Audit Office, Sydney,  
10th March, 1856

JOHN STIRLING.

1856.

NEW SOUTH WALES.

**CUSTOMS DUES.**

(MORPETH AND NEWCASTLE.)

*Ordered by the Legislative Assembly to be Printed, 20 August, 1856.*

RETURN to an *Order* dated 15 August, 1856, respecting "Customs—  
"Dues—Morpeth and Newcastle."

## No. 1.

MORPETH, N. S. W.

No Customs Duties are collected at Morpeth. The Officer is stationed there for the protection of the Revenue, and to act as Locker to the Bonding Store in that place.

J. GIBBES,

Collector of Customs.

## No. 2.

MORPETH, N. S. W.

A Return of the Expenses incurred on account of the Customs' Department at Morpeth, from the 1st of January to the 30th April, 1856. .... £106 13 4

## No. 3.

A Return of the Expenses incurred on account of the Customs' Department at Morpeth, from the 1st of May to the 30th June, 1856 ..... £53 6 8

J. GIBBES,

Collector of Customs.

## No. 4.

PORT OF NEWCASTLE, N. S. W.

A Return of the Expenses incurred on account of the Customs' Department at Newcastle, from the 1st of January to the 30th April, 1856 ..... £465 17 8

## No. 5.

A Return of the Expenses incurred on account of the Customs' Department at Newcastle, from the 1st of May to 30th June, 1856 ..... £230 19 10

J. GIBBES,

Collector of Customs.

## No. 6.

PORT OF NEWCASTLE, N. S. W.

A Return of the amount of Customs' Duties collected at Newcastle, from the 1st of January to the 30th April, 1856 ..... £1274 14 4

## No. 7.

A Return of the amount of Customs' Duties collected at Newcastle, from the 1st of May to the 30th June, 1856 ..... £2421 12 10

J. GIBBES,

Collector of Customs.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author details the various methods used to collect and analyze the data. This includes both manual and automated processes. The goal is to ensure that the information gathered is both reliable and comprehensive.

The third part of the report focuses on the results of the analysis. It shows a clear upward trend in the data over the period studied. This suggests that the current strategies being implemented are effective and should be continued.

Finally, the document concludes with a series of recommendations for future actions. These include further refining the data collection process and exploring new opportunities for growth. The author believes that with continued effort, the organization can achieve its long-term goals.

1856.

NEW SOUTH WALES,

## CUSTOMS' DUES, MORPETH.

(LETTER FROM COLONEL GIBBES, COLLECTOR OF CUSTOMS.)

*Ordered by the Legislative Assembly to be Printed, 19 September, 1856.*

THE COLLECTOR OF CUSTOMS to THE COLONIAL SECRETARY, *respecting the Returns of Customs' Duties collected at Morpeth and Newcastle.*

(No. 104.)

*Custom House, Sydney,*

*18 September, 1856.*

SIR,

I have the honor to acknowledge the receipt of your letter of the 17th instant, calling on me for further information respecting the Return furnished by this Office of the amount of Duties collected at Morpeth, for the first six months of the present year, and which Return was "Nil."

2. In reply, I beg to say that no Duties were, or could be, collected *officially* at Morpeth, which is not a Port of Entry, or a port at all, but merely a River Station attached to the Port of Newcastle, for the convenience of the trade carried on by steamers between Sydney and Maitland.

3. The Landing Waiter at Morpeth is neither a Collector or Sub-Collector of Customs, and consequently not eligible under the Customs Regulations to receive Duties; neither is it usual to allow a Bonding Store to be established at so great a distance from the Port of Entry as Morpeth is from Newcastle; but, considering when the application was made to me by Mr. Taylor, that such an establishment would be very advantageous to the residents in that part of the Colony, and that arrangements could be made without putting the Government to additional expense, or the Revenue in jeopardy, I at once recommended it to His Excellency the Governor General.

4. I went further, and desired that Mr. Allman should receive, as a deposit, any moneys tendered, and forward them to his superior officer, the Sub-Collector of Newcastle, in whose account of Duties rendered to the Auditor General they must appear, as that officer neither would or could recognize any accounts from Morpeth.

I have, &c.,

J. GIBBES,

Collector of Customs.

THE HONORABLE  
THE COLONIAL SECRETARY.

&c.,            &c.,            &c.

[*Enclosure to the foregoing.*]

(No. 162)

*Custom House, Sydney,*

*10 October, 1856.*

SIR,

I do myself the honor to transmit herewith an application from Mr. James Taylor to be allowed to use part of his buildings at Morpeth as a public Bonding Store; and as it appears from the Sub-Collector of Customs of Newcastle's letter of the 2nd instant, on the subject, as well as a memorial (herewith enclosed) from the inhabitants of the Hunter River District, that it would be a great benefit to them, and as no additional expense will be incurred by the Government in consequence, as the officer at Morpeth can perform the duties of Locker, I beg to recommend the application to the favorable consideration of His Excellency the Governor General.

I have, &c.,

J. GIBBES,

Collector of Customs.

THE HONORABLE  
THE COLONIAL SECRETARY.

&c.,            &c.,            &c.

NEW SOUTH WALES.

ALTERATION OF THE TARIFF.

*Ordered by the Legislative Assembly to be Printed, 28 October, 1856.*

To the Honorable the Members of the Legislative Assembly, in Parliament assembled.

The Petition of the undersigned, Merchants and Traders of Sydney, present at a Public Meeting held at the Exchange Room on Monday, the 22nd September, 1856, and others,

HUMBLY SHEWETH,

That, in their opinion,

I. It is highly objectionable to resort to frequent alterations in the Tariff, even as a temporary expedient, to meet the exigencies of the Public Service, inasmuch as they are extremely injurious to the free course of trade, and prejudicial to the public interest, especially at the present time, when a movement has been originated for the purpose of promoting an assimilation of the Tariff of the Australasian Colonies.

II. The additions to the Tariff proposed by the present Government are in themselves objectionable, for the following reasons :

- 1. The proposed duty on unmanufactured wood, iron, slates and oils, is especially objectionable in this Colony, where the cost of building is already enormous.
- 2. The proposed duty on flour and grain is highly inexpedient in a Colony which does not at present produce a sufficient quantity of breadstuffs for its own consumption.
- 3. The imposition of a duty upon packages according to their size, without regard to their value, is unjust in principle, unequal in operation, and repugnant to the usages of trade.
- 4. And, further, the general scheme ignores the principle that raw materials imported for the purpose of manufacture should be exempt from taxation.

III. As the Harbour of Port Jackson is one of the finest in the world, the fiscal Regulations of New South Wales should be so devised as to encourage the principles of Free Trade, with a view to render her metropolis an advantageous entrepôt for the surrounding Colonies.

IV. To meet the present exigencies of the Public Service, and until the Tariff can be maturely revised, direct taxation would be less objectionable than the additions now proposed.

Your Petitioners therefore humbly pray that your Honorable House will be pleased to take the premises into consideration.

And your Petitioners, as in duty bound, will ever pray, &c., &c.

Here follow 143 signatures.

1857.

NEW SOUTH WALES.

CUSTOMS' DUTIES.

(INCREASE OF ON OLD TOM.)

Ordered by the Legislative Assembly to be Printed, 13 January, 1857.

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned Merchants and Traders of the City of Sydney,

RESPECTFULLY SHEWETH:—

That an order has been issued from the Treasury, under the authority of the Minister of that Department, directed to the Collector of Customs, and inserted in the Government Gazette, of Tuesday, 30 December, 1856, instructing that officer to levy on the spirit known by the designation of "Old Tom," the rate of ten shillings the gallon, without allowing for the reduced strength of the said spirit, causing an increase of duty ranging from four to five shillings per gallon on this article.

That this order has been issued in consequence, as therein alleged, of the strength of that spirit not being determinable by the test afforded by Sykes' Hydrometer, and, therefore, classing this spirit with those articles mentioned in the Schedule to the Act of Council, 19 Victoria, No. 14, viz:—"Spirits, Cordials, Liqueurs, or Strong Waters, sweetened or mixed with any article so that the degree of strength cannot be ascertained by Sykes' Hydrometer."

That since the passing of the Act above referred to, as well as previously, the Department of Customs, whose province it is to carry out the provisions of this Act, has ignored the category within the application of which this spirit is now brought by the order above referred to, as applying to or as including the said spirit, and has accordingly, in every instance, tested the strength thereof by Sykes' Hydrometer, duly recorded the same in the Customs Books, and by such and by receiving the duties agreeably thereto, have published to the public at large such strengths, and led the public to understand that such were the true strengths, and to believe that the Customs would continue to receive the duties on the said spirit according to such strengths.

That on the faith of this rule, so established by the Department of Customs, importers have accompanied their orders to Great Britain by special instructions for the shipment to this market of the spirit in question at certain reduced strengths, to meet the requirements and conveniences of trade suggested by the peculiar circumstances of the Colony.

That Traders have operated in this article in our own market, in perfect reliance on the validity of this rule so established, as they were warranted in doing, viewing the Customs Department as the recognised exponent of Government in the matter, and that the stocks in the said article, so purchased and held by them in good faith, will be rendered valueless in this market by the effect of this new order, if the increased rate of duty be allowed to attach.

That it was in consequence of the high rate of duty leviable on this spirit that it became necessary to order the same from Great Britain at further reduced strengths, in order to bring it into trade here, and of consequence within the reach of consumption.

That your Petitioners, submitting the premises to your consideration, rely upon your Honorable House adopting the inference that reason and justice point to, viz.:—that of exempting from the increased rate of duty the stocks in hand, in such way or by such measure as to the wisdom of your Honorable House may seem fit.

That your Petitioners submit, beyond doing justice to the present holders of "Old Tom" spirit, that the continuance of the rate of duty now proposed is undesirable, as it would amount virtually to a prohibition to the importation and consumption of that article.

That your Petitioners conceive it would be neither politic nor just to impose a rate of duty on an article of British manufacture, which, whilst it would have the effect of shutting out the same from consumption here, would unduly favour the consumption of articles of Foreign production.

Your Petitioners, therefore, humbly pray that your Honorable House, representing British sentiment and principle, will adopt such measures as will not only reach the case of the present holders of the spirit in question, but also by a suitable rate of duty, say on the liquid gallon, give encouragement to the future trade in this article.

And your Petitioners will, as in duty bound, ever pray, &c., &c.

[Here follow 61 Signatures.]

1856.

## NEW SOUTH WALES.

## BONDED WAREHOUSE KEEPERS AT MORETON BAY.

(LICENSE FEE.)

*Ordered by the Legislative Assembly to be Printed, 28 November, 1856.*

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned, proprietors of Bonded Warehouses in the Town of Brisbane,—

RESPECTFULLY SHEWETH,

That your Petitioners are the owners and occupiers of licensed Bonded Warehouses in the Town of Brisbane, and Port of Moreton Bay, and they observe that it is the intention of the Government, towards the ways and means, and to meet the estimated expenditure of New South Wales for the year 1857, that there shall be taken and levied upon owners of all Bonded Warehouses in all parts of the Colony, an annual fee at and after the rate of fifty pounds sterling for any such licensed Bonded Warehouse.

That of the dutiable goods for consumption, both for Brisbane, Ipswich, and the more distant towns of the interior, only a small portion is received in this port under bond, the greater part arriving from Sydney duty paid.

That the Bonded Stores occupied by your Petitioners, though certainly of great convenience for their own business, and of equal advantage to the Government, in the accommodation which they afford for lodging goods subject to duty; yet, for the reason they have stated, that the greater part of the bonded goods which are consumed in these districts arrive duty paid, your Petitioners derive no adequate return for store rent, in respect of goods deposited in their warehouses, which alone would justify the imposition of any tax whatever.

That your Petitioners have been subjected to considerable outlay in building suitable Bonded Stores, for which they receive no adequate return, owing, as above stated to the fact, that nearly all dutiable goods for consumption arrive in the district duty paid, and it would be injustice to tax them for a public convenience for which they receive no commensurate benefit.

Your Petitioners therefore humbly pray, that your Honorable House will consider the foregoing premises, and, as affects your Petitioners, that you will not pass into law any motion having for its object the imposition of a tax on the owners of Bonded Warehouses in the Port of Moreton Bay.

And your Petitioners will ever pray, &c.

CUSTOMS RETURNS.

---

*Ordered by the Legislative Assembly to be Printed, 6 January, 1857.*

---

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 9 December, 1856, for,—

- “ (1.) A Return of all Bonded Warehouse-keepers; distinguish-  
 “ ing the names of the persons licensed, the street or place in  
 “ which each Warehouse is situated, the Port or District for  
 “ which the License is granted, and the date of License.
- “ (2.) A Return of the proceeds of fines, seizures, and satisfaction  
 “ made, in the Customs Department, from 1st October, 1852, to  
 “ 1st October, 1856; together with an account of the distribution  
 “ of the net proceeds thereof,—shewing the share awarded to  
 “ the Officers of Customs.
- “ (3.) A Return of the number of Entries passed in the Long  
 “ Room of the Customs Department, at the Port of Sydney, for  
 “ each of the years ending on the 1st October, 1853, and 1st  
 “ October, 1856.
- “ (4.) A Return shewing similar particulars from the Custom  
 “ House, Newcastle, and the Custom House, Brisbane, respec-  
 “ tively.
- “ (5.) A Return of the gross amount of the Receipts of the Cus-  
 “ toms Revenue of New South Wales, from the 1st October,  
 “ 1852, to the 1st October, 1856, and the cost of collection  
 “ thereof.
- “ (6.) A Return of the amount of Revenue received for duty on  
 “ Colonial Spirits, for the like period.
- “ (7.) A Return of the cost of collection of that Revenue, during  
 “ the same period.”

NEW SOUTH WALES.

DEFICIENCY IN BONDED STORES.

(REPORT OF COLLECTOR OF CUSTOMS.)

Ordered by the Legislative Assembly to be Printed, 12 February, 1857.

Notes and Proceedings of the Legislative Assembly, No. 85, 6 February, 1857, page 4.

With reference to the proposed "Question" by Mr. Weekes—will the Collector of Customs have the goodness to inform the Honorable the Treasurer if any other deficiencies have been discovered than that in Lamb's Bonded Store, reported by Colonel Gibbes on the 19th ultimo?

HENRY LANE.

Treasury, 7 February, 1857.

In compliance with the directions of the Honorable the Minister of Finance, that Stock should be taken, as far as practicable, in an expeditious manner, in the different Bonding Warehouses, in consequence of the discovery made, that certain casks of low-duty goods were missing from Lamb's Store,—I directed Mr. Still, Inspector of Distilleries, and Mr. Hindmarsh, one of my Landing Waiters, to visit those Warehouses, twenty-two in number, and count the packages of brandy, gin, rum, whiskey, wine, tobacco, and cigars, without gauging, (as such would occupy months, and tend to nothing,) leaving tea, sugar, coffee, ale, and other low-duty articles for a second survey, when the first may be finished.

The examination commenced on the 19th ultimo, (and has been continued daily,) since which eleven Bonding Warehouses have been visited; and comparing the quantities found in Bond with the quantities standing in the Warehouse Keeper's Ledger, no further deficiencies have been discovered.

With regard to the wording of Mr. Weekes' intended motion, "Whether in the recent taking of Stock, in the Bonding Stores, by the Customs Authorities"—I beg to explain that no Stock was taken, according to the meaning of the term.

Goods in Bond after three years are considered as over-time goods, and are at once to be cleared from the Warehouse by payment of the duty, or by exportation—otherwise to be sold by the Customs.

In order to effect this, the Warehouse Keeper goes through his Stock Book at the end of each year, and extracts the number of packages of that standing in each Warehouse, and sends a list to the Lockers, who ascertain that they are there.

This was the case in regard to Lamb's Warehouse, when it was discovered by the Locker on receiving the Warehouse Keeper's list, that seventy-two packages of Port Wine, warehoused in October, 1853, could not be found or accounted for.

The

The names of the Eleven Warehouses examined up to Saturday inclusive:—

	Pkges.		Pkges.
Leigh's .....	2144	Circular .....	534
Griffiths' .....	658	Lloyd's .....	7799
Cooper's .....	1121	Smith's .....	2702
Anderson's .....	1478	Aldis' .....	512
Brown's .....	1665	Kirchner's .....	3449
Exchange .....	1622		
		Total .....	23,684

The importation consisted of 6 pipes, 20 hogsheads, and 80 quarter-casks, ex "Amalia," from Oporto, containing 3824 gallons of wine,—and of this quantity 1098 gallons are written off as duty paid, and delivered for exportation.

The balance has disappeared in some mysterious manner, which no one that I have examined can account for; and Messrs. Lamb and Spry have been called upon to pay the duty of 2s. per gallon under the present Tariff, (instead of the 1s. under the Tariff which existed when the wine must have been delivered,) amounting to £272 12s., which they have ordered their Custom House Agent to pass entries for.

Messrs. Lamb and Spry have made no concealment of the transaction.

They have admitted that no duty could have been paid, as it has not been charged to the Consignor; and also that the packages were taken out of the store at different times, during the years 1854, 5 and 6, in small or moderate quantities.

All that I can discover is, that a part of these wines are supposed to have been removed from the Bonding Warehouse, in consequence of its crowded state, into one of the Free Stores, but by whose authority, or under whose superintendence, I cannot ascertain, (the Locker of that day having been for some time past lying in a helpless state from paralysis,) and thus after a time were lost sight of, or looked upon as free goods, and delivered as such when sold.

The difficulty however of reconciling this is, that under such circumstances the Queen's Lock would, or at any rate should have been put on the Free Store door; and there is no evidence to shew now, whether such was the case or not.

Neither of the present partners were here at the time, and Mr. Walter Lamb, who then conducted the business of the firm, is at present off the Colony; but he is expected back in a few weeks, and may possibly be able to throw some light on the subject.

J. GIBBES,  
Collector.

9 February, 1857.

1857.

NEW SOUTH WALES.

**BONDED WAREHOUSES.**

(REPORT OF STOCKTAKING.)

*Ordered by the Legislative Assembly to be Printed, 17 March, 1857.**Customs, Sydney,  
15 March, 1857.*

SIR,

I beg leave to state that Mr. Still, who was appointed to take stock in the several Bonding Warehouses, closed his inspection on the 6th instant, and that the comparing his returns with the Warehouse-keepers Stock Books has occupied the Clerks in the Warehouse Branch from the 27th ultimo to the 13th instant, which will account for my not having sooner made any Report.

2. I am happy to say that the discrepancies are insignificant, and that the deficiencies out of *fifty-two thousand two hundred and forty-six packages in Bond, amount to only twenty-seven quarter casks of wine.*

3. I do not mean to say that other articles are not apparently missing; but where three or four cases of brandy, under a particular mark, which stand in the Warehouse Books as being in the Warehouse, are not to be found, five or six other cases of brandy of another mark, which have been, or rather ought to have been, delivered according to those books will be found to be still in the Warehouse;—to account for which is perfectly easy, as mistakes have been made in the marks and numbers, and wrong cases and casks in consequence delivered to the parties who have paid the duty.

4. Again, there are numerous packages on which the marks and numbers have become obliterated, since being bonded, which can neither be identified or traced, but which are, of course, a part of those lots which are found to be short in number under their respective marks.

5. There are also some goods in Bond which have paid duty, but not been removed; irrespective of these, however, the quantity in Bond over what, according to the books, ought to be there, but which is not there, is entirely in favor of the revenue to (I should say) a considerable amount.

6. I purpose in future to make the attempt of taking stock every six months, by a process which I propose to adopt, and of having a half-yearly sale of overtime goods, which will, I expect, prevent to a certain extent any such mistakes from arising again.

I have, &amp;c.,

J. GIBBES,

Collector of Customs.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF  
THE LEGISLATIVE ASSEMBLY.

---

VOTES No. 36. FRIDAY, 31 OCTOBER, 1856.

14. Customs Department:—Mr. Nichols moved, pursuant to *amended* notice,—
- (1.) That a Select Committee be appointed to inquire into the Management of the Customs Department of the Colony, and the future arrangement for carrying on the business of that Branch of the Public Service.
- (2.) That such Committee consist of Mr. Robert Campbell, Mr. Egan, Mr. Gordon, Mr. Buckley, Mr. Lord, Mr. Barker, Mr. Weekes, Mr. Holt, Mr. Irving, and the Mover.
- Question—(1.) That a Select Committee be appointed to inquire into the Management of the Customs Department of the Colony, and the future arrangement for carrying on the business of that branch of the Public Service,—put and passed.
- Question—(2.) That such Committee consist of Mr. Robert Campbell, Mr. Egan, Mr. Gordon, Mr. Buckley, Mr. Lord, Mr. Barker, Mr. Weekes, Mr. Holt, Mr. Irving, and the Mover,—put and passed.
- 

VOTES No. 62. THURSDAY, 18 DECEMBER, 1856.

12. Securities given by Officers of Customs:—Mr. Donaldson moved, pursuant to notice, That the Correspondence respecting Securities given by Officers of Customs be referred to the Select Committee on the Customs Department.
- Question put and passed.
- 

VOTES No. 67. TUESDAY, 6 JANUARY, 1857.

3. Paper:—Mr. Donaldson laid upon the Table the Return to the *Order* made by this House on the 9th ultimo, on the motion of Mr. Nichols, for Customs Returns.
- Ordered to be printed, and referred to the Select Committee on the Customs Department now sitting.
- 

VOTES No. 68. WEDNESDAY, 7 JANUARY, 1857.

5. Disposal of the Commissariat Stores in George-street:—Mr. Donaldson moved, pursuant to notice, That the Return and Further Return to the Address on the subject of the Commissariat Stores in Lower George-street be referred to the Select Committee on the Department of Customs.
- Question put and passed.
- Ordered to be referred accordingly.
- 

VOTES No. 71. TUESDAY, 13 JANUARY, 1857.

6. Duty on "Old Tom":—Mr. Nichols moved, pursuant to notice, That the Petition of certain Merchants and Traders of the City of Sydney, praying for a modification of the Duty of Ten Shillings per Gallon, levied on the Spirit known by the designation of "Old Tom," presented by him on the 9th instant, be printed, and referred to the Select Committee on the Customs Department now sitting.
- Debate ensued.
- Question put and passed.
- Ordered to be printed, and referred accordingly.
- 

VOTES No. 92. FRIDAY, 20 FEBRUARY, 1857.

8. Customs Department:—Mr. Holt, as Chairman, brought up a Progress Report from, and laid upon the Table the Evidence taken before, the Select Committee on the Customs Department, appointed on the 31st October last.
- Ordered to be printed.
-

---

**PROGRESS REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 31st October, 1856, "to inquire into the Management of the Customs Department of the Colony, and the future arrangements for carrying on the business of that branch of the Public Service," and to whom were referred, on the 18th December last, "the Correspondence respecting Securities given by Officers of Customs," on the 6th and 7th ultimo respectively, several "Customs Returns" and "the Return and Further Return to the Address on the subject of the Commissariat Stores in Lower George-street," and on the 13th ultimo, "the Petition of certain Merchants and Traders of the City of Sydney, praying for a Modification of the Duty of Ten Shillings per Gallon, levied on the Spirit known by the designation of 'Old Tom'";—have agreed to the following Progress Report:—

Your Committee, in the prosecution of the inquiry entrusted to them, have taken the Evidence of several Witnesses; but, from the importance and extent of the subject, the incomplete state of the inquiry—in consequence of the great number of Witnesses still remaining to be examined, and the advanced period of the Session—which render its completion therein altogether impracticable, your Committee are of opinion that they will best perform their duty by at once submitting the Evidence already taken to the consideration of your Honorable House.

THOMAS HOLT,  
Chairman.

Legislative Assembly Chamber,  
Sydney, 20 February, 1857.

PROCEEDINGS

## PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 20 NOVEMBER, 1856.

**Members Present:—**

Mr. Nichols,		Mr. Irving,
Mr. Barker,		Mr. Egan,
Mr. Campbell,		Mr. Buckley,
		Mr. Gordon.

Mr. Nichols was called to the Chair.

Committee deliberated as to their course of proceedings, and resolved upon taking evidence.

Motion made and *Question*,—"That J. G. N. Gibbes, Esquire, Collector of Customs, be summoned before this Committee, as a witness for to-morrow"—*agreed to*.

Committee then deliberated as to the best mode of conducting the examination of witnesses.

Motion made (Mr. Egan) and *Question*,—"That after the conclusion of the Chair-man's questioning, the examination be taken up by the Member nearest to the Chair on the left, and so passed on *seriatim* from Member to Member round the Table, it being, however, reserved to the discretion of any other Member during such examination to put, through the Chair, any incidental questions which might occur to him as bearing immediately upon the portion of the examination to which the witness was at the time being subjected, and as calculated to elucidate the same"—*agreed to*.

[Adjourned till to-morrow, at Twelve o'clock.]

FRIDAY, 21 NOVEMBER, 1856.

**Members Present:—**

Mr. Buckley,		Mr. Weekes.
--------------	--	-------------

A Quorum of the Committee not being present,—

[Adjourned till Wednesday next, at Twelve o'clock.]

WEDNESDAY, 26 NOVEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.

Mr. Buckley,		Mr. Irving,
Mr. Lord,		Mr. Egan.

Mr. J. G. N. Gibbes, Collector of Customs, examined.

Motion made and *Question*,—"That J. G. N. Gibbes, Esquire, be again summoned before this Committee, as a witness, on Friday next"—*agreed to*.

[Adjourned till Friday next, at Twelve o'clock.]

FRIDAY, 28 NOVEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.

Mr. Weekes,		Mr. Buckley,
Mr. Gordon,		Mr. Holt,
		Mr. Barker.

Mr. J. G. N. Gibbes, Collector of Customs, further examined.

[Adjourned till Thursday next, at Twelve o'clock.]

THURSDAY, 4 DECEMBER, 1856.

**Members Present:—**

Mr. Nichols,		Mr. Weekes.
--------------	--	-------------

A quorum of the Committee not being present,—

[Adjourned till Tuesday next, at Twelve o'clock.]

TUESDAY, 9 DECEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.

Mr. Egan,		Mr. Gordon,
Mr. Weekes,		Mr. Buckley,
		Mr. Lord.

Mr. George Thornton, examined.

[Adjourned till Thursday next, at Eleven o'clock.]

THURSDAY,

THURSDAY, 11 DECEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.  
 Mr. Irving, | Mr. Holt,  
 | Mr. Barker.

Mr. George Thornton, further examined.  
 [Adjourned till Tuesday next, at half-past Ten o'clock.]

TUESDAY, 16 DECEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.  
 Mr. Irving, | Mr. Buckley.  
 | Mr. Egan.

Mr. F. Gavling, Landing Surveyor, examined.  
 Motion made and Question,—“ That W. N. Llewellyn, Esquire, Chief Clerk, and  
 “ A. W. Rolleston, Esquire, First Landing Waiter, in the Customs Department, be summoned  
 “ before this Committee, as witnesses, on Friday next”—*agreed to.*  
 [Adjourned till Friday next, at Twelve o'clock.]

FRIDAY, 19 DECEMBER, 1856.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.  
 Mr. Weekes, | Mr. Buckley,  
 Mr. Gordon, | Mr. Barker,  
 | Mr. Holt.

The Chairman laid before the Committee the Correspondence between the Collector  
 of Customs and Colonial Treasurer, with respect to the grounds upon which certain of the  
 Custom House Officers do not give security, referred to the Committee, on the 18th instant.  
 Motion made (Mr. Gordon), and Question,—“ That the Correspondence be printed in  
 “ the Appendix to such Report as this Committee may hereafter make”—*agreed to.*  
 Mr. W. N. Llewellyn, Chief Clerk in Customs Department, examined.  
 [Adjourned till Tuesday, 6 January, at Eleven o'clock.]

TUESDAY, 6 JANUARY, 1857.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.  
 Mr. Weekes, | Mr. Barker,  
 Mr. Buckley, | Mr. Irving,  
 | Mr. Egan.

Mr. A. W. Rolleston, First Landing Waiter in the Customs Department, examined.  
 Committee deliberated.  
 Motion made and Question,—“ That Henry Fisher, Esquire, J.P. be summoned before  
 “ this Committee, as a witness, for Thursday next”—*agreed to.*  
 [Adjourned till Thursday next, at Twelve o'clock.]

THURSDAY, 8 JANUARY, 1857.

**Members Present:—**

Mr. Irving, | Mr. Buckley,  
 Mr. Weekes, | Mr. R. Campbell,  
 | Mr. Holt.

Mr. Irving, in the absence of the Chairman, was called to the Chair.  
 Resolution of the House, referring to the Committee, on the 6th instant, the following  
 Returns, viz:—

- “ (1.) A Return of all Bonded Warehouse-keepers; distinguishing the Names of the  
 “ persons licensed, the street or place in which each Warehouse is situated, the Port or  
 “ District for which the License is granted, and the date of License.  
 “ (2.) A Return of the proceeds of fines, seizures, satisfaction made, in the Customs  
 “ Department, from 1st October, 1852, to 1st October, 1856; together with an account of  
 “ the Distribution of the net proceeds thereof,—shewing the share awarded to the Officers  
 “ of Customs.”  
 “ (3.) A Return of the number of entries passed in the Long Room of the Customs  
 “ Department, at the Port of Sydney, for each of the years ending on the 1st October, 1853,  
 “ and 1st October, 1856.  
 “ (4.) A Return shewing similar particulars from all other Free Warehousing Ports  
 “ in the Colony.  
 “ (5.) A Return of the gross amount of the Receipts of the Customs Revenue of New  
 “ South Wales, from 1st October, 1852, to the 1st October, 1856.  
 “ (6.) A Return of the cost of the Collection of that Revenue during the same period.  
 “ (7.)

"(7.) A Return of the gross amount of Revenue collected by the Department of the Inspector of Distilleries, for the like period.

"(8.) A Return of the cost of Collection of that Revenue, during the same period."

—read.

Resolution of the House, referring to the Committee, on the 7th instant,—

"Return and Further Return to an Address relative to the disposal of the Commissariat Stores, in Lower George-street."—read.

Mr. *Henry Fisher* examined.

[Adjourned till Wednesday next, at Twelve o'clock.]

WEDNESDAY, 14 JANUARY, 1857.

**Members Present:—**

Mr. Nichols, | Mr. Irving.

A Quorum of the Committee not being present,—

[Adjourned till Wednesday, 28th instant, at Eleven o'clock.]

WEDNESDAY, 28 JANUARY, 1857.

**Members Present:—**

George Robert Nichols, Esquire, in the Chair.

Mr. Buckley, | Mr. Irving,

Mr. Egan, | Mr. Weekes.

By direction of the Chairman, Resolution of the House, referring to the Committee, on 13th instant, a Petition from certain Merchants and Traders of the City of Sydney, praying for a modification in the Duty at present payable on a Spirit called "Old Tom," read by the Clerk.

Petition then read.

Mr. *Aldis*, Tobacco Merchant, examined.

Committee then adjourned.

FRIDAY, 20 FEBRUARY, 1857.

**Members Present:—**

Mr. Holt,

Mr. R. Campbell,

Mr. Buckley,

Mr. Egan,

Mr. Irving,

Mr. Lord.

Mr. Egan having informed the Committee that, in consequence of severe indisposition, Mr. Nichols would be unable to resume his duties as Chairman.

Mr. Holt was called to the Chair.

The Chairman stated that the present Meeting of the Committee was convened for the purpose of considering the Draft Progress Report, which he now laid before the Committee.

Motion made (Mr. *Egan*) and *Question*,—"That the proposed Draft Progress Report be now read"—*agreed to*.

Report read accordingly.

Committee deliberated thereupon.

Motion made (Mr. *Buckley*) and *Question*,—"That this be the Progress Report of the Committee"—*agreed to*.

Chairman requested to report progress to the House, together with the Minutes of Evidence.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

SELECT COMMITTEE

ON THE

CUSTOMS' DEPARTMENT

WEDNESDAY, 26 NOVEMBER, 1856.

Present:—

MR. BUCKLEY,		MR. IRVING,
MR. EGAN,		MR. LORD,
	MR. NICHOLS.	

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

Lieutenant-Colonel J. G. N. Gibbes, Collector of Customs, called in and examined:—

1. *By the Chairman*: You are Collector of Customs for this Colony? I am.
2. When were you appointed? I think I took office here in April, 1834.
3. Were you appointed to the office of Collector originally? I was. I have been thirty-seven years a Collector.
4. By whom were you appointed? By the Lords of the Treasury.
5. Were you appointed by Commission? Yes.
6. At the time you were appointed was there a Comptroller of Customs as well? There was. It was in Jamaica I was first appointed.
7. When were you first appointed in this Colony? I do not recollect the month, but it was towards the end of 1833. I sailed in November of that year.
8. You have continued to fill the office of Collector of Customs from that time in this Colony? I have.
9. What salary was attached to the office when you were originally appointed? £1,500 a year were the emoluments.
10. What do you mean by the emoluments? The officers in Jamaica were paid by fees established by the Legislative Assembly; a salary was paid, a very small one, from England; but the emoluments of the office depended on fees collected there, which fees were established by the House of Assembly.
11. What was the salary or emoluments when you accepted office in this Colony? £1,000 a-year.
12. And no fees? No fees.
13. You have continued to receive the same salary since that time, with the exception of the short period during which the Gold Increase has been given? I have.
14. You were formerly responsible to the Commissioners of Customs? Yes.
15. You transmitted all your accounts to England for the purpose of being audited and finally settled? Yes.
16. At what period of time was the Customs' Department handed over to this Colony? On the 1st October, 1852.
17. Has any alteration taken place in the general management of the Customs' Department since that period? No, not any, that occurs to me.
18. In what way was this transfer of the duties of Customs made to the Colonial Government—by whose direction? By the direction of the Secretary of State. To the best of my recollection, he wrote out to the Governor General, to desire him to fix a time for transferring the Customs' Department from the Home Authorities to the Colonial Government. Mr. Merewether, the then Auditor General, and myself, were directed to report upon it, and we fixed the 30th September, 1852, as closing our connexion with the Home Government.

Lt.-Col.  
 J.G.N. Gibbes  
 26 Nov., 1856.

Lt.-Col.  
J.G.N. Gibbes  
26 Nov., 1856.

19. From that time up to the present the Customs' Department has been under your management as before, but you are now responsible to the Colonial Government? Yes.
20. How have the accounts of the Customs been audited since that change? By a gentleman in the Auditor General's Office, appointed expressly for that purpose.
21. How often does the audit of the accounts take place? I believe it is almost constantly going on; I get queries from the Audit Office upon the accounts at all times.
22. *By Mr. Lord*: The accounts are not audited in your Office? No.
23. *By the Chairman*: I presume you make a periodical return of all matters connected with the receipt of Duties of Customs to the Auditor General? Every week.
24. And that audit is constantly going on, week by week? No. We send to the Audit Office an account of the moneys received each week, and the receipt for the money from the Colonial Treasury; but there is no audit on that. Once a quarter we send in the general accounts of the department to the Audit Office, and, of course, it takes a certain time to get them up; from the nature of the business of the department, we cannot send in our accounts for each quarter immediately on its conclusion; it takes some four or five weeks in the next quarter to close them.
25. Then the audit takes place quarterly? Yes.
26. The final audit? The final audit.
27. On the accounts being deemed satisfactory, you receive a discharge from the Auditor General, I presume? I have not as yet, but I think I ought to have one.
28. *By Mr. Lord*: How are the accounts kept in your Office, by single or double entry? By single entry. The nature of our accounts is peculiar, and I somewhat doubt if they could be kept by double entry.
29. *By the Chairman*: At the present time are there any accounts in arrear that have not been audited? Yes.
30. During what period have those arrears been standing over? Perhaps not above two quarters; and perhaps it is right to say, that that arises in some measure from the queries that are sent to us upon the accounts, and which sometimes give a little trouble, as to the explanations to be given. Of course, they cannot complete their audit until these queries are answered. In other cases, again, perhaps four or five quarters back, on re-examination of the accounts, fresh queries are received upon them. I could not tell you, without reference, to what period any of the quarters are finally audited.
31. Did you receive any letter of instructions from the Commissioners of Customs in England at the time of the transfer of your department to the Colony? There were letters on the subject, but I do not recollect any particular instructions.
32. Have any general instructions been issued by the Colonial Government as to the conduct of the officers of the department since the transfer. No.
33. Was it not customary for the Commissioners of Customs to issue general regulations, from time to time, as to the mode of conducting the business? They seldom made any change as to the mode of conducting the business, but we had printed instructions as to how the duties were to be carried on.
34. No such instructions have been given since the matter fell into the hands of the Colonial Government? They have not.
35. You furnished last year a return of the persons employed in your department? Yes.
36. That return was correct up to the time of its date? Yes.
37. You can easily furnish an additional return shewing the alterations that have taken place since that return was made? Yes, with great facility. (*The witness handed in the same. Vide Appendix A.*)
38. In what way are the hours of attendance at the Custom House regulated? They were regulated by instructions from the Lords of the Treasury, and we have continued to follow those instructions. In the indoor department the hours are from ten o'clock till three, according to the Treasury instructions, but the office is seldom or never closed before four o'clock, and the generality of the clerks are there about half-past nine. The original instructions fixed the hours from ten till three, which are the hours throughout all the British Colonies.
39. *By Mr. Lord*: The office is closed to the public at three o'clock? We do not close it, but we are entitled to do so.
40. *By the Chairman*: You are not bound to keep the office open after three o'clock, according to these regulations? No.
41. And it is under those instructions you now act? Yes; we follow the rules we have always hitherto followed.
42. What are the proper duties attached to your office? The superintendence of the whole department; carrying on the correspondence; receiving people—which, in fact, is almost the greatest portion of my duty—people who come on references made to me, sometimes to settle disputes between them and the officers of the department, at other times for instructions how to act under particular circumstances; the taking of bonds; signing of clearances; and a variety of other matters.
43. Who is the person who receives the money of the Customs' Department? The second Clerk, or Cashier, Mr. Maddocks.
44. I suppose he is specially employed for that purpose? Yes; it occupies his entire time, I may say—that and taking certain bonds.
45. To whom does he account for the receipt of the money? Of course he accounts to me. Every Saturday he produces his book shewing the sum total of the money received, in order that I may draw a cheque to hand it over to the Treasury.
46. *By Mr. Irving*: Does he keep an account at the Bank? No, I keep the account at the Bank.
47. It is paid in to your credit? It is paid in to my credit, daily.

48. *By the Chairman:* And on Saturday you check the account? Yes. We used to pay the money over to the Colonial Treasury every Monday, and it was a much more convenient plan than the present one, which was adopted on the suggestion of Mr. Merewether, the then Auditor General. We now pay on the days on which the Auditor General strikes his balances—the 7th, 15th, 23rd, and the last day of the month. When we paid on Mondays we did not include the receipt of the day; but the previous Saturday's receipt.

Lt.-Col. J.G.N. Gibbes  
26 Nov., 1856.

49. *By Mr. Irving:* You closed with the previous week's receipt? Yes.

50. What became of the money during the week under the old plan? It remained in the hands of the Bank.

51. You paid it in daily? Yes. Formerly, when I first arrived, I only drew out the money once a month, but now I draw it out in the way I have just described. Formerly, I only paid the Treasurer once a month; now I pay the money four times a month.

52. *By the Chairman:* In what way are the accounts of the Cashier checked? In a variety of ways. The moneys received are entered in the Collector's cash book at the time they are paid; and at the end of the day, the cash is carried to the Bank and lodged to account of General Customs' Revenue. These moneys are paid by Bills of Entry in triplicate. One is kept by the Collector; a second is sent to the Landing Surveyor, who enters the amount in his cash book, and each day that cash book is compared with the Collector's cash book, whereby, if any error is made, it can be immediately corrected. But there is a further check, and that is by the third Bill of Entry, which is sent to the Landing Waiter as his warrant for the landing of the goods on which the duty has been paid, which bill comes back with the Landing Waiter's book when the vessel is discharged, to the Jerquer at the Custom House, who re-calculates the duty and certifies to their correctness. At the end of every seven or eight days, a further comparison is made by the different rates and amounts of duty being entered in separate Abstracts, and the sum total paid over to the Colonial Treasurer, one of whose receipts is kept by the Landing Surveyor. The different accounts are checked by examination; for instance, the imports are checked with the Warehouse accounts, to see that the duties on all the different articles delivered from the Warehouse have been paid; and then again there is another check on the exports, to see that nothing has gone out that has not been accounted for in the Warehouse.

53. *By Mr. Irving:* Whose duty is it to check these accounts? It is the duty of the Warehouse-keeper; and the clerk's who keeps the import and export accounts.

54. I understood you to say that they entered in their books, each of them, the bills of entry passed for the goods—but is it their duty to go to the Cashier, and say "we want to examine your books, and see that they are correct"? No.

55. Whose duty is it to examine the two books, the clerk's and the Cashier's, to see that he has accounted for all the moneys that have been paid over to him? It is the duty of the Landing Surveyor and the Chief Clerk, not of the Cashier; he does not take any part in that. There is his book which is balanced daily, and which I look over to see that all is correct—that he has received the whole of the duties; and I, of course, lodge these duties daily in the Bank, and draw them out as I have said. No mistake can arise, except upon a miscalculation, with regard to an entry.

56. Suppose four people pay the duties on different importations, to whom do they pay the money? To Mr. Maddocks, the Cashier.

57. The same entry is made by another party, as I understand you? No. If you wish to take anything out of bond, or to pay the duty on anything landing from the ship, you may pass the entries yourself, if you think proper, but a Custom House Agent is generally employed; he draws out three bills of entry at once for the goods—one is written in words at length, the other two in figures.

58. Whose duty is it to take that entry on the part of the Customs? Mr. Maddocks'; the three entries are presented to him at the time the duty is paid.

59. Who receives the money? He receives the money; he ascertains that the calculations are correct, and, having done so, he signs the documents, and gives one to the party, that he may go to the Warehouse-keeper, who then gives a locker's order for the delivery of the goods if they are in bond; if on the ship, it is taken at once to the Landing Waiter, who then allows the goods to go.

60. Will you explain the check on the Cashier? As soon as these entries are laid before him, and the money paid, he signs them, and immediately enters them in his book; they are all numbered from the beginning of the month from one to several thousands, and, therefore, no intermediate entry could be put in; nor could any be abstracted, in consequence of the numbers. The main check is that the Landing Surveyor keeps a book of his own from these entries, and at the end of the day, or the next morning, at any rate, these two books are compared.

61. *By the Chairman:* By whom? By the Landing Surveyor and Chief Clerk.

62. *By Mr. Irving:* Was any one appointed to check these books? No. The Chief Clerk looks over them every day, but he has not been officially appointed to check them.

63. *By the Chairman:* What are the duties of the Chief Clerk? They are very considerable; He overlooks all the other clerks in the office; conducts the correspondence, although, in some special cases, I myself draw the rough drafts of the letters, but by no means always, and he drafts those that I do not; he keeps the imprest cash book, or ledger, in which all the moneys other than duties are entered, and all the moneys paid, separately from the other books I have alluded to.

64. I presume the ledger, or imprest book, is kept on a plan directed by the Lords Commissioners of Customs? Yes, on the same principle; but I may say it is an improved plan; for, formerly, the Cashier not only kept in his book the account of duties received, but he kept, also, on the other side, an account of the imprests, and the payments made. That, however, was found eventually to lead to a great many mistakes and inconveniences, and it is now separated, the Chief Clerk, Mr. Llewellyn, keeping that account taken from the Cashier; he

Lt.-Col. he keeps the account of the imprests issued by the Treasury to me, and also the whole of  
 J.G.N. Gibbes the expenditure. But the books can, of course, be sent, and they will afford a more satisfactory  
 explanation.

26 Nov., 1856.

65. I presume you could furnish the Committee with a return of the gross amount of Customs duties received since the first of October, 1852, shewing also the cost of collection. Yes. (*The witness handed in the same. Vide Appendix B.*)

66. What are the duties of the Landing Surveyor? He is the head of the waterside department, and he has the overlooking of all the officers of that department, viz., the Landing Waiters, Coast Waiters, Lockers, and various other persons; he has to go round to the different ships and warehouses to see that they are all present in the due performance of their duties. Besides keeping the cash book I have alluded to, he has, to a certain extent, to settle all disputes that arise on the spot; if any difficulty arises with regard to the landing of goods, a messenger is sent to the Landing Surveyor, and he goes and rectifies any mistake or any difficulty, and if that cannot be done it is, of course, referred to me.

67. Has he the control of the Tide Waiters? No; they are under the Tide Surveyor. He has the control of the Lockers as well as the Landing Waiters, and, in short, the superintendence of the Bonded Warehouses. The truth is that he has more to do than any individual can do properly. I could give you a list of the duties of the different branches, but such list will not give a perfect idea of the work to be performed. (*The witness handed in the same. Vide Appendix C.*)

68. From your long experience, do you think the expense of collection could be reduced in any way? I do not think it can much. There are two officers that are no longer necessary, certainly—the Baggage Searchers. These appointments arose from a representation to the Governor General, in Sir Charles Fitz Roy's time, from some highly respectable party, that a great deal of smuggling was carried on by means of the baggage of passengers coming from California; and there was a particular case in which a very large quantity of tobacco was got ashore in that way. In consequence of this, two Baggage Searchers were appointed—one for Darling Harbour, and one for the Circular Quay; and for a little time they were found very useful; but there is nothing of that kind going on now, that I am aware of.

69. *By Mr. Buckley*: Is it likely to be commenced again in the event of their being dispensed with? No; because there is not the same amount of communication with California now, nor are the passengers who come from there of the same class as before.

70. *By the Chairman*: The Sub-Collector at Albury has been discontinued? Yes; the Customs' establishment there is broken up.

71. And the establishment at Watson's Bay is broken up? Yes; it was broken up at my suggestion.

72. How are the Tide Waiters appointed? By myself.

73. How are they paid? They are paid as they work; if they are not employed they get no money, but as long as they are employed they get twelve shillings a day. They remain on board ships to see that nothing is taken out of them without my warrant. There are four Tide Waiters, called established Tide Waiters, who were appointed by the Lords of the Treasury. The other men are called extra Tide Waiters, from the circumstance that they are only employed when actually required.

74. *By Mr. Buckley*: Are there many persons employed in the same capacity at the out-ports? At Newcastle there is one, and one at Moreton Bay; but in consequence of their being, as I have said, on the system of no work no pay, their names do not appear on the list of the establishment.

75. *By the Chairman*: Who pays them? I pay them, as I pay the rest of the department.

76. Is their pay made a charge on the shipping? No; there is no charge on the shipping, unless they exceed a certain number of days, and then the charge falls upon the shipping.

77. *By Mr. Buckley*: Is there any extra charge in the event of their exceeding the number of hours allowed for unloading by the regulations? Not to the Government. There is a charge made for extra time.

78. To whom does it go? The Landing Waiter gets one shilling an hour on each £100 of his salary; for instance, if a man has £300 a year he gets three shillings an hour for his attendance during his own time, that is, either before nine in the morning or after four in the afternoon.

79. That is his perquisite? Yes; it is allowed regularly by the Board of Customs, under the authority of the Lords of the Treasury.

80. It does not come under cognizance of the department? Not exactly, but the ships cannot discharge, or the officers attend, at extra hours, without my permission.

81. *By the Chairman*: Are the Tide Waiters paid in the same way in England? Yes.

82. Are none of them paid by salary? None here. Some of them at home have £5 a year as salary. I cannot exactly state it as a fact, but I believe the highest pay to any Tide Waiter in England is £30 a year. At Liverpool and London the Tide Waiters are divided into classes; the higher class receive as much as £30 a year, and it varies down to £5; but at my own port in England, no Tide Waiter received more than £5 a year as salary.

83. What are the duties of a Tide Waiter? His duty is to guard against smuggling. He receives a copy of the manifest of the ship, and enters it in a book, which he keeps for the purpose; all the goods are entered therein, and these he ticks off with the pen when they go over the side of the ship.

84. He is under the control of the Tide Surveyor? Yes.

85. Do you think the Tide Waiters are of any use in checking smuggling, bearing in mind the pay they receive? Yes, I do. The men employed here are a very superior class to those in England. The Tide Waiter's pay in England is only two shillings and sixpence a day.

86. Have any regulations been issued for the guidance of these Tide Waiters? No printed regulations, but when they are appointed the Tide Surveyor explains to them the nature of  
 the

the duties they are expected to perform; and, in fact, they are generally put on board at first with another Tide Waiter, in order that they may learn the duty. No doubt it is an exceedingly idle berth, but it is one, to my mind, absolutely indispensable. Perhaps I cannot better explain it than by saying, that in England every ship has two Tide Waiters put on board to keep watch and watch, night and day, and to every ship there is a Landing Waiter; now, here, my Landing Waiters have sometimes five ships at the same time to take charge of, and we only board single from economy, but of course that man cannot keep watch night and day—he goes to bed at night—but still we have had instances of his being disturbed in the night and finding something wrong going forward. In England the Landing Waiter keeps a book to mark off everything that goes over the side, but no man can keep five books, as would be necessary in the case I have alluded to, for to do so he must see every package come out of the ship before he can tally it off in the book. I have thought well of it, and if you do away with the Tide Waiters you must have a Landing Waiter to each ship, which would be certainly much more expensive, as their salaries range from £200 to £400 a-year.

Lt.-Col.  
J.G.N. Gibbes  
26 Nov., 1866.

87. Are Tide Waiters put on board all ships, or only on board ships having dutiable articles on board? Generally speaking, they are put on board every ship at starting; but in some cases, as, for instance, vessels with cargoes of timber and flour, they are withdrawn, after the Tide Surveyor has made a proper rummage of the ship, and examined the account of the stores, and found that it tallies with the stores in the store-room.

88. Is it the duty of these Tide Waiters, where there are dutiable articles on board, to seal the hatches at night? No, we never do.

89. Is not that done in England? Very seldom, I think. Of course, as I have been here so many years, I cannot speak positively. At Hobart Town it is done, because the cove there is so small that an officer can go round every night and seal the hatches, and then they have no Tide Waiters. It is, after all, in my opinion a very uncertain way of securing the revenue, for the generality of ships have some means of access to the hold from below.

90. *By Mr. Buckley:* Have the parties who are appointed Tide Waiters generally respectable references? Most of them have.

91. *By Mr. Lord:* Their hours are from ten to four o'clock? Yes; but they sometimes unload till six, and they then receive pay at so much an hour, as I have mentioned before. But I have, in a great measure stopped the unloading till six, and made it five o'clock, because the parties interested differ so much in their views on this point; of course the agent of the ship wishes the working hours to be prolonged as much as possible, but the consignees are anxious to have them concluded sooner, for fear of having their goods left on the wharf all night.

92. *By the Chairman:* The Tide Waiter is generally fed by the master of the vessel, is he not? He is, but it is not obligatory. According to law the master of a ship is only bound to find the Tide Waiter with a proper place to sling his hammock; but it has always been the practice here to give the Tide Waiter two or three meals a day; in fact they would be starved if it were otherwise, for they are not permitted to leave the ship even for ten minutes.

93. Some cases have occurred, I believe, in which you have dismissed them for doing so? I have dismissed several for that reason.

94. Have you been compelled to dismiss any of the Tide Waiters or Landing Waiters for being intoxicated on duty? I have, the former.

95. Many of them? Not many, perhaps two or three. I have let it be understood, that if any man is reported to me as being intoxicated on board ship, he will that moment be dismissed.

96. *By Mr. Irving:* In any case, have you taken back a man after having dismissed him for that cause? There was one man who had not been exactly dismissed for drunkenness, but for neglect of duty, and I did restore him, after being exceedingly teased to do so; however, he was afterwards found to be drunk on board ship, and I dismissed him finally.

97. *By the Chairman:* Who regulates the practice in the long room at the Custom House? I may say I do myself entirely.

98. Have any written instructions been given to the clerks? None from the Local Government; and it was rather a strange thing, that when we were turned over to the Colony the Board of Customs desired me to send back every man's instructions. These instructions were in printed books; they have them in thousands, in fact, in the London Custom House, and they are issued to each officer, according to his grade. When the Customs' here were handed over to the Local Government these instructions were called in by a direct order.

99. *By Mr. Buckley:* Did you retain any copy of them? I think I may have some copies.

100. *By the Chairman:* You say the long room is regulated by yourself? Yes.

101. I suppose it is immediately under the Chief Clerk? Yes, it is under his general superintendence.

102. What is the latest hour for receiving money at the long room? The hour for ceasing to take money is half-past two, for this reason, that it takes the Cashier at least half an hour to make up his account, and the Bank will not take the money after three o'clock. The Cashier does not go away until half-past three or four o'clock.

103. In what Bank do you make your deposits? For many years past we have placed all moneys in the Bank of Australasia; but by a recent order, since Responsible Government has been established, the Bank has been changed for the imprest account, which money is now deposited in the Australian Joint Stock Bank. The Revenue is still lodged in the Bank of Australasia.

104. Do you not think that any of the Banks, in dealing with a public office like the Customs, would receive the money at any time before four o'clock? No; they will receive the money, but they will not give a receipt, nor will they carry it to account; they will not be responsible for it.

105. At what hour do the Bonded Stores close? Four o'clock?

- Lt.-Col.  
J.G.N. Gibbes  
26 Nov., 1856.
106. Do you not think great inconvenience may arise to a person wishing to take out bonded goods if he cannot pay the duty up to the time when the stores close? It is his province to take care to come to the Custom House and get an entry passed for whatever he wants in time.
107. Would it not afford additional facility to the public if the money could be taken, say up to three o'clock? No doubt it would.
108. *By Mr. Irving:* Do you find practically that the hours for receiving money are too short for the public? I do not think so in a general point of view. It frequently happens on Saturdays that after the Cashier has closed his account, money is tendered in payment of duty, and in such cases I always take it personally; but it is not carried to the account of that day, it is made the first entry for the following day.
109. *By Mr. Buckley:* Do you think any advantage would be derived by the public in the event of the hours being extended? There might be some advantage in a few isolated cases, but not in a general point of view.
110. *By Mr. Egan:* Has it not been the case that persons have been there at a quarter to three o'clock with their entries and their money, and upon their presenting it, it has been refused? It may have been the case.
111. Do you not think great inconvenience may arise in cases where teams may be detained for want of goods which cannot be had on account of this rule? In all cases of that kind where it is shewn to me that inconvenience will arise, I always take the money myself, to prevent teams being detained.
112. Could not the course adopted by you in these cases be followed by the Cashier in the long room, as a general rule? No, because the money taken after the proper hour would lead to confusion in the Cashier's accounts. There is a great deal of difficulty in that way.
113. Do you not think that one out of the number of Banks might be found to receive the money, and carry it to account at a later hour, for the sake of the balances? I am not at all prepared to give an answer to that question, but my idea is, that it is of no great value to the Bank; I do not see that one week's receipt can be of any material consequence to the Bank.
114. You always keep a large amount in the Bank? Yes, but only for six days; we lodge £1,000 to £1,200 a day, perhaps.
115. There is never less than £1,000 and there may be £10,000? Yes, seldom less than £1,000.
116. *By the Chairman:* Are there any rules for promotion in your department? In most of the Government Departments the clerks have been classed, and they get a yearly increase of salary, according to their class, but they have never been classed in mine, and the salaries are therefore fixed. However, the junior clerk is usually as respectable a man as the senior, or at all events is supposed to be so; and I have made it a rule, whenever a vacancy occurs, to promote from the bottom to the top. I do the same with all the officers of the department. If the office of senior Landing Waiter becomes vacant, I recommend the next to step into his shoes, and so on down to the bottom, leaving only a small appointment to be filled.
117. Is there any regulation with respect to superannuation allowances—is there not something of the sort in the case of those appointed, like yourself, by the Lords of the Treasury? We are all entitled to superannuation from England, not from this Colony.
118. Is there any regulation on that subject in this Colony? No, I believe not. If a Colonial appointment has been sanctioned by the Lords of the Treasury, the holder then becomes entitled to superannuation. But I believe none is allowed for any period of service within ten years.
119. Since Responsible Government has been introduced, no alteration has taken place in the appointment of clerks? None.
120. *By Mr. Buckley:* What course is generally pursued when an officer obtains leave of absence, say for two years? The officer going on leave receives only half his salary, the other half being given to the party who acts for him; and if that party is in the department, he again gives up half his own proper salary to the person who acts for him.
121. Are you aware whether in any of these cases there has been any understanding between the parties, different from the regulation? It has not come to my knowledge.
122. *By the Chairman:* Are there any official regulations with reference to the appointment or promotion of officers in your department? No, none.
123. There is a rule in England, I believe? In England it is very different. Everything is done by the Board of Customs themselves. The Custom Houses are so numerous and extensive there, that men are taken out of one establishment to fill vacancies in another.
124. Are you aware whether that is done by the Treasury in England? No; I think it is done by the Board of Customs.
125. At all events the Board has a veto? Yes.
126. *By Mr. Egan:* If an officer obtains leave of absence, do you ever fill his place by some person not connected with the department? No; the duties are generally performed by the next in rotation.
127. Granting leave of absence does not increase the expense to the Government? Not at all.
128. *By the Chairman:* You sometimes regulate the promotion by the merit of the officer? Yes; but, in the upper branches, I have generally followed the rule of seniority.

## APPENDIX A.

## A RETURN of the Persons employed in the CUSTOMS' DEPARTMENT.

NAME OF THE PARTY.	WHEN APPOINTED TO THE CUSTOMS' SERVICE OF THIS COLONY.	NATURE OF OFFICE.	BY WHOM APPOINTED.	SALARY. (Temporary increase included.)			LENGTH OF SERVICE IN THE CUSTOMS' DEPARTMENT, NEW SOUTH WALES.

\* The total amount collected in the year 1852 was £217,025 5s. 6d.

APPENDIX C.

STATEMENT shewing the Duties performed by the Collector of Customs, and the Clerks in the Customs' Department, Sydney.

The Collector, though so called, does not collect the moneys himself, his duty being the superintendence of the whole of the Department in Sydney, at which Port there are seventy-seven persons under his orders.

He is, according to the instruction of the Board of Customs, to attend in his office at the Custom House from 10 to 3 o'clock; and in cases of emergency, for such further time as may be necessary for the despatch of the current business.

To see that the Officers and Clerks sign an Appearance Book, in the morning and evening of every day, showing the precise time of their arrival and departure, which book is signed according as they arrive, and not according to rank or grade, and initialled by him.

He superintends the registering of all vessels; all bills of sale on transfer of vessels, and all certificates of registry, are declared before and signed by him; all changes of masters are endorsed by him. His office is open at all times, during office hours, to all comers.

He has to decide when registry *de novo* shall take place, and when it cannot; and is repeatedly called on to settle disputes between parties as to titles, &c.

In fact, the greater portion of his time is taken up by references made to him, and by interviews with merchants, and others, on business relating to the Service.

He signs his name four times to all debentures for drawback, which are very numerous. He examines and signs all clearances of vessels, except those coastwise.

He occasionally visits the Bonding Warehouses, to see that the regulations in regard to them are carried out. In fact, superintends the whole business of the Department.

He is, to a certain extent, still retained as an Imperial Officer, under the appellation of Comptroller of Customs and Navigation Laws; and transmits, quarterly, to London, Returns of all Imports and Exports, and of all Shipping.

He prepares at certain times the probable Estimate of Expenditure of his Department, and probable amount of Customs Revenue to be received for the year ensuing—and has, hitherto, been tolerably correct in those estimates.

He receives no pay for his Imperial services, nor does he derive any advantage therefrom in any way.

The Chief Clerk is engaged in carrying on the correspondence of this Department, and in the performance of this duty he has to read all letters on their arrival, and to prepare memoranda for the Collector's information, so that answers may be given to the same. Chief Clerk.

Besides the correspondence with the Principal Secretary's, the Treasurer's, and other Government Offices, and the out-ports, there is that with the Boards of Admiralty, Customs, Light Houses, and with the Board of Trade (Marine Department.)

He keeps the \*Imprest Cash Book, and Seizure Accounts, and Postage Account.

He attends to the Out-Ports. He passes, and pays, all salaries and accounts.

Each cheque which is drawn has to be copied three times, besides the original.

The 2nd Clerk receives the revenue on all dutiable goods, to do which he has to check, examine, and pass all entries liable to duty (which entries are passed in triplicate). 2nd Clerk and Cashier.

241—C He

\* Containing accounts of all payments, viz.—Salaries, Drawbacks, and Tradesmen's Bills, &c.

- Lt.-Col.  
J.G.N. Gibbes  
26 Nov., 1856.
- He keeps the Cash Book, into which each entry, with the number, the merchant's name, and the amount of duty, is entered.  
He forwards the Collections to the Bank at the close of each day, to be credited to the Customs' account.  
He receives the Manifests, and other documents, of all vessels arriving, which he examines and compares with the Master's Reports Inwards, after which he takes their declarations.
- 3rd Clerk.
- The 3rd Clerk has to record Bills of Sale in the Book of Ships' Registers; and he prepares the Declaration and Bond before a Register is granted; he then makes out the Certificate of Registry, enters it in the Register Book, makes a copy of the Certificate for the Commissioners of Customs in London. He keeps a copy of all Transfers, Mortgages, Re-assignments, &c., and Changes of Masters, in a book kept for that purpose; records them in the Register Book, and endorses them on the Certificates of Registry.  
He prepares a monthly account of Transfers of Property and Endorsements of Changes of Masters, for the Commissioners of Customs; he also prepares a list of all Certificates of Registry that have been granted and cancelled at this Port, once a month, which is forwarded to the same authorities.  
He writes letters to the different Ports of Registry on any change of ownership or masters, and he enters in Register Book all changes of masters.  
He keeps a Return of all Steamers, and forwards every half year a copy (in duplicate) for transmission to the Secretary of State.  
He also prepares the following Returns and Accounts:—  
A Return of vessels built and registered during the year.  
An Account of the number of vessels belonging to this Port which have been registered, with their tonnage, and the number of men and boys by whom they are usually navigated, distinguishing such of them as have been lost, broken up, or otherwise destroyed, sold to foreigners or registered *de novo*—this account is forwarded to the Commissioners of Customs once a year.  
An Account of Gold Exported—a Return of which is forwarded (in duplicate), once a quarter.  
A Return of all Boats licensed.  
The number of vessels registered in this Port for the last year (1855) was 132; the number of transfers of property, mortgages, re-assignments, &c., for the same time was 273.
- 4th Clerk.
- The 4th Clerk keeps the Export Journal, containing an account of the goods shipped on all vessels outwards.  
He examines and passes all drawback Debentures, and certifies to their being correct.  
He keeps a Quarterly Statistical Return of all goods exported, a copy of which is forwarded to the Customs Department of London; and he also compiles the Return of Exports for the Blue Book once a year.  
He prepares the Revenue Returns for Audit Office and Treasury.
- 5th Clerk.
- The 5th Clerk compiles the Quarterly and Annual Returns of Imports.  
These Returns are of the most troublesome description; every item has to be taken out of each entry separately.
- 6th Clerk.
- The 6th Clerk checks all the entries that have been passed with the Ships' Manifests, both duty and free, averaging 5,000 a month; and he sees that every thing is accounted for in accordance with the masters' reports at the time of entering.  
He jerques all the Landing Waiters' Books, together with those of the Tide Waiters; and sees that all the goods reported agree with the papers issued to the different ships at the Ports from which they sail for this place.  
He makes up and labels for reference all the documents of each vessel by themselves.  
He issues all Post Notes for outstanding duties, arising from Prime Entries.  
He keeps the Book of Ships Inwards, and prepares the Quarterly and Annual Returns of them.
- 7th Clerk.
- The 7th Clerk prepares the documents connected with the clearing of all vessels outwards.  
When a London ship clears, an extra Certificate is attached, shewing the Produce of New South Wales.  
He clears all coasting vessels, and compares their transires with the Cargo Books, and he then signs them.  
He numbers, examines, and signs all Export Entries, and enters them in a book.  
He keeps the Book of Ships Outwards, and prepares the Quarterly and Yearly Returns of them.  
He attends to the provisions of the Passengers' Act, 18 and 19 Victoria, cap. 119.
- 8th Clerk.
- The 8th Clerk corrects the Landing Waiters' Gauging Books, Red Books, and Regauge Orders. He also assists the Warehouse Keeper.
- 9th Clerk.
- The 9th Clerk is wholly employed in the Warehouse Keeper's office.
- 10th Clerk.
- The 10th Clerk copies all official letters. He prepares a Monthly Return of Drawbacks, Incidental Payments, and an Account Current; also the Abstracts of Officers' Salaries (monthly.) He checks the Boatmen's, extra Tide Waiters', and Messengers' Abstracts; he also prepares the following Returns:—The Yearly Return of the Officers, Clerks, and others employed in the Department; a Return of the state of the Officers' Securities (yearly); a return of the Duties levied on Articles Imported—in triplicate, yearly, for the Secretary of State.—He keeps up the Indexes, and the Landing Surveyor's Check Cash Book of Collections.
- 11th Clerk.
- The 11th Clerk is wholly employed in the Warehouse Keeper's office.

*A STATEMENT of the duties performed by the Out-Door Officers of the Customs' Department, Sydney.*

Lt.-Col.  
J.G.N. Gibbes

The Landing Surveyor has the supervision of all the Waterside Officers, and he has 26 Nov., 1856.  
Landing Surveyor.  
to apportion the duties of each, and to visit daily the several places appointed for the landing of goods. He has to adjust all Tares; to check the Gauging and Weighing, and to see that the proper duties are charged by the Collector, and to certify to the correctness of the collections. As the Surveyor of Warehouses, he has to visit all the Bonded Stores daily, so as to ascertain that the Lockers are in attendance. He has also to examine the Stowage, and to survey all Ullage or empty casks that are occasionally discovered.

The duty of the Landing Waiters is, to attend to the discharge of the vessels to Landing Waiters.  
which they are appointed, (sometimes 4 or 5 to each officer.) To examine and open any doubtful packages, and detain any articles in them subject to duty, which may have been entered as free. To gauge all spirits and wines, whether duty paid or for Bond, that may be landed on the wharf at which they are stationed, whether from their own ships, or from others which are landed in Lighters. To weigh all tobacco and cigars landed in the same way. To attend to the shipment of all goods for Drawback; if for wine, to gauge it the same as on landing; if sugar or coffee to weigh them. The Landing Waiters also prevent goods from being landed which are not properly reported, and duly entered. On the completion of the landing of each ship's cargo, the Landing Waiter has to forward his Book to the Jerquer for examination, so that all matters connected with the cargo may be adjusted, and that all the Post Entries may be passed.

The Tide Surveyors board all vessels on their entering the Heads; examine the mani- Tide Surveyors.  
fests, and ship's papers; take an account of the name of the vessel, name of the Master tonnage, time of sailing, and where from, with names of passengers, and of Agent for vessel, as required by the Customs' Regulations, and in order to prepare the Shipping Reports on returning to Sydney, for the Governor General, Colonial Secretary, and Immigration Agent. They have to measure all ships for Registry, to allot the ships which are to be boarded after arrival to the different Extra Tide Waiters. To visit some of those vessels every night at uncertain hours, to see that the Tide Waiters are at their posts. To Jerque the ships when discharged, and take off the Tide Waiters. To appoint Officers to take charge of goods to be exported.

The Warehouse Keeper has charge of the Stock Book, in which he records all goods The Warehouse Keeper.  
warehoused, and writes off all deliveries from the same. He makes out Despatch Notes containing particulars of goods shipped coastwise; compares all entries with Stock Book for the correct quantities and strengths, whether for duty, exportation, re-packing, vating, or otherwise. Makes out (with occasional assistance) all Home Consumption Lockers' Delivery Orders from Bond. Endorses applications for samples. Jerques Quarterly Register; gives the marks and numbers for the guidance of the Landing Waiters, which are placed on packages previous to warehousing. He has charge of the keys of the several Bonding Warehouses, which he delivers to the respective Lockers in the morning, and receives them again in the evening. A large amount of work devolves on the Warehouse Keeper's Office, in furnishing information to the parties whose goods are lodged in Bond.

One of these Clerks has charge of the Warehouse Keeper's Register, in which he Clerks employed wholly in Warehouse Keeper's Office.  
records an account of all receipts into, and all deliveries from the Bonded Warehouses, and he also prepares a copy of the book at the expiration of every Quarter for the Audit Office. He makes out an Annual Return of all goods remaining in Bond beyond the time prescribed by Law. He assists the Warehouse Keeper in cases of emergency.

The other Clerk compares the Warehouse Keeper's daily entries with the Landing Surveyor's. He makes out the Lockers Orders for Exportation for deliveries out of Bond, and enters them in Lockers' Day Book, for the purpose of obtaining their signatures thereto. He arranges daily the Warrants, numerically, for binding. He also assists the Warehouse Keeper when required to do so.

The Lockers receive and take an account of all goods brought to the Bonding Ware- Lockers.  
house under their charge, and also see that they are properly stowed: casks of spirits and wine in not more than three tiers, viz., puncheons and pipes on the floor, hogsheads over them, and quarter-casks or octaves on the top, so as to prevent the leakage consequent on pressure.

