one working day.

2524. That was chiefly produce from the other colonies? Yes, we take anything that comes. The greater part of the oversea ships are consigned to merchants when they leave the Old Country. These merchants have an interest principally in private wharfs, and they send the ships to their own wharfs, or to places where they can get the greatest concessions. I except, of course, the liners which go to the Government wharfs.

2525. Are your wharfs generally pretty fully occupied? No. I wish they were; they are not occupied more than a third of the time.

2526. I suppose you will be willing to allow any vessels requiring accommodation to go there? I shall be very glad, as soon as I get my jetties finished. I shall employ a man to go and hunt up ships.

2527. What width of pier do you think would be necessary to enable two of the largest vessels which come here to load and unload—one on each side of the pier? If I were constructing such a jetty I should make it from 80 to 100 feet wide.

2528. You think 100 feet would be ample? Yes.

2529. With that width two vessels would be able to load and unload without confusion? Yes; and you would be able to keep the cargoes separate. Another matter to be considered is that consignees must have the goods kept separately—the brands must not be mixed. The consignees must have access to the different stacks with their drays.

2530. When you spoke of the glut of produce last year, you did not mean to say that there was any lack of wharfage accommodation? No; there was merely a superabundance of produce. One wharf had 120,000 sacks of produce stored in its shed at one time, and the consignees would not remove it. When the next ship came in there was no place for her produce, and she had to go hunting about, not for a jetty, but to find a place where she could store her cargo.

2531. Do you think jetty accommodation is equally satisfactory with that of a broadside wharf for the loading and unloading of cargo? I hardly care to give a definite opinion; it depends very much upon circumstances. A side berth is best when you can work four or five hatches all together. When the cargo

Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.

- cargo is out of the ship's slings it is done with in that case. If you are discharging on a jetty you have to remove part of the cargo from the jetty from time to time, so as not to hamper the unloading.
2532. If a jetty were long enough it would be equally convenient? Yes, especially if it were roofed over.
2533. The erection of jetties is a tremendous economy of water frontage? Yes.
2534. You could accommodate at least four ships at a jetty, whereas at a broadside wharf you could accommodate only one? Yes. I am able to accommodate three large ships, but I could accommodate only one of equal tonnage, with a side berth.
2535. So that where the width of the harbour permits of it you think jetties are the most economical and the best way of dealing with the shipping? Undoubtedly.
2536. You know that there is a likelihood of additional accommodation being provided at Woolloomooloo? I am very much opposed to it.
2537. If that work were carried out you think there would be still less necessity for the Glebe Island scheme? Yes; I do not acknowledge that there is at present any necessity whatever for that scheme.
2538. Even although the Woolloomooloo proposal might not be carried out? Quite so. You could berth one of the ships at Pyrmont, which is in the city of Sydney. It would be easy to make crossings over the rails at Pyrmont and Darling Island. Vehicles could then get across without any inconvenience. I am sorry they cannot do so now. A great blunder was made in laying the rails there with a projection of 6 inches above the surface of the planking. I was watching the "Southern Cross" taking in goods the other day, and it was painful to any man with a knowledge of wharfage to see the blundering, stupid toil expended where a little skill and forethought would have saved three-fourths of it.
2539. You know the amount which it is proposed to expend at Glebe Island? I have heard it stated.
2540. And you do not think that expenditure is justified? No.
2541. *Mr. McFarlane.*] You have been for a number of years engaged in the timber trade? Yes.
2542. You have stated that a large quantity of imported timber is brought by ships which anchor at Johnstone's Bay, and which discharge into lighters;—do you think these vessels would use the wharfs if they were suitable for the landing of timber? No; the timber merchants require to take the stuff into their own yards, to separate it and to pack it according to its dimensions and quality. They could not do that at a public wharf; they would still have to lighter it away from that wharf after paying wharfage rates. A timber merchant would naturally prefer to take the timber to his own wharfs and land it there.
2543. Is not one of the causes of the timber merchants treating timber in that way that there is not sufficient depth of water at their wharfs to bring the vessels alongside? I know that Goodlet and Smith bring large ships alongside their wharf and land the stuff there; but in other cases where there is not enough water the merchants resort to punts and lighters. Under the old system the timber was consigned to one man. It was taken to a public or private wharf, where there was space to put it out; it was then stacked according to quality and size, and was submitted to auction. Those in the timber trade attended the auctions every Wednesday afternoon, and purchased what lines they required. We then sent our drays to the wharf, or the timber was lightered away to our own wharfs. Now, a consignee having a cargo of timber receives his invoice perhaps a month or six weeks before the vessel arrives. He waits upon the various timber merchants, and lets them know that he has a cargo to arrive of such and such quality, size, and price. In nine cases out of ten the timber is sold to arrive. When it arrives the consignee gives the purchaser an order, and the purchaser provides a punt or lighter, or whatever conveyance he chooses, and takes delivery from the ship's side, so that no wharfage rates are paid by any person. That is an important change which has taken place in the system of importing timber.
2544. You think, then, that the timber merchants would not use the proposed wharfs at Glebe Island? No.
2545. Has there been any marked increase in the importation of timber during the last five years? There has been a steady increase, especially in Oregon and kauri.
2546. Is the increase likely to continue? There cannot be much more increase, I think. We are skinning the forests of the Pacific Coast for our requirements. At the same time the demand will not decrease for some years to come. I have not seen the "Statistical Register" lately; but I do not think so much Baltic timber came in last year as before; but the quantity of Oregon has increased.
2547. A considerable quantity of timber, both cedar and hardwood, is brought down from the Northern rivers? Yes.
2548. A number of sailing vessels and steamers are engaged in that trade;—would they be likely to use the proposed wharfs? No; I do not think there will be 1,000 feet a year landed at Glebe Island. The only condition under which I could imagine timber being landed there would be in the case of a man having a quantity to export, and leaving it there a month or two until he had collected enough for shipping, not having room for it at his own place.
2549. If a railway were constructed to the proposed wharfs, and if there were a quantity of timber to be sent into the country, do you not think the wharfs would be used? I think not; a whole range of wharfs at Darling Harbour is now used for that purpose, Darling Harbour being the centre of the Railway goods traffic. Empty trucks are always there to load timber bound for the interior. The wharfs there were built for that trade. I may say that there is not on the average an eighth part of the wharfage frontage, from the coal-trains right up to the foot of Liverpool-street, occupied by timber vessels or vessels of any kind.
2550. Do you think the wharfage accommodation at Darling Island will be ample for the timber trade? More than ample.
2551. You said that merchants would object to having their goods landed at Glebe Island? Yes.
2552. What particular objection would they raise? There are numerous objections. In the first place, the distance from the city; there would be a waste of a certain amount of time in backwards and forwards cartage. It would cost at least double what it costs at present, either from the wharfs at Darling Harbour or at Circular Quay, and you would have to pass over the two bridges. I suppose it would be fully 1 mile further into the city. That would be a big handicap against many positions nearer the centre of trade.
2553. You think it would prevent the use of the wharfs? Certainly it would.
2554. Would there be a material difference in the cost of cartage? My opinion is that there would. I have heard carters say that they would cart from one place at the same price as from another; but my experience is that, immediately they get out of the beaten track, they are very much alive to their own interests, and put on the price.

Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.

2555. It has been stated that, owing to the congested condition of shipping between Dawes' Point and Pymont Bridge, there is a great waste of time in getting loads, and that the carters would rather go a considerably longer distance than have that delay? It is a notorious fact that, when a steamer is advertised to sail at a certain hour, the cargo is not sent down until shortly before that hour arrives. Suppose the steamer is advertised to sail at 5 or 6 o'clock to-night; you would not see a dozen dray-loads down there before mid-day, but from 3 to 6 o'clock every merchant would rush his stuff down, and block the place. It is the merchant's own fault; they will not send their goods down to be shipped until the last moment.

2556. *Mr. Watson.*] Sometimes they do not get their orders until the last moment? I know all about that. I have been a heavy sufferer from this cause. I have a little steamer running down south; she is advertised to go at 1 o'clock every Thursday, and not one-eighth of that ship's cargo comes down before noon; it all comes down in the last hour, and the bulk of the orders are received, to my certain knowledge, two or three days beforehand. That is the chief cause of the occasional block in relation to outward cargo.

2557. The principal stuff which you get at your wharf is agricultural produce? Yes.

2558. Your wharf is specially adapted for the purpose? It is in the centre of the produce trade.

2559. Do you think that trade would be likely to go to any part of the harbour if suitable wharfs were constructed? Certainly not. It will be within your memory that fifteen or sixteen years ago the A.S.N. Co. left the centre of the produce trade at Sussex-street and removed to Campbell's wharf. Some of the directors of the company declared they would change the current of the produce trade and bring it to the eastern side of the city. The result showed that the company lost the most profitable lines of produce in which their steamers engaged, and they never afterwards succeeded in that trade. You cannot force trade into any channel you like; it will follow the channel into which it has fallen for many years.

2560. As to the wharfage accommodation generally between Dawes' Point and Pymont Bridge, do you think there is sufficient wharfage there for the present trade? Yes, excepting ships exceeding 4,000 tons burden.

2561. You say that a number of those wharfs are often empty;—can they accommodate the class of shipping which you accommodate? I have never seen all the wharfs in Darling Harbour occupied once within the past twelve years.

2562. There are some companies trading on the coast;—is it not a fact that they cannot get wharfage accommodation at the spot I am referring to? I should be glad to accommodate any of them if they wanted it.

2563. Take, for example, the H.R.N.S.N. Co.? They are trying to do an extensive trade with limited accommodation, but they can get better accommodation if they like to ask for it and to pay for it.

2564. Do you think they can get it? As long as they are prepared to pay for it.

2565. We have been given to understand they cannot get it in a central locality? I shall be glad to give them the accommodation if they will pay for it, but some people want to get goods below the current market value.

2566. You say that Darling Island is an ideal site for an export depôt and for wharfage accommodation generally? Yes.

2567. I believe the area is about 8 acres? I think altogether there will be about 11 acres available.

2568. Do you think that area will be sufficient to serve all the probable export requirements of the Colony for some years to come? Yes; we have no provision at all for export at the present time.

2569. As far as we are informed there will be a surplus of wheat for export this year amounting to somewhere about 90,000 tons, that is the official estimate;—as against that we have a low quantity of sheep and a considerable reduction in the quantity of wool exported;—but assuming that a similar increase in the wheat production of the Colony takes place in the next four or five years as has taken place during the past four or five years, do you think Darling Island will provide sufficient accommodation for shipping requirements? Darling Island and the resumed land at Pymont will provide all the accommodation you require for export purposes for the next twenty years. The Board of Exports have asked the Government to set apart 3 acres on the northern part of the island upon which to erect cool stores, refrigerating machinery, and grain elevators. Iron tanks are also to be provided in which the wheat can be so stored as to be weevil proof. It can be put into bags by gravitation. The Chairman of the Board has been inquiring into the matter in the Old Country, and he is now on his way out. Mr. Wildridge had a partner recently in England who went across to America to inquire into the best methods of handling and shipping grain and food stuffs, and he has also been enabled to collect important information.

2570. Do the Board contemplate the re-bagging of the stuff or the shipping of it in bulk to England? That is a matter we have not gone into, because the elevator could be constructed in such a way that the wheat can be shipped in bulk or in bags. There has been a great objection raised to shipping grain in bulk in over-sea ships, because, no matter what care you take to press it down, when the ship has been a month at sea there is a settlement, and even if you have strong boards put down amidships, if the ship were struck with a heavy sea, the grain would be liable to shift to such an extent as to make a list which might be dangerous to the ship. It has become the practice throughout the world to ship all grain in bags.

2571. We were informed recently by the Manager of Public Wharfs that the jetties at Pymont are now used, and will still require to be used, for coal export, so that they would hardly be available for the class of export to which you are referring? There are only two cranes there, and therefore they can only load two ships at once. The rest of the space would be available for general export trade.

2572. When you speak of the land adjoining Darling Island, you refer to the wharfage accommodation between the jetties and the island proper? Yes.

2573. Inclusive of all that land, you think there will be enough space for the export trade for twenty years to come? Yes; I do not think the designers of the wharfs at Pymont have made the most of their opportunity. They have made a series of straight lines. If a ship were lying head and stern, unless she were a straight-stemmed steamer, you would lose a lot of space. They do not appear to have adopted the echelon system; had they done so they would have increased their accommodation by one-third.

2574. The reason for making straight wharfage was, I take it, to accommodate vessels of various lengths? There are, of course, advantages; but they would be counterbalanced, I think, by the increased accommodation you would get under the other system.

2575.

Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.

2575. There is no room for jetty extension at Darling Island? They could extend the jetties to the westward, but I question much whether that would be the case on the Darling Harbour side. I think it would be inexpedient to run a jetty out there; it would block the access to Pymont Bay.

2576. In your estimate of exports, you have included frozen meat? Yes; if our designs are approved, the trains could go right under cover before the trucks containing cold meat were opened. The outer door could be shut to prevent any detriment to the meat in transit from the waggons into the cold room. Then the steamers could come alongside, and bring their gangway abreast of the doorway of the cold stores. The meat could be transferred by travellers, without being handled at all. That, in a crude form, is the idea we had.

2577. You would also treat there subsidiary lines of export which the Board has so far supervised? Yes; we are paying now for a limited accommodation a rental of £1,600—that is to treat the minor products. The greater part of this amount will be repaid by the charges on the goods we handle.

2578. You think there would be room for the erection of complete buildings? Yes; to get the accommodation we require, we should have to pay at least £3,000 per annum; we reckon that if the Government put up adequate buildings and machinery, the interest upon the cost would be more than saved by our having in our own hands the machinery and the handling of the goods. At present we have to pay heavily for the carting of the frozen goods from Pymont market above the bridge. Everything has to be carted from there to Circular Quay at a cost averaging 3s. 6d. a ton.

2579. And there is the possible detention of the goods in transit? Yes; the reason we selected Darling Island is because it is the terminus of the railway system of the Colony, connecting the interior with the harbour. There is a splendid depth of water all round; there is Johnstone's Bay to the north and west of it, and there is space for the handling of the largest ships which enter the port.

2580. As a public man who has taken an interest in these questions for many years past, have you formed any plan for the utilisation of Glebe Island; we are informed now that it is almost a certainty that the Abattoirs will be shifted from there; could you offer any suggestion to the Committee as to the proper disposition of the Government land there? No; my advice would be to leave it alone for the present.

2581. As to the possibility of utilising the accommodation there, we are informed by one carrier who is engaged in a big way in Sydney that the difference in the cost of delivering consignments as compared with Woolloomooloo Bay, would not be more than 6d. a ton? I should like to get that man's address so that I might send to him.

2582. Mr. McMahon gave the Committee that information? He has done a good deal of work for me, but I have never found him so generous as that statement seems to imply.

2583. He, no doubt, had in view the possibility of doing a fair amount of trade;—he said there would be 20 per cent. increase upon the prices charged at Woolloomooloo and Circular Quay? I do not doubt his veracity, but I should not like to put him to the test.

2584. You think he has underestimated the additional cost? He carts about the city from the wharfs to the warehouses at from 1s. 6d. to 2s. a ton; he can cover the space between the ship and the warehouses in ten minutes. To go to Glebe Island he will want half an hour to go and half an hour to come, making altogether an hour. During the extra time he could make a whole trip to one of the wharfs, get his goods and deliver them at a warehouse in Sydney.

2585. What is the difference from Glebe Island to the foot of Market-street? I should say it is about 1 mile; you have also to take into consideration the risk of delay at the Pymont Bridge.

2586. Mr. John Booth, who is a timber merchant at Balmain, thinks it is probable that the timber merchants would be likely to take advantage of the wharfage accommodation at Glebe Island? I should like to know whether he would promise to take advantage of it for his own trade. I am pretty certain he would not.

2587. *Dr. Garran.*] In regard to the difficulty of wharfage at Darling Harbour I understand you to explain to us that it is not a shortage of wharfage, but a want of storage? Yes.

2588. It is not possible for you to alter the course of trade and make consignees take goods where they ought not to take them;—if you had rails on your jetties and took the stuff straight into the covered sheds would it not relieve the jetties a great deal? We do that to some extent, and we are going to do it to a greater extent.

2589. You are going to put down rails on your new jetties? No; we shall not convey the goods to the sheds by rail; a rail would reach only one point. A vessel's cargo will contain as many as 150 different consignments, ranging from 20 sacks up to 500 or 1,000. Each lot must be stored separately, so that the consignees can have access to them. A line of rails would take you to only one spot.

2590. Your evidence confirms that of Mr. Thomas, who said that to make a wharf suitable for the coastal trade we must have a large shed space available? Yes.

2591. Many of the wharfs are deficient in shed space, and the consequence is that the jetties are crammed because the stuff in the sheds cannot be got away. Yes.

2592. The difficulty, as a rule, is not as to the wharfs, but as to their appurtenances, and the custom of the trade? Yes. Some of our consignees take not only the ten days' grace we give them, but a good deal longer. I have had goods lying on my wharf for three months.

2593. Cannot you all combine, and charge them wharfage from a certain date, as the Government do? It is hard to make a rope out of sand.

2594. It is important, when we are told that the wharfage is deficient, to find that it is not the wharfage after all, but some custom connected with the trade, which is responsible for what occurs? The great trouble we had last June and July, when an immense quantity of produce was being landed from Tasmania and New Zealand, and the southern colonies, was that it was consigned to persons who wanted to store it. A great deal of it was for transshipment to Queensland. I sent away as much as from 300 to 400 tons from Tasmania to northern parts of Queensland.

2595. In the case of that transshipment you would not want to put the produce into sheds, but you would put it straight from one vessel into another? I put it into lighters, and took it alongside the other vessel in that way, otherwise we should have been jammed on the outgoing wharf.

2596. When the Darling Harbour wharfs and streets were laid out, in the early days, the present trade was not dreamt of;—the trade has outgrown its facilities? Yes.

2597. Do you repeat what other witnesses have said—that in the present state of things the facilities are not up to date for the intercolonial and coastal business? Undoubtedly they are not. I myself am expending

expending a large amount of money in improving the accommodation of the Market wharf.

2598. But you cannot increase your area? I have an acre and a half of floor; I could take 70,000 sacks of produce.

Hon.
A. Kethel,
M.L.C.

2599. We are told that so great is the pressure for space that some of the larger companies have taken wharfs above the bridge as relief wharfs? Yes; the Union Company have had a wharf of that class for some ten or twelve years, and I am told that recently the Adelaide Company have taken the wharf at the foot of Bathurst-street.

19 Jan., 1900.

2600. Is it just as convenient for the consumer, when you sell, to take stuff from above the bridge as from below the bridge? I do not think so. Consignees having goods to sell would prefer to have them landed as near the foot of Market and King Streets as possible. Purchasers will not go where you like.

2601. But I suppose you could go to the railway just as readily from above the bridge as from below it? If you went up Hay-street, for example, you would have better access than if you went up Market-street. You must bear it in mind the locality in which the produce trade is carried on.

2602. Mr. Thomas says that the produce is not sent to Sussex-street, but to the people to whom it is sold; they are not in Sussex-street; why, therefore, is it necessary that you should be so close to that street? I do not know. I know that it pays to be close to Sussex-street; the buyers all come there naturally. If you visit Sussex-street in the forenoon, you will find that from King-street to Market-street there are scores of men busy buying grain and produce.

2603. It is a kind of produce exchange? Yes; something like the Ballarat corner in the olden times. A man can run down in two minutes to a handy wharf and clinch the sale of a line of goods at once. If it were suggested that he should go to the head of the harbour, he perhaps would not go.

2604. It is the concentration of the agents there which makes the place the produce market of Sydney? Yes.

2605. You know the iron wharfs which Mr. Moriarty built, and the wooden wharfs, which have been built since his time, in that direction;—we are told that those two wharfs, which have cost the Government an enormous sum of money, are hardly ever utilised; is that so? Yes.

2606. It would seem that there has been a great waste of public money? A great many of us have been of that opinion for many years. It shows that you cannot force trade out of its natural course.

2607. Have you ever used either of those wharfs? No, except to land timber, which had to go up country by train.

2608. You have used them for no other purpose? No.

2609. For all other purposes they would be inconvenient wharfs? Sometimes, just above the Pymont bridge, small cargoes of timber have been landed for local consumption. That is the only instance where I have known the wharfs to be utilised for other than Railway purposes.

2610. Can you make any suggestion for the utilisation of those wharfs? I would rather not express an opinion. There is a sort of dual control over the wharfs above the bridge. Captain Jackson at one time, I believe, claimed to be the authority, but the Railway Commissioners claimed that they could do what they liked with them. I believe matters were eventually settled in favour of the Treasury. One inconvenience, and a marked one, attaching to the use of the wharfs, is that drays or waggons, or vehicles of any kind have to cross a number of lines of railway, the rails projecting to the extent of 6 inches. There are only one or two places where vehicles can cross conveniently, and if they happen to be some distance away from the place where the stuff is landed there is a difficulty.

2611. There is no shed-space there? No, excepting that occupied by the Commissioners.

2612. Without such conveniences the wharfs would be of no use for the coastal trade? Excepting occasionally for timber.

2613. You say there is only one private wharf to which the timber ships go at present? Only one, of which I am aware, which has water enough.

2614. Do the ships going there take the timber out through a hole in the stern or through the hatches? Some of the timber comes out of the hatches, but the greater portion would come out of the bow port or the stern port.

2615. In the case of Goodlet's wharf, would it be possible to get timber out of the stern port? Yes; the ships as a rule have two ports, one opening into the 'tween decks and the other into the lower hold. When a certain quantity of timber has been taken out the vessel rises, and it is possible to get the timber out of the lower port.

2616. They do not have to turn the stern of the vessel into the wharf? No.

2617. As far as the present timber merchants are concerned, they get their timber into their wharfs as cheaply as they can? Yes.

2618. You do not think they would give up their wharfs to rent any space at Glebe Island? Certainly they would not; the cost of bringing the timber from the ships' slings and storing it at their own wharfs would have to be paid. They would have to pay the Government schedule rates for landing the timber on the wharf, and that, I think, would be about 3d. per 100 feet.

2619. They would have to pay the Government more than they pay the lightermen? Yes.

2620. So that they would be no better off? They would be worse off, because they would have to send vehicles to remove the stuff to their own yards afterwards.

2621. As to the length of wharfs in Darling Harbour, do you think the present fairway has been unduly narrowed by the jetties which have been run out? I can hardly say that. There are two jetties which trench upon the accommodation—one is Howard Smith's, and the other McIlwraith, McEachern's.

2622. Years ago it was not contemplated that the harbour would be used for such a long class of ships as now come here; therefore, the fairway is being put to a test which was not originally intended? Quite so.

2623. Have you noticed any blockage? No.

2624. There is about room enough, then? Under ordinary circumstances there is room enough to handle any ships that come there. I have seen 4,000-ton ships taken above the Pymont Bridge; but there was great trouble in getting them through. I have not seen any there lately.

2625. You are building jetties yourself because you cannot do anything else; but do you think it would be at all wise at Glebe Island to put jetties instead of broadside wharfs? I do not at present see any necessity for erecting jetties.

2626. You prefer straight wharfs there? Yes.

2627. You just see the north-east face of the island; you could not put jetties there? No.

2628.

- Hon. A. Kethel, M.L.C.
19 Jan., 1900.
2628. Could you put any on the western side? You could do so; but you would block Cowlshaw's wharf, I am afraid. White Bay narrows in very much. Where Drake's shipyard is, down towards the point, it would not interfere with navigation.
2629. One witness says the Government have not utilised the space to the best advantage, and it might do better by a larger use of jetties? With the exception of provision for one or two very large steamers, the Government have ample space now. Darling Island will be ample for all purposes.
2630. But you would not put jetties at Darling Island? No, they would interfere with navigation.
2631. Nor at Glebe Island? No.
2632. You would go in for direct broadside wharfs at both those sites? Yes.
2633. You think the Government have made no mistake in that matter? No.
2634. You know the conditions under which persons are allowed to lengthen their jetties;—do you think the terms the Government offer are reasonable as between the Public Treasury and private men of enterprise? I think they are rather hard on private individuals. I myself am now putting out jetties; but any Minister who took it into his head to say that he required the space could, upon giving me six months' notice, take the place. I should get nothing by way of compensation. The Municipal Council would get the cost of the structure on the land, allowing for deterioration; but I should have to go without a penny of compensation, although I have spent a great deal of money in carrying out improvements.
2635. Yours seems a peculiar case; but the majority of persons deal directly with the Government, and they would get back the cost to which they have been put, less depreciation? Yes.
2636. Do you think that is a reasonable arrangement? I do not. Not only does the man lose the place which is resumed, but his entire business is dislocated to such an extent as to amount practically to ruin.
2637. You are speaking of a case in which a Minister may take a sudden fancy into his head;—but suppose the resumption were required for a colossal reorganisation for the whole frontage as one Government property, you would have your land bought as well as your jetty, and your land would be paid for at a valuation; you would therefore get back some compensation for the loss of the jetty? The amount given for the land would be comparatively small, because the land without the water frontage would be of small value.
2638. The water frontage carries with it the right to apply for a jetty, and that would be taken into account by the valuer? I do not think so. My opinion is that the Government should be more liberal in their terms. I think they should give more than six months' notice to quit. Some years ago I occupied a Government site at Pymont, and had expended some thousands of pounds. I paid the Government to dredge the place for me, and three months after the work was finished, I received a summary notice from the Public Works Department to clear out. I was allowed to take my sheds away, but I dropped £2,000 there in nine months.
2639. You had a wharf just inside the two jetties there? Yes; I got six months' notice, but that was worse than nothing to me, because I could not enter into fresh contracts. I asked the Department to take the land from me at once, but they would not do so, and I had to pay what was due for the six months.
2640. You know the bay between the Pymont jetties and Darling Island;—will it be available for wharfage? It ought to be very convenient; it is just a stone's throw to the Pymont Bridge. I do not know whether the wharfs there are to be Railway wharfs, or whether they are to be handed over to Captain Jackson.
2641. Would it be well for the Government to lease the property to timber and coal merchants, or to make more jetties there? I do not think any timber or coal merchants could afford to pay a rental sufficient to repay the Government the interest on the value of the property. Twenty-five years ago the coal-yards and steam saw-mills were all round Darling Harbour, but as the value of the frontage increased, one mill after another cleared out and found accommodation elsewhere. They have nearly all left Darling Harbour now. The property there has been put to more profitable use.
2642. Has that been the case, do you think? I think so. The land is all used for private wharfage purposes.
2643. We have had it said that ships sometimes arrive in port and have to wait for some days before they can get to a wharf;—is not that largely due to the fact that the agents are interested in certain particular wharfs? I think so. I know that certain merchants have an interest in certain wharfs, and they accordingly send the ships there. The ships are consigned to the wharfs before they leave the old country, and they have to go to them, and to no others; the entries are passed for a particular wharf.
2644. It is fixed before the ship comes to the port? Yes.
2645. Then the fact of a ship waiting is due, not so much to the want of wharfage as to the fact that the merchants are interested in particular wharfs? Yes.
2646. That has the effect of keeping particular wharfs overflowing and others empty? Yes.
2647. Do you think the competition of the Government at the present time presses unduly on the owners of private wharfs? I do not. The Government grant no rebate; they charge schedule rates. Some years ago I believe there were cases in which they allowed a rebate; but there are no recent instances, and there is not a private wharf which does not give a rebate.
2648. Then the severity of the competition comes from private people, and not from the Government? Yes.
2649. No private wharfs could have given the accommodation for large steamers which is afforded at Circular Quay? One or two wharfs at Miller's Point might, but no others could do so.
2650. The accommodation could not be given at all immediately to such steamers as the "Medic" and the "Afric"? No; the Aberdeen line berths at the Central wharf at the foot of Kent-street, but those steamers are not so very large.
2651. Then up to the present time the Government have not over-supplied the demand? Not for that class of vessel.
2652. Not even with what has been done at Woolloomooloo Bay? No.
2653. Even when the Darling Island wharfs come into full swing the Government will not have over-supplied the demand? No.
2654. But you think that, if they brought wharfs at Glebe Island into use as fast as they could, they would be overdoing it? Yes; so far as Darling Island is concerned, I have always contended that the Government, owning all the railway lines, have a right to provide at the terminus for the disposition of goods, either by local consumption or by export. It is the duty of the Government to provide at Darling Island accommodation for all classes of trade, relating to the interior especially. 2655.

Hon.
A. Kethel,
M.L.C.
19 Jan., 1900.

2655. For the export trade, it is an essential of modern commerce that there should be a railway to the water's edge? Yes.
2656. That is not so necessary for import purposes? No.
2657. There is no need to take a goods railway to Circular Quay, but there is a need to take one to Darling Island? Yes; Darling Island is the natural terminus. I do not think the Government should upset what has been determined upon there by entering upon a fresh line of business at Glebe Island; they could only make another export depôt there at great expense.
2658. You do not quarrel with the Government policy of turning the western side of Darling Harbour into Government wharfs? No.
2659. You think that the only respect in which they have blundered is above the bridge? Yes.
2660. *Chairman.*] I suppose you recognise that the coastal and intercolonial trade is constantly increasing? Yes.
2661. That is instanced by the fact that the companies having wharfs between Pymont Bridge and the Gasworks are taking relief wharfs above the bridge? Yes.
2662. As those wharfs become fully occupied, where do you think the intercolonial trade will go? I believe the improvements we are making will meet the demand for the next twenty years. I and others are making considerable improvements at Darling Harbour. We should be able to do three times the trade that we have been able to do.
2663. You think that if others act as you have acted the demand arising from the natural increase of trade will be met? Yes; works are being carried out in many places at Darling Harbour.
2664. What term of lease have you? Fourteen years. The Government would not give the Corporation a lease of more than twenty-eight years of the frontage, and the City of Sydney Corporation Act only permits the Municipal Council to lease for a term of twenty-one years. Instead of giving me a term of twenty-one years, the Council was determined to divide the twenty-eight period into two equal portions and to give two leases of fourteen years each.
2665. *Mr. Watson.*] Do you get tenant-right in improvements at the end of fourteen years? No.
2666. You referred to the land owned by Mr. Cowlshaw at White Bay; what area has he there? About 300 feet frontage, from the middle jetty over to the surface sewer.
2667. By about what depth? By about 200 feet.
2668. Captain Jackson informs us that that block is let for £250 a year;—could you say what a similar block of land with a wharf such as is there would fetch where you are at Darling Harbour? I should be glad to give £1,500 a year for it.
2669. Suppose it were at Darling Island, what would it be worth? About half that amount.
2670. That shows that the rents over there are very low? Yes.
2671. *Mr. Dick.*] As to Darling Island, it will be necessary to have both a railway track and an ordinary road right round the wharfs? Yes.
2672. What width would there be between the edge of the wharf and the back of the double track? In 40 feet you could put down four lines of railway; 15 or 20 feet would be enough for the road, but it would not be necessary to have it right round the island, because there would be buildings at the extreme northern end. I believe the Government have determined to set aside 3 or 4 acres there for buildings for export purposes.
2673. What width would be necessary as a minimum, for the railway, the road, and the sheds? I have not gone into particulars; I could not say.
2674. If you took 100 feet as a minimum that would take 6 acres out of the 11? It would not come to so much as that, because you would not want the railway and the road all round the island.
2675. The rails, of course, would have to be sunk? Yes.
2676. You think you will have plenty of room at the island for the export buildings to which you have referred and for the usual appurtenances of a large export wharf? Yes.
2677. *Chairman.*] One mercantile witness stated that an excessive rent was demanded by the Government for the use of the land covered by the wharfs? I know that there is a general consensus of opinion as to that. I have sometimes given evidence for the Crown in these cases and sometimes for the applicant. In some cases, in the harbour, the rents charged by the Government are excessive. In other cases I think they are moderate.
2678. But, as a rule, would you consider that the rents demanded by the Government are excessive? I should not say they were excessive; in some cases I think they are beyond the true value.

TUESDAY, 30 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

THE HON. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Francis William Bacon, Chairman, Co-operative Wool and Produce Company, Ltd., sworn, and examined:—

2679. *Chairman.*] I understand that you have been connected with the pastoral industry for a great number of years? Yes; about thirty years. F. W. Bacon.

2680. *Mr. Levien.*] Are you favourable or unfavourable to the proposal to construct new wharfs at Glebe Island? I am distinctly favourable to it. The traffic at the old-established wharfs of the port has increased so much that it will soon become absolutely necessary to make new wharfs. As many as 447,000 bales of wool were sold in Sydney last year, the total number of bales sold throughout Australasia amounting to 890,000 bales, so that more than half the wool sold in the colonies, including that sold in New Zealand, was sold in Sydney. 30 Jan., 1900.

F. W. Bacon. 2681. *Dr. Garran.*] Do your figures include the wool sent to England to be sold there? No; my statement refers wholly to the wool sold out here.

30 Jan., 1900. 2682. *Mr. Levien.*] As a grazier, you must know the advantage which would accrue from any lessening of charges in the handling of pastoral products;—do you think that that advantage would be gained by the construction of the proposed wharfs? I think that if the scheme which I should like to suggest to the Committee were carried out it would result in the saving of at least 8d. per bale in the cost of dealing with the wool. Last year we had 715,000 bales to deal with, and if we allow for a loss of 115,000 bales this year, which is the loss estimated by the *Daily Telegraph*—and I think the estimate is a fairly good one, and one which is generally accepted—we shall have this year to deal with 600,000 bales, and a saving of 8d. per bale on that quantity would amount to £20,000.

2683. *Chairman.*] Were the 715,000 bales you speak of sent away from the Colony? Yes. Practically, all our wool is exported. Probably not more than 1,000 bales of wool are kept in the Colony. Besides the saving in the handling of wool, there would be a saving in the handling of other pastoral products, such as skins, for instance.

2684. Do you think that Glebe Island would be a suitable place for the export of skins, bones, and other pastoral products? I do. I think it is patent to everyone that the present wharfage accommodation at the Circular Quay is very much overtaxed, and we have not yet reached the full development of our wool trade; in fact, I think we are now at our lowest point. The company of which I am chairman has recently gone to the expense of erecting new stores at Pymont, because we believe that the present store accommodation in Sydney is insufficient. I think that within a year or two, the whole of the Australian wool-clip will be sold in the Colonies, just as the whole of the Argentine clip is sold in the Argentine. The result of last year's sales will give an immense impetus to the colonial sales. People who shipped their wool Home last year met a bad market, while those who sold out here did splendidly.

2685. *Mr. Watson.*] But the reverse was the state of things the season before? Yes; but such a state of things occurs only once in a quarter of a century. Nothing like it had occurred before, since 1871.

2686. *Mr. Levien.*] You are increasing your storage accommodation at Pymont? We are building a new store there, upon entirely new principles. By going to Pymont you get land cheaper than you would get it in the city. You can get land there for £5,000, which you could not get for £100,000 at the Circular Quay.

2687. How would you propose to utilise Glebe Island? The very great advantages of making this conversion cannot be more clearly indicated than by the sketch which I have produced, on which is clearly shown the way a tramline could be run along some of the quietest streets of Sydney, and those on which there is practically no traffic whatever—from Eveleigh Railway Station, at a considerably higher level than the present Redfern Railway Station, to the proposed wharfage accommodation at Glebe Island—and thereby provide carriage accommodation for some of the largest factories in Sydney. Those principally affected would be the following:—Freeman's flour-mill, Gibson, Battle, & Co.'s machinery works, Tullock's machinery works, Messrs. J. and C. Hoskings, boilermakers, the Co-operative Wool and Produce Co.'s new store, Messrs. Winchcombe, Carson, & Co.'s wool store, and Messrs. John Bridge & Co.'s wool store; and by a slight deviation up Bowman-street, as shown, the Colonial Sugar Co.'s works could also be accommodated. In addition to this the establishments of a large number of timber-merchants would be affected by this tram-line. The Kent brewery, by having a branch line along Irving-street, could also be accommodated, as it is well-known that though the map shows their premises to be near Redfern station, the railway level is very much below that of Kent-street, so that a tramway is impracticable, and would, moreover, have to pass over some very busy thoroughfares. The total length of the proposed tram-line (which would necessarily be the same gauge as the railway line, so that ordinary railway trucks could be conveyed along it) is 3 miles and 12 chains, the heaviest gradient 1 in 20. It is estimated that the three wool-brokers whose establishments are above mentioned receive approximately, on an average, at least 25,000 to 30,000 tons of wool and produce annually from the railway. Under present traffic arrangements the Railway Department pay cartage on all of this, which large expenditure would be avoided if the tram-line indicated above was completed. We understand that the output of the Colonial Sugar Co. alone is approximately 1,000 tons weekly, much of which must necessarily go by rail; and when the business of the numberless other companies that would be served on each side of the road along which the proposed tram-line is indicated, the saving in cartage alone would seem to be enormous; and if the tram-line as indicated was made, there is no doubt whatever that much of the vacant land about Pymont would be immediately occupied by factories of one class or another. When the whole tram system is converted into electricity there will be a very large number of tram-motors, now in use, which would be of no service whatever, a few of which could be utilised to haul the traffic along the proposed line.

2688. What distance would it be from your store to the wharfs at Glebe Island? Between 50 and 60 chains, and about the same from Winchcombe, Carson, & Co.'s stores. I do not wish to speak solely for our own store. The proposed tram-line would start from the Eveleigh Railway Station, and would follow through Abercrombie-street, Thomas-street, Jones-street, Gibb's Crescent, and Banks-street, to the Glebe Island Bridge.

2689. And what wool-stores are there along that line of route? There is, first of all, John Bridge & Co.'s store; then there is the Co-operative Wool Co.'s new store, and then there is Winchcombe, Carson, & Co.'s store. Goldsbrough, Mort, & Co.'s Pymont store and Hill, Clark, & Co.'s store are both in close proximity to the route.

2690. How many bales of wool passed through those stores during the last year? During the season which is just over the four firms I have mentioned sold approximately 187,000 bales of wool.

2691. You think that the bulk of that wool would go over the proposed tram-line if your suggestion were carried out? I think it would.

2692. The construction of the tramway as you suggest would lessen the handling of the wool? Yes; and it would result in the saving which I have spoken of. There would be the saving in the handling of wool, and, in addition, a saving in the handling of sheep-skins, hides, tallow, and other products, which I should think would amount to £6,000 or £7,000. Then, too, it must be remembered that the grain trade of Sydney is growing, and we have now, for the first time, a surplus for export. Our company has, at the present time, something like 10,000 bags of wheat in store.

2693. I suppose you will have a great deal to do with the grain trade? Yes.

2694. Would your proposal, if carried out, assist in curtailing expense in connection with the handling of grain? It would be of enormous assistance in that direction, and, if some such assistance is not given, it will not be found profitable to export wheat. In order to compete in the markets of the world, our grain must be conveyed from the place of production to the place of sale at the cheapest rate possible.

F. W. Bacon.
30 Jan., 1900.

2695. I suppose grain could be trucked directly to the ships? Yes; if it were sent away in bulk. I think that the only way in which we should be able to compete with the people of the United States will be by conveying the wheat in bulk, and discharging it direct into the ship's hold.

2696. Do you think that Glebe Island would be a convenient spot for this trade? I think it would be a most convenient spot. The water there is sufficiently deep to allow the biggest steamers to come alongside the wharfs.

2697. Is Glebe Island a better place for the purpose than Darling Island? That is a matter upon which I am scarcely able to speak; but I think that Glebe Island is quite as good a place for the purpose as is Darling Island.

2698. *Mr. Dick.*] You do not think that the custom which has grown up of shipping large quantities of wool from the Circular Quay will interfere with wool shipments from Glebe Island? I do not think so.

2699. If the greater part of the wool were sent to Glebe Island, how would the large vessels which now load wool at the Quay obtain cargoes? My experience is that the ships would go where the wool is. We are so well catered for now by the big carrying firms of France and Germany that shippers will send their vessels wherever they can get cargoes.

2700. Do not the mail steamers take away a great deal of wool during the season? Yes.

2701. Do you think that they would go to Glebe Island for cargoes? Yes; if it were necessary to do so in order to get the wool. At the present time big steamers will call at Townsville, Bowen, Rockhampton, Brisbane, and, perhaps, Sydney and Melbourne, in order to get cargoes of frozen meat.

2702. Those are tramp steamers;—would the mail steamers, which now come to the Circular Quay, go to Glebe Island for cargo? There is such a keen competition between companies like the Orient Company, the P. & O. Company, and the Compagnie des Messageries Maritimes that they would be willing to send their vessels to Glebe Island, if it were necessary to go there in order to get cargo. If the buyers can save 1d. a bale by sending the wool to Glebe Island, they will send it there.

2703. Why do you think that in future the bulk of the wool will be sold in the Colony, instead of being shipped Home for sale? Well, most people like to see their produce marketed, and it has now become the custom for wool-growers to visit Sydney during the sale time, and personally inspect their wool, and in many cases they have an independent valuation made of it by some one in the trade, apart from the selling broker. Then, again, by selling in the Colony, they have the additional advantage of obtaining the proceeds of the sales within a week, and I need not remind you how satisfactory it is to a man who has a large overdraft to have the money realised by his produce coming in to him within the year in which the produce is grown. Most graziers during the last ten years have had to obtain large overdrafts, and, of course, the sooner the overdrafts are liquidated the better they are pleased, and the better the bankers are pleased. Last season 300,000 bales of wool were sold in Sydney between September and Christmas, realising something like £6,000,000. Such a state of things is very satisfactory to the banks. The last half-yearly return of the Commercial Banking Company of Sydney was the largest that it has ever had. One cause of the dearness of money in London this year is undoubtedly the large remittances which have had to be made to these colonies, and to the Argentine. It is estimated that during the last three months of the last year 800,000 bales of wool were sold in the colonies and London, and realised something like £16,000,000, while the Argentine clip sold to London realised something like £20,000,000, so that as much as £36,000,000 had to be remitted from London in money or in goods in a very short space of time. Last season those who shipped their wool to London for sale had a very good time. Mr. McCaughey is one of those who would have done better last year if he had shipped, and I myself would have been £6,000 better off if I had shipped my wool to London for sale; but this year I again sold in the Colony, and my average per bale was something like £20, as compared with £11 last year.

2704. Have you considered the inconvenience which would be caused by drawing a number of heavily-laden trucks along a fairly busy thoroughfare like Abercrombie-street? It would not be greater than the inconvenience caused by running cars through the city. The trucks would move very slowly, and would really not be more inconvenient than a string of heavily-laden wool-waggon. Moreover, they would do no harm to the surface of the road.

2705. How would you get the wool from the trucks into the stores;—would you have sidings? At our stores, and at Winchcombe, Carson & Co's. stores the wool would be thrown off the trucks on to platforms—in the one case descending from the platform by vertical shoots, and in the other by diagonal shoots; there would be no interference with the traffic.

2706. Would there be any difficulty in arranging for sidings into the stores? Not the slightest.

2707. Could a great deal of this traffic be carried on at night-time? Yes, because the men are all paid by the hour.

2708. Have you made a comparison of the cost of haulage, such as you speak of, with the cost of ordinary horse haulage;—we have it in evidence that, practically, it would be cheaper to cart the wool from Eveleigh than to send it by tramway? I have not gone into the matter, but I have no doubt that it will be cheaper to use the tramway. We are not likely to revert from railways to bullock teams.

2709. Did your scheme originate in a desire to relieve the present wharfage accommodation of the port, or is it merely a scheme which you think is of itself a good one;—do you consider our present wharfage accommodation insufficient? I think it is insufficient. The scheme to which you allude I have put forward in the general interests of the city. The matter is one which does not immediately concern the company of which I am chairman, though it concerns the graziers, whom we naturally desire to serve. Our company was formed to enable the graziers to sell their wool more cheaply than they were previously able to do, and, so far, we have been very successful. We have 700 or 800 shareholders, and we require all our shareholders to be producers. Under existing arrangements the wool is delivered at our stores by the Railway Commissioners without any charge for cartage from the railway station. For instance, the Commissioners take greasy wool from Bourke to Sydney for £4 per ton, and deliver it to any store in the city by waggon, without additional charge. If, however, the tramway which I suggest were made, the Commissioners would save in respect to wool sent over it the 4d. per bale which they now pay to the carriers. Then the buyers, on the other hand, pay for the delivery of the wool from the stores to the

ships,

- F. W. Bacon. ships, or wherever it has to be sent. This costs 4d. per bale, and that amount would be saved if the wool could be sent direct from the stores to the wharfs by tram.
- 30 Jan., 1900. 2710. To what wharfs do you generally send your wool now? It is sent to whatever wharf the ship by which it is consigned is berthed at.
2711. *Dr. Garran.*] You have had a great deal to do with the shipment of products of late years,—have you any reason to complain of the inefficiency of the shipping facilities of the port? In the height of the season there is occasionally a block, and we have had the wool left in the stores as long as two or three weeks at a time. That is a very great inconvenience. When we asked the buyers to take it away they told us that they had not been able to make shipping arrangements.
2712. Was that because they had not been able to agree as to freights, or because the ships could not take the wool? Possibly in some cases the shipowners took advantage of the circumstances to raise their freights, and the buyers did not consider that they could afford to pay an extra farthing a bale.
2713. Do you think that the difficulty arose from the want of wharfage accommodation or from other causes? I think it arose from a want of proper wharfage accommodation. The trade is now too much concentrated at the Circular Quay.
2714. Is not a good deal of wool shipped from the private wharfs of the port? Yes; from wharfs like the Central wharf, Dalgetty's wharf, and others.
2715. Do you find that you can get the wool away from the private wharfs as easily as from the public wharfs? Yes.
2716. It does not matter to you where the ships are lying? No. We are just as well served at one wharf as at another.
2717. Do you think that we have not enough wharfs? I do. I am aware that it is now in contemplation to resume land at Woolloomooloo Bay to provide additional wharfage accommodation, but I do not think the wool traffic should be taken there.
2718. Has there been a shortage of wharfage accommodation this season? At times there has been a difficulty in getting the wool away, and the excuse has been made by the buyers that they could not get freight.
2719. But the difficulty may have arisen from the higgling between the shipowners and the buyers,—it may not have arisen from want of wharfage accommodation? That is possible.
2720. Still you think that, on the whole, there has been a shortage in wharfage accommodation? Yes. I think that we are now at the lowest point of our productiveness.
2721. If our production of wool last year had been anything like what it was four or five years ago we should have been very much more hampered? Yes.
2722. If we had five good seasons, one after another, our wool output would be very large, and the demand for wharfage accommodation would be very much increased? Yes; the output would practically double itself, and I have every hope that that will happen.
2723. Is your company a New South Wales company, or is it an intercolonial company? At the present time we have very few shareholders, except in New South Wales. There are a few Queensland men in the company, and we have handled 5,000 or 6,000 bales of Queensland wool.
2724. You are a company of graziers who have combined to get rid of the middle man? Yes.
2725. You are your own middle man? Yes.
2726. And you find that you save by acting in that way? Yes; one-eighth of a penny per lb., or about 4s. per bale.
2727. When you said that the Railway Commissioners would save 4d. per bale by using your proposed tramway, you did not make any allowance for the cost of constructing the tramway, or for working expenses in connection with it? Of course, there will be those charges.
2728. Have you considered what they will be? No.
2729. Then you cannot say positively that it would cost less than 4d. per bale to send the wool by tramway? I cannot say so positively, because I have not gone into the figures.
2730. Do you think there would be enough traffic to keep the tramway going all the year round? Yes. They are now shearing in some parts of Queensland in January, February, and March, in order to get the clip off before the rain comes, and, with it, a flush of grass and grass seed, so that now wool is coming in practically all the year round, and we have hardly dealt with one clip before we have another to deal with. Then tallow, hides, skins, and grain are always coming in.
2731. Do you think that when the buyers required the cheapest carriage from the stores to the ships the carriers would put the wool on the tramway, or would they put it on their carts? I think they would put it on the tramway.
2732. You said that Goldsbrough, Mort, & Co.'s store would be pretty close to the tramway; but it would not be close enough to enable the wool to be rolled off the tramway into the store? No.
2733. Then if they wanted to send wool to Glebe Island by tramway they would first of all have to cart it to the tramway, and then take it from the carts to put into the trucks? Yes. I am not sure that it would suit them to use the tramway. Once they had the wool on the carts, it would suit them best to take it all the way on the carts.
2734. It would only pay the stores along the route to use the tram-line? Yes.
2735. And are you sure that they would send their wool to the wharfs in the trucks? Yes.
2736. I understand that it would be sent by truck from your stores? Yes.
2737. When heavy rain was falling would not the wool be injured by being loaded in the open street? That is a risk which has to be taken now at every country station. The rain would have to be very heavy indeed to do any injury to the wool while it was being loaded into the trucks. Of course, when the trucks were loaded the bales would be covered with tarpaulins. I have seen a bale of wool lying out all night during heavy rain without getting wet for more than 1½ inch from the outside. It is only when the wool gets wet in the middle of the bale that it begins to heat. If the rain were likely to injure the wool, we could leave off loading until it had ceased.
2738. *Mr. Watson.*] In any case, you could take the tram-line into the stores? You could have a loop into the stores.
2739. *Dr. Garran.*] Your scheme seems to give the go-by to the Darling Island scheme, which is nearly completed, and which will make a very handsome addition to our wharfage accommodation? That is so, to a great extent; but I understood that the wharfage at Darling Island was primarily intended for the shipment of frozen meat.

2740. The intention is to ship all kinds of produce there—wheat, wool, meat, and other things? Well, F. W. Bacon. Darling Island does not seem to me to be so convenient to the wool stores I speak of.
2741. Would it not be more convenient to Goldsbrough, Mort, & Co.'s store;—the Committee have been informed that if the Darling Harbour wharfage improvements realise what is intended there will be a very considerable change in our methods of shipment here; that is to say, that instead of a vessel unloading and loading at the same wharf, she will unload at an import wharf and load at an export wharf. I presume you have the same idea in regard to the Glebe Island project? Yes.
2742. You know how conservative people are; do you think it would take much time to bring that change about? I think that the competition between ship-owning firms is so keen at the present time that they would make the change.
2743. Do you think that a profit of 6d. or 8d. per ton would knock all conservatism on the head? Yes. An ocean tramp, which had taken in a part cargo of frozen mutton at Darling Island, would go to Glebe Island to complete her loading with wool.
2744. We have been told by the representative of the Norddeutscher-Lloyd Company that its vessels take to Europe more wool than is taken by any other company in the trade;—do you think that those steamers would go from the Circular Quay to Glebe Island for wool, and then come back again to the Circular Quay? I think so.
2745. If, by doing so, they could save 2d., 3d., or 4d. per bale? Yes.
2746. As we have already incurred such a large expenditure at Darling Island, do you think it would be wise to make new wharfs at Glebe Island until we have seen how the Darling Island wharfs are used. If you owned both properties, would you make wharfs at Glebe Island before you had given a trial to the Darling Island wharfs? I do not know that I should; but I am not very conversant with the Darling Island scheme. I should not advocate anything that I do not think beneficial to the community.
2747. Some of our witnesses have said that the mail steamers will never leave the Circular Quay? If they do not, other steamers will take the trade. I think, however, that all these steamers would be willing to go to Glebe Island if they could obtain cargo by doing so. The Orient Company has not yet paid a dividend, and its people would do anything within reason to obtain trade.
2748. At the present time the mail steamers never leave their wharfs—all their coal and cargo is brought to them? Yes.
2749. We have it in evidence that the cost of making a railway from the main line to Glebe Island—it would have to come from Ashfield or Summer Hill—would be something like £160,000, exclusive of land resumption;—do you think that a tramway would save that expenditure? Yes, because a tramway would only cost a few thousand pounds.
2750. And it could carry the traffic quite as usefully as a railway? Yes.
2751. At Darling Island we shall very soon be afforded an opportunity of seeing to what extent produce will be sent direct to the wharfs;—you admit that wool will seldom go direct to the wharfs? Yes, because as a rule it will be sold in Sydney.
2752. To enable it to be sold it must be unloaded and examined? Yes.
2753. But wheat might be bought at the farms or in the country towns? Yes, and sent right through to the wharfs.
2754. There is no need for it to be examined in Sydney? No.
2755. Must frozen meat be stopped in *transitu*? No. It could be sent right through to the ship's side. Practically, the whole of the freezing establishments in the Colony now belong to Mr. John Cook, of Melbourne. He bought the five establishments which belonged to the Graziers' Meat Export Company.
2756. Those works proved failures in the hands of their promoters? Yes. Mr. Cook has also purchased the Bourke works. His idea is that the best way of treating the mutton is to freeze it in the country and send it down frozen, instead of chilling it in the country, and afterwards freezing it in Sydney. Chilled sheep must be hung up in the cars, and cannot be packed as closely as frozen sheep, and there is always a risk of the meat getting soft, so that when it is frozen a certain amount of deterioration takes place, and the legs become black.
2757. Has anything been done to establish the success of Mr. Cook's method? Yes. He has employed that method in connection with his works at Deniliquin, and his brand—the "Hercules" brand—commands the highest prices. He has only recently acquired the works of the Graziers' Company, so that he has not had an opportunity to do much with them. The frozen carcasses are put into bags and thrown into refrigerating trucks in heaps.
2758. At what temperature is the meat kept? At a temperature of 25 or 30 degrees. When the carcasses are taken out of the trucks they are as hard as bricks. The works that I speak of are the works at Forbes, at Carrathool, at Werris Creek, at Nyngan, at Bourke, and at Sandown, near Granville. The Graziers' Company was under the management of a Board, of which Mr. T. F. Knox was Chairman. £70,000 was subscribed by the shareholders, and permission was given to borrow £50,000 more; but altogether the Company spent £132,000 without finishing their works. Then, too, they brought a canning expert from America at a salary of £1,500 a year, and they never tinned one can of meat. I lost £1,000 in the Graziers' Company, and £200 in the Bourke Company.
2759. The money was lost through not understanding how the work should be done? Precisely. On the other hand, the Australian Chilling and Freezing Company, which is carried on with Scotch capital, and is managed by a hard-headed man of business, Mr. Benn, of New Zealand, can afford to pay 2s. per head more for sheep than the average Homebush price, and still make money out of their operations.
2760. How are the frozen carcasses conveyed to the steamers? They are unloaded into carts, and so driven to the wharfs.
2761. Is there not a risk of them becoming warm? Yes.
2762. Then the present system of shipping frozen meat here is not a perfect system? Not by any means.
2763. If we could take the trucks right alongside the ships, that would avoid any risk of spoiling the meat? Precisely.
2764. It would also save a great deal of handling? Yes.
2765. But Mr. Cook is carrying on the trade now in spite of the difficulties which exist? Yes.
2766. Are no complaints made about the meat getting soft while being carted through Sydney? Mr. Cook's operations have been uniformly successful. He started in New South Wales as the Chairman of the

F. W. Bacon. the Deniliquin Company. He is an enthusiast upon the subject, and gave up an income of £3,000 a year to enter upon the business.

30 Jan., 1900. 2767. Have you ever heard him complain about having to cart the meat from the railway to the wharfs? Yes; and I have heard the same complaint from Mr. Richards, of Riverstone, who is another man who has made a success of the trade. He does all his freezing at the Fresh Food and Ice Company's works in Sussex-street. The mutton has to be carted from there, and there is great risk of its deteriorating on the way.

2768. Then it is clear that if we are to increase our export of meat, we must improve our shipping facilities? Yes.

2769. We want wharfs on to which we can bring the meat-trucks? Yes.

2770. If the Darling Island accommodation is not sufficient, the necessity of providing accommodation at Glebe Island will arise at once? Yes.

2771. Darling Island will, of course, have railway communication, and, under your scheme, Glebe Island would have tramway communication, which you think would furnish the necessary facilities to the trade? Yes.

2772. *Mr. Shepherd.*] Seeing that the railway now goes to Darling Island, do you not think that that place is more convenient for shipping purposes than Glebe Island? Not for the stores which I have mentioned.

2773. But would your scheme save cartage to the other stores which are scattered throughout the city? It would be impossible for us to put forward any scheme which would serve every store in the city.

2774. Is it usual to send wool from the country ready for shipment? If the wool is intended to be shipped direct to England it has generally to be dumped before being put on board the ships, because only a few of the large graziers dump their own wool.

2775. There used to be some very large wool-scouring establishments at Botany and at Liverpool—is the work of wool-scouring not carried on to the same extent now as it was formerly? To nothing like the same extent. A certain amount of wool-scouring is done, but very little is done on commission. The scourers generally wait until wool is cheap, and then they buy it, scour it, and resell it.

2776. *Mr. Watson.*] We were informed a little while ago that if a larger number of wool stores were established at Pyrmont it would be difficult to get buyers to go there? That is nonsense. They go there now, to the stores of Messrs. Winchcombe, Carson, & Co., and Messrs. John Bridge & Co. Those firms are amongst the first four in the trade, and sold last year over 50,000 bales each.

2777. Then you anticipate no difficulty of that sort? No. In Melbourne, buyers go to Essingdon, 5 or 6 miles out. Stores have been put up there, because the land is cheap. The older firms in the city cannot sell the wool cheaply, because in some cases they have had to pay as much as £500,000 for their buildings. We are putting up a store at Pyrmont for £25,000 which will do the same work as Messrs. Goldsbrough, Mort, & Co.'s store, which cost £250,000.

2778. Is the roadway on a level with the higher storeys of your building? Yes. I might mention that the wool sales are arranged for the convenience of buyers, so that the sales at the stores in the same vicinity can be attended on the same day.

2779. *Chairman.*] It is almost necessary that a large wool store should be connected with a railway, and as near as possible to a wharf? Yes.

2780. Competition has cut things so fine that it is necessary to reduce handling and carriage as much as possible? Yes.

2781. That apparently is the intention of your tramway proposal? Yes.

2782. I suppose the owners of wool stores are not likely to rent any of the wharfs themselves? I think that they will leave the wharfs to the shipping companies.

2783. Is the present system of carting the wool from the Railway station to the stores, and from the stores to the ships, a disadvantageous one? Yes, and a very troublesome one. It would be a great advantage if the five or six trucks containing the wool from one station could be taken direct to the stores and unloaded there. Under present arrangements the trucks are unloaded in a shed, and the bales are mixed up, and when the wool is delivered at the stores it is often found that a consignment is five, ten, or fifteen bales short, and it sometimes takes a week or two to get the missing bales. This, of course, delays the sales. In the height of the season the wool traffic is very much congested, and every year the congestion is becoming greater. We are considering the practicability of holding two series of sales—one series to take place before Christmas and the other after the London sales. At the present time the buyers play off one market against the other, so as to reduce the prices.

2784. What makes you think that our wool export is likely to increase so much in the future? Well, New South Wales can carry more sheep than any of the other colonies. We have carried very nearly 62,000,000 sheep, whereas I do not think Victoria has ever carried more than 10,000,000 sheep. Then, again, a great deal more wool will come to Sydney when we have Federation than comes here now.

2785. Why do you think so? Because under Federation Victoria will be unable to give the excessive rebates which she now gives. For example, the Victorians will carry wool from Swan Hill to Melbourne for £3 per ton, if the wool is grown in Victoria, but if it comes from a Darling River station above Wilcannia, they will carry it right down the Darling and up the Murray by steamer, and then from Swan Hill to Melbourne by rail for £1 a ton, because they give the New South Wales growers a rebate of £2 a ton upon their railway rates. Such an arrangement, however, would be prevented by the Inter-state Commission; while, on the other hand, we in this Colony could impose what rates we liked for the development of our own territory, so long as we did not devise those rates to secure Victorian wool, which we do not want, and which I do not suppose we could get.

2786. But, under Federation, wool grown on stations which are nearer to Melbourne than they are to Sydney would go to Melbourne? I do not know that that would always be the case. For instance, the wool grown at Table Top, near Albury, is sent to Sydney, and I think it will come to Sydney after we get Federation, because it will be brought to Sydney at the same rates that would be charged to take it to Melbourne. I do not say that Sydney is the best market in the Colonies, but it is the leading market, because most wool is sold here.

2787. Sydney is recognised as the wool centre of Australasia? Yes.

William Henry Hall, Sub-Editor, *Statistical Year Books*, Government Statistician's Office, sworn, and examined:—

2788. *Chairman.*] I understand that you have compiled some figures illustrating the advance of the trade of the port of Sydney during a period of some years? I have here two statements, one of which shows the tonnage of the vessels which have entered and cleared the port during the years 1890 to 1899, and the other shows the value of the imports and exports of the port during the same period. Unfortunately, I have not been able to obtain any figures in regard to the coastal trade, because an arrangement is come to with the Customs authorities whereby coastal vessels which do not want to make a clearance every voyage may obtain an exemption. For that reason my shipping return deals only with the intercolonial and over-sea traffic. I believe it would be impossible to obtain figures showing the tonnage of the cargoes imported each year. The trade returns indicate that a large quantity of the imports come here as packages, and no weights are given. The following is the statement which I have prepared in regard to the tonnage of vessels entering and clearing the port:—

W. H. Hall.
30 Jan., 1900.

Year.	Entered.						Cleared.						Total entered and cleared.	
	With cargo.		In ballast.		Total.		With cargo.		In ballast.		Total.			
	No.	Registered tonnage.	No.	Registered tonnage.	No.	Registered tonnage.	No.	Registered tonnage.	No.	Regist'd tonnage.	No.	Registered tonnage.	No.	Registered tonnage.

I wish to say, in regard to my next statement—that relating to the trade of the port—that the figures for 1899 are subject to adjustment. The imports and exports are, of course, exclusive of the coastal trade. The statement is as follows:—

Year.	Imports.	Exports.	Total Trade.	Year.	Imports.	Exports.	Total Trade.
	£	£	£		£	£	£
1889	18,783,283	14,417,413	33,200,696	1895	13,778,148	15,696,631	29,474,779
1890	17,792,986	12,178,053	29,971,039	1896	16,821,742	16,638,847	33,460,589
1891	20,176,364	15,201,381	35,377,745	1897	17,302,514	17,438,592	34,741,106

1894	13,564,181	13,790,770	27,354,951				

James Johnston, clerk, Department of Public Works, sworn, and examined:—

2789. *Chairman.*] I understand that you have prepared some information in regard to money received from the sales of land adjacent to public wharfs? I have obtained, as far as I was able, information as to the proceeds of the sales of land reclaimed at the head of Woolloomooloo Bay.

2790. Is that the only instance in which reclaimed land has been sold by the Government? I cannot say. I have brought a plan which shows the area to which my figures apply. The Woolloomooloo Bay Reclamation

J. Johnston.
30 Jan., 1900.

J. Johnston. Reclamation Act was passed in 1862, and the first sale of reclaimed land took place on 25th September, 1865, when the sales realised £4,275. A sale on the 26th September realised £2,277, and a sale on the 27th September, £1,950. Another sale was held on the 29th December, and it realised £1,872. Further sales were held on 9th August and 5th November, 1866, when £2,285 and £1,287 were realised. That was the end of the public sales, so far as I can ascertain; but the proceeds of private sales on 11th February, 1867, amounted to £420, and on 7th October to £687. Then, on 27th July, 1868, a private sale realised £68, and another private sale on the 15th March, 1869, £1,306; so that, in all, £16,427 were obtained. It is highly probable, however, that that was not the whole amount obtained from the sale of the reclaimed lands. These sales are entered in the Treasury registers according to the parishes in which the land is situated. The land with which we are concerned is situated in the parish of Alexandria, and between 1864 and 1869 some officer, who must have been pretty well acquainted with the place, has pencilled in the actual localities from which the money came, and that is why I was able to find that it was obtained by the sale of reclaimed land; but private sales have been going on ever since, and I think that the Lands Department is at the present time trying to compel certain people who are illegally in occupation of land which has never been sold to buy their allotments right out, or to come to terms for them.

2791. *Dr. Garran.*] Then there is still more to be realised? Very little more. The whole of the land is occupied; but a little of it is illegally occupied.

2792. Was the land on which the Fish Market stands bought by the Sydney Municipal Corporation? I have not been able to ascertain that.

2793. That is reclaimed land? Yes, almost entirely. When it was first proposed to reclaim this land, the whole of the frontage at the head of the bay was illegally occupied by various persons, some of whom had run out long jetties into the bay, while others had reclaimed land and erected business premises upon it. In 1862, when the Woolloomooloo Reclamation Act was passed, the Crown was empowered to reclaim and dispose of the reclaimed land by auction sale or lease, while the owners of land severed from contact with the water were entitled to compensation. A *Gazette* notice of 24th August, 1863, invited all persons interested to lodge claims for compensation within a month, and several claims were lodged. In some cases the land reclaimed was granted in lieu of compensation, while, in other cases, monetary compensation was given for the severance. The area reclaimed was 19 acres 3 roods.

2794. *Chairman.*] You do not know what the reclamation cost? No; I cannot tell you anything beyond the information given in the statement read by Mr. Hickson.

2795. Was any of the surplus land on the eastern side of the bay sold? There was no surplus land there; the area resumed was only sufficient for the wharfs and the approaches.

2796. *Dr. Garran.*] I suppose the money spent upon the reclamation at Woolloomooloo Bay is all borrowed money? The great bulk of it came out of the Loan Fund.

2797. But the proceeds did not go back to the Loan Fund? The proceeds went into the Consolidated Revenue Fund.

WEDNESDAY, 31 JANUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of cutting down Glebe Island, reclaiming the foreshores, and constructing a Wharf round the Island.

Adam Forsyth, J.P., Manager, Burns Philp & Co., Ltd., sworn, and examined:—

A. Forsyth, J.P. 2798. *Mr. McFarlane.*] How long have you been manager for the A.U.S.N. Company? I am manager for Burns, Philp, & Co., who are the managing agents in Sydney for the A.U.S.N. Company.

31 Jan., 1900. 2799. For what length of time have they been so? For fifteen years.

2800. Had you any knowledge of the shipping of Sydney previous to that time? Yes; my experience dates back twenty-four years.

2801. What wharfs do your company occupy at the present time? Burns, Philp, & Co. occupy two wharfs at the Circular Quay, where the steamers of the Canadian-Australian line, and the Nipon Yusen Kaisha line, and three jetties at Lime-street, where the A.U.S.N. Company's boats lie. We are also managing directors for the Federal wharfs.

2802. Are these wharfs the property of the steamship companies? No; the wharfs are leased from the Government and the jetties from the Sydney Municipal Corporation. The Federal wharfs are freehold.

2803. How many steamers have you under your management? I suppose about fifty altogether. We are the agents for a great number of lines.

2804. Are they large steamers? Yes.

2805. Have you ample wharfage accommodation at the present time? We have sufficient accommodation for our trade.

2806. What length of frontage do you occupy at the Circular Quay? Roughly speaking, I should think about 450 feet—from the Floating Jetty to the Orient Company's wharf. There are two sheds behind the wharfs which we occupy there, one of which is used by the Japanese line and the other by the Canadian line.

2807. What is the length of the jetties which you lease from the Municipal Corporation? The biggest of them is 310 feet long.

2808. And how wide? About 30 feet. It is 20 feet wide at the ends, but it broadens out towards the shore.

2809. Do you prefer jetty accommodation to wharf accommodation? We prefer wharf accommodation where there is room for it.

2810. Jetties are not so convenient as wharfs for the discharging and taking in of cargo? That is so. We lease two jetties from the Corporation at Lime-street, and we have another jetty which is held partly on lease and partly on freehold.

2811.

2811. I understand that at Melbourne you have wharfs on the Yarra? Yes. The disadvantage about a jetty is that when there is a vessel discharging on each side the cargo coming out often blocks the cargo going in; whereas, with a wharf, the outgoing cargo can be taken direct from the hatchways to the shed, and any blocking prevented. A. Forsyth, J.P.
31 Jan., 1900.
2812. Have you sufficient accommodation for the cargo on the jetties? The cargo taken out of the vessels cannot be removed until they have left the jetties, except, of course, passengers' luggage, which is delivered straight away.
2813. Have you any knowledge as to whether there is sufficient wharfage accommodation at the various Government and private wharfs for the trade of the port? I think there is sufficient accommodation at the present time.
2814. Has there been a marked increase in the trade of the port during the last ten or fifteen years? Yes.
2815. The number of steamers coming here has increased, and their tonnage has increased? Yes.
2816. If the traffic continues to increase, will not additional wharfage have to be erected to provide for it? I do not think additional wharfage is necessary. The companies engaged in the intercolonial trade must keep to certain wharfs, and deal with their traffic there. If they are unable to meet the requirements of the trade they lose it; it is for them to keep up with the demands of the trade.
2817. The intercolonial companies would not care to remove their steamers from the wharfs at which they are now berthed? They could not afford to remove their steamers from those wharfs; they could not afford to leave Sussex-street.
2818. Why is that? The bulk of the intercolonial trade is in produce, and the steamers must take that produce as close as possible to the centre of the produce trade, which is Sussex-street. In certain seasons of the year, when they have droughts in Queensland, we export enormous quantities of produce there, and we are always importing large quantities of produce; and it is necessary that this produce should be landed near to the produce merchants' places of business. If a produce merchant had 60 tons of chaff at Woolloomooloo Bay, he would not be able to get a customer to go there to look at it, because of the distance; whereas, when the produce is lying on the wharfs in Darling Harbour, the customer will come down and examine it there before buying it.
2819. The produce merchants require the landing of the produce at wharfs close to their business places? Yes, so that customers may have only a short distance to go to see it. If a merchant had produce lying at Glebe Island or at Darling Island, a customer would say, "I cannot spare the time to go over there and look at it."
2820. Do you not think that, if wharfage accommodation superior to that which exists now in Darling Harbour were provided for, the produce would shift there? I am certain that it would not.
2821. Darling Island, for instance, is connected with the railway;—do you not think that that fact would give the wharfs there a preference in the minds of the buyers? I do not think so.
2822. Is not a considerable quantity of the produce which is imported sent up country by rail to Bathurst, Goulburn, and other places in the interior? No, I think, on the contrary, that produce is sent down to Sydney from those places. I understand that they grow their own oats and cereals generally.
2823. If a railway were constructed to Glebe Island and wharfs were constructed there, would shipping object to go there? I do not think that any wharfs constructed at Glebe Island will be used by the intercolonial shipping during my lifetime, and I hope to live a good many years yet.
2824. Would such wharfs be used by deep-sea steamers? I do not think so, though they might do for timber ships.
2825. Is not Glebe Island as suitable a place as any other for the construction of wharfs to relieve the present congestion of traffic? The very best wharfs, if placed somewhere out of the way of traffic, will remain unused.
2826. Would the German steamers go to wharfs at Glebe Island? The German steamers are quite free; they can land their cargo at any part of the harbour; but the question is, would it suit consignees to have cargo landed there?
2827. Do you think consignees would object to Glebe Island as a shipping-place? I think so.
2828. Why? In the first place, it is too far away.
2829. It is further away than the Circular Quay? Yes; and it is further away than Woolloomooloo Bay.
2830. But would it not be something in favour of Glebe Island if the wharfs were connected with the railway? I do not think so.
2831. What would be the nature of the inconvenience suffered by the consignees if goods were landed at Glebe Island? If there were any dispute about the landing of cargo, Glebe Island would be a long way to have to go to settle it. The journey there in a cab would occupy at least twenty minutes, and there would be another twenty minutes taken up in the journey back. You can only send responsible people to investigate claims in regard to cargo, and they cannot waste their time in making such long journeys as that.
2832. The bulk of the cargo brought by the boats I am speaking of would be merchandise? Yes.
2833. Is not such cargo consigned by the consignees to their warehouses by dray? Yes.
2834. Would the distance of Glebe Island be an objection in that respect? That would not be any particular objection, because, no doubt, goods could be carted from Glebe Island to warehouses in York-street almost as cheaply as from Woolloomooloo Bay.
2835. Do you ever have delay and difficulty in connection with the carting of goods from your wharfs? Yes.
2836. Owing to the insufficiency of space? Owing to the congestion of traffic in Erskine-street. All the traffic from the Grafton wharf, the North Coast Company's wharf, the Union Company's wharf, Huddart, Parker, and Company's wharf, the Illawarra Company's wharf, and our wharfs has to go up Erskine-street, and things will be still worse there if they run a tramway down the street. Erskine-street is the only street north of Market-street up which you can get a loaded dray, and, consequently, the traffic there is often very congested.
2837. Do blocks often occur? They occur very often.
2838. A considerable quantity of timber is imported by the intercolonial boats? Yes.
2839. Would it not be more convenient to have that timber landed at Pyrmont? It would be more convenient for the timber merchants; but when you have one-eighth of your cargo timber and the rest general

A. Forsyth,
J.P.

31 Jan., 1900.

general cargo, you cannot land your general cargo at Darling Harbour and then go over to Pymont to discharge the timber.

2840. How do you manage now? We land the timber on our jetties, or allow it to be taken away by lighters.

2841. Timber cargoes are brought here chiefly by sailing ships? Yes, of course. Sailing ships could go to Glebe Island.

2842. Do you think that the proposed new wharfage accommodation at Woolloomooloo Bay would be more convenient than wharfage accommodation at Glebe Island? I think that, for timber, wharfs at Glebe Island would be just as suitable as wharfs at Woolloomooloo Bay.

2843. But for general cargoes? Wharfs at Woolloomooloo Bay would be preferable for general cargoes, because Woolloomooloo Bay is more accessible than Glebe Island.

2844. Do you think that if wharfage accommodation is given at Glebe Island it will be taken advantage of by the various steamship companies? No, I do not. I do not know any company which it would suit to go over there.

2845. *Dr. Garran.*] I understand that you find Darling Harbour rather crowded? The approaches to it are cramped, but the accommodation on the wharfs is not so cramped.

2846. As a rule, are not the jetties too narrow? They are not too narrow; but, of course, when you have to take in cargo, when there is other cargo stacked on the wharf, you are liable to have a block.

2847. If two vessels are unloading at a jetty at the same time they so fill it with goods that carriers cannot take the goods away? Not easily, when there is any loading to be done.

2848. Your shed accommodation is also rather small? Our own company has plenty of room.

2849. The meagreness of the water frontage is aggravated by the narrowness and steepness of the streets which give access to it? Yes.

2850. What length of water frontage have you at Darling Harbour? I cannot say exactly, but I think about 400 feet.

2851. How many steamers can you accommodate at your jetties at one time? Six.

2852. And how many at the wharfs at the Circular Quay? Two.

2853. How much cargo can you get rid of at the jetties in comparison with what you could get rid of at a wharf? I can hardly give you a fair answer, because the Canadian and Japanese steamers only come to the wharfs once a month, whilst our intercolonial steamers come to the jetties several times a week.

2854. It is evident that the conveniences at Darling Harbour are not quite up to the requirements of the trade? I would not say that the conveniences which we provide do not meet the requirements of the trade.

2855. You get through your business, and so do your competitors, but you have to contend with great inconveniences;—a steamer making a run from Brisbane to Fremantle, when she gets to Sydney, will have some cargo to put out and some to take in;—does she load and unload at the same wharf? Yes; we have discharged 1,000 tons of cargo from a vessel, and put 1,000 tons on board within the space of twenty-four hours.

2856. But you could do better than that with a broadside wharf? Yes.

2857. How many hours of the twenty-four could you save at a broadside wharf? We might save four.

2858. Not more than that? No.

2859. In any case you would only unload from one side of the vessel? Well, sometimes we unload into lighters; but I do not take that into consideration.

2860. You said that you were better off in Melbourne than you are here, because you have broadside wharfs there? Yes.

2861. Are you better off at Port Adelaide? Yes.

2862. At Fremantle? Yes.

2863. At Brisbane? Yes.

2864. At Rockhampton? Yes.

2865. At Maryborough? Yes.

2866. At Cooktown? Yes.

2867. Where are you worse off than you are in Sydney? You cannot compare the Queensland ports with the accommodation here, because up there the traffic is so small. At Brisbane we have wharfs instead of jetties, and run the cargoes straight from the hatchways to the sheds. So, too, at Rockhampton, the vessels lie alongside the river bank, and the cargo can be taken straight away.

2868. Can you get cargo in and out at these wharfs more quickly than you can get it at the Sydney jetties? We can handle cargoes better in Brisbane than we can here, because we have more accommodation there than we have here. We have three distinct wharfs at Brisbane; we have the old A.S.N. Co.'s wharf, the Council wharf, and the old Queensland wharf.

2869. Port Jackson has the reputation of being a very commodious port? So it is.

2870. But it appears not to be commodious enough for the coastal and intercolonial trade which congregates in Darling Harbour? The traffic is congested in Darling Harbour; but you could not move Sussex-street.

2871. If you could make Sussex-street 5 miles long, we might get rid of the congestion? That would make things better.

2872. Has not your company got a relief wharf above the Pymont Bridge? We have now; but we have not yet commenced to use it.

2873. I suppose you will store some of your cargo there for the benefit of the consignees? Yes.

2874. That will be the principal use to which you will put the wharf? It is also intended for other uses.

We are going to make engine shops.

2875. Is there much room above Pymont Bridge for the accommodation of the intercolonial traffic? There are the Federal wharfs, the Union Company's wharfs, and Russell's wharf, which is the wharf that has been sold to us.

2876. Then, on the other side, there is the iron railway wharf? Yes.

2877. That is of no use to you? No.

2878. Have you ever looked at it to see if it would suit you? Yes.

2879. What makes it unsuitable? There is the same objection to it as to the Glebe Island wharfs; it is too far away from Sussex-street.

2880. There would be an easy approach to the city by way of Hay-street from that wharf? Yes.

2881. But you think the distance would prevent it from being used? Yes.

2882.

A. Forsyth,
J.P.
31 Jan., 1900.

2882. I suppose the intercolonial and coastal trades are on the same footing in regard to the necessity for being near Sussex-street? Yes.
2883. It would not suit one class of boats more than another to go away from there? No.
2884. If the wharfage accommodation in the bight between Dawes' Point and Miller's Point were available, it would not suit you to go there any more than to the Circular Quay? No.
2885. You could not leave Sussex-street? No.
2886. The trade of Sydney will grow? Yes.
2887. Sussex-street cannot become any bigger? Most of the produce-houses there are on the harbour side of the street now; but, as the trade increases, I suppose they will also extend the business on to the other side of the street, or into Clarence-street.
2888. What can we do to improve the wharfage accommodation of Darling Harbour, if all the trade must be done close to Sussex-street? Each company will have to do the best it can to suit its constituents.
2889. I suppose you will agree with other witnesses that it would be of no use for vessels to move to the other side of the harbour? No.
2890. No electric tram service would improve the position? No.
2891. The wharfs must be within walking distance of Sussex-street? Yes.
2892. Until a revolution takes place in the produce trade, Sussex-street and Darling Harbour are wedded together, as far as intercolonial shipping is concerned? Yes.
2893. It would be out of the question to seek to give you relief by offering you wharfage accommodation at either Glebe Island or Darling Island? Yes.
2894. Wharfs at these places might be available for deep-sea shipping; but not for intercolonial shipping? Exactly.
2895. Not even if there were railway facilities? Not even so.
2896. Glebe Island is simply out of the question, so far as intercolonial shipping is concerned? Yes.
2897. *Mr. Shepherd.*] I understand that you can berth two vessels at the Circular Quay, where you have about 500 feet of frontage, and six vessels at Darling Harbour, where you have only 400 feet of frontage; so that the jetty system is the more economical system so far as frontage is concerned? Yes; but, of course, at the Circular Quay you could not run out a jetty without blocking the traffic.
2898. Could you not, by widening your jetties, give more facilities for dealing with cargo? We could not widen our jetties without taking too much water space. We must have room for one of our vessels and a collier alongside the jetties.
2899. But where there is sufficient water space the widening of the jetties would be feasible? Yes.
2900. Do you ever have to lease other wharfs besides those about which you have been speaking? Not for the A.U.S.N. boats.
2901. You do not know much about the difficulties which others who have no regularly leased wharfs may experience in obtaining accommodation? I do not think there is any difficulty about getting wharfage accommodation.
2902. Do you think there is ample for the shipping of the port? I think so.
2903. If the railway were taken to Glebe Island would that to a certain extent get rid of your objections to it as a shipping place? No.
2904. Do you think that it is unnecessary to carry out the Glebe Island proposal at the present time? Yes.
2905. The Darling Island wharfs do not seem to be largely used at the present time? No.
2906. Is that because of their distance from the business centre of the city? Yes.
2907. That is the objection which you take to the Glebe Island proposal? Yes.
2908. And no railway facilities can remove it? That is so.
2909. *Chairman.*] Do you think that if wharfage accommodation were provided at Glebe Island or at Woolloomooloo Bay the intercolonial trade would drift to either place, as the wharfs now used by that trade became overcrowded? No.
2910. Those places would not be convenient for that trade? They would not.
2911. In your opinion, wharfs at either place would for a long time be used only by over-sea ships? Yes.
2912. The intercolonial trade is so concentrated that you do not see any chance of its being taken away from Darling Harbour? That is so.
2913. Darling Harbour will be made use of to its utmost capacity before any of the trades move elsewhere? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.
Glebe Island Improvements.

APPENDIX.

A.

[To Evidence of W R Benson, Manager, Wharf Association, Sydney]

RETURN showing number of inward cargo ships and steamers (oversea) berthed at wharfs, exclusive of those controlled by the Government, from 1st July, 1896, to 30th June, 1899

B.

[To Evidence of J. Jackson, Manager of Public Wharfs.]

AMOUNTS RECEIVED FROM SALES OF LANDS AND HOUSES, AND RENTS RECEIVED, IN CONNECTION WITH GOVERNMENT WHARFS.

Parliamentary Standing Committee on Public Works,
Public Works Buildings, Bridge-street, Sydney, 19 January, 1900.

Sir, I am directed by the Chairman of this Committee to ask you to be so good as to supply me with a return showing the amounts received from sales of land and houses, and rents received, in connection with the items "land resumptions," in the attached statement supplied to the Committee by the Engineer-in-Chief for Public Works. The information is required in order that in the evidence relating to the proposed Improvements at Glebe Island, the Government Wharfs, while charged the cost of land resumption, shall be credited with what has been obtained from sales and from rents.

I have, &c.,

CHARLES LYNE,

Secretary.

The Under Secretary for Finance and Trade.

Captain Jackson.—Can you supply the information?—F.K., 22/1/00. Yes. Report as required sent herewith.—
Public Wharfs, 29/1/00. The Under Secretary for Finance and Trade.

Resumed Properties Branch, Department of Public Wharfs,
Circular Quay, 29 January, 1900.

Sir, In reply to letter of the 19th inst., from the Parliamentary Standing Committee on Public Works, asking for return of rent, &c., I have the honor to enclose return showing actual rent received from the various resumed properties to 31st December, 1899, other than wharfs, jetties, and sheds.

The amount received from sales of land, houses, &c., should be obtained from the Departments of Works and Lands. I would at the same time point out that the wharfs are debited with the amount of £495,666 11s. 10d. for resumption of land at Darling Harbour, although this land is used exclusively by the Railway Department for railway purposes; also with an amount of £19,773 19s. 8d. for railway extension; and with the cost of construction of the wharf at Manly (£3,000), the rent (£263 per annum) received for the wharf, however, being paid to the Lands Department, the wharf not being under the control of the Treasury.

I have, &c.,

JOHN JACKSON,

Manager and Collector.

The Under Secretary for Finance and Trade.

RETURN showing amount of Rent received to 31st December, 1899.

Resumed Properties.

Circular Quay	£42,642
Darling Harbour	13,000
Woolloomooloo Bay	5,467
Erskine-street	3,403
	<hr/>
	£64,512

JOHN JACKSON,

Manager.

Sales of Land and Houses.

Darling Harbour	£21,275
Circular Quay	Nil.
Woolloomooloo Bay.—I understand the figures have already been furnished to the Committee by Mr. Johnson, of the Public Works Department.	

S. R. CORKHILL,
Receiver.

The Treasury, 15/2/00.

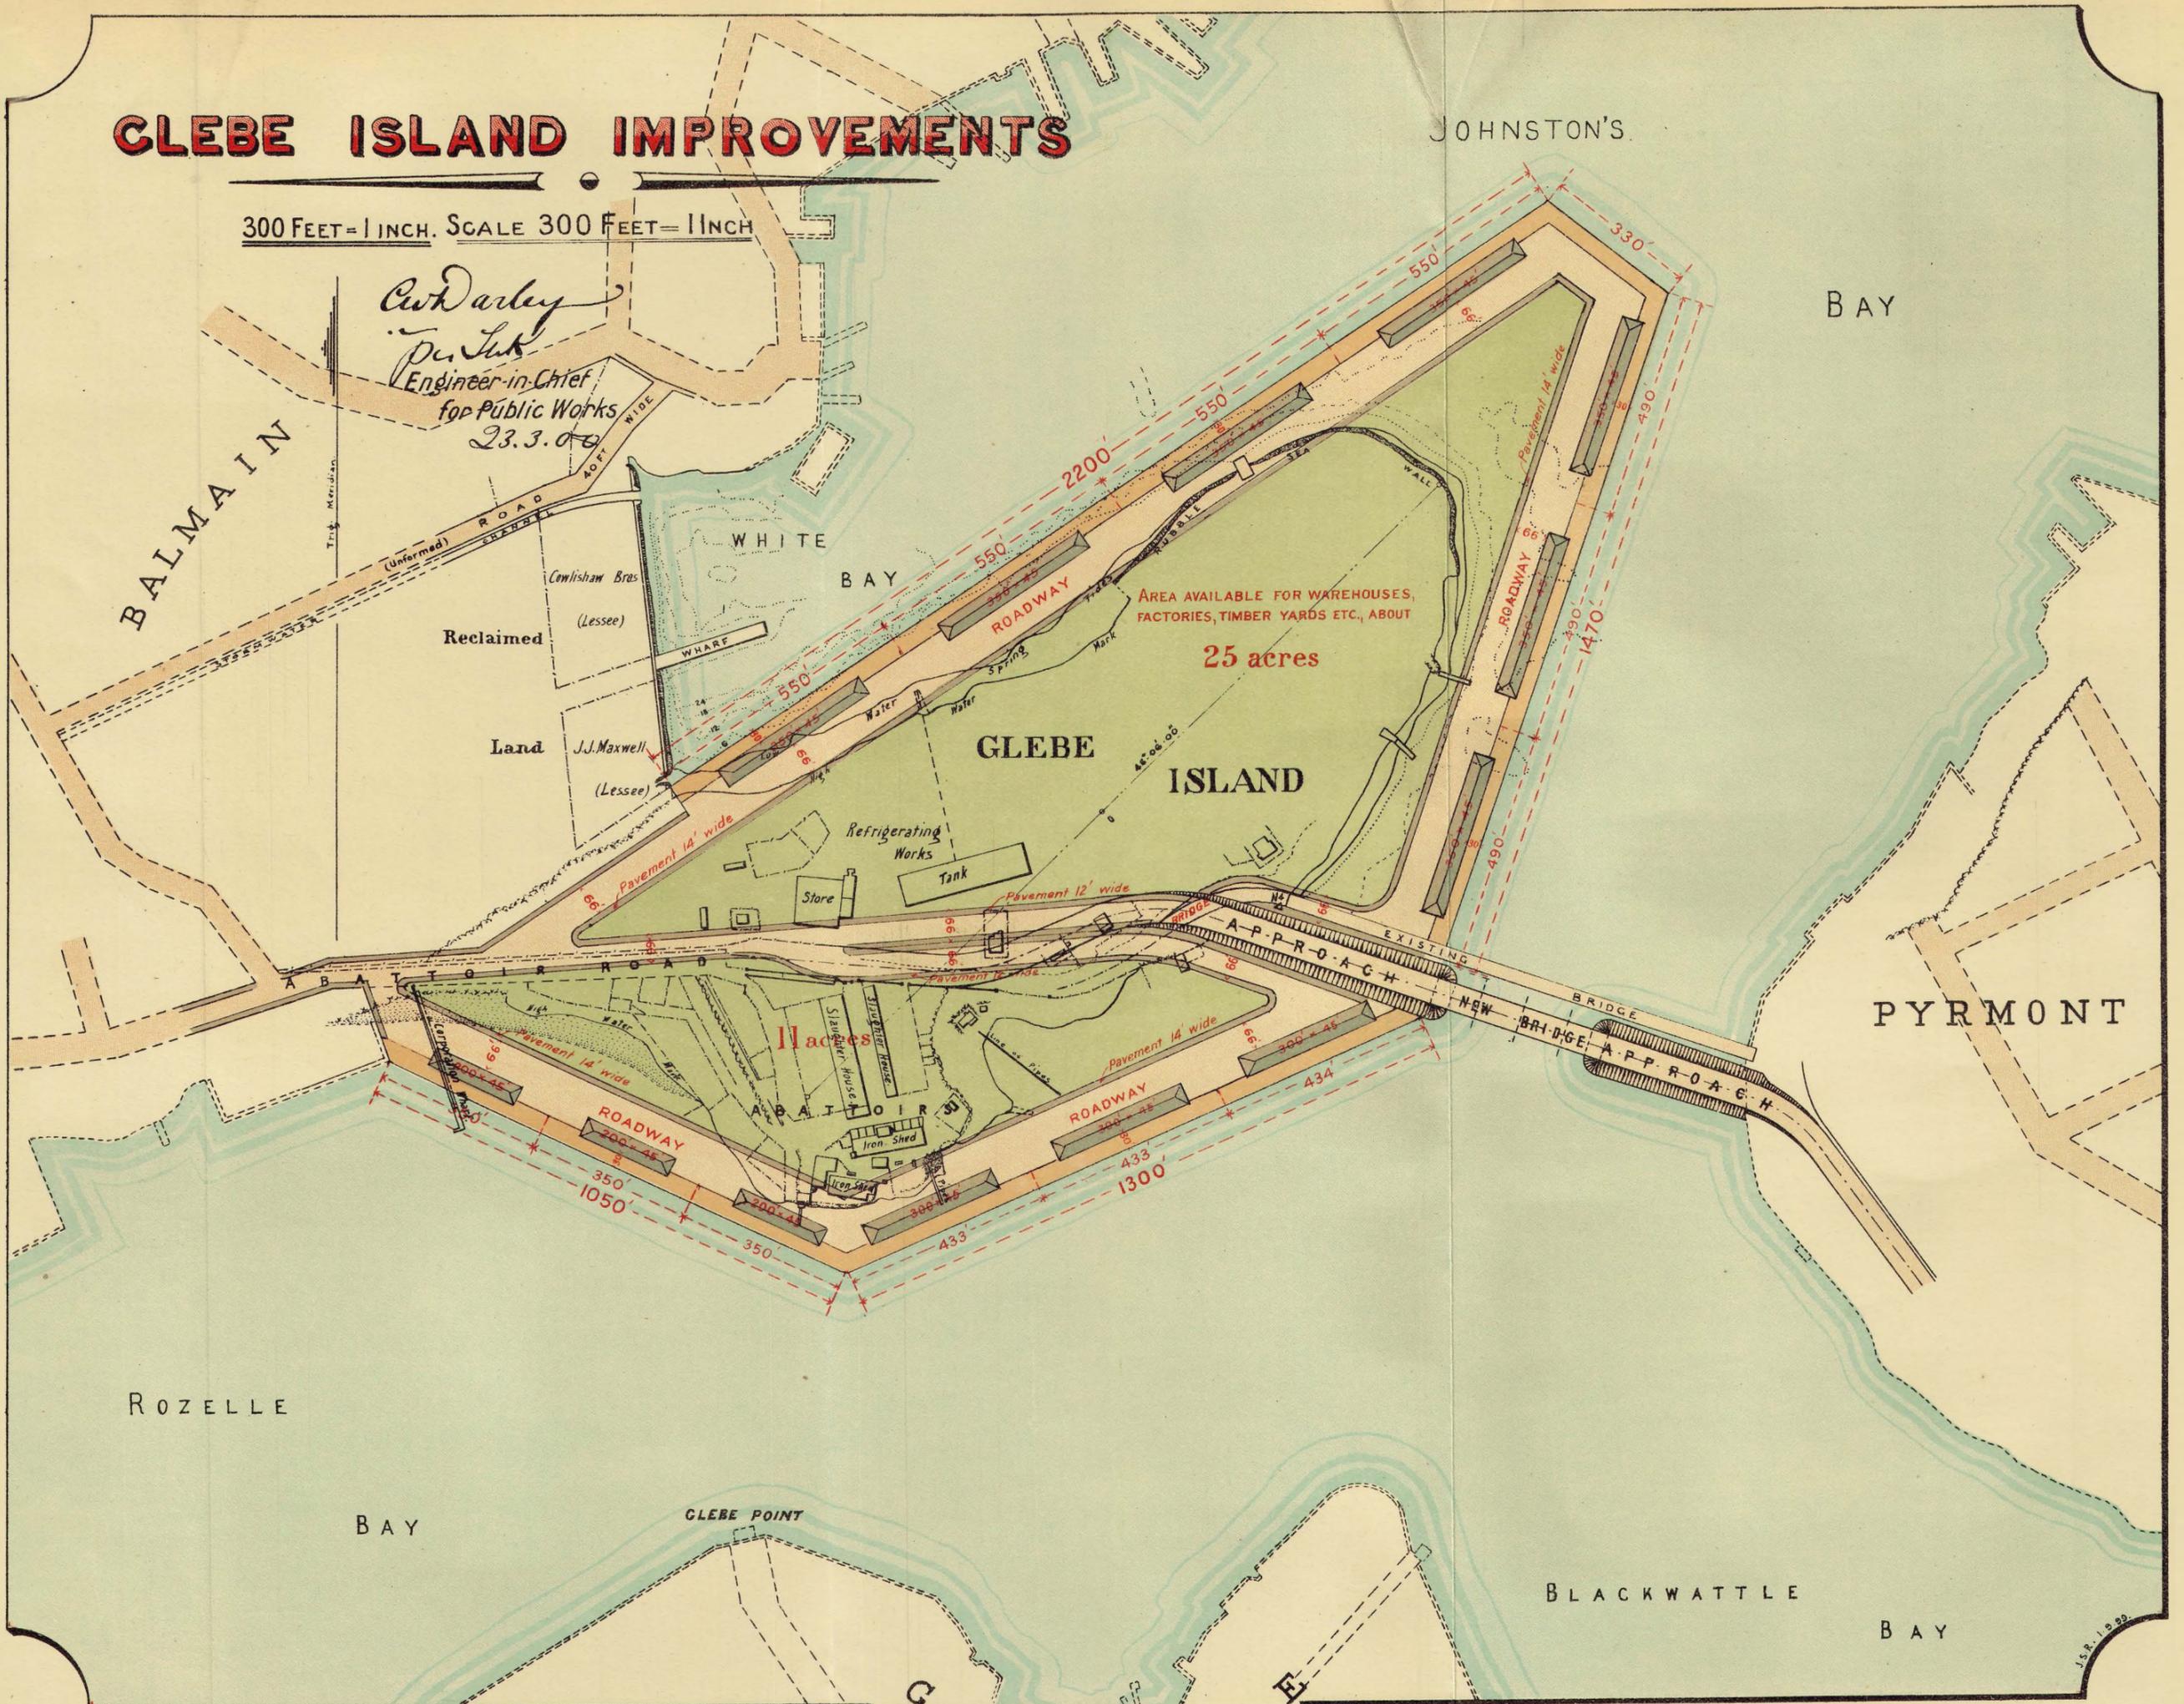

The Secretary, Parliamentary Committee on Public Works. B.C., Treasury.—F.K., 15/2/00.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

TUCKIAN FLOOD ESCAPE SCHEME.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing works in connection with the Tuckian Flood Escape Scheme," have, after due inquiry, resolved that it is not expedient that the proposed works be constructed, but if the owners of the land benefited will undertake to enter into a satisfactory guarantee for the payment of 3 per cent. upon the cost of construction, together with the cost of all claims for any damage to land, or from the silting up of the river that the cutting of the channel may cause, the Committee are disposed to recommend the carrying out of the work,—and not otherwise; and, in accordance with the provisions of sub-section (IV), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

DESCRIPTION OF THE SCHEME.