The Lockers re-gauge and re-weigh all goods for duty; they deliver all goods for exportation and for Home Consumption, and enter the same in the Stock Book belonging to the particular Store from which the goods have been removed. These Officers superintend the delivery of samples in accordance with the Collector's orders.

The Coast Waiters stationed at Broken Bay and Botany Bay, are employed for the Coast Waiters.  
protection of the Revenue.

The duties of the Coast Waiters in Sydney are precisely the same as the Landing Waiters.

The established Tide Waiters attend to the export duty, and frequently to the Tide Waiters.  
shipment of goods for drawback. At times, when the Melbourne steamers are in, and other vessels taking in Bonded Goods, and when, at the same time, there is more than they can attend to, it is necessary to put on duty extra Tide Waiters.

An extra Tide Waiter is boarded on every ship which brings goods liable to duty. Extra Tide Waiters.  
A book is given to him by the Tide Surveyor, in which the particulars of the cargo is entered. His province is to attend to the landing of the goods after a warrant has been issued to him for that purpose, and to tick them off in his book as they are put over the side of the vessel during the hours of discharge, from 9 o'clock A.M., to 4 o'clock P.M. In the event of any dispute or difficulty arising, he applies to the Landing Waiter on the wharf.

He remains on board until the cargo is out, or at any rate for twenty days, at the expense of the Government, after which, should the vessel be a longer time discharging, he is paid by the ship.  
When

Lt.-Col. J.G.N. Gibbes receives no pay. When off duty, which happens sometimes for three and four weeks together, he is called a Day-pay Officer; but as it is impossible to know how many ships may arrive, or at what times, it is necessary to have a larger number on the list than is at all times required for duty.

26 Nov., 1856.

The extra Tide Waiters are mostly respectable men, and generally recommended by persons of standing in the community.

They are not allowed to leave their ships at any time, under pain of dismissal. When relieved, their books are sent to the Custom House, to the clerk called the Jerquer, who compares them with the manifests and cockets, and sees that every part of the cargo has been accounted for, and the duty paid where due.

(Copy.)

No. 30½.

Custom House, Sydney,  
27 February, 1855.

SIR,

I beg leave to acknowledge the receipt of your letter of the 23rd instant, No. 31, and in compliance with the directions contained therein, to transmit herewith a Statement of the Duties performed by the several Clerks and Lockers in this Department.

2. With regard to Mr. Llewellyn's appointment, I would observe, that the best explanation I can give is a reference to the correspondence which led to it, copies of which I enclose.

3. There is but little in a name. He was not appointed by the late Governor General as Secretary; and although I inadvertently called him, in my letter of the 29th ultimo, No. 10., Assistant, "or Secretary," it is in the former light which he stands, and his assistance is most necessary to myself.

4. When such an office was but little required, I had a Comptroller to share with me the labour, but just as business was beginning to increase, that office was abolished throughout the Colonies; and although subsequently, the Board of Customs proposed to re-establish it at this port, the Lords of the Treasury never came to any decision about it.

5. My correspondence with the Government is very insignificant. It is with the shipping interests; with the Merchants of Sydney; with the out-ports of Brisbane, Newcastle, Eden, and Albury, and with the neighbouring Colonies, that the correspondence occupies much time, and so little have I to myself, that I have sometimes been unable to get through a single letter of a morning, from the constant interruption of persons coming to see me on business.

6. In fact, mine is peculiarly an office of reference, and one from which I cannot at any time exclude the public. They come to me to sign Bonds, to make Declarations, to settle disputes between the Landing Officers and themselves; to ask advice, or information how to act in cases of difficulty arising from defective bills of sale; the absence of powers of attorney, the loss of ships' papers, or flaws in documents regarding the transfer of vessels, with various other matters, too numerous to describe.

7. Under these circumstances, it will be seen that there are very many things which must be done, and which I cannot always attend to myself; and experience has shewn, that to give them on one occasion to one clerk, and on another day to another clerk, who may happen to have a little spare time, is anything but a desirable system, and one that would lead, and frequently has led, to serious mistakes and confusion; in fact, it is only a clerk of standing, and with a thorough knowledge of the nature of the service, that can be depended on for such purposes.

8. The statement of Mr. Llewellyn's duties will shew the work he has to perform, the most important of which, perhaps, is the charge of the Imprest Cash Book, which has, since he commenced his present occupation, been separated from the Duty Cash Book (kept by the Cashier), and has proved of the greatest possible advantage, preventing the numerous mistakes which were so often before made.

9. The Lockers are, without doubt, numerous; but instead of reducing them, they will, I fear, require to be increased so long as the stock in hand renders the occupation of so many warehouses necessary. Indeed, the present number was established by the late Governor General, in consequence of complaints from the mercantile community of their weakness, and on the application of the Chamber of Commerce.

10. They are, nevertheless, not sufficient in number, and, for the sake of economy, I have for some time been employing three Tide Waiters to act in that capacity, instead of applying for more Lockers.

11. The inference drawn by His Excellency the Governor General is quite correct; the Warehouses, twenty-two in number, being scattered all over the city—but there was no help for it. The importations in 1853 and 1854 were so great that I was compelled to approve of them, wherever they could be found, every old warehouse being filled to the roof.

12. Wherever it can be done, one Locker attends to two and three Warehouses; but the magnitude and extent of business of eight of them renders it necessary to keep those open all day, and a Locker is consequently necessary for each.

13. Herewith I transmit a Return of the quantity of goods that were in Bond on the 31st December last, although within a few preceding weeks, several hundred casks of spirits, and eight thousand four hundred and sixteen cases of brandy, gin, and wine, had been exported.

14. The Colonial Secretary (Mr. Thomson) knows that I have ever studied economy as to the strength of the Department, and that I at one time carried it so far as to be injurious to myself and prejudicial to the public; and that it was only from absolute necessity that it was increased to what it is now.

15. We have frequently thirty ships discharging at the same time along a margin of water of nearly two miles, and to attend to them I have six Landing Waiters and three Coast Waiters (Landing Waiters upon inferior pay); whilst at Liverpool, Glasgow, Hull, and other large Ports in the United Kingdom, the same number of vessels would have thirty Landing Waiters to take charge of them.

16. When I arrived here, twenty-one years ago, the Customs' Revenue was considerably under £100,000 a year, and we had then four Landing Waiters, four Clerks, and one Locker. In 1841 it amounted to £178,921, and there were six Landing Waiters, seven Clerks, and four Lockers. Now, the Revenue is about £400,000 a year, and we have twelve Clerks, nine Landing Officers, and nine Lockers, being an increase only of five Clerks, five Lockers, and three Landing Waiters, in fourteen years.

17. Whatever may be the number of Tide Waiters, it makes no difference to the Government, as they are only paid when occupied.

On my arrival in 1834, there were ten, and until the end of 1852 they never exceeded fourteen.

In 1853 I was obliged to increase them to forty-four, all of which were constantly boarded.

Last year, when a reaction took place, I reduced them to thirty, and they are now fully employed.

18. In the promotion recommended by me, it will be observed that one clerk is proposed to be reduced.

19. I trust that I shall be excused for the length of this letter, but I think it better to give at once all the details I have given, for the information of His Excellency the Governor General, and trust that it will shew him, that although the Department is numerous and expensive, it is not more so than the trade of the place, and the due protection of the Revenue requires.

I have, &c., &c.,

The Honorable  
The Colonial Secretary.

J. GIBBES,  
Collector of Customs.

FRIDAY, 28 NOVEMBER, 1856.

Present:—

MR. BARKER,  
MR. BUCKLEY,  
MR. GORDON,

MR. HOLT,  
MR. NICHOLS,  
MR. WEEKES.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

Lieutenant-Colonel J. G. N. Gibbes, Collector of Customs, called in and further examined:—

- 1. *By the Chairman:* I believe you are the authority for licensing Custom House Agents? Lt.-Col. J.G.N. Gibbes  
I am. 28 Nov., 1856.
- 2. Upon what principle are these persons licensed—by any rule or regulation? By law.
- 3. Are they licensed in pursuance of the Act of Council regulating the Customs Department? They are.
- 4. In what way are the licenses issued to them? They enter into a bond, when they apply to be made Custom House Agents, of £200, with one surety for their good behaviour, and binding them to do what they can for the due protection of the revenue, and to render every assistance in their power to keep things straight and in order.
- 5. Are they furnished with apartments at the Custom House? Some of them are.
- 6. Do they pay anything for the privilege? Nothing.
- 7. Neither for the license nor for the occupation of these apartments? Neither the one nor the other.
- 8. Are you aware whether any of them carry on their own private business as Shipping Agents, or Commission Agents, or anything of that sort in the Custom House? I did understand that on one occasion it was done, but I put a stop to it as far as the House was concerned. The Custom House Agents in London are not found in any accommodation of that sort.
- 9. I suppose it arose from the necessity of the case in this Colony? It did. There is a large room appropriated to their use in the London Custom House, without any other accommodation than a sloping desk running round the room, with inkstands in it. Sometimes there are as many as thirty or forty of them present in this room, performing the business of their clients.
- 10. You license the Bonded Warehouse-keepers also? Yes.
- 11. Do they enter into any bond or give any security? Not any.
- 12. In what way are they licensed—in pursuance of the Act of Council? Yes.
- 13. They make application to you and you grant it or not, as you think fit? Yes, according to the state of the port. The present number of Bonded Warehouses arose from the extraordinary state of trade a few years back, when, owing to the immense quantity of goods imported, we were glad to take any store we could get.
- 14. Do they pay anything to the Government? No.
- 15. It is proposed to put some tax upon them? Yes.
- 16. Do you think that is a proper mode of proceeding? I do.
- 17. Do you think Custom House Agents should pay a fee? I do not think so, although I think it would be no hardship upon them if they were obliged to do so, for I believe it is a lucrative occupation.

- Lt.-Col. J.G.N. Gibbes  
28 Nov., 1856.
18. Do you think they should pay for the occupation of rooms in the Custom House? I think they should. It would be but fair that they should pay. The only objection to tax them on that score would be that we may want the rooms ourselves, and they must go out at any moment. I have been obliged to remove the principal Custom House Agent from the room he occupied into an inferior one, because we could not do without it. When I say the principal Agent, I mean the one who does the largest business.
19. Are there any instructions issued by you for regulating the mode of conducting business by the Custom House Agents? No.
20. Were there any issued by the Commissioners of Customs? I cannot say that there were; I am not sure.
21. Are there any for the Bonded Warehouses? Yes.
22. By whom were they issued? By the Board of Customs. We still go on as if we were under their orders, although we are now entirely under the orders of the local Government.
23. Are these regulations written or printed? Printed.
24. Can you furnish the Committee with a copy? Yes, I believe I can. (*The witness handed in the same. Vide Appendix A*). We are not as stringent here as they are in England: there they will not allow different articles to be bonded in the same room.
25. You allow spirits, tobacco, and cigars, all to be put in the same bond? Yes.
26. Why is not that allowed in England? Really I do not know.
27. What are the hours for keeping open the Bonded Warehouses? From nine to four o'clock.
28. Are they all open from nine to four? No. I think eight of them are; and the remaining thirteen are open, each, during half the day—some of them from nine to twelve, or perhaps, one o'clock, and others from twelve or one till four; so that the same Locker goes to one store in the morning, and to another in the afternoon.
29. What is the course of proceeding with reference to taking goods into these stores and out of them? There are certain entries passed for stowing the goods in any particular Warehouse.
30. What do you call that entry? An entry for bond. And then the importer enters into a bond that these goods shall not be removed under any other circumstances than the payment of duty upon them, or for exportation. They are then landed under charge of a proper officer and carried to the Warehouse, where they are received by the Locker, who stows them according to the nature of the goods. The rule is not to allow more than three tiers of casks of wine or spirits—the larger casks at the bottom, the hogsheads above them, and the quarter casks above all; and this is perhaps one of the difficulties with regard to a tax on the Bonded Warehouses, if they are to pay by measurement, because possibly half the contents of the store are not occupied—it cannot be under the regulations. But where case gin, or cigars, or tobacco, or any goods of that sort, are stored, of course they are, and can be, piled to the roof.
31. The goods are taken, you say, from the ship, in the custody of one of your officers, to the store, and there delivered to the Locker? Yes, excepting in the case of such a store as that of Messrs. Campbell and Co., which is on the wharf, and the goods are rolled at once from the ship into the Warehouse.
32. Who pays this individual who has charge of the goods during their transit from the ship to the store? The Government. It is for the protection of the revenue, and therefore the Government has to pay.
33. Is there any charge to the owner of the goods? No, none at all.
34. The Government pay the Lockers also? Yes.
35. There is no charge to the Warehouse-keeper for the attendance of the Locker at the store? No.
36. That comes out of the Customs' revenue also? It does.
37. How many Lockers have you? We have nine Lockers to twenty-one Bonded Stores.
38. Are they paid by salary? They are paid by salary.
39. I see in the return made last year their salaries are set down as varying from £110 to £200 a year? Yes.
40. That is without the gold increase? Yes.
41. How are goods taken out of a Bonded Store? By a warehousing entry.
42. And payment of duty at the Custom House? Yes; in much the same way as duty is paid on goods for home consumption when taken out of the ship; the only difference is, that there are four entries when they are taken from the warehouse, and only three when taken from the ship; because the Warehouse-keeper requires to have one to retain in his own possession.
43. Who keeps the keys of the Bonded Warehouses? My Warehouse-keeper; the Lockers bring them to him every evening, and he locks them in an iron chest.
44. Is the proprietor of a warehouse allowed to keep any key? He has one key. Every Bonded Warehouse has two locks—one belonging to the premises, and one to the Customs—so that neither can enter the premises without the other.
45. Have you ever discovered whether there has been any change in the quality of spirits from one cask to another? No; but I have heard of such things. I have been told that inferior brandy has been put into casks with Martell's brand. When a man applies for permission to rack off a quantity of spirits from damaged casks, and the casks selected are of a different or superior brand, it is the Landing Surveyor's duty to see that those brands are erased.
46. *By Mr. Gordon*: Supposing the Locker omitted or neglected to lock the store at night, there would be nothing to prevent the owner from entering then? No.
47. Have you ever heard of such being the case? I cannot say I ever have. I do not recollect that I ever heard of it, and I think I should remember it if I had heard it, because it would be quite necessary to take the matter up in a very serious way.

48. *By the Chairman*: There is no other safety for these goods being kept in the store, except in the way you have described—the Locker having one key, and the owner having another? That is all. Lt.-Col.  
J.G.N. Gibbes
49. So that, by the connivance of the Locker, spirits might be taken out very easily? Cer- 28 Nov., 1856.  
tainly.
50. How could that be discovered? It would be very difficult to discover it. The cask would be found to have a defect in it, of course, and it would be said to have leaked out.
51. Have you ever heard of such a case? No; I have never heard of it. There was one case in Unwin's Bonded Store, in which the cask stood too near the window, which had bars but no shutters, and they contrived to get a syphon in and take away a considerable portion of the spirits. After that I, of course, took care that it should be impracticable to repeat the operation.
52. You never heard of a vast number of casks of rum and other spirits being taken out and distributed in Sydney, and the certificates being burned afterwards? No,—never. There was an immense deficiency in what is called taking stock in Unwin's stores. It was a store excessively damp and bad. The hoops of many of the casks had burst, and the deficiency was accounted for in that way.
53. You say there are two keys kept of these stores—do you mean that there are two different locks? Yes. The usual plan is that the proprietor of the Warehouse keeps the key of the door, with a lock in the interior, and an iron bar crosses that, on which the Locker's lock is put.
54. Does anybody inspect these Warehouses after the hours for locking up, except the Locker? No.
55. You have no Inspector of Warehouses? No; one is much wanted.
56. Why? The duty of looking after these Bonded Warehouses is at present cast upon Mr. Garling, the Landing Surveyor, and any one who would follow him about during the day must admit that it is quite impracticable for one man to do all that he has to do as carefully as it should be done. The consequence is, that he can only occasionally visit the Bonded Warehouses.
57. These are not stock locks that you have on these stores? No. We used to have very superior locks, padlocks, that cost three or four guineas each; but, after all, it was found that they could be broken.
58. They are padlocks at present, are they not? Yes.
59. Did you ever hear of good snuff or cigars being taken out of the cases, and bad tobacco being put in its place? It has never been brought before me. I frequently hear rumours, but when I try to trace them, I can find no ground for them.
60. *By Mr. Holt*: Do you not give permission to open cases of cigars for certain purposes? We only give permission to open them in order that any part of them that may be damaged may be burned.
61. Is it not the practice with some of the merchants to open cigar cases, take the finer descriptions out, and substitute common cigars for them? I can only depend on my Locker; the thing is quite impracticable without his connivance.
62. *By the Chairman*: With reference to spirits, I collect from your testimony that if any deficiency arises there are no means of finding out whether there has been any fraud, because the answer would be that the cask was defective, and it had leaked out? That is the case. Formerly, in England, a certain allowance was made for loss of spirits in bond, principally from evaporation, and however great the actual loss might be beyond the quantity allowed, the owner of the spirits was obliged to pay the duty on it. But such a clamour was raised about it, that a man should not only lose his goods but pay the Crown a duty on that which he never, in fact, could get, that that rule was done away with, and only the actual quantities taken out of bond pay the duty. That is the course pursued here, by law.
63. When these goods are taken into the store are they gauged for quantity? Yes; going in and going out.
64. Are goods such as tobacco and cigars weighed before being bonded? Yes.
65. And weighed again on being taken out? Yes.
66. Is any account kept of the weight or quantities? Yes.
67. Who keeps it? The Custom House Warehouse-keeper. His books shew everything that goes in, and everything that goes out, and the difference between the two.
68. *By Mr. Weekes*: Then you keep an account, in fact, against each of the several Warehouses, giving them credit on one side and debiting them on the other? Yes.
69. If there are any empty casks or staves lying about the stores, are you obliged to be satisfied with any account that may be given of them? Yes; pretty much so.
70. *By Mr. Gordon*: Are they not obliged to keep the marks or brands? Yes, the Locker has to see to that. There is always a certificate for every package. At one time these certificates were made out by my Warehouse-keeper, and were looked upon almost as bank notes; but the Board of Customs, many years ago, gave me authority to do away with them. However, they did not order me to do so, and on conferring with the late Mr. Richard Jones and other mercantile gentlemen, I did not break off giving them at that time. At last I did it, being particularly induced to do so by being threatened with an action for giving up some goods sold at a Sheriff's sale. The party who had bonded the goods threatened, on the strength of my certificate, to bring an action against me for delivering the goods to the party who purchased them.
71. Has any complaint been made to you, or has it come within your knowledge, that some of these Lockers are not very temperate men? I have heard so, but I have never been able to bring it home to them. People mention such circumstances to me, but whenever I ask for proof I never can get anybody even to come forward.
72. Is there no officer of superior standing whose duty it would be to see that the Lockers do attend to their business, and that they are steady and sober? The Landing Surveyor is supposed

Lt.-Col.  
J.G.N. Gibbes  
28 Nov., 1856.

supposed to do it, but his business is, as I have already explained, too extensive to enable him to do it properly; and that is why a Surveyor of Warehouses is so much wanted.

73. *By the Chairman*: Was it ever reported to you that a gentleman, who has lately been pensioned from the Customs' Department, was drunk for years, when in the service? Yes; there was one man named to me, but I never saw him drunk; and I have never been able to induce anybody to come forward to testify to the fact.

74. *By Mr. Weekes*: Does the same practice prevail at home as to Bonding—are all the stores held by private individuals, or does the Queen——? Never. That was what was proposed by a Committee on the Bonding system here, but I do not think it would answer well. During my lifetime it has not been the case in England. It was for a short time the case in Dublin, but that has for years been done away with, and all Bonded Warehouses there are now private property.

75. Do you see any objection to the Government acting as its own Warehouse-keeper? I went into the matter when the Committee sat here very minutely, and I could not see any advantage to be derived from it. A smaller number of lockers might answer, but Warehouses of such magnitude as these Government ones must necessarily be—for there must be one for the Circular Quay, and one for Darling Harbour—would require a vast number of people to attend them. They would have to be divided and subdivided, according to the goods that were to go in each department. And I confess I can see no advantage in it.

76. *By Mr. Holt*: Would there not be a great saving of time in the Lockers not having to run about from store to store—some of the tobaccoists Bonded Stores, for instance, are very small? They only have a Locker when they make a requisition the day before. I have no doubt if a tax were put on Bonded Warehouses, those two would be given up.

77. The Bonded Stores are scattered in all parts of the city, are they not? Yes.

78. It must require a great amount of time for the Lockers to go from one to another—now, could not the Government, by borrowing money at a low rate of interest, building large Bonded Warehouses, and deriving from them the store rent now paid to private individuals, make a large profit on that money? If they did so, they would require an immense number of additional clerks.

79. I cannot see that—you have the whole of the goods to enter now just the same as you would have then; and from what I learn from you there is not a sufficient check upon the Bonded Warehouses now—for instance, could such great deficiencies as those in Unwin's Store have taken place in a Government Store, if you had taken stock regularly? That was the cause of it, not taking stock; and since then we have made it a rule to take stock once a year.

80. *By the Chairman*: Is there any Act of Council regulating these Bonded Warehouses? No.

81. You know that in England there is a Warehousing Act? Yes.

82. They are regulated here by Rules and Regulations? Yes.

83. Who frames those Rules—the Commissioners of Customs? We act under instructions from the Commissioners of Customs, framed under that Act.

84. *By Mr. Holt*: You do not consider the Act in force in this Colony? No, there is no such Act in this Colony.

85. *By Mr. Gordon*: Some two or three years ago, so large a quantity of dutiable goods arrived here that you found a difficulty in getting suitable stores, and that led to all sorts of Bonded Stores being licensed? Yes, we were obliged to take any stores that offered—not but that every one of these stores are stores of a very superior class to those that were in existence when I came here.

86. Do you not think that Bonded Stores distributed through the city in the way these are, are a great convenience to the public? I think so. There might be rather fewer Lockers required if we had Government Stores; but there is no great amount of time lost now. Each Locker has his own store to attend to. In some cases where the store is open all day the Locker goes to it and stays throughout the day. In other cases the Locker goes to one store in the morning, and locks up that at a particular hour, say twelve or one o'clock, and goes to another for the afternoon; so that there is no real time lost by that means at all. In two gigantic Warehouses the question would be how many Lockers would answer the purpose; but there would be the same number of entries to make, and gauges to take, and the public would not like to wait if I had not Lockers enough to meet their demands. I do not think that system would be of any particular advantage, myself.

87. *By Mr. Weekes*: Would there be any advantage in all Bonded Stores being in close proximity to the Custom House? Mainly to ourselves, not to the public. There are not many persons who pass their entries themselves. No person can act as a Custom House Agent without a license, but every merchant may pass his entries by means of his own clerk, though one man's clerk cannot pass an entry for another, under a penalty of £100.

88. Would it not give you a better opportunity of inspection? Yes, it would. The Landing Surveyor would not have so far to go round. The Bonded Stores are not scattered all round the waterside, but some are in the heart of the town; for instance, Mr. Cooper's in George-street, Mr. Griffiths', and various others.

89. *By Mr. Gordon*: It is your opinion that the present system of bonding is an advantage to the public, and that it would be no advantage to the Government to undertake to establish Bonded Stores of its own? I do not think it would.

90. *By Mr. Buckley*: Would it be any advantage to the Government to rent them? I do not think so. I consider that we should have to employ so many additional hands that there would be no saving to the Government, but rather a loss.

91. Is it your opinion that the owners of these Bonded Stores make no profit? They make a very large profit.

92. Supposing the Government were to become lessee of these stores, do you not think it would be an advantage? It might be. I am not altogether prepared to give a direct answer to

to such a question. It would require a great deal of consideration, and a great deal of calculation, to say yes or no.

93. *By the Chairman:* What is the practice when dutiable articles are sent from a Bonded Store to Twofold Bay, and other places coastwise? They are taken out under bond, and go under bond to the port they are sent to, unless it is not a port of entry, and then they must pay the duty here and run the risk of losing the amount of duty, as well as the prime cost, in case of accident to the vessel.

94. *By Mr. Gordon:* They may be taken either way to ports of entry, at the option of the owner? Yes.

95. What is your opinion with regard to the proposed tax on Bonded Stores—do you think it would act equitably? I do, with the exception that I do not think stores open only half the day should pay as much as those which are open the whole day.

96. Is it not within your knowledge that certain stores, in which spirits are bonded, are not half full? Yes. I have alluded to that before. There would be a species of injustice in charging by the cubical contents in such cases.

97. *By Mr. Weekes:* Who signs the certificates now? The occupier of the Bonded Store.

98. Did you ever hear of instances of duplicate sets of certificates being issued and negotiated? I think I have heard of something of the sort. We allow them to be used, but they are not documents that in truth the Customs or the Government have anything to do with now; neither has it been so for years. I have heard of disputes about these certificates being changed, and about rents and so forth; but I do not consider that they were under my cognizance as Collector of Customs, nor were they brought before me officially at all.

99. *By the Chairman:* Do steamers going from here to Port Phillip, and from here to Moreton Bay, pay duty on the spirits they take out of Bond? There is a difference between them. Spirits sent to Melbourne are exports.

100. Do they pay duty for spirits taken out for the use of the ship? No they do not.

101. They get their spirits duty free.

102. You are aware that they sell liquors on board these steamers? Yes. I have often thought of that.

103. Do they take out very large quantities? Occasionally the quantities have been large, but I directed that that should be stopped.

104. Have you ever heard of a quantity of spirits being taken out for a steamer going to Port Phillip, a part of which has been supplied, at the wharf where the vessels were lying alongside, to steamers bound for the Hunter River? No.

105. That might easily be done? It might, except that their clearance shows the quantity taken out for Port Phillip, and when they get there it is the province of the Officer of Customs there to ascertain that that quantity is on board, except what has been used for the passengers and the ship. That is the only check.

106. Have you any idea what quantity they take out for the trip? No, I have not the least in the world.

107. Do you know that they carry spirits, taken out for exportation, as it is called, on their decks? I was not aware of that. It ought not to be the case.

108. That would facilitate smuggling to a very great extent? No doubt.

109. Under that system could not smuggling take place to any extent; for instance, if they called in at any place on the coast, they could easily land a cask of spirits placed on the deck? I think smuggling might take place by means of the steamers, certainly. There was a case the other day in which a steamer in bad weather gave a lurch and stove in the head of a cask of spirits. There were several respectable witnesses who testified to the fact, on an application being made to the Government for a remission of the duty; but the law will not allow any remission of duty unless the accident takes place in the sight of an Officer of the Customs, and therefore the application could not be granted.

110. *By Mr. Gordon:* Is there not an Officer of Customs sent on board the steamers with spirits? Yes.

111. Is it not his duty to see that they are put below? Yes; but we find the steamers extremely troublesome in that respect. The officer, whose time is valuable, cannot wait perhaps while they remove the cask to the hold. In the hurry of taking in cargo he cannot get them to attend to it; and he is apt to go away, taking their word that it will be all right. It is very difficult to deal with these steamers indeed. They expect even greater latitude than is given them, and that is already almost too great.

112. Is there not a certain officer whose duty it is to clear these steamers? No; they are cleared in the same way as other vessels. Those going coastwise, are cleared at eight, nine, and ten o'clock at night. There is an officer specially to attend to them.

113. How is he paid? By them,—5s. for each vessel.

114. Do you not think it would be better to give him an extra salary, and let the fees go to the Government? These things grow up from small beginnings. When the custom was first established, the old Hunter River Company, finding it inconvenient to clear their vessels earlier in the day, applied to me, and said, that if an officer of the Customs were directed to attend at night, they should have no objection to pay the expense, because they were quite aware that an officer's time is as valuable to him as any other person's, and if he has to pass his time on their wharf, he ought to have additional remuneration, while at the same time the Government ought not to be called on to pay for their convenience.

115. *By Mr. Gordon:* Do you find any difficulty in getting gentlemen to undertake the different duties enumerated in the Return of the Strength of your Department made last year, at the present rates of pay. Take the case of the Landing Surveyor, for instance, do you think that officer is sufficiently paid? I represented to the Government that Mr. Garling was very ill paid, and they have given him an increase, with which, I think, he is satisfied.

Lt.-Col.  
J.G.N. Gibbes  
28 Nov., 1856.

Lt.-Col.  
J.G.N.Gibbes  
28 Nov., 1856.

116. *By the Chairman*: What is your opinion as to the general scale of salaries to the officers of Customs? I think that, under the proposed estimate, it is very fair.

117. It is an increase upon the amounts set down in this Return of last year? Yes; that was the scale before the gold increase was given.

118. You think it possible to obtain good service at the rates of salary now proposed? Yes, I think so, generally speaking.

119. The Lockers and Tide Waiters receive very small salaries—do you not think these men are very open to receive presents? They might be, but there is no saying whether they would not be open to receive them if they were better paid.

120. *By Mr. Gordon*: I see the salaries of the Lockers are set down in this Return at from £200 down to £110. Now, looking at the importance of these gentlemen's position, if they really are efficient and steady men, I think the salaries quite inadequate, and I was just about to ask you whether it has ever come within your knowledge, that gentlemen have been appointed to situations in the Customs after they have been dismissed from merchants' offices for being tipsy, and for general unsteadiness? No, I have never heard of that.

121. *By the Chairman*: These men are subject to great temptation, are they not? No doubt of it, and, unfortunately, they are subject to great temptation in another way; they are always obliged to be with their heads over the bung-holes of casks of wine and spirits, and I dare say that in this extremely hot climate, without meaning to commit themselves at all, they do take a little more brandy and water than they ought to do. I have endeavoured to check it as much as possible; and I receive anonymous letters from people making charges of intoxication against particular officers, and saying that they will come forward, but they never do come forward.

122. *By Mr. Gordon*: I think you said you thought it might be desirable for Custom House Agents to pay a small fee—do you know whether it is customary at home for them to pay anything? No, I believe not.

123. *By the Chairman*: Are the charges of Custom House Agents and Bonded Warehouse-keepers regulated by any scale? No; they charge what they like.

124. Is that the case in England? I believe so; I am not sure of that, for I am not acquainted with the practice at the two great ports, London and Liverpool, but at my own port the business was done by the clerks of the merchants, or by my Chief Clerk, who was there allowed to prepare the entries for people, and to receive a shilling for so doing, not by me, but by the Lords of the Treasury.

125. *By Mr. Buckley*: Are the charges made for bonding goods considered excessive? I really do not know. The whole system, I think, is bad; whatever charge one man fixes on, another will offer to do it for less.

127. *By Mr. Gordon*: The supply of goods regulates the price, in the same way as in any other business? Yes. I have heard of goods being taken into a Bonded Warehouse free of every charge for six weeks, as an inducement for parties to go to that bond instead of another. But you cannot control it, for if you were to fix by law a certain price, it would be avoided by the return of a portion of the rent afterwards.

128. *By Mr. Holt*: You think the Government could not interfere as regards their charges? Certainly not.

129. *By the Chairman*: Does any examination of the luggage of persons on board the steamers take place? No, never.

130. Then it is possible for a man to smuggle quantities of dutiable articles with his luggage? I think not. Perhaps a few cigars may be sometimes got ashore in that way.

131. You think it is better that that should be the case occasionally, than that ninety-nine out of a hundred persons should be annoyed without cause? Yes, and I am one of those who think that the amount of smuggling in this port is very small, compared to what many persons think.

132. You do not know how much may take place at Twofold Bay, or other places on the coast? No; but I do not think it is carried on to any extent.

133. Have you anything to do with the Distillation Department or with the collection of duties on Colonial spirits? Nothing.

134. Do you not think that might be placed under the Customs? I hope not. I have a clerk attached to my department, although he does not belong to me, in consequence of that most extraordinary Act, which was brought in by Mr. Abercrombie, to bond Colonial spirits in Customs' Bonded Warehouses, for the purpose of colouring them—in fact, to cheat the public by making them think they were imported spirits.

135. Whatever inconvenience it might be to you, still it would save something to the public to place the two departments under one head? It might; but the distilleries are a long way from us. I apprehend that precisely the same staff would be required, and I therefore see no other saving that could be made than in the salary of the Chief Inspector of Distilleries, and certainly he can attend to the working of that Department better than the Collector of Customs.

136. Do you not think it is right that the management of the Customs and Excise should go together? Perhaps it is; but such is not the case in England.

137. *By Mr. Gordon*: Have you not heard that large quantities of what is called silent spirit have been manufactured into brandy, and sold as Colonial brandy, only paying rum duty? I have heard something of it, but I never heard any particulars; and, of course, Mr. Stirling is the proper man to attend to that. I consider it would, of course, increase my responsibility.

138. *By Mr. Holt*: Would it not be a better check for the public? Perhaps it might; but really I do not feel prepared to answer the question decidedly.

139. *By the Chairman*: Is the entry for free goods very troublesome? No, it is not very troublesome now, because we do not take the wharfage. When Sir William Denison proposed that the system should be renewed of the wharfage being collected by the Customs' Department,

ment, the Circular Quay being taken back into our own hands, I pointed out this objection to it; and I pointed out also that we should never make as much money out of it as was made by leasing, indeed nothing like it. Lt.-Col.  
J.G.N.Gibbes

140. Would there be any difficulty in furnishing a Return of the number of entries of free goods? None at all. If the collection of the wharfage had rested with us, it would have been a most laborious affair, because free entries are separated from other entries, and are made by a different clerk. All that he has to do is, to ascertain that nothing in that entry is liable to duty, and then to pass it, which may occupy him perhaps a minute or two; whereas, if the wharfage had to be collected, it would have taken ten times the number of minutes of time as are necessary under present circumstances. 28 Nov., 1856.

141. With reference to seizures of goods, what is done in case goods are stopped by one of your officers? If he is an officer who has not power to seize, he has to go to some officer who has; but if he is an officer who has power to seize, he seizes the goods at once, and lodges them in the Queen's Warehouse, and sends in an account of the circumstances to me, explaining why he has seized them. If it is a case which I think frivolous or vexatious, I order the goods to be returned to the owner. But if no claim is put in by the party owning the goods within a month, they are condemned by law, and sold; one half of the proceeds going to the Government, and the other half to the seizing officer.

142. All Officers of Customs have not power to seize? No; for instance, the Tide Waiters are not, properly speaking, officers of the establishment, but a certain power is given to them to detain goods until they can call on an established officer to seize them. And I am not at all clear that a Locker has power to seize.

143. *By Mr. Holt:* Who have the power to seize? Landing Surveyors, Landing Waiters, and various other officers.

144. *By the Chairman:* The Police may stop goods suspected to be smuggled? Yes, but they have no power to seize; they become the informer.

145. *By Mr. Holt:* Would it not save a great deal of time if the strength of spirits were ascertained at the time of their being warehoused? That is the case, because they could not be entered in our books without that.

146. So that it should be final, and the duty should be paid according to that ascertained strength? That is a question for Parliament to decide. Supposing that after the spirits have been in bond some considerable time, a certain amount of loss has been sustained, I do not know why we should call upon a man to pay for that which he does not possess; because, even if a robbery has taken place from the Bonded Store, it has not been committed by the owner of the goods, and if the deficiency has arisen through leakage, the spirits have not gone into consumption, and therefore the Crown has no right to charge duty upon them. It is on that principle that the law has been regulated here. If a man has a hogshead of brandy in a Bonded Store, and he sells it to a publican, who, upon taking it out, finds it contains only ten instead of sixty gallons, we know very well that the publican must take out another cask to supply the deficiency; so that, in fact, there is no loss to the Crown;—the duty is still paid on the quantity that actually goes into consumption, and that, in my opinion, is all that we have any right to expect.

147. Supposing that he had taken this brandy into his own cellar, and it had leaked out, he would have had to bear the loss, and therefore, since it is for the convenience of merchants that these goods are allowed to be stored in bond, is it not right that they should be placed in the same condition as those who have paid the duty? I think the cases are quite different. One man has it under his own eye, and if he loses it, it is his own fault; but the other does not know of the leakage until he comes to take out the cask. The great difficulty here is, that the Bonded Warehouse-keepers will not take upon themselves to cooper; they say they have trouble enough to get their rents, without asking for cooperage charges. They have tried it, in fact, I am told, and they have always found difficulties. Perhaps the goods are left so long that they are sold at an overtime sale by me, for a mere nothing, so that they scarcely get their rent out of them.

148. Would not people look much better after their casks if they had to pay the duty? I agree with you there.

149. *By the Chairman:* Does it often happen that there is a large stock of goods remaining in the Warehouses without owners? Yes. There used to be, but it is not so now, though sometimes the owner will not take his goods.

150. What becomes of them? We sell them at overtime sales.

151. What is the limit of time? Three years.

152. Do you not think that is too long? It is the English law. We have a sale every year.

153. *By Mr. Holt:* Why do they sell so low. Have you ever ascertained what the strength of these over-time spirits is, so as to guard against fraud in these cases? No.

154. Is there not something very suspicious about these over-time goods when they sell for a mere nothing? Perhaps there ought to be a gauge made. At the present time our overtime sales are trifling in the extreme.

155. *By the Chairman:* When goods are removed from a Bonded Store to a vessel for exportation, who sees that they are actually put on board? An officer follows the cart; he is called a Cart-follower.

156. Where do they pay duty if they are sent to any place on the coast? They pay the duty here if they are intended for any port where there is no Custom House Officer, and then we have nothing to do with it.

157. *By Mr. Holt:* Would you allow goods to be sent to Twofold Bay without paying duty? Perhaps, under certain circumstances I should not object, because the officer there could receive the duty just as well as I could here. And there is this advantage to the shipper, that if the ship was lost he would not lose the duty; while the Government would sustain no

loss,

- Lt.-Col. loss, because the goods did not go into consumption. I consider that the Government has no right to any duty on goods which do not go into consumption.
- J.G.N.Gibbes  
28 Nov., 1856.
158. *By the Chairman*: I think you said the owners of the Bonded Warehouses give no security? No.
159. Who is liable, do you consider, for the duties on goods that are put into Bond? The importer.
160. Supposing he transfers his right to the property, how is that ascertained? That is very loosely done, generally speaking. If he sells his goods to A, B, or C, and wishes to protect himself, he should require them to enter into a fresh bond; but no one does it.
161. That might occur at any time before the three years elapsed? Yes.
162. Do you not think that the suggestion made in England, that the Warehouse-keepers, and not the importers, should be held responsible, with certain securities, is a good one? I agree to that. But there is a clause in our own Act which enables me to call upon the proprietor of any Bonding Warehouse to produce any particular packages, one or twenty, and if he cannot produce them I can fine him five pounds for each package.
163. *By Mr. Holt*: Is there no upset price on goods sold at overtime sales—must they not bring the duty? No; they are evidently not worth the duty, or they would not be abandoned. All goods seized must fetch the duty, but that is not the case with overtime goods.
164. *By the Chairman*: When these overtime goods are sold, what becomes of the proceeds? The rent is first paid, and the surplus handed to the owner, if claimed; if not, it goes to the Government.
165. *By Mr. Buckley*: What description of goods usually remain over three years? All kinds—spirits, cigars, and so on.
166. Are the spirits usually of an inferior description? Yes, they are generally inferior spirits.
167. You never find any good brands, such as Martell's, remain over? No. There is at this moment a puncheon of gin, I think it is, lying in the Queen's Warehouse, that was sold at an overtime sale, and the man that bought it will not take it away.
168. *By the Chairman*: Is there any time named for cancelling the bond of the importer? Three years.
169. Is there any law for that purpose? Yes.
170. In your Act? I am not aware. There is in the English Act.
171. Do you not think it desirable that the Acts relating to the Customs should be consolidated and amended now? Yes, very desirable.
172. How many years is it since we passed a Customs' Regulation Act? It was the 9th Victoria, No. 15, I think, in 1843.
173. What is the term in which they pass a new Customs' Act in England—five years? No, I do not think there is any particular time.
174. Do you not think it desirable that new Rules and Regulations should be made for the whole department? Yes.
175. Do you not think it would be well to have the Rules printed and distributed to each officer and to the public? I think it would.
176. Do you not know that there have been great complaints that the public never could get the Rules, and the officers themselves could not get them? Yes, as regards those of Colonial appointment.
177. *By Mr. Buckley*: About what proportion is there, at the end of each year, of overtime goods? I could not tell you the proportion now. It is very small.
178. Has it not generally been the case that the greater proportion of overtime goods consisted of cigars and tobacco? No, always a quantity of spirits also.
179. Have you not been compelled, on a great many occasions, to destroy such goods, because no person would purchase them? Yes.
180. Have you ever exercised any discretion as to keeping these goods, or have you generally made a point of destroying them? We have generally destroyed them, but the law allows me to extend the time, and if, on inspection, I find them to be good in strength, the casks right, and so on, I extend the time for another year.
181. Does that apply to tobacco as well as spirits? Yes.
182. These goods that are sold at auction as overtime goods can go into consumption? Yes.
183. Is it your opinion that these goods generally fetch a fair and reasonable price in proportion to their quality? I am not prepared to answer that question directly, but I believe they do.
184. Have any instances occurred of spirits not being sold which have been put up at overtime sales? I do not recollect any.
185. In the event of anything of the kind not being sold, would you consider it necessary to knock in the heads of the casks? Yes.
186. And you give no consideration to the owner of the Bonded Store? No.
187. *By the Chairman*: There is a Custom House Officer stationed at Morpeth? Yes.
188. Is that a free port? It is no port at all; I stationed the Officer there purely as an accommodation to the public.
189. Is there a Bonded Warehouse there? Yes. An Officer has long been stationed there to superintend the colliers and steamers going up the river, but it is only recently a Bonding Warehouse has been established there with the sanction of the Government. I have been obliged to step out of my way to allow the Officer there to take a deposit of money; he is not a Collector, and therefore cannot collect duties; but to obviate the difficulty which would arise if gentlemen who wished to take goods out of the Bonded Warehouse at Morpeth had to go all the way to Newcastle to pass their entries, pay the duty there to Mr. Bolton, who is a Collector, and get his order for the delivery of the goods, I allowed the entries to be made at Morpeth, and the money to be handed over to Mr. Allman, who immediately accounts for it to Mr. Bolton and sends it to him. It is therefore, after all, Mr. Bolton's collection, as Collector of the port of Newcastle.

190. *By Mr. Buckley*: There were some Returns called for a short time ago, from which it appeared that you did not recognise Morpeth in any way? No, only Newctstle. But I have now furnished a Return shewing the amount of duty paid on goods taken out of the Morpeth Warehouse, and on those taken out of the Warehouse at Newcastle, and I own that the difference astonished me; the amount of duty paid at Morpeth was about £7,000, and the amount paid at Newcastle was only about £1,700, shewing that the establishment of the Warehouse at Morpeth has been a great accommodation to the public.
191. *By the Chairman*: Is there any such Warehouse at Eden? No.
192. It is not required? No.
193. *By Mr. Buckley*: I suppose just as much security and protection to the revenue is afforded to the Bonded Warehouse at Morpeth as at Sydney? Yes. The Officer there, of course, keeps his key, and Mr. Taylor his key. It is entirely under the control of Mr. Allman, but there is just the same security as there is in any other Bonding Warehouse, I believe.
194. You are in direct communication with the party in charge of the Bonded Store? Only with Mr. Bolton. I send to him for the returns from Morpeth, and, of course, he prepares them from his books.
195. *By the Chairman*: Who issues the order for the discharge of goods from the Bond at Morpeth? Mr. Allman must. He writes the Locker's order, which, in truth, is to himself; that of course is filed as his security, and the other documents go to Mr. Bolton, at Newcastle, together with the cash.
196. Is there a duplicate warrant for delivery handed by the Locker to the Warehouseman? There is not.
197. Do you not think that a proper regulation? I think there is no objection to it.
198. *By Mr. Buckley*: You never have any complaints from any party at Morpeth, connected with the store? No.
199. No complaints of want of attention or of irregularity in any shape or way? None whatever.
200. *By the Chairman*: In the case of an order to discharge goods where no duty is involved, is it left to the option of the party getting the order to land the goods, or to deliver them over the side to another vessel? He cannot, in strictness, deliver them over the side to another vessel; he must land them.
201. What is the object of that? I do not know. It is the law. Of course I should give him leave if they were free goods.
202. *By Mr. Buckley*: You would allow a lighter to come alongside? Yes, and send an Officer with the lighter. I believe every facility that can be granted to the public is granted here.
203. *By the Chairman*: Who pays the Officer on board the lighter? The Government.
204. Do you not think the party should pay? If it was a cart it would be the same thing. I think if we employ an officer for the protection of the revenue, it is the duty of the Government to pay him.
205. Have you any other suggestions to make for the improvement of the administration of the Customs Department?

Lt.-Col.  
J.G.N.Gibbes  
28 Nov., 1856.

APPENDIX A.

*INSTRUCTIONS by the Commissioners of His Majesty's Customs, to the Warehouse-Keepers at the Free Warehousing Ports in the British Possessions abroad.*

To

*Warehouse-Keeper at the Port of*

ARTICLE 1. You will observe that by the Act 6 Geo. IV, cap. 109, sec. 11, you are required to take the oath therein set forth on your admission into office, and that by the 9th section of said Act, you are prohibited from receiving any fee or reward without the sanction of the Lords of the Treasury, on pain of dismissal for the first offence; and that by the 29th section of the aforesaid Act, if any person shall give, offer, or promise to give any bribe or reward to any Officer of the Customs, to induce him to neglect his duty, or to do any act whereby the provisions of any Act of Parliament may be evaded, every such person forfeits the sum of £500.

Art. 2. Having been appointed to carry into execution the provisions of the Acts 6 Geo. IV. cap. 114, 7 Geo. IV. c. 48, and 7 and 8 Geo. IV. c. 56, so far as relates to the Warehousing of Goods Free of Duty on the First Entry thereof at the Port of

Art. 3. You will receive herewith Copies of the above Acts, and you are to use every means in your power to enforce a due observance of the same, so far as relates to your particular department, observing that if you fail to represent to the Collector and Comptroller any instance of neglect of the regulations contained in the said Acts, you will be held responsible for the same; and when you have occasion to represent any matter to the Collector and Comptroller relating to the Service, or to the misconduct of any person, on any subject connected with the duties of your office, you are to make such representation in writing.

Art. 4. You are to give regular and due attendance, either in your office or at the Warehouses, and at such hours as may be most convenient to the general trade of the Port, and you are diligently and faithfully to employ yourself in the execution of the duties hereinafter mentioned, and when you are unable to attend your duty through sickness, or other unavoidable causes, you are to acquaint the Collector and Comptroller therewith, without loss of time, in order that the duty may be otherwise provided for.

Lt.-Col.  
J.G.N. Gibbes  
28 Nov., 1856.

See Instructions  
to Warehouse-  
keepers in United  
Kingdom.

Art. 5. A very important part of your duty will be to see that the goods deposited in the Warehouses are properly secured, and that no part thereof be taken out for Home Consumption, until the full duties thereon have been first paid, nor any goods taken out for exportation until security has been given for their due exportation, and with a view to the correct understanding of your duty in these respects you will receive copy of our Instructions to the Warehouse-keepers at the several Out Ports of the United Kingdom for your general information, only observing that you are to consider those instructions as you guide.

Art. 6. You will also receive form of a Warehouse Ledger, wherein you are to keep an account of all goods received into, and delivered from, the Warehouse, under the authority of the aforesaid Act.

Art. 7. On receiving a Warrant or other proper document for goods intended to be Warehoused, you are to enter the same in your Warehouse Ledger, and when the Landing Officer's Book, containing the particulars of the goods landed by virtue thereof is received, you are to enter such particulars in your said Ledger, under the heads of the respective Ships in which the goods were imported.

Art. 8. In order to prevent confusion and unnecessary delay in searching for goods in the Warehouse, when wanted, you are to take care that they be stowed in such a manner as to afford free and convenient access to the several packages, and in case of refusal on the part of the proprietor of any Warehouse to make the necessary arrangement for the proper stowage of goods, you are to report the same to the Collector and Comptroller, who will revoke their approval of such Warehouse if they deem it expedient, and whenever the contents of any package shall be discovered to have been materially diminished by leakage, or any other cause, you are to report all the circumstances to the Collector and Comptroller, in order that they may take such measures as may be deemed necessary.

Art. 9. When you have received a Warrant certifying that the duties have been received, or notice that bond has been given for due exportation of any goods, you are to make out on the proper certificate an account of the landing mark, number, weight, gauge, tale, or admeasurement of the packages, and when you have duly recorded these particulars in your ledger, you are to date and subscribe the order authorizing the delivery of the packages therein mentioned, either for home consumption or exportation, as the case may be, taking care in the latter instance to compare such document with the merchant's endorsement on the cocket, which you are to sign in proof thereof, and that the goods be delivered into the care of the proper officer for shipment. And you will take care that goods entered for exportation be not delivered from the Warehouse or other place of security, unless there is sufficient time to deliver them to the searchers, that they may be shipped during the hours of business on the same day, except in such special cases as may be directed by the Collector and Comptroller.

Art. 10. You are frequently to inspect the state of the Warehouses, and whenever you discover any defects therein, you are to give notice to the proprietors to repair the same, and you are to see that every possible precaution be taken to prevent fire, by not permitting candles to be used except in vaults, or places where day-light cannot, without lessening the security of the revenue, be introduced, and in such cases, with lanterns.

Art. 11. At the expiration of the time allowed for the deposit of goods in the Warehouses, &c., you are to give or send a notice to the proprietor of the said goods, and in case the regulations under which they are permitted to remain in the Warehouse are not complied with, you are to make a return of the goods to the Collector and Comptroller, in order that they may be dealt with as directed by the 41st Section of the Act 6 Geo. IV. c. 114, unless they shall have deemed it fit to grant further time for any such goods to remain warehoused.

Art. 12. You are to have charge of the Keys of the Padlocks provided at the expense of the Crown, for the Warehouses in which bonded goods are deposited at your Port, and of which you are to take due care.

Art. 13. You are to refer to the Collector and Comptroller when you are at a loss on any point connected with your duty, and in case they cannot decide the matter, you are to request them to lay it before us for our directions.

Art. 14. You are to use your best exertions to prevent fraud or depredations in the Warehouses when the parties are taking samples, and you are to see that the regulations relating thereto, laid down by the Collector and Comptroller, be strictly attended to.

Art. 15. You will observe, that the Collector and Comptroller are authorized by the 40th Section of the Act 6 Geo. IV., c. 114, before alluded to, under such regulations as they shall see fit, to permit the proprietor, or other person having control over any goods so warehoused, to sort, separate, pack, and repack any such goods, and to make such lawful alterations therein, or arrangements or assortments thereof, in the presence of the Officers appointed for that purpose, as may be necessary for the preservation of such goods, or in order to the sale, shipment, or legal disposal of the same; and also to permit any parts of such goods so separated to be destroyed but without prejudice to the claim for duty upon the whole original quantity of such goods; provided always, that it shall be lawful for any person to abandon any whole package to the Officers of this Revenue for the duties, without being liable for any duty upon the same; and you will note in your accounts the particulars of any alterations that may be made in the original packages, as also the contents of the new ones.

Art. 16. You are to use your best endeavours to prevent goods being deposited in Warehouses for which they have not been approved, the Collector and Comptroller are directed to furnish you with lists, which you will cause to be affixed in some conspicuous part of each bonded Warehouse in the Port.

Art. 17. You are once a quarter, or oftener, if necessary, to sort out the Landing Waiter's Books, Warrants, and other documents, and compare the same with the entries in your Warehouse Ledger, and when the account is balanced, you are to enter the delivery

notes

notes at the end of the Book, and if the whole appear to agree, you are to write off the same in the Ledger, and deliver such book and document to the Comptroller for his examination.

Lt.-Col. J.G.N. Gibbes

Art. 18. You are to deliver, at the expiration of each Quarter, to the Collector and Comptroller, a copy of the entries in your Ledger, detailing the balances on each ship from the preceding quarter, the particulars of every delivery, whether for Home Consumption or otherwise, with the quantity remaining on hand on account of each ship.

28 Nov., 1856.

Art. 19. You shall frequently look over and duly observe the foregoing, and such other Instructions as you may from time to time receive from this Board, or from the Collector or Comptroller; and you shall faithfully and diligently demean yourself, and you shall not do, or suffer to be done, abet, or conceal, any act or thing prejudicial to the Revenue, or contrary to the laws of importation or exportation; taking special notice that you will be called upon to make good any loss which the Revenue may sustain from your negligence or misconduct.

CUSTOM HOUSE, LONDON.

TUESDAY, 9 DECEMBER, 1856.

Present:—

MR. BUCKLEY,  
MR. EGAN,  
MR. GORDON,

MR. LORD,  
MR. NICHOLS,  
MR. WEEKES.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

George Thornton, Esquire, J.P., called in and examined:—

G. Thornton, Esq.

1. *By the Chairman*: You were formerly a Custom House Agent? Yes.
2. I believe you were regularly articled to the profession, and brought up to it? Yes.
3. You have given up the business of a Custom House Agent? I have, for the last three years.
4. How long did you carry on business? Nearly eighteen years, but not all that time on my own account. I was only a clerk a portion of the time.
5. During that time you were engaged in business either as a clerk or on your own account? Yes.
6. You were licensed, of course? Yes.
7. Did you pay anything for your license? No. I gave a bond for the proper performance of the duties, that was all.
8. That is the case with every Custom House Agent? It is.
9. Did you occupy premises in the Custom House? Yes.
10. Did you pay anything for them? No.
11. Were any of the other gentlemen who carried on business as Custom House Agents in occupation of premises in the house? Yes, several others.
12. Did any of them pay for the accommodation? No.
13. Did any of them carry on any other business besides the business of Custom House Agents within the building? Yes.
14. Were they engaged in trade as owners of ships, consignees, and so on? Yes. Myself and others did carry on business other than that strictly appertaining to a Custom House Agent.
15. During the time you were a Custom House Agent, I presume you had good opportunities of judging of the system pursued in the Customs Department? Yes. I believe I am thoroughly conversant with the whole of the details from one end to the other, in all their ramifications.
16. Do you think the system carried on in the Customs Department was a good and efficient one for the public? No; I have always been of a contrary opinion.
17. What part of the system did you object to principally? There are so many objections, and so various, that my answer would necessarily be a very lengthy one. I have not considered the answer I should give, as I did not know the questions to be asked, and, therefore, I am not prepared at the moment to answer it as fully as I could wish to do; but the system generally was insufficient.
18. The general management of the Department was insufficient? Not the management so much as the system. As regards the officers, their ability, character, and general management was insufficient, in my opinion; and, as regards the collection of the revenue, the system was inefficient.
19. Are you acquainted with the system carried on with reference to Bonded Warehouses? I know the system carried on at the Bonded Warehouses. In fact, I was myself Storekeeper at a Bonded Warehouse at first.
20. Do you believe the way in which the Bonded Stores have been managed is the proper manner, having due regard to the interests of the public? It is defective in a great many respects.
21. In what way would you say it is defective—do you think there is not a proper supervision by the Officers of Customs? I was about to make the remark that I do not think the supervision, as carried on, was sufficient for the due protection of the revenue. In fact, there is no "supervision" at all, according to my understanding of it.
22. Who supervises that Department? There is no supervisor except the Collector of Customs that I have been aware of. There has been no supervision, I can answer more properly.
23. No proper supervision? No proper supervision.

9 Dec., 1856.

- G. Thornton, Esq.  
9 Dec., 1866.
24. Has the Landing Waiter charge of that department? No. There is an officer—I do not know what he calls himself—he is the gentleman who is waiting outside.
25. He is called the Landing Surveyor—Mr. Garling? Yes, that is the person I allude to.
26. He is the person who has charge of that Department? Well, I should be at a loss to tell you what that gentleman's duties have ever been.
27. He is supposed to have charge of the Bonded Warehouses? He is supposed to have charge of them.
28. Do you know whether there is any system of check to prevent fraud upon the revenue in these Bonded Warehouses? The only check is a lock and key kept by the Locker; the Bonded Storekeeper has another lock and key.
29. So that, by an arrangement between the Locker and the Bonded Storekeeper, the Government might be plundered to any amount? Yes, to any amount.
30. Have you heard of such things as spirits being taken out of Bonded Stores without payment of duty? I have heard such things, but I should not like to speak of what I do not know of my own knowledge.
31. You have heard rumours of that kind? Yes; it is a popular impression, and, perhaps, a correct one, that a great deal of "evaporation" goes on. I would rather not be asked these questions, if you will pardon me for saying so, but I may say that I know, of my own knowledge, of cases of cigars, and boxes of liqueurs, and other such packages being plundered by some persons or other. These are matters which occurred many years ago, but whether they have continued since I am not in a position to say.
32. What was the character of the Lockers generally during your time? Some of them were very good, but others of them quite the reverse.
33. Do you know of any check having been introduced to prevent similar occurrences to those you have mentioned as having occurred some years ago? No; I cannot conceive how there can be any check. If the Locker chooses to lend himself to the Bonded Storekeeper there can be no check.
34. I suppose if the Bonded Storekeeper provides himself with an extra key, that is, a duplicate key of the Locker's lock, he can go in when he likes? Yes; but I do not suppose any of them would do so. The stowage of packages in Bonded Stores has, in my opinion, been highly irregular. I allude to the impropriety of putting three or four tiers on the top of each other; for instance, three or four tiers of hogsheads. No doubt a great deal of loss has been occasioned by that. I have heard many complaints of deficiency in the packages, but of these people can speak for themselves; for instance, I have heard Mr. Aldis, the tobacconist, complain repeatedly of the robbery and plunder of his cigars in bond. I have heard him complain of robberies of his cigars.
35. Have you heard any of the importers of spirits complain? Yes, many of them.
36. Do these Bonded Storekeepers pay anything for the privilege? No.
37. Is it a profitable business, can you say? Very profitable.
38. Do you think they can afford to pay a license fee? I think they would not object to pay it. I do not know what the profits may be now, but speaking of Unwin's store, where I was experienced, I believe the profits of that store were about £5,000 a year.
39. *By Mr. Egan*: At what time was that? It would be within the last five years, particularly during the gold career; and even before then the profits were very large.
40. That was in 1853? Yes.
41. *By the Chairman*: Did you ever hear of any spirits being taken out by means of a syphon through the iron bars of a window? I have no knowledge of such a thing personally, but I have heard of it as matter of common repute. I know that it is generally complained of, that in re-gauging spirits, great deficiencies between the quantities bonded and the quantities on which duty was paid were apparent; and I have often observed personally that it could not arise from leakage.
42. Are the charges for storing bonded goods fixed by the Government or Collector of Customs in any way? No; they are not regulated by law in any way.
43. *By Mr. Weekes*: Are they not limited by law to a certain amount, although their regulation up to that limit depends upon private arrangement? I am not aware of any law limiting Bonded Storekeepers' charges in any way.
44. *By the Chairman*: Do you know whether there are any printed regulations issued, according to which the business of Bonded Storekeepers is to be carried on? I have not known of any regulations having been issued.
45. They can make what charges they like? Competition generally guides them, but I know there have been great complaints of excessive charges.
46. Do Bonded Storekeepers bond their own goods in their own stores? They do.
47. Can you tell us what check is maintained with reference to goods taken in and taken out, to prevent fraud on the revenue? The check, in my mind, exists only in name and not in reality. They ascertain at the end of three years, and this is a system only lately adopted, the quantity of spirits stated by the warehouse books to be in bond, and those that have been in bond for three years without payment of duty are sold, but whether they really exist in the bond or not is not looked into, that is to say, stock is not actually taken, therefore it is no check at all.
48. Spirits and other dutiable articles in the store might have been taken out? Yes; but this applies to former years.
49. And then, at the end of three years, they are sold, as if they were in store, although they may not be there at all? Perhaps so. It is open to the Bonded Storekeeper to purchase at these sales, and as they have a claim for rent, they generally get them, and whether the goods exist in name or in fact, they are written off the books. Instead of actually taking stock the books are resorted to. But of late years, all purchasers at these sales have to pay duty or export the goods purchased.
50. *By Mr. Weekes*: Do they never take stock? I have never known stock to be taken. The way they take stock is by the books.

51. *By the Chairman*: They do not actually take stock? No, not to my knowledge. I G. Thornton, Esq., would suggest that there should be a Supervisor or Inspector of Bonded Warehouses, who should be a man of knowledge, ability, and integrity; it requires perfect integrity.
52. Would you give such a man a good salary to put him above temptation? I would, and 9 Dec., 1856. I am sure the Government would save a large amount; I cannot estimate what would be the amount.
53. What salary would you suggest for this gentleman? £600 a year; because such a man would of necessity have to give the whole of his time to it, and keep a large amount of accounts and carry on a great deal of correspondence. There would also be much responsibility, and naturally, much odium cast upon him, for he would have to compel the Bonded Storekeepers to store their goods properly, to have their cases properly secured at all times; and to check that system of speculation that was so rife in former years.
54. Do you think one man could do it? I am sure one man could do it. There is one man in the department now—he is not a personal friend of mine, and therefore, I am not actuated by any feeling of interest in him—but from my knowledge of that man's character, integrity, and abilities, I feel confident he would be a proper man to appoint to this situation. I have watched his career for many years, and the tongue of scandal never yet approached him. If I were asked the question, I would name him.
55. What is the practice with reference to gauging goods when going into bond, and when being taken out? The Landing Waiters gauge the goods, and from their statement they are entered in the books. The goods are marked and numbered, and a regular account is opened in the warehouse books. That involves necessarily an amount of talent and educational acquirement.
56. Do the Landing Waiters generally possess that necessary amount of acquirement—those that you have known? Not generally, I think.
57. Have you known some of them incompetent to add up the quantities? I have known some of the Lockers, and I think I may say some of the Landing Waiters, who were not competent to add up a common column of figures; in fact, I knew one Locker who could not ascertain the quantities; but he is not now an officer of the department, and therefore, I should not like to name him.
58. Do you believe there have been more of that class of persons who were incompetent from want of knowledge? I believe there are some.
59. The Lockers gauge the spirits on their being taken out of bond? Yes, and on their certificate the Custom House Clerk receives the duty.
60. Do you believe the Government has been defrauded by the ignorance of these Lockers, in not putting in the certificate the necessary quantities? Unquestionably; it follows that if a man cannot gauge a cask, and cannot ascertain the quantity of spirits it contains, the Government must be defrauded.
61. *By Mr. Lord*: Might he not make a mistake on the other side? The party himself who had to pay the duty would look after that. If any merchant is about to pay duty on a cask of spirits he knows from his certificate the quantity and the strength, and if the officer makes a mistake against him he is sure to know it.
62. *By the Chairman*: Is there any regulation about this re-gauging? The system pursued is this,—the party requiring to have goods re-gauged gets an order from the Warehouse-keeper to the Locker, instructing him to get the cask ready to test it, and to certify the quantity and strength; he does so, and upon his certificate the duty is received.
63. *By Mr. Egan*: Must not a certain period elapse before such a certificate can be granted to any one, and within which the duty must be paid on the original gauge? It was not so in my time.
64. *By Mr. Lord*: Are the public charged anything for re-gauging? Not when duty is to be paid. If a merchant sells a quantity of goods, and wants to know the quantity, the Locker is employed privately to gauge them, and he gets something for it; but that is a private matter entirely.
65. Does the Locker put that money in his pocket? Yes. For instance, suppose Mr. Long buys twenty hogsheads of brandy from Campbell and Co., the sale, as is generally the case, would be by re-gauge; the Locker is employed to re-gauge the casks, and he gets so much a cask for doing it.
66. How much is it—are you aware? I think it is eighteen-pence a cask. But there is not much of that carried on.
67. Mr. Long, the buyer, would pay in that case? No, the seller, I think, would be the party to pay, because it would be his duty to prove the quantity.
68. Is it not customary for parties to purchase twenty hogsheads and only take one out of bond at a time? Yes, certainly.
69. Consequently there would only be one gauged at a time? The Locker does not charge for that; it is a portion of his duty.
70. *By the Chairman*: You say the Landing Waiter gauges the casks before they go into store? Yes, and tests the strength.
71. That is for the Customs? Yes.
72. What sort of persons are they generally in point of character? They are not always of the character and ability I should like them to be.
73. Have you not known some of them to be notorious drunkards? I cannot deny the fact. I do not like to be asked these questions, but I cannot deny the fact when I know it of my own knowledge.
74. Perhaps some of them get drunk from smelling the spirits so constantly? I do not think that would make them drunk. I was for some time employed in a brandy store, but although constantly smelling it, I was never intoxicated.
75. I suppose they must taste it to tell whether it is rum or brandy? They could tell that from the appearance of it. It is certain they cannot get drunk without tasting. The smell,

G. Thornton,  
Esq.  
9 Dec., 1856.

smell, in my opinion, would never make a man drunk, or I should have been drunk every day; for I was always amongst spirits. I judge, from my own experience, that the smell of spirits would not make any body drunk.

76. There are different Bonded Stores in different parts of the town? Yes.

77. When spirits are gauged by the Landing Waiter they are taken away in carts, I presume? Yes.

78. Do you know whether any body belonging to the Customs goes with them? There should be. It is the duty of the cart followers, as they are called, or sometimes a Tide Waiter or a messenger; what rule is practically carried out I am not in a position to say; if it is not done, the cask might be taken to any place the party chose.

79. The cask might be taken to the Bonded Store, but not the spirits? They might all be taken away. The only check, as I said before, is by referring to the books. Until the Government do appoint some supervisor—a man duly qualified and above suspicion—the same thing most necessarily go on. I would recommend that the Government should be very particular in making such an appointment, because there are very few men qualified for such a position.

80. What is the object and duty of the Tide Waiters? A Tide Waiter is a sort of bailiff to remain on board a ship to see that no dutiable goods are landed without the duty having first been paid: the object is to protect the revenue.

81. What class of persons are they generally taken from—an inferior class? An inferior class of persons, I should say, with some exception always.

82. The ostensible object in putting them on board vessels is to prevent smuggling? Yes.

83. Do you think it has that effect? No, I think it has not. I might say it is a facility for smuggling.

84. You do not think they have the slightest effect in checking smuggling? No, except in instances where the officers are careful and attentive to their duties; but while they receive such miserable pay, and such uncertain employment, they cannot be efficient.

85. You do not think they can live on their pay, except they have recourse to extraneous means? I am strongly of that opinion. They are only paid when employed, and they are only employed, I should say on average, four months in the year. I speak, under correction, I think they used to get six shillings a day before the gold increase was given, and how any man can support a family on such pay, I am at a loss to know. Therefore, I say that it is a facility for smuggling, clearly.

86. These Tide Waiters do not rise in grade or in rank in the Customs' Department? Yes. I know some instances where Tide Waiters have risen to other offices.

87. It is not the general rule? It is not the general rule, I believe. I know of some who have been selected as clerks and Lockers; they have been men of a superior class.

88. According to your opinion, they are of no use whatever in preventing smuggling? Yes; I would recommend the abolition of the system of Tide Waiters.

89. What would you recommend instead? I would recommend a greater number of Landing Waiters, who should be of a different order. For instance, I would suggest that one expert Landing Waiter, a man who would be sober, careful, steady, and attentive to his duties, and having some ability, could attend to the discharge of three ships lying at a wharf; take for example the Circular Wharf, and could perform the whole of the duties the Tide Waiters are now supposed to perform, keeping at the same time a thorough check on improprieties of all sorts; and I would also recommend that all ships should have their hatches, after a certain hour in the day, fastened and secured by a Locker.

90. *By Mr. Egan:* And sealed? Sealed would be better, in addition to the lock. In carrying out that idea too, I would also suggest that ships when reported inwards should be properly manifested, and afterwards made to account for any difference between the quantity reported to be landed and the quantity reported inwards. That would be, in my estimation, a very excellent check as regards discharging ships, and I believe has succeeded in America. The duties of the Tide Waiters are generally carried out by the discharging clerks, as far as the numbers and marks of the packages are concerned.

91. *By the Chairman:* I suppose in severe weather these Tide Waiters are often below? Yes, and they may be often on shore. Perhaps the next witness will tell you instances of some men having been discharged for leaving their vessels.

92. Have you heard instances of any of these men receiving presents from the captains of ships? I certainly have heard of it; and I have known instances where the Tide Waiters have been found not to be on board their ships.

92. Do you know of your own knowledge of any instance of their receiving presents? No.

93. *By Mr. Gordon:* In what way do you suppose the Tide Waiters are a facility for smuggling, as you said just now? Because they are supposed to be the only check on vessels discharging after hours, or landing dutiable goods without payment of duty; there is no other preventative adopted by the department than the Tide Waiters, and their pay is so wretched, and the men themselves are sometimes of such a class, that they cannot be above the temptation that may be offered to them.

94. Do not the dutiable goods come under the notice of the Landing Waiter, as well as the Tide Waiter? The Landing Waiter only attends in the the day-time, and the hatches are not secured at night, because the Tide Waiter is supposed to be on board, and to be a sufficient check as to any landing at night-time.