1. The scheme is designed to protect Lismore and other towns, and many of the settlers on the Richmond River, from injury by the overflow of the river when in high flood. The river finds its way to the sea by a very tortuous course, and meets with many obstructions in the form of reefs, sharp bends, and contractions in the channel, all of which it is stated tend to choke the ready outflow of flood-waters, with the consequence that a vast area of valuable land is periodically submerged.

The question as to what can be done to improve the position of the settlers in this respect has been the subject of agitation amongst the residents of the district for many years past, and the project which has been under the consideration of the Committee suggested itself to the Resident Engineer of the district in 1893. It is to cut down the left bank of the river at a little over 4 miles above the junction of the north and south arms of the river at Coraki, and to construct therein a weir 300 feet in length at the crest, which would be 10 feet wide and 12 feet over low water at Woodburn. The average level of the bank at the off-take is 20·8 feet above low water, and the highest floods rise 1·51 feet above this, and spill over into the Tuckian Swamp, in which the highest floods at present only rise to 14·26 feet over low water, the difference in levels being 8·09 feet. The channel in connection with the weir would be cut 300 feet in width, and the flood-water conveyed through it would be discharged into the Tuckian Swamp, and would there spread and rise more quickly than it now does, but, according to Mr. Keele, the author of the scheme, not to the same height, as the Broadwater would carry a large portion of it direct to the river, particularly if the current were trained toward the Broadwater by running out the spoil from the excavation to form an embankment some distance through the swamp. If, it is contended, a large body of water coming down the north arm is diverted by means

means of the works proposed, and allowed to pass quickly, in a third of the distance the water now travels, into the lower river, the congestion in the river channel during flood would be much relieved, and the north and south arms of the river benefited as well.

ESTIMATED COST.

2. The estimated cost of the scheme is given under several differing conditions, which are referred to in the official statement put before the Committee by the Engineer-in-Chief for Public Works, as schemes Nos. 1 to 6, ranging in cost from £23,700 to £80,700, none of them including anything for compensation for damage.

THE ENGINEER-IN-CHIEF ON THE PROPOSAL.

3. The scheme is not approved by the Engineer-in-Chief for Public Works. He holds that, by raising the water in the lower parts of the river, the country in those localities will be drowned and a lot of damage done, and that, by reducing the force of the natural scouring of the river in times of flood, the scheme will lead to the silting up of the river channel and to serious interference with navigation. The immediate result of the anticipated relief by means of the proposed weir and channel would be, he states, to flood about 8,000 acres of alienated land to a considerable depth, a portion of which is not now liable to be flooded, while a further result would be to raise the level of floods considerably at and below the Broadwater; and, in view of the fact that there is a good deal of settlement along that part of the river, including the Colonial Sugar Company's large mills, as well as the town of Wardell, he fears that if the cutting be made it may lead to heavy claims for compensation. The owners of the land liable to be flooded by the raising of the water over the islands in the swamp will also, he points out, be likely to advance claims for damage sustained. At the same time the scheme will not appreciably benefit Lismore. It may possibly shorten the duration of a flood there, but it will not lower it.

Some years ago, he points out, a channel was cut from the Tuckambil Creek to the Evans River, to relieve the residents of the locality on the river known as The Elbow, from the effects of floods. As the creek is very small, and so bound by rocks that it is not possible for the river water passing through it to scour to any extent, the work was carried out. No high flood has since occurred to test the effect of the work, but he is satisfied that the floods in the neighbourhood will not be lowered to the extent of 1 inch.

In his report upon the Tuckian scheme he states that he cannot recommend it unless an undertaking be obtained from all concerned to free the Government from responsibility. In his opinion it would be much wiser to spend a large sum in improving the river channel by cutting off some sharp bends, widening narrow portions, and removing rocky obstructions, a method by which the flood-discharging capacity would be much improved, and the river made more navigable.

SECTIONAL COMMITTEE'S REPORT.

4. The Full Committee having examined the Engineer-in-Chief on the subject, a Sectional Committee was appointed to inspect the site of the proposed works, and the Richmond River from Lismore to the Heads, to take local evidence, and report the result of their visit. They examined witnesses at Lismore, Coraki, Woodburn, Broadwater, Wardell, and Ballina, travelling down the river for that purpose, and visiting on the way the top of the Tucki Ridge, from which they obtained an extensive view of the surrounding country, the swamp and the line of the proposed channel, the off-take site, and the spot at which the proposed channel would cross the Coraki-Lismore Road, the Tuckambil weir, which is about a mile from Woodburn and the Tuckian Swamp.

From their report it will be seen they found that in times of flood immense damage is done to property both on and near the river and for many miles inland, and that owing to the tortuous character of the stream, and its many arms and arteries, the varying heights of the river banks, and the low-lying character of much of the surrounding country, it will be very difficult, if not impossible, to provide an effectual means against submergence in time of high flood; so that the proposed channel at best could only be regarded as a partial remedy. The proposed diversion
of

of the water into the Tuckian Swamp would, in their opinion, have a good effect as far as relieving that part of the country connected with the river above the weir site, and as far down as Woodburn, but the effect on the river and lands below Broadwater could only be ascertained by experience.

Regarded as a partial remedy, the Sectional Committee were inclined to the opinion that at the early stage of a flood, and provided there are no over-balancing forces, such as a very high tide and a strong gale up the river from the coast, the channel, if cut right through to the head of the Broadwater, would have the effect of carrying the conducted water quickly to sea, and so relieving the low-lying lands between the weir site above Coraki and the Broadwater; but in high and continuous floods, it is difficult to see how the channel could continue its effectiveness, as the surrounding country lies so low that it must become a huge water reservoir. It must also be borne in mind, they say, that to reduce the height of the weir, as suggested, must necessarily reduce the scour in the river.

The evidence of the witnesses examined at Lismore and at other places as far down the river as Woodburn was largely in favour of the scheme, but most of them advocated a considerable lowering of the weir level. At Broadwater and at Wardell the evidence was distinctly against the proposal, and some of the witnesses intimated that they would expect compensation in the event of the quantity of water concentrated at Broadwater submerging their lands.

Mr. Kemp, the present Resident Engineer, who also was examined, stated that if the proposed weir were constructed, and especially if it were reduced to a lower level than that intended, the north arm of the river between the weir site and Coraki would be silted up through loss of necessary scour, and it might also happen that with a rush of water down the south arm the water in the north arm would be forced up stream towards the weir, which, by checking the velocity of the current, might increase the deposit of silt at this point. The additional dredging that would be necessary between the weir site and Coraki would, he estimated, cost an annual sum equal to the interest on the expenditure involved in the proposed relief channel.

As to the residents of the district contributing to the cost of the scheme, that question the Sectional Committee found had not been carefully studied. The Lismore Borough Council seemed prepared to perform its part; but at Coraki no determination had been come to by the Municipal Council, and individual witnesses were divided in opinion, the amount, betterment area, and rate of contribution not having been anywhere systematically thought out. As to compensation for any possible injury that might be caused by the diversion of the river waters, that also had not been sufficiently considered.

EFFECT ON OTHER RIVERS OF DIVERTING THE WATER FROM THE ORDINARY CHANNEL.

5. Experience all the world over, the Engineer-in-Chief for Public Works states, has shown that where a short cut is made in connection with a river it causes the stream to shallow lower down, and he brought under the attention of the Committee instances of the kind in relation to the Mississippi in the United States of America, and the Hunter River between West Maitland and Morpeth. In the case of the former, a flood relief channel, called the Atchafalaya Channel, constructed near the junction of the Mississippi with the Red River, has caused the Mississippi to shoal to the extent of 31 feet, and there has been no diminution in the height of flood-levels while the river has been shoaling. The river has come to a condition of equilibrium, is shoaling up, and is not as good a carrying channel as formerly, being deprived of the scour from the flood-water which previously cleared it. In the case of the Hunter, the late Engineer-in-Chief for Harbours and Rivers, Mr. Moriarty, reported after the 1867 flood upon the best means of flood-prevention at Maitland, but he did not recommend short cuts for the river. He thought it was very doubtful what their effect would be, and that it was very probable they would have an injurious effect on Morpeth. A Royal Commission, in 1870, also refrained from recommending such a course. Their recommendation was the protection of West Maitland by embankments to keep back the water. But, since then, a series of

of floods at Maitland have made some short cuts in the river, thereby reducing the distance by water from Maitland to Morpeth to about one-fourth of what it formerly was. Yet the floods at Maitland have been higher than ever—certainly not lower—and considerable portions of the original river channel have silted up and become dry land, while the effect upon Morpeth has been that the flood-water comes down there much more quickly, and is relatively much higher in the neighbourhood of the town.

Accompanied by the Engineer-in-Chief for Public Works the Committee visited and examined the short cuts the Hunter River has taken, and were forcibly impressed with the effect they have had in causing extensive portions of the original channel to silt up, and in one very noticeable instance become dry land which is now cultivated, and in others, practically dry. The statement of the Engineer-in-Chief with respect to the flood effect upon Morpeth was afterwards confirmed by evidence from the Manager of the Newcastle and Hunter River Steam Navigation Company, stationed at that place.

THE CROWN SOLICITOR ON INTERFERENCE WITH NAVIGATION OR INJURY TO PROPERTY.

6. In relation to the possibility of the scheme, if carried out, resulting in claims for compensation for damage done to land or other property on the lower parts of the river, the Committee examined the Crown Solicitor upon the question as to how far the Government would be legally liable if this damage should occur. From his evidence it will be seen that the right to navigate a tidal and navigable stream belongs to everybody, and any person who has private property on the banks of the stream, or behind the frontages, has rights which entitle him to the natural flow of the water. According to a well-known principle it is illegal to divert from a navigable stream such a volume of water as would lessen the quantity that any person lower down the stream is entitled to use; and it is equally wrong to increase the quantity or volume of water that goes down the stream, to the possible injury of any residents in the neighbourhood. Parliament has the right to pass an Act to alter the course of a tidal river, if in the interests of the public it be considered proper to do so, but it cannot alter the stream to such an extent as to interfere with the right of navigation, or without being liable for damage caused to owners of property along the stream.

The Crown Solicitor pointed out that guarantees hitherto given had proved practically worthless, and that adequately to protect the Government by making the landowners responsible for any damage done, or to meet the interest on the cost of the scheme, would require an Act making the undertaking an express charge upon the land itself. That would ensure a binding arrangement upon both the present holders of the land and their successors.

THE SCHEME NOT FREE FROM RISK.

7. It appears to the Committee that the scheme is not free from risk, both in regard to the flooding of properties and to navigation. In their opinion the relief from the effects of floods would not be so great as anticipated, for while in the early part of a flood the proposed channel would carry the water away from the upper part of the river more quickly than now, there would be a danger of additional flooding of the land at and below Broadwater. They cannot, also, from the results that have followed in the similar cases brought under their notice, avoid the conclusion that it is extremely probable the river below the off-take would silt up to an extent that might seriously reduce its depth.

EXPECTED RESULTS FROM THE RIVER IMPROVEMENT WORKS NOW PROCEEDING.

8. In the consideration given to the proposed work it should be borne in mind that, as the official statement of the Under Secretary for Public Works shows, over £400,000 has, up to the present, been spent by the Government upon the Richmond River, the works at the entrance having absorbed £250,000 of that amount. Parliament has authorised the completion of the entrance works, and it is estimated

estimated that a further outlay of about £100,000 will be required to make them successful. When this has been done, it is expected that vessels drawing 17 feet of water will be able to safely enter the river; and it is pointed out that when this takes place it may be taken for granted that the towns on the river banks will at once insist upon the navigation of the river itself being so improved as to permit of the largest vessels that enter the river loading and discharging at the respective town wharfs, instead of having to tranship their cargoes at the river entrance into vessels of lighter draught.

In view of this contingency, which is expected to be realised within the next five years, Parliament is likely to be moved at an early date to sanction a comprehensive scheme for improving the river from the entrance up to Lismore, by cutting the sharp bends, widening the narrow portions, removing rocks and other obstructions, and generally deepening the channel,—works which, while making the river more navigable, will, at the same time, increase its discharging capacity, and thus, if not wholly preventing floods, greatly mitigate their severity.

DECISION ARRIVED AT.

9. The Committee, therefore, do not feel justified in saying that it is expedient the scheme should be carried out; but, as it is strongly approved by the Lismore and Coraki Municipal Councils, by the Members for the electorates included in the area affected, and by a large number of the residents, they are disposed to recommend the work, provided the owners of the land benefited will undertake to enter into a satisfactory guarantee for the payment of 3 per cent. upon the cost of construction, together with the cost of all claims for any damage to land, or from the silting up of the river that the cutting of the channel may cause, and not otherwise.

RESOLUTION PASSED.

10. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings:—

“Mr. Watson moved—‘That, in the opinion of the Committee, it is not expedient the proposed Tuckian Flood Escape Scheme, as referred to the Committee by the Legislative Assembly, be carried out.’

“Mr. McFarlane moved—‘That the motion be amended by the addition of the following words: “But if the owners of the land benefited will undertake to enter into a satisfactory guarantee for the payment of 3 per cent. upon the cost of construction, together with the cost of all claims for any damage to land, or from the silting of the river that the cutting of the channel may cause, the Committee are disposed to recommend the carrying out of this work,—and not otherwise.”’

“On the question ‘that the words proposed to be added be so added’ the Committee divided.

Ayes, 4.

Mr. Dick,
Dr. Garran,
Mr. Hyam,
Mr. McFarlane.

Noes, 3.

Mr. Shepherd,
Mr. Watson,
Mr. Levien.

“The amendment was, therefore, passed.

“The motion as amended was passed on the following division.

Ayes, 5.

Mr. Dick,
Dr. Garran,
Mr. Hyam,
Mr. Watson,
Mr. McFarlane.

Noes, 2.

Mr. Shepherd,
Mr. Levien.”

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 21 August, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

TUCKIAN FLOOD ESCAPE SCHEME.

WEDNESDAY, 21 FEBRUARY, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you brought a statement explaining the proposed Tuckian Flood Escape Scheme? C. W. Darley. I have a statement which has been prepared under the direction of the Under Secretary for Public Works, and which he was to have read to the Committee; but he has been called away to meet the Premier, I think, this morning. 21 Feb., 1900.
2. Will you kindly read the statement? It reads as follows:—

TUCKIAN FLOOD ESCAPE SCHEME, RICHMOND RIVER.

THE proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration on 23rd November, 1899, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing works in connection with the Tuckian Flood Escape Scheme."

The question of the alleviation of the disastrous effects caused by floods in the Richmond River has been the subject of agitation for many years past amongst the residents of the district.

The Richmond River finds its way to the sea by a tortuous course, and, in addition, meets with many obstructions in the form of reefs, sharp bends, and contractions in the channel, all of which tend to choke the ready outflow of flood-waters. As a consequence a vast area of valuable land is periodically devastated by floods as severe, perhaps, as any in the Colony.

Even if there were no floods in the Richmond River, the growing importance of the district, of which it is the main artery of trade, would entitle it to very considerable improvements.

Parliament has already recognised the importance of the Richmond district by sanctioning the outlay of some hundreds of thousands of pounds on improving the navigation of the river. The total expenditure on works of all kinds in connection with the river, from the year 1855 to 30th June, 1899, amounts to £402,050, of which the entrance improvement works have absorbed the sum of £250,000. Parliament has now authorised the completion of these works, and it is estimated that a further outlay of about £100,000 will be required to bring them to a successful issue.

When this has been accomplished, vessels drawing 17 feet of water will, it is expected, be able safely to enter the river, and it may then be taken for granted that the towns lying on its banks will at once insist upon the navigation of the river itself being so improved as to permit of the largest vessels that can enter the harbour coming alongside their own respective town wharfs to load and discharge goods, instead of same having to be transhipped at the entrance into lighter-draught vessels.

In view of this contingency, which will be fully realised in the course of the next five years, Parliament is likely to be petitioned at an early date to sanction a comprehensive scheme for the improvement of the navigation of the river, right from the entrance up to Lismore, by the cutting of the sharp bends, widening the narrow portions, removing rocks and other obstructions, and generally deepening the channel.

Such works, while making the river more navigable, will, at the same time, increase its discharging capacity, and thus, if not wholly preventing floods, greatly mitigate their severity. Any other project for flood-prevention can only be regarded as a temporary and partial expedient.

The project now before the Committee for the mitigation of floods in the Upper Richmond suggested itself to Mr. Keele, the Resident Engineer of the Richmond district, early in the year 1893, when he was studying the question of a flood-relief channel at Tuckombil Creek, and before the improvement works at the entrance of the river had advanced to that stage which now calls for an early consideration of a scheme for the improvement of the river generally.

Mr. Keele's proposal to afford relief by diverting the flood-waters directly into Tuckian Swamp, on being submitted to the municipalities and other interested bodies, appears to have been unreservedly adopted by all as one which would give the much-desired relief to the entire Richmond River District.

They have unceasingly continued to urge the Government to proceed with the scheme, and have expressed, through their Parliamentary representatives, and by accredited deputations, their willingness that the cost of the works should be made a charge on the lands benefited thereby. It is, therefore, only because of the repeated and urgent requests emanating from the residents of the district that Mr. Keele's proposal is submitted for the Committee's consideration. An investigation by the Committee would appear to be the proper course to be adopted for the purpose of definitely ascertaining whether the project is feasible and expedient, and whether the benefits expected therefrom by the residents are likely to be realised. The Committee's inquiry might also embrace the following questions:—

- (1.) To what extent, and in what way, the residents are prepared to contribute to the cost of the works?
- (2.) If the proposed works are approved, what areas should be included in any "betterment" scheme that may be decided upon?
- (3.) To what extent are the residents prepared to indemnify the Government against any possible claims for damage through the flood-waters being temporarily raised to a higher level than heretofore?

C. W. Darley.
21 Feb., 1900.

The following is a description of Mr. Keele's scheme:—The scheme is a very simple one, although it will be rather costly, viz., to cut down the left bank of the river, at a point a little over 4 miles above the junction of the north and south arms at Coraki; and to construct therein a weir, as shown on drawing No. 2. 300 feet in length at the crest, which is 10 feet wide and 12 feet over low water at Woodburn, the inner slope to be 1 in 6 for 24 feet, then level for 21 feet at 8 feet over low water. The outer slope to be 1 in 12 for 83 feet, then level for 32 feet at 5 feet over low water. The average level of the bank at the off-take is 20·8 feet above low water, and the highest floods rise 1·51 feet above this, and spill over into the swamp, in which the highest floods only rise to 14·26 feet over low water, the difference of level being 8·09 feet.

Great care will, therefore, have to be exercised in the construction of the weir, to protect it, and especially the outer toe, from erosion, otherwise a deep hole might be cut by the flood water, which would have a tendency to extend backwards, and so undermine and destroy the weir.

The works shown provide for covering the whole surface and side slopes of the weir with concrete 12 inches thick, on 2 feet of stone ballast, the inner and outer toe to be protected by sheet piling, carried up the slopes and extended 20 feet into the bank on each side. As a further protection to the toe, heavy stones to be deposited outside the sheet piling on the lower side, in a trench to be cut 18 feet by 4 feet, the full length of the toe.

The rest is merely a matter of excavation, and the estimates appended have been prepared to show what would be the cost of the works under several conditions, viz. :—

Scheme No. 1.—Weir, 300 feet long on crest, as shown on plan. Channel, 500 feet wide at bottom; side slopes, $1\frac{1}{2}$ to 1, and bottom level, R.L., 105·00. Total cost, £77,300.

Scheme No. 2.—Channel same as No. 1 scheme, but weir to be 521 feet long on crest. Total cost, £80,700.

Scheme No. 3.—Same as No. 1, with the exception that the bottom level of 500-foot channel is R.L. 110·00, and a drain is cut along the centre, having a bottom width of 20 feet, side slopes $1\frac{1}{2}$ to 1, and bottom level R.L. 105·00. Total cost, £34,500.

Scheme No. 4.—Same as No. 2, with the exception that the channel is the same as in No. 3. Total cost, £37,800.

Scheme No. 5.—Weir 300 feet long on crest at R.L. 112·00 and carried through on similar section to No. 1, but without the widening at east end, as shown on plan. The channel being also cut 300 feet wide at R.L. 112·00, with R.L. of bottom 105·00. Total cost, £46,500.

Scheme No. 6.—Same as No. 5, but channel to be excavated only to R.L. 110·00, and having a central drain as described in Scheme No. 3. Total cost, £23,700.

It will be seen that the amount of excavation in Schemes 1, 2, and 5, will be costly if carried down at once to the depth R.L. 105·00, and that under the arrangement proposed in Schemes 3, 4, and 6, the lower part of the channel is left for the floods to cut away, which no doubt they very soon would, with the lead given by the trench through the centre; and if necessary, further assistance might be given by ploughing the surface of the bed after every flood. The silt carried away by the water would be spread over the swamp.

If there is any reason to fear injury to the weir by the concrete being disturbed through water getting under it and hydrostatic pressure being engendered, stone-pitching similar to that used on the Tuckombil weir can be substituted for the concrete, and the cost of the work thereby reduced; but the pitchers to cover so large an area would take a long time to procure.

There are two roads which cross the channel—one at 4,000 feet, viz., the Lismore to Coraki road, and the Lismore to Woodburn road at 9,200. The former would require a bridge, which is provided for in the estimates, but the latter crossing is so near the end of the channel that heavy ballast in the bed would not be likely to be disturbed and would be sufficient to carry the traffic.

The flood-water conveyed through the channel would be discharged into the swamp, and would there spread and rise over it more quickly than it now does, but not to the same height, as the Broadwater would carry a large portion of it direct to the river. The current might also be trained towards the Broadwater, by running out the spoil from the excavation, to form an embankment some distance through the swamp.

Under present conditions the swamp is filled by the back-water, which makes its way through a large drain above Buckendoon, and also through Dungarubba Creek and through the Broadwater, and subsequently, when the flood rises over the banks to the level stated R.L. 114, when the country between the Bungawalbyn and Tuckombil Creeks and right across the river to the northern margin of Tuckian Swamp becomes one vast sea.

This is caused by the gorging of the river at a number of places through sharp bends and contractions of the cross-sectional area of the channel caused by reefs. The first rise is caused by the sharp turn at the Devil's Elbow at Swan Bay; then there is a very extensive reef at Woodburn, which is almost a complete block to the river at flood-time. A sharp turn and contraction of the channel occurs below Dungarubba Creek, where there is rock on the concave bank. Another serious obstruction exists at Broadwater, where a reef extends half-way across the river, just above the Mill. Below the Broadwater there is another reef with shoal-water, and above Wardell there is a long stretch over the Blackwall Flat, where there is only 8½ feet at low-water on indurated sand.

Each of these obstructions causes the water to head up to pass them, and the consequence is that it stands with very little variation, for some days after it has reached its highest level between Woodburn and Broadwater. Eventually, no doubt, it will become necessary in the interest of navigation, to deepen and otherwise improve the channel of the river, which will also lower the level of flood-water below Woodburn, better than any flood escape that could be constructed.

In the meantime, however, it appears to me that if a large body of water coming down the North Arm is diverted by means of the works proposed, and allowed to pass quickly, in a third of the distance, into the lower river, the congestion above described would be much relieved, and the North and South Arms benefited as well, by lowering the flood-level there.

The question of the discharging capacity of the weir and channel, when working under high flood conditions, and also of the extent to which relief will be effected, together with the question of the probable effect on the lower river, if the works were in operation, I propose to allow to stand over, until the information obtained during the last flood, which occurred three weeks ago, and rose level with the bank at the offtake of the weir, viz., 18 feet over low-water can be collected, and the flood gauges connected by levelling, which will supply more accurate information concerning the slopes of the flood water, as it rises and falls, than we at present possess, the observations having been simultaneous.

The latter portion of that statement, I may explain, is simply a copy of the report of Mr. Keele, the resident engineer.

3. *Mr. Watson.*] Have you got the plans to which Mr. Keele refers in his report? They are only sketches which he refers to in his report. On the receipt of his report, I supplied a covering report to the Minister.

4. *Chairman.*] Before you read your own report, will you show the catchment area which comes into this swamp, and then describe the country to be treated by the proposed scheme? The plan on the easel only shows a small portion of the catchment area of the Richmond River. The plan commences at Lismore. There are two arms above Lismore which join at Lismore, and which drain a very large territory. From Lismore the river is known as the North Arm, down to the town of Coraki.

5. Will you state the distances from point to point? The distance from Lismore to Coraki is 24 miles by river. At Coraki the South Arm joins. The South Arm passes through Casino, which, by river, is 30 miles above the junction. The river then passes on through a tortuous course, and at about 5 miles below Coraki a creek draining a considerable area, and known as Bungawalbyn Creek, joins. The river continues then to Woodburn, where the Tuckombil Creek, which is not a large creek, joins the river, and thence on it goes down to the sea. The distance from Coraki to the sea is 38½ miles.

6. There are two outlets to the sea independent of the outlet at the Richmond River Heads;—are these outlets of any material use in the way of relieving the flood waters? They take a little water out of the river. In a big flood a very large overspill takes place into the sea opposite Broadwater. A small quantity has been allowed to pass out of Tuckombil Creek into Evans River by the canal which has been made, and which is known as the flood-relief channel south of Woodburn.

7. But those are altogether insufficient to afford the necessary relief? They are insufficient to afford any appreciable relief. In the report which I have just read to the Committee, Mr. Keele has explained how the Tuckian Swamp and district are flooded at present. This large territory, which is enclosed, you may say, on the west by the river from Coraki towards the portion known as The Elbow, on the south by the portion lying between The Elbow and Woodburn, and on the east by the river from Woodburn to Broadwater, is nearly all put under water during flood. The flood-waters passing down the North and South Arms, whilst still within the banks, pass on to about opposite Bungawalbyn Creek, where there is a small drain or creek, which allows a large quantity of water to pass into the back country—into the swamp. It passes on down to near The Elbow, where there is another smaller drain, letting water into the back country. From there down a large quantity of water reaches the swamp by passing through Dungarubba Creek, and then the swamp is further filled by water passing in by the Broadwater. These are the four principal sources which cause the swamp to be flooded. Before the river breaks over any portion of the North Arm bank there is about 14 feet of water in the Tuckian Swamp over low-water level.

C. W. Darley.
21 Feb., 1900.

8. Is there any good land in the Tuckian Swamp and the block of country which you have just described to the south of the Tuckian Swamp? Yes; and the frontages to the river. South of the river, between The Elbow and Woodburn, there is some very good country also.

9. Will you explain the portions of the river which hold water without overflowing and the portions which overflow;—is that a general thing or is it intermittent? The portion of the river from Lismore to Coraki holds its own water for good freshes and small floods. It keeps within the banks. For instance, the biggest flood—the 1893 flood—was only 1 ft. 4 in. over the bank at the point selected for the off-take, so that the banks of the river are all high and up to holding pretty good floods, except near Lismore. The town of Lismore itself is on high land, but a good deal of water escapes through little creeks which enter the river south of Lismore, and swamp the back of the town, where there are low lands and also a creek near Gundurimba. Through a creek a little south of Gundurimba a good deal leaves the river there and flows north, flooding a considerable area to the back of the river and south of Lismore. It is not an overspill of the banks, because the banks are the highest portion of the country. It fills in a large area of country east of the river and south of Lismore. That large area is chiefly filled from this creek, which flows south and east of Gundurimba.

10. I understand that the real trouble of overflowing the banks does not occur until you get down the river to the western end of your proposed weir site? The river does not overflow the banks; but the water does pass up some of the creeks which drain the low land at the back of the river. It forms a backwater, when the floods get back. The banks there, as a rule, are high. In very few places do any of the floods cross to any depth over the banks; but they do pass in through some of the channels.

11. Will you now go on with your explanation of the proposed scheme? Some years ago the residents down about The Elbow complained of the damage done to their farms by floods, and asked for a cutting to be made from Tuckombil Creek out to Evans' River. It was low, swampy land, and it was known that in big floods the water did find its way through that way. A certain amount of water in all big floods did naturally escape, and the residents wanted the channel deepened and enlarged.

12. And that was done? It has since been done. It was brought under my notice when I was in the district twenty-eight years ago, and the Committee will find a reference to the subject in my report, which was read before a former Committee and printed as an appendix, in their report on the Richmond River harbour works scheme. I then called attention to the fact that any attempt to cut a channel should be entered upon with the greatest possible care; that if you let out the river at a point above its natural outlet you could not tell what the result was going to be in the river below that point; that it might silt up; and, of course, it might mean that the floods would enlarge it to such an extent that it would become possibly the main outlet, and yet not one which would be sufficiently good for navigation. When the scheme was mooted a few years ago, Mr. Keele took, I think, somewhat the same view as I did, and also saw the danger of letting the waters out of the river at all, of letting them escape from an unnatural channel instead of making them pass through the entrance where we were carrying out large works, and where we required and looked to the floods to make a permanent work. He then suggested to some people the Tuckian Swamp scheme as a possible alternative, thinking that it would keep the water in the river. His proposal was looked into; I, however, came to the conclusion that no serious harm could be done by letting a portion of the water out there. At the same time I held then, and I hold still, that no good will be done by it. I am quite satisfied that it will not lower the flood. It may satisfy the feeling of some of the settlers; but I am quite sure that it will not lower the floods in the neighbourhood to the extent of 1 inch.

13. That is the proposed weir? The work which has been carried out. It was taken up by the Mines Department, and they were rushing it through, and the Minister said it should be referred to a board of engineers in the Works Department. It was referred to a Board composed of Mr. Hickson, Mr. Firth, who was acting for Mr. Deane, some other gentleman, and myself. We thoroughly investigated the proposal, and seeing that Tuckombil Creek was so small, and bound by rocks, that it was not possible that the river would scour to any great extent, we decided that it might be done. At the same time we did not believe that it was going to do any good. We gave way to sentiment, and the work has been carried out at a cost of about £8,500.

14. *Mr. McFarlane.*] Did the residents give any guarantee for the repayment of the money? They did, but like all these guarantees, they appear to be valueless, and have not been collected.

15. *Chairman.*] Has it had a test yet to see whether it is any good? There have been no big floods down since it was done.

16. So that you are not able to say whether it will be a success? No; but I am quite satisfied in my own mind that it will not lower the water at The Elbow by 1 inch. Where Tuckombil Creek joins the river, it has a rocky bottom.

17. Which would have the effect of preventing what was wanted you think in the direction of creating a scour and facilitating the outflow? It is a safeguard to any serious injury by a large escape in that direction. I look upon the rocks as a protection from any serious harm taking place. The Creek is very narrow, so that a very large body of water cannot pass.

18. As a rapid means of exit, these rocks are a disadvantage, but as a protection to prevent erosion and all that, they are an advantage? Yes.

19. Will you now explain by the aid of the plan, the working of the weir which it is proposed to erect, stating

- C. W. Darley. stating first why it is that you have selected that particular site for the weir, and giving the distance from Lismore? This site was selected because it is the first site in that neighbourhood to give the shortest cut across to the Broadwater, and on account of the high hill to the north of the off-take.
- 21 Feb., 1900.
20. Will you state the distance from Lismore to the off-take? The distance from Coraki to Lismore is 24 miles, and the take-off is $4\frac{1}{2}$ miles above Coraki and $19\frac{1}{2}$ miles below Lismore.
21. Will you describe the weir it is proposed to erect at that point? That particular position was selected because you could not go further north on account of the high land, there being a hill immediately to the north of the proposed off-take. It was necessary to keep to the south of that hill, and to take the shortest cut to the Broadwater. The highest land to cut through is at the river end. When you get a short distance back, the country falls rapidly into the Tuckian swamp. Of the six schemes put before the Committee, No. 1 is for a weir 300 feet long, and a channel 500 feet wide below.
22. The channel would be wider than the weir? Yes, because the water passes with some velocity over the weir, and the wide channel gives a clear get-away. It is proposed to cut the channel down to a reduced level of 105 feet.
23. What height will that weir be above low-water? Our datum is low-water at Woodburn, and the crest of the weir is 12 feet above low-water.
24. Does not the tide rise and fall about 3 feet there? The tidal range varies from 2 feet 6 inches to 3 feet, but we adopt one datum—low-water. The present level of the ground at that site is R.L. 121 feet, so that the crest of the weir will be 9 feet lower than the bank at that point.
25. *Mr. Watson.*] Will the bottom of the channel be lower than the crest of the weir, or will it be approximately the same level? The bottom of the channel will be 7 feet lower.
26. I mean at the off-take? It will have a fall of 7 feet.
27. A direct fall? A slope.
28. There is no necessity for a smart fall? It is not wise. It would cause too much damage. I always make the fall as easy as possible.
29. *Chairman.*] In the paper which you read, you briefly describe the formation of the weir under Scheme No. 1; will you now describe the construction of the channel from that weir to the Broadwater;—will there be a fall in the channel? On the eastern side of the weir, towards the Broadwater, there will be a fall of 7 feet. The bed of the channel will be 5 feet over low water, and the top of the weir will be 12 feet above low water.
30. Will the channel be of uniform width right through? Five hundred feet. It is only proposed to extend that cutting until it meets with the Tuckian Swamp.
31. When you ceased your cutting, how would you keep the water in its course until it reaches the Broadwater? It is spread over the whole country, and that acts, as Mr. Keele has explained in the opening report, as a sort of relief. It is stored over that country.
32. Is it distributed over the swamp and kept away from the good land to the south of the swamp? It will fill all the swamp, and then pass off steadily down the river.
33. Will it relieve all that patch of country which you pointed out gets flooded now? In my opinion it will not.
34. But is it intended to do that;—is it thought that it will do that? It will not relieve the lower part. I will come to that afterwards.
35. Is not that the intention of the work? The people moving in the matter are chiefly people up at Lismore, who think it will lower the water in front of their town, and relieve the up portion of the river. It is mentioned in this opening statement that the third question which will engage the consideration of this Committee is in what way will these people indemnify the Government for any damage which is done lower down. I hold that it will drown this country lower down if it does anything at all. It will raise the water down below, and do a lot of damage.
36. When you relieve the river by means of your weir and channel, the channel having a fall, as I understand, of 7 feet from west to east, at what level will it strike the water at the Broadwater;—is that water 7 feet lower than the river water which you are proposing to relieve? No; the Broadwater is in its normal state level with the river. This channel is only proposed to be cut down to the 105 feet level. Therefore, the cutting will only extend to the 105 feet contour.
37. At the weir you are going to cut a channel which will be 500 feet wide? A channel joining the weir at a width of 500 feet, and extending for a distance of about 2 miles.
38. That channel will have a fall of 7 feet? It will not have a fall of 7 feet. It is a level channel, and the bed of the channel will be 7 feet below the crest of the weir.
39. Do I understand that from that point, for a distance of 2 miles down to the Broadwater, it is a dead level, or is the Broadwater 5 feet lower than that point? The low water in the Broadwater is 5 feet lower than the bottom of the channel. When the channel is beginning to work a considerable flood must be passing down the river—12 feet of flood must be passing down the river; therefore, the Broadwater itself will be in flood, so that the chances are that it will be fully 5 feet, if not higher. Possibly before the water passes over this country, the flood in the river will be found backing up that channel. It is quite possible that before the water passes over the weir the back-water may be rising in the channel, and the channel coming up to the weir on the other side.
40. It is very possible in flood time, when the services of the weir and the channel are required, that the waters of the Broadwater may be in a state of flood, which will have the effect of backing up the water, and instead of having a fall of 7 feet from the weir to the Broadwater, you may have only an effective fall of 5 or 6 feet, thereby reducing the escape of flood-water to that extent? Yes.
41. You have told us that you are going to dig out your channel for a length of 2 miles to the east of the weir site;—how far is it from the end of that length of 2 miles to the Broadwater? Three miles.
42. How do you propose to treat that length of 3 miles; on the plan you have a relief channel marked;—is that an imaginary thing? It is an imaginary channel, simply to show the direction of it.
43. Will you explain briefly how No. 2 scheme differs from No. 1 scheme? No. 2 is making the weir 521 feet long instead of 300 feet long; in fact, it is making the weir, if anything, a little wider than the channel.
44. Does that blue tint on the map show approximately the edge of the Tuckian Swamp? I think that is the extent of the permanent swamp.
45. *Dr. Garran.*] Will the boundaries of that swamp be enlarged if this scheme is carried out? It will cover about 13,600 acres.
- 46.

46. *Chairman.*] Does it extend in flood-time;—is that blue tint the actual boundary of the swamp, or is it only the approximate boundary? I think the blue tint denotes the portion which is permanent swamp. Many years ago a landowner there made large drains to try and drain the swamp. C. W. Darley.
21 Feb., 1900.
47. When we pour a lot of water in the Tuckian Swamp by means of this weir and dam, by how much will the swamp be extended? Mr. Keele may be able to give some information on that point. I find, on reference to the detail contour plan, which is not quite clear, that the area which will be flooded is very much larger than that; that the country rises pretty quickly all round. These islands in the swamp would be nearly all covered in by a flood, but otherwise it would not be largely going beyond the limits shown on the plan. The total area which will be covered will be 13,600 acres, of which 8,000 acres have been alienated, leaving a balance of 5,645 acres of reserved Crown land.
48. Will you now go on with your explanation of No. 2 scheme? No. 2 scheme is practically the same as No. 1 scheme, except that it makes the weir 521 feet long.
49. Will you state the object of doing that? It is to give a wider discharge area.
50. Will it make it safer? It would be no safer, but it would take more water out. The work would be properly protected on the sides, and it would let the water out more quickly.
51. Would your channel be made wider? No; the same channel—the same channel exactly, except making a wider weir.
52. That means an extra expenditure of about £3,000 for extending the length of the weir? Yes; that is the only difference.
53. Will you now explain scheme No. 3, which is to cost only £34,500? No. 3 scheme is the same as No. 1 scheme as regards the weir. The weir is 300 feet wide, but the channel below is only taken down to the 110 feet contour, and only 2 feet below the top of the weir.
54. Then you narrow the bottom of the channel apparently? There will be a drain cut along the centre in the direction in which the channel goes. The bottom width will be 20 feet, and down to the former level of 105 feet level, that is 5 feet over low water.
55. What width was the other channel? No. 1 was 500 feet wide, and in No. 3 it is made 20 feet wide, with the idea that the flood-waters will do the scouring.
56. For a certain distance from your junction with the weir you would have to make some solid work? It will be masonry for a certain distance, and then narrowed into a 20-foot gutter.
57. How long will that channel be? The same length as the other—2 miles—because it is the same level.
58. Will it be of the same construction as the other;—are you merely going to dig out the channel? It is simply to be a dug-out gutter along the centre, 20 feet wide.
59. The 500-foot channel will, I suppose, be a dug-out channel? Yes.
60. There will be no paving? There will be nothing beyond the weir. Near the weir it will be all protected; but beyond that it will simply be dug out of the earth.
61. What is the character of the soil through which the channels are proposed to be dug? Alluvial and clay. Near the river it is alluvial deposit—hardish black alluvial, but as you get towards the swamp it will be tougher clay.
62. *Mr. Watson.*] But it is not so tough as to prevent a scour? It will scour away.
63. *Chairman.*] Scheme No. 4 is very little different apparently? It has a weir 521 feet wide, with a channel as in scheme No. 3; 20 feet wide.
64. And the extra cost of scheme No. 4 over scheme No. 3 is the same as that of No. 2 over No. 1, by reason of the extra cost of the weir? It is practically the same.
65. Scheme No. 5 is a little more elaborate? The weir is 300 feet long, and the crest R.L. 112 feet again, being the same height as the other, but without making any widening at the east end.
66. That means that your weir and your channel will be of the same width? In No. 1 we propose to make the weir 300 feet wide, but it is immediately widened out to 500 feet. In No. 5 it is proposed to do away with the widening out, simply to go on 300 feet wide.
67. Would it not be narrower at the bottom? The channel will be also cut 300 feet wide, instead of 500 feet, and at a reduced level of 112 feet.
68. At a reduced level, which would be how many feet below your weir? No. 5 has a 300-foot weir, and a 300-foot channel.
69. What will be the depth of your channel in scheme No. 5 at its junction with the weir? Seven feet below the top of the weir. That is to cost £46,500.
70. Will you now describe No. 6 scheme? No. 6 scheme is the same as No. 5; that is, to have a 300-foot weir again, but the excavation is only taken down to 110 feet, or 2 feet below the top of the weir, and the central channel is only 20 feet wide at the 105 feet level, or 7 feet below the crest of the weir.
71. Will you now read your covering report to the Minister on Mr. Keele's report? My report reads as follows:—

TUCKIAN FLOOD RELIEF SCHEME.

The proposal to make a cutting across the Tuckian swamps was originally asked for with the twofold object of granting a ready escape for flood-waters from the North Arm of the Richmond River, and also as a means of draining the swamps and making them more available for grazing purposes in dry weather. Mr. Keele's report clearly sets the latter question at rest by showing that drainage works have been already attempted on a fairly large scale and ended in a disappointing failure, as the surface of the land was actually lowered by the operation, and is now in a worse state than before anything was done.

I think the whole of the opening portion of his report was not put in the statement I read—it was condensed. Many years ago—how many I am not quite sure—Mr. C. Henderson had a lease of a large area of land there, and he set to work to drain the swamp. He cut drains at an expenditure of several thousand pounds, but instead of draining the swamp he lowered the whole surface of the swamp and really let it down below high-water mark—making it worse than it was originally. He let the tide in on him, and he had to abandon the country. I tried to get the history of the work, but Mr. Ewing told me that it was done before his time, that he could not give any information about it. I have asked one or two persons; but the people about there know very little of it now, though the drains are there to be seen. I think Mr. Henderson spent about £5,000.

Mr. Keele gives six estimates for opening a cutting from the river into the swamp to provide flood relief varying from £80,700 to £23,700 according to the size of the channel and depth of excavation.

The proposal is briefly to tap the North Arm of the Richmond River at a point about 4 miles above Coraki, where the North and South Arms join, and make a cutting with a weir to regulate the depth and let the flood-waters pass into and
over

C. W. Darley. over the swamps, where a portion would be temporarily stored, while all would eventually pass back into the river through the Broadwater, about 5 miles above Wardell. The immediate effect of this relief to the river would be to flood about 8,000 acres of alienated land to a considerable depth, a portion of which is not now liable to be flooded. A further result of the short cut would be to raise the level of floods considerably at and below the Broadwater. It is not easy to say by what height the floods would be increased, but that the flood-level would be raised is unquestionable, and, seeing that there is a good deal of settlement along that part of the river, including the Colonial Sugar Co.'s large mills, as well as the town of Wardell, I am afraid if the cutting be made it may lead to heavy claims for compensation. The owners of the land liable to be flooded by raising the water over the islands in the swamp will also be likely to advance claims for compensation.

21 Feb., 1900.

The cheapest of the effective schemes proposed by Mr. Keele is No. 5, estimated to cost £46,500; but seeing the risk there would be of having to meet heavy claims for compensation if the proposed work were carried out, I cannot recommend that the work be entered upon unless an undertaking from all concerned to free the Government from responsibility could be obtained. This I consider most unlikely.

In my opinion it would be much wiser to spend a large sum in improving the river channel by cutting off some sharp bends, widening narrow portions, and removing rocky obstructions from the channel. By doing so the flood-discharging capacity of the river would be much improved, and at the same time the river would be made more navigable.

It should be borne in mind that the work of improving the entrance to the river has now reached a stage that before very long larger vessels will be able to safely cross in over the bar, in which case it will be necessary to improve and deepen the river all the way to Lismore.

All the money spent on the improvement of the navigation will at the same time increase the capacity of the river and give relief at Lismore by lowering the flood-levels.

I therefore recommend the river improvement works for early consideration in preference to the Tuckian canal scheme.

72. When did you put in that report? On the 6th October, 1898.

73. Was any more recent report called for from you before this proposal was referred by Parliament to the Committee? No. I may mention that pressure was brought to bear upon Mr. Secretary Young to carry out the work, and he consulted me, and I simply gave my opinion in accordance with my report. Then subsequently pressure was brought to bear on Mr. Secretary Lee to bring the scheme before the Committee, and he again submitted the matter to me, and I gave him my views on it.

74. Have you the full text of Mr. Keele's report? Yes. It contains nothing else of special importance, except that he gives the history of the scheme.

75. In your report to the Minister you have quoted pretty well all the material portions of his report? Yes; and in my report I have touched on the drainage aspect of the case which I found was not touched on before.

76. *Mr. Watson.*] Did Mr. Keele go into any detail in regard to the possible effect of the scheme on the people below, and how much water would be subtracted in flood time? No; the material part of Mr. Keele's description of the scheme is contained in my report, which I have read.

77. What is the width of the river at the off-take where you propose to put the weir? At low-water level it is 310 feet wide.

78. So that the weir would be similar in width to the river? Of course, the river would be wider.

79. What width is it at the weir level, which I think is 112 feet? About 370 feet.

80. *Chairman.*] Have the operations on the Richmond River been a success as regards improving the entrance, and also as a means of relieving flood waters? Very little work has been done up the river. The work has so far been chiefly confined to the entrance. There the works are, so far, successful, and they promise to be a complete success. The work is still in progress, and we have not yet reaped the full benefit; we have got a safe entrance, which steamers are negotiating freely. Within a year I hope that we shall have a good deep entrance into the river up to Ballina. There is very good water on the bar, but inside we are cutting through a reef of indurated sand.

81. Have the improvement works on the river reached such a stage that you are able to say whether they have been an assistance in relieving the flood waters in addition to improving the entrance? I have no hesitation in saying that a flood will be better discharged through the entrance now than it would have been before. We have had no flood in the river since the work was begun.

82. *Dr. Garran.*] Has the river helped you much in scouring at the entrance? I cannot say that we have had much help from the scour. We have had no fresh in the river since we have been carrying on the work.

83. You have done no dredging on the bar? No, not on the bar; we did some dredging on the sand-crossing. We have practically diverted the channel at the entrance. The scheme has been somewhat departed from. Sir John Coode's scheme was put before the Committee, and that drew the channel away from opposite Ballina, round to the south wall, and along the south wall towards the north breakwater, and then a sharp turn seawards. We found that, allowing the channel to draw towards the south wall put the current at right angles across the entrance to the north breakwater, and that we never could get a good result while that lasted. I recommended to the Minister, and he approved of our directing a middle training-wall down the harbour, and dredging a channel north of that so as to straighten the channel to the bar. We have got on so far that the navigation is now using the new channel. It is only at the transition stage. We are only about to shut up the old tortuous channel. When we carry out a little more dredging, and deepen the channel a little more, we shall have, I suppose, a very good and straight run in and out of the Richmond River.

84. Are you trusting to the scour to dredge the bar? Yes; the outer bar is kept clear by the scour. Practically, we have no bar; there is deep water. Such a thing as a bad bar on the Richmond is unheard of now. It is the inner crossing which is bad, and we have dredged all that.

85. The outer bar was due to the sand? Yes; it has been washed away.

FRIDAY, 8 JUNE, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, LL.D.
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Thomas Thomson Ewing, Esq., M.P., sworn, and examined:—

86. *Chairman.*] You were for many years resident on the Richmond River, and are thoroughly acquainted with the district? Yes; I was virtually in charge, under the district surveyor, of all the surveying there for many years.

87. You have seen the Richmond River in flood-time? Yes; under all conditions.

88. How long back does your experience of floods extend? More than twenty years.

89. Do you remember the flood of 1879? Yes.

90. During the period you have named you have observed floods upon the Richmond River and their effect upon the district generally? Yes.

91. Having this general knowledge, you are prepared, I believe, to make a statement to the Committee with reference to the proposed channel? Yes. I have prepared the following statement:—

TUCKIAN CANAL.

I AM aware of the arguments for and against this proposal, and will endeavour to state my views with a fair recognition of both. My opinions were formed from a fair knowledge of the floods which visit the Richmond River district, and which, it is claimed, will be alleviated by the proposed scheme.

The question resolves itself into:—(1) The necessity for the work; (2) will the proposed scheme be effective? (3) will it create any new source of loss or damage?

No. 1. The necessity for the work.—The height of the floods places that beyond doubt, since the Richmond River rises at Lismore as much as 30 feet; Coraki, 20 feet; Bungawalbyn, 20 feet; and Irvington, 50 feet; the magnitude of the floods need not be further emphasised.

There are adjacent to the river and its tributaries more than 200 miles of alluvial flats and vast areas of back country liable to submergence. A great portion of this is devoted to agricultural pursuits, and almost the whole area productively occupied in one way or another. The damage done over such an extent of country by floods is very considerable. It may, perhaps, not be an incorrect way to convey it to the minds of those not fully seized with local conditions, to state that probably the loss experienced by half a dozen farmers in one flood would pay the yearly amount of the interest on the expenditure, which is stated for an effective scheme to be approximately £50,000.

In estimating loss in this way I have not taken into consideration the submergence of several towns of which the Committee have knowledge. The injury to property and effects, by the flooding of the towns, and the periodical disaster to the whole of the district within the submerged area are too well known to require further comment.

No. 2.—Will the scheme be effective? Water leaving the North Arm by the canal would reach Broadwater in 9 miles. The distance from the offtake to Broadwater by the river is 27 miles, therefore, water going by the canal instead of by the river would save 18 miles on its journey to the ocean. It is difficult to state exactly what rate the river current runs in flood—different reaches run, from conditions which will at once suggest themselves, at a different rate; but 5 miles might be regarded as a high uniform rate, therefore, the water passing through the canal would be three to four hours ahead of river borne water, and probably be out to sea at Ballina before water which passed down the river reached Broadwater. This fact requires to be taken into consideration when it is urged that there will be a great piling up of water at Broadwater.

The map shows the width to be approximately three times as wide below Broadwater as at the offtake, which at once demonstrates the capacity of the lower river to carry, if the channel be unobstructed, not only the water from all sources, but both streams of water, even if they arrive simultaneously.

If it be possible by the improvement of the upper river, as is contended, to enable it to carry its flood-waters, the improvements required on the lower river, where the width is nearly three times as great, would be trifling to enable it to carry the body of water which would require to be discharged by it. In point of fact a flood on the lower reaches of the river depends more upon conditions outside of the river than the amount of flood-water coming down.

If a flood takes place during an easterly gale, and at spring-tide the flood-water is unable to get away, there is a tendency for even the lower reaches to become surcharged. An easterly gale with spring-tides affects the height of the lower reaches of the river near Ballina more than a big flood in the upper river without these conditions.

In a flood, such as would be denoted by the heights I have previously mentioned, under present conditions, the water covers the whole country, fills up Tuckian Swamp, and makes the valley of the river one vast lake. This is formed by water, much of which were the canal in existence would be away hours before.

The water is now piled up at Broadwater in a way which could not be augmented by the Tuckian Canal; but would be obviated to a very great extent by it.

This scheme is assailed in two ways:—(1) That the proposed canal will take so little water out of the upper reaches, where the stream is narrow, and the level is, therefore, more readily affected, as to be inappreciable; but (2) will take such a body of water that it will pile up the wide reaches of the lower river. Further, that the amount taken from the North Arm will be so small that it will not reduce the height of the floods locally; but so great will be the amount of water taken that the current will actually run up stream.

I believe it to be a fact that in the 1893 flood, in which there was a daily average for eighteen days of about an inch of rain, the flood was higher at Swan Bay than it was in 1899, when 18 inches fell in four days. The Tuckombil Canal, not in existence in 1893, ran in 1899 between 5 and 6 feet above the sills and quite 9 knots an hour, with a width of at least 300 feet. The residents claim that had the conditions been unaltered the 1899 flood must have been the greater one. Tuckombil Canal doubtless saved them to the extent of the water which passed through it, although other conditions contributing may, perhaps, have been overlooked.

It appears to me that the reasoning is correct. The effectiveness of the proposed Tuckian scheme depends primarily upon one salient point, viz., that a great body of the water would reach the sea at a saving in distance of 18 miles and a saving in time of, say, three to four hours. It is difficult to see what reply can be made to this by those who oppose the scheme.

It is not possible to make a statement with regard to the velocity of the water passing through the Tuckian Canal, but after a full consideration of the conditions I believe that the time mentioned by which it would outpace water going round by the river is understated, for the velocity of the water going the shorter distance must be greater than that travelling the longer distance, the heads being the same. If that be so, the scheme would be still more effective.

No. 3.—New sources of loss or injury may be divided into—(a) Silting of the river; (b) Destruction of the river banks; (c) Breaking out to the sea at Broadwater; (d) Submergence of land in the vicinity of Tuckian; (e) Alteration of course of river current.

(a) Silting of the river. The result of this work must be to divert the top of the floods by a new channel into a wider reach of the river, by giving a greater fall for the water, it will also lessen the floods in the upper reaches and remove them more rapidly therefrom; the tendency, therefore, will be to keep the river within its banks. This, instead of causing the river to silt up, will have exactly the reverse effect. Large floods at their height bring down,

T. T. Ewing,
 Esq., M.P.

8 June, 1900.

T. T. Ewing,
Esq., M.P.

8 June, 1900.

- down, especially in a sandstone country, from the adjoining lands and by tearing the banks, large quantities of debris into the bed of the river. A big flood appears at times to almost permanently destroy the waterway in some of the tributaries, but as the flood falls the wearing-away process sets in, and from the steady application of the running force of the river to the recently created shoals by the time the tributaries get back to their normal condition the shoals have frequently disappeared. It follows from this that if the river could be kept within its banks there would be an absence of the more violent erosion, and there would be in existence all through the flood that force which, under present conditions at the end of the flood, again brings the waterway to its usual state. These remarks apply specially to a sandstone country, where the detritus is more easily moved, than to the basaltic country, such as that of the country through which the North Arm and its tributaries run.
- (b) Destruction of the river bank.—Remarks made in (a) to some extent cover this ground. It is obvious that a great flood tearing over the banks, loosening the roots of trees, and finding many obstacles, will shatter the banks to a far greater extent than the flood that finds its way through the usual drainage centre.
- (c) Breaking out to sea at Broadwater.—It has already been explained that the water *via* the Tuckian Canal, passing for a lesser distance and at a great velocity, will be in advance at Broadwater of water passing the Tuckian off-take at the same time, and proceeding by the river to Broadwater; but passing this point, a large flood, of which I have given the heights, will, under present conditions, cover the whole valley of the Richmond, and be over the banks near the off-take; therefore, the worst possible state of things with regard to piling up exists. The water being denied the speedier outlet lies at the top of the flood in a vast lake right along the route of the Tuckian Canal, but increased in volume because of the absence of the discharge by the canal in the early parts of the flood, therefore, there will be more water piled behind it than there would be had a proportion of the water previously passed down to the ocean. If the Tuckian were constructed the danger of breaking out of the river would be lessened. The river has broken out below Broadwater to the sea frequently. No serious injury has ever resulted therefrom. Immediately after the cessation of the flood the silting-up process begins, and the wash-out closes. No sandy estuary on any part of the coast can be kept open under similar conditions. I do not desire to suggest to the Committee that the safety-valve at Broadwater, as the break-out certainly is, might be more fully utilised, but am satisfied that this could be done with great advantage, and could be placed under proper control without any danger. Still the discharging area of the river below Broadwater is so great that if two obstructions be removed floods will be permanently lowered in that vicinity. The obstructions referred to are what are known as "The Rocks," almost opposite the mouth of the Broadwater, which lessen the discharging capacity of the river by quite one-half. Their removal will increase the area of the river by a much greater extent than the discharging area of Tuckian Canal under the most favourable circumstances, and the water coming by Tuckian Canal is not new water, but the up-river water coming by a different route. The removal of "The Rocks" and of the indurated sand above Wardell will so increase the volume of the river discharge that probably the floods will never again be over the banks near Broadwater after the completion of the works, which are at once to be taken in hand for navigation purposes. The large superficial area of the river in the lower reaches renders it possible by improvements in its bed to enable it to discharge the flood-water; but where the width is but one-third in extent in the upper reaches such a result cannot be looked for. A sufficiently large cubic capacity cannot be obtained in the upper reaches without work at a prohibitive cost.
- (d) Submergence of land in the vicinity of Tuckian.—There will continue in the lower depression of Tuckian to be submergence in flood-time; but it will be for shorter periods, and the canal will have a tendency to drain some of the adjoining lands. I have not a statement with regard to the exact area of the flooded land; but it cannot be seriously prejudiced, and even if it were, the area is comparatively so small that it cannot stand in the way of a scheme for the benefit of a great district.
- (e) Alteration of course of current.—It has been urged that the presence of the Tuckian Canal might cause the river to run up from below Coraki, and thus silt up. If the current did run up stream there is no reason to apprehend any silting process therefrom; but it is difficult, however, to understand how such a contention can ever have been urged, for before the water could run up the river it would be necessary for the Tuckian Canal to intercept the water of the North Arm, and take also large bodies of water from the South Arm and the main river below. It will be understood that I am not dealing with minor stray currents. Since the North Arm alone is as wide at the off-take as the Tuckian, and at least 20 feet deeper, it is clear that the Tuckian Canal cannot take the North Arm water alone. The contention may at once be dismissed. No comment is required upon it.

General.—I would suggest that the Committee lower the off-take, or at least arrange that the work should be so constructed that it can be lowered without serious difficulty. I would rather take the scheme as it is than jeopardise it by an alteration in design; but am so convinced that the fancied dangers will disappear before practical experience, that it will be a great cause of regret if the works be kept permanently up to their present height. I would suggest, therefore, if the Committee feels it unwise to accept the responsibility of making the off-take several feet lower, it should insist that the work for the first 6 feet at least should be of a temporary character, which can be removed when experience justifies a disregard of the prophesied dangers.

With regard to the aspect of the case—Who should pay for it? This is a matter which can be decided only in accordance with the general policy of the country. If the cost of all works of this nature—that is, flood relief—are to be partially borne by the people primarily benefited, the Richmond River residents can offer no objection; but if, on the other rivers, such as the Clarence and Hunter, flood-relief works have been carried out by the State in accordance with the general policy of the country, I see no reason why the Richmond River should be made an exception. There has been a suggestion that half the yearly interest should be paid by the residents. I am satisfied that it would be better for the district to pay half this yearly interest than to endanger the scheme. Estimating the cost at £50,000, the yearly interest paid by the whole district would be some £750. This amount levied over the vast area of valuable land to be benefited would be so small that it would be barely worth considering. If properly adjusted it would mean at the utmost a very small amount to each individual contributing. On the other hand, if it be determined to carry out the scheme at the sole expense of the State, the increase in the value of land subject to taxation, and under flood-level, will be so great that under the present laws of the country the State will be benefited pecuniarily to a greater amount than the yearly interest on the work.

The Colony will participate in the improvement in the value of land and the increased productions of a great district.

Departmental statement with regard to area of Tuckian Swamp.—The area of Tuckian Swamp amounts to 10,890 acres, exclusive of islands, which have an area of 975 acres. The area under high tide-level (10½ contour) is 4,540 acres, and the area between the high-tide contour and the one 4 feet above it, which would probably subside to high-tide level if drained, is 4,900 acres, making a total of 9,440 acres, which would leave an area of 1,450 acres round the margin of the swamp, which might be improved by drainage works.

92. *Chairman.*] I desire to refer you to the evidence of Mr. Kemp to the Sectional Committee upon the proposed work;—Mr. Kemp, at Question 1599, says:—

1599. What effect do you think that would have—first, upon the navigation of the river; and, secondly, upon the scour necessary to complete the works which you have in progress down at the entrance? As far as the river between the proposed weir and Coraki is concerned, I think it would have a very bad effect on the channel; because the weir would take off a large quantity of water from the North Arm which otherwise would come down the channel to Coraki, and on some occasions the water from the South Arm would be running in an opposite direction, towards the weir, backing up through the North Arm to the weir, with the result that the flow of water in that part of the channel would be very slow; in fact, at times it would be simply dead water. Therefore, the whole of the silt which came down into that part of the river would remain there.

? I have already made a brief reference to that point in my statement. Mr. Kemp contemplates the river apparently in flood. Since the Tuckian Canal would be the same width as the North Arm and 20 feet less in depth than that arm, it is obvious that it cannot carry the water which comes down the arm. In flood-time there will be pretty well 30 feet of water running in the river, and only 8 feet running in the canal at a fair bank flood. In other words, there would be 22 feet more water running in the river than in the canal, the width of the canal and of the river being the same. 93.

93. Mr. Kemp predicts that there will happen on the Richmond River what has actually happened on the Hunter at the Horseshoe Bend? The local circumstances are entirely different. I might also mention to the Committee, with regard to Mr. Kemp's contention, that if the South Arm were in heavy flood, and the North Arm were running low, the water would break over the South Arm and come down into the North Arm above the off-take. Take this aspect of the case: Suppose there were a heavy flood in the South Arm at the present time without the off-take, and no flood in the North Arm, the water would run up the North Arm, and silt it up to a greater extent than it would if the Tuckian canal were in existence, because the water from the North Arm would be intercepted at a shorter distance. A great deal appears to me to depend upon the quantity of silt. I am not sure that the river carries enough silt suspended in the water to create a serious deposit. In point of fact, the water lies in a great body over the site of the proposed canal in flood-year after flood-year, and no great deposit has been found.

T. T. Ewing,
Esq., M.P.
8 June, 1900.

94. *Mr. Dick.*] Assuming the two arms to be practically at the same level, and that both began to rise at the same rate, the canal being the same width as the North Arm, and presuming that the river rose 2 feet higher than the weir, would the channel take off half the water coming down the North Arm, the other half of the 2 feet going down the river? I should think the channel would take off an amount equal to the 2 feet, but would not reduce the level to that extent.

95. Admitting that, and going back to the first assumption—that the two arms were at the same level—the northern arm from the off-take would be at a lower level than the southern arm? I will subsequently fully explain the position.

96. Would there not in that case be a danger of the water from Coraki going up towards the weir? Although you would be taking off a foot of water by means of the canal, you would not be lowering the level 1 foot. Although you would have the double discharge—one by the river channel and one by the Tuckian canal—you would not be reducing the respective levels of the two arms, as might at first sight appear.

97. *Dr. Garran.*] You think, perhaps, that as a result of the work the water from Lismore would come down faster? Yes. I quite see that there might be a tendency to deaden the water between the off-take and Coraki. That is quite possible, and it would be a reasonable contention. The water might be running down to the weir at the rate of 5 miles an hour, and it is possible that it might not run after the delivery of more than $3\frac{1}{2}$ miles an hour. The body of water coming down, however, would be so great that it must continue to go down. The velocity might be lessened, but the water would never come back. Before the water could come up the river from Coraki to the off-take it would require to have ceased to go down the river below the off-take. It is taken for granted, too, that if the river did lie dead for a few hours, there would be a large amount of silt deposited. There is no evidence whatever that that would be the case; in fact, the whole of the evidence points the other way. In the Tuckian Swamp, in the low elevations, you have the same class of water as would lie between Coraki and the off-take, and there is no silt. I do not think many persons are of opinion that the river carries enough silt to make a deposit of any magnitude near Coraki, even if there were a delay there of some hours. There would be no deposit, I think, which would not subsequently disappear in the ordinary running of the river.

98. At the pace at which the flood-waters come down they could not deposit much silt? No.

99. It is only when the water begins to rest that it can deposit silt to any extent? Deposits might be made when the river is in high flood, and when the banks break away. The banks tumble into the bed of the river under those circumstances, and they might lie there for some time, but as the flood falls the shoals gradually erode and the channel is found to be pretty well what it was before the flood.

100. *Chairman.*] Is it not a fact that after a flood there is a considerable silting up upon the Richmond River beyond the actual bed? I do not know that a fresh in the Richmond does much harm. A flood, of course, always has a tendency to tear the banks and throw them into the river, but I do not think an ordinary flood would do much harm.

101. Do the banks of the Richmond River indicate much erosion? Yes; they are broken in a great many places.

102. I understand you, in your statement, to advocate the cutting of an exit to the ocean below the Broadwater? Yes; at the point where the flood broke through in 1890.

103. *Dr. Garran.*] Would you not regard that safety-valve as a necessary part of the scheme? If I were sufficiently powerful to insist upon it being part of the scheme I would do so. I do not think the Works Department would urge that it could not control the river at that point, and if it can control the river there, why not let the water go out.

104. *Chairman.*] To mention a case somewhat in point;—you know that the Macleay River has broken out into the ocean, and has created a new mouth, which the Government are improving at the present time; between this new opening and the old entrance to the river, there has been a silting up, rendering the river quite unnavigable;—do you not think the same effect might follow the letting out of the water at the point you mention? In point of fact, what was done at the Macleay was this: The Department found that the river had broken through on one occasion, and it seized upon the opening, and kept it open; but, notwithstanding the fact that the river was coming out there at the time, if the Department had not carried out works, the opening would have been silted up to-day.

105. But has not the result been to caused the river between the new entrance and the old entrance to become silted up and unnavigable? I am quite prepared to believe that that would be so. If you absolutely brought the Richmond out at the point I have named, the river below the Broadwater no doubt would silt up; but my suggestion is that you should only allow the top flood-waters to go out.

106. *Dr. Garran.*] You would not dream of allowing a new mouth to be made there? No. The only thing to be urged against it would be that the river might take charge and force itself out; but if that does not take place at the present time, surely it would not be likely to take place under the new conditions. I have felt for years past that the flood-waters should be allowed to come down the Broadwater, and out through the ocean somewhere near the point I have indicated.

107. *Chairman.*] I am asking you these questions, because the tendency of the head of the Department is entirely, as you perhaps understand, against such a proposition. He contends that if you weaken your river by making outlets here and there, your scour must necessarily diminish;—you do not agree with him in that point of view? Not in this case. The Engineer-in-Chief is probably apprehensive as to the scour at the Heads, but if you were to do nothing at all at the point I suggest, and were simply to allow the flood water to break out itself in the case of a big flood, you would still have lost the benefit of that water so far as the scour is concerned.

T. T. Ewing,
Esq., M.P.

8 June, 1900.

108. I understand the contention of the Engineer-in-Chief to be—in the case of such improvements as you have at the Richmond Heads—that it is necessary to produce a forcible scour to keep the entrance always navigable;—if you make the outlet you suggest is there not a danger of reducing such a scour and imperiling the efficiency of the works at your port entrance? I might point out that the Department have already allowed an outlet by means of the Evans' River.

109. That is a natural river? But a cutting has been made at Tuckombil. In any case a high flood will break out, and you will lose a certain quantity of water. This raises another point upon which I think no one is quite clear—that is to say, what is the power which really keeps open a river mouth such as that of the Richmond? Some persons are of opinion that the rise and fall of the tide is really the scouring influence. I am not sure that a flood—especially a high flood—would have any very great effect upon it. My opinion is that it is the daily scouring influence which is the prime agency.

110. Your main argument in favour of the proposed channel is that it will get the water quickly away to the sea. We have examined various witnesses as to the current in the Broadwater. Let me refer you to the evidence, for instance, of Mr. Byrne. He says;

902. Will you describe the working of the Broadwater in flood-time? At the commencement of a flood the current runs up the Broadwater. I have taken boats up there, and have hardly had to pull. In the flood of 1870 there was a great current up there, and the Tuckian water broke out. That would be within 2 feet of the flood's highest level.

903. Where did it break out? In the Broadwater. I could see the colour of the water. I was pulling in a boat in the river.

904. Was that during the time a heavy gale was raging on the coast? A heavy gale was raging all the time for four days, and it rained, and it rained a very long time in the 1870 flood; but the gale was not heavy all the time—not as heavy as it was first of all.

905. Was that current up the Broadwater caused by the river being driven back at high tide? It was the force of the main river water that caused the flood at Broadwater.

If this channel were cut, and the water you are proposing to send across from above Coraki were to meet with an up-stream upon the Broadwater, that would create rather an awkward position of affairs, would it not? I think the reason of the water going up the Broadwater is to be found in the reef just below. The river is wider above the reef, and the channel in flood-time becomes gorged. The water, of course, turns the only way it can go—up the Broadwater. The Department have it in contemplation to remove the reef, and if it were removed the conditions would be entirely altered.

111. If the water did go up the Broadwater, would the channel be effective? If the water were brought down *via* the Tuckian Swamp the Broadwater would be as high as the main river, which would not, therefore, go in that direction.

112. *Dr. Garran.*] Why not;—one channel would be as easy to go up as the other? The tendency of the river is from the Broadwater to the sea. The levels are so close that I think if you were to take the level at high tide at the Broadwater, and down off Ballina out in the sea, you would not find very much difference. The river is practically an estuary, and any little swelling or flood makes the head the other way.

113. *Mr. McFarlane.*] An easterly gale would be sufficient to cause that? Yes; it would unquestionably surcharge the lower river.

114. *Chairman.*] The position appears to me to be this: A river is very much like any other receptacle for water; it will only hold a certain quantity; you must take the Richmond River as a whole; suppose, in case of flood, you take a certain quantity of water from the river above Coraki, and take it through a canal into the Broadwater, for a certain time the water so taken will reach the sea more rapidly than if it followed the ordinary course of the river; but there will be flood waters from the South Arm and from other sources flowing into the river below the off-take; these waters will accumulate, and if the flood were to continue for, say, twenty-four hours, these accumulated waters will overtake the water coming through the canal into the Broadwater, in which case the river must overflow; it does not appear to me that when the river has been running in flood for a certain length of time the cutting of the channel can have any very beneficial effect;—in other words, it cannot make the river hold more water than it holds at the present time? No doubt there would be a more rapid exit for the water in the early portion of the flood, and when the waters have accumulated in the way you suggest, that which happens at the present time would happen—that is to say, there would be a break-out to the sea. The Department, however, for reasons of navigation, intend to take away the Blackwall Flat, and also the reef at Broadwater, which are the two main obstructions. When these two obstructions are removed the discharging power of the river will be greatly increased. That being done, even if the Tuckian waters were new waters, the river could not possibly be in as bad a condition as it is in now. If, however, there is any doubt as to the piling up of water at the Broadwater, there is a simple way out of the difficulty by a safety valve such as I have suggested. Such a state of things as you have indicated might occur in the case of a prolonged flood. I believe that even with the Tuckian Canal in existence and with the recurrence of floods—two or three, one on top of the other—there might be such an accumulation of water as to cause a break-away; but that state of things exists without the Tuckian Canal, and it could not be worse with the canal in existence. If the Committee fear the backing of water up the Broadwater then there can be no doubt that the right thing to do is to make the safety valve I suggest. I do not think any engineer would tell you that he could not protect the river bank at that point.

115. *Mr. Dick.*] Do you think the Tuckian Canal will add to the effective outlet of the river;—is it not merely taking water from one part and putting it into another? It takes water from a narrow reach and puts it into a wide reach. The North Arm is narrow, and the lower part of the river is wide. The water conveyed to the Broadwater through the Tuckian Canal may swell the river at the Broadwater, but it will have passed away from the river and is not flood-water so far as the main body of the river is concerned.

116. That is during four hours? While it is passing away.

117. *Dr. Garran.*] The effect will be to diminish the risk of flood for the whole of the river down to the Broadwater? Yes.

118. The whole of that portion of the river will be benefited by the canal? Yes.

119. *Chairman.*] You stated that the height of the river bank at the weir site was 21 feet above low water, and that the height of the proposed crest of the weir would be 12 feet above low water, so that the river bank would be cut down about 9 feet; a great many witnesses contend that the weir would be utterly useless if it were 12 feet, and were of opinion that it should be made only 6 or 8 feet above low water;—do you think that would be desirable, and if it were done what effect would it, in your opinion, have upon the

the river? I think the first 6 feet, instead of being made a permanent work, should be made a temporary work. When engineers are in doubt as to a work of this character, a portion of it is made of a temporary character. One portion after another is removed as experience may show can be safely done. I would deal with this weir in that way. I would not make the permanent work as high as 12 feet. I would make 6 feet of temporary work.

120. Could such a plan be carried out with a large opening of that character? Yes.

121. You think it would be better in the first instance to have the weir the full height? There appears to be a certain amount of objection to the scheme, and therefore one must look about for a compromise. I think this might be effected by making the first part of the work temporary, so that a reduced level may be obtained if it is found to be necessary.

122. *Mr. Watson*] To what level do you think the weir should be reduced consistent with the maintenance of a scour in the main body of the river? I think it will be found possible to take off several feet. At all events, I think the first 6 feet should be work of a temporary character.

123. Do you think that if the work were 6 feet above low water that would be a sufficient height to make a scour in the river? Yes.

TUESDAY, 12 JUNE, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Thomas Thomson Ewing, Esq., M.P., sworn, and further examined:—

124. *Chairman.*] Since you were here on Friday last, it has occurred to you that there are two points with regard to the silting up of the river, and possibly the flooding below Broadwater, which require a little more thought, and on which you are prepared now to explain your views further to the Committee? That is the case. I will state to the Committee as clearly as I can my views on the matter. I desire to direct the attention of the Committee still further to the question of the silting up of the North Arm consequent upon the Tuckian Canal taking off flood-water from the North Arm. Under present conditions in floods in the North or South Arm one flood at times anticipates the other. If the South Arm flood be ahead the water would be higher there than in the North Arm at a certain time, and *vice versa*. So it is probable that under present circumstances there is a tendency for the higher flood to affect the Arm not then so fully charged; and, therefore, there may be for a very short distance, and for a brief period, an up-current or slack water in either of the arms; but it is certain that it could never reach any great distance or be really seriously worth considering. The North Arm and the South Arm must not be regarded as two streams discharging into each other, and, therefore, immediately regulating their respective levels, as would be the case if the two streams met with no other circumstance to be considered; but this is not the case under consideration, for the map shows they both discharge into a wider reach of the river, and it would be the head in this wide reach (which, generally speaking, is able to carry the flood-waters of both arms) that would cause the water from one arm to force its way up the other. The fact to be considered is not the respective heights of the North and South Arms several miles above the junction, but the height of the receiving long reach of the joint river where the currents meet. The water from the South Arm before it passed from Coraki and up through the Tuckian would require to swell the wide reach of the river below Coraki to a considerable height above the North Arm. If there were coming down the South Arm such a volume of water as to swell the main reach below Coraki and force the North Arm up stream over the Tuckian, it would burst over the banks of the South Arm, and enter the North Arm by Pelican Creek above the proposed off-take. I feel justified in again asserting that any danger from this up-current may be dismissed from consideration. This question has been so prominent in this inquiry that a further explanation may not be regarded as out of place. One question asked me virtually was: Supposing the two arms were running level, and 8 feet of water then found its way over the Tuckian, would not there be a current from Coraki up to the offtake? I think the amount stated to the Committee was 2 feet of water over the Tuckian, but 8 feet being the extreme amount which can go over makes a stronger case. Since 8 feet of water will be passing through the Tuckian, and the river will be carrying at least 22 feet of water more than that, *i.e.*, 30 feet in all, the first question which naturally suggests itself is, where will this remaining 22 feet go? Down the river of course. It will be conceded at once that this 22 feet of water still goes to Coraki. I may be permitted to state an extreme, or rather an impossible case: Supposing, for instance, the two arms of the river be running level as suggested, and the Tuckian were suddenly opened, and the result from this was to snatch 8 feet of water from the surface of the river from the intake of the Tuckian to Coraki instantaneously the result would be as follows: Since in flood-time one hour's run, say, 5 miles, with a channel running 30 feet deep, would fill the river from the Tuckian intake to Coraki, a body of water 22 feet deep would fill it in under one and a half hours; thus in one and a half hour the river would be running, as far as the eye could see, pretty well as usual, no doubt, however, steadied somewhat by the removal of the water at Tuckian; but still running down all the time—but the water in the main river, if given an instantaneous drop of 8 feet would rush to meet the swelling head from up river, and so very considerably under half an hour the river would have returned apparently to its normal condition, the time for which it did run up being limited to that in which the water rushing up from Coraki met the down-coming stream, and the joint currents swelled to the Coraki level. The time, therefore, under this state of circumstances for which the river could run up would be limited to certainly not more than half an hour. I have stated an impossible case which will serve to show that the statement I previously made is correct under normal conditions. The reason why the Tuckian would reduce the higher reaches of the river is partly because the water, if removed *via* Tuckian, fails to reach the main river at Coraki, and, therefore,

T. T. Ewing,
Esq., M.P.
8 June, 1900.

T. T. Ewing,
Esq., M.P.

T. T. Ewing,
Esq., M.P.
12 June, 1900.

therefore, the level will be reduced at that place. The surface of a body of water in flood time is practically a gradual slope, dependent upon the elevation of the country through which it runs, the amount of water falling on the catchment area, and the height of the reach or reservoir into which it discharges; therefore, it follows that by permitting less water to reach Coraki the height will be reduced in the large reach at that place, and the height of both arms of the river lessened above it proportionately in accordance with the distance. The following example, although it does not cover the whole ground, may be of interest: When a big flood discharges into the ocean from any of the coastal rivers, although there is a difference in height in the receiving reservoir of about 4 feet twice during the twenty-four hours (that being approximately the difference between the high and low tide), the river when running out a banker runs out continuously all through the twenty-four hours. To the eye, at the height of the flood, there appears little difference in the velocity, although the discharge is during this time into different elevations. The fact is that the water adjusts itself to its new level, piles up gradually, furnishes itself practically with a new head, and proceeds as usual, with, however, probably a lessened velocity. I have endeavoured to prove, first of all, that the fears of a current worth considering, running up the South Arm are imaginary, and secondly that if it did run up, the experience obtainable in connection with the tributaries with more level catchment areas on the Richmond, enables me to state that where it is usual for the flood to run up the tributaries as the waters rise these waterways have not silted up; therefore, the fears are groundless under any circumstances. With regard to the piling up of the river at Broadwater, which appears to be the only other matter requiring serious consideration, I would again emphasise the fact that the removal of the "Rocks" and the indurated sand at Wardell will give the river a greater discharging capacity than the Tuckian canal can have under any circumstances; thus, even if the Tuckian canal were new water, which it is not, after the removal of these two obstacles, floods will never be as high at Broadwater as they have been in the past. I am confident that the residents, were they assured of the removal of these obstacles, would withdraw any objection they may have. They do not desire to be unreasonable, but are quite justified in desiring to be satisfied that works for the benefit of one part of the district will not inflict any injury on them. I have already stated that the Department intends immediately to remove these obstacles, but in order to make it certain, the Committee might insist on it in their report. Still, further, it is possible by regulation of the safety-valve to the lower river to give it a speedier outlet to the sea near Broadwater. This being placed under control would, in my opinion, complete the scheme, make it more effective, and finally remove any fears the residents of the lower part may have. There is another point which I might bring before the Committee, and it is this: The engineers will tell you that they want the flood-waters to scour the bar. I do not think that any engineer now, unless it was necessary for breakwater purposes, would put up anything but a half-tide wall, so that the tide could flow over it.

125. *Mr. McFarlane.*] Respecting the flooding of the river below Broadwater, Mr. Darley stated in reply to Question No. 34:—

The people moving in the matter are chiefly people up at Lismore, who think it will lower the water in front of their town, and relieve the upper portion of the river. Of course, it is hinted in this opening statement that the third question which will engage the consideration of this Committee is in what way will these people indemnify the Government for any damage which is done lower down. I hold that it will drown the country lower down, if it does anything at all. It will raise the water down below, and do a lot of damage.

That is Mr. Darley's opinion; what do you say on that point; Mr. Darley says it is going to drown the country down below; but, since you are only taking 8 feet of water off a reach 300 feet wide, how is it going to drown the wide reaches lower down? I have already stated that the removal of the reef and the indurated sand will give a discharging power to the lower river considerably over what it has at present, which is greater than would be required for the water coming down from the Tuckian under any circumstances whatever. The Engineer-in-Chief knows how much water the Tuckian can discharge, and he knows also how much extra discharging power will be given to the lower part of the river by the removal of the reefs and the indurated flats. The removal of these will give an infinitely greater discharging power than the Tuckian water can under any circumstances overtake.

126. Would not the removal of the obstructions have the effect of minimising the floods without the new channel? It would.

127. I think it is Mr. Darley's opinion that that would be the better way to do—to remove those obstructions without cutting the proposed channel? It would have a tendency to lessen the floods, but would not be so satisfactory.

128. It is easy to understand that in case of a sudden rise in the river, the flood only lasting a few hours, the body of water going out by the proposed cutting would get out to sea before the water could reach Broadwater by the channel; but in the event of a flood lasting a couple of days, which it frequently does, would not that cause the water to meet the water from the new channel and that brought down by the main river at Broadwater? Under those circumstances, the Tuckian working full, and the river working full, there would be a tendency for the river to swell at Broadwater. With regard to that, I have explained that the result obtained by the removal of those two reefs, and the Blackwall flat being larger than the discharging power of the Tuckian, it would place the lower river in a better position than before. I stated in my report that it would be well to emphasise those two points; but if there is any doubt about the river swelling at Broadwater, you should settle it by telling the Department to remove those two things. Mr. Darley will tell you that it will give a greater discharging power, and if you do that you can afford to ignore the lesser augmenting power.

129. The removal of the obstructions would allow the water to get away to an extent more than sufficient to make up for the extra water brought down by the new channel? Yes.

130. Have you a knowledge of the Tucki River? Yes.

131. How much flooded area is there from Broadwater upwards? For 40 miles from Broadwater it is all flooded, it is flooded for 20 miles above Lismore. This improvement would take the water away much more quickly than it gets away now.

132. Have you discussed this proposed canal with many of the people in the district? Yes.

133. What is the general opinion about it? The general opinion all through the district is distinctly favourable.

134. Is it your opinion that the whole of those owning land from Broadwater as far as the flooded country goes would be benefited by this work? It is.

T. T. Ewing,
Esq., M.P.
12 June, 1900.

135. There is one question which arises as to the cost of the work;—have you discussed that with the residents? Yes. I think the matter ought to be considered in accordance with the general policy of the country with regard to works of this kind. If such works are to be dealt with under the betterment principle, there is no reason why it should not apply in this case; but if the betterment principle is not to be applied generally, there is no reason why the Richmond River people should be singled out and made to pay.

136. The Mayor of Lismore said he believed that the Lismore people would be prepared to pay their share of the cost of the work;—do you think that the same feeling would prevail throughout the area that would be benefited by it? I think so, when people understand how small the amount of the cost would be. If it is to cost £50,000, the yearly interest would be £700 or £800, and that sum spread over a district like that does not amount to much. It amounts to a couple of men's crops. In times of flood the losses caused on the Richmond River are very great.

137. With regard to Broadwater, do you know that part of the country? Yes. I have been all through that country.

138. Could you describe it? I do not think I could tell you exactly where the Broadwater ends and where the swamp begins. It is all jungle and scrub.

139. It spreads out into a swamp? Yes. It would be hard to say where the Broadwater ends and the swamp begins.

140. Do you know Henderson's drain? Yes.

141. What effect had the cutting of that drain? The effect was, by removing some of the moisture, to consolidate and lower the level.

142. What class of land is it there? Ordinary swamp land. My idea is that it was rather a sort of loamy-looking, reedy swamp. Of course, when they cut the drains it took the moisture out of the loam, and it shrunk.

143. Do you consider that it improves the land materially? With a system of cultivation, and with the expenditure of a good deal of money, something might be done, but it is always a doubtful matter to tackle anything that lies so dangerously close to high water. Some of the Tuckian land is below high water, and then, of course, it means flood-gates.

144. Does that refer to Henderson's property also? I think that a high tide would run up some of Henderson's drains.

145. With regard to the Tuckian Swamp, can you tell the condition that the Tuckian Swamp is in before the overflow of the banks? It depends a good deal on what I might call the timing of the flood.

146. Does the water back up the Broadwater and fill the Tuckian? At times it might.

147. We have had evidence already that the current does run up the Broadwater? I can quite imagine it happening.

148. Would it run up the Broadwater after a heavy swell on the bar at high tide? Anything that would surcharge the lower reaches would cause a greater head at Broadwater, and the water then would seek the lower elevation—which the Tuckian might be—if it had not been filled from other sources.

149. Is the whole of that land in the Tuckian Swamp reached by the river overflowing its banks? It is possible that it may be, but I do not think it would be in all cases.

150. Do you think it would be generally;—would it be filled by local rain-water before it would enter the proposed cutting, 12 feet above low water? I do not think that, as a rule, it would be. By the time the canal commenced to work you would find water in the Tuckian, but I do not think it would be a heavily flooded Tuckian.

151. Does it not rather frequently happen that floods are caused by heavy rain on the mountains when there is not very much rain down the river? Yes, that may happen.

152. Under those circumstances the Tuckian Swamp would not be filled? No. But I cannot imagine enough rain falling, say, 25 miles north, to create a flood that would give a 12-foot rise and no water to fall on the southern side of the hills which feed the Tuckian. I think it would be improbable. But I grant this in regard to the floods, that sometimes a flood takes some days to come down, and sometimes it comes suddenly.