95. *By Mr. Buckley:* You say a Landing Waiter could attend to three vessels—would it be possible for him to attend to one at Campbell's Wharf and two others at the Circular Quay? Not unless they were close together. If they were at the north-western end of the Circular Quay, where it joins Campbell's Wharf, he might.

96. But if a ship were at Botts' Wharf, and another at the Circular Quay, there should be one Landing Waiter to each wharf? I think there should be one to each where the distance is so great between them:

97. *By the Chairman*: Is there any night guard—any boats that row guard in the harbour? G. Thornton, Esq.
98. *By Mr. Gordon*: Is there not a Water Police guard at night? It is no part of their duty to attend to these matters. In fact, I question if they have the power to make a seizure. They might stop any goods that were being landed contrary to law, but I do not think they legally possess the power to make a seizure. 9 Dec., 1856.
99. But a Water Police boat does row about the harbour at night? Yes; there is a Water Police regulation of that sort.
100. *By Mr. Buckley*: Have you ever known Tide Waiters to allow of smuggling—has it ever come under your own knowledge? No.
101. You said it was quite possible for a dray load of spirits to be taken away, intended for a Bonded Warehouse, and not go there? Unless accompanied by a cart follower.
102. Is it likely such a thing has ever occurred as a dray load of spirits being taken away in that manner? No, I think not.
103. You were speaking about disposing of goods that had been over the proper time in bond, do you know of any instances of goods having been sold at public auction that were not in store? Of my own knowledge I do not.
104. But you have heard of such things? I have.
105. In what way could they be taken out without the knowledge of the Customs Officers? Anything I could tell you would only amount to supposition.
106. Is it the invariable rule, that Bonded Storekeepers purchase everything put up to auction in this way? It is open to public competition, but the Bonded Storekeepers having a large amount of lien upon them for rent, are generally the purchasers, because nobody can compete with them.
107. *By Mr. Weekes*: Are they sold without sample? I believe by description.
108. *By Mr. Buckley*: Taken from the books of the Customs? Yes, and advertised in the newspapers.
109. *By Mr. Weekes*: No sample is exhibited at the sale? Not that I am aware of.
110. *By Mr. Lord*: Do you think it would be possible to do away with the private Bonded Stores, and bond all goods in a large Government store? I think the quantity of dutiable goods in bond is so large, that I do not know of any range of stores that would contain them.
111. *By the Chairman*: Would they not be more easily supervised in a Government building? I have no hesitation in saying that if one Government building could be erected, no impropriety could be carried on, under proper regulation. But that would interfere with the vested rights of the proprietors of Bonded Stores.
112. *By Mr. Buckley*: Would it be as convenient to the public generally? Yes, more convenient. The hours for keeping open the present Bonded Stores are necessarily varied, and are therefore inconvenient; for instance, some are only open for an hour in the day, others for two hours, some all day. I have known many instances where a party going to a store to get a cask re-gauged, could not get back to the Custom House in time to pay the duty, and get an order for its delivery, before the store was shut. If one Bonded Warehouse were erected, sufficient to contain all the spirits and bonded goods of the Colony, and were carried on by the Government, I have no doubt it would work satisfactorily, because it would open at a given hour, and close at a given hour, and remain open all day.
113. *By Mr. Lord*: Do you think the rent of these goods would be quite sufficient to pay the expenses of such a store? Far beyond it. It would not only be a self-supporting establishment, but would return a large revenue besides, because, if Bonded Stores pay as at present conducted, it would pay in a greater ratio.
114. *By Mr. Gordon*: Do you not know as a fact that what pays private individuals does not pay the Government? The Government does not generally manage so well, but I have no hesitation in declaring that one Government Bonded Warehouse would be a great public convenience, a check on a great many improprieties, and a source of very large revenue.
115. Do you not think that Bonded Warehouses, distributed as they are now, are a much greater convenience to the public than one large warehouse confined to one place? Decidedly not.
116. How do you arrive at that conclusion? I have held the position of storekeeper to a Bonded Warehouse, and I have no hesitation in saying that if one large Bonded Store were erected by the Government at the Circular Quay, near the Custom House, or at some central place, it would be much more convenient than the stores as at present scattered, and the hours as at present varied.
117. Do you not think it would require a great many places of ingress and egress to prevent confusion? No doubt, and so does a large store like Campbell and Co's.; there are numerous places of ingress and egress there.
118. *By Mr. Lord*: Would it not be a saving of Lockers, and all that class of people? It would a great public convenience, a great saving to the revenue, and would yield a large return.
119. *By Mr. Gordon*: Will you point out in what way it would be a saving to the revenue? In many ways—practices carried on under the present system could not be carried on.
120. Has it not been the custom to take stock in these Bonded Warehouses once a year of late years? Not to my knowledge. During the time I was there stock was not taken.
121. Colonel Gibbes gave evidence before this Committee to that effect, if I understood him rightly? It must be since I ceased to be interested in such matters. I have been away three years.
122. *By Mr. Buckley*: If a license fee were imposed on Bonded Storekeepers, would it tend to increase the rental of spirits and other goods put in bond? I think it would have that effect.
123. In fact the public would pay it? The public would pay it.

- G. Thornton, Esq.  
9 Dec., 1856.
124. Would it not require to be a fee of large amount to make any increase in the rental? I do not see the object of the Government in charging a license fee, or why it should be charged at all.
125. *By the Chairman*: Do these licensed holders of Bonded Stores give any security to the Government? I should say they do. I believe they do, though I am not aware of the fact. I should suppose they do.
126. Do you think they ought? I think they ought.
127. *By Mr. Lord*: Are you not aware that large profits are made by Bonded Storekeepers in the shape of rent? Yes.
128. *By Mr. Gordon*: Do you think they are much greater in proportion than the profits of ordinary stores? Yes, much greater. I know that in Unwin's store the profits arising from rents alone amounted to £5,000 a year.
129. But there must have been considerable expense attending that? I have no hesitation in saying that since that period, and during the gold career, when goods were so abundant and the stores so full, the same store must have yielded a greater amount than £5,000 a year.
130. Do you think that is the case now? No; the quantities of goods have fallen off to a very great extent.
131. Is it not within your knowledge that if you have goods arrived in the harbour, you have some half-dozen Bonded Storekeepers running after you, to see if you will give the storing of them to them? Yes, no doubt that is the case; but the number of stores has been extended of late years.
132. *By the Chairman*: Do tobacco, spirits, and cigars go into the same Bonded Store? Yes. They are stowed separately, but are taken into the same store.
133. You have said that a Bonded Storekeeper can store his own goods—can he store any goods than those that are dutiable in his Bonded Store? I do not know that.
134. Do you think he ought not to be allowed to do it? I think he ought not.
135. Can he refuse to accept goods? I think he could refuse. I think the Collector of Customs could prevent his receiving any free goods, and Colonel Gibbes, if he knew it, would, I am sure, prevent such a thing.
136. *By Mr. Gordon*: Have you observed the scale of license fees intended to be imposed on the Bonded Warehouse-keepers? I have not seen it.
137. If it is proposed that each Bonded Warehouse-keeper should pay a license fee of £50, and £1 for every ten tons his store will contain by measurement over a certain quantity, do you think that would be an equitable or fair way of putting a charge on Bonded Stores? No, I do not think so, because some stores are far more convenient than others, and more popular; one man would pay for surface where another man would be paying for value. I think that is an improper basis to go upon.
138. *By Mr. Buckley*: What principle would you lay down as equitable for a fee of that kind? I think the charge should be according to the position and repute of the store.
139. *By Mr. Gordon*: Do you think it desirable to have a fee at all? As a means of revenue, I should say not.
140. *By the Chairman*: Do you know that in England every thing is regulated by the Government—rent, charges for cooerage, and so on? I believe that is the rule. I have had no experience in England; I have never been there.
141. I suppose you are aware that there is no Act to regulate Bonded Warehouses here? I am not aware of any law, or any rules or regulations affecting them.
142. You think that one Bonded Store, superintended by responsible and respectable persons, would tend to prevent deficiencies? I should have said improprieties. They would be a great public convenience, as well as a source of large revenue.
143. *By Mr. Gordon*: How many thousand pounds would it take to build such stores as would be sufficient at the present time? I do not think it would reach £100,000. The present Commissariat Stores, with some additions to them, would, in my opinion, contain all the goods at present in the Colony; and there would be no expense of cartage, and no danger of loss, but the goods could be landed on the wharf, gauged there, and put into the stores at once.
144. *By the Chairman*: Those stores are not half used now—scarcely occupied? I believe not.
145. *By Mr. Buckley*: The more popular a store is, the greater the amount of goods bonded in it, of course? Unquestionably.
146. Under these circumstances, how would you fix or vary the license fee? It would be such a difficult and invidious question of arrangement, that I would rather say I would not fix any license fee at all. I would recommend no license fee at all. For instance—Campbell and Co.'s store, by reason of the liberal conduct and character of the proprietors, is highly popular, and not only so, but highly convenient. For such liberality I would not tax them; but if you tax them in an *ad valorem* shape, you would tax them heavily.
147. Suppose they were taxed in proportion to the quantity of goods in the store? It varies every day.
148. Suppose an average were struck every month of the contents of the store? You could not come to any correct or just conclusion; you would either be injuring unduly the warehouse-keeper or the Government.
149. You cannot suggest any mode? No; it would not be correct to charge any license fee at all at present.
150. *By Mr. Weekes*: Do you say that because they are not making money now, or on the principle? That is one reason, and the principle I have stated is another.
151. Do you see any grounds why keepers of Bonded Warehouses should be taxed at all? At present I do not; but when they were so overbearing, and so extortionate in their charges, I should have strongly recommended a high license fee; however, those days have gone by.
152. *By Mr. Gordon*: Competition regulates their charges, as it does everything else? Yes.
153. *By Mr. Lord*: Do you not think you confer a benefit by allowing a man to have a Bonded Store? Yes.
- 154.

154. Do you not think he should pay for that benefit? We cannot come at a correct basis for a charge. I have already stated that I think the Bonded Storekeepers would willingly pay a tax for the privilege. For instance—if I built a store on the Circular Quay, and made application to the Collector of Customs for a license, and he said to me that I had to pay so much as a license fee, I would pay it willingly, for the sake of the advantage it would give me.

G. Thornton,  
Esq.  
9 Dec., 1856.

155. Do you not think that, under any circumstances, where permission is given to the proprietor of a store to bond goods, he should be charged a fee for that permission? I cannot forget the difference between the values of Bonded Stores.

156. That is his business; but do you not think that, as the proprietor of a Bonded Store, he ought to pay the Government some tax? Yes; I said before that I think they would be willing to pay for the privilege.

157. *By Mr. Weekes*: Is not the bonding of goods a public benefit? Yes, a very great public benefit. If a merchant imports fifty hogsheads of brandy, it may not be quite convenient, and indeed would be highly impolitic, for him to pay the duty at once; and, therefore, it is a great benefit to him to be able to let the goods remain in bond until he sells them, and then the purchaser pays the duty.

158. Then on what principle is it just, that a man who goes into a speculation for the public benefit should be subject to a tax? Only on the principle that it is a source of income to him, which he would not otherwise possess.

159. *By the Chairman*: He has an advantage over a person who is not licensed? Clearly so.

160. *By Mr. Weekes*: Is there any difficulty in getting a license for bonding goods? Very great difficulty indeed, because it involves an additional expense to the Government, as there must be a Locker appointed to it.

161. What would be the consequence if all the present holders of Bonded Stores withdrew from the trade, in consequence of the tax upon them being so large? I cannot conceive the possibility of such a thing. It would be such an act of lunacy, that it is not possible to occur, because their capital, their income, and their interest, are so identified with these particular goods that are in their stores, that they cannot abandon them.

162. I take it that if individuals were to decline to go into a business of this kind it would be the duty of the Government to do it, as the necessities of commercial men would demand—? They would demand that the Government should have some store to receive their goods.

163. *By Mr. Gordon*: Because they are not likely to withdraw, would you impose a tax on them? I have already stated, as a principle, that it would not be fair to charge a fee to a person applying for a license. If we were setting out in a new city it would be fair and equitable, and it would be acknowledged, and readily responded to, by applicants, that they should be charged a license fee. But, under present circumstances, I know of no correct basis on which you could go to charge a license fee.

164. *By Mr. Weekes*: Instead of imposing a tax on the keepers of Bonded Warehouses, which might react upon the rent they would charge to the public for storing goods, and so increase the expenses attending commercial operations, would it not be better policy, looking at the question in a commercial point of view, to fix a reduced scale of rent to be demandable from the public? I do not see how you can legislate on men's private arrangements; but if it were a Government building, of course you would regulate the charges by law.

165. *By Mr. Buckley*: If Bonded Storekeepers were charged a fee of £50, do you think they would increase their store rents? I think an annual payment of £50 would be looked upon as a nominal charge, and would not be objected to. I would further say, that if a person owning such a store could not afford to pay £50 a year for the privilege of being licensed, it would be better that the store should be dispensed with, and it would be a convenience to the Customs' Department if it were so.

166. Is it your opinion that if this fee were charged it would reduce the number of Bonded Stores? In one or two instances it would cause them to be discontinued.

167. And the revenue would be benefited in proportion by lessening the number of officers? No doubt.

168. In the event of such Bonded Stores as Aldis's, Leigh's, and others of the smaller stores, being given up, would it be any public inconvenience? No, it would not be a public inconvenience, but it would be a private injury.

169. Is it likely such a fee as that would induce them to give them up? Some of them it would. No doubt it would cause a great deal of inconvenience to persons like Aldis and Leigh. The permission to bond in their own stores has been a saving and a great convenience to them.

170. What kinds of locks are there generally on the doors of Bonded Stores? They are generally very good locks.

171. Are they stock locks generally? Yes, those belonging to the proprietors.

172. What description of lock is used by the Locker? Generally a bar and padlock.

173. Does the crossbar cover the keyhole of the storekeeper's lock? I cannot say at this moment.

174. Have you known of any instances of duplicates of the keys held by the Customs being in existence? Of my own knowledge, none.

175. Are they a common description of padlocks? No, generally a superior kind of lock.

176. Have any instances come within your own knowledge of the transfer of packages of cigars into different packages, those that were bad into good packages, and *vice versa*? Only by hearsay.

177. Do you know of spirits having been transferred in a similar way? It scarcely amounts to knowledge, but I have heard it rumoured.

178. *By the Chairman*: Did you ever hear of a quantity of tea having been delivered by a Locker without payment of duty? Yes. No doubt stores have been left open at times so that Tom, Dick, or Harry could go into them; but that is the fault of the officer. According

- G. Thornton, Esq.  
9 Dec., 1856.
- to rumour—and I believe in the truth of the rumour—spirits have been changed from one cask to another; brandy of an inferior character—  
179. *By Mr. Buckley:* Spanish? I would not say Spanish—has been put into casks bearing a better mark; for instance, I have heard of brandy of a quality not so good having been put into Martell's casks and sold as Martell's.  
180. That mode of deception, you think, has been practised in Bonded Stores? I have heard of such things, and I believe in the rumour. But I am quite sure that such things have never occurred in some of the Bonded Warehouses.

THURSDAY, 11 DECEMBER, 1856.

Present:—

MR. BARKER,  
MR. HOLT,

MR. IRVING,  
MR. NICHOLS.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

George Thornton, Esquire, J.P., called in and further examined:—

- G. Thornton, Esq.  
11 Dec., 1856.
- By the Chairman:* You are acquainted with the business carried on in the Long Room at the Custom House? Yes, intimately.
  - I suppose you transacted most of your business in that room yourself? Yes; the principal business of the department is transacted in the Long Room.
  - Do you think any improvement could be made in the business of the Long Room, with reference to the entries of goods? I cannot myself see the necessity of keeping up the system of an account of imports and exports, which necessarily involves a great amount of labor. The only object for which these accounts are kept, I imagine, is for statistical information, and that could be obtained in another way.
  - How many clerks are employed on that duty? I think there are two or three clerks constantly employed. It is just so much paper and so much time used unnecessarily. Every bale of goods, case of hats, trunk of boots,—with all particulars,—ship, master, port, date, value, description, importer, and so on—must be entered several times over; and copies of those entries are sent to other places. I do not see the object of it; I seldom see any statistical information arising out of these things.
  - How many Officers of Customs do entries for free goods pass through? The entries for free goods employ, at least, one clerk; and those entries are very obstructive to the public convenience, and the business of the public, because, although there are no duties leviable on those free goods, unless the officer has an entry passed through the Customs, shewing the marks and numbers, and all other particulars, they are not allowed to be landed, and much inconvenience arises in consequence.
  - Free goods have to be entered, and a warrant obtained for their discharge from the ship, in the same way as dutiable goods? Yes; they have to pass through a long routine, in my humble opinion, wholly unnecessary.
  - Does it take up much of the time of a merchant's clerk who attends to make these entries? Yes.
  - He has to draw out two copies of the entry? Three copies.
  - Do you think the ship's manifest, and the report of the consignee, would be sufficient entry in the case of free goods? I think free goods should be allowed to pass without any notice whatever. The Landing Waiter, if a proper and zealous officer, could, at all times, prevent dutiable goods being landed under the head of free goods.
  - Do you think the course suggested in the following paragraph, from the Report of the Committee of the House of Commons, in 1852, on the Board of Customs, is a good one:—  
“That the ship's manifest, and the report of her consignee, be the sole entry required in the case of free goods; that a copy of them be sent to the Landing Waiter as his warrant, and that the information for statistical purposes now obtained from the merchants entering goods, should be given by the ship's consignee from the freight account”? That is my opinion exactly; I adopt every syllable you have read.
  - Here is a suggestion from the same Report, which I will take your opinion upon:—“In order to dispense with the entry for goods (all now free) outwards, it has been suggested to your Committee, that every shipper should send to the agent for the ship a bill of lading, containing on the back the information required for statistical purposes, which is the sole point that concerns the Customs; and that, from the number of those documents, composing a cargo, the ship's agent should be bound under penalty to make out one content, to be delivered at the Custom House within a reasonable time after the departure of the ship”—do you think that would furnish sufficient statistical information? It would furnish it fully and completely, and save an immense amount of labor. The only export account then necessary, would be that for goods under bond and goods under drawback, which form a very small portion of the exports of the Colony.
  - Can you suggest any amendment in the despatch of business in the Long Room, with the view of dispensing with unnecessary forms? The matters you have already questioned me upon would have the effect of lessening or dispensing with unnecessary forms to a very great extent.
  - You are aware that the Collector alone manages the Customs' Department now? I am aware of it.
  - Do you think it desirable that there should be a Board of mercantile men to assist the Collector in matters connected with the Customs? I could not too strongly recommend such a course. It would be highly conducive to the public convenience, and beneficial to the Government,

Government, and to every body concerned, especially the Department itself; because it would relieve the Collector of a great many duties which now necessarily devolve on him; he has to give so many audiences, to answer so many questions, and to decide so many matters which should properly come before a Board, that he has not time to attend to the details of the Department. While I think of it, I would suggest an improvement that might be made in the Long Room in one respect: I think the hours of attendance are too limited for the public convenience. I think from ten until three—and those hours never kept punctually, according to practice—are not sufficient for the public convenience.

G. Thornton,  
Esq.  
11 Dec., 1856.

15. What hours would you recommend in summer and winter? In summer from nine until four, and in winter from ten to half-past three, or somewhere thereabouts. Indeed, I see no reason why the hours should not be from nine to four all the year round. It would very much tend to facilitate the business of the public, and keep the Department itself in better order, because if the clerks' duties are put off from day to day, as they often are when the office is closed at three o'clock, these backward matters necessarily accumulate.

16. Is there any means of clearing a ship after three o'clock in the day? My practice was, when from unforeseen difficulty a ship could not be cleared within the time—and the time was more limited than even you have mentioned, during my career, at any rate—my practice was generally to refer to Colonel Gibbes himself. I always found him the readiest and most willing in the whole Department to oblige. I never had a refusal in my life from him to oblige any proper request. I cannot say so for all the other officers of the Long Room. On payment of a fee we could get a vessel cleared.

17. *By Mr. Irving:* Who got that fee? The clearing clerk remained beyond the time, and of course he was paid for his overtime.

18. *By the Chairman:* What used you to pay? I think half a guinea, but I am not clear about it.

19. Do you think it desirable that a clerk should remain after hours for the purpose of clearing ships? I think that, if my suggestion were adopted with reference to the hours, these matters could not possibly arise, that is to say, if the office were kept open till four o'clock. There is no reason in the world why any clerk there should leave his office before four o'clock. Speaking of the Chief Clerk, when I was there, and some of the out-door officers of the Department, they were most uncouth and disobliging.

20. *By Mr. Holt:* Who is the Chief Clerk? I do not allude to the present Chief Clerk, but the Chief Clerk when I was there. Some of the other officers were particularly disobliging. I will take this opportunity of saying that I believe the hardest-worked man in the Department, for the great number of years I was there, was the Collector himself; he was always employed, from the moment he went into the office—and he was generally there the first—until he left. I am quite sure he did more than any two men in the Department; and he was the readiest to oblige any one, were he humble or otherwise. The establishment of a Board of Customs would relieve him of a great deal of trouble in granting audiences, and other public matters. A great amount of time is taken up in that way.

21. *By Mr. Irving:* Your remarks tend to the belief that they are not good clerks in the Custom House? I am speaking of my own time. Some of the clerks, and especially those in high authority, were most uncivil and disobliging to the public—a great portion of whom I represented in my business. I have known instances where a team has been waiting for one package of tobacco, perhaps, to complete a load, when a single stroke of a clerk's pen on a piece of paper would have been sufficient to pass it, and when delay was of great consequence—perhaps on a Saturday, when the team would be detained, at great expense and inconvenience, until the Monday, for want of this package—and he has refused it, notwithstanding the matter has been urged to him time after time; and the consequence has been that the team was compelled to wait till next day, or perhaps Monday, at a great amount of expense and annoyance. Therefore, I say that in my time I have received a great amount of want of courtesy from some of the officers of the Department. Of late years I am quite sure the discipline and routine of the Long Room has been very much improved. A system has been adopted. In former years there was not much system, but of late years there has been a system, and matters have been going on with much greater order and regularity. But still there is great room for improvement, and nothing will improve it more than to increase the hours of attendance, and to have a Board of Customs.

22. *By the Chairman:* You are aware, I believe, that the original importer of goods is liable for all duties thereon, however long they may remain in bond? I do not think that is the case, with due submission to you as a lawyer. I think the law is that if he accounts for those goods within a given time then the obligation becomes void. He enters into a bond that he will warehouse them, and if they are properly warehoused, and properly accounted for, I think his liability ceases as the importer.

23. That is your impression? That is my impression of the law. I may be wrong, of course. For instance, if I were to import ten kegs of tobacco, and warehouse them in Campbell's stores, I would give a bond that I would pay the duty, or otherwise properly account for them. I think that is the nature of the bond. If they were stolen I should not be liable for the duty if I could account for them; and the bond would be void as against me, even though a third party smuggled them. As the importer I would not be liable to the consequences of such smuggling, either as regarded the duty or the penalty for smuggling.

24. Is there any regulation as to importing packages of particular sizes? No.

25. Packages of all sizes are imported here? Yes.

26. Are you aware that that is not the case in America? I am quite aware that is not the case in America. The size of the packages is regulated.

27. Do you know what is the course when a seizure is made of smuggled goods? As regards the goods, or do you mean the practice from beginning to end?

28. When an officer seizes a quantity of goods what is done—how is the matter adjudicated? They are locked in a store, called the Queen's Warehouse, for security, until the matter is investigated.

G. Thornton, Esq.  
11 Dec., 1856.

investigated by the proper tribunal—whether it be the Magistrates at the Police Office, or the Collector himself—and if the seizure be a proper one, the goods are condemned and sold, the proceeds of the sale being divided in proportions regulated, I think, by law, or by a regulation of the Customs, which, of course, has the effect of law, namely, one portion to the informer, I think a portion to the seizing officer, and a portion to the Queen.

29. Supposing a man is detected smuggling, and the Collector exercises the power which is given him, and allows the information to be compounded for a certain payment by way of penalty, who distributes the money then? The Collector would have the control of it, I think, but I am not aware of the fact.

30. Do you know anything of the practice followed in shipping spirituous liquors on board steamers? Yes.

31. Do you know that the steamers trading between this Port and Victoria take their spirits out of bond duty free that they use on the voyage? Yes; they are allowed to ship quantities of spirits duty free for their own use.

32. *By Mr. Holt:* Is there any limit? They are limited by law, but whether they are in practice I do not know.

33. *By the Chairman:* Is the quantity they can take duty free limited by law? It is.

34. Are you sure of that? I am quite sure. But if they abided by the law the quantity would be so small that it would be hardly of any service at all. It is a gallon per man per month.

35. How could they tell beforehand how many passengers a steamer would have? They are not allowed to take spirits in that way for passengers.

36. Do you not know that they do get spirits out of bond duty free for the purpose of supplying both crews and passengers? I know that spirits are permitted by the law to be shipped in bond for the use of the crew, but what the practice is as to quantity I am not prepared to say. The law contemplates the issue of spirits free of duty to the men and the Captain, but I think if it does not specially exclude passengers—it does not mention them in reference to it.

37. You know there is an establishment called the Department of the Inspector of Distilleries in this Colony, which forms part of the Excise? Yes.

38. Are you aware that one portion of the duties of that Department is carried on under the Customs Department, namely, the bonding of spirits? Yes.

39. There is a clerk for that purpose also? Yes.

40. That clerk is attached to the Customs Department? Yes.

41. Do you not think that, with a Board of Customs and an efficient person like Colonel Gibbes at the head of the Department, they might manage to carry on the business of the Distilleries there? Yes, certainly.

42. With the assistance of the usual inspectors? Yes. I am very sanguine indeed. I repeat the observation, that a Board composed of business men, merchants, would add very much indeed to the efficiency of the department in every respect and to the public convenience. It would regulate the department in all ways satisfactorily to the public and to the Government. It is impossible that Colonel Gibbes alone can do so. I believe he is the hardest worked gentleman in the country. It is quite impossible that he can attend to the detail of his own department as he could wish to do. I will direct your attention very respectfully to an office which I think is wholly unnecessary. It is called that of Landing Surveyor; and whether as regards the office itself, or the present occupant of it, they are both utterly useless and unsatisfactory.

43. What are the duties that officer ought to perform? I cannot conceive the services he performs in the department.

44. *By Mr. Irving:* What does he do? He seems to walk about with his hands in his pockets.

45. Is there more than one? Only one. He seems to me to be doing nothing from morning to night but walk from store to store.

46. *By the Chairman:* If an Inspector of Warehouses were appointed he really would have nothing to do? No. That gentleman should be employed as a Landing Waiter; that is his particular duty; he should attend to the business of landing goods. Landing Surveyor is altogether a misnomer. I cannot understand why he should be called so. He does not assist the Collector in the slightest.

47. His business, I suppose, he professes to be to go to the Bonded Warehouses and look after them? No doubt.

48. If the system I have drawn your attention to, as to the entries of free goods being provided for in some other way, were adopted, do you not think two or three of the clerks might be dispensed with? They might be made Landing Waiters of, and they would thereby be made useful to the department and to the public. I cannot conceive that an account of imports and exports is at all required, except for statistical information, and that could always be had in the manner described by yourself, by getting a content outwards and a manifest inwards.

49. *By Mr. Irving:* That would not shew the value of the goods? The value according to the present system is of such a wild and uncertain character, that if you form any foundation for an import value you form a false one. If I were passing an import entry for you for a number of packages, I would guess the value, and have always done so. Therefore the statistics of value are wholly false. It is all guess work. If you imported a case of drapery I might value it at £600, whereas the real value might be £35.

50. *By the Chairman:* There are no *ad valorem* duties in connexion with the Customs now? No; I think the system is abolished.

51. *By Mr. Irving:* What is your opinion of *ad valorem* duties—would they be easily levied or work well? I think that *ad valorem* duties could be worked well.

G. Thornton,  
Esq.  
11 Dec., 1856.

52. *By Mr. Holt*: They are easily evaded, are they not? A rascal, a man who would have the courage to undervalue his goods, might succeed; but the instances would be very few indeed; the risk is too great; and if the law were acted on imperatively, that when a false value is given the goods should be seized and sold, there would not be many cases of fraud. I speak from an immense amount of experience. It was my particular business, and I did a very large amount of business. In theory one would be supposed to be unfavourable to *ad valorem* duties; but in practice I would offer my opinion that *ad valorem* duties are beneficial, whether as regards the importer or the revenue of the department. No doubt frauds would be attempted, but it would be the fault of the Landing Waiters if they were successful. If there were careful, sober, zealous officers, these frauds would seldom occur.

53. *By Mr. Irving*: How would you value goods—at a per centage on the invoice cost? I would take the invoice as a guide, but that is a question I am not prepared to answer. I would rather reduce the invoice than add to it.

54. Are you aware that goods are sometimes worth a hundred per cent. premium on the invoice price? I would take the value at the place where the goods were imported, at the time of entry. For instance, sugar when entered might be worth £50 a ton, then I would make that the basis of the calculation for the duty. At another time the price might be only £20 a ton, according to fluctuation in prices, and the duty should be in proportion. I do not think duties collected in such a way would be oppressive. If any dispute arose, the matter might be very easily settled by referring it to arbitration instantly, or the Board of Customs.

55. *By the Chairman*: The Board we have spoken of might arbitrate in matters of this kind? Yes, they would be most useful.

56. Can you form any idea what revenue might be derived from *ad valorem* duties in this Colony? The amount of revenue would depend entirely on the duty to be imposed. You would have to fix your duties so as to operate equitably on the different kinds of goods. Sugar should be so much per cent.; jewellery, so much; drapery, so much. You would have to regulate the charge by the character of the goods. That would be a matter for inquiry by a Committee whenever such a Bill might be brought before the House. There is another thing—I cannot see why the tonnage duty on ships was taken off. It was never objected to, and cheerfully paid. They got the *quid pro quo* in the shape of police protection and lighthouses. There is no port in the world adopts the same principle. All the captains of ships that I have been doing business for, never yet made an objection to the charge. It was nominal in itself, but in the aggregate of large amount.

57. Have you heard masters of vessels complain of any delay that they have been put to at the Customs' Department, by having to run to and fro to the Shipping Master's Office, the Water Police Office, and so forth, to get their business done? These establishments have been mostly in operation since I have left the Customs, and I am not prepared to speak on the point. The Shipping Master's Office I do not think was in existence during my career.

58. Can you give the Committee any suggestions as to reductions in the number of officers and clerks in the Customs' Department? I think there are too many clerks, and that their duties are incorrectly divided; here again a Board of Customs would be useful, to regulate the numbers and the duties of the clerks, &c. By extending the hours, as suggested before, a great saving in time would be effected, and the public greatly inconvenienced.

59. Have you looked through the scale of salaries in this Return, which was laid on the Table of the House last year? These are not the salaries at present paid.

60. *By Mr. Holt*: The gold increase would be in addition to those salaries? Yes. (*Reference was here made to the Estimates for 1857.*) The salaries are large considering the hours of attendance. I think they should give their services from nine to four for such high salaries.

61. *By the Chairman*: You are, of course, acquainted with the amount of work performed by mercantile clerks, and with the general rate of their salaries—do they range at a higher or a lower rate than those proposed in this estimate? I think generally at a lower rate, and they give a much greater amount of service.

62. What are the ordinary hours in merchants' offices? From nine till five, and they often have to work at night.

63. *By Mr. Irving*: Would the clerks in the Custom House bear a comparison with merchants' clerks in point of ability? I think not.

64. *By the Chairman*: The merchants' clerks possess a greater amount of talent? Generally, and they have to work harder.

65. And they are entrusted with more arduous and responsible duties? Yes they are; I know some merchants' clerks who could do the work of two or three of these. I see that some of these parties have been appointed by the Lords of the Treasury; and I fancy they have been made without reference to the ability or fitness of the parties. The Lords of the Treasury used to appoint some favourite, and send him out here with a good berth, to the exclusion of our colonial appointees. There are some of the officers named here who are really praiseworthy and efficient men, and others who are the very reverse. I could take each man and paint his character to life. A Board of Customs could regulate all these difficulties, and obviate all these unpleasanties.

66. *By Mr. Irving*: They would dismiss an incompetent clerk? Not only that, but if a man were dismissed for being drunk, he would be dismissed at once, and for ever.

67. *By the Chairman*: Have you known men who have been dismissed from merchants' offices for drunkenness, and bad conduct, to be taken into the service of the Customs? No.

68. Have you heard of men being dismissed for drunkenness, and afterwards being taken back? I have known such things to be reported.

69. You know Colonel Gibbes is a very good natured man, and therefore he is likely to forgive? He is the most gentlemanly, kindhearted man I ever knew in my life.

70. Are these Baggage Searchers of any use? No, they are of no use. Their duties could and should be done by the Landing Waiters.

- G. Thornton, Esq.  
11 Dec., 1856.
71. Can you tell us anything about the eleven boatmen put down in this Estimate for 1857—is there any necessity for so many? I think not, unless it includes the Coast Waiters' boatmen; they must necessarily have a boat and crew, and if it includes them there are not too many. A Customs boat is absolutely necessary in Sydney; the crew should consist of four men, one of them being the coxswain. It is important that every ship should be boarded immediately on arrival, and certain information afforded, her name and other particulars, which are of great importance to the mercantile community.
72. How do you account for the variation in the Locker's salaries, from the first down to the ninth Locker—are not the duties of one Locker the same as those of another? There is no difference in the duties. Here again a Board of Customs would be useful. Some of these Lockers on whose certificate the duties have to be paid are not competent. The appointment should involve a correct knowledge of arithmetic at least.
73. *By Mr. Irvin:* They should be examined first? They should be examined before a Board, to see that they understand fully the principles of arithmetic, gauging, &c. During my time, I knew more than one Locker who could not add up a column of figures, and could not gauge a cask properly, although they had to certify.
74. *By the Chairman:* What are these Warrant Messengers? They are concerned with the entry for free goods. When a warrant is granted for landing goods, they employ one of these messengers to take it; they will not let the merchant's or Custom House Agent's clerk do it, I do not know for what reason, and this messenger may be an hour, or two hours, or three hours, according to his own fancy, in delivering it to the Landing Waiter; whereas if the Custom House Agent's clerk could take it, it would be done in a few minutes. But this is one of Mr. Barnes' improvements.
75. What is the object in refusing to give it to the Custom House Agent's clerk? I do not know, except it is that it obstructs public business.
76. You do not think these Warrant Messengers necessary? No.
77. I asked you, on a former occasion, whether you knew of any rules or regulations having been issued by the Government of this Colony for carrying on the business of the Customs' Department? I know there are Customs' Regulations.
78. They were issued by the Lords of the Treasury? They were.
79. Do you not know that those regulations were withdrawn when the Customs Department was handed over to the local Government? There was a colonial enactment passed, adopting nearly all those rules, I believe.
80. Do you know whether any fresh rules have been issued by this Government for the management of the department? I think not.
81. Do you not think it desirable that such rules should be made, and that the hours of attendance, the duties of the clerks, and the opening and shutting of the Bonded Warehouses should be regulated, so that the public might know them? Yes, and not only so, but all matters of detail, which this Board I have so often spoken of could so well regulate.
82. *By Mr. Holt:* Do you think a Board composed of merchants, who have so much business with the Customs, would be a fair and impartial Board? I would not confine it to merchants wholly; I said that hastily, perhaps. There are many persons who have retired from business who would be glad to devote their time to such an occupation.
83. *By Mr. Irving:* You think it desirable that some persons possessing mercantile knowledge should be on the Board? Yes; for this reason, that the merchants ought not to be entirely unrepresented.
84. Supposing there were a Board of five—how many merchants would you have on it? One, at least, should be a mercantile man in active business, so that if there were any grievance on the part of the mercantile body he would be able to represent it to the Board, and take part in their discussion upon it.
85. You have already stated that you would have an Inspector of Bonded Warehouses, to whom you would give £600 a-year—in that case would you abolish the office of Landing Surveyor? Yes; but I think such an officer should have a thorough knowledge of Customs' matters.
86. *By Mr. Holt:* Do you think there are many frauds upon the revenue in consequence of there being so many small Bonded Stores? Frauds are very easily perpetrated in such places. In fact I have no hesitation in saying that they offer facilities for frauds.
87. Have you heard of good cigars having been taken out of the boxes, and their places being supplied with others that were little better than rubbish? I have heard of such things, but it amounts to mere rumour. I know that in former years there must have been a large amount of fraud carried on. I am quite prepared to say that the revenue from Customs might be increased to an enormous extent by the department being properly regulated and properly officered. I think it might be increased to a great extent by the suppression of smuggling, which has been, and is still going on, by carrying on the business in a different manner to the present system.
88. *By Mr. Irving:* You have had a good deal of experience in paying duties for different clients? As much as any person in the Colony.
89. Is the present system at all satisfactory? No, it is not satisfactory.
90. Cannot great frauds be perpetrated—for instance, when duty is paid on tobacco or cigars, whose duty is it to see that the packages are the correct weight? The Locker's; the Landing Waiter certifies to the quantity in the first instance, and when they are re-weighed for duty, the Locker is the party on whose certificate the duty is paid.
91. Do you think the Lockers are the proper persons to be entrusted with that important duty? In the majority of instances, as regards their integrity, I should say, decidedly, yes; but in some cases I should say, decidedly, no. Some of them are drunkards; there can be no mistake about that. I have heard myself, within a week, of a Locker standing up against the Colonial Secretary's Office, drunk.

92. *By the Chairman:* I find here that there are boatmen set down for Botany Bay, and other places; and it appears these eleven boatmen are for Sydney, and there is a coxswain also—do you think that number can be required? It must be a mistake, for I never knew eleven boatmen in Sydney; I have never known of more than six, and I think that quite sufficient.

G. Thornton,  
Esq.  
11 Dec., 1856.

93. There is a Warehouse-keeper in the Estimate—I suppose that is the keeper of the Queen's Warehouse? No; the Warehouse-keeper is one of the most important officers and offices in the department. He has charge of all the journals and accounts of spirits and dutiable goods in the Bonded Warehouses; and he has a continual check on their being taken out. In fact, he keeps the account current of all dutiable goods in bond. He is one of the best and most useful officers, individually too, in the department; he is a very hard-working, most obliging, and attentive man.

94. Do you know of any inquiry having been held into the Department of Customs since it was handed over to the Colonial Government, in 1852? I do not think there has been any; at all events, between 1852 and 1854, when I left, I knew of none.

95. *By Mr. Holt:* When was it that the officer was sent out by the Lords of the Treasury to inquire into the department? Mr. Barnes and two clerks held a very lengthy inquiry, and elicited some information, which would be of assistance to this Committee. I think that was about ten years ago.

96. *By the Chairman:* Have you any further suggestions to make on the subject of the Committee's inquiry? I have already spoken of the necessity of a Board of Customs being appointed, and I cannot too strongly recommend it, and to be adopted as speedily as possible. Incivility, drunkenness, incompetency, and other irregularities which have characterized some of the officers of the department during my time would at least be remedied. The whole machinery of the department might be regulated, and would work well. The business has increased and will continue to increase as the country grows older, and it requires very different management now to what it did twenty, or even ten, years ago, although I can confidently say, that at the time I left (in March, 1854,) the great majority of the officers of the department were zealous, high-minded, and honorable men; those on the contrary, of whom I have before spoken, formed the exception, and not the rule. I have also spoken of the abolition of the Tide Waiters, and the propriety of extending the hours of business. I simply reiterate what I have before said. I would strongly recommend the appointment of night officers, *i. e.*, Night Watchmen, one for each wharf; they would check smuggling, if not wholly prevent it. The system has, I believe, been tried successfully in Liverpool, and prevails in other large ports—due regard to be had to the character of these men, and they should be paid a permanent and liberal salary. I would recommend every newly-appointed officer first to pass an examination as to his knowledge of all the rules of arithmetic, if not of higher sciences. As to the appointment of Inspector of Warehouses, I would suggest that that officer be selected from the department, as a thorough knowledge of the business in all its detail, as well as a knowledge of proprietors and localities, are in my opinion absolutely indispensable; besides, those who have served faithfully for many years are entitled to be selected. I could suggest many other matters of detail, but if a Board be appointed, these necessary improvements will be self-evident from time to time, or failing to adopt my suggestion as to the appointment of a Board, I think if a Comptroller were appointed, he (if an efficient man) could take a great deal of the labor now necessarily devolving upon the Collector; he could make a daily inspection of the officers in the exercise of their several duties, which would tend much towards the improvement of the department; this officer could also be the Supervisor of Bonded Warehouses before recommended, but let not a stranger be appointed to this office; there are gentlemen in the Department entitled to be advanced, and fully qualified in every respect to fulfil the duties of it.

TUESDAY, 16 DECEMBER, 1856.

**Present:—**

MR. BUCKLEY,		MR. IRVING,
MR. EGAN,		MR. NICHOLS.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

Frederick Garling, Esquire, called in and examined:—

1. *By the Chairman:* You are Landing Surveyor in the Customs' Department? I am.
2. How long have you been in that Department? Since the first establishment of the Department in October, 1827.
3. You were appointed by the Lords of the Treasury? I was appointed first by the Governor, and the appointment was confirmed by the Lords of the Treasury.
4. What duties do you perform in the capacity of Landing Surveyor? I have the general supervision of the out-door department, and a check on the collection of the receipts.
5. By general supervision of the out-door department do you mean the superintendence of the Lockers and Landing Waiters? Yes.
6. Is the Warehouse-keeper under you? The Warehouse-keeper's is an in-door branch of the department. I superintend the Lockers and Landing Waiters principally.
7. How frequently do you visit these Bonded Stores? Some of them daily.
8. For what purpose do you visit them? To see that the Lockers are in attendance and attentive to their duties, and that everything is going on regularly.
9. Are the Tide Waiters under your supervision? They are more immediately under the Tide Surveyor.

F. Garling,  
Esq.  
16 Dec., 1856.

- F. Garling,  
Esq.  
16 Dec., 1856.
10. What hours of attendance do you give to this duty? From nine to half-past four.
  11. When these Bonded Warehouses are shut for the night who keeps the keys? The Warehouse-keeper receives them from the Locker, and locks them in an iron chest.
  12. *By Mr. Irving*: Who is the Warehouse-keeper? Mr. David Nash; he is the head of the Warehouse Department.
  13. *By the Chairman*: Who locks the Bonded Warehouses? The Lockers appointed to each warehouse.
  14. There are two locks? Yes; we have one, and the proprietor the other.
  15. When dutiable goods are taken into these stores, what is the practice followed? The Locker keeps an account of them, and has them stowed away until an order comes for their delivery.
  16. They are entered in a book? Yes.
  17. Who keeps that book? The Locker.
  18. Where is it kept? Each store has a book of its own.
  19. Kept in the Bonded Store? Kept in the Bonded Store.
  20. Is there any check on the Locker's account? Yes; the Landing Waiter keeps an account of the goods before they go into the store.
  21. What does the Landing Waiter do with his account? That is sent in to the Custom House, to an officer called the Jerquer, to go over it and see that it is all correct as to the gauging and weighing.
  22. Is there a book kept in the Custom House? Yes.
  23. Who does that part of the business? The Landing Waiter keeps his account, and the Locker his own.
  24. But when the account of the Landing Waiter is sent into the Custom House, who jerques it? A clerk named Fancourt is the Jerquer at present. The Customs' Warehouse-keeper keeps the account sent in by the Landing Waiter; he has a set of books taken from the Landing Waiter's accounts.
  25. *By Mr. Irving*: Could you go to the Custom House, and, without looking at the Locker's book, tell what goods were in a particular warehouse? Yes; there is a record kept in the Warehouse-keeper's office.
  26. *By the Chairman*: Is there a record kept in the Warehouse-keeper's office of the goods taken out of bond? Yes.
  27. So that his account acts as a check upon the Locker? Yes.
  28. There is no further security about these warehouses than what you have stated about the locking? No.
  29. If the Locker left his lock unlocked, the Warehouse-keeper could take out what he liked, if he was that way inclined? Yes.
  30. How long do goods remain in bond before they are sold? Three years, by law.
  31. Is there any stock actually taken before they are sold? Yes, we occasionally take stock.
  32. How often? About once in three years; there is no particular time.
  33. Are goods that are sold at overtime sales sold by the books or from actual stock-taking? They are from actual stock-taking; the packages are found before they are advertised for sale.
  34. And examined? And examined.
  35. Who does that duty? The Locker.
  36. The same Locker who attends the store they are taken from? It may be, or it may not, because we change the Lockers occasionally. It does not follow that it is done by the same man; in fact it is most likely not.
  37. How many Bonded Warehouses are there in Sydney? Twenty-two.
  38. Is it possible for you to visit the whole of these daily? No, I do not visit all of them daily, but part of them daily.
  39. Then some of them are entirely without your supervision for one day at least? Yes.
  40. Do you not think it would be more convenient to the public if there were one large Bonded Warehouse, belonging to the Government, in which all dutiable articles could be placed? I do, decidedly.
  41. Do you think it would be more profitable to the Government than to have these private Bonded Warehouses? I can hardly answer that question, for I do not know what the expense would be.
  42. The Bonded Warehouse-keepers make a profit, of course? Yes.
  43. Can you tell what profit they make annually? I have no idea at all.
  44. Independently of being more convenient to the public to have one place in which goods should be bonded—under a proper Inspector of Warehouses, having a staff of Lockers under him—do you not think it would prevent anything like dishonesty being practised? I do not think it would be any greater check than at present.
  45. What check have you now; supposing by chance any dishonest person got into a Bonded Warehouse, and managed to steal away the contents of a hogshead of brandy, would it not be said to have leaked out? The cask would tell for itself. Whenever a cask is found empty we hold a survey on it, to ascertain whether it has become so by plunder or by leakage. The cask will always tell.
  46. *By Mr. Irving*: Even twelve months afterwards? Any time afterwards.
  47. If it was quite dry? I could tell whether it was from plunder or not; I could see whether there had been a spile put into it.
  48. Did you ever know of spirits being taken away from a cask in Unwin's store, through the window, by means of a syphon? There was an instance, some years ago, before I was Landing Surveyor.
  49. You would be much astonished if evidence came out that it is the system to plunder in this way? Yes.
  50. You would not like to say it is not done now and then? I think, if it were done, I must know of it.

51. If you only take stock once in three years, could you tell whether a cask had leaked out, or whether the spirits had been drawn from it? Not if it had been empty two or three years, perhaps.

F. Garling,  
Esq.

16 Dec., 1856.

52. Could you tell after twelve months? Perhaps not a twelve-month afterwards.

53. I will put it to you whether six months afterwards you could tell—it would not be done by means of a spile, or anything of that sort; they would take the bung out, would they not? That could not be done without collusion between the Warehouse-keeper and the Locker.

54. That is another thing—could you tell six months afterwards, if an empty cask were found all mouldy, whether the spirits had been drawn off or had leaked out? I do not think I could, after such a length of time.

55. *By the Chairman:* Have you ever heard of spirits being changed in the Bonded Stores, one description being put into a cask out of which another description had been taken? Never; it is not allowed.

56. If such things have happened, of course, if you had found it out, the parties would have been prosecuted? Decidedly.

57. What is the practice when spirits are taken out of bond for home consumption? They are ganged before the duty is paid.

58. By whom? The Locker.

59. Is he paid for that? No.

60. He is not paid by the merchant for re-gauging? Not for re-gauging for duty.

61. Is he ever paid for re-gauging for sale? He is, for sale, sometimes, if he has time to do it before or after hours.

62. He re-gauges and then gives a certificate of the quantity and strength when duty is paid? Yes; and upon that they pay the duty.

63. Are these Lockers mostly respectable men? Yes; I consider them respectable men.

64. Are they pretty well educated—do they possess sufficient qualifications to perform this duty? Yes; they are subject to examination before they are put on duty.

65. Who examines them? I examine them on gauging; that is the principal thing they have to learn—the only thing, I may say. They are put under instruction the same as the Landing Waiters.

66. *By Mr. Irving:* Then you have never appointed any one who did not understand gauging? I am not aware of any such appointment having taken place.

67. Do you examine them before or after their appointment? They are examined before they are put on pay.

68. After the appointment? After the appointment.

69. Did you never find any of them deficient in the necessary knowledge of gauging? I have been obliged to put one under instruction a second time after admitting him; I found he was not sufficiently competent.

70. Has that happened in only one instance? I only recollect one instance.

71. You think it impossible there could have been more, because it is your duty to examine them? Yes, the Lockers.

72. All the Lockers? Yes. At times, during the absence of a Locker, we have been forced to send a Tide Waiter to take temporary charge of a store, and, perhaps, he has not been able to gauge.

73. What course is pursued then? He sends to me, and I send a Landing Waiter, or some competent officer to gauge when it is necessary.

74. Then it is not within your knowledge that it is sometimes left to the merchants to gauge themselves? Never.

75. If it is done you are not aware of it? No; we never take the merchant's gauge; the re-gauge order requires the signature of an officer of the department.

76. *By the Chairman:* These Bonded Warehouses are open at certain hours at different times? Yes; the larger ones all day, according to their capacity.

77. Do you not think it would be more convenient to the public if they could have access to their goods at all times during the day? I do not see that it would; I have never heard any complaints.

78. *By Mr. Irving:* Are not some of these Bonded Stores inconveniently out of the way? It would be much more convenient if they were not so scattered.

79. Are these all public Bonding Warehouses? Yes.

80. All of them? All of them.

81. Are not some of them private, that is, they do not take in any but their own goods? The Collector allowed some persons to have private Bonding Stores, but it was disallowed by the Board at home.

82. Do you see that chapel opposite—is not that a Bonding Store? The under part of it is.

83. Below the chapel? Yes.

84. *By the Chairman:* Do you know anybody who bonds goods there except the owner of it? I do not believe there is anything in it now. He applied for that temporarily when there was such a rush of imports that we had not room to put the goods anywhere.

85. *By Mr. Irving:* That chapel was once the notorious Tawell's chapel? I am not aware.

86. What was done with all the tobacco and cigars when they were swimming there some little time ago, after the heavy rain? They were condemned as worthless, and destroyed.

87. Who destroyed them? The proprietor of the store, in my presence.

88. Were you present when all were destroyed? Yes.

89. The whole of them? The whole of them. If I was not personally present there was an officer of the Department present.

90. Then you were not present when they were all destroyed? I think I was, to the best of my recollection.

91. *By the Chairman:* Do you know what quantity was destroyed? I have no recollection just now without referring.

- F. Garling, Esq.  
11 Dec., 1856.
92. Do you keep an account of the quantities of goods destroyed? Yes; the Warehouse-keeper keeps an account of all that have been destroyed.
93. What is done before warehouses are authorised as Bonding Warehouses? They are examined, to see that they are sufficiently secure in every respect.
94. Who examines them? I do.
95. Do you give any certificate? No written certificate. I report to the Collector that I consider them sufficient.
96. Verbally? Yes.
97. Have you any rules or regulations for the guidance of your Department issued by the Government or the Collector? There are instructions issued by the Treasury at home.
98. Do you not know that they were withdrawn in 1852, when the Department was handed over to the Colonial Government? Yes; I am aware of that.
99. Have there been any issued since that time? No.
100. Do you not think it desirable that proper instructions should be given to every superior officer as to the performance of the duties of his Department? Yes, I think so; but we have acted up to the former instructions hitherto.
101. You have carried on the business in the same way? Yes.
102. When spirits are taken out of bond for exportation, what is done with them? They are shipped in the presence of an officer—one of the Tide Waiters; he gets the mate's receipt, and endorses the warrant that is issued as shipped by himself.
103. Are there any means of preventing these spirits from being taken out and put on shore again? No.
104. Then, supposing a person to be dishonestly inclined —? He might land them again; but, in that case, his bond would be put in suit.
105. Have you heard of large quantities of spirits being shipped as for New Zealand and landed again? Many years ago.
106. Not latterly? No, not for some years.
107. There is not much smuggling going on, in your opinion, just now? I do not think there is.
108. You think the present rate of duty may have prevented that? I think that is one reason.
109. Are any of these spirits shipped for exportation allowed to be taken away on deck? The officer who is shipping them ought to see them put below.
110. You know the steamers trading from here to Port Phillip, and trading coastwise to Moreton Bay, get the spirits they use on board out of bond? Between here and Melbourne they do; it is not a coasting voyage, being in another Colony.
111. Do the steamers from here to Newcastle and Moreton Bay get their spirits duty free? No.
112. Those are considered coasting voyages? Yes.
113. And the other you call for exportation? Yes.
114. Are these spirits shipped on board the steamers put in charge of an officer? They are always sent from the warehouse in charge of an officer.
115. Are they in charge of an officer when shipped on board the steamer? No; the officer gets the mate's receipt, and they are put in the manifest, and if they were not landed at Melbourne, the Collector there would write up to that effect.
116. What is done with respect to the spirits that are consumed on the voyage? They are shipped as stores, not as cargo.
117. Do you know what quantity they take generally? A quarter-cask of brandy, perhaps—whatever they consider they will require, according to the number of passengers.
118. The Tide Waiters are under you? They are under me, but they are more immediately under the Tide Surveyor.
119. What class of persons are generally appointed to this office? A respectable class of men. I am not acquainted with the Customs in England, but I understand they are a very superior class to the Tide Waiters in London.
120. *By Mr. Irving*: Do they find any security? The Tide Waiters do not.
121. *By the Chairman*: Do you give any bond? Yes.
122. To what amount? £500.
123. Do any of the other officers give bonds? The Landing Waiters do.
124. Have you heard any instances of Tide Waiters leaving their ships when on duty? I have heard instances, but that comes under the province of the Tide Surveyor, because it is his business to go round at night to see that they are on board.
125. Do you know of any of these Tide Waiters having been dismissed for drunkenness? Yes.
126. I see in the Estimates for 1857 there are eleven boatmen and one coxswain put down—how many boats are used in the Customs Department? Three boats.
127. *By Mr. Irving*: Where are they stationed? In Sydney.
128. What are the duties of the three? To board ships, and to take the Tide Surveyor round to measure vessels—they do the general duty afloat.
129. How many men are there to each boat? I think there is one five-oared and one four-oared boat.
130. *By the Chairman*: There is also a boatman at Watson's Bay in this Estimate? The station at Watson's Bay is done away with.
131. *By Mr. Irving*: What do these boats' crews do when there are no ships, sometimes for a few days perhaps? They are not employed at all, I suppose; but the boats are entirely under the Tide Surveyor; they have all the duty afloat.
132. Do you consider three boats necessary? At times they are not.
133. Do you think two would be necessary? I do, because there are very often vessels to measure, while the other Tide Surveyor is boarding vessels that have just arrived, or searching vessels.

F. Garling,  
Esq.  
16 Dec., 1856.

- 134. Two boats would be necessary? Yes.
- 135. How many men to each? I think five men to each boat would be necessary; they are five-oared boats.
- 136. Why are so many men required to each boat? It is a long pull from here to the Heads, or Watson's Bay.
- 137. *By the Chairman*: What part of the department has to go that distance? The Tide Surveyors; there are frequently vessels lying down there.
- 138. For what purpose do the Tide Surveyors go there? To rummage the ship, if necessary. Sometimes ships cannot come up, and then they have to go down to board them there for their papers.
- 139. The Customs boat used formerly to bring the mails ashore? Yes, we used to do that.
- 140. *By Mr. Irving*: What is this Coxswain for? He is one of the men; he pulls the stroke oar.
- 141. Do you not think he might be dispensed with? I think four men to each boat would be sufficient.
- 142. *By the Chairman*: There are two messengers in the Customs Department? Yes; inside messengers.
- 143. What are their duties? One is principally to attend on the Collector, and the other on the clerks in the Long Room.
- 144. *By Mr. Irving*: Do you mean that one attends upon the Collector as a servant? No; there are messages constantly required to be sent; he is employed carrying letters and messages.
- 145. Do you not think one messenger would be enough? No; I consider one necessary in-doors altogether. I consider the messengers are fully employed.
- 146. *By the Chairman*: There are two warrant messengers—are they required? I consider they are; to carry the warrants to the different wharfs.
- 147. *By Mr. Irving*: Why could not the merchants, or their clerks, take these warrants themselves? Because when they did so, they used to keep them back for days, perhaps, and constant complaints were made they were obstructing the delivery of the ship; the Collector then made the rule that he would send them by his own messengers. We have known entries to be passed and not to be delivered to the ship for days afterwards, before these messengers were employed. It is the London practice.
- 148. *By the Chairman*: Do you think the baggage searchers are necessary? I do not, now.
- 149. You thought they were at the time they were appointed? Yes; there were a great many foreign vessels at that time, principally Californian vessels, with a great number of passengers.
- 150. How do you account for the difference of salary amongst the Lockers—are not the duties the same? The salaries increase progressively, from the junior up. If that were not the case, there would be no promotion, or inducement for a man to enter the service. They are promoted as vacancies occur.
- 151. You know the Old Commissariat Store? Yes.
- 152. Do you not think that place might be made available as a general Bonded Store? I consider it very suitable.
- 153. Have you any idea what quantity of goods it would hold? I should say it would hold nearly all that are imported here; that is, taking both George-street and the water-side.
- 154. Do you think that would be a convenient situation for a mercantile community to have a Bonded Store in? Very much so, I consider.
- 155. Do you think it would be sufficient to hold all the spirits, tobacco, and cigars that are imported? I think it would.
- 156. Would it hold the other articles that pay duty? There are various other articles that pay duty, such as tea and sugar, which take a great deal of room in stowing—tea especially.
- 157. Do you not think parties might be allowed to bond their own tea and sugar, on giving a bond to the Customs not to remove them except on payment of duty? Yes.
- 158. That is the case at present? Yes, we frequently bond tea and sugar now.
- 159. The duty on them is so low that it would not be worth while to smuggle? No, and it is a bulky article that cannot be smuggled.
- 160. Then you think, leaving these goods to be bonded in the way they are at present, all other goods might be bonded in the Commissariat Store, if that were established as a Government Bonding Warehouse? I think so.
- 161. Do you think it would hold the Colonial made spirits also? I am not prepared to say what stock they have on hand. We have no great stock of Colonial spirits in our stores.
- 162. They are sometimes moved to your stores? Yes.
- 163. There is a clerk kept in your establishment for the purpose of keeping an account of these spirits? Yes.
- 164. *By Mr. Irving*: Does that clerk do nothing but attend to that business? I fancy not. I am not so conversant with the duties of the clerks as I am with the out-door department.
- 165. *By the Chairman*: What are the four weighers here—what do they do? They attend on the Landing Waiters,
- 166. And weigh goods taken from the ships? Yes, and make themselves generally useful at the waterside.
- 167. Do you know anything of the American system with reference to Tide Waiters and Landing Waiters? No.
- 168. Is there any locking of hatches here at night? No.
- 169. Used there not to be at one time? No, we never adopted that system here.
- 170. Is it not the practice in England? I believe it is lately, and I believe it is also at Hobart Town.

- F. Garling,  
Esq.  
16 Dec., 1856.
171. Do you not think it would be advisable to adopt that course here? There are so many other openings to the hold that I do not think it would be worth while.
172. Do you think these Tide Waiters are sufficiently paid in the way they are employed now, being only paid when on duty? Their pay is twelve shillings a day—I think it ample.
173. They are sometimes off duty for a considerable time? Yes.
174. *By Mr. Irving*: What do they do for a living then? I think their pay is so ample that they ought to be able to put by plenty to live on when they are not employed, because they are at no expense when on duty.
175. The Captain of the ship feeds them, does he not? He is not bound to do it, but they always do it, as a general rule.
176. Who appoints these Tide Waiters? The Collector.
177. *By the Chairman*: Are the ships charged anything for these Tide Waiters? Not till after the number of days allowed by law has expired—twenty working days; after that the Tide Waiter is paid by the ship.
178. Do the Tide Waiters get any fees besides the Government allowance? They are not allowed any.
179. But supposing the Collector gives permission for the hatches to be open after hours? Then they are entitled to pay.
180. What do they get? One shilling an hour, I think, which the party making the application pays, whether it be the ship, the agent, or the importer.
181. How many Bonded Stores do you say there are? Twenty-two.
182. I see there are nine Lockers—how do they attend to twenty-two stores? We are obliged to have four Tide Waiters to do Locker's duty. These four established Tide Waiters are doing Locker's duty.
183. Do you not think half these would be sufficient if you had a proper Inspector and one consolidated Bonded Warehouse, in the way I have spoken of? Yes, I should fancy so.
184. *By Mr. Irving*: Are twenty-two Bonded Stores necessary? Yes; at the time some of them were licensed we had not even room in these without stowing them as full as they would hold.
185. *By the Chairman*: Supposing a warehousing establishment under one roof were instituted, all matters now done in the Customs Department, except the actual payment of duty, could be done in the warehouse itself? Yes.
186. Do you not think it would facilitate the discharge of ships greatly if they could roll the dutiable goods at once into the Bonded Warehouse? It would alter our system.
187. Do you cooper the casks? No.
188. Do you not think it would be advisable to do that? When it is necessary to cooper, notice is given to the importer, and he sends a cooper down; that is done at his own expense.
189. You are not aware of any inquiry having been made into the Customs Department since it was handed over to the Colony? Not since Mr. Barnes was here; but he was sent from Home.
190. Do you happen to have a copy of his report? No; I never have seen it. I did not hold the office I do now when he was here.
191. You are aware that the Custom House Agents are licensed? Yes.
192. Some of them have rooms in the house? Yes.
193. Do they pay anything for the use of those rooms or for the license? No.
194. Have you any suggestions you can offer for the improvement of your department? I cannot say I am prepared to make any suggestions at present. It would be advisable if we could do with fewer extra Tide Waiters, but while we continue to take an account of the free goods, which is necessary for satistical purposes, I do not see how we could do without them.
195. *By Mr. Irving*: What would be the difference if you did not take these free entries? We should have to consider what would be the best system to adopt if they were taken off.
196. *By the Chairman*: Do you know whether the Bonded Warehouse-keepers give a bond to the Customs? I think they do.
197. Is there any Act to regulate these warehouses? No, except what is in the Customs Act.
198. They can charge any rents they like? Yes; we do not recognize their rents at all; it is entirely a private affair of their own.
199. Do you not think the entry of free goods might be simplified considerably? I dare say it might, upon some little consideration.
200. Does it not give a great deal of unnecessary labor to the department and to the merchants' clerks—they have to draw out two or three entries? Three entries.
201. All for satistical purposes? Principally so.
202. Do you think the ship's manifest and the report of her consignee, if sent to the Landing Waiter with a warrant, would be sufficient in the case of free goods? The manifest would not be sufficient, because it does not give the contents.
203. Could not the consignee give that from the freight account? Not always, because when freight is paid in England no contents are given.
204. In this Colony how do you ascertain the values? Merely by the value given in the entry by the importer himself. We do not care about the values now, as there are no *ad valorem* duties.
205. *By Mr. Buckley*: You can ascertain the values from the cockets? Cockets are done away with now.
206. If it were made a rule that a merchant who has goods consigned to him should take his invoice, if required, to the Custom House, would not that be sufficient for satistical purposes? I think it would. At present we cannot compel him to do so.
207. *By the Chairman*: Supposing he were to send a bill of lading containing the information required on the back of it? That would give all the information required.
208. He would have to make out one content, as it is called, and that would be quite sufficient? I think it would.

209. What are the hours of attendance for the clerks at the Custom House? From nine o'clock till three. F. Garling,  
Esq.  
16 Dec., 1856.
210. Except on Saturdays? Except on Saturdays They are frequently later than that, but the door is closed to the public at three o'clock.
211. *By Mr. Buckley:* You think, if parties were compelled to give contents and value on the back of the bills of lading, that that would be sufficient for statistical purposes? I think it would.
212. There would be no possibility of practising deception in any way? I am not aware of any object they could have in doing so for free goods.
213. What method is adopted when a ship comes in with a large quantity of spirits or other dutiable goods? An account is taken of them before they go over the ship's side, and when they are over the side they are in the Landing Waiter's charge; he gauges them and hands them over to the Bonded Store.
214. Speaking about goods in Bonded Stores, are many packages put into Bonded Stores that leak? None are put in, in a leaky state, if we are aware of it.
215. Is it the rule of the mercantile community to be very careful in such matters? Yes, but if the importer is not present, and we find a bad cask, we give notice to him to send a man down to cooper it.
216. With reference to the Commissariat Store in lower George-street—supposing we had an immense importation of goods like we had some time ago, do you think that store would be sufficient? I do not think it would under such circumstances as existed two or three years ago.
217. Is it the practice for any one who applies for a Bonded Store to get a license, provided the building is approved of? Unless we require additional room he does not get it.
218. Would not a representation from a number of mercantile men, that it would be a convenience, be sufficient? The Collector would not grant it unless he considered it to be necessary. There have been instances where the Collector has refused a license, and upon application being made to the Government they have acceded to it, against the Collector.
219. *By the Chairman:* You conceive it would be desirable to have one Bonded Store, instead of these two or three and twenty? It would be a great convenience to the public.
220. *By Mr. Buckley:* Sugar pays duty? Yes.
221. What is the plan adopted in landing sugar? It is all weighed, and tare allowed for the bags.
222. Whose duty is it to weigh it? The Landing Waiter's.
223. Does this sugar generally go into bond? All that is entered for bond.
224. Is it the general practice for merchants to allow it to go into bond? No; some will pay the duty on a whole cargo at once.
225. You are obliged to take particular account of it? Yes, both the weight and number of packages.
226. Do merchants bond sugar in their own stores? Yes, if they hold Bonded Stores of their own.
227. Does it ever go into private stores? No; sometimes we have allowed a cargo of tea or sugar to go into what is called a special store, but we always have our lock upon it.
228. *By the Chairman:* That is authorised from the necessity of the case? Yes.
229. *By Mr. Buckley:* With regard to bonds for the payment of duty, do you think it would be advisable to take the bond of another party besides the owner of the goods? Yes, I think it would.
230. What is the amount of the bond? Double the amount of the duty.

FRIDAY, 19 DECEMBER, 1856.

**Present:—**

MR. NICHOLS,  
MR. BARKER,  
MR. HOLT,

MR. WEEKES,  
MR. GORDON,  
MR. BUCKLEY.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

William Norman Llewellyn, Esquire, called in and examined:—

1. *By the Chairman:* You are the Chief Clerk in the Customs Department? I am.
2. You have been so for many years? I have been actually the Chief Clerk for 1855 and 1856. I was acting Chief Clerk for many years on a previous occasion.
3. You are appointed by the Lords of the Treasury? I was.
4. What are the hours of attendance at your office. The clerks are under your supervision? They are under mine and the Collector's supervision.
5. Are the clerks in the Long Room under your immediate supervision? Yes, certainly.
6. What are the hours of attendance of yourself and clerks? Perhaps I had better explain. The hours of attendance are nominally fixed at from 9 till half-past 3 o'clock. The clerks are allowed to write their names if they are detained up to 10 o'clock, or up to 10 minutes after 10 o'clock. If they arrive at the office after 10 minutes past 10 o'clock, by an arrangement that is made, they are fined? I will explain this. There is a rule in our service which exists throughout the Customs Department in England, which fixes the hours at from 10 to 3 o'clock. The Collector of Customs has the power of making the clerks who are behind with their work stay until the work is done.
7. In point of practice, the hours of attendance for the clerks are from 10 to half-past 3 o'clock?

W. N.  
Llewellyn,  
Esq.  
19 Dec., 1856.

W. N.  
Llewellyn,  
Esq.  
19 Dec., 1856.

- o'clock? Yes; if they arrive after 10 minutes after 10 they are fined 2s. 6d., as a general rule.
8. After this hour of half-past 3 o'clock, is there any business done in the Long Room of the Customs? Do you mean public business?
9. Yes, public business? Entries are not taken after a certain hour, nor can ships be cleared, except under special circumstances.
10. What are these special circumstances? Steamers clearing out for Melbourne. I believe, that by an arrangement made by the Collector of Customs, steamers are allowed to clear out after hours. The Australasian Steam Navigation Company's steamers clear out after hours.
11. Do they pay any fee for that privilege? I believe they do.
12. Is it necessary that a clerk should attend for that purpose? Yes; a clerk does attend after hours. It generally happens on a Saturday, when vessels require an extension of time for clearing out.
13. On that day, does the Customs close at half-past 1 o'clock? No; at 1 o'clock now; that is the Government regulation. A clerk stops after that time for the purpose, and is paid for doing so.
14. Do you know at what rate he gets paid? No, I do not.
15. Does the clerk get the fee for his own use? Yes. May I be allowed to explain this. I was never in the Customs Service in England, but I believe the practice sanctioned by the Lords of the Treasury is to allow all Officers who work over-time to be rewarded for anything they do.
16. *By Mr. Barker:* And to charge what they like? No; the rate is fixed by the Lords of the Treasury and the Board of Customs.
17. *By the Chairman:* This fee was fixed by the Head of the Department—by the Collector of Customs? No; I cannot say that.
18. Is it a matter of arrangement between the clerks and the ship? No; they are paid at a certain rate for over-time, but I do not know at what rate.
19. There are eleven clerks, including yourself, in this Department? Yes.
20. Do you find work enough for all these clerks? Yes, generally speaking.
21. Are they always employed? The Cashier may be very busy, and then be disengaged for a short time, so may the Clearing Clerk, and the Clerk for Free Entries. There may be, for instance, ten or twelve people waiting to pass their entries, and then it will be as much as he can do to attend to them. After that he may not be so fully employed, but in an hour afterwards, perhaps, there is another press of business, and so on. They never know when the merchants intend coming. They are not idle at any time, though they may not be fully employed.
22. You mean by free entries the entries of free goods? Yes.
23. How many clerks does that employ? Generally the time of one clerk.
24. Is not the time of more than one clerk employed in passing free entries? He may call for assistance if he is very busy. The clerk who passes these entries now is the Distillery Clerk, and he combines with that business the making out some other returns for the Distillery.
25. Does he do so now? Yes.
26. He is not a clerk of your Department? No; he is the Distillery Clerk.
27. He is not paid by you? No, not up to this time, but he will be by the Estimates for next year.
28. That will make twelve clerks in this Department. This Distillery Clerk was appointed specially by Sir George Gipps to attend to the Distilleries.
29. That is that part of the business of the Distilleries which relates to the bondage of goods, and taking them out of Bond? Yes; this clerk is placed under the control of the Collector of Customs.
30. This Distillery business does not occupy all his time? No.
31. Is he engaged all the day in this particular business of bonding goods? No.
32. How many hours could you say he was so engaged? I cannot say. He also passes free entries, and prepares accounts for the Distilleries. He makes a return of spirits and tobacco, showing the receipts and issues of stock on each day, and at the close of the week. He also makes a return of the passengers arriving, for the Blue Book.
33. He has time to attend to passing these entries of free goods? Yes.
34. How is that done? By the merchants' clerk and the Agent.
35. How many entries do they have to make? The law requires a warrant and Bills of Entry rendered in such number as the Collector may require; generally we have a warrant and two entries.
36. That is three documents. Are these documents only used for statistics? Not only for statistics, but also for the supervision of the Landing Waiters. I believe in passing free goods these entries after being passed, are sent down to the wharfs to the Landing Waiter, who looks at them to see they are correct, and he hands them to the Tide Waiter to take charge of; after this the entries, with the warrant, are forwarded to the Jerquer. The Jerquer then goes over these documents, and strikes out of the manifest all the goods that are marked correct. If there is anything on which duties have to be collected, and which are not marked, he writes to the agent or the master of the vessel on the subject.
37. Have you ever known an instance of free entries being passed for dutiable goods? Yes. I have known, through inadvertence, that perfumery has been passed for free goods.
38. Perfumery contains strong spirits? Yes.
39. Have you known that free entries have been passed for any other reason besides inadvertency? No; it is not a common occurrence.
40. May not free entries have been passed for the purpose of fraud? Yes, they may have.
41. Do you think some plan could not be invented for abolishing these free entries? I think not—not with safety.

W. N. Llewellyn, Esq.

19 Dec., 1856.

- 42. Why not allow the master of the vessel, when he makes his report, to state the quantity of goods, and the number of packages, and what they contain, so that each merchant could come down and pass his entries, and there would be an end of the matter? The Government have adopted a system that all Bills of Entry shall be passed in triplicate. You could not do what you suggest unless the law were altered, but I should not advise that.
- 43. Do you think the ship's manifest, and the report of the consignees, and a copy of his papers, sent to the Landing Waiter as his warrant, would be sufficient, with a copy of the freight for statistical purposes? You mean to alter the law, then, I presume?
- 44. Of course. The packages will require to be enumerated in the Bill of Entry; the consignees of the goods are also enumerated, the value of the goods, and to whom they belong—that is, that the Bill of Entry of every shipper sent to the agent should contain all the particulars required for statistical purposes, and he should be bound to make out these particulars under a penalty—would that be sufficient for statistical purposes? Anything would be sufficient which would give the information the Department required.
- 45. Are not these documents principally used for statistical purposes? Yes.
- 46. Would not the system I have suggested facilitate the despatch of business, and relieve them passing all free entries? Yes, if you could do it with safety.
- 47. Would that relieve you from keeping so many clerks? One might be dispensed with.
- 48. Can you tell us what the other clerks are employed in—what is your own particular duty? I made out a Return of the duties of the clerks, which is rather voluminous, and forwarded it to the Committee.
- 49. To whom did you send it? To Mr. Calvert. This document contains a full epitome of the duties of the clerks.
- 50. *By Mr. Gordon*: At what time did you say the business of the office was over? At half-past three o'clock the clerks are allowed to leave.
- 51. Is public business carried on to that time? Up to half-past two o'clock entries may be passed every day, except the Treasury day, when all entries by which duties are paid must be passed at an earlier hour, so that the money may be forwarded to the Treasury before half-past two o'clock, together with the statements for the same.
- 52. You have got a Warehouse-keeper as well? Yes.
- 53. How many clerks has he got under him? Three clerks.
- 54. Is that included in the eleven? Yes, they are included.
- 55. How many clerks sit in the Long Room? The Long Room contains six—myself and another gentleman, who have particular duties, sit in another room. Perhaps I had better explain this. There are three clerks who sit out of the Long Room: the Chief Clerk, the Registrar of Shipping, and the Copying Clerk—they are all Long Room clerks, although they do not sit in the Long Room; the Cashier, the Drawback Clerk, the Clearing Clerk, the Jerquer, the Statistic Clerk, and the Distillery Clerk, all sit in the Long Room.
- 56. *By Mr. Holt*: What does the Drawback Clerk do? He passes the drawback debentures, frames the export statistics, and prepares the statements for paying the Customs' receipts into the Treasury.
- 57. Is it necessary to have a clerk for this purpose? Yes.
- 58. *By Mr. Gordon*: Is he fully employed? At times he is fully employed.
- 59. There are days at a time when there are no drawbacks? Then he frames the abstract of the payments in the Treasury, and checks the amount with the Cashier when the pay-day comes—that is also part of his duty.
- 60. Then he is fully employed? As I said before, there are times when a man may be more at leisure than another. It is like a teller in a Bank, who sometimes is very busy, and is very much pressed, and then for a short time has nothing to do. In the year 1841 the Lords of the Treasury, through the Board of Customs, fixed the number of clerks as follows:—a Collector, a Landing Surveyor, seven Clerks, four Landing Waiters, one Warehouse-keeper, four Lockers, and four Tide Waiters.
- 61. On whose recommendation was that made? By the then Collector of Customs of Hobart Town, Mr. Barnes, who was sent here to report on the state of the Department: he was acting as a Surveyor General.
- 62. How many more clerks are there now than there were in 1841? Only one clerk was employed in the Warehouse in 1841, and now there are three. We have had an addition of two clerks to the Long Room in sixteen years.
- 63. Is not the business of Warehouse-keeper very much reduced by doing away with the signing of all certificates? We do not recognize certificates now; formerly the Warehouse-keeper signed them, and kept a registry of them. So far as my supervision goes, and after looking into the matter carefully, I think the Warehouse-keeper could scarcely do with a less number of clerks.
- 64. I have no doubt you are aware of the nature of the accounts that are kept? Yes, I am aware of it.
- 65. I presume the business of the Warehouse-keeper must be much reduced in consequence of this labor of signing the certificates having been taken from the Warehouse Department, and thrown on the Bonded Clerks? The system was altered, and the certificates were done away with, many years ago.
- 66. *By the Chairman*: Do you not think the corresponding part of the business has been reduced since the Customs has been handed over to the Colony? No doubt of it.
- 67. In 1852 and 1853 was there not a large amount of business done? Yes. I have heard that the Collector had applications made to him by the merchants to put on extra clerks.
- 68. The business has decreased since that time? Yes.
- 69. Was there not a great deal of time formerly occupied in corresponding with the Board of Customs? Yes.
- 70. Did you not have to make out your accounts in duplicate and in triplicate? We used to send them one account.

W. N.  
Llewellyn,  
Esq.

19 Dec., 1856.

71. Did you not make out your accounts in triplicate? No; we sent one copy home and kept one ourselves.
72. Has that not reduced the work of the clerks a great deal—was there not a continued correspondence about surcharges? We have a continued correspondence with the Audit Office now.
73. But it is not to that extent? No.
74. *By Mr. Gordon*: Do you not think it possible that the same amount of business could be performed with a fewer number of clerks—that is, the business of some of them who are partially engaged might be transferred to others who are only partially engaged? The person who advised that change should be responsible for it. I would not recommend it, because you never know on what day you may have a rush of ships, and the public would be inconvenienced if the clerks are wanted at a particular time, and they are not there.
75. The shipping to this Port has been very much reduced during the last two or three years? Yes.
76. Still the establishment is kept up to its full extent? Yes, to its full extent.
77. The number of clerks has rather increased, indeed? I know of no increase, lately.
78. Perhaps not, lately. You said only seven clerks were recommended, and now you have eleven? That was in 1841, and the population then was about 125,000, now it is about 277,000. There is a great deal more business done now than there was in the years following 1841; then, on the discovery of Gold, a still greater amount of business was done, and after that a great falling off.
79. Had you any more officers in 1853 than you have now? Only one.
80. *By the Chairman*: What was he? A Tide Surveyor, at Watson's Bay.
81. *By Mr. Holt*: He was done away with when I was Treasurer? Yes.
82. *By Mr. Gordon*: Was not the business at that time something like double what it is at present? It was very much greater; we were all at sixes and sevens then.
83. *By the Chairman*: You managed to get through it? Yes.
84. Did you stop after hours—did you work for a longer time? We did not keep the office open for the public business after the usual time.
85. *By Mr. Holt*: The Tide Surveyor at Watson's Bay was a perfectly useless Officer? It was considered by the Collector, after mature consideration, as unnecessary. Perhaps I had better explain this. Formerly, some ten or twelve years ago, the Government did away with the Water Police at Watson's Bay. They then thought it necessary to have some protection, and appointed this Officer. This was done solely by the Government, and without any reference to the Collector.
86. Then this was the act of the Government and not of the Collector? Yes.
87. *By the Chairman*: In what proportion has the shipping decreased in this port since the year 1853? It has materially decreased.
88. Can you tell us in what proportion it has decreased? No, I could not without referring to the books.
89. If the clerks in the office are the same in number as were sufficient before 1853, now that the business has much decreased do you not think you have too many clerks? No; because they are all employed. The Cashier may be lightly employed to-day, but to-morrow he may have a very heavy day's work. The Clearing Clerk the same. And the Jerquer also. The nature of the duties is such that I do not think it is desirable, nor should I like to be responsible for reducing the number of clerks.
90. You think it necessary to keep up the number of officers, because, one day they may have plenty to do, and another day they may have nothing? Yes.
91. What has the Drawback Clerk to do? He has to attend to the drawback debentures; to make out an abstract for the Treasury; and to check the balances with the Cashier.
92. Is it necessary to keep all these particular accounts? Yes. I should like you to see them.
93. I have seen large volumes at all events? The Drawback Clerk copies all warrants of all goods exported, and he examines the drawback debentures to see that they are properly passed, and he also examines the ship's papers outwards.
94. He is not fully occupied in attending to drawbacks? I know of one claim as much as £2,000 in one month. All the debentures have to be examined, to see that the money is paid and the goods exported.
95. *By Mr. Gordon*: Do you not think the Clearing Clerk and Export Clerk, who have similar duties to perform, could be united in one—would it not be sufficient for one clerk to perform the duties of both? Formerly he did so—I mean in 1842, 1843, and 1844, I did these duties myself.
96. Do you not think you could now do it if you had no other business to do—I mean that the amount of labour would not be too great for you to do? I could not say that I could do it. I might be able to do it by working till six o'clock at night. Some days the work is very laborious, at others it is not so.
97. Do you think the clerks at your establishment work as long as clerks in mercantile offices? Yes, I do. I believe merchants' clerks are allowed to go out in the middle of the day; ours are not.
98. Do you not give them permission to go to refreshment? No; it is an established rule that they shall not go out during business hours; they are obliged to eat their lunch in the house.
99. Do you allow half an hour for lunch? We do not allow them any particular time; it is specially ordered that they are not allowed to go out.
100. Who finally examines all these accounts that are kept by the Customs Department? The Auditor General. There is an accountant kept for that purpose in the Audit Office. When the Customs was not under the control of the Colony an Inspector was appointed to examine our accounts.
101. Does he examine your books in the building of the Customs? No.

W. N. Llewellyn, Esq.

19 Dec., 1856.

- 102. Does anybody examine your books? He may have reference to them.
- 103. At any particular period does anybody examine your books? No.
- 104. You are responsible, as Chief Clerk, for the correctness of the books—that is your business, I believe? Yes. The accounts are not audited in our Department, but they are audited at the Auditor General's Office.
- 105. There is a clerk kept for that purpose, and he has occasional reference to your books? Yes; but he does not audit the accounts in our office. He may refer to them, for instance, if he wanted to see ships' papers for any information connected with the audit of our accounts. He has access to and has liberty to have access to any book he likes.
- 106. You have charge of the accounts—the whole of the accounts? They are in the hands of each clerk respectively.
- 107. Under your supervision? Yes.
- 108. You are responsible for their accuracy? Yes.
- 109. Do you give any bond? Yes, all the clerks give bonds, but they are very small bonds; mine is only for £100. The Collector gives bonds for £6,000.
- 110. That was given in pursuance of the orders of the Lords of the Treasury? Yes.
- 111. Is there any rule or regulation since the Customs have been handed over, in 1852, made by the Government? No.
- 112. Has any rule been issued by the Collector? No, we always followed the old (Board's General) orders.
- 113. Do you not know that these orders were withdrawn by the Lords of the Treasury when the management of the Customs was given up to the Colony? Yes, but we follow them because they are very good rules.
- 114. Do you know anything of the practices of the Landing and Tide Waiters? No, it is no part of my business. I can only tell you what is done in the in-door department. I do not know what is done at Campbell's Wharf or any other wharf.
- 115. To whom do the Sub-Collectors at the out stations pay their accounts? The Sub-Collectors send their money to the Treasury, and notify to us that they have done so. Their accounts are forwarded by them to the Auditor General's Office.
- 116. *By the Chairman:* They do not send their accounts or money to your Department? No. When the change took place the Auditor General directed us that the Sub-Collectors were to forward the money they collected direct to the Treasury, and notify to us that they had done so, by sending us a certain document to that effect.
- 117. Then you have nothing to do with the collection of the Customs at the out-ports? I do not understand what you mean. We pay their salaries, and all communications come to us for advice. They forward their returns to the Auditor General's Office to be audited.
- 118. These documents are not forwarded through your Department, but are forwarded direct to the Auditor General's Office? Yes.
- 119. You have no control over their accounts? We never had any control. The Auditor General directs them to forward the account of the exports and imports of goods. The money they are to forward to the Treasury, and notify to us that they have done so, and what amount they have sent.
- 120. Does he forward an acquittance to the Sub-Collectors when that is done? There is no formal acquittance sent to them. There is a document sent which contains queries and answers, but it is not what would be called an acquittance.
- 121. *By Mr. Weekes:* You say the officers are allowed until ten minutes after ten to arrive at the Customs? There is a book kept in which every clerk when he comes in signs his name, and the hour he arrives at, and it is part of the orders that he shall also sign his name and the hour when he leaves. To prevent any mistake, the messenger is ordered to draw a red ink line after the names that are signed at ten minutes after ten o'clock, and then to take the book away to the Collector's office. Any clerk coming after that time is fined.
- 122. What is the amount of the fine? Two and sixpence.
- 123. What becomes of the money? We never had but few fines.
- 124. The fines are not of frequent occurrence? No.
- 125. *By the Chairman:* When was this Rule established? Some time in this year.
- 126. Why was it established? I cannot answer that question.
- 127. Was it not for the better attendance of the clerks, and because some complaints had been made of the non-attendance? No; the Collector thought it necessary to introduce this Rule. It is the same as in England. We are all subject to the same Rule, and there is no distinction made. We very often see men sign their names at nine and half-past nine. The attendance book is kept for marking the hours of their arrival and when they depart.
- 128. *By Mr. Weekes:* Were there any duties performed by that officer at Watson's Bay? The duties he was supposed to perform were walking up and down Watson's Bay, and by keeping a watch to put down smuggling.
- 129. During the time he was there was there any report made by him shewing the necessity for this appointment? I recollect none. He was ordered to board ships at a certain point, and he had also to send up a report of them. All ships are boarded on arrival by the Tide Surveyors; he was ordered to do that at a certain time, but I believe the order was rescinded.
- 130. *By Mr. Holt:* He had a boat's crew? Yes.
- 131. Do you know that this appointment is continued in the present estimate? Yes; but it is not to be acted upon,—since the Estimates were prepared this office has been abolished.
- 132. *By Mr. Weekes:* Was there not an expensive house built at Watson's Bay for this officer? Yes, a very expensive house.
- 133. Who occupies it now? It is handed over to the Government, and is in the hands of the Colonial Architect.
- 134. What was the rent paid by the Government? It belonged to the Government. It was an iron house, built by the Government.

W. N.  
Llewellyn,  
Esq.  
19 Dec., 1856.

135. What do you think it cost? I speak advisedly, and I should say from £1,500 to £2,000.

136. About how long was Mr. Keon stationed there? I must explain this. Mr. Keon was originally appointed to this station after Mr. Edmund Gibbes. I believe he held the office before this.

137. Was Mr. Edmund Gibbes appointed to that office? Yes, originally.

138. Did he occupy the iron house for some time? No, he did not occupy the iron house; he lived in some little quarters he got put up there.

139. *By the Chairman:* What was Mr. Keon's salary during the time he occupied the house? His salary was £250 a year—£150 a year, and £100 a year temporary increase.

140. *By Mr. Weekes:* Are there any records in the Customs' department to shew that that officer was in existence otherwise than by his quarterly payments of salary? No.

141. There was no work done by him and no returns made? No, he was not appointed to make returns; he was appointed for the protection of the Revenue. I must explain this. Since this appointment has been done away with, the Collector of Customs has issued a commission to the Water Police Inspector to do the duty. It is necessary, in my opinion, to protect the revenue and to prevent smuggling.

142. Is it more necessary to have an officer there than on the North Shore? Yes; a vessel might run into Watson's Bay and then run out again.

143. *By Mr. Holt:* Do you think it necessary to have a coast guard for both sides? I do not think it is. I think it is only necessary to protect the salient points.

144. *By the Chairman:* Did this gentleman ever, while he was there, prevent any smuggling? I do not remember a single case.

145. Would it not be almost as easy to smuggle at Middle Harbour as at Watson's Bay? I can only say that in England, where there is a most expensive coast guard, they cannot entirely prevent smuggling.

146. *By Mr. Weekes:* Would there not be as much necessity to place them at a hundred places as at Watson's Bay? No, I should not think so.

147. What attraction is there for smuggling at Watson's Bay? It is very near to Sydney. A man might take spirits out of bond and export them to the South Sea Islands, and bring them back, land them there, and so get them into Sydney without paying the duty.

148. There are many parts of the coast which are as easy for smuggling as Watson's Bay? The access to Sydney would not be so great. The great object, I believe, of the smuggler, is to land his goods where he can look for a market. It is no use landing his goods where he cannot.

149. *By Mr. Holt:* There is a good road from Sydney to the South Head? Yes; no part of the coast would be so accessible.

150. Is this man supposed to protect the whole of the harbour? He is supposed to be always on the *qui vive*, pulling about the harbour, and keeping his eye on every thing.

151. *By Mr. Weekes:* He furnishes no return of any duty he performs? No.

152. *By Mr. Holt:* Did Colonel Gibbes recommend the appointment? No; the appointment was made by the Government. The correspondence with the Government directs that an officer should be stationed there. This appointment arose through the Government itself, who thought it necessary to protect the revenue by placing an officer there.

153. *By Mr. Weekes:* That necessity has ceased? Not at all. It was in consequence of the removal of the Water Police that this officer was appointed. When the Water Police were re-established, the office was thought unnecessary. We have issued a Commission to Mr. Hilliard to do the same duties as were performed by this officer.

154. Did this officer's duties cease at the re-appointment of the Water Police at Watson's Bay? They were carried on for some time concurrently.

155. *By Mr. Buckley:* Have you any reason to conclude that the appointment of this officer precluded smuggling. Have any circumstances come within your knowledge which would lead you to this conclusion? The officer was supposed to be a preventative officer. The very fact of his being there would prevent smuggling, although no cases may have arisen when he was there.

156. Your opinion is that his presence prevents smuggling? My opinion is, that it does undoubtedly prevent smuggling.

157. You are of opinion that his duties are necessary and useful? I think they are necessary, but they may be combined in the way they are now; for instance, the Inspector of Water Police does the duty now which Mr. Keon performed.

158. An efficient officer performs his duties now regularly? Yes.

159. Do you keep any record of bonded goods at the out-stations, and receive any returns from the Sub-Collectors? No; they go to the Auditor General's Office, by order of the Government.

160. Have you any return of the goods in the Bonded Stores at the out-ports for statistical information? No.

161. Is that information furnished to the Government direct? They keep similar returns to us, which are forwarded to the Auditor General from the two out-ports, viz., Brisbane and Newcastle. The Auditor General makes his queries, if any, and observations on these returns.

162. Do you receive any return of the goods that are seized at the out-ports? Yes, they are carried to our seizure account.

163. How are the proceeds of the seizures disposed of? Half goes to the informing officer, and half to the Crown.

164. Are these returns made out in the same way as when the duties are remitted to the Treasury? No; when a seizure is made in this port or any other, a seizure note is made out for information, and that seizure note is forwarded to the Collector by the seizing officer.

165. You get in copies of the duties received, or imports from the out-stations? The Collectors of the out-ports forward their returns of money received direct to the Treasury, and their accounts to the Auditor General's Office, and a return stating the amounts received on spirits, tobacco, &c.

W. N.  
Llewellyn,  
Esq.

19 Dec., 1856.

166. What check have you as to the correctness of the account, and as to the sum paid into the Treasury? We do not check his accounts; that is done by the Auditor General's Office.

167. What check have you over any deficiency of goods once bonded? That would appear in the Auditor General's Office. Suppose any cask were to leak out, it would be written off the Warehouse Keeper's accounts as having leaked out.

168. Does that apply to the out-stations as well? Yes.

169. Is it through the Collector that these deficiencies are made known, and is it the duty of the Auditor General to see that these things are corrected? We do not know what may leak out. There are some special cases in which the Collector has declined to give a return of duty. The law provides for these cases.

170. Does the Drawback Clerk check the Cashier's return of the duties? The Cashier, after he has copied the entries into his Cash Book, hands them to the Drawback Clerk, who divides them under different heads.

171. In the event of any error arising, is that check sufficient? Yes; that check, and the receipt from the Bank, as to the amount of money paid in.

172. You say the duties of the Drawback Clerk are indispensable and important? Yes.

173. Might they not be performed by some one who is not fully occupied. What is the amount of the labour in passing the entries of free goods? It occupies one clerk. He passes through three entries, which he has to initial; two he forwards to the Landing Waiters, and the other he puts into his drawer.

174. Do you think his duties are sufficiently great as not to be combined with any clerk in the establishment? As I said before, I should not like to do it on my own responsibility. In England, the internal arrangements of the Customs are left to the Collector, who gives a high bond. There the Government do not look to the clerk, but they look to the Collector for everything.

175. During the hours of ten to three, whoever may go to the Customs on business, everything must be set aside to attend to it, even if the clerk should be eating his lunch? Undoubtedly, yes.

176. Have you ever heard of any complaints of inattention? I have heard of no complaints; if I had, the thing should have been stopped directly.

177. You do not remember any complaint having been made of inattention of any clerk to the head of the department? No.

178. How many messengers have you in doors? Two.

179. Do you require two messengers? I may here state that we had two messengers in 1841, and three porters, and eight boatmen, we have also two warrant messengers.

180. Do you think these two messengers are wanted? Yes.

181. How are they employed? They have different duties. The warrant messengers go to the wharfs usually every hour, at half-past ten, half-past eleven, &c. They deliver warrants to the Tide Waiters. We keep these two messengers to deliver warrants for the benefit of the public, so that there shall be no delay.

182. Do you ever see the Tide Waiters—are they in the habit of coming to the office to be engaged? I see them when they pass through the hall.

183. Do you see them frequently at the office? They are not in my department; I see them sitting in the hall when they are wanted; they are generally to be found there.

184. You do not know anything of their character? No, not at all.

185. *By Mr. Weekes:* Can you state the amount of bonded goods entered for re-exportation to the neighbouring Colonies, their quantity and value? I cannot.

186. *By the Chairman:* Have you not found the business decrease since the abolition of the *ad valorem* duties, I mean in the work of the clerks? No; I do not think the *ad valorem* duties made much difference; I did the duties of Cashier when the *ad valorem* duty on wine was 15 per cent., and now they pay two shillings per gallon.

187. *By Mr. Holt:* Were there many goods that paid an *ad valorem* duty? All goods paid a duty of 10 per cent., except flour, which paid 5 per cent., and wine 15 per cent.

188. *By the Chairman:* Can you tell us what difference the abolition of the *ad valorem* duties has made in the Returns of the Customs? I could not, unless you moved for the Returns.

189. *By Mr. Weekes:* Can you state the quantity and value of goods on which a drawback has been paid during the same period, and the amount of such drawback? I cannot

TUESDAY, 6 JANUARY, 1857.

Present :—

MR. BARKER,  
MR. BUCKLEY,  
MR. EGAN,

MR. IRVING,  
MR. NICHOLS,  
MR. WEEKES.

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

Arthur William Rolleston, Esquire, called in and examined :—

A. W.  
Rolleston,  
Esq.  
6 Jan., 1857.

1. *By the Chairman* : You are first Landing Waiter in the Customs Department. Yes.
2. How long have you been so? I have been so since the retirement of Mr. Dean and Mr. Neville, in 1851.
3. Were you in the Customs before? Yes. I served eight years in the West Indies; I joined in 1840.
4. When did you join the Customs Department in this Colony? In 1849.
5. What duties have you to perform as Landing Waiter? The Landing Waiters' duties are very various. We have to gauge all spirits and wines, and to take the strengths of spirits, and write them down in our books, examine all case spirits, returning the strengths, &c., examine wines in case; we have to take the weights of all tobaccos, cigars, snuffs, &c., all teas, and sugars, molasses, coffee, &c.
6. Are the Tide Waiters under your supervision at all? Yes.
7. In what way? They remain on board the ships, and the general discharge is under our direction.
8. What hours are you in attendance for the purpose of discharging ships? They vary according to application. Our regular hours of attendance are, from the first of October to the first of April, from eight o'clock till half-past four, and in the winter months from nine to half-past four. If a special application is made for overtime to discharge a ship, our time is from six to half-past five.
9. *By Mr. Irving* : What hours of attendance do the rules of the Custom House require? From nine to half-past four.
10. *By the Chairman* : If you stop after half-past four, or go before nine, you receive extra pay? Yes.
11. At what rate? At the rate of one shilling an hour per hundred pounds of standing salary.
12. What rate do you receive? My standing pay is £300 a year, and I therefore receive three shillings an hour.
13. Are the Tide Waiters paid extra? The Tide Waiters are paid one shilling an hour when employed overtime.
14. During what hours are the discharges continued? Sometimes they apply for permission to discharge from six to six; sometimes they only ask from six to half-past four. In the winter season there is very seldom any overtime, but in the summer time they like to take advantage of the fine weather.
15. Do all the Tide Waiters receive only one shilling an hour for overtime? Only one shilling.
16. That is, the Tide Waiters not permanently attached to the Customs Department—supplementary Tide Waiters? Extra Tide Waiters.
17. *By Mr. Irving* : Who pays the charge for overtime? The agents of the ship.
18. *By the Chairman* : Do the other Tide Waiters, attached to the Department, receive anything? They are not immediately under us, but I believe they do receive something.
19. According to the amount of their salaries? Yes.
20. That would give them about two shillings an hour? About two shillings, I dare say it is. The salaries are noted in a late return. The next two Landing Waiters, Mr. Bramwell and Mr. Hindmarsh, receive, one, half-a-crown, and the other, two shillings an hour, according to the amount of their salaries.
21. Do you attend on the wharf during these over hours? I have scarcely ever missed it, except when I unfortunately got my leg broken, a short time ago. There was only one ship I did not attend, and I went to the captain every afternoon to inquire of him whether he would discharge the next day or not, so that I might make my arrangements.
22. Do you mean to tell us that you attend from six in the morning till six in the evening? Yes, if the ship is discharging.
23. *By Mr. Irving* : You put somebody on board the ship? Yes, the Tide Waiter is on board.
24. You do not attend personally? Yes; I have never missed a day, except within the last six months, owing to the accident I have mentioned.
25. *By the Chairman* : Have you more than one ship discharging under your care at one time? Yes; sometimes as many as four at the same wharf.
26. All under your personal supervision? Yes.
27. With a Tide Waiter on board each? With a Tide Waiter on board each.
28. Would you get paid, at the same rate, for overtime for all these ships, supposing they were all discharging at once? Yes, if they were all working overtime I would expect it from all. But that is a thing that very seldom occurs.
29. Can you tell us the average cost to vessels discharging overtime? From £3 to £5.
30. For the whole time? For the whole time they are discharging.
31. Have you ever known it to extend to £15 or £20? I have not met with such a case, unless you include the payment of the Tide Waiter after the twenty-one days allowed for discharging have elapsed. After twenty-one discharging days the Tide Waiter becomes chargeable to the ship.

- 32. During those twenty-one days he receives pay for overtime, if he is called upon to stop? Yes.
- 33. And for that the ship pays? Yes.
- 34. And pays you as well? Yes.
- 35. What is the greatest number of ships you have had under your charge that have paid overtime at the same time? Once or twice I might have had two.
- 36. Not more? Not more.
- 37. Do you know of any Landing Waiters having had as many as four ships discharging at once, and paying overtime? I cannot say, because I do not know what may occur on any other wharf than the wharf I am attached to myself.
- 38. Are you in the habit of boarding ships at night upon which Tide Waiters are placed? No.
- 39. Whose duty is it to do that? The Tide Surveyor's.
- 40. You have nothing to do with the vessels after the hours of attendance have ceased? No, unless we think there is something suspicious. It is the Tide Surveyor's duty to attend to the officers on board ships.
- 41. Is it the custom of yourself and your co-Landing Waiters to lock the hatches at night? No.
- 42. What security is there that goods are not smuggled at night? There is an officer on board—the Tide Waiter.
- 43. Does he ever sleep? I suppose he does.
- 44. If he is on duty all these hours the ship is discharging, from six to six, he must sleep at night? It is very seldom that a vessel of that description would think of such a thing as smuggling. The only thing he has to look out for is the general discharge all through the day. Tide Waiters are put on board all vessels from Home or Foreign Ports, and, as soon as work is over for the day, the hatches are put on.
- 45. *By Mr. Irving:* What vessels are Tide Waiters not put upon? They are not put on board vessels from Port Phillip or Tasmania, and such places, unless there is spirits, or something dutiable on board.
- 46. *By the Chairman:* None of this money you receive for over hours goes into the Public Treasury—it is your own perquisite I suppose? That is our own perquisite.
- 47. By what authority is that regulated? Generally by the Customs. If I do not mistake there is an authority for it in the Customs Regulations, but I cannot lay my hand upon it at this moment.
- 48. Are you alluding to the rules and regulations issued by the Customs Authorities at Home? Yes.
- 49. Do you know those rules have been abrogated by the Lords Commissioners of the Treasury, since the Customs Department here was handed over to the Colony? We have always acted on those instructions.
- 50. You have no other Colonial instructions? None.
- 51. You continue to follow these instructions? Yes.
- 52. Were they given to you at your original appointment? Yes.
- 53. To this Colony or to the West Indies? To this Colony. For what is called the gauging department we have separate instructions, emanating from the Customs itself.
- 54. *By Mr. Buckley:* The Customs here or at Home? At Home. The Landing Waiter in London is Landing Waiter only; the Gauger's is another branch. Here we amalgamate the two; we are both Gaugers and Landing Waiters.
- 55. Your duties cease after the first gauge of spirits that come out of a vessel to go into bond—you have nothing to do with the re-gauging? We have nothing to do with the re-gauging. We have to see the casks properly gauged, marked, and numbered, and delivered to the Bonded Store. Then the Locker becomes the responsible party for the delivery.
- 56. *By the Chairman:* Do you keep a book containing an account of all goods landed from the vessels under your charge? Yes.
- 57. What do you do with that book? We forward it to the Jerquer in the Long Room. We do not take account of free goods. The Tide Waiter's book shows the return of free goods.
- 58. How do you ascertain whether they are free goods or not? By examination.
- 59. Do you examine every package? Not every package, when we satisfy ourselves that they are not dutiable.
- 60. How do you satisfy yourselves of that? By opening some of the packages. It is easy to tell a package of brandy, for instance, from a package of soap.
- 61. *By Mr. Buckley:* Are you aware of any instances of packages, apparently consisting of pickles and mustard, containing spirits? I have tried such packages frequently, in consequence of notice I had from Mr. Garling that he had been informed that snuff was sometimes imported in that way; but I never detected it. There have been cases in which wines have been landed and passed as free goods, not so much from a wish to defraud the revenue as because the merchant did not know what his goods were, in consequence of the invoices not having arrived.
- 62. Are they in the habit of passing goods absolutely in such cases, or do they pass sight entries? They passed them absolutely. I have been obliged to detain them, and forward them to the Queen's Warehouse, for not being properly entered.
- 63. Do many sight entries come to your hands? A good number.
- 64. How does that arise? Sometimes from a merchant not knowing what his goods might be. Another reason is that the goods may be wanted for immediate delivery, and instead of going through the expense of bonding it saves all the trouble and expense, and the goods are taken away and the duty paid immediately.
- 65. Can a person pass a sight entry and pay duty upon it at the same time? As soon as it is completed.
- 66. Is it a common practice in Sydney to pay duty on goods as they are being landed and transmitted to the store? When it is upon a sight entry there is a deposit lodged in the

Esq.

6 Jan., 1857.

Custom House towards the payment of the duty; or, if there is not a deposit, the Landing Waiter has the power of retaining a certain portion of the goods until he finds the duty is paid.

67. *By the Chairman*: Will you tell us your duty with reference to goods for exportation? We have to see that the quantities of goods for drawback are correct. Spirits going from the bond are re-gauged by the Locker, and the quantity is endorsed on the back of the warrant.

68. Who sees such goods put on board the vessel? The Export Officer.

69. The Landing Waiter has nothing to do with that? The Landing Waiter has nothing to do with it. The Export Officer sees the goods put on board, gets the mate's receipt, and sees them put under hatches.

70. Whom do you call the Export Officer? The established Tide Waiters do that duty. I think you will see there are four of them.

71. *By Mr. Buckley*: When spirits are landed from vessels that arrive, have you any check against the quantity shipped on board? We have, of course, a check when we land them; but if they remain any time in bond, they are re-shipped under a re-gauge by the Locker.

72. I do not think you understand me. Suppose a quantity of spirits is shipped in London, have you any means of ascertaining the difference between the quantity put on board there and the quantity landed here? What is shipped in London they do not take any account of more than what their private invoices may be. The duty depends entirely on our gauging.

73. *By Mr. Barker*: You do not compare your gauging with the London measurement? No; we have to gauge every cask ourselves.

74. *By Mr. Buckley*: Does it not appear in any shape on the entries you receive? Yes, a nominal quantity is returned on the face of the entry.

75. Have you ever known cases where casks have been spiled and quantities of the spirits abstracted? Small quantities—not frequently.

76. Stolen by persons on board the ship? Yes. When a cask is deficient the Surveyor is called in, and he states his opinion of the cause of the leakage, whether it has arisen from undue pressure, or from spiling, or any other cause; and of course it goes either against the ship or against the merchant. We do not consider ourselves surveyors in that point of view. All that we have to do is to return the actual quantities. We generally make a deficient cask the last number of a shipment, and write opposite it—deficient in consequence of a stove, head, or broken stave, or whatever it may be.

77. Suppose it has been spiled and a quantity taken out, whose loss is that? It goes against the ship, I believe.

78. Is it frequently the case? I do not say it is very frequently the case. It has occurred in some ships.

79. Does it frequently happen that the people on board the ship have access with such facility to those parts of the hold where these casks are stowed? I strongly suspect that a great deal of it is done amongst the stevedores when the casks are being put on board.

80. Before they are put on board the vessel? Yes—in the stowing, not exactly before they are put on board—in the docks at home.

81. When you say you think it has been done by the stevedores at home, have you known any instances where discoveries have been made previous to the shipment of the spirits? I cannot say I have.

82. Then do you come to that conclusion, because in consequence of the mode of stowing the casks no person could get at them while on board the vessel? Yes. In some few cases packages, particularly case spirits, have been opened while on board.

83. But not to any great extent? Not to any great extent.

84. Have you ever found any cases on board entirely empty? No, I do not recollect any.

85. Have you heard your brother officers mention such things? I can scarcely call it to mind.

86. It is not a general thing—it does not often happen? It does not often happen.

87. Does it often happen that there is any deficiency at all beyond the breakage of a bottle, or anything of that kind? Sometimes there is a deficiency in case spirits.

88. It depends upon where they are stowed in the vessel? Yes. The captains are always anxious to get rid of case spirits, because it is impossible that they can watch them; and when there is a lot of men discharging a ship, if they can lift the lid of a case and take out a bottle or two, they will do so.

89. Then one or two bottles are frequently missing, particularly where the cases are defective? Yes; they will take it if they can get the opportunity.

90. *By the Chairman*: The shipping visiting the port has fallen off lately in the amount of tonnage? At present I think we are just about as busy as we have been at any time during the last twelve months. During the period immediately succeeding the gold discovery, and at the time of the rush from California, we were perhaps a little more employed.

91. Had you the same number of Landing Waiters then that you have now? The same number.

92. There was no increase at that time? No. Since that the Collector has considered it necessary, in consequence of the increase of wharfage in Darling Harbour, which has become one general wharf almost, to appoint Coast Waiters, because it was impossible for the Landing Waiters to attend to all the wharfs there. Coast Waiters were therefore appointed for Darling Harbour, who are, in fact, assistants to the Landing Waiters. I have one of them working with me, who has the same responsibility as I have. They may be classed as Landing Waiters.

93. Free goods are considerably more numerous now than they were before the passing of the new tariff? Yes; when I first commenced duty here we used to charge duty on Tasmanian and New Zealand goods, flax, and things of that sort. The duties were much more general then.

94. How do you distribute the Landing Waiters—is there one to each wharf; for instance, the Circular Quay or Campbell's Wharf? The Circular Quay, being very extensive, requires two Landing Waiters, and there are also two at Campbell's Wharf.

95. How do you manage at Darling Harbour? There are two officers to Lamb's, Botts', Walker's, and Macnamara's wharfs—four wharfs to two officers; and one officer to Moore's, Towns', and Smith's wharfs.

96. Are there none in the upper part of Darling Harbour? In the upper part of Darling Harbour there are two officers.

97. I thought there were only six Landing Waiters? The three Coast Waiters take the place and duty of Landing Waiters.

98. Do you ever examine the coasters that come into Darling Harbour, and other places? As you have suggested the subject, I may say that it is one of the matters in which I think there might be some alteration made.

99. Is there anything to prevent a coaster meeting a vessel at sea, and taking on board puncheons of rum, and landing them anywhere near the Market Wharf? She carries a cargo-book and transire, tantamount to a clearance—the transire is lodged in the Custom House.

100. Suppose a vessel cleared out for New Zealand, or elsewhere, ran into Port Hacking, for instance, where there is no Customs officer, and landed a quantity of goods, could not a coaster bring away those goods, and land them at the Market Wharf, without the slightest chance of being discovered? Perhaps so.

101. The Customs have no check? There is a certain check in the transire. I believe if there is any smuggling going on, it must be through illicit distillation up the country, the spirits thus made being sent down by the coasters.

102. A vessel, for instance, coming from the Macleay River, where there is a great deal of corn grown, and where spirits might be distilled, might bring them down to Sydney easily, covered up with corn, and land it without being discovered? Just so. In the West Indies they have a different system with regard to coasters, because there are so many small islands, besides the foreign islands—Martinique, Guadeloupe, and those places—close to them. There every coaster was obliged to have a "driving permit," and he was obliged to have his driving book headed with the name of the vessel, port, date of departure, description of goods, and so on; and he was not allowed to discharge an article until the Collector's signature had been obtained, and it was forwarded to the Landing Waiter.

103. You have no such check here? No.

104. *By Mr. Barker:* In the case put by the Chairman, of a vessel clearing for New Zealand with spirits on board, would not her manifest be examined on her arrival at New Zealand? Yes.

105. If half the spirits that appeared in the manifest were then found not to be actually on board, would any report of it be made—would not some notice be taken of the deficiency? Yes; the captain must account for it, being under bond.

106. *By the Chairman:* Were you here when the vessel cleared out for Guam, and landed a full cargo of spirits at —? I was not. I dare say such things may be done. American whaling vessels sometimes apply to take out a much larger quantity of spirits than they can require for consumption, intended for traffic amongst the islands.

107. Do you not know that American whalers could bring tobacco stowed away so that the Customs officers could not find it? Yes, they might do it.

108. Packed in their large tun butts? Yes. There was a lot of tobacco landed, on one occasion, at the Flour Company's Wharf from casks entered in as corn; the head of one of the casks gave way and the tobacco was discovered, and Mr. Jeffries, who was then Tide Surveyor, and Mr. Neville, made a seizure of it. That was before my time; it must have been about 1846.

109. *By Mr. Buckley:* Does it frequently happen that vessels trading between this and New Zealand have arrived there with a much smaller quantity of spirits than was shipped in Sydney? I cannot say I know anything of that.

110. *By the Chairman:* You give security for the due performance of your duties? Yes.

111. Where did you give that security? At home.

112. You have not given any security in this Colony? I have not given any security in this Colony. My two brothers are my sureties.

113. For what amount? £500.

114. Do you know whether any of the other officers in the Customs Department here have given security in this Colony? Those appointed in the Colony have.

115. Can you tell us whether any of those appointed by the Lords of the Treasury have been called upon to give fresh security since the Customs Department here was handed over to this Colony? I do not think they have. I have not.

116. *By Mr. Buckley:* With regard to Eau de Cologne and things of that kind, how do you arrive at the duty payable on them? By measurement. We do not take any proofs. It is done merely by measurement, and charging the duty on perfumed spirits.

117. At so much per gallon? Yes.

118. How do you gauge Old Tom? We have recently got a new order to charge it as cordial. Before we measured and took the strength by Sykes' hydrometer as long as it showed the strength. Sometimes I have had it from thirty to fifty under proof, according to the sweetening.

119. Does over sweetening make the difference? Yes, the sweeter it is, the heavier the spirit, and the hydrometer does not act upon it the same as it would with high proof rum. They can put any amount of sweetening, to bring it down to any proof they like.

120. In the absence of that sugar it would not be so much under proof? I should say it would not.

121. What is the general strength of Old Tom? About thirty. I have known it under fifty. Some merchants have ordered Old Tom to be only a certain strength, to be above fifty under proof, to save the duty; it also enhances the value, being more saleable. They reduce it to that at home by sweetening.

122.

A. W.  
Rolleston,  
Esq.

6 Jan., 1857.

A. W.  
Rolleston,  
Esq.  
6 Jan., 1857.

122. Is that the case with Lowndes's Old Tom? Lowndes's Old Tom is generally very weak.
123. What is its general strength? About forty-six under proof. Booth's Old Tom, I think, is about the strongest; it ranges from thirty-three to thirty-six.
124. *By the Chairman*: How long is it since the increased duty has been taken on Old Tom? Within the last week.
125. Do you know by whose orders it has been done? No, except that Mr. Garling gave me an order that it was to pay as cordial.
126. *By Mr. Buckley*: What rate does it pay now? Ten shillings a gallon.
127. Without reference to strength? Without reference to strength.
128. *By the Chairman*: What did it pay before? The same as other spirits, but regulated by the strength.
129. *By Mr. Barker*: It is not, in fact, so strong as other spirits? No. The end of it will be that it will drive Old Tom out of the market altogether, and all that is here now will have to be exported.
130. *By the Chairman*: That will encourage the introduction of foreign gins? Yes; it might.
131. They might manufacture Old Tom in this Colony. I do not know whether they understand it or not. Holland gin is a very different spirit from Old Tom.
132. *By Mr. Buckley*: Is not English gin imported? Yes, in casks.
133. Old Tom comes in cases? In cases generally, some in casks.
134. *By Mr. Weekes*: Do you class English gin as Old Tom? No, it is passed as British gin.
135. What is it by which you characterize Old Tom—by its sweetness? By its sweetness and by the test of the hydrometer.
136. What is the general strength of case gin? The general strength of case gin is 15 under proof. That is the Dutch proof, and it varies from 14.6 perhaps to 16 under proof; but 15 is about the average proof of gin, that is, Holland gin of the JDKZ or anchor brand.
137. It is generally very troublesome, is it not, to make up the packages? Yes, it is troublesome.
138. By whom is that labor performed? By the store it is bonded in.
139. No labor is charged to the Government? No, except the superintendence of the Landing Waiter; he has to see it weighed, to take the proofs. The store provides all the labor.
140. *By Mr. Barker*: You ascertain the quantity by weighing? We ascertain the quantity by weighing to a certain extent. If we were to open every case, it would be both an injury to the package and to the merchant. We find one package that is perfect, and put it in the scale, and weigh the others by it; the scales are so nicely balanced, that they will show when a case contains a broken bottle immediately. When we find a broken case, we set it aside, and fill up any others that may be deficient from it. I have seen as many as thirty-five cases out of four hundred empty.
141. You mean with the bottles broken? Regularly gone—I mean broken. But that is very seldom the case now. They send out a better description of case than they did formerly. The insecurity of those formerly sent out was much complained of by the merchants, particularly, I think, by Mr. Lamb, who wrote home about it, and now they send out better cases. The cross sticks were so slight that they did not protect the bottles.
142. How are they secured now? By regular sawn sticks, firmly fixed.
143. Are they tenoned into the sides of the case? Yes.
144. In consequence of that alteration, you have found the deficiency less than before? Far less.
145. The deficiency in those days was about four or five per cent? Sometimes even more than that.
146. How much more generally? Well, I have seen as much as ten per cent. in one shipment.
146. The alteration has reduced it to one per cent? Taking the average, it is about two per cent.
147. *By the Chairman*: You say you have never had any printed instructions issued to you by the Collector? No; I brought them from home with me.
148. Do you know of any of the other officers having received such instructions? No.
149. Do you obey this order, as to entering the time of your commencing and leaving off work in a book? Yes.
150. If you stop over time, how do you get to the book? There is a back door to the Custom House.
151. *By Mr. Buckley*: Does that apply to six o'clock in the morning as well as nine? Yes, it applies to six as well as nine; we have access to it at that hour.
152. *By Mr. Weekes*: What do you say are the duties of the Tide Surveyors? That is a different branch to ours. They have to attend vessels coming inwards or going outwards, place officers on board, take account of the cargo, and things of that kind. It is quite a distinct duty from the Landing Waiters.
153. It does not come under your cognizance? No.
154. *By the Chairman*: Do you ever use the boats belonging to the Customs Department? No; they are used by the Tide Surveyors.
155. How many boats have they? Two.
156. How many men? If I do not mistake, there are six men in one boat and four in the other.
157. Are those boats constantly in use? Yes, constantly, in going off to visit ships, and to jergue ships, to see that their stores are correct.
158. Are there as many as six men in one boat? I think it is five and a Coxswain, but I am not certain, having nothing to do with the boats. I cannot enumerate the crews exactly.
- 159.

A. W. Rolleston, Esq.  
6 Jan., 1857.

- 159. *By Mr. Weekes*: Can you state the highest amount you ever received in any one year for your overtime? I could hardly say. Within the last six months, if I were to take it by that, I have not received £5. But at other times, when there are a great number of vessels in, it might amount to £12 or £14 for the quarter.
- 160. How late at night do you work overtime? According to the application. Some apply to discharge until five, some till six.
- 161. It is regulated by the application? Yes.
- 162. Permission would be granted to discharge till dusk then if it were granted? Merchants will not receive their goods when they discharge so late as that.
- 163. Still, if applied for, it would be granted? Yes.
- 164. During all that time do they put dutiable goods on the wharf? No.
- 165. At what time of the day do they land dutiable goods? Till twelve o'clock, so as to afford time to see them safely bonded before the stores close. If dutiable goods were discharged till four o'clock, it would keep the Bonded Stores open too long.
- 166. Is it ever the case that dutiable goods remain on the wharf all night? I have known that to be the case, in consequence of the merchant himself having passed a duty entry, and paid duty upon them.
- 167. *By the Chairman*: Have you known it to be done without that entry? No.
- 168. *By Mr. Weekes*: Are you prepared to say it has never been the case? I cannot say that it has never been the case, because I do not know what other officers may have done; but I myself have never allowed a single cask to be landed that I did not see delivered to the Bonded Store. If such a circumstance should occur, a watchman is put on.
- 169. *By the Chairman*: When dutiable goods are landed and carted away to a Bonded Store, does any Custom House Officer go with them to see them safely delivered? No.
- 170. What is the security to the Revenue that part of the goods may not be abstracted on the way? We have a form of load note, containing the particulars, which is forwarded with the goods to the store, and when the Locker receives it he sees that the packages correspond.
- 171. How does he know that the gauge is correct, in the case of spirits—does he re-gauge them on delivery at the store? No. It is not likely that a person going through the open street in the day-time would think of starting a bung on a dray.
- 172. *By Mr. Weekes*: Supposing a number of casks of brandy are taken away in the way you describe, merely handed over to the drayman for conveyance to some Bonded Store in another part of the town, how are the Customs' Officers to know that the dray has not been drawn into some yard on the way, and half the contents abstracted from the casks, and then taken on to the Bonded Store; what check have the Customs? It would show at the Bonded Store on the re-gauge for delivery.
- 173. Do they re-gauge on arrival at the store? No.
- 174. Then in what way are the Customs able to detect the abstraction of any amount of liquor *in transitu*? Such a case has never occurred.
- 175. *By the Chairman*: You mean it has never been found out? I do not think it has ever occurred.
- 176. When do the Lockers re-gauge the liquor taken to the Bonded Stores? If a merchant wants any quantity of spirits for consumption, he passes what is called a requisition, which is taken to the Locker, and the Locker then re-gauges it for duty.
- 178. That may not happen till the cask has been in Bond two years? It may not.
- 179. Then it might be found out, two years after the date of its entering the Bonded Store, that half the supposed brandy was only water? The proof would tell that.
- 180. Supposing such a cask to be left in a Bonded Store two years, it is then sold as overtime goods, is it not? After three years.
- 181. During the whole of that time it may not be re-gauged? It may not.
- 182. *By Mr. Weekes*: Is any body made responsible for any deficiencies that may be discovered in re-gauging in a Bonded Store? I cannot say there is. If a cask is found deficient after, perhaps, remaining in the store a long time, the Landing Surveyor inspects it, and satisfies himself as to the cause, and certifies that the loss is occasioned by defect in the cask, or otherwise.
- 183. And that is an end of the matter? That is an end of the matter.
- 184. *By the Chairman*: Do you know whether stock is actually taken when goods are sold at overtime sales? I should say so.
- 185. Do you not know they are sold by the warehouse book only? By the warehouse book and the Locker's book.
- 186. Is stock taken according to merchants' practice? Stock is taken very frequently at the different stores.
- 187. *By Mr. Weekes*: A hogshead of brandy may, at the end of a few years, be represented by a bundle of staves only? There have been some cases in which the whole contents have leaked out; the head of a cask absolutely went out of it at Pollard's Bond, and one with a broken stave at Towns' Bond.
- 188. Was that discovered soon after it took place? Almost immediately. The Locker discovered it in going through the store.
- 189. I understand you that although the Customs' Officers satisfy themselves that casks of spirits are full, or contain a certain quantity, when they leave the wharf, they have no check that the quantity and strength they have gauged is actually delivered into the Bonded Store? They have no check except the note to the Locker.
- 190. Unless the Locker at the Bonded Store were to re-gauge the casks and test the strength again, there is no check at all? No; but I have never known an instance of its being necessary.
- 191. *By Mr. Buckley*: The note to the Locker is merely a guarantee that the package is delivered? The note shows the quantity delivered from the wharf.

A. W.  
Rolleston,  
Esq.  
6 Jan., 1867.

192. You say stock is taken—how is it taken? An officer goes through the store and takes down a list of the goods.
193. Is that stock entered in the Custom House books? Yes.
194. Is that checked with the accounts kept in the Custom House? Decidedly.
195. Have you any means of knowing whether there has been much difference? No; I have not. If there was anything of the kind I might, perhaps, hear of it; but I never heard it.
196. Have you ever been present when overtime goods have been sold? No.
197. Have you any means of knowing whether samples are produced? No, I cannot say whether they are or not.
198. *By Mr. Weekes*: Then an ordinary drayman is the only guardian on behalf of the Customs while dutiable goods are being transmitted from the wharf to the Bonded Store? The Bonded Store is generally so much adjoining the wharf where the ships are discharging that goods are almost in sight the whole way.
199. Are there not Bonded Stores spread all over the town? There are.
200. *By the Chairman*: How many Bonded Stores are there? I cannot call to mind.
201. Are there not twenty-two? Yes; I think that is the number.
202. Is the same course pursued with reference to cigars? Yes.
203. Could not a man take out half-a-dozen bundles from a case while it was on the way to the Store? He could not; the cases are too well made up.
204. If he broke the outer case, could he not take out half-a-dozen boxes, supposing the man was rogue enough to do it? Of course these things might occur, but I have never known them.
205. *By Mr. Barker*: You spoke of keeping accounts in the Custom House of all cargoes, are these accounts regularly balanced and the deficiencies shown? That goes entirely through the Long Room. It must be done to get the statistical returns of imports and exports.
206. No, you misunderstand me; I want to know what is the per-centage of deficiency on cargoes generally—are there books to show the deficiency? Yes, our gauging book shows the deficiency. We furnish to the Long Room, in fact, the whole data on which the duties are paid. If it is case spirits or tobacco, there is the Red Book to show it, and if it is spirits or wines in bulk, there is the Gauging Book. This is the form used, and every cask is put down separately. (*The Witness handed in a form.*)
207. *By the Chairman*: Have you charge of all the other Landing Waiters? No; the Landing Surveyor is our superior officer.
208. I was going to ask you whether you know that a great many of them are in the habit of getting drunk? You will always hear remarks of that sort made.
209. Have you not very frequently seen it? Not very frequently; there may perhaps, have been isolated cases—and I do not know whether they were drunk either, for if a person is standing out in the hot sun with no shed or anything to protect him, and has perhaps eighty or ninety casks to gauge, he is very likely to be affected, although it may not be through drink. I have had as many as from one hundred and twenty to one hundred and fifty casks spirits, besides wines, to gauge in a day.
210. *By Mr. Weekes*: Is it not the fact that sometimes the fumes of the liquor will create partial intoxication? If a person were standing over it for any time they would.
211. *By Mr. Barker*: If standing in a confined cellar perhaps, not in the open air? Even in the open air.
212. *By Mr. Buckley*: Is it usual to taste spirits when they are gauged to know whether the cask contains brandy or rum? We see that by the strength and smell of it.
213. It is not necessary to exercise that particular sense for the purpose of determining the kind of spirits? Not at all.
214. *By Mr. Weekes*: I suppose they generally keep a little water handy in the Bonded Stores in case anybody wants to sample the spirits? The Storekeeper generally has water, certainly.
215. Is it not the fact that there is a great deal of tasting going in Bonded Stores—I do not mean by the Customs' Authorities, but by callers in? I do not think it. I have known myself, on Campbell's Wharf, that absolutely for a whole fortnight there was not a bung started in that store. The Storekeeper is very careful about anything of the kind.
216. Campbell's Wharf has a particularly good character, and the Bonded Store also? Yes.
217. *By Mr. Buckley*: If these people were in the habit of being a state of intoxication, would you have opportunities of seeing them—the Tide Waiters I mean? Of course I would, during the discharge of the ships.
218. There are a good many Tide Waiters kept, are there not—extra ones? Yes, there are a good number of extra ones; but they are not on pay except when they are on duty.
219. What pay do they get? Twelve shillings a day for every day they are employed.
220. Are they paid at the same rate for every part of a day? They are paid as long as they are on the ship.
221. Are any half days allowed? No.
222. If they commence in the morning they are paid for the whole day? Yes.
223. *By Mr. Egan*: When you say Campbell's Bonded Store has a good character, you do not mean to imply that any other has a bad character? No, I do not say that; I should be very sorry to do so.
224. You mean to say you know more of that store, as it is under your supervision? Yes; it has been for the last six months under my more frequent observation.
225. *By the Chairman*: Does it not often happen that goods for Towns' Bonded Store are landed on the Circular Quay and carted round? No, they are lightered round.
226. *By Mr. Buckley*: Who goes with the lighter? Only the lighterman, who receives the same form of load note.
227. No officer of the Customs? No.

WEDNESDAY, 7 JANUARY, 1857.

Present:—

MR. BUCKLEY,		MR. HOLT,
MR. R. CAMPBELL,		MR. IRVING,
	MR. WEEKES.	

CLARK IRVING, ESQUIRE, IN THE CHAIR.

Henry Fisher, Esquire, J.P., called in and examined:—

H. Fisher,  
Esq.

7 Jan., 1857.

1. *By the Chairman:* I believe you are a merchant in Sydney? I am.
2. And have been so for many years? Yes, twenty-five years; and I have been a Custom House Agent since 1831.
3. For how long? For twenty-five years.
4. You are an agent now? Yes; I hold a license still.
5. Then, I presume, you have had great experience in the working of the Customs Department? Yes; for ten years I was actively engaged as a Custom House Agent daily. I may add that I have also had a Bonded Warehouse for sixteen years.
6. Could you suggest any improvement in the collection of the Customs, and the conduct of the business of that department. What is your impression as regards Bonded Warehouses—do you think there could be any improvement in the system of bonding? The mode of exporting goods at present is very unsatisfactory. It would be a saving to the revenue, and, at the same time, it would be more easy for the trade, to do away with the Export Officer, and remove goods under a permit, in the same way as they do in England, from port to port, and from to town. In fact, that is one of the principal alterations I should recommend. At present, if I have ten hogsheads of rum to export, I have to pass an entry at the Custom House, to give notice of the export, to sign a bond for double the amount of duty, myself and one sufficient surety. The present system, then, is to send an Export Officer to the Warehouse whose duty ought to be to see the goods shipped.
7. Is that carried out? In many cases it is not.
8. Then they trust to the drayman or to chance for the shipment? It is too fatiguing in a climate like this for a man to walk some ten times in a day from a Warehouse to a distant wharf—they could not do it—and it would be derogatory to a respectable Officer of Customs to ride on the dray.
9. You now speak from experience, that they have not been in the habit of doing so, and will not do so? I will explain what takes place. When you ship ten hogsheads of rum, you enter into a bond, together with a surety, at the Custom House, for double the amount of duty. The Customs then send an Export Officer to the Warehouse. It is the duty of this Officer to see the goods shipped. He, after delivering the goods on board, takes his warrant to the Landing Waiter, who certifies that they are shipped, on the word of the Export Officer and signature of the mate of the vessel. He endorses the warrant although he knows nothing about the matter.
10. What officer gives the warrant to the Landing Waiter? The Tide Waiter.
11. Is it the Tide Waiter's duty to go and see that the spirits are actually shipped? The Tide Waiter is supposed to accompany the goods to the ship. It is the Tide Waiter's duty to take the warrant and get a receipt on the back of the warrant from the Chief Officer of the ship; and he then carries the mate's receipt to the Landing Waiter.
12. Then your opinion is that, under the present system, the greatest roguery may be going on, and robbery of the revenue? My opinion is that you run a great risk, as *no superior officer* of the Customs has any control over the shipment of goods, and that the shippers of goods run a greater risk than they would do if a permit from port to port were sent, which permit should be in force only for so many hours.
13. Will you have the goodness to explain the system of permits in operation in England? In lieu of leaving it to an Export Officer to ship the goods, and to the Landing Waiter to trust to the genuineness of the mate's receipt, I would recommend that a permit should be issued direct to the Landing Waiter at the Sufferance Wharf, on notice being given that a certain number of casks of spirits were about to be shipped; that would be his notice to look out for them, and to see them shipped, and it should be in force a certain number of hours—I would give the parties forty-eight hours after passing their entries—that would be quite long enough, and then any officer of Customs meeting goods without a permit, or the permit not being in force, could seize the goods. That would do away with this unnecessary man—this extra Tide Waiter.
14. As regards the export, have you any other suggestions to make? Yes; there is one matter which causes very great inconvenience to the inter-colonial trade. If we take a variety of goods, free goods, on board a vessel—I, myself, being the owner of a vessel in the colonial trade, have felt the inconvenience—we have to wait sometimes, and lose a day in clearing a vessel, because each shipper has to pass an entry for every package of free goods. Say, for instance, there are twenty cases of cheese, or twenty bales of wool, although they are colonial goods and free, they must be passed in the name of the shipper. I would suggest, instead of that, that all free goods should be passed by one entry of the Agent of the ship, he describing the nature of the goods and the number of packages. This suggestion, if carried out, would do away with the necessity of having one of the clerks in the Long Room, who is engaged in copying these entries every day into a book, which is quite unnecessary. We should lodge in the Custom House our manifest, and, attached to this manifest, one entry containing the whole of the goods on board the ship, excepting the bonded goods, and there should be a specific entry for bonded goods.
15. You would be bound to enter the particulars previously to the ship's sailing? Yes; the master of the ship being compelled to lodge a complete and full entry from his cargo book.

At

H. Fisher,  
Esq.  
7 Jan., 1857.

At present he may go to the Custom House at twelve o'clock in the day, to clear his vessel, and may find that five or six people have not passed their entries, and in consequence the ship will be detained till the following day. I would particularly impress upon the Committee my plan for shipping spirits, tobacco, cigars, &c.; if this were adopted, the warrant would be forwarded to the Landing Waiter's office *direct*, and the Landing Waiter would then be responsible for the due shipping of the goods, instead of an irresponsible officer, as at present.

16. As regards the imports, what would you suggest to simplify the business, to save expense, and to do away with a portion of the present establishment? It would be very desirable, now that there is no wharfage connected with the Customs, if it could be carried out with free goods, I think the Agent of a London ship might be permitted to pass one entry inwards for all free goods—one long entry for a ship's cargo, if it were composed of British goods.—I think the Master of a ship, or the Agent, might be permitted to clear all goods, say at all events those that had not been entered within forty-eight hours of the arrival of a vessel.

17. Then as regards bonded goods? Bonded goods should be described particularly, and, to prevent fraud, it would be absolutely necessary that the owner, or consignee of the goods, should pass an entry, as you could hardly describe the contents of many packages.

18. What is the present system as regards the bonding of dutiable articles—spirits for instance—in landing them, supposing they had to go to Towns', or Lamb's wharfs? At present the importers and Bonded Storekeepers sign a bond to double the amount of the duty payable upon the package, that it shall be accounted for to the satisfaction of the Customs. That is the first step we take before landing goods for bonding.

19. That authorises their being landed immediately afterwards? Yes, during Customs hours.

20. That does away with the necessity of an officer accompanying the goods? Strictly no spirits ought to be allowed to leave a ship without an officer going with the goods, but in fact that order is not complied with—they send dray notes with them.

21. Who gives that memorandum? The Landing Waiter.

22. To whom is it addressed? To the Locker at the Bonded Warehouse the goods are entered for.

23. Supposing the goods are sent by a lighter? The Tide Waiter then forwards a boat note to the wharf.

24. Does not that give a great opportunity for fraud, if there be any connivance between the dray keeper, or the store keeper, or any person connected with the spirits? No; at every step the Government is protected by the bond entered into.

25. Supposing a full cask is put on board the lighter, or in the dray, and an empty one is delivered, how is the Locker to know that that is not the cask that came from the ship? The casks are gauged previous to removal, except when the business is much hurried, and then sometimes they are obliged to leave forty or fifty casks to be gauged next day.

26. Supposing the parties wish to save wharfage, are not the casks delivered on board ship direct from the lighter? Yes.

27. In such cases are they gauged? No, they go to the Sufferance Wharf entered for.

28. *By Mr. Campbell:* In charge of a Custom House Officer? No, they do not send off people in the lighter; the officer on board the ship sends a boat note to the Locker in charge of the store, to the best of my belief.

29. *By the Chairman:* That is the present system? Yes.

30. What would you suggest in lieu of that? I think if you carry my views out they cannot be improved; I would adopt the same system in exports as in imports, viz., by the permit direct from the Landing Waiter.

31. Speaking of exports, what check would there be, if there were this mere memorandum that the goods were not taken elsewhere than on board ship? Only this, that the Master of every British Registered Ship signs a bond on taking command, which is sufficiently stringent.

32. I will suppose a case, to illustrate what I mean. There are six drays containing twenty hogsheads of brandy, which are to be shipped, but instead of these, six other drays containing twenty hogsheads of low wines go alongside the vessel, and are shipped, the brandy being sent elsewhere. The master of the vessel would know nothing of the contents of these casks, but would require only that they should have certain marks upon them. It is the duty of the Landing Waiter shipping them to see to this.

33. I am speaking of exports? The time would not allow—it would be impossible to carry out a fraud of that kind, besides, the master of the ship would be liable to have his vessel seized at any other British port to which he might go if he could not produce the brandy; it is borne on the cockpit. On his clearance is stated the number of gallons each hogshead contains—so many hogsheads of brandy, so many hogsheads of wine, containing so many gallons, so many tierces of tobacco, weighing so much—and the ship is liable to seizure if the master cannot explain to the satisfaction of the Customs what he has done with them.

34. You think if these suggestions were carried out, not only with the imports but with the exports, it would be a great improvement upon the present system? The system of export is radically bad, because the Landing Waiter is bound to certify to the receipt of goods he knows nothing about.

35. Neither he nor any other officer? Yes; the Tide Waiter does.

36. Have you any other suggestion to make to the Committee? Now that you have passed the duty upon Bonded Stores, I may call the attention of the Committee to the number of hours during which these are allowed to remain open. Some of these are kept open an hour, some a couple of hours, some four hours, and some the whole day, according to the view the Collector of Customs took of the requirements of each store; but, in justice to parties holding goods in bond, all the Warehouses should be open from nine to four. I would suggest that all Bonded Stores should be kept open from nine o'clock till four.

37. That rests with the Collector of Customs? Yes; at the present time a Bonded Store-keeper often finds it difficult to get an officer at all—I may instance my own store. It was approved of, and licensed by Government in May, 1855. The time appointed for its being open was from nine to three. Directly after, another Bonded Store was opened, and my officer was taken to attend that store from twelve o'clock. The officer's duty was thus divided, and my store could be opened only between nine and twelve.

H. Fisher,  
Esq.  
7 Jan., 1857.

38. Who gave you authority in the first instance, when you were first licensed to open from nine to three? The Collector of Customs.

39. And immediately after he withdrew that authority? A few months afterwards it was found necessary to send my officer to Brown's store for the remainder of the day. This arrangement is injurious, both to Mr. Brown and myself, because we may want to deliver our goods at any time, and certainly ought to have that privilege.

40. If the Collector of Customs chose to give an order that Bonded Stores should be open one hour a day, he has the power? He has the power. I suggest that now the Bonded Stores have been called upon to contribute to pay for the officer, that every Bonded Store should be open the same number of hours that the Long Room is open.

41. *By Mr. Holt:* You are aware that some of the Bonded Stores are very small, and could not afford to keep an officer all through the day—such as Dixson's? The Act of Council will annihilate these; you will not find them willing to pay £200 or £300 for nothing.

42. *By the Chairman:* Do you think there is a necessity for these Bonded Warehouses up and down the town—is it not rather detrimental to business, than otherwise, to have Bonded Stores in out of the way places? I think in granting licenses for Bonded Stores, it should be considered whether they were necessary for the requirements of the port, and that they should not be granted merely for the convenience of a merchant who wants to store a cargo of wine.

43. For instance, do you think a chapel should be licensed as a Bonded Store? I think there are two or three private Bonded Stores which are an expense to the Revenue, and if the Bonded Store Duty Bill is passed, it will do away with these.

44. What is your opinion as to the desirableness of Government undertaking the whole business of Bonding—if they were to take it entirely into their own hands, and to have one large store? Had it been done when *they had good water frontage, and plenty of room to build a store, it might have been desirable*, say on the Circular Quay. The present Commissariat building would make a very good Warehouse, with a little alteration. If this had then been done, no doubt it would have given great satisfaction to the public, who do not like the system of private Bonding.

45. Do you know anything of the Customs Regulations at the out-ports on the coast—whether they are satisfactory to the community? Newcastle is a Free Warehousing Port, and so is Moreton Bay; but I have had no opportunity of observing how the Customs work on the coast.