153. Do you think there would be any objection on the part of those who own property on the Tuckian, seeing that it would cause an early flooding of the land, through the channel being cut? I think that one improvement which I suggested below Broadwater would be a full compensation to them, as the water would get away so much more rapidly.

154. We will say that a flood rising about 15 feet at the proposed cutting near Coraki on the North Arm would have a flow of about 3 feet over the weir? Yes.

155. A rise of that height would not be sufficient to overflow the banks between the Tuckian and Broadwater;—that would cause an earlier flooding of the Tuckian country, which would not be flooded at all but for the cutting being made? A 15-foot rise would come up the Broadwater or from other sources flood the Tuckian. I might make a general statement in regard to that. If it did injure the Tuckian, I think the Tuckian Swamp should not stand in the way of the scheme intended for the benefit of the whole district. But if the Tuckian people suffer, those who profit by the improvements might bear a portion of the expense of compensating them.

156. Of course, the danger is that they may claim compensation in the event of any damage being done? I have such confidence in the scheme that I think it will be pretty hard to prove damage.

157. Speaking of the scheme generally, your contention is that it will not do any damage on the lower portions of the river? I am sure that the alterations which I have mentioned must be beneficial to the whole river.

158. Holding the opinion you do as to the necessity of removing the obstructions about Broadwater, do you not think it wise to carry them out before making the proposed cutting? You could do it simultaneously. I think it would be wise to insist upon that.

159. With regard to the silting between Coraki and the proposed cutting, do you think that is a serious matter? I do not. I think the idea is purely visionary.

160. You think there is sufficient scour to prevent any silting, notwithstanding the quantity of water passing through? Yes. Even if it were possible to conceive that the current did go up for a while as soon as the flood falls, you have the old scouring process at work cleansing the river.

161. *Mr. Dick.*] This proposed Tuckian flood-relief channel practically gives a "banker" an additional flood-outlet of 300 feet by 8 feet? Yes.

- T. T. Ewing, Esq., M.P.
12 June, 1900.
162. That is a total of 2,400 square feet of additional flood-opening? Yes.
163. Would a scheme which gave twice the superficial area of flood-opening give twice the relief? Yes. My reply to that would be that if you had one opening it gives you so much, and if you put another alongside of it, it would do just as much more.
164. It is proposed, as you seem to thoroughly understand, to deepen the rocks near Wardell from 6 feet to 17 feet;—that will give a width of 1,300 feet in the river at that particular place, or nearly 12,000 feet of additional flood-opening? Yes.
165. That is nearly five times as much as the Tuckian flood-channel proposal would give;—do you not think it would be wise in the first instance to carry out that work first, and see what its effect is before we carry out the much smaller work proposed at the Tuckian? Without binding myself to your figures, I have stated once or twice that the removal of those rocks to the extent you mentioned will give such an enormously larger discharge in the lower river that we need not fear the piling up of the water there.
166. But you desire to make the cutting away of the rock at Wardell an appendage to the smaller work? No.
167. Which do you think will have the more important effect—the flood-relief channel by itself, or removing the rock by itself at Wardell? On the upper river, the Tuckian improvement; on the lower river, the removal of the rocks.
168. Do you not think it would be wise to wait until we see what effect the cutting away of the rocks will have? We know what the effect will be. It will give better navigation, and it will give the river a much larger discharging power. The result cannot be felt very materially a distance of 30 miles up the river.
169. Is the corollary to that that the presence of the rocks at Wardell is not now felt in flood-time 30 miles up the river, because one involves the other? Any obstruction in a river has some effect upon all parts of the river; but it would not have enough effect 30 miles away to be appreciable. No doubt everything that is taken out of the way is so much to the good.
170. *Dr. Garran.*] I understand that you cannot give us any estimate of the number of acres of land exposed to flood? No; I could not accurately.
171. Nor of the value of the land? I presume that adjacent to the Richmond River and its tributaries there must be much more than 200 running miles of alluvial country. For a considerable distance back there is good alluvial land, and at the back of that an average distance of, perhaps, a couple of miles, there is good grazing country.
172. All that flooded land is rich alluvial? Yes; it is all good.
173. And it is rich, because it has been flooded in times past? Yes.
174. Has it been taken up mostly by free selectors? It was originally.
175. If those people had the public spirit to combine together and form a great co-operative society for protecting their land from floods, there would be no objection, political or otherwise, to their doing so? There should not be any.
176. Under the scheme now proposed, instead of working together voluntarily, they ask the Government to do the work for them? Yes.
177. Would it not be as reasonable that the Government should make a levy on each estate as it would be for the members of a co-operative association to make a levy upon themselves? Yes; if it is in accordance with the law of the country.
178. A great many people insure their property against fire? Yes.
179. But nobody thinks it the duty of the Government to insure their property against fire? No.
180. Then why should the Government insure their property against floods? There is no other method of getting it done.
181. I asked the question because you said that insurance against floods was a national work, then why should not insurance against fire be a national work? My view is this: I can see that the people of the district are those who will be primarily benefited by the proposed work. If it be in accordance with the law of the country and the general practice for the Government to carry out works of this kind, primarily benefiting the local inhabitants at the expense of the general taxpayers—and there are examples of it in this country—then the people of the Richmond River district ought not to be levied on to defray the cost of this undertaking. But if it be the law already that those primarily benefited shall contribute specially towards the cost of this work, I do not know how the people in that district could object to it.
182. You do not say that it is right, but that it has been done elsewhere, and that if it has been done elsewhere there is no reason why it should not be done in the Richmond River district? If it is the right thing to do. It is done elsewhere.
183. But have we had such a big thing as this elsewhere? No. But I see no other way of dealing with the matter than through the Government. I think it would be hopeless to endeavour to bring about an adjustment among the people.
184. I see the difficulty myself; but the principle of the thing is the same as if the people were doing it for themselves, is it not? It is. Might I make a further statement. I do not know exactly where the idea came from, but it has been suggested that the State should carry out the work, and levy one-half of the cost on the people.
185. You have referred several times to that natural breakaway opposite Goat Island? Yes.
186. Do you know how high the water has to get before nature takes that relief? I think about 12 feet, but I would rather leave a question of that kind to the engineers.
187. Do you know the character of the soil;—would it be easy to put in piling? Yes, very easy; there would be no trouble.
188. *Mr. Watson.*] The contention of the people at and below Broadwater, in respect to the scheme, is that with an easterly gale and high tides, even without a flood in the upper river, the lands adjoining the main river are submerged; and they say that, even admitting what is urged by the advocates of the scheme, a portion of the flood-water of the upper river would get away earlier after the scheme is in operation than is the case now; they would get more flooding than they get at present;—do you think that is likely to occur? I am sure it is not. First of all, an easterly gale would not affect any one living on the river near Broadwater. The removal of those obstructions will give the river such an increased discharging power that you can afford to ignore the altered state of things in the upper reaches of the river.
189. As far as the backing up of the water in the upper part of the river is concerned, it would seem, from local evidence, that the greater bar to the outflow of the water is about Riley's Hill? Yes.

190. Do you think that even with the removal of the Blackwall Flats the other would not require removal to give free egress to the water? I am quite satisfied that the removal of any rock in the bed of the river will be of some assistance. The reason why I refer to the rocks below Broadwater is that it is creating a new state of things, accentuated at Broadwater by the junction of the two streams. The removal of the rocks at Riley's Hill must do good. T. T. Ewing,
Esq., M.P.
12 June, 1900.
191. I want to get from you an expression of opinion as to the comparative value of the removal of these rocks as against the Tuckian scheme, with a view to flood relief? What I have already stated is this: That if you take the water out by the Tuckian from the off-take above Coraki down to Broadwater it ceases to be flood-water as far as the Richmond is concerned. It may swell the head at Broadwater, but it ceases to be flood-water. With regard to the rival schemes of removing obstructions, I concede that everything you take out of the river does some good; but time is the basis of the whole thing. You can get water with the same head coming from the North Arm down to Broadwater, and out by the so-called safety-valve into the ocean, so much more rapidly than the other way. You have virtually two rivers running instead of one.
192. Assuming that it is correct to say that a certain amount of water would be taken off in the early part of a flood, do you think the amount of relief that will be afforded by the channel will be worth the cost? I do.
193. In high or continued floods do you think there would be material relief? I am sure there would be. If you submitted it to calculation it, perhaps, does not look much; but still a current running 300 feet wide and 8 feet deep must materially affect the Richmond River.
194. It is hardly one-third of its present discharging capacity? It is approximately that, and that means a good deal.
195. The question is how much relief would be spread over the vast area that is flooded once the river gets over its banks? No one can give a definite reply to that. The real question is by an earlier and more rapid discharge the floods are prevented from spreading over so vast an area as that at present submerged.

WEDNESDAY, 13 JUNE, 1900.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The HON. PATRICK LINDSAY CRAWFORD SHEPHERD.
The HON. ANDREW GARRAN, LL.D.
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Thomas William Keele, Acting Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and examined:—

196. *Chairman.*] You have been in charge of the works on the Richmond River for some time? Yes. T. W. Keele.
197. How long? Since 1st April, 1889. 13 June, 1900.
198. Does your knowledge of the district go further back than that? Only in a general way.
199. Not through residence? No; I was never there before that time.
200. *Mr. Watson.*] You know the scheme under the consideration of the Committee? Yes.
201. We are given to understand that the projection of it was practically a suggestion of your own? Yes.
202. Could you offer any opinion as to the extent to which the scheme, if carried out, would prove effective? I think it would afford a measure of relief on the North Arm, and that it would also tend to reduce the flooding on the lower part of the river as far as Broadwater.
203. There has been some fear expressed by some people, first about the Tuckian Swamp, and, secondly, below the Broadwater, that the scheme would work injuriously. Some persons near the Tuckian seem to think that if the water were taken by the proposed channel into the swamp, and no further, it would cause an earlier flooding of their holdings on the south or south-western boundary of the swamp;—could you offer any opinion on that? I certainly think that the water would be drawn off quicker, owing to its coming in a shorter time down the lower river, and that it would not rise so high.
204. That the river lower down would not rise so high? No. If it did rise, it could not possibly rise higher than it has done already, owing to the flood-valve, which always opens, when the flood reaches a certain height, as it opened in 1890 and in 1893.
205. You allude to the channel through which the river broke in 1893? Yes. There are two.
206. One near Goat Island, and one near German Creek? Yes; at a place called Blanche's Mill. Those valves would prevent the water from ever rising higher than it has done already. But, independently of that altogether, we intend to deepen the river channel and remove the rocks at Broadwater, and also at Wardell. It is not worth while, therefore, arguing the point as to whether or not the water would heap up at Broadwater and below it. The fact of our removing the flats or deepening them at Wardell, and also removing the rocks at Broadwater, will certainly considerably reduce the level of the flood-water. A channel 500 feet wide and $3\frac{1}{2}$ feet deep cut through the indurated sand flats at Wardell for 1,000 feet would carry off more water than would be likely to come down the proposed relief channel. It would carry off 10,000 cubic feet per second more than it does now, when the flood is passing there 5 feet above low water, with a slope of 6 inches per mile.
207. That is assuming the proposed relief channel to be carrying water to its fullest capacity, the deepening of the channel as you suggest below Broadwater would be more than sufficient to carry off the extra water? Yes.
208. Could you say whether those works at Blackwall Flat and Broadwater are likely to be undertaken shortly? We have two sums of £10,000 each on the Estimates for that purpose, not specially for these two places, but £20,000 altogether is proposed to be expended in improvements to the Richmond River, and out of that we should spend a portion in removing those two reefs.
209. Down about Wardell it was stated to the Sectional Committee that during an easterly gale, and with a king tide, the water now, even without the flood rising at all, was backed up over the surrounding country from the river? Not so high as that. I have known a king tide at Ballina to rise 7 feet above low

- T. W. Keele.
13 June, 1900.
- low water without any fresh in the river to assist it; but the effect of that tide would not be felt very far.
210. The principal fear expressed by the people on the lower part of the river was that with such a king tide as you have mentioned, and a flood in the river, the water from the proposed channel would increase the flooding of the land;—do you think that is likely? I do not see how it possibly can do so, in view of the two flood-valves which I have spoken of.
211. But then those flood-valves are not kept open? No; but they open when the water reaches a certain height.
212. What head of water do you require over the banks opposite Goat Island before the escape-valve is forced? I cannot tell you what the height would be exactly opposite Goat Island. The level of the flood at Broadwater would be 12 feet 9 inches over low water when it would break through.
213. What height would that mean over the bank near Broadwater? That would be in the township itself, probably a foot or more—the bank varies in height there.
214. Just at Broadwater the bank is slightly higher than it is further down? Yes.
215. So that down about Goat Island, before the escape-valve would begin to work, you would have a height of, say, a couple of feet? Yes; you would have that, and more. Opposite the mouth of that channel there are one or two houses, and I have seen the water there fully 4 feet over the banks.
216. And had the channel then broken out? No; not at that time.
217. I gather from what you say that your contention is that, though these people's land would be flooded, they would be in no worse position than they are in at present? They would be in no worse position. As soon as the water reaches a certain height it escapes into the ocean.
218. Against that their contention is that with the conjunction of a king tide and an easterly gale, and the water coming from the proposed relief channel, their land would be more frequently flooded to a height less than that necessary to enable the water to escape through the escape-valve? They have already experienced that. They have had the king tide with floods. The flood in 1893 was the highest on the river; it occurred on the 23rd January. On 20th January, 1889, they had a flood which rose within 3 inches of the height of the 1893 flood.
219. Can you give the respective heights of those floods? I have a chart here; but it shows the heights at Coraki only. I cannot give the exact heights at Broadwater; but the highest flood at that place was in 1893, when it was 12 feet 9 inches above low water.
220. What were the heights at Coraki? Within 2 miles of Coraki on the North Arm, the flood of 1889 was 20 feet 9½ inches over low water. In 1893 the highest flood occurred which they have had on the river. The height was 21 feet 0½ inches over low water. These very high floods occur in January or February. The floods occur nearly always when there are easterly gales.
221. From the evidence given in the locality, it would appear that the flood-waters break over into the Tuckian Swamp at two or three points, between Dungarubba Creek and the proposed off-take of the channel? Yes.
222. And that seems to point to a congestion just below Riley's Hill? Yes; there are several obstructions in the river besides those at Riley's Hill. I consider that at Woodburn to be one of the worst.
223. That is now being removed, is it not? It is. There is a reef with an area of 2 or 3 acres with only 2 or 3 feet of water on it at low water. If that were removed it would let the flood-waters down very considerably.
224. Do you think that is a greater block than the rock below Riley's Hill? I do.
225. You say that it is proposed to widen the channel below Dungarubba Creek? Yes; that is one of the places that we propose to operate on in order to remove the rock.
226. There is another objection taken by one or two of the settlers more particularly on the southern side of the Tuckian Swamp;—they are afraid that the water coming down the proposed channel in conjunction with the local flood-waters would cause a flooding of their holdings, where, without this channel, no flood would take place? They would not be flooded to the same extent as they have been.
227. The evidence so far went to show that the Tuckian was, under general wet weather conditions, to a certain extent affected by the local rainfall coming down the creeks? I have read through the evidence, and the only witnesses I consider qualified to give good information with regard to the Tuckian Swamp are those who are residing close by it. Mr. Bagott is a reliable witness, and if you refer to his evidence you will find that he does not bear out the statement that the Tuckian Swamp is flooded from its own catchment. A certain amount of water is discharged into it, and it rises 2 or 3 feet.
228. It rises 2 or 3 feet from the local inflow of water? Yes.
229. The contention of several settlers on the southern side of the swamp is that the water from the proposed channel coming into the swamp at the same time as the local water will subject them to flood, where otherwise they would escape;—do you think the difference in the level of the swamp and that of the adjoining country is sufficiently marked to allow all the water brought in by the proposed channel to be taken away before it would rise sufficiently high to cause floods? We do not propose to take freshes through the flood relief channel. The crest of the weir is fixed at a level of 12 feet above low water.
230. Do you think it would be unlikely to make the water spread over the lands to the south of the swamp? I do. I think the water being taken into the swamp so much earlier it would pass down the river more readily, and the water would not rise so high in the swamp itself.
231. Another feature is that the present proposal only contemplates the cutting of the channel to the edge of the swamp? Yes.
232. It was suggested by the local witnesses that it would be safer to make a channel through the bed of the swamp right into the Broadwater? I do not think that is necessary, and it would add to the expense.
233. There seems to be a good deal of growth in the swamp? Yes; that will have to be cleared, but there will not be any excavation. An excavated channel would be of considerable assistance; but it would cost a considerable sum of money, and it is not absolutely necessary.
234. Then there seem to be amongst the people of Coraki, and from there round towards Woodburn, rather a unanimous feeling in favour of a lower height for the weir than that proposed in the scheme;—it was suggested that 6 feet above low water would be a proper height? It would not do to cut it down below the proposed level.
235. What do you think should be the minimum level of the weir, consistent with maintaining a scour in the river? The one I have fixed it at—12 feet above low water. I do not think it will be safe to go below that.

236. You say "not safe"; but I meant from the point of view of maintaining navigation? Quite so. T. W. Keele.
237. There is no other reason, I suppose, why it should not be done? A foot or two lower would give more relief, and by the deepening of the reefs at Wardell and Broadwater, the water might be passed away without causing a greater rise in the lower river; but it certainly would not be advisable in the interests of navigation to lower the weir. 13 June, 1900.
238. If there is any force in the objection of the people below Broadwater on the score of the earlier flooding of the land, it is not at the weir itself, but below the weir-level, that the greater objection would be? Certainly.
239. When you stated that the effect of the scheme at Broadwater and below would not be harmful, you were, I suppose, referring to the 12-foot level, always having that in view? Yes.
240. Would you have the same opinion as to its being harmless to the people below if the weir were cut down to, say, 6 feet above-low water? I should not.
241. You think the quantity of water going down would be so great as to render it possible that the land would be more frequently flooded than it is now? Yes, and the river would be reduced below its maximum capacity in the North Arm, which would be harmful.
242. It was suggested by Mr. Ewing, in giving evidence yesterday, that though 12 feet might be adopted as its present height, the weir might be so constructed as to permit of its being lowered if the effect was found not to be harmful;—do you think there is any possibility of arranging economically so that the weir could be made lower? No; I should object to the weir being below 12 feet. If they want to have it below 12 feet, we ought to resist that in every way.
243. You think the weir should be at that height to keep sufficient water in the river to provide a scour? Yes.
244. Have you studied the question as to how the section of the river between Coraki and the weir on the North Arm would be affected as far as the scour is concerned? Yes.
245. It has been suggested that if, as it is said sometimes occurs, the South Arm brought a considerable flood down whilst the North Arm was not flooded, the tendency would then be for a certain proportion of water in the South Arm to flow up the North Arm as far as the weir, and that would interfere to some extent with the flow between the off-take and Coraki, with the result that silt would be deposited to a greater extent than occurs under the natural conditions? I have here a diagram showing the discharge of flood-waters on the 21st to 25th February, 1898. That was the smallest flood that has occurred on the river for some years. The others were freshes. Of course freshes frequently take place.
246. When do you call it a flood? When the river is just about level with the bank throughout. On this occasion the water-level at Tuckurimba was 18 feet and the discharge was 45,000 cubic feet per second. At Coraki, at the same instant of time, the water was being discharged at the rate of 80,000 cubic feet per second, showing that the balance was coming from the South Arm. The water passing through the proposed weir 6 feet in depth would probably be discharging at about 7,000 cubic feet per second. That would only be a very small proportion of the whole amount of water passing down the North Arm, and a small proportion as compared with the water passing down the South Arm. How, therefore, could the water from the South Arm run up the North Arm towards the weir.
247. You are taking a case in which the North Arm is flooded; but it has been suggested that there might be a flood in the South Arm and none in the North Arm, and that, consequently, owing to the lower level in the North Arm, the water would flow up the North Arm;—but as the lower river relieves the pressure in the upper portion, the water would come down again, and in doing so would scour away any silt that might have been taken up from the junction? The South Arm can run back water up the North Arm now, but if such a thing does occur it does not appear to have been injurious.
248. The suggested difficulty is that, though a flow might take place from Coraki to the weir, there would be no back-flow to take away the silt under the new conditions? It is very rarely that floods or heavy rains do not occur on the catchment areas on both arms of the river. When high floods occur, the rains usually come from the north and finish off from the east, so that both catchment areas get a rainfall.
249. If it came from the north it would be more likely to flood the North Arm than the South Arm? Yes. As a rule, the flood comes down the North Arm before it comes down the South Arm.
250. Does the catchment area of the North Arm consist of more precipitous country which sends the water off more quickly than is the case on the South Arm? Yes; the rain-clouds burst there more quickly, I suppose. But even assuming the water ran from the South Arm up the North Arm, which it might do under conditions such as a waterspout bursting on the South Arm, and the fall of rain not extending to the North Arm; the phenomenon of water running up a tributary is not unusual. It occurs every flood on the Bungawalbyn. That tributary is navigable for 20 miles—for the first 10 miles for vessels drawing 10 feet, and I have never heard the residents complain of its shoaling.
251. But you see that in that case the full flood of water which is forced up the stream would come down again? So it would in this case.
252. No; some of it would escape through the proposed channel? Only a small proportion of it.
253. Then all below the 12-foot level would come down again? There is no doubt about that.
254. Would that be sufficient to maintain the scour? If there was absolutely no water in the North Arm, and the water rose sufficiently high to go through the proposed channel over the weir when it ultimately rose to the 12-foot level, it certainly would be dead water, except the current caused by the draught through the weir, because there would be nothing to cause a current down stream, but the fact of the weir being there does not affect the case; there would be under such conditions dead water in the North Arm, even if there was no weir there. But those conditions do not exist. On every occasion when there is a flood in the South Arm there is also a flood in the North Arm.
255. Although to a less degree? It may be to a less degree. There is always sufficient flood in the North Arm to produce more water than will ever be taken down the proposed flood channel.
256. The difference between the 12 feet and low water would cause an outward flow, and you think that would be sufficient to maintain the scour? Yes. I can give you somewhere near the amount of water that would be passing. There must have been over 20,000 cubic feet per second passing down on the 25th February, 1898, when the surface level of the water was level with the weir at the off-take.
257. That would be to the full depth of the river? The full section of the river, the surface of the water being level with the off-take. That was only in a small flood, when the water was falling.
258. So that you do not on the whole apprehend any danger of the stream silting? None whatever. It is the freshets which keep the low water channel deep, and the high floods spoil the work done by them.
259. The evidence as to the river below Coraki was that even with the proposed channel in full operation the

- T. W. Keele. the remaining water passing down the North Arm, in conjunction with the water from the South Arm and the Bungawalbyn, would be sufficient to keep the scour in the main river? Yes. I think the information we have about the Bungawalbyn has a great bearing on the question of the silting of channels or otherwise, by water running up them, as showing how little damage is caused by water running up that channel. It runs up there two or three days during flood, and meeting the water from its catchment area it is checked. By-and-by it stops, remains dead, and may remain so a day or two before it starts back again. It has an opportunity then to precipitate its sediment; but it does not silt up the channel. No doubt a deposit takes place, but as the water passes out it takes the silt away again.
- 13 June, 1900.
260. As it is so frequently occurring, the Bungawalbyn Creek having water flowing into it would go to substantiate the suggestion that the Northern Arm is the earlier flooded? The catchment of the Bungawalbyn Creek is 660 square miles. It actually drains a larger area than the North Arm above Coraki, which has 610 square miles.
261. The other arm being filled first, it would indicate that the Bungawalbyn got its rainfall latest, as a rule? No. The reason why the Bungawalbyn water takes so long to come down is that the country is so very flat, and the catchment area very low. The catchment area of the North Arm is very high.
262. Do you know whether the waters from the South Arm break over about Pelican Creek into the Northern Arm? Yes, they do.
263. Could you say what height the water would require to be in the South Arm before it could break over, and where? I could not tell exactly; but I can give some figures which will throw light upon the subject. On the 22nd February, 1898, at noon, the water at Coraki was flowing 68,000 cubic feet per second, and the level of the water was standing at 13.58 above low water-mark. At Codrington, on the South Arm the water was at a level of 19.49 feet, and was discharging at the rate of 56,000 cubic feet per second. At Tuckurimba, opposite the weir site on the North Arm, the discharge was 51,000 cubic feet per second, the water standing at 16.8 above low-water mark. There was actually 68,000 cubic feet of water per second passing Coraki, at the same instant of time when the two Arms together were discharging at the rate of 107,000 cubic feet per second, it is therefore evident that 39,000 cubic feet per second must have been escaping from the river somehow, most probably by Pelican Creek.
264. If there was anything in the contention that there might be a silting up between Coraki and the proposed weir on the North Arm through the earlier flooding of the South Arm, the probability of its breaking over at Codrington and at Pelican Creek to the North Arm above the weir would minimise any danger from that source, so there would not be any danger to the navigation of the river? In my opinion there would be always sufficient water coming down the North Arm to scour the river out after the surplus water had been discharged over the weir. Assuming that the weir was discharging 9 feet in depth of water, with a width of 300 feet, the greatest amount of water that could pass over such a weir, in thin plate and flowing freely into air, would be 27,000 cubic feet per second. In the flood of February 21st to 25th, 1898, the greatest quantity of water that was passing down the river at the 18 feet level was 45,000 cubic feet per second, so that there would have been under such conditions 18,000 cubic feet per second still that would pass down to scour the river out.
265. That is, that the water was 18 feet;—supposing it was 21 feet? I am only pointing out that the greatest quantity of water that can go through a weir 9 feet by 300 feet is 27,000 cubic feet per second. Even if you allowed the whole of that to pass at the time I have referred to, you would still have had 18,000 cubic feet per second passing down to scour the channel. We know that it is impossible for 27,000 cubic feet to pass through. That water does not flow freely.
266. You have given an 18 feet level;—if you take 9 feet off that it leaves only 9;—suppose you left 12 feet, and the water went at the same speed as you have mentioned, what would be the remaining portion? I have already assumed that 27,000 cubic feet of water per second was passing through the weir. Even if so large a body of water as that were passing away you would still have sufficient water to scour the river out. We know that the proposed channel cannot possibly discharge so great a volume, and we assume that a certain proportion passes through. The discharge for 6 feet is 14,000 cubic feet per second, if flowing freely into air, and, if we take half of that—which would be a fair thing—the quantity would be 7,000 feet per second that would probably have passed through the weir when the water was running at 18 feet above low water in the river.
267. Were you in charge of the works on the river when the Tuckombil relief channel and weir were put in? Yes.
268. Can you give any opinion as to whether that acted up to expectations? I was not there whilst it was working. But we have good information about it. It was flowing 5 feet 3 inches in depth, and we believe that a very large quantity of water passes through, and that a very considerable relief has been effected.
269. That weir is about the same width as the one now proposed? Yes; 300 feet wide.
270. Do you think it has been satisfactory? Yes, very satisfactory—that is to say, in relieving the district of the back-waters. It had no effect on the current of the river.
271. It took some water away in the direction of Bungawalbyn which would have gone into the river? Yes.
272. And which would have maintained the flood-level? Yes.
273. I suppose the weir was put in for general purposes, not solely to take away the back-water? We knew that that would be the chief work. We never anticipated that it would lower the level of the river much. Of course it affects it in this way—so much water being taken away that there is less to go down the main river, and consequently it would not hold up so long.
274. If there were no local rainfall in the catchment area above Bungawalbyn then the Tuckombil channel would relieve the main river? Yes. I have explained that the water comes down the main river, runs up the Bungawalbyn, then breaks over across to the Tuckombil. That was taking place last year. The water was coming out of the river, running across the country and through the weir to the ocean.
275. The impression in the district was that the weir was carrying away water which had fallen on the catchment area of the Bungawalbyn? It was coming from the main river as well.
276. Would you care to hazard an opinion as to what extent the proposed channel would relieve the liability to floods either in the North Arm or in portions of the South Arm;—how would it affect the duration of a flood, or would it save the district from floods in some instances where otherwise moderate freshes would occur? It is a very difficult thing to realise how relief will be effected. There can be no doubt that when from 7,000 to 10,000 cubic feet per second of water is passing over the weir, considerable relief must be given to the North Arm, to the lower part of the South Arm, and, in fact, to all that flat country. To what extent relief will take place it would be very difficult to determine.

277. It is desirable if we could fix on a point to which the river would fall with the channel in operation, so that we could determine how much was owing to the action of the channel? The floods are principally caused on the North Arm through the greater volume of the South Arm backing the water up. There is a great difference in the catchment area of the two arms. The catchment area of the South Arm is 1,050 square miles; that of the North Arm is 610 square miles. The greater volume of water comes down the South Arm. The North Arm is merely a tributary of the Richmond. The greater volume of water coming down the South Arm backs the water up the North Arm, and causes it to overspill the banks almost up to Lismore.

T. W. Keele.
13 June, 1900.

278. Do you think the relief from this channel would be material? I think it would be very material. In the small flood of the 21st to 25th February, when it was at its full height flowing 6 feet above the level of the proposed weir, there would have been about one-seventh of the whole body of water passing through that channel.

279. If the Government carried out this work, it would not be very cheering to have the local people telling us after the money had been spent that the relief was not sufficiently great for it to be worth their while to contribute towards the cost;—that it seems is being said now by the people for whose benefit the Tuckombil escape was provided? I certainly would be very careful about making a definite statement as to the exact extent to which the river would be affected; but I believe the water will be kept off the land level with the banks of the river. I do not believe that after this work is carried out, it will spill over the banks to the same extent that it has done before.

280. Do you think that a greater quantity of water will go through that channel than goes through the one at Tuckombil? It all depends on the head of water above the weir.

281. Will the relief afforded in this case be greater than in the other? The people living about Woodburn and Bungawalbyn seemed to think, at the time of the last flood, that very considerable relief was given. It was almost impossible to calculate whether the flood at Lismore will be lowered or not. That it will be, I have not the slightest doubt, but to what extent I think it is impossible to say. I tried to calculate it on one occasion, but I could not make anything out of it. We know what the flood slopes were on the flood of the 21st to 25th February 1898. The slope of the flood, when it was flowing 18 feet deep opposite the weir site on the 23rd February, was $\cdot 59$ feet per mile. That was the inclination of the flood-water at that time, and the discharge was 45,000 cubic feet per second. Assuming that the flood was standing at that level, and 7,000 cubic feet per second was the amount passing down the proposed flood-relief channel at the same time, making 52,000 cubic feet per second, the problem would be, to find what would be the flood slope. It would be $\cdot 81$ feet per mile. If you carry $\cdot 59$ feet per mile as far as Lismore, multiplying by 19, you would get the level at which the flood stood on that occasion at Lismore, 29 \cdot 21 feet, and the actual level at Lismore was 27 \cdot 59. If you multiply $\cdot 81$ by 19, you get 33 \cdot 39. It would appear from that calculation that the water would have to rise 5 \cdot 8 feet above what it actually was on that occasion at Lismore to discharge that 7,000 cubic feet per second over the weir in addition to 45,000 cubic feet per second down the river.

282. What would that mean in the reduction of the levels if the weir were constructed? The water required a slope of $\cdot 81$ to discharge 7,000 cubic feet per second through the weir in addition to what was going down the river, and it only had $\cdot 59$ to discharge the water passing on that occasion—45,000 cubic feet per second.

283. Did the flood you are referring to go over the banks? No; it was confined between the banks. If that weir had been working, the flood slope required to produce the amount of water which would have been flowing through it when the level was 18 feet above low water, would have required the water to be at the level of 33 \cdot 39 feet at Lismore, whereas it was only 27 \cdot 59 feet.

284. Is it a fair deduction from that to say that, with the weir and the channel in working order, you could have got rid of another 4 feet of water? No; it does not point to that at all. It looks, at first sight, as if considerable relief would be effected at Lismore; but you cannot get very much out of the calculation, except that some relief would be given. Of course, floods are caused by the friction of the channel of the river in its whole length to the sea. If it is possible to take off water from a side delivery cut like that proposed, it is obvious that under those conditions you must have a greater flood-slope, because you lower the water at that particular place. You consequently have a greater inclination, the velocity would be increased, which would therefore draw the water away quicker from the upper river.

285. *Mr. McFarlane.*] How many floods have you experienced on the Richmond? We have had a succession of floods. The river was almost constantly in flood from the time I arrived till 1895. We had four or five floods in a year.

286. What year would that be? In 1890 we had several floods and also in 1893.

287. Is that the year when the record flood took place? That took place in 1893; we had three or four floods in that year.

288. Did you observe what effect the floods had on the entrance to the river? Yes; they scoured the bar out to a very considerable depth. Very heavy floods gouge out a deep channel.

289. Which had the greater effect, the highest or the medium floods? The highest floods, no doubt.

290. Would that also apply to the channel generally from the entrance up towards Lismore? The high floods would certainly scour the banks above the normal level to a greater extent. It is the freshets however which keep the navigable channel open. The floods bring down silt and deposit it in places. To keep open a navigable channel a number of freshets would be preferable to floods.

291. Regarding the obstructions which it is proposed to remove in the river, is that to be done to prevent floods, or for navigation purposes? For navigation purposes principally. The removal of those reefs will also tend very considerably to the reduction of the flood levels.

292. Apart from the construction of the proposed channel, would the removal of the reefs have a material effect in preventing the flood from rising so high? Yes, undoubtedly.

293. How far up the river would that extend? It would extend all up the river.

294. In regard to the south channel, do you think it would be wise to cut that channel before carrying out the other proposed improvements? I should prefer to see the obstructions removed first. I stated that in my report. I pointed out that the removal of those obstructions would afford more relief than any work such as I have proposed.

295. If the channel were made first, do you think it would have the effect of creating a higher rise below Broadwater? I think if the channel were made first it would not cause great trouble below Broadwater, even if the reefs were not removed.

- T. W. Keele. 296. You do not think that the additional flow down the channel, together with the flow down the main river, would cause an additional rise between Broadwater and the river entrance? No. The water would be taken away much more quickly. The condition of time is a great element in this scheme. It is however scarcely worth while going into that, as we have already arranged to remove the two principal obstructions. We are actually about to commence work on the reef below Broadwater.
297. As a matter of fact, the reefs will be removed before the channel is made? Yes.
298. With regard to the water getting away at Blanche's Mill, would not that be relieved to some extent if a channel were cut there? I should not care to carry out a work for improving that; I should prefer to let it act in a natural way.
299. Is there any danger in carrying it out? What you refer to has been working for a long time, beyond the memory of white men, and it certainly has done no harm to the river. If a flood broke out there and the cut remained open, no doubt it would spoil the river below by silting it up. The same thing occurred on the Tweed; a flood broke out at Womyn, and it silted the river up between that place and the entrance. If this were to break out in that way it would injure the lower part of the river; but I do not anticipate that it would do so—it never has done so up to the present time.
300. There is no artificial means being provided to widen that get-away? No.
301. What class of country is it there? There are clay banks.
302. Is it a class of country that it would be dangerous to tamper with for relief purposes? Yes; I think it would be unwise to attempt to improve that channel to pass more water through than at present escapes there.
303. Is the land of a similar character to the land on the Tuckombil? It is somewhat similar. The lower part of the Evans' River is rock.
304. I am speaking of that portion at the weir? The soil there is alluvial.
305. Is it liable to be washed away? No; we have had several freshets and one flood through it, but the water has done no injury.
306. Would it be practicable to make that channel much wider, so as to give additional relief at Tuckombil? Yes; but I would not suggest that it should be made wider at present. I would recommend the deepening of the channel at the Iron Gates. We have a channel there 300 feet in width, and down to the low water level but we had to knock off the work, owing to the difficulty of going deeper. I think considerable relief would be effected at that particular place by deepening the channel there.
307. Would there be any further obstruction in the Evans' River? No; that is the only obstruction of any importance. The only reason why the river remains shallow now is because of the block of the Iron Gates.
308. From your experience of that cutting, you consider that it has already done some amount of good? Yes; a very large amount of good. Previously the river was almost completely blocked at the Iron Gates. Only a very small quantity of water went through—I should say less than one-tenth of what goes through there now. Since the widening of the Iron Gates, and the construction of the weir at Tuckombil, the floods remain a shorter time on the land between Tuckombil and Bungawalbyn.
309. Has there been a high flood since the channel was made? No; it was flowing 5 feet in depth during the flood last year, and that enabled us to form some opinion of what it would be doing in time of high flood. High floods pass 4 feet over the banks at that place into the Evans' River.
310. Would a similar result follow the cutting of this proposed channel? Yes; to the extent of relieving the land on either side of the banks of flood-waters.
311. Have you a knowledge of the Tuckian Swamp? Yes.
312. How is it affected by the local rains? The local rains bring in sufficient water to raise the level of the swamp about 1 or 2 feet.
313. What depth of water would there be there at the time of a high flood? In the highest flood we know—that of 1893—the level at the point where the proposed flood relief channel meets the swamp was 14·26 feet above low-water.
314. Would not the cutting of the channel have the effect of flooding that country earlier than it otherwise would be flooded? Yes.
315. Suppose that a flood rises to a height of about 13 feet at Coraki, would it overflow its banks between Coraki and Broadwater? No. The flood of 21st to 25th February, 1898, kept within the banks throughout. It rose 18 feet at the proposed weir, and at Broadwater its greatest height was 5·95, showing that very little water could have been running into Broadwater. In no case was it overrunning the banks. Consequently, the weir would have been discharging 6 feet of water when nothing was flowing over the banks, or passing into the Broadwater.
316. Assuming that a flood of the height of that described took place, it would not overflow its banks between Coraki and Broadwater, but if a channel were cut it would lead the water in after it rose over 12 feet at Coraki, and would not that have the effect of flooding the country round the Tuckian which otherwise would not be flooded? No doubt about it.
317. Would not the owners of land object to that? They would be very likely to do so on that account. But when they found the water would not rise so high as it usually does in high floods, they would consider that one thing would balance the other.
318. Would that apply also to land not exactly in the swamp? Well they are flooded every time a high flood takes place.
319. Is that from the local rain? No. Local rains only flood the land for a foot or two.
320. You think that the benefit which would be derived through the taking away of water at the time of high floods would compensate the people for any inundation which would take place from moderate-sized floods? I should say so.
321. Would a flood, such as that you have described, back up the Broadwater and flood the country in that way? No; I have explained that when the water was standing at 13 feet at Tuckurimba, it was only 5 feet at Broadwater. It never rose higher than 6 feet altogether at Broadwater on that occasion.
322. It has been stated by several witnesses that occasionally floods run up the Broadwater? Yes; when the water would be higher than 18 feet at the proposed weir site, and kept up for a considerable time, then the lower channel would begin to get gorged, and the water would commence to back up the Broadwater. The water would flow in to about 6 or 7 feet in the Broadwater before it would meet the water coming over the banks from the Swan Bay portion of the river.

323. Is that only in cases where the water would rise sufficiently high to overflow the river bank? Yes; only in cases where the flood would be breaking over Swan Bay, and flowing towards the Broadwater. There would be at least 6 or 7 feet of flood then at Broadwater. T. W. Keele.
13 June, 1900.

324. Several questions have been asked by Mr. Watson respecting that portion of the river between the weir and the proposed channel as to the silting of the channel; it has been pointed out by several witnesses—one of them the Mayor of Lismore—that the South Arm is frequently flooded when there is no flood in the North Arm? But there is always some flood in the North Arm.

325. Suppose there was a high flood in the South Arm, and only a moderate one in the North Arm, the greater body of water coming down the South Arm will back up the water in the North Arm? It is like driving a wedge underneath. The water from the South Arm will lift up the waters in the North Arm. Water still flows down, but it is being lifted up. There would always be a large body of water coming down the North Arm. The South Arm water causes the water of the North Arm to be blocked, and it rises, but the current would be still coming down the North Arm.

326. Do you think there would be sufficient current to remove any silt that would be deposited by the dead water? I do not anticipate the slightest difficulty in regard to the river silting up between the weir and Coraki if the weir is not made lower than 12 feet above low water.

327. You are aware that it has been contended that silting up must take place? Yes. I cannot understand how any man can assert such a thing, knowing that the proposed channel can only take a small proportion of the whole body of water in the North Arm. The flood of the 21st to 25th February, 1898, was really only a freshet; it did not rise to the level of the banks, and 45,000 cubic feet of water per second was going down the North Arm when the water was at its highest. If the weir had been there, about one-sixth of the water might have escaped through it, which would not seriously affect the velocity of the water remaining in the river.

328. This was brought out in evidence at Lismore, where it was stated that the silting of the channel would take place? I cannot see how it could take place under these circumstances.

329. Is it a fact that more silt comes down the North Arm than down the South Arm? No; the South Arm brings down the most silt.

330. With regard to the Bungawalbyn, in that stream the same quantity of water flows up and flows back again; but in the case of the North Arm it is not so? A large body of water flows up and breaks over across to Tuckombil. If silting of the bed of a channel occurs through water running up it and becoming dead, then I think the Bungawalbyn would have a fair chance of being silted up in case of a flood in the South Arm, because it brings down an immense amount of silt, and not having water from the North Arm to assist in keeping the silt in suspension. The water runs up the Bungawalbyn and deposits the silt there; then, having stood some time, a day or so, the water from the Bungawalbyn catchment area overcomes the water flowing up, and causes a current downwards, which removes the silt deposit.

331. Do you think that the same effect will be produced at Coraki? There is no doubt about it, in my mind. There would always be sufficient water in the North Arm to keep the channel open, presuming that you did not lower the water below 12 feet.

THURSDAY, 14 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
JOHN CHRISTIAN WATSON, Esq.

The Hon. ANDREW GARRAN, LL.D.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Thomas William Keele, Acting Principal Assistant Engineer, Harbours and Rivers Branch, Department of Public Works, sworn, and further examined:—

332. *Dr. Garran.*] Am I right in understanding that sometimes in this locality you have rain-water floods without very heavy gales at sea? Yes. T. W. Keele.

333. And sometimes you have a gale at sea with no excessive rainfall? Yes.

14 June, 1900.

334. And sometimes you get the two together? Yes.

335. And then it is that you get the worst floods? Yes.

336. When you only get a fresh-water flood, is there as much need for a Tuckian Relief Channel as there is when you get a sea flood? Owing to the friction on the sides of the channel, a fresh-water flood would cause a rise of the water at the off-take.

337. When you have the backing up of the water from a heavy sea and wind, how far does that salt-water go up the river? The influence of the tide is felt as far as Lismore.

338. What I mean is how far is the pressure of the salt-water felt beyond Broadwater? Probably not further than Broadwater.

339. Does the salt-water get into the Tuckian Swamp? I always thought it did; but from the evidence which I have read it would appear that the influence of the tides only is felt there, and that the salt-water does not go into the swamp.

340. Of course there is salt-water at Broadwater? Yes, the tide is brackish at Broadwater.

341. The tide alone will sometimes flood the land at Broadwater? Yes.

342. Especially when there is a gale? Yes.

343. So these floods are not dependent on flood-waters coming down the river? No; flooding of low land is caused by very high spring-tides occasionally.

344. The overflow of that salt-water damages the land? Yes.

345. So that the land is occasionally injured at present by the overflow? Yes.

346. And this proposed channel will certainly not relieve that in any way? No.

347. The only question is, whether it will do the people any injury? It certainly will not entirely relieve them.

348. The only thing to relieve them is to break through to the sea direct? Yes, in flood time.

- T. W. Keele. 349. If you carry out this Tuckian relief scheme, will it give most relief to the settlers above or below? I think that the greatest relief will be given to those in the lower parts of the North and South Arm.
- 14 June, 1900. 350. By increasing the slope of the surface of the water, it would cause it to get away more quickly? Yes.
351. It would also discharge less water into the river below the relief channel? All the water would have to pass out at the entrance.
352. Yes, but I am talking of the part between the entrance to the channel and the Broadwater junction;— all that part of the river will get less fresh water than it would if the Tuckian channel were not made? I think so, inasmuch as that it would not rise so high.
353. Therefore it would be relieved to that extent? Yes.
354. But will they go in equally with the people above? Yes, to the extent that they will not have the floods so high. They would be very rarely flooded.
355. Do you think the people between the channel and Lismore will escape floods if the weir is made with 12 feet on the sill? No. During extremely high floods there may be an overflow of the water, but in ordinary floods I think the relief channel will draw off the water and keep the stream within the level of the banks.
356. It was stated in evidence given in the country that one prolonged flood killed the crops for the year, whether it is grass or cane? Yes.
357. So that, if they are liable to one flood in the year, they would lose the whole of their crops each year that there was a flood, notwithstanding the escape channel? I think they said that unless it was covered the cane would not be destroyed.
358. But the grass would be killed? Yes, if the water lies too long on it. But, if this relief channel was in operation, the flood would get away more quickly.
359. Of course, if the relief channel is made, they expect they will get no more floods? They may be flooded, but not so seriously.
360. That will be the case right down the river? Yes, I think so.
361. So that the scheme does not provide absolute immunity against floods? No, it would be only a partial relief.
362. Will the relief be greater in the big floods or in the little floods? In the big floods.
363. When there is only a little flood, it will not act very materially? It should keep the water from overspilling the banks.
364. How often do these floods, which arise from gales outside, and from the stream inside, happen on the average? During the wet season. From 1893 to 1894, we had several very bad floods in the year.
365. Some years you are without one? Yes; entirely without them. Since 1893 we have had only small floods, and from 1870 to 1884 there were only freshets.
366. If a single flood will destroy the whole crop, four floods in a year will not do much more harm than one? No.
367. You have seen these floods? Yes, since 1889.
368. What was the effect on the grass when you saw them? They certainly killed the grass during the season of 1893.
369. How long was the water on the ground? The river was in flood for certainly half the year.
370. Could you say whether, if the water were on the grass for a week and no longer, that would kill the grass? I do not think it would.
371. Then if this channel were the means of getting the flood away within a week, you would save the grass? Yes.
372. The statement has been made that the grass being killed by the floods, the settlers had no food for their cattle? I think that what the people south of the Tuckian Swamp object to is being flooded more frequently.
373. You have no figures to show the quantity of land that would be protected by the scheme? No.
374. And you have no figures as to the quantity of land at Broadwater that would be threatened by the scheme? No.
375. So that you cannot compare the land that is to be benefited with the area that will be threatened? No.
376. You spoke to the Committee yesterday about the removal of the obstructions up the river, do you think the removal of those obstructions will tell with regard to the flood? Each obstruction causes a heading up of the water. It really amounts to a succession of steps, and if the obstructions are removed, the steps would be removed, and the inclination of water will be improved, causing a more uniform current which would deepen the channel and consequently lower the floods.
377. But how far would that tell? Up as far as the last reef beyond Coraki.
378. Take Wardell. Suppose you resolved to cut a satisfactory channel through, how far would that tell in relieving the flood? It would not prevent the overspilling of the banks on the upper part of the river, but it would take off the water more quickly. If you made arrangements there to take off 10,000 cubic feet per second more water, that quantity would be going down constantly, instead of standing, or being heaped up in the river above.
379. Would it relieve the Broadwater from the fresh water coming down? Yes, because there would be so much less water to come down.
380. It would not afford any relief to Broadwater from the sea-water being banked up? You mean it would be easier for the salt-water to get in.
381. Yes? The salt-water is driven out of the river in the first few hours of a flood. It takes about twenty-four hours after the flood has reached Broadwater to drive the salt-water out.
382. Every obstruction in the river is to some extent a hindrance to water going out? Yes.
383. If you are going to remove them you give greater facilities for the salt-water to come up? Yes.
384. Would that be likely to make the salt-water go over the land at Broadwater more than it does now? I do not think so, the tide would not rise any higher.
385. Do you not think the salt water would reach Broadwater a little more quickly? The salt water runs at the bottom of the river, and lifts the fresh water up. It would influence the tide. There would be more salt water, but it would not rise higher.
386. Do I understand you to say that the salt water clings to the bottom of the river, so that practically in the floods you have fresh water above and salt water below? Yes; until the salt water is driven out.
387. So that we may have fresh water coming down on the top and salt water going up underneath? Yes; it is owing to that action that the influence of the tide is felt as far as Lismore. 388.

388. It would be fresh water overflowing the bank? Yes.

389. It seems strange, then, that you should get salt water over there at all? The salt water mingles with the fresh to a larger extent in the lower river; but above Wardell to Woodburn the water is occasionally so fresh that you could almost drink it, although there is an actual range of the tide at Woodburn of about 3 feet 6 inches.

T. W. Keele.
14 June, 1900.

390. You propose that the Tuckian channel should be 300 feet wide; suppose after that is at work the Broadwater should be found to be unaffected, would it be better to widen or deepen that channel to give more relief? I certainly would not deepen it.

391. If you were to widen it, could you take twice the quantity of water off? No; not double the quantity. A 6-foot weir, 300 feet wide, discharging freely into air, would take 14,000 cubic feet per second. A weir 500 feet wide and the same depth would discharge 24,000 cubic feet per second, but of course much less would be discharged through a channel such as is proposed.

392. I asked what would be the result if you doubled the size? You would get less than double the outflow.

393. You would rather double the width than go down deeper? Yes; in a channel of that description.

394. Would doubling it like that give equal relief to the people above than making it deeper would give? Yes; because it will take the water off more quickly, but only a limited amount of water can be taken away without affecting the scouring action of that portion remaining in the river.

395. It would be as good for them as cutting the channel deeper? I explained yesterday that it is not advisable to go deeper. It is necessary to keep the weir to the 12-foot level, or you would lose in the scour.

396. Are you at all favourable to making a permanent relief channel opposite Goat Island? No.

397. Do you think there would be any risk in making it? Yes.

398. If the clay is so hard there as we hear that it is, why should not the additional strength given by the piling make it more secure? It all depends upon how long a flood would be discharging there. A flood discharging in a short time would not make much of a cut, but a flood lasting a considerable time would certainly cut deep. We had evidence of that on the Tweed and on the Macleay.

399. You admit that if there were a channel there, so constructed that you could control it, that would be the most direct outlet for the Tuckian channel that you could have? Yes.

400. And there would be very little danger of any flooding at Broadwater? Yes.

401. So that it would be a very complete part of the scheme if it were safe to do it? Yes.

402. The only question is, would it be safe? I prefer that it should act naturally.

403. You do not, as an engineer, care to take the risk of devising what might turn out to be disastrous? No.

404. *Mr. Shepherd.*] What is the actual distance by the river, from the mouth to Lismore? It is 62 miles from the bar.

405. And you say that the influence of the tide is felt right up to Lismore? Yes.

406. So that practically it is level almost the whole way;—I suppose there is not a rise of more than 6 feet in the tide? At the heads the rise would be 6 feet; at Lismore the range of the tide is not more than 2 feet 6 inches.

407. That would only give a fall of about 3 feet 6 inches from Lismore to the mouth of the river? Yes, on the low water gradient.

408. Have you seen any works of this character carried out anywhere else? I have not.

409. Are you of opinion that it would be of real advantage to the river to cut this canal? I think it would be a better thing to deepen the river channel, as I said in my report. I would advocate the spending of a large sum of money in removing the flats and reefs in preference to making the side delivery cutting.

410. Do you not think it would have the effect of silting up the river between the Broadwater and the weir, the extra quantity of water being brought down into Broadwater? I do not think so, if only the water above the maximum capacity of the river is drawn off through the weir.

411. It would have the effect of raising the water at Broadwater, would it not? The water would pass from the flood relief channel into the Broadwater, and away down the river.

412. Do you think it would get away quick enough to prevent the floods to a serious extent coming down the river? The water going by the weir would be so much in advance of the other water that it would escape more quickly. If this water remained in the river, it would go towards swelling the floods and causing the over-spilling of the banks. By taking that water off, we prevent the over-spilling from taking place.

413. Are the river banks there much affected by flood;—is there much washaway? In the South Arm there is a very great deal—millions of tons—being washed down and carried away.

414. Has that been owing to the river silting up at any point? The banks, being very high and steep, tumble in and silt up the bed of the river. I took the opportunity to ascertain to what depth it took place. I got our inspector to make an examination at Irvington, when the river was in high flood, and he found that the bottom of the river had silted up 7 or 8 feet, but after the water went down, the bed of the river was found to be at its normal level.

415. Is there any explanation why it should have silted up there more than at any other point? There is no doubt that it is close to the 2-mile inclination from Casino. There is a 28 feet drop there, and sand would accumulate. It went to show that during very heavy floods the river silts up in places. As the river falls we find the deposit in the river gradually lessening until, when it reaches its normal level, there is the usual depth of water, the sand having been swept away. That is the action everywhere along the river.

416. In going round a point there is generally an eddy, and that is where the silt would be—is it not? No; the silt would be deposited below the eddy. The greatest scouring effect on the bed of the river is not on the top of the flood, it is on the lower part of it. Freshets are of more use than high floods, which erode the banks and cause all the trouble.

417. This proposal, then, is intended as a sort of experiment, if you are not aware of anything of the kind having been carried out elsewhere? We are not putting it forward as a Government proposal. I think it is generally understood how the scheme came before the Committee. The scheme was originated by me at a time when the people were wanting a weir at Tuckombil, and they proposed to take away to the

T. W. Keele. sea, water which I wanted at the heads to scour the bar. I wanted all the fresh water to be kept in the river, and I did all I could to block that other scheme. I suggested to the people that it would be better to construct this scheme that we are now investigating than to do what they proposed. The other scheme was eventually carried out, and now the people are taking up this scheme as their own. It is not a departmental scheme.

14 June, 1900.

418. *Mr. McFarlane.*] Do you remember speaking about the shoaling of the river between Casino and Irvington? Yes.
419. Could you state what that was caused by? That was caused by the stuff being brought down the South Arm, from above Casino, and carried down the 28-foot incline between Casino and Irvington, and lodged in the bed of the river.
420. Are you aware that a number of years ago that river was navigable as far up as Casino? No; it never was navigable up to Casino. The navigable limit is about a mile above Irvington, and from there there is a rise of about 28 feet to Casino. It is rock the whole way, and the water runs over it in a series of cascades.
421. Does the silting extend lower down the river? Yes. I have noticed that the trouble has increased at Irvington.
422. Is it likely to increase still more? No; I do not think so, unless there is a succession of high floods.
423. Irvington is practically the head of the navigation on the South Arm? Yes.
424. *Mr. Watson.*] Do you know the composition of the soil through which the proposed channel will go? It is alluvial material throughout.
425. Do you think it such that it will be likely to scour with the action of the water, suppose the suggestion of the Department were adopted, to cut practically only a ditch, and to leave the deepening of it to the action of the flood-water;—do you think that that would take place? I believe it would. That is a proposition which I made to cheapen the cost of excavation—instead of cutting down to the bed level, to make only a gutter, and let the floods do the rest of the work.
426. From the portion of the channel which I inspected it seems to me that the soil was too clayey to be likely to scour away, and I noticed that on the further or lower side of the Tuckombil weir the channel there, in what seemed to be similar soil, has not either deepened or widened from what it was when originally made, although the floods have gone over it? No; I do not think it has scoured there at all.
427. Do you think that is similar? Yes, it is somewhat similar material, but I provided for ploughing it after every flood. If the surface was ploughed the soil would be carried away to the depth to which the plough had gone, and you could in that way get the excavation done very quickly and without much expense.
428. Could you say whether at the outlet opposite Goat Island, underneath the sand, you would come on a similar kind of clay soil? I think you would.
429. *Mr. McFadyen*, in his evidence, testifies to having assisted the flood to open that channel. He states that there is evidence of an old channel having been cut out of the clay and subsequently filled with sand, but there is no evidence that the flood ever got below a certain depth? I can easily understand that previous floods have cut the channel through there, and that sand from the beach had been drifted over and covered it.
430. From that he seems to deduce, as an argument, that there would be no danger of that channel if it were widened to afford further escape for flood-water becoming unduly deep, so as to menace the lower part of the river? I think it would be best not to interfere with that channel.
431. Of course, it does not work until the flood has attained a very great height? No.
432. The local idea is that if the natural channel were deepened, and, if necessary, a weir were put across the entrance, it would be acting so much sooner that it would give a great deal more relief than it does now? Yes; but they would get almost the same relief by cutting through the flats at Wardell. I mentioned that a width of 500 feet by $3\frac{1}{2}$ feet would take more water than would go by this proposed relief channel. If you cut deeper you would take more water away. It would not cost more than £3,000 to dredge it.
433. Do you think the dredging would be practicable? We should use the sand-pump dredge "Dictis," fitted with cutting machinery.
434. The cutting of these flats would be a more effective and safer relief than the attempt to interfere with the outer channel opposite Goat Island? No doubt it would improve the navigation and lower the flood-level, and carry away nearly as much water as would go out through the beach terrace, and what is of more consequence, the water would be retained in the river to assist in scouring the entrance.
435. Your estimate of £3,000 for the dredging works out at $3\frac{1}{2}$ d. per square yard? I have estimated the cost at 9d. per ton. We have done it for less. Some works have cost 7d. or 8d. owing to having to lead the stuff through pipes some 2,000 feet; but in a work like this, where we have only to cut an area 500 feet wide, you would not have to throw the stuff more than 500 or 600 feet, but as the material will have to be cut up before it can be lifted, I have allowed 9d. per ton to cover everything.
436. Could you give an estimate of what it would cost to remove the reef at Broadwater? That would be a more expensive work. It is basaltic rock there. It would cost from 15s. to £1 a cubic yard.
437. You have no idea what the total sum would be; it might be worth considering whether a portion of that cost might be added to the cost of the proposed channel? I do not think it would be fair to do that, for the reason that we are proposing now to remove these obstructions in the interest of the navigation. We have already two sums of £10,000 each on the Estimates for removing obstructions above Ballina.
438. Not for those particular points alone? No.
439. Have you any idea as to what the total sum would be for the work at Broadwater? I think that about £5,000 would be sufficient to pay the cost of removing that reef. The reef is in pinnacles.
440. *Chairman.*] Would it be right to describe the scheme as one which would conduct a certain portion of the flood-waters of a tributary of this river by a direct route to a reach lower down the river, instead of allowing it to go along a more devious course? Yes.
441. In justification of the scheme you rely upon the element of time? Yes.
442. Will you show how the scheme really will work? The distance is 9 miles by the proposed route as against $27\frac{1}{2}$ miles round. It takes now one day for the flood to reach Coraki from Lismore, and another day for it to reach Broadwater from Coraki. We have got that information definitely from flood observations, taken during the floods of the 21st to 25th February, 1898. It takes another day to reach Ballina. That is really three days which it takes to travel from Lismore to Ballina. The flood was at its height at Lismore on the 22nd at noon; it was at its height at Coraki on the 23rd at noon, and at Broadwater on the 24th at noon. That gives just twenty-four hours between each of those places. 443.

443. How long does the river generally remain a "banker" during a flood at any particular point, such as the point of the proposed weir? It has frequently remained there for two or three days. T. W. Keele.
444. Presuming that it stops for only two days, the element of time would only operate in respect to water which should have taken a day to go from the weir to Broadwater? Yes. 14 June, 1900.
445. After that, would the proposed channel ease the river at all;—would not the second day's water practically meet the first day's water at Broadwater, and the river be in the same condition as it would have been if the channel had not been constructed? No; the water by the proposed weir would have gone a day earlier to the sea.
446. Could you give the total quantity of water which would have gone down the river to the sea from the North and South Arms, and the Bungawalbyn Creek, and the relation which the amount that would go down the proposed channel bears to that total amount of water? In the flood of the 21st to 25th February, 1898, I think that about one-sixth of the whole body of water coming from the North Arm would have been taken away by the proposed channel when the flood was at its highest.
447. That is a larger quantity than the area of the outlet would lead one to conclude? Yes.
448. Could you give us the area of the outlet—first of the North Arm, then of the South Arm, then of the Bungawalbyn Creek, and the total as against the 300 feet by 8 feet of your proposed channel? Unfortunately I cannot give it; but I shall be able to supply you with that information.
449. If you had the totals which I have asked for, I should like to ask you would the relation between those areas be a fair indication of the relief which the channel would afford? I do not think it would, for the reason that you are only taking off water from the 12 feet level.
450. You think that the relief to be afforded would be greater than the relations between those totals? It is difficult to say. I will get these areas for you. It is difficult to view the question from that standpoint. For instance, during the last flood there was actually more water—51,000 cubic feet per second—with 16·8 feet of water going down the river opposite the weir than when it was higher. When it rose to 18 feet above low water it was only going at the rate of 45,000 cubic feet per second. There was a greater inclination of the water at 16·8 feet than there was at 18 feet. It was a bigger flood-slope, and everything depends upon the flood-slope. The fact of having a larger area does not necessitate a larger body of water coming down than you will have in a smaller area. A smaller area with a bigger flood-slope would carry more water than a larger area with a less flood-slope.
451. Do you regard this scheme as one that can stand alone on its own merits, without the removal of the reefs and rocks above Wardell? I scarcely think so.
452. You regard the removal of those rocks as an essential part of the scheme? I do.
453. Yet you do not think the scheme should be charged with the cost of removing those obstructions? No; I do not. They will be removed in any case.
454. For another purpose? Yes. I should like to say that very great relief can be given by deepening the Iron Gates on the Evans' River. That is 300 feet wide, but the channel is very much choked there. It is rock both on the sides and bottom. We widened it and cut it down to low-water; we did intend to cut it down to 3 or 4 feet below low-water, but the contractor giving some trouble, we cancelled his contract, and nothing has been done there since. I think it would be worth while to cut that down 6 feet or more; it would take off a very large body of water that at present remains on the land between Bungawalbyn and Tuckombil.
455. There is another point which requires a little more elucidation;—you stated that a channel 500 feet wide and 3½ feet deep at Wardell would carry away more water than your proposed channel, although it is practically a smaller opening;—is that because it is a lower level, and would always work whilst your proposed channel would only operate to its fullest extent when the stream was a "banker"? The 500 feet by 3½ feet by 1,000 feet will discharge 10,000 cubic feet per second more water than it now does, supposing the inclination of the flood is 6 inches per mile, which it was on the occasion of the flood of the 23rd February, 1898.
456. What will the proposed channel take off? 50,000 cubic feet per second was going then past the weir, and the water was then 4·8 feet above it. Probably 5,000 cubic feet per second would have been escaping.
457. You say that whatever water once goes through the flood-relief channel would go over that channel cutting the reef? Yes; you could cut a channel through the Blackwall Flat to take whatever quantity of water would be likely to come down the flood-relief channel.
458. The angle at which the channel relieves the North Arm is practically a right angle, is it not? Yes.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

459. *Mr. Watson*] There seems to be amongst the local residents a good deal of difference of opinion as to the effect of this proposed work—those on the upper part of the river favouring it, whilst the people below seem afraid that they may have their land more frequently flooded than is the case at the present time;—could you offer any opinion on these conflicting views? As regards the flood heights, my opinion is that the people up the river will receive no appreciable benefit from the cutting. At Lismore they will not feel the existence of it. It may, possibly, shorten the duration of the flood, but it will not lower it. The only place at which it might lower the flood a little is very near the off-take, within a certain radius. On the other hand it may tend to raise the water about Broadwater. Of course a large amount of water going into the swamp will prevent it from rising too high, but it will have the effect of raising the water there. Then it has again the safety-valve of the outlet across to the coast, where it has broken out on one or two occasions before. C. W. Darley. 14 June, 1900.
460. Near Goat Island and German Creek? Yes; it breaks out there, and that acts as a safety-valve to prevent it rising too high. In the interests of the river generally, I would prefer to see it not allowed to break out there. I would improve the river sufficiently to make it carry all the water. Experience, all the world over, has shown that where a short cut is made in connection with a river, it causes the shoaling of the river lower down. I have some information on the subject in connection with the Mississippi River. Some Commissioners there have given more attention to the matter than has been given to it in any other place. We have had no experience of that kind of work in this country, except on a small scale on the Hunter River, the result of which would be against this proposal. On the Mississippi River great attention has been given to the subject. I have had a diagram prepared of the lower portion of the Mississippi,

C. W. Darley. Mississippi, which I will show to the Committee. The general experience is that wherever you make a short cut from a river and lead through it a portion of the flood-water, you get the shoaling of the river below the point of the off-take. This work would affect the river up to Coraki, and the outlet at Goat Island, where a portion of the flood-waters escape, must tend to shoal the river between that point and the entrance, and no doubt it has shoaled a good deal of it. The general conclusion come to by engineers is to make every effort to keep the water in the river, to train the river, and equalise the flow as much as possible, then you get a channel that will not shoal, but which will have a natural scour, and keep itself clear. Wherever you draw water off from the river, you get shoaling below the off-take. The diagram (*produced*) shows 350 miles of the Lower Mississippi River. The Red River joins the Mississippi at a point 300 miles from the outlet. Close to the Mississippi comes a flood-relief channel, which would correspond to the one now proposed here, called the Atchafalaya Channel, a short cut to the ocean. A large amount of money has been spent in deepening and widening the Atchafalaya Channel, and the result has been that, whilst the Atchafalaya Channel is now carrying one-sixth of the whole volume of water that formerly went down the Mississippi, leaving only five-sixths to go down the Mississippi, the Mississippi has shoaled 31 feet below the junction of the Red River. A series of observations with flood-gauges shows that there has been no diminution in the height of flood-levels while the river has been shoaling. It is simply this, that the river has come to a state of equilibrium, is shoaling up, and is not as good a carrying channel as it was formerly.

14 June, 1900.

461. Could you say first whether the tidal influence is felt up to the point of junction you have mentioned? It is. I will read some extracts on the subject from a paper read by Mr. C. L. Corthell, M. Am. Inst. C.E. (*see Transactions, Vol. II.*) which I have brought with me:—

MISSISSIPPI RIVER.

WHEN the Bonnet Carré Crevasse occurred, the river below it, 107 feet deep, shoaled up 31', because the volume of water in the river, being lessened by the crevasse, was no longer sufficient to maintain the normal current.

We see, therefore, that the causes which control the speed of the stream, and those which give it the ability to hold its burden of solid matter in suspense, are constantly acting in opposition to each other, and the equilibrium between them is restored as often as it is distributed by alterations in volume or irregularities in channel.

P. 258. The observations made by the Commission after careful survey plainly show that the effects of crevasses and gaps in levees have been to raise the flood-line of the river above any height previously attained, and the observations further show that between Natchez and the mouth of the Ohio the deposits of sediment, *due entirely to these crevasses and gaps in the levees*, have raised the bed so much as to injure navigation.

P. 261. The facts, based upon observation and experience, show us that the proper way to utilise this land formerly overflowed by the river is to confine within its natural channel *the whole volume of water*. This we can best and most easily do by means of levees and embankments built along the river.

But we will, at the same time that we permit the overflow of the floods, accomplish a still more necessary result, and one more extensive in its influence, and that is, the *deepening* of the channel of the river.

It has often been stated, but erroneously, that levees tend to raise the bed of the river. The contrary is true, for levees deepen the bed of the river, and *outlets* and crevasses always raise it, not only in the Mississippi, but in the Po and Rhine, and other rivers of Europe.

P. 272. The Atchafalaya has been increasing in size for some time, and now carries off one-sixth the flood discharge of the Mississippi. The gauge at Natchez, however, shows that there has been no decrease in flood height of the river below the outlet.

Forum, November, 1897.

Article by Robert Stuart Taylor, on the success of the Levee System.

The next article by Gustave Dyes is entitled *Dredging versus Levees*.

IN May last, Senator George G. Vest, introduced a resolution in the Senate directing the Committee on Commerce to report on the causes of the Mississippi floods, to suggest means for preventing them, and to state what legislation was necessary. The resolution was prompted by the fact that the means employed by the Mississippi River Commission to prevent overflows and to maintain at all seasons a navigable channel, had signally failed. Whenever a majority of the tributaries between Cairo and New Orleans had contributed flood discharges simultaneously to the main river, the construction devised to carry off the accumulated volume had proved inadequate, causing breaks in the levees from 5 to 6 miles in length, while at low water stages the depth of the channel was insufficient for navigation.

Every disastrous flood in the Mississippi brings with it advocates for creating artificial outlets for a part of the flood discharge—a plan opposed by the well-founded arguments of nearly all hydraulic engineers. At first sight the proposition appears plausible. If the water volume in the main river be reduced it follows that the natural and artificial embankments (levees) must be relieved to that extent. But the question which cannot be logically answered is: How long does this reduction give relief, and what shall be done with the volume of water thereby diverted from its legitimate channel? If a flow of 30,000 feet per second (less than one-fifth of a flood discharge) be turned into an artificial channel, another river as large as the Rhone or the Po is thereby created. It is officially reported that between 1861 and 1880, £2,257,872 was expended in prospecting the embankment of the latter river. Regardless of the cost, however, such an undertaking if otherwise practicable, and the relief afforded were of a permanent nature, would be deserving of consideration. In practice the plan would be found to result in augmenting existing difficulties in proportion to the number of outlets created. The report of the Mississippi Commission, dated 25th June, 1893, says: "When completed there would be two or more rivers, each presenting the same dangers and requiring the same treatment as the present single channel."

The following extract from a paper on the Yellow River, in China, read by Mr. G. J. Morrison, before the Shanghai Literary and Debating Society, in September, 1888, is to the same effect:—

"When the Chinese have been troubled with floods in their rivers, they have been too ready to cut extra channels to carry off the surplus water. This, as a rule, is the exact opposite of what should be done. The extra channel lowers the velocity, the river deposits more silt, the bed rises, and the level of the floods becomes higher than ever."

Outlets in any form, whether waste weirs, artificial reservoirs, or waterways connecting directly with the ocean, all come under the same head and require the same treatment. Each separate part of the volume of which the main channel is temporarily relieved will require a proportionate expenditure for cost of construction and maintenance, and the object in view will fail of accomplishment.

The preliminary report of the Mississippi Commission dated 17th February, 1880, contained the following observations, which explains the methods that have since been employed in the treatment of the Mississippi River:—

"The work to be done, therefore, is to scour out and maintain a channel through the shoals and bars existing in these portions of the river where the width is excessive, and to build up new banks and develop new shore lines so as to establish, as far as practicable, the required conditions of uniform velocity for all stages of the river."

The report of June, 1893, shows that up to this date in accordance with this plan, \$25,871,066.38 had been expended by the Commission in protecting embankments against erosion, in strengthening and raising the levees so as to withstand higher flood discharges, and in the construction of spur dykes, in order to concentrate the scouring force in the channel. The report of 1893, says:—

"The effect of such improvement as has already been made has been to confine between levees a much larger high water volume, amounting in some cases, as at Mount Providence, to an increase of 40 per cent. Accompanying this increase of volume is, of course, an increase in flood height." P. 3560.

Cenni attributes the height of the great flood, 1839, to "the more perfecting leveeing of the Po and its tributaries, preventing the lateral escape of the waters, and sending in a canal to the sea that which previously flowed over the country."

Conclusions.

Conclusions.

Outlets are in any form inadmissible for permanent relief of flood-water in Mississippi.
Dredging in harmony with the laws of nature recommended.
The remedy obtained justifies construction of dredging plant of great magnitude.

C. W. Darley.
14 June, 1900.

462. Do you know whether any information is given as to the effect of the Atchafalaya outlet on the flood height above the Red River? It is stated that they found no difference 75 miles above. The fact is that if you lower a river 6 inches at the off-take you bring water down more quickly, and you establish a new state of affairs.

463. That would have the effect of lowering your level some distance above to some extent? The only effect is that it may get the river out of the valley a little more quickly—you do not reduce the height of the flood. The moment you lower the water an inch the other water comes down.

464. But you must reach a point where you do lower it? You do not lower it much. If you do lower it above and flatten the gradient, it stops running below, then it comes to a balance. I would refer to the case of the Hunter. In 1867 there was a big flood in the Hunter, and Mr. Moriarty was asked to report upon flood prevention in the Hunter River. He sent in a very valuable report upon the subject, and threw out certain suggestions to shorten the course of the river between Maitland and Morpeth. The distance by river from Maitland to Morpeth was 16 miles; but in a direct line, it is something under 4 miles. The general conclusion of the report was that whilst certain cuts could be made to shorten the course of the river, Mr. Moriarty did not recommend that they should be made. He thought it was very doubtful as to what the effect would be, and that it was very probable that it would have an injurious effect at Morpeth. In 1870, Parliament appointed a Royal Commission comprising a number of the ablest men then in the country to inquire into the subject, and they went very fully into it. Their report, which was laid on the Table of the House, dealt with the question of short-cuts; but they did not recommend them. They recommend the protection of West Maitland by embankments to keep back the water. That was all. What has happened since? There has been a series of floods in Maitland. Nearly every one of those short cuts then proposed have been effected by nature. The river has had a remarkable straightening up, so much so, that from Maitland to Morpeth by the river now is only about 8½ miles, yet the floods at Maitland have been higher than ever. A smaller rainfall will lift the river over its banks more than a large fall used to do. I am not able to offer any explanation of it; but such is the fact. We know that though the length of the river has been shortened, the bed of it has filled up, and it is not so good a discharging channel as it was formerly.

FRIDAY, 15 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

465. *Mr. Watson.*] During the visit of the Sectional Committee to the district, it was stated, and the idea C. W. Darley. was generally held, that a small flood in the river was better than a very high one as far as keeping the river clear was concerned;—what is your opinion on that? That is very natural, on the principle that I explained yesterday. A small flood is kept within the banks of the river. The Mississippi Commissioners, after a long investigation, recommended that that should be done with the Mississippi—that the water should be kept within the banks. I read carefully through the evidence last night, and I noticed that one witness stated that small floods tended to scour the river, and did not shoal them, whereas big floods often did shoal the rivers. You will find the shoals are a short distance below where the water escapes over the banks. So sure as you have a breach through the banks, and the water passing through into a creek or gorge, you will have a deposit below that point. 15 June, 1900.

466. Is there any evidence as to what proportion of the total flood would require to go through the opening to materially affect the deposit of silt? No; it would be hard to say. We have evidence that one-sixth of the water of the Mississippi escaping caused the shoaling of the water.

467. This opening would be 9 feet deep and 300 feet wide, and would be nearly one-third of the size of the river itself, allowing the river to be 30 feet deep? Yes.

468. According to the experience on the Mississippi this would be causing even a greater danger? Yes, there would be very great risk of its being injurious to the river.

469. Do you think there is, proportionately, as great an amount of silt held in solution by the flood-water of the Richmond as there is in the Mississippi? No; our rivers do not carry so much silt.

470. Is there any difference in the quantity of silt carried by the North Arm and that carried by the South Arm? I have not been on the river when it was in flood, but I should say that the greater quantity of silt is carried down by the South Arm. I know the South Arm for a great many miles up, and the banks are falling in very largely, especially since the timber has been cleared away.

471. Is it because of the clearing of the timber? I think it is very largely due to the timber being taken off the banks.

472. The breakaway of the banks does not seem to be so pronounced on the North Arm, from Lismore to Coraki, after it is denuded of timber? It is grassed over, and the banks are not so high as on the other arm. The North Arm is breaking away less than the South Arm. The South Arm, from Casino downwards, is not breaking away so much as it is up above. Large masses are falling away in some parts of the banks from the upper part of the South Arm, sending down large quantities of silt, and filling up the bed of the river. Formerly we could get up to Irvington wharf, but now we cannot get near it.

473. Would the greater amount of silt in any of those rivers be due to the caving in of the banks, or to soil coming off the catchment area? I think it is due chiefly to the caving in of the banks. No doubt,

as

C. W. Darley. as the land is put under cultivation, we shall get increasing proportions of silt from that source. Now that they are cultivating cane-fields on the slopes of the steep hills, no doubt when there is a heavy rainfall a considerable quantity of that light volcanic soil will get into the creeks, and from there into the river.

15 June, 1900.

474. Out in the West it seems to be slightly the reverse; stocking the country and hardening the ground seems to have decreased the amount of silt carried into the rivers? Yes. But when you come to cultivate the hill-sides, which were covered with roots and vines which could not be scoured away, it makes a change. Any one who has had anything to do with the cultivation of hill-sides will know how the soil gets washed away. All the hills about Lismore are now being cultivated. It is only within the last five or six years that that has commenced to be extensively done.

475. One feature, which was given some prominence to by Mr. Kemp more particularly, was that a flood in the South Arm, and only a moderate fresh in the North Arm, with the proposed channel in full operation, would cause the water to have a tendency to work up towards the proposed channel off-take? It must do so.

476. And, consequently, the amount of water going back from that point towards Coraki would be smaller than under natural conditions, and there would be a greater probability of the water silting up than there is now? That is quite likely.

477. Some of the witnesses seem to think that so long as we kept 10 or 12 feet of flood-water above low-water mark to flow down the river that would be sufficient to maintain the scour;—do you seem to agree to that? Damage might be done when the river rose high.

478. It seems that an alteration of speed in the current tends to cause the deposit of silt? Yes; the weight of silt carried is in proportion to the velocity of the water.

479. Could you offer any opinion as to the area of valuable land held for production below Broadwater which might be subject to additional flooding if this proposed channel were constructed; it has been contended by witnesses from the lower part of the river that they would be more subject to flood if the proposed channel were constructed, and in that connection it has been suggested that it might be worth while considering whether the Government should not take into account the land below, which is liable to be damaged, buy it out, and charge the scheme? I could not give any idea of the area that might be damaged; it is not very extensive. As you get down towards the entrance the land is not so valuable. The good land is limited to the frontage of the river.

480. It would appear from the plan exhibited by yourself that immediately below Woodburn the land on the bank of the river is subject to flooding now? Some land there is.

481. And that a height of 5 or 6 feet above low-water in the river is sufficient to flood it? Yes.

482. It was stated by some witnesses that king tides, combined with easterly gales, had the effect occasionally of flooding fairly large areas of land in that district? I believe that is a fact.

483. Would you care to express an opinion as to whether, if on the top of such a tide as we spoke of with an easterly gale, water is brought by the proposed channel down to Broadwater that would increase the liability to flood of the lands below? The people below would get the flood quicker. Smaller freshets which otherwise would not flood them would come down on to their land. If you let a body of water down rapidly the water will pile up near Broadwater, that is how it would do the damage. In one case a flood rose to 18 feet at Tuckurimba, but at Broadwater the next day it was only 6 feet.

484. That 6 feet at Broadwater would be sufficient to flood a good deal of land there, would it not? At Lismore it was 31 feet, and Broadwater only 6 feet. That does not hurt them very much below Broadwater. A small flood would have more effect on them if you made the cut. At present the water takes so long to come down round by the river that much of it has time to get away. If water is brought down by this short cut it will back up at the mouth of the Broadwater.

485. But it would be only a portion of the water that would run down the river, one portion going through the weir? The quantity is not far short of one-third of the river.

486. You think there would be sufficient to make a difference, causing the water to pile up down below? I think they would feel it down below.

487. It has been suggested that a gutter only should be cut in the centre of the proposed channel, and that the balance of the work should be done by the scour of the flood, but from an inspection of the site it seems to me that the soil is too clayey for that? I do not think that would answer.

488. At Tuckombil, where the soil is similar, it does not seem to scour the channel out? No; I think the bottom there is hard clay.

489. So it would appear that if the work is entered upon it would be a wise thing to cut the channel down to the required level at once? That is what I recommend.

490. *Mr. McFarlane.*] It has been stated in evidence, that the higher a flood the better the scour on the Richmond River bar, that a high flood has a better effect than a medium sized one? We always like a big flood as having the best scouring action on the bar.

491. Witnesses have also said that whilst a big flood would have that effect on the bar, it would not have the same effect on the channel of the river; what is your opinion about that? I can quite understand that statement being made. A big flood would be crossing the banks, and would cause the river to silt; the moment the river begins to leave its bed you get a deposit.

492. Mr. Fraser made a statement with regard to the entrance in a high flood having a better scour, but he also stated that you would have the same result on the river, that the higher the flood the better would be the scour in the river? That is not the case.

493. I will quote a question that was asked, and the answer which he gave—

If the proposed scheme is carried out a considerable body of water must go through the escape channel to Broadwater, instead of round by its natural course; therefore, that part of the river between Coraki and Broadwater will not have so much water passing down as if the channel were not cut. In your opinion, how would that part of the river be affected with regard to navigation? I should think the tendency would be to silt the river up. The fact of taking so much water away from the river between Coraki and Broadwater would tend to silt the main river up by reason of its not having the full force of water.

Do you agree with that? That is exactly what I am contending. In my opinion, he is quite correct.

494. Do you think the cutting of the proposed channel would have the effect of causing the silting up of the stream between Coraki and Broadwater? That is my opinion.

495. Could you give any information concerning the escape channel at Tuckombil? There has been only one small fresh since that was made. We have not been able to get any information about it yet.

496. In the event of this channel being cut, do you think there will be any danger of its washing away and

and making a short cut for the river? No; I think we could make it quite safe by using concrete and stone. C. W. Darley.

15 June, 1900.

497. There would be no danger of the channel scouring out and becoming deeper than it is desirable it should be? All the witnesses up the river are emphatic about having it cut down 6 feet. I think the danger is that if the Government made it 12 feet, pressure would be brought to bear upon them to induce them to lower it, and the people would not be satisfied till they got it cut down to 1 foot.

498. What is your opinion with regard to that contention;—a number of witnesses have stated that it was most desirable that the weir should be reduced in height from 12 feet to about 6 feet? My opinion is that it would be disastrous to the district.

499. In what way? It would block the navigation.

500. Would that be by the silting up of the river? Yes.

501. Such a large body of water going through the new channel there would not be a sufficient scour to clear the river? The water passing down the river at a reduced velocity silt would precipitate and shoal up the river. We have had experience of that on all the rivers. Wherever a river takes a short cut the long course of the river is silted up. A cut was made at the Horseshoe Bend at Maitland. When the flood of 1893 came the work was cut through, and where the river had been 12 or 15 feet deep it was filled up to the level of the banks, and when the flood went down the farmers on each side began fighting for the land. In six months there were crops growing where the water had been.

502. That improvement was carried out to minimise the floods? To take floods away from a portion of Maitland.

503. What effect has it had from that point of view? There is no doubt that it has done that.

504. Has it caused increased flooding down the river? It has cut away large areas of land.

505. Did it cause the river to rise higher than usual below where the improvement was made? I cannot say that; but we know that the same fresh now occurring in the river will cause as high, if not higher, floods than it used to cause formerly. Since the short cut has been made at Maitland the floods have not decreased in height, although the river has been shortened to a little more than a quarter of the length it was before between Maitland and Morpeth.

506. Then it would appear that the carrying out of that work was not a success? It was a success as regards taking away of the river from High-street, Maitland; but otherwise I cannot say that it was beneficial.

507. Did it do damage below Maitland? It did considerable damage to the farms in the neighbourhood.

508. Would the silting up you refer to depreciate the value of the properties along the bank of the river where the silting took place? I cannot say. The direct effect of it is that the floods now rise more readily than they did formerly.

509. Do you think it will have a similar effect on that part of the river where it is proposed to construct this channel down to Broadwater;—do you think it will injure the navigation? That is my belief.

510. Apart from the question of navigation, do you think it would have the effect of decreasing the flood-waters above Coraki on the North Arm? In my opinion, the benefit would be extremely local. There is no doubt it would cause a draft in the water near the point of the off-take, but I do not think it would be felt far up the river. I am sure it would not lower the flood at Lismore.

511. What effect do you think it would have on the lower part of the river between Broadwater and the entrance? I think that small floods would rise considerably higher.

512. What effect would it have on the high floods? As regards the high floods, there is a natural safety-valve which will always regulate the depth of the water—that is, the escape across the country to the sea by German Creek. At the same time, I should certainly like to see that escape well protected, and the quantity of water allowed to escape there limited, if the overflow was not altogether prevented. I am afraid that a big flood coming down may cause the entire river to break out there, and if that happened, the harbour works at the entrance would be lost.

513. It has been stated in evidence that if the cutting of this channel resulted in the excessive flooding of the lower river, there would be a safety-valve at Goat Island;—what is your opinion about that? That is a safety-valve for very big floods.

514. Would it be safe to make a cutting there? No; I think it would be a very dangerous thing to do. I think great danger attaches to it in its present condition. The water might break out there, and allow the river to be filled up down to the heads.

515. Is the soil there of such a character that it would be likely to wash away? A heavy flood would very soon take it away, there is a great deal of sand there.

516. You think it would be dangerous to tamper with it for the relief of floods? One of the works there should be to protect the river bank with a stone wall—to raise a good barrier of stone to limit the quantity of water escaping there.

517. You think it would be dangerous if any artificial means were adopted there to have the flood waters diverted instead of allowing them to go to the heads? If one big flood burst through there the navigation might be blocked altogether. A similar thing occurred on the Macleay; but that brought the entrance nearer to the Bay, and into a more sheltered part. The river between the offtake on the Macleay, and the entrance, a distance of 6 miles, is nearly all filled up.

518. Do you think a similar result would follow if an escape channel was made at Goat Island similar to that? Yes; you would lose the navigation from Goat Island down to Ballina.

519. It has been stated in evidence, whilst acknowledging that the proposed channel would cause higher flooding between Broadwater and the Richmond River Heads, that the removal of a number of obstructions, which it is intended to carry out, would enable the water to get away so as to relieve that part of the river from the increased flow;—what is your opinion concerning that? I think that by improving, deepening, and clearing the river you would lessen the injury that would be caused by bringing down the water.

520. You think that when the proposed improvements were carried out it would have the effect of carrying away the additional water that will come through the proposed channel? It could be made to do so.

521. I mean would the carrying out of the proposed improvements have that effect? The object of the improvements is to get deeper water. In my opinion there is everything to justify the improvement of the navigation of the river.

- C. W. Darley. 522. The carrying out of these improvements which would be sufficient for navigation purposes, would provide an outlet for the additional water that would come through the channel? No doubt it would help to get it away.
15 June, 1900.
523. Do you think it would completely carry it away without doing damage? I do not say that it would carry it all.
524. I understand that it is purely for navigation purposes that the removal of the obstructions would be effected? I have already recommended that money be expended in deepening the river, and for the navigation a narrow channel would do; but I would recommend the Government to carry out more extensive works to carry away the floods.
525. Which do you think would have the best general effect—the removal of the obstruction and the deepening of the channel of the river generally, or the proposed cutting? The deepening of the channel, because I hold that the proposed cutting will injure the navigation of the portion of the river between the offtake and the entrance. My recommendation is that they should not make the cutting; but that they should spend the money, or a much larger sum, on the river, and that would accomplish the two objects of letting out the flood-waters, and improving the navigation.
526. Are you acquainted with the Tuckian Swamp? I have been across a portion of it.
527. It has been stated in evidence in regard to the Tuckian Swamp and the adjacent country that a considerable quantity of water accumulates there from the local rains which does not entirely flood the land except in time of flood;—I want to know whether, by cutting the channel and letting in the water earlier, we should damage the properties round the Tuckian Swamp? It would put more water on the country, but I do not know that it would do much damage; it is only grazing country. What is proposed would flood a larger area than is flooded at present.
528. Would owners of property be likely to ask for compensation for that? Some, of course, would.
529. It has been stated that it frequently occurs that the South Arm is in high flood when the North Arm is only in moderate flood? Sometimes you get a larger rainfall in one place than in another.
530. When the South Arm is in high flood and the North Arm is only moderately flooded there would be a stoppage near the junction of the South Arm, and if the proposed channel were cut the water of the North Arm would flow when it got to the height of the weir and would not pass down that particular part, so that there would be dead water;—what do you think would be the effect on that portion of the channel? You would get a shoaling; but I think those that would feel it most would be the people below Coraki on the main river. Suppose a flood was coming down the South Arm and it took a short cut, you would have slacker water passing below Coraki; then you would get a deposit of silt. In the portion between the junction and the cut you would get a deposit also; but I should expect a larger deposit in the main river below Coraki.
531. With regard to the shoaling at flood-time, have you any idea of the nature of the silt that accumulates? Yes; it is coarser the higher up you get. At Tomki it is nearly all clean sand.
532. There is a difference of opinion as to which arm produces the greater amount of silt; one gentleman states that the North Arm produces the greater quantity? I have not been there in flood-time, but I believe that the South Arm would be the more prolific in silt, unless future floods should bring down a great deal of stuff from the hills near Lismore. We have had no experience of that yet.
533. Is it not a fact that the Lismore branch drains a greater amount of country than the other? The Lismore branch will drain a great deal of hilly country which is likely to be cultivated in the future, so that we shall be likely to get a great deal of silt from there. There has been no big flood since the hills have been so extensively cultivated. From my experience in other parts, I think we may expect considerable quantities of silt to come down the creeks and gullies into the main river.
534. Do you think that the quantity of silt consequent upon the flood escape being cut, extending from Coraki to Broadwater, would be a considerable item in regard to the carrying out of the scheme? I think it would be a very serious matter indeed. To keep dredging the river after every flood would be a very serious matter.
535. Do you think it would involve a considerable annual expenditure in dredging? I do. It would be a very costly matter to maintain the navigation.
536. Is that a reason why you consider it undesirable to carry out the scheme? That is my sole reason—its effect on the interest of navigation.
537. *Dr. Garran.*] I understand you to say that, if this scheme were carried out, the settlers between Lismore and the relief channel would be rather worse off than before,—is that so? I do not know that they would be worse off, but I do not think that they would be benefited. They may get rid of the flood a little quicker, but I do not think it will save many inches in the height of the water at Lismore.
538. The utmost they will gain will be a slight diminution in the duration of the floods? I should expect that the floods would pass off a little quicker.
539. With regard to the scour, if we take a freshet which comes up to the level of the banks, that would do the maximum amount of service in scouring, would it not? Yes.
540. If you got a lot of water over that in a flood, you do not want all that water for scouring purposes? No, but wherever it breaks out the bulk of the water will go over the bank. You get a reduced velocity from that point, and consequently a deposit of silt.
541. Yes, but the high pressure—that is the most serviceable for scouring—you keep? Yes.
542. The other water which has gone away is surplus water, which you did not want,—how can it hurt you to lose that? Once the water commences to break over the side the velocity is diminished in the main stream.
543. Still, you have the velocity that does the work of scouring? But there is not the same velocity past the overflow as approached it; therefore the water will precipitate silt.
544. If the water breaks out as it does now you would get that back again between where it breaks over and the mouth of the river—it has to come back to the river somewhere, has it not? You would get it all back into the river at Broadwater, but as it would pile up there quicker it will rise more quickly up to the old flood point again.
545. I understand from the evidence that in a high flood a good deal of water naturally finds its way into the Broadwater? Yes; it runs in there for a few days, until it begins to fill up from above.
546. Do you mean to say that you miss the value of that water from the channel below? It is not enough to feel it in the river.

547. What I want to get at is, how much do you lose if you keep a bank-high river? If you have a bank-high river you are not losing anything. C. W. Darley.
548. If you keep that you get the benefit after the water falls? There is 27 miles of river deprived of that scour, the water that overflows the banks at the off-take will run down and fill up the lower river, 9 miles below, and will check the flow through the 27 miles; therefore, you get stagnant water down that 27 miles of river, all of which will be depositing silt. 15 June, 1900.
549. I understand that what goes by nature into the Broadwater is not enough to do any serious mischief? No.
550. If you intensify it by making this channel, you take too much off the scour in the lower part of the river? Yes.
551. How long would it take you to clear away that indurated sand near Wardell? I think in two or three years we could do the most of it.
552. You think that that is one of the most needed wants on the river for navigation purposes? There are three or four points that want dealing with; that is one of the worst.
553. Is this a kind of work that is done out of loan money? It would be.
554. Do you get tonnage rates from steamers that use the river in return for the expenditure in deepening it? Not for works in the rivers, but there are annual dues charged for the cost of lighthouses and harbours.
555. Nothing is paid to defray the cost of maintaining the navigation of the river? No.
556. There is no direct return to the Government? No.
557. If it will take you three years to remove that indurated bed of sand, how long would it take you to remove the other obstructions on the river to give a freer flow of the water? I think that in five years the whole of that work could be done. It depends upon the amount of plant that we can bring to bear upon it.
558. When you have cleared away all the obstructions, do you think it will do more to promote the rapid exit of the water than the proposed Tuckian relief channel would do? I do.
559. So that the more valuable permanent improvement would be to improve the bed of the river? That is my opinion.
560. But even that would not prevent some flooding in the upper part? No.
561. People who have land there must expect to have the lower part of their land flooded? That is inevitable; even with the cutting their land will be flooded.
562. This land owes its richness to previous floods? It was floods that made it.
563. Now we are trying to get the benefit of the whole of past flooding, and to prevent the mischief of future flooding? Of course, there are places where the land is benefited by the floods, though the owners may temporarily lose their crops.
564. Is that where the water does not rush over the land, but moves slowly enough for a quantity of silt to settle? Yes.
565. The water comes down pretty fast, does it not? Not at a great velocity.
566. Not fast enough to wash away the surface of the soil? No.
567. Is there a danger of the surface being washed away, as it sometimes is on the Hunter River? A portion will be washed away.
568. Then you do not look upon either scheme as giving complete protection against floods? No.
569. In fact, there is no such thing as complete protection? No.
570. You are totally opposed to artificially assisting the water opposite Goat Island? I am quite opposed to it.
571. That would damage the channel below Wardell? It would.
572. You would rather build up the breakaway than prevent the water from getting away there? Well, I propose, in moving the reefs, to deposit the rock along there to make a strong barrier.
573. And would you do the same with regard to the other breakaway? Yes.
574. You would like to force all the flood-water to flow between the banks? Yes.
575. And that would be of great assistance to the works at the mouth of the river? It would.
576. Do you think that the scour at the mouth of the river is most affected by the natural rise and fall of the tide, or by freshets and floods? Freshets and floods give the best washing out.
577. The rise and fall of the tide is not fierce enough? No; it is not local in its action.
578. Has what you have done at the heads improved the channel? It has.
579. You want the scour from the river? Yes.
580. If you have three or four dry years, do you find sandbanks growing outside? With certain winds we find banks growing on the north side; but I think the freshets will take it all away.
581. You want the freshets to take that away? Yes.
582. So you still depend upon the freshets? Yes; we must always in these bar harbours. We want them to clean out the bar harbours.
583. *Chairman.*] Do you agree with the statement which you quoted yesterday from an authority that the relieving of the river at any point by any of the methods indicated in the report is usually followed by the shoaling of the river below that point? Yes.
584. This river has relieved itself at Goat Island and German Creek on several occasions;—could you say whether the effect of shoaling was observable there? We have not had a sufficient series of soundings to say definitely what the effect has been.
585. Presuming that this proposed channel were cut, would the water pile up at Broadwater to the same height as it would a distance along the South Arm and down the river equal to the length of the flood channel? The idea would be the same distance along the channel as down the river, though not quite perhaps; because, no doubt, the Tuckian Swamp would distribute a good deal of the water.
586. Then, would not that have the effect of subjecting the people at Broadwater to higher floods than they would have without the channel? Yes.
587. And they would have reasonable cause of complaint? Yes; smaller floods would injure them far more than they do now.
588. Would you anticipate any danger of the proposed channel, by erosion, becoming the river itself, or could you sufficiently protect the offtake? We could make the offtake quite strong enough to prevent that. The soil is pretty strong, and I think we could count on carrying out the work in such a way as to prevent the river from bursting through. 589.

C. W. Darley. 589. Your statement yesterday contains this:—

15 June, 1900.

Every disastrous flood in the Mississippi brings with it advocates for creating artificial outlets for a part of the flood discharge—a plan opposed by the well founded arguments of nearly all hydraulic engineers. At first sight the proposition appears plausible. If the water volume in the main river be reduced it follows that the natural and artificial embankments (levees) must be relieved to that extent. But the question which cannot be logically answered is: How long does this reduction give relief, and what shall be done with the volume of water thereby diverted from its legitimate channel? If a flow of 30,000 feet per second (less than one-fifth of a flood discharge) be turned into an artificial channel, another river as large as the Rhone or the Po is thereby created. It is officially reported that between 1861 and 1880, £2,257,872 was expended in protecting the embankment of the latter river. Regardless of the cost, however, such an undertaking, if otherwise practicable, and the relief afforded were of a permanent nature, would be deserving of consideration. In practice the plan would be found to result in augmenting existing difficulties in proportion to the number of outlets created.

You think that this proposed work is opposed to the best hydraulic practice? I do.

590. Was the effect of that cutting at the Horseshoe Bend on the Hunter to raise the height of the flood at that point? I cannot say that it had the effect of raising the flood there. All we know is that Maitland is as easily flooded now as it was formerly. It is difficult to give a definite opinion; there are so many surrounding circumstances to be taken into consideration. We get a flood there now after several rainfalls just as readily, if not more readily, than before the river was shortened by the improvement.

591. Most of the statements contained in your quotations yesterday refer to work of this character, which diverted part of the water of a river into the sea or into some artificial reservoir; but this scheme contemplates diverting the water from one part on the river to another;—does the same objection hold good with regard to that? In this case it applies with even greater force. This short cut leaves the river at one point and fills up the river 27 miles further down, causing the intervening 27 miles to silt up through the river being rendered more stagnant than it would have been if the water had been taken direct to the sea. In that case the balance would have been running down to the sea; but that will not be the case here. The water will be brought lower down by the short-cut, and that will make the water in the other portion of the river more stagnant, as it will be blocked for that 27 miles; so that this will be a worse case in the interests of navigation than that of the Mississippi. Dr. Garran asked me a question yesterday about the effect of the alteration of the flood-height on the Mississippi, at Natchez. I have here a statement on the subject, which I will read:—

Extracted from Vol. XI, Transactions Am. Society, C.E., 1882.

Statement by Mr. E. L. Corthell.

PAGE 271.—Careful examinations show that in the Atchafalaya, by the increase of its volume (and that is a very large increase) there has been a decrease of elevation; but on the other hand, in the Mississippi no decrease of flood-height has been observed, although a large volume has been abstracted from the main river by this outlet. The gauge records at Natchez, Red River, and Baton Rouge shows this to be a fact, although the abstracted volume practically amounts to the diversion of a tributary with about one-sixth the flood discharge of the Mississippi River.

That is to say, the Mississippi, below the Atchafalaya, is to-day carrying one-sixth less than it did formerly, and yet no diminution in its flood-line is observable at these points below the outlet.

592. *Dr. Garran.*] Is that because the river has silted up higher? Yes.

593. Has that been proved by soundings? Yes; they keep constant records of the soundings.

594. You have taken nothing off the top because you have added to the bottom? Yes; the river has silted up to the extent of 31 feet. The discharge has been reduced by one-sixth; but the height of the flood has not been reduced.

FRIDAY, 22 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

George Colquhoun, Crown Solicitor, sworn, and examined:—

G. Colquhoun.

22 June, 1900.

595. *Dr. Garran.*] The scheme before us is a project for relieving the upper part of the river primarily of the effects of floods, and the contrivance is to cut a channel, as you see marked on the map, across the lower part of the river to make a short cut for the water. In its main aspect it is an engineering question, but there also arises a legal question. The people on the lower part of the river will get the water a day earlier if this channel is cut than they would by the natural course of the river, and a great many of them are apprehensive that their land will be subject to flood if this additional quantity of water comes down upon it, especially if it comes at a time when there is a heavy easterly gale, backing the saltwater up the river. What we have called you for is to get your opinion as to how far the Government will be legally liable if these people should be injured. Water will be sent down the proposed channel to Broadwater, and people, not only at Broadwater, but down below Broadwater, as far as German Creek, all, more or less, profess to be anxious about the flooding of their land from the river. In a matter of this kind, we cannot undertake to say whether there will be any damage or not;—What we want to know is, what are the risks the Government run when it undertakes to bring that water through that channel to Broadwater? I understand that the stream from the entrance at the ocean is navigable up to Lismore—that there is salt-water right up to Lismore;—so that there is no necessity to consider any position at all to the westward of Lismore. The remarks that I may have to make would apply equally as well to anybody having property to the left of Lismore, though not with such great force. I was afraid that, perhaps, two different questions might arise in the matter—as to the rights of owners upon a non-tidal river, and the rights of owners upon a tidal and navigable river. I am relieved from the difficulty of the first from the fact that the non-tidal part will scarcely be affected. With reference to a navigable stream, I think it will

be

G.
Colquhoun.
22 June, 1900.

be known to all you gentlemen that the soil of a navigable stream is in the Crown; but the stream being navigable, the right of navigation is in the subject. Anyone of Her Majesty's subjects has a right to navigate that stream from its entrance up to where it ceases to be navigable.

596. It is a natural highway? That is what it is exactly. The rights of the owners of private land upon the borders of that stream are the same as the rights of what are termed the riparian owners upon a non-navigable stream, with this difference—that they cannot claim any right to the centre of the waterway on account of its being navigable. The owners on the borders of a navigable stream cannot erect anything in the shape of a pier or wharf that might be an obstruction to the navigation of that highway. With regard to the question of the right to the water, all the owners on a non-tidal and also on a tidal river are entitled to the use of such quantity of water passing by their property as may be necessary for domestic purposes, for their cattle, and so on. The rights of owners on the banks of a stream are now protected by the first sub-section of clause 2 of the Water Rights Act, which, after all, is simply declaratory of what the law was before. The second section says that an occupier of the land should have the right to use the water then being in the river for domestic purposes, and for watering cattle or other stock, or for gardens not exceeding 5 acres in extent. That is only declaratory of what the law was, except that they have put in the 5-acre area. Therefore, on the whole course of that river, any person who has private property there is entitled to the natural flow of the water. There are two other rights in connection with that. First of all, it is a well-known principle that you cannot divert from that stream such a quantity of water as would lessen the quantity that any person lower down the stream would be entitled to use. In non-tidal rivers you may, for mill purposes and other matters of a similar character, divert water, so long as you return to the stream that which is not used, and so long as you do not sensibly diminish the volume of water that passes on to your next-door neighbour. And, on the same rule, I think I am perfectly right in saying that this holds with regard to all streams that are navigable. As a matter of common law right, the owners of these properties are entitled to such quantities of water passing by the front of their properties as may be necessary for all their usual home requirements.

597. That part does not so much touch us; it is not a question of too little, but of too much, water? I am coming now to what you want to know something about. Then comes another question, that of increasing the quantity and volume of water that goes down the stream. It is just as much a wrong to increase that quantity of water as it would be to decrease the volume of water; that is, supposing that anyone, by engineering skill, could collect a large quantity of water in one place, and open the flood-gates and let that down on to his neighbour's premises, he would be liable for damages for all the injury which his next-door neighbour sustained by that increased flow of water. I think these are about the principal rules that apply to the right to the use of the water in a river. We come now to the consideration of another matter, and that is the right to divert or interfere with the course of a running or tidal stream. There is no doubt in my mind that Parliament has a perfect right to pass an Act to alter the course of a tidal river, if, in the interests of the public, it is considered right and proper to do so; but they cannot alter the stream to such an extent as to interfere with the right of navigation, for that is a higher right than the power of Parliament; and should Parliament in its wisdom think proper at any time to alter the course of a stream like that, it could only be at the risk of paying compensation for any damage that might be caused to any owners of property along which the stream originally went. In the making of a new stream, I think it almost goes without saying that that could only be done legally in two ways—either by resuming, under the Lands for Public Purposes Acquisition Act, a strip of land for the purpose indicated, or obtaining the entire consent of all the surrounding people. Upon the latter point I unhesitatingly give it as an opinion that I have been able to form, after three or four different matters which have come before me lately, that that is a very unsatisfactory mode of getting a right to the land you are going to take. After all, it is only done with personal consent. True, the land is got rid of, but the obligation on the part of those who have given it dies with them. Then, in reference to the resumption of land taken under the Lands for Public Purposes Acquisition Act, we know that compensation would have to be given to the owners of property. But whether the land is taken under that Act or not, it could not be taken from the public without compensation being provided for by Act. I mean that if this scheme is presented to Parliament it can only be carried out by a special Act adapted and suitable to the purpose, and in which all the circumstances would have to be provided for. In America it has been laid down on undoubted authority that the supreme power in the State can alter the course of a stream, but only on paying compensation to those who might be injured more or less by such an act. The amount of the compensation of course is a matter upon which no one can pass an opinion. A great deal would depend upon the value or the position of the land taken, and the improvement or deterioration of the land of the same proprietary in the immediate neighbourhood; and there is another thing to be considered, and that is that the proprietors of land at the back of those who have the river frontage may have a right of way down to the river for crossing and other purposes. I do not know that there is anything else that I could touch upon, but I shall be glad to answer any questions.

598. There is a little complication in this particular case, because the lands to which I have referred as being liable to flood, are already liable to flood in the natural course of things from fresh water, and also by the sea-water being backed up there; but the people say, "If you give us this third quantity of water through this channel, we shall suffer more from floods than we do now"? Then that is a case of damage arising from the improper increase of the velocity of the water.

599. Then it would be almost impossible for a jury to say how far a flood at a given time was traceable to the proposed channel? I should be sorry to be one of that jury.

600. The Government is, of course, open to be sued if a man thinks he has been damaged by what is done? Yes; that would be an ulterior consideration. The actual results of that may be increased very much indeed against the Government if, by cutting that stream, you bring down a very much larger volume of water, and throw it all over those farms, extending to the mouth of the river. Suppose you put 2,000,000 tons of water every day on that land; you have no right to do it. Parliament may give the right, but the country would have to pay for it.

601. The people up above are disposed to say, "Your land is flooded, but we have had such heavy rains that you would have been flooded in any case; you have not been flooded because of the existence of this channel"; then the other people say that it would not have been so serious a flood but for this channel;—there is a ground of quarrel? Innumerable questions might arise.

G.
Colquhoun.
22 June, 1900.

602. The only way for the Government to make itself perfectly safe would be to resume every bit of land liable to be flooded? Then I suppose you would resume the whole of the area shown on that map on the wall.
603. No, we might resume a fringe along the river? But it might interfere with the land further back.
604. You say that people who have not a frontage have the right of crossing, and if the river were made unduly high, they might be complaining that the bridges were put under water? Of course, that is rather a remote contingency; but we have seen bridges under water at West Maitland.
605. Supposing that increasing the floods in the river put the bridges under water twice in a year, would a man who had a right to cross the bridge have a right of action? He would have a right to cross. The damages in that case would not be very much.
606. But he is cut off from his market, perhaps, twice as often as he otherwise would be;—could he make that a ground of action? I will answer that by mentioning another case. Take the Belmore Bridge: if you were to cut a canal higher up, and throw water in such quantities down the river that it went over the Bolwarra Estate so that they could not get to the bridge, the parties concerned would have an action for damages.
607. It is not only people having water frontages who would be concerned, there might be other people? Yes; but in a case of that kind the damages would be very small.
608. The matter is so doubtful that some of the people living on the lower part of the river do not anticipate any difficulty at all; but there is a sufficient number of them who object absolutely to this scheme, on the ground that they are likely to be subject to injury; that is quite enough to make the Government cautious? That is more an engineering than a legal question. If they have not their proper volume of water, then, by diverting the stream, you have done them an injury.
609. Another question is as to the navigation of the river;—the engineers say that if we take the water down through the proposed cut we diminish the scour below, and it may be that that part of the river will silt up to some extent to the damage of the navigation; therefore, the Government would have to dredge that out with all possible rapidity;—suppose that the navigation were seriously interfered with, before the Government had time to dredge it out, would people who have a right to the navigation under natural conditions have a right of action against the Government? I think they would. You cannot go and interfere with the right of the public to navigate tidal rivers.
610. And if, in any way, we take off so much of the water that they have to lighten their boats, they can claim damage from the Government? I think so.
611. You understand that the Government are improving the navigation of this river at the entrance, and they are deepening the channel of the river by removing obstructions;—would it be any set-off for the Government to say, when charged with injuring the navigation at one part: “Look at the money we have spent on other parts of the river”? No; I do not think it would be. Kinney, on Irrigation and Water Rights, says:

The right to enter from one's own estate upon a watercourse and to pass from the watercourse to one's own estate, bordering upon the stream, exists only in the riparian owners of such estate. This right exists by virtue of his riparian ownership, and is entirely different from the public right of passing and repassing along the highway of the river. This right is exclusive in the proprietor, and extends to all portions of his domain fronting upon the water, whether it is ever used by him or not, and any interruption of it is an encroachment upon a private right, whether caused by a public or a private nuisance, or authorised by legislative enactment, unless proper condemnation proceedings had been had for it with just compensation.

The word “condemnation” is used in an American sense.

This riparian right is property, and is valuable, and the owner can be deprived of it only when it is necessary that it be taken for the public good. In *Yates versus Milwaukee*, Mr. Justice Miller says: “This riparian right is property, and is valuable, and though it must be enjoyed in due subjection to the rights of the public, it cannot be arbitrarily or capriciously destroyed or impaired. It is a right of which, when once vested, the owner can only be deprived in accordance with established law, and if necessary that it be taken for public good upon due compensation. The riparian owner is permitted to make a landing, wharf, or pier, for his own use, or for the use of the public, provided that he does not interfere with the general right of the public to navigation upon the stream.”

612. *Mr. McFarlane.*] There is an understanding that, in the event of the work being carried out, landowners are prepared to guarantee interest on the outlay, and not only that, but to compensate owners for any damage that may be caused;—what steps would be necessary to bind the landowners to carry that out? I am quite certain that the only mode in which that could be done would be by making it an express charge upon the land itself, not a mere personal obligation on those who give the undertaking.
613. Would it have to be in the shape of an Act? You could not do it in any other way.
614. Would a guarantee signed by the landowners be sufficient? No; I would not give a penny for it at the end of twenty-five years.
615. In the case of the Tuckombil flood escape there was an agreement of that sort? Yes. We have had two railway cases in which the owners have consented to give the land, and we have taken their consent; but I feel certain that taking bonds, unless you can make them a charge upon the property, is really valueless after the lapse of a few years.
616. Would that mean that there should be something like a tax on the land for the payment of a certain sum? Yes. Suppose that a work was going to cost £100,000, and the payment was to extend over 100 years, you would recoup yourself principal and interest by putting an annual rent charge upon the whole of the land in the district. Everybody who took the land would have to contribute a certain sum. If you make it a mere personal obligation, a man's heirs, executors, administrators, and assigns may not comply with it, or a man may die insolvent; then the bond is waste paper.
617. Can you give an opinion as to what area of land should bear the tax? I could not. The land in the neighbourhood should bear a tax proportionate to the advantage that might be conferred by the public work. I may mention that the river Thames, in England, divides the counties of Kent and Essex, and a tax called the Walscot has been imposed on the landowners for centuries to defray the cost of embanking the Thames to prevent it from overflowing. It remains still a charge upon the land.
618. Could an Act be passed binding the landowners to pay the tax without stipulating the exact sum in the Act which they were liable for? You would estimate the amount of the tax to be imposed beforehand.
619. The claim for compensation would be an unknown amount, and could not be estimated;—that is why I asked that question? That is a matter which I have not considered at all. If you passed an Act to

to apply the betterment principle you would obtain evidence as to how to apply that principle, and a similar course might be adopted in this case.

620. You would know the capital cost of the works, but in this case you would not know the amount of compensation that would be claimed? There might be a question of damage arising ten years hence.

621. Could not provision be made in an Act to cover all claims of that description? I do not know exactly how I should draw a Bill for that purpose; it would be a very difficult thing to do.

622. Your experience of guarantees is that they are found to be inoperative? Sometimes they are fairly well carried out, and in other cases they are ignored altogether. I find people willing to take advantage of any technicality to get out of their liabilities.

623. *Mr. Shepherd.*] There is one aspect of the matter which has not yet been discussed. There is a great difference of opinion as to the effect that this proposed canal would have on the navigation; it is thought by some that it will affect the navigation for about 27 miles, from Broadwater up to the weir, and would create still water;—in interfering with the navigation we should affect not only those who are liable to floods, but also all those who use the river? They could maintain an action for damages if you decreased their right of navigation. If they wanted to get vessels drawing 10 feet of water up the river, and the depth was so reduced that it would only admit a vessel drawing 8 feet, you would so interfere with the right of navigation as to create an injury, and, as an abstract principle of law, I think you would be liable.

624. It is possible that the navigation might be stopped altogether beyond Broadwater, and that might affect the shippers as well as the residents in the district? If you stopped the navigation from the Broadwater right up the river you will be doing a wrong to the public.

625. If it could be clearly shown that the work had affected the navigation in that way I suppose the shippers would be entitled to compensation? Yes.

626. So that is the biggest question in connection with the matter? It would affect people interested in the navigation. You have no right by any unnatural means to stop the navigation.

TUESDAY, 26 JUNE, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

JOHN CHRISTIAN WATSON, Esq.

The Hon. ANDREW GARRAN, LL.D.

ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

627. *Chairman.*] It has been urged against the proposed scheme that the diversion of the water into a new channel will be followed by defects similar to those which followed the diversion—either artificially or by natural means—of the water at certain parts of the Hunter River; will you indicate, by means of the map, the effect those diversions on the Hunter River produce in illustrating what is likely to happen on the Richmond River? The map shows the course of the river—following the blue line until it meets the brown course—previous to 1874. In the year 1874, during a large flood, a narrow neck of land between two bends of the river, at a point known as Pig Run, broke through, cutting off a considerable length of river, and shoaling up the old course. The river cut deep down, made a completely new course, and shoaled up the old course.

C. W. Darley.
26 June, 1900.

628. What was the depth of the old course prior to that time? Various depths. Running down the course of the river at low-water, the depth varied, being at different points 9 feet, 14 feet, 13 feet, 12 feet, 9 feet, 7 feet, 9 feet, and 9 feet.

629. How did the depth of the elbow of the river compare with that portion just above and just below it, prior to 1874? It is hard to say. A portion of that bend is rather deeper than the other portion. There are depths of 7 and 9 feet, with deep holes at intervals. The break-through shoaled up the old track round by the Pig Run. There are a few holes in it still, but the greater part of it is shallow. The entrance is shoaled up altogether, and the greater part of the old bed has silted up very flat. The next short-cut occurred in connection with the 1889 flood, when the river broke through at a place called Narrow Gut, about Morpeth, where there is a large bend. From there, for a distance of about 3 miles, was isolated and cut off. It was of considerable depth in parts, 13 feet, 11 feet, 8 feet, 25 feet, 34 feet, 15 feet, 14 feet, 13 feet, 9 feet, and 7 feet. The whole of that bend is now shoaled up. There are some holes left, but the greater part of it is very shallow indeed. At present, for about a mile in the neighbourhood of Largs, it is filled up above low-water 2 or 3 feet. The next break-through was in connection with the 1893 flood, from the Horse-shoe Bend, Maitland. The Government of the day had commenced to do some work there, but this had not been proceeded with to any great extent when the floods occurred and burst through the bank and swept a deep channel. The action of that flood, in filling up the river below, was more rapid than had been the case in any other instance. I attribute that very largely to the river bringing down the silt. Formerly, the soundings there were 11 feet, 15 feet, 17 feet, 18 feet, 35 feet, 8 feet, 10 feet, 7 feet, and 7 feet. A large portion has filled up; so much so, that when the river went down you could walk across it. Of course, at the lower end there is still some water, but it is very shallow. Where there were soundings of from 17 to 35 feet there are not soundings now of more than 6 feet. A short cut also occurred about a mile beyond the Pitnacree Bridge. When the floods rise 12 feet they sweep across that point. Another short cut also took place at Narrow Gut. When the river rose 4 feet it burst through there. At Narrow Gut, although the river holds its course at ordinary low-water, where there were formerly from 9 to 5 feet, there are now a great many shallows, which we have to dredge from time to time in order to keep navigation open for flat-bottomed boats. Formerly, it was all deep water; now we have to dredge several of the shallows in several places along the river to keep the navigation open for craft drawing from 4 to 5 feet of water. That is an illustration of what occurs where

- C. W. Darley. where there is a partial cut-off. At Narrow Gut, where there is a complete opening, the river has been practically filled up, as was the case at Horse-shoe Bend, where the old cut is filled up. At Pitnacree bridge, also, the river is very shallow indeed. The river comes under Pitnacree Bridge, from a spot called Pig Run. Formerly the depth varied from 12 feet, 9 feet, 11 feet, 26 feet, 18 feet, 7 feet, 11 feet, 14 feet, 10 feet, and 9 feet. It is now, however, very shallow indeed and a boat could not get up.
- 26 June, 1900.
630. Could the ordinary flood escape to the right of the Narrow Gut be taken as an illustration of what would happen to a proposed weir on the Richmond? It is a somewhat similar case.
631. You find that, as the result of that escape, that the bend which it cuts off is gradually shoaling? Yes.
632. In the case of the Richmond, the bend is a much larger one than any of those on the Hunter? It is a much longer bend.
633. And it also possesses this additional feature: that it is fed by another arm—the South Arm? There are two arms feeding it.
634. Would the shoaling in that case be as rapid as it would be in the case of the Hunter, taking into consideration the size of the bend? It is quite possible that the shoaling would not be so rapid, because I do not think that river carries so much silt. There is not so much caving-in of the banks; but I am quite satisfied that it would shoal in the course of time.
635. As far as that portion from the proposed weir to the junction of the two arms is concerned, I suppose we could naturally expect that, other conditions being equal, the shoaling would be as rapid as it was on the cut-offs on the Hunter? It might not be quite so rapid. The floods are not so heavily charged with silt.
636. Would the shoaling be so great as to render necessary the constant employment of expensive dredging plant? I believe it would.
637. And if this scheme were adopted it would be only fair to charge against it the annual cost of maintaining the channel by means of dredging plant? Yes.
638. What was the effect of the various shortenings of the Hunter River with respect to the flood-levels below them? The difference is chiefly noted about Morpeth, where they get flooded more rapidly than formerly. Formerly, when the flood passed Maitland, the different companies tried to get their goods beyond flood reach. They lifted the goods to upper floors of the stores. Now the floods come upon them very rapidly indeed. A gentleman who was working at Morpeth can give actual facts in illustration of that. I think evidence will show that floods rise higher than they did formerly.
639. Would the fact that the proposed relief channel, as guarded by a permanent weir, would only work off the top of the flood, minimise the amount of silting likely to take place in the lower reaches of the river, or would it act as a flood escape as the Narrow Gut does? It would be exactly the same. The water in the long bend at Richmond would run very slowly indeed. The water taking the short cut would be piled up at the lower end, whilst if the cut was acting at all it would be lowered at the upper end. It would reduce the velocity round the bends. One end would be raised, and the other slightly lowered by reason of the action of the short cut. The gradient you now have in the 27 miles would be largely reduced.
640. *Dr. Garran.*] In whose interest do you dredge that long piece which is filling up? In the interest of the farmers and of the drogher steamers which go to get the hay from the farmers.
641. How much does it cost you to dredge that piece of channel? We have had a dredge stationed on the river now for nearly a year, and it has cost about £2,000.
642. Would each flood put you to that expense? It is only during the last two years that we have been asked for a dredge to go there. We put the matter off for a long time, but it was getting worse and worse, and we have had a dredge there for nearly a year.
643. Another flood would not make it so bad as did the last one? It is hard to say. The action of the different floods varies very much, but it has been steadily growing and getting worse.
644. Does the Government get any return for that expenditure? No.
645. And when the river-bed is laid dry, to whom does the land belong? That is rather a legal point, but I think the farmers claim to the centre of the river. Of course it is a question whether it should or should not be looked upon as a tidal river. If it is not a tidal river, they claim to the centre. As a matter of fact, they did claim and fence to the centre of the river.
646. Where the short cuts have taken place they have gone through farming land? Yes.
647. Has there been any claim for compensation from the people owning the land? No, because most of the cuts have occurred on account of matters over which the Government had no control; they were the acts of Providence.
648. But you began a cut at Maitland, and coaxed the water into the Horseshoe Bend there? Yes. No claims, however, have come in, although I anticipated them. I think there is some legal difficulty about that matter.
649. In every one of these short cuts you see the same phenomenon of the silting up of the course? Yes.
650. Is it uniform in every case? Yes.
651. Do you know of any case of any river where there has been a short-cut made, and there has not been silting up? I cannot call one to mind.
652. You say there has been an extra rise in the water at Morpeth in consequence of the greater rapidity with which the water comes down the shorter distance;—how far does that phenomenon occur down the river? I think it gradually tails out.
653. Does it go down for ten miles? It tails out before we get to Raymond Terrace.
654. Do you think it goes as far as Raymond Terrace? Of course, they get the water quicker at Raymond Terrace now.
655. As a consequence of these short cuts? Yes.
656. What is the distance from Morpeth to Raymond Terrace by the bends? Twelve miles.
657. There is no extra flood between Morpeth and Raymond Terrace—nothing very remarkable? It is very hard to say, because the floods act so differently. Of course, we know that where a short-cut has been made a very heavy flood has occurred. That may be due to excessive rain. Sometimes they get an extremely high flood at Raymond Terrace, due perhaps to the Williams River—not to the Hunter River at all. It is very difficult to compare floods.
658. Then it is impossible to say exactly how much is due to the short-cut? I have not sufficient observations to

to enable me to make a definite statement that the floods are higher at Raymond Terrace than they were formerly, but they get the water there quicker than they did formerly. C. W. Darley.

659. The case is parallel with that of the Richmond, where two or three different causes might give rise to the high water? That is so. 26 June, 1900.

660. It is exactly the same in the Hunter? Yes.

661. *Mr. Shepherd.*] Would the character of the soil in the vicinity of these rivers facilitate the silting up in one case more than in another? There is no doubt the light friable soil will cause silting up more rapidly than it will where it is stronger.

662. And the Hunter is nearly all alluvial soil? Yes; the Lower Hunter.

663. The Richmond soil, I believe, is much harder and more inclined to be clayey? The sub-stratum is clay. There is also alluvial on the top, but not to the same depth.

664. Under those circumstances, the Richmond, perhaps, would not be so liable to silt up to the same extent as the Hunter? Not so rapidly, I think.

665. Has any portion of the Richmond a rocky bed? There are bars at intervals along the river.

666. I suppose that would be to its advantage in resisting silting up? No. If you take the current out of the river you would simply get a reduced depth on the bar. It would silt over the bar.

667. Drift soil during a flood will hardly be so much inclined to rest on a rocky as on a muddy bottom? It depends on the velocity of the water passing the rocks. If there is a choke taking place where the rock occurs, it would not rest so well; but given a uniform channel, it would make no difference whether the bottom was rock or clay; the silting would take place equally. As a rule, where you get the rock bars, the channel is somewhat restricted. The presence of the rock restricts the channel, and at that particular point the velocity would be somewhat high. There would be a heading up of the water, and a high velocity to get by the obstruction. Therefore, the silt would not be so liable to deposit; but in a uniform channel there would be no difference whether the bottom was rock or clay.

668. How do the two rivers compare with regard to fall? In the lower river about equal. As you rise the Richmond rises more rapidly. At Casino there are considerable rapids, and the river rises very quickly. Again, two of the branches at Lismore commence to rise very soon. The river gets into hilly country. Above Lismore and Casino the fall per mile is greater than the fall above Maitland.

669. That would have something to do with the scour;—the greater the fall the river has the more likelihood would there be of keeping a channel? The higher the velocity the more scour and the more silt will be in the water.

670. *Chairman.*] The flood-escape below the Narrow Gut only acts in time of flood? Only during time of fresh or flood.

671. And the result of that action is that the bend which it cuts off in time of flood is gradually shoaling up? Yes.

672. Could we say that that is an exact illustration of what is likely to take place in the case of the proposed flood-escape on the North Arm of the Richmond—I do not mean in regard to effect, but in regard to the operation? I think it is a somewhat similar case.

673. In other words, there will be a serious amount of silting following the taking off of part of the flood-waters, as in the case of the flood-escape at the Narrow Gut? Yes.

The Hon. John Perry, M.P., sworn, and examined:—

674. *Chairman.*] Have you any statement to make? Yes. For many years farmers and men of business on our coastal rivers have been subjected to periodical and great loss through floods, and various Governments have had under consideration the adoption of some means whereby floods might be to a considerable extent, if not altogether, prevented. I know of no river on our coast where such prevention can be so easily carried out, and at so small a cost as in the case of the Richmond River. In dealing with this matter, I do not propose to dwell on the necessity for the work under consideration. This has long since been admitted. As to the effectiveness of the scheme proposed, if carried out, it is with hesitation that I, not being an engineer, offer an opinion; but from an intimate knowledge of the river, extending over thirty years, during which period floods have been frequent, it appears to my mind that the scheme must be effective in a great measure in lowering the flood levels. I am strengthened in my conviction by an occurrence which, within my own knowledge, took place during the flood of 1890. On that occasion the waters broke over the banks of the river, and forced an escape to the sea below Broadwater. The result was that the river from that point to Ballina was saved from a heavy flood, and by the flood-water being allowed to escape more rapidly than it would otherwise have done, the upper portion of the river was greatly relieved of the superabundant water, and much damage to property prevented. With this experience in mind, it is fair to assume that a scheme which follows on the lines of what I may term the natural one of 1890 could be made even more effective. The proposal is to make a short cut for the flood waters to the sea. That this will lower the level of floods has been proved on the Richmond by the construction of the Tuckombil Canal at Woodburn, which I strongly advocated, and Mr. Darley, the Engineer-in-Chief, as strongly opposed. Mr. Darley was of opinion that the canal would be useless, and predicted ill effects at the entrance to the river. As to the usefulness of the work, I would refer to the flood of 1899, which was carefully watched by those interested, also Supervising Engineer Keele. I have been assured that had not the escape been provided at Tuckombil, a much heavier flood would have occurred, causing much loss; whereas, thanks to the canal, there was very little damage done. These are the views of men whose interests were at stake, and I prefer to take their practical experience before any theoretical opinion. The principle at Tuckombil is the same as that before the Committee, viz., a short cut to the sea. As to the ill effects predicted by Mr. Darley, viz., the forming of mud flats in the river if the scheme be carried out, I would like to draw your attention to the fact that the flood waters coming down the South Arm would hardly be interfered with. I will, therefore, deal with the silt effects of floods in the North Arm. We know that the flood-waters are charged with mud, &c. Under the present conditions, where the channel is throttled, there may be silting because the whole of the water laden with soil, &c., is confined for a considerable time to a much longer and a comparatively level channel, throttled in a number of places. This induces the settlement of silt above the contractions in the channel, and creates temporary mud flats in various places along the river. On the other hand, the shorter and more rapid course provided by the scheme would give a greater scour and prevent

The Hon.
J. Perry, M.P.
26 June, 1900.

The Hon.
J. Perry, M.P.
23 June, 1900.

prevent so great a deposit on the lower river except, perhaps, a useful one over the Tuckian Swamps. It may be said that silting would occur below Broadwater; but this could not possibly be so great as at present with a slower stream. To my mind one point requires careful consideration, and that is, the question as to whether the scheme would not relieve one section of the farmers to the detriment of another. In this connection I may say that the local opposition to the proposal comes from those who believe that it will do so. I, however, do not share their opinion; if I did I would oppose the proposal. But the interests of any who might possibly suffer by the scheme should undoubtedly be safeguarded by providing for compensation when dealing with the question of cost. As regards the repayment of cost, I know the people in the district who will be benefited would agree to pay a reasonable portion of the expenditure, provided all similar works are undertaken under the same conditions. I am aware that Mr. Darley is opposed to the scheme, otherwise it would have been submitted to your Committee for report some time ago. Owing to his opposition I had some difficulty in persuading my colleague, Mr. O'Sullivan, to submit it, and I certainly would not support it if I were not firmly convinced that the work should be carried out. If the Blackwall flats and the reef at Broadwater are removed, it would remove any doubt in my mind as to the liability to damage by flood-waters of the lower parts of the river not now affected. The level of the crest of the weir at the off-take should not be more than about 6 feet above high-water. Temporary wooden sills might be fixed a few feet higher; and if less water flows down the present channel in flood time, certainly, a correspondingly less quantity of silt would be deposited in the reaches between the off-take and Broadwater. I would suggest that the permanent crest of the weir be fixed 6 feet above the level and that temporary sills of timber, such as have been in use at Tuckombil, should be placed over the crest of the weir. They could be carried to any height. If Mr. Darley's predictions were fulfilled, it would be easy to shut the river off altogether by putting wooden sills one over the other at the off-take. I need hardly point out that if this water flows down the present channel in flood-time, a correspondingly less quantity of silt will go down.

675. You established a comparison between the flood relief channel at Tuckombil and that proposed on the North Arm;—does the fact that the flood relief channel at Tuckombil diverts the water direct into the sea, whilst that at the North Arm simply takes it out of one part of the river and places it in another, strike you as being an essential difference between the two methods of escape? No. The water that escapes direct to the sea by the Tuckombil escape drain carries with it silt; but there is that much more water going away, which Mr. Darley said was necessary to create a scour in the river. When the river overflows its banks there is more deposit of mud than there is when it is confined to its banks. The scour in the river actually takes place when the current is confined to the river itself.

676. Mr. Darley points out that, by diverting part of the water in the North Arm into the Broadwater, you would reduce the level of the whole of the river from the weir right round the ordinary course of the river to the Broadwater; by piling up flood waters at Broadwater, you practically make the whole of that long arm between the weir and the water one level, and considerably reduce the current, consequently there is a large deposit of silt;—have you considered that aspect of the case? Yes; but I do not think that will be borne out, because there is such a difference between the level at the off-take and the level at Broadwater.

677. Mr. Darley has pointed out that the flood escape at Narrow Gut, on the Hunter River, near Morpeth, which only operates in time of heavy flood, has had the effect of silting up the bend of the river which it actually cuts off, although the ordinary flow still continues round the bend; he stated that similar effects might be anticipated from the proposed relief channel from the weir to the Broadwater? Yes; but on the Richmond it will be different, because we are not depending on the water coming down one arm. In one case the water comes down one channel; whereas, in connection with this proposal, the water comes down the South Arm, which is not interfered with at all.

678. The official evidence went to show that, even with the waters coming down the South Arm, there would be a considerable silting up of the river, due to the construction of the flood relief channel, which would necessitate a considerable annual cost in the way of dredging;—you seem to hold an opposite opinion? Yes; and I am led to form that opinion from the fact that ever since I have been on the river in big floods the water has broken over the banks, say, at Woodburn, to the height of 3 or 4 feet. There has been a big overflow there, and the water has cut through in two places lower down the river. Notwithstanding that, there have been no flats formed by the floods, either above or below those places.

679. Is it not a fact that at the German Creek, and at the outbreak near Goat Island, the river has shallowed? I think the river cut its way there in ages gone by. There are islands there. Judging by the timber there is upon them, I do not think they have been formed since the river formed itself there.

680. Have you considered whether a larger measure of relief would not be afforded by cutting away the flats below Woodburn and the other rocks and obstructions higher up the river? I would not like to offer an opinion, more than this: I should say that the silting would be more likely to occur on a wider channel, with the same quantity of water coming down, than on a narrower one. It would undoubtedly be of use in flood-time in emptying the river more rapidly.

681. *Dr. Garran.*] You have stated that you do not think the islands in the river have been formed in any way as a consequence of the breakaway, because of the timber upon them;—how old do you consider that timber to be? I can only speak from what I have heard and from what I have observed myself. The timber there appears to be exactly of the same description as the timber in the older and harder parts of the district.

682. You could not say how many years the timber has been growing? No; because it has been cut away many times, and burnt at other times.

683. You think that the island is as old as the river channel itself? Yes; I do not think that the island has been formed by sediment coming down the river.

684. Do you think the island was there when the river channel cut through? Yes.

685. How many years do you imagine it is since the river channel cut through there as it is now? I would not like to express an opinion.

686. Do you not think it was there long before the trees began to grow? Yes; there must have been some timber there ages ago.

687. The question is whether the island itself was there? I think there has been a flat there at one time, and the island has been formed by the river coming down one channel and breaking through in a fresh place.

The Hon.
J. Perry, M.P.
26 June, 1900.

688. The island has been silted up on a shoal originally;—it has been a shoal, which has grown to an island? Some of the islands at the mouths of rivers have formed in that way; but I do not think the island in question has been formed in that way.

689. Do you think it is the original surface soil? Yes.

690. Have you been on the Broadwater? Yes.

691. Have you ever seen a flood there? No.

692. Are you familiar with the different floods which have occurred at Broadwater? I took particular notice of a flood which broke through in 1890 near Blanche's mill, and which also broke through higher up at German Creek. I was living between Ballina and Lismore at the time, and there was a strong easterly gale blowing, and a heavy flood coming down the river. Being interested in the flood relief question—I arrived in that district in 1870, when one of the heaviest floods ever known was at its height—I left my place with the intention of going to Ballina to see its effect. When I got to the Duck Creek, I found the road was dry. In connection with previous similar floods, I had to ride up to the saddle for miles before I could get into Ballina, but to my surprise, the road on this occasion was dry. When I arrived at Ballina, I asked the reason, and found that the river had broken through at the places I have mentioned, thus entirely relieving Ballina and other points up the river.

693. In connection with very high floods, does not the river naturally break through on the line of the Tuckian flood escape scheme? It comes across lower down than the off-take—about Bungawalbyn and Swan Bay.

694. Some of it gets across the peninsula? Yes.

695. In those cases, do you think some of it got across, and added to the flood in the Broadwater? I think it would.

696. Then, without any artificial diversion, the Broadwater people have to submit to a certain amount of flooding in a high gale? Undoubtedly.

697. Under this scheme, they would have to submit to more? Under this scheme they would get the water down quicker, and away quicker.

698. You consider it essential to the scheme that there should be a regulated discharge where the river now naturally breaks over? Yes.

699. In both places, or what? I think one place would be sufficient. I think the Tuckombil escape will draw a lot of the flood-water which comes down the South Arm, and which breaks across the Bungawalbyn Creek.

700. Do you think the Tuckombil escape has been thoroughly tested? I should like to be there to watch it myself. I think, however, it has been tested, because there was a great diversity of opinion between people in the district and some of the engineers who were asked to give an opinion, and the Department in Sydney.

701. Some of the evidence which has been given is to the effect that that scheme requires a still further test of good flood before we can speak positively of its effect? I have been informed by the residents there that, with the same amount of water coming down the different arms, there was a heavier flood on previous occasions than that which occurred in 1899, when the Tuckombil canal was opened.

702. You say that, as far as you know, the residents were prepared to pay part of the expense;—do you not think that they ought to pay the full interest on the whole of the cost? No, I do not; because they are not the only ones who receive benefit. I will explain in this way: when the people on the Richmond River were agitating for improvements to the entrance—they were paying 5s. per 100 feet on timber—we had an idea that we would be able to get vessels there which would take three times the amount of cargo, and thereby reduce the freight to about 2s. 6d. A great many of us thought that 2s. 6d. would be retained in our own pockets. Freights have been reduced to 2s. 6d., but the producer there does not get it.

703. Who does? The consumer in Sydney.

704. He gets it so much cheaper? Yes.

705. If the Government charged that 2s. 6d., would the consumers have had to pay it? No. Great injustice would have been done to us, because we would not have got anything for it. The consumer would have obtained the benefit.

706. But is not the material made cheaper to the consumer in Sydney because of the freight being made cheaper? Yes.

707. If the freight had been kept up to the ship's companies charging the 2s. 6d., the consumer would have had what he had to pay before? Yes.

708. If the Government had charged what it was entitled to charge, would not the cost of the timber in Sydney have been the same? Yes, to the consumer.

709. And the Government would have had interest on its expenditure? It would have been an injustice to the producer if he had been charged with the cost.

710. But as you put it, the whole of the country pays the cost, and the consumer of timber in Sydney gets the benefit? Yes.

711. Because of the Government neglecting to levy a fair charge to pay interest on its improvement? Exactly.

712. That is rather a lesson to show that when the Government makes these river improvements it will impose a fair charge to cover the expense? Yes; if that is the general policy of the country it is fair.

713. And the people in the district would have a better river and better conveniences, and would not suffer financially? Exactly.

714. The only person who could be said to suffer would be the consumer in Sydney, who would not gain? That is so.

715. That is rather a reproach on our policy for not making the river works pay? But no one likes to be the first to be brought under a new system.

716. We make enormous expensive improvements—£400,000 on one river and £400,000 on another—and your evidence is exactly the same as that which was given in connection with the Clarence River inquiry—namely, that the gain should pay for itself if a charge were levied? Yes; if you could put the charge on the right shoulders; but if you charge the people in the district you do not put it on the right shoulders.

717. Would they not pass it on? Unfortunately the producer does not seem to be able to do it; the middleman generally gets in.

- The Hon. J. Perry, M.P. 718. And if you levied a charge on the steamship company as a tonnage-tax, would they not pass it on?
 Yes, if you put it in that way.
- 26 June, 1900. 719. Is not that the simplest way? It is.
720. Do you not find the steamship companies sharp enough, as a rule? Sometimes a bit too sharp.
721. *Mr. McFarlane.* Is there a strong desire on the part of the residents of the Richmond to have this work carried out? Yes, from end to end of the river; but some of the residents at the lower end of the river fear that they will be damaged by the scheme, and will not be compensated for that damage.
722. Would there be any objection on the part of the residents above Broadwater? No.
723. So that any objection that there would be to the carrying out of the scheme would be below Broadwater? Yes.
724. That is, in view of any damage being done? Yes; just at Broadwater and below Broadwater.
725. The whole of the river, from Broadwater down, is included in your electorate? Yes.
726. You, knowing the feeling of your electorate, think the majority even below Broadwater would be in favour of the scheme? I think there would be very little opposition, indeed, to it, if that point were made clear—that they are not to be made to suffer for the benefit given to farmers higher up the river.
727. Do you think there is anything in the contention that they would be likely to receive damage in the event of a channel being constructed? I have a doubt in my mind; but that would be altogether removed if the point at which the river is throttled below there were widened. If Blackwall Flat and the reef at Broadwater were removed, I do not think they would suffer any damage at all.
728. Before the scheme is entered upon, the Department propose to remove the obstructions of which you were speaking? I think Mr. Darley was always opposed to making any cut in the river, and his idea, as an alternative, was to widen the river and remove the reefs. One objection to that would be that the present inhabitants of the place would, perhaps, be dead before the scheme was completed.
729. How would you compensate those who suffer damage? I hardly think they will suffer damage; but in case they do, I think the Department may have a sum of money at its disposal which would compensate them.
730. You have stated that the residents benefited would be willing to pay for a portion of the cost;—can you suggest how that would be levied? Levels would have to be taken, and a rate struck on the value of the land.
731. Would that be on the portions benefited? Yes, on all portions benefited.
732. Do you think the channel, if cut, would benefit higher up the river; if so, to what distance? It would benefit the head of navigation up to Lismore.
733. Mr. Darley does not think it would be of benefit, whilst other witnesses maintain that it would? It would benefit in this way: the waters would be drawn off more quickly than they are at present. The water lying on the land kills the grass and all vegetation if it covers it. The water would be drawn off more quickly. If it lies on the land two days instead of a week it must be a benefit. I cannot understand that it will not lower the flood-level. You will have two channels emptying a certain vessel, and if you draw off by two channels you must necessarily lower the water. In Lismore the storekeepers have on many occasions been put to considerable expense in removing their goods from the shelves and storing them higher up. All that means labour and loss.
734. Who were the people who agitated most strongly for this work? The people from Lismore down to Woodburn and Dungarubba Creek.
735. Has this agitation been going on for any length of time? To my knowledge, for the last twenty years, but this scheme is one which I think Mr. Keele, who was the supervising engineer, thought out seven or eight years ago. I had a doubt in my mind, which is not altogether eradicated now, that we would relieve a number of people from damage, and cast that damage on others. I am quite satisfied, however, that if the flats are removed there will be little or no danger.
736. I believe you have been living in the district for some time? I first went there in 1870.
737. Have you a good general knowledge of that part of the district through which the proposed channel will pass. Yes. Conflicting statements are made regarding the country about there in flood time.
738. The Tuckian Swamp and the surroundings of the Tuckian are rather low;—does that get filled up by the local rainfall before the flood-waters come down? Yes. I have known the Tuckian to be flooded from the waters coming down the creek, and from the other creeks running into the swamp. We have floods in the North Arm and none in the South Arm, and we have had a heavier flood in the South Arm than in the North; but there is a large extent of country where we have heavy rains draining down into the swamp. I do not think there is any opposition in that part of the country to the relief.
739. How far would the local rain raise the swamp? It would vary, I think, from 4 feet up.
740. Would that in any way approach the flood level caused by the flooding of the river and the overflow there? No. When I first went down to the river, a mailman told me he rowed in a boat from above Ballina right across to Coraki.
741. Not during flood-time? Yes. It had spilled over the banks of the river, and spread over the country about there. It is more or less swampy right across from Broadwater—in fact, eighteen months ago I went across from Broadwater to Coraki; it is low-lying country.
742. Do you know the river banks where the proposed channel runs towards Coraki? Yes.
743. Where does the flood first break over the banks? It breaks across at Swan Bay and above Bungawalbyn Creek.
744. So that it would actually break over there as soon as it would flood over a sill in the proposed channel, which is about 12 feet below low-water mark? Yes.
745. How high would the river be at Coraki when it would break over? I could not say.
746. In the event of the water coming through the proposed channel at an earlier period than it does now, it would let the water at an earlier period into the Tuckian country? Yes.
747. Would those holding the land around the swamp object to that? I have heard no objections from any one I have spoken to about that.
748. It is mostly grazing country? Yes. It is swampy country in any case. I do not think there are many people about there who would be affected.
749. Whilst it would let the water in earlier at flood time, would it have any effect in carrying the water away quicker after the flood had subsided? I think the flood-water would pass down the Broadwater, but I do not think it would make much difference. As it is, the whole of that water comes down the river and floods up the Broadwater.

The Hon.
J. Perry, M.P.
26 June, 1900.

750. We have had some evidence about flooding up the Broadwater; is that caused by waters from the upper river, or by higher tides caused by heavy gales? Both. For instance, in one part, below Broadwater, there is a reef, and wherever they are you will see a difference in the flood a few miles above. You will see a difference, above and below, of a foot. At Tuckombil, near Woodburn, there is a patch of rocks. The flood-waters often used to run up Tuckombil five days before they started to run down again, by reason of the fact that the channel was throttled and did not allow the water to escape.

751. Would the run up the Broadwater take place before it would overflow the banks higher up the river? I think so.

752. How long would that continue? Until the floods had got considerably out of the river—until the tides began to make. At times, when there is a flood, there is no tide at all in the river. At times you can see fresh water three miles out to sea.

753. Can you give us any particulars as to what benefit is to be derived from cutting the channel? The benefit I can see from it is that it will allow the water to escape to sea by a short cut more quickly than it does.

754. Would it make any difference in the rise of the river? Yes. The flood-waters will be taken off the land more quickly, and if it only makes a difference of 6 inches, it means the difference between saving a crop and losing it. If the water rises over a cob of corn, the corn is destroyed. If the water is below the cob, it is not destroyed.

755. Would it not be a good idea to minimise the floods by widening the channel at Tuckombil where the water could have a clear run out to sea? I think so.

756. You have stated that there is frequently a flood in one Arm and not in another? Not frequently; but it has occurred.

757. Some of the evidence given by Mr. Kemp is that that would have the effect of silting between the junction of the South Arm and the main river, and the mouth of the proposed channel; if there is a flood in the South Arm, and only a medium one in the North Arm, the channel would carry away what would come down the North Arm, and the South Arm, being in higher flood, would create dead water between the mouth of the channel, and silt would accumulate? It would, I think, create dead water, and whilst the water was dead there might be a precipitation of the silt; but as soon as the water becomes confined to the banks, and the level of that water going down the South Arm is the same as the level of the water going down the North Arm, a scour takes place. That is when a scour takes place. There is little or no scour at the top of a heavy flood.

758. Do you think there would be sufficient flow of water when the river got to its banks to clear away any accumulation of silt which might be there? I am sure of it. I have been trying to induce the Department for years to protect the banks from erosion. Nearly all the mud-flats are caused by the erosion of the banks of the river. Great masses of it fall in at O'Connor's farm in Swan Bay. As a matter of fact, the river now runs where there was a road. I have asked the Department time after time to protect the bank of the river, pointing out that the erosion created flats right across the river. It made a wide and a shallow channel. As a matter of fact, the steamers were stuck there the other day. Those are the conditions under which the mud-flats are formed.

759. Have there been any attempts to prevent erosion? In one or two places at the lower end of the river they have piled the bank, but there has been no systematic attempt.

760. Have the attempts which have been made been successful? Yes.

761. Where do they put the silt? In the past they have been lifting the silt from one place and putting it into another. That means that the work is interminable. Now that we have better appliances and sand-pumping dredges, they put the silt ashore, or take it out to sea.

762. *Mr. Watson.*] You have stated that, in your opinion, the effect of the proposed channel must necessarily be to reduce the level of the water above the weir, because you would be drawing off by two channels instead of one. Mr. Darley, in his evidence, instances what has been the result of works of a similar character on the Mississippi. He pointed out that the Red River, which formerly ran into the Mississippi, at the point shown on the map, had a volume of about one-sixth of the total flow below the junction. It was diverted into Atchafalaya Bay by making a canal—an old flood-water channel—and the result is that the flood is as bad to-day as it was prior to the spending of the several millions of dollars which it took to carry out the work;—that does not look hopeful, as far as the result of the present work is concerned? The two cases may not be analogous. For instance, the watershed of the Mississippi is 435 times greater than that of the Richmond River, and it would all depend where the cuts are controlled. It may be that up the river, with such a big watershed, there is not such a big get-away, and the cuts may not be large enough.

763. As to proportions, they seem somewhat similar. The diversion of the Red River from the Mississippi subtracted one-sixth of the total flood which formerly went into the main channel below the junction. In this instance it is proposed to subtract, roughly speaking, one-third of the North Arm at Gundarimba? Yes.

764. To that extent it would be somewhat analogous. It must be admitted that the same proportion of silt is not contained in the waters of the Richmond as is contained in the waters of the Mississippi; but it is evident that the silting up of the Mississippi was very remarkable after the subtraction of the waters of the Red River. There seems to be a consensus of opinion amongst engineers in other parts of the world that it is not a wise thing to do anything which will have the effect of varying the velocity of a current in a river. Wherever the velocity is smaller at one point than at another there is bound to be a deposit of silt. Which is the more important to the people of the Richmond generally—the maintenance of navigation, or a possible minimising of flood? I should say the maintenance of navigation.

765. That necessity is always with them? Yes; for this reason: Floods occur and cause a good deal of damage. If they occurred very frequently there would not be much need to improve the river, because there would be no produce to take away; but if it is a question of blocking the waterway, and taking one flood off in two or three years, I should say, "Keep the waterway open."

766. The chief objection raised by the engineers seem to be to the variation in velocity of the current below the weir, and round as far as the Broadwater, as compared with what it will be above the weir. That, maintained with the variation induced by drawing off portion of the water, will be sufficient to cause a deposit of silt below. If that is done, it will be so much more difficult to keep the channel open for navigation? I do not think that would occur. I recollect having a conversation with Mr. Keele with

The Hon. J. Perry, M.P.
26 June, 1900.

reference to a deposit of silt, which a Mr. Blakeney, who is in charge of snagging on the river, reported to him. The people agitated straight away for a dredge to be sent there. I think it was caused primarily by some willows falling in, and that accumulation of stuff against them, as well as a falling in of a large portion of the banks. It was stated that a dredge would have to be brought at once to remove this, as the steamers could not get up. When, however, the flood had gone down, and the river had got to its normal level, this had disappeared, proving that the scouring takes place during the last few feet of the flood, and not by the top of the flood.

767. Might it not occur that you would ensure a better scour by having a uniform flow down the river? Yes, I think it would be better; but I think you would have to build the banks of the river above the highest known flood, for the simple reason that there are many escapes along the banks into different places? If you make any permanent improvement in that way, you will have to provide not only for a uniform width of the escapes, but for a uniform height of the banks.

768. It has been suggested that the only way to get over the difficulty with respect to the possible claims for compensation which might arise through the carrying out of the scheme would be to resume the farms which might be subject to flood on the lower part of the river, charge the cost of resumption against the scheme, and credit the scheme at the same time with whatever was realised from the resale of the farms after it was in operation? It would be a simple way to deal with the matter to resume the land at the present prices. It could be sold afterwards under the altered conditions of things, and then there could be no claim for compensation.

769. You will admit it is a difficult thing to determine to what extent it is possible they may be damaged? Yes; that would not be possible.

770. Could we say whether there is a large area which would be subject to flood below Broadwater? I do not think so; as a matter of fact, I think more damage is done on the lower end of the river by king tides and an easterly gale, because it brings over the salt-water, which spreads over the grass and crops and destroys them, whereas flood-waters, if there is any silt deposited, enrich the land.

771. That was one of the objections raised by the people on the lower river—that they were subjected to king tides with an easterly gale;—if they occurred in conjunction with a flood they would find themselves in a worse plight than they are in now? In 1870 there were strong gales and heavy rains. I do not think there was a farm from one end of the river to the other which was not flooded then.

772. It would appear that in order to remove all possibilities of claims for damages you would have to resume a great area? I do not think there is a great area which would have to be resumed. It is a narrow strip between the river and the ocean, and a good deal of which is swampy and sandy.

773. Is there no low-lying land on the left-hand bank, below Wardell? There are sandy heaths. At the back of Pimlico there are farms, with some good land right through.

774. Is that subject to flood? No; no one has ever heard much of anything in the shape of a flood below there. They are damaged more by an easterly gale and a king tide.

775. *Chairman.*] Which is of greater importance to the people of a district—a means of reducing the flood or permanent navigation, taking the whole of the river and the district supplied by the river? Undoubtedly the navigation.

776. If there were any prospect of this scheme endangering permanent navigation, would you care to advocate it? Not if the scheme would permanently endanger the navigation; but I do not think there is the slightest probability of it.

777. You have made a statement as to the way in which the cost of the scheme might be defrayed: Presuming that the Departmental fears were realised, and that a considerable portion of the river between the weir and the Broadwater silted up after every flood, it would naturally follow that a considerable amount of dredging would have to be done to keep the channel free;—do you think, in addition to the primary cost of the scheme, it would be a fair thing to charge it with the subsidiary cost of dredging? No; because you would have to dredge now. I am prepared to admit that an officer opposed to the scheme would say that there was more silt deposited by reason of the flood, and that he would perhaps want to make a charge upon the people; but we have to dredge now, and have had to do so for some time. If it is possible to lower the level of the flood, less of the banks will fall into the river, and there will be less dredging to do.

778. *Mr. Watson.*] Is not a certain proportion of silt brought down from the headwaters of either arm by the floods? Yes; there is not much brought down the North Arm. There is a good deal of heavy stuff brought down the South Arm; but in either case I do not think very much of it reaches the main river. In the South Arm there is heavy sand, and when the banks are overcharged with water they keep slipping in, and it is deposited in the arm itself.

779. What is the average height of the banks from the Broadwater to the proposed weir? From 4 feet upwards. I may mention that the steamers going up the river create a wash or draught, and that undermines the banks to a considerable extent. When the floods come up on the top of it, the weight of the water presses the bank into the river, and then there is a slip.

WEDNESDAY, 4 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Henry Dumaresq Portus, Traffic Manager for the Newcastle and Hunter River Steamship Company, Morpeth, sworn, and examined:—

H. D. Portus. 780. *Dr. Garran.*] Are you a resident of Morpeth? Yes; I am a native of Morpeth, and I have been there during the greater part of my life.

4 July, 1900. 781. Have you had an opportunity of seeing many floods in the Hunter? Yes.

782.

782. We are engaged in an inquiry as to what will be the effect on the navigation of the river by making short cuts for flood water; we have been given to understand that there are at least three short cuts which have been made by Nature in the Hunter between Morpeth and West Maitland;—are you acquainted with those cuts? I know two of them. The cutting at the Pig Run I have not seen; but I know the one above the township of Largs. H. D. Portus.
4 July, 1900.

783. Each of these short cuts was made in different years;—do you know anything of the floods which gave rise to them? The cut above the punt at Largs broke away in 1890; that is known as Narrow Gut.

784. Was that an unusually high flood? I was not at Morpeth then; but I have some particulars of the heights of floods before that time, and they show the effect on Morpeth and West Maitland. During the flood of April, 1870, the highest record at West Maitland was 34 feet 6 inches, and at Morpeth 13 feet 6 inches. During the March, 1875, flood the height was 33 feet at West Maitland, and 14 feet 5 inches at Morpeth.

785. That is a tremendous difference? There is always a difference of about 20 feet as between Maitland and Morpeth.

786. Is there such a get-away at Morpeth as to allow for that? The water is congested about Maitland; it comes down rapidly from Singleton to Maitland and is congested about Maitland, and then comes down slower to Morpeth.

787. Does the overflow on the land diminish the flow at Morpeth? Yes.

788. It acts as a flood moderator? Yes.

789. If those lands were protected against floods, you would have a rush of water at Morpeth? Yes. That has been the effect of the embankments. As the embankments have been proceeded with from time to time about Bolwarra, there has been a higher rise at Morpeth. The 1875 flood was the one in which the Honorable Mr. Arnold was drowned. In May, 1889, the height at West Maitland was 33 feet 6 inches, and at Morpeth, 12 feet 8 inches. I am not sure what the height was at Maitland in the March, 1893, flood—I believe it was 38 or 39 feet, and at Morpeth, it was 19 feet 8 inches. In January, 1895, the height at West Maitland was 32 feet 6 inches, and at Morpeth, 15 feet 2 inches. During the flood last year the height at West Maitland was 30 feet, and at Morpeth, 16 feet 6 inches. The water comes down much more quickly since the breakaways have occurred, and is relatively much higher about Morpeth.

790. Of the three cuts the nearest from Morpeth is what is known as at Narrow Gut? Yes.

791. Do you know what the height of the water is there in time of flood? No; but it is considerably higher than it is at Morpeth.

792. And yet it has passed by the greater part of the land which is flooded? There is a lot of land below Narrow Gut which is flooded—Phoenix Park, for instance.

793. Still it is the nearest to Morpeth? After it passes that cut, it breaks over Narrow Gut, and makes a short cut of itself; then it overflows at Howe's Lagoon and comes down about Morpeth.

794. Does Phoenix Park get flooded much? Yes; it did during most of the floods which I have spoken about, and last year there was scarcely a dry spot on it.

795. That must greatly relieve the water at Morpeth? Again, there is the difficulty below Morpeth. There is a restricted channel below Hinton, and the water is forced back upon Phoenix Park and Narrow Gut.

796. What restricts it? The narrowness of the river.

797. Is there no rocky bar? There is one 3 miles further down—the Green Rocks.

798. What is the effect upon the original circuitous channels of the river of a short cut;—is any of the silt deposited in them? Yes; there is a considerable deposit of silt. Even after the last fresh there has been a considerable deposit of silt above Largs. The steamship companies have droghers going up the river, and since the fresh of a fortnight ago there has been a considerable silting up.

799. How far do you send the droghers up? About 6 miles.

800. Do you mean 6 miles, including the winding of the river? Six or 7 miles.

801. Do you get to the western side of Narrow Gut? Yes.

802. And much above it? About 1½ mile.

803. The other two cuts do not affect you at all? Not as far as the navigation is concerned.

804. Supposing the river were navigable, commercially, to Maitland—which it is not—would the effect of these short cuts be to spoil the natural bed of the river for that navigation? I think so.

805. You could not take a boat up to West Maitland now? No; not by the old channel. You could take a light draught boat, drawing a few inches.

806. But you could not get through the channel where the township is now? No; a portion of the channel at the Horseshoe Bend is silted up completely.

807. Supposing it had been the custom to take steamboats to West Maitland, the natural operation of these floods, by cutting off the bends, would have stopped that navigation? I think so.

808. You state that the old channel is greatly injured? Yes; and the portion marked brown on the map is now quite dry at low tide.

809. If Narrow Gut were more than a mere escape for high water, and the river cut through there to its full depth, would it intercept the course round the old bend? No; in time the same effect would be produced as has been produced at West Maitland—it would silt up.

810. You would have a shorter cut, and you would be able to get up the short channel, and, perhaps, a little higher up the river, but you would not be able to go round the bend? No; lots of farmers who have river frontages would be completely cut off.

811. And they rely on your boats to fetch the produce away? That is the only means of getting produce away.

812. Do you ever get the flood over your wharf at Morpeth? Yes; as much as 8 feet over it.

813. Does it come into your sheds? Yes, into the lower sheds.

814. Do you keep bales of hay in the lower sheds? No. Knowing the height of the floods above, and being in telegraphic communication, we take the precaution of putting the hay into the droghers.

815. So that now-a-days you never get any hay spoilt? No. During the 1893 flood I was working all night helping our men to remove cargo—150 tons—hoisted to the higher level.

816. Then you can hoist cargo to a higher floor? Yes; or we can put it into the droghers, whichever is the more handy.

H. D. Portus. 817. The works which were made to protect the bank at West Maitland are now really no longer necessary;—I believe they did some piling there in order to prevent the water breaking the banks down? I do not know much about that.

4 July, 1900.

818. At any rate, the town is no longer threatened by floods? Except by high floods—floods which would rise over the embankments. During the 1893 flood the greater part of West Maitland was under water.

819. But still there would not be such a strong current running in the old channel? No.

820. The danger to West Maitland would be in the banks falling in? Yes. Of course they have blocked up the natural safety-valve in Wallis Creek, and this, with the embankments, has had the effect of raising the height down the river.

821. And it has prevented the Wallis Creek people being so much flooded? Yes; but there is a greater extent of cultivation about Morpeth than there is there. The effect of that was seen in connection with the last flood relief. About eighty farmers applied for flood relief about Morpeth, as against twenty at West Maitland.

822. Then the good done in one direction has been balanced by harm done in the other? Yes. The great mistake was that the works were not commenced lower down—at Newcastle—and brought upwards.

823. I believe you have had four or five dry years in the district lately? Yes.

824. Has the land during that period suffered from the want of a flood—from the want of top-dressing, for instance? I do not think so. I do not see any falling off in the quality of the hay. About Bolwarra they still get good crops from the land, although the embankments have excluded the waters from it.

825. Has any opinion been formed by the settlers as to the number of years they can go without a flood, and without the ground suffering? There were no floods from 1840 to 1851, and there were none from 1851 to 1857.

826. Did the crops show any sign of suffering during that period? No. The only thing was that the constant cropping of the land caused it to give out. I may mention that wheat-growing was the great industry in the Hunter River district prior to 1857. Then, owing to constant cropping, the rust affected the wheat, and the farmers went for lucerne.

827. I suppose the lucerne roots would extend a long way down below water-level? Yes.

828. And they would draw nourishment at the depth to which they would go? Yes; it is all alluvial deposit.

829. Then you do not think that the last few dry years have injured the soil to the slightest degree? Not appreciably.

830. You do not see any difference in the quality or quantity of the yield? No; the yield keeps up.

831. It is important to ascertain whether, if we keep the floods off the land altogether, we shall not also keep the manure off? Of course, if the river could be regulated like the Nile, it would be all right.

832. I suppose the people would like a flood in winter time? Yes; when they have nothing on the land.

833. Would they like a flood just now? I am afraid it would kill the lucerne just now.

834. Do they cut the lucerne all the year round? Yes; five or six times a year.

835. But not so frequently in the winter as in the summer? No.

836. Is the lucerne as nutritious in the winter as it is in the summer? The spring cutting is the best.

837. You are of opinion that whether the short cuts are made by nature or by art, the effect is to destroy the old channel for navigation? That is the effect.

838. How many feet do you think the water would rise at Morpeth beyond what it would rise if there were none of these short cuts? It would make a difference of 4 or 5 feet. During the flood of May, 1889, before the breakaway at Narrow Gut, the height was 33 feet 6 inches at West Maitland, and only 12 feet 8 inches at Morpeth. In the flood of 1895 it was 32 feet 6 inches at West Maitland and 15 feet 2 inches at Morpeth. There is a difference of 2 feet 6 inches there with a foot less at West Maitland.

839. Have you ever seen the whole of Phoenix Park covered with water? Yes, in 1893. It was also covered in August of last year, and Narrow Gut as well.

840. Have you had much flood this year? No; we have had a fresh.

841. I suppose the ground is now so saturated that if a heavy rain came it would go off in the river? Yes. The swamps, too, are quite full.

842. *Mr. McFarlane.*] You state that since several new channels have been opened between Morpeth and Maitland, which means a shorter flow for the water in flood time, it has left a higher rise in the river at Morpeth? That is so.

843. Would that mean a less rise at Maitland? It would make some little difference there. The water would get away from there quickly.

844. So that the less rise at Maitland would mean a higher rise at Morpeth? Yes. The reason of the higher rise at Morpeth is that the Paterson and Williams are always in flood at the same time as the Hunter. Formerly they had time to get away. Now the water is blocked, and the Hunter River comes down quicker and causes the rise at Morpeth.

845. Have you any information as to what effect it will have between Maitland and Singleton? I do not think it will make any difference there.

846. Would not new channels affect the river above Maitland? I do not think they would make much difference.

847. Below Morpeth, what would be the effect if the water came down so much quicker than by the old channel;—would it have the effect of flooding, to a greater extent, the river below Morpeth? No; it cannot get away so quickly just below Morpeth and Hinton. There is a bank on one side, and Mount Pleasant on the other, and that prevents the water getting away. It is congested, and is thrown back to Phoenix Park. It is congested again at Hinton. If it were not for that, Miller's Forest, lower down, would get swamped out.

848. Would not the water coming down so much quicker and so much earlier have the effect of causing a great current? No; because it is backed up by the waters below—the Paterson and the Williams.

849. So that the only parts really affected would be to the advantage of Maitland in the first place, and to the disadvantage of Morpeth in the second place? Exactly. Morpeth itself is not flooded, but the country opposite Morpeth is flooded.

850. You state that the opening up of the new channel has had a bad effect on the old channel from a navigation standpoint? Yes.

851. It has completely blocked up several portions of the old channel between Morpeth and Maitland? H. D. Portus.
Yes. The part marked brown on the map is completely silted up.
852. Have you any knowledge of the Richmond River? No. I have been from Ballina to Lismore, and that is all. 4 July, 1900.
853. Do you think the effect that would be caused by these short channels—that is, in shoaling the rivers at the bends—would apply generally to other rivers similarly situated? I think so. If you make a cut you cannot very well control the water; it takes charge and becomes the main channel. Even if you make a sort of get-away above high-tide mark, there is always the risk of it breaking through, and that becomes the main channel, and cuts off the other portions of the river for navigation.

MONDAY, 9 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Robert Pyers, Esq., M.P., sworn, and examined:—

854. *Mr. McFarlane.*] You are the Representative of the Richmond Electorate in the Legislative Assembly? Yes. R. Pyers,
Esq., M.P.
9 July, 1900.
855. How long have you resided in the district? I resided for twenty years on the Richmond, and for ten or twelve years on the Clarence.
856. You have resided for the last twenty years on the Richmond? Yes.
857. Have you considered the proposal to construct a flood-relief channel, known as the Tuckian Scheme? Yes.
858. Have you a statement to make? Yes.
859. Will you be good enough to read the statement? It is as follows:—

I have been a resident of the Richmond River for the last twenty years, and previous to that resided on the Clarence River for about eleven years, and have a good knowledge of the Richmond River and its tributaries—in fact, all its drainage area. Having been for many years a ship and steamboat owner, and largely interested in buying and shipping timber to Sydney, New Zealand, and the other colonies, I was put to a lot of trouble and loss by losing timber during floods in the river, so am well acquainted with the losses the residents have suffered by floods there; and for the last six years I have, with the other Members for that river—Messrs. Ewing and Perry—been urging each Minister for Works, viz., Messrs. Young, Lee, and O'Sullivan, to have this work of constructing the Tuckian Scheme carried out in one of the forms devised by Mr. T. W. Keele, Assistant Engineer for Harbours and Rivers, but was always put off by Minister Young, that Mr. Darley, the Engineer-in-Chief, was opposed to the scheme, and he could not move in the matter. And on Mr. C. A. Lee taking office, we got him to go fully into the matter, and he promised to put the proposal to the Public Works Committee for report. Mr. Lee left office before this was done, and the present Minister for Works, I am pleased to say, had the proposal put to your Committee without any further delay. Now, I have no hesitation in stating that, in my opinion, the construction of this Tuckian Scheme will lower the height of the flood-waters of the Richmond very considerably, even if carried out with the take-off at 12 feet above low water, as all the water that goes through the weir will be out to sea before it would be round the river to Broadwater as it now runs.

Re the take-off, I must say that my opinion is the same as all those on the river that take any interest in the matter is, that it should not be higher than 6 or 7 feet above low-water mark; also, that there should be an opening cut from the Broadwater up some distance into the Tuckian Swamp towards the take-off, to let the flood-water coming over the weir out the shortest way possible, and this would drain the swamp at the same time; and this would be a very important part, as the waters coming out of the four creeks, viz., Marom Creek, Gum Creek, Tucki Tucki Creek, and Young Man's Creek, into Tuckian Swamp, would be out to sea before the waters of the North Arm broke out at the take-off.

Re Mr. Darley's evidence, *re drains cut by Mr. Henderson from the Broadwater into Tuckian Swamp letting the tidal waters in on to the land,* is absolutely incorrect, as no such thing has ever taken place; and I have no hesitation in saying that Mr. Darley has been misinformed in the matter, as he has also certainly been in the cost of cutting the drain there by Mr. Henderson, say, £5,000 to £7,000. From my knowledge of work I should say the whole of the work would be done under £500.

Re Mr. Darley's opinion as to the river shoaling if the scheme is carried out as proposed. In my opinion that is only imaginary, as the North Arm only drains about one-third of the drainage area of the Richmond River, and not a third of that would go over the off-take, the other two-thirds going down the river.

And another thing to be taken into consideration is that, when the South Arm is in flood of any height, large quantities of water flow through every inlet from Tomki to Codrington into Pelican-tree Creek, which flows into the North Arm some distance above the proposed take-off. This water having to come down the North Arm, will always have the effect of helping to scour-out the river; and as for the river flowing from the junction at Coraki back up to the weir, is, in my opinion, simply nonsense, when you know the direction the water takes when the South Arm is in flood; and as for the river from Coraki to Broadwater, the South Arm, which drains about twice as much country as the North Arm, will certainly keep this clear, allowing all the Bungawalbyn water to go out through the Tuckombil weir, which is not the case.

And if Mr. Darley's theory is correct, as to the silting-up of the river, how is it that Bungawalbyn Creek does not silt-up, as the water coming down the river, in four floods out of five, flows up that creek from one to two days before it meets the water coming down the creek; and then the bulk of that water spreads over the low flats towards Tuckombil, and eventually empties into that creek, leaving little to scour out Bungawalbyn Creek, as most of that water takes a short cut over the low country into Tuckombil Creek.

And Bungawalbyn Creek has not shoaled up, and this has been going on for ages, no doubt, and there is always from 10 to 12 feet of water as far as the creek is navigable, where it is rock-bound, some 10 or 12 miles up. I think there can be no stronger proof than this that Mr. Darley's idea is only an imaginary one. And as to quoting the silting of the Hunter River, near Maitland, I am well acquainted with that portion of the Hunter, and must say that case has no bearing in any way with the Richmond River, as the Hunter River has no tributaries or arms running into the bends of the river that are cut off by the short cuts made by the floods there like the South Arm and Bungawalbyn Creek, which have two-thirds of the drainage area of the Richmond River. Besides this, those cuts through the Hunter were washed out to the level of the bottom of the river, whereas the take-off at the weir on the Richmond, at whatever height, will be thoroughly protected some feet above low-water mark, and there will always be sufficient water left running down the river after it has ceased running over the weir to scour out the river down to the junction of the South Arm at Coraki.

As mentioned before, my opinion, and that of all the people interested in this scheme, is that the take-off should not be more than 7 feet above low water, and that timber sills could be placed on up to the height devised by Mr. Keele—12 feet—and these could be removed after a test by flood, and replaced if found not to work well, which I feel sure would not be the case.

R. Pyers,
Esq., M.P.
9 July, 1900.

I would also like to see the openings into the sea at Goat Island and Blanche's Mill made part of the scheme, and the outlets near the sea properly protected. This, with the removal of the rocks at Broadwater and the indurated sand-banks lower down the river, as proposed by the Harbours and Rivers Department, the Richmond would not suffer much by flood. This done would, I feel sure, satisfy the residents below Broadwater; thus, they would not suffer by flood. I may say I have always failed to see how the carrying out of the Tuckian work would flood the residents below Broadwater any more than if it were not carried out. In fact, I have always held the opposite opinion—that is, the flood-waters would be lower, as the water out of Tuckian Swamp, and that passing through the weir, would be out to sea before the water coming down the river would reach there.

In conclusion, I would like to point out to the Committee that a flood in the Richmond River will do more harm now and entail more loss, by far, than ever it has done before. As the dairying industry has started there since the last floods ceased—and it is a very large and increasing industry on all the flooded area—a flood would ruin the grass and starve the stock for a considerable time, and put the industry back for years, if not ruin it altogether, in the flooded area.

And I feel certain that the residents would pay their portion of the interest if it was the law of the Colony that all similar works constructed in other parts of the Colony be charged in the same way, by a Betterment Bill; the Crown owning a considerable amount of land, paying their quota of the interest. Also, as I know well, that several times the amount of the cost of the work is lost in one flood, which is a great drawback to the district and the Colony as a whole.

860. You mentioned in your statement that you have frequently been engaged in sending steamers and vessels between the Richmond and Sydney? I was until about three years ago.

861. Was there any difficulty in navigating the river at that time? Up to ten or twelve years ago there was great difficulty at the Heads.

862. Would there be any other obstruction between the Heads and the upper part of the river, where your vessels would leave? There were a few obstructions, but nothing to bother about. The entrance was the worst part.

863. Has that been improved since to any material extent? It has been greatly improved by the works at the Heads.

864. What depth of water would your vessels draw? About 9 feet was the greatest depth at which we could get out.

865. Would there be any difficulty or delay at the Heads at that time with a vessel drawing that depth? Yes; it would be weeks, and sometimes months, before they could get out.

866. Does that class of vessel experience any difficulty at the present time? None whatever.

867. What depth could vessels trading to the Richmond River now draw without suffering any inconvenience or delay? About 11 feet. There is about 12 feet of water on the Crossing and they could get out at any time. Over the bar drawing 13 feet.

868. Would there be any obstruction up the river to prevent them proceeding once they got over what is known as the Crossing? Yes; there would be a few flats that 12-foot vessels might touch unless it was high water; they would have to wait for high water.

869. Is there any improvement going on which would minimise that delay for vessels drawing the depth of water you mentioned? The Department of Harbours and Rivers has, I think, a sum of £10,000 or £20,000 on the next Estimates to improve that portion by removing the flats.

870. Where are these obstructions situated? There is one at Wardell, from 8 to 12 miles up the river. There is another one at Swan Bay, and it is about the worst one at the present time.

871. Is there not one at Woodburn? No; that has been removed. They are working at it now; and have taken the worst part away.

872. Would these be the principal obstructions in the river from the Crossing upwards? Yes. There are some rocks also at Broadwater.

873. Have you experienced many floods while you have resided in the district? I was there during the whole of the largest floods. The 1887 flood was the highest on the South Arm; and the floods in 1890 and 1893 were the highest on the North Arm.

874. That is the main river? What I term the main river other persons call the South Arm.

875. But that is not the general opinion? It drains three times as much country as the North Arm, and therefore I take it it must be the main river.

876. You stated that these periodical floods have caused a considerable amount of damage to the whole district, and that the cutting of this channel would, to a large extent, minimise that obstruction? That is my opinion, and the opinion of hundreds of people up there.

877. Would that apply to the South Arm as well as the North? To the lower part of the South Arm it would.

878. Would it affect the South Arm seeing that the channel is to be cut above the channel of the South Arm? It would naturally follow that the water taken out of the North Arm would be less coming down the main channel.

879. The flood-waters coming down the South Arm and the North Arm meet at the same time at the junction? No, the North Arm is generally flooded first; it has the shorter distance to go, and is more mountainous.

880. How long would the North Arm be in flood before the South Arm water would meet it? A day or a day and a half or sometimes two days. When the North Arm gets flooded over the rain generally comes from the coast, and it has to come across. That area has the rainfall first.

881. The North Arm is flooded first, and would reach the junction first? In nearly all cases, unless the rain came from the north, which seldom takes place there. The wet weather that we get generally comes from the south and south-east.

882. The South Arm is nearer the south than the North Arm? The rain follows the coast along in nearly all cases and comes inland.

883. It would, then, appear strange that the North Arm would not be flooded so early as the South Arm? You must understand that the North Arm is a great deal longer up to the mountains; it is 30 miles. The country on the South Arm is all flat country for 40 miles up.

884. Seeing that the flood-waters coming down the North Arm would reach the junction one or two days before the South Arm water, I do not think the flood-waters of the North Arm would pretty well recede before the flood-waters of the South Arm would reach them? In some cases, but not in all cases. They might meet together at times. The general rule is that the North Arm gets down to Coraki before the South Arm does. I have known cases where it has not done so, particularly in the 1887 flood.

885. Is it not a fact that the North Arm is in flood occasionally when the South Arm is not flooded? Yes.

886. And is it not a fact that the South Arm is flooded when the North Arm is not? That has only occurred once, to my knowledge.

887.

R. Pyers,
Esq., M.P.

9 July, 1900.

887. In your statement you recommend that the height of the weir be decreased from 12 feet to 6 or 7 feet? Yes; and the opinion of the whole of the people interested on the river is that it should be made permanent up to 6 or 7 feet at low water, and the balance to 12 feet be put on by wooden sills.

888. When you use that term, do you mean the whole of the people above Broadwater, or the whole of the people on the Richmond River? It does not interest some people on the Richmond River. I mean the whole of the people above Broadwater, in the drainage area, as high up as it would affect them. The query is, how high up it would affect them.

889. Do you know the general feeling of the people below Broadwater? Yes; I have a good idea. Some of them are against it, and some of them do not care as long as they have nothing to pay. Some say that they object to it, because if they did not object to pay they would be brought under the Act, and would have to pay some part of the cost of a scheme from which they would receive no benefit. Others are very much against it. I know that Mr. Meston, who gave evidence before the Sectional Committee, is in favour of the scheme, although he is a large landowner below Broadwater.

890. Is he not a large landowner above Broadwater? Yes; but just equally as much as he is a large landowner below Broadwater, so that it would really make no difference in that way.

891. How do you think the altering of the height of the sill from 12 feet to 7 feet would be appreciated by those who now complain under existing circumstances of the damage likely to be done by the cutting of the channel? I cannot see that that would make any difference, because, as I say in my statement, that water would be out at the Heads before the water could possibly get round. You are not bringing more water into the river than would otherwise come into the river. It must come down past Broadwater in any case.

892. It has been stated in evidence that the floods occasionally last a number of days? That depends a good deal on the rainfall. It is Bungawalbyn Creek where the water takes a long time to come down.

893. In the event of floods continuing to rise slowly, and lasting a considerable period, do you not think it would affect the people below Broadwater in a case of that kind, when the water could not possibly all get away, even through the new channel, before the water coming down the main river would meet it at the mouth of Broadwater? I cannot see that that would make any possible difference. They would be in the same position in that case as they are in now.

894. Will you explain what you mean? That water has all to come down, and it would have a better show to get out to sea by coming over the weir than it would if it ran the other way.

895. It would have a better show to get out as far as Broadwater? What would stop it from getting out to sea. The heavy seas or king tides would have an effect.

896. It could not get down so quickly if only allowed to go down the channel of the river; but when there is another channel cut, it would then? Some of it would be down a day and a half before the other.

897. Would it be a day and a half going through the new channel before it could go by the river? Not in all cases. If Bungawalbyn Creek were up the water would come down much more quickly than it would if it were not up, because the water flows up that creek sometimes for a day and a half before it meets the water which is coming down. The country is flat up Bungawalbyn Creek, and it takes a long time to run off.

898. Where does it enter the river? About 4 miles below Coraki, or about 9 miles below the take-off.

899. And also below the junction of the South Arm? Yes.

900. You made some mention about a getaway at Goat Island in the event of the lower river being flooded; it would be a means of relief if the channel were cut through? If it were properly protected. I do not think they should interfere with it unless they protect it. At German Creek and Blanche's Creek, which are close together, it went through when there was a heavy flood. These two have always opened during heavy floods and always closed up again.

901. Do you think the cutting of a channel there, in view of the complaints of people below Broadwater, would give the necessary relief for the additional accumulation of water afforded by the cutting of a new channel? It would give them some relief; but the water will always go out there again if there is a heavy flood.

902. Before what is termed a heavy flood occurs, very often a lot of damage is done? Yes.

903. In order to counteract the additional water caused by the opening of the new channel, would you recommend the cutting of a channel from Goat Island to the sea? It would be a very dangerous thing to do unless it were very well protected. You might have a river out there unless it were well protected at the beach.

904. Do you know that particular locality? I have been there, but I do not know much about it.

905. With regard to reducing the height of the sill at the entrance above Coraki, have you considered this aspect of the question: That it would let the water into the country known as the Tuckian Swamp and surrounding country at a much earlier period than it would if it were reduced to 7 feet? I quite see that; but if, as I say, a channel were cut out at the bottom, it would let out the water which goes into these swamps long before the water came down to the weir at all, for those creeks are always the first which flood the swamp. That is flooded a day or so before the water comes down the river. That water would be out to sea if there were an opening cut at the bottom end of the swamp.

906. Is it not almost on one level at the Broadwater and the Tuckian Swamp? No; the Tuckian Swamp is a good deal higher than the Broadwater.

907. How much higher? I should think the lower part is a couple of feet higher than the Broadwater.

908. Than high water in the Broadwater? Yes.

909. Is there a bank on the Broadwater? There is a kind of bank, which keeps the water in the swamp.

910. There must be a bank along the Broadwater at least 2 or 3 feet above high-water mark? Yes.

911. You said that by cutting that bank it would allow the waters to flow through the Broadwater, and so relieve the whole of the Tuckian Swamp? That water coming down would not interfere with it very much. Of course, it would be flooded, but it would not be flooded to any greater height than it is now.

912. At flood-time would not the local rain have some effect on the swamp? Of course it would, but the opening I advocate would do away with that. It would take away that water as it came down.

913. The opening which you suggest should be made at Broadwater would have the effect of carrying out the whole of the local rains? The local rain-water; and that would be out before the water came down the Arm.