46. Could you suggest any improvements as regards the Customs at the out-ports? No; generally speaking, I think, there is really less to complain of in the Customs Department than in any other Government establishment; that I state from my experience of twenty-five years. The Revenue is collected, and the business is done more satisfactorily in that Department, than in any other under Government. There are, no doubt, a few inefficient officers, and the Landing Waiters have, especially, a great inducement to irregularity, if in any way inclined to it, from being compelled, in this hot climate, to gauge spirits on a wharf, unprotected from the sun. On all Sufferance Wharfs there ought to be sufficiently roomy sheds beneath which the spirits should be gauged. I have seen men in a dreadful state when they have been gauging brandy on the Circular Quay and on Campbell's Wharf—what with the fumes of the spirits, and the burning sun, it has been enough to kill them. The Messrs. Campbell did erect a shed for this purpose, but of late it has not been so employed, as it has been completely blocked up with other goods.

47. *By Mr. Holt:* The exposure to the sun when engaged in gauging spirits must have an effect upon the men? Yes, and upon the spirits as well.

48. Under such circumstances, can spirits be gauged accurately? I am not aware in what proportion spirits will swell, but I know that a hogshead of brandy will rise nearly an inch in the sun, and, of course, it is also impossible to ascertain the exact strength. Numerous complaints are made after the casks have been gauged.

49. Do you not think it would be well to gauge all spirits in a proof room, to take, say half a pint from a cask into a bottle, which should be hermetically sealed, and afterwards be tested by a competent person? I believe that is done in England, but it could not be carried out with every package, time would not permit. I would suggest, as a check upon the accuracy of taking the strength of spirits, that as there is now upon the Estimate a Surveyor of Warehouses; it should be part of his duty to have samples drawn occasionally, to enable him to test the accuracy of the Landing Waiter's return. But it would interfere too much with the business of the port to have spirits gauged in the way you suggest.

50. *By the Chairman:* Would you have the spirits pass through his hands before delivery, so that he might check the returns as to their strength? It would be well to give the public power to apply to him. For instance, if I had forty hogsheads of brandy landing, if he checked one out of five, that would be sufficient to enable him to tell whether the officer had done his duty.

51. You have been speaking of the Lockers, and their duties—have you, generally speaking, found them efficient? Yes. I have always had a very efficient Locker. I cannot speak of other stores; in fact it would be invidious to do so. In my store, the Locker keeps up his book to within five minutes of his delivery. You can go to my store and ascertain the stock in hand at any time.

H. Fisher,  
Esq.

7 Jan., 1857.

52. Spirits sometimes remain two or three years in hand? Yes; that is a hardship. At present the Collector can, by the Warehouse Act, compel you to clear goods in three years, or at the expiration of that time to sell them.

53. Do the Customs take any notice of spirits during that time, while they are in the store—is it any one's duty to see that they are carefully stored? It is the Landing Surveyor's duty to visit the stores.

54. Are they in the habit of doing it? Yes; Mr. Garling visits my store occasionally, and it is the duty of the Bonded Storekeeper to report any leakage. If a cask bursts, or any accident happens, and we have to get Mr. Garling's certificate of the accident, and how it occurred, that is the only way by which we can relieve ourselves from the payment of the duty.

55. Do you think that a satisfactory mode, when there is a great leakage of spirits; do you not think some check might be kept upon that if an officer were, from time to time, say once a month, to visit the stores and examine the stocks? I think that may very well be left to the merchant and Bonded Storekeeper; for a merchant, if he looks to his own interest, will not bond his spirits in a store where there is a suspicious amount of leakage.

56. No doubt it may be left where the Warehouse-keeper is an honest man, but does not the present arrangement afford great facilities for the appropriation of property? Not if the Warehouse Act is carried out to the letter, because if there is undue leakage the Collector of Customs can call upon the party to pay the duty, unless he can account for it.

57. Has there ever been an instance of the Collector having called upon any one to pay duty for leakage? I do not know; he has generally believed the statement of the party; in fact, it has generally been proved to his satisfaction.

58. *By Mr. Campbell:* Have not storekeepers had to pay for leakage? I have not. At one time I had the largest store in Sydney—Unwin's—and I was compelled to take in more goods than I had room for. I had immense leakage, but I was not called upon to pay one farthing, though I had to furnish an account of the cause, and I had also the statement of the cooper. Maedermott and Dixon lost heavily by leakage in twenty hogsheads of rum, in the years 1842 and 1844. At this period immense importations took place, and the stores were inconveniently crammed. The Collector did all he could to protect the Revenue and Importer, and every one knew that Mr. Maedermott was very careful of his rights, but neither he nor the Customs complained of carelessness on my part. Undue leakage often arises from careless stowage on board ship. Hogsheads of brandy, for instance, come from Liverpool with salt stowed over them, and wherever a bag of salt touches an iron hoop it causes the hoop to corrode, and to break within twelve months. I have lost many casks in that way. You can hardly discover when the casks are landed where the salt has touched, because the hoops are generally rusted. But it does not affect the revenue; it would be all the same to the revenue if all the brandy in the Colony leaked out at night, as it would not go into consumption, if a supply came the next day.

59. *By Mr. Weekes:* Not if it leaked away, but if it were taken away the revenue would suffer? Yes. You will see that there is a three-fold protection; in the first place you make the merchant and the storekeeper enter into a bond for the payment of double the amount of duty; then the storekeeper is liable to have his license cancelled, if his store is not conducted to the satisfaction of the Collector; then again you have Lockers, who are under a bond to the Customs for the proper fulfilment of their duties, and they hold the keys of the store.

60. Have you ever known the license of any Bonded Store cancelled? No, not for any irregularity.

61. Or Locker discharged for any neglect of duty? Yes; many years ago several Lockers were discharged for having irregularly let some tobacco out of bond. That is the only instance, in twenty-five years experience, that I have known of any irregularity.

62. Is stock ever taken of goods deposited in a Bonded Store? About eighteen months or two years ago they took stock. We do not know when they are about to take it, as they give us no notice. I have only known stock to be taken twice since I have been in the Colony, once in 1855, and in 1839 or 1840, when Mr. Barnes was here.

63. *By the Chairman:* That was done at Mr. Barnes' instance? I cannot tell.

64. *By Mr. Weekes:* Then, for a period of sixteen years no stock was taken? I am not aware of stock having been taken by the Customs, except at the times stated by me already.

65. You would have known had yours been taken? I should.

66. Do you know the result of this stock taking, as to the deficiency discovered? As to my own only. I know that my own stock was correct; that it tallied with the books.

67. When you say that it tallied with the books, do you mean that there were the same number of casks or cases? With the exception of leakages, and breakage of cases, such as cases of gin, which had been examined from time to time, rectified in the Landing Surveyor's certificate, and entered in the book. The Warehouse-keeper keeps his ledger, and the Locker keeps his book in the store also, in which all these matters are entered.

68. Where there are a great quantity of spirits in stores, several tiers, and two or three deep, is it not possible that a leak may run so long that a cask may be entirely emptied before it is discovered? Yes; there, I think, the merchant would be protected by a Surveyor of Warehouses. If such an officer is necessary, his duty should be to visit and inspect the stores—which has always been done when occasion required it. It is now my duty to report to the Landing Surveyor any case of leakage; if I did not I should hold myself responsible to the Collector for duty.

69. What character for sobriety do the Lockers and Officers of the Customs generally bear? With one or two exceptions, very good.

70. The excitement to which you have alluded—do you think that has arisen from exposure to the sun only? I have witnessed with pain the effect it has had upon the constitutions of very regular men, who have been for a number of years exposed on the wharf. It is not right

right that any man should be required to gauge spirits in the burning sun; in gauging, he is, of course, obliged to hold his head over the spirits and inhale the fume, and has also sometimes to taste them. A Landing Waiter, not unfrequently, will have fifty or sixty casks to gauge.

H. Fisher,  
Esq.  
7 Jan., 1857.

71. There is no tasting necessary to the trial of the spirits? If I landed brandy under the denomination of rum, I might cheat the revenue of three shillings a gallon; so that the officers have sufficient cause for the examination, indeed I think the Landing Waiter is bound to taste. I should, if I were in such a position, feel bound to taste a little of every parcel, if my nose were out of order, and I could not smell so as to distinguish between brandy and rum; and even this will operate on the system of a weak constitution. But I have no doubt that the excitement to which I have referred is caused chiefly by exposure to the sun. There ought to be a large shed on every wharf, beneath which spirits should be gauged. The shed on the Circular Quay was originally intended for that purpose, I believe.

72. Are Bonded Stores at all used as convenient places for persons to drop in at about lunch time? That has, from time to time, come under my notice, and I have had to object to it. But if a publican is taking goods out of bond, he can demand that the casks be re-gauged, and then, when the spirits are tasted, whatever is left in the tube is his property, and we cannot prevent him giving it to any one he pleases. Besides there is always enough to drink when the sampling is going on, and, if they are inclined to do so, they can take it, as they must take samples in order to test the strength. In fact, we cannot get men to work at a Bonded Store without allowing them to drink, and I think it is much better, at stated hours, to give the men a glass of grog, than to attempt to prohibit them taking it altogether.

73. You think you should not muzzle the ox that treads out the corn? From my experience I should say that you cannot employ a man at a brewery, a distillery, or any other place of a similar kind, without allowing him to drink.

74. If a man is surrounded with spirits you must let him taste them? Yes.

75. On the landing upon a wharf of spirits intended to be placed in bond, is it always gauged? It should be; that is the order of the Collector of Customs.

76. And then it becomes the duty of the Customs, through its officers, to see that these goods are deposited in a Bonded Store? It is the duty of the Landing Waiter to forward a permit, a dray ticket, or cart note, to the warehouse, and in the evening, before he leaves his work, he ought to ascertain that these goods are received and properly housed.

77. Is it not the duty of the Customs' Department to see that these goods are kept in their custody until they are bonded in the store? I think not; I think that is a responsibility which we incur when we sign the bond. We incur the risk, for instance, of a dray conveying spirits from a wharf to a store. It would be an enormous expense to the revenue to send an officer with every dray.

78. Then a dray load of spirits which has not paid duty, is placed in the custody of an ordinary drayman for transmission to a Bonded Store which may be at the other end of the town? Accompanied by a written permit; and any constable could seize the spirits if the drayman could not produce that, or explain satisfactorily.

79. The permit states that there are a certain number of casks on the dray? Yes; it gives the mark and number.

80. What check is there that the drayman does not drive his dray into a yard or any other place, take half the spirits out of the hogsheads, and either leave them in that condition, or fill them up with water or an inferior spirit? Because the time would not admit of it. No spirits, without a special authority given by the Collector, can be landed after twelve o'clock, or I believe they go on now till one, and before three the wharfs ought always to be clear of them.

81. What check is there upon the drayman whether he is one hour or an hour and a-half going to Miller's Wharf, for instance? None. That is one of the risks we take in signing the bond.

82. In such a case as I have supposed of goods, after having been gauged on the wharf, being committed to the custody of an ordinary drayman who abstracts half the spirits, as it is not re-gauged on entering the Bonded Store, and may remain there for two years, who is responsible? An ullage cask could not be received for a full one, but if it were reduced in strength we should not find that out until the party owning it came to export it or to pay the duty. It might, as you say, remain two years undiscovered.

83. Does not that strike you as a great neglect of duty on the part of the proper authorities? While you have Bonded Stores straggling about the town as at present, it is impossible, with the number of men the Collector has at present at his disposal, to do any other.

84. Is there any necessity for placing so large an amount of property at the mercy of a common drayman? I believe there are twenty-three warehouses in Sydney, say each of these has six drays, that is one hundred and thirty-eight drays all going to twenty-three different points. To perform the duty of accompanying them, at least twenty officers would be necessary.

85. That proves the imperfection and rottenness of the system? I certainly object to the manner in which licenses for Bonded Stores in different parts of the town have been granted, some of them in positions where it is impossible they can be under the control of the Collector, for instance, under a chapel. There are several private stores unnecessary—Mr. Smith's, and others.

86. *By the Chairman:* What Mr. Smith? John Smith that is in Darling Harbour. In former years there was one at Dixon's, but the license for that was cancelled some time ago. I think all private Bonded Stores should be done away.

87. *By Mr. Weekes:* Taking into consideration the unprotected state in which spirits are removed from the wharfs to the Bonded Stores, it is impossible to estimate the amount of loss arising to the revenue? No, I do not say that, for I think the risk of detection is so

great

- H. Fisher, Esq.  
7 Jan., 1857.
- great that no man would incur it—the penalty is so very heavy; the least infringement of the Customs' Act renders the party liable to a penalty of £100.
88. Would not the remedy in this case be against the drayman? No; the Solicitor for the Customs, if there were any such person here, would sue the persons signing the bond at the Custom House, and would make them pay double the amount of the duty.
89. You think the bond given by the merchant and the storekeeper is the sole protection, as it is not the duty of the officer at the store to check the condition in which they find the casks? Yes. In the same way in Scotland whiskey is sent to many parts of the country by railway, or by any other public conveyance.
90. There, I apprehend, the Railway proprietors would be liable? Yes, or whoever they could find had cognizance of it.
91. Is it not customary to open cases of cigars and to take out one of the smaller boxes to see the size and weight of the cigars? Yes, that should be done; it is generally done at the store.
92. I mean on first landing, previous to going to the Bonded Store, do they not then go through the same process as spirits—are they not placed on a dray and transmitted to a store? Yes.
93. One of the cases having been opened to ascertain the weight and number of the boxes inside? Yes.
94. So that the drayman on the road to the store would have only to lift the lid of the larger package to remove a quantity of the cigars, and nail down the lid again; in such a case what possible protection would there be? The only way to avoid that would be by employing honest draymen.
95. The present system is open to that objection? Yes it is.
96. In fact the drayman becomes a Customs' officer and guardian of the Queen's revenue for the time being? It is plainly proved to be impracticable in landing to have every package accompanied by an officer.
97. I am alluding now to importing? No officer would walk at the tail of a dray.
98. Then I say that, to all intents and purposes, a common drayman becomes, for the time, a guardian of the Queen's revenue? Yes. In the same way, I may say, I am carrying a quantity of gold to the bank, but I do not carry it myself; I employ a porter to do it.
99. But you keep pretty close upon his heels—the same principle exists in exporting? Yes. So do the Customs' Authorities see every day the goods are sent to their proper destination. There is a great discrepancy in weighing goods in landing; it all depends upon the officers, some are more liberal in giving tare than others. It appears to me that there should be a tare fixed for packages of all dimensions, such as cases of cigars, as is done with bags of sugar. It happened that two tobacconists, Aldis and Leigh, received each a consignment of the same description of cigars in the same ship. One officer weighed Aldis' and another Leigh's; the latter gave Leigh the benefit of one pound in the weight, he gave the weight as seven pounds; while the officer who weighed Aldis', stated the weight to be eight pounds. Now I think all No. 2 or No. 3 Manilas should be a fixed weight, upon which a certain amount of duty should be payable. In looking at the London Customs' Regulations, I find that in all sugar warehouses three per cent. is allowed every three months for wastage. Now as we have to find the scales and weights for weighing the sugar when it is received into our stores, and as it is attended with considerable time and labor to re-weigh it, I think we ought to be allowed wastage according to the time it has been in our stores. At present we are required to re-weigh the sugar, and both the Government and ourselves are put to great expense and loss of time, as we cannot send out a ton of sugar without the presence of an officer.
100. Bonded goods, waterborne to the various wharfs are also placed in the uncontrolled custody of puntmen? I cannot positively answer that question, because being a Bonded Storekeeper, situated as my store is, I take all my goods by dray; all my goods are land borne. I believe they go round in the punt without an officer, but I cannot positively say; I know however, that spirits go up to the warehouses without an officer.
101. *By Mr. Campbell:* In all cases? Very nearly all; it is very seldom now you see them in charge of an officer.
102. I understood you to say with no exception? Not now, because they send cart notes instead of an officer.
103. *By Mr. Weekes:* Did I understand you to say that more stores are licensed than are necessary, merely for the convenience of private individuals? Yes; I do not think licenses for Bonded Stores should be given to merchants merely for the storage of their own goods.
104. Do you think it would be a desirable change that Government should be their own bonders? It was a matter of surprise to me many years ago, when Government had plenty of ground at the Circular Quay, that there was not a range of stores erected there, and I believe it was suggested to the Government by many merchants. I am of opinion that it would be much better than the present plan, provided of course, you compensated the present storekeepers; you could not lose sight of that.
105. *By Mr. Holt:* Do you think notice would not be sufficient? No, I do not think so; because many merchants have built stores for Bonded Stores; that on Campbell's Wharf was built specially for that purpose.
106. Would they not do for free stores? No; they are built for Bonded Stores.
107. *By the Chairman:* Is it necessary for these persons to get a sanction from the Collector of Customs beforehand? It has been the case; I know it was the case with Unwin's, the Argyll Bonded Store, of which I took the lease; before a stone was laid the Governor and the Collector of Customs promised it should be licensed, because stores were so much wanted.
108. *By Mr. Holt:* Other persons, as the Messrs. Campbell—did they apply? I cannot say.
109. *By Mr. Buckley:* You say as far as your own store is concerned, you know what takes place, but have you no idea of what takes place at other stores—whether there are any irregularities.

irregularities practised? No. It is an old saying "Two of a trade never agree," and I do not think it prudent to pry into other stores; but as a Spirit Merchant, I have frequently had occasion to clear spirits at other stores, and I have generally found them well conducted.

H. Fisher,  
Esq.

110. No irregularities, such as the abstraction of goods, have come under your notice? No; I only know of one instance, where three kegs of tobacco were irregularly delivered; some officers were then dismissed, and among them one named Douelly. Twice or three times Bonded Stores have been broken into in the night.

7 Jan., 1857.

111. You never heard of a syphon having been used, and spirits extracted through the window? Never.

112. Speaking of delivering goods from a Bonded Store—are you aware that it has been the practice to deliver goods in Sydney without a proper entry? There was one very hard case came under my notice, connected with a person of the name of Magrath; he was dismissed for delivering some goods to Messrs. Smith and Campbell, on their promise to pay the duty in a few minutes. He was a very honest man, and the duty was merely nominal; an *ad valorem* duty on some two or three hundred pounds, and he had the guarantee of a respectable merchant that in a few minutes the officer would receive the warrant.

113. That was done purely as a matter of convenience to the parties? Yes.

114. You are not aware that that is done both with regard to tobacco and spirits? As far as my own experience goes, I know they are very strict; if I wanted even a case of gin five minutes before duty was paid I could not get it, neither would I ask for it.

115. You have not heard of transactions of that kind? No.

116. With reference to the carting of spirits—is the fact of drays not being accompanied by an officer known to the Collector of Customs; is it done with his cognizance? Yes, to the best of my knowledge it is by his express instruction that cart notes are substituted in landing.

117. You say that in importing a quantity of spirits you enter into a bond for the payment of double the amount of duty unless they are satisfactorily accounted for? Yes.

118. Do you consider that you have the entire risk? Yes.

119. Does the Government incur no responsibility to open these casks, and test the strength of the spirits while they are in the store? No. I consider that it is a boon to the merchant; and for the risk he runs the Government say, "you may bond your goods in a store approved of for the purpose, and you will not be required to pay the duty until you want them."

120. Do you think the Government is justified in exposing the merchants to this risk; supposing, for instance, the storekeeper were disposed to act dishonestly? With the staff at the disposal of the Collector of Customs, it would be impossible to act otherwise.

121. As a matter of equity, is it equitable for the Government to place you in this position without taking any responsibility upon themselves? Yes, I think so; I think, as I have said, it is a boon to the merchant, by allowing him credit for the payment of the duty.

122. From your experience, you do not think either that the individual who exports spirits or the public revenue suffers by this means? No. There are several officers of Customs, for instance the Landing Surveyor, Mr. Garling, who are in the habit of visiting the warehouses two or three times a week, and every day he is at the principal wharfs—he is generally on that duty from eleven to one o'clock. Spirits are generally landed at the principal Suffrance Wharfs, and it would be next to impossible for anything wrong to be carried on with a number of eyes watching, and the Locker doing his duty at the other end.

123. After these spirits have been gauged and tested on the wharf, is it the practice to secure the bungs in the same manner as when they were landed? No; they are not tinned over; we are called upon to find a fresh bung cloth. It is the duty of the storekeeper to send a cooper, and the Landing Waiter's instructions are to see that the casks are delivered to the storekeeper in merchantable condition.

124. You have spoken of the permits, that it would be better to adopt them—in what way would it be better than the present system? Sometimes we have to trust to a Tide Waiter, in receipt of, I believe, twelve shillings a day, who may be on duty one day and off duty the next week. I would have the principal officer, the Landing Waiter, to receive the goods and see them properly shipped. I have signed an export bond for several thousand pounds in the morning, and then, in order to get the work done and the goods shipped, have frequently had to pay them for over hours.

125. Do they usually loiter and idle away their time for the purpose of securing this payment for over hours? If any portion of the department is badly managed it is that; it is greatly neglected; it is a nuisance to the public, as well as the cause of great loss of time and money to the Government.

126. Do you think the inefficiency of these officers arises from their intemperate habits? There have been some intemperate men in the Custom House, but they are rooted out of the establishment; several of them have been dismissed.

127. Are there none now? I cannot say; there may be one or two.

128. Is it not notorious that parties frequenting these wharfs find these men in a state of intoxication constantly—almost every hour of the day. Are there not instances of this kind you have seen and known? Yes; from the ill effect of putting men on a duty where it is impossible for them to keep sober. I have seen them labouring under the effects of the sun, combined with the taking a glass of brandy and water.

129. Do you know none of these officers at the present moment to be in the habit of suffering from *delirium tremens* every now and again? I think there is one instance.

130. Not more than one? I do not know of more than one.

131. This permit, you propose, should be signed by what Officer of the Customs? We now pass five entries, and the fifth entry might be signed by the Chief Clerk, addressed to the Landing Waiter at Campbell's Wharf or Circular Quay; and any officer could seize spirits not accompanied by a permit. I would strengthen the Landing Waiters' Department, and

H. Fisher,  
Esq.

7 Jan., 1867.

do away with the Export Officer's entirely. I would have two Landing Waiters on each wharf to perform the duties.

132. You were speaking of entries just now, do you think they are unnecessarily multiplied at the Customs? Yes. We are called upon from the warehouses to make four entries; why we should make more than two I am at a loss to know. I can understand one being required for the Warehouse Department, and one for the Landing Waiters'; but by the present system four sets of books have to be kept in the Custom House instead of two. There are four entries for bonded, and three for free goods; and I do not see why I should be called upon to pass a double set of entries merely that the Customs may be enabled, if an Honorable Member of the Assembly moves for returns, to prepare a statement in detail of all imports and exports.

133. What mode would you adopt to enable the agent of a vessel to make only one entry; how would you furnish him with the information to enable him to make the entry—for instance, supposing there are 100 cases of mustard? This is my suggestion to meet that: To require all parties to forward to the agents of a ship within a certain number of hours or days, particulars of goods imported to them, and failing to do so that the goods should be liable to be opened. If such an arrangement were carried out there would be no difficulty in the matter, as the importers would not run the risk of having valuable cases of drapery and haberdashery broken open. I would issue an order that the particulars should be furnished to the agent within forty-eight hours, or three clear working days, of the ship's arrival, and the agent should then pass one entry for the entire quantity of one particular kind of goods. When I acted as a Custom House Agent, I have passed as many as fifty or sixty entries for single packages by a London ship. That has cost the labour of entering fifty or sixty lines in four books in the Custom House.

134. Then, with reference to the Custom House Department, you are of opinion that these books of entries may be kept more simply and less expensively? Yes; for instance, say the "Vimeira" brought in 250 packages of boots and shoes, these came out to some thirty different people, and this involved thirty different entries in the books at the Custom House.

135. You think a considerable amount of labor might be saved to the Customs if this system were adopted with free goods? Yes.

136. Are you prepared to say what reduction might be made in the Custom House staff by the alteration you suggest? I should say that by economising the time, the duties might be performed by half the number of clerks in the Long Room.

137. You have spoken of the Lockers being under bond—by that, I suppose, you mean that they give security—are you aware whether that security is given here or in England? It is given to the Collector of Customs here.

138. Are you aware whether that has been done since the Customs' Department has been handed over to the Colony? Yes; I am bondsman for several officers.

139. With reference to the Commissariat Store at the Queen's Wharf, what is your opinion of that as a central position for a Bonded Store? I think that alone would be of no use to the Government; for without you make a row of stores sufficiently large to hold all the bonded goods coming to the country, it would be of no service. It would cause a great deal of scrambling, unless you put the Government in a position to hold the bonding of the Colony, as people would prefer putting their goods in a Government to putting them in a private Bonded Store. I need not tell you that the Commissariat Stores would not hold one-fifth of the goods now in bond.

140. Are these stores, so far as their extent will admit, suitable for the purpose as they are now constructed? With very little alteration, very strong Bonded Warehouses might be made of them.

141. In the event of requiring additional accommodation, is there room to extend them in any direction? Yes. There is no private ground from the Commissariat to Campbell's Wharf. Where the old Water Police Office and the Ordnance Ground is, they might be extended. The old Dock Yard is now a perfect nuisance. A row of stores might be built there, taking the Commissariat Stores as the southernmost.

142. Would that be as convenient to the public generally as the Bonded Stores are now? Yes, because we must come to the Custom House to clear our goods.

143. Would it be as convenient to have the store erected somewhere on the other side, near the Custom House? I think it would be desirable to have them in one block. I do not think an objection could be raised to either side; either side would be equally convenient. The only difference would be, that you would come down Pitt-street—which I consider the principal street of the town—to the Commissariat Store, and the Bonded Stores would thus be a continuation of that street.

144. If there were a general Bonded Store erected by the Government, would it, in your opinion, greatly decrease the present amount of expenditure in the way of officers? Yes, because you could easily introduce a clause in the Warehouse Act compelling us to land our goods on the Circular Quay, to have all our spirits gauged on one wharf, and put in one block of the building.

145. In the event of a cask being injured by conveyance on a dray, or lost by a lighter going down, whose loss would that be? If it were explained to the satisfaction of the Collector of Customs that it was accidental, the duty would be remitted. The other matter is only between one merchant and another; the Customs have nothing to do with disputes of that nature.

146. Their interest is in the duty alone? Their interest is in the duty alone; they take no cognizance of the rights of property.

147. With reference to the conveyance of cigars—you say that it is quite possible for a drayman when conveying a case from a wharf to a store, to raise the lid and abstract some of the cigars from the smaller box which had been opened previously; do you not think, if the officer at the Bonded Store exercised proper care, he would ascertain on what boxes there were such losses? Yes, I do.

- 148. You think it is the duty of the officer to turn over the cases, and to see that they are entire? I should consider it to be my duty if I were an officer. I am answerable to the Government to deliver up a case of cigars containing ten boxes, and if I produce one containing only nine, I am compelled to pay the duty upon ten, unless I can shew that the box was deficient when delivered to me.
- 149. You are not aware whether any instances of that kind have occurred? I am not. I have very few cigars in my warehouse, as it is not suitable for that purpose.
- 150. *By the Chairman:* Some parties have suggested the appointment of an Inspector of Bonded Warehouses? I think if the Landing Surveyor does his duty, he could perform all that would be required in the way of supervision. As a merchant of Sydney I was surprised to see the item on the Estimates, and still more when the House allowed it to pass. The office of Senior Landing Surveyor includes, in my opinion, the survey of every thing.
- 151. Then, in fact, this new appointment takes the most important part of his duties from him? Yes, you only leave him as an assistant to the Collector, to answer questions which I think is unnecessary.

H. Fisher,  
Esq.  
7 Jan., 1857.

WEDNESDAY, 28 JANUARY, 1857.

**Present:—**

MR. BUCKLEY,		MR. IRVING,
MR. EGAN,		MR. NICHOLS,
	MR. WEEKES.	

GEORGE ROBERT NICHOLS, ESQUIRE, IN THE CHAIR.

Mr. William Henry Aldis called in and examined:—

- 1. *By the Chairman:* You are a tobacco merchant? I am.
- 2. Are you a large importer of tobacco? I cannot say I am a large importer. I am a very large dealer in tobacco.
- 3. Are you a purchaser of goods in bond? Yes; very largely. I have been doing business to the extent of £50,000 a year, or thereabouts. I am not an importer generally.
- 4. You have been for many years in the trade? Yes; I am the oldest tobaccoist in the Colony.
- 5. Do you ever find any deficiency in the weight of the goods delivered to you from the Bonded Stores? Yes, repeatedly—very great mistakes. I have had a very recent instance of a discrepancy on the part of the Custom House officers with respect to the weight, and such mistakes are everlastingly occurring.
- 6. Do you mean that there is a difference between the weight of the goods when issued from the Bonded Stores, and the weight as given at the Custom House? Yes.
- 7. *By Mr. Irving:* There are so many mistakes that you have no confidence in the weights taken at the Customs? No; I would not put any confidence in the weights of the Customs, and those parties who deal in the article are of the same opinion as myself with reference to that matter. I do sometimes buy in bond at the certificate weight, but I generally have the goods weighed immediately after, and frequently find a considerable deficiency.
- 8. That would arise from the neglect of the Custom House officer? Yes.
- 9. Have you found the deficiency in weight very large? Very large. In the instance to which I just alluded there was a deficiency of as much as 10 and 11 lbs. in each package.
- 10. In what quantity? About four hundred-pound packages. The package was in the same state as when it entered the store, but the mistake was made in the weighing; I cannot say how, by whom, or under what circumstances; all I can say is, that I discovered it, and that I have not yet got the money for the deficiency from the party from whom I purchased the tobacco. The discrepancy in the weight was a very glaring one indeed.
- 11. Do you find any difficulty arise to you from dutiable goods being bonded in different Warehouses? Generally speaking, all the goods I can put into my own stores I do, and when I cannot I put them in the next nearest to me, into Pollard's. It is very expensive to have to send to Moore's and other stores at a great distance for goods. It costs a great deal for carriage.
- 12. Besides the inconvenience? Yes.
- 13. It creates inconvenience in mercantile transactions? Yes, and loss.
- 14. *By Mr. Irving:* And loss of time? Yes, loss of time and loss of money.
- 15. *By the Chairman:* You think it would be better to have one Bonding Establishment where dutiable goods—such as spirits and tobacco—could be stored? Yes, it would save a vast expense to the public and to the Government too.
- 16. To the merchants and to the Government? Merchants—at least the owners of Bonded Stores—would be the losers.
- 17. But to the mercantile community generally it would be an advantage? Yes.
- 18. *By Mr. Irving:* That is, you think if there were only one Bonded Store it would be a great advantage to the trading community? Yes; the bonding business ought to be concentrated, and brought into a focus under the eye of the Government, because I do not consider it under the eye of the Government when stores are scattered about the City, at such a distance from each other.
- 19. I suppose you are not in the habit of going to Bonded Stores? Well, I do go; I am at the Custom House almost every day.
- 20. Do you find the Lockers in attendance at the proper time? I think they are. I think the old servants in the Custom House are, generally speaking, attentive; but I could not answer that question.

Mr. W. H. Aldis.  
28 Jan., 1857.

- Mr. W. H. Aldis.  
28 Jan., 1857.
21. Do you think the present staff efficient—are the officers who now hold the position of Lockers such as you would appoint? Taken as a body I could not say that. It is a very delicate matter, and I do not like to point to individual cases.
22. You would not like to give an opinion separately; but, taking the whole, would you consider the Lockers efficient and qualified for the duties they have to perform? The Lockers?
23. I will include the Customs' Department generally? I think, then, they are anything but efficient as a body, and have often told them so.
24. *By the Chairman:* Do you find any difficulty in passing entries? I do not, generally, being treated perhaps more civilly than others; I might say why, knowing how to remedy these complaints. You cannot have a greater proof of the inefficiency of the Customs than the continued re-weighs and re-gauges, one man being engaged doing the duty that ought to have been done by another previously.
25. Have you ever had to pay extra for opening Bonded Warehouses? No; the Warehouses are open when I go there. I generally pay for sampling—I pay a man a shilling for opening the package.
26. *By Mr. Irving:* The Locker? Not the Locker, but the laboring man in the store; he does the work, and generally gets the money.
27. Has your attention been drawn to the Customs in other matters, as well as in your department, with reference to tobacco and cigars? No; I am so fully employed in my own business that I cannot attend to other matters: I may hear such a thing as a matter of gossip.
28. You could not give an opinion as to the bonding of spirits or wines? No, I could not.
29. Can you give any opinion as to the mode of passing entries for exports—whether there can be any improvement? I think there is a vast deal of parade—of unnecessary form and ceremony, which is a very great obstruction to the export business.
30. I suppose you are not acquainted with the details of the business? I export pretty largely.
31. Are you prepared to suggest any improvement in any way? I cannot say that I am; but I heard a suggestion made the other day—it was as regards permits for exports; that would facilitate the thing. I do not see why we should require a Custom House Officer to accompany the goods. I believe the permit would answer every purpose.
32. You think the permit system in existence in England would be an improvement? *That* part of the permit system. I should prefer being under a heavy bond. It would simplify the business. I would rather be under any responsibility than I would go through the present Customs' forms. I know very little of the permit system in England, not having studied the matter.
33. What is your experience as regards the bonding of tobacco and cigars—you say you very often purchase on ship board? Always, if I can, in order to avoid the mistakes of the Customs in weighing.
34. Have you ever observed the system pursued with respect to the weighing of cases of tobacco or cigars, whether they are weighed on the wharf or in the store? I do not think there is any particular system; sometimes they are weighed at the stores, sometimes at the wharf.
35. Sometimes, perhaps, not at all? I cannot say.
36. *By the Chairman:* Does the Customs' Officer go with the goods from the wharf to the stores? No; he ought to do so, according to the regulations.
37. Who has charge then? The drayman.
38. Any man you may hire on the wharf? Yes, he is responsible; he brings them to my store; then I have to get the Locker to put them into the store, unless it is one like Pollard's, which is open through the day, and then they are taken in there direct. They have a very loose system of doing business in the weighing of cigars. A very extraordinary case of negligence occurred a few months ago. A brother tobacconist had twenty-five cases of cigars in a ship which came from Manila. I had the same quantity by the same vessel. The cigars were Havana-shaped Manilas; they were alike in every respect as regarded number, size, and weight. Mine were charged to me at eighty-six pounds and a quarter. Some short time afterwards, I discovered that my neighbour had disposed of some of his to a customer of mine at a lower price than I could afford to supply him with them. I could not understand how this could be done, until, on reference to the books at the Custom House, I found that his cigars had been charged duty at the rate of 72 or 73 lbs. a case. I went to the Landing Waiter, Mr. Passmore, (a very gentlemanly man,) and told him of the discrepancy in the weights, and that I had lost my customer in consequence of my neighbour underselling me; and he said there must have been some mistake in the matter, that mine were not the same cigars as Mr. Leigh's, (the party to whom I have referred). I said, "You'll excuse me —"
39. Was he the officer that weighed your cigars? It was he who weighed mine with the other party's. He said they were not the same cigars—that they were not by the same ship—that they were old dry cigars. I said, "Mr. Passmore, you must have been deceived; I know for a fact, and can prove it, that they were exactly the same." Mr. Passmore is a very gentlemanly man, and said, "I will go and enquire about it at Leigh's; I will see into the matter, but I am sure you are mistaken, Mr. Aldis." He went and enquired, and, on his return, said, "I know how it is, I made the mistake in the taring." I said, "nothing of the sort, I weighed three or four boxes and they were very correct—it will not suit me—if you don't like to look into it, I shall go to Mr. Garling." He said, "go to Mr. Garling, you had better, as you seem to get rather warm about it." I did feel a little warm, for it made a difference of some £30 or £40 to me. I then went to Mr. Garling, who promised to go to Leigh's store and see into the matter. After procuring the shipping marks, Mr. Garling went into the store, and selecting a promiscuous case, had it weighed, when he found the weights, as I had stated, to correspond with mine to a quarter of an ounce—the weights being altered in the Customs books to 86½. I believe from that time to this no steps have

been

been taken in the matter. I never applied to Colonel Gibbes, but was advised to write or see Mr. Donaldson, who was then at the head of the Government.

40. They made you no allowance? I could not expect any allowance, but I expected that my competitor in business would be charged the same rate as myself.

41. *By Mr. Buckley:* How long is it since this occurred? About six or eight months' ago. I consider this one of the most glaring cases of negligence.

42. Who superintended the weighing of the cigars on the part of Mr. Leigh? That I cannot say; but there is another officer in Leigh's store.

43. They were not both weighed at the same time? Almost simultaneously. They came out in the same ship together, and I believe that there was some mistake about them, for Mr. Leigh was going to have my cigars, only mine were marked "W. H. A.," while his were marked "J. M. L."

44. Is it customary to weigh cigars in the store where they are bonded? I think it ought to be customary.

45. You say Mr. Passmore weighed the other lot of cigars as well as yours? Yes. I expressed myself more freely in the matter to Mr. Garling than I have to-day.

46. Do you suppose the difference between the two weighings arose from any clerical error? I should not like to say how it arose; so far as Mr. Passmore is concerned (who is a very gentlemanly fellow), I think it was through negligence. How it was done in the store I know not.

47. *By Mr. Irving:* How could it be through negligence, if he was so particular in weighing the different boxes of your cigars—there were no symptoms of negligence there? I do not think there was any collusion in any way by Mr. Passmore; I believe him to be too respectable. He was deceived by some one.

48. Do you think that there was any roguery in the transaction by any party? I am afraid there was, but it is not for me to say; I am not a detective. Such is the case.

49. It appears you were a detective in this instance? Yes, not a permanent one—not a paid one; I paid for being a detective. I think the difference of duty might have been about £30 or £40.

50. *By Mr. Buckley:* Do you think, if the other party had looked as closely after the weighing as you did, anything of the kind could have occurred? I was looking after my interest, and, I presume, those who superintended the weighing for Mr. Leigh were looking after theirs. It is not for me to say how it occurred; it has been hinted at by some of my own men.

51. What mode is adopted in taring cases of tobacco or cigars—is it customary to strip tobacco? No; when that is done you destroy it.

52. It has been done to settle disputes? Yes. With respect to cigars, I think it is very absurd to have a dozen different weights for number twos; in one store to have them weighed as 73 lbs. per case, in another to be made to weigh 86 or 89 lbs. or more. As the cigars are bought by the thousand, I think there should be a fixed weight upon this article.

53. There is no principle laid down with regard to taring? They turn the cigars out of the box, and weigh the box, and weigh the cigars; but I do not think it necessary to do that unless there is some extraordinary difference in the size of the cigars. I think there ought to be a fixed weight; I think the staple of consumption, which is the No. 2 cigar, should certainly have a fixed weight.

54. In your opinion this system should be adopted for the sake of avoiding mistakes of this kind? Yes; and also for the sake of keeping people honest, for the weight of the cigars cannot vary to the extent reported by the Customs officers.

55. *By the Chairman:* These cigars are packed by the Spanish Government? Yes.

56. And have some brand on them? Yes. I believe they have established a rule of the sort at Melbourne—to have a fixed rate for every 10,000 No. 2 cigars.

57. *By Mr. Buckley:* You have given an instance with regard to the weights of cigars—have many others of the same character come under your notice? There have been continual discrepancies. This is one of the most recent—perhaps the most flagrant one. The idea of losing £30 and upwards on twenty-five cases of cigars (the difference between me and my neighbour on the other side) is ruinous.

58. *By Mr. Weekes:* Could it have happened but from a neglect of duty on the part of the officers? I do not wish to insinuate anything improper, but at the same time I believe Mr. Passmore is perfectly scatheless with regard to any collusion. It might be other persons behind the scenes; for instance, there is a Custom House officer in the store, I believe—what could he have been doing at the time? Mr. Garling will, however, give you all other particulars.

59. *By Mr. Irving:* Do you think that the same thing has taken place as regards the bonding of tobacco? Yes, of course it could. What is to prevent it? There is nothing to prevent it. Here is the other instance of negligence (I do not know how this was done, but it was): About three months ago I had twelve or fourteen tierces of Barrett's tobacco. That is an article that does not waste to the extent of any other tobacco, being years before it loses any quantity; it is such an immense pressure that without being in any package at all it is almost hermetically sealed against evaporation. I had these re-weighed, and found them some ten or eleven pounds short each package.

60. *By the Chairman:* You know the Commissariat Store? Yes, but I think it not large enough for a Bonded Store.

61. There is plenty of land attached to it? Yes. I do not know that I was ever in it.

62. *By Mr. Egan:* Do you think that would be a good situation for a Bonded Store? Yes.

63. *By Mr. Buckley:* You were speaking a short time since about permits—you think that there should be permits to ship tobacco out of bond, without requiring any operation or action of the Custom House Officer—how would you accomplish that from your store? I have never studied that.

Mr. W. H.  
Aldis.

28 Jan., 1857.

- Mr. W. H. Aldis. 64. Is it your opinion that the forms of the Custom House might be lessened in the way of passing entries? I think the Customs might be altogether very much improved: I have often imagined so.
- 28 Jan., 1857. 65. *By Mr. Weekes*: If there have been many instances such as you have been recounting, the Customs Department can have been of very little use? *I do not see* what utility there is in it; I do not think you need ask that question.
66. I think you said that you were aware of many other instances besides this one that you have mentioned? Discrepancies in the weights are very often occurring; how they occur of course I cannot state.
67. So that, so far as the whole tobacco and cigar importation is concerned, you have reason to believe that there is negligence running through the whole of the bonded system? I will tell you how that can be illustrated better than by any witness that can be called—by looking to the re-weighs and re-gauges, which must be a perfect abomination. The everlasting re-weighs and re-gauges for instance on articles coming in and going out of bond. I discovered the error in the weight of the twelve or fourteen half-tierces of Barratt's tobacco accidentally from a customer, who is more correct, or has more time to weigh than I have, that the package is eight or ten pounds short, and then I have to allow him the duty as well as the tobacco, having previously paid the duty to the Custom House.
68. *By Mr. Weekes*: When you called Mr. Garling's attention to this instance of neglect on the part of the officer, do you know whether he reproved the officer or reported the matter to the Collector? I do not know whether Mr. Garling ever went to the Collector.
69. You are not aware that he did in this instance? No.
70. Are you aware whether he gave any reproof to Mr. Passmore? Yes, he did. I said that either Mr. Passmore should pay the duty or Mr. Sawyer, that is the party who paid duty and received the twenty-five cases of cigars corresponding with mine. He succeeded Mr. Leigh in his business.
71. *By the Chairman*: Do you know whether the difference of duty has ever been paid? I do not believe that it has, though I cannot say; I am not at the receipt of Customs.

## APPENDIX A.

## MEMO.

Particulars of the two instances of negligence referred to in the foregoing Evidence.

The 25 cases of cigars were by the "Adèle," from Manila, in May, 1856, marked  $\frac{Z}{426}$  § 1 to 25; the Customs' weight, and upon which I paid duty, was  $86\frac{1}{2}$  lbs. The 25 cases of cigars, free, by same ship, either Leigh's or Sawyer's, were marked  $\frac{O}{427}$  § 1 to 25, and the Customs' weight, when I pointed out the discrepancy, was 77 lbs., at which rate Mr. Sawyer had paid duty upon seven or eight cases. On looking at the Landing Waiter's, or red book, this week, I found there had been *several alterations, and a variety of weights, to the 25 cases*. The loss (or difference) to the revenue and myself on these 25 cases of cigars was—taking one at  $86\frac{1}{2}$  lbs. per case, and the other at 77 lbs., exactly £34 13s. 9d.

The other case, Barrett's tobacco, (referred to), was a small parcel of 14 half-tierces tobacco, per "Catteaux Wattell," marked  $\frac{Z}{417}$ , and bonded at Lloyd's 25th February, 1856, and upon which there was a deficiency in the original weights of about 10 lbs. per package.

WM. H. ALDIS.

SEPARATE

## SEPARATE APPENDIX.

*The Collector of Customs to the Colonial Treasurer, respecting the grounds upon which some of the Officers of the Customs Department do not give Bond.*

No. 4.

*Custom House, Sydney,  
30 October, 1856.*

SIR,

I do myself the honor to acknowledge the receipt of your letter of the 28th instant, No. 56-1237, requesting me to inform you whether some Officers of this Department, viz., Lockers, Tide Waiters, Baggage Searchers, and the Distillery Clerk, have not omitted to give Bond for the due performance of their duty; and I beg to inform you, that it is not the practice of this Service to require security from Lockers and Tide Waiters, as will be seen by the enclosed copy of a letter from the Honorable the Commissioners of Customs.

2. The office of Baggage Searcher is a very inferior one, and such as I think I should not be justified in requiring the parties to enter into bond for.

3. The Distillery Warehouse Clerk, although attached to this Department, does not in fact belong to it, and is not paid by me, but as Mr. Emmott (who is a nephew of Mr. W. Wentworth) is in the same position as other Clerks, he can, of course, be called upon for a similar bond.

I have, &amp;c.,

J. GIBBES,  
Collector of Customs.

The Honorable  
The Colonial Treasurer.

No. 25.

GENTLEMEN,

With reference to your letter of the 16th December last, No. 52, enclosing the Bonds of certain officers at your Port, I have it in command to acquaint you that the Bonds in question have not been taken in the form prescribed by the Board's Regulations, and to direct you to call upon the undermentioned persons to enter into renewed security, according to the form of Bond herewith transmitted, viz. :—

Mr. James Philps, 2nd Clerk.  
" W. Gibbes, 3rd "  
" Thomas Oliver, Landing Waiter.  
" J. L. Dean, do.  
" Fredk. Garling, do.  
" D. Goodsir, do.

In respect to the Lockers and Tide Waiters, I am directed to acquaint you that it is not the practice in the United Kingdom to require officers of this class to enter into security, and will not therefore be necessary for the Tide Waiters and Lockers at your Port to enter into renewed bond. I am further directed to return the bond given by the Commander of the "Prince George," who, being an officer under the orders of the Colonial Government, should not have been required to enter into bond to this Department.

I am, &amp;c.,

(Signed) W. MACLEA,  
Custom House, London,  
27 June, 1835.

Sydney, New South Wales.

## NEW SOUTH WALES.

## STEAM POSTAL COMMUNICATION.

(DESPATCH FROM SECRETARY OF STATE.)

*Ordered by the Legislative Assembly to be Printed, 23 September, 1856.*

THE SECRETARY OF STATE FOR THE COLONIES to GOVERNOR SIR WILLIAM DENISON.

(CIRCULAR.)

Downing-street,

5 July, 1856.

SIR,

I have great satisfaction in being enabled to inform you, that a Contract, has been agreed upon for the service of the Postal Communication between this country and Australia, by which, I trust, that this all-important object will be secured in the most regular and satisfactory manner. I regret that I am not able to send out the Contract itself by this mail, but I transmit a memorandum from the Treasury upon it, which will put the Colonies in possession of its main provisions.

From the great interest which has been evinced in this question by the Legislatures and people of Australia, I feel sure that I have met their wishes by consenting to the payment of a larger sum for a complete and well secured system of rapid and direct communication, rather than by endeavouring, at a smaller cost, to obtain one that does not equally well fulfil those essential conditions.

I have, &amp;c.,

H. LABOUCHERE.

GOVERNOR SIR WILLIAM DENISON,  
&c., &c., &c.*MEMORANDUM of terms for the Australian Mail Contract.*

1. The Contractors agree to perform the following service for £185,000 a year.
2. To convey, by full power screw steamers, the Mail and Passengers from Southampton to Melbourne and Sydney monthly each way; the steamers from Suez to Australia to be not less than 2,200 tons burthen.
3. The time from Suez to Melbourne to be 39 days, and from Melbourne to Suez 35 days. The time to be occupied between Suez and Southampton to be 14 days. The route through France *piâ* Marseilles will reduce that time by about 6 days.
4. The route from Suez to Melbourne is to be by Point de Galle; but the whole service is to be performed by vessels entirely distinct from the India Mail.
5. The service is to be performed in the time stated, subject to penalties, which *under no circumstances whatever are to be relinquished, for any delay from whatever cause arising, of £50 for the first day, £100 for the second day, £150 for the third day, and increasing by £50 for each day accumulatively, with a limit only that the penalties for any one voyage shall not exceed the whole subsidy for such voyage.*
6. The first boat is to leave this country in October, to be ready to carry the homeward January Mail from Sydney and Melbourne to Suez; the next boat leaves here in November, for the February Mail from Sydney and Melbourne; the third boat leaves in December, and the fourth in January, for the homeward Mails of March and April; so that after the month of January the service each way will be complete.

Treasury Chambers,  
4 July, 1856.

# STEAM POSTAL COMMUNICATION.

(CORRESPONDENCE.)

---

*Ordered by the Legislative Assembly to be Printed, 6 June, 1856.*

---

JAMES A. YOUL, Esq., to THE HONORABLE E. DEAS THOMSON, Esq.

5, *Cleveland Terrace,*  
*Hyde Park, London,*  
 6 March, 1856.

SIR,

I am directed by the Committee of the General Association for the Australian Colonies to transmit, for the information of His Excellency the Governor General, and the Legislature of the Colony of New South Wales, the enclosed Memorial to the Lords of the Treasury, on the re-establishment of Steam Postal Communication with Australia.

I have, &c.,

(Signed) JAMES A. YOUL,  
 Honorary Secretary.

THE HONORABLE  
 E. DEAS THOMSON, Esq.,  
 COLONIAL SECRETARY.

---

[Enclosure in the foregoing.]

To the Right Honorable the Lords-Commissioners of Her Majesty's  
Treasury.

THE MEMORIAL adopted at a Meeting of the GENERAL ASSOCIATION for the AUSTRALIAN COLONIES, held in the City of London on the 4th day of March, 1856; W. C. WENTWORTH, Esq., late Member of the Legislature of New South Wales, for the City of Sydney, in the Chair.

HUMBLY SHEWETH,

That your Memorialists approach your Right Honorable Board with the painful conviction that the great Imperial question of Steam Communication with Australia has met with unmerited neglect on the part of Her Majesty's Government.

That in the year 1852, after many years of previous hesitation, and delay, a Postal Steam Service was at length organized on alternate months, *via* the Cape of Good Hope and the Isthmus of Suez.

See proceedings of Parliamentary Committee on Steam Communication, Session 1851, p. xxxi.

That the Bi-monthly Service, *via* the Cape of Good Hope, was a mere experiment, undertaken contrary to the publicly recorded opinion of the Right Honorable the present First Lord of the Admiralty; that such Service was tried under two different Companies and Contractors, and in each case was characterized by failure, and disappointment to the public.

That the Bi-monthly Service, *via* Suez, was, during its continuance, carried out in a more regular and reliable manner, but that the Route was so devious, and the stoppages so numerous, that the passage to Melbourne occupied sixty-four days; the speed maintained, if measured by direct distance, not exceeding six-and-a-half knots per hour, whereas the usual speed on other contract lines is ten knots, or nautical miles per hour.

See Appendix No. 1.

That such last-named Service, in the month of November, 1854, was, without notice, wholly suppressed, nominally on account of the requirements of the war, but your Memorialists are prepared to substantiate that the exigencies of the public service in no way rendered this measure necessary.

See Appendix No. 2, giving statement of average passage of Mail Packets during 1855.

That since the above period our Australian Colonies have been wholly deprived of all Postal Steam Communication, and the result has been, that the transit of letters has been effected with extreme uncertainty and irregularity, the outward Mails having been delivered, upon an average, at Melbourne in 84½ days, and the homeward Mails, from the same place, in London upon an average of 93½ days.

See Treasury Minute, p. 8 & 9.

That your Memorialists now collect, with extreme regret from your Lordships' published Minute, that in lieu of immediately re-establishing a Service which ought never to have been discontinued, you propose first to make a reference to the Colonies, in order to ascertain the exact amount of subsidy each Colony is willing to contribute to the cost of a Postal Steam Line.

That your Memorialists beg respectfully to represent to your Lordships, that such reference must, under any circumstances, be attended with a delay which cannot be estimated at less than eighteen months, even though the various Colonies concerned should then agree amongst themselves, as to the amount of their respective contributions.

That your Memorialists in consequence, feel it to be their duty to impress on your Right Honorable Board that the Colonies expect, that their Steam Postal Service will be re-established by the Imperial Government without any further unnecessary delay, and great disappointment will arise if these their just hopes are not realized.

See Appendix 3, giving statement of Australian British Imports, compiled from Parliamentary Returns.

That your Memorialists would urge on your Lordships, that if the Contract Steam Service between Liverpool and New York were casually interrupted, the Executive would not allow a week to elapse without arranging for its immediate resumption; but in the case of Australia, your Lordships have already permitted its Mail Service to continue in abeyance for seventeen months, and are now about to protract its final re-establishment for a further indefinite period, notwithstanding that its trade with England is proved by Parliamentary Returns to be scarcely less important than that with America, and the regular and speedy transmission of its monthly supply of Gold, averaging a million sterling, would be of incalculable importance to this country.

That

That at no period of our Colonial history has the Imperial Government required, from any Colony, pecuniary contributions for postal purposes; and that in the present instance, to make the voluntary and munificent offers for contribution of the Australian Colonies, a special ground for indefinitely postponing the re-establishment of their Postal Service, originally suppressed without sufficient cause, does not appear to your Memorialists consonant with principles of equity or sound policy.

The Colony of Victoria alone has voted £50,000 per annum. (See Treasury Minute.)

That if your Lordships desire such contributions, they will be best secured by a Treasury Minute, graduating the scale of Postages for each Colony, according as your Lordships may find that the moneys voted by their respective Legislatures are adequate or otherwise; but to refer the question in the manner proposed by your Lordships' Minute, will probably be to throw an apple of discord amongst the Colonies, without obtaining therefrom any practical result.

That your Memorialists observe, with great concern, that your Lordships select no definite route for the conveyance of the Mails, but trust to secure, by a system of penalties, their regular delivery within the contract time.

That your Memorialists entreat your Lordships to remember that the very recent history of the Cape line, amply evidences that really heavy penalties are never enforced, while lighter penalties, such as are provided for in the present notice for tenders, have been paid with a smile by the Contractors; and therefore that a mere system of penalties affords no practical guarantee of any kind to the public for the due performance of a Mail Service.

That your Memorialists submit, with all respect, that the right way to ensure the rapid and due transmission of the Mails is not to rely altogether on penalties, but rather to select the shortest route; and, as is usually done in other branches of the Contract Packet Service, to insist on the employment by the Contractors of First-Class Vessels, with adequate Steam Power, and well-tested speed.

That your Memorialists have satisfied themselves that the shortest route is *via* Suez and Diego Garcia; such being, according to official computation, 3,019 miles shorter than the passage by the Cape of Good Hope; and 2,338 miles shorter than that *via* Panama, the latter traversing 76 degrees of longitude more than the eastern route.

That your Memorialists are also convinced it is for nautical as well as other reasons, highly desirable that the Postal Steamers, without touching at Ceylon as heretofore, should proceed direct from Suez to Melbourne, stopping for coaling purposes only at the Island of Diego Garcia, a dependency of the Crown, situate in the midst of the Indian Ocean, half-way between Arabia and Australia, and possessed of a most excellent and capacious harbour.

That the route *via* Diego Garcia being the shortest of all routes by 2,338 miles, it is evident that, at the required rate of ten miles an hour, the mails admit of being forwarded by it nearly ten days sooner than they can be conveyed by any other line; and if the rate of speed were accelerated to eleven or twelve miles per hour, as is quite practicable, the period of transmission would be reduced in proportion.

That your Memorialists would also observe that, viewing the geographical position of Diego Garcia, a short branch might with facility be organized from this island, which would bring the Mauritius and the Cape of Good Hope into close communication with Australia, and at the same time realize for the two Colonies first named, a speedy and cheap steam connexion with the mother-country, of which great advantage they now continue wholly deprived.

That if your Lordships entertain any doubts as to the superiority of the route to Melbourne, *via* Suez and Diego Garcia, your Memorialists trust your Lordships will refer this question for the consideration of the Hydrographer Royal, in order that thus their confident opinion may be corroborated by official testimony.

That your Memorialists are ready to prove that by adopting this route, and insisting at the same time on an average speed of ten knots an hour from Suez to Melbourne, the Mails may easily be delivered in Melbourne within forty-four days from the date of their leaving London.

That, by the same route, telegraphic intelligence from Australia might be received within forty-two days.

That a trunk line to Melbourne, as being the most central terminus for the Australian Colonies in general, is all that is at present absolutely necessary, and that it should be left to the several Governments of Australia and New Zealand, to direct the organization of the requisite branch lines.

In conclusion, your Memorialists submit that the wealth, intelligence, and great commercial importance of Australia fully entitle her to the best and speediest Postal Service which it is possible to organize; and they would add, that the just expectations of her population will be satisfied with no less; they contend that the close union by steam of Australia with the mother country, will be attended with great results, and they believe that a measure so Imperial in its object, merits, at the hands of the British Government, at least the same degree of support which, in the case of other and less important steam lines, has already so materially assisted the development of our commerce, and the extension of our civilization.

Trusting

Trusting that this their appeal will meet from your Right Honorable Board that consideration which they feel it deserves, your Memorialists earnestly pray,

- 1st. That your Lordships will, without further reference to the Colonies, withdraw the notice for tenders now advertised, and invite tenders for the immediate establishment of a regular and reliable Monthly Postal Steam Communication with Australia.
- 2nd. That in order to obtain the delivery of letters in Melbourne within forty-four days from their leaving London, you will select the shortest route, viz., that *via* Suez and Diego Garcia.
- 3rd. That to secure a uniform speed of ten knots an hour in all weathers, you will not rely altogether on a system of penalties, but rather stipulate that the steam vessels employed by the contractors be first-class ships of 2,200 tons burthen at the least, and be capable of performing, when tested for speed in the usual manner, not less than twelve knots or nautical miles per hour.

And your Memorialists will ever pray, &c.

Signed by Order of the Meeting,

W. C. WENTWORTH,

Chairman.

## APPENDIX.

### No. I.

#### *Suppression of the Australian Postal Steam Service.*

Their Lordships are referred on this head, to the communication addressed by this Association on 15th of August, 1855, to the late Sir WILLIAM MOLESWORTH, as Secretary of State for the Colonies; as also to the excellent letter addressed by the London Australian Postal Association, on the same subject, under date 4th December, 1855, to the present Secretary of State for the Colonies.

From these documents it appears, that although the Australian Postal Line was peremptorily suppressed, the China Line was maintained intact, the relative importance of the two lines being amply evidenced by the fact, that in 1853 the Australian Imports from England came to £14,506,532, while the China Imports amounted only to £1,787,675. Hence it may be said to be proved to demonstration, that whatever may have been the exigencies of the war, there was no necessity for the suppression of the Australian Postal Line; for had the comparatively-speaking unimportant China Mail Service been selected for discontinuance, it is clear that the due transit of the Australian Mails need never have been interrupted. This becomes even more apparent, when it is considered that the relative lengths of the two lines are about equal, and employ the same number of Steam Ships.

7. Brazil .....	2,768,125	15. Cape of Good Hope .....	744,638
8. France .....	2,115,296	16. Mexico .....	536,904

### No. IV.

*As to the Enforcement of the Performance of a Mail Service by a System of Pecuniary Penalties alone.*

In one of the strongest cases of neglect and default ever made out, against Mail Contractors, viz., the Royal Australian Mail Company (contractors for the Cape route), the heavy penalties incurred were never enforced. The General Screw Steam Company also, their successors in the same contract, although guilty of several defaults, never paid any penalties.

Penalties at the rate of £30 per diem, were indeed exacted from the owners of the sailing packets established *vid* the Cape in the year 1853, upon the plea that the Royal Australian Mail Company having failed, that route was not adapted for steam navigation.

These penalties, however, were all paid with alacrity; in fact, they constituted no penalty at all, but were merely deductions from the mail money agreed to be paid to each ship. In one case, a shipowner tendered a vessel to perform the passage in seventy-three days, as is believed without much, if any, hope of performing the voyage in that time. The tender was accepted by the Post Office, and the vessel, partly from dull sailing, and partly from overloading, was thirty-seven days over the period contracted for. In this case, the ship received £1,000 mail money, and paid £1,011 penalties, shewing a loss of £11 to the contractor. The sum, therefore, actually paid in this case was a penalty of six shillings and twopence for each day of default: by payment of which large sum the owner was enabled to style his ship "Her Majesty's Royal Contract Mail Packet," and, under cover of that epithet, to earn a large freight by filling her with a full cargo of merchandise and passengers.

With these facts before them, the Committee of the Australian General Association are anxious to impress on their Lordships, that pecuniary penalties in themselves are no guarantee to the public for the performance of a mail contract, while it is clear that the mulcting of a contractor in any sum, however large, is no compensation to the public for the irregular and uncertain transit of their letters.

## No. VI.

*Diego Garcia.*

The following particulars with regard to this island are extracted from *Horsburg*, by which it will be seen that no place can by nature be better adapted for a coaling station:—

“Diego Garcia, or Great Chagos Island, extends from lat. 7° 13' S. to 7° 26' S., its length from north to south being about fourteen or fifteen miles, and the general breadth from three to four miles, having the form of a crescent, with the convex side to the eastward. This remarkable island may be considered as a steep coral wall standing in the ocean, for the whole interior of the island is a lagoon or natural harbour, nearly of the same length and breadth as the island itself, as there is no part of the circumjacent wall above half a mile broad, and the greater part of the eastern side is only about one-tenth of a mile in breadth. This island, or, rather, contour of an island, is low, generally 8 or 10 feet above the sea at high tides, but inundations of the sea appear to have pervaded the wall in some places, and imparted their waters to those in the harbour. Although low, the island is covered with tall cocoa trees, which make it visible five or six leagues at sea.

“The only safe channel into the harbour is between West Island and the sand projecting from Middle Island, above half a mile to the S.W., leaving a channel near a mile wide between it and West Island, which is safe to approach on the N.W. and N.E. sides. There are no soundings until a ship is close to the entrance; the water then shoals suddenly, from 100 fathoms, no ground, to 20, 10, and 7 fathoms.

“A variety of fish abound in the harbour, and excellent green turtle visit the shores on the outside of the island; the land crabs, which feed on the cocoa nuts as they fall from the trees, are also wholesome food; and good fresh water may be had in almost every part of the island, by digging eight or ten feet deep.

“The S.E. winds prevail here from April to November, but are strongest in June, July, August, and part of September, during which time the current generally sets between W. and N.W. from twelve to twenty miles daily. In March and April, the winds are often very variable and light; October and November are also changeable months, but more unsettled and more squally than the former. In December and January the N.W. winds prevail almost constantly, producing a current to the south-eastward.”

Inquiries instituted by the Association enable them to state that the island is now occupied by some Mauritius houses, who have there establishments for the manufacture of oil from the cocoa nuts growing on the island. The harbour is described by a resident as well sheltered, and the island free from hurricanes. It is also stated that a wharf for the rapid coaling of steamers could be easily constructed. (See the Admiralty Chart of this island left herewith.)

## No. VII.

*Rate of Speed maintainable by Ocean Steamers.*

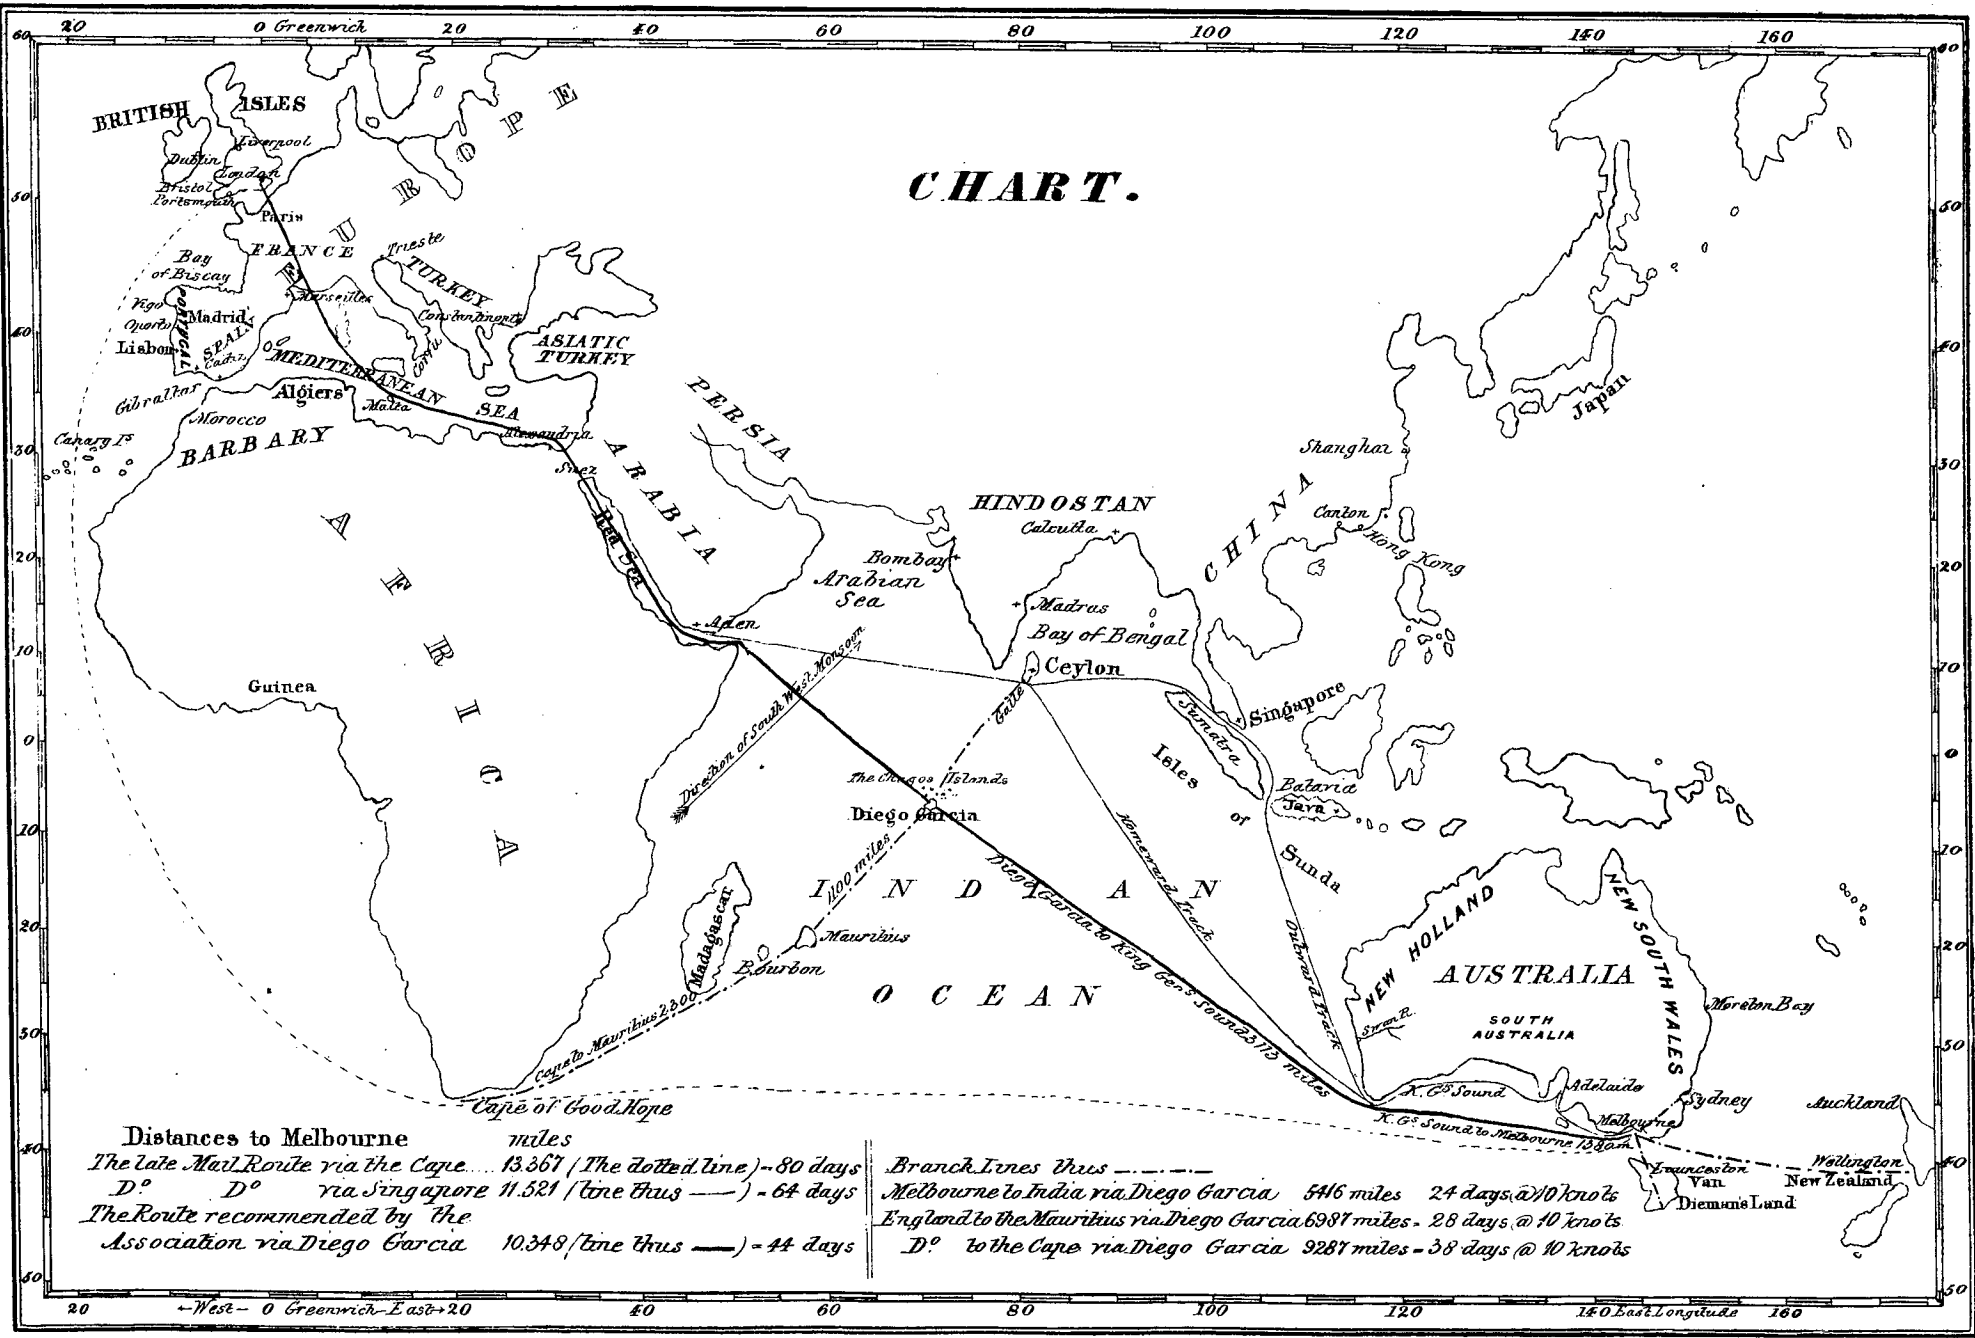

In their memorial, the Association have named 10 knots per hour as the usual Contract Postal Rate; they add, however, in that document, their belief that a much higher speed might with facility be maintained.

It is understood that the passages of the more recently constructed large steam-ships of the Contract Steam Companies would, if analysed and distinguished from the performances of the slower and smaller steamers of ancient construction, shew an average between 11 and 12 knots per hour. It has been stated to the Committee that the “Atrato,” on one voyage from Southampton to St. Thomas, averaged 14 knots, while the “Himalaya” is well known to be capable of equal speed. The “Persia,” also, a ship of 3,400 tons, constructed for Cunard’s Line, averaged also 14½ knots on her recent trial trip. In his evidence before a Parliamentary Committee (Holyhead and Kingstown, 1853, p. 103), Mr. Penn, the highest naval engineering authority in England, asserts the possibility of constructing a vessel to proceed at the rate of twenty-five miles per hour, while Mr. Lloyd, Head of the Steam Department of Her Majesty’s navy, corroborates his statement (p. 104).

Having these facts in view, the Memorialists trust that, in the future contract for the conveyance of the Australian Mails, a higher rate of speed than 10 knots may be stipulated for, in which case they look with confidence to the passage to Australia being brought considerably within 44 days.

## REMARKS.

The assertion that the passage between Melbourne and London might be effected in forty-three days, has taken many persons by surprise ; in fact, some individuals, accustomed to the present long duration of the voyage, have wholly refused to credit the possibility of such a performance. If, however, it be remembered that the distance in question is not much more than three times that between Liverpool and New York—a passage which has often been performed in ten days—it will be seen that at the same rate of going, the transit to Melbourne might be effected in about thirty-three days. Viewing, also, that one-tenth part of the direct route to Melbourne, that is, upwards of 1000 miles, passes over a line of rail in good working order, it would appear, on reflection, that in lieu of a forty-four days' passage being a wonderful performance, in reality it leaves neither the progress of science or the enterprise of the age much to boast of. At the rate of eleven knots the passage would be performed in thirty-nine days.

## STEAM POSTAL COMMUNICATION

---

No. 1.

THE COLONIAL SECRETARY, NEW SOUTH WALES, to THE CHIEF SECRETARY, VICTORIA.

*Colonial Secretary's Office,  
Sydney, New South Wales,  
4 March, 1856.*

SIR,

With reference to my letter of the 27th ultimo, in which, in compliance with the request preferred in your communication of the 22nd of last month, I forwarded a Return of Letters, and Newspapers, received by this Colony from, and despatched to, the United Kingdom and the Ports in the Indian Ocean, and China Seas, during the 12 months ended 31st December, 1855, I am now directed by His Excellency the Governor General, to transmit to you a copy of an Act of the Legislature of this Colony, 19 Victoria, No. 29, containing the appropriations made for the promotion of Steam Communication with England *vid* Singapore, in connection with the Steam Mail Packets from that port, and shewing the period for which they have been made, and the conditions which attach to them.

2. I am directed to add, that an offer was made and submitted to the Secretary of State in May last, from Mr. Beit, of Sydney, as Agent for an English Company (the Australian General Investment Association), to establish a Monthly Line of Packets between Sydney and Singapore, by way of Torres Straits, for the sum of £24,000 per annum, and the Postage on Letters. There is, however, reason to believe, from information since received through Mr. Beit, that this offer would not be entertained by the Home Government, but that a Contract for Postal Communication with the Australian Colonies generally would be submitted for public competition; and, until the receipt of some communication on the subject from the Secretary of State, this Government does not therefore propose to take any step for the re-establishment of the conveyance of Mails by Steam Packets.

I have, &c.,

(Signed) E. DEAS THOMSON.

THE HONORABLE  
THE CHIEF SECRETARY,  
&c., &c., &c.,  
VICTORIA.

---

No. 2.

THE CHIEF SECRETARY OF VICTORIA to THE COLONIAL SECRETARY OF NEW SOUTH WALES.

*Chief Secretary's Office,  
29 February, 1856.*

SIR,

I have the honor to transmit herewith a copy of the Report of a "Select Committee" of the Legislative Council of Victoria, on Steam Postal Communication, to the third and fourth paragraphs of which, I would invite special attention.

2. The arrangement therein proposed, I would beg of you to submit to His Excellency the Governor General at the earliest opportunity, and if it meets his sanction and approval, that you will lose no time in communicating the result to me.

3.

3. You will observe, that the interests of the other Colonies, as regards this important subject, are not lost sight of in the proposed arrangement, but as it is of extreme importance that an hour shall not be unnecessarily lost in giving it effect, it is considered inexpedient to incur the delay which would arise by waiting for the formal concurrence of their respective Legislatures.

I have, &c.,

THE HONORABLE  
THE COLONIAL SECRETARY,  
&c., &c., &c.,  
NEW SOUTH WALES.

WILLIAM C. HAINES.

[Enclosure 1 in No. 2.]

REPORT OF SELECT COMMITTEE ON STEAM POSTAL COMMUNICATION.

The Select Committee appointed to consider the propriety of immediately establishing a line of steamers between Melbourne and Point de Galle, or Singapore, have agreed to the following Report.

After having examined several witnesses, as to the suitability of Colonial steam vessels for the proposed service, and various other matters relating thereto, your Committee had the satisfaction of having before them the Despatch of the Right Honorable the Secretary of State, dated 4th December, 1855, which was laid on the Table of your Honorable House yesterday.

As this Report embodies a plan for the restoration of steam communication with England, which will secure all the essential requirements, as determined by the Government of Victoria, and your Honorable House, the Committee do not think it necessary to pursue their inquiries further; and your Committee recommend that the plan proposed by the Home Government be definitively approved and adopted.

Considering the large grant for the same object made by the Legislature of New South Wales (£25,000), your Committee recommend that an arrangement be immediately made with the Government of New South Wales, to undertake at once the responsibility of providing, in proportion to their respective appropriations, the Colonial moiety of the cost of establishing this service, without incurring the great delay that must ensue by waiting for the formal concurrence of the Legislatures of Tasmania, South Australia, Western Australia, and New Zealand.

The obvious advantage to those Colonies, as well as ourselves, of speedy action puts their ultimate concurrence beyond doubt. Besides which, it will be in our power to reimburse this Colony by an intercolonial postage until final arrangements are made.

Should, however, the Government of New South Wales not agree, your Committee recommend that it be arranged with the Home Government for Victoria to bear the entire Colonial moiety of the line from England to Melbourne, this Colony having the power to arrange with all the other Colonies for the charge of their mails.

Under any circumstances, your Committee are of opinion that the system of compulsory prepayment, must be made universal.

Although your Committee thus agree in the main points of the proposal of the Home Government, there are some minor subjects which it is desirable to press upon the attention of the Home Government—such as the mail vessels making a longer stay at Melbourne on the homeward route than twenty-four hours, and some arrangement for the conveyance of passengers from Australia without the risk of detention at Point de Galle, should that route be adopted.

And your Committee being aware that two members of your Honorable House (the Honorable the Treasurer and Mr. William Nicholson) are about to proceed to England, recommend that those gentlemen, in conjunction with Mr. W. Rutledge, recently a member of your Honorable House, and who has devoted much attention in England to this subject, be requested to act on behalf of this Colony in treating with the Home Government, and the contractors, in forwarding as much as possible the views expressed in this Report, and the re-establishment, with the least possible delay, of steam communication.

AUGUSTUS F. A. GREEVES,  
Chairman.

[Enclosure 2 in No. 2.]

*COPY DESPATCH with its Enclosures from the Right Honorable the Secretary of State for the Colonies, respecting Steam Postal Communication with the United Kingdom.*

*Laid upon the Council Table by the Treasurer, by command of His Excellency, the Officer Administering the Government, and ordered by the Council to be printed, 27th February, 1856.*

Downing-street,  
4th December, 1855.

SIR,

With reference to previous correspondence, I transmit to you herewith for your information and guidance the copy of a letter from the Secretary to the Board of Treasury, with a minute of their Lordships, dated 27th ultimo, detailing the plan which they propose to adopt for the establishment of Steam Postal Communication between this country

country and Australia, including New Zealand. You will perceive that it is proposed as part of the arrangement, that the entire cost of this service shall be divided equally between the Home Government, and those Colonies collectively; and that each of the Colonies shall contribute to the moiety to be paid by them collectively in proportion to the number of letters despatched by each, to be ascertained every two years. It will, of course, be necessary to obtain in the first place from each of the Colonies named some Act or Resolutions of the Legislature, indicating their readiness to abide by the proposed arrangement, and you will therefore lose no time in bringing the subject, with that view, under the consideration of the Legislature of Victoria, and in reporting the result for the information of Her Majesty's Government.

You will, however, perceive, that as some time must elapse before replies can be received from the different Colonies, and as Her Majesty's Government are anxious that no time should be lost in re-establishing a monthly mail by steam, the Lords Commissioners of the Treasury, relying on the reports which have been received from the Colonies of New South Wales, Victoria, and South Australia, have decided to take immediate steps in order to secure a recommencement of the same at the earliest possible period after the receipt of communications from the different Colonies, expressing their acceptance of these proposals.

I have, &c.

W. LABOUCHERE.

GOVERNOR SIR C. HOTHAM,  
&c., &c.,  
VICTORIA.

[Enclosure 3 in No. 2.]

Treasury Chambers,  
30th November, 1855.

SIR,

With reference to various communications from the Colonial Office, upon the subject of a postal communication by steam between this country and the Australian Colonies, I am commanded by the Lords Commissioners of Her Majesty's Treasury to acquaint you, for the information of Mr. Secretary Labouchere, that the plan which my Lords propose may be thus shortly summed up—

First.—That they shall instruct the Admiralty to obtain tenders, by open competition, for a monthly postal service between this country and Australia, the vessels, outward and homeward, touching at King George's Sound, Melbourne, and Sydney, carrying the mails for the six Colonies of, New South Wales, Victoria, South Australia, Western Australia, Van Diemen's Land, and New Zealand:

Second.—That branch services shall be established by open competition from Melbourne, as the central point, with Port Adelaide, Van Diemen's Land, and New Zealand:

Third.—That all letters and newspapers shall be prepaid, and that each post office shall retain its own receipts:

Fourth.—That the entire cost of the services described, shall be divided equally between the Home Government, and the Colonies collectively:

Fifth.—That each of the Colonies shall contribute to the moiety to be paid by them collectively in proportion to the number of letters despatched by each, to be ascertained every two years.

In the first place it will be necessary to obtain from each of the Colonies named, a duly authorized Legislative acquiescence in the arrangement proposed.

For this purpose I am directed to transmit to you a copy of their Lordships' minute of the 27th instant, and to request that you will move the Secretary of State to take the necessary steps with that view. But I am to state that as some time must elapse before replies can be received from the different Colonies, and as my Lords are anxious that no time should be lost in re-establishing a monthly mail by steam, my Lords, relying upon the correspondence now before them from the Governors of New South Wales, Victoria, and South Australia, have decided to take immediate steps in order to secure a commencement of the service at the earliest possible time after the receipt of communications from the different Colonies, acquiescing in the proposed arrangements.

I am, &c.,  
(Signed)

JAMES WILSON.

HERMAN MERIVALE, ESQUIRE,  
&c., &c., &c.

[Enclosure 4 in No. 2.]

Treasury Minute, dated November 27, 1855.

My Lords have under their consideration various communications from the Colonial Office, giving cover to Despatches from the Colonies of New South Wales, Victoria, and South Australia, and reports from the Postmaster General, upon the subject of a postal Communication between England and the Australian Colonies.

My Lords advert to the arrangement which they sanctioned some time ago for the purpose of securing a monthly postal communication with Australia by steam-boats. By that arrangement a mail was carried, *via* the Cape of Good Hope, by the General Screw Steam Navigation Company, and another by the Peninsular and Oriental Company, *via* Singapore, in every month alternately, so as to secure a monthly communication between the two. The former of these companies having found itself obliged to abandon the contract, and the latter, in consequence of the demand for their vessels for the purposes of the war, having been obliged to suspend the branch service from Singapore to Australia, my Lords deeply

deeply regret that for some months past, so far as steam-vessels are concerned, this important postal service has been interrupted.

As early as the month of February last, with a view of obviating this inconvenience, my Lords requested the Lords of the Admiralty to take steps to obtain a tender for a monthly conveyance of mails to Australia, but it is only within the last few weeks that that tender has been received by the Government; and it is one which, in its present shape, and in the position which the question has now assumed, my Lords are not prepared to accept. This tender, which has been received from the Peninsular and Oriental Company, is to convey a mail by steam, once in every month between Ceylon and the Australian Colonies, in connection with their India mail-boats, for the sum of £84,000 a year. But as the present estimate of the postal revenue with Australia, cannot be computed at more than £36,000, of which £24,000 can only be taken as the portion applicable to the sea service, my Lords would not feel justified in imposing upon the Home Exchequer exclusively, so large a loss (viz., £60,000 a-year,) as would attend the adoption of this tender.

It has been with great satisfaction that my Lords in the meantime have perused the Despatches received from Sir William Denison, Sir Charles Hotham, and Sir R. G. Macdonnell, as well as the proceedings of the respective public authorities of New South Wales, Victoria, and South Australia, upon the subject of postal communication. And my Lords have no doubt that when sufficient time shall have elapsed to enable the replies of the Governors of Van Diemen's Land, Western Australia, and New Zealand, to the Circular Despatch addressed to them by Sir William Denison of the 16th March, inviting their co-operation with the other Colonies, and the mother country, in order to place the postal communication upon a permanent and satisfactory basis, to reach this country, they will be found to coincide with the enlightened and public-spirited views expressed by those Colonies already referred to, in reference to the subject of that Despatch.

The general tendency of all the correspondence upon this subject which has reached this Board, shows that the different Colonies of Australia have become so impressed with the necessity of maintaining a permanent, certain, and rapid postal communication with England, that they are now prepared to share with this country any loss which it may be necessary to incur; but the offers of contribution, though made by those Colonies from which communications have been received in a spirit of earnestness upon which my Lords place the most implicit reliance, are yet either too vague or are accompanied by conditions too contradictory and inconsistent with each other to form at once the basis of an arrangement with regard to which, it is most desirable there should be no possible misunderstanding. It may therefore, be convenient that my Lords should here place on record the various proposals which have been made by the different Colonies, first and last, with respect to sharing in the expense of the postal service, and the conditions attached to those offers:

1. It appears that in 1846 the Legislative Council of New South Wales recommended, that £6,000 a-year for three years should be placed at the disposal of the Home Government, in aid of steam communication *vid* India. In 1852 this recommendation was confirmed, but on condition that the route should be by Torres Straits. In 1852 the Government offered a payment of £6,000 for three years to the first Steam Company which should establish a monthly line of steamers, performing the distance from Sydney to England and back in 120 days.

2. In 1849 the Governor of Van Diemen's Land reported that £2,000 a-year had been appropriated from the local revenue, towards a line from Singapore *vid* Sydney; that is, by the Eastern route through Torres Straits.

3. In 1847 the Legislative Council of South Australia reported in favour of a line by way of the Cape, and promised £3,000 a-year for three years if the passage were accomplished within seventy days.

4. In 1853 the Governor of Western Australia reported that the Council would be willing to pay £1,000 a-year towards the expense of the line from Singapore to Sydney, provided the ships should call at Fremantle.

5. In the same year the authorities of Victoria, in expressing an anxious desire for a cheap postal communication with England, offered to contribute, so far as their own Colony was concerned, for the necessary expenditure; but it afterwards appeared that a misconception had arisen as to the intention of the Colonial authorities in this declaration.

6. In the present year an Act was passed by the Legislature of South Australia, authorising a payment of £500 to each steam-vessel delivering direct mails, *vid* the Red Sea, within fifty-eight days, provided that such vessel had not touched at any port eastward of Adelaide, and that the mails were delivered direct from the same ship that brought them from the last point of land before reaching the Australian Colonies.

7. There remains to be stated the substance of the communications which have taken place between Sir William Denison and the other Governors in the present year. On the 16th of March Sir William Denison addressed the Circular Despatch already adverted to, to Sir Charles Hotham, the Governor of Victoria, and to the Governors of the other Australian Colonies, as well as to the Governor of New Zealand; in which, after dwelling in appropriate terms upon the necessity of restoring, as early as possible, a regular postal communication, he proposes that the whole of those Colonies should join in defraying a portion of the loss which, at least for some time to come, must attend the establishment of a monthly steam communication between them and England; in which circular Sir William Denison divides the subject into the following three points for consideration:—

1st. What should be the maximum sum to be paid for such service?

2nd. In what proportion this amount should be divided between the Colonies, and the mother country?

## STEAM POSTAL COMMUNICATION.

3rd. In what manner the contribution of the Colonies should be apportioned among them?

In discussing these points Sir William Denison assumes that the maximum cost of the service would be £100,000; and he expresses an opinion that of that sum £40,000, or two-fifths of the whole, should be contributed by the Colonies, and the remainder by the Home Government; and that so far as regards the distribution of the contribution among the different Colonies, that should be determined by the proportion of letters which each Colony transmits by the mail, and should be revised annually. The views entertained by Sir William Denison appear to have been entirely adopted by the Executive Council of New South Wales, who passed a resolution that the Legislative Council should be invited to place the sum of £15,000 annually at the disposal of the Government to carry out the arrangement; as yet, however, no information has been received that that has actually been done.

With regard to the Colony of Victoria, my Lords have before them several Despatches of Sir Charles Hotham, addressed to the Secretary of State and to Sir William Denison, by which it appears that the authorities entered warmly into the arrangement proposed; and it appears by Sir C. Hotham's Despatch to Sir William Denison of the fourth of May, that he had caused to be inserted in the "Post Office Act Amendment Bill," a clause pledging the Legislature to the expenditure of a sum not exceeding £50,000 per annum for the maintenance of steam communication between Victoria and Great Britain, not less than once a month, and that the Legislative Council had given its sanction to the Act. But Sir Charles Hotham states that any contribution on the part of Victoria must be subject to the following four conditions:

1st. That no contract should be made that does not provide for the delivery of the mail at Melbourne in a period not exceeding fifty-five days from the date of leaving London, the choice of route to rest with Her Majesty's Government.

2nd. That if the overland route is adopted, the packet must proceed from Point de Galle *via* Cape Lewin and King George's Sound to Melbourne; she must touch at Kangaroo Island, but, to avoid a loss of two or three days, she must not enter Port Adelaide, and that she shall proceed from Melbourne to Sydney.

3rd. That in case the overland route is adopted, the packet would proceed to Sydney immediately after the delivery of the Melbourne mails; but that on her homeward voyage she must remain at least forty-eight hours in the port of Melbourne, exclusive of Sundays.

4th. That preference must be given to the passengers from the Colonies on the homeward route, over any passengers for a shorter distance.

With regard to the Colony of South Australia, my Lords have before them a Despatch of the Governor, Sir R. G. Macdonnell, to the Secretary of State, giving cover to a copy of a Despatch addressed to Mr. Finnis, who administered the Government of the Colony prior to Sir R. G. Macdonnell's arrival, in reply to Sir William Denison's circular letter; the substance of which is, that he had sufficiently ascertained the state of public feeling in the Colony as to be able to say, with some degree of confidence, that the Legislature (which was not then in session) would give its support to any plan arranged by the Home Government, with any steam company, by which an ocean steamer shall monthly call off Port Adelaide, outward and homeward, delivering the mails within the same time as under the late contract with the Peninsular and Oriental Company; remaining in the port only a sufficient time to deliver the mails on the outward voyage, but remaining twenty-four hours on the homeward voyage; that, to secure this advantage the Government would propose to the Legislative Council a Bill, to pay on behalf of the Colony a contribution not exceeding £12,000 a year. In respect to the cost of the whole service, the Acting Governor of South Australia suggests that the Colonies should pay one-half, and the Imperial Government the other.

My Lords have also read with much satisfaction, the enlarged and liberal views taken of the proposal as a whole, in the Minutes of the Executive Council of the 17th of April, as well as in the reports of the Postmaster General of the Colony, of the acting Colonial Secretary, the Advocate General, and the Surveyor General.

Sir R. G. Macdonnell in his Despatch states that the letter of Mr. Finnis represents the views of members of the Legislature, and of the general community, being in favor of steamers from Point de Galle, calling off Port Adelaide.

From the remaining three Colonies, *viz.*, Van Diemen's Land, Western Australia, and New Zealand, as yet no intimation of any reply to Sir William Denison's Despatch has reached this Board.

From this summary of the existing state of these negotiations, it is apparent that they have not yet assumed that clear and tangible position, which would enable the Home Government to make them the basis of an actual arrangement. The Executive Council of New South Wales has passed a resolution to invite the Legislative Council to appropriate a sum of £15,000 towards the service, but no advice has yet been received that this has been adopted. Sir William Denison has stipulated for no conditions which could embarrass the arrangement; but looking to the great preference hitherto shewn and embodied in the Acts of the Legislature for the route by Torres Straits, by which the first arrival and the last departure would be from Sydney, it is possible the Legislature may attach such a condition to any grant it may make. In Victoria the Legislature has authorized a very liberal expenditure for the purpose, but Sir Charles Hotham has attached conditions which are inconsistent with the conditions contended for by South Australia, and, in part, such as it may be impossible to obtain. In South Australia the only Act that has really been passed offers a payment of £500 to every steamer which shall deliver a direct mail *via* Suez, and without first having called at any port eastward of Adelaide; that is, without having first touched at Melbourne. And the Governor now holds out hopes that the Legislative Council would vote £12,000 a-year in aid of a plan by which the mail packets on their outward, and homeward voyages shall call at Port Adelaide. The acquiescence therefore of the Colonies

of

of Victoria and South Australia in the proposal of Sir William Denison, is thus based upon contradictory conditions. With regard to the other three Colonies no engagement, as far as my Lords know, has yet been entered into of any kind.

However, notwithstanding all the difficulties and conflicting views, as exhibited in the various correspondence under consideration, my Lords are of opinion that the interests involved, both Imperial and Colonial, in a speedy restoration of a monthly postal communication between the United Kingdom and the Australian Colonies, are so great, that the time has now arrived when the Home Government should take the initiative, and propose for the adoption of the Colonies some great and comprehensive scheme, which shall upon mature consideration appear the best adapted for the interests of the whole, and pending a communication with the Colonies, in order to save time, to take such preliminary steps as shall secure its coming into operation as soon as possible. And my Lords are the more induced to arrive at this decision for the following reasons:—

1. My Lords cannot, after all the discussions which have taken place upon this subject, be surprised that the different Colonies should view with favour and even insist upon plans which, from the geographical position of the Colonies, promise to confer peculiar advantages upon them, and that in this respect the requirements of some may be at variance with the interests of others or of the whole. And my Lords fear that a great delay would take place, if they were to wait until these differences should be adjusted among the Colonies themselves.

2. My Lords are convinced, from the whole tenor of the correspondence now before them, that all the Colonies are now so much in earnest in their desire to see a permanent steam-postal communication established, that they will be ready to sink any minor differences of opinion, and to submit to slight disadvantages in order to secure the far greater benefits which will result from a well-considered general scheme.

3. My Lords are further induced confidently to believe that each Colony will accept a general plan, prepared by the Home Government after full consideration, in the full conviction that, as it is proposed without any bias or leaning in favor of any one Colony, it may be assumed as that which is the best calculated to meet the public wants.

The principle upon which the postal communication between England and the Australian Colonies has latterly been conducted, is, that a postage of 6d. for a single letter has been charged, of which 4d. was understood to represent the sea rate, 1d. for collecting or delivering a single letter in any part of the United Kingdom, and the same in any part of the Colonies; so that the whole cost of sending a letter from any part of the United Kingdom to any part of the Australian Colonies, or *vice versa*, should not exceed 6d.

As the whole cost of the packet service has hitherto been borne by the Imperial Government, the portion of the postage which represented the sea service has been accounted for to the Home Post Office, so that of the 6d. charged, 5d. has been appropriated to England and 1d. to the Colony receiving or despatching the letter, as the case may be.

My Lords have already adverted to the heavy charge which has hitherto been imposed upon the British Exchequer from the loss which has attended this arrangement, and to the circumstance that they would not feel justified in adopting the still heavier loss which would attend the improved service which the Colonial authorities think absolutely required for their present wants. But this difficulty is happily removed by the enlightened view taken by the Colonial authorities, and their willingness to defray a share of the loss which shall be incurred in securing a regular monthly steam communication. This loss, though it will be great at first, may fairly be expected rapidly to diminish by the increase of the postal revenue, consequent not alone upon an increasing population, but also upon the establishment of a more frequent and regular service. And it may also be hoped that, before many years shall pass, the increased communication may enable contracts for the conveyance of mails, to be made upon considerably more favourable terms.

With a view to effect such an arrangement, there are two modes which might be adopted:

1. The present plan might be continued by which the home authorities defray the whole cost of the sea service; receive the entire sea postage, and might then divide the net annual loss between the Home Government and the different Colonies in proportions to be fixed. Or,

2. It might be arranged, as has been suggested by Sir William Denison, that each Colony should receive the postage of all the letters forwarded by it to the United Kingdom or to either of the other Colonies, and that the Home Post Office should receive the postage upon all letters outward, in which case the entire cost of the sea service would be divided in the proportions determined upon, in place of the balance of loss; but in the adoption of this plan it would be necessary to introduce the system of compulsory prepayment.

It appears to my Lords that the latter plan presents in many respects very important advantages. In the first place, as it may be reckoned that upon an average of the whole year, about the same number of letters are sent to, and received from each Colony, the plan would practically amount to an equal division of the postage between the Colonies and the United Kingdom, while the inter-Colonial postage would go entirely to the Colonies. In the next place the system of intricate accounts, at present subsisting between the Home Post Office and each of the Colonial Offices, in order to show the amounts collected for and due to the former, might be entirely dispensed with. And in the last place, it would leave the Home Government and each Colonial Government free to regulate their rates of postage in any way they thought fit, within the terms of existing Treaties, so far as regards foreign States. It would of course be stipulated that a letter from England should be delivered in any part of each of the Colonies for the payment charged in England, and *vice versa*, that any letter posted in the Colonies should be delivered in any part of the United Kingdom without any additional charge to that made in the Colony. My Lords are therefore prepared to adopt the suggestion made by the Australian authorities on this point, to make prepayment

ment necessary, and that each post office should retain the postage collected by itself as its own proper share of the whole. It will, however, be necessary to make some provision in respect to letters which are posted in the Colonies for Continental, or other foreign countries, and which will pass through the English Post Office. By this arrangement the sum to be divided between the Home Government and the Colonies will be the entire cost of the service, and not the net loss.

My Lords now come to consider the three points raised by Sir William Denison, viz. :—1st. What amount should be expended for the entire service. 2nd. In what proportion that amount should be paid by the Home Government and the Colonies; and 3rd. In what proportion each Colony shall contribute to the share to be paid by the Colonies respectively.

1st. As to the cost of the service. As the only fair and satisfactory means of determining this point, my Lords propose to give instructions to the Admiralty immediately to ascertain by public competition the lowest rate at which it can be accomplished, on the conditions and plans hereinafter defined.

2nd. As to the proportion to be paid by the Home Government on the one hand, and by the Colonies collectively on the other, Sir William Denison suggests that three-fifths should be paid by the Home Government and two-fifths by the Colonies. The Executive Council of South Australia expresses an opinion that, on the arrangement ceasing by which the Home Government receives five-sixths of the postage, which is now proposed as part of the new plan, the cost of the service should be borne equally between the Mother Country and the Colonies collectively. My Lords are of opinion, that there are many sound reasons why this latter course should be adopted, namely, that one-half of the whole cost should be defrayed by the Home Government, and half by the Colonies collectively. In the first place, in making this arrangement, my Lords are desirous above all things that it should be based upon principles that will prove as permanent in their operation as possible, and that will be simple and self-adjusting in the natural changes which must in the course of time take place. It is to be expected that, as the Australian Colonies become more and more developed, the net loss arising from a postal service will become less; but it may be laid down as a principle, that the advantages derived from the conveyance of letters will always be equal to the people at home, and to those of the Colonies, as it is presumed that the same number of letters will be sent and received at each end. This equality of advantages would therefore point to an equal division of the cost. In the next place, as it is proposed that each post office shall retain the prepaid postage upon the whole of its own letters forwarded, and which will practically result in the Colonial Post Offices receiving half of the entire postal revenue attached to the service, it is obviously fair that they should also bear half the cost. And, lastly, it appears to my Lords, that in a mutual arrangement of this kind, which it is essential to place upon a permanent footing, it would not be desirable, even on the part of the Colonies, for the sake of the slight advantage it would confer upon them to adopt a plan which had the characteristic of being in any degree one-sided. On the contrary, it is better for all parties that it should be perfectly fair and just. My Lords therefore propose, that the Home Government shall in the first place defray the entire cost of the main service, and shall be reimbursed by the Colonies to the extent of one-half.

3rd. As to the proportion of the moiety of the cost which shall be contributed by each Colony. It appears to my Lords, that the plan proposed for this purpose by Sir William Denison, and acquiesced in by the authorities of the other Colonies—so far as their views have been expressed—is a perfectly fair and satisfactory one, viz. : that each Colony shall contribute in proportion to the number of letters despatched annually by the steamers. It is proposed that this proportion should be adjusted anew every year; but it appears to my Lords that this would lead to unnecessary trouble, and that if an adjustment took place every two years, it would be sufficiently accurate for all practical purposes.

With regard to the entire cost of the main service, it is necessary to observe, that if upon receiving the tenders which shall be made, it shall be decided to adopt the East Indian route, an addition will have to be made to the amount paid for the service from Point de Galle to the Australian Colonies, as between them, and the Home Government, for the portion of the cost of the existing overland service, which would fairly represent the Australian postage: inasmuch as in an arrangement made between Her Majesty's Government and the East India Company for that service, a portion of the entire cost was calculated to be borne by the former in respect of those Colonies.

My Lords now come to consider the important question of the manner in which the service is to be performed, and the steps to be taken with a view to that end. Great difference of opinion has prevailed as to Panama, or by the Indian overland route, although up to this time experience has shown that the latter is the preferable. My Lords are, however, desirous that a fair test should now be made of all these routes, and they are therefore of opinion that any tenders to be invited should be open to all alike, and that it will be for the Government to consider, and decide, which will be the most advantageous, taken as a whole. At present there is a contract existing with the Peninsular and Oriental Company, for the conveyance of a mail every two months, *via* Singapore, upon terms that may be considered favourable to the Government; that service has been suspended for some time past, in consequence of the vessels of the Company being required for the war, and my Lords have now to decide whether they will hold the Company to the contract, or release them from it. Looking to the circumstance that the new service to be provided for will be monthly, it appears to my Lords that any arrangement for that service which could be made, if it were to work in conjunction with this contract now existing for one-half of it, would be made under great disadvantage, and that the only way by which the best terms and arrangements could be secured, would be to throw the whole open to competition. My Lords are therefore of opinion that the best course will be to relieve the Peninsular and Oriental Company from their

their contract for that portion of the service, and to enter upon the new plan unembarrassed by an existing partial arrangement.

My Lords have already adverted to the conflicting and irreconcilable views taken by the different Colonies as to the mode in which the service should be performed, and as to the route to be taken by the steamers employed; but there are two principles which are so obviously desirable to be observed, that my Lords cannot hesitate to lay them down as a rule which must be for the benefit of the whole: first, that each Colony shall have the benefit of an arrival and departure by each steamer monthly, and that the passage out and home, together, shall be made in the shortest possible time. Upon a very careful examination of the whole subject, and consideration of the correspondence which has taken place, my Lords are of opinion that these objects can be best attained by restricting the points at which the steamers of the main line should call to three, viz., King George's Sound, Melbourne, and Sydney, and that all the other Colonies should be provided with branch services fitting into the arrangements of the main service. My Lords have carefully and especially considered the difference of views upon this subject entertained by the Colonies of Victoria and South Australia. The authorities of the latter Colony very naturally desire that the steamer shall call at Port Adelaide, but when it is considered that vessels of the size which must be employed in this service are unable to cross the bar of the port, and are obliged to bring up at a distance from the port of fifteen miles, and from the land of five miles, and often in very bad weather, and that under any circumstances a small branch steamer must be employed; and when it is further considered that calling at Port Adelaide would cause considerable detention to the more important mails of Melbourne, and Sydney, if the eastern route shall be adopted, as well as a loss of time also on the return voyage, and that therefore the entire voyage out and home would be lengthened, a disadvantage which would affect South Australia as well as the other Colonies, my Lords feel convinced that the inhabitants of that Colony will be satisfied, upon due consideration, that so far as the arrangement above proposed may be a concession on their part, it is one which the general interests of all concerned calls upon them to make, and that they will see that the saving of time in the outward and homeward services together so obtained, will be an advantage to them as well as to others.

My Lords are, however, of opinion that, in the comprehensive scheme which they are now proposing, arrangements should be made at the common cost for the branch services required to convey the mails to and from Port Adelaide, Van Diemen's Land, and New Zealand, making Melbourne the common point of arrival and departure of those branch services. They, therefore, propose that arrangements shall be made on the spot for those services, and that the cost of the same shall be added to the cost of the main services, and divided in the same proportions as already indicated.

My Lords advert to a condition which Sir Charles Hotham attaches to his acquiescence in the proposals of Sir William Denison, namely, that in the event of the overland route being adopted, preference should be given to passengers from the Australian Colonies on the homeward route, over any passengers for a shorter distance. With regard to this condition, my Lords entirely agree with the objection made by Sir William Denison in his Despatch to Sir Charles Hotham of the 18th of April, in which he urges that such a condition might be inconsistent with any arrangements which the Peninsular and Oriental Company could positively make, and that the effect of insisting upon it would be to exclude from the arrangement the advantage of the competition of that Company. Sir Charles Hotham states, as a reason for insisting upon it, the fact that, in the return voyages of the South American steamers, the passengers from the furthest point in the River Plate have the preference over those from Rio de Janeiro; but the circumstances are not the same. The Australian steamers, if that route were adopted, would join the Indian line at Point de Galle, and if that were the extreme point of the Indian service the case would be parallel and the plan possible; but in place of this being so, Point de Galle is a station on the homeward route from Hong Kong, Singapore, and Calcutta, and it would obviously be impracticable to insist upon such a provision in favor of Australian passengers, over those who may have come from those various points.

My Lords are of opinion that, in a purely postal arrangement, conditions in relation to passengers, however important the subject is in itself, should not be permitted to embarrass the more immediate question, and that all parties may rest satisfied that, in this respect, any Company undertaking the service will, for its own interests and profit, make such arrangements as shall be most convenient to all parties.

The plan, therefore, which my Lords propose, may be thus shortly summed up:

1. That they shall instruct the Admiralty to obtain tenders, by open competition, for a monthly postal service between this country and Australia, the vessels, outward and homeward, touching at King George's Sound, Melbourne, and Sydney, carrying the mails for the six Colonies of New South Wales, Victoria, South Australia, Western Australia, Van Diemen's Land, and New Zealand.
2. That branch services shall be established by open competition from Melbourne, as the central point, with Port Adelaide, Van Diemen's Land, and New Zealand.
3. That all letters and newspapers shall be pre-paid, and that each post office shall retain its own receipts.
4. That the entire cost of the service described shall be divided equally between the Home Government and the Colonies collectively.
5. That each of the Colonies shall contribute to the moiety to be paid by them collectively, in proportion to the number of letters despatched by each, to be ascertained every two years.

In the first place, it will be necessary to obtain from each of the Colonies named a duly authorized legislative acquiescence in the arrangement proposed. For this purpose, let a copy of this Minute be transmitted to the Colonial Office, and request that the Secretary

of State will take the necessary steps with that view. But state, that as some time must elapse before replies can be received from the different Colonies, and as my Lords are anxious that no time should be lost in re-establishing a monthly mail by steam, my Lords, relying upon the correspondence now before them from the Governors of New South Wales, Victoria, and South Australia, have decided to take immediate steps in order to secure a commencement of the service at the earliest possible time after receipt of communications, from the different Colonies, acquiescing in the proposed arrangements.

Write to the Secretary of the Admiralty, and request that the Lords Commissioners of the Admiralty will take immediate steps to procure tenders for a monthly postal communication by steam with Australia, on the following conditions, and report to this Board before any contract is actually made :

1. The tenders to be delivered within two months of the date of the advertisement.
2. The tenders to specify the route, and the maximum number of days, between the departure of the mail from Southampton, and its arrival at Melbourne, and Sydney, and King George's Sound, respectively ; and also the number of days on the homeward route.
3. That the service shall be performed under a penalty of £100 a-day for delay in starting, and £30 a-day for any time consumed in the voyage beyond the allowed maximum.
4. The contractors to state in what time from the acceptance of their tender they will be prepared (under a penalty to be agreed upon) to commence the service.
5. The contractors to give such adequate security, as to the Lords of the Admiralty may appear necessary, for the payment of any penalties which may become due, and generally for the performance of the contract ; which penalties in no case whatever shall be relinquished.
6. The contract to be for five years.

Transmit copy of this Minute to the Colonial Office, Admiralty, and Post Office, for their information and guidance.

(Signed)

JAMES WILSON.

No. 3.

THE SECRETARY OF STATE *to* GOVERNOR SIR WILLIAM DENISON.

*Downing-street*

4 December, 1855.

SIR,

With reference to previous correspondence, I transmit to you herewith, for your information and guidance, a copy of a letter from the Secretary to the Board of Treasury, with a Minute of their Lordships, dated the 27th ultimo, detailing the plan which they propose to adopt, for the establishment of a Steam Postal Communication between this country and Australia, including New Zealand.

You will perceive that it is proposed, as part of the arrangement, that the entire cost of this Service shall be divided equally between the Home Government and those Colonies collectively ; and that each of the Colonies shall contribute to the moiety to be paid by them collectively in proportion to the number of letters despatched by each, to be ascertained every two years. It will, of course, be necessary to obtain in the first place, from each of the Colonies named, some Act or Resolutions of the Legislature, indicating their readiness to abide by the proposed arrangement ; and you will, therefore, lose no time in bringing the subject with that view under the consideration of the Legislature of New South Wales, and in reporting the result for the information of Her Majesty's Government.

You will, however, perceive that, as some time must elapse before replies can be received from the different Colonies, and as Her Majesty's Government are anxious that no time should be lost in re-establishing a Monthly Mail by Steam, the Lords Commissioners of the Treasury, relying on the reports which have been received from the Colonies of New South Wales, Victoria, and South Australia, have decided to take immediate steps in order to secure a recommencement of the Service at the earliest possible period after the receipt of communications from the different Colonies, expressing their acceptance of these proposals.

I have, &c.,

(Signed)

H. LABOUCHERE.

GOVERNOR SIR W. DENISON,  
&c., &c., &c.

[Enclosure

[Enclosure in No. 3.]

Treasury Chambers,  
30 November, 1855.

SIR,

With reference to various communications from the Colonial Office, upon the subject of a Postal Communication by Steam between this Country and the Australian Colonies; I am commanded by the Lords Commissioners of Her Majesty's Treasury, to acquaint you, for the information of Mr. Secretary Labouchere, that the plan which my Lords propose may be thus shortly summed up.

First.—That they shall instruct the Admiralty to obtain tenders, by open competition, for a Monthly Postal Service between this Country and Australia, the vessels, outward and homeward, touching at King George's Sound, Melbourne, and Sydney, carrying the Mails for the six Colonies of New South Wales, Victoria, South Australia, Western Australia, Van Diemen's Land, and New Zealand.

Second.—That branch services shall be established, by open competition, from Melbourne, as the central point with Port Adelaide, Van Diemen's Land, and New Zealand.

Third.—That all letters and newspapers shall be prepaid, and that each Post Office shall retain its own receipts.

Fourth.—That the entire cost of the Services described, shall be divided equally between the Home Government and the Colonies collectively.

Fifth.—That each of the Colonies shall contribute to the moiety to be paid by them collectively, in proportion to the number of letters despatched by each, to be ascertained every two years.

In the first place, it will be necessary to obtain from each of the Colonies named a duly authorized Legislative acquiescence in the arrangement proposed.

For this purpose I am directed to transmit to you a copy of their Lordships' Minute of the 27th instant, and to request that you will move the Secretary of State to take the necessary steps with that view. But I am to state, that as some time must elapse before replies can be received from the different Colonies, and as my Lords are anxious that no time should be lost in re-establishing a Monthly Mail by Steam, my Lords, relying upon the correspondence now before them from the Governors of New South Wales, Victoria, and South Australia, have decided to take immediate steps in order to secure a commencement of the service, at the earliest possible time after the receipt of communications from the different Colonies acquiescing in the proposed arrangements.

I am, &c.,  
(Signed) JAMES WILSON.

HERMAN MERIVALE, ESQ.  
&c., &c., &c.

## No. 4.

THE COLONIAL SECRETARY OF NEW SOUTH WALES to THE CHIEF SECRETARY OF VICTORIA.

Colonial Secretary's Office,  
Sydney, 8 March, 1856.

SIR,

I avail myself of the opportunity of the departure of the steamer "Telegraph" for Melbourne this day, to inform you of the anxious desire of this Government to co-operate with that of Victoria, in giving effect to the proposal of the Secretary of State, for the re-establishment of Steam Postal Communication with England, upon the terms set forth in the Treasury Minute of the 27th November, 1855, a Copy of which accompanied the Report of the "Select Committee" of the Legislative Council of Victoria, on the subject enclosed in your letter of the 29th ultimo, and of which a Copy has also been transmitted to the Governor General by the last mail.

2. You will observe by the Act of the Legislature of this Colony of the 19th Victoria, No. 29, a copy of which was enclosed in my letter of the 4th instant, that this Government is empowered to make arrangements for the re-establishment of Steam Communication, with the Governments of the other Australian Colonies, provided the proportion of expense to be borne by New South Wales does not exceed £20,000 per annum, and that the contract does not extend over a longer period than five years. Subject to this limitation, this Government will be quite prepared to join in sharing with the Government of Victoria the responsibility of anticipating the concurrence of the Legislatures of the other Australian Colonies in the general plan determined upon by Her Majesty's Government, so as to prevent, as far as possible, any delay in bringing this most desirable measure into operation at the earliest date practicable.

3. I beg to add that this subject has been brought by the Governor General, under the consideration of His Executive Council, and that a further communication will be made

to

Minute  
printed at  
Page 4.Minute  
printed at  
Page 4.

to you, as soon as they have terminated their deliberations; but, in the mean time, I am anxious to assure you of the cordial concurrence of this Government, in the recommendation of the "Select Committee" of the Council of Victoria, referred to in your communication above-mentioned.

I have, &c.,  
(Signed) E. DEAS THOMSON.

THE HONORABLE  
THE CHIEF SECRETARY  
OF VICTORIA, MELBOURNE.

---

No. 5.

THE GOVERNOR GENERAL to THE SECRETARY OF STATE.

No. 48.

*Government House,  
Sydney, 17 March, 1856.*

SIR,

I have the honor to acknowledge the receipt of your Circular Despatch, dated 10 December, 1855, containing a copy of a letter from the Secretary of the Board of Treasury, embodying the substance of a Minute of the Lords Commissioners upon the subject of Steam Communication with the Australian Colonies, a copy of which Minute was also enclosed.

2. It would appear from these papers that tenders for the conveyance of a Monthly Mail, in accordance with the conditions laid down by the Lords Commissioners of the Treasury, have been already called for, and that the service will be commenced so soon as Her Majesty's Government has obtained from the different Colonies, in the shape of Legislative enactments, their assent to the scheme as proposed.

3. Having laid your Despatch, and its enclosures, before the Executive Council, I have the honor to inform you, that an unanimous opinion was expressed, in favor of the scheme as proposed by the Lords Commissioners of the Treasury, and as by the Act of Council 19 Vict., No. 29, forwarded with my Despatch, No. 192, dated 10 December last, the Governor, with the advice of the Executive Council, has full power to make arrangements with Her Majesty's Imperial Government for the conveyance of Mails by steam from England, to Australia, for a term not exceeding five years, provided that the expense to the Colony shall not exceed £20,000, it is evident that, so far as New South Wales is concerned, the necessary Legislative enactment has already been obtained.

The enclosed correspondence between this Government, and that of Victoria, upon the subject of the proposed arrangements, will show the importance which is attached to the speedy resumption of Steam Communication; and as it is evident that there are ample means at the disposal of the Governments of these two Colonies, to defray the proportion of the cost of the scheme which would be payable by the whole of the Colonies combined, I trust that Her Majesty's Government will accept the guarantee of the Governments of New South Wales and Victoria, for the payment of the Colonial contribution towards the cost of the undertaking, and will *at once* proceed to take the necessary steps to give full effect to the plan detailed in the Minute of the Lords of the Treasury.

I have, &c.,  
(Signed) W. DENISON.

THE RIGHT HONORABLE  
HENRY LABOUCHERE,  
&c., &c., &c.

---

No. 6.

COLONIAL SECRETARY OF NEW SOUTH WALES to CHIEF SECRETARY OF VICTORIA.

56-21.

*Colonial Secretary's Office,  
Sydney, 26 March, 1856.*

SIR,

In my letter of the 8th instant I expressed to you the anxious desire of this Government to co-operate with that of Victoria, in giving effect to the proposal of the Secretary of State, for the re-establishment of Steam Postal communication between England  
and

and the Australian Colonies; and intimated my intention of addressing you again on the subject, as soon as the Executive Council of this Colony had terminated their deliberations.

2. The Governor General accordingly directs me now to inform you, that it has been decided by this Government to adopt, in its integrity, the plan proposed in the Treasury Minute of the 27th of November last, alluded to in my former letter, which differs but little from that recommended by the Executive Council of this Colony in 1855; and that with a view to obviate the delay which will ensue before each of the other Colonies, including New Zealand, can give their legislative sanction to the scheme, this Government readily accedes, with one exception, to the proposal contained in your communication of the 29th February, that the Colonies of Victoria and New South Wales, in both of which large appropriations have been voted by anticipation, should become responsible for the payment of one moiety of the entire cost of this service, leaving it, of course, optional with the other Colonies, to give in their adhesion to the arrangement hereafter. The exception alluded to is, that, whereas the Government of Victoria propose, that that Colony and New South Wales, should contribute towards the moiety of the cost, in proportion to the appropriations made by their respective Legislatures, this Government deems it preferable, to adhere in its entirety to the arrangement of the Home Government; that is to say, that each Colony shall contribute in proportion to the number of letters despatched, with the further understanding, that the proportion to be paid by New South Wales shall not exceed the amount actually voted by the Legislative Council, which is £20,000 a year, for the next five years; and not £25,000, as appears to have been supposed at Melbourne.

3. As it is part of the arrangement proposed by the Home Government that Branch services shall be established by open competition, from Melbourne, as the central point with Adelaide, Tasmania, and New Zealand, I am further directed by Sir William Denison, to invite the Government of Victoria to cause Tenders to be called for immediately, by open competition, for the performance of these Branch services, and to apprise me of the result, for His Excellency's information.

4. I beg to add, that the Governor General has reported to the Secretary of State, by the last Mail, the adoption by this Colony of the plan proposed in the Treasury Minute already referred to for the early re-establishment of Steam Postal Communication; and also the arrangement made between the Government of Victoria and New South Wales, for the purpose of giving effect to it without the delay which would be the result of waiting for the concurrence of the adjoining Colonies.

I have, &c.,  
(Signed) W. ELYARD.

THE HONORABLE  
THE CHIEF SECRETARY OF  
VICTORIA.

No. 7.

COLONIAL SECRETARY OF NEW SOUTH WALES to COLONIAL SECRETARY OF TASMANIA.

*Colonial Secretary's Office,  
Sydney, 16 April, 1856.*

SIR,  
I have the honor, by the direction of the Governor General, to transmit for your information the accompanying copies of a correspondence which has taken place with the Melbourne Government, respecting the re-establishment of Steam Communication between England and the Australian Colonies; and to express to you His Excellency's hope, that the Legislature of Tasmania may see fit to concur in the general plans for this purpose, proposed by Her Majesty's Government.

I have, &c.,  
(Signed) E. DEAS THOMSON.

THE HONORABLE  
THE COLONIAL SECRETARY,  
TASMANIA.

A similar communication was addressed to the Governments of South Australia, Western Australia, and New Zealand, respectively.

No. 8.

COLONIAL SECRETARY OF TASMANIA to COLONIAL SECRETARY OF NEW SOUTH WALES.

*Tasmania,*  
*Colonial Secretary's Office,*  
*30 April, 1856.*

SIR,

I do myself the honor to acknowledge the receipt of your letter of the 16th instant, in which, at the instance of the Governor General, you enclose copy of a correspondence that has taken place between the Governments of New South Wales, and Victoria, relative to the re-establishment of Steam Communication, between the Mother Country and these Colonies.

Having laid your communication before Sir Henry Edward Fox Young, I am directed to inform you, that this Government concurs in the propriety of acceding to the proposals of the Lords of the Treasury, in their entirety; and that a recommendation to that effect will be submitted to the Legislature, at its next meeting, when His Excellency has no doubt but that its approval will be obtained.

I have, &c.,  
W. CHAMP.

THE HONORABLE  
THE COLONIAL SECRETARY,  
SYDNEY, NEW SOUTH WALES.

## NEW SOUTH WALES.

## CONVEYANCE OF MAILS FROM THE UNITED KINGDOM.

(LETTER FROM SECRETARY TO GENERAL POST OFFICE, LONDON.)

*Ordered by the Legislative Assembly to be Printed, 18 December, 1856.*

THE POSTMASTER GENERAL to THE COLONIAL SECRETARY.

*General Post Office,  
Sydney, 16 December, 1856.*

SIR,

I have the honor to transmit for your information a copy of a letter I have received from the Secretary to the General Post Office, London, relative to the mode by which the Mails from the United Kingdom are to be conveyed after the departure of the Packet conveying the Mails of the 5th October last.

I have, &amp;c.,

THE HONORABLE  
THE COLONIAL SECRETARY.  
&c.,            &c.,            &c.

W. H. CHRISTIE,  
Postmaster General.

THE SECRETARY TO THE GENERAL POST OFFICE, LONDON, to THE POSTMASTER GENERAL,  
SYDNEY, NEW SOUTH WALES.

*General Post Office,  
4 September, 1856.*

SIR,

The European and Australian Royal Mail Company being about to dispatch four of their steam vessels from this country to Australia, to take up the regular Service of the Australian Mails under their Contract with Her Majesty's Government, the Postmaster General intends to avail himself of the departure of these steam vessels for the transmission of the Mails to Australia, instead of sending the Mails by sailing packets, as provisionally arranged; and His Grace has concluded a special contract for this Service with the European and Australian Royal Mail Company.

Notice has accordingly been given to Messrs. James Baines and Co., and to Messrs. Pilkington and Wilson, to terminate their present contracts, and the Service of the Australian Mails by sailing packets from England will cease after the departure of the packet appointed to leave Liverpool on the 5th October next. Thenceforward, and up to the month of January, the Mails for Australia will be despatched from London on the following dates, for conveyance by the European and Australian Company's Packets, from Southampton *via* the Cape of Good Hope, viz. :—

The 18th October,  
12th November,  
12th December, and  
12th January.

## CONVEYANCE OF MAILS FROM UNITED KINGDOM.

The Packets are to proceed direct to Melbourne, and the Contractors are bound to convey, or cause to be conveyed, at their own cost, the Mails for New South Wales from Melbourne to Sydney; and if by other means than the main packet, they are to obtain the written consent of the Postmaster of Melbourne.

The time allowed for the Service, including the delivery of the Mails at Melbourne and Sydney, is 75 days from the date of departure from Southampton.

A Premium of £20 a day will be paid to the Contractors for delivering the Mails within the stipulated time; and, on the other hand, a Penalty of £20 per day will be deducted from their earnings, if the voyage exceed that time.

No fixed subsidy will be paid to the Contractors for this Service, but they will be allowed one-half of the Postage on Letters and Books, and one halfpenny on each Newspaper conveyed, according to the arrangement made in the existing contracts.

I am, &c.,

R. HILL.

THE POSTMASTER GENERAL,

&c., &c., &c.,

Sydney, New South Wales.

---

1857.

## NEW SOUTH WALES.

## STEAM POSTAL COMMUNICATION.

(COPY OF CONTRACT WITH EUROPEAN AND AUSTRALIAN R. M. COMPANY.)

*Ordered by the Legislative Assembly to be Printed 17 February, 1857.*

## AUSTRALIAN MAILS.

ARTICLES OF AGREEMENT made the fourteenth day of October, in the year of Our Lord one thousand eight hundred and fifty-six, between John Orr Ewing, of Ratho, Mid Lothian, gentleman; Walter Buchanan, of Shandon, merchant; Allan Gilmour, of Eaglesham, Renfrewshire, gentleman; John Stirling, of Kippendarie, gentleman; John Dunbar, of Holme, merchant; James Galbraith, of Glasgow, merchant; Niel Black, of Dunoon, merchant; John Houldsworth, of Glasgow, merchant; William Connal, of Glasgow, merchant; all in that part of the United Kingdom of Great Britain and Ireland called Scotland: and Thomas Augustus Gibb, of London, merchant; and Robert Smith and John Pender, both of Manchester, in the County Palatine of Lancaster, merchants, Directors of the European and Australian Royal Mail Company (limited), of the one part, and the Commissioners for executing the office of Lord High Admiral of the United Kingdom of Great Britain and Ireland (for and on behalf of Her Majesty) of the other part.

Witness, That the said John Orr Ewing, Walter Buchanan, Allan Gilmour, John Stirling, John Dunbar, James Galbraith, Niel Black, John Houldsworth, William Connal, Thomas Augustus Gibb, Robert Smith, and John Pender, (hereinafter designated as the said Company), in consideration of the payments hereinafter stipulated to be made, do, for and on behalf of the said Company, and separately for themselves, their heirs, executors, and administrators, and each and every of them, doth for himself, his heirs, executors, and administrators, hereby covenant, promise, and agree to and with the said Commissioners, that they, the said Company, shall and will, at their own cost and charge, at all times during the continuance of this Contract, diligently, faithfully, and to the satisfaction of the said Commissioners for the time being, convey Her Majesty's Mails, which shall at any time or times, and from time to time, by the said Commissioners, or Her Majesty's Postmaster General, or any of the officers or agents of the said Commissioners or Her Majesty's Postmaster General, be required to be conveyed monthly each way between Southampton, in England, and Alexandria, in Egypt; and between Suez, in Egypt, and Sydney, in Australia, by means of full power steam vessels (not less than six), supplied with first-rate appropriate steam engines.

That the vessels to be employed in conveying the said Mails between Southampton and Alexandria, shall be of not less than one thousand six hundred tons register, N. M., each, and each be furnished with engines of not less than four hundred horse power, Admiralty measurement, and that the vessels to be employed in conveying the said Mails between Suez and Sydney shall be of not less than two thousand two hundred tons register, N. M., each, and shall each be furnished with engines of not less than five hundred and thirty horse power, Admiralty measurement.

That the said Company shall also provide during the continuance of this Contract, a substantial and efficient steam vessel, or vessels, on board of which the said Company shall and will convey Her Majesty's Mails between Marseilles, in France, and the Island of Malta, in the Mediterranean; and that the said vessel or vessels to be so employed shall be of not less than five hundred tons burthen register, N.M., and to be supplied with first-rate appropriate steam engines, of not less than two hundred horse power, Admiralty measurement.

That all the vessels employed under this Contract shall be always supplied and furnished with all necessary and proper machinery, engines, apparel, furniture, stores, tackle, boats, fuel, oil, tallow, provisions, anchors, cables, fire pumps, and other proper means for extinguishing fire, lightning conductors on Sir Snow Harris's or other approved principle, charts, chronometers, proper nautical instruments, medicines, medicaments, and whatsoever else may be requisite and necessary for equipping the said vessels and rendering them constantly efficient for the service hereby contracted to be performed, and also manned and provided with competent officers, with appropriate certificates granted pursuant to the Act 17 and 18 Victoria, cap. 104, or to the Act or Acts in force for the time being relative to the granting certificates to officers in the merchant service; and also a medical officer to be

Company to convey Mails monthly each way between Southampton and Alexandria, and between Suez and Sydney by full power steam vessels (not less than 6), fitted with first-rate engines.

Vessels employed between Southampton and Alexandria to be of not less than 1,600 tons N.M., each, with engines of not less than 400 horse power; and vessels employed between Suez and Sydney of not less than 2,200 tons N. M., each, with engines of 530 horse power.

Company to provide efficient steam vessels for the Mails between Marseilles and Malta of not less than 500 tons, N.M. with first-rate engine, not less than 200 horse power.

All vessels to be furnished with necessary and proper machinery, &c., with pumps for extinguishing fire, lightning conductors, &c., &c., manned with competent officers, with appropriate certificates granted pursuant to Act 17 and 18 Vict., c. 104, and a medical officer to be approved by said Commissioners, and with a sufficient number of efficient engineers and a

sufficient crew of able seamen, &c., to be approved by said Commissioners.

Company, if required, to submit designs, plans, and sections of vessels to said Commissioners.

Vessels from and to Southampton shall touch at Malta, and vessels from and to Suez shall touch at Point de Galle and Melbourne on outward voyages, and at Melbourne, King George's Sound, and Point de Galle, on homeward voyages, and at Aden on outward and homeward voyages, and at King George's Sound on outward voyage, to coal if necessary, when Mails are to be delivered and received.

One vessel shall, on 18th January, 1857, or such other day of that month as said Commissioners may determine, and once in every succeeding calendar month, on such day and hour as shall be appointed, and immediately after Mails are embarked put to sea from Sydney and proceed to Suez, touching at intermediate ports before referred to, at which Mails are to be delivered and received.

Another of such vessels shall, on the 1st March, 1857, or on such other day as aforesaid, put to sea from Suez and proceed to Sydney, touching at intermediate ports.

On the arrival of Mail at Alexandria from Sydney, Company shall cause same to be embarked on board one of said vessels for Southampton, touching only at Malta.

One vessel shall, on the 14th February, 1857, or other day, and once in every succeeding calendar month after Mails embarked, put to sea from Southampton, and proceed to Alexandria, touching only at Malta.

On arrival of Mail at Suez from United Kingdom, Company shall cause same to be embarked on board one of said vessels, which shall proceed forthwith to Sydney, calling at Point de Galle and Melbourne.

Within what time homeward Mails are to be delivered.

Within what time outward Mails are to be delivered.

approved of by the said Commissioners, and who shall give medical attendance, medicines, and medicaments gratis to all persons, conveyed under or by virtue of this agreement, or whose passage money may be paid for in whole or in part by the public, and with a sufficient number of efficient engineers, and a sufficient crew of able seamen and other men to be in all respects as to vessels, engines, equipments, officers, engineers, and crew, subject in the first instance and from time to time, and at all times afterwards to the approval of the said Commissioners, and of such other persons as shall at any time or times, or from time to time have authority under the said Commissioners to inspect and examine the same, and the said Company shall, if required by the said Commissioners, submit the designs, plans, and sections, of all and every vessel building or to be built, and intended to be employed in the performance of this Contract to the said Commissioners, and be bound to adopt such fittings, scantling, and such dispositions of hatchways as the said Commissioners shall declare in writing to be necessary for carrying such armament as the said Commissioners shall consider suitable and requisite.

That the vessels proceeding from and to Southampton in the performance of this Contract shall touch at Malta, and the vessels from and to Suez shall touch at Point de Galle, in Ceylon, and Melbourne, in Australia, on their outward voyages, and at Melbourne, King George's Sound, and Point de Galle on their homeward voyages, and the vessels may touch at Aden on the outward and homeward voyages, and at King George's Sound on the outward voyage to coal if necessary, and the said Company shall convey in the said vessels to and from, and cause to be delivered and received at each of the ports or places to or at which the said vessels are to, or may proceed or touch, in performance of this Contract, all such of Her Majesty's Mails as shall or are to be delivered or received thereat.

That one of such vessels of not less than two thousand two hundred tons register, N.M., so approved of, and equipped and manned as aforesaid, shall, on the eighteenth day of the month of January, on thousand eight hundred and fifty-seven, or on such other day of that month as the said Commissioners may determine for the first time, and once in every succeeding calendar month, on such day of each month, and at such hour as shall at any time or times, or from time to time, be appointed by the said Commissioners, and immediately after Her Majesty's Mails are embarked, put to sea from Sydney aforesaid, and proceed without loss of time to Suez, touching at, but only at the intermediate ports or places hereinbefore mentioned or referred to, at which Her Majesty's Mails are to be delivered and received, and that one other of such vessels of not less than two thousand two hundred tons register, N.M., so approved of, and equipped and manned as aforesaid, shall, on the first day of the month of March, one thousand eight hundred and fifty-seven, or on such other day of that month as the said Commissioners may determine for the first time, and once in every succeeding calendar month, and at such hour as shall at any time or times, or from time to time, be appointed by the said Commissioners, and immediately after Her Majesty's Mails are embarked put to sea from Suez aforesaid, and proceed without loss of time to Sydney, touching at, but only at the intermediate ports or places as hereinbefore mentioned or referred to, at which Her Majesty's Mails are to be delivered and received.

That on the arrival of every Mail at Alexandria from Sydney, the said Company shall and will without loss of time cause the same to be embarked on board one of the said vessels of not less than one thousand six hundred tons register N.M., and which vessel shall proceed forthwith to Southampton, and there deliver the said Mails, touching only at Malta, as hereinbefore mentioned.

That one other of such vessels of not less than one thousand six hundred tons register N.M., so approved of and equipped, and manned as aforesaid, shall on the fourteenth day of the month of February, one thousand eight hundred and fifty-seven, or on such other day of that month as the said Commissioners may determine for the first time, and once in every succeeding calendar month, on such day of each month, and at such hour as shall at any time or times, or from time to time be appointed by the said Commissioners, and immediately after Her Majesty's Mails are embarked, put to sea from Southampton, and proceed to Alexandria, touching only at Malta, as hereinbefore mentioned.

That on the arrival of every Mail at Suez from the United Kingdom, the said Company shall and will, without loss of time, cause the same to be embarked on board one of the said vessels of not less than two thousand two hundred tons register N.M., and which vessel shall proceed forthwith to Sydney, calling at Point de Galle and Melbourne, as hereinbefore mentioned.

That the said Company shall deliver the homeward Mail at Southampton in one thousand two hundred and twenty-four hours from the hour of its departure from Sydney, exclusive of the time taken for conveying the Mails from the shore at Suez to the shore at Alexandria, when the Mails can and shall be conveyed between the said vessels and the said shores by the said Company, or from their steam vessels at Suez to their steam vessels at Alexandria, where the regulations of the Egyptian Government prohibit the use of the boats of the said Company from conveying the Mails between their vessels and the said shores, and exclusive of any time which the said vessels are hereby authorized to remain at Melbourne, and so that the said Mails shall be conveyed from Sydney to Melbourne in sixty hours, from Melbourne to Suez in eight hundred and sixty-four hours, and from Alexandria to Southampton in three hundred hours, the said Company, however, on the homeward voyage from Sydney to Suez being allowed an additional twenty-four hours for touching at King George's Sound, until such time as lights for the guidance of vessels approaching and navigating King George's Sound shall be fixed and exhibited.

That the said Company shall deliver the Outward Mail at Sydney in one thousand two hundred and ninety-six hours from the hour of its departure from Southampton, exclusive of the time taken for conveying the Mails from the shore at Alexandria to the shore at Suez, or from their steam vessels at Alexandria to their steam vessels at Suez, as the case may be, as hereinbefore specified, and exclusive of any time which the said vessels are

are

STEAM POSTAL COMMUNICATION.

are hereby authorized to remain at Melbourne, and so that the said Mails shall be conveyed from Southampton to Alexandria in three hundred hours, from Suez to Melbourne in nine hundred and thirty-six hours, and from Melbourne to Sydney in sixty hours.

That whenever there shall not be any regulation of the Pasha of Egypt to prevent the said Company from conveying the Mails between their vessels at Alexandria and Suez respectively, and the shore, the said Company shall convey the Mails between such vessels and the shore as at other places where the Mails are to be landed and received under this Contract.

When not prevented by regulation of Pasha, Company to carry Mails between their vessels at Alexandria and Suez and the shore.

That the said vessels between Sydney and Suez, on the outward and homeward voyages, shall stay at Melbourne the authorized time, and in addition thereto, any Sunday, Christmas Day, or Good Friday; should any of the said vessels, whilst employed in the performance of this Contract, be at Melbourne on each or any of those days. And it is hereby agreed, that if the said Company fail, from whatever cause arising, to deliver the Mails at Southampton or Sydney, in the respective periods hereinbefore agreed, then and in such case the said Company shall forfeit and pay to Her Majesty, her heirs and successors, the sum of fifty pounds for the first twenty-four hours, a further sum of one hundred pounds for the second twenty-four hours, a further sum of one hundred and fifty pounds for the third twenty-four hours, and a further sum for every succeeding twenty-four hours, increasing the amount each twenty-four hours fifty pounds; and so on for every twenty-four hours for any time consumed on the respective voyages beyond the number of hours as hereinbefore respectively agreed: Provided always, that the full amount of such penalties, on any one voyage, shall never exceed the sum of seven thousand seven hundred and eight pounds, six shillings, and eight pence; and such penalties shall, in no case whatever, be relinquished: Provided further, And the said Commissioners for and on behalf of Her Majesty, do hereby covenant and agree to pay to the said Company a premium of thirty pounds for each and every twenty-four hours within which the said Mails shall be delivered less the number of hours hereby covenanted for the delivery of the same respectively at Sydney and Southampton. And it is hereby agreed, that weather permitting, the Mails from Geelong are to be brought on deck before reaching Port Philip Heads, and on the mail boat coming alongside, the Mails shall be lowered into it, but in the event of the mail boat not coming alongside before the health officer has left the ship, the vessel is not to be required to wait.

As to stay of vessels at Melbourne.

Penalties for not delivering of Mails within specified times, which are in no case to be relinquished.

When premium to be paid to Company.

As to Mails at Geelong.

And the said Company do hereby further agree with the said Commissioners, that on the arrival of every vessel employed under this Contract at Malta from Alexandria, the said Company shall and will, with all possible despatch, convey Her Majesty's Mails from Malta to Marseilles aforesaid, and there deliver the same, to whom and as the said Commissioners may direct. And further, that the said Company shall and will convey Her Majesty's Mails from Marseilles aforesaid to Malta, from time to time, so as there to meet every steam vessel leaving the United Kingdom under this Contract for Alexandria, and shall deliver the said Mails at Malta accordingly.

As to conveyance of Mails between Marseilles and Malta.