914. It has been stated in evidence that there would be from 4 to 5 feet of water in the Tuckian Swamp caused

R. Pyers,
Esq., M.P.
9 July, 1900.

- caused by the local rainfall? I take it that there would be all that, and in some cases more, with these four large creeks running into it.
915. You said that by cutting this bank along the Broadwater it would reduce the whole of this water before the flood-water could come down? It would let the flood-water out as it came down. It would go straight out, instead of being stopped, as now, by the bank which is at the top of Broadwater.
916. Has there been any effort made to relieve the Tuckian Swamp by this means? Only the small drains cut by Mr. Henderson.
917. Had those drains the effect of taking away the whole of the local rain-water which falls there? To some extent they have, but they are not large enough. They are only small drains.
918. How would you suggest that it be done? To cut an opening as wide as you cut the off-take—300 feet wide. It would not require to be deep, and it would not be a very expensive work to do.
919. Where Mr. Henderson's drains enter the Broadwater have they to go through any bank? No; there is very little bank they have to go through. The highest would not be 2 feet or 2 feet 6 inches above high-water mark.
920. Is it not a fact that the tides go up the whole length of Henderson's drains? They go up a good way, but not the whole of the distance. I was there two or three months since.
921. Did you know the locality before the drains were made? No.
922. What, in your opinion, has been the effect of cutting these drains;—has it had the effect of improving the country through which they run? By all I have heard, it has. You could not walk over it before the drains were cut, and now you can ride over it.
923. Do you know the river between where it is proposed to cut the channel, above Coraki, on the North Arm, and Broadwater? I know the river well.
924. Do you know it well at flood-time? I have been there in a few floods.
925. How high has the river to rise at Coraki, or at the entrance of the North Arm to the proposed channel, before it overflows its banks between there and Coraki? Different heights. I think the highest would be about 20 feet.
926. At Coraki? At the take-off, to get over the bank.
927. Does that mean that the river would have to rise 20 feet at Coraki before it could overflow the banks between Coraki and the Broadwater? No; as you go down a good deal less will do.
928. I want to know how high the river, at flood-time, would have to rise at Coraki before it would have the effect of causing the overflow of the banks between Coraki and Broadwater? I think about 13 feet at Coraki overflows the banks down below Swan Bay. Of course, it is going up the inlets or drains long before that.
929. What inlets? What they term O'Connor's Drain, near Swan Bay. It goes up that drain from just above high tide.
930. Where does it flow? It flows across there towards the Tuckian Swamp.
931. Does that mean that the Tuckian Swamp is filled by these inlets before there is an overflow of the river over the banks? No doubt, in all cases.
932. How high would the river have the effect of filling the swamp by the inlets you mention? That I could not say. It would overflow about Swan Bay at first; but that would be the lowest bank.
933. Would that affect the Tuckian Swamp speedily? It would take some time.
934. Or is the Tuckian Swamp not filled till the river flows over the banks? The swamp is generally filled by its own water, and that of the four creeks mentioned—for the first 3 or 4 feet.
935. That is by local rain-water? Yes.
936. You stated that that could be overcome by cutting an opening at the Broadwater? Yes.
937. And reducing the level of the sills from 12 to 7 feet would not, in your opinion, have the effect of additionally flooding the Tuckian Swamp? It would flood it more, but it would get away just as soon if the opening were made as straight and as short as possible.
938. How do you think the residents along the Tuckian Swamp, or those who will be affected, would view the matter;—would they be satisfied with earlier flooding and higher flooding if provision were made that the flood-waters would get away more quickly? I think so. I feel sure that all I have spoken to along the Tuckian are in favour of having the work carried out, and they want it carried out at the lowest level, if they can possibly get it done.
939. How do you think the new channel would affect the flooded waters of the South Arm? It must lower the South Arm, as less water has to come down to meet the South Arm water.
940. In regard to the silting up of the channel, have you considered that part of the question? Yes. I cannot see that it can silt the channel up, because there will always be sufficient water to scour the channel out 3 or 4 miles down to Coraki, from the take off, and the waters in the South Arm will always scour the river out.
941. It has been stated in evidence that the South Arm is flooded when there is not a high flood in the North Arm; between the junction of the North Arm and the South Arm there is a stretch of 4 or 5 miles to the entrance of the proposed channel above Coraki, and it is contended that with a high flood on the South Arm, and only a small flood on the North Arm, there will be dead water between the entrance to the proposed channel and the junction of the South Arm;—how do you think that will be affected in regard to silting? I cannot see that that would take place, because the waters run from the South Arm into Pelican Creek, and that runs out above the off-take, and that is a big creek which takes a great deal of water out. That water would go through the weir.
942. Seeing that the water goes through the weir, there would be no running water between the entrance to the weir and the junction of the South Arm until the South Arm reached almost a normal level? How can that be? There is only a certain amount of water which can go over the weir. The rest of the water going down the river must go by the Arm into the main river.
943. Would not that be a small amount of water, in view of there being only a small flood in the North Arm? I take it that there would always be sufficient water going down the North Arm to scour out that stretch of $4\frac{1}{2}$ miles.
944. Do you consider that in the event of even there being a large amount of silt left in the dead water, there will be a sufficient flow of water, if the South Arm waters do subside, to scour it away? I take it that it would. The most silt, I may say, would be in the South Arm; but that silt does not go any distance down the river.
945. Where does it go? The greater part of the silt which comes down the South Arm does not go more

R. Piers,
Esq., M.P.

9 July, 1900.

more than 4 or 5 miles below Casino, and there it has been, for years, blocking up the river. Lower down there is a good channel from there to Coraki, and has been for years. The heavy silt does not go 4 or 5 miles below Casino.

946. How do you think the river will be affected in the event of the proposed flood escape being cut? I cannot see that it would be affected at all, because there is sufficient water to keep it open in the South Arm, which drains twice as much country as the North Arm.

947. You think the reduction of water that would go through the new channel would not be required to create a scour? In my opinion it would not make any difference.

948. You think there would be sufficient water without that? Yes.

949. Do you think there is anything in the contention that when a high flood occurs, and there is a great rush of water, it has a better effect than when all comes down together to create a scour at the entrance to the river? That is not so. The worst flood you can have to block up the river is a high flood. The floods which keep within the banks are the best to scour out the river. When a flood gets too high it flows over and tears the banks away, and they go into the river.

950. You consider there is nothing in that contention? No, there is nothing in the idea of a big flood scouring out the river.

951. Have you any experience or knowledge of the Tuckombil Escape? Only from the residents. They state that it has done a wonderful amount of good. The last flood they had in 1898 was only a small flood; but in similar floods they say the water would have been much higher if the scheme had not been carried out.

952. Some benefits which have been derived are due to that escape being made? The residents there say so, and I think it is true, because less water has to go out at the Heads.

953. Do you know the locality where the escape was made? Yes.

954. Do you think the widening and deepening of it would have a more beneficial effect, and would minimise the rise in the river about that point? It stands to reason that it would do so. If you make it twice as wide, it would take twice as much water direct out to sea.

955. You stated that you believed that the residents interested would be willing to contribute something to pay the interest on the cost of constructing this scheme? I believe most of the people are willing. If every other work in the Colony is carried out on the same principle—that is, a similar work—by a Betterment Bill, I believe the people there would be just as willing to pay as any other people are.

956. Would that apply to the people on the land on the South Arm as well as on the North Arm? For a short way up it would. I do not think it would benefit the people on the South Arm a great way up. I am quite satisfied that the people on the South Arm would be willing to pay a certain amount.

957. How do the people living between the Broadwater and the Richmond River Heads view the question;—are they apprehensive of any danger being done through the cutting of the channel? Some of them are. Some of them think the channel will bring the flood down on them more quickly.

958. Do you think they have any grounds for that feeling? In my opinion, they have not; but mine is only an opinion the same as theirs is.

959. Your opinion generally is that if the proposed channel were cut it would be the means of allowing the flood-waters to go out at a quicker rate, which would cause a less rise in the river above the weir without damaging those persons living below the Broadwater? If you deepen the river lower down, and remove the rocks above Wardell, I cannot see that the people will suffer in any way. I think it will benefit them, because it will let the water out to sea much more quickly.

960. Would the removal of the rocks take place between the Broadwater and the Heads. There is one lot of rocks just above the Broadwater, and some soft rocks, or indurated sand, between the Broadwater and Wardell.

961. Would you advocate the cutting of this channel unless a provision were made for the removal of the obstruction you named below the Broadwater? That is going to be done in any case.

962. Do you think any bad effect would follow the cutting of the channel without the removal of the obstructions—that is, in regard to the people below Broadwater? I cannot see that it would; the water would get out more quickly—it would not be brought down all at once.

963. You state that it has been decided to remove these obstructions, and that with their removal you do not think there would be any danger at all of an overflow caused by the escape channel below Broadwater? I do not think so.

964. *Mr. Shepherd.*] Do you not think that it is more than likely that when there is a large body of water carried to a lower point that would rise higher than the water above it, and cause a stagnation in the water? In that case I cannot see that it would, because there would be a fall to sea, and the water would be out to sea before it could possibly get out the other way. It would be only 9 miles across, I understand, and it is 28 miles round. It would be only 14 miles out to sea from there, so that that water would be out to sea which came out first.

965. That would be all very well if it were not a flood lasting about an hour, but when there is a continuous rain for several days, or perhaps weeks, that argument would not apply? Taking the extreme case which you suggest, the people would be no worse off then than they are at present. That water has to come down there now.

966. We have had evidence to show that the diversion of the Hunter River has created a complete silting up? That has no bearing on this case at all. I know the Hunter well where it has silted up. It has no tributaries and creeks running to create a scour like the South Arm of the Richmond River has. In the Hunter it is all dead water; the water cuts across, and the other part quite naturally silts up. There is no water running round to keep it open.

967. Does it silt up to any extent as it is now, in its natural state? There is very little silting taking place in the Richmond, except at the Heads. That is the place where they dredge most.

968. Has it never been necessary to dredge the river? I think there was a dredge once about Wardell. I do not know that there has been a dredge higher up in the main channel—only in the inlets.

969. What is the nature of the bottom of the Richmond, as a rule? It is a very fine muddy sand, except at the head of the creeks, where it is coarse sand, as, for instance, at Casino. The South Arm is sandstone country, and the North Arm is trap-rock, or volcanic country.

970. The diversion of a large body of water must have some effect on the scour? The floods which may create the greater scour are the floods which keep within the banks of the river. We always have sand flats

R. Pyers,
Esq., M.P.
9 July, 1900.

flats after a big flood, but they draw away themselves as the water gets within the banks. There has never been any occasion to dredge the main river except at the Heads, and in very few places.

971. I suppose you have not had any experience of any work of a similar character? No.

972. So that at the very least this is, to a certain extent, an experiment? Yes. But we have had the Tuckombil scheme. All sorts of things were predicted to take place under that scheme, which have not taken place. It was predicted that it was going to silt up, and wash away, and do a lot of things; but nothing of that sort has come to pass. That was the Engineer-in-Chief's idea of things. We had great trouble to get that work carried out.

973. You have given this work a good deal of study and attention? I have studied it from all points.

974. And you have come to the conclusion that this will relieve the country? I have not the slightest hesitation in saying that it will relieve the Richmond.

975. According to the opinion of the Crown Solicitor it seems that it is a very touchy thing to interfere with the navigation of the river? I have read his opinion, and I admit that it is so stated there.

976. You see the Government would be liable for any interference with the navigation of the river? There is no doubt about that.

977. Do you think the persons who would be affected by the floods would be willing to become responsible for any damage which might be done in that respect? I can hardly say that.

978. If they are so confident that this scheme would be a success, and a great advantage to them, I should think that they ought to have no hesitation in putting themselves in the place of the Government? It has never been put to them in that way. I do not know their feeling in that matter. I am quite satisfied that they are willing to pay interest on the cost of their proportion of their work; but as for paying for any damage which may occur, a man may come in with a bill who never received any damage, and make them liable for a law suit. I am not a landowner down there; but if I were a landowner I should be very glad to take that risk. My opinion is very strong in the matter, because I consider that there is no risk. I do not say that you would not have a law suit, for many people go to law about nothing.

979. You have also read Mr. Darley's opinion? Yes.

980. His opinion is that the construction of this channel would, to a certain extent, act in the same way as the diversion of the water in the Hunter River? I am afraid you do not see my contention. In the case of the Hunter River there is only one river, but in the case of the Richmond River, the South Arm running in below the take-off would always keep the river clean, and the South Arm drains twice as much country as the North Arm. The river there is about 20 feet deep, and the take-off would be 8 feet above high water. Only a third of the water coming down the Arm would ever go over the weir. The rest of the water must go down the river. The Hunter, at Maitland, is quite a different thing. It is quite natural that the bends in the Hunter should silt up, because there is no channel coming in to keep them deep.

981. You rely chiefly on the North Arm to scour the river? Yes; it is the main river, and drains such a large area that it must keep the channel open.

982. *Mr. Levien.*] It is the channel cut from Maitland which filled up the flats? Yes.

983. When did you see that channel? I have not seen it, but I know the river.

984. How many years is it since you have been there? Twenty-five years.

985. And you know where it was cut through? At the Horseshoe Bend.

986. That is the one that caused the flats to silt up? Quite so; but that does not alter my contention in the slightest degree. The water is sure to take a short cut; it will go by the shortest way it can; but had there been another river coming into one of these bends lower down that river would have been kept open just the same as before.

987. But there was Wallis' Creek coming in lower down? That is not a tidal creek. Very little water comes out of that creek?

988. It is a tidal creek up to Maitland? The tide goes up the Richmond 30 miles from Coraki.

989. How does the tide rise and fall near Lismore? About 2 feet near Lismore, I should think.

990. *Dr. Garran.*] You say that the people in the district will be quite willing to pay interest on the cost of this work if it is the law and the custom that the same thing should be done elsewhere? Quite so.

991. What other works do you refer to? The flood scheme at Maitland.

992. Do you refer to what has been done, or to what is proposed to be done? To both.

993. To what work do you refer as having been done? The cutting of the Horseshoe Bend. That was done by the Public Works Department.

994. We are told that that was mostly done by the work of Nature? The contract was let, and it was only by an accident that the work of Nature interfered.

995. It was not executed except by the work of Nature? I take it that the man was paid just the same as if it had been cut by him.

996. There are a great many works which have been done all over the Colony; it would be rather hard to make a collection of them; so that, if there were not a single case adduced where there was no payment by the people, you might hold that to be a sufficient excuse for letting all these people off? Yes.

997. It seems to me that it is a very poor guarantee for the Government to spend the money on such an understanding as would involve that word "if"? Of course, I am only giving you my own opinion.

998. What chance do you think there would be of the Government getting the interest paid on this outlay? I think, if the Government bring in a Betterment Bill, there is no doubt about their getting the money.

999. They could get betterment as regards the future, but would that Bill apply to the past? Not unless they made it retrospective, which, I suppose, they could not very well do.

1000. Would you consider that a reason why they should not pay, if it was not made retrospective? I do not think it matters much what I think about the payment. I think the people are willing to pay in any reasonable way.

1001. Have you seen the Broadwater country when it has been in flood? Yes.

1002. Can you tell us how much of the land on shore there is flooded at Broadwater? It is all very flat country round Broadwater, right into the hill at Wardell.

1003. So that there would be a great many acres flooded? Yes.

1004. In order to avoid this possible litigation, would it be a wise policy for the Government, before carrying

carrying out the Tuckian scheme, to buy up the floodable land? It would be the wisest scheme, in my opinion, to avoid litigation.

1005. Could they not then release that land, subject to all the conditions applying? They could do that, or resell it. Your suggestion would be a good one, I think.

1006. It would be quite possible to do that, and make it a charge on the work? Yes; and resell the land or let the land.

1007. I suppose we could release it at from 2 to 3 per cent.? Yes.

1008. At the Broadwater, what is the land used for? It is used for sugar-growing.

1009. Does the flood rise high enough to kill the sugar-cane? Not unless it goes over it.

1010. How often does it go over it? Hardly ever.

1011. The expanse is too wide? Yes.

1012. You have never known a cane-field to be destroyed on the banks of the Broadwater? No.

1013. But if that were turned to dairy-farming work would the grass be killed? The grass would not be killed unless the water was over it for three or four days.

1014. How many days would it take to kill the grass? It is according to the time of the year. In warm weather it would take a longer time to kill the grass than it would in cold weather.

1015. Does it depend on the kind of grass? Yes.

1016. Are there artificial grasses on the banks of the Richmond River? In a good many places there are.

1017. What kinds? Different kinds, such as cocksfoot, rye-grass, and clover. Couch-grass is the general grass there.

1018. Do these artificial grasses stand the wet worse or better than the native grasses? I do not know about their standing the wet better, but they give a better percentage of milk and butter than natural grasses do.

1019. But they are more likely to suffer from flood? A good many of them are, on the low land.

1020. Are they more tender? Yes; some of them are very tender.

1021. I understand you to say you consider it is an essential to the Tuckian Escape scheme that the indurated sand by Wardell should be cleared away? Yes.

1022. Would it not be safer to have that cleared away first? I think that will be done.

1023. Would it not be wise to have that done, and see the effect of it before a spade is put into the Tuckian channel at all? Seeing that it is going to be done, I do not think that would make any difference. That will be done whether the scheme is carried out or not.

1024. Will it so let the water out as to relieve the Broadwater of any risk of flood from extra water coming down the Tuckian channel? I should think so. It is reasonable to think so, no doubt.

1025. Do you think taking away the indurated sand there and the rock in other places would relieve the upper river sufficiently without the Tuckian channel? I do not think so; it is too far away.

1026. You said that there is a sum on the Estimates for removing these rocks? Yes.

1027. On the Loan Estimates, or on the Revenue Estimates? On the Loan Estimates.

1028. Do the Government get any return from that money? No; it is sure to be on the Loan Estimates.

1029. It is all borrowing money, and getting no direct return to meet the interest on the loan? There would be no direct return that I know of, only through settling the people there.

1030. Is there any direct return from the works at the Heads? There are harbour dues for vessels; but I do not exactly know what they are. When I was running boats to the Richmond, I had to pay pilot dues.

1031. Is not the charge you speak of a charge in return for the lights? I could not say how the money was used.

1032. I do not think it is a special charge on the harbour works? I do not think so.

1033. You have spoken about the non-silting up of the river; but you must understand that the part which is thought to be particularly dangerous is the part between the take-off and the junction with the other branch? I quite see that.

1034. So that it does not get the benefit of the large quantity of water coming down the south channel? No; but it gets the benefit of a lot of water which flows from the south channel into what is called Pelican Creek, which flows in above the weir.

1035. That only comes in high floods? Yes.

1036. It is the floods which do not go over the banks which do the work the best? Yes.

1037. We have had shown to us a work on the Mississippi River which leaves a far greater proportionate volume of water to come down the old river channel than would be the case here, and yet silting up has occurred there? I do not understand that at all; I do not know whether the conditions are similar.

1038. Have you any idea of the number of persons whose land might be injured, and who would raise a question of damage? No.

1039. Would there be a couple of hundred? That would be the outside number.

1040. Would the risk of actions be below the junction of the Broadwater and the main river? Below the Broadwater. There would not be anything like two hundred people unless it were half-acre blocks in towns which were likely to be injured.

1041. Suppose this scheme were made, and we had a king tide and a terrific gale of wind all at once, the water being backed up from the sea, and coming down the river in great volume at the same time, could you say what the flood at the Broadwater was particularly due to—whether it was due to the tide, or to the gale, or to the rains? I could not say; but the people would be in no worse condition if it came than they would be otherwise.

1042. If you were on a jury, how could you discriminate how much should be charged against the rain, how much against the gale, and how much against the tide? I admit that is a knotty question to go into; but I cannot see that the people would be any worse off than they are. The water would have to come down in any case.

1043. It is not a wise thing for the Government to run indefinite risks of this kind? No, I suppose not; but I take it that there is no risk to run.

1044. Their lawyers might take a different view? Yes.

1045. Do I understand you to say that the slope of the water is far greater from Lismore down to the weir than it is in the other branch? It comes down more slowly in the other branch; it is flatter country.

1046. Have you any notion of the number of people between Lismore and the escape channel who would be benefited by that one piece of river? I could not mention the number of them; but there are a good many.

1047.

R. Pyers,
Esq., M.P.

9 July, 1900.

- R. Pyers,
Esq., M.P.
9 July, 1900.
1047. On both sides of the river? Yes.
1048. It would be very easy to ascertain the number? Yes.
1049. Is the frontage land mostly used for cane or dairying? Some is used for each purpose; but the greater part is used for dairying.
1050. That is more exposed to damage than the other? Yes.
1051. This tendency towards change in trade has really increased the importance of this question altogether? Yes.
1052. To some of these dairying people, if their grass is killed it means the loss of the season? Yes; they have to sell their stock or shift them until the grass grows again.
1053. Do the settlers on the bank have any high land in the rear, or are they mostly on the flat? Some of them have, in places. In some places you would have to go 7 or 8 miles to get high land.
1054. And is the whole of that intervening land liable to flood? Yes.
1055. *Mr. Watson.*] You stated that there are some Crown lands in the neighbourhood which would contribute towards the cost of this scheme;—where are they situated? Behind the Tuckian Swamp, measuring about 5,000 acres.
1056. The Tuckian Swamp will not be improved by the taking of water into it? Yes, it will, according to the drains which Mr. Henderson dug there. The drains improved the swamp and made it good grazing land.
1057. The scheme now proposed only contemplates the taking of water into the swamp? Quite so; but I advocate an opening being made at the bottom to let it out.
1058. If you only let out as much water as you put in, the position of the swamp is not altered? No.
1059. If the position of the swamp is not altered, how can the Government land be said to have been benefited? For nine or ten months in the year the swamp would be quite dry, the same as Henderson's swamp is.
1060. Is it not dry now because of the lack of draining? The water cannot get out.
1061. One or two of us went up to the height of the Broadwater, and we could not see any sign of a bank which would preclude the water getting out? You did not go high enough up.
1062. We went right up into that creek, which is as high as you can get with a boat? Is it not reasonable that there would be no water in the swamp if there were not a bank to keep it there?
1063. We were told that there was no water in the swamp when we were there? Not in the swamp; but there is generally a foot or a couple of feet in the top of it. It was a very dry time when you were there—about as dry a season as they have had on the Richmond for twenty years.
1064. *Mr. Hyam.*] Do you think if this cutting is made it will relieve the town of Lismore in a time of heavy flood? To a certain extent I think it would.
1065. It would lessen the chance of a flood? It would naturally lower the flood.
1066. I suppose it is quite patent to you that the heaviest floods on the river are caused by easterly and south-easterly rains? Yes; we never had any flood with any other rains.
1067. During that time we have had mountainous seas on the coast? Not always heavy seas.
1068. And high tides, as a rule? The water is backed up, and it is almost impossible for water to get away; in fact, but for these conditions the possibility of flood would be remote.
1069. You would have floods which you never had in high gales? The flood backs the water up to a certain extent; but we have had floods and no gales, too.
1070. You have seen a good many floods? I have seen the highest floods which have been there.
1071. You are of opinion that it would give some relief to the town of Lismore? Considerable relief.
1072. Would it lessen the possibility of a flood altogether? I think not.
1073. *Chairman.*] I understand you to say that the flood which keeps within the river banks is the one which does the best scouring? Yes.
1074. And, on the other hand, that the flood which gets over the banks leads to silting? It tears the bank away in all cases; the banks go into the river.
1075. Taking these two statements in conjunction, are they not an argument against making any opening whatever in the banks to divert half of the water which otherwise would remain within the banks to beyond the banks? That is quite so. But it is the water which goes over the banks which we want to remove. If we never had it over the banks it would be right enough.
1076. This proposed channel cannot remove any of that water, because, whether the channel is there or not, some water would go over the banks? If a take-off is there, it must certainly remove a lot of water.
1077. You think it will prevent it going over the banks? Yes.
1078. Suppose the proposed channel were constructed, do you think it would entirely prevent a high flood going over the banks? Unless it was a very exceptional one it would.
1079. *Mr. Hyam.*] You said that during flood time the Tuckian Swamp fills up first, and you propose to bring the water from the river into the swamp;—now, is it not impossible to get water into the swamp if it is already filled? If my idea is carried out there will be an opening cut into the Broadwater, and the Tuckian Swamp water will be out to sea before the other water is taken there.

Thomas Thomson Ewing, Esq., M.P., sworn, and further examined:—

- T. T. Ewing,
Esq., M.P.
9 July, 1900.
1080. *Chairman.*] You wish to supplement your former evidence? Yes. Through the courtesy of the Committee I have had an opportunity of seeing the evidence given by the Engineer-in-Chief. There are one or two matters in his evidence which I thought might be referred to, and that is why I suggested to you that I should be called again.
1081. Will you be good enough to read the statement which you have prepared? It is as follows:—
I WILL endeavour to avoid reiteration, and direct the attention of the Committee only to the salient points of objection, which are—
- (1) Piling up of water at Broadwater.
 - (2) Deposit of silt.
 - (3) Injury to residents below Broadwater.
 - (4) Necessity for bringing the whole flood-waters along the whole course of the river.
 - (5) Examples chosen to exemplify the danger incidental upon the scheme.

1. PILING UP OF THE WATER AT BROADWATER.

(a) Since the water coming *via* Tuckian during the early period of a flood will be out to sea before the river-borne water reaches Broadwater, there will be less water to pile up. (b) Water cannot be piled up at Broadwater to a greater extent than in the past, nor sufficiently to materially affect the slope of the water from Coraki to Broadwater, because the banks below Broadwater are too low to retain it. When the flood rises over a certain height it simply rushes direct to the sea. It would be as reasonable to expect to pile up water in a saucer with one side broken out. Not being desirous of endangering the scheme by going beyond it, I did not press the point that the "safety-valve" of the river near Broadwater might be used and controlled. No engineer will contend that this cannot be done with safety as readily as at the off-take at Tuckian. Since the unregulated power of the water forces its way to sea every high flood, without apparent danger to the main waterway of the river, how can regulating and strengthening works cause any ill-effect,—if the natural banks stand, surely they will resist any force more readily when strengthened and protected.

Further, the point was not pressed, for the Committee has full information that the discharging area of the river below Broadwater is to be increased by the removal of specified works to a much greater extent than the discharging area of Tuckian Canal (even if this were new water, which it is not).

I trust these three obvious facts will be sufficient to cause the Committee to dismiss from the question all arguments based on the piling up of water at Broadwater, which piling up will be simply impossible.

2. DEPOSIT OF SILT.

(a) If it be impossible that the water will be piled up at Broadwater, which the foregoing facts show, the whole question of silting up between Broadwater and Coraki disappears. The idea mooted that the South Arm water would run up the North Arm from Coraki over the off-take, and thus sit up that portion of the river, I presume has been dismissed from consideration:

- (1) Because of the body of water coming down the North Arm before the Tuckian off-take will work would be sufficient to maintain a strong downward current.
- (2) Because, before such a state of things could prevail, the South Arm water would reach the North Arm *via* Pelican Creek.

All rivers carry foreign matter in solution more or less; but no attempt has been made to prove that the flood-waters of the Richmond carry sufficient foreign matter to cause the silting question to be serious. The suggestion rests on surmise in direct opposition to the history of the river. All experience points exactly in a reverse direction. If the flood-waters carried large quantities of silt, the Tuckian Swamp would long ago have been filled up, for the flood-waters have reached it, and laid almost still on it for considerable periods, probably for centuries past. Although it may be granted that every flood makes some deposit, it is too slight to be appreciable even under these favourable conditions.

Again, take the case of Bungawalbyn Creek, where the flood-water at times runs up for days; even at this low level there is no deposit.

The explanation may be that ordinary silt is so easily moved, a very slight current being sufficient. Half a mile an hour moves coarse sand. (Sir Chas. Lyell.)

·17 miles an hour begins to work on soft clay.

·341 " " left fine sand.

·681 " " sweeps along fine gravel. (Minard.)

Login agrees with the above.

Those who desire to prove that silt would rest in the river must claim that the falling flood-current is not half a mile per hour, which will at once be conceded as being absurd. I am now dealing with the ordinary river-borne silt, not with land-slips and heavy erosions which are deposited in the river contiguous to the banks from which they come. These will be dealt with later.

If removing flood-waters by side delivery always causes rivers to silt, what is to be said of the great works now being carried out on the Nile, which river is estimated to carry annually 140,000,000 tons of silt; of the great works in India; of the proposals to divert flood-waters from the Murray. But, perhaps, it is unnecessary to continue this point further. The regulated discharge of the top of flood-waters having obviously been confounded with unregulated breaks and cuts in the banks which have disturbed the natural conditions, torn away great areas of adjacent lands, raised the original river-beds, and, at times, even changed the courses of the rivers.

3. INJURY TO RESIDENTS BELOW BROADWATER.

The points emphasised in No. 1 deal with this question. The Committee may place the works in such order that this question will no longer be open to argument.

With regard to Tuckian, it is obvious that the floods can be no higher (to put it guardedly) than in the past. Even if the lower parts of the swamp be flooded somewhat earlier than at the present, there will be a compensating advantage in the rapidity with which the flood-waters will be removed under a well-regulated scheme.

4. NECESSITY OF BRINGING THE WHOLE FLOOD-WATERS DOWN THE WHOLE COURSE OF THE RIVER.

It may, perhaps, be pointed out that this is not now the case. The Tuckian scheme is simply a proposal to do scientifically what nature does now spasmodically.

The facts are,—the coastal rivers, being the drainage centres of large areas of country, have so small a discharging capacity that they cannot carry the large volumes of water resulting from the heavy rains or their watersheds, most of them run with generally so direct a course to the sea that no relief can be given. It is universally admitted that freshes, or small floods, rather improve the navigation; and that large floods, by tearing away the banks, and depositing them in the waterway, are the hinderers of navigation. If, therefore, it is possible to remove one-third of the water passing down the North Arm, and discharge it into a wide reach of the river, or right out to sea, it is clear that, to the extent of its volume, the disastrous effect of heavy floods will be lessened.

Further, the Richmond runs, practically, through alluvial flats, composed, in a great part, of friable soil. If, therefore, it were possible to force all the floods bodily down the river, making it a fitting discharging agent for the whole of the flood-waters (although I grant that much may be done by the removal of shoals and bars), the tendency would be, not to deepen the river, but to tear a greater width in the adjoining friable banks. The river would make its own symmetrical section. In making this symmetrical section serious erosion of the banks would take place, and temporary mud-flats be formed adjacent thereto. The Committee might consider this point when weighing the question of using any coastal river unduly as a flood-discharging agent.

I may be permitted to remark that I am aware of the disadvantages appertaining to the advocacy of views in antagonism to those of one who deservedly occupies so high a position in your esteem as the Engineer-in-Chief. It has not been pleasant to me to assume such an attitude, and I would not have done so were I not firmly convinced my views are correct, and that I am sustained by a sense of responsibility to a great body of producers, who expect me, at all risks, to do my duty. I do not desire to be thought to undervalue professional men, but engineering is at the base but common sense. The Committee is aware that some of the most successful works in the world have been carried out in the face of the utmost discouragement from professional men.

1082. Is there any other statement you wish to make? As the drainage centre of vast areas of country the Richmond cannot carry the water any more than the Hunter can carry its water. You have, therefore, to decide whether you are going to permit the valleys of these rivers to be ravaged, or whether you are going to have some scheme to obviate it. The Richmond happens to run in such a direction that this is possible. If you made this channel of the Richmond able to carry the water falling over the whole catchment area, the alluvial banks would be torn in all directions. With all its sinuosities the Hunter still runs direct to the sea. The coastal rivers almost without exception run straight to the sea. The Richmond is one of the few exceptions. The Department felt the flooding of the Hunter to be so serious that they even considered the making of a huge impounding area at a cost of some millions of money

T. T. Ewing,
Esq., M.P.
9 July, 1900.

T. T. Ewing, Esq., M.P. money to alleviate the floods in the valley of the Hunter, showing that they feared the floods, and now Mr. Darley tells you to bring your floods right down the valley of the Richmond River.

9 July, 1900.

1083. Is there any statement you desire to add? Yes, in regard to side deliveries. In a report made to Mr. Darley, by Mr. Price, on "Flood Prevention in the Hunter River," I find this statement: "A flood outlet from some point on the upper river would be a complete remedy for all great floods; but from an examination of the intervening mountains I am convinced of the practical impossibility of carrying out such a scheme." This officer, you will see, entertains the idea whether he can make some cuts in the Hunter River, and Mr. Darley, in his covering report, made no comment on that statement. I saw the statement made by Mr. Darley in his evidence with reference to this matter. I have not had very much time to look into the subject, but I asked Mr. Darley, at lunch-time, if he would lend me the book in which he obtained his authorities, which he kindly did. I will mention one or two things which struck me at once. First of all, some of the quotations which were made by Mr. Darley were with reference to the discussion on a paper by Mr. Lyman Bridges, member A.S.C.E. Mr. Bridges read a paper in August, 1882, before the American Society of Civil Engineers. Mr. Bridges is an advocate of the dispersion theory—that is to say, the theory of relieving a river by side-cuttings; he is one of the men who believed in dealing in that way with the surplus water in rivers. But Mr. E. L. Corthell and Mr. J. A. Ockerson, members A.S.C.E., from whom Mr. Darley quoted, are opponents of that system, they believing in the concentration theory. These two gentlemen, the defenders of the concentration theory, attacked Mr. Bridges, giving a large number of quotations. I was desirous of finding where those quotations came from, and I found that Mr. Bridges, in making his reply, pointed out that their quotations came from a minority report, not from the report of the Commission at all; so that the whole thing rests upon a minority report, signed, apparently, by one man. In looking a step further, I found that the chairman (Mr. Ashbel Welch), one of the most competent American engineers, and the head of the American Society of Civil Engineers for that year, in dealing with that question, made these observations:—
If a stream of uniform section, bearing its maximum load of silt, and confined within its banks, is furnished with an additional channel, then though each channel may take its proportion of the silt brought down from above, the reduction of velocity consequent on the increased aggregate sectional area, will cause a deposit to take place below bifurcation, the bed of the original channel will be raised, and its capacity diminished. Hence, a bar is likely to form below an extensive crevasse.

But if a stream overflow its banks, then the water that would otherwise run overland may be carried off by additional outlets, so that they do not lessen the velocity of the main stream, below the point of diversion.

TUESDAY, 17 JULY, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Thomas Thomson Ewing, M.P., sworn, and further examined:—

T. T. Ewing, Esq., M.P.
17 July, 1900.

1084. *Mr. Watson.*] When you were last before the Committee you were speaking of the unlikelihood of the water being piled up so high at the Broadwater as to cause the inundation of the surrounding country;—would you venture an opinion as to whether there would be sufficient piling-up at the Broadwater to materially affect the velocity of the current above the Broadwater, and right on up the river towards the "off-take"? I am quite prepared to venture an opinion with regard to that point. I have already stated that it is not a question of opinion, but a question of fact, that there can be no piling-up at the Broadwater. The reasons I gave in the first instance were that there cannot be any piling-up at the Broadwater, because between there and the ocean simply lies a level stretch of country, and adjacent to the ocean a ridge of sand, that at any time the river has attempted to pile up there it has broken away to the ocean. These are facts, and there is no getting away from them.

1085. After it has piled up to a certain extent? After it has piled up to a certain extent it must get away to the ocean.

1086. The question is: Given a certain amount of piling-up, to the extent which the banks will permit of, what ill-effect, if any, would it have on the velocity of the water above? If you will permit me to go a step further, I will make a reply to your question.

1087. Very well? The next reason why there cannot be any piling-up at the Broadwater is that the works already in progress by the Government, to which the Department has already given its adherence, give a greater increased discharging capacity to the river below the Broadwater than can possibly be furnished by new water—although it is not new water—from Tuckian canal under any circumstances, and therefore there can be no piling-up; but presuming there was piling-up, taking a height of 3 feet, the distance from the Broadwater, approximately, to Coraki would be 27 miles. Of course, you will understand that I am dealing with a case which is not possible; but we will take it for granted, for the sake of argument, that there is a piling-up to the extent of 3 feet—that means a difference of a little over an inch per mile. I have looked carefully into the question, because I understood from some remarks that were made when I was last before the Committee, that that question would obtrude itself, and I find it very difficult to tell exactly what an inch per mile means in velocity; but you may take it, I think, as correct that it certainly cannot mean at the very outside anything like a mile an hour.

1088. Can you state the flood inclinations between Coraki and the Broadwater? Not in detail at this moment; but the flood discharge of the Richmond is under a foot, and I know the Murray runs at times about 3 inches. In my opinion, the flood inclination of the river, which varies, may be stated as under a foot per mile, and rather better than an inch of that will not materially alter the velocity.

1089. I take it now for granted that you are now on the question whether the velocity will be so lessened that there will be a deposit of silt below the weir and above the Broadwater? Yes; the Committee will, perhaps, remember that I contended that no water leaving by the Tuckian canal, or any piling up of the Broadwater, which I claim is impossible, can lessen the velocity sufficient to cause any deposit

deposit of silt. Against that statement, you will remember it was shown in the evidence of the Engineer-in-Chief for Public Works that any lessening of the velocity caused a deposit. My contention was that, if the velocity is sufficient to carry the matter suspended in the water, it does not require to have greater velocity than that; in other words, that if the material in the water would be carried at a velocity of 3 miles an hour, you do not want a velocity of 6 miles an hour. In regard to that point, the Committee, perhaps, will allow me to make a quotation. I have taken one of Mr. Darley's own authorities, Mr. J. A. Ockerson, a member of the American Society of Civil Engineers. In looking through his remarks on a paper on "The Overflow of the Mississippi River," which was read on the 15th March, 1882, by Mr. Lyman Bridges before the American Society of Civil Engineers, at page 272, I find this statement dealing absolutely with that point:—

T. T. Ewing,
Esq., M.P.
17 July, 1900.

In the discussion of the paper it was stated that "the current cannot be slackened in the *slightest* degree without depositing a part of its sediment." If this be true, then the river must *always* be fully charged with sediment. That is, it must always carry as much sediment as the velocity of the current can support. An examination of the following table will show how far the above statement is true:—

Date.	Velocity— Ft. per sec.	Sediment— Parts in 1,000.	Date.	Velocity— Ft. per sec.	Sediment— Parts in 1,000.
1879.			1880.		
3 November.....	3.1	Gauge 163. 48	18 February.....	6.7	Gauge 181. 112
2 December.....	3.2	90	9 April.....	6.3	74
1880.			4 May.....	6.6	202
16 August.....	2.7	104	12 May.....	6.2	54
28 January.....	5.9	Gauge 179. 47	10 July.....	6.2	232
17 April.....	5.7	127	26 January.....	6.3	Gauge 185. 53
8 July.....	6.0	207	23 February.....	7.3	79
1 January.....	6.4	Gauge 181. 184			

It shows what must strike any person without going into the engineering aspect of the case—that if the water is running with sufficient rapidity to carry the silt, that is all you want. Anything beyond that may carry it more rapidly, but still if the velocity is sufficient to carry it, you have achieved your object. After giving his table, he says:—

It will be observed—1st, that the amount of sediment carried at the same stage is not the same; 2nd, that the most sediment is not necessarily carried at the highest stage; 3rd, that the most sediment is not always carried at the highest velocity. It must be evident, then, that the river is not always fully charged with sediment.

I may say that there is no attempt made to prove that the Richmond River carries any sediment worth considering. The whole of my experience leads me to a different conclusion. He goes on to say:—

The amount of sediment carried must depend on the amount *supplied* from erosion of banks and other sources, as well as the amount the current is *able* to carry.

1090. It is usually greater at flood-time? There is more at flood-time; there is more erosion, more break of the rivers. There is more in some rivers than in others. There is more in the Nile, for instance, than in others. One branch of the Nile is surcharged with foreign matter, and the other comes down clear. Mr. Ockerson goes on to say:—

Now, inasmuch as the river is not always fully charged, the current may be slackened to a certain extent without reducing a deposit of its sediment.

I bring this statement before the Committee to show, although I grant that there is a possibility of a slight lessening of the velocity, that the velocity will still be sufficient to carry the sediment, and that it is not in opposition to the views of the engineers to lessen it to that extent.

1091. I have ascertained from Mr. Keele that in the flood on the 23rd February, 1898, the flood inclination was .59 feet per mile, which would be 7 inches, and that was noted when it was flowing 18 feet deep opposite the weir site, that is 3 feet below the bank? Taking it as 7 inches, the lessening of the slope of the river in flood-time from 7 inches to 6 inches, or a little more than that, will not appreciably lessen the velocity of the river, or rather, to put it otherwise, not sufficient to cause it to lose sufficient velocity to deposit much sediment.

1092. Mr. Darley urges that the greater amount of cultivation gone in for lately, especially on the North Arm, where you have a friable volcanic soil, is likely to result each year in an increasing amount of sediment being brought down? With more cultivation, certainly on hillsides, some of which have a fair angle of elevation, there is always a tendency for that sort of thing to happen, but I do not regard it as material to this point. It was stated to the Committee that it was opposed to the best hydraulic practice to use side discharges. In reply to that statement, I asked this question when I was here previously, and that is the way it would strike a layman in the first instance—how are all irrigation works in all parts of the world carried out, how in our own Colony was it possible to carry out an irrigation scheme without side discharges, and if the result from these side discharges was always the silting up of the river, the engineers in all parts of the world were making a very serious mistake. However, the point really at issue is: Is it opposed to modern hydraulic practice. I asked Mr. Darley, as I informed the Committee previously, to lend me his authority, which he did. The last time I was here, I pointed out that Mr. Lyman Bridges, an eminent member of the American Society of City Engineers, is an ardent advocate of side discharges. In an article which is published in volume II of the Transactions of the American Society of Civil Engineers for the year 1882, he says it is not possible to make the Mississippi River by any process of dredging or any process of levees carry the water that falls in its own catchment areas. There is an article, which I have marked, dealing with the matter which I will hand in.

1093. *Chairman.*] Is not that somewhat beside your point;—if it was not possible for the Mississippi to carry all the water which falls on its catchment area, it does not follow that you ought to relieve it by side discharges? He says not by any system of levees or any system of dredging. The American schools,

T. T. Ewing,
Esq., M.P.
17 July, 1900.

schools, and I think the engineers in all parts of the world, are divided into two, namely, the diffusion men, who believe in side cuts, and the men who believe in concentration—that is, by a system of levees by raising the banks to make it carry the water, and again, to some extent, agreeing with those who believe that the levees should be placed on the bank to make the river itself carry the water, is the school who believe in the levee and the dredge. On pages 253, 254, and 255 of this volume will be found the statements by Mr. Lyman Bridges. He is quite as eminent a man as any of Mr. Darley's authorities, and believes in side discharges.

1094. You have not read any passage where he said that? I was going to hand in the article. However, I will read one or two passages to give the general tenor of the article. At page 253 he says :

We claim that the overflow has never been carried off by the Mississippi, and that its maximum capacity in time of floods never can be the medium or channel of the overflow at the flood stage without many years of labour and great expense in deepening the river channel, and that the old natural channel or cut-off, *via* the Atchafalaya River, should be the main channel of relief, aided by the Plaquemine Bayou to the Atchafalaya, and the Bonnet Carré to Lake Pontchartrain.

The old channel of the Mississippi, near the mouth of the Red River, near Williams' Port, above Morgan's Bend, and the Atchafalaya River and Bayou from its connection with the Red River above its mouth, should be improved, and a connection made with the old channel of the Mississippi through Latanache Bayou to Morris' Bay at Atchafalaya River and Bayou, thence through Bayou Alabama, Whiskey Bay and Grand River, Lake Rond, and Grand Lake.

1095. *Mr. Watson.*] The contention of Mr. Darley's authorities, and the conclusions he cited, was that by the construction of this Atchafalaya channel the river had been silted up? The facts with regard to the Mississippi, which I presume are as well known to the Committee as to myself, are that the Red River has absolutely been diverted, and, therefore, the Mississippi does not get any benefit from the water of Red River at any time. That one fact alone removes it away absolutely from reasonable comparison with the scheme before the Committee, because that scheme is to deal with flood-water only. Then, again, on the Mississippi, for hundreds of miles above the junction of Red River, and contiguous to the silting up, there have been a large number of levees put in, and the side diffusion men—the engineers who believe in dispersion—say it is the levees which have lifted the bed of the river. We will go on a step further. At page 275, we find that General Hugh A. Gillmore, who was chairman of the United States Commission in connection with the Mississippi, says :

The views of the several members, however, are not in entire accord with respect to the degree of importance which should be attached to the concentration of flood-waters by levees as a factor in the plan of improvement of low-water navigation which has received the unanimous preference of the Commission.

1096. *Chairman.*] Is that the same Commission as Mr. Darley referred to? Yes. General Gillmore recommends further investigation, further study. They evidently had not made up their minds with regard to the origin of the trouble. On page 276 I find this statement :

In fact, Mr. Corthell and Captain Eads show by the extracts quoted from the minority report that the levees may be broken by extraordinary floods.

Following the matter along, you will find exactly the same sort of thing. Now we will turn to the article on "Dredging *versus* Levees," in volume 24 of the "Forum," to which Mr. Darley referred, and I am taking only his own authorities. At page 335, Mr. Gustave Dyes brings forward some statements in his article to show that all works on the Mississippi have signally failed. You will find that statement made in the first paragraph of his article.

1097. *Mr. Watson.*] That would include the subtraction theory as well as the levee? The whole lot. He says they have all failed, and he recommends dredging. If the Committee will just bear that in mind for a moment, they will see how wonderfully the engineers agree in with one another. Then Mr. R. S. Taylor, who writes the prior article, "Success of the Levee system," says the levee system has succeeded so magnificently that he uses these terms in his concluding paragraph :

Upon the whole, the great flood has demonstrated—as only a great flood could—the practical efficiency of a levee system. It has disclosed the shortcomings of the present structures, and where and how they are to be remedied. Comparing what was saved by the levees as they were with what would have been lost without them, their utility and success were beyond question. The protection which they afforded against this single flood was worth many times over the entire cost of the system as it stands to-day.

If you go into the opinions of engineers you will find them in all directions.

1098. The same objection as was urged to the subtraction of the water of the Red River, so far as it had affected the Mississippi, was also urged to the side cuttings at Plaquemin and Bonnet Carré;—those were openings cut in the side, I understand? Yes, and which were, according to Mr. Darley's citation, equally condemned. The dispersion men still maintain that that is the only way of relieving the water of the Mississippi, and that they are doing a magnificent work.

1099. Here is a statement in answer to Question 461, page 26 of the evidence, which was put forward, not as an opinion, but as an actual statement of fact, that below Bonnet Carré the river, originally 107 feet deep, shoaled up 31 feet, because the volume of the water in the river, being lessened by the crevasse, was no longer sufficient to maintain the normal current? In point of fact, the crevasse to which you refer, is not a side delivery at all. I think it is a cut down to river-bed, and works at all times. Can you tell me where that is taken from?

1100. Mr. Darley says : "I will read some extracts on the subject, which I have brought with me," and then he goes on to quote about the Mississippi River, but it is taken from a set of extracts? I can quite imagine an unregulated side-cut, a tear from the side of the river into which the river entered when it saw fit; I can understand it being a very serious matter, but the Committee is not considering that any more than it is considering a state of things such as there is on the Hunter, which, instead of being an example of what flood discharges can do, is a magnificent example of what floods can do if you have not a side discharge.

1101. Your contention is that an absolute diversion of the water might be dangerous, but that while it is merely letting off a little of the extra volume, it will not do any harm? I am sure it will not. To me as a layman it is amazing that when such an opportunity is offered it is not seized by the engineers with avidity. I say that after full consideration. What is to become of the water. Let us take the history of the flood-water. If it is not diverted, where does it go. It tears down the valley of the Richmond, rendering every resident—it may be in the course of one night—a pauper, taking the whole of his earnings for many years. You cannot do anything worse with water than that. That is the very worst use to which it can be applied, and when there is an opportunity of getting rid of it, or a portion of it, he engineers say, "Keep it charging down the river to work its own sweet will where it sees fit."

T. T. Ewing,
Esq., M.P.
17 July, 1900.

1102. *Chairman.*] Do these engineers admit that when the river does work its own sweet will as through a crevasse the effects which the opposite school anticipate follow, and that they have to cure the evils of the river working its own sweet will by dredging;—do they admit that if a river breaks over one of its embankments it causes silt to be piled up, and hence that to cure that the thing is not to confine the river, but to dredge after the damage has been done? Their contention is that the water should not be allowed to go there at all. Their contention is that, by a proper regulated flood discharge, the top of the flood should be taken away in another direction altogether. But your question was this: whether, if a break did take place in the banks, then, probably, it would form some deposit below. I think if you got any heavy break in the banks, and the water tears through down to the same depth as the bed of the original river, it is highly probable in most instances that there will be a deposit. But I want to impress upon you that we are not considering that sort of case. The whole consideration has been contorted, if I can use the term, by bringing in a state of things which the Tuckian can never create.

1103. We have one case up before us on the Hunter which seems exactly parallel with what is proposed to be done on the Richmond—that is, the flood escape, which operates only below the Narrow Gut, takes 4 feet off the top of the flood-water, and the actual result of this is that the bend, which is partly cut off by that naturally-operating flood escape, is rapidly silting up? In reply to that statement, I cite the circumstantial evidence, or the internal evidence, in the departmental report on “Flood Prevention in the Hunter River.” If the Department could have got rid of the surplus water of the flood higher up, they would never have allowed it to go to Maitland at all. With regard to that aspect of the case, I hand in these statements:—

A flood outlet from some point on the upper river would be a complete remedy for all great floods, but from an examination of the intervening mountains I am convinced of the practical impossibility of carrying out such a scheme.

Having, therefore, been convinced, from my examination of the lower river, that it would be a costly if not an impossible task to so reduce the level of great floods by any series of cuttings as to remove all danger, I turned my attention to the upper river and tributaries, in the hope that some suitable sites for regulating reservoirs could be found either large enough to control a whole flood or half a one as suggested by Mr. Gordon.

With regard to the Hunter, used as a comparison, it is useless, and the inference drawn from it is incorrect. The detail you have mentioned in regard to shoaling below Narrow Gut, consequent on the partial discharge of the flood tide over Narrow Gut, is a wrong inference absolutely, for the whole of the Hunter River above Pitnacree Bridge is shoaling. It is all shoaling, and it is perfectly clear to any person who looks at the plan here that it must shoal. I know the dredges are working above the Narrow Gut now, where there was 8, 10, 15, 9, and 7 feet of water. The whole river as shown is shoaling from Narrow Gut. If it is shoaling above Narrow Gut, the cut below Narrow Gut cannot be the reason for that, and therefore it is reasonable also to infer that the partial discharge of Narrow Gut is not the reason for the partial shoaling shown by red figures on this plan.

1104. We were assured that the shoaling below the flood escape at the Narrow Gut was very rapid, and we have no evidence so far that the rest of the river is shoaling at all? Some of the river, as shown by the yellow marks on the plan, is shoaling absolutely.

1105. That is where it has been cut off? Quite so. If the cut at the Tuckian meant the divergence of the river, I would not be here to advocate it. I ask the Committee just to look at the plan for a moment, and see what has happened on the Hunter. The blue line shows the present position of the river, and the yellow line shows the old position of the river. The river virtually took charge, and broke through various narrow necks, and the process of silting started round the long bend. A person asks at once what happens when, as shown, occurs one of those narrow bends. A large quantity of earth is taken away. For instance, we see a very considerable distance of new earth which must have been torn away as shown by the plan. Where has that gone to. It simply has drifted down here. For instance, take the river at Narrow Gut, past Largs Point, where the red marks are shown. We will not talk as engineers at all. Suppose we were informed that the river had broken through as shown by the plans. If you were asked the question, “Where has the stuff gone to which is torn away as shown by the marks on the plan?” you would say, “The earth that composed the old neck is lying there, raising the bottom of the river.” These breaks further on in the Hunter have been very serious breaks.

1106. *Mr. Watson.*] It would not all lie like that? A great deal of it.

1107. That would only be carried away in flood-time when the velocity was at its highest? Some of it went down to Newcastle Harbour, and it was a serious matter for a little while there.

1108. The evidence, as I understand it, is that since the big cut-aways have been completed the shoaling is still going on below Narrow Gut? The whole of the Hunter, virtually, above Hinton is altering its position. It has torn large quantities of alluvial soil, and it has temporarily raised the river very materially. The whole way, you may say, from Hinton right up past West Maitland, the river is altered. It is virtually a river-bed at a new elevation, consequent on the floods. I would propound a question of this kind to the Committee: Suppose it had been possible, above Maitland, to divert a large quantity of water, you are in this position: The engineers would tell you, as they tell you in the case of Tuckian, that water must still go down the river. It has still gone down the river, and you see the result. The other person, the diffusion man, says, “Remove the water altogether.” There is the question exactly: Is it to go down the river, and do that sort of thing as shown by the plan, or are you to have the diffusion process and take it away. There may be objections to side-cuts—there is objection to most things engineering; but the engineer has to decide which is the best thing to do. Is it better to have such things happening on the Hunter, or to have a side discharge. If you concede that it is better to have a side discharge than to have that state of things, then I ask you in the Tuckian why is not the same thing done. There is one point more. I think it was Mr. Watson who asked Mr. Pyers the other day whether the Tuckian people approved of doing this, and the inference from the question was that the Tuckian people could not possibly be benefited by this work.

1109. As I understood, Mr. Pyers expressed the opinion that the Government should contribute towards the work, because their lands would be benefited, and pointed to the Tuckian Swamp as being Government land, and I then asked in what way they would be benefited, and he said by the draining? I will make a brief statement in regard to the attitude of an individual living adjacent to the Tuckian Swamp which pretty well covers the question of Crown lands. A person living in the vicinity I have mentioned believes that if the proposed flood-channel be cut through he will have an opportunity of draining such of his land as is above high-water mark—in other words, he will cut his drains into the canal. That deals with the area above high-water.

T. T. Ewing,
Esq., M.P.
17 July, 1900.

1110. That supposes a scheme is extended to include a channel cut right through the swamp which is not embodied in the present proposal? Yes. Even the person below high-water—and land under high-water is not very valuable—believes it is quite possible by a system of flood-gates, and using an intermittent discharge, to deal with his lower areas—in other words, although not proposed as a system of relief in connection with the draining of land, the man believes he will ultimately be able to use it for that purpose. I only make that statement for what it is worth. I do not know whether it is worth while going any further into the matter.

1111. *Chairman.*] Is there any point which you omitted to bring out the last time you were examined. All I could do would be to emphasise the old points which appear all through the evidence.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

TUCKIAN FLOOD ESCAPE SCHEME.

REPORT.

THE Sectional Committee, consisting of Mr. W. J. Trickett, M.L.C., and Messrs. Watson and McFarlane, Ms.P., appointed on Thursday, 22nd February, 1900, to inspect, take evidence, and report with reference to the proposed Tuckian Flood Escape Scheme, commenced its inquiry in the Municipal Council Chamber, Lismore, on Wednesday, 7th March, the same Committee having been engaged from the 26th February to the 7th March in an inquiry as to a proposed line of Railway from Grafton to Casino. Evidence was given by Captain Paulsen, of the s.s. "Tomki," with reference principally to the condition of the Richmond River, as regards navigation; and by Mr. J. W. Coleman, Mayor of Lismore, and Mr. J. O'Flynn, ex-Mayor, as to the damage caused by floods, both in the town of Lismore and along the river banks lower down. Mr. John Greenhalgh, fisherman, was examined as to the state of the river in time of flood, and the probable effect of the proposed channel. On Thursday, 8th instant, at 9:30 a.m., the Sectional Committee, accompanied by Mr. W. E. Kemp, Acting District Engineer, and Mr. Thos. M'Donnough, Surveyor, Harbours and Rivers Department, left Lismore by Government launch and proceeded down the river as far as Tucki Wharf, where they were met by the Mayor of Coraki and others. Driving for some distance they reached the top of the Tucki Ridge, and there obtained an extensive view of the surrounding country, the swamp, and the line of proposed channel, and were able to form a good idea of the proposed scheme, especially as regards the lands more directly affected. The river, in this part of its course, is confined between the Tucki Ridge on the north, and what is known as the Pelican Creek Ridge on the south. Flood waters coming down the South Arm, on reaching Pelican Creek, have the effect of backing up that watercourse, which, in consequence, overflows its banks at North Codrington, about 6 miles above Coraki, and spreads over the low-lying lands between the South and North Arms of the river. In high flood the water from the North Arm also breaks over the bank of the river at Tuckurimba, near the site of the off-take, 5 miles above the town of Coraki, and makes its way over the Tuckian Swamp into the Broadwater—an arm of the main river lower down. In the valley, on the western side of the Tucki Ridge, the country affected by flood embraces a very large area, stated by some to be "hundreds of thousands of acres." Further down the river, at Swan Bay, the water in high flood breaks over its northern bank and flows in a northerly direction over 7 miles of intervening country into the Tuckian Swamp. It is contended that, by diverting a large volume of water from the North Arm of the river, the proposed channel would reduce the flood level at Swan Bay, and lessen the danger from inundation at and above that point. Having visited the "off-take" site, and the spot at which the proposed channel would cross the Coraki-Lismore road, the Sectional Committee drove on to Coraki, where, next day, the 9th, they took evidence from local residents,

residents, who all favoured the scheme, and the majority of whom were of opinion that the level of the weir was much too high, and should be about 8 or 6 feet above low water, instead of 12 feet, as proposed by the Department. Next morning, the 10th March, at 9.15 a.m., the Sectional Committee proceeded to Woodburn, where an inspection was made of the Tuckambil Weir, about a mile from the town, and afterwards a large number of witnesses was examined at Woodburn. These were also favourable to the scheme, their evidence being similar in effect to that given at Coraki, and particularly as to the reduction of the weir level. On Monday morning, the 12th March, at 8 a.m., the Committee proceeded to Broadwater, where evidence was taken from farmers and others residing on that part of the river. Some of the witnesses were opposed to the scheme, believing that if carried out it would have an injurious effect upon their land in time of flood, and that they would look for compensation. It was stated that the incoming tide, especially in times of easterly gales, backs up the flood-waters brought into the Broadwater by the Tuckian escape channel, and thus raises the flood-level in that locality.

The Sectional Committee then proceeded to Wardell, where they examined a number of witnesses, all of whom (with one exception) being opposed to the scheme, on the same ground as that put forward at Broadwater.

The Committee then proceeded to Ballina, arriving at 6 p.m. On Tuesday, 13th March, a sitting was opened in the Court-house, Ballina, at 10.15 a.m., and continued until 5 p.m. The witnesses included Mr. W. E. Kemp, Acting District Engineer, who was examined as to the probable effect of the proposed scheme upon the navigation of the river, and raised a fresh objection to the scheme as being likely to silt up the river between the weir site and Coraki; and Mr. Thos. McDonnough, Harbours and Rivers Department, who had been engaged in survey work in connection with the scheme, and who gave evidence concerning flood levels, and particulars regarding the condition of the Tuckian Swamp. On Wednesday, 14th March, Messrs. McFarlane and Watson, accompanied by Mr. M'Donagh, surveyor, proceeded by Government launch to Broadwater, and thence by rowing-boat to Tuckian Swamp. At the head of Broadwater a creek is entered which continues for some distance through the swamp. This creek has recently become almost blocked with weeds, and extreme difficulty was experienced in forcing a way through. The junction of the proposed drain outlet was found to be with the main Broadwater arm of the river, and not with the creek as shown on the wall map. There was no bank visible at the junction, though there was a dense growth of mangrove and other trees which might lead a casual observer to the conclusion that a bank existed there. No doubt the fact that the wall map shows the drain as emptying into the creek mentioned, where a bank exists, led to a little confusion on the point. The members of the Committee came to the conclusion that if the scheme were carried out it would be advisable to facilitate the outlet of the water from the flood channel into Broadwater by cutting down the growth of trees now at the junction.

When the Committee left Sydney to take local evidence and inspect the country to be served by the proposed Flood Relief Channel, only one witness, namely, Mr. C. W. Darley, Engineer-in-Chief for Public Works, had been examined; and as that gentleman will be recalled, and the evidence of Mr. Keele, the Resident Engineer responsible for the scheme, and others, will have to be taken, the Sectional Committee do not feel justified in, at present, coming to a final conclusion on the matter under consideration, but beg to report as follows:—

1. That in times of flood immense damage is caused along the whole length of the Richmond River, both to property on and near the river, and for many miles inland, and that on such occasions trade suffers, and the whole of the inhabitants are, on those occasions, losers to a very heavy extent.
2. That owing to the tortuous character of the river, and its many arms and arteries, the, varying heights of the river banks, and the low-lying character of much of the surrounding country (some of it being lower than the adjacent or protecting river banks), it is very difficult, if not impossible, to provide a general remedy against submergence in times of high floods.

3. That while the remedy suggested by the proposed Flood Relief Channel would have a good effect as far as relieving that part of the country connected with the river "above the Weir site," and as far down as Woodburn, the effect on the river and lands below Broadwater is one that experience alone could illustrate; and in this connection there is therefore nothing to guide the Committee in coming to a determination.
4. The evidence of witnesses taken at Lismore and at various places down to Woodburn (a town a few miles above Broadwater) is largely in favour of the scheme; but most of those witnesses contended that the weir, to be effective and to be a means of relief against freshes or moderate floods, must be reduced considerably below the 12-foot level.
5. At Broadwater (a township at the junction of the Broadwater and the Richmond River), and at Wardell, a few miles lower down the river, the evidence was distinctly against the proposal; and some of the witnesses clearly asserted that they would look for compensation in case of an unnatural quantity of water being concentrated at the Broadwater, and submerging their lands.
6. The contour of the country, and the varying heights of the river banks, coupled with the fact that the circumstances and conditions of former floods have been variable, in some cases the flood-waters first "breaking in" at a point near the proposed weir site, and finding their way thence to the Swamp; in other cases the flood-waters overflowing the banks near the elbow at Swan Bay, and flowing for about 7 miles northerly to the Swamp, &c., are such that there is no distinct point or set of circumstances as a guide to say at what part of the river a sure and effectual plan of relief to all concerned could be carried out, so that the proposed channel, at best, can only be regarded as a partial remedy.
7. In connection with the possible damage that some of the witnesses urged may be caused to their lands by the proposed work, an important feature was brought out by Mr. Kemp, the Local Engineer, who stated that by the construction of the proposed weir (especially if reduced to a lower level) the navigation of the North Arm of the Richmond River, between the weir site and Coraki, would be silted up by loss of necessary scour, and it might happen that, with a rush of water down the South Arm, the North Arm would be caused to flow up stream to the weir. The additional dredging that would be rendered necessary between the weir site and Coraki is estimated by Mr. Kemp to cost an annual sum equal to the interest on the expenditure involved in the proposed relief channel.
8. The weir at Tuckambil has not been long enough constructed to be a sure guide. The local evidence was to the effect that on the occasion of the fresh that occurred in that part of the country in 1899, the outlet was the means of escape of a great body of water; Mr. Kemp stating that, on that occasion, the flood water was fully 5 feet over the sills on the weir. No reliable test of the efficiency of the weir is possible until a high flood takes place. It may be here noted that this escape is into a stream known as Evans' (or Little) River, about 2 miles distant, which empties itself direct into the sea.
9. As to the local payment for the scheme, this question had evidently not been carefully studied. The Lismore Borough Council seemed prepared to contribute; at Coraki no determination had been come to by the local Municipal Council, while individual witnesses were divided in opinion, the amount, betterment area, and rate of contribution not having been anywhere systematically thought out. As to compensation for any possible injury that might be caused by the diversion of the river waters, that had not been considered.
10. Whether the proposed channel is constructed or not, dredging and clearing the river must continue to keep it navigable; and it seems that the breakwater at the entrance will have to be continued a considerable distance seawards.

11. Looked at as a partial remedy, the Committee are inclined to the opinion that at the early stage of a flood, and provided there are no over-balancing forces, such as a very high tide and a strong gale up the river from the coast, the channel cut right through to the head of the Broadwater, would have the effect of carrying the conducted water quickly to sea, and so relieving the low-lying lands between the weir site above Coraki and the Broadwater. In high floods, and continuous floods, it is difficult to see how the channel could continue its effectiveness, as the surrounding country lies so low that it must become a huge water reservoir. It must also be borne in mind that to reduce the height of the weir, as suggested, must necessarily reduce the scour in the river.

W. J. TRICKETT,
Chairman.

28 March, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

TUCKIAN FLOOD ESCAPE SCHEME.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

WEDNESDAY, 7 MARCH, 1900.

[The Sectional Committee met at the Municipal Council Chambers, Lismore, at 11 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Sectional Committee proceeded to consider the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Louis O. Paulsen, master of the steamship "Tomki," sworn, and examined:—

1. *Chairman.*] You are master of the s.s. "Tomki," trading between Sydney and Lismore? Yes.
2. Have you any knowledge of the river when in a state of flood;—when was the last flood of any consequence? Last July. I was here with the "Tomki" at the time.
3. That was not a very big flood, was it? Not exceptionally big. It was a good high one.
4. Could you tell us what effect a flood has on the river in any particular part—for instance, about Broadwater—as regards backwater, or anything of that kind? Down at that part I do not think a flood would have any effect on the river. It is too far down; the river is too wide. There is a great spread there. The rise of the flood there is very small compared with up the river. In the heaviest floods we generally come close up to Broadwater from Ballina to moor. In former times we used to do that, but I did not move last time.
5. You would not know what the effect of a flood would be in setting the water up to Broadwater towards the Tuckian Swamp? It would not tend to do that, because the spread is so wide. The lower river, having a greater width, will carry a greater quantity of water away. There must be a tremendous quantity of water there before it rises to the level of the banks. The more water you have down there the greater is the scour.
6. Then you do not think that any flooding of the country about the Tuckian Swamp would be caused by backwater setting up again, but would be caused by water going down towards the river? There could not be any backwater, because the flood is so great that it must carry it away. There would be no backwater up there to any great extent, except that coming down the Tuckian drain.
7. At the junction of Broadwater and the Richmond River, and from thence downwards, does the water in flood-time overflow the bank? No; unless there is an exceptional heavy flood and a very heavy sea outside to back the water up. With a heavy sea outside there might be a tendency for the water to overflow the banks a little, but not to such an extent as to do any damage.
8. During a period of nine years have you ever seen the water over the banks below the Broadwater? No.
9. How close to the banks would the water be from the highest flood you have seen. A foot from the bank. The highest I have seen it has been just level with the banks.
10. And that was in a big flood? Yes.
11. What flood was it? I forget the year.
12. With regard to the rapidity of the water in flood-time, does the outward flow vary very much in different parts of the river? Up the river it varies.
13. Between Lismore and Coraki, for instance, does the outflow vary much? In some parts it varies a little. That is caused through the bends in the river.
14. When you get down to the broad, straight portion of the river below Broadwater, then you have a pretty uniform flow? Yes; a regular, uniform flow.
15. In flood-time and ordinary time as well? Yes.
16. You notice a marked difference in that respect between the upper and lower portions of the river? Yes. Down below you do not notice the outflow very much. Where there is a considerable rise up here at

L. O. Paulsen.
7 Mar., 1900.

L. O. Paulsen. Lismore, you hardly notice it down there, unless, as I say, there is a heavy sea outside to back the water up. That is the only thing that tends to raise the water to the bank, and make what we call a banker down there.

7 Mar., 1900.

17. How far would that heavy sea operate in that way? It might sometimes have an effect right up to the Broadwater, and sometimes not quite as far—it might only go as far as Wardell.

18. But that, I suppose, is exceptional—only in a south-easterly gale? Yes; in a south-easterly or easterly gale. The heaviest sea we get here is from the east-north-east.

19. I suppose you have studied the proposed scheme for dealing with the river by cutting a channel from near Coraki over to the Broadwater? No; I have not made a study of the scheme.

20. Have you formed any opinion about it? I think it would be a great benefit to relieve the land of the flood-water, and carry the water away. It ought to be a great benefit to the upper portion of the river to relieve the low-lying lands. The effect would also be to benefit the crossing and the bar down below, because there would be a larger body of water going out, which would create a heavier scour.

21. The proposal is to erect a weir on the river above Coraki, and divert a large volume of water by means of a channel over towards the Broadwater;—what effect do you think that would have on the ordinary river channel between the weir and the heads? It would not have any material effect, except to take away a certain body of water which otherwise would force itself over the bank below Coraki. It would relieve the land below Coraki towards Woodburn, and prevent it from being flooded, except by a very high flood. The proposed channel would afford a means of escape for the flood water.

22. You do not think it would so minimise the flood below the weir as to render the channel liable to silt up;—you think there would still be plenty of water left to keep the ordinary channel clear? Yes; I think there would still be plenty of water, and that the escape channel would have no material effect in that respect. In fact the effect would probably be to keep the river at a more uniform depth, instead of there being a big rush of water down in time of flood, with the result of a silting-up in certain places, and the formation of a flat. If you have a uniform flow it tends to maintain a regular depth.

23. I suppose in your trips up and down the river it has occurred to you that there are many places, in the corners of the rivers and so on, that want improving? There are a good many places that want dredging or deepening. As the depth of the water on the bar and on the crossing increases, so shall we have to deepen the river. The rise and fall will be greater up the river as the water runs out and comes in. In former times there was no escape for the water in flood-time because there was no bar at the Heads. There was only a shallow flat, and no proper channel formed, and the water would remain in the river. There was no rise and fall to any extent. But with a greater depth of water on the bar, and the improvement of the entrance, there would be a greater quantity of water in the river, and, consequently, less rise and fall in flood-time. I have no hesitation in saying that when the bank of indurated sand is cut through at the crossing, and a proper channel secured, there will be from 18 to 20 feet of water on the bar.

24. What is the state of affairs at the junction of the Broadwater and the river when there is a flood;—is there a much intensified stream at that particular point—what water effect do you get there—are there eddies or anything of that kind? There is still water in flood-time at the junction of the Broadwater and the river, because a big body of flood water comes down the main river at about Pelican Island, and there is no counteracting body of water coming down the Broadwater.

25. In time of flood do you think there is a tendency for water to flow up the Broadwater towards the Tuckian Swamp—to be backed up? No; it never flows up the Broadwater, but there is a great run down.

26. It has been suggested that if the proposed drainage is made, and the river is utilised in the ordinary way, there would be at flood time a set-back up the Broadwater which would prevent the Tuckian Drain from relieving the water by that cross-cut;—I want to get your views as to the state of the waters at flood-time at the junction, to indicate whether there is any such backing-up as that suggested? I do not think there is any possibility of damage being done by the backwater. The big body of water coming through the channel would drive it away. At present there is no such outflow, and consequently there is still water. If a channel were cut as proposed, that would tend to bring a force of water down, and give life to the other water. At present there is none—it is dead. There is no channel leading into it, and as there is no current it remains still water. On the other hand, if the channel were carried out, I have no hesitation in saying there would always be a steady current through to carry the water away.

27. *Mr. Watson.*] What effect do you think the bringing down of the water by the proposed relief channel would have upon the land, say at Wardell; would it cause that to flood earlier? No.

28. Why do you think that? Because the river is too wide.

29. You think there is plenty of get away? Yes.

30. You see the flat in the river shown on the map? Yes.

31. Would not that have the effect of blocking the getting away of the water, there being a depth shown of 8 feet 6 inches, which, I suppose, is at low water? No; it would not have that effect, because it is too wide—over a mile wide.

32. You have no doubt that once the flood-water is brought into the Broadwater it can get away easily enough below that? Yes, without any trouble, because there is a big body of water to carry it away.

33. The incoming tide would retard its flow a bit? In flood-time the fresh water overpowers the incoming tide for two or three days. It depends on the height of the flood, and it might do so for four days, or a whole week.

34. Have you ever seen the water over the banks about Wardell? No.

35. Or below Broadwater? No; I have seen it level with the banks.

John William Coleman, Mayor of Lismore, sworn, and examined:—

J. W. Coleman.

7 Mar., 1900.

36. *Mr. Watson.*] How long have you been in the district? I have been in the district all my life; I was born here. I have been a member of the Municipal Council for nine or ten years.

37. You know the proposal to construct a flood-relief channel from the north arm of the Richmond River to the Tuckian Swamp? Yes.

38. Has that matter been under the consideration of your council? Yes.

J. W.
Coleman.
7 Mar., 1900.

39. With what result? The council are favourable to it and the different mayors have done all they could to forward the project, believing that if carried out it will relieve the whole of the northern part of the river from high flood. It would prevent Lismore from being flooded, and the municipal councils are willing to bear their share towards payment of the interest on the betterment principle, should the work be carried out.
40. Has there been any estimate made as to what your share would amount to? No; I do not think we have had any intimation of what our share would be.
41. Have the floods been serious in the town of Lismore? Yes. I have a map here showing the contour of the highest flood—that which occurred in 1870. It starts above the bridge at Brown's Creek, crosses Zadoc Creek, O'Ryan-street, and Lester-street, and it comes back across O'Ryan-street again and out beyond Draden-street, and then it goes away round to the south of Ballina-street and into the river again below John-street. The flood of 1870 was 36.94 feet above high-water mark.
42. Would that flood the greater portion of the settled part of the town? Yes.
43. What was its height above the street level at "McGrath's Hotel"? The street level was put down at 35.32, so that the water there would be a little over 1 foot in depth.
44. Is "McGrath's Hotel" at a fair average elevation, or is it slightly higher than the rest of the town? It is slightly higher.
45. And going towards the Post-office? There the level is lower.
46. Which is the lowest point? According to the plan, there is a fall of about 4 feet between McGrath's corner and Nesbitt's store, opposite the Post-office. That would give a depth of over 5 feet at Nesbitt's store.
47. During the flood mentioned? Yes. There would be very little difference between the Post-office corner and Ellis's corner.
48. So that the 1870 flood, with 1 foot of water at "McGrath's Hotel," practically covered the whole business part of the town, having a depth varying from 1 foot to 6 feet? Yes. There is another flood marked on the map, which occurred in 1890. That was not quite as high, the height being 35.11 feet, or rather more than 1 foot below the 1870 flood.
49. Have there been any floods of any moment since the flood of 1890? There was a flood in 1892 at a height of between 36 feet and 37 feet, which also covered part of the town. That would be about the same height as the 1870 flood.
50. Have there been any floods since 1892 which have come over the banks? No; I do not think there has been a serious one since 1892. There has been one or two which has just come up into the town, but have not flooded any of the buildings.
51. At any rate, the damage done during the very high floods that have occurred is sufficient to create a desire to insure against them in the future, even if you have to bear a portion of the cost? Yes. We would rather bear a portion of the cost and have some relief. The water remains on the land a long time. It rises very slowly—perhaps an inch an hour—after it gets above the banks of the river, and it falls very slowly, so that the damage is done by the length of time the water remains on the land. Take the farms above Lismore. If the water came on to the land to-day, and was off again to-night or to-morrow morning, there would not be much damage done, but the injury arises owing to the length of time the water lies on the farm.
52. Could you say how far the flooding of the land immediately near the river extends above and below Lismore;—does it extend for some distance to your knowledge? Yes; you can get a boat about 10 miles up the river above Lismore. One of the steam launches can go right up to the junction of Wilson's Creek and Cooper's Creek. The farms on either side would be flooded, and also the land above that again where the creeks are narrower.
53. Do you mean you can get a boat up there across the banks? No; at any ordinary time you can get a steam launch up there; they go up that way droghing cane down.
54. And, as far as it is possible to navigate, the floods spread over the banks? Yes, and even above that point. Right up as far as Eltham on the railway line the land is flooded in flood-time, simply because it cannot get away down here. If there were some means of taking the water away, of course it would flow much quicker.
55. From which point does the greater quantity of water come—from Leicester Creek or Wilson's Creek? It depends upon the rainfall. I have seen Leicester Creek running here at such a rate that Wilson's Creek, instead of coming the ordinary way down the river, has backed right up, owing to the force of water coming out of Leicester Creek.
56. Those creeks are both above Lismore? Yes; the junction just at the bridge.
57. There is no backing up of the water from below Lismore;—your trouble arises from water that comes from above Lismore? Yes; the water, not being able to get away, backs up the other water to a certain extent. No water comes from below to flood Lismore; it comes from above Lismore.
58. You would not be flooded because of the rainfall in the other arm, for instance? No; not to any extent.
59. Your trouble arises from great and capricious falls of rain further up than Lismore, in one or other of the two main creeks? Yes. Rain falling up at the head of the creek here is the most serious thing for us. Fig-tree Bend, shown on the map at a point marked 55 miles, has a very serious effect in delaying the downward flow of the water, and preventing it from getting away from Lismore.
60. Why is that? The angle is very sharp, and the water rushes against the left bank. Striking the left bank the water rises there 2 feet higher than the water on the further side of the bend, showing that the water is much retarded in its outward flow.
61. Would it cost much to get across that narrow neck at the bend? The neck is very narrow. Coming round in the steamer you can see the trees growing on the opposite bank. I understand it is only a chain across.
62. Is it composed of rock? No; it must be composed of earth. A short time ago the Government advertised for tenders for leasing the bend, and the Lismore Municipal Council and the Chamber of Commerce interfered, and the tenders were withdrawn, so that at the present time there is nothing to stand in the way in the event its being decided to sever the neck. There would be no compensation, and no private interests involved.
63. You think it would help the flood outlet if that bend were cut across? Yes; it would be a material help. Even if the Tuckian scheme were not carried out this in itself would relieve Lismore to a certain extent. Of course, the Tuckian scheme would afford much greater relief.

- J. W. Coleman.
7 Mar., 1900.
64. Did your Council get any expert to examine the Tuckian scheme? I think the late Mayor, Mr. O'Flynn, had two or three meetings down the river, and will be able to give you information. We did not send an engineer down to report upon the scheme, or anything of that sort.
65. At any rate, you are satisfied from your local knowledge that the proposed work would be a benefit to Lismore in the way suggested? Yes.
66. Have you heard anything of protests against the work from people at Wardell, or in that locality? Only what I saw in the paper. I saw in the paper that they had had a meeting at Wardell, and they said they would oppose the scheme, provided it was likely to damage their property in time of flood, but if they could get the assurance of the engineers in charge of the work that it would not flood their property they would raise no objection.
67. From the evidence given in Sydney by Mr. Darley, the Engineer-in-Chief for Public Works, it would appear that there is some danger of flooding the lower banks of the river? As to that it would be very difficult for anyone like myself to offer an opinion.
68. Can you think of any practicable method by which a financial guarantee could be given to the people of Wardell in the event of the scheme when entered upon proving to their detriment? That would be very difficult. It would depend entirely upon the value of the land damaged. A lot of the land down about Wardell, on those low-lying flats, is not very valuable.
69. Do you know whether the flood in 1870, which you say was the highest, overflowed the banks at Wardell, or near that place? The highest floods we have here do not seem to affect the lower parts of the river at all. A high flood at Lismore would not be over the wharfs at some of the towns down the river. If they get a heavy sea on the bar in an easterly gale and spring tide that will do more damage to them than a flood. I refer to the lower part of the river down below Broadwater.
70. Has that sometimes the effect of backing the water over the low-lying lands there? The streets of Ballina have been flooded once or twice by the heavy sea and spring tides.
71. Has that occurred at Wardell? Going up the river from Ballina the effect, of course, would diminish, but the water would be over the wharfs at Wardell, and, perhaps, into the town. As you come up the river, the effect of the south-easterly gales and spring tides would be lighter.
72. It would appear that if that condition of things existed at Wardell, and you had, simultaneously, a flood in the river, then, with the proposed relief channel in working operations, their troubles would be accentuated? Yes; if you happened to get the two things together.
73. Do these easterly gales, sufficient to cause this backing up of the spring tides and so on, usually occur during the rainy season? No. The rain here generally comes from the south. The greatest trouble, so far as the floods are concerned, occurs if we get northerly rains with north-east weather, because we then get the water right up at the head of the creek. Our river rises right away up in Mount Warning, and if we get rains up in that direction we feel the effect very much quicker, and we have a higher flood, than we have with southerly rain.
74. Is the rain you usually get from the north-east a tropical summer rain, or a winter rain;—what time of the year, for instance, was it when the 1870 flood took place? The flood in 1892 was in April, I think. There is no regular season. We have had floods here in June, and, perhaps, we may have one in December. There seems to be no regularity in that respect. You might have a flood from winter rain, or you might have one from summer rain.
75. Has there been any attempt made to ascertain the flooded area that would be relieved by the success of the proposed scheme? Not that I am aware of.
76. Have any statistics been collected on that point? Mr. O'Flynn, the gentleman who will be next examined, knows more about a matter of that kind, because he was mayor at the time the discussion was on, and took a more active part in it. Unless it has been roughly calculated, I do not think there has been any survey made to ascertain the area that will be relieved.
77. What basis has been suggested for a contribution towards the cost of the work, and any possible damage which might occur lower down;—I dare say, in the various discussions, some suggestion was made on that point? I do not think the matter of indemnity for any damage to property down the river ever cropped up. The question of contributing to the cost, on the betterment principle, was discussed, and the Lismore Council expressed themselves willing to contribute whatever might be their assessment in connection with the matter. The Council would only pay in respect of the property within the municipal area. It was thought that the Government intended to make some charge, by way of assessment, on the properties receiving benefit.
78. I take it that land outside the municipal boundary—farm land, and so on—would also receive a certain amount of benefit? Certainly.
79. It would pay the owners of those lands to insure against floods in the manner suggested? Certainly it would.
80. So they might reasonably be expected to contribute to the cost? Yes. I do not think there would be any bother in regard to that.
81. What would it be worth to a man;—what, assuming that the extreme amount would be collected;—we must have some basis on which to form an idea of the matter;—what do you think would be the extreme betterment that would accrue? It would depend very largely upon the position of the man, and the kind of crops he was growing. In the case of a man going in for cane, a flood would not hurt him, after the cane was up a certain height, nearly as much as it would injure a man going in for maize-growing.
82. The water lying on maize land would kill the crop? Yes; but in the case of cane, if it were a certain height, the water might have no effect at all; so that it would be very difficult to make an assessment.
83. As far as the better class of agricultural land is concerned, it is rather a benefit to have an occasional flood, if it comes at the right time? Yes; and most of the better class of land here is high land, away from flood-level. It is only the land along the river banks, the alluvial soil, that would be affected. What we call the big scrub lands here, where the majority of the dairy people live, are not affected by the floods. They are out of the flood reach altogether. It is only the farming land, where people go in for maize-growing, potatoes, and sugar-cane, that would be affected.
84. Do you think those people would sooner be free from flood than risk the loss of their growing crops, at the same time, of course, losing the chance of manuring the ground by the deposit which a flood would leave?

J. W.
Coleman.

7 Mar., 1900.

leave? I think the people would rather be free from flood altogether. The land here is rich enough, without the deposit left by a flood. We have a very big rainfall.

85. You could not form any estimate of what it would be worth—for instance, in the town of Lismore—would it be worth 1s. 3d. or 6d., or any other stated sum, in the £ per annum? I have not given that matter consideration. It would take some little time to work it out. You will probably get those figures from the farmers down the river at Coraki.

86. But with regard to the town of Lismore? It would take some little time to work it out. I have not gone into the matter. Some of the shopkeepers have 5 feet of flood water in their stores, while others have only 1 foot. It would, therefore, be difficult to fix a uniform charge. The idea is that the council should contribute collectively, and then make the shopkeepers pay according to their assessment—that is, the value of their property.

87. Could you say, at a rough estimate, whether it would be worth £600 or £700 a year to the people on the river who are affected? I should think so.

88. That would be added to probably if there were any claims for damages from Wardell; but you think it would be worth that to the people affected, anyhow? I certainly think it would be worth that. More than that has been lost in one flood.

89. That would apply to the people affected above the proposed wier? The people of Coraki would receive as much benefit as those anywhere else. The land down there would be relieved from floods to a large extent by this scheme.

90. So that you include Coraki in the benefited area, and also Woodburn, because by relieving those places of the water which now goes down from Lismore, you reduce the flood level there? Yes. Coraki would get no flood waters from the North Arm, above the weir; it would only get flood water from the South Arm.

91. Taking the rise in the river at Lismore at 3 feet, that would mean about 9 feet above high-water? I do not think you would notice a 9-foot flood at Coraki much. I do not think a 9-foot flood here would be over the Government wharf at Coraki.

92. Might not that, in conjunction with a flood from the South Arm, be sufficient to flood Coraki to some extent? A flood from the South Arm would flood Coraki to a certain extent, but not nearly so much as one from here.

93. Does it sometimes occur that you have a heavy flood on the north arm, and only a moderate one on the South Arm? Very often. At one time there was a very high flood at Casino, and a boat was sent across from Lismore, and at the same time we had only an ordinary sized fresh here. The water did not break over the banks here, and at Casino they had one of the heaviest floods they ever had. In that instance the South Arm would have more flood in it than the North Arm.

94. And does it sometimes occur the other way round—that the north arm is flooded while the south arm is only moderately affected? Yes. Very often there would be very little flood at Casino, while we would have a very fair flood here.

95. So that anything that would reduce the flood on the North Arm would have a tendency to relieve Coraki? Very materially, I should say. They get more water from the North Arm than they do from the other.

96. *Chairman.*] With regard to the offer which the people seem to have made to contribute to the cost of the proposed work, do you think they would consent to some such arrangement as that which exists with regard to the country towns water supply, namely, that the interest on the cost of the work, amounting to between 3 and 4 per cent., should be spread over a certain number of years, and that principal and interest should be recouped by a rate levied *pro rata* on all property coming within the betterment area? That means that in a hundred years we would repay the money expended in constructing the work.

97. Do you think that would be an equitable way of arranging the matter? I do not think the people would have any objection so long as the annual payment was not too high. It is just a matter of how the thing would work out. If the cost were such that the interest and repayment would become too heavy, perhaps they would not care to do it; but as long as the charge came within reason, and the people could fairly meet it, I do not think there would be any difficulty at all.

98. Seeing the large extent of country to be benefited, and considering that the most expensive of the schemes would cost slightly under £60,000, one would think that spread over a long term the people would be able to fall in with some such arrangement as that, which, of course, would have to be made the subject of an Act of Parliament? Yes.*

99. Is that your idea of how the thing should be worked out? I do not think there would be any difficulty in working it out on that principle. But very often a work estimated to cost £60,000, before it is finished, is found to cost a great deal more. There have been numbers of instances in connection with the country towns water supply where the towns have been saddled with interest and repayment which they could not possibly meet. If the Government would form a basis on which they could give the people here some idea of what they would have to contribute annually for a certain number of years, they would soon get a definite answer as to whether the people would do it or not.*

100. Would there be any difficulty in arriving at a betterment area in connection with a work of this kind? I do not think so. I think the surveyors could get at it very readily, because I think the Harbours and Rivers Department have ascertained the rise and fall from the head of the river down to the entrance, and it is only a matter of getting the levels in order to ascertain the places affected.

101. I suppose you consider that the populated areas, such as Lismore and other towns, would receive more value from the scheme, and would be likely to contribute more in proportion, than the people on the agricultural and the pastoral lands affected? I do not know. The damage done in Lismore itself is not so great, nor are the individual losses so great, as is the case on the farming lands. Although in Lismore a flood would cause great inconvenience through people having to remove out of the low-lying places, and to move their live stock, yet, so far as other losses are concerned, they would be far greater on the farming lands.

102. Speaking as Mayor and as a townsman of Lismore, you feel quite sure that the municipality would contribute its fair proportion? Yes.

103. More than that you cannot say? No. The aldermen have expressed their willingness to contribute their fair share.

Alderman

* NOTE (on revision):—Amount since estimated by Engineer-in-Chief, £80,700.

Alderman James Francis O'Flynn, Lismore, sworn and examined:—

- J. F. O'Flynn. 104. *Mr. McFarlane.*] What is your occupation? I am an engineer, and I have resided in Lismore for about eighteen years.
- 7 Mar., 1900. 105. You are also an alderman of the municipality? Yes; I have been twelve years in the Municipal Council, and was mayor for seven years.
106. Have you given any consideration to the proposed flood relief scheme at Coraki? I have studied it generally to the extent of reading Mr. Darley's report, and Mr. Keele's report, and other documents in relation to it.
107. Have you seen the plan? Yes; I saw it this morning for the first time.
108. Having seen the plan, do you think the scheme would have the effect of relieving the flood-waters of the upper river? I have no hesitation in saying that in my judgment it would.
109. How did this scheme originate;—did it emanate from the Council, or was it put forward by the officers of the Department? I think it was put forward by Mr. Keele. It did not originate in the Municipal Council.
110. Was it submitted by Mr. Keele to the Council? No; when the matter was ventilated through the Press the Council took it up.
111. How long ago is it since it first came under the consideration of the Council? I should say from memory five or six, or, perhaps, seven years.
112. Did the Council approve of it unanimously? It has been several times before the Council in the shape of resolutions urging the work on the Department, and it has received the unanimous support of the Council and the ratepayers. No voice has been raised against it.
113. The Council believe it will have the desired effect of minimising the destruction caused by floods? Yes; that is their impression.
114. You have heard Mr. Coleman's evidence? Yes; most of it.
115. Do you endorse the statements he made in regard to the extent of the floods in Lismore in 1870, 1890, and 1892? Yes; there have been other serious floods besides those mentioned.
116. Do they cause, as a rule, much destruction;—I speak of the town of Lismore? They cause more inconvenience here than destruction. There is not much danger to life or property, but there is a lot of inconvenience and some loss of property. Damage occurs owing to goods not being removed in time.
117. Have you a knowledge of the country along the banks of the river above Lismore? I have for some miles up the river—7, 8, or 10 miles.
118. And also down the river towards Coraki? Yes; down the river as far as Broadwater.
119. Is much of the land along the banks of the river, both above and below Lismore, liable to flood? A very large portion of it.
120. And that also would be benefited by the proposed scheme? I believe it would.
121. If it will benefit Lismore, it will naturally benefit the flooded area above the site of the proposed scheme? Yes, and also below it.
122. How far would that extend to? Certainly to Woodburn.
123. How many miles is that below the scheme? I suppose it would be about 25 miles.
124. Mr. Coleman said in his evidence that the Municipal Council at Lismore were prepared to contribute their share of the cost of this work on the betterment principle? The matter has never gone that far. We have not formulated anything yet. We looked upon that as a Departmental matter. The Department having carried out the survey, and taken all the levels, we thought they would be in a position to give us full information on that point. We knew for certain that the work was to be done under the Water Rights Act, which embraces something of the betterment principle, and consequently that we must be prepared to pay, and we are prepared to pay.
125. Has any decision been definitely come to by the Council that they would pay their share of the cost on the betterment principle—has it yet reached the stage of a resolution? No, there has been no resolution of that kind; but we ascertained approximately what the interest on the outlay would be, and we considered it quite within our means to meet our share of it.
126. Would you state what that amount would be? I cannot tell you from memory.
127. Would that be your share of principal and interest, or of interest only? We presume it would be done in the same manner as under the Country Towns Water Supply Act.
128. Is it your opinion that the Council would offer no objection to paying their share on the betterment principle? I have no hesitation in saying so. That, at least, is the consensus of opinion here and anywhere down the river where I have attended meetings on the subject. I have attended several meetings, and there is a consensus of opinion everywhere.
129. You think there would be no difficulty as regards the residents outside Lismore who would be benefited, paying their share in the same way as the Lismore people are prepared to do? I think not, judging from their utterances at public meetings.
130. That has been your experience? Yes.
131. Have you made any calculation as to what the amount of interest would be on the betterment principle in connection with the cost of the proposed work;—there are five or six schemes in Mr. Darley's report, the most favoured one being estimated to cost £60,000, which would mean a yearly payment of £1,800 or £1,900? Considering the very large number of people who would be contributors, I do not think even that amount would be regarded as excessive when spread over such a large number of contributors.
132. You think that, in consideration of the benefit done by the prevention of floods, the residents interested would be willing to pay even that large amount? Yes; I think that, spread over a long term, it would not be oppressive, and they would receive an adequate benefit in return. I believe that one large flood, such as the heaviest we have had in the district, would involve a total loss equal to the cost of the whole scheme.
133. A good portion of the land up and down the river, excepting the townships, is land already occupied for farming and dairying purposes? The whole of it is occupied for those purposes, except one or two small reserves.
134. So that the whole of the flooded area would contribute? Yes. In reference to the manner in which the matter might be dealt with, I think the municipalities might be placed on a basis different from that of the landowners, who would pay a special charge. That is an idea of my own. I have thought that possibly

J. F.
O'Flynn.
7 Mar.; 1900.

possibly an assessment might be made in Lismore generally over the municipality, for I hold that a resident in the municipality is not in the same position as a farmer. Every business man in this town would benefit from flood relief, as well as every man who actually suffered from a flood. In time of flood the whole business of the town is stagnated, and every business man, though he may not be flooded, loses by that stagnation in business. I would suggest that in the case of the two municipalities interested—Lismore and Coraki—the charge should be levied by a general assessment of a penny in the £, which should be equivalent to their share of the cost.

135. It would be like a special rate, irrespective of whether they benefited to a greater or less degree? Exactly.

136. You think they are all directly interested and would all be benefited? Yes.

137. With regard to the farming land? I consider that only the man who would be flooded should be assessed, and in proportion to the extent that he was flooded.

138. You get a number of floods that are not looked upon as destructive? Yes; there are many of what we call freshets—we do not find fault with those.

139. What height would a flood have to be in Lismore before it could be classed as a destructive flood? I think anything above 30 feet. Anything below 30 feet causes very little inconvenience or loss. A flood at any height above 30 feet involves serious loss and inconvenience to the town and loss to the farmers.

140. Would that also hold good with regard to the areas of land along the river? There are some much lower than others; speaking generally, the same would apply. I think the introduction of the dairy industry on the river will lead to an amount of loss from floods never known before. That is, by the destruction of grass in the low-lying paddocks.

141. And stock, too, in some cases? The stock they can always relieve, but the destruction of grass by floods is a serious loss to dairy people. That is a loss we did not sustain in former years, because the dairy industry was not so much carried on on the river.

142. Are you well acquainted with the locality through which the proposed cutting goes? I am not at all acquainted with the locality. I have never travelled over it. I know the site of the proposed outlet from the river, but otherwise I know nothing about the scheme beyond what I have read.

143. You could not, as an engineer, give us any practical information as to the desirableness or otherwise of carrying out that particular work? I was never on the ground.

144. If the proposed cutting would in flood-time carry away a considerable quantity of water, that would cause a less flood down the main river from Coraki to the Broadwater? Yes.

145. Would that have any effect in the main channel between Coraki and Broadwater? I do not think it would have any effect as regards keeping the reach scoured.

146. That is what I mean? I believe it would have no effect. I have noticed that with a rise of 12 or 14 feet there is as much scour in the river as at any stage of a flood.

147. Notwithstanding that a considerable quantity of water would go through the new channel, you think there would still be sufficient to make a complete scour, and to have the effect that floods usually have under present conditions? That is my impression.

148. You think that the channel of the river would not be damaged to any extent by the cutting? Not to any extent at all.

149. Suppose there was a flood rising to the height of 30 feet at Lismore, could you supply us with any information showing to what height that flood would raise the river at Coraki, above the junction? You can get that information from the Department more accurately than from anybody else. During recent years, at the instance of the Department, I have sent men to take the levels simultaneously at every public wharf along the river. This was done both night and day.

150. *Mr. Watson.*] Did they take a common level all through as a datum point? I know the Department telegraphed to me from Ballina asking me to appoint a man to take the rise and fall, and I know that has been done also at Coraki and at other places on the river on the same date and at the same hour.

151. The banks of the river are higher, are they not, at Lismore than Coraki? Yes; they gradually get lower as you go down.

152. When the higher banks at Lismore overflow does the same flood cause an overflow of the banks down the river, though it does not rise nearly so high there? That is not so. Very often when we have a high flood here the injury done at the lower end of the river is comparatively slight. The river, getting wider, seems to accommodate itself to the increased flow. There is a greater spread of water.

153. Do you think the construction of the proposed weir would have the effect, down below the weir near Broadwater, of temporarily raising the water in flood-time to a higher level than it was before? I do not think so at all, on the ground that the water they get at Broadwater would reach them at an earlier stage. As it is now, they get all the water pretty well, but it takes longer to go there. My impression is that by taking the flood-water off from the North Arm, as proposed, the flood-water will reach Wardell and the lower portions of the river at an earlier stage; but I do not think the proposed channel will have the effect of raising the water any higher there. It will meet ordinary normal water down there and will be taken away and over the bar a day or two earlier than if it went by the long circuitous route which it has to take now.

154. The river down there being so much wider? Yes. Practically the water would get through the channel and over the bar before it would get round the ordinary circuitous channel.

155. As a rule, for what length of time after a flood do these extensive flats remain under water before they drain off? They cannot drain off until the river goes down. I could not say the level. I know the large flats remain full of water a long time—until the river gets down below them.

156. Would you say a week? Probably a week.

157. Long enough to seriously injure vegetation? Yes, that is the great trouble—the length of time the land remains covered. There are some crops that would recover if the water went off quickly, but otherwise they get injured and scalded.

158. And this character of country, with your present rainfall, does not require the drenching by floods that some other parts of New South Wales do;—some people, I suppose, would like these floods for the benefit of the deposit they would get upon the ground, and so on? If floods could be relied upon to come regularly it would be a different thing, as you could then prepare your crops for them; but I have seen floods in July, and I have seen floods in January and December, and in April.

159. Is there any information you would like to add to that already given? Reference was made by Mr. Coleman

- J. F. O'Flynn.
7 Mar., 1900.
- Coleman to the Figtree Bend. I understand from other sources that that is a portion of the flood relief scheme, though not embraced in the present inquiry. I understand that the cutting of that bend and other bends on the river is intended to relieve the places above Lismore.
160. You are of opinion that besides this proposed work there are other various bad points on the river, which would have also to be improved? Yes. There is dredging to be done here to widen and straighten the river in order to meet the growing requirements of the place.
161. If the proposed flood channel has the effect that so many people think it will, will it enable a much larger tract of land to be under cultivation, and utilised for grazing? Yes, I am certain of that. Places that are risky now would then be perfectly safe.

John Greenhalgh, fisherman, Ballina, sworn, and examined:—

- J. Greenhalgh.
7 Mar., 1900.
162. *Chairman.*] Does your occupation take you along the river between Ballina and Lismore? Before I started the fishing business I used to travel the river. I am a native of the Richmond, and I have been principally in and amongst the timber. I used to follow the river up and down at all times.
163. Rafting timber? Yes.
164. Cedar? Cedar and pine.
165. We want your evidence chiefly as to the effect of flood-waters in the river, especially down on the low-lands, and at the junction of the Broadwater;—will you tell us where the flood-waters in ordinary floods cease to overflow the banks of the river? The whole of the banks of the river overflow more or less.
166. Even below the Broadwater? Yes.
167. Is that the result of the flood-water, or is it the result of a southerly blow with a heavy sea setting in? Both. In a heavy flood, such as that of 1870, an easterly gale would stop the water from getting out.
168. But without an easterly gale? It is not then nearly as bad.
169. But does the flood-water go over the banks? Yes, over a good portion.
170. We have been told that a flood without an easterly gale setting in does not overflow the banks below the Broadwater;—is that your experience? Easterly weather and a flood generally come together. The flood of 1870 was the biggest and the worst as regards loss that we have had in the district. In that flood the whole of the banks of the river from Lismore right down to the bottom, with the exception of only a small portion, were overflowed.
171. Do you know the proposal to cut a channel at a point 4 miles above Coraki over to the north-west end of the Broadwater? Yes; I know the ground well.
172. What do you think of the proposal? As far as the North Arm is concerned, it will relieve that to a great extent. The main street in Lismore is covered by the time there is a depth of 5 feet of water at Coraki. What is wanted is to relieve the water before it gets to Coraki—that is, to relieve the water from here. When we get a general flood, the same as that of 1870, or that of 1880, the water from the two arms coming together, swells the middle portion of the river. We have something like 28 feet of a fall between Lismore and Ballina on the top of high tide; that is to say, in a high flood, when we have from 36 feet to 37 feet of water at Lismore, there is only from 7 feet to 9 feet at Ballina.
173. How do you know that there is that difference of level? From measurement.
174. What effect would the drain have on the river between Lismore and the weir;—how would it benefit the country on either side of the river? My opinion is that it would take the North Arm water away at least three days out to sea before it would get down by the main river as it does now. I will tell you how I know that. There is a wharf here just below the Council Chambers at Lismore. I left that on the commencement of the 1870 flood, and I travelled five days and had to anchor against the incoming tide between Pimlico Island and Immigrant Point; so that I travelled with the flood-water the whole of those five days. In fact, in a general flood—a flood in all the arms—the worst of the flood at Ballina comes a fortnight later.
175. Then the proposed scheme would have a good effect down there? Yes.
176. What effect would it have on the river between the weir and the Broadwater? It would have a much greater effect than on any other portion of the river, because it would relieve all the low-lying lands towards Bungawalbyn and Swan Bay. It would also relieve the whole of this portion (*pointing to the map*), where there are some thousands of acres covered in ordinary flood-time, and where have been hundreds of stock drowned.
177. The water getting away by the proposed channel would leave much more space for the water from the surrounding lands to get down the main river as far as Broadwater? Certainly. The North Arm water would not shove the South Arm and Bungawalbyn waters back on to the farming lands.
178. Then when you get to the Broadwater, how would you get on then;—what would be the effect? I do not think there would be any great effect at all, simply because all the North Arm water that would get up to any height would be out to sea before the other water came down.
179. Is there any water that backs up the Broadwater towards the swamp? No.
180. You are sure of that? Yes.
181. From your observations there is nothing of that kind? No; the water is always going out of the Broadwater.
182. According to your observations, is this a correct statement:—
Under present conditions the swamp is filled by the backwater which makes its way to a large drain above Bucken-
doon, and also through Gungarubba Creek and through the Broadwater.
—? That is correct.
183. Where does that backwater spoken of in regard to the Broadwater come from? The water that comes into the Broadwater is simply from the watershed of the flat shown on the map.
184. Which way does the backwater go through the Broadwater? The whole of the water from Marom Creek empties into the Broadwater, and there is also the watershed from Marom Creek very nearly to Wilson's Creek; the whole of that water comes out into the Broadwater. So that really there is nearly as great a stream running out of the Broadwater at flood time as there is out of the main river, because it is fed from the great watershed of the mountains.
185. That being so, when a big flood occurred, would there be any danger, in the event of the proposed work being constructed on the North Arm, that the water would not get away quickly from the Broadwater, because

because the same state of flood would exist there and would have no fall—is that likely to occur? No, I do not think so; the flow is too great.

J.
Greenhalgh.
7 Mar., 1900.

186. Suppose the whole district is flooded, and you raise the water 12 feet to go over the weir, the object of that is to send the water over towards the Broadwater; you say that a lot of water comes down towards the Broadwater on the eastern side of the Tuckian Swamp;—is there any danger of that water, which collects from the eastern side of the Tuckian Swamp and runs into the Broadwater, being so high that it will prevent the rapid rush of the flooded water from the weirs towards the Broadwater? I do not think so; I do not think that is possible.

187. There is too big an outlet at the Broadwater for that to happen? The water is spread over too great a surface. The water is spread right over from the bank at Coraki right back to the mountain, and there is only the one tributary—that is, of any great power—Marom Creek, running into the Broadwater, and it spreads over such a great area that it is just like a big swamp.

188. That being so the water will get quickly into the Richmond River at the junction of the Broadwater and the river? Yes.

189. From there down towards Ballina, will the shutting in of a large quantity of water at the weir, and sending it over to the Broadwater, have the effect of flooding the lands on both sides of the Richmond River there more than occurs at present? I do not think so.

190. Why not? Simply because the force of water will be greater, and will operate so much earlier than if the water got away as it does at present. It would get away at least three days before it would be going round by the main river.

191. The quick exit of the water right through at the widest part of the river would enable it to get away quickly? Yes. There is nothing to block the water below the Broadwater, and, if the flood-water got down there two or three days sooner than under present conditions, it would be out to sea before the easterly weather came on. I am speaking of the North Arm water, which rises so much faster than the other.

192. And the great object of this scheme is to get the water quickly away, and not let it take a slow and spreading course between the weir and the junction of the Broadwater with the river? Yes; my opinion is that it will produce a benefit in that respect to the extent of three or four days.

193. Did you ever register the rate at which the water flows down the river at various times? Only just travelling down with it on rafts. In that way we have a pretty good idea of how fast it runs.

194. For a river in flood, is the Richmond a slow-running river? It is not so fast as most other rivers. This scheme will materially help the rush of water out of the North Arm.

195. *Mr. Watson.*] You say that in the 1870 flood you left Lismore for down river, taking five or six days to reach Pimlico? Yes.

196. And at the end of that time the high flood you had left at Lismore had not reached Pimlico? Yes.

197. What was the height of the flood at Lismore when you left? The height of the flood when we left the wharf here was about 3 feet above high water.

198. It was not a high flood that you left on, then? No.

199. That is hardly a fair guide as to how fast that flood travelled;—you left on 3 feet, and when you got down to Pimlico it was not noticeable? No; there was an incoming tide at Pimlico.

200. How soon did it rise at Lismore after you left; would you hear how soon it had risen behind you;—did it rise quickly above 3 feet? It was over the street at Lismore when we were at Pimlico.

201. Can you tell us how long it takes to go down from Lismore to Pimlico;—does it not travel faster than five days over that distance? On the ebb-tide there is extra water going down; but still that was one of the heaviest floods we ever had, and why I know the water was over the street at Lismore is because my brother and I went down on the raft, and when the flood rose so high my father pulled after us in a boat, and the water was then over the main street at Lismore. He came down in one day, and we were at Pimlico Island when he arrived.

202. You say it was only 3 feet in Lismore when you left? Yes.

203. So that it is hardly right to say it took five days to go down to Pimlico, because 3 feet, when you got to Pimlico, would hardly be noticeable, as the river widens out there? You would not notice it at Pimlico.

204. What I want to get at is the time it took the heavier flood to go down;—what would you reckon to be the rate at which the water travels in flood-time between Lismore and, say, the lower reaches of the river? The heaviest portion of the 1870 flood was ten days later at Ballina than at Lismore.

205. The highest point of the flood at Ballina was ten days later than the highest point of the flood at Lismore? Yes.

206. Would a state of flood in the South Arm have any effect on that, Ballina being below the South Arm? The whole of the waters go almost directly together.

207. Was the South Arm in flood in 1870? Yes; in very heavy flood.

208. So that it would be operating equally upon either arm pretty well? Yes.

209. Have you attempted to ascertain the actual speed at which a flood travels down the river? I could only give the height of the tide on each night when he tied up.

210. That would be the amount of rise during so many hours? Yes.

211. Did you ever attempt to estimate the strength of the current when you were going against it during a flood? I have no idea as to the speed of the current.

212. Was it a strong current? Yes; a fairly strong current.

FRIDAY, 9 MARCH, 1900.

[The Sectional Committee met at "McFadden's Hotel," Coraki, at 10.30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

John McKinnon, Mayor of Coraki, sworn, and examined:—

J. McKinnon, 213. *Chairman.*] What is your occupation? I am a dairyman. I have been in the district for nearly thirty-four years, and I am at present Mayor of the Municipality of Coraki.

9 Mar., 1900. 214. In the first place, I suppose all are agreed as to the great damage done to the surrounding country when floods occur? Yes.

215. Starting in 1870, could you give particulars of the various floods that have affected the district since then? The flood of 1870 was the first heavy flood we had on the river after I arrived here, and it happened to be a double flood, which made it so bad. It attained to its great height on the 10th March, 1870—that was the first rise. I will quote from my diary: "1st March. The river is in high flood. It rose at the rate of 4 inches per hour until it overflowed the banks, then at the rate of 3 inches, 2 inches, 1 inch, $\frac{1}{2}$ inch, $\frac{1}{4}$ inch, until it attained its full height." That would be about 19 feet above the normal level of the river at half tide. The rain came from the south-east, with a heavy gale of wind. Then on the 20th March the same year the river rose to the same height. As I have said, it was a double flood. The rain-storm went off for two or three days, and the river fell within its banks, and then the same gale of wind set in again, and rain came on again, and on the 20th the flood was up to the same height as before. During all this time the back-water was rising out on the flats. The consequence was that about 1,000 head of cattle were drowned over in the forest belonging to the Gerards. Not expecting such a flood—it seems they never had the like of it before; that is, a double flood—they had not shifted the cattle. There was a bit of a hill 2 or 3 feet high, on which the cattle gathered, and there was a house being built on the top of it. On Sunday, the 20th, Gerard came down as far as our place, and we sailed over to where the cattle were, and it was the most horrible sight I ever saw. On about an acre of ground there were between 800 and 1,000 head of cattle dead and dying, piled up three and four thick on top of each other. When the owner saw them he was for some time speechless. We turned away from the sight, and started away back home again. We found a current setting up towards Tuckian across the whole of the flats at the rate of about $\frac{3}{4}$ mile, or a mile, an hour. The current was going in a north-easterly direction. All the crops of corn were lost. At that time the farmers, as a general rule, had no cattle except a few cows for the use of the house, so that the loss in the shape of cattle would be very little. After that flood, so unexpectedly high, a great number of the farmers got disgusted. Some of them threw up the land merely for the deposit money they had paid when selecting, and left the farms on the lower river. But, luckily, the storm stripped away a portion of the sand down along the sea beach, and left a deposit of gold all along the beach, and the farmers who lost their crops managed to make a living for years on the gold found on the beach. In fact, some of them have been making a living in that way ever since, and are working there now. When that failed, then cane came to be grown on the river, and of all crops the cane stood the floods best. In fact, the cane seems to grow as well in water as on land, as long as it is not altogether covered. When completely covered, and when the air is altogether excluded, the cane will die, but that is the only thing that will kill it. Then came a succession of floods. A cycle of years seemed to come round now and again of excessive wet, with dry seasons between. Between 1860 and 1870 there seemed to be a number of floods. After 1870 there were high freshets, but not a big flood until 1884. I find this entry in my diary: "Saturday, 3rd May, 1884; river running bank high, current running unusually strong." That is all I have down about that; the losses were not very heavy in that month. Then I had this entry: "Sunday, 23rd January, 1887, river in flood; it rose within 3 inches of 1870 flood; rising at rate of 7 inches per hour." This was a flood that came down the south arm. It was the only one that I know that came from inland. All the other floods came from the east, with a gale of easterly wind. In this case the wind and the rain were from the north. That flood came down like a wave through the South Arm, but there was no flood to speak of on the North Arm. The effect was to back up the water over the ground between Baxter's place and Coraki. It forced the North Arm over there. Then again there is this entry in the diary: "Saturday, January 20, 1889, river in flood, 6 inches higher than 1870 flood; rate of rise, 2 inches per hour." That is all I have with regard to that flood. The next is: "August 6, 1889, river in flood; it rose within 2 ft. 6 in. of July flood."

216. Would that be enough to cover the flats? Yes.

217. Where did you take your heights from—Coraki? About 2 miles from Coraki, following the arm.

218. I think you said your mark would be about middle between high and low water? Yes, the normal level. The next entry in the diary is this: "Monday, March 10, 1890; a terrible flood in river; it rose within 3 inches of last year's flood. It is the worst flood yet, as it has kept at full height during forty-eight hours. It commenced on the 6th, raining in heavy showers on the 6th, from east all day; 7th, raining all day from S.E., river rising steadily; 8th, raining and blowing a strong gale of S.E. wind; river rising about 2 $\frac{1}{4}$ inches per hour; we are expecting a heavy flood; 10th, 1 a.m., blowing gale of south wind and raining; matters are getting rather serious; raining, with the river in high flood and rising; it is within 6 inches of the big flood last year, the highest we have seen on the river." It remained for nearly forty-eight hours at the same height, falling and rising one inch twice during its full height. The next one was on 4th April, 1892: "River in high flood, it rose as high as '89 flood"; that was about 3 inches higher than the '90 flood. Again: "January 23rd, 1893, river rose level with the bank. February 6th, 1893, river in high fresh again. Monday, 13th February, 1893, river in flood; it rose within 1 ft. 9 in. of highest. Saturday, February 18, '93, river in high flood; it rose 3 inches higher than ever we had seen it rise before. March 28, '93, river rose level with the banks again. Saturday, 2nd February, '95, river in flood; it rose within 18 inches of highest flood (that would be 18 ft. 3 in.) February 23rd, '98, river in high fresh; next day it ran 11 inches deep over the sills at Tuckombil." The height of the water according to my register was 16 ft. 3 in.

The

The last flood was on Tuesday, 11th July, '99. It rose 6 inches higher than the flood of the previous year, J. McKinnon, or a height of 16 ft. 9 in. I did not go down to Tuckombil, but I was told it ran 5 ft. 3 in. over the sills, with only 6 inches odd at Coraki. In the flood before the river was running strong up Tuckombil Creek, 9 Mar., 1900. while in the last flood it was coming down, besides what was going out in the escape channel. That flood came from Bungawalbyn.

219. In regard to the earlier floods you have mentioned, you have only the heights registered at your own place? Yes; and also the rise and fall.

220. You have not the heights at the other places? No. In 1893, when we had the highest flood of all, I had 300 head of cattle. I did not lose any during the flood except a calf or two; but all the pasture was destroyed, and two months afterwards I had only ninety-seven head. The others died of starvation after the flood. I had 10 acres of splendid cane. The flood washed away the soil as deep as the plough, and destroyed that paddock for cropping afterwards. It is under grass now. After that we banked the river with slabs as closely as we could, to prevent such a rush of water coming on us again. We have not had a very high flood since, but on one occasion the river was 18 inches higher outside the slabs than inside. The consequence was that we had about 100 acres of pasture above the flood which did not get covered owing to the embankment. So that people could do a great deal in that way in some places to protect themselves from flood. It would not do on the other side of the river, because you could not stop the water there; but on that side a man could build a mound of earth on which to put his cattle in time of flood instead of having to send them away. The mound need only be 2 or 3 feet high above flood-water mark, and large enough to hold his stock. A shed could be built over it, and when a flood came the farmer might save all his cattle and horses, and feed them also.

221. You have given us a record of the floods since 1870? Yes; of all the big floods. There were plenty of small ones which destroyed pasture, but they did not destroy cane.

222. From the statement you have had it would seem that the majority of those floods occurred in the early part of the year;—is that so? Generally—between, say, from January up to August. That is generally the wet season. March is the worst month of all for floods. It is wetter than any other month.

223. Take an area of flooded country having Gunderimba on the north, the North Arm on the west, the Tuckian Swamp on the east, and the site of the proposed weir on the south;—can you tell us what depth of water lies in a heavy flood on that tract of country? In some places it is deep and some places shallow, but, on an average, I suppose it would be about 5 or 6 feet in most places.

224. I mean the large extent of arable land;—to what extent would that be under water in a big flood? Speaking generally, I should say 4 or 5 feet in a heavy flood. In some places it would be less, and in others more.

225. It would be sufficiently deep, and lie there sufficiently long, to seriously affect the crops? Yes; to destroy the crops and all feed.

226. Would that same kind of flooding occur on the other side of the river, between the North Arm and the South Arm? Yes; and even more so.

227. We have now got down as far as the weir site;—can you give us the same kind of information with regard to the flooded area of country south of the weir as far as Coraki, and for some distance below? The whole of the flats on that country, coming down towards Coraki, is flooded to a depth of from 7 to 10 feet.

228. Is the whole of it flooded on the left-hand side of the river? Yes.

229. Starting south of the weir at its western end, and following the river round as far as the Elbow, and then round to Dungarubba Creek, is the whole of that country submerged in flood-time? Yes; and the water then seems to take a sharp run through the Tuckian Swamp and into the Broadwater.

230. When that occurs are the whole of the river banks submerged? From the weir side down to Coraki the river banks are submerged, and from Coraki to Swan Bay they are not.

231. Although the banks may not be submerged the country on either side of the river banks is submerged? Yes; 2 or 3 chains back from the river banks it is all one sea.

232. That portion between the weir site and Coraki seems to be narrower and more twisting than the other portion you described;—you think that is the reason of its overflowing there? No. There seems to be a block at Coraki, where the two arms meet. On the banks, between the weir and Coraki, the river has left blind creeks ever since it broke through. There are broken banks or holes, and when the river rises about 14 feet it backs into Rainbow Creek, and other similar depressions, and from there runs over the adjoining country.

233. So that the river bank is usually higher than the country immediately behind? Yes.

234. But in this case the water-escapes over the banks through these blind creeks into the back country? Yes.

235. Would you indicate where the water first breaks over the river banks? The water first breaks over a little distance above the proposed weir site at Rainbow Creek.

236. But does it break over above the present weir site at Rainbow Creek earlier than where the water comes in near the Elbow at Swan Bay? Occasionally; it depends upon the fall of rain. With a sudden rise in the river it will go over near the weir site first. With a slow rise and a big flood at Bungawalbyn it will go over at O'Connor's, near Swan Bay. But generally it will go over below Swan Bay first.

237. The Department, in a statement, have given their explanation as to the filling up of the swamp, and the back-water, and so on;—if you and the other witnesses can agree that they have given a correct description, it will put the matter in a concise form, and we shall have a good basis to go upon;—do you agree with this statement:

Under present conditions the swamp is filled by the back-water, which makes its way through a large drain above Buckendoon, and also through Dungarubba Creek, and through the Broadwater, and subsequently, when the flood rises over the banks to the level stated R.L. 114, when the country between the Bungawalbyn and Tuckombil Creeks and right across the river to the northern margin of Tuckian Swamp becomes one vast sea.

This is caused by the gorging of the river at a number of places through sharp bends and contractions of the cross-sectional area of the channel caused by reefs. The first rise is caused by the sharp turn at the Devil's Elbow at Swan Bay; then there is a very extensive reef at Woodburn, which is almost a complete block to the river at flood-time. A sharp turn and contraction of the channel occurs below Dungarubba Creek, where there is rock on the concave bank. Another serious obstruction exists at Broadwater, where a reef extends half-way across the river, just above the Mill. Below the Broadwater there is another reef with shoal-water, and above Wardell there is a long stretch over the Blackwall Flat, where there is only 3½ feet at low-water on indurated sand.

Each of these obstructions causes the water to head up to pass them, and the consequence is that it stands very little variation for some days after it has reached its highest level between Woodburn and Broadwater.

J. McKinnon. Is that a fair description of the trouble? There is one thing there I do not believe in. It says the water backs up through the Broadwater. This is the part of the statement to which I refer: "Under present conditions the swamp is filled by the back-water, which makes its way through a large drain above Buckendoon, and also through Dungarubba Creek, and through the Breakwater." I do not know anything about its backing up the Broadwater. I always understood it ran out of the Broadwater. The Broadwater never helps to flood the country between the Tuckian and Swan Bay.

9 Mar., 1900.

238. *Chairman.*] I take this from Mr. Darley's evidence:

Do I understand that from that point, for a distance of 2 miles down to the Broadwater, it is a dead level, or is the Broadwater 5 feet lower than that point? The low water in the Broadwater is 5 feet lower than the bottom of the channel. When the channel is beginning to work a considerable flood must be passing down the river—12 feet of flood must be passing down the river; therefore, the Broadwater itself will be in flood, so that the chances are that it will be fully 5 feet, if not higher. Possibly before the water passes over this country the flood in the river will be found backing up that channel. It is quite possible that before the water passes over the weir the back-water may be rising in the channel, and the channel coming up to the weir on the other side.

I would like your views on that question and answer? In all the floods that I have seen on the river—and I have seen them all since 1870—there has been a set of the current running into Tuckian. If the water were backing up through the Broadwater into Tuckian, the current could not be going there. In all the floods I have seen the set of the current has been towards Tuckian. Water must be getting out of Tuckian or else that would not occur. If the water were backing up from the Broadwater, how could the Tuckian Swamp be taking in all this other water. The flood-water from between the weir and Dungarubba Creek flows towards the Tuckian Swamp. There must, therefore, be a flow in that direction, and an outlet through the Broadwater to the river. Consequently, there could not be any back-water running up the Broadwater—at any rate, not to such an extent as to run up the relief channel and prevent its operation. From my observation, for a length of time that has been the course of the current on the flooded country.

239. You are quite sure of that? I am quite sure the water never backed up from the Broadwater.

240. Do you think this would happen: That the water might back up the Broadwater in the direction of the proposed flood-relief channel before the water overflowed the banks of the river between the river and Dungarubba Creek? I have never been over there in a rainy time, but it is very hard to believe that it would back up the Broadwater at any time, because the river is very often at its full height before there is any rise down there, and then it is a very slow rise.

241. You do not think, then, that what I suggested is possible? No.

242. There is another question: It is proposed by this weir to let the water into the proposed channel at a height of 12 feet above low water-mark—that is, about 9 feet lower than the present river bank; the water would be let into the weir at a height 9 feet lower than would be the case if the bank were left in its natural state;—the water being let in there at a level 9 feet lower than its natural level, will that have the effect of letting any water on to property, and damaging it, lower down, that would not be damaged if the river were left at its natural height? No doubt the water would get on to some land which would not, under natural circumstances, be flooded.

243. The weir will be cut down to a 12-foot level, but the sides of the channel will be kept up to the existing height of the banks; the water will get in quicker, but then there is a fall from the crest of the weir down to the outlet in the swamp;—do you think that can possibly do any harm to land down below? Very little. If the material that is taken out by the excavation is deposited on one side of the channel it will keep the water from spreading.

244. It is proposed to form a channel by using chiefly the stuff taken out of the cutting, and piling it up on either side, thus making a channel to keep the water in and prevent it from overflowing the banks; that will extend for a length of 2 miles;—do you think that channel is taken sufficiently far, or ought it to go further, in order to ensure that the water will go quickly into the Broadwater? When once the water gets that far it will not damage any land.

245. Then you think that a channel to the edge of the swamp, as proposed, will be sufficient? Yes, to keep it from doing any damage to any one. Certainly, if the channel were cut down through the swamp to the Broadwater it would take the water away quicker, but that is not included in the scheme.

246. Would this channel afford relief in the case of a heavy and prolonged flood, when the whole country would be submerged, or could we only regard it as affording relief in pretty quickly-passing floods? It would afford relief, but not so much as in the case of quick-rising floods and high freshets. It will assist in such cases, because the water will commence to get away a day or two before it does at the present time. But when there is a heavy prolonged flood, the whole country is so flooded that there is an immense quantity of dead water standing. That, however, happens very seldom.

247. The proposed channel is provided as a means of rapid exit for the water from the upper part of the river? Yes.

248. But once the whole country gets in flood, and the river between the weir and Dungarubba Creek is fully charged with the flood-water, then the proposed channel must close its force in a great measure? It will lose its force; but still it will be running, because the water in the arm will be higher than the water at the back. It will be running all the time, because even in the highest flood the arm is some feet above the back-water.

249. Have you and your municipality in Coraki considered the question of damage, and also of compensation; it is urged in the scheme put before us that the people to be benefited are quite prepared to bear the cost of the work;—have you considered the question from that point of view? Yes.

250. With what result? I have not travelled through the district, because I do not know the area that would be included, but, as far as I know, about here we are all willing to contribute towards it—that is, if it will not come too heavy upon us. I think it lies with the surveyor and the Government to make out a betterment area, because we cannot know. That is the only way to get at them all. Even some of those who would be most benefited would try to get out of it unless we had a betterment area.

251. Taking as a basis of compensation an arrangement similar to that under the Country Towns Water Supply Act, the payment of the cost of the work being spread over a number of years, and interest being added at, say, 3½ per cent., would the inhabitants be willing to contribute a yearly amount to recoup the Government? Yes, certainly. It is for their own benefit, and the man who is not ready to pay something towards it is not a man.

252. In reference to any compensation that might be required for any possible injury by flooding people down

down below, do you think you would be inclined to go into that question? I cannot say anything about J. McKinnon. that. It would first have to be proved whether anyone would be injured.

253. That is a somewhat difficult question? Yes.

254. That would be coping with an unknown quantity? Exactly. We believe here that the scheme will not injure anyone down at the Broadwater. At any rate they cannot claim anything until it is proved that they are injured. That cannot be decided until there is a flood.

255. Any injury occurring through altering the course of the river would be a very serious thing? Yes.

256. However, the inhabitants have not come to any arrangement about that matter? No, we cannot do so. Our belief up here is that there will be no damage down there. Those people may believe there will be, but that will have to be proved. The engineers, by calculating the rainfall and the rise in the river, ought to be able to give some idea on the subject, but we ourselves cannot tell.

257. With regard to the area covered by the swamp itself, there are some high ridges shown on the map which are called islands;—are those settled or leased? They have been selected.

258. In the event of this scheme being carried out and a greater quantity of water being put into the swamp than before, and in a quicker time, do you think it will be necessary for the Government to resume the whole of the swamp? Those who selected the islands, if they hold them yet, might make out that they would be damaged. They are flooded now. In a heavy flood there is 3 or 4 feet of water over the whole of their land.

259. *Mr. McFarlane.*] Has this scheme been submitted to your Council, and have they discussed the question of whether they approve of it or not? Yes, several times.

260. Were they agreeable to have it or not? Yes.

261. Did the question of payment, under the betterment principle, crop up? We have not considered that, but I believe the Council would be in favour of giving a share towards it.

262. You are of opinion that the Council will give their share in the event of the betterment principle being adopted for carrying out the scheme? Yes; because I know it will be a benefit to the Council by reason of the less damage that will be done to the roads within the municipality. There will be a saving in regard to the roads, so that they ought to contribute.

263. From your knowledge of this locality, extending over a great number of years, and your experience with regard to floods, are you of opinion that if the proposed scheme were carried out it would have the effect of considerably minimising floods in the flooded portion of the district above the proposed weir towards Lismore? Yes.

264. And for what distance below? All below, down to the Broadwater would be benefited.

265. Would it have much benefit up towards Lismore? It would have a certain benefit, but not so much as below, because the same quantity of water will have to come down, and the only difference the scheme will make will be to draw it away quicker.

266. Would not that have the effect of reducing the height? A little; but there would not be as much benefit above as below, because below there will be so much less water coming down. The same quantity of water will come down the river above the weir, and it will get away quicker and there will be less rise. That would apply a certain distance, but I would not like to say how far.

267. How high would a flood have to rise before it would overflow the banks at any part between the proposed weir and Broadwater? Ten feet above mean water below Swan Bay.

268. How high would the water have to rise at Coraki before it would overflow the bank so as to allow the water to run into the Tuckian Swamp? At a level of 14 feet it will commence to run into the Tuckian Swamp.

269. It will have to rise 17 feet before any of the river water will discharge into the Tuckian Swamp? Yes, about that.

270. What height would a flood have to be to cause the water in its backed-up course to go into the Tuckian Swamp? Seventeen feet above mean water.

271. Could you name the locality, or as near to the exact spot as possible, where the river first overflows so as to discharge into the Tuckian Swamp? Near Baxter's.

272. Along the whole distance down to Broadwater there would not be any place where there would be an overflow into the Tuckian Swamp until such time as there was an overflow at Baxter's,—is that the case? No; the place where the water first overflows in the direction of the Tuckian Swamp is below Swan Bay.

273. When the proposed drain is cut the water will actually go into the Tuckian Swamp with a less rise than it now takes—at a rise of 10 feet above mean water? Yes.

274. When the scheme is completed, and an outlet given into the Broadwater, is it your opinion that the flood-water will go with sufficient rapidity through the channel as not to cause any great overflow in the Tuckian Swamp than that occasioned by floods at present? Yes. I do not think it would cause any additional rise. All the water that would go through the channel would not represent a rise of a quarter of an inch an hour at Tuckian.

275. Do you think it would cause any additional rise in the river below Broadwater—between Broadwater and Ballina? No. I do not think it would materially affect the land down there, simply because the water taken from the North Arm would get down to the Broadwater so much quicker than the water from the South Arm and Bungawalbyn would get round the long bend of the river. I do not believe the water will rise any higher at Broadwater than at present, because it will be taken away so quickly.

276. *Mr. Watson.*] You will have observed, perhaps, that several distinct methods of effecting the object aimed at have been submitted to the Committee? Yes.

277. One proposal is that there should be a weir 300 feet wide giving access to a channel of the same width; the channel to be continued as far as the swamp, but only to be cut down for about a couple of feet below the crest of the weir where the water leaves the river. It is proposed, further, that in the centre of that channel there should be cut a drain 20 feet wide and about 5 feet deep—that is, 5 feet deeper than the channel of 2 feet—the expectation being that if the channel and central drain were cut in that shape, the earth and clay would scour out, and give eventually a deep channel, the silt, of course, going into the swamp;—do you think if that were done the channel would be likely to scour out, knowing as you do the character of the clay? No.

278. Why? Simply because the nature of the soil is so tough that it would not wash out.

279. What is its nature? It is of a sticky, clayey nature.

280. And, in your opinion, not likely to scour? No.

281.

J. McKinnon.
9 Mar., 1900.

- J. McKinnon.
9 Mar., 1900.
281. At any rate, the floods would be comparatively infrequent, I suppose? Yes; floods that would go over that height.
282. That is 10 feet above mean level? Yes.
283. That would not occur very often? No.
284. And the fewer floods there were the less likelihood of the scour, I suppose? Certainly. The small drain in the middle of the channel would, I think, fill up in the first flood with accumulated silt.
285. Where would that come from—the main river or the immediate vicinity? The banks would fall in on each side.
286. If the banks fell in, that would show that there was a possibility of a scour? The top of the ground is generally looser than the bottom.
287. But you must recollect that the channel is only a slight excavation with, of course, the usual batter of $1\frac{1}{2}$ to 1? Exactly.
288. With that batter, do you think there is any likelihood of the banks falling in? They would always be washing in with the rain.
289. Local water, irrespective of floods? Exactly.
290. Then, in your opinion, in order to give full effect to the scheme, it would be necessary to excavate to a level some distance below the crest of the weir to give the water a fair chance of getting into the Tuckian Swamp? Yes.
291. Assuming that the water was taken in a channel 2 feet below the level of the proposed weir, do you think there would be any danger of the flood-water breaking out of that channel somewhere between the weir and Tuckian Swamp, and going over the adjoining country to the southwards—that is, towards Swan Bay—or would it make direct toward Tuckian? It would make direct towards Tuckian. There is higher ground between the line of the channel and further to the south.
292. The channel will enter the Tuckian Swamp south-east from the stockyard;—is the higher ground on the south-east side of the proposed channel? Yes.
293. So that it is improbable that any water from the channel before entering the swamp would flow in the direction of the surrounding country? Yes; it is improbable. From a point taken practically from Coraki towards the swamp, southward of the proposed channel, there is land slightly higher than that still further south. Therefore the water, if once in the channel, would make towards Tuckian.
294. Touching the method by which this work could be paid for, has any attempt been made by the Municipal Council or by any of your local residents to estimate the benefit that would accrue to any one individual—that is to say, what would it be worth any one individual's while to pay per acre towards this scheme? We have not reckoned exactly what it would be worth to each person individually; but we know it will be a benefit to everyone on the low-lying land.
295. Do you think the district expected to be relieved by the proposal could bear the imposition on a charge amounting to from £1,500 to £1,800 per annum in respect to this work, assuming it to be equitably contributed? Yes; if all were made to contribute who benefited by it, it would not be a very heavy burden.
296. You have known for many years past the effect of local rainfalls and floods on channels;—would you care to offer an opinion as to what would be the cost of the maintenance of the proposed channel;—do you think it would require much expenditure in the way of maintenance? No; I think not.
297. There are a number of watercourses, which at high flood run towards the swamp? Yes.
298. Do they seem to be silting up, or do they remain much as they were years ago? They remain much the same; but that would be different. In regard to these watercourses, there are generally waterholes in them, and vegetation grows, and when a flood comes it keeps them clean; but in this case, where there would be no standing water, the vegetation would become so great that a flood might not be able to sweep it away.
299. You would probably want a man or two to keep the growth down? It might be that in a number of years it would require to be cleaned out.
300. It would not be a heavy item compared with the total cost? No.
301. You must recollect that in such an excavation we should cut down to the clay, which would not be so fruitful in growth as the top soil would be? No; it would not grow very much.
302. You understand that the proposal embraces a weir at the height of 12 feet above low-water mark, or 10 feet above the mean water-level which you usually take here; do you think that that is a proper height, or too high or too low? I think it is too high. There are people with pasture lands out at the back from the river bank, where drains have been cut which have opened out and become like creeks, and now at a rise of 7 or 8, or even 6 feet, the water runs backwards on to the low land inside.
303. Is there any considerable area affected in that way? Yes.
304. Your suggestion is that the lowering of the height of the weir would allow a number of those smaller freshets in the river to escape more quickly, and relieve the people occupying those low lands? Yes.
305. To what height do you think the weir should go? About 5 feet, I think, would be quite sufficient.
306. The engineers seemed to think that to reduce the level too much would result in the river not receiving a sufficient quantity of water to scour the ordinary silt obstructions which arise in rivers of this description, between the off-take and Broadwater;—the object of the engineers being to preserve sufficient water in the river to ensure a sufficient scour, do you think 5 feet would be sufficient for that? Yes, I believe so; because when a flood came there would be plenty of water to scour the river.
307. There would be fewer freshets below the weir with a level of only 5 feet than there would be with a level of 12 feet? There is very often a rise of 4 or 5 feet.
308. But there would be fewer with the proposed weir and channel than there are now? Quite so. Still we believe in getting the water to run off as quickly as possible in flood-time.
309. You said just now that from your inspection of the land on the northern side of the river, between the proposed weir and Dungarubba Creek, you found the current in a high flood going towards Tuckian? Yes.
310. The assumption being that they found an outlet through the Broadwater? Yes.
311. Do you know whether any great body of that water, when the main river began to fall, would go back towards Swan Bay or anywhere near there, or would it all continue to go on through the Broadwater? It would all continue to go on until it would fall below the level of the slightly rising ground on a line running from the proposed flood-channel to the head of Dungarubba Creek. No water comes back from Tuckian.

312. Could you estimate by what depth it would be necessary to reduce the floods to be of any material benefit to the people;—assuming that the highest flood over that large area of country has been about 5 feet, how much would you want to reduce the height of water in order to help them? If you could reduce it 1 foot, it would be a great help. It would leave uncovered a lot of land that otherwise would be flooded, and allow the cattle to have islands of safety where they could get feed and have dry ground to lie down. A foot means a great deal. J. McKinbon.
9 Mar., 1900.
313. I presume your chief contention as to the effect of the proposed scheme is that in those floods which were not the highest you would largely escape flooding, because of the proposed channel taking the water away earlier than it would otherwise go? Yes.
314. Therefore, even although you might still suffer in the very highest flood, you would escape a number of smaller ones? Yes.

Samuel Cook, grazier, Tucki Creek, sworn, and examined:—

315. *Mr. Watson.*] What is your occupation? I am a grazier residing on Tucki Creek, above where it enters into the swamp. S. Cook.
9 Mar., 1900.
316. You know the scheme to take a channel from the North Arm of The Richmond to the Tuckian Swamp? Yes.
317. Can you offer any opinion as to the effect it will have in relieving the surrounding district from flood? I think it will relieve it; but I do not see any relief from the swamp into the Broadwater.
318. Why do you think that the water when taken from the North Arm by the proposed channel into the swamp, is likely to remain there? I think it will do so unless the bank between the Broadwater and the swamp is cut away to a certain extent to allow the water to go into the Broadwater. The bank of the Broadwater is much higher than the swamp.
319. But, at its extreme head, does not the Broadwater tap the lowest level of the swamp? I suppose it does where the drain has been cut in. There is a small drain which has been cut at the head of the creek, and which I suppose does tap the lowest part of the swamp.
320. If water were taken into the swamp from the western side of the weir, where the channel is proposed to be made, would it not find its level round to the drain you speak of, and then into the Broadwater? It might; but it would take a long time to get out. The flood puts about 8 or 9 feet of water into the swamp two days before the river rises. There are five large creeks running into the swamp from the tableland. The water cannot get to the river. I suppose if it could get to the Broadwater it would go to sea before the river rose.
321. So that you think that unless some means are taken to facilitate the discharge of the additional water from the swamp to the Broadwater the scheme will lose a lot of its effect? Yes.
322. How far back from the Broadwater bank—say the southern bank of the Broadwater—towards the North Arm does the higher land extend? Not far; it is only about a chain or two on the bank of the creek.
323. It would be easy cutting? Yes, very easy.
324. But you would suggest the cutting of an entrance to the Broadwater to make a connection between it and the swamp? Yes.
325. Do you think it would be necessary to make a channel right across the swamp, or would it be sufficient to get the water into it and out again? I think it would do without making a channel right across, or if it were made it would only need to be very light.
326. I gather, then, from your description of the water flowing into the swamp, that the height of the bank would be 9 or 10 feet at the point you refer to? It is not that; but when the water begins to force itself up the Broadwater, as soon as the flood begins to rise, it naturally draws up the Broadwater for a little time—that is, for a day or so. It draws up the Broadwater just for a day before it makes down, and then the body of the water gets in at the back, and forces it out again. It does not force it up into the swamp, but only just up into the Broadwater.
327. Where does it make from first into the Broadwater—at a point near the Broadwater into the swamp or up where the drains are? Below the drains, in about a line with where the channel is proposed to go.
328. Usually, it breaks over into the Broadwater first? Yes.
329. So that any cutting made there with a view to a connection would be about the spot of the natural channel? Yes. When the river begins to flow, the water naturally comes out of the swamp in a body quickly down to a certain point, and then it stops.
330. At a depth of what? I suppose the deepest part of the swamp is about 3 ft. 6 in.
331. Might it not be that when it gets to that 3-foot level it is then about low-water level—I mean tidal low-water level? I do not think so, because I have seen them come out together. I have travelled over it on horseback from the lowest part.
332. So that the fact of the water being retained there must be due to some obstruction about the entrance to the Broadwater? Yes.
333. Without the making of such a connection or cutting near the Broadwater, it would appear that the water would have a great deal further to travel from the North Arm to the Broadwater;—it would have to take a roundabout course to get out? Yes.
334. It has been suggested that, unless some channel were made through the swamp, with some amount of clearing, the vegetable growth there, such as rushes, timber, and so forth, would have the effect of blocking the getting away of the water;—do you think that is likely? I do not think so, because there is very little timber on it.
335. Is there no ti-tree? Not sufficient to make any difference.
336. You do not think the rushes would form an obstruction, with the gathering of the silt? I do not think so. When once cleared out, I do not think there would be any difficulty afterwards.
337. When you say when once cleared out, you mean when the surface is cleared;—you think the surface should be cleared through the swamp in a line with the channel? Yes.
338. Do you know sufficient of the general aspect of a flood to feel justified in offering an opinion as to whether the swamp is filled through the backing up of the Broadwater before any overflow takes place from the river in flood-time? No, it is filled from the Meerscham Mountains. There are five creeks which fill the swamp before the Broadwater can get up to it.

- S. Cook.
9 Mar., 1900.
339. When you said that the floodwater before going out began to run up the Broadwater, I understand you to mean that it merely emptied the top part of the Broadwater? No, the mouth. When the force of the flood comes down, the creek backs it up, but not up into the swamp.
340. You are not speaking of a flood from Tuckian Swamp, but you mean a general river flood;—when the river flood comes down and affects the height of the stream at the Broadwater, then you say it forces it up a certain distance, but not into the actual swamp? No, not into the swamp.
341. Why will it not go in there—because it is met by the flood-waters from the creeks? Because the bank of the creek round the edge of the Broadwater is so much higher than the inside of the swamp.
342. You do not think there is any importance to be attached to the statement about the river water or the flood-water backing up into the swamp by the Broadwater? No.
343. When the flood-waters back up the Broadwater in the way you mention, is the flood in the swamp—the local flood-waters—higher than the Broadwater itself? About the same.
344. But you say that the main reason why the Broadwater does not back up into the swamp is because the banks around the Broadwater are rather higher than the swamp itself? Yes; I suppose when the flood forces itself up there it will back up, but not otherwise—not at the usual level.
345. Then any statement as to the tide overflowing the banks of the Broadwater and going into the swamp would be incorrect? I have been over it at all times of the year, and I never saw the tide overflow the banks. The swamp overflows for two days before the river rises. There are five creeks running into it off the tableland.
346. Would you indicate on the plan where the banks of the Broadwater are high—several feet above flood level? At the head of the creek, just where the drains connect.
347. The drain referred to is a drain made by Mr. Henderson many years ago;—but how far will that high bank extend northerly from the junction of the proposed channel, as shown on the map? About $1\frac{1}{2}$ or 2 miles.
348. Then below the channel the high bank you speak of extends for another mile and a half? About that, I suppose.
349. That will be practically to the end of the swamp? When you get to the end of the swamp it is very high there, because it is high land.
350. Is that bank you speak of out of water when the swamp has a depth of 8 or 9 feet in places? No; the water is just about going over it then.
351. How high would that bank be above the lowest level of the swamp? It must be 4 or 5 feet from the inside part of the swamp—the lowest part of the swamp.
352. Have you noticed how high the bank is above high-water? A pretty good height; I could not tell you exactly. When you go through you would think it was 5 or 6 feet high, on account of the peaty turf that grows on the bank of the Broadwater. The water has to filter through this for a certain distance when the flood falls. It is all round the bank for miles. You could stand up to your waist in the holes between.
353. Still, it would be sufficiently solid to present an obstacle to flood-water getting away quickly? Yes.
354. In his evidence in Sydney, Mr. Darley, Engineer-in-Chief, for Public Works, said:
When the channel is beginning to work a considerable flood must be passing down the river—12 feet of flood must be passing down the river; therefore, the Broadwater itself will be in flood, so that the chances are that it will be fully 5 feet, if not nigher. Possibly before the water passes over this country the flood in the river will be found backing up that channel. It is quite possible that before the water passes over the weir the back-water may be rising in the channel, and the channel coming up to the weir on the other side.
Do you know whether that is likely to occur? I should not think so. I have never seen the water back up there; I have always seen it going down.
355. And I think you said that the local flood in the Tuckian was generally a couple of days ahead of the river? Yes; it is flooded about two days before the water comes down the river.
356. The channel of which you speak would probably also facilitate the getting away of the water from the Tuckian swamp itself? Yes; it would be going to sea, because, if it got in there it would be gone before the water came from the North Arm.
357. It would seem to be important to have the way for the flood-water from the North Arm made as clear as possible before it came down? Yes.
358. And your suggestion would be to that end? Yes. There are about 5,000 acres of Government land in the swamp, and it would benefit all that on account of the drain. It would then be all grazing country, and in a few years it would be all cultivated.
359. This proposal is that the water should be taken to the Tuckian; from what you have said, it would appear that if the cutting were made near the Broadwater, as suggested, the Tuckian would be dry, except in flood-time—it would drain more freely? Yes; perfectly dry.
360. If so treated, would it be available for grazing purposes for a longer extent than is the case at the present time? Yes.

William Yabsley, saw-mill proprietor and grazier, Coraki, sworn, and examined:—

- W. Yabsley.
9 Mar., 1900.
361. *Mr. McFarlane.*] How long have you been a resident of the Richmond River? Fifty-six years.
362. You are one of the oldest residents? Yes; I think I am.
363. Have you resided at Coraki or in the immediate locality during the whole of that time? I resided at Ballina for the first five years.
364. How long have you been a resident at Coraki? About fifty-one years.
365. During your residence on the Richmond River has the destruction caused by floods come under your particular notice? Yes.
366. The last witness gave us information regarding floods dating back to the flood of 1870;—were there any destructive floods previous to that? Yes.
367. Of a similar character? Yes. In 1857 we had the first big flood within my experience that did much damage.
368. Do you endorse what Mr. McKinnon has stated with regard to the floods generally, or would you like to add anything to what he said? I endorse all he said with respect to destruction by floods, and all his evidence as to dates and other particulars correspond with my own accounts of these floods.
369. Which flood would you regard as the most destructive one you ever had? I think the 1870 flood
was

was the most destructive in one sense. There were more cattle lost then. But in those days there was not so much cultivation by farmers on the banks of the rivers. There may have been greater losses since in crops, but as far as cattle is concerned I daresay the destruction was greater in former times, because there was a great number of cattle destroyed on the Broadwater side. The floods kept up a very long time. I think there was about three weeks' continuous rain in the month of March, 1870, and that spread the water on the land for such a long time that it destroyed a lot of cattle. Since then we have had great losses in crops at different big floods.

W. Yabsley.
9 Mar., 1900.

370. As the district became settled with more population, the destruction caused by floods would be much greater? Yes. There have been a much greater loss in crops since the 1870 flood, because at that time there was little settlement.

371. Have you given any consideration to the proposed flood relief scheme? Yes; we have discussed the matter over a great deal at different times.

372. In your opinion will it have the effect of minimising the damage by floods? Yes, that is the general opinion of most of the people in this district; provided the weir is brought down to a height of about a 6 feet, and the channel continued right through to the Broadwater tide-level. The height of the weir should be reduced to 6 feet above normal level. Unless the height is reduced to 6 feet the scheme will not be considered satisfactory or beneficial.

373. Would not that have the effect of allowing the flood-waters to go into the Tuckian Swamp at a much earlier period;—whenever there was a fresh of 6 feet, the water would naturally flow through the channel; would not that have the effect of causing an additional flooding of the Tuckian Swamp, and the land adjacent? No. The river, to begin with, would not be sufficiently high to cause the overflow; but if the weir were 12 feet high, as proposed, there would be so much more water in the river to overflow.

374. What I mean is this: The river bank is about 20 feet high, and it is proposed that the weir should be 12 feet high; there are many freshets that come down not exceeding 12 feet, which would not go into the Tuckian Swamp at all;—if you reduce the height of the weir from 12 feet to 6 feet, as you suggest, would not all the small freshets cause a flooding in the Tuckian Swamp, which otherwise would not occur? No; because as the earth would be thrown up on either side, there would be a canal which would take the water right down to the Broadwater, to the salt-water tide-level. But it is not yet decided whether that embankment will be made right across.

375. Do you mean that the height of the weir should be reduced to 6 feet, and that there should be an embankment on each side of the channel, right through the Tuckian Swamp to the Broadwater? On the south side of the canal I would suggest having an embankment, to get the water out of the North Arm down to Broadwater, instead of allowing it to flood over the lower country.

376. The width of the proposed cutting is to be 300 feet; if you reduced the height of the weir to 6 feet, an enormous body of water would naturally go through that channel at a time of high flood;—in your opinion, under those circumstances, would there be sufficient water left to get a scour in order to maintain the navigation of the main river? Yes.

377. You are aware that Mr. Darley, the Engineer-in-Chief for Public Works, thinks not—thinks it would materially affect the navigation of the river? I differ from him there, because we have noticed that after a flood the river is not a particle deeper, while sometimes after a flood we find shallows in the river that did not exist before. There is a deposit from flood-water, and sometimes that deposit is equal to the scour.

378. You think it would not interfere with the navigation of the river? I think not, for this reason: We have a great many small floods from a night's rain that bring the river up 2 or 3 feet. If floods are a benefit in scouring the river, then there is greater benefit from these small floods, because we have more of them than of the large floods.

379. Do they create sufficient scour to keep the channel clear? Yes; there is more scour with them than with the higher floods, because the latter flow across the lower places in the banks.

380. You think there is no more scour from a high flood that overflows the bank than from an ordinary fresh? Not so much, because in a big flood you can very often pull a boat up the river better when the flood is at the height than you can at a half-bank flood. The water loses its power to travel, owing to the increased spread, and having to go across corners, being blocked lower down, and that sort of thing.

381. Have you inspected the soil through which the channel is proposed to be cut? No.

382. Are you aware whether it is a soil likely to be washed away? No; it is not. I have seen soil of the same nature, and it does not wash away.

383. Would strong currents running through the channel periodically at flood-time have the effect of making the channel deeper or washing away its banks? I do not think so—not to a perceptible degree.

384. How much country do you think this scheme would benefit, taking the upper part of the river first;—would the whole of the low-lying lands along the North Arm as far as Lismore, and even above Lismore, be benefited? Yes.

385. Do you think it would have a material effect in reducing the height of floods? I believe it would have a very material effect in that direction. The river at that point is not much more than 200 feet wide, and if you make a channel 300 feet wide, that would be equal to a river 500 feet wide at the offtake.

386. *Mr. Watson.*] But the offtake is not so deep as the river? I understand that.

387. *Mr. McFarlane.*] Have you a good knowledge of the condition of the country along the North Arm and in the upper part of the river, embracing areas likely to be benefited in the event of the scheme being carried out? Yes; I know every tributary of the North and South Arm.

388. Coming down from the site of the proposed channel to the Broadwater, what effect do you think the scheme would have upon that portion of the river? It would have the effect of reducing the height of the river in flood.

389. It would have a beneficial effect? Certainly; it would benefit all the farmers, dairymen, and graziers.

390. Would a very large area of land be benefited within that distance? Certainly.

391. Within that distance are there many places above the reach of the highest flood? Scarcely any. There are just one or two odd places. There is an isolated mound or sandstone ridge at one or two places, but with that exception none of the river bank flats are out of water in high floods.

392. That would mean that all the low-lying portions of the river above Broadwater, taking in the North Arm, would be benefited? Certainly.

- W. Yabsley. 393. With regard to the portion of the river below Broadwater, I do not know whether you are aware of the fact, but Mr. Darley holds the opinion that the scheme will have a very injurious effect. He says: 9 Mar., 1900. "I hold that it will drown this country lower down if it does anything at all. It will raise the water lower down and do a lot of damage" ? I do not know that the farmers below Broadwater, on either side of the river, have suffered from flood to anything like the same extent as those above Broadwater. There is this peculiarity, that the land below Broadwater is of a different nature; the flats are not so low and extensive. On the left-hand side going down there is a different formation. About Broadwater and for many miles there is a flat going back to the mountains for several miles, which floods do not touch at all. After that there is very little settlement except on the banks of the river; the mountains come in very close to the river.
394. But touching the question itself, do you think the cutting of the new channel would have the effect of causing an additional rise in the river, say, between Broadwater and Ballina, or from Broadwater down the river? No; I consider it would have the reverse effect. It would lower the flood-waters.
395. Perhaps you would state the reason? Because a large quantity of water would go through the Tuckian canal and be out to sea long before the waters of the South Arm and Bungawalbyn Creek would reach Broadwater. Otherwise, the North Arm water, the South Arm water, the water out of the Broadwater, and the water out of Bungawalbyn Creek would meet pretty well at the one time down the river, and cause it to rise very rapidly. But under the proposed scheme there would be so much less water in the river by the time the waters from the South Arm and Bungawalbyn Creek reached that part of the river.
396. You think that the proposed channel from above Coraki to the Broadwater being so short the flood-waters of the North Arm would get out speedily through it, and would probably be at sea before the waters coming down the main river could reach the Broadwater? Yes.
397. How much sooner would the water through the Tuckian canal reach the Broadwater? It would depend upon the height of the flood and in what part of the district the rain fell. If rain fell out in a westerly direction that water would not travel down so fast. We notice that, as a general rule, in half-flood the water will run at the rate of about $2\frac{1}{2}$ miles an hour. That is about the speed of the water generally—say, about 2 miles an hour in an ordinary flood.
398. Can you explain how long it takes for the flood-waters to travel from Coraki by the main river to Broadwater? In some cases it would take three days; but when the water on the south side is at a high level, and there have been big floods out that way, then it would not take so long. But I should say it takes two days to get down to Broadwater. Because we have lost timber here at different times, and it has not gone down the river at all. On one occasion we lost about eighty logs in a flood. A steamer was sent after the logs, but the timber could not be found—it had gone up Bungawalbyn Creek. I think in that case the water did not go down the river at all, and the timber did not go down, but it went down 5 or 6 miles, and then followed the course of the creek. The water coming down the North Arm often does not go down the river; it goes up Bungawalbyn Creek, and overflows the low-lying land on the southern side of the main river and runs up Sandy Creek. Until those creeks are filled no water of any moment comes down the river. It first fills those creeks, unless they have been already filled by a flood from the other direction. In that case the water would be two days before it would get to Broadwater. If the Tuckian canal were cut the water from the North Arm would be out to sea long before the water coming by the main river would reach Broadwater—two days before.
399. In view of that you do not hold with the statement that the cutting of the proposed channel would cause any increased flooding of the river below Broadwater? No. I should like to state that the farmers below Broadwater have not to my knowledge been distressed by floods to any great extent. They have never asked relief from the Government on account of being flooded, while most of the other parts of the Richmond River up this way have had to apply to the Government for assistance in time of flood—Coraki, Swan Bay, and different places.
400. Still I suppose they would object to more water if they knew it was coming? I suppose they would.
401. Mr. McKinnon stated that where a flood took a considerable time to rise, and remained at its full height for some time, the canal scheme would not have such a good effect as in the case of a rapid-rising flood? I believe that too; but the floods that would occur that way would be very far between—they are not so frequent.
402. You mean that the rapid floods are the ones that you have mostly to contend with? Yes. We have those mostly every year; but the very great floods only come periodically, and we are all prepared then to make the best of the trouble, and we have to.
403. Which causes the most destruction to stock—a flood that rises rapidly, or a flood that is slow in rising? A flood that rises rapidly.
404. That is a description of flood you have mostly to contend with? Yes.
405. With regard to the cost of the scheme, if it were carried out at the estimated cost, do you think the residents would be willing to contribute, under the betterment principle, according to the amount of benefit they would receive? As far as I can gather from my acquaintances and the people generally they would be willing to contribute under a Betterment Bill, if the Government would pay a fair share—say, one-half; the canal to be constructed so as to take off the water down to a 6-foot level, and to be cut right through. I think the people would then be willing to contribute towards the cost, but not otherwise. I do not think they would contribute towards it if the weir were up to the 12-foot level.
406. You say they would contribute half if the Government would give the other half? Yes; that is, if the betterment area would embrace a reasonable extent.
407. I am not speaking of Coraki alone, but of the whole of the area that would participate in some benefit from the scheme;—in your opinion would the landowners and residents within such an area be willing to contribute under the betterment system? I think they would, because they are very anxious for the work to be done.
408. In speaking of a reduction in the height of the weir to 6 feet, do you mean above high water-mark, or between high and low water-mark? It would not matter much, because there is only a rise and fall of about 2 feet, so that it would make only a foot difference. I should be satisfied with a height of 6 feet above half water-mark—that is the mean level—or 5 feet above high water-mark, and 7 feet above low water.

409. *Mr. Watson.*] Is not the rise and fall of the tide there more than 2 feet—is it not 4 feet at Woodburn? That is at high spring tide. I have measured the tides at Coraki, and 2 feet 6 inches is a good height up this way, and the further you go up the river the less it is.

W. Yabsley.
9 Mar., 1900.

410. You mean, then, that you think the residents would be agreeable if the weir were reduced to a height of 6 feet above ordinary high-tide level? No; 5 feet above high-water level.

411. Suppose the scheme were carried out, and the weir were reduced from a height of 12 feet to 5 feet, in your opinion would the residents be willing to contribute the whole of the cost under the betterment principle—you said “Provided the Government contributed one-half”? It would show they were anxious to work with us, and not run us into a big expense; because it has been considered by a number of us that the cost estimated is too large for the actual work. It is only an ordinary outlet for water, and we have had a lot of work cutting drains, and we have some idea of the cost of such work.

412. Have you had any experience in putting in a weir that would not erode away;—a work of this kind is very different from cutting an ordinary channel? We consider the Government throw away too much money on these weirs; it is very unsatisfactory to us.

413. You could not say whether the residents would be willing to contribute under the betterment principle the whole of the cost in the event of a scheme being sanctioned? I am of opinion that they would contribute if the Government paid half. In discussing the question with our neighbours it was said that under the betterment system that was the principle adopted—for the Government to pay half—and then we said, “Well, in that case we will do it.” Further than that I cannot say what is their opinion.

414. Have you discussed the question with many of the residents interested. Yes.

415. Did that seem to be the general opinion? Yes, as far as I can see, that is the opinion of my friends and acquaintances.

416. Have you noticed in the statement submitted by the Public Works Department this paragraph:—

They have unceasingly continued to urge the Government to proceed with the scheme, and have expressed through their Parliamentary representatives, and by accredited deputations, their willingness that the cost of the work should be made a charge on the lands benefited thereby.

? That may be the view of some of the electors.

417. Do you think that statement would be carried out in the event of the scheme being gone on with? Yes, rather than not have the work done I believe we would—if they would construct it cheaply and at a low level. But I can assure you there is a good deal of discussion about the expense of it.

418. Considerable care has to be taken in the construction of a weir? That may be where there is a great rush or flow; but here there is only a gradual motion. It is merely a tide current that will go through; it is not like water rushing down a gorge.

419. With respect to the whole of the scheme, do you think that if carried out it would prove a considerable benefit to the majority of the residents, or to those holding land liable to flood? Yes.

420. I gather from what you say, then, that the residents are not in favour of the work being gone on with unless the weir is lowered to 5 feet above high water? Yes.

421. That would be approximately a reduction of about 4 feet in the height of the weir as proposed in the scheme? Yes, I suppose it would.

422. The engineers tell us that anything below 12 feet in the height of the weir would mean a serious chance of injuring the navigation of the river, because of the lack of water. Suppose they are correct in that, which do you think the people here would prefer to have—cheap navigation and communication maintained, or to have the weir at the height of 8 feet? It would want more than an ordinary man to answer that question. We want the river kept navigable, and we consider that can be done by dredging, because it is only in certain places that the river is not deep now. The average depth of the river is sufficient except in a few places, which could be dredged. Then there is a tremendous lot of water in the river besides that, which we consider would scour. We would still have all the water on the South Arm to scour the river the same as before, and we should have the Bungawalbyn Creek water and the rainfall.

423. But if any reduction in the amount of water coming from the North Arm, and helping to scour the river, takes place through the weir being constructed, and this causes more dredging to be employed, are you willing to bear a little extra taxation to pay for the dredges? We should have to, because the Richmond would have to bear that. Yes, we would.

424. If the scheme means a greater call on the taxpayers for dredging the river, that has to be taken into account? From Lismore to the weir there will be the same quantity of water coming down; then from the weir to Coraki, which is the only place where there would be danger, you have the scour of the South Arm, so that in reality there would only be a danger of the river silting up in that small distance, and it could be kept clear. I believe the water of the North Arm carries more silt than any other water in the district, and we should be rid of that silt by its going out through the canal.

425. What is the reason of its carrying more silt;—because it comes from mountainous country? Yes. The land off which it comes is more loamy and richer. The water from the North Arm has a different colour from that coming down the South Arm. You see the two waters mixing when they meet. The water from the North Arm is thicker, and carries more sediment. I wish to add to my evidence in reference to the suggestion that the people below Broadwater might be affected by the construction of the weir, that there is at present a relief outlet to the sea for flood-waters, at a place a little below the junction of the Broadwater and the river. At that point when the flood-water rises a certain height, there is an outlet for it.

Reverend John Robert Fagan, Roman Catholic priest, Coraki, sworn, and examined:—

426. *Chairman.*] How long have you been here? Three years and two months. I was six months at Lismore, and the rest of the time at Coraki.

427. I believe you have some figures as to the disastrous effects of floods in the district? Yes. I have prepared the following statement:—

Rev.
J. R. Fagan.
9 Mar., 1900.

I purpose to show, in as few words as may be consistent with clearness, that the large area of land within reach of the flood-waters of the Richmond River is, by its own intrinsic value and richness, so full of future possibilities that Government should take immediate steps to prevent any serious obstacle to its complete development. It is admitted by all who are cognizant of the geography of the Richmond River district that floods have checked the progress of this part of

Rev. J. R. Fagan. of the country. No doubt farmers and dairymen forget in the prosperity of the last two years the reverses and almost ruin of past years; but if it take them a few good, successive seasons to make up for the losses sustained in one season by one flood, and if their whole existence must be passed in making good this year the calamitous effects of last year's flood, where shall we find progress, or happiness, or stability?

1. The great increase in the population of the district is a sure test of its resources. Even the Coraki district, the population of which in 1895 was 1,361, has now a population of 1,672. What should it be if the vast tract of eligible land running from the back of Coraki towards Myrtle Creek were thrown open for selection or divided up into farms?

2. Although the main river from Ballina to Lismore is only 61 miles in length, yet the total number of miles of navigable water for droghers is 177. This calculation is based on the following data.—Ballina to Coraki, 38 miles; Coraki to Lismore, 23½ miles; Coraki to Irvington wharf, 28½ miles; Bungawalbyn to loading-place, 20½ miles; Sandy Creek, 6 miles; Dungarubba Creek, 7 miles; Tuckombil Creek, 7 miles; Wilson's Creek, 7 miles; Leicester Creek, 5 miles; Terania Creek, 4 miles; Empant Creek, 18 miles; Terom Creek, 9 miles; Duck Creek, 4 miles; total, 177 miles.

In the South Arm to Tatham 14½ miles are navigable for ocean steamers and barges. In the Bungawalbyn, 13 miles are navigable for ocean steamers and barges.

Along the banks of these 177 miles of navigable water, and for miles inland, is to be found some of the richest land in New South Wales, suitable alike for agriculture and dairying, most of which, however, in time of flood is useless and unprofitable.

3. The following tables will show what great strides both farming and dairying will take if spared the evils of a flood.—

In the years 1896-97, the area under cultivation was as follows.—Lismore district, 9,461 acres; Casino district, 1,781 acres; Coraki district, 3,152 acres; Woodburn district, 998 acres; total, 15,392 acres.

In the years 1898-99 and 1899-1900, the number of farmers engaged in agricultural pursuits was—

	1898-99	1899-1900
Lismore district	607	846
Casino „	366	391
Coraki „	186	282
Woodburn „	187	194
Total	1,346	1,713 (increase, 367).

The approximate area of dairy farms in acres on 1st November, 1897, was—Lismore district, 61,455; Casino district, 19,754; Coraki district, 20,090; Woodburn district, 3,750; total, 105,049 acres.

The number of registered dairies in the limited area of the Richmond River electorate was, on 1st January, 1896, 8; on 1st June, 1899, 320; made up thus—Casino, 139; Coraki, 120; Woodburn, 61; total, 320. For the Richmond electorate (Ballina and Lismore), on 1st June, 1899, 1,208.

The number of milking cows was as follows—

	1896	1899
Lismore	7,006	14,756
Casino	588	6,706
Coraki	237	3,367
Woodburn	491	3,019
Total	8,322	27,848 (increase, 19,526).

In the year ending 31st July, 1899, the amount of butter manufactured, and its value was—

Lismore	1,702,000 lb.	£72,250
North Lismore	506,000 „	32,400
Casino	374,164 „	15,000
Coraki	151,267 „	5,042
Woodburn	188,160 „	7,056
Total	3,221,591 lb.	£131,748

* Few months only

The above statistics give only a part of the produce of the district watered by the Richmond. Farming and dairying are only in their infancy, and they prosper, and we are apt to think they will ever go on prospering. Unfortunately the next big flood will turn this smiling Paradise into one vast valley of tears and misery, and farmers and dairyman will either be ruined or must begin a hard up-hill struggle to retrieve their losses.

From the districts watered by the Richmond River the North Coast Company takes in a good season 50,000 bags of maize, or 200,000 bushels at 2s. 6d. = £25,000. But so complete is the ruin of the crops in flood time that not only is there no export of maize; but the Company has to import from Sydney.

As the dairying industry is but of recent growth it has so far only suffered from partial floods. A big flood would mean an incalculable loss. We may gather some idea of it from the following calculation. In the Lismore-Ballina and Richmond River electorates there are 1,208 registered dairies. Let us say that 408 of these dairies are beyond the reach of flood water. There remain 800. Very few people will deny that, as things are at present, the average loss to each farmer would mean at least £200; for a flood means not only the loss of the monthly cheque while the flood lasts, but the ruin of the grass for four or five months after the flood has gone down. His calves die, and his entire herd is impoverished for the remainder of the year. His crops, of course, all go. If then we multiply 800 by 200 we have the enormous loss of £160,000. This amount, big as it seems, will be thought ludicrously small by people more at home than I am in these matters.

I have not had the time to canvass the business and tradespeople of Lismore, Coraki, and Woodburn, and get a fair estimate of the losses they suffer during flood time. But when it is remembered that in Lismore the flood water rises as high as 3 feet in the shops, and that all business is suspended for weeks, we can gain a fair estimate of the loss caused to our business people by a big flood. I believe I am not exaggerating in saying that £200,000 is but a meagre estimate of the damage that one big flood would cause to the districts from Lismore to Woodburn. And as the population increases, so will the losses be greater. We deem it, therefore, imperative that the Government should relieve this otherwise happy and rich district of its only curse. It seems incredible that the intelligent, prosperous, and energetic population of the Richmond River should have submitted so long to the indignity of being ignored by each successive Government, and it seems still more incomprehensible that the Government for the time being were blind to the rare opportunity they had of securing to themselves the lasting gratitude of the voters of three electorates, in return for an act of justice.

428. In your various interviews with the people of the district, have you ascertained their views as to the desirability of their contributing in any way to the cost of this scheme;—have you gauged public opinion on that subject? I have up and down the river. Personally, I may say that I am against the principle brought forward by the Government, and I think some of the brainier men of the district are of that opinion, too. It would seem to us that this should be undertaken by Government as a national work, because whatever outlay the Government makes upon it, the district itself amply refunds, as the more money the Government spend on this district in the development of its resources, the more money will be brought into the country.

429. I suppose the Government, and the people who have advanced this idea, look upon it as an ultra means of relief; we can understand the river improvements and similar work being carried on by the Government; but this is something in the nature of an experiment and an ultra means of relief;—I suppose that is really what induces them to make the offer, because, as Mr. McFarlane pointed out a little while ago, in every approach to the Government that position has been taken up and the residents have agreed in a measure to contribute to the expense? The hands of those who are opposed to the principle

principle of contribution, or who would have opposed it in those days, are tied by those promises; they should never have been made, in my opinion.

430. That is really one of the elements of our inquiry, and why we have pursued the matter as we have done? Although I am not a farmer, I have as much stake in the country as others. I am one of them, and I take an interest in the country; and I think the people should stand out and refuse to pay a penny on general principles. Of course, this is only my view. Although I advance this view, I should be one of the first to contribute my mite if the people agreed to contribute anything.

431. You have not told us what the people think whom you have come across? The people I have come across are willing; they are not very eager. They seem to have been entrapped—just as in the Tuckombil business—and there being no escape they have to surrender, like Cronje in a hole in the Modder River. Rather than be looked upon as inferior men, they will nobly stand by their promise. That is the general feeling in all these districts—that they will stand by any reasonable arrangement.

Rev.
J. R. Fagan.
9 Mar., 1900.

John Storey, representative at Coraki of the North Coast Steam Navigation Company (Limited), sworn, and examined:—

432. *Mr. Watson.*] What is your occupation? I am at the present time the representative of the North Coast Steam Navigation Company on the Richmond. I was formerly a master mariner.

433. You have had considerable experience on the river and on the coast generally? Yes; I have been a resident of the Richmond River for fifteen years.

J. Storey.
9 Mar., 1900.

434. Have you taken note of the condition of trade in the district both before and after the high flood? Yes, very particularly.

435. How do the two states compare? The decrease in the exports after a heavy flood is immense—in fact, they are reduced to nil. After the 1893 flood we had little or nothing but empties to carry back in our steamers. Of course, the people have to live, and there were a few imports, but no exports.

436. In what lines would the falling off at that time be most noticeable? At that time the principal industries were maize and sugar-cane. The maize was all destroyed, except a little on the high ground above Casino, and on any other high land there was, which was very little indeed. The sugar also suffered very heavily; but sugar does not suffer half as much by flood as other industries; cane stands the water better. I suppose our output of sugar would be reduced by heavy floods probably about 25 per cent.; but the maize would be reduced 90 per cent.; and, of course, maize is the principal commodity. Poultry is a very important matter on the rivers. The poultry industry keeps the farmhouses pretty well, and with no maize there is no poultry. After a flood the farmer has to sell his poultry, because he has nothing for them to eat. Of course, an end is also put to pig-breeding and pig-rearing, which is another industry here.

437. Would that condition of things obtain for a considerable time after a flood? Until the next season's crop. It would, of course, cripple the people for years. They would not get over it for years—many of them, never. That is why such an immense amount of property on the Richmond River has got into the hands of the banks, and why the people generally have got into difficulties.

438. For how long has the dairy industry assumed large proportions here? During the last three or four years.

439. And since that industry has grown there have been no floods of any importance? No. The 1893 flood was the last serious one we had, and dairying did not start for some time after that. But what, to my mind, urges the necessity of some relief from floods more than ever is this fact: that with sugar-growing disappearing, as I am sorry to say it is doing to some extent, we are now coming to the time when we must depend on maize and dairying, and, with maize and dairying together, when the next big flood comes the farmer, who, with his land under sugar and maize, would lose £10, will then lose £15 or £16, or even more. The losses in the district generally will be very much heavier than was the case before dairying was introduced.

440. From your calculation they are likely to be half as great again? Fully so.

441. That is owing to the greater loss that would probably take place in cattle? Yes. January, February, and March are our flood months. A January flood is not so disastrous as a March flood. Under the dairying, a March flood will be most disastrous, because in a few weeks the ground gets cold. After a heavy flood, with the water lying on the ground perhaps for a week, or even weeks, the ground will be dead, and after the water goes away there will be no growth in the grass until the following August. There is no doubt that after a big flood the output of the butter factories at Coraki and Woodburn will be nil for three or four months, and in the case of the Lismore factories and the Byron Bay factories the output will diminish, I am certain, by 25 or 30 per cent.

442. Is Byron Bay affected by the flooded area? Yes, to some extent. The factory is at Byron Bay, but it is very largely supplied from the Richmond River. Even farms away out on the South Arm, between here and Casino, have sometimes supplied milk to the Byron Bay factory, and many other dairymen about the Richmond River have sent their milk by railway. I think I am safe in saying that one-third or more of the butter manufactured at Byron Bay comes from the Richmond River district.

443. And from land subject to flood? Yes; the land above Lismore is subject to flood—Wilson's Creek and those lands—and dairying will be checked very severely by flood.

444. And, of course, there is the additional cost of feeding your stock during the time the grass is not growing? Certainly; in many cases the farmers would have to import feed for their stock. But, independently of that, there is another big indirect loss—the loss of cattle. There are thousands of cattle lost in consequence of floods. After the flood is over the farmer loses a great many cattle by starvation. Take the price of cattle at the time of the last big flood. From the year 1887 to 1893 you could buy a good milch cow for £3, and now you would have to pay £8; so that if a man loses a lot of his valuable herd it will be a serious matter. The herds in the Richmond River district in another year or two will be second to none in the Colony, and if a man loses one-third of his herd, with cows ranging in value from £8 to £34—because milch cows have fetched £34 lately—it will be very serious. If he loses the same number of cattle he will lose nearly three times as much money. The records of my office will show that, after the 1893 flood, there was no export of produce, or, at any rate, that the export was reduced by 90 per cent. That occurs after any of the big floods.

445. That state of things continues for some time after the flood? Yes.

- J. Storey. 446. Could you furnish us, in a tabulated form, with some figures showing the exports in flood years, as compared with those in ordinary times? Yes.
- 9 Mar., 1900. 447. Prior to taking up the management for the steam company you had some experience on the river as a master mariner? No, not on this river. I travel all over the river at least once a month by steam launch.
448. It has been suggested—I think by Mr. Darley—that the most effective and certain way of dealing with floods and their prevention in this river, would be to go to work systematically and clear the river channel—got rid of the shallows and cut out the extreme bends, and so on—in preference to any such scheme as that now under consideration, having in mind always the possibility of a reduction in the volume of flood-waters allowing the silt to deposit? I can only speak as an amateur, and not as an engineer or expert. I should certainly say that, independently of the proposed canal, it is absolutely necessary that the obstructions in the river—the reefs that cross the river in various places, and also the flats—should be cleared. At the same time it is equally necessary that the proposed canal should be made.
449. You think that the clearing of these reefs and other obstructions would not alone afford sufficient outlet for flood-waters? While acknowledging that that work would do a certain amount of good, I feel certain it would not give the relief we want.
450. *Chairman.*] Is there anything else you would like to say? I heard some gentleman giving evidence to-day with regard to the difference in the flood-waters at various times at Broadwater and at Lismore. I can corroborate Mr. Yabsley in his statement that it takes fully forty-eight hours—I myself would put it down at fifty hours—for the flood-waters to reach Broadwater from Lismore, with a rise of 15 feet at Coraki wharf, and 28 feet at Lismore, there being, of course, a good stream in the river, I went down to Broadwater in one and three-quarters or two hours, and when we got down there there was no trouble at Broadwater at all. That shows that while there might be a tremendous run in this part of the river, there would be no obstruction to the flood-waters going across Tuckian. When we left Coraki the wharf was submerged; when we got to Woodburn the water was just going over the wharf, and when we got to Broadwater the wharf was not covered at all. I can also vouch for the truth of another statement by Mr. Yabsley—that for the first twenty-four or thirty-six hours, the flood-waters coming down here go up Bungawalbyn Creek, fill up the enormous area of flat land at the back. The quantity of water going down to flood the lower river would be nothing to speak of, until those back lands were all filled. We had from 6 feet to 10 feet of water about a mile or two from here, out at the back. The back-water in a high flood comes as far as the next street to us. So that there is no doubt that the water going across through the canal, if it should be constructed, would relieve the North Arm, and I consider it would get away from thirty-six to forty-eight hours quicker than if it went round the other way. If the conditions were in any way favourable, a great quantity of it would be at sea before we would get the flood-waters here.
451. Do you endorse the opinion of former witnesses that for the relief of minor floods it is advisable that the weir should be cut down lower than 12 feet above low-water mark? I am of opinion, as an amateur, that 12 feet would be too high. I think it ought to be lower; but, at the same time, I for one would not attempt to dictate on that point, or limit the height. I think it is a matter for the engineers.
452. I am not looking at it from the engineering point of view, but as a means of relief to the district; from what we gathered from former witnesses, it is possible that this height of 12 feet may not afford relief from the smaller and quickly-rising floods;—do you think it would be so? I think that even at 12 feet the weir would, in the case of the big floods, from which we suffer most, render invaluable service. At the same time, I should like to see it lower. There has been very little said about the South Arm. The greater part of our maize comes from the South Arm, between here and Irvington; and with regard to the silting up of the North Arm, through too much water going over the weir, the South Arm drains a great deal more country than the North Arm; so that even although all the water of the North Arm went over the weir the water coming down the South Arm would, in my opinion, be quite sufficient to keep the river clear between here and Ballina.
453. At any rate, between here and the Broadwater junction? Yes. We have not had a flood now for six years—we have had freshets, but not a serious flood. I do not think the river has suffered by not having a flood. I think that the ordinary ebb and flow, with an occasional small fresh, which, perhaps, would not go over the weir at 12 feet, is quite sufficient to scour the river without a big flood. There was a fresh in the river last July, and the water was 5 feet 3 in. over the top of the Tuckombil weir. That, I think, was a relief to the flooded country between Coraki and Woodburn, as it caused the water to flow off the land more quickly. To the people of this district, the reduction of a foot in the height of a flood means, perhaps, the saving of their crops, because, at certain stages in the growth of the maize, if the water only reaches the bottom of the cob, and does not go any higher, it does not do nearly as much damage. The farmers would thus save all their crop. But if the extra foot of water comes it covers the cobs and the crop is gone. I should like to say something in regard to the lower part of the river. There seems to be an idea—perhaps it is well founded and perhaps it is not—that water going down through the proposed canal will flood the lower river. I firmly believe, from the experience I have had that, instead of being damaged, the farmers on the lower river will benefit pretty well to as great an extent as we shall. The water will get away to sea much quicker. The escape from the Tuckian will go down Broadwater with great force, and, as it rises, will escape through the drain opposite Goat Island, giving an outlet to the sea, I suppose, within a mile. Even if the water did rise, which I do not admit would be the case, it would have greater force, and would get a bigger channel out. That outlet to the sea is the safety-valve of the river in heavy floods.

Samuel Cook, grazier, Tucki Creek, sworn, and further examined:—

- S. Cook. 454. *Chairman.*] Having read Mr. Darley's evidence as to the effect of the drains made by Mr. Henderson in connection with the Tuckian Swamp, will you kindly explain exactly what did take place with regard to those drains? About twelve or thirteen years ago, when the drains were first dug—I think they were about 3 ft. 6 in. deep in the mouth of the creek—the water at high-water followed up the drain for pretty well half a mile, but it did not overflow. The cattle have been grazing there ever since. You can ride over any part of it now. The tide does not overflow.
- 9 Mar., 1900. 455. But if the drain had the effect of letting the water in on to the land, what was the use of making it? It did not let the water in on to the land, but only into the drain itself. When Mr. Henderson cut the drain to a depth of about 3 ft. 6 in., and that was when I saw it first, the tide at high-water came up the drain, but it did not get on to the land. 456.

456. Then is this statement incorrect: "Instead of draining the swamp he lowered the whole surface of the swamp, and really let it down below high-water mark?" I have been over it at all times—at high-tide and low-tide—and I have seen the cattle grazing over it, and have myself ridden over it, and walked over it, and I never saw any water on it, except at flood-time. S. Cook.
9 Mar., 1900.
457. Did it let the tide in on to this land? Up the drain, but not on to the land.
458. It is stated in Mr. Darley's evidence that Mr. Henderson spent about £5,000 upon the work, and then abandoned the place;—why was that? He told me himself that the drains cost him 11s. a chain. I do not know the extent of them, but I am doubtful whether he spent £500.
459. Did he tell you why he abandoned the country, or do you know why? I think he had property in Queensland, and had to go and look after it.
460. *Mr. Watson.*] Did he sell it to somebody else? No, he still owns it; he has it leased now.
461. So that it is not abandoned in the full sense of the term? No; no portion of it is abandoned.
462. *Chairman*] Could you say whether the drains were a success or a failure? They were a success. During a number of years before the land was drained, I often tried to cross it on foot and could not do so, and since then I have ridden across the drained portion on horseback.
463. That would be at ordinary times? Yes; and once over the whole after a long drought.
464. In what state are the drains now, have they got much into disrepair? No; they are in a very good state.
465. *Mr. Watson.*] You say you were over a part of the swamp through which the drain goes before it was drained? Yes.
466. You would have a fair idea of its height then, as compared with high-water and low-water? Pretty fair.
467. And you have been over it since frequently both on foot and horseback? Yes; over the drained portion.
468. Is there any marked difference in the elevation of the general body of the land? Yes; it looks lower because it is trampled down by the cattle. There is a good surface coating of grass on it whereas, as formerly, it was covered with rushes to a height of 6 or 8 feet, and the cattle got amongst that.
469. One gentleman told me that before being drained it was peaty, like a sponge filled with water, and the withdrawal of the water allowed it to be trampled down to a more solid mass, and therefore it is now lower than it was previously, although still not below tide-level;—is that correct? Yes.

George William Sharp, farmer and dairyman, Wyrallah, sworn, and examined:—

470. *Chairman.*] What are you? Farmer and dairyman, living at Wyrallah, about 8 or 9 miles above the proposed weir. G. W. Sharp.
9 Mar., 1900.
471. Would you like to make a statement? I desire to say a few words to strengthen the argument in favour of lowering the canal at the off-take. I may say that on last July, when we had what Mr. Storey calls a fresh, the water was right up to the top of the banks opposite the Wyrallah creamery—you might almost say running over it. At the same time, the back-water—for I suppose it is water that breaks over the river further up, I think at South Gunderimba somewhere—caused the water on the main road, between Coraki and Lismore, to be clear over the top of the posts. This would be half a mile this side of the Wyrallah turn off. The whole of the country was under water. There was a depth of 6 feet of water right behind my place, and deep water right through to Pelican Creek.
472. What height is the bank at your house above low-water? I think it is somewhere about 22 feet, or perhaps more.
473. How much would it be at the weir? I could not say.
474. The 1893 flood at the point where you lived is marked as 25 feet? Yes. I was living at Woodburn at the time, and that was the highest flood we had experienced for twenty-one years.
475. Then you say that this flood, of which you speak, in July last, was within three feet of that? Yes; I believe so.
476. And yet down here at Coraki it was only a fresh;—the South Arm water was not up, I believe? In 1890 I was down the river collecting Census returns, and I was on the creek near Goat Island, which goes out from Broadwater. In the flood of 1890 the water broke through to the sea, and ten days later when I went round collecting the papers, there had been a heavy sea with a gale which had driven the salt-water right into the river. That shows that a canal could be very easily opened there.
477. Did you have a look at the water when it was going out? It was running out pretty freely.
478. Could you give the width and depth? On one side there is a steep bank, and on the other the land is pretty flat. The whole of the country at the back of my place is flooded before the water breaks over the bank of the river. That water comes in on to the flat through some small creeks.
479. It is proposed near Baxter's place to put a weir, the height of which would be 9 feet below the bank;—do you think that height of weir would take off the water sufficiently to relieve you up there? The proposed weir would relieve us to a certain extent, but not so much as if it were lower. The water is on the back farms two days before it is at the top of the river bank. We have to drive our cattle away, perhaps two days before the flood is up. The water cannot get off those plains while the river is swelled.
480. At what height of flood would it commence to fall into these back creeks you mention, or get over the land adjoining? It would start to run in, I think, at about 12 feet of a rise.

Samuel Baxter, farmer and dairyman, Tuckurimba, sworn, and examined:—

481. *Chairman.*] What are you? Farmer and dairyman, living at Tuckurimba, close to the site of the proposed weir. I wish to endorse the statement made by former witnesses that it is desirable that the sill of the weir should be reduced by 3 or 4 feet, in order to make it effective for the purpose of dealing with ordinary floods. S. Baxter.
9 Mar., 1900.

SATURDAY, 10 MARCH, 1900.