That if they the said Company fail to provide an efficient vessel in accordance with the terms of this Contract, ready to put to sea on the appointed day, and at the appointed hour, at each of the appointed places, then and in such case, and as often as the same shall happen, the said Company shall forfeit and pay unto Her Majesty, her heirs and successors, the sum of one hundred pounds, and also the further sum of one hundred pounds for every successive twenty-four hours which shall elapse until such vessel shall actually proceed to sea on her voyage in the performance of this Contract.

Penalties for not providing efficient vessels ready to put to sea.

That the said Company shall at all times, during the continuance of this Contract, have in constant readiness for the due execution of the service hereby contracted to be performed, vessels equal in tonnage and efficiency to those hereinbefore stipulated to be provided, and shall in every case of any of the said vessels becoming disabled, immediately, at their own cost and charge, replace the same by good and efficient vessels of similar tonnage, obtained by hire or otherwise.

Efficient vessels to be kept in readiness, and Company to replace same when disabled.

That the said Company shall receive and allow to remain on board each of the said vessels so to be and while employed in the performance of this Contract, and also while remaining at each or either of the ports or places for return Mails and with or without Mails in charge an officer in Her Majesty's Navy, to be appointed by the said Commissioners to take charge of the said Mails, and that every such officer shall be recognized and considered by the said Company and their officers, agents, and seamen as the agent of the said Commissioners in charge of Her Majesty's Mails, and as having full authority in all cases to require a due and strict execution of this Contract on the part of the said Company, their officers, servants, and agents, and to determine every question whenever arising, relative to proceeding to sea, or putting into harbour, or to the necessity of stopping to assist any vessel in distress, or to save human life, and that the decision of such officer as aforesaid, shall in each and every such case be final and binding on the said Company, unless the said Commissioners, on appeal by the said Company shall think proper to decide otherwise; but it is understood the above expression "to determine every question," shall not confer upon such officer the power of compulsion in such cases.

Admiralty officer in charge of Mails to be received and conveyed on board vessels.

Such officer to decide all discretionary questions, subject to reversal on appeal to Commissioners.

That if the said Commissioners at any time or times think fit, they shall be at liberty in any case or cases to substitute for the said naval officer an officer in the service of Her Majesty's Postmaster General to have charge of the said Mails, and in such case or cases any such last-mentioned officer shall be received and be allowed to remain on board each of the said vessels as is hereinbefore provided with respect to any such naval officer; but when any officer in the service of Her Majesty's Post Office has the charge of the said Mails his duties shall be confined to Post Office business.

Commissioners may substitute officer from Post Office for naval officer in charge of Mails, but duty to be confined to Post Office business.

That a suitable first-class cabin, with appropriate bed, bedding, and furniture shall, at the cost of the said Company, be provided and appropriated by them for and to the exclusive use and for the sole accommodation of every such naval or other officer, and also a proper and convenient place of deposit on board, with secure lock and key, for Her Majesty's Mails; and

Officer to be provided with first-class cabin, &c., and chief-cabin fare and place of deposit for Mails to be provided.

and that each and every of the said officers shall be victualled by the said Company as a chief cabin passenger, without any charge being made either for his passage or victualling.

Where Mails are to be delivered and received, and Admiralty officer and Mails to be conveyed between vessels and shore.

That Her Majesty's Mails shall be delivered and received at each of the places to which the said vessels are to proceed in the performance of this Contract, and that at each port or place where the said Mails are to be delivered and received the said officer having charge of Her Majesty's Mails shall, whenever and as often as by him deemed practicable or necessary, be conveyed on shore, and also from the shore to the vessel employed for the time being in the performance of this Contract, together with or (if such officer consider requisite for the purposes of this Contract) without Her Majesty's Mails in a suitable and seaworthy boat of not less than four oars, to be furnished with effectual covering for the mail bags, and properly provided, manned, and equipped by the said Company, and that the directions of the said officer shall in all cases be obeyed as to the mode, time, and place of receiving and delivering Her Majesty's Mails.

Admiralty may entrust Mails to masters of vessels, and when master has charge, he is to deliver and receive the Mails to and from the proper parties.

That if the said Commissioners shall, during the continuance of this Contract, or of any part thereof, think fit to intrust the charge and custody of the Mails to the Masters of all or any of the vessels to be employed in the performance of this Contract, and in all cases when the officer or other person appointed by the said Commissioners to have charge of Her Majesty's Mails shall be absent, the Masters of all or any of such vessels shall, without any charge to the public, take due care of, and the said Company shall be responsible for the receipt, safe custody, and delivery of the said Mails, and each of such masters shall make the usual oath or declaration or declarations required, or which may hereafter be required by Her Majesty's Postmaster General, in such and similar cases, and furnish such journals, returns, and information to and as, and perform such services as the said Commissioners or any of their agents may require, and every such Master having the charge of such Mails, shall himself, immediately on the arrival at any of the said ports or places, of any vessel so conveying the same, deliver all Her Majesty's Mails for such port or place, into the hands of the Postmaster of the port or place where such Mails are to be delivered, or into the hands of such other person as the said Commissioners shall direct and authorize to receive the same, receiving in like manner, all the return or other Mails to be forwarded in due course.

Only certain letters to be conveyed.

That the said Company shall not, nor shall any of the Masters of any of the vessels employed or to be employed, under this Contract, receive or permit to be received on board any of the vessels employed under this Contract, any letters for conveyance other than those duly in charge of the said naval officer, or other person authorized to have charge of the said Mails, under or by virtue of this Contract, or which are or may be privileged by law, and the said naval officer or other person, shall report to the said Commissioners any default in this respect, and in case of any such default, the said Company shall be liable to be proceeded against for a breach of this Contract.

Admiralty officer may survey vessels, and Admiralty may survey vessels by other officers

That every naval officer authorized to have the charge of the said Mails, shall either alone or with such other persons as he may consider necessary, have full power and authority as often as he may deem it requisite, to examine and survey in such manner and with the assistance of such persons as he may think proper, any of the vessels employed or to be employed in the performance of this Contract, and the hulls, machinery, equipments, and crew thereof, on his giving reasonable notice in writing, to the Master for the time being of the vessel about to be examined, or to the person acting as such, of such his intention, and if any defect or deficiency be ascertained and notice thereof in writing be given to such Master or person and if the said Master shall not immediately, or as soon as possible, thereupon remedy, replace, or effectively repair or make good every such defect or deficiency, the said Company shall, in every such case, forfeit and pay to Her Majesty, her heirs and successors, the sum of two hundred pounds, but the payment of such penalty shall not in any wise release or discharge the said Company from remedying, replacing, or effectively repairing or making good such deficiency or defect, or from being considered to have committed a breach of this Contract. And that the said Commissioners shall also have full power whenever and as often as they may deem it requisite to survey, by any of their officers or agents, all or every the vessels employed and to be employed in the performance of this Contract, and the hulls thereof, and the engines, machinery, furniture, tackle, apparel stores, equipments, and the officers, engineers, and crew of every such vessel; and the said vessels shall be opened in their hulls whenever the said officers may require, and if any such vessels, or any part thereof, or any engines, machinery, furniture, tackle, apparel, boats, stores, or equipments shall on any such survey be declared by any of such officers or agents unseaworthy, or not adapted to the service hereby contracted to be performed, or if the said Commissioners shall deem it necessary or expedient that any alteration or improvement shall be made therein, or any part thereof; in order to keep pace with the more advanced state of science, every vessel which shall be disapproved of, or in which such deficiency, defect, or want of improvement shall appear, shall be deemed inefficient for any service hereby contracted to be performed, and shall not be employed again in the conveyance of Her Majesty's Mails until such defect or deficiency shall have been repaired or supplied, or the alterations or improvements, as the case may be, shall have been made to the satisfaction of the said Commissioners, and if employed before such defect or deficiency shall have been supplied, or such alterations or improvements, as the case may be, shall have been made to the satisfaction of the said Commissioners, the said Company shall forfeit and pay to Her Majesty, her heirs and successors, the sum of five hundred pounds.

Vessels objected to not to be employed.

That the said Company, and all commanding and other officers of the vessels to be employed in the performance of this Contract, and all agents, seamen, and servants of the said Company shall at all times, during the continuance of this Contract, punctually attend to the orders and directions of the said Commissioners, or of any of their officers or agents as to the landing, delivering, and receiving Her Majesty's Mails.

Company and their officers to attend to directions of Admiralty and their agents, as to the landing, &c., of the Mails.

That

## STEAM POSTAL COMMUNICATION.

That the said Company shall and will, when and as often as in writing they or the masters of their respective vessels shall be required so to do by the said Commissioners, or by such naval or other officer or agents acting under their authority (such writing to specify the rank or description of the person or persons to be conveyed, and the accommodation to be provided for him or them), receive, provide for, victual, and convey to and from and between the places to which any of the vessels are to proceed in the performance of this Contract, on board each and every or any of the vessels to be employed in the performance of this Contract (in addition to the naval or other officer authorized to have charge of the said Mails); any number of naval, military, and civil officers in the service of Her Majesty not exceeding four in any one ship, with or without their wives and children, as chief cabin passengers; and any number of non-commissioned and warrant officers or civilians in Her Majesty's service not exceeding two in any one ship, with or without their wives and children, as fore cabin passengers, together with the servants of both chief and fore cabin passengers, and any number of seamen, marines, soldiers, or artificers in Her Majesty's service not exceeding ten in any one ship, with or without their wives and children, as deck passengers; to be always provided with effectual protection from rain, sun, and bad weather, and not exposed on deck without such competent shelter, a fortnight's notice being given, if practicable, to the said Company or to their agent at the port of embarkation, and all such passengers shall be permitted to ship the quantity of baggage allowed by the said Company to ordinary passengers of similar rank, free of all charge for the conveyance of the same.

Certain number of officers, and others in the service of Her Majesty, to be conveyed, with or without their wives and children, and servants, and those who are deck passengers to be effectually protected from the weather.

That commissioned officers, their wives and children, shall be considered as chief cabin passengers; non-commissioned officers and warrant officers, their wives and children, as fore cabin passengers; and seamen, marines, private soldiers, artificers, and their wives and children, as deck passengers; and the said servants (in respect of accommodation) as the servants of chief cabin passengers.

As to what class of passengers such officers, &c., are to be considered.

That the victualling of officers, their wives and children, conveyed as chief cabin passengers, shall be the same as is usually allowed by the said Company to chief cabin passengers, their wives and children; the victualling of non-commissioned officers, their wives and children, conveyed as fore cabin passengers, shall be the same as is allowed to the boatswain and carpenter of the said Company's steam ships; and the victualling of seamen, marines, soldiers, and artificers, their wives and children, conveyed as deck passengers, shall be the same as is allowed to the seamen of the said Company's steam ships; and the victualling of the servants of officers, whether chief or fore cabin passengers, shall be the same as the servants of other chief or fore cabin passengers.

As to their victualling.

That the passage money shall be paid in full of all charge for mess, including a pint of port or good foreign white wine, and one bottle of malt liquor per day for each officer conveyed as a chief cabin passenger, and half a gill of spirits per day, or an equivalent, if not issued for each warrant officer, non-commissioned officer, seaman, marine, soldier, artificer, and servant, conveyed as a fore cabin or a deck passenger, at and after the rates charged by the said Company for ordinary passengers of a similar description, the said Company carrying children under three years of age free, and charging for male servants one half and for female servants two-thirds of the rates charged for their employers.

As to their passage money, and what the same is to include.

That the payment for the passage ordered at the expense of the public for any person shall only be made on the production of the order for the passage and of a certificate from the person in the following form, namely:—

Certificate to be produced.

I hereby certify, that on the \_\_\_\_\_ embarked at \_\_\_\_\_ as a \_\_\_\_\_ passenger on board the Mail Steam Packet \_\_\_\_\_ for a passage to \_\_\_\_\_ and landed at \_\_\_\_\_ on the \_\_\_\_\_

To this certificate the following addition is to be made in every case of a male cabin passenger, namely:—

"I further certify, that the first dinner meal taken on board was on the \_\_\_\_\_ and the last dinner meal on the \_\_\_\_\_

"Dated this \_\_\_\_\_ day of \_\_\_\_\_  
And the correctness of the dates must be corroborated by the Master of the packet and by the signature of the passenger underneath.

"The dates inserted in this certificate are correct.  
\_\_\_\_\_  
(Signature.)  
\_\_\_\_\_  
Master of the Packet.

\_\_\_\_\_  
(Signature.)  
\_\_\_\_\_  
Passenger."

That the passage money for the families and wives of officers shall be paid to the said Company by the officers themselves, at the rates charged for ordinary passengers of a similar description; their children under three years of age being conveyed free of charge.

Officers to pay passage money for their families and wives.

That the passengers hereinbefore mentioned or referred to are to be exclusive of any men to be sent home under the provisions of the Act 17 and 18 Victoria, cap. 104, the rate of passage, for whom is to be, and to be paid for in accordance with the provisions of that Act.

Such passengers to be exclusively of distressed seamen, &c.

That whenever the said Company shall convey any soldiers or deck passengers other than those specially provided for by this Contract, the said Company shall provide them with adequate protection from rain, sun, and bad weather; and they shall not be exposed on deck without such competent shelter.

When soldiers or deck passengers are conveyed other than those before provided for, they are to be protected from bad weather.

That all and every the sums of money hereby stipulated to be forfeited and paid by the said Company unto Her Majesty, her heirs and successors, shall be considered as stipulated or ascertained damages; and shall and may be deducted and retained by the said Commissioners out of any monies payable, or which may thereafter be payable, to the said Company; or the payment may be enforced as a debt due to Her Majesty, with full costs of suit, at the discretion of the said Commissioners.

Stipulated damages.

Certain packages are to be conveyed by Company, and also naval and other stores, not exceeding ten tons in weight.

As to the employment of exceptional vessels.

If stoppage of Mail to visit through Egypt.

As to alteration of times of departure and arrival of Mails by Admiralty.

Payment to Company.

That the said Company shall and will receive on board each and every of the said vessels employed in the performance of this Contract, any number of small packages containing astronomical instruments, charts, wearing apparel, medicines, or other articles, and convey and deliver the same to, from, and between all or any of the said ports or places to or from which the said Mails are to be conveyed, in the performance of this Contract, when and as often as directed by the said Commissioners or their agents, or by the British naval officer in command of the station, or at any port where the vessel may touch, free from all costs and charges; and also shall and will receive on board each and every of the said vessels, and convey and deliver to, from, and between all or any of the said ports or places any naval or other stores not exceeding ten tons in weight, at any one time in any one vessel, at the rate of freight charged by the said Company for private goods, on receiving from the said Commissioners, or any of their officers or agents, two days' previous notice of its being their intention to have such stores so conveyed; and that the said Company shall in all cases be strictly responsible for the due custody and safe delivery of the said packages, articles, and stores: Provided always, and it is hereby agreed, that notwithstanding anything herein contained it shall be lawful for the said Company to convey the Mails between Southampton and Alexandria in vessels chartered by the said Company, and approved of by the said Commissioners, until the said steam vessels of the said Company of not less than one thousand six hundred tons are ready; which last mentioned vessels the said Company hereby agrees shall be ready and shall perform the said service as soon as practicable. And it shall also be lawful for the said Company to convey the Mails from Suez to Sydney three times in the year one thousand eight hundred and fifty-seven; and from Sydney to Suez three times in the year one thousand eight hundred and fifty-seven, but on no other occasions, in vessels of not less than one thousand eight hundred tons new measurement, and being full power steamers, touching on each of the voyages at Point de Galle and Melbourne on the outward passage, and at Melbourne, King George's Sound and Point de Galle on the homeward passage; and with regard to such six exceptional voyages, if the same shall have been performed to the satisfaction of the said Commissioners, such allowance shall be made for extra time for the same as the said Commissioners shall in their discretion think fit. And it is hereby agreed, that all clauses, penalties, stipulations, and conditions contained in this Agreement shall, as far as practicable, be made applicable to and shall apply to such last mentioned vessels, and also to any such chartered vessels as aforesaid, and to the voyages performed by them respectively, and to the said Company in respect thereof. And it is hereby agreed, that in the event of an entire stoppage of Her Majesty's Mails through Egypt the circumstances shall be investigated by the said Commissioners, in order that the said Commissioners may come to such determination as in their opinion the circumstances of the case may require.

That if at any time or times during the continuance of this Contract, the said Commissioners shall deem it requisite to alter the particular days, times, and hours of departure from, and arrival at, any of the ports or places to or from which Her Majesty's Mails are to be conveyed under or by virtue of this Contract they shall be at liberty at any time or times, or from time to time to alter the days and hours of departure and arrival, on giving notice in writing of such their intention to the said Company, but so that such alteration be so arranged as not to involve the necessity of employing a greater number of vessels than were or ought to have been employed under this Contract, previously to any such alteration, and any such notice if applicable to vessels employed on the western side of the Isthmus of Suez, to be a three calendar months' notice, and if applicable to vessels proceeding from Sydney or other ports on the eastern side of such Isthmus, such notice to be a six calendar months' notice, and the particular days, times, and hours of departure from and arrival at such ports or places which may be appointed by any such alteration in force for the time being, shall be deemed to be the days, times, and hours of departure and arrival of Her Majesty's Mails under this Contract, and shall be observed and kept by the said Company accordingly.

And in consideration of the due and faithful performance by the said Company of all the services hereby contracted to be by them performed, the said Commissioners do hereby agree that there shall be paid to the said Company so long as they perform the whole of the said services in the manner and with such vessels as herein provided, by bills payable seven days from and after the respective dates thereof, by Her Majesty's Paymaster-General, a sum after the rate of ONE HUNDRED AND EIGHTY-FIVE THOUSAND POUNDS per annum, a proportionate part of such sum to be paid on the completion of each entire voyage, each performance of the postal service hereinbefore covenanted, to be performed between Sydney and the United Kingdom, and between Malta and Marseilles, or between the United Kingdom and Sydney, and between Marseilles and Malta, being deemed an entire voyage; and on the production by the said Company from time to time to the Accountant-General of the Navy of three certificates that the service has been duly performed, that is, one certificate from each of the three officers severally having charge of the said Mails in the following form, payment is to be made accordingly, subject to any abatement on account of penalties or other sums which may be payable by the said Company, and with the proper addition if any premium has been acquired.

#### FORM OF THE SAID CERTIFICATE.

"I hereby certify to the Lords Commissioners of the Admiralty, that H. M. Mails were embarked and received into my charge, on board  
 on the \_\_\_\_\_ day of \_\_\_\_\_ at \_\_\_\_\_ A.M. or P.M.,  
 at \_\_\_\_\_ and were landed at \_\_\_\_\_ on the \_\_\_\_\_  
 day of \_\_\_\_\_ at \_\_\_\_\_ A.M. or P.M."

Provided

Provided always that a deduction after the rate of one thousand five hundred pounds per annum shall be made from the said annual payment of one hundred and eighty-five thousand pounds, in case and so long as or while no accommodation shall be required by the said Commissioners, for a naval or other officer of Her Majesty in charge of the Mails: And it is hereby agreed that the said Commissioners for executing the Office of Lord High Admiral, shall at any time during the continuance of this Contract, if they shall consider it necessary for the public interest, have power and be at liberty to purchase all or any of the said vessels of the said Company at a valuation, or to charter the same exclusively for Her Majesty's service, at a rate of hire to be mutually fixed and agreed on by them and the said Company; but if any difference should at any time or times arise as to the amount of valuation or hire so to be paid, such difference shall be referred to two arbitrators, one to be chosen from time to time by the said Commissioners, and the other by the said Company, and if such arbitrators shall at any time or times not agree in the matter or question referred to them, then such question in difference shall be referred by them to an umpire, to be chosen by such arbitrators before they proceed with the reference to them, and the joint and concurrent award of the said arbitrators, or the separate award of the said umpire, when the said arbitrators cannot agree, shall be binding and conclusive upon all parties, and that the said Commissioners, in the case of hiring any such vessel, shall return the same to the said Company in the same state and condition as she was in at the time of any such hiring, reasonable wear and tear excepted, and if any difference should arise upon that point, the same shall be settled in the same manner as the amount for the hiring is to be settled in case of difference. And it is further agreed that in case of such purchase or hire, the service hereby contracted to be performed shall be performed by other vessels of the Company of a similar description to the vessels or vessel purchased or hired, if they can in due and proper time furnish them such other vessels as to construction, machinery, equipment and crew, to be subject to the same approval as other vessels employed under this Contract. And it is agreed that any submission which may be made to arbitration in pursuance of this Contract shall be made a Rule of Her Majesty's Court of Exchequer, pursuant to the statute in that case made and provided, and that any witnesses examined upon reference may be examined upon oath. And it is hereby agreed, that the whole postage of all mails, despatches, and letters of every description conveyed in the vessels employed under this Contract, whether carried from or out of Her Majesty's dominions or otherwise, shall belong to Her Majesty and shall be at the disposal of Her Majesty's Postmaster-General. And it is hereby agreed and declared, that this Contract shall commence on the day of the date hereof, and shall continue in force for five years from the day on which the first vessel shall commence her voyage from Sydney, in the performance of this Contract, and at the expiration of such five years this Contract shall determine accordingly, but not so as to prevent either of the said parties hereto availing themselves of this Contract for recovering any sum of money or damages, should there have been any breach of this Contract previously to the determination of the same. And it is hereby distinctly understood, that the said Company shall undertake for themselves all arrangements relative to quarantine, as connected with the due and regular performance of the conditions of this Contract. And it is hereby further agreed and provided, that without the consent of the said Commissioners, signified in writing, under the hand of one of their secretaries, neither this Contract nor any part thereof, shall be assigned, underlet, or disposed of, and that in case of the same or any part thereof being assigned, underlet, or otherwise disposed of, without such consent, signified as aforesaid, or in case of breach of this Contract on the part of the said Company, either by habitual negligence or wilful default, it shall be lawful for the said Commissioners for executing the said Office of Lord High Admiral (if they think fit, and notwithstanding there may or may not have been any former breach of this Contract) by writing under the hand of one of their secretaries for the time being, to determine this Contract, without any previous notice to the said Company or their agents, nor shall the said Company be entitled to any compensation in consequence of such determination, but if even this Contract be so determined, the payment of the sum of money hereinafter agreed to be made shall be enforced should the same be not duly paid by the said Company, and the said Company shall continue liable for any liability which they may have incurred previous to any such determination. And it is also agreed that the notices or directions which the same Commissioners or their secretary, officers, or other persons are hereby authorized and empowered to give to the said Company, their officers, servants, or agents may, at the option of such Commissioners or their secretary, officers, or other persons be either delivered to the master of any of the said vessels, or other officer or agent of the said Company in charge or management of any vessel employed in the performance of this Contract, or may be left for the said Company at their office or house of business in Glasgow, or at their or any of their last known places of business or abode, and any notices or directions so given or left shall be binding on the said Company. And in pursuance of the directions contained in a certain Act of Parliament made and passed in the 22nd year of the reign of King George 3rd, entitled "An Act for restraining any person concerned in any contract, commission, or agreement made for the public service from being elected or sitting and voting as a member of the House of Commons." It is hereby expressly declared and agreed and these Presents are upon this express condition, that no member of the House of Commons is or shall be admitted to any share or part of this agreement, or to any benefit to arise therefrom. And it is hereby agreed that if, when this Contract terminates, any vessels or vessel should have started or should start with the Mails, in conformity or in intended conformity with this Contract, such voyage or voyages shall be continued and performed, and the Mails be delivered and received during the same, as if this Contract remained in force with regard to any such vessels and services, but the said Company shall not be entitled to any payment or compensation for the same. And lastly, for the due and faithful performance of all and singular the covenants, conditions, provisoes, clauses, articles, and agreements hereinbefore contained, which on the part and behalf of the said Company are or ought to be observed,

As to deduction therefrom when no accommodation for officer in charge of Mails.

Admiralty may purchase or charter vessels.

Commencement and duration of Contract.

Company to make arrangements as to quarantine.

Contract not to be assigned, &c., without Admiralty consent.

In case of breach, Admiralty may determine Contract when breach is either from habitual negligence or wilful default.

As to service of notices.

No Member of Parliament to share in Contract.

As to vessels which have started, or might start, when Contract has terminated.

Company to pay twenty-five thousand pounds in case of breach.

observed, performed, fulfilled, and kept, the said Company do hereby bind themselves and their successors unto our Sovereign Lady the Queen, in the sum of twenty-five thousand pounds of lawful money of the United Kingdom, to be paid to our said Lady the Queen, her heirs and successors, by way of stipulated or ascertained damages hereby agreed upon between the same Commissioners and the said Company in case of the failure on the part of the said Company, in the due execution of this Contract or any part thereof.

In witness whereof the said parties to the presents have hereunto set their hands and seals the day and year first above written.

Signed, sealed, and delivered (being first duly stamped) by the said Walter Buchanan, Allan Gilmour, John Stirling, and William Connal, in the presence of

FREDERICK TREVOR,  
Collector of Customs at Glasgow.

Signed, sealed, and delivered by the said John Dunbar, in the presence of

SARAH A. FALCONER,  
Postmistress, Croy-Ardsier.

Signed, sealed, and delivered by the said John Orr Ewing, James Galbraith, John Houldsworth, Thomas Augustus Gibb, Robert Smith, and John Pender, in the presence of

ANTONIO BRADY.

Signed, sealed, and delivered by the said Niel Black, and the said Commissioners, in the presence of

JOHN DOUTTY.

NEW SOUTH WALES.

---

## STEAM POSTAL COMMUNICATION.

(LETTER FROM MESSRS. BEIT &amp; SONS.)

---

*Ordered by the Legislative Assembly to be Printed, 5 August, 1856.*

---

Sydney, 11 July, 1856.

SIR,

With your Excellency's kind permission, we have the honor again to submit the proposal for re-establishing a Monthly Mail Communication between this Colony and England, *vid* Singapore, modified in accordance to the views your Excellency expressed on the former occasion, as regards the remuneration to the Company, and, at the suggestion of the Company, increasing the tonnage and power of the boats to be employed.

The Directors have furnished us now with full power of attorney, &c., &c., to make a binding Contract, on their behalf, with this Government; and they will be prepared to begin the service within a very short period, (to be stipulated,) after receipt of a concluded Contract.

We take this opportunity of bringing under your Excellency's consideration, first—the peculiar and important advantages which this route offers for New South Wales; secondly, a plan conferring upon all the Australian Colonies the greatest benefits obtainable, to which they are respectively entitled by their importance and geographical position, without favoring the interests of one at the expense of another; and, lastly, the actual position of this Postal Communication with the Imperial Government, and the probability of its ready concurrence in the scheme now proposed.

1. For New South Wales it is of the utmost importance that the Torres Straits route should be adopted, in preference to any other, even if the Mails could be brought within the same time, or even one or two days quicker, by the latter, on account of the importance of bringing the Northern part of Australia in direct communication with the Indian Archipelago and China; from whence a laboring population for the tropical portion of Australia must be obtained, and with which a beneficial commercial intercourse would rapidly be established, as soon as a settlement can be formed at Port Albany, or its neighbourhood.

2. The superiority of the navigation *for steamboats* has been so fully established, by repeated reports of Sir J. Beaufort, the late Admiral King, Captain Stokes, and others, that it may be justly supposed that passengers from all India and China intending to visit Sydney, will prefer to come by this, generally, smooth-water passage, than to go by the western route *vid* Cape Leuwin and Melbourne.

3. This route can be established with the least delay, and at the smallest expense, being the nearest to the well-established trunk line from England to India and China.

4. It is the only line upon which it can be calculated, with any degree of certainty, derived from actual experience, that *not only the Mails can be carried* within 60 days either way, but that an answer may be received in or from Sydney within 125 days, allowing sufficient time for correspondence between arrival and departure of the Mails.

5. That Sydney would be the first port of arrival, and last of departure, is an advantage which may very fairly be likewise claimed by Melbourne; we should, therefore, feel a serious difficulty to overcome if our scheme did not provide a perfect equality in that respect; only we think it would scarcely be fair or consistent that New South Wales should be absolutely placed, in that respect, at a disadvantage; and, in fact, we believe that the scheme to adopt the eastern route from Pointe de Galle, *via* Melbourne, to Sydney, *only*, is absolutely impracticable, as we shall shew presently.

In establishing the line from Singapore to Sydney direct, we have calculated that, bringing the Mails within fifty-nine to sixty days to and from London, not more than five days could be allowed for despatching the return Mail from Sydney, to be in time for the *next* return Mail to Europe, from Singapore. To go on to Melbourne, and allow time for correspondence from Victoria and the other Colonies, would require an additional delay, which would bring the Mail necessarily over to the next half-monthly Mail, so that a return correspondence could not be obtained in less than one hundred and forty days.

We believe that precisely similar calculation will apply to the proposed line from Pointe de Galle to Melbourne, and thence to Sydney; so that by a combination of these two Colonies, *to either one route*, both would be placed to a great disadvantage, the question in the choice being, not which should have the greatest advantage, but which should have the least disadvantage.

We believe that the following scheme, if adopted, and initiated by Your Excellency, would be hailed with satisfaction by the several Colonies, and approved by Her Majesty's Government.

1. Mails should be despatched from Southampton, by the established Overland Route, on the 5th of every month, and supplemented on the 9th, *via* Marseilles, on to Singapore, and thence by the Torres Strait route direct to Sydney, and forwarded to New Zealand; and on the 20th of every month, supplemented on the 24th, to Pointe de Galle, and thence direct to Melbourne, touching at King George's Sound and Kangaroo Island, and leaving the Mails for Western and South Australia, while the Mail for Tasmania would be forwarded immediately from Melbourne to Launceston.

Both Melbourne and Sydney should reciprocally forward any European Mails which may be forwarded by their respective routes, without any additional charge. By this arrangement, both Melbourne and Sydney would each have *monthly* a direct arrival and departure of a Mail within sixty days from London, and an indirect one within sixty-three to sixty-four days; while all the other Colonies will partake fully in all the advantages which their geographical position will permit.

2. The entire cost of this service should be borne equally between the Home Government and the Colonies, and we estimate the expense as follows:—

(a.) For an additional payment by the Home Government, to the Peninsular and Oriental Company, for carrying all the Australian Mails between Southampton and Singapore, and Pointe de Galle, and for a reduction in the charge to the East India Company ..... £20,000

[We believe that this Estimate is very liberal. The Peninsular and Oriental Company is under their contract obliged to carry any Mails put on board, deliverable at any port on the line; but the Home Government would not take advantage of that stipulation, and would grant a reasonable compensation for the additional service. Calculating therefore, that in forty-eight trips per annum, the Peninsular and Oriental Company would have to carry 5 tons, or 250 cubic feet extra Mails, and allowing £40 per ton extra freight, £10,000 per annum would very liberally remunerate the Company; and the East India Company would probably be well satisfied with a reduction of £10,000 in its subsidy.]

(b.)

Brought forward.....	£20,000
(b.) For the service between Singapore and Sydney, as per tender ...	36,000
Transmission of the Mails to and from New Zealand .....	2,400
(c.) For the service between Pointe de Galle and Melbourne .....	50,000
[We believe that the Peninsular and Oriental Company will readily undertake this service for the proposed sum, after receiving £10,000 for the Mails as above, when the service is disencumbered of the conditions to proceed to Sydney, which involves the necessity of employing three boats, while the service to Melbourne only, as specified, can be effected by the Peninsular and Oriental Company, who have always reserve boats on the Indian line, with two boats.]	
Steamer between Kangaroo Island and Adelaide .....	600
Steamer between Melbourne and Tasmania.....	1,000
<hr/>	
Total cost of Service .....	£110,000

The Home Government being prepared to bear one-half of the total cost of the Service, would therefore be chargeable with £55,000; and as it may fairly be calculated that, by the more frequent communication of *twice* in every month, the postal revenue will increase to at least £50,000 per annum; and the Home Government retaining all its receipts, which may be computed at £25,000, the actual loss to the Imperial Exchequer will be reduced to about £30,000.

(d.) The Service of the two Australian branch lines should be under the immediate control and management of the Governments of New South Wales and Victoria; and the subsidies they would have to pay being respectively as estimated, £38,400 and £51,600, they should receive the following fixed contributions:—

NEW SOUTH WALES.	
From the Home Government .....	£15,000
From New Zealand .....	6,400
<hr/>	
	21,400
Probable amount of Postages receivable in New South Wales .....	7,000
<hr/>	
	28,400
Annual loss to the Treasury of New South Wales .....	10,000
<hr/>	
The estimated cost of Service .....	£38,400
VICTORIA.	
From the Home Government .....	20,000
From Western Australia .....	1,000
From South Australia .....	3,600
From Tasmania.....	4,000
<hr/>	
	28,600
Probable amount of Postages receivable in Victoria .....	10,000
<hr/>	
	38,600
Annual loss to the Treasury of Victoria .....	18,000
<hr/>	
The Estimated Cost of Service.....	£51,600
<hr/>	
The Colonies of Western Australia, South Australia, Tasmania, and New Zealand, would thus contribute a total of .....	15,000
And receiving in postages about .....	8,000
<hr/>	
Would, in the aggregate, only have an annual loss of .....	7,000

(e.)

(e.) Pre-payment of all letters and newspapers, &c., &c., should be absolutely required; and each Colony, as well as the Home Government, to retain the amounts received. There only remains to make some provision in respect of letters posted in the Colonies, for Continental or other Foreign Countries; which, we apprehend, will be better left entirely to the Home Government, to receive the whole of the additional postage, and to account with such Foreign countries.

Respecting the position of this Postal Communication with the Imperial Government, we believe that Your Excellency need be under no apprehension that any definite steps will be taken to establish the route proposed, by the Lords of the Treasury, upon the strength of the Despatches of Your Excellency, or those from Victoria. Our private information perfectly coincides with the official announcements, in the Treasury Minute of the 27th November, and by the Duke of Argyll, upon the interpellation of the Earl of Hardwicke, *on the 7th April last*. Their Lordships say, in alluding to the offers of contributions from the several Colonies,—“that although they place the utmost reliance upon the spirit in which they have been made, yet it is most desirable there should be *no possible misunderstanding*.” Again, section 5 of the proposed plan, their Lordships distinctly state,—“*In the first place it will be necessary to obtain from each of the Colonies named, a duly authorized Legislative acquiescence in the arrangement proposed, &c., &c.*; and My Lords, relying upon the correspondence before them, from the Governors of New South Wales and Victoria, have decided to take immediate steps to secure the earliest possible commencement of the Service, *after the receipt of communications from the different Colonies, acquiescing in the proposed arrangements.*” The Duke of Argyll states,—“that the advantages of the several routes remain an open question; and that before any plans could be carried out, the general assent of the Colonies would be obtained.” Our private information goes to the effect, that the Lords of the Treasury will not authorize any permanent arrangement, to which the interested Colonies shall not have given their distinct assent, through the newly-established Legislatures; that their Lordships find extreme difficulty to devise any plan to do justice to the several interests of the Colonies; and would favorably receive any plan, by which the Colonies would themselves undertake the management and responsibility of the Service, from any point of the Indian line; as the Colonial Governments would be better able to control that portion of the Service; while also the contracts would be more simplified; as the Imperial Government would only have to contract for delivering and receiving the Mails, at and from the two points of the established Indian line; while a Tender to the Imperial Government, for the entire service, would include a separate line *all the way*. In every way, the authorities at the Post Office and the Treasury appear to favor the proposal that the Colonial Governments should contract themselves, for the Services *to the southward of the Indian line*, and send their own officers to take charge of the Mails from the Imperial officers, and deliver them those they bring for Europe.

Your Excellency will observe, that in the above Estimate we have only approximately divided the contributions of the several Colonies, upon the basis proposed by the Lords of the Treasury, to divide the whole cost equally between the several Colonies and Home Government. We believe that the total cost will be found substantially correct. For New South Wales we speak, of course, positively; and we think that it would be more convenient for New South Wales and Victoria to accept from the other Colonies a rather moderate and, to them, favorable fixed contribution, than to ascertain, every two years, the letters despatched by each.

We have abstained from entering upon any comparison with other routes; and beg leave only to observe that no other would produce, in equal degree, that cohesion of the British Possessions so desirable in commercial, social, and political points of view. Your Excellency and the Legislature will decide between them, when any clear and distinct offers are made.

We hope that your Excellency will see sufficient grounds to communicate our general proposal to the Governments of the Sister Colonies, and to bring our offer to effect the service for this Colony before the Legislature of this Colony, immediately upon its re-assembling.

We remain, &c.,

BEIT & SONS.

TO HIS EXCELLENCY

SIR WILLIAM DENISON, KNT.,  
Governor General, &c., &c.

TENDER

## TENDER OF CONTRACT FOR STEAM POSTAL COMMUNICATION.

*Sydney, 11 July, 1856.*

On behalf of the Directors of the "Australian General Investment Association," of London, and as their lawfully-constituted and authorized attorneys, we make the following offer of Contract for the conveyance of Mails to and from Europe:—

1 The Company will contract, under the usual guarantee, to carry all the Mails between Sydney and Singapore *via* Torres Straits, either way once a month, by Steamers of not less than 400 tons measurement, and not less than 100-horse power, and to perform the passages within 22 days. The days of departure from Singapore to be so fixed as to bring on the Mails leaving London the beginning of every month, and the days of departure from Sydney so fixed as to meet the next Mail leaving Singapore for London, which can be so arranged as to allow an interval of five or six days between the arrival and next departure from Sydney.

Besides the Mails, the Company will engage to provide a cabin-passage for a Mail-master, or (at the option of the Government) require the Captains to take the usual Post Office oaths or declaration, and to perform such services as the Postmaster General of this Colony shall require of them in respect of delivering and receiving the Mails; and the Company will further engage, so soon as the Government may have established a station at Port Albany, to call there and deliver Mails, and land passengers.

It shall be optional with the Company whether to call at Java or not.

The Company will also engage to carry Naval and Military Officers and Men, and packages containing astronomical instruments, wearing apparel, medicines, &c., &c., in the proportions, and on the terms usually inserted in Contracts made by the Lords of the Admiralty.

2. This Service,—to which the Company will devote three boats, of the most improved construction, and of which one will always be in reserve in Sydney,—the Company will undertake for a subsidy of £36,000 per annum, payable in Sydney monthly, within fourteen days after the expiration of the previous month.

3 The Company will engage to despatch, within six months after receipt of a definitely-concluded Contract in London, or after ratification of the same, if required, by the Home Government, the first Steamboat with a Mail direct to Sydney, and to despatch in the two succeeding months the other two boats, which, after arrival in Sydney, will at once successively be despatched for Singapore, and so open a permanent line.

Should this Government think it necessary, before finally concluding any Contract, to obtain the concurrence and ratification of the Home Government, we are authorized and willing to conclude such Contract irrevocably on behalf of the Company, but subject, on the part of the Government, to be ratified or rejected after being received by Her Majesty's Secretary for the Colonies; such ratification or rejection to be signified to the Directors of the Company within one month after arrival of the Despatches and the Contract in London.

BEIT &amp; SONS.

1856.

## NEW SOUTH WALES.

## STEAM NAVIGATION BETWEEN THE COLONIES.

(MEMORANDUM OF DELEGATES ON LIGHT HOUSES.)

*Ordered by the Legislative Assembly to be Printed, 18 December, 1856.*

## MEMORANDUM.

Having duly considered the existing Laws relating to Steam Navigation in New South Wales and Victoria, and the necessity for the establishment of an uniform system of control and conservancy, we have agreed to recommend the following suggestions for the consideration of our respective Governments.

With a view of securing efficiency, as well as simplicity, in any modifications which it may be advisable to make in the Acts at present in existence, we would suggest, that as far as it may be practicable or consistent with the views of the several Colonies interested, the Imperial Acts for the amendment and consolidation of the laws relating to the Merchant Shipping, where they apply to the regulation of Steam Navigation, be adopted, and the Local Acts now in operation be repealed; or, should such a course be not deemed prudent, we would recommend that in any Acts which may be submitted for the consideration of the Legislatures to amend those now in force, the following provisions of the Imperial Statute be, as far as possible, enacted:—

- The Regulations for Boats and Life Buoys in accordance with Table S.
- Those as to Light and Fog Signals.
- Those as to Ships meeting and passing each other.
- Those as to the adjustment of Compasses.
- Those as to Shelter for Deck Passengers.
- The mode of making Surveys and the appointment of Surveyors.
- The transmission of Declarations and issue of Certificates.
- The necessity of Safety-valves on each Boiler.
- The Penalty for placing undue weight on Safety-valve.

We would also recommend the following provisions, in addition to those provided in the Act of Parliament, viz.:—

- Quarterly Survey of Steam Vessels propelled by High Pressure Engines.
- Steam not to be turned off. Steam-Gauge under penalty.
- Gangway Stage necessary to River Boats.

We would likewise recommend for adoption the Scale of Fees as set forth in Schedule T, making, however, a reduction of one-half the charge in favor of vessels requiring a quarterly instead of a half-yearly survey. And, with a view of promoting the intercourse and commercial relations between the two Colonies of New South Wales and Victoria, we are prepared to advise that Surveys granted in one Colony should, during their currency, be received and held to be sufficient, for all purposes of the Act, in the other: Provided that the same be granted by an authority similar to that constituted under either the Imperial or the existing Colonial Acts, and that power be reserved to cancel or revoke any such Certificate so granted, should it appear that, during its currency, any accident has been sustained by the vessel to which it refers, or any circumstances arise to justify such a course.

In carrying out an arrangement of this kind, it will be requisite, in order to prevent any undue advantage being taken by either Colony, that an account be kept of all Fees received for Steam Vessels trading between the two Colonies, and that the proceeds be equally divided.

Melbourne, 26 August, 1856.

HUGUEZ CHILDERS.

1857.

## NEW SOUTH WALES.

## LOCAL BOARD AND STEAM TUG FOR PORT OF NEWCASTLE.

(CHAIRMAN, &amp;c., OF NEWCASTLE CHAMBER OF COMMERCE.)

*Ordered by the Legislative Assembly to be Printed, 27 January, 1857.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.  
The Petition of the undersigned, the Chairman, Deputy Chairman, and Committee of the  
Newcastle Chamber of Commerce, in the said Colony,—

HUMBLY SHEWETH:—

That Newcastle has acquired an unfortunate notoriety from the number of wrecks which occur at the Port, and which, in their consequences, are as repugnant to humanity as they are detrimental to commerce.

That these wrecks have, at various times, occupied the attention of the Government, which has vainly endeavoured to carry out means for their prevention, and to remedy those defective port arrangements which have been the subject of just and continued complaint; that with proper precautions, under an effective direction and supervision, and with those means of precaution adapted to the necessities of the Harbour, which in similar cases, are provided elsewhere, the Port of Newcastle may be rendered as safe for vessels as are most other harbours—as is proved by the recent safe arrival here of the “Punderiald,” a ship of fifteen hundred tons register, and of the “Edmond,” of nearly one thousand tons register.

That the distant management in which the Port arrangements of Newcastle are vested is the neutralizing cause which renders ineffective the efforts of the Government to remedy evils which have reflected discreditably on the Executive, and injuriously on the Port.

That your Petitioners' experience enables them confidently to state that the establishment of a Local Harbour and Pilot Board, for the direction and supervision of the affairs of the Port of Newcastle, as is provided in every like instance in England, is the only remedy for the evils complained of.

That your Petitioners, having earnestly called the attention of the Executive to the subject, and pointed to local direction, as here indicated, as the remedy, had waited in the confident expectation that the magnitude of the evil, and the claims of humanity and of trade, would have caused provision to be made for the purpose on the Estimates: But your Petitioners regret to observe that, while a Light Navigation and Pilot Board is provided on the Estimates for Sydney, no similar provision, to any extent, is made for this Port; nor is any other indication afforded by the Executive of the slightest attempt at a remedy.

That, as a means, under local direction, a powerful Steam Tug is of the first importance here for the prevention of wrecks.

That it can be shewn, by practical men, that nearly all the wrecks which have occurred at the Port of Newcastle might have been prevented had the vessels been assisted at the proper time by a powerful Steam Tug.

That the aid of a Steam Tug is also necessary, in entering and leaving the Port, to vessels which, during certain prevailing winds, are detained at sea or in harbour for want of such aid, and that much risk and loss are consequently incurred, to the detriment of trade and of the Port.

That the removal of vessels to and from the coal shoots in harbour, which is now frequently tedious and difficult, also requires such assistance.

That confirmatory proof on this head is also supplied by the fact that a Tug Boat was specially brought down here to assist the ship "Dundonald," with freight, on Government account, into Port.

That, for these reasons, the establishment of a Tug Boat is connected with the Pilotage and general economy of the Port of Newcastle, and should be supported by dues levied for the purpose on all shipping entering the Harbour.

That the interests of Colonial Commerce, which are largely concerned in this question, as well as considerations of humanity, strongly call for immediate legislation upon it.

That your Petitioners therefore humbly pray:—

First—That in addition to the provision already made for the establishment of a Light Navigation and Pilot Board in Sydney, your Honorable House will be pleased to provide for the appointment of a Local Board here, to direct and supervise the public business of this Port, and that your Honorable House will be pleased also to cause a measure to be passed giving the necessary powers for that purpose.

Secondly—That your Honorable House will be pleased to grant powers for the establishment and maintenance of a first-class Steam Tug for the service of this Port, to be supported by dues to be levied for the purpose.

And your Petitioners will ever pray.

[Here follow eleven Signatures.]

NEW SOUTH WALES.

# SHIPPING LAWS.

(MERCHANTS, SHIPOWNERS, &amp;c.)

*Ordered by the Legislative Assembly to be Printed, 19 December, 1856.*

To the Honorable the Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

The humble Petition of the Merchants, Shipowners, Masters, and others connected with  
the Shipping Interests of the said Colony,—

SHEWETH:—

That your Petitioners, at a meeting convened at the "Dove Inn," Sussex-street, Sydney, on the 19th day of November last, for the purpose of considering the Merchant Seamen's, Water Police, and other Acts upon the Shipping Laws now in force in the said Colony, and particularly at the Port of Sydney, resolved unanimously to Petition your Honorable House upon their general greivances, arising from the operation of the said Acts.

Your Petitioners humbly complain of the inefficiency of the Shipping Master's Department, and that the regulations operate prejudicially to the Masters of Vessels, as well as to seamen, causing them (the Masters) to lose much time in attending to ship and discharge their seamen, and in particular where they have the command of coasting vessels and steamers, especially the Port Phillip and New Zealand steamboats, whose crews consist of *forty* men each; they have to be discharged and re-shipped every month, thereby causing a great loss of time to Masters and Owners, besides the expense of paying two shillings for shipping, and two shillings the seamen have to pay for being discharged and re-shipped, although they do not want to leave their vessels. The men complain of the heavy tax imposed upon them, and the Masters feel aggrieved having to employ labourers while they are absent at the Shipping Office—which is a great loss to the Owners. Coasters are exempt from this great expense and annoyance in England—Masters being required to make a Return to the Shipping Master every six months by a declaration only.

Whereas, under the old system, Agents performed the duties, without taking the Masters from their vessels and otherwise; and these Agents were then only required to ship such new hands as might be required, and not, as now, all hands every month; and by this arrangement, both Masters and men were saved considerable expense and time.

The present law, besides, having a tendency to engender in the feelings of the men the idea of a surveillance so repugnant to the feelings of a British seaman.

Your Petitioners complain of the operation of the present Shipping Act as an infringement on the rights of Free Trade—the Government performing for a profit, and the public being put to the great and unnecessary expense of a department to do the legitimate business of independent Agents of those Masters and Merchants who would otherwise do the business for themselves, at no expense.

Your Petitioners humbly suggest that the late Shipping Act, with some few alterations and additions, would be better adapted to the present wants and requirements of the present enlightened and progressive state of the Colony.

Your Petitioners complain also of the unnecessary stringency of the Police Act in many particulars, one of which is, that they are bound to keep watch on board their vessels at night, although they may be moored to the wharfs, at all of which are employed watchmen amply sufficient for the protection of property.

Also, that those Masters of Vessels engaged in the coal trade find considerable difficulty in shipping men, who, after working hard in unloading during the day, will not agree to keep watch during the night, as they require rest.

Your Petitioners, therefore, humbly pray your Honorable House will take into consideration their grievances, and appoint a Committee of Inquiry of your Honorable House, with a view of affording your Petitioners such redress as may be required.

And your Petitioners will, as in duty bound, ever pray.

## SHIPPING MASTER'S DEPARTMENT

(SHIP OWNERS &c., OF THE PORT OF SYDNEY.)

---

*Ordered by the Legislative Assembly to be Printed, 3 February, 1857.*

---

To the Honorable the Members of the Legislative Assembly in Parliament assembled.

The Petition of the undersigned Shipowners, Ship-masters, and others interested in the Trade and Shipping of the Port of Sydney, present at a Public Meeting held at the Exchange, on Friday, the 16th January, 1857, and others,—

HUMBLY SHEWETH :—

That your Petitioners view with alarm the proposed reduction about to be made in the Shipping Master's Department of this Port, and most respectfully crave the attention of your Honorable House to the following observations :—

1. That prior to the formation of the Shipping Master's Office, the Owners, Masters, and Agents of vessels frequenting this port, were subjected, through the influence of crimps, and other characters of the worst description, to annoyances and impediments of such a nature, as seriously retarded the progress of Trade.

2. That greatly increased facilities have been afforded to the Shipping interest, in all its relations, by the establishment of this Office, both in economy and despatch.

3. That your Petitioners are therefore deeply impressed with the urgent necessity of maintaining its efficiency to the utmost extent, and for that purpose would even submit cheerfully to an increased scale of charges, should such be found necessary.

4. Your Petitioners respectfully submit for consideration the fact, that this Institution is not only self-supporting, but has actually yielded annually a large surplus to the General Revenue of the Colony.

5. That your Petitioners firmly believe, that the effect of the reductions recently made in the salaries and Staff of this Department, will be such as to impair materially, if not altogether destroy its utility.

Your Petitioners therefore humbly pray, that your Honorable House taking the premises into your favourable consideration, will be pleased to adopt such measures as to your Honorable House may seem meet to effect the desired object, and afford such relief as the necessities of the case may require for the purpose of retaining the Shipping Office in a state of efficiency.

And your Petitioners, as in duty bound, will ever pray.

# RIVER HUNTER.

(DEEPENING OF, AND SPECIFICATIONS THEREWITH)

*Ordered by the Legislative Assembly to be Printed, 8 August, 1856.*

RETURN to an *Order* of the Honorable the Legislative Assembly, dated 3 June, 1856, for—

“ All the Correspondence that has passed between the Executive Government and Mr. Moriarty, respecting the Deepening of the River Hunter; together with Plans, and Specifications connected therewith.”\*

### SCHEDULE.

	Page.
1. Extract from Letter from Colonial Secretary to Mr. E. O. Moriarty, dated 22 November, 1855, transmitting an Extract from a Minute of the Governor General, respecting Improvements in the River Hunter . . . . .	2
2. Mr. Moriarty to Colonial Secretary, 23 November, 1855, in reply . . . . .	2
3. Colonial Secretary to Mr. Moriarty, 23 April, 1856, to expedite the transmission of Plan, &c. . . . .	2
4. Mr. Moriarty to Colonial Secretary, 29 April, 1856, transmitting Plan, Specification, &c. . . . .	3
5. Colonial Secretary to Mr. Moriarty, 27 May, 1856, approving of certain portions of the Work being proceeded with . . . . .	4
6. Mr. Moriarty to Colonial Secretary, 3 June, 1856, forwarding Draft Notice inviting Tenders . . . . .	5
7. Notice of 7 June, 1856 . . . . .	5
8. Mr. Moriarty to Colonial Secretary, 23 June, 1856, with Schedule of Tenders received under the Notice . . . . .	5
9. Colonial Secretary to Mr. Moriarty, 4 July, 1856, intimating the acceptance of Mr. Strong's Tender . . . . .	6
10. Ditto to ditto, 11 July, 1856, requesting information as to Contract . . . . .	6
11. Mr. Moriarty to Colonial Secretary, 11 July, 1856, in reply . . . . .	6
12. Colonial Secretary to Mr. Moriarty, 16 July, 1856, in continuation . . . . .	7
13. Mr. Moriarty to Colonial Secretary, 19 July, 1856, in reply . . . . .	7
14. Colonial Secretary to Mr. Moriarty, 24 July, 1856, in continuation . . . . .	8
15. Civil Crown Solicitor to Colonial Secretary, 15 July, 1856, transmitting Bond entered into by Mr. Strong . . . . .	8
16. Colonial Secretary to Mr. Moriarty, 23 July, 1856, transmitting Mr. Strong's Bond . . . . .	8

\* NOTE.—These Plans and Specifications were not laid upon the Table, but deposited in the Library for present reference.

## RIVER HUNTER.

---

### No. 1.

(EXTRACT.)

THE COLONIAL SECRETARY to EDWARD MORIARTY, ESQ.

*Colonial Secretary's Office,*

*Sydney, 22 November, 1855.*

SIR,

In transmitting to you the accompanying copy of a Minute of His Excellency the Governor General, respecting improvements in the River Hunter, I am directed to request, that you will prepare and transmit to me the Plans and Estimates required by His Excellency.

I have, &c.,

(Signed)

W. ELYARD.

EDWARD MORIARTY, ESQ.

[Enclosure in No. 1.]

*EXTRACT from Governor General's Minute.*

#### HUNTER RIVER IMPROVEMENTS.

1. I send back the Plans of the Hunter River, having seen Mr. Moriarty, and arranged with him to send in proper Plans and Estimates for the work to be done, of which he is to have the charge, with a salary of £750 per annum, he being answerable for the work, and providing his own means of superintendence.

2. To send in Plans and Estimates of such work as may be required to deepen the water over the Flats above Newcastle.

### No. 2.

E. O. MORIARTY, ESQ., to THE COLONIAL SECRETARY.

*Sydney, 23 November, 1855.*

SIR,

I have the honor to acknowledge the receipt of your letter of the 22nd instant, transmitting to me a copy of the Minute of His Excellency the Governor General, respecting the proposed improvements on the Hunter River.

2. I shall immediately commence the preparation of the Plans, &c., specified in His Excellency's Minute, and shall, on their completion, do myself the honor of transmitting them to you.

As I shall immediately enter on the duties, I presume the arrangements proposed by His Excellency with regard to Salary will commence from this date.

I have, &c.,

(Signed)

E. O. MORIARTY.

THE HONORABLE

THE COLONIAL SECRETARY.

### No. 3.

THE COLONIAL SECRETARY to E. O. MORIARTY, ESQ.

*Colonial Secretary's Office,*

*Sydney, 23 April, 1856.*

SIR,

I am directed by the Governor General to request, that you will, as soon as possible, submit the Plans and Specifications of the work to be done, in clearing and deepening the River Hunter, which His Excellency considers you have been very long about.

I have, &c.,

(Signed)

W. ELYARD.

E. O. MORIARTY, ESQ.

## DEEPENING OF THE RIVER HUNTER.

3

No. 4.

E. O. MORIARTY, ESQ., to THE COLONIAL SECRETARY.

29 April, 1856.

SIR,

I do myself the honor to forward you, for the sanction of His Excellency the Governor General, the accompanying Plans, Specification, and Estimates of the work to be done, in clearing and deepening the River Hunter, at the Flats.

I have, &amp;c.,

(Signed)

E. O. MORIARTY.

THE HONORABLE

THE COLONIAL SECRETARY.

[Enclosure in No. 4.]

*GENERAL SPECIFICATION of Work to be done, in clearing and deepening the Hunter River, at the Flats.*

Sydney, 29 April, 1856.

The principal obstructions to the navigation, in that part of the River Hunter called the Flats, occur near the small Horse-shoe Bank, abreast of Snapper-hole Island. It is here that the waters of the river, having been divided amongst four channels, lose in some degree the velocity due to their united volume; so that the particles of sand and other matters which they had brought thus far, are deposited, forming banks and shoals, which, in process of time, have been converted into islands.

That the estuary of Fullerton's Cove exercises considerable influence on the direction of the current, and on the form of the channel below it, will be evident on examination of the ebb currents, indicated by the red lines on the accompanying plan; as the resultant of two lines, representing the force and direction of the ebb tide out of Fullerton's Cove and down the Hunter, will exactly strike the north-east end of Snapper-hole Island.

Before, however, reaching this point, the direction of the current has been diverted by the western edge of the Horse-shoe Bank, causing the principal body of the ebb waters to flow down the channel west of Snapper-hole Island, where it has scoured out the bed to a depth of 17 feet; while that portion of the water which passes down the other channels is comparatively insignificant, being insufficient to maintain a greater depth than from 6 to 7 feet, at low water.

There is another cause, in addition to the above, which contributes, in some degree, to the waters being drawn into this western channel, namely,—that being the straightest, and, consequently, the shortest course, the rate of declivity is greater in it than in those channels which are more tortuous.

The object, therefore, of any operations undertaken to improve the navigation over the Flats, must be to counteract the ill effects arising from crooked channels, and a divided current; so that by straightening the former, and concentrating the force of the latter in one navigable course, a scouring power shall be produced, which will be sufficient to maintain in it the required depth of water; taking care, at the same time, that the works constructed for this purpose, shall offer no material impediment to the free passage of the tidal wave up the river.

The works which, in accordance with the foregoing principles, I have marked on the plan, and which I now do myself the honor respectfully to propose for the sanction of His Excellency, are as follows:—

1st. To close, by means of sheet piling (such as shall be hereafter more particularly described), all the channels except the principal one leading into Fullerton's Cove, so that the waters entering and leaving it shall be made, (as far as is practicable,) to pass up and down the main channel of the river. The channels to be closed are marked respectively A, B, H, H I, on the accompanying plan.

2nd. To direct the current of the ebb tide flowing out of Fullerton's Cove, and guide it fair for the channel below. The rows of piles for this purpose, by being divided into three sections, and driven in the positions shown on the plan at C, C 1, C 2, although tending to direct the ebb currents, will offer no impediment to the free passage of the flood tide up the river, as they are placed in directions nearly parallel to its course.

3rd. To straighten and deepen the present channel, between the points marked E and F, by dredging away the end of the bank marked D, and tinted pink on the plan; and to form the channel to an uniform curve between the points marked F and G, by dredging through the bar at the head of the Horse-shoe Bank, and removing some of the sand on its eastern side, shown on the plan by a pink tint and letter J; and by confining the action of the water to this latter channel, by a line of sheet piling, placed in the direction shown at K. By forming the channel at this place to a fair curve, not only will the scouring effect of the water be increased, but in addition, one principal difficulty in the navigation will be removed; as all the captains of steamers plying to the Hunter are agreed, that the difficulties in the navigation of the Flats, arise nearly as much from the tortuous nature of the present channel, as from its shallowness.

41a.

4th. As soon as the new channel, above described, has been opened to the required depth of, say 10 feet at low water, we may then commence to close the upper ends of the branch channels, between the Long Bank and the mainland on the east, and between Snapper-hole and Ash Islands on the west, by rows of sheet piling, placed in the positions marked L and N.

5th. The portions tinted pink on the plan and cross sections will show where it is proposed to dredge out the new channel, to be not less than 100 feet wide, on each side of the curved black line marked on the plan, or 200 feet in full width at the narrowest part (in most places it will be considerably more); but I have no doubt, when the channel is once formed even to this breadth, which will be sufficient for the present steam traffic, that the action of the water, when once fairly directed into it, will in a short time widen it considerably.

6th. The sheet piling may consist of the common slabs of the country, driven between guide piles and wales, in the manner shown by a sketch on the accompanying plan. If necessary, it could be removed without difficulty, and placed in any other position, at a trifling cost; or, by being backed up with fascines and sand, would form a good permanent embankment.

The approximate cost of the proposed works, given in detail, is as follows:—

	£	s.	d.
<b>TO FORMING NEW CHANNEL BETWEEN F AND G.</b>			
Excavation, 102,135 cubic yards, at 1s. 6d. ... ..	7,660	0	0
<b>TO FORMING NEW CHANNEL AT D.</b>			
Excavation, 63,434 cubic yards, at 1s. 6d. ... ..	4,757	0	0
<b>SHEET PILING.</b>			
At A, 77 yards lineal, at £1 13s. ... ..	£127	0	0
— B, 77 ditto ditto ... ..	127	0	0

E. O. MORIARTY.

No. 5.

THE COLONIAL SECRETARY to E. O. MORIARTY, Esq, E. C.

*Colonial Secretary's Office,  
Sydney, 27 May, 1856.*

SIR,

I have the honor to inform you that the Governor General has laid before the Executive Council your letter of the 29th ultimo, submitting a Plan, Specification, and Estimate of the work to be done in clearing and deepening the River Hunter at the Flats.

2. This work, the entire cost of which is estimated at £16,375, is divided by you into three portions, viz. :—

- (1.) Forming a new channel between the points marked F and G on the plan, £7,660.
- (2.) Forming a new channel at the points marded D on the plan, £4,757.
- (3.) Piling at all the points indicated thereon, £3,958.

3. Fortified by the opinion of the Governor General, who has personally examined the locality, the Council advised that the work indicated in the first two subdivisions should be deferred for the present; but that the Piling should be at once proceeded with, except at the spot marked K on the plan, which will also be deferred until experience is gained of the result of the Piling in the other portions of the River.

4. I am accordingly directed by His Excellency to request, that you will submit a notice for publication, inviting Tenders for the performance of that portion of the work now sanctioned, the cost of which is estimated at £2,724.

I have, &c.,  
(Signed) W. ELYARD.

E. O. MORIARTY, Esq., C. E.

No. 6.

E. O. MORIARTY, Esq., to THE COLONIAL SECRETARY.

*Sydney, 3 June, 1856.*

SIR,

I have the honor to forward you a notice for publication, inviting Tenders for the performance of the Sheet Piling on the Hunter River Flats, the sanction of which by His Excellency the Governor General, was conveyed to me in your letter of the 27th May last.

I have, &c.,  
(Signed) E. O. MORIARTY.

THE HONORABLE  
THE COLONIAL SECRETARY.

No. 7.

[Enclosure in No. 6.]

*Colonial Secretary's Office,  
Sydney, 7 June, 1856.*

TO CONTRACTORS AND OTHERS.

Tenders will be received at this Office until 12 o'clock of Monday, the 23rd instant, from persons willing to contract for the execution of Sheet Piling on the Flats of the River Hunter.

Plans, Specifications, and all further particulars, can be obtained on application at the Office of Mr. E. O. Moriarty, Civil Engineer, Mort's Buildings, Pitt-street, Sydney.

Tenders to be endorsed, "Tender for Sheet Piling."

Tenders must state the time within which it is proposed to complete the work, and at the foot of every Tender there must be a memorandum signed by the party tendering, and two responsible persons as sureties, agreeing to be answerable for the due performance of the Contract, in the event of the Tender being accepted, and undertaking, in that event, that they will severally execute and deliver, at the Office of the Civil Crown Solicitor, in Sydney, or at the Police Office, Newcastle, within ten days from the usual notification of acceptance, a Bond to Her Majesty, in the penal sum of £500, for securing such performance, otherwise the Tender will not be taken into consideration.

The party tendering, or an agent authorized in writing to act for him, is requested to attend at this Office at the time appointed for receiving the Tenders, to afford such explanation or information as may be required.

(Signed) STUART A. DONALDSON.

No. 8.

E. O. MORIARTY, Esq., to THE COLONIAL SECRETARY.

*Pitt-street, Sydney,  
23 June, 1856.*

SIR,

I do myself the honor to enclose you a Schedule of the Tenders which have been made, by persons desirous of contracting for the execution of the Sheet Piling, to be constructed on the Flats of the River Hunter.

The Tender of Mr. W. Strong being the lowest, and as he is, I believe, quite competent to carry out the work efficiently, I beg to recommend the acceptance of his Tender.

I have, &c.,  
(Signed) E. O. MORIARTY.

THE HONORABLE  
THE COLONIAL SECRETARY.

## No. 9

THE COLONIAL SECRETARY to E. O. MORIARTY, ESQ., C. E.

(Copy.)

*Immediate.**Colonial Secretary's Office,  
Sydney, 4 July, 1856.*

SIR,

I am directed to inform you, that the Tender of Mr. William Strong, for Sheet Piling to be constructed in the River Hunter, at the Flats, has been this day accepted, and that he has been referred to you for further information, and to the Civil Crown Solicitor, for the purpose of signing the necessary Bond for the due observance of his contract.

The Bond will be forwarded to you, when executed.

I have, &amp;c.,

(Signed) W. ELYARD.

E. O. MORIARTY, ESQ., C. E.,  
Sydney.

## No. 10.

THE COLONIAL SECRETARY to E. O. MORIARTY, ESQ., C. E.

(Copy.)

56-5586.

*Colonial Secretary's Office,  
Sydney, 11 July, 1856.*

SIR,

With reference to your letter of the 23rd ultimo, submitting a Schedule of Tenders for the execution of the Sheet Piling to be constructed on the Flats of the River Hunter, and to my reply of the 4th instant, approving of the Tender of Mr. Strong for the performance of that work, I am directed to request, that you will be good enough to inform me whether the Contract has been accepted for the whole of the work according to your Estimate, amounting to £3,958, or for the reduced amount of £2,724, excluding the item of £1,234, marked K in the Estimate referred to.

I have, &amp;c.,

(Signed) W. ELYARD.

E. O. MORIARTY, ESQ., C. E.

## No. 11.

E. O. MORIARTY, ESQ., to THE COLONIAL SECRETARY.

*Pitt-street, Sydney,  
11 July, 1856.*

SIR,

I have the honor to acknowledge the receipt of your letter of this date, inquiring whether the Contract for Sheet Piling on the Flats of the River Hunter has been accepted for the whole of the Works, according to my Estimate, amounting to £3,958, or for the reduced amount of £2,724, excluding the item of £1,234, marked K in the Estimate referred to.

In reply, I do myself the honor to inform you, that the item K (£1,234) has been excluded from the Tender of Mr. Strong, and also from my Specification of the work to be performed.

Mr. Strong's Tender for some portions of the work is above my Estimate, for other portions a little below; but the total amount of his Tender for the work (excluding K) is above the amount I had estimated for it; the sum by which it exceeds it I cannot, just now name, as the papers relating to the subject have not yet been returned to my office from the Civil Crown Solicitor.

I have, &amp;c.,

(Signed)

E. O. MORIARTY.

THE HONORABLE  
THE COLONIAL SECRETARY.

## No. 12.

THE COLONIAL SECRETARY to E. O. MORIARTY, Esq., C. E.

(Copy.)  
56-6,046.*Colonial Secretary's Office,*  
*Sydney, 16 July, 1856.*

SIR,

I am directed to acknowledge the receipt of your letter of the 11th instant, respecting Mr. Strong's Contract for Sheet Piling on the Flats of the River Hunter, and to inform you, that as his Tender exceeds your Estimate by 50 per cent., or nearly so, it does not tell well of the accuracy of the data on which the Estimate was founded; the work may, however, proceed, as intimated to you in my communication of the 4th instant.

I have, &amp;c.,

(Signed)

W. ELYARD.

E. O. MORIARTY, Esq., C. E.,  
Sydney.

## No. 13.

E. O. MORIARTY, Esq., to THE COLONIAL SECRETARY.

*38, Pitt-street, 19 July, 1856.*

SIR,

I have the honor to acknowledge the receipt of your letter of the 16th inst., in reference to the Sheet Piling for the Flats of the River Hunter.

I must admit that I was a good deal surprised at the difference between the amount of my Estimate for the work and Mr. Strong's Tender—a difference for which I was wholly unable to account before, not having until to-day received back the papers on the subject.

On carefully going into the matter again, I find that the discrepancy arises principally from a clerical error in the Estimates which I submitted to the Government, wherein a wrong price was placed opposite the items C<sup>s</sup> and M<sup>s</sup>, which were charged at £1 13s. per yard run, instead of £3, the latter being the price I had estimated for the 15 feet deep Piling, and which is only one shilling per yard run above the price in the Tender. The Specification states that the Sheet Piling at C<sup>s</sup> and M<sup>s</sup> shall be 15 feet deep, and that this depth will be required at these spots will be evident, on examining the Plans, which I do myself the honor of returning to your office for that purpose. You will observe that the depth of water being about 8 feet at low-water *spring tides*, the 10 foot Sheet Piling would have been quite insufficient.

My Estimate for the work, if these items had been put at their proper prices, would have been £3,200, or £411 17s. under the Tender, the latter being £3,611 17s.; a discrepancy which is not so very great, when it is remembered that most of this work can only be executed during certain times of tide, and not at all in stormy weather; both of which are circumstances of which a contractor would be certain to take full advantage, in framing his tender.

With reference to the difference between Estimates and Tenders generally, I may, perhaps, be excused for observing, that the fluctuations in the price of labor are so great, that it is exceedingly difficult, if not impossible, to make them agree. In proof of this I may instance the Breakwater, the tenders for the repairs to which vary from £7,408 to £2,985; the latter being the price for which we are getting the work performed; my own Estimate having been about a mean proportional of them all.

I have, &amp;c.,

(Signed)

E. O. MORIARTY.

THE HONORABLE  
THE COLONIAL SECRETARY.

W. ELYARD.

E. O. MORIARTY, Esq., C. E.

[Enclosure 1 in No. 16.]