[The Sectional Committee met at "Murray's Hotel," Woodburn, at 11.30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

William Gollan, dairy-farmer and grazier, Woodburn, sworn, and examined:—

- W. Gollan. 482. *Mr. Watson.*] What are you? Dairy farmer and grazier, residing at Woodburn. I have been in the district for thirty-four years.
- 10 Mar., 1900. 483. Do you remember the flood of 1870? Yes.
484. In measuring the height of floods, what do you take as your ordinary level? Mean water.
485. Could you give us the height of the 1870 flood at Woodburn? Not exactly. It overflowed the banks for miles round—for, I suppose, 20 miles.
486. Then there was another flood in 1884;—do you remember the height of that? No: I do not know the height of any of the floods except the last one, and that I think was about 8 feet at Woodburn.
487. Was that the one in July last year? No, in 1893.
488. In each of these high floods do I understand that the banks of the river have been overflowed for many miles round? In the flood of 1870 about 1,000 head of cattle perished by reason of the long time the water was lying on the ground. The flood went down and rose again, and halfway between Woodburn and the proposed channel for fourteen days there was about 1 foot of water on the land.
489. You know the scheme to take a flood relief channel from the North Arm of the Richmond to the Tuckian Swamp? Yes.
490. What do you think would be the effect on this portion of the river if that scheme were carried out? The work would have a very good effect, because it would allow the water which is at present so long coming down to get away sooner to sea.
491. It would assist it to get sooner to sea? Yes.
492. Do you know the land through which it is proposed to take the channel? Most of it—on this side I know it.
493. Up to Tuckian? Yes. In the flood of 1870 I took a boat with five men across to the foot of the ridges.
494. Did you notice whether there was any current in the flood-water? Yes.
495. In what direction was it going? From the river out to Tuckian Swamp; and down the river, at Robins' Hill, the water was running very strong from Dungarubba across there. There was a rise of about 4 feet. On this side of Robins' Hill also, towards Tuckian, the whole of the area from Riley's Hill to the foot of the ridges was covered with 4 or 5 feet of water, which was running right across into the Tuckian Swamp, and then emptying itself into the Broadwater.
496. Then the direction of the water from Woodburn to Tuckian would be nearly due north? Yes.
497. It is proposed that the weir at the take-off on the North Arm should be placed at a height of 12 feet at low water—that would be about 10 feet above the mean, which you gentlemen here usually take—that would ensure an opening in the bank as at present of about 9 feet by 300 feet long;—do you think that would be sufficient to cause any material diminution in the floods down here? I do not think 12 feet would be low enough. I think about 6 feet would be quite low enough, or 4 feet above high water-mark.
498. That would be 8 feet from low water-mark, or 6 feet from mean water? Yes; because the river would have to rise considerably over the 8 feet or 9 feet before there would be any run. Shallow water does not run very fast, and it would not take much water away, and we should not have the good effects of it.
499. You think there would not be much effect until the water had risen a foot or two above the weir? Yes; it must force itself in there first, and then force itself down the river. I believe the drain should be cut right into the Broadwater. The tide rises there about 2 or 3 feet.
500. Assuming that it would be safe to cut it down to the level you mention, what then do you think would be the effect down here—in what way would it assist you;—assuming that the body of water up to the banks were going through, would that cause a sufficient reduction in the flood-level about Woodburn to be of material value? It would assist very much.
501. To what extent do you think it would assist? I believe we would not have the flood going over the banks at all. The effect of the last little flood in the Tuckombil escape channel convinces me that if there was another outlet near Coraki as proposed, so as not to let that water down here, we would have very little fear of floods coming over the banks.
502. Of course, you would still have a certain amount—that is, the difference between the mean level and the weir, which would be about 6 feet; you would still have 6 feet above the normal level coming down the North Arm to Woodburn, and you would have also the waters from the South Arm coming down; so that you would have to reckon on the possibility of those waters flooding down here;—you seem to think there would not be much likelihood of flood going over the banks at this place from the waters I have mentioned? Yes; I am positive of it.
503. Is there any reason for that other than the mere subtraction of the water;—is there any difference in the times of arrival of the flood-waters from the different arms, or anything like that? There is occasionally, when one arm rises higher than the other. If we had both arms coming down at the one time with a heavy flood, the whole place would be almost swept away.
504. What amount of difference in flood-level do you think the weir would make if you attempted to work it out;—do you think it would make a difference of 3 inches down here or a foot? I think it would make a difference of 3 feet here. That would prevent it from going over the banks then. The flood has been over here 3 or 4 feet.
505. Where does the water first break away from the right-hand bank of the river about here? It goes over the river at different places.
- 506.

W. Gollan.
10 Mar., 1900.

506. There is a great extent of low flooded country all along the right-hand bank of the river between Woodburn and Coraki, and even further up, is there not? Yes; a great quantity of water also comes down the Bungawalbyn Creek, and floods the place. When it becomes very high it flows over the land at the back and comes out here at the head of the Tuckombil weir.
507. Then, on the left-hand bank we have been informed that in flood-time the water usually breaks over first towards Tuckian about Swan Bay, at O'Connor's place, is that so? Yes.
508. And later on, it breaks over at the head of Dungarubba Creek—it backs up there? Yes.
509. And the whole area between those points becomes flooded with water? Yes.
510. What, in your opinion, has been the effect of the construction of the flood relief channel in the Tuckombil Creek? It has had a very good effect. In the last flood the water was highest here on the Wednesday, and we went down to the Broadwater on the Saturday, and there was no water in that town at all. They give credit to the Tuckombil drain for keeping the place dry.
511. Was it an unusual occurrence for them not to get water in the height of a flood? Yes, it was unusual; they could not understand it until they knew the effects of the Tuckombil drain. A man from Wardell told me that the flood down there was only 3 inches above highwater-mark, so that the effect of the Tuckombil drain must have been very great indeed.
512. Was that a flood coming from all the arms to the river, or was it confined to the Bungawalbyn Creek? It came from all the arms of the river.
513. So that we might term it a general flood? Yes.
514. I understand that the weir at Tuckombil gave most escape to the waters that came from Bungawalbyn Creek? Yes.
515. The water that went through the weir principally came from that creek? Yes, and from the river. That creek empties into the river about 8 or 9 miles up the river, between here and Coraki, and, of course, it would swell the river as well as the back country. At Woodburn the water backs up Tuckombil Creek, and gets over the plains behind, and floods hundreds of acres.
516. It has been suggested that the greater amount of water that went over the Tuckombil weir came not direct from the river, but from the flooded country from the head of Bungawalbyn Creek, right down to Tuckombil Creek, and thence into the weir;—is that likely? Yes; it was running in a sheet over the bank into Tuckombil Creek, and then escaping by the weir to the sea.
517. When I was asking you about the break over on the left-hand bank of the river, you said something about it backing up into the Tuckombil—that is, when there is a general flood? Backed out of the river up the drain. It must be the top of high-water when Bungawalbyn Creek goes over and runs in there. It runs into the river until it fills it, and then it runs over the flats, and the Tuckombil weir is the escape for the backwater when it flows over the flats.
518. Would it not run over the Tuckombil weir before it was bank high? Yes. There are some low places up the creek, and it would be over the banks first.
519. Do I understand you to say that some portions of the bank at Tuckombil Creek are lower than the sill of the weir? I believe that is so in some parts—at the upper end.
520. At those low places, if the water flows over, where would it go to—towards Evans' River? It would remain there until the main river began to fall, and then it would come back to the river.
521. So that it would not be taken away from those low places? Not the whole of it.
522. Suppose it got no higher than sufficient to go over these low places, would it get into Evans' River, or come back to the Richmond River? Some would escape, as long as it was high enough to run over the weir, and the rest would go into the creek and rivers.
523. I am speaking as though there was no weir there? It would come back to the river if there was no weir there.
524. So that the weir has some effect in letting out the flood-waters towards Evans' River, which otherwise would not get there? Yes, decidedly.
525. You say that the effect of the Tuckombil weir has been beneficial as far as Broadwater and Wardell were concerned? I received my information from a man at Wardell.
526. What was the effect of the Tuckombil weir as far as the district immediately above it is concerned—that is, Woodburn and further along the right-hand side, between Woodburn and Coraki? It lowered the water very much. I believe that is what kept the river within its banks last time.
527. Do you remember the flood of 1893? Yes.
528. That was slightly higher than the one last year? The flood of 1893 was the highest we have had here since 1870.
529. In 1893 the weir was not working? No.
530. Last year it was? Yes.
531. Was there any improvement in the condition of any of the farms—that is, as to being flooded—last year as compared with the previous time? Yes.
532. How much land was there out of water that was previously submerged? There must have been a great quantity; I could not say exactly how much.
533. Do you know of any instance yourself that you could quote? I know that in 1893 you could not go up the road on horseback; the water was right over the horse's back.
534. And in 1899 what was its state? In 1899 it was just as dry as it is now. A good deal of the effect of the flood of 1899 was owing to the "Iron Gates" being open, which allowed the water to get right away.
535. That is below the weir? Yes.
536. But in connection with the same channel? Yes; just on the sea.
537. Those gates, as they are called, have been widened, and consequently more water can get away? Yes.
538. Still all the water that would go through those gates in flood-time would go over the weir? Yes; except it went over the banks as well. It might go over the banks here.
539. Have you seen any of it go over? Not since the weir was erected.
540. Previous to that? Yes; it used to go towards Evans' River. It is 5 feet deep between here and that drain now. We used to get the cattle across there. The water used to run across where the bridge is, and we could hardly cross it with a horse; but it was then shallower more in this direction.
541. That was then originally a natural flood channel from the Richmond to Evans' River? Yes; I believe it was an outlet for some time.

- W. Gollan.
10. Mar., 1900.
542. You know that one phase of this matter is as to the manner in which the work should be paid for; I understand that the people of the district have indicated their willingness to pay the cost of the work, or at any rate interest on the cost; I should like to know whether any attempt has been made by the people here to estimate the probable area that would be benefited by the work—that is, the probable area to which you might properly look for some payment in respect to it;—do you know whether that is so? No, we do not know.
543. The people here have made no such attempt? No. At one time we were making a kind of an estimate. We thought about 80,000 acres would be benefited; but that area is considerably larger than that. At that time we did not go past Lismore, and we know now that it would be necessary to go up to Eltham, about 10 miles further on, and also to Casino. The whole of the country up there would feel the benefit of the scheme.
544. The South Arm as well as the North? Yes; I suppose it would benefit the South Arm just as much as the North Arm.
545. Assuming that 80,000 acres was the area affected, do you think the benefit likely to be derived would be sufficient to make it worth the while of the holders of that land paying between them, say, £1,500 or £1,800 a year? Yes, I believe so.
546. As an insurance against the extreme floods? Yes. We are all willing to assist the Government in the matter. We are all willing to pay our share—the farmers hereabout; I speak of myself and others—provided it is under the betterment system, so that all men pay alike. In regard to the Tuckombil escape scheme, that was not the case.
547. An undertaking was given to pay something towards that work? Yes, but in this way: a Government officer came down and went to one and another round about the place, asking “How much will you give?” and “How much will you give?” and when four or five signed, all the rest were held responsible. Some had nothing to pay, although they got the same benefit. So that we must have it under the betterment system. We are all quite willing to contribute.
548. You think there should be a general contribution rather than isolated instances? Yes.
549. In the case of the Tuckombil weir, have the people who promised to pay a certain amount paid anything? They have not paid anything yet, because the Minister said he would allow the Tuckombil arrangement to stand over until such time as the Tuckian scheme was considered, and then he would couple the two together and include them in a betterment area, and we should all pay alike. That is the last promise we had from the Minister.
550. Over that area of 80,000 acres the benefit would not be absolutely equal;—it would vary considerably with each individual man’s case, would it not? Well, I do not know. Every man whose land was subject to floods would be benefited.
551. Is there a considerable area of Crown land in that 80,000 acres? No.
552. It is all private land? There may be some Crown lands, of course.
553. But I mean in the rough estimate of 80,000 acres? We did not go into the estimate of any Crown lands; we simply made a rough guess. In view of the greater extent of land to be benefited, we now think the area would be double that mentioned.
554. On what basis would it be proper to place the betterment—at per acre, or so much per £ on assessment? I should think the payment should be according to the value of the properties held and the amount of benefit derived.
555. The difficulty is for a man to go round and estimate the exact amount of benefit any holder is going to derive from it; in anything of that sort, if you are to have a betterment at all, it must be on rather a rough and ready principle, or else the disputes would be interminable;—do you think it would be roughly arrived at by a contribution of so much in the £ on the capital value or the annual value—that is, practically, instead of so much per acre, so much in the £ on the assessment? Yes; that would do.
556. Is it the case here that some men’s land differs very much in value from other men’s land—that is, that the actual river frontage is worth a lot more than the land a little behind, and so on—I mean, as it is at present? There are greater improvements; and of course the more improvements you make on a farm the greater its value.
557. Take it in its unimproved condition, does the land within a certain distance of the river differ very much, or is it much of the same value? It does not differ much.
558. Would an acreage tax then be roughly equal all round, say at so much per acre? I think so.
559. I said a minute or two ago that it would be an enormous work to arrive at the exact benefit derived by each individual; for instance, if one man has land flooded to a depth of 2 feet, and another man to a depth of only 2 inches, then there is a great difference in the amount of benefit that each derives? Yes; but generally where there is only 2 inches of water, the land is of a character that no one goes on it.
560. The flooded land is fairly equal in height? Yes; as nearly as you can get it.
561. Once you get back from the bank, the height is the same all over the flat land? Yes.
562. And the depth of the flood would be approximately the same? Yes.
563. Speaking generally, you think the flood area would be easily defined, because of the fact that the land is much about the same height? Yes.
564. Which would you prefer yourself as the basis for such a payment—per acre or per £ on the unimproved value—you know the unimproved value under the land tax—which would you prefer yourself as being most equitable? I have no preference in the matter; we left that solely in the hands of the Department.
565. Is the land below the Tuckombil weir occupied at present—that is, between the Tuckombil weir and Evans’ River? Yes.
566. For what purpose? It was taken up for selection. It is not all occupied just now. It is used for grazing.
567. Is it cleared and farmed, or is it mostly forest land and scrub land? Forest land and scrub.
568. Has there been any complaint from the people who occupy that land below the weir about additional flooding, as the result of constructing the weir? No, not the slightest. They considered it a benefit.
569. In what way? Because the widening of the “Iron Gates” took the water away in a night which otherwise would have remained on the ground for a week.
570. That was not the effect of the weir exactly—it was the removal of what is called the iron gates, which is a matter separate from the weir, although assisting the weir? It was done at the same time, and done for the same purpose—to open it.
- 571.

571. But if the iron gates had been removed, without erecting a weir, that would have been a bigger benefit to the people below, would it not? I do not know. It would take a large quantity of water away quickly; but the large quantity of water would not be there without the weir to take it in. W. Gollan.
10 Mar., 1900.
572. Is there much of the land between the weir and Evans' River which is affected for the worse by the water being taken on to it through the weir? I do not think so.
573. In that case I understand there has been no channel made for any great distance below the weir? No.
574. It is simply allowed to follow the natural course or depression in the ground? Yes. The last fresh affected some little islands in the place—pulled the saplings out.
575. There has only been a channel made, I understand, for some little distance below the weir? Yes.
576. And from the end of that channel to the Evans' River the water was allowed to find its own way by the natural depressions? There is just a dip-down leading to Evans' River, but it is very shallow. The flood goes over it.
- 576½. Do you think it would have been any great advantage to have had a channel at a reasonable depth to complete the communication between the two? Yes; it would have been a great benefit.
577. In what way? It would take a much greater quantity of water away.
578. Give it freer egress? Yes. It would take a great quantity of water away, and would be the means of relieving the place very much, if it were straightened and made the same width.
579. You say that if the channel were made it would get a much more direct course to Evans' River than it does now, and get rid of a greater body of water? Yes.
580. That would not encourage a greater body of water to come over the weir, would it? Yes.
581. How do you make that out? Because the drain narrows there. There is a width of 300 feet at the entrance, and about 2 or 3 chains down it narrows into about 60 feet. The same quantity of water that would come in at the entrance could not possibly get out in 60 feet.
582. But, then, where the channel is narrowed to 60 feet the natural surface of the land is below the sill of the weir, is it not? No; about the level of the sill.
583. So that it has not a chance to get away? No; half of it would not get away that would get away otherwise.
584. So that you think the weir would be of greater benefit if the channel were continued further on towards Evans' River? Yes; and if the spoil from the excavation were placed as a training-wall on the north side of the channel towards Evans' River, it would increase the get-away for the water.
585. Coming back to the proposed work, in your opinion the channel, after arriving at the Tuckian Swamp, should be continued through on to the Broadwater? Yes.
586. You know that the proposal as put before us is that the water, after being taken to the edge of the Tuckian Swamp, should be allowed to find its own way further on towards the Broadwater? Yes.
587. To what depth and width, in your opinion, would the channel require to be cut through the Tuckian Swamp itself? I would have it the same width as it is cut in other places.
588. That is 300 feet? Yes. There would be very little cutting into the swamp itself if you went down the lower end, where the banks go across.
589. Under the proposed scheme the weir is 12 feet above low-water; then for 2 miles further on a channel is continued at a depth of 5 feet above low-water, which takes you into the Tuckian Swamp;—when you get into the Tuckian it gradually goes down until you get to 2 feet above low-water;—at that point, where it is 2 feet above low-water, do you think it would be necessary to cut a channel? Nothing further than just a clear watercourse.
590. And that clear watercourse you would continue right on to the Broadwater? Yes, into the Broadwater.
591. Keeping the same width practically? Yes.
592. When you get to the Broadwater there is, I understand, a bank between the Broadwater and the swamp? Yes; it would have to go through that.
593. Would you cut down to the swamp level? Yes.
594. And, of course, the same width? Yes.
595. You think that unless something of that sort is done, there would not be a sufficiently clear get-away for the water? The water would have to rise in the swamp 3 or 4 feet before it would get away. When the water comes from the river that place should be clear ready to receive it, so that it will go away instead of remaining there.
596. But if the bottom of the swamp is 2 feet above low water, and you cut a channel through it into the Broadwater, when the high water comes it will have some water in it? Yes.
597. You do not think that would be any detriment to the scheme? No.
598. So that you think it is necessary to have the channel cut to the swamp level right through? Yes.
599. Between the weir and the swamp there have been various suggestions made as to the channel; one of them was that a mere dishing should be made, with a drain down to this level of 5 feet above low-water in the centre—that is, a drain about 20 feet wide or so—with a view to allowing the flood waters to scour the rest of the channel out themselves;—do you think that would be a success? I do not think it would. I think you would have to clear it right away, because the ground is so sticky that it would not wash away.
600. It is too sticky to go? Yes; that is my experience of the land in this district.
601. The clay below the alluvial? Yes; that is the nature of the soil before you get to Tuckian—across the Lismore-road.
602. So that in your opinion there would be no escape, if the scheme is to be made effective, from cutting the channel right down to a proper depth from the start? Yes.
603. What effect do you think the taking of the flood-waters through the Tuckian from the North Arm and out at Broadwater into the main river would have upon the people about Broadwater, and from there on the other side of the river down past Wardell;—do you think it would have a bad effect? I do not think so, because you would bring the water from the North Arm into the Broadwater. Before that water, under present conditions, could get here, it would, under the proposed scheme, be out at sea. The proposed weir would commence to act forty-eight hours before the water would be over the banks here. It has to travel a long way round to come here.
604. So you think that the people at Wardell and anywhere below the Broadwater would not be prejudicially affected by this scheme? I do not think they would.

- W. Gollan. 605. You think that the water getting away so much sooner would keep the river so much lower? Yes.
- 10 Mar., 1900. 606. Do you anticipate that this scheme will only be useful or of assistance in moderate floods, or will it be of some assistance in even the larger and more general floods? I think it will be of assistance in all cases, because it will be the means of taking the water away sooner off the land. If you lower the canal the water from the whole district that is flooded will make its way through the channel, and will be taken away.
607. So that even in a heavy flood it will make some reduction in the amount of water which otherwise would be pent up in the river and along the banks? Yes; I believe that water would go right away.
608. Would that reduction in a heavy flood be sufficient in your opinion to be of any value;—say, there was a lasting flood, which continued for three or four days, would the difference which, in your opinion, the scheme would make, be worth having in a high flood? Yes. We have had a good deal of experience of that in connection with dairying. It is not so much the cattle we lose at the time the flood is up; it is the time that the water lies on the ground and rots the grass. If we had a flood at the end of March the whole of the winter would be before the cattle, and the whole of the grass would be destroyed. The consequence would be that our herds would not come in until the spring, and then would be useless for the incoming season, and a lot of them would die.
609. What do you mean when you say they would not come in? I mean they would not come into use. They would be of no value for dairying until the spring, and then they would be so poverty stricken that they would not be of much value for that season.
610. And you would probably have to buy feed for them? Yes; we should have to keep them alive the best way we could. That is the time when they die, and not just when the flood is at its highest.
611. So that any reduction in the height of the flood would be an advantage in that way? Yes. If the scheme only reduced the flood by a foot it would make a great deal of difference, because there would be some spots that would not be so deep where the water would get away. That is where we are affected the most.
612. I understood you to say that the land was fairly of a height? Yes; but there are creeks and holes in all land. Taking the whole area right along it would be something about the same.
613. In these places, where we are told that 5 or 6 feet of water is running at a time of flood, would there be any water-courses—that is, any land further depressed than the rest or the general run of the land? Yes, holes; they assist to drain the other land if they can get an outlet. They are the natural drainage for the place.
614. So that when 5 or 6 feet in depth is spoken of it does not refer to the whole of the country, but perhaps to a few hundred yards across any one place? No. I should like to say that the people would like the scheme to be carried out that would be most effectual. We do not want a cheap scheme that would not answer the purpose afterwards. If we are going to give this a trial, let us have it whatever the cost is. We do not object to that. We feel so confident that it will be a benefit to the district and the people that we are willing to have the very best piece of work that can possibly be done.
615. You do not think any cheeseparing would be a wise policy in this matter? No.

Alexander Meston, dairyman and grazier, Woodburn, sworn, and examined:—

- A. Meston. 616. *Mr. McFarlane.*] How long have you been a resident of Woodburn? Twenty-four years.
- 10 Mar., 1900. 617. And previous to that? I was twenty years on the Clarence.
618. Have you had much experience of floods? Too much.
619. I suppose you know something about the destruction caused by them? Yes; I know it well.
620. You have heard the evidence of Mr. Gollan;—do you generally endorse the statements he has made? There are some minor points on which I differ from him.
621. But do you endorse his evidence generally—first of all, with regard to the necessity for making this flood escape channel? Yes.
622. And, with regard to the Tuckombil weir, he stated that had a good effect during the late small flood;—was that your experience? Yes; I am perfectly satisfied of that. I had a piece of land above the mill, and I had it in crop last year, and it is the first time I ever got a crop off it in a flood. The water only stayed up two days, and before it used to stay up for a week. I attribute that to the weir. The sills were on at the time of the last flood, and now that they have been removed it will be of greater benefit.
623. Have you given the proposed scheme consideration? Yes; I have been thinking of it a good deal.
624. Do you think it a wise proposal? I think it will enormously relieve the river of the flood waters. It shortens the distance some 28 miles to sea, and that is bound to result in relief. The water will run the nearest way to the sea.
625. That will relieve the river from Coraki upwards on the North Arm? Yes; it ought to relieve the South Arm too.
626. First of all, would it relieve the whole of the North Arm above Coraki? Certainly.
627. And how far the other way, from Coraki down the river? It would relieve us all downwards. The water that goes through the channel cannot come here.
628. When you say all the way down, how far do you mean? Down to the Broadwater.
629. Going further down from the Broadwater to the mouth of the river, what effect do you think it would have on that part of the river? The effect cannot be the same as formerly, when the whole of the water went down, because the Tuckombil weir takes off an enormous quantity of water.
630. Would it increase the flooding of the lower part of the river below Broadwater? No; I cannot see how it could possibly do so.
631. I suppose you are aware that some of the Government engineers hold the opinion that it will increase the flooding of the river below the Broadwater? Perhaps they are right; but it is not my opinion, because there is any amount of get-away down there. And another thing, the river in 1893 broke through at Planche's mill, and below that they have never had a flood since. I have a lot of land down the river near Ballina, and I have had no flood there since the river broke through in 1893.
632. Have you a good knowledge of the country about Broadwater? Yes; I know all the country about there.

633. Suppose there is a flood in the river, and it is at its full height at Coraki for a certain period;—how long would that flood take going down the main river until it would be in full flood at Broadwater? In a pretty high flood it goes down at the rate of about 6 miles an hour, so that it would take about five hours to go down. A. Meston:
10 Mar., 1900.

634. You think a flood would be a full flood at Broadwater five hours after the river would be at its full height at Coraki? Yes; it takes about five hours to get down there.

635. How long do you think the water going through the relief channel would take to get to Broadwater and into the main river at Broadwater? It would not take above an hour.

636. So that the water that went through the new channel would get away before the flood-water coming round by the river could reach there? Yes.

637. I understand you own property below Broadwater? Yes, down at Immigrants' Creek.

638. Are you apprehensive of any damage in the event of this scheme being carried out? Not the slightest.

639. You are quite willing to take the risk? Quite willing, because I am satisfied there is no risk whatever.

640. For the reason you have given—that the floodwater would get away? Yes. It will relieve the lower Richmond, the same as it will here.

641. With regard to the flood escape scheme, the proposal is that the weir on the Richmond River should be 12 feet high? That is too high altogether. You might as well have it 20 feet. That would leave us just where we started.

642. It would relieve you to some extent, would it not;—the bank of the river, where they propose to cut the canal, is something about 20 feet, so that there would be a height of 9 feet? But why not let the water over at high tide?

643. Suppose it were cut down so that the weir would only be some 4 or 5 feet high, would not that have the effect of allowing what we call freshets on to the low-lying lands of the Tuckian Swamp, which otherwise would not go there unless the water rose sufficiently high to overflow the natural banks? No, because these swamps are all under water now when it rains, and it would not matter whether you sent any more in or not. They will take a certain amount, and will not take any more. The swamp would be flooded by rain water before even a small flood going through the drain could affect it. The first thing the rains do is to fill the swamps, and you cannot fill them any higher.

644. You consider that it would not cause any additional flooding by having the weir, say, 4 or 5 feet high? Not a bit, because in cutting the drain, you would have to cut through the banks into the Broadwater, and it would drain the whole country. You must cut through the banks into the Broadwater to let the flood waters off.

645. If the weir were only 4 or 5 feet above, say, half tide, a considerable additional volume of water would go through over and above the quantity under the proposal with the height of the weir at 12 feet? Of course; you would have 8 feet more water.

646. The engineers say that the opening of this new channel would most probably affect the navigation of the river, and, seeing that you propose a further reduction in the height of the weir, so that a less quantity of water will go down the main river, do you think that would affect the navigation of the river? They get the water all the same through the bar.

647. I am not speaking of the bar. The engineers maintain that the flood-waters in the river create a scour which has the effect of keeping the channel clear and deepening it, and they say that if that scour is reduced it will mean the silting up of the river;—have you considered that aspect of the question? I have never known these scours to remove any sand-banks. They have always had to use sand-dredges.

648. And you do not think that the navigation of the river would be affected by a large body of water being taken away through the new channel? No, I do not think so. You would still have Bungawalbyn Creek and the South Arm, which would create scour enough.

649. You consider that the water discharged by the South Arm and Bungawalbyn Creek would create sufficient scour? Yes, and if you saw them in full flood you would think so too.

650. Have you considered the question of cost in connection with this scheme? Yes. There is only one way in which it can be done, and that is under the betterment principle, because if it is done in any other way a few have to pay for the whole lot.

651. If the scheme were carried out, would you be prepared to contribute your share of the cost under the betterment principle? Decidedly, or I would not advocate it.

652. And are the residents to whom you have spoken of the matter agreeable in the same way? Yes, all I have spoken to are agreeable.

653. They are willing to contribute in this way, believing that they will derive considerable benefit by the carrying out of the work? Yes.

654. Taking the whole valley of the river, from the Broadwater upwards, including the North Arm, it would embrace a very large area? Very large. I have no idea how many acres, but it is an enormous district.

655. Would the whole of that large area, in your opinion, be benefited by the proposed scheme? Most decidedly.

656. You said you did not exactly concur with some of the views expressed by Mr. Gollan? It was in reference to what he said about getting through the swamp here, through the Evans' River, to the Tuckombil drain. I do not see that it is of any benefit whatever. The land is so low that the tide goes out over it. Well, if the tide goes over it is quite low enough for all the purposes of flood relief. Neither do I see any benefit in cutting through the Tuckian Swamp, because in a flood it is generally 8 or 10 feet under water.

657. You do not think it would be necessary to cut the channel the whole distance? No.

658. At the Broadwater end of the swamp, is the bank high along the Broadwater? It is too high; it would have to be cut through.

659. How far would it have to be cut from the Broadwater in towards the Tuckian Swamp? No great distance; but I could not tell you how far—a chain or two. It is a mere bagatelle, anyhow.

660. Have you a knowledge of how the rainwater affects the Tuckian Swamp down at the lower end, at Broadwater? It fills up the swamp.

661. So that the rainfall, if it makes a flood, would, by your statement, fill the Tuckian Swamp? Yes.

- A. Meston. 662. How would the Broadwater be affected when the flood-water came down through the river—in which direction would the flood go from the main river;—would it go up the Broadwater, or would the rain-water be running out the other way into the river? Running into the river.
- 10 Mar., 1900. 663. Notwithstanding the flood-water? Yes.
664. You maintain, then, that the water in the Tuckian Swamp, caused by the local rain-flood, would be higher than the flood-water coming down the river? Yes, certainly it would.
665. So that there would be no backing up? No.
666. Have you any knowledge of the drains that have been cut by Mr. Henderson? I saw the drains; they have done a lot of good—drained a lot of country.
667. Is it a fact that they let salt-water into the country there? Salt-water comes up the drain, but that does not hurt.
668. It does not overflow the drain? No.
669. Are these drains still in good order, and still of use? The last time I saw them, three years ago, they were in good order.
670. Do you consider they were of benefit to the locality? Decidedly; they drained a lot of country.
671. Is it a fact that they have rendered land, that was previously of little value, of considerable use? As far as I can see the swamp at present is dry, with cattle grazing on it, where there were no cattle before.
672. And that dryness is caused by the drainage? Yes.

Alexander MacPherson, farmer, dairyman, and sugar-mill owner, Woodburn, sworn, and examined:—

- A. MacPherson. 673. *Chairman.*] Where do you reside? At Swan Bay. I have been thirty-five years in the locality.
- 10 Mar., 1900. 674. Do you know the flood escape scheme that is projected? Yes, pretty well, I think.
675. Having listened to the evidence of the last two witnesses, do you generally agree with what they have stated? In most part.
676. Would you state if there is anything to which you take exception? I think that the biggest scheme of the lot would be of the most benefit—that is, No. 2 scheme, with a weir 520 feet long on the crest. I believe that would relieve us in this part.
677. What about the height of the weir;—do you endorse the opinion of the last two witnesses that it should be less than 12 feet? Yes; I do not think it would be of any benefit whatever at 12 feet. I think about 5 or 6 feet is quite high enough for the weir.
678. Will you briefly state your reasons? Because I consider that it is the small freshets that we want to keep off the grass lands. The big floods we have no control over whatever.
679. It is no use trying to cope with those? No; if the drain on the biggest scale is adopted we would only be bothered with freshets afterwards. The big floods would be done away with, owing to that cutting and the Tuckombil drain.
680. You think they would even relieve the district in time of continuous floods? I am almost sure of it. It is the small floods we want to keep off our grass lands.
681. You live over at Swan Bay? Yes.
682. Will you explain how the scheme will benefit the country between Swan Bay and the site of the weir, seeing that the water very often breaks over at the Swan Bay side before it breaks over the river above the proposed weir site? From my place at Swan Bay, near the Elbow, to Dungarubba Creek, I make out that it is something about 7 miles. Below my place, at O'Connor's, I believe a rise of 6 feet 6 inches will take the water over the banks. We call that a bit of a fresh. Before my door there is a bit of a flat, and when the water is over that flat it is going into the swamp.
683. What height is that flat? About 6 or 7 feet; it is the first bank.
684. *Mr. Watson.*] The first bank is 6 feet 6 inches;—the second bank must be higher than that? Yes.
685. How much higher? I could not tell you. The highest flood we ever had here was never over the second bank. From my place to Dungarubba Creek it is about 7 miles. I have seen the water 4 feet over the highest land there—what we call the forest. The whole of this water goes to Tuckian. I always estimated that more water goes through Tuckian than goes through the main river at Riley's Hill. There is a very strong current running to the Tuckian; this water, 7 miles wide, travels at the rate of about 2 miles an hour. Then there is another portion further up the river that is discharged into the Tuckian.
686. Where does the water go over first—down at Swan Bay or at Baxter's, above the weir? I believe in a very high flood it goes over at the weir before it goes over at Swan Bay, because there is a vast difference in the time.
687. That is when it comes down quickly? Yes; a big flood. It goes through Bungawalbyn first, and fills up all the back lands.
688. Do you think that by relieving the land down by Swan Bay of a lot of water that will go through the weir the scheme will prevent all this southern part of the river from being flooded? Yes; and I am more of that opinion since I have seen the Tuckombil drain working. I am certain that the river at my place was 2 feet lower than it would have been but for the Tuckombil weir. I came down at the height of the flood to see it, and the water was fully 6 feet lower at Woodburn.
689. Do you compare that state of things to a similar flood that occurred before the Tuckombil weir was built? Yes; according to the number of feet in Casino and Lismore. In the last flood the river was 2 feet lower at my place than it would have been without the Tuckombil weir.
690. The effect of this channel, if constructed, would be to get the water quickly away from up the river; but it must necessarily surcharge the water from the Tuckian Swamp to the Broadwater—it must put more water in there, must it not? I do not think so.
691. All that quantity of water going through the channel must get into the swamp quicker than it would otherwise do? There is about 7 or 8 miles of water going into the swamp from here, and I do not think the weir will carry more than that. Besides, the water is clear below Broadwater. There is no flood below Broadwater when this water begins to run.
692. You get that water quicker over to the Broadwater through this flood relief channel if you cut down the bank there to about 8 feet. It must get through to the Broadwater quicker than if it had to come round the river? Yes.

693. If a flood continues, and you still have water rapidly running through the relief channel, and also coming right down past the Elbow and Swan Bay, would there not be a possibility of a congestion at the junction of the Broadwater with the Richmond River which might spoil the effect of the drain? No; there would be far less water to meet there. It will never get as high down there with the channel as it will without it, because it will go away earlier.

A.
MacPherson.
10 Mar., 1900.

694. When you get to the Broadwater, at the junction of the river, the river then becomes a very wide stream? Yes; far wider than it is up here.

695. Does it overflow its banks there in flood-time? There is one part there which goes straight to the sea.

696. But, otherwise, does it not generally keep within its banks down the lower part of the river? Yes; I never heard of any bad effect at the time of the floods.

697. Is the chief trouble above the junction of the Broadwater and the Richmond River? Yes. In regard to Mr. Henderson's drains, I remember his land before he constructed the drains. It was then impossible to cross that part of the swamp, but after the drains were constructed I saw cattle grazing on them, and the land was much improved. I have seen it for the last ten years. I have been here for thirty-five years, and I have seen a lot of damage done by floods which could have been avoided if right schemes had been adopted for carrying the water away. Until the Government make a scheme which puts everyone on the same footing I do not think the country will ever prosper.

698. If this drain is constructed I suppose it will still be necessary to keep on improving navigation of the river by taking out the curves and looking after the shallows? We want shipping always to come to our doors; but, nevertheless, I consider this work is a great deal before the shipping, because ships can do very little if we have no produce.

John Lang, farmer, near Woodburn, sworn, and examined:—

699. *Chairman.*] Where do you reside? About 2 miles below Woodburn, on this side of the river.

700. How long have you been in the district? Thirty-four years; I have always lived in this locality.

701. You should know the country about here thoroughly under all conditions during that time? Yes; I know this part thoroughly.

J. Lang.
10 Mar., 1900.

702. Would you kindly give us your views as to the Tuckombil flood escape? When the proposal was made to cut the canal I was rather against it. I have a lot of land down along the Evans' River and the Richmond River here, and the flood had to rise over the bank before it came in upon that land. I thought when the flood escape was made we should be flooded straight away, but I have had reason to alter my opinion through the last threatened flood here in 1899. In 1889, when the flood broke over the bank, we lost a lot of cattle on the selections out at Evans' River; but in the last flood, although it was over the banks in many places, we had no occasion to shift the cattle at all. The difference between the height of the flood of 1889 and that of 1899 was 1 foot. It was 1 foot higher before the Tuckombil escape was made. In 1890 it was 2 feet 6 inches, and in 1893 it was 3 feet higher than in 1899. We attribute the fall in a great measure to the Tuckombil escape. If it had not been for the Tuckombil escape we would have had the water as high as in 1889. The levels I have given are those at Woodburn ferry; they are reliable, because they were measured.

703. Were these floods of any duration? Yes.

704. How long did they last? I could not say exactly.

705. With regard to the flood that occurred when the Tuckombil weir was in operation, how long did that last? Only a day or two.

706. Did the escape seem to keep pace with the discharge of water, or do you think the flood was overtaking it? No; I do not think the flood was overtaking it.

707. This water does not get away quickly;—does it come to the back of the town? The water is forced through the cutting, and it goes straight into a swamp at the back of the town where it passes the weir, and then it spreads.

708. Does it do any harm there? I do not know that it does any particular harm, but water is allowed to spread over the land, otherwise it would go direct into the river.

709. You think it would be better if there was a straight channel right away through Evans' River? There is no doubt about it, and a wall on the upper side. The dirt coming out of the channel would form an embankment to keep the water out of the back of the town.

710. How far does the water go before it reaches where it gets away quickly;—is the Evans' River a good size. Yes; a good size. It is nearly as wide as the river here.

711. And that river discharges into the sea? Yes; at a distance of about 6 miles from the weir. There are little channels and islands in the river, and you see the trees surging as the current goes down at a great rate. It seems to be washing the islands away. If there were many floods the islands would be cut right away. Otherwise it would not seem to do any damage to the main banks.

712. Those islands would be of no importance? No; they are only slight obstructions.

713. How many feet is the weir now above the sea-level? I could not say. I suppose it is about 4 feet above the creek-level at medium tide.

714. Are you strongly of opinion that it was too high before the sills were removed? Yes; I think it is a good thing that the sills were removed. The effect is to let the water get away sooner. The difficulty is that after the water rises a little above high water-mark here it backs up the Tuckombil Creek and spreads over the swamp instead of going out to sea. It fills up the lower lands above the sea. With the sills off it will get away to sea.

715. And that experience, you think, should be followed in regard to the proposed weir at Tuckian? Yes; I believe that by intercepting the water there a great improvement will be effected.

716. I mean that instead of the weir being 12 feet above low water, as is proposed, you think the height should be reduced? Yes; it ought to be reduced as much as possible. The sooner the water gets over the weir and goes away to sea the better. The more water that goes away to sea the less water comes out over the creeks and the less damage will be done, because there is so much of the water gone.

717. That is, I understand, the point of view from which you desire to give evidence? Yes. In view of the good that the Tuckombil flood escape has done, I think the other scheme must be a benefit.

Thomas

Thomas Casey, farmer, Swan Bay, near Woodburn, sworn, and examined :—

- T. Casey.
10 Mar., 1900.
718. *Chairman.*] Where do you reside? At Swan Bay, about 3 miles up the river from Woodburn. I have been there twenty years.
719. Is your land lower than the land at Woodburn? Yes; it is lower than the general run of the river bank lands.
720. Will you give us your opinion with regard to the proposed Tuckian weir? I think the weir is too high. I think 4 feet above high water is sufficient. We always find that the small freshets alleviate the condition of the river and the bar better than the high floods. The weir might even be made lower, and, if found necessary, raised afterwards by means of sills as in the case of the Tuckambil escape. It seems a stupid thing to allow 250 square miles, or 163,840 acres of land, to be flooded before giving relief. While the water was within the banks of the river the escape would do the best work. On the other hand, when the water spreads over these 16 square miles of country the escape drain would be of very little use to that body of water. In regard to the damage caused by flood, particularly in connection with the dairy industry, I may say that my cheque for the month of May, 1899, amounted to £18 7s. 1d., while my returns for the month of July, 1899, after the flood, were £5 8s., showing a loss of £12 19s. 1d. in one month. I contend that if the Tuckian escape channel is carried out, and at the level we propose, although I might suffer some loss, a great deal of my land would not be under water, and probably my returns would not be reduced at all in consequence of the flood.
721. The loss you have mentioned was due to that particular flood of 1899? Yes.
722. And your loss would be minimised by the construction of the Tuckian escape channel? Yes. I should like to give a few notes, taken from the diary of Captain Nelson, of the "Electra."—"Tuesday, 22nd February, 1898, water 29 feet at Lismore and standing. Left Lismore for Coraki; water 8 ft. 9 in. above high-water at Coraki wharf, and at Woodburn water 15 in. below the wharf." I may state that I measured the wharf at Woodburn at high tide, and I found that there was only 46 in. of a rise when the "Electra" arrived here in the afternoon, according to Captain Nelson, while it was 29 ft. at Lismore in the morning. Captain Nelson's diary continues: "Went on to Broadwater and loaded sugar; scarcely any rise there." That was the same evening. That is the substance of what I got from Captain Nelson's diary with regard to his experience of that flood. In reference to the Tuckambil escape, from levels taken I find that about 5 chains below the weir the channel is drawn in to a width of 60 ft. I find the banks there to be about 5 in. above the sills, which have since been taken off. That would be 2 ft. 5 in. above the weir at that point. According to that, the flood of last July would only be over the banks for a little bit of that 60 feet. Assuming that there was 4 feet of water running over the sill, there would be only 2 feet running over those banks; so that, practically, there would only be a width of 60 feet for the 300 feet of water going over the weir. It does not give us the benefit we desire. It would be necessary to widen the offtake to the full width of 300 feet right into Evans' River.
- 722½. But the land that is higher than the weir on the bank does not continue right down to the river? No.
723. How far would it continue above the weir? I suppose it would be about 5 or 6 chains before you would get below the weir.
724. The channel should be taken at least that distance? The channel should be taken at least 300 feet wide for another 5 or 6 chains, until it comes below the level of the weir. It ought to be taken more to the south, so as to go as nearly as possible in a straight line to the head of Evans' River. I would strongly advocate, and I think the people would, perhaps, with the exception of a few, that the width of 300 feet should be continued, so that the tide would come from Evans' River right up to the end of the weir. If the salt water were allowed to come up to the weir, the channel would not require any maintenance, because the salt water would prevent anything from growing. The water would have a clean passage into the head of Evans' River.
725. That would be a pretty expensive job, would it not? No. The spring tides come up the narrow channel which has been already dug out, and if it were continued as I suggest the spring tides would come up to the weir.
726. You say the banks are 2 ft. 6 in. higher than the top of the weir going towards the Evans' River? Yes.
727. Did you notice whether the water was flowing over that when it was in flood;—I believe you saw the water going through the weir? I did not see the flood when it was at its height; but there is evidence of the flood having been over that bank. When I did see it the water had been over it to a depth of 2 ft. 6 in.
728. There was a depth of 5 ft. 3 in., I believe, going over the weir? I did not see it when it was at its full height.
729. Do you know the character of the soil or earth through which it is proposed that the Tuckian Swamp channel should go? Yes; it is somewhat similar to what we call the fox-tail lands on the Richmond River, and that is chiefly a very strong blue clay.
730. Is the land through which the Tuckian channel is to be taken similar? It is of a similar nature to the back land over the bank.
731. Is it possible that the drain that is taken from Tuckambil towards Evans' River was made smaller with the idea that it would afterwards scour out? That was the object, I believe.
732. And it has failed to do that? It has failed to do that, certainly. The last flood did not make the slightest impression.
733. Would you expect, from your knowledge of that class of clay, that it would scour with a flood? Not until I was dead and forgotten for years.
734. It would follow from that, then, that it would be an unwise thing, in your opinion, to calculate upon a scour being sufficient to make a channel from the North Arm to Tuckian? Rather. When the people are in need of the relief just now it would be unwise to prolong the thing until the water would cut away the channel. It would be fairer for the Government, if they are going to carry it out at all, to make a complete job of it at once.
735. If the Tuckambil soil was expected to scour and did not, and it is the same class of clay, it is more than probable it would not scour at the Tuckian? We have the evidence of that here in the Tuckambil escape. The last flood has not made the slightest impression, and we conclude that it would be generations before the scour operated in the case of the Tuckian channel.

736. *Chairman.*] Have you anything to say in regard to the cost of the proposed work? The question has been asked of everybody whether they are satisfied to bear the cost. Well, my conscience and my will are at loggerheads. My conscience says "Don't pay," and my will says, "If there is so much to be saved to you every year, pay," and, of course, I have to fall in with the majority. If I am to save as much in one year as I have shown in dairying and sugar-cane, it is better for me to pay on the betterment principle than to say I will not pay. On principle I would say, "I will not pay"; but it is better for me to say, "I will pay," and save this much money, because I am so confident that I will save it.

737. Is there anything else you would like to state? I would advocate cutting the Tuckian channel right into the head of Broadwater, and of the same width as at the off-take. I should by all means advocate bringing the height of the weir down to 4 feet above high-water; and with regard to the lowering of the weir having the effect of diminishing the scour between the weir site and Coraki, I feel sure that all the time the water was running out at 4 feet, there would be a good current running down to Coraki, and we find that a fresh of 4 ft. 6 in. has a better scour than a flood of 26 feet.

T. Casey.
10 Mar., 1900.

George McLean, grazier, Swan Bay, sworn, and examined:—

738. *Mr. Watson.*] Where do you live? Opposite Swan Bay; I formerly lived at East Coraki.

739. I understand you are able to give us some information as to the points at which, in flood time, the water breaks over between Baxter's, above Coraki, and Broadwater? It breaks over first at Rainbow Creek, near Baxter's, a little over a mile below the site of the weir. I lived for years at Rainbow Creek, and the water there runs over thirty-six hours before there is any flood on the back land—before it begins to run into Tuckian. The next place where the river breaks over is at O'Connor's, about 29 miles from the mouth. All the water goes towards Tuckian.

740. Are there any other places at which the water breaks over; does it back up at Dungarubba Creek? It backs up, but it does not go right back to the swamp. It backs up until the water coming from Swan Bay and Rainbow Creek meets it, and then it rushes back behind Woodburn.

741. But the great body of the water, even in the highest flood, makes towards the Tuckian Swamp, that being, apparently, the easiest outlet for it? Yes. I lived out there for years, and was often looking after cattle in time of flood, both on horseback and in boats.

742. Assuming that the proposed channel is made, and the flood-waters taken towards the Broadwater, do you think they will be able to find a way to the Broadwater from the swamp without any guiding? No; I think the channel will have to be cut from the off-take and an embankment made on the southern side, otherwise the water will come over and sweep the whole lot of us away, and we intend to go for damages. We have 1,600 acres in the locality of the drain, and we intend to go for damages if it is not banked up on the southern side of the channel.

743. Can water get out of the Tuckian Swamp on to your land? No, it never does; the Tuckian never does any harm.

744. If the engineers take the water into the Tuckian Swamp, how can it get up on to your land from the Tuckian? It would not come from the Tuckian, but from the head of Wilson's Creek—from near the Tweed, and a long way above Lismore. The water all comes down here from the boundary of the Tweed and from Mount Lindsay.

745. How does it affect you? If you put it into this take-off, and there is no bank on the southern side, it will break over and run down on to the low land.

746. What I understand you to say is that the proposed channel would require to have an embankment on the southern side, between the take-off and the swamp? Through what we call the Tuckian crossing, not all the way to the Broadwater. There should be an embankment to that point, and then a clear waterway to the head of the Broadwater. I heard some witnesses say that there was a bank between the Broadwater and the swamp. I was there some years ago, and was also there not long ago, and to my knowledge there is no bank there. There is a sort of a brush and high weeds that want clearing; but I think the land itself is virtually level. There is no rise there. But there should be an embankment on this side of the Tuckian Swamp, and I think that would save us; but, if that is not done, 1,600 acres of my land will be considerably damaged, whereas it would otherwise be benefited. My brother and I own about 1,600 acres just below the weir site, extending from the river to Woodburn-road. "Duart" is the name of my place.

747. How far is the Woodburn-road from the river? About 2½ miles in a straight line to East Coraki wharf.

748. What is your opinion on the question of paying for the construction of the proposed work? I do not think we ought to pay for it. Only yesterday I left a cheque in the bank for £34 some odd shillings, comprising £30 for interest on the land, and £4 odd for the land tax. I do not know how much more the Government want from me.

749. We have been assured that the residents are willing to pay something for this relief? There are a good many who are not. I will pay if I have to pay; but I will never sign for it. If I see I am benefited I shall be pleased to pay for it. I do not want anything for nothing. But the Government have hundreds of acres of land which this scheme is supposed to redeem, and have we to pay for redeeming their land.

G. McLean.
10 Mar., 1900

John Carmichael, blacksmith and wheelwright, Woodburn, sworn, and examined:—

750. *Mr. Watson.*] What are you? A blacksmith and wheelwright residing at Woodburn. I have been here for thirteen years.

751. I understand you have taken some notice of the various flood levels at Woodburn? With regard to the 1893 flood, I know a property situated about 2 miles south-east of the proposed Tuckian escape drain, and the water from the last July flood was between two and three feet lower than it was in the 1893 flood.

J.
Carmichael.
10 Mar., 1900.

752. Do you attribute that to the Tuckombil escape drain? Yes.

753. Do you know that at Coraki there was a difference of 3 feet? Yes, that would be about four or five miles in a direct line from my place, lower down.

754. It would affect the case very materially if in the 1893 flood the water at Lismore and in the South

- J. Carmichael.
10 Mar., 1900.
- Arm was very much higher than in 1899, because there could then be no argument in favour of the Tuckombil drain? At Lismore the water was within 4 feet of the height of the 1893 flood.
755. If it was 4 feet lower at Lismore than in 1893, the quantity of water coming down was not so large? It is very hard to say, because there are so many different creeks, and the rain does not all come at one time; at one place it rains heavily, and at another place it is light.
756. You feel convinced that the Tuckombil escape drain has been of material assistance? Yes, quite convinced. In regard to the method of payment for the proposed Tuckian scheme, I would suggest that the betterment area should be made as large as possible, because then the tax would become lighter. There are very few people in the district who would not be willing to pay a little towards the scheme, and the burden would be all the lighter to the people on the flats.

Edward Murray, hotel-keeper, South Woodburn, sworn, and examined:—

- E. Murray.
10 Mar., 1900.
757. *Chairman.*] Can you give the Committee any information in regard to the proposed scheme? In regard to the Tuckian, I know it pretty well. I was living there for eight years looking after the stock on Dungarubba station. I think if an embankment is not made from the river to the Broadwater the water will come back here again to the river, and fill all the swamps up.
758. When the swamp gets surcharged you think the water will come back down south? Yes.
759. And you agree with Mr. McLean that a high embankment will have to be constructed on the southern side of the channel, extending from the offtake to the Broadwater? Yes; to McIntosh's Hill. If that is not done, the water from Marom Creek and the other creeks must come over here.
760. When once the swamp got full up to its edges, you think the water would come south again? Yes; because it is about 4 feet 6 inches lower here than it is in the main Swamp.
761. Does the water flow at any speed on that country, or very slowly? Very slowly; it seems to be spread all over the country.
762. An ordinary earth embankment, I suppose, would be sufficient? Yes; I think 5 or 6 feet would be plenty high enough.
763. Do you think there is any possibility of the tide water flowing up this channel? I think it goes up the swamps a little now, but it could not get up the channel very well.
764. How far would it go? I could not exactly tell you; but I know it goes up amongst the grass a bit. There are little bits of arms at the top of the Broadwater, and the saltwater runs up sometimes in very high tide—up amongst the grass.
765. Not every day? I have not been there every day; it is an awkward place to get at. You can only get there in a dry time.
766. Is the swamp itself subject to the influence of the daily tide, or is it only at high tide that the water goes up? I think it is only at high tide. I was never there to observe how the tide worked; I never took that much notice.

MONDAY, 12 MARCH, 1900.

[The Sectional Committee met at Victoria Hall, Broadwater, at 10.45 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).
JOHN CHRISTIAN WATSON, Esq. | JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

Albert Ernest Armbruster, grazier, Tucki Swamp, sworn, and examined:—

- A. E. Armbruster.
12 Mar., 1900.
767. *Mr. Watson.*] I understand that you hold, under lease from Mr. Henderson, 1,200 acres of land in the Tuckian Swamp? Yes.
768. How long have you been there? I have lived there for three years. Prior to that I lived near the swamp for about ten years.
769. Had you a knowledge of the condition of the 1,200 acres which you now lease before Mr. Henderson's drains were made? I had not.
770. What is the position of affairs now since the drains have been made;—is the land fit for grazing? It is, in anything like a fair season.
771. Take the present season, for how long during this season have you been able to graze upon it? I should say since last spring—since September.
772. Immediately prior to that the land was under water mostly? Yes.
773. And had been so since when? Since the flood of last July.
774. From July to September, then, the land was under water? Yes.
775. From that time the waters got away, and you were able to graze? Yes.
776. Do you think the drains have proved effective to any extent? Yes; they are so in any kind of fair weather, as long as there is not too much rain.
777. They assist the getting away of the water from the swamp itself? Yes.
778. Where do you get the principal quantity of water from at the present time? It all comes from the creeks in the big scrub—Marom Creek, Tucki Tucki Creek, Youngman's Creek, and Gum Creek.
779. Would the flow from all those creeks you have mentioned make towards the land you occupy where the drains are? Yes.
780. That is, it would make there from Tucki Tucki Creek, which empties on the north-west edge of the swamp—then would make over to the eastern part of the swamp, where your land is? Not exactly where my land is; it comes down more by Tuckian Island, shown on the plan.
781. Does it keep on the westerly or the easterly side of that island? On the east side—the right-hand side shown on the plan.
782. Does it come between your drains from Tuckian Island? There is a lot of water that comes down there; there are water-holes there now. But Marom Creek comes on both sides of Cedar Island.

783.

A. E.
Armbruster.
12 Mar., 1900.

783. Take Tuckian Island, where does Marom Creek run there—principally towards your drains? Yes.
784. And the same with Gum Creek and Youngman's Creek? Yes; Youngman's Creek comes down there too.
785. And each of those make towards the drains which run through your land? Yes.
786. To what size were those drains originally cut? Some of them were cut 18 feet wide, others 12 feet, and some of them 6 feet.
787. And about how deep? From 3 to 4 feet, I should say.
788. Have they been made larger by the action of the floods? No; I do not think so, not much.
789. Floods have not affected them to any extent? No.
790. Have there been any signs of silting up? I do not think so.
791. They remain much as they were when they were cut? Yes.
792. We have been told that a large quantity of water goes into the Tuckian Swamp from an overflow of the Richmond River above Dungarubba Creek;—do you know if that is so from your own knowledge? I have not been over that way very much.
793. You would know probably the action of the Broadwater? Yes.
794. Have you seen any signs of the swamp being flooded by water being backed up the Broadwater? No; it principally comes from the creeks.
795. Has the current at any time to your knowledge been over the Broadwater up into the swamp? No.
796. It has always been the other way? Yes.
797. Can you say whether the drains have had the effect of letting the tide in on the swamp? I do not think they have. The tide may flow up the drains a little way, but I do not think it goes out on to the swamp.
798. It would naturally follow that where the drains are cut below high-water level the tide would flow up them during high tide? Yes.
799. But you have not seen any signs of the high-tide water spreading from the drains over the adjoining land? No.
800. It has been suggested that if the proposed flood relief channel were taken to the swamp, it would be still necessary to cut a channel of some sort in order to get the water to the Broadwater;—do you think that would be so? Yes; I think it would be necessary.
801. To what extent do you think it would be necessary;—would it be confined to the cutting away of the mere surface growth in the shape of rushes and ti-tree to prevent the water from being blocked, or would it be necessary to cut through the clay bottom? I should think it would be only necessary to make a slight channel—a wide channel, but not a deep one—just sufficient to guide the water.
802. Can you say from the time you have been there, and watching as you have done the effect of the various floods and inundations of the swamp itself, whether Mr. Henderson's drains are an improvement or a detriment? They are an improvement, I should say.
803. They are an improvement to the condition of the land on which you are? Yes.
804. So that, in your opinion, the land without the drain would be worse than it is at the present time? Yes.
805. Do you think it would be fit for grazing, if you had not the drains? I do not think it would.
806. Assuming that the relief channel were carried out as proposed, and the slight channel you have indicated were made through the swamp to the Broadwater, what effect do you think that would have upon the land which you and others may occupy now for grazing purposes—that is, under the present scheme of allowing the flood-waters above 12 feet to go into the swamp first, and then towards the Broadwater—what effect would the bringing of those waters in have upon the land which you and others occupy? I should think it would make the water there rise higher in flood-time, but it would go down a lot quicker.
807. Why do you think that? There would be a better get-away for it. There is no get-away now—nothing to guide the water.
808. You think that the slight channel which would require to be made through Tuckian, beyond merely carrying the water from the North Arm, would also help to drain the local waters out of Tuckian? Yes; I think it would take them down quicker.
809. In your opinion, it would have the immediate effect of raising the flood-level, but the water would get away sooner, and the swamp would be more quickly available for grazing than is the case now? Yes.
810. Temporarily the effect would be bad, but, on the whole, you think it would be rather good than otherwise? Yes; I think it would take the water away quicker.
811. Assuming that the water were merely brought into the swamp, and not taken through by a channel as you suggest, then it would make it worse than ever on the whole? I do not think it would make it worse. It would make it as bad as it is at present.
812. It would not improve it? No; it would not improve it at all.
813. Do you know what it cost to make those drains for Mr. Henderson? I was told he spent £8,000 on the place. I could not say whether that was for draining it alone, or whether it was altogether. He had some high land that took some clearing, and he built a large house.
814. Have you rented that, too? Yes.
815. What rental do you pay now for the property? £50 a year, including the house and the higher land.
816. Could you say how many miles of drains there are? I think there are 8 miles of drains about the place.
817. What would be a fair price for making those drains, taking the average width and depth and allowing for the kind of country through which they go? I could not say.
818. I presume that when you see indications of a flood you remove your cattle from the swamp to the higher land, which is also on the property? Yes.
819. Have you sufficient high land to suffice for the cattle while the flood is on? No; there is not much high land on the place; there are only about 100 acres altogether.
820. The higher land, I presume, would be close to the swamp? Yes.
821. And adjoining the low land in the swamp itself? Yes.
822. Have you ever lost any cattle through the floods? Yes, I have. They were drowned principally in the big floods.

- A. E. Armbruster.
12 Mar., 1900.
823. You did not anticipate the flood rising, so I suppose you left them there? Yes; they were principally young cattle that did not come out.
824. Looking at the matter broadly, do you think that your interests as a grazier and lessee of land on the swamp would be affected by the construction of the proposed channel? I do not think so.
825. And from that I assume you are prepared to run the risk if anything happens from the construction of the drain? Yes.
826. The scheme as proposed is to erect a weir above Coraki, with a height on its crest of 12 feet above low-water mark; that will allow a given quantity of water to get over in flood time; assuming that the weir were reduced in height from, say, 8 feet above low-water mark, that would mean another 4 feet in height of water escaping through the weir into the swamp;—do you think that would have any bad effect upon yourself and other lessees? I do not think it would.
827. While it would mean, of course, more water going into the swamp? Yes; there would have to be a canal cut to carry it through.
828. If the channel were cut right through the swamp, you do not think it would be affected by it? No.
829. You think the water would go right through—that instead of spreading over the swamp it would follow the channel to the Broadwater? Yes.
830. I gather from what you have said that, in your opinion, whichever scheme is adopted, or whatever height of weir is made, there will still be a necessity for some slight channel through the swamp proper, from end to end of the swamp, to guide the water? Yes.
831. Otherwise there would be a spread all over the swamp itself by the water taken in? Yes.
832. So, with that channel made, you do not think it is a material point what height the weir is, so far as your interests are concerned? No.
833. Are there any other lessees or owners who use the swamp for grazing purposes? Yes, Mr. Lovett, further over from me again, has about 1,300 acres.
834. Is his land about the same level, or higher or lower, than yours? I should say it was a little bit higher towards the top end.
835. Are there any on the western side, towards Coraki, from your place? I think over about Tuckian there is Mr. MacPherson; he is the only one I know on that side.
836. These other settlers carry on grazing during the months of the year which are suitable? Yes.

William Frederick Armbruster, farmer, Meerschaum Vale, sworn, and examined:—

- W. F. Armbruster.
12 Mar., 1900.
837. *Chairman.*] Where do you reside? At Meerschaum Vale, at the north-east corner of the Tuckian Swamp.
838. *Mr. McFarlane.*] How long have you been residing in the locality? Twenty-two years.
839. You have heard the statement made by your brother respecting certain drains on the property which he leases? Yes.
840. Do you bear out that statement with regard to the good these drains have done to the land by carrying the water away quickly? Yes, I can say they have done an enormous amount of good.
841. Did you know this particular country before the drains were cut? I did. I have been all over it.
842. Will you state what was its condition before the drains were cut? It was impossible to take a horse through it. You could only cross it on foot.
843. For what reason? It was too boggy, too wet. There were patches of dry land at places—rises or small ridges.
844. And, excepting for those ridges, it was too wet? Yes.
845. For grazing purposes? Yes.
846. When the drains were cut you noticed a great improvement? Yes, a great improvement. I have ridden a horse, in fact galloped a horse, all over the swamp, where, before the drains were cut, a horse never trod.
847. These drains, I believe, were afterwards deepened; but when they were cut at first they had a good effect in taking away the surface water? Yes.
848. What reason was there for deepening them? It was Mr. Henderson's intention, I believe, to both deepen and widen them.
849. So as to carry off more water? Yes.
850. With regard to the salt water, do you know how high the tide rises, say, where the drains enter into the Broadwater? About five years ago I was in Wardell, and we had a very high tide there. The water was all over the low-lying lands between Wardell and Tuckian, and at that time the water was only running up the drain to a quarter of a mile.
851. You mean that the salt water only followed the bed of the drain, and did not overflow? Yes; it went up about a quarter of a mile.
852. So that it would not be a fact, if anyone so stated, that the salt water runs into the swamp by overflowing the drains? Not on this end of the swamp. I am confident it never went in on this end of the swamp. I could not say about the other end of the swamp. I am speaking of the drains.
853. During your residence there you had some experience of floods that have occasionally visited the district? Yes.
854. Even without a general flood, do the local rains have any great effect in creating a flood on the swamp? Yes; there is about 7 feet of water on the swamp before the river starts to rise.
855. You consider that the swamp is filled with the local rain? Yes, the rain coming from Marom Creek, Gum Creek, and Youngman's Creek.
856. What additional rise would a high flood, such as that of 1893, cause on the swamp;—you say that the local rains would make a rise of 7 feet when the swamps would be considered full: how much additional rise would a high flood, such as that of 1893 make? I could not say exactly, but very little, as far as I could see.
857. Do you know the locality where it is proposed to cut the escape channel—I am speaking now more particularly of above Coraki? No, I do not know that locality, except just by riding through it. I am not well acquainted with it personally.
858. It is proposed to construct a weir there to the height of 12 feet above low-water;—what is your opinion as to the effect which the cutting of this channel would have on the land you were just speaking of? I think the lower the water the quicker the water would get away. 859.

W. F.
Armbruster.
12 Mar., 1900.

859. It would also get in quicker, would it not? Yes.
860. Your brother said that it would raise the water higher in the swamp and would also have a beneficial effect by letting it away quicker;—is that also your opinion—that is, irrespective of the height of the weir? No; I do not see how it could raise the water in the swamp, because the swamp is flooded from the hills around and not from the river. The backwater is very little, and only in a very high flood has any effect whatever on the swamp.
861. Reducing the height of the weir, according to that theory, would not affect the height of the swamp? I do not think so.
862. Are there occasions, within your knowledge, when the river rises to a considerable height after local rains? No; we usually get the heaviest rain down near the coast before we get it inland.
863. So that, in your opinion, the swamps would be full before the flood-waters of the river could reach them? Yes; I have always noticed that the swamp is full first and there is 7 feet or 8 feet of water in the lowest places.
864. Have you a good knowledge of the swamp in flood time—say a high flood such as that of 1870 or 1893;—have you a distinct recollection of being in this particular locality during one of these record floods? Yes; I have pulled over the swamp in a boat.
865. Have you noticed the direction of the current in any part of the swamp? Yes; the current seems to draw in from a north-east direction on the eastern side and to come from Lismore and Coraki on the other side.
866. When the local rain fills the Tuckian Swamp, where does it first get vent—does it run in any particular direction? Yes, it appears to be all making down to the Broadwater Bay.
867. Have you noticed a flow down the Broadwater caused by the overflow of the swamp—any current in the Broadwater? No; I have not been in the Broadwater at such a time.
868. If it flows into the Broadwater it is natural to assume that it runs through the Broadwater into the main river? When it reaches the tide in the Broadwater the current ceases.
869. Have you noticed at flood time the Broadwater backing up in the direction of the swamp—that is, the flood-waters backing up to the Broadwater and discharging into the swamp? No, I have not. I have been right down to the mouth of the Broadwater, and all along, in a boat, and have never seen any indication of the Broadwater backing up.
870. Was that at very high flood? Yes; all the rubbish and logs seemed to be going out into the bay.
871. Would that indicate that the surplus water was getting an outlet in the bay? I have noticed that when the current coming from across the Coraki side and the current off the range on this side meet in the river, they cause a sort of eddy, and the rubbish and logs rest there.
872. Is your land on the swamp? I have a small portion of the swamp on my land. My farm runs right along the side of the swamp.
873. You are not much affected by the swamp;—you have plenty of land without it? Yes; but if the water comes down, it starts to break over the creeks into my farm before it reaches the swamp.
874. Is there much settlement round the swamp? Yes; there are free selectors all the way round, with small holdings.
875. I suppose people are living on the different holdings? Yes; dairying on the land all round.
876. Have you a good knowledge of the settlers living round there? Yes, I know them all between there and Wyrallah.
877. I suppose they are pretty well aware of the proposal to cut this channel? Yes.
878. Did you hear any objection raised by them as to its having the effect of flooding their property? All the men I have spoken to on the matter have favoured the scheme.
879. They are willing to run any risk of additional flooding? Yes.
880. Do the settlers along the swamp clearly understand how it is proposed to make this cutting—that is, to cut a portion of the bank above Coraki for a distance of 2 miles from the bank of the river, to let the water go into the swamp, to find its way from there to the Broadwater without any defined channel;—what is your opinion about that? I think that would not improve the swamp.
881. Do you think it would be necessary to make the cutting the whole distance? I think so.
882. Assuming that that channel is cut with a weir, say, 5 or 6 feet high in place of 12 feet, do you remember numbers of freshets that come down the river that do not overflow the land? Yes.
883. And which would be sufficiently high to enter this large swamp if the weir were reduced to the lower level mentioned;—would not that have the effect of flooding the swamp, when, under present circumstances, no flood would take place? I do not think so, because the swamp is not flooded by small freshets like that; it is flooded from the creeks. It is not the river that floods the swamp; it is the creeks.
884. But you say that the local rains at high flood make sufficient water to overflow the swamp? Yes.
885. Say there was only a small flood or freshet, which would only have the effect of raising the river from 8 feet or 10 feet at Coraki, coming down from Lismore on the North Arm; thus under existing circumstances would not overflow the the river bank there, and, I understand, would not overflow the river bank between Coraki and Broadwater; consequently this water would not go into the swamp; but if the cutting were made with a weir only 6 feet or 7 feet high, that water would go through the weir into the swamp—would that have any injurious effect? I do not think so; because it would get away so much quicker than if it simply backed into the swamp again after the rain ceased. I do not think it would have an injurious effect.
886. Would it not cause more water in the swamp? I could not say.
887. Your contention is that, if it brought the water in, it would take it out quicker;—but I am putting forward a case where in the present circumstances it would not go into the swamp at all, but would go round its natural channel—I am only speaking of freshets? I am aware it is impossible to prevent flooding on the swamp in big floods; but what is required is to get the water away after a flood. It is not possible to prevent a flood on the swamp.
888. Do you think it would be wise to reduce the height of the proposed weir at Coraki? I do not think it would injure the swamp.
889. *Mr. Watson.*] That is with the channel right through? Yes.
890. Do you know the Broadwater near where the proposed channel would enter it? Yes.
891. Is there a high bank there;—has the Broadwater Creek a bank higher than the swamp? Yes; there

- W. F. Armbruster. 12 Mar., 1900. is a slight rise all along the creek in places, and in some places it is level, and the water can get away.
 892. How high would that be, say, at low water at Broadwater at the present time? About 3 feet.
 893. It would have 3 feet of a bank? Yes.
 894. High tide would pretty well cover it? In places; it may break over at different places in little valleys.

John Byrne, farmer and hotelkeeper, sworn, and examined:—

- J. Byrne. 12 Mar., 1900. 895. *Chairman.*] Where do you reside? Opposite where the Broadwater junctions with the main river.
 896. You are acquainted with the proposed scheme? Yes; I have heard of it.
 897. You understand thoroughly what the proposal is? I understand the principal part of it. I do not know the lower part of the ground; I have never been on the place.
 898. But you understand the scheme? Yes.
 899. Do you approve of that scheme or not? I do not approve of it.
 900. Will you give us your reasons? I think we will be flooded out on several occasions, when otherwise we would not be flooded, and we shall have a higher flood occasionally than ever we had before. The water will come down so much quicker. I have a record of the floods since 1870. I have been thirty-one years on the river.
 901. The contention of those who favour the flood relief channel is that by constructing the weir on the river near Baxter's place, the water will be taken quickly across to the Broadwater, where it will pass away rapidly, without affecting the lands below? It will affect the lands below, because when rain comes we always have a heavy storm on the beach, and the river runs up. There is no chance of the water getting out until the storm eases off.
 902. Will you describe the working of the Broadwater in flood time? At the commencement of a flood the current runs up the Broadwater. I have taken boats up there, and have hardly had to pull. In the flood of 1870 there was a great current up there, and the Tuckian water broke out. That would be within 2 feet of the floods highest level.
 903. Where did it break out? In the Broadwater. I could see the colour of the water. I was pulling in a boat in the river.
 904. Was that during the time a heavy gale was raging on the coast? A heavy gale was raging all the time for four days, and it rained, and it rained a very long time in the 1870 flood; but the gale was not heavy all the time—not as heavy as it was first of all.
 905. Was that current up the Broadwater caused by the river being driven back at high tide? It was the force of the main river water that caused the flood at Broadwater.
 906. Was that caused by the heavy flood on the coast? It was, with the run down as well, both together. The heavy weather on the coast prevented it from getting out. As soon as the weather eases off the water begins to fall.
 907. How long did that water run up the Broadwater? Until the flood rose to about 2 feet of its height, which was 8 feet 6 inches. It was not very high tide, but it was high water.
 908. Did it remain at that stage? It rose at the rate of about 1 inch to the hour in the first instance.
 909. How long did it stop at the 6 feet 6 inch level? It did not stop at all; it was continually rising.
 910. Until it got to the 8 feet 6 inch? It might ease off a little according to the tide. If the tide were running out it might ease off, and then it would rise again.
 911. And still go on running up the Broadwater? No, I do not think so.
 912. When it got to the 6 foot 6 inch level, then, instead of continuing to flow up the Broadwater it began gradually to run outwards? Yes.
 913. And then it continued to keep on running out? Yes.
 914. So that it is only at the early stages of the flood that you have noticed the flood water running up Broadwater? Yes.
 915. When you get to the junction of the Broadwater and the river, is there any confusion of water there—any eddies? Not at the junction. There is an eddy lower down at a hill opposite my place, but not opposite the Broadwater.
 916. Does that eddy lower down help to block the free egress of the water? The eddy does not. There is a hill there, and there is no get-out for the water which at flood-time is confined between the two hills—my quarry and the hill on the other side. I suppose the distance between the two hills is about 40 chains.
 917. At the early stages of the flood is your land submerged? When the flood rises about 2 feet there is water on part of my land.
 918. Do you think that instead of the water brought down by the proposed flood-relief channel getting rapidly away, it will accumulate at the junction and have the effect of flooding the land opposite? Yes; I am quite satisfied it will.
 919. You told us what would happen to your property as a resident on this part of the river; do you think the same would happen to the properties of other people in the locality? Yes; to all the properties on the lower river from here down.
 920. Would the place where we are now be flooded? No; this place would not be flooded at the height of the flood, though it was flooded in the 1870 flood and the 1893 flood; the ground was covered.
 921. But it would not take place in an ordinary flood, and with this drain? Not in a slight flood; but in 1870 it flooded, and in 1893 I had the flood over the top of my fences.
 922. *Mr. Watson.*] Then you have a lot of swampy land? It is good cultivation land; it is all cane land.
 923. Is it not indicated as a swamp on the map—low-lying land? It may be so indicated on the map. There is not one bit of that ground, that is put down as swampy, but what is good cane land.
 924. It is good land when the water is off it? It is land that will stand as much water as the land where we are now, unless it comes to a flood.
 925. *Chairman.*] Is there much land near you or below you that would be affected in the same way as that described by you? All the land from my place down to Ballina is nearly about the same. Mine is higher than some of the other land. After you pass Wardell it is nearly all low land; a foot over high tide will go on some of the land.
 926. You hardly contend that when the river widens out, as it does when you get below the Broadwater, the effect of the proposed scheme would be to flood the properties right down to Ballina? Yes, I do, because the bar is not nearly so wide now as it was at one time. 927.

927. I believe you have a record of the floods? Yes. In 1870 the height of the flood was 8 feet 6 inches; on July 21st, 1889, the full height of the flood was 7 feet 8 inches; on August 8th, of the same year, it was 6 feet 10 inches; on March 13th, 1890, it was 9 feet 6 inches; on February 15th, 1892, it was 6 feet; and in 1893 it was 9 feet 10 inches. I am giving the height of the flood at Broadwater. Since 1893 we had a rise of 2 feet, and we had a fresh in October last, which was only 1 foot 6 inches at the very outside.

J. Byrne.
12 Mar., 1900.

928. Was your property flooded during all these floods? Yes, to a certain extent. In the 1892 flood I lost £500 worth of cane—25 acres of as good sugar-cane as was grown along the river.

929. It does not seem to matter much whether you get any more water or not, you are always flooded? I am not done yet; I can grow sugar-cane yet.

930. You seem to have chosen rather a damp spot? I do not see how I can better myself, or how I can keep the floods away. If the water from the drain were to come down I would suffer a great deal more.

931. Do you know Goat Island, at Boundary Creek? Yes.

932. In the 1870 flood did the water break over that island? I could not say. It was all a bush then but it must have been on part of it.

933. I do not mean on to the island but into the sea? No; it did not break into the sea.

934. Do you know at what height the flood was running when it broke through in 1890? I think it was at its top level. I do not suppose it rose more than 6 inches after they cut the channel in 1893. In 1893 when the flood had risen from about 9 feet above high-water some local residents went with shovels to assist the channel by cutting a track in the sand to let the water run through.

935. *Chairman.*] Are there any other residents in the locality who take the same view as yourself with regard to the proposed scheme? I think they are all about of the same opinion judging from that meeting which we had down the river, and which was unanimous.

936. Where was that meeting? At Wardell. There are four others waiting to give evidence. I should like to say that the best cane is grown on this lower land, and consequently it is of greater value.

937. *Mr. Watson.*] The contention of the people who are in favour of the proposed channel, is that under present conditions the water comes down the river from the North Arm, the South Arm, and Bungawalbyn Creek in one mass, and as much of it as can do so gets through the gorge below Dungarubba Creek, and the balance, when it gets above a certain height, falls towards Tuckian and down through the Broadwater—do you think that is so? No. The water from the two arms has no more effect down here than the water from only one arm would have. We shall get all the water from the canal, which will come down suddenly.

938. It is further contended that the water from the North Arm, which the proposed relief channel would convey to the Broadwater would get away towards the sea at least a day earlier than the water by the South Arm and Bungawalbyn Creek? I cannot see that, because the river will be rising with the tide and the water will not be able to get out.

939. How far would the water coming by the proposed channel have to travel as compared with the water coming round by the main river? About a third of the distance.

940. And the presumption is that it would travel very much quicker? Yes.

941. If it came quicker would it not be possible that in a small flood all the water would have got away to sea before it would otherwise have arrived at Broadwater? No. If that canal had been made when we had the last rain in the summer there would have been a flood all over my place. The water would come down so quickly. It only takes five hours to get to the canal from Lismore.

942. I understand that you would only get a small proportion of that water—that is, all of it that was at Coraki, or just above Coraki, above the 12-foot level—and of course the bottom part; that is, the deep body of the river up to 12 feet, you would get later than you would get that which was above the 12-foot level? But the water above the level of the proposed weir would be travelling at a faster rate. When once the river got above that level it would travel at a faster rate, and consequently be liable to flood down there.

943. *Chairman.* Suppose the weir were cut down to 8 feet about low-water mark, that would make things worse for you? Yes.

Thomas McFadden, hotelkeeper, Coraki, sworn, and examined:—

944. *Mr. Watson.*] I believe that until recently you were a resident of the Broadwater district? Yes; from 1883 to 1898.

T.
McFadden.
12 Mar., 1900.

945. And owned some land here? My wife owns a large farm on a point between the Broadwater and the main river, southerly. It is the point between the left-hand bank of the river and the right-hand bank of the Broadwater.

946. And touching both frontages? No; it is within about 7 chains of the frontage to the Broadwater. There is one farm about 7 or 8 chains between me and the bank of the Broadwater.

947. Is that high land? No; it is all inundated except about 1½ acres.

948. And has been flooded in high floods? Yes; in high floods, and partly in low floods.

949. You know the proposed scheme to take a channel into the Tuckian Swamp from the North Arm? Yes.

950. How do you regard that? I regard it favourably, because I claim to be one of the first originators of the scheme. It was partly through my instrumentality that it was laid before the Department some years ago.

951. What do you think of the effect of it? I think it will give us the relief we want. It will minimise the floods to a certain extent.

952. When you say that, do you speak as one owning land near the Broadwater, or above? Both above and below. I believe it would minimise the floods. If I did not think so I would not be in favour of it. This farm at Broadwater is one of the most valuable farms on the river.

953. Taking it for granted for the moment that it would relieve the people above Dungarubba Creek, how would it relieve the people down at the Broadwater? The North Arm is the first arm that is flooded, because we generally get our rains with north-east and north winds; therefore, as the North Arm lies nearest to the wind point, we generally get the North Arm water down first. In one flood that I remember the Casino Arm rose to a greater height, but that was only on one occasion, and on that occasion it was a north-west wind. Strange to say, the only floods we ever had of any consequence from the Casino Arm

came

T.
McFadden.
12 Mar., 1900.

came with a north-west wind, which naturally caused a heavy fall of rain on that arm. My opinion is that if this drain were constructed, the North Arm being always the first to rise, we would get the water much sooner to Broadwater, where there would be a straight line to the sea, and the water would be running out at least two days before it would come down in the ordinary way. Another great factor in the matter is the Bungawalbyn Creek. The North Arm water coming down forces itself up Bungawalbyn Creek for some considerable time—two or three days. The Bungawalbyn country includes a very large area of watershed, and is of a low-lying description, so that the water does not come down so quickly from the Bungawalbyn side as it does from the North Arm side and the South Arm side. The water coming down both the North and South arms runs up Bungawalbyn until the water from the watershed of Bungawalbyn meets it, and it is then forced across to the south side of Swan Bay into the head of Tuckombil Creek.

954. So that your contention is that at present there is a massing of the water? Yes. My contention is that if the proposed drain were cut it would relieve the North Arm to a very considerable extent, and would also relieve the Bungawalbyn water, and so on right down the river.

955. You heard the evidence of Mr. Byrne? Yes.

956. He stated that in the early period of the flood he had noticed the water running up the Broadwater—that is, the back-water from the flood—towards the Tuckian Swamp? Certainly. It runs up all those creeks when the river commences to rise—the Dungarubba Creek, the South Creek, and the other creeks.

957. Every creek right up the river, including Bungawalbyn? Yes.

958. How long does that continue, say in the Broadwater? It continues in the Broadwater until the water rises from 3 to 4 feet.

959. If that takes place in the early part of a flood, would not that water meet the water coming down the proposed channel, and block it from getting to the sea? A good deal of the water coming through the channel would come down before the river rose. That is my contention: that the water from the proposed canal would come down before the river here had started to rise, and would be out to sea before we would otherwise get the water in its usual course.

960. So that your contention is that though the back flood-water goes up the Broadwater at the present time before the local swamp-water comes down from Tuckian to meet it, if the proposed channel were made the water from the North Arm would be running down for some considerable time before the Broadwater started to back up? Before the river would rise here sufficiently to back up. That is, provided the weir was at a sufficient height. I do not say it would at the proposed height, but if the weir were lowered it would.

961. What do you consider would be a proper height? About 6 or 7 feet. It takes that rise in the North Arm before the water backs up these watercourses and creeks.

962. That is, the bulk of the creeks and watercourses which it would back into from below the proposed weir at the take-off? Yes. That would cause all the low-lying lands at the back of those watercourses and creeks to be flooded. My opinion is that the weir should be lowered to about 6 or 7 feet. That is about the level to which the water would rise before the low back lands would be inundated from the creeks and watercourses.

963. Assuming that you had a high tide down below the Broadwater, with an easterly gale forcing the sea-water in, and supposing this water coming up the Broadwater met the water from the proposed channel, would that have the effect of backing it up to any material extent? Yes, to some extent; but before venturing an opinion, I should like to know the fall from the take-off at 6 feet to ordinary tide-level. I am certain that high tide would not have a very material effect in stopping the water from coming down with that flow.

964. I understand that though you have lived at Broadwater for thirteen years you have been in the district much longer? I have been in the district since 1863, and I have permanently lived here since 1868. But I have been living right round the district for different periods, and I am thoroughly acquainted with every creek that flows into the river, and all the arms, right up to the source.

965. We have been informed that the flood-water from the river, after it reaches a certain height, breaks over at O'Connor's, near Swan Bay, and also near the proposed weir, and again at Dungarubba Creek, and that a certain amount of that water between the proposed weir and Dungarubba Creek flows in high-flood towards Tuckian, and thence to the Broadwater? That is correct. I have seen cedar logs floating from Swan Bay right in towards the Tuckian Swamp and to the head of the Broadwater.

966. If the proposed channel were to end where it reached the swamp, would the water from the channel be likely to flow back towards Swan Bay? No. There would be too much of a flow from Swan Bay and too much of a flow from the proposed off-take. It would never come back towards Swan Bay; it would be more inclined to come into the Tuckian Swamp near the drains—north-east towards the lower end of Henderson's drains.

967. You think there would be no probability of its flowing back, for instance, towards the land of Mr. McLean? No.

968. Taking a line from the proposed weir to Dungarubba Creek is there a watershed running along there? Yes.

969. A slight watershed? Yes; and inclining all into the Broadwater.

970. Could you indicate to the Committee the rising land which forms a divide between the Tuckian Swamp and the main river—that big bend of the river running from Coraki to Dungarubba? It runs roughly speaking, about 2 miles south of the proposed channel.

971. I understood you to say that although the water in a high flood flows from that rise towards Tuckian, when the water began to recede on the northern part of the line indicated the water would continue to fall towards Tuckian, while on the south of it the water would go back into the main river and come down the main channel? That is correct.

972. Have you any idea how high that rise would be above the rest of the flood—say above the swamp where the proposed channel enters it? I should not think it would be more than 3 or 4 feet.

973. Do you think that would be sufficient to prevent the waters from the proposed channel running back towards the elbow or Swan Bay, if they were once taken into the swamp? Yes.

974. Do you know the drains constructed by Mr. Henderson in Tuckian? Yes. The first time I saw the Tuckian Swamp was in 1869, and I had a good idea of it, because I was cutting timber all round that edge of it, and used often to go down to it. I think from 1869 to about 1886 it had never been fired.

was

was one mass of weeds and rotten vegetation. About 1886 it was fired and burnt completely off. That was before the drains were constructed.

975. When were the drains constructed? I think about ten or eleven years ago.

976. What was the condition of the swamp, prior to the drains being constructed? It was perfectly useless. In fact I went one day to try to get a drink of water—that would be in about 1872—and there was a long piece of timber, about 8 or 9 feet long, something like a fishing-rod, and I stuck it into the swamp, and I could just put it right down to the bottom. Since the drains were constructed, I have been on exactly the same spot, and you could take a horse dry over it.

977. Therefore the drains have effected a considerable improvement? Certainly.

978. Have you noticed them frequently since they have been made? Yes; I have been there several times at different periods. I have not been there for two years, but up to two years ago I was there frequently.

979. Did you ever notice the drains at high-tide? Yes; I have been up the drains with a boat at high-tide.

980. The tide runs up the drains for some distance? Yes; for about a mile and a quarter in some cases.

981. Did you ever see the tide get over the adjoining land from the drains? No; the tide never gets over through the drains.

982. It will go through them, but not on to the land? No.

983. Do you know whether the tide runs into any part of the swamp outside of the creek? I never saw it, and I never heard of it—not since the drains have been constructed.

984. Do you know what the drains cost? Mr. Henderson came down and asked me to get him the men to construct those drains. The contract for the first mile was let at 11d. per cubic yard. After that he found out that the men had earned so much money that he reduced the price to 7d., and gave them another mile, and after that the same men did the rest of the work for 4d.

985. How many miles of those drains would there be? I could not say.

986. A good number? Yes; I should think, from guesswork, about 9 or 10 miles.

987. And we are told that they varied from 18 feet to 6 feet? I am only acquainted with the large drains.

988. Could you form any idea roughly, or have you been informed, as to what was the total amount spent on it? No.

989. We were told it was something like £8,000? I am certain they did not cost that much.

990. Were there any other forms of expenditure that Mr. Henderson was going in for that might account for a large sum? He went in for a lot of experiments in fruit-trees and grape-growing, and I can believe that he spent £8,000; but not on drains. From the way he lived, with no income from the land, and considering the amount of money he expended on the drains, I would not be a bit surprised to learn that he got through £8,000 while he was there.

991. How long was he there? Six or seven years, or perhaps a little more.

992. Then he leased the land? Yes.

993. Did the improvement in the condition of the land around the drains to which you refer extend for the whole distance between them, or only for a short distance? Between them, and outside of them as well.

994. How far would it extend outside of them? Walking along the drains for some distance, it would appear to extend a mile or a mile and a half in some places.

995. Could you say whether the surface of the land between the drains sank any considerable distance after the drainage? It might appear so; but to my mind it was not the case. When the dry reeds and other growth were burnt off there was left a kind of stubble—a peaty rise. When the cattle had been on it for some time they trampled this down, and made it firmer, so that the ground had the appearance of being lower; but I do not think the actual surface was made any lower.

996. At any rate, it is still above the influence of the tide? Yes.

997. As to the channel itself, do you think it would be necessary, with your knowledge of the swamp, to cut a channel through to make some provision for the water? Yes; it would be necessary to make provision.

998. Through the swamp? Yes, right through.

999. We have been informed that when you get to Boadwater Creek, where the channel junctions, there is a bank a little higher than the rest of the swamp? Yes.

1000. Do you think that would require to be cut through? Yes; everything should be made clear right through to give the water a proper get-away.

1001. What depth do you think it would be necessary to take it in the swamp itself? I do not think it would be necessary to go very deep. I do not think it would be advisable to go lower than the top of high tide. If the small bunches of grass and similar vegetation were left, the water would have to filter through; but if the channel were clean like a roadway, the water would run straight through, and get into the Broadwater much quicker.

1002. And still require a cutting through the bank on the immediate edge of the Broadwater? Yes; I have never been at the exact place where it strikes the Broadwater; but I know that about there there is a low bank. Further up the Broadwater Creek there is a bank, and I think it will be the same a little below.

1003. Then your clear opinion is, taking the scheme as a whole, that, instead of having any prejudicial effect on the people about the junction of the Broadwater and below towards Ballina, it would rather improve their prospects in times of flood? Yes, that is my opinion.

1004. Speaking as the landholder in both places? Yes.

1005. I understand that at one time you lived opposite Goat Island, where the breakaway took place in 1890, towards the sea? Yes, I lived there for four years when I first came to the river. That was in 1870, at the time of the flood.

1006. Did it break over in 1870? No.

1007. When was the first occasion? In 1890.

1008. Did you observe it in 1890? Yes; there was not much of a breakover in 1890. In 1893 it broke considerably more than it did in 1890.

1009. Were you on the spot when it broke over, or did you go there after it had broken over? I went immediately

- T. McFadden.
12 Mar., 1900.
- immediately after to see the result. I asked two or three of the residents to go out with some shovels, and cut some of the sand away, and next morning I went out to see the result.
1010. What was the result? It was running about 3 or 3½ chains wide. I could not say how deep. I got one of the best divers we had to swim out into the centre with a long-handled shovel and dive down, but he could not touch the bottom. I reckon it must have been from 16 feet to 20 feet. The man swam out with the shovel and put it down in front of him, and dived down, and he could not touch the bottom with the shovel.
1011. You say that in 1893, when the people gave it a start, there was a considerable body of water going through? Yes.
1012. Has the channel since silted up? Yes, it silted up a few weeks afterwards.
1013. So that it is not likely that any breakover would occur there now until the flood got to a good height? To about the same height as it did before, unless it was assisted.
1014. It would not have any effect in relieving the people from a low flood? At present, no.
1015. What did you make the height of the water at Coraki above low-water to the top of the piles at the wharf? 14 feet 6 inches.

Edwin Collard, grazier, Dungarubba, sworn, and examined:—

- E. Collard.
12 Mar., 1900.
1016. *Chairman.*] Where do you reside? At Dungarubba, about 1 mile south of the middle of the proposed Tuckian channel.
1017. You understand the proposed scheme? Yes.
1018. Do you approve of it or not? I do not. I believe if the proposed scheme is carried out it will flood me and a great many others in less than half the time we are flooded now.
1019. Would you explain how that would happen? The water would be brought in so much sooner. At present we get no flood there until the river breaks over the banks. If the river is brought in 10 or 12 feet sooner it stands to reason we will be flooded so much earlier.
1020. Would that take place even if the proposed channel were dug from end to end? Yes; it would cause the water, where I live, to rise a great deal higher. It would meet the heavy sea and it would flow over the river.
1021. It is proposed by the Department to take the channel only to the edge of the swamp; the weight of evidence is that it would be necessary to have the channel dug right through, from the weir to the Broadwater, making the southern side of the channel a considerable height;—do you not think that the water would get rapidly through that channel and into the Broadwater and away without either overflowing on the south side of the channel or backing round on to your property? No; there is absolutely no fall. I have seen a number of floods there, and have had considerable losses from them; but even in the last flood, in July, there was not any perceptible current.
1022. Which way does the flood approach your property? At the present time it comes from Swan Bay; that is the first flood I get.
1023. If it comes from Swan Bay, the idea is that this channel will prevent a great body of water coming down in the direction of Swan Bay and coming up towards you;—it will take it quickly over to the Broadwater and shoot it into the main river, and get rid of it, and so avert the very flood which now affects you—what do you think of that? I think it will bring it about two days sooner.
1024. Why do you think so, if, instead of letting it come round the river and come up that way, it is taken right away to the Broadwater? If it could be got away from the Broadwater I should be satisfied, but it would not get away from the Broadwater.
1025. In time of flood what is the working of the water at Broadwater? For several days the water backs up at Broadwater until it meets a heavier body of water at the other end, and then, of course, it runs back.
1026. Did you hear Mr. Byrne give his evidence? Yes.
1027. Do you agree with him as to the working of the water at the Broadwater? Yes.
1028. Do you know that slight ridge of 3 or 4 feet that Mr. McFadden spoke of a little while ago, about 2 miles south of the proposed channel? Yes; it is almost imperceptible.
1029. Your place is between that and the proposed drain? Yes.
1030. And you are afraid that the water will run along the channel, get into the Broadwater, and then back up again in between that ridge and the drain? Yes.
1031. Do you know the difference of level between the Tuckian in its normal state and when the flood-water goes on to it? It varies in depth. I have seen at places 9 feet of water. I suppose there would be an average of from 9 to 10 feet in flood time.
1032. That would be a local flood? No, a big flood.
1033. I mean the beginning of the flood? It would be from 5 to 6 feet then, before the flood waters got into it. I mean the flood-waters from the river. The local water would come from the creeks and the rain.
1034. It is proposed by the Department to make the weir 12 feet above low-water level; the residents say it should be only 8 feet; the flood-water cannot get in there until it comes up to 8 feet or 12 feet level;—how would that affect you? The lower the weir the sooner I should be flooded. I think it takes a rise of about 15 feet now to get over the bank.
1035. The top of the weir would be 7 feet above the bottom of the Tuckian Swamp;—do you think a sufficient body of water would go through there to fill up the whole of the swamp to a sufficient extent? Yes, with the other creeks that run in as well. We have not only the river to contend with, but the creeks as well. They fill the swamp before the flood comes, and if the river is added to that it will make it a serious matter.
1036. Do you think, then, from your observation of the Broadwater that, instead of the channel offering a speedy exit for the water at the commencement of the flood, it will have just the contrary effect? Yes, that is my opinion, because the water backs up. The country is very level; there is absolutely no fall.
1037. What height has the water to rise in the Tuckian Swamp before it affects your property? I suppose it would be 6 feet high before it came on to my ground, but I cannot say exactly.
1038. Do you get flooded by local water before the water from the river comes over towards you? No; I am never flooded until the river comes. At about 8 feet the swamp would flood me.

1039. Are there any other people besides yourself who would be affected? Yes, a great number of people.
1040. Are they of the same opinion as yourself? I think a great many of them are.
1041. Do they object? I think they are against it.
1042. You think this would do you damage, and I suppose if it did you would want compensation? It would do me damage by bringing the flood on quicker. It might take it away quickly; but at the same time the damage is done, and many a flood would reach me then that would not reach me now. Small floods do not reach there.

E. Collard.
12 Mar., 1900.

MONDAY, 12 MARCH, 1900.

[The Sectional Committee met at the Commercial Hotel, Wardell, at 3 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing works in connection with the Tuckian Flood Escape Scheme.

William Anderson, farmer, near Wardell, sworn, and examined:—

1043. *Chairman.*] Where do you reside? Between Broadwater and Wardell, on the right bank of the river. W. Anderson.
12 Mar., 1900.

1044. How long have you been in the neighbourhood? Over twenty years, farming all the time.

1045. I believe you desire to make a statement? Yes; I have been a resident of the Lower Richmond for over twenty years, and have seen a good many floods, and the damage done by them. I will give the heights of floods at my place since 1859. In that year there were two floods; the first was on the 31st February, and rose to a height of 7 feet 8 inches, and the second was on the 8th August, and rose to a height of 6 feet 10 inches. On 13th March, 1890, there was a flood with a rise of 9 feet 6 inches, on the 6th April, 1892, there was a flood with a rise of 7 feet 6 inches, and on the 15th February, 1893, there was another with a rise of 6 feet. On the 20th of the same month the highest flood of all occurred; it rose at Lismore 34 feet, and at my place 9 feet 10 inches. It took five days to rise, and it broke out to sea behind my place. In the flood of January, 1894, the rise at Lismore was 23 feet 6 inches, and down here 2 feet. In January, 1895, there was a rise of 27 feet at Lismore, and no rise down here, but only a fresh in the river. On 4th February of the same year there was a rise at Lismore of 29 feet; there was little or no rise down here, on account of there being a calm sea, which allowed the flood-waters to get out freely. In regard to the proposed Tuckian escape canal, I am under the impression that if carried out it will do us farmers down here an injury. My reason for thinking so is that it will bring the Lismore rise in flood-time too close to us. It is like bringing the hills closer to us. Where the rush of water came from in the last two floods shows very plainly that we escape some of the Lismore floods by allowing the water to take its natural course. It is a noteworthy fact that all the floods on the lower end of the river have been caused by stormy weather from the east and north-east. These storms cause rough seas outside, backing up the water in the river. I am not in favour of the Tuckian canal scheme.

1046. By that you mean that the floods down at this end of the river are caused by the sea action referred to? Yes.

1047. Has your observation been that the water backs up the Broadwater? Yes.

1048. At what stage of the flood do you notice that? At an early stage. I have had a terribly heavy pull to the Broadwater, and when once I have got into the Broadwater the current has taken me up the Broadwater.

1049. How long would that inflow go on? I was never up at the top of high flood; but I have had occasion to go up there about middle flood. When it was flowing in at the top of the flood I could not say when it would stop.

1050. The idea of the proposed canal is, as you rightly suppose, to cut off the water just above Coraki, and shoot it quickly over into the Broadwater. The contention of those who are supporting the scheme being that by arriving quickly at the Broadwater the water would come down there before the Broadwater, and that portion of the river at its junction and below it would be in a state of flood, and that it would get out to sea quickly;—what do you think of that? My experience in the lower end of the river is that when a flood comes on it generally starts raining and blowing, and there is a storm along the coast for about three days before it subsides. If the water from the channel were to come down quickly upon us while the storm was raging we would be flooded. By the time the storm is subsiding the Lismore waters begin to come down upon us to get out to sea; but if they were coming down when the storm was raging they could not get out at all. That is my experience on the lower Richmond.

1051. In the earlier part of your statement you said that with regard to the highest flood in 1893, it took five days before it began to rise down at Broadwater? Yes.

1052. Do you argue from that that is a kind of safeguard for you down here preventing it from coming upon you too suddenly? It comes gradually. I look upon it in this light. Up the river I have been told that sometimes the river rises at the rate of 3 feet an hour. At my place I have never known it to rise more than 2 inches an hour, or an inch, or inch and a half an hour.

1053. Can you describe to us what was the state of affairs in high flood in 1893 with regard to the surrounding land here;—was it all submerged? It was all covered except just at a place where my house is.

1054. Do you remember at what stage of the flood the water first began to affect you most? When it rose about 6 feet.

1055. How long was that after the flood started up at Lismore;—five days? About five days.

1056. What is the height of the banks here above high-water? I could not tell you. In places up my way the salt-water gets over the road. The very high spring tides come over the metalling, especially on the lower part of John Byrne's property.

1057. *Mr. Watson.*] It would not be to any depth? No, not to any depth; but it comes over the metal in places, and, of course, the bank rises and falls as it comes along.

1058.

- W. Anderson. 1058. *Chairman.*] When this part of the country gets flooded, does the flood water remain on the land long, or does it drain off quickly? It drains off very fairly after the flood subsides; most of it goes down with the flood.
- 12 Mar., 1900.
1059. Still it does injury to your land? It does great injury.
1060. What are the chief crops about here? Sugar-cane.
1061. No other crops do so well as sugar-cane? I have had twenty years on the Richmond, and I have never got a crop of maize. Of potatoes I never get what you might call a crop. I get a crop of sugar-cane, but no other crop.
1062. Do you know the Broadwater well up to its junction with the Tuckian Swamp? Yes; I have been all through it. I know all about the drains through the Tuckian Swamp. I have pulled through them.
1063. How is it that portion of the swamp that is drained by Henderson's drains affected each tide;—does the tide-water flow up there? The tide-water flows up to the foot of the hill. I have pulled right up to the top of one of Henderson's drains. That is about two years ago.
1064. Are the drains about the same now as they were then? They were getting filled in when I was there with weeds and rubbish. When Mr. Henderson was there he kept them very clear, and there was no trouble to get up.
1065. Could you tell us whether the salt water overflows the banks of the drains and gets on to the swamp itself? I never saw that; and I went up there with very high tides.
1066. Did you know that portion of the swamp before Mr. Henderson's drains were made? No.
1067. Would you be able to form an opinion, from your knowledge of the locality generally, whether the drains were of advantage in draining the swamp? Undoubtedly they were; because Mr. Henderson told me himself that before he reclaimed it by the drains not a beast could go on it in that part, and after it was drained it got firmer and the cattle could go on it and graze over it.
1068. When you were up there about two years ago, could a person ride or walk about over the land between the drains? Yes.
1069. That was the result of the drains? Yes.
1070. It has been said that the cutting of those drains was the means of letting the salt water right on to the land—that is not your experience? No. I have been on those drains at high tide and middling tide, and I never saw the salt water get out of the drains.
1071. How deep were the drains when you saw them? About 5 feet in places.
1072. Why did Mr. Henderson give up the place himself, do you know? That I could not tell you.
1073. It seems strange that if the place were improved by these drains, and he having expended such a large sum of money, that he should let the place now for a nominal rent and clear out? He is a man of independent means, and I think he got tired of living there.
1074. With regard to the flood-relief channel, if instead of bringing the water with a rush on to you at the head of the Broadwater, the drain were made to the edge of the swamp, and the water allowed to be distributed gradually over the swamp area do you think that would injure you? It would not injure us to such an extent if the water were allowed to come broadcast; but I should think it would injure the residents around there, because I should think they would then often get a flood when otherwise they would not.
1075. It would injure the swamp and the land near it by bringing water upon it which it would not otherwise get; but it would not bring the water with such a rush upon the people down here? No; I do not think it would.
1076. Is the swamp of much value for grazing purposes? I believe it would be the best in the Colony if you could keep the water out.
1077. Then, instead of putting more water on to it, your idea is that it should be relieved of it? Yes.
1078. *Mr. Watson.*] Probably if it were not flooded once in a while, it would not be so good for grazing? I think it would. It contains a great deal of decomposed matter, and it is grand grazing country when you get the water off. It would carry an enormous number of cattle.
1079. *Chairman.*] You are a very old resident of the river and I suppose you recognise like most people that these floods are a danger to the whole country and an injury to the farmers;—have you ever thought out any other means, yourself, of relieving the overflow of the river to the extent that takes place in flood-time? The only means I have ever thought of as likely to relieve us at the lower end is to continue the Tuckombil escape up as far as Bungawalbyn, and take the Bungawalbyn water into Evans' River. But I cannot see the force of letting the water out at Coraki and putting it into the river here. If you could let it out up there, and put it into the sea somewhere else, it might be a relief to us.
1080. From the Broadwater down to Ballina does the river overflow its banks generally in flood-time? In anything like a rise, with a rough sea outside, it does.
1081. Have you seen the Tuckombil weir? Yes.
1082. Did you see it the time it was working? No, I was not up there, and the sills have been removed since I was up last.
1083. Have you formed any opinion as to whether, if the proposed Tuckian channel were constructed, it would affect the scour of the river between the site of the weir and, say, the junction of the Broadwater? I reckon that the scour leaving that part of the river it must shallow.
1084. The withdrawal of the flood waters would lead to a shallowing? Yes. I am under the impression that if the water were let through by the proposed canal, it would cut another canal out behind me, where it broke out before, at Boundary Creek. Where it broke out before there had been a watercourse in olden times, because when they scoured the sand out there were clay banks on each side.
1085. *Mr. Watson.*] How do you reckon the relief channel would have any effect on that? It would shoot the water out to Broadwater, straight across the lower end of John Byrne's farm, leading to the old outlet to the sea behind us, and take a weak spot there.
1086. Is it not a fact that at very high flood a large quantity of water from Dungarubba Creek, right away to Coraki, goes across country into the Tuckian? Yes.
1087. And then drains out through the Broadwater? Yes.
1088. When that is the case, and the water is so high in Tuckian, why does it not cut open Boundary Creek? The only time that it did cut it open was in 1893.
1089. *Chairman.*] But that water, you say, would have a gradual outlet and not a rush, such as would be caused by the channel? Yes.
1090. Yours is cane land? Yes.

W.
Anderson.
12 Mar., 1900.

1091. What is the extent of your cultivated land? About 103 acres of cane-land.
1092. If a flood came on that land to such an extent as to injure your crops, what would be the extent of the damage—how much per cent.? I could not tell you, but I reckon it would be my living anyway.
1093. How long would the injury last? It would affect the entire crop if the water got over it.
1094. How long would it be before you could expect to get another crop of the same value? The second year; because all the floods occur in the winter time, and the cane would not grow again by cutting down.
1095. In which of the floods of which you have given us the various heights did you lose your cane altogether? I never lost it all; there was some high ground. But in every flood I lose a little.
1096. I understand you to say it would spoil your crop altogether? Unless on the very high ground.
1097. Of the 103 acres how much is on land where the crop would be absolutely lost? I do not suppose there would be over 50 acres.
1098. *Mr. McFarlane.*] Do you know the country through which the proposed channel is to be cut? No, I do not know that part of it.
1099. Do you know the effect that floods have on it? No; I know it covers the Tuckian Swamp.
1100. A number of witnesses have suggested that the height of the weir should be reduced some 5 or 6 feet;—what effect do you think that would have? I think it would bring a great deal more water down upon us.
1101. Would that cause a higher flood in the Tuckian Swamp than if the height of the weir were left at 12 feet? I do not know. The Tuckian Swamp before the flood comes is generally full.
1102. What fills it? The rain off the hills; there are several creeks leading into it.
1103. The local rainfall fills the Tuckian Swamp before the flood comes? Yes.
1104. In the event of its being full by local rain, would the overflow of the river in time of flood increase that? I should think it would.
1105. To what extent? I could not tell you; it would spread more.
1106. To what depth would the flood raise the swamp over and above the point to which you say the swamp would be filled by the local rainfall? At the time I was there when the local rainfall overflowed the swamp there was about 4 feet of water on it where cattle were grazing the day before. I never saw a flood on it; that was the local rain.
1107. In the event of that channel being cut, what difference would it make in this respect: At the present time if a freshet came down—what we would call a half flood—which would not overflow the banks, would that water get into the Tuckian Swamp? I do not see how it could, unless round through the Broadwater.
1108. But would the rain-water that caused this half flood fill the Tuckian Swamp? Yes.
1109. So it would not make any difference? No.
1110. It would not make any difference whether this channel were opened or not, even in the case of a half flood, seeing that the Tuckian Swamp would be already filled;—is that so? Yes.
1111. Have you observed whether in flood-time the flood-waters back up the Broadwater—that is, the water running up the Broadwater? I went with the flood-water up the Broadwater.
1112. Where does it go? It spreads over the Tuckian.
1113. You told us that the local rainfall fills the Tuckian? So it does, but I never saw it in a flood. When a flood is coming it might not be full.
1114. You have seen the water back up the Broadwater? Yes.
1115. Then it is your opinion that the water goes into the Tuckian Swamp? It must go in somewhere there at the head of the Broadwater.
1116. Would that be the actual flood-water coming down the river, or would it be the tide caused by the rough weather outside? It is the flood rising. Of course the tide works up too. The tide works up the Broadwater when there is no flood at all; it goes right up the Broadwater, and right up through those drains.
1117. You said in your evidence that the cutting of the proposed channel would have the effect of causing additional flood-water at Broadwater, and I understand below Broadwater? That is my opinion.
1118. Have you noticed how long it takes a flood to come from Lismore to the mouth of the Broadwater? In my experience it takes forty odd hours.
1119. What is your reason for thinking that the water going through the channel would cause additional flooding below Broadwater? Because it would come on us so much quicker by coming through the proposed channel, and it would perhaps meet a rough sea, because it is generally blowing and raining from the east, with a sea outside at flood-time. By letting a rush of water down upon us when a storm is on here the effect must be that the water cannot possibly get out: it must cause a bigger rise here.
1120. It has been stated in evidence that the water coming through this proposed cutting would pass through the Broadwater, and be out at sea before the flood-water could come round in the usual course of the river;—is that your opinion? No.
1121. Your opinion is that the meeting of the two waters—that coming by the main river and that coming by the escape channel—would cause an additional rise? That is my opinion.
1122. Have the floods been destructive below Broadwater? I can speak for myself; I have lost a good bit by them.
1123. Is the land generally low and subject to floods? Where there is good cane land, from which in good seasons we could get a good crop, the floods have destroyed the cane.
1124. An additional rise in the river would naturally cause greater destruction? Yes.
1125. In the event of the proposed scheme being carried out, I believe it is proposed that the residents should contribute their share according to the benefit derived;—would you be willing to contribute in that way? I would not.
1126. You say it would cause additional flooding on the land below Broadwater;—in the event of damage being done, I suppose you would put in a claim for compensation? Yes; and a good big one, too.
1127. Summing up the matter, you believe it would be a mistake to carry out the proposed flood-relief channel? I am not in favour of it all.
1128. For the reason that it would cause additional flooding in the lower river? Yes.
1129. You would not be a contributor to it if carried out? Not unless I was forced to.
1130. And if you suffered damage you would put in a claim for compensation? Yes.
1131. *Mr. Watson.*] From what you say it would seem that your contention is that anything which allows the water to come down quicker, so that it would meet the rough water which usually accompanies these floods, would be a detriment to you? Yes.

- W. Anderson. 1132. Then any widening or deepening of the river above you would be a detriment too from that point of view? I do not know that it would be much of a detriment.
- 12 Mar., 1900. 1133. It seems now, from what the other witnesses have said, that there is a big block of flood-waters just below the mouth of Dungarubba Creek, at a gorge between Riley's Hill and Alley's Hill; if that gorge were widened and deepened it would shoot the water down faster? It would.
1134. It would be a good thing for the people up above? Yes.
1135. And how would it affect you? We would get a little more of it.
1136. Is there any point below you think that should be touched first with a view to letting the water out? The channel below wants deepening—the mud banks removed—I mean a little above Pimlico.
1137. But any widening or deepening of the river up above at the contracted point would be detrimental to you? I should think we would get more water, but not so much as by the Tuckian Swamp.
1138. You think you would get more injury from the proposed channel bringing the water down the Broadwater than you would by the removal of portion of the obstruction at the gorge below Dungarubba Creek? I do.
1139. *Chairman.*] Are there others in the locality who share your opinion in objecting to this scheme? I believe so. I was appointed by a public meeting, held at Wardell, to give evidence against the proposed scheme. On the eastern side of the river, between Wardell and Broadwater, there is a considerable amount of low-lying land which is occasionally flooded by water coming in from the ocean, and that occurs at the same time as the heavy floods, when easterly winds are prevalent. When I first came to the district, this land was well protected from the inroads of the sea by a high sand ridge; but, subsequently, gold-digging along the coast took place and that caused breakages in the sand ridges, thereby letting in the sea. Now that the gold-mining has been discontinued the bank is forming again, but very slowly, after every flood. This occurs at intervals along the coast, between Broadwater and Ballina.

James Gould, farmer, near German Creek, sworn, and examined:—

- J. Gould. 1140. *Mr. MacFarlane.*] What are you? A farmer, residing near German Creek.
- 12 Mar., 1900. 1141. How long have you resided there? About fifteen years.
1142. You heard the evidence given by Mr. Anderson with regard to the additional flooding that would be caused by the cutting of the proposed channel on the lower Richmond below Broadwater? Yes.
1143. What is your opinion with regard to Mr. Anderson's evidence? I think it was in the main correct.
1144. Do you think that the proposed channel will have the effect of causing additional flooding on the lower Richmond? Yes; I think so.
1145. Have you observed the action of different floods since you have been a resident? Yes.
1146. You know the Broadwater pretty well? Yes.
1147. Have you observed it during flood time? I have not been on the spot at flood time.
1148. Therefore you cannot say what action takes place there—whether the flood-water backs up the Broadwater or not? I know, as a matter of fact, that it does.
1149. How did you ascertain? I have not been on that side of the river at flood time, but I have been on the river and noted the water as the flood-water met the tide.
1150. Was that tide caused by the rough weather outside? The natural outflow at the heads is not so great when a gale is raging on the coast.
1151. And the meeting of both waters you contend backs up in the Broadwater? Yes.
1152. Do you know the Tuckian Swamp? Yes.
1153. Is the greater part of it subject to flood? Yes; the swamp itself is always full at flood time.
1154. How does it get flooded? There are two creeks, one a large one and the other not so large, that empty into the swamp from the mountains—from Rous and Alstonville—and help to fill it.
1155. Does this water completely fill it? It is not like a glass that can take no more.
1156. Is it so full that it begins to overflow and find an outlet into the river? It is almost on a level with the river in flood time.
1157. Is that caused by the local rain flooding? Yes.
1158. Do you know the proposed scheme of flood relief just about Coraki? Yes.
1159. What effect do you think that would have, first of all, on the Tuckian Swamp in flood time? I think it would have the effect of raising the height of the water in the swamp considerably—that is, by the amount of water that comes from the weir, and no more.
1160. It will cause additional water, which will raise it above what the rainfall leaves there? Yes.
1161. What effect would it have below Broadwater and in the Broadwater? It will intensify the flood in the river.
1162. Can you give any specific reason for that? The quantity of water in the swamp from natural sources will be added to by the amount of water coming over the proposed weir.
1163. That holds good as far as the Tuckian Swamp is concerned; but as regards the river below the Broadwater, you stated just now that it would cause the river to rise higher? Yes, by the amount of water that comes over the weir. The natural flow has always come out of the swamp into the river.
1164. I want you to point out how this scheme, if carried out, would cause a rise in the river below Broadwater? Instead of following the natural channel, which would take a great number of hours, by going across the Tuckian Swamp as proposed, it will come down to the river in a shorter time.
1165. But it would mean less water coming by the main river;—any water going through the proposed channel would, to that extent, lessen the quantity of water that would otherwise go along the main river? Undoubtedly.
1166. By allowing the water to come down in a shorter space of time, do you think the proposed channel would have a material effect in causing an additional rise down the river? Yes. The gale starts with rain, as a rule. The water in the river does not get away at its normal rate. The water coming down from the upper part of the river into the lower, while the gale is raging, will naturally cause it to overflow its banks here, and we shall have a flood.
1167. What then? If the water comes down the natural channel, the gale has subsided before the up-river water reaches the lower river, and we escape.
1168. You contend that, owing to the greater length of time in coming down the river by its natural channel, the gale has subsided, and this water is allowed freer egress to the sea;—is that so? Yes.
- 1169.

1169. And that would not happen if the water came down in a shorter space of time? It would not happen, because if there was a gale blowing, and the water came down while the gale was raging, we should have a flood, and without it we should have none. J. Gould.
12 Mar., 1900.
1170. Is the land you occupy subject to floods? No; it has been flooded.
1171. You mean it is only subject to high floods? Yes.
1172. And you object to having the floods higher still;—is that the reason you are objecting to this scheme? Yes, I should object.
1173. It is proposed that the height of the weir at Coraki should be 12 feet;—would a reduction in the height of the weir do any damage in the Tuckian Swamp, or would the additional amount of water that would be allowed to go through cause any damage below Broadwater? The lower the weir, the greater the flood on the lower Richmond.
1174. The lower the weir the greater your objection to it, I suppose? Yes.
1175. How is the feeling of the residents generally with regard to this scheme—I mean those whom you have come across? Totally opposed to it.
1176. For reasons similar to yours? Yes.
1177. Do you know the Tuckombil escape? Yes.
1178. What is your opinion with regard to that? I think it is a very good work.
1179. There has only been a small flood or two since;—is it correct that it has not materially diminished the flood-waters? I think it has materially diminished the flood-waters, and that it is capable of doing still better work.
1180. In the event of any proposed scheme for flood mitigation, would you favour extending that work rather than carrying out the Tuckian scheme? I would.
1181. Have you anything further to add? With regard to Mr. Henderson's drains through the Tuckian Swamp, though I do not know anything about the drains at flood tide or at high spring tides, I may mention that the spring tides that Mr. Anderson referred to are really not the spring tides at all. They seem to be what are termed tidal waves; they have only occurred about four times in about fifteen years.
1182. *Mr. Watson.*] That is, those that have gone over some of the land here about Broadwater? Yes. The difference between a flood here and a fresh is only a few inches.
1183. The floods only rise a few inches altogether? A few feet.
1184. What is the highest rise you have had here? I have never measured it, but I should say about 3 feet above ordinary tide. When the river is 30 feet at Lismore the banks here are able to carry the water well; unless there is a gale raging on the coast they can carry that to sea when it comes down in its ordinary course. But if it came—or the greater part of it—through the short cutting as proposed there would be a flood on the lower river as well as on the upper. With regard to the improvement in the bends of the river, my opinion is that the effect would be so little that it is not worth talking about.
1185. If the improvement suggested were carried out and the river deepened and widened, would that have any effect? I should think it would have practically no effect whatever on the land.
1186. It would not be so injurious in its effect as the proposed channel? No.
1187. If the proposed weir were constructed an ordinary freshet which would not do you any harm otherwise would do you as much harm here as a flood without the weir? Yes.
1188. At that rate, the lower the weir is constructed the more often the damage would occur? Yes.

Patrick Baker, farmer, sworn, and examined:—

1189. *Mr. Watson.*] What are you? A farmer, residing between here and Broadwater, on the right-hand bank of the river. P. Baker.
12 Mar., 1900.
1190. How long have you been in the district? Over thirty-three years.
1191. And you have had an experience of all the floods during that period? Yes.
1192. Has your land been under water in most of the floods? Yes.
1193. You have heard the evidence of Mr. Anderson and Mr. Gould; do you agree generally with that evidence, as far as its bearing on the proposed scheme is concerned? Yes, I do.
1194. I take it, therefore, that you yourself are opposed to the scheme? I am opposed to the scheme.
1195. What, in your opinion, would be the general effect of bringing the water through the proposed flood-relief channel, down towards the Broadwater, and into the main river? I reckon that during my experience of over thirty years, we have had just enough to do to hold our own, with the water coming in its natural course, and if you run the water on to us much quicker than it comes at present, as we have no banks here fit to take it, it must come over our banks and destroy us. I also wish to point out that we are in a level country, and have not a hill of any description to put a beast on, or to shift our cattle to, and if this water comes quickly on us, we reckon that both ourselves and our cattle will have a narrow squeak to escape. On the other hand, when the water comes round its natural course we can shift our stock. We take the rise of the water as it comes slowly on us, and we say to ourselves, "we will shift our cattle somewhere." If you run that water quickly upon us, we shall only have time to shift ourselves and clear, and leave the cattle to look after themselves.
1196. Do you think that the flood would rise quickly if a fresh from the North Arm were brought down to the Broadwater more quickly than under present conditions? Yes; I can see nothing to stop it, from my experience of floods on the river for the last thirty years.
1197. Then you contend that it would not only raise the water here to the level of a fairly high flood, but would also raise it more quickly? Yes, it would give us no time to escape.
1198. At what rate does a flood here generally rise? If a gale is not raging, and the flood comes at its natural pace, it only rises at the rate of 1 or 2 inches an hour.
1199. If there is a gale raging outside does it rise more quickly? Undoubtedly.
1200. How fast would it rise then? It is continually rising on us. As a rule the Lismore water does not reach us while the gale is raging.
1201. You said the flood would rise about 1 or 2 inches when there was no gale, how fast would it rise with a gale? It would rise considerably. That is, if the Lismore water happened to meet the gale; but as a rule it does not.
1202. Has it sometimes done so? Very rarely has it met the gale. The gale has generally subsided by the time the Lismore water has come on us, and then it takes an easy course away. On the other hand
my

- P. Baker.
12 Mar., 1900. my objection is this: It is proposed to take a channel through a new country—the Tuckian. It is a place full of rubbish and such like. That water will come down more quickly, and whenever there is a low bank it will flow over carrying with it a quantity of rubbish, and our crops are behind that bank. Three feet of water might not hurt my crop so much; but run in a lot of rubbish and logs, and my crop has no chance to escape—it is levelled to the ground.
1203. On your land do you go in for more than cane-growing? I have gone in for maize and potatoes, and dairying—a little of everything.
1204. In any trouble caused by floods, you would probably lose cattle too? I would be at the loss of what I have got.
1205. Would you also lose cattle, besides injury to cane and other crops? Yes; the cattle would be in as much danger as the crops. I have not a place to stand them on. There is not a hill between this and Ballina, on the eastern side, to stand a beast on for safety. Generally the punt cannot work, and there is not a Government reserve here you could put a beast on unless we paid, perhaps, more than its value.
1206. How high is your land above high water-mark, taking every day high water? I suppose it is 3 feet or 4 feet over high water.
1207. Is that much the same as the rest of the land roundabout? Much the same. Wherever the lowest spot is the water will rush in the quicker, and wherever it rushes in, and the crop is behind, the crop must go.
1208. Do the people about here seem to regard the recurrence of floods as inevitable, or do they see any way of coping with them in the future? I cannot see any way of coping with them.
1209. It has been suggested that the enlargement of the Tuckombil flood escape would have some effect in helping the people down here;—do you think there is anything in that? There may be a little in that. I have no doubt it is a big help to the surrounding people about Tuckombil.
1210. Do you think it is any help down here;—will it have any effect in preventing too much water from coming down here over your land before it gets to sea? I do not know that it does us a great deal of good.
1211. The chief trouble you seem to have here is the backing up of the water by the gale—I mean combined with a flood? Yes, combined with a flood.
1212. You seem to think that if there was a moderate flood up above, and if it was accompanied by an easterly gale, you would probably have the water over your land? It might come over my land; but it might come only gradually. It would not get over at the commencement of the gale, for we would not have the water; but a little of it might get over at the end of the gale. As soon as the gale subsides it draws back off my land and into the river on the way out. It draws back; it does not go over with a rush.
1213. Did you ever have water over your land when there was no flood in the river? No, never.
1214. So that it is when the gale acts in conjunction with the flood that you have floods? Yes; I would be likely to catch it then; but that very rarely occurs. At present when a gale is raging, by the time the flood-water from Lismore and the hills reaches us the gale has subsided, and the water coming down has some chance of getting out; but if that water is brought down upon us more quickly by the Tuckian escape channel, and strikes us during a gale, we shall have one of the biggest floods ever known in this part of the world.

Edward Barrett Hollingworth, labourer, Wardell, sworn, and examined:—

- E. B. Hollingworth.
12 Mar., 1900. 1215. *Chairman.*] What is your occupation? I am a labourer, residing at Wardell. I have been here twenty years.
1216. You have a knowledge of the whole river, and you understand the proposed scheme? Yes.
1217. What do you think its effect would be? I think it would be beneficial to the river as a whole—to the majority of the people.
1218. I suppose we are all agreed that it would be a benefit to the people above the site of the proposed weir;—will you explain how it will benefit the people lower down? I will explain my experience. In the 1870 flood, four days after it was at its height in Lismore, I started, on Friday, with two other men from Broadwater. We went across to Dungarubba Creek, right up towards the swamp, and out across about just above the weir site. We passed on the right of the hill there. We crossed the river on to the plains and went up to Wyrallah. I wanted to go around to Gundurimba, but they were frightened we would get stuck, so we went into the river, and from there up to Lismore. That was on Friday. On Sunday we came back with the owner of the station. We came down to McKenzie's, between Coraki and the weir. The water was not running over above the weir. It was running over at Rainbow Creek on the Sunday. From there we came across country to the head of Dungarubba Creek. We were in a boat with six people. There was from 4 feet to 14 feet of water across, and a pretty good run.
1219. Which way was the current? Straight across from west to east, to the upper part of Dungarubba Creek. It was breaking down in that direction to the river. There was an immense lot of water on the lower part—more than on the upper part; the water was deeper as you came down towards the Dungarubba Creek. On the Friday the highest land about Dungarubba was about 18 inches; the pigs were standing on their hind legs against the trees. When we returned on the highest parts of the land there was about 4 feet of water. If you cut a channel from the proposed weir site into the swamp the water will get away so quickly that it will benefit all the country above Dungarubba Creek and all the country on Tuckombil. It will not have any effect on the people at Broadwater and Wardell and down the river, unless they have a north-east or east gale. If that is coming up, naturally it will back the tide up. There is always a tide, flood or no flood, and raises the water very quickly here. But my impression is that if the proposed escape channel is cut, the water will get away into so many more places. There are such a lot of low places in the swamp that the water would not get down here any quicker. The water would not flood this part any quicker than if it came round the river, although part of it would come down so much quicker.
1220. We have had various opinions about this channel;—the Department proposes that the channel should be cut to the edge of the Tuckian Swamp, and the water allowed to spread itself out and go away by degrees down the Broadwater;—on the other hand, the people up the river who want the work done say, "That will be no good—our object is to have that channel cut right from the weir site to the head of the Broadwater, so as to get it quickly on to the Broadwater";—which do you think is the better plan of the two? To cut the channel all the way.

1221. You have heard the evidence given by the other witnesses here to-day, who stated that the trouble at the Broadwater part of the river occurs at the early stage of a flood when it meets an easterly gale;—they think that this water, being shot quickly on to the Broadwater, meeting the incoming tide with a gale, will cause a submergence all about Wardell and in this part of the river? According to my experience, I do not think it will have any effect on it whatever, more than it has at present. The effect on the river here depends on the escape at Ballina. E. B. Hollingworth.
12 Mar., 1900.
1222. Their evidence is that it does not get the escape there, and you say the gale backs it up? I do not think it will affect Wardell at all.
1223. You do not think it will affect Wardell one way or the other? No, neither Wardell nor any part of the river between Broadwater and Ballina.
1224. You think the stream is sufficiently wide there to take the extra water? Yes.
1225. Does your experience agree with that of the other witnesses, that it is in the early part of a flood that the water begins to run up the Broadwater as a rule? Yes; it runs up when the tide runs up. As soon as there is sufficient water to start a run, it runs there the same as it runs in the river until it is backed up—the same as it is backed up on the plains by a gale down here. Until that occurs, until every place is full, including Coraki Plain and all round that district, it will run, and it is a good scour too. It takes you all your time to pull a boat against it.
1226. Do you think the training-wall and the partial breakwaters at the Heads are improving the outlet to the river or otherwise? I think they are improving it.
1227. Some people say they have narrowed it, and it does not let the water out so quickly? I do not think a gale has the same effect on the bar. It does not shallow it up so much. There is greater force to carry the water than if it were spread across a mile and a half. It has now only got a small channel to go out of, and it goes out with greater velocity.
1228. *Mr. Watson.*] In reference to the gorge below Dungarubba Creek, where there are some rocks, would the cutting of that wider and deeper to a reasonable extent have any serious effect upon the flood? I think there is plenty of vent there for any water.

Timothy O'Keeffe, farmer, German Creek, sworn, and examined:—

1229. *Mr. McFarlane.*] Are you a landowner? Yes, I hold a conditional purchase. T. O'Keeffe.
12 Mar., 1900.
1230. How long have you been residing at German Creek? About twenty-seven years.
1231. You have had some experience in floods during that period? Yes.
1232. Do they cause much destruction in your locality? Yes, to young corn and grass.
1233. Is your land mostly agricultural land? Yes.
1234. I suppose you have heard something about the proposed flood relief scheme? Yes.
1235. What is your opinion with regard to it? I think if the Tuckian scheme is carried out it will damage the Lower Richmond.
1236. What do you call the Lower Richmond;—from any particular point? Say from the Broadwater down.
1237. You have heard the evidence given by Mr. Anderson, Mr. Gould, and Mr. Baker;—do you endorse their view of the case with regard to the increased flooding of the Lower Richmond which would result if this proposal were carried out? Yes.
1238. For the same reasons that they gave? Yes.
1239. You heard them make statements also about the higher floods being caused by rough weather at the Heads;—is that your opinion too? Yes.
1240. That the flood-waters in conjunction with a gale cause the floods on the Lower Richmond? Yes.
1241. Will you give us your reason for believing that the proposed channel would cause additional flooding on the lower river? On account of the height of the flood. Now that the breakwater is constructed the entrance is not so large. An easterly gale coming in at the entrance, and stopping the water from going down, would raise the height of the flood here considerably. It has not half the outlet it had before the breakwater was started.
1242. You think the breakwater had something to do with it? Yes.
1243. By making the channel at the entrance narrower? Yes; the water now has not the same outlet.
1244. But would not that have the effect of raising the height of the floods independently of the proposed scheme? Not so much as if the Tuckian Scheme were carried out.
1245. It has been suggested that the flood-water coming through the proposed channel would come down more speedily to the Broadwater, and would find its way out to sea before the flood, taking the ordinary course, could arrive at Broadwater, so that the two waters would not meet;—is that your opinion? No; I do not agree with that at all. I cannot see it.
1246. Do you suffer much from floods? Not a great deal, unless the flood comes when the young corn is not strong, and then it may kill it.
1247. Is it maize that you grow? Maize and cane.
1248. A flood has not such an injurious effect on a cane crop, has it? No.
1249. Is your land above flood reach or partially so? It is partially so.
1250. There is some that the flood never covers? Yes.
1251. How do you regard the proposed scheme;—would you like to see it carried out? No; I would not.
1252. You object to its being carried out on the ground that you believe it will be injurious to the farmers and others on the Lower Richmond? Yes.
1253. Are you well acquainted with the Broadwater? Not very well.
1254. Have you noticed it in flood-time? No; I was never up past Wardell in flood-time.
1255. How high does the river rise in a high flood at your farm above ordinary high-water mark? I have not taken the measurement, but I should say about 3 feet.
1256. That covers most of the banks of the river right down, I suppose, and is considered a high flood? Yes; it is a pretty high flood.

TUESDAY, 13 MARCH, 1900.

[The Sectional Committee met at the Court-house, Ballina, at 10.15 a.m.]

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

JOHN CHRISTIAN WATSON, Esq.

JOHN McFARLANE, Esq.

The Sectional Committee further considered the expediency of constructing Works in connection with the Tuckian Flood Escape Scheme.

William Webster, Mayor of Ballina, sworn, and examined:—

- W. Webster. 1257. *Chairman.*] What are you? I am a licensed victualler, residing at Ballina, and also Mayor of the town. I have lived at Ballina for ten years, and I have been in the district for forty-seven years.
- 13 Mar., 1900. 1258. Are you well acquainted with the Richmond River and the surrounding country? Yes.
1259. And know that it is subject to heavy floods occasionally, causing great damage? Yes. As a boy I put in a great deal of time on the Dungarubba Station.
1260. Having looked at the wall map, you are acquainted with the proposed flood relief channel which is to start a little above Coraki? Yes.
1261. From your long acquaintance with the river and the effects of floods, and so on, would you kindly state whether that is a desirable work to carry out? I think it is very desirable, with a view to minimising the losses by flood on the Richmond River.
1262. I suppose all are pretty well agreed that the upper portion of the river, above the site of the proposed weir, would be benefited by the construction of the proposed channel? Yes, I should think so.
1263. The point of difference, or doubt, arises after we pass the weir site;—what do you think would be the effect of constructing that weir, as regards getting the water away at the Broadwater? If the channel were cut right through to the head of the Broadwater, and not only half-way, I have not the slightest doubt it would keep the water from overflowing on the low land, and if it did overflow, it would drain off again very quickly.
1264. You think it would get rid of that water rapidly and send it into the Broadwater and to sea before the whole of the country became flooded? I do.
1265. Are you sufficiently acquainted with the working of the water at the Broadwater at a time of flood to say whether there is, or is not, enough flow up the Broadwater? I could not say.
1266. Take another point of view: The putting of that water into the canal and bringing it by a short cut through the Broadwater to the sea must necessarily reduce the force of the water in its natural channel down past Swan Bay and the Elbow and past Woodburn up to the junction of the Broadwater with the Richmond River? Yes.
1267. It must reduce the quantity of water that would ordinarily come there? Yes.
1268. What effect do you think that would have on that portion of the river? I could not say whether it would be detrimental or otherwise.
1269. Have you thought of this point of view: By interfering with the natural course of the river and relieving that tortuous part of the river from a large body of water which otherwise would go there, might not the effect be to shallow up the river? Yes; I have.
1270. What do you think? I really could not say, because, since the sill has been lowered at Tuckombil, a great quantity of water that would come through by this scheme must necessarily go out to sea by the Evans' River.
1271. Since the weir has been erected at Tuckombil I think there has only been one test of its working? Yes, and it has not been a very severe one.
1272. So that we have nothing exactly to guide us as to what the result of the diversion there would be? No.
1273. From your ten years' residence in Ballina do you think you could tell us whether at the start of a flood with easterly weather this part of the river has an inset;—whether the rough sea helps to prevent the water from getting rapidly out to sea? The heaviest flood I have seen occurred in July, 1890. It started with north-east rain, and when the river was in full flood the gale turned round to the east, and without a doubt all the low lands from here to the quarry and on the main road were under water.
1274. Was that after the breakwaters were constructed at the Heads? They had just started a little on the north side. I do not think there was anything put into them. There was certainly not enough work done to make any difference.
1275. You were going to say something about the gale and the rough weather? We had a very strong easterly gale. It started with a north-east wind, and when the place was in flood it worked round to an easterly gale.
1276. Did that easterly gale have the effect of backing the water up over Ballina, and up the river? It was not so much over Ballina, it was on the low lands up above. The town was not so bad. I have seen the town worse with a salt-water tide.
1277. How long after the commencement of the flood did that overflowing of the low lands here occur—next day, or when? It was some considerable time after; I could not exactly say—perhaps the best part of a week. It had ceased raining.
1278. Has your experience of the river been that it takes a long while after the flood is at a great height at Lismore before it reaches the Broadwater? Yes; that is my experience.
1279. Two or three days generally? Yes.
1280. And if that water could be got more readily to the sea, do you think it would prevent all those lands from Swan Bay, and the Elbow from being flooded? I do; and not only that, but it would give us a much longer scour here, which is a thing we want very much for the harbour works.
1281. How would it give you a longer scour? We would get the water so much quicker, and it would be kept up with the South Arm and Bungawalbyn Creek.
1282. With regard to the works at the Heads—the training-bank inside and the two breakwaters—has your experience shown that those have been of advantage to the place? I think anyone who will speak the truth will say that they have done more good than most people anticipated,

1283.

1283. In giving you a more reliable entrance? Yes. There is only one difficulty, and when that is removed we will have a splendid entrance. I refer to the bank of indurated sand, in the channel this side of the training-wall on which the Department are now working. The improvement that has taken place in this river is marvellous. W. Webster.
13 Mar., 1900.
1284. Since the two breakwaters have been partly constructed have you had any delays in the arrival and departure of steamers such as formerly occurred? No; not within the last twelve months. It is only lately since the breakwaters have got up to a certain point that we have begun to feel so much benefit from them. We used not to have the depth of water on the bar that we have now; it has not been less than 12 feet for a long time.
1285. It was suggested by some of the witnesses up the river that the narrowing of the entrance by the construction of the breakwaters was reducing the opportunity of flood-waters getting out through the Heads;—do you think that is the case? I think that the deepening of the channel and clearing the spot, as they are doing, will make up the difference, if not more.
1286. And enable the water to get out quickly to sea? I think so.
1287. And, I suppose, the narrowing of the entrance will also reduce the force of the waves and their effect in driving the water inside up the channel? It is a matter of commonsense, that the channel being narrow makes it a great deal safer than when it was three-quarters of a mile broad with a heavy sea running into it.
1288. You are the owner of farm-land at Lismore, and also between Fishery Creek and Immigrant Creek? Yes.
1289. You have no fear of your land being flooded near Ballina? Not the slightest. I do not think it will run as much risk of being flooded if this work is carried out as it did before. Of course, we may be flooded sometimes all the same.
1290. Will you state why you do not think floods will injure you? I think that in a great many cases we will get the weight of the water from the North Arm out of the way by means of the proposed channel before the other water comes down, and should a heavy sea come up afterwards it will not do the same amount of damage as it would otherwise do.
1291. Then I take it that on the whole, as a resident of the Lower Richmond, you are favourable to the proposed scheme? Yes.
1292. In this part of the river there is no unanimity of opinion in regard to the scheme, some are for and some against it? Yes.
1293. Has there been any meeting of the Municipal Council to consider the question? No; it has never been made the subject of a resolution of the Council.

Joseph John Lewis, master of the tug "Protector," sworn, and examined:—

1294. *Mr. Watson.*] How long have you been at Ballina? I suppose it is about fifty-one years since I came here. J. J. Lewis.
13 Mar., 1900.
1295. For how long have you been master of tug-boats here? On and off for the last seven years. I was on the boats before that.
1296. In any case, you have been about the entrance to the river for a considerable time? Yes, all my lifetime.
1297. You knew the state of the river before the harbour works were started? Yes.
1298. What was it then? Very bad.
1299. What were the chief difficulties that vessels going in and coming out had to encounter? Shoal water.
1300. Where? On the bar first, and afterwards on the crossing.
1301. What depths were they able to get then, as a general rule—say, first on the bar and then on the crossing;—I mean before the harbour works were started? As a general rule, the depth was from 8 ft. 6 in. to 9 feet on the bar, and on the crossing I have seen it as low as 6 ft. 6 in.
1302. Was that at high or low water? At low water.
1303. That refers to the bar also? Yes.
1304. That was usually, I suppose, or was it only occasionally? That was usually. When the sailing vessels were here first they had to wait for the spring tides to get across.
1305. Vessels drawing how much would have to wait? They did not draw any more than 8 or 9 feet, and they would have to wait for spring tide.
1306. Would you occasionally have deeper water than that? No; it went on for a long time.
1307. What impression did floods make on the state of the crossing and the bar prior to the harbour works being started? They used to clear it out for a short time.
1308. How much impression would a big flood make? A big flood would deepen it, I suppose, to 12 or 14 feet on the crossing; on the bar I have seen it as deep as 21 feet. That was on the south channel, when the bar broke out to the southward.
1309. Were there two channels on the bar in those days or only one, or was it a shifting channel? It was a shifting channel.
1310. To deepen it to the extent you have just mentioned in those days would it require a very heavy flood—what would be looked upon as a heavy flood up the river? Yes, it would. Sometimes we would get a short flood, and the water would come down quickly in a heavy rain. That would run much faster than a higher flood would with not so sudden a rainfall.
1311. So that, even in those days, the more sudden the flood from the upper reaches, the more concentrated the big bulk of the water, the better was the effect on the scour at the crossing and the bar? Yes.
1312. Where the flood was only gradual—that is when only one portion of the upper river, say one arm of the upper river was flooded at a time—the effect would not be so great on the scour? I do not know; it would depend upon how long the flood would run.
1313. If it ran very many days it would have more effect than otherwise? Yes.
1314. You have also had experience of the condition of the entrance to the river generally since the harbour works have been entered upon? Yes.
1315. What has been the effect of those works? They have had a great effect.
1316. A good effect? Yes; you can see an increasing effect every month.

- J. J. Lewis. 1317. What is the depth now? Fifteen and a half feet on the bar, and 11 feet 6 inches on the crossing at middle tide. I sounded it the other day coming up.
- 13 Mar., 1900. 1318. Do you know what it is at low tide? I do not know what the rise and fall was the day before yesterday; I sounded it then, and I suppose the rise and fall is not above 2 feet.
1319. Then 11 feet 6 inches at a medium tide would mean 9 feet 6 inches in a low tide? I am speaking of high tide.
1320. What would that mean at low water? I suppose about 9 feet 6 inches.
1321. Would there only be 2 feet between high and low water? Yes, when I sounded it.
1322. That would mean 9 feet 6 inches at low water? Yes.
1323. That would be a difference of about 2 feet on the crossing as compared with what it was previously? Yes.
1324. It would seem, then, that the effect of the harbour works has been greater on the bar than on the crossing? The effect of the training-wall is to stop the water from going through. It digs a hole out between the two walls—the cutting, as we call it—and throws it ahead. That is my opinion.
1325. What part do you now regard as the crossing—below the middle wall, that is on the bar side of the middle wall, or is it near where the wharf and crane are connected with the harbour works? Above the wharf and crane—that is where I took the soundings. You can get 12 and 13 feet there; as you go along it gets deeper. There is just a small ridge that the water fills up going through the gap.
1326. Is not the channel and crossing now in a sort of transition state;—the Department, I understand, are endeavouring to divert the channel, and while that endeavour is being made the inner works are not looked upon as permanent? No; this other channel has improved wonderfully—what they are working at now.
1327. The northern channel? Yes.
1328. Do you think it likely that when the full effect of the training-wall is felt on the inner harbour a greater depth on the crossing will result? I do not think there will be any crossing.
1329. You think it will be scoured right away? Yes; I do not see anything to stop it.
1330. That is, when the channel has been taken from a southerly course to a more northerly one, and a full flow of the water takes effect down there? Yes; I have no hesitation in saying that. It is going to be a fine place, and there will cease to be a crossing there, because you can see every day the rush of tide that is getting through there now.
1331. Then when the inner works are completed, in your opinion there will only be the bar to contend with in future? Yes.
1332. What do you think will be the position so far as the bar is concerned;—do you think there is any possibility of its being shifted further out beyond the influence of the breakwaters, or will it disappear—I mean to a reasonable depth? I think it will be a reasonable depth right out.
1333. At the present time vessels coming in, I understand, keep to the northward of the entrance, following the northerly channel, and then, as they get near the entrance, they come a little southward and get into the channel? Yes.
1334. That is because the bar immediately opposite the entrance is shallow, is it not? Yes.
1335. Can you offer an opinion as to whether, later on, with the works in a more complete state, it will be possible to take a direct course towards the entrance, and avoid that northerly detour? I think the channel will go more south and strike on the north breakwater and shoot outwards.
1336. And avoid the necessity of going up northerly towards the beach that now exists there? Yes.
1337. With the possibility, if any accident happens, of being driven on to it? Yes.
1338. So that, in your opinion, the works, so far as they have gone, have been a decided success? Yes.
1339. Do you understand the proposed Tuckian flood escape scheme? Yes.
1340. What effect do you think it will have upon the state of the bar and the crossing, and upon the river below Broadwater, as far as scouring is concerned? I think there will be rather too much scour out. The water will come down a lot quicker.
1341. Assuming that the portion of the North Arm flood-waters that will come down the escape channel gets into the river before the balance of the water, would not that have the effect of spreading the flood over a greater period—that is to say, a little of it would come down earlier, and the balance would come down later; if it worked in that way what effect would it have on the scour? It would be hard to say. The same water would come down either way, but it would not come down so quickly.
1342. In your opinion the effects of the scheme would not be noticeable, as far as the bar is concerned? No.
1343. Do you think it would in regard to the inner works—the crossing, the river inside the bar, and up to the Broadwater? It would keep that clear.
1344. To a greater extent than now? No; I do not think it would make any difference whatever. The same quantity of water has to come down.
1345. Is it an advantage or a disadvantage, in your opinion, as far as scouring is concerned, to have all the water in a lump, or a little at a time? All in a lump.
1346. If the channel as proposed brings the earlier flood-waters from the North Arm sooner into the main river than they could get there by going round the other way, that would have the effect of bringing the water piece-meal instead of in a lump? Yes.
1347. It would seem from what you say that you do not think it would be so good for scouring purposes that way? No; I do not think it would.
1348. Taking the other portion of the river between, say, Coraki on the weir side and Broadwater, what effect do you think would follow on that part of the river from the taking away of a portion of the North Arm waters? I believe there would be more silting up.
1349. It is claimed by those who favour the scheme that a moderate fresh has just as much scouring effect in the river as a heavy flood—do you agree with that? No, I do not; because I reckon that any water that comes down through Broadwater would back up the other water to a certain extent, and you would not get the run.
1350. If flood-water came through the proposed channel to Broadwater, it would have some effect in blocking up the waters coming down the river proper to Broadwater, and would stop the run to some extent? Yes.
1351. But the people there say that the water through the proposed channel will get away to sea before the other water gets to it—having a shorter distance to travel, and a greater fall, it would get ahead of the

- the other water? When we get floods we generally have a very heavy breeze here, and it is only once out of a hundred times that we do not have a heavy sea to back it up.
1352. And that sends the waters up from the entrance to the river and backs it up? Yes.
1353. And you think that would minimise the chance of the water from the flood relief channel getting away to sea before the other water came on top of it;—on the Broadwater there is too much spread, and the water coming from the river would not be enough to fill it sufficiently to force the tide away? No, not the first of the flood.
1354. Then you disagree with those who say that a moderate fresh would be as good for scouring the river proper, or the upper part of the river, as a flood? Yes.
1355. Do you think there is anything in the statement that when once the flood-water gets above the banks the scour in the river almost ceases? No.
1356. Have you noticed whether the navigation of the river has been improved after a flood—I am not speaking of the entrance, but above Broadwater? Yes, I think it has.
1357. We were informed by some of the witnesses further up the river that the river was in a worse state after a big flood than previously, is that your experience? No. The fine weather we have had lately shows that the river is worse as the result of continued fine weather.
1358. How long is it since you have had a fresh or flood? There was a small flood in July last.
1359. And the river latterly has been worse than for some time previously? Yes.
1360. Because of the lack of floods? Yes.
1361. Have you endeavoured to distinguish between the effect of a moderate fresh and a heavy flood; the contention higher up was that a moderate fresh would scour the river quite as well as a high flood;—have you ever noticed the condition of the upper river, or the river above Broadwater, first, after a fresh, and next after a flood, with a view to comparing the effects of the two? When you get a fresh it is a very strong run.
1362. Would you get as good a scour from that as from a big flood? If you get the run of water, I believe there is a better scour from a big flood on the river above Broadwater.
1363. So that, in your opinion, any subtraction from the flood-waters above would cause a lessening of the scour in the river proper, and a consequent addition to the silting up? Yes.
1364. Is there any other point you think you would like to mention from the point of view of a tug-master? I know that our harbour works are doing a great deal of good. Within the last twelve months I have not been getting the work I used to get. The vessels can now get in and out without the assistance of the tug.
1365. Have you noticed the effect of the various floods on the inrush of the tidal waters—the running in of the tide? In a heavy flood the incoming tide is stopped occasionally by the flood-water higher up the river.
1366. Could you tell us at what height of the river, at any point, say, above Broadwater, the incoming tide stops running in a flood? When the flood reaches a height of 10 feet at Woodburn, in my opinion it stops the inrush of the incoming tide. A week after a high flood has reached its highest at Lismore the incoming tide will have been stopped running up.
1367. So that we may take it from what you have said that you do not think the scheme would be a wise one from the standpoint of keeping the river and the river entrance clear and fit for navigation? I think it would not be any improvement whatever.
1368. Do you think it would be any detriment—any drawback? It will be a detriment from Broadwater up.
1369. That is from a navigation standpoint? Yes.
1370. You mean up the river, from Broadwater to the weir? Yes.

John Guy Bagot, timber merchant, Ballina, sworn, and examined:—

1371. *Mr. McFarlane.*] I understand you resided at Broadwater for some time? Yes.
1372. How long? Since 1881.
1373. Do you know the locality well? Yes.
1374. Have you had any flood experience? Yes; we have had a good deal of flood experience in that locality.
1375. Do you know the Tuckian Swamp? Yes.
1376. I believe most of that is subject to floods? Yes; it is all subject to floods.
1377. Do you own property on the Broadwater? Yes.
1378. How is that affected by the floods? Very little; it is mostly high land. The damage the flood used to do us was in sweeping sawn timber away which we had near Broadwater.
1379. Which is the highest flood you have had there since you commenced to reside at Broadwater in 1881? The 1893 flood.
1380. There was also a high flood in 1890? Yes; there was very little difference between the two.
1381. Taking these two floods, have you noticed a run of water at Broadwater? I have, and noticed it very particularly.
1382. In which direction does the current run when the river first commences to rise? It always runs from the river into the Tuckian Swamp.
1383. Would that have the effect of filling the swamp? Yes; it also runs up from the effect of the flood-waters being blocked at Byrne's Point, on the Broadwater, owing to the narrowing of the river there.
1384. Have you noticed how far up Broadwater the current would be running upwards? The Broadwater extends a little over a mile above us, and then the swamp starts. When once it gets into the swamp the current is destroyed—it spreads.
1385. Have the local rains any effect in filling the swamp before a flood takes place in the river? Yes, some effect; but they only flood it locally, not enough to cause a current in the Broadwater.
1386. You would call the swamp full after a local rainfall? They would be full in themselves.
1387. But more could be put in them by a rise in the river;—a flood in the river would raise them higher? Local rains would put, say, a foot of water on the swamp; any water after that would be caused by flooding from the main river.
1388. How much water would the flood of 1890 and the flood of 1893 put in the Tuckian Swamp, speaking in a general way? Approximately speaking, about 7 feet of water.

J. J. Lewis.
13 Mar., 1900.

J. G. Bagot.
13 Mar., 1900.

- J. G. Bagot. 1389. That would be 6 feet in addition to the local rainfall? Yes.
- 13 Mar., 1900. 1390. Have you noticed how high the river would rise when the backing-up would take place;—would it rise to the full height of the river? To about half-flood. We have to watch that very particularly, because as soon as the river breaks over its banks from the North Arm and at Buckendoon a very strong current sets in down the Broadwater—almost as strong as the river.
1391. Can you account for that? It is caused by the flood-waters breaking over the banks higher up the river in two or three places.
1392. Where would these places be—near Swan Bay? I have not seen the river breaking over on the North Arm; but I know it does. I have seen it breaking over at Buckendoon. It breaks with a very strong current in the direction of the Broadwater and Tuckian.
1393. When the river overflows the banks up the river it has the effect of filling the swamp, and the water then runs in an opposite direction to Broadwater back into the main river again? Yes.
1394. Have you considered the scheme under consideration—that is, for cutting a channel, with a weir, some 4 or 5 miles above Coraki, and letting the water from the main river into the Tuckian Swamp? Yes; I have taken a great deal of interest in it.
1395. What is your opinion of that scheme;—do you think it would have the effect of relieving the upper river? Yes, decidedly.
1396. You are speaking now of Coraki and upwards? Yes.
1397. Do you think it would affect the river below Coraki to Broadwater? Yes; I think it would relieve that also by reducing the height of the flood.
1398. By the proposed new channel? Yes; I think it would reduce the height there.
1399. With regard to the river between Broadwater and Ballina, what affect do you think the carrying out of the new channel would have at flood-time? I think it would raise the height of medium floods, but would lower very high floods.
1400. Have you any particular reason for that contention? Only this, that these very high floods do not come all at once; they are really three or four freshets, one on top of the other. In 1890 we had a freshet; then it stopped raining, and the water stood still, or perhaps lowered a little. Then it started raining again, and on top of that freshet we had another freshet which raised the water still higher again. At that time it did not stop raining altogether; but it steadied, and the river stood still, and, as far as I recollect, went down a little. Then it started raining again, and we had a big flood then right on top of the lot.
1401. That would mean that the river was in high flood for how many days? It extended over a fortnight; but the big flood extended over seven or eight days. It was rising four days and falling again about the same number of days. With regard to the effect of raising these smaller floods, if the proposed channel were cut it would allow the water down quicker, instead of the water, as at present, wandering all round the country by Woodburn. It would have the effect of raising the water in an intermediate flood; but the water getting away would leave room for the next fall of rain.
1402. *Chairman.*] You said a little while ago that at the commencement of a flood the water always ran up the Broadwater. The object of this scheme is that at the commencement of a flood a quantity of water should be shot across the Tuckian Swamp into the Broadwater;—would not the water that was being shot into the channel over to Broadwater be blocked, seeing that it would be met by the in-running water which you said a little while ago was always running up at the commencement of a river flood? We would not have that up-current; instead of coming all round the river it would go direct through the Tuckian.
1403. You mean that the water through the channel would get down before even the early part of the northern flood would back up the Broadwater? Yes. I presume something would be done with the reef opposite Byrne's property immediately below the Broadwater. In my opinion that is greatly the cause of the up-current in the Broadwater.
1404. *Mr. McFarlane.*] Would the lower portion of the river be materially damaged by an increase of the flood-waters, if the proposed channel were constructed? I fail to see how it could be.
1405. You stated that in low floods you thought there would be a higher rise? But it would be within the banks.
1406. And, therefore, not destructive? Yes; that is, if it were not blocked too much by the reef.
1407. Have you considered this point: Suppose a flood continues at a great height for twelve or fourteen days; there would be water continually running through the proposed channel, if constructed, and water running down the main river at the same time;—would not the water in the main river meet the water running through the proposed channel? Of course it would; but we must remember that there would not be so much water coming down the main channel, and Tuckombill escape would carry off a portion.
1408. But would not the South Arm and the Bungawalby waters be running in also after that length of time, with the river at a great height? I stated just now that most likely the rain would cease falling. It would stop suddenly, perhaps, for a short time.
1409. Even supposing it were stationary, if it kept a certain height would there not be a current in the river? Yes.
1410. And also through the Tuckian channel? Yes.
1411. That would show that the water was getting away towards the sea? Yes.
1412. With all these channels running full at the same time, do you think that would have a greater tendency to cause a rise in the river below Broadwater than in the case of a small flood? Yes; that is what I stated—the intermediate flood would be higher.
1413. I understood you to say a small flood would be higher? Even a moderately high flood would be higher.
1414. Would that mean any serious damage to the residents on the lower river? No, I think not; because, even in very high floods, the water is barely over the banks at Wardell.
1415. How high does the flood rise, say about Wardell? About 5 or 6 feet.
1416. Would that be considered a high flood? Yes; at Wardell it would—or about 7 feet would be a high flood.
1417. It has been stated that on the lower river the greatest amount of destruction is caused by the rough weather outside the Heads in conjunction with a flood;—is that your experience? Yes; the rough weather would make a great deal of difference.
1418. Do you know the exact locality of the proposed Tuckian channel? Yes. 1419.

1419. It is proposed to construct a weir to a height of 12 feet above low-water;—a number of witnesses have said that that height should be reduced so as to allow a greater body of water to go through the channel;—what is your opinion with regard to that? Naturally, if it were reduced it would allow more water to go through; as far as getting rid of flood-water is concerned it would be better to reduce it. J. G. Bagot.
13 Mar., 1900.
1420. Would it not have the effect of flooding the low land in and around the Tuckian Swamp by letting the water in at a much earlier period than would otherwise be the case? Certainly; but if there is much rain about it is flooded now.
1421. To the extent of about 1 foot of local rain, I think you said? Yes.
1422. Suppose a rise of 8 feet at Coraki would allow the water to go through the channel, it would soon raise the water in the Tuckian more than a foot? Yes.
1423. Would not that cause some damage to the low lying country there? It might on the outer edges of the swamp.
1424. There are settlers, I understand, right round the swamp; would it not damage their holdings, and cause an additional depth of water? To a slight extent it would; but once there is a foot of water there that land might as well be covered by 6 feet of water, except as far as cattle are concerned.
1425. Would a foot cover the whole of it? No.
1426. An additional foot again might cover a larger area? It would, of course; it would do damage to some extent.
1427. Do you know the drains known as Henderson's drains? Yes; I know them well.
1428. Did you know the country before they were constructed? Yes.
1429. What was its condition then? I have tried to get into the swamp, and found it impossible to do so anywhere.
1430. What prevented you—the water? The boggy state of the swamp, and the water to some extent.
1431. When the drains were constructed had they a good effect? Decidedly; in reasonably dry weather.
1432. Had the cutting of the drains the effect of drying up the swamp? Yes.
1433. Previous to the cutting of the drains was the swamp used for grazing purposes? No; it was impossible to get into it at all.
1434. It was a waste? Yes.
1435. After the drains had been cut could the land be utilised for grazing? Yes; in reasonably dry weather only.
1436. It must be very low country? Yes; very low.
1437. Did you notice that these drains were deepened some time after they were cut? Yes; Mr. Henderson who cut these drains had them widened and deepened afterwards.
1438. Had that a good effect—did they carry away more water? Yes; I think it improved them.
1439. Did you notice at any time the salt-water following these drains up from Broadwater? No; I never saw any salt-water in them. I have seen the water very slightly brackish at the lower end of the drains. The cattle always drink out of them.
1440. Did you notice whether any of the exceedingly high tides, caused by rough weather on the coast, overflowed the land in that locality? They did slightly, but not nearly as badly as a week's rain would.
1441. I suppose an ordinary spring tide would not cover them? Well, it might run up a short distance from where the drains would end.
1442. Mr. Henderson lived on the property for some time, did he not? Yes.
1443. He spent a considerable amount of money carrying out improvements? Yes.
1444. Was that expenditure remunerative? Decidedly not, I should say.
1445. He has leased the land now to some other party? Yes.
1446. Do you consider that the expenditure on the drains has resulted successfully? Only in dry weather. That is where Mr. Henderson's object was defeated—owing to the immense rainfall we get here; sometimes the drains could not cope with the rainfall.
1447. Are you in favour of carrying out the proposed channel in the interests of the district? Yes.
1448. It has been proposed that the residents should contribute to the cost under the betterment principle—that is, those who are benefited;—do you think that would be a wise proposal, and one that the residents benefited by the work would be likely to agree to? On the whole, yes; of course, provided the betterment principle was applied to all public works.
1449. Do you think it would do to shoot this water into the swamp without taking it right across into the Broadwater? I do not think it would do much harm. It goes there now; it might as well go there at once.
1450. I mean it is proposed to stop the drain at the beginning of the swamp, and it has been suggested by many witnesses that the drain should be cut right through to Broadwater? It will be better to cut it right through at a moderate depth, I think. Even if it were only cut part of the way it would be better than not going there at all.
1451. Would you describe the banks of the Broadwater? The Broadwater, commencing at its junction with the Richmond River, is bounded on its northern side, for a distance of about 2 miles, by ti-tree and mangrove growth, which is almost level with the water. Then, for a length of about a mile, the banks and land at the back are fairly high. You then come again to low mangrove swamp, which continues right to the Tuckian Swamp. On the southern side of the river, commencing at the junction, there is a low mangrove swamp for about a mile; then there are good banks 4 or 5 feet high, with hills behind, for about a mile and a half. After that you get into low swampy land again up to the Tuckian Swamp. Between the two high banks the Broadwater narrows into a kind of gorge.
1452. You see on the map the red lines showing the channel at the head of the Broadwater;—what is it like there—is there a bit of ridgy land there? No, there is no ridge at all.
1453. Coming to McPherson's Island, shown on the map, is there a bit of a bank there that would block the water? No, no bank whatever. The high tide makes over there.
1454. Is there nothing to prevent the free egress of the water into the Broadwater? Yes, there is; there is a mangrove and ti-tree growth, but nothing in the ground itself.
1455. Down towards the lower end of the Broadwater it appears that there are low banks on either side, just the mangrove and ti-tree growth;—if this drain were constructed, and the water conveyed quickly from the weir site over to the Broadwater, and from the Broadwater to the river, do you think there would be any possibility of flooding the land on either side of the mangrove swamps at the eastern end of the Broadwater,

J. G. Bagot. Broadwater, which otherwise would not be flooded? Yes, to a slight extent; it might spread over where the main river is running. Of course, a high tide almost comes in there; and, as I said just now, it is of a swampy nature; but just a short distance back—only a few chains—there is a ridge. That is high land, and no harm would happen to it.

13 Mar., 1900.

1456. Is the lower mangrove land occupied? It is taken up.

1457. But not cultivated? It is not cultivated at present. It has been cultivated.

1458. Would that be apt to be flooded? Yes, it would be flooded; it is now.

1459. *Mr. Watson.*] Do you know McFadden's farm on the right bank of the Broadwater, near the main river? Yes.

1460. Is there any bank or high land between his farm and the Broadwater? No; the land, I should say, gradually fell from his farm to the Broadwater. There is a gradual slope, because his farm is fairly high.

Robert Adie Fraser, Pilot and Harbour-master, Ballina, sworn, and examined:—

R. A. Fraser. 1461. *Mr. McFarlane.*] How long have you held your present position? Ten years.

1462. Do you remember the condition of the Richmond River bar when you first became pilot? Yes.

13 Mar., 1900. 1463. What was its condition? Very poor.

1464. What do you mean by that? Shallow water, shallow bar, and trouble with crossings inside.

1465. What depth of water would there be at that time, first on the bar and then on the crossing? In time of freshets we used to have 12 feet; but the average is about 8 feet.

1466. I mean at ordinary times? The average would be 8 feet.

1467. Would that apply to both the bar and the crossing? The crossing is 7 ft. 6 in. A fresh used to relieve us for the time-being.

1468. Are these depths at high tide? Yes.

1469. Is it part of your duty to take soundings? Yes.

1470. Had the harbour improvements been commenced at that time? Yes; the north wall had been made for a short distance.

1471. During the course of constructing the harbour works, have you noticed any marked improvement coming up to the present date? Yes.

1472. What is the condition of the bar at the present time? I am reporting 13 feet at high-water, but I have got more than that; I have got 12 feet at low water.

1473. How much would that be at high-water? We have about 15 feet at high-water.

1474. At the present time there would be 15 feet of water on the bar? Yes.

1475. How long has it continued at that? Ever since July last. That was when we had the last fresh. There has been no change since.

1476. Has there been any shallowing from July up to the present time? Nothing to speak of.

1477. There has been no detention to steamers coming to and going from here;—they have been regularly trading? Yes; at high and low water they come in and go out.

1478. What is the present condition of the crossing? The depth is 12 feet at low water; we have no crossing now.

1479. You gave us the depth of the crossing ten years ago;—I want to know what depth of water it carries now? Twelve feet.

1480. Does that mean for any length of time back? Since July last year.

1481. It keeps pace with the bar then? Yes.

1482. With the improvements being carried out, do you think the depth of water on the bar or the crossing will continue to increase? I have no doubt of it.

1483. You feel certain? Yes.

1484. It is proposed to carry out the breakwaters a considerable distance further? Yes. The south wall has given us the biggest relief since we started. We have had far better results since we started the south wall. They have been working at it since May last night and day.

1485. Do you remember the width of the channel before the harbour works were commenced? Yes.

1486. The carrying out of the breakwaters has naturally confined it and made it much narrower? Certainly.

1487. What effect has that caused; I do not mean with regard to giving a greater depth of water, but with regard to the rough weather;—has it made the bar smoother? Certainly; the deeper the water the smoother the bar.

1488. Has the effect been to reduce the tides caused by rough weather? Yes.

1489. That is inside the bar? Yes; since the channel has been made narrower we get more water into the river.

1490. In your opinion that makes higher tides? Yes, and lower tides.

1491. The water runs in faster and gets away faster? Just so.

1492. You have noticed floods occurring in the river during the ten years you have been here? Yes.

1493. Will the narrowing of the channel have any effect in preventing the run of water out to sea? Certainly not.

1494. You do not think it will prevent the flood-water running out? No; the channel takes away twice as much water now as when I came here, because then we only had 7 feet or 8 feet of water; but now we have 15 feet. Therefore, we take away more water.

1495. The channel would be much narrower, would it not? Certainly; but that would give us all the better scour on the bar—it would take away more water.

1496. Have you noticed the effect that floods have on the bar;—do they cause the channel to be deeper—create a scour, and leave deeper water afterwards? Certainly.

1497. What creates the greater scour—a high flood or a moderate flood? The bigger the flood the better for us.

1498. The bigger the flood the greater the scour and the greater depth left afterwards? Yes.

1499. You know the channel up the river, I suppose? Yes.

1500. Are there obstructions in the shape of sand-banks? Yes; I just know the river by going up and down. It is not under my jurisdiction; but I simply go up and place buoys there. I do not go up working the river. I know where the obstructions are,

1501. If the proposed scheme is carried out a considerable body of water must go through the escape channel to Broadwater, instead of round by its natural course; therefore, that part of the river between Coraki and Broadwater will not have as much water passing down as if the channel were not cut. In your opinion, how would that part of the river be affected with regard to navigation? I should think the tendency would be to silt the river up. The fact of taking so much water away from the river between Coraki and Broadwater would tend to silt the main river up by reason of its not having the full force of water. R. A. Fraser.
13 Mar., 1909.
1502. Your contention is that the greater the force of water or the higher the flood the better the scour, is that so? Exactly.
1503. Are there are many difficulties in the river between Coraki and Broadwater? Yes; there are the Woodburn flats.
1504. Do you know what is the depth of water on the flats at Woodburn? Eleven feet at high water.
1505. Proceeding further down, where would the next obstruction be? I do not know of any other flat besides that, except certain places where there are rocks. There are rocks opposite Riley's Hill.
1506. What depth of water do the steamers now trading here draw? We have had them here this last month drawing 11 feet 6 inches.
1507. How do they manage to negotiate the flats? They only come to Ballina.
1508. I mean proceeding up the river? They would not do well with more than 10 feet up the river—from Ballina up.
1509. If there happened to be much silting of the river, there would have to be some dredging to keep the channel clear? It would require a lot of dredging, no doubt.
1510. And, in your opinion, the proposed flood-relief channel would have the effect of causing the river to silt between Coraki and Broadwater? Yes. I think it would naturally silt the main river up, because we always live in the hope of getting a flood to clear our rivers by scour. There is always a certain amount of sediment coming down the river, and if you take water away from the main river as proposed, there will not be the same scour.
1511. The sediment that comes to the weir by the river will be more inclined to continue in the river, owing to the force of the water being diminished by the outflow into the channel? Yes; the sediment will naturally stop in the main river and silt up.
1512. With regard to the proposed escape channel, do you think it would have the effect of relieving the upper river from floods? I should think it would relieve the country there.
1513. And for the same reason it would have the effect of relieving the country between Coraki and Broadwater from floods? Yes; it would take the water away from that lower country.
1514. Take it away quicker? Yes; it would take it away quicker too.
1515. How do you think it will affect the river between the Broadwater and the heads? I do not see that it would make any difference to it; the only thing is that we would get the water quicker.
1516. Coming quicker, would it make any difference in the height of the rise? I do not think so, because it would come down gradually—it would not all come from one direction. This water would be down before the water in the main river.
1517. Have you noticed the length of time it takes a flood to come from Lismore to Ballina? About forty-eight hours. If there is 30 feet of a rise at Lismore, we may look out for it down here in forty-eight hours.
1518. Say it is at its full height at Lismore, what time would it be at its full height at Ballina? I should say in about three days. We would feel it here in forty-eight hours.
1519. How high would the river have to rise at Woodburn before it would stop the flowing tide at Ballina? I would not like to say, because I never studied that point. I have always taken Lismore.
1520. What rise at Lismore would it take to make a flood sufficiently high to stop the flow of the tide? From 15 to 20 feet at Lismore.
1521. After rising that 15 or 20 feet at Lismore, how long would it be before you would have the effect of it here at Ballina to stop the incoming tide? About three days.
1522. From the time you got an announcement that there was a high flood at Lismore—say 30 feet—and from the time it reached its highest point there, how long would it be before the river would get so much effect at Ballina as to prevent the inflowing tide? Forty-eight hours. It is not exactly the Lismore water that we have here to stop it. There are many other creeks which bring water down, besides that which comes from Lismore. We have Immigrant's Creek, the South Arm, Bungawalbyn, and many other places that bring water to us before the Lismore water comes here.
1523. *Mr. Watson.*] When there is a general flood, I understand you to mean that the incoming tide is stopped to some extent before the high flood from Lismore can get down? Yes; perhaps a couple of days.
1524. *Mr. McFarlane.*] After you are aware that there is a flood raging at Lismore, and it has reached a very high point—about forty-eight hours after that you notice it stops the inflowing tide? Yes.
1525. *Chairman.*] Do you regard that portion of the river between Coraki and the Broadwater as the part of the river in which the scour should not be interfered with? I certainly say it should not be interfered with as far as the navigation of the river is concerned; it should be kept at liberty for the navigation of the river. I am of opinion that the proposed cutting will cause a certain amount of silting up which cannot be afforded in the present state of things. I am not against the cutting all the same; I am simply saying what I think would be the result of it. I think the cutting would relieve the lower country, but might affect the navigation of the river between the two places mentioned.
1526. When the flood-waters get below the Broadwater, they meet with some obstruction to their free egress, do they not? I cannot say they do, unless they take over the banks.
1527. Is there not a shallow place called Blackwall flats? Yes.
1528. Would not that offer some obstruction to the ready outflow of the flood-waters? Certainly it would; the flood-water generally scours that and relieves it.
1529. But does it scour the indurated sand, of which those flats are mainly composed, or simply the silt lodged on top? The silt lodged on top of the indurated sand. The indurated sand cannot be removed by any water passing over it.
1530. Those flats are extensive, are they not? They are. I should think about three-quarters of a mile from Wardell.

- R. A. Fraser. 1531. They extend right across the river? The shallow water extends right across.
 1532. There is no channel on either side? No. The channel is greatly deepened by dredging; that has not been done, I think, for the last four years.
 1533. There is another point just below Broadwater where the channel of the river seems to be contracted a little by a reef—I think they call it Long Point, opposite Byrne's Hotel? Yes.
 1534. Do you think that offers any serious obstacle to the flood-waters getting away? I think the flood-waters coming from the Broadwater would go right over the reef.
 1535. Do you mean over the reef and continue down the river, or over the reef towards the land opposite? Over the reef towards the land opposite.
 1536. The reef would have the effect of turning it in that direction rather than allowing it to go down the river? Yes.
 1537. Do you think that the water running through the proposed channel, combined with the water from the Tuckian Swamp itself, flowing together down the Broadwater, would stop the force of the main river current to some extent, and that the tendency would be that the water coming down the Broadwater from the proposed channel would strike against the reef at Byrne's, and from there go on to the land on the seaward side of the river? Yes.
 1538. It would be a bit awkward for those people? The scheme would be injurious to those people near Byrne's, owing to the two waters meeting.
 1539. If that reef were removed, do you think the water from the proposed channel would then come down the river? No doubt it would help; but I do not think it would be much good.
 1540. There would always be a danger of the water going on to the land on the ocean side of the river at that point? Yes.
 1541. There is another contraction apparently on the river at Alley's Hill;—do you think that contraction has much effect in keeping back the flood-waters from up above? I do not think so.
 1542. What is the width at that point? I should think the width would be about 40 feet down below Alley's.
 1543. Does a good depth continue right through that contracted channel? Yes, in the channel; but you must not go out of it; it is very narrow.
 1544. Would you not think it would have some effect in damming back the water, seeing that from that point upwards the water in very high flood all seems to go towards Tuckian? That is because the country is so low.
 1545. Do you think the removal of the reef on the point opposite Alley's Hill would have any effect in assisting the escape of flood-waters from above? I should think it would.
 1546. And in this way assist the more rapid scour of the river below? Yes.

William Edmond Kemp, Acting District Engineer, Harbours and Rivers Branch, Department of Public Works, Ballina, sworn, and examined:—

- W. E. Kemp. 1547. *Mr. Watson.*] You have been here only a short time on this occasion, I understand? Yes; I have been here a little over two months.
 1548. But you were here previously? I have been here on three previous occasions, amounting in all to seven and a half months.
 1549. Could you tell the Committee what is in contemplation at the present time in connection with the harbour works—what is intended to be done? The breakwaters are intended to be extended, as shown on the plan, to a length of 1,500 feet beyond what they are at present. The inner portion of the wall is more in the nature of a training-wall. There will be somewhere about 3,000 feet of actual breakwater on each side.
 1550. Where the channel comes between them, will the two breakwaters be eventually about 3,000 feet in length? Yes.
 1551. And then, in addition, there will be a training-wall? Yes; what I call the middle wall.
 1552. The object of that being to concentrate the water on the northern side, with the view of keeping the navigable channel as near the northern bank of the river as possible? Yes; and get as straight a run through the entrance as possible.
 1553. At present I understand that inner training wall is not in full operation? There is an opening about half way along its length, about 200 feet wide, for the purpose of allowing steamers to use the southern channel.
 1554. The hope is that, eventually, the northern channel will scour sufficiently to permit of the closing up of the opening in the inner training wall? Yes. As soon as the bank of indurated sand is cut through by the dredge.
 1555. Where does that bank lie? Opposite Norton-street, and about a mile inside the entrance to the harbour.
 1556. What has been the result, so far, of the works undertaken—what effect have they had on the channel and the entrance? Their effect has been to bring about a very great improvement both on the bar and on the crossing. The crossing is a few hundred yards inside the entrance, close to the end of the middle wall.
 1557. Do you think the works are having the effect anticipated? Yes, there is no doubt about it.
 1558. So that there will be no disappointment in respect to them? No, I do not think so.
 1559. Are there any indications that the more northerly channel is being deepened by the tidal action outside the training wall? Yes; below the indurated sand there has been a very great improvement.
 1560. What depth is that bank of indurated sand? It varies from 5 feet down to 14 feet, where we are now working on it.
 1561. You are now working on it with a view to its removal? Yes.
 1562. What depths do you anticipate having—first on the bar, then on the crossing, and the bank of indurated sand? I think after the works are completed there will be from 18 to 20 feet on the bar and crossing.
 1563. And you are deepening the bank of indurated sand to how much? At the present time we are going down to about 17 or 18 feet with it.
 1564. Eventually, I suppose, you will have it in harmony with the depths of the outer work? Yes.
 1565. How long do you think the works now in progress at the entrance will take to complete? I think about five years. 1566.

1566. But you will not have to wait till that time for a larger measure of benefit from them, I suppose? W. E. Kemp. No. A great deal depends on the floods in the river.
1567. Further up the river there are works also in progress in the way of deepening and assisting navigation? We are removing the reef at Woodburn at present. 13 Mar., 1900.
1568. Is that rock formation? It is of a very mixed character. It is pipeclay and rock mixed up together.
1569. Are there any other shoals up the river that you have mapped out as being points for working? There are five or six different places where we have had soundings and borings taken with a view to the removal of obstructions. The first one is below the Broadwater, opposite Mr. Byrne's property, about $15\frac{1}{2}$ miles from the entrance, opposite the junction of the Broadwater with the Richmond.
1570. Is it proposed to remove that reef? Yes.
1571. That does not extend right across the river I understand? I may say generally that none of these rock obstructions are very bad obstructions to navigation at present; there is a fairly good channel to a depth of about 9 feet at all of them. The next one is about $17\frac{1}{2}$ miles from the entrance, in the Humbug Reach. The next is at Woodburn, which we are already removing. The next above that is about 28 miles from the entrance—that is, below the Buckendoon wharf. The next is about $34\frac{1}{2}$ miles from the entrance, at a place called Newby's Hill, just above Bungawalbyn Creek. The next is in the North Arm, a little above Coraki, about 39 miles from the entrance.
1572. Have you had any opportunity of observing the effect of the flood relief channel constructed at Tuckombil? I was here when the flood of July, 1899, occurred. I had observations taken of the flow of the water over the Tuckombil weir, as regards the height over the weir and the period for which it was running over. On the 9th July, 1899, the water rose to the present level of the sill—that is, the top of the stone work. The Tuckombil flood relief channel consists of a weir and flood-channel from the Tuckombil Creek to Evans' River. The take-off for the flood-waters of the Richmond is at the town of Woodburn, the course of the flood-waters being from Tuckombil Creek over the weir, passing through some low-lying lands into Evans' River, and thence to the sea.
1573. What height is the weir above low-water mark? Five feet above low-water at Woodburn; that is the present level.
1574. At the time when you had the observations taken I understand there were wooden sills above the top of the existing weir? Yes; 2 feet high.
1575. Those have since been removed? Yes; they were removed just after the flood I speak of.
1576. During the observations you made they were in position and blocking the water to that extent? Yes.
1577. Would you give the Committee the result of your observations? On the 9th July, 1899, at 8 p.m., the water rose to the level of the present crest of the weir—2 feet below the then existing sills. On the 11th, at 6 a.m., it rose to the height of the existing sills—that would be 7 feet above low-water. At 1 p.m., on the 12th, it was 4 feet over the sills; at 5 p.m., on the 12th, it was 5 ft. 3 in. over the sills; at 11 a.m. on the 13th, it had fallen to the top of the sills; on the 17th, at 6 a.m., it was down to the crest of the present weir.
1578. Was the weir acting to its full capacity, considering the height at which the flood was? Yes; there was no obstruction whatever to the get-away.
1579. We were informed, by a witness at Woodburn, that the land, some 4 or 5 chains below the weir, was 2 ft. 5 in. above the level of the weir, or 5 inches higher than the sills that were there during the flood; and further, that as the escape drain below the weir was only 60 feet wide, as against 30 feet on the weir itself, there was not sufficient get-away for the water that passed over the weir;—did you see any signs of any detention in that respect? No; the water had a free escape the whole time. In fact, it was considerably lower just on the seaward side of the weir than it was above.
1580. Indicating that it was acting to the fullest extent possible at that time? Of course, the sills being on at that time, there would be very little of that bank above at that period.
1581. With the removal of the sills, the proportionate height of the bank some distance below would be increased? Yes; but there is such a very large escape from the surrounding country that I do not think that would have any effect whatever.
1582. That is below the bank of which the witness spoke? Yes.
1583. The draw from the lower land beyond the bank would be sufficient to take the water through the 60-foot channel just as quickly as it would go over the weir? Exactly.
1584. Because, immediately below the weir there is a fall, as it is? Yes, there is a big fall.
1585. Can you say whether that comparatively narrow channel through the banks, of which you are speaking, was left with a view to relying upon the scour to make it wider? I believe it was. I had no personal acquaintance with the scheme at the time.
1586. Have you seen any indications of that bank scouring away through the action of floods? No; there is no indication on the ground at present.
1587. Do you care to offer an opinion as to what measure of relief to the flooded area above that escape channel afforded by its existence? I think there is no data whatever on which anyone could give an opinion on the subject. Although that was a comparatively high fresh at Lismore and at Bungawalbyn Creek; the South Arm was not in big flood at all at the time.
1588. So that from that standpoint it would be a partial flood? Yes.
1589. Did you notice the direction from which the water was flowing towards the weir? The whole of the water which went over the weir came from Bungawalbyn Creek and from Tuckombil Creek.
1590. And not from the main river? No; the water was running into the main river during the whole period of the flood.
1591. Of course, it is to be assumed that the existence of the weir resulted in a certain amount of water going to sea through Evans' River which otherwise would have gone down the main river? Exactly.
1592. But, so far as the weir was acting on the occasion when you saw it, it had no chance of proving its effect in respect of relieving the main river itself? In taking away water from the other creeks it must relieve the main river to a certain extent.
1593. What I meant was relieving it from water coming down from above through the main river? [It was all water which would have gone into the main river; it must have relieved the main river to some extent.

- W. E. Kemp. 1594. But when you said the water was coming from Bungawalbyn Creek you did not mean *via* the main river, but coming across country? Coming from Bungawalbyn Creek at a point some distance south of its junction with the Richmond. The water coming from Bungawalbyn Creek above its junction with the Richmond was going over the weir.
- 13 Mar., 1900. 1595. When the water was 5 feet 3 inches over the sills at the weir, was it also over the surrounding country west of Tuckombil Creek? Yes.
1596. So that, as far as relieving from flood the country in its immediate vicinity is concerned, the weir did not make any alteration? This country was still flooded, but not quite to such an extent as it would otherwise have been.
1597. You are aware of the proposal to take a relief channel from above Coraki into the Tuckian Swamp? Yes.
1598. Have you looked into that matter yourself at all? No; I have not gone into the question by calculations or in that way. I have only just a general idea of it.
1599. What effect do you think that would have—first, upon the navigation of the river; and, secondly, upon the scour necessary to complete the works which you have in progress down at the entrance? As far as the river between the proposed weir and Coraki is concerned, I think it would have a very bad effect on the channel; because the weir would take off a large quantity of water from the North Arm which otherwise would come down the channel to Coraki, and on some occasions the water from the South Arm would be running in an opposite direction, towards the weir, backing up through the North Arm to the weir, with the result that the flow of water in that part of the channel would be very slow; in fact, at times it would be simply dead water. Therefore, the whole of the silt which came down into that part of the river would remain there.
1600. That is down to Coraki;—then going on from Coraki to the Broadwater? From there I think the water from the South Arm and the other creeks—Bungawalbyn Creek and Sandy Creek—would be sufficient to keep the channel fairly well scoured to its present depth.
1601. Suppose the proposed relief channel works in the way that some people anticipate by bringing a certain amount of water into the Richmond at Broadwater earlier than the other flood-waters would reach it;—what effect do you think that would have upon the works at the entrance? I do not think it would make any difference whatever to the entrance.
1602. When you get that far the quantity will not be great enough to make any difference? You would get the whole of the water there at one period or another.
1603. And would it make no essential difference at what period you got the water? I do not think there would be enough difference in the time of the arrival of the water to have any effect.
1604. So that from the point of view of navigation it would seem that the only objection in your mind to the proposal is with respect to that portion of the river between Coraki and the weir? Yes.
1605. Which is about $4\frac{1}{2}$ or 5 miles long? That is so.
1606. But in that part of the river you think it would do an injury, and the river would require dredging? Yes, it would require dredging after each flood.
1607. Can you say whether the existence of the Tuckombil relief channel in its present state, had any effect on the action of the last flood—any influence upon the river scour? That is the only fresh in the river I have seen, so that I cannot draw any conclusion as to what would have happened in other cases. But there was a very good scour at the entrance at that period of the flood, and it did a very great amount of good to the entrance.
1608. Prior to that flood what was the state of the entrance so far as the depth was concerned? It was not so very shallow; but the crossing was very narrow and crooked, and the scour had the effect of straightening it as well as deepening it considerably to a greater width.