## HUNTER RIVER IMPROVEMENTS.—SPECIFICATION FOR SHEET PILING AT THE FLATS.

The work embraced in this Contract will consist in the construction of the undermentioned lengths of Sheet Piling, to be driven in the positions shewn on the general plan of the Hunter River, hereunto attached, and marked respectively (A, B, C, C', C'', H, H', L, M<sup>3</sup>, N,) thereon.

2. The length of Sheet Piling across the upper channel, into Fullerton's Cove, marked A on the general plan, will be about 77 yards, the depth 10 feet. It will be formed by driving a row of guide piles, at distances of 15 feet apart from centre to centre. These are to be not less than 10 inches through, in their least dimension, and 15 feet long. They may be roughly squared only on the two sides adjoining the sheet piles, and shall be driven at least 8 feet into the ground. On each side of the row of guide piles, walings must be fixed, and fastened by wrought iron bolts of 1 inch in diameter, with proper heads, nuts, and washers. These wales may consist of half timbers 10 in. × 6 in., and 16 feet 6 inches long, the ends being notched where they join the piles, and the piles being notched in, one inch to receive them, so that when secured in their place, there shall be a space of about 3 inches broad between their inner edges, in which the sheet piles will be driven. The sheet piles shall consist of slabs of iron bark, or other approved timber, sawn or split. They shall be not less than 9 inches wide, and 3 inches thick, and 10 feet long, perfectly straight and square on the edges, so that when driven in their places, and set up with a wedge pile, they shall fit, *butt to butt*, closely and uniformly throughout their entire length. They shall be driven to such a uniform depth as will leave their heads level with the high water mark of spring tides.

The next length of Piling will be driven across the channel, into Fullerton's Cove, marked B on the general plan. It will be also 77 yards long, and similar in all respects to that already described for channel A.

Sections C and C 1, will be respectively 88 yards and 187 yards in length. They shall be driven in the positions shewn at C—C 1 on the general plan, and similar in all other respects to that already specified for section A.

Sections H—H 1, will be respectively 286 yards and 55 yards in length. They are to be constructed across the eastern channel into Fullerton's Cove, at the places indicated on the plan by the letters H—H 1. In all other respects they are to be similar to that already described for section A.

The Piling of section L will be constructed across the narrow channel, running to the eastward of the long sand-bank, in the position indicated by the letter L on the general plan, being 110 yards in length. The top of the sheet piles in this section need only reach to the level of half tide; in all other respects they are to be similar to those already described for section A.

Sections C 2, M 3, and N, are to be driven in the position indicated by those letters on the plan. They will be respectively 176 yards, 176 yards, and 231 yards in length.

The guide piles for these sections shall not be less than 20 feet long and 12 inches diameter, driven at distances of 15 feet apart from centre to centre; they are to be perfectly straight and square on the two sides adjoining the sheet piles. The sheet piles for these sections shall be not less than 15 feet long, 5 inches thick, and 12 inches broad; they are to be driven between wales not less than 12 in. × 6 in., and 16 feet 6 inches long, properly secured to the pile heads by 1 inch wrought iron bolts, with nuts, heads, and washers, as before described.

All the timber used for guide and sheet piles, shall consist of good sound iron bark, spotted or blue gum, or of such other kind as shall be approved by the Engineer to the Harbour Works or his assistant; they shall be perfectly straight, sound in heart, and free from all defects; they must be properly pointed and dressed to a line on the edges, so that they will drive straight and close. If necessary, the heads of the guide piles shall be bound with a wrought iron ring, to prevent them from splitting while being driven; and in all cases both guide and sheet piles, shall be driven to such a depth as to give them a sufficiently firm hold in the bottom. The exact position and direction of each section of Sheet Piling will be marked out in the first instance by the Engineer, to which the Contractor will be bound strictly to adhere, and should he deviate therefrom in the least, he shall be bound, when called on to do so, to take up any portion of the Piling which may have been driven out of the true line, at his own cost, and replace it in the true position. The Contractor shall be also bound to see that any poles or marks which may have been placed by the Engineer, when so laying out the work shall not be injured or removed. The Contractor shall also be bound immediately to remove any materials or workmanship which may be objected to by the Engineer in Chief, or the Resident Engineer, and substitute in its place such materials or workmanship as shall be approved of by the Engineer or his assistant.

The plans, sections, and drawings, represent generally the forms and dimensions of the several works, and are signed by E. O. Moriarty, the Engineer for the Government. When any discrepancy exists between the dimension as indicated by the scale, and the written dimensions and figures, the latter shall be taken as correct; and should there be any discrepancy between the figures or dimensions or form of construction given on the drawings, and the dimensions and descriptions given in this specification, the latter shall be received as correct; and in all cases of ambiguity or insufficient description, in either the drawings or specification, the explanation given by the Engineer shall be considered correct, and shall be binding upon the parties. Any minor parts not included in the drawings or specification, but the intention to include which is obviously necessary for the completion and stability of the works, shall be provided by the Contractor, and are supposed to be included in the sum at which he contracts for the works.

The Contractor shall provide at his own cost all materials, tools, pile engines, machinery and labour of all kinds necessary for the complete carrying out of his contract, and upon its completion he shall remove all surplus materials which might, if allowed to remain, divert or affect the currents of the river.

The Contractor is not in any case to deviate from the specification or dimensions shewn on the accompanying drawings, without written directions to that effect, signed by the Engineer. But if at any time the Government or their Engineer shall direct any changes to be made either in the nature or extent of the works, the Contractor shall be bound to carry out the same, and be paid the extra cost, or allow the consequent deduction, the value of which shall be estimated and agreed upon before such change is made, according to the schedule of prices to be furnished by the Contractor, and in all such cases the change is only to be considered as affecting the object in view and not the contract generally.

The Contractor will be required to give due personal attendance, and in his absence to have some person properly qualified to act responsibly in charge of the work, who will be required at all times, when called upon to do so by the Engineer, to furnish a true return of all labor and materials used upon the works.

Should it appear to the Engineer that the Contractor is not performing his work in a proper manner, or with the requisite expedition, or that he does not comply with the orders to the fullest extent which the Engineer may give from time to time, the Government shall have power to take the work out of his hands, on giving him not less than fourteen days' notice to that effect, paying the fair value of the work actually performed, according to schedule price, less 10 per cent.; the Government may then employ other contractors or workmen to complete the same—the Contractor and his sureties remaining still answerable for any extra sum the work may cost above the contract price.

The Contractor shall state in his tender the sums for which he is willing to contract, for the completion of each section separately, as well as for the whole; he shall also state in schedule the rate per yard run, at which he will contract for the Sheet Piling of 10 feet and of 15 feet in depth, as shewn on the plan, so that any alterations which may be made shall be charged extra or deducted for according to these rates.

The work will be measured by the Engineer at the end of every four weeks, and payments made to the Contractor at the rate of 90 per cent. on the work actually completed, the remaining 10 per cent being retained by the Government, until the work is finally taken off the Contractor's hands, when the balance will be paid him.

The whole of the works herein mentioned are to be completed, in the most substantial manner, within a period of nine months from the date of signing the contract, to the entire satisfaction of the Government and their Engineer, under a penalty of the amount for which the Contractor's sureties are liable, being forfeited.

The Contractor is not to sub-let his contract, or any portion of it, without permission from the Engineer.

The Contractor whose tender shall be accepted, shall provide satisfactory security and sureties, within ten days from the date of its acceptance, for the due performance of the work, and within the time specified.

(Signed) E. O. MORIARTY,  
Engineer to the Hunter River Improvements.

This is the Specification marked with the letter C, referred to in our bond to Her Majesty, dated the 9th day of July, A.D. 1856.

[Enclosure 2.]

KNOW ALL MEN by these presents that we, John Tredgold Strong, of Newcastle, in the Colony of New South Wales, William Wright, of Newcastle, in the Colony aforesaid, Contractor, and James Bryson, of Newcastle, in the Colony aforesaid, Engineer, are held and firmly bound unto our Sovereign Lady Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, in the sum of Five Hundred Pounds of good and lawful money of Great Britain, to be paid to our said Lady the Queen, Her Heirs or Successors, to which payment, well and truly to be made, we bind ourselves, and each and every of us, jointly and severally for and in the whole, our and each of our heirs, executors, and administrators, and every of them, firmly by these presents.

Sealed with our Seals, dated the ninth day of July, in the year of our Lord one thousand eight hundred and fifty-six.

WHEREAS the above bounden John Tredgold Strong made the tender hereunto annexed, under the terms and conditions of a notice dated the seventh day of June now last past, and published in the *New South Wales Government Gazette*, of the tenth day of June, (of which notice a copy is also hereunder written) and at the prices, and under the stipulations, in the said tender mentioned or referred to, to provide the materials for and perform the work required in Sheet Piling on the Flats of the River Hunter, according to certain plans and specification,

specification, marked with the letters A, B, and C, and to complete the same in a substantial and workmanlike manner, according to the said plans and specification, within nine months from the date of these presents, for the sum of three thousand six hundred and eleven pounds, seventeen shillings, and the work and materials to be subject to the approval of E. O. Moriarty, or such other person as His Excellency may appoint for that purpose; and whereas the above bounden William Wright and James Bryson have severally agreed to become and be bound to Her Majesty, Her Heirs and Successors, for the due performance and fulfilment of the said tender, within the time mentioned in that behalf, according to the terms and conditions of the said notice; and whereas the said tender has been duly accepted, by His Excellency the Governor General of the said Colony, on condition that this bond should be entered into by them, the said John Tredgold Strong, William Wright, and James Bryson: Now the condition of the above written bond and obligation is such, that if the said John Tredgold Strong, shall, and do well and truly perform, and fulfil the said tender, and the contract arising out of such tender, and the acceptance thereof as aforesaid, and all and every the terms, conditions, and stipulations thereof, within the time hereinbefore in that behalf mentioned, then this obligation to be void and of none effect, otherwise to remain in full force and virtue.

[Enclosure 3.]

Colonial Secretary's Office,  
 Sydney, 7 June, 1856.

TO CONTRACTORS AND OTHERS.

Tenders will be received at this Office until 12 o'clock of Monday, the 23rd instant, from persons willing to contract for the execution of Sheet Piling on the Flats of the River Hunter.

Plans, specification, and all further particulars can be obtained on application at the office of Mr. E. O. Moriarty, Civil Engineer, Mort's Buildings, Pitt-street, Sydney.

Tenders to be endorsed "Tender for Sheet Piling."

Tenders must state the time within which it is proposed to complete the work, and at the foot of every tender there must be a memorandum signed by the party tendering, and two responsible persons as sureties, agreeing to be answerable for the due performance of the contract, in the event of the tender being accepted, and undertaking in that event, that they will severally execute and deliver at the office of the Civil Crown Solicitor, in Sydney, or at the Police Office, Newcastle, within ten days from the usual notification of acceptance, a bond to Her Majesty in the penal sum of £500, for securing such performance, otherwise the tender will not be taken into consideration.

The party tendering, or an agent authorized, in writing, to act for him, is requested to attend at this office at the time appointed for receiving the tenders, to afford such explanation or information as may be required.

[Enclosure 4.]

Newcastle, 20 June, 1856.

SIR,

I hereby offer to execute the Sheet Piling on the Flats of the River Hunter, according to Plan and Specification, at the following rates, viz., sections A, B, C, C 1, H, H 1, L, two pounds three shillings (£2 3s.) per lineal yard, or 880 yards for £1,892; sections C 2, M 3, and N, at two pounds nineteen shillings (£2 19s.) per yard, or 583 yards for £1,719 17s.

I am, &c.,  
 (Signed) J. T. STRONG.

The Honorable  
 The Colonial Secretary.

The gentlemen whose names are given below, have consented to become sureties for the due performance of the work.

(Signed) { WILLIAM WRIGHT, Newcastle.  
 JAMES BRYSON, Newcastle.

VOTES No. 37. TUESDAY, 4 NOVEMBER, 1856.

8. Deepening the River Hunter:—Mr. Scott moved, pursuant to notice,—  
(1.) That a Select Committee be appointed to inquire into the present plan proposed, and recently commenced, for deepening the River Hunter, at those parts commonly known as the Flats;—and into all matters connected therewith;—with power to send for persons and papers.  
(2.) That such Committee consist of Mr. Faucett, Mr. Flood, Mr. Parkes, Mr. Jones, Mr. Nichols, Mr. Plunkett, Mr. Osborne, Mr. Weekes, Mr. Arnold, and the Mover.  
Debate ensued.  
Question,—(1.) That a Select Committee be appointed to inquire into the present plan proposed, and recently commenced, for deepening the River Hunter, at those parts commonly known as the Flats;—and into all matters connected therewith;—with power to send for persons and papers,—put and passed.  
Question,—(2.) That such Committee consist of Mr. Faucett, Mr. Flood,\* Mr. Parkes, Mr. Jones, Mr. Nichols,† Mr. Plunkett, Mr. Osborne, Mr. Weekes, Mr. Arnold, and the Mover,—put and passed.

\* Seat declared vacant, 20 December, 1856.

† Seat declared vacant, 27 January, 1857.

---

VOTES No. 42. THURSDAY, 13 NOVEMBER, 1856.

11. Deepening the River Hunter:—Mr. Scott moved, pursuant to notice, That all the Correspondence that has passed between the Executive Government and Mr. Moriarty, respecting the deepening of the River Hunter, together with the Plans and Specifications connected therewith, and which Correspondence, Plans, and Specifications were laid upon the Table of this House on the 8th of August last, and ordered to be printed, be referred to the Select Committee appointed to inquire into the proposed plan for deepening the River Hunter.  
Question put and passed.

---

VOTES No. 46. WEDNESDAY, 19 NOVEMBER, 1856.

19. Shipwrecks at Newcastle:—Mr. Flood moved, pursuant to notice, That the Petition of the Inhabitants of Newcastle, presented by him yesterday, praying inquiry into the recent wrecks in and near the Port of Newcastle, be printed, and referred to the Select Committee on Deepening the River Hunter.  
Question put and passed.  
Ordered to be printed, and referred accordingly.

---

VOTES No. 92. FRIDAY, 20 FEBRUARY, 1857.

2. Deepening the River Hunter:—Mr. Scott, as Chairman, brought up a Progress Report from the Select Committee on Deepening the River Hunter, appointed on the 4th November last, together with the Evidence of Mr. Moriarty, and the Minutes of Proceedings of the Committee, in reference to the necessity for the immediate employment of the Dredging Machine, in furtherance of the works now progressing at the River Hunter.  
Ordered to be printed.
-

1857.

## DEEPENING THE RIVER HUNTER.

## PROGRESS REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 4th November, 1856, "to inquire into the present plan proposed and recently commenced for deepening the River Hunter at those parts commonly known as the Flats; and into all matters connected therewith; with powers to send for persons and papers;" and to whom were referred, on the 13th of the same month, "All the Correspondence that has passed between the Executive Government and Mr. Moriarty, respecting the deepening of the River Hunter, together with the Plans and Specifications connected therewith," and, on the 19th of the same month, "The Petition of the Inhabitants of Newcastle, praying inquiry into the recent wrecks in and near the Port of Newcastle";—have agreed to the following Progress Report:—

Your Committee have this day examined Mr. Moriarty, who has just returned from a careful survey and examination of the works in progress, and their effects upon the Channel at the Flats; and your Committee consider this information of such importance as to induce them to draw the immediate attention of this Honorable House to the matter.

The evidence of Mr. Moriarty shews that, owing to the piling operations having been carried on without the assistance of a Dredge, as originally recommended by him, the channel of the River now in use is becoming more tortuous, and is rapidly shoaling; and there is reason to apprehend the entire stoppage of the ordinary traffic of the River, unless steps be immediately taken to prevent such a calamity.

Mr. Moriarty has informed your Committee that but a very small shoal requires removal to render available the new channel, as indicated in his plan, as laid before your Committee; and that such removal could be effected in two or three months, provided the Dredge were at once put into operation.

Your Committee, therefore, strongly recommend that no time should be lost in sending the Dredge down to the Hunter for this purpose.

A. W. SCOTT,  
Chairman.

Legislative Assembly Chamber,  
Sydney, 20 February, 1857.

PROCEEDINGS OF THE COMMITTEE.

FRIDAY, 20 FEBRUARY 1857.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Jones,		Mr. Arnold,
Mr. Weekes,		Mr. Flood,

Mr. *E. O. Moriarty*, Civil Engineer, examined:—

Mr. Moriarty, in the course of his examination, handed in a new plan of the Flats of the River Hunter, prepared by him from soundings taken on the 12th instant.

At the close of Mr. Moriarty's examination, Committee deliberated as to the expediency of at once submitting a Progress Report to the House, stating the necessity which existed for immediately despatching the Steam Dredge to Newcastle for the purpose of removing a small shoal, so as to render available the new channel, now rapidly shoaling, in consequence of the piling operations having been proceeded with without its aid; and, being of opinion that it was decidedly advisable to immediately bring this matter under the notice of the House, requested the Chairman, with a view to accomplish this object, to forthwith draft a Progress Report for their consideration; and the Chairman having drafted such Report;—

Motion made and *Question*,—"That the Draft Progress Report, proposed by the Chairman, be now read"—*agreed to*.

Report read accordingly.

Whereupon motion made and *Question*,—"That this be the Progress Report of the Committee"—*agreed to*.

Chairman requested to report progress to the House, together with the Minutes of Evidence taken *this day*.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

## DEEPENING THE RIVER HUNTER.

FRIDAY, 20 FEBRUARY, 1857.

Present:—

MR. ARNOLD,  
MR. JONES,

MR. WEEKES.

MR. FLOOD,  
MR. SCOTT,

ALEXANDER WALKER SCOTT, ESQUIRE, IN THE CHAIR.

Edward Orpen Moriarty, Esquire, C.E., called in and further examined:—

1. *By the Chairman*: I believe you have been lately on the Hunter, examining the flats? I have.
2. Will you state to the Committee if any alteration has taken place up to this period from your last examination? I find that the channel hitherto used by the steamers seems to have been scoured a great deal in some places, holes, as it were, are scoured out of it, and the sand and matter scoured out of these places seem to have been deposited lower down, where the channel is somewhat wider, and where, consequently, the velocity of the water is less.
3. Is there any alteration in the channel nearer the head of Mosquito Island, from Mosquito Island towards Snapperhole Island? I have not made any soundings, but I do not see there can be much. I do not see that it would be affected at all.
4. Where does this alteration in depth commence? At the north point of Snapperhole Island.
5. *By Mr. Arnold*: Opposite the piling? Opposite the piling. From the piling downwards.
6. *By the Chairman*: Do you find any alteration in the direction of the channel itself? Yes; it is more tortuous, and the bottom seems to be very irregular.
7. Do you find that the course of the channel is approaching nearer the flats on the north-eastern side of Snapperhole Island? It is at the upper end, but it is further from it at the lower end. It seems to be working into the bank. There is nine feet six inches water here (*pointing to the plan*.)
8. Do you think the course of the river will become less or more tortuous in time? More, I think.
9. Will you state the depths of water in the present channel formed recently, compared with that formerly used by the steamers, in the worst places where you find it fill up? There is about five feet six inches of water compared with six feet six inches.
10. Less water? There is a foot less water in some places.
11. So that the course of the river is not only becoming more tortuous, but more shallow? Yes; the sand which has been scoured out of the upper part of the channel seems to have been deposited lower down, making the lower part shallower than it formerly was.
12. The lower portion of the flats, I suppose you mean? Yes.
13. Will you state your opinion now as to what will be the ultimate effect, if no other measures are taken? It is very difficult to say. Water is such an uncertain thing that I defy any man to tell where it will work. If left to itself possibly in the course of years it will cut out a new channel, but I cannot say where it will go. The eastern channel is opening and improving; but at present the effect is to injure the channel now in use; it is not so good as it was.
14. The eastern channel is, I presume, the channel you recommended originally to be adopted? Yes. I find that there is now a greater depth of water throughout this channel, with the exception of a short bar at its lower extremity. The channel is becoming more defined, and the depths are more uniform.

Edw. Orpen  
Moriarty,  
Esq., C. E.

20 Feb., 1857.

- Edw. Orpen  
Moriarty,  
Esq., C. E.  
20 Feb., 1857.
15. Then if no other improvement is to take place, is it your opinion that the channel you recommend would become sufficiently good—without using the dredging machine, say? I think it would in time; but I think before that time arrived the navigation of the river might be seriously affected for the worse.
16. Then you are still of opinion that a dredge is necessary? I am quite of that opinion.
17. How long would it take a dredge to make the channel you consider the proper one effective? Three months, at the outside.
18. With the use of a dredge for three months you would make that a good channel? Yes. It is now a better channel than the other, with the exception of the lower end.
19. *By Mr. Arnold*: What would be the minimum depth of water? Nine feet six inches. I proposed deepening it to ten feet six inches. If the bar were once cut through, it would soon not only widen but deepen itself.
20. *By the Chairman*: Have the bars or shoals, tinted pink in your original plan, been swept away? No, I cannot say there is much difference in them. The water on the upper one is a little deeper, I think. I should like to devote my attention now to cutting through the bar at the lower end. That could be done in three months.
21. Your intention still is to carry on the piling in the various spots indicated in the original plan? Yes.
22. In addition to the piling at the head of Snapperhole Island? Yes.
23. Do you propose to do it with ballast-stone or wood? I should propose to use some stone with the wood where we use it, and to substitute stone altogether for some other portions.
24. Do you intend to protect the piling against the ravages of the cobra? I should do that by dropping the silt which is excavated from the channel.
25. Have you any additional plan to suggest from your recent experience? No, I see no reason to change the scheme I first sent in. In fact, the more I see of it, the more I am convinced it is the best.
26. And had it been adopted, you think the navigation would have been much improved, without being at all impeded? Yes.
27. *By Mr. Jones*: Does it come within your knowledge that the steamers stick more frequently now than they did before you commenced piling? I believe they do; I have heard so from several persons connected with the steamers, and I have seen them stuck there myself; when I was sounding there was one.
28. In your opinion have the effects which have resulted from the piling rendered the new channel, which you pointed out originally, as the most desirable, more necessary? I think so. I think that if we were to set to work to dredge the present channel, it is very likely that as soon as we had dredged it we would find it silt up again. I have no doubt the new channel will be opened in course of time, but, perhaps, not before the other is blocked up.
29. Unless artificial means are resorted to, to open it? Yes.
30. Do you think it is necessary to have a dredge to deepen that new channel without delay? I do. I think the dredge out to go down there at once. The dredge might work in the new channel without in the smallest degree interfering with the navigation of the old channel.
31. Are you apprehensive, if measures are not early taken to deepen the new channel, that the old one will be closed, and the navigation of the river interfered with seriously? I am afraid it will. It seems to have filled up very rapidly of late.
32. Can you give a rough estimate of the probable amount of work necessary to be done in the new channel, to admit of its being used by steamers? Yes; there will be about fourteen thousand tons to be dredged.
33. How long will that require the dredge? Between two and three months; two months if smartly worked.
34. And that would secure an uniform depth of 9 feet 6 inches at low water? Yes.
35. That I think is considerably beyond the average depth of the channel which has existed hitherto? Yes, nearly 3 feet.
36. With that channel deepened to 9 feet 6 inches, there would never be any risk of the steamers now used sticking? Not the smallest.
37. Are you aware whether any steps are about to be taken to send any dredge down there to do the necessary work? I am not; in my original proposition I contemplated getting the Sydney dredge for a time, because I knew we had only a certain sum of money, and we could not afford to spend nine or ten thousand pounds for the purchase of a dredge.
38. *By Mr. Arnold*: What is the rise and fall of the tide in the Hunter at this spot? 4 feet 6 inches, springs, and 2 feet, neaps.
39. *By Mr. Flood*: Do you not think it would be better to have a dredge exclusively for the River Hunter? If we could afford it, it would decidedly be advisable, because I believe a dredge is required on other places besides this.
40. Irrespective of the cost, do you think the trade of the river and port is of so much consequence that it is absolutely necessary to have a dredging machine stationed there? I think there ought to be one.
41. *By Mr. Jones*: Have you brought under the notice of the Government the necessity of measures being taken early to send the dredge down there? I have written a letter to that effect, but I have not sent it in, because I am to see the Secretary for Lands and Works on Saturday. He has written to me for a Report on the subject.
42. You contemplate some steps being taken at an early date to remove the bars in the north-eastern channel? Yes. I have just reported to Mr. Hay that I think it necessary for a dredge to be employed to deepen this channel.
43. *By Mr. Arnold*: Have you any knowledge of any of the shallows in other parts of the river besides the flats? No; my original instructions confined me to the survey of the flats. I believe there are obstructions higher up; but I do not know them of my own knowledge.
44. You do not know whether it is practicable to continue the depth of water you have mentioned

- tioned the whole way up to Morpeth, by means of the dredge? I do not know; but I fancy it could be done.
45. That has been no part of your business? No, I had no instructions on that point. I believe there are only two places where there any serious obstructions.
46. One opposite Mr. Eales', and the other at Raymond Terrace? Yes.
47. Supposing a dredge were permanently stationed on the Hunter, would it not be practicable to excavate a channel of a greater depth than 9 feet 6 inches? I think so; but it would be a large work to endeavour to make it much deeper, because the mean depth of the river is not much greater than that. It is no use attempting to get a greater depth than the mean depth of the river.
48. From what you know of the mean depth of the river, do you think it would be practicable to increase the depth to eleven feet—that is eighteen inches more? I have not sufficient acquaintance with the other parts of the river to be able to say. It could be done on the flats, and I fancy the mean depth of the river is as great as that.
49. *By Mr. Weekes*: Has the silting up of the present channel, which you have spoken of, been owing to the small amount of piling you commenced with? Yes. It has scoured out deep holes in some places, washed the sand down, and deposited it where the channel is wider, and the water loses its velocity.
50. Seeing the effect that small amount of piling has had, do you still adhere to your original recommendations? Yes; I am more firmly convinced of the advisability of them than ever I was. In a sandy river it is no use attempting to keep a tortuous channel; you must straighten it; because the sand is deposited solely by the want of sufficient velocity in the water. If it is taken out there will be a deposit again from the same cause. If the channel is straightened, the current will keep it clear.
51. *By the Chairman*: Were you there during the strength of the ebb-tide? At the end of it, not the strength of it: about an hour before the end of it.
52. Did you observe whether there is much sand or mud carried away by the action of the water of the river? I could not say that.
53. *By Mr. Weekes*: Did there seem to be much sand or other matter held in suspension? I could not see any difference.
54. There was not a particularly cloudy aspect in the water? Nothing unusually so, I think.
55. *By the Chairman*: There is a shallow, or kind of a bar across the river near where the Stockton Factory used to be, but a little higher up—have you heard whether that has increased or decreased? Some say it has increased; others say it has not. Vessels do stick at it, I believe.
56. I asked you a question on your first examination, with reference to your responsibility, in respect to these works, and I wish to repeat it now, because you have had more experience of the action of the water—do you, as a professional man, consider that you would have to bear much of the responsibility, or the entire responsibility, of the failure of the works, as at present carried on, without having the assistance of a dredge and the other appliances you originally recommended? Of course I cannot be responsible for the effect of carrying out half my plan. It is unreasonable to suppose I should be.
57. So that if the channel were to be choked up now, you would not consider your professional character had suffered? In this way I might be considered responsible:—if I considered that only half the work being carried out would prove destructive to the navigation of the river, I do not think I ought to have been a party to its being done. I ought to have said I would have had nothing to do with it if I thought it likely to be injurious.
58. But you consider you have been relieved of a great portion of the responsibility? I do think a great portion of it has been taken off my shoulders by my plan not being entirely carried out; but, at the same time, I cannot say I feel the responsibility entirely removed from me.
59. Supposing your recommendation to have a dredge sent down immediately is not complied with, would you consider yourself then relieved entirely from responsibility? Yes, I think I should. If I make a recommendation and it is not attended to, I think I should be relieved from all responsibility, in consequence of its not being carried out. I believe the piling would of itself do a great deal of good, unassisted with anything else; but I think, in the meantime, until it has effected a cure, there may be some inconvenience felt. I have no doubt there will be a channel formed, but I cannot undertake to say where that channel will go.
60. Seeing that the present channel is working into the flat opposite Snapperhole Island, is it your opinion that it will work into it more and more, and try to force itself between Spectacle Island and Snapperhole Island? I think it will deepen this bend. You will see the sand is now thrown up all the way along here (*pointing to the plan*.) There is now five feet six inches where there was formerly little better than five feet, but it is not uniform; there is nothing like uniformity or regularity about it. The current acts on the bottom wherever the material is soft, and it is carried on until the water loses some of its velocity, and then it is deposited.
61. *By Mr. Weekes*: You do consider yourself responsible in a degree by consenting to undertake a portion only of your plan? Yes.
62. *By Mr. Flood*: I fancy you yielded to the opinion of those who are in power? I yielded to the opinion of those in whose judgment I had more confidence perhaps than in my own.
63. *By Mr. Weekes*: Have you not, in point of fact, put your professional character in danger in deference to the judgment of others? At the time this portion of my plan was sanctioned, I did not feel any degree of apprehension that it would be ultimately injurious to the river; nor do I now.
64. Should this partial execution of your plan prove a failure, will you consider your professional character involved in that failure? I feel a certain degree of responsibility.
65. Have you agreed to a divergence from your original plan, from some strong pressure? No; I have been instructed to carry out a certain portion of it, but it was quite competent to me to say I would not do it, if I thought it would be injurious.

Edw. Orpen  
Moriarty,  
Esq., C. E.

20 Feb., 1857.

- Edw. Orpen  
Moriarty,  
Esq., C. E.  
20 Feb., 1857.
66. Have you communicated to the Government that you would not consider yourself responsible for the effect of this portion of your plan alone? No, I have not.
67. *By Mr. Arnold*: Was it not your design from the commencement that the piling, the action of the water, and the dredging, should all act conjointly? Yes, that was my plan—to open the new channel partly, then go on with the piling, and then continue the dredging and drop the silt about the piling.
68. The object of the dredging would be to throw the force of the water into the particular channel that you desire to adopt? Yes. We always find that the water runs in the deepest channel.
69. But if the action of the water is left to itself it may seek other channels than that which you desire? It may.
70. Then, supposing that by means of this piling the channel is thrown from its present position, if it does not happen to take exactly the course which you desire, when the steam dredge is applied—supposing it is applied at some future time—the new channel which is opened will be prejudicial to the action of the dredge? Yes.
71. That is a reason why the dredge should be immediately set to work? Yes, I think so, in order that the action of the water should be confined to that channel.
72. *By Mr. Weekes*: Does not the course you are now pursuing reverse the order in which you intended to carry out your plan? Yes, with reference to the dredging in some degree it does.
73. *By Mr. Arnold*: Do you know where the steam dredge is employed now? No.
74. *By Mr. Weekes*: According to your original plan you would have first made use of the dredge? Yes; I proposed to form this new channel with the dredge.
75. And then to undertake what you have been instructed to make your first operation—what you have been instructed to make your first operation would, if you had been left to your own judgment, have been the second or the third? It would have gone on simultaneously with the others. Before working with the dredge I proposed closing some of the sections, in order to get a pocket, as it were, in which to throw the silt.
76. Had you been able to carry out your plan in that way, using the dredge at once, you do not apprehend that any of this shallowing of the water would have taken place? I think it would, because as soon as we opened the new channel the old one would have been filled up.
77. But the new one would have been opened before the old one was filled up? Yes.
78. *By Mr. Arnold*: The object of my questions was to show that the immediate application of the dredge would cause a very great saving of labour and inconvenience? Yes; it would save a considerable amount.
79. *By the Chairman*: In case the river should not take your proposed channel, I presume you could assist it very materially, or direct it very materially, by some formation of ballast-stone or piling, at the head of Mosquito Island? I propose to line all this with ballast (*pointing to the plan*.)
80. *By Mr. Arnold*: If the dredge is employed at once, your original plan can be still carried out? Yes; certainly.
81. *By the Chairman*: You think the dredge ought to be sent down without any loss of time? Yes. I intend to report to the Government to that effect.
82. If you have anything further to state, the Committee will be much obliged to you if you will mention it? I do not think there is anything else.

VOTES No. 37. TUESDAY, 4 NOVEMBER, 1856.

8. Deepening the River Hunter :—Mr. Scott moved, pursuant to notice,—
- (1.) That a Select Committee be appointed to inquire into the present plan proposed, and recently commenced, for deepening the River Hunter, at those parts commonly known as the Flats ;—and into all matters connected therewith ;—with power to send for persons and papers.
- (2.) That such Committee consist of Mr. Faucett, Mr. Flood, Mr. Parkes, Mr. Jones, Mr. Nichols, Mr. Plunkett, Mr. Osborne, Mr. Weekes, Mr. Arnold, and the Mover.
- Debate ensued.
- Question,—(1.) That a Select Committee be appointed to inquire into the present plan proposed, and recently commenced, for deepening the River Hunter, at those parts commonly known as the Flats ;—and into all matters connected therewith ;—with power to send for persons and papers,—put and passed.
- Question,—(2.) That such Committee consist of Mr. Faucett, Mr. Flood, \*Mr. Parkes, Mr. Jones, Mr. Nichols, †Mr. Plunkett, Mr. Osborne, Mr. Weekes, Mr. Arnold, and the Mover,—put and passed.
- 

VOTES No. 42. THURSDAY, 13 NOVEMBER, 1856.

11. Deepening the River Hunter :—Mr. Scott moved, pursuant to notice, That all the Correspondence that has passed between the Executive Government and Mr. Moriarty, respecting the deepening of the River Hunter, together with the Plans and Specifications connected therewith, and which Correspondence, Plans, and Specifications were laid upon the Table of this House on the 8th of August last, and ordered to be printed, be referred to the Select Committee appointed to inquire into the proposed plan for deepening the River Hunter.
- Question put and passed.
- 

VOTES No. 46. WEDNESDAY, 19 NOVEMBER, 1856.

19. Shipwrecks at Newcastle :—Mr. Flood moved, pursuant to notice, That the Petition of the Inhabitants of Newcastle, presented by him yesterday, praying inquiry into the recent wrecks in and near the Port of Newcastle, be printed, and referred to the Select Committee on Deepening the River Hunter.
- Question put and passed.
- Ordered to be printed, and referred accordingly.
- 

VOTES No. 92. FRIDAY, 20 FEBRUARY, 1857.

2. Deepening the River Hunter :—Mr. Scott, as Chairman, brought up a Progress Report from the Select Committee on Deepening the Hunter River, appointed on the 4th November last, together with the Evidence of Mr. Moriarty, and the Minutes of Proceedings of the Committee, in reference to the necessity for the immediate employment of the Dredging Machine, in furtherance of the works now progressing at the River Hunter.
- Ordered to be printed.

VOTES No. 104. THURSDAY, 12 MARCH, 1857.

7. Deepening the River Hunter :—Mr. Scott, as Chairman, brought up the Report from, and laid upon the Table the Evidence taken before, the Select Committee on Deepening the River Hunter, appointed on the 4th November last.
- Ordered to be printed, together with the accompanying Appendix.
- 

\* Seat declared vacant, 20th December, 1856.

† Seat declared vacant, 27th January, 1857.

1857.

## DEEPENING THE RIVER HUNTER.

## FINAL REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 4th November, 1856, "to inquire into the present plan proposed, and recently commenced, for Deepening the River Hunter at those parts commonly known as the Flats;—and into all matters connected therewith;—with power to send for persons and papers;" and to whom were referred on 13th of the same month, "all the Correspondence that has passed between the Executive Government and Mr. Moriarty respecting the deepening of the River Hunter, together with the plans and specifications connected therewith," and on the 19th of the same month, "the Petition of the Inhabitants of Newcastle, praying inquiry into the recent wrecks in and near the Port of Newcastle," and who, on the 20th ultimo, brought up a "Progress Report, together with the evidence of Mr. Moriarty, and the Minutes of Proceedings of the Committee, in reference to the necessity for the immediate employment of the Dredging Machine, in furtherance of the works now progressing at the River Hunter";—have agreed to the following Final Report.

## DEEPENING THE RIVER HUNTER.

The Witnesses examined in this matter have been Mr. E. O. Moriarty, C. E., Mr. Alexander Bremner, C. E., Mr. James Scott, Mr. J. T. Strong, Mr. Charles Paine, Mr. Alexander Livingstone, Mr. G. B. White, surveyor, and whose evidence (appended hereto) tends to shew that the new channel recommended by Mr. Moriarty to be formed over the Flats should have been carried out by the Executive, and that the Dredge ought to have been employed at the very commencement of the operations, so that by acting simultaneously with the system of piling, the silt raised might have been at once deposited at the foot of this piling, in order to close more effectually the useless channels, and to protect the woodwork itself from injury and decay.

Your Committee, after careful investigation, have found that the witnesses approve and recommend that Mr. Moriarty's plans, as contained in his "general specification of work to be done in clearing and deepening the Hunter River at the Flats," and which specification was transmitted to the Executive by that gentleman on 29th April, 1856, should have been carried out. The propriety of this appears to be borne out by the recent injurious diversion of the stream, caused by the partial adoption of the piling erected between Snapper-hole and Mosquito Islands, which has already the tendency to impede and render more difficult the navigation of the channel hitherto in use, and which circumstance led your Committee to bring up to your Honorable House a Progress Report in order to afford the Government the earliest opportunity of preventing consequences so ruinous to the trade of the whole district.

Your Committee are of opinion that the channel over the Flats should be made as straight as circumstances will permit, and therefore recommend that the Dredge should be immediately used to render the new channel available, in conjunction with the parallel system of piling at the upper estuary of Fullerton Cove, as proposed by Mr. Moriarty; so that the vast body of water contained therein might at ebb tide be forced in a fair and even course direct towards the proposed channel, thereby keeping it free from obstructions, and probably scouring it to an additional depth and width.

The

The Government have stated that measures have already been adopted to carry out with vigour and despatch the original intentions of the Engineer, and that no delay will arise to prevent the accomplishment of the object under consideration. Your Committee deem it unnecessary to enter more fully into the matter, and close with the observation, that in their estimation a grave error was committed by the Executive in relieving the Engineer from any portion of the professional responsibility which should attach to him, by not carrying out the original plan in its integrity, and express a strong recommendation that an efficient Dredge be permanently attached for the sole service and use of the Harbour and River of the Hunter, whose important imports and exports fully justify this recommendation.

#### HARBOUR OF NEWCASTLE AND SHIPWRECKS.

The evidence adduced under this head has satisfied the Committee of the necessity of some absolute and immediate change in the present system of Harbour management, and do recommend that the Harbour and Port of Newcastle, and all matters connected therewith, should be placed under a Local Board, in lieu of the Port Master's Department. And, in order to prevent a recurrence of those lamentable shipwrecks which have occurred at this spot, they urge that a *powerful* Steam Tug should be supplied, and placed entirely under the care and control of this Board, as all the evidence, without exception, proves that the loss of life and property would have been prevented had such a Tug been ready for service.

The Committee, therefore, in strenuously advocating the necessity of a Steam Tug, do so under the belief that this vessel could be easily made self-supporting.

A. W. SCOTT,  
Chairman.

*Legislative Assembly Chamber,  
Sydney, 12 March, 1857.*

---

PROCEEDINGS OF THE COMMITTEE.

FRIDAY, 7 NOVEMBER, 1856.

**Members Present:—**

Mr. Scott,		Mr. Jones,
	Mr. Plunkett.	

Mr. Scott was called to the Chair.

The Chairman stated the course which he considered that it would be expedient for the Committee to adopt in prosecuting this inquiry.

Committee having before them a Return to an Order of the Legislative Assembly, dated 3rd June, 1856, for "all Correspondence that has passed between the Executive Government and Mr. Moriarty, respecting the Deepening of the River Hunter, together with the Plans and Specifications connected therewith"—considered the same.

The Chairman read the general Specification of the Engineer, Mr. E. O. Moriarty, as given in page 3 of the above-mentioned Return, and the Schedule, shewing the approximate cost of the proposed Works, appended to the Specification.

Committee then examined the Plan alluded to in the Specification, and deliberated on the various propositions for carrying out the Works set forth therein.

The Chairman read the letter from the Colonial Secretary to E. O. Moriarty, Esq., No. 5 in the Return.

Committee deliberated on the propriety of the course pursued by the Governor General and Executive Council in carrying out a portion only of the Works proposed by Mr. Moriarty.

Motion made (Mr. Jones) and Question—"That E. O. Moriarty, Esquire, Civil Engineer, be summoned before this Committee, as a witness, on Wednesday next"—*agreed to.*  
[Adjourned till Wednesday next, at Eleven o'clock.]

WEDNESDAY, 12 NOVEMBER, 1856.

By direction of the Chairman, the meeting of the Committee to be holden *this day* was postponed until further notice.

THURSDAY, 27 NOVEMBER, 1856.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Nichols,		Mr. Parkes,
Mr. Faucett,		Mr. Weekes,
Mr. Plunkett,		Mr. Flood.

Resolution of the House referring to Committee on 19th instant—the Petition of the Inhabitants of Newcastle, praying inquiry into the recent Wrecks in and near the Port of Newcastle—read.

Petition then read.

The Clerk, by direction of the Chairman, then read the Minutes of Proceedings taken at the former meeting of the Committee.

Mr. E. O. Moriarty, Civil Engineer, examined.

[Adjourned till Tuesday next, at Eleven o'clock.]

TUESDAY, 2 DECEMBER, 1856.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Plunkett,		Mr. Parkes,
Mr. Weekes,		Mr. Jones,
	Mr. Flood.	

Committee deliberated, and directed that the Plan of the Port of Newcastle and part of the River Hunter, which Mr. E. O. Moriarty had been requested to prepare on a reduced scale from his original Plan, as an appendance to his Evidence, and the Sectional Plan of the River Hunter, shewing the alterations which have taken place in the channel since the commencement of operations therein, given in by Mr. Moriarty during his examination before the Committee, should be lithographed and bound up with such Report as the Committee might hereafter think fit to make.

Mr. *Alexr. Bremner*, Civil Engineer, and Mr. *J. T. Strong*, examined.  
 Motion made and *Question*—"That Mr. *J. Scott* and Captain *Mulhall* be summoned  
 "before this Committee, as witnesses, on Thursday next"—*agreed to*.  
 [Adjourned till Thursday next, at Eleven o'clock.]

THURSDAY, 4 DECEMBER, 1856.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Flood,		Mr. Jones,
Mr. Weekes,		Mr. Arnold,
Mr. Parkes,		Mr. Faucett.

The Clerk, by direction of the Chairman, read the Minute of Proceedings taken at the last meeting of the Committee.

Mr. *James Scott* examined.

The Chairman informed the Committee that Captain *Wm. Mulhall*, who had been personally summoned before the Committee, as a witness, for this day, had neither appeared in answer to such summons, nor assigned any reason for his non-appearance, as requested to do, in case of it being out of his power to attend, under the letter, dated the 2nd instant, addressed to him by the Clerk of the Assembly; and desired the opinion of the Committee as to the most expedient course to be pursued under the circumstances.

Committee considered that, although Captain *Mulhall* ought undoubtedly to have replied to such summons, as requested, in case of his inability to attend the Committee on the day specified, nevertheless, as he might have good and substantial grounds for such non-attendance, they would now recommend that a similar summons be again addressed to Capt. *Mulhall*, and that they should await the result of such summons, prior to taking any further steps in the matter.

The Chairman then read an Estimate received from Mr. *Alexr. Bremner*, Civil Engineer, prepared by him at the request of the Committee, setting forth the expense of making an examination into the rate of the current and condition of the Flats, near the Snapper-hole, in the River Hunter, which Estimate amounted in its sum total to £63 10s., and requested the opinion of the Committee as to the advisability of incurring this expense for such examination.

Committee deliberated.

Motion made (Mr. *Parkes*) and *Question*—"That this Committee are of opinion  
 "there is nothing before them to shew that any real practical good would result from making  
 "this examination, and, therefore, it would be inexpedient to incur an expense so considerable  
 "therefor"—*agreed to*.

The Chairman also laid before the Committee a letter from Mr. *J. Howden*, of Newcastle, condemnatory of the present plan of pile-driving, as carried on under the directions of Mr. *E. O. Moriarty*, in the River Hunter.

Committee deliberated thereon.

Motion made and *Question*—"That A. *Livingstone*, Esq., Harbour Master at New-  
 "castle, and Captains *Mulhall*, *Paine* and *Pattison*, be summoned before this Committee, as  
 "witnesses, on Tuesday next"—*agreed to*.

[Adjourned till Tuesday next, at Eleven o'clock.]

TUESDAY, 9 DECEMBER, 1856.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Arnold,		Mr. Weekes,
Mr. Jones,		Mr. Faucett,
Mr. Parkes,		Mr. Plunkett.

The Clerk, by direction of the Chairman, read the Minutes of Proceedings taken at the last meeting of the Committee.

Captain *Paine*, of the "*Illalong*" steamer, Mr. *G. Boyd White*, and Mr. *A. Livingstone*, Harbour Master at Newcastle, examined.

Committee having been informed by the Chairman that the Clerk had not succeeded in serving Captain *Wm. Mulhall* with a second summons, in consequence of his absence from Sydney during the period intervening between the previous and present meeting of the Committee, were of opinion, that as they had now examined Captain *Paine* on this subject, it would be unnecessary to take Captain *Mulhall's* evidence also.

Letter from Captain *Pattison*, of the "*Paterson*" steamer, stating his inability to attend the Committee, as a witness, *this day*, was read by the Chairman; and Committee considered that Captain *Pattison's* evidence would not now be required.

Motion made and *Question*—"That E. O. *Moriarty*, Esquire, be again summoned  
 "before this Committee, as a witness, on Thursday the 18th instant"—*agreed to*.

[Adjourned till Thursday, the 18th instant, at Eleven o'clock.]

THURSDAY,

THURSDAY, 18 DECEMBER, 1856.

**Members Present:—**

A. W. Scott, Esquire, in the Chair

Mr. Jones,		Mr. Plunkett,
Mr. Weekes,		Mr. Osborne.

Mr. E. O. Moriarty further examined.

Committee deliberated.

Motion made (Mr. Jones) and Question,—“That the Chairman do now prepare a  
“Draft Report for the consideration of the Committee”—*agreed to.*  
Committee then adjourned.

THURSDAY, 15 JANUARY, 1857.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Nichols,		Mr. Plunkett.
--------------	--	---------------

The Chairman stated, that he had directed the Committee to be summoned for *this day*, purposing to examine Mr. Bourne Russell, whose evidence he was desirous to obtain, prior to proceeding to draw up a Draft Report; but that Mr. Russell had informed him of his inability to attend as a witness, until to-morrow;—

Whereupon motion made and Question,—“That Bourne Russell, Esquire, be now summoned before this Committee, as a witness, for to-morrow”—*agreed to.*  
[Adjourned till to-morrow, at Eleven o'clock.]

FRIDAY, 16 JANUARY, 1857.

**Member Present:—**

Mr. Arnold.

Mr. Bourne Russell was in attendance, as a witness; but a quorum of members not being present, no meeting of the Committee was holden *this day.*

FRIDAY, 20 FEBRUARY, 1857.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Jones,		Mr. Arnold,
Mr. Weekes,		Mr. Flood.

Mr. E. O. Moriarty, further examined.

Mr. Moriarty, in the course of his examination, handed in a new plan of the Flats of the River Hunter, prepared by him from soundings taken on the 12th instant.

At the close of Mr. Moriarty's examination, Committee deliberated as to the expediency of at once submitting a Progress Report to the House, stating the necessity which existed for immediately despatching the Steam Dredge to Newcastle for the purpose of removing a small shoal, so as to render available the new channel, now rapidly shoaling in consequence of the piling operations having been proceeded with without its aid; and, being of opinion that it was decidedly advisable to immediately bring this matter under the notice of the House, requested the Chairman, with a view to accomplish this object, to forthwith draft a Progress Report for their consideration; and the Chairman having drafted such Report;—

Motion made and Question,—“That the Draft Progress Report, proposed by the  
“Chairman, be now read”—*agreed to.*

Report read accordingly.

Whereupon motion made and Question,—“That this be the Progress Report of the  
“Committee”—*agreed to.*

Chairman requested to report progress to the House, together with the Minutes of Evidence taken *this day.*

TUESDAY, 24 FEBRUARY, 1857.

**Members Present:—**

A. W. Scott, Esquire, in the Chair.

Mr. Jones,		Mr. Arnold,
Mr. Weekes,		Mr. Flood.

The Chairman stated that he had requested the attendance of two witnesses, Mr. Moriarty and Mr. John Bingle, for the purpose of examining them relative to the Petition respecting shipwrecks at Newcastle, referred for the consideration of the Committee on the 19th November last.

Mr. Merion Moriarty, Portmaster, examined.

A letter from Mr. *John Bingle*, Chairman of the Newcastle Chamber of Commerce, excusing his attendance before the Committee, as a witness, *this day*, read ;—

Whereupon motion made and *Question*,—“That Captain Rountree and A. Livingstone, Esquire, be summoned before this Committee, as witnesses, for Friday next”—*agreed to*.

[Adjourned till Friday next, at Eleven o'clock.]

---

FRIDAY, 27 FEBRUARY, 1857.

**Members Present :—**

A. W. Scott, Esq., in the Chair,  
 Mr. Arnold, | Mr. Flood,  
 Mr. Jones.

Mr. *A. Livingstone* further examined.

Captain *Rountree* examined.

Motion made, and *Question*—“That Charles Bolton, Esquire, and Mr. John Hannell be summoned before this Committee, as witnesses, for Wednesday next”—*agreed to*.

[Adjourned till Wednesday next, at Eleven o'clock.]

---

WEDNESDAY, 4 MARCH, 1857.

**Members Present :—**

A. W. Scott, Esquire, in the Chair.  
 Mr. Jones, | Mr. Flood.

Mr. *Charles Bolton*, Sub-Collector of Customs at Newcastle, and Mr. *John Bingle*, Chairman of the Newcastle Chamber of Commerce, examined.

Motion made (Mr. *Jones*) and *Question*—“That the Chairman now prepare a Draft Final Report for the consideration of the Committee”—*agreed to*.

[Adjourned till Thursday, 12th instant, at Eleven o'clock.]

---

THURSDAY, 12 MARCH, 1857.

**Members Present :—**

A. W. Scott, Esquire, in the Chair.  
 Mr. Jones, | Mr. Flood,  
 Mr. Weekes, | Mr. Arnold.

Letter from Mr. John Hannell, stating his reasons for non-attendance on the 4th instant, in compliance with the summons addressed to him, read.

Committee considered Mr. Hannell's explanation, as given therein, satisfactory.

The Chairman brought up and laid before the Committee a Draft Final Report.

Motion made and *Question*—“That the Draft Final Report proposed by the Chairman be now read 1<sup>st</sup>”—*agreed to*.

Report read 1<sup>st</sup> accordingly.

Committee deliberated.

Motion made (Mr. *Jones*) and *Question*—“That this Draft Report be now read 2<sup>d</sup>, and considered paragraph by paragraph”—*agreed to*.

Paragraphs 1, 2, 3, 4, 5, 6, and 7 read, and, with certain verbal amendments, agreed to.

Whereupon Motion made and *Question*—“That this be the Final Report of the Committee”—*agreed to*.

Chairman requested to report to the House, together with the Minutes of Evidence.

## LIST OF APPENDIX.

## MINUTES OF EVIDENCE

TAKEN BEFORE THE

SELECT COMMITTEE

ON THE

## DEEPENING OF THE RIVER HUNTER.

THURSDAY, 27 NOVEMBER, 1856.

Present:—

MR. FAUCETT,	MR. PLUNKETT,
MR. FLOOD,	MR. NICHOLS,
MR. PARKES,	MR. SCOTT,
MR. WEEKES.	

A. W. SCOTT, ESQUIRE, IN THE CHAIR.

Edward Orpen Moriarty, Esq., C. E., called in and examined:—

1. *By the Chairman*: You are by profession a Civil Engineer? I am.
2. You were required by the Government to make a report upon the deepening of the Hunter at those points known as the Flats? Yes.
3. Do you produce a plan of the river, shewing the alterations you proposed to make in the channel, and the works to be carried out with that view? I do. (*The Witness handed in the same. Vide Appendix A.*)
4. Have you seen these printed papers, supposed to contain the correspondence between yourself and the Government, and your report? No, I cannot say I have seen them in print.
5. Will you look over them, and say whether we can assume that they are correct? I believe they are all right; I see nothing to lead me to suppose they are not complete; but, of course, I cannot speak positively without comparing them with the copies I have.
6. You have been lately down to the Hunter? Yes; I was down on Saturday last.
7. Examining the works now in progress? Yes.
8. What is your opinion now, with respect to the recommendations that you originally gave in—has your opinion been altered or confirmed with respect to the propriety of these recommendations? I have had no reason to alter my opinion, with this exception, that we shall find in future stone ballast to be cheaper than timber piles.
9. You recommended certain dredging to be done, without reference to the materials at all? I did, and I see no reason to change the view I first formed in that respect.
10. Your original recommendations you consider ought to have been carried out, from what you now see? I believe so. I have no reason, whatever, to change my mind on the matter.
11. *By Mr. Plunkett*: Are the works being carried on as you originally recommended them to be carried on? No. I recommended that certain points, tinted pink on the plan, between D and G, should be dredged simultaneously with, or a little before, closing the channels which I intended to stop up, in order to give the river a fair sweep from the point marked F on the plan to the point marked G; in fact to straighten the course of the river as much as possible.
12. Was that recommendation acted on? The piling for the purpose of diverting the current has been sanctioned, but the dredging has been postponed.
13. Was the dredging a necessary part of your design? It was part of it.
14. Is your design being carried out to your satisfaction? I cannot say it is; I should like to have the dredge down there now.
15. *By the Chairman*: In your general specification of the work to be done you recommend as follows:—"4th. As soon as the new channel, above described, has been opened to the required depth of say 10 feet at low-water, we may then commence to close the upper ends of the branch channels, between the Long Bank and the mainland on the east, and between

E. O. Moriarty  
Esq.

27 Nov., 1856.

E.O. Moriarty Esq.  
27 Nov., 1856.

" Snapper-hole and Ash Islands on the west, by rows of sheet piling, placed in the positions marked L and N." I believe your original plan was that the dredge should be first in operation? Yes, it was; but I intended to have closed some of the minor channels first, in order to get still water recesses in which to drop the silt.

16. Have you had any reason to change that opinion? No; I have not.

17. Your reason for wishing to dredge was that the force of the current should be directed in a straighter channel instead of the present tortuous one? Yes; I wanted to straighten the channel to avoid that bend, as by so doing the tidal water would have ascended the river more freely, so that there would be a greater body of water to act on the bottom.

18. Will you give some reasons for that proposal, as regards tidal influences and currents? By straightening it the distance between the points F and G on the plan is considerably shortened, and, therefore, whatever fall is due to that distance on the river will be increased, and consequently the velocity of the waters will be accelerated.

19. And the strength of the current thereby increased? Yes; the difference of level, being divided by the shorter distance, gives a greater ratio of inclination.

20. Will it have any effect as regards keeping the channel clear afterwards? I think so—a great deal.

21. Do not steamers and other vessels experience as much difficulty from the tortuous nature of the present channel on the flats, as they do from the shoalness of the water? I have been told so. I have spoken to most of the Masters on the subject, and they say they have found the greatest difficulty on that account; their vessels smell the ground, as they express it—they cannot steer them very well.

22. On account of the shallowness of the water, and the tortuous channel? Yes.

23. As much the one as the other? Yes; they won't steer well, because of the shoalness of the water, and that makes it more difficult to get round those sharp bends.

24. If you dredged the course you propose, that difficulty would be entirely done away with? Yes; I think it would.

25. *By Mr. Faucett*: Do these flats that you wish to dredge appear above water at low tide? No; there is 6 or 7 feet water on them.

26. *By the Chairman*: What effect has the sheet piling you are now putting up at the head of Snapper-hole Island had upon the current of the river? It diverts it nearly all into the present channel. This is fully proved by the fact that the water is 6 to 7 inches higher on the up channel side of the piling than on the lower during ebb-tide; there is scarcely any difference of level (not 1 inch) during flood-tide.

27. Where will the water strike with the greatest force? It strikes on the bank at the north-east point of Snapper-hole Island.

28. If I understand you correctly, it strikes with some force on that bank? Yes, and it is then diverted across to the Long Mud Bank. The tendency of the water is to wear into that mud-bank.

29. What will be the ultimate effect of that in the course of years? To make a deeper bend.

30. Will it not have the effect, in the end, of going right through that bank? It may have that effect in course of time. I think it will work into the mud-flat, and deepen the bend.

31. The bend will be increased? Yes.

32. Therefore, instead of having a straighter channel, it will ultimately be a more tortuous one? Yes.

33. Do you think that the present work is at all likely to stand? I hope so.

34. Without any further assistance? I hope so after it shall have been finished.

35. Just as it was originally planned? No, I do not think it would, as originally planned, unless the silt and mud taken up by the dredge had been dropped about them, and this the addition of a few fascines, or a little ballast, as I suggested in my first report, would have been quite sufficient.

36. What would you recommend to make it effectual? I have dropped a lot of ballast along the foot of the piles. The channel at N is closed now, at the head of Snapper-hole Island.

37. You are now obliged to drop ballast to protect the sheet piling? Yes.

38. What is the expense of that ballast? Three shillings a ton.

39. Thrown into position? Thrown into position.

40. How many tons do you think you will require to do the work effectually? About four hundred tons.\*

41. Then you think that for sixty or seventy pounds you will make this particular sheet piling we are now speaking of efficient? We had great difficulty in executing this part of the work, because the bottom is a quicksand. One portion of the work which was left enclosed from Saturday night to Monday morning, was found to be scoured away to the depth of seven feet.

42. You think you will only require four hundred tons of common ballast to stop all that? I am in hopes four hundred tons will be enough.

43. *By Mr. Plunkett*: Will that permanently secure the piling? I think so. We only want to protect the bottom from being washed away from it.

44. *By the Chairman*: Have you finished any other sheet piling in any other direction? No, this is the only portion that has been done.

45. What has been the effect of the recent freshes upon the places where you propose to place piling at M? I cannot observe any change there. I did not look very closely at it, to say the truth.

46. I wish to know whether you think that if that sheet piling is finished at M, it will require ballast to protect it? I think it will.

47.

\* I have made a mistake here. I find that 650 tons have been deposited, and I fear we shall require more, say 850, much more.

47. What will be the additional expense of that? I have proposed to the Minister of Public Works to substitute ballast entirely, instead of sheet piling. E.O. Moriarty Esq.
48. What will be the difference of expense? I do not think there will be any increase. If there is a difference, I think it will be in favour of ballast. When I first made inquiries on the subject I could get no offers for ballast for less than six shillings a ton; they were charging four shillings for moving coals in the harbour of Newcastle, and they said that if I wanted stone up there at the Flats, I could not get it for less than six shillings. I am now getting it for three shillings, and on that account I think it will come cheaper than the piling, and it will certainly be more permanent. The high price of the ballast, and the apparent cheapness of the piling as compared with it, were my reasons for recommending that the latter should be used. I now find, however, that the bottom is not sufficiently strong to give the piles a firm hold, and to resist the action of the water; I have therefore proposed to substitute stone ballast for those places which are accessible to a loaded barge. 27 Nov., 1856.
49. In the event of these barriers being erected as proposed, and if the present tortuous channel is persevered in, do you think it is likely, from your knowledge of the tidal influences and currents, that there will be new channels formed over the mud-flats between Snapper-hole Island and Mosquito Island, (or Ash Island, as you have called it there,) and the various small islands that we call the Mangrove Islands? I do not think it would affect them much, that is supposing the waters coming out of Fullerton's Cove, were directed as is proposed. I think the only effect of continuing this tortuous channel will be, to cause the water to act on the north-eastern portion of Snapper-hole Island, and on the western edge of the long bank, and to enlarge the curve of the present channel.
50. You were down at the Hunter during the fresh, were you not? Yes.
51. Was the water fully as high as the highest spring tides? I cannot say positively; it was very close to it.
52. Were these flats covered? Yes.
53. How did the tide take? It ran in the main channel.
54. *By Mr. Faucett:* Supposing these dams to be substantially made, and to be permanent, would the tide running up between Snapper-hole Island and Ash or Mosquito Island make a passage towards the north, or would these curved lines that you have marked pink, running into the islands between Snapper-hole Island and Mosquito Island, would the water running in that direction make a passage in that way: in other words, would there be a passage made from the upper to the lower part of the river, between Snapper-hole Island and Ash Island, by the tidal influences or the influences of the current? I think it will have the effect of enlarging the passages already shewn, unless the sectional area of the river below them is increased by dredging or other ways, so as to let the water get freely away, but the currents indicated by these red lines, are caused by the body of water coming out from Fullerton Cove, and striking on the current coming down from the Hunter. Here is one line representing the velocity and direction of the water from the Hunter, and the other the velocity and direction of the water from Fullerton Cove. Any tendency to enlarge the present channels about M, may be easily checked by dropping a border of ballast along the edge of the bank, which would be sufficient to protect it without impeding the upward passage of the flood waters.
55. Would the result of the two forces, that running between the pink lines from above the letter E, and that running from Fullerton Cove, meeting together at the banks marked M 1, M 2, M 3, would the resultant of these several forces form a channel between Snapper-hole Island and Mosquito or Ash Island? They would, if the current out of Fullerton Cove were allowed to continue in its present course.
56. Would that current, from the resultant of these two forces, along with the tidal forces, in the course of any short period, form a channel navigable by ships of any considerable size? I do not think it would, because there is a bar in the Ash Island channel, and the effect of the ebb currents down the river is to extend the bank from M, on towards the head of Snapper-hole Island. If the currents were allowed to continue in their present course, the effect no doubt would be to drive a great body of water down at the point marked N, between Snapper-hole Island and Ash Island, or Mosquito Island, as it is more properly called.
57. Then, considering the entire plan, without regard to the expense, which would be the more desirable channel, as a new channel, the channel between Snapper-hole Island and Ash Island, or the channel now proposed? I believe the channel I have proposed. It possesses one great advantage over the other, from the circumstances that most of the flood waters pass up it.
58. *By the Chairman:* Do you know whether it is the intention of the Government to put the sheet piling at the points marked M, M1, M3, and L? That is the plan as at present decided on; but I have reported that I prefer using ballast.
59. Have you contracted for the sheet piling? Yes.
60. Have you paid for it? Only for that which has been properly executed, and which appears likely to stand well.
61. Can you stop it? I have put a clause in the specification to the effect that the Government can take the contract out of the contractor's hands, on giving him fourteen days' notice to that effect; also that the Government can diminish, alter, or increase its amount of work without any compensation. The contractor should have confined himself to getting the piling for the section we are at work upon. He has dropped piling at other places; but that will be at his own risk.
62. You think the work can be done at as cheap a rate with ballast as with sheet piling? I believe it can.
63. Have you made any calculations with the view of ascertaining that? I have.
64. With respect to your own proposal, to come back to that, if the dredging had been carried out as you suggested at first, do you not think it would have been a permanent and effectual job? Yes.

- E.O. Moriarty Esq.  
27 Nov., 1856.
65. Are you clearly of that opinion? I am satisfied of that. There would have been scarcely any tendency to alteration in the channel from this gentle curve. It is a well ascertained fact that obstruction to the passage of the tidal wave up a river arises as much from the tortuous nature of the channel as from the shallowness of it.
66. Do you not consider that if that plan of yours, as to the dredging, had been carried out, it would have thrown nearly the whole strength of the river Hunter into the new channel, and taken it away from those you are now piling? I think it would; it would have eased their work at N a good deal.
67. And if so, would not the sheet piling you intended to put up have stood without ballast, that is to say if the dredging, according to your plan, had been carried out to the full extent, and the force of the current directed into your channel, would the sheet piling have been sufficiently strong? It would have had a much better chance; but I do not think, from what I have seen, that it would be sufficient in any case, unless the silt taken up by the dredge had been dropped about it. You cannot make the piles perfectly close, and even if there is a quarter of an inch between them, the constant action of the water cuts out a little circle round the orifice, and gradually undermines the whole. If the bottom had been clay or gravel, it would have been sufficient without ballast; but it is a quicksand.
68. During your recent visit to the Hunter, you took several sections of the river? Yes, three.
69. Will you produce them? I will. (*The Witness handed in the same. Vide appendix B.*)
70. These sections include both channels, that is, the one you propose to make, and the one now in use? Yes.
71. Did you find any difference in the depth of water since the fresh? I found a difference of over a foot in some places.
72. Did you find that the channel now used by the steamers was deepened? It is deepened in some places, in others it is a little shallower, shewing that the channel is altering.
73. Did you also find that the new channel from which you propose to remove the obstructions was deepened? I did.
74. Which was deepened the most, the present tortuous channel or the one that you suggest ought to be made? The tortuous channel, I think.
75. Is there much difference between them, taking one place with another? No; the water will not open the new channel to any extent until the bar is removed from the head of it. Until that is dredged the water will not act with full force. The almost invariable practice in river engineering is first to form the channel it is desired to open, by dredging, and then by confining the tidal action to this channel, trust to it to maintain a sufficient depth of water.
76. Those sections were taken by you since the completion of the sheet piling you have been putting up? It was nearly completed.
77. How long after? They were taken on Saturday last.
78. When was the sheet piling finished? On Tuesday.
79. These were taken on the preceding Saturday? Yes.
80. Do you attribute the increased depth of either of these channels to the common tidal influences, or the ordinary current of the river, or to the late flood? It was principally owing to the flood. But it must be borne in mind that the flood was made to come down the present channel, in consequence of the channel at N being in a great measure closed. At the time it was more than half closed.
81. If your original plan had been carried out, what effect do you think this large body of water coming down would have had upon the new channel you propose? It would have opened it to a very much greater extent.
82. The spots tinted pink on the plan are the parts you wish to have dredged? Yes.
83. Will you state to the Committee what amount of work is required to be done by the dredge there? The quantities are marked on the plan—63,434 cubic yards from the upper one, 43,033 cubic yards from the centre one, and 59,102 cubic yards from the lower one.
84. Was there any vast amount of work to be done which would have occupied any great length of time? No, I think not; a dredge in active work could take up four hundred tons a day.
85. You know the present dredge? Yes.
86. Is that capable of doing the work? Yes, in course of time, but it is not a very good one.
87. Has the Government more than one dredge? No.
88. Is that dredge in any employment now? I believe so.
89. Could it have been spared for the Hunter? I do not know.
90. Do you know what would be the cost of an improved dredge, for such a purpose as we require it, for the Hunter? For about nine or ten thousand pounds you could get a very good dredge.
91. It is nine months since you sent in your general specification? Yes, I think so.
92. In nine months would there have been time, or nearly time, to have had a dredge from England? No, not in nine months; it would take about fourteen months to get a dredge out; I think you might have a dredge in operation here in fourteen or fifteen months after the order was given for it.
93. With reference to that channel which we will call Mosquito Island Channel, you have been in it—have you not? Yes, frequently.
94. Have you observed on the eastern bank of it the habitations of various settlers? I have.
95. I do not know whether you are aware that those settlers purchased that land and gave high prices to the Government for it, on purpose to have the advantage of that water frontage? I am not aware of that; but they do not seem to object to the closing of the channel, because a good many of them are at work on the works.
96. If a settler residing on what you have called Ash Island, somewhere about where I see  
the

the letter I of the word "Island" on the map, wished to go up the river, how would he go after that channel is stopped at the points marked N and M? He would have to go round Snapper-hole Island. E.O. Moriarty  
Esq.

97. What difference of distance would that make to him? About six miles. 27 Nov., 1856.

98. *By Mr. Parkes*: What is the distance on the river occupied by your proposed new channel? A mile and a half; but the dredging will only be required at the places tinted pink.

99. How far is it from Newcastle to the commencement of it? About four miles and a half.

100. *By Mr. Flood*: Would it not be a great advantage to you if you had the Dredging Machine on the spot? Very great.

101. If you had a Dredging Machine on the spot where would you deposit the debris or silt? I would put it in what I may call the pocket of the channels we are closing.

102. *By the Chairman*: Did the Government give you any instructions respecting leaving an outlet for the benefit of the settlers on Mosquito Island? None.

103. If they had, could you have so contrived it as to leave an outlet, without involving any very great expense or any vast amount of engineering skill? Yes, I could have done it easily.

104. *By Mr. Faucett*: Could you have left such a channel without interfering with the plan you propose? I think so; I do not think there would be any difficulty in leaving a small break there, about forty feet wide and ten feet deep.

105. *By the Chairman*: That is if your plan that you proposed had been carried out in its integrity? Not if it had been fully carried out. There would have been no channel then, as I proposed closing it altogether and depositing the silt in it which had been dredged out of the other places.

106. Supposing the Government had told you that these settlers had a right of passage, could you have left them an outlet, provided the other portions of your plan had been carried out? Before answering that question I should like to know what the accommodation required by these people is.

107. They would require accommodation for a punt or barge? They could get over all this flat (*pointing to the plan*) at high water with a boat or light barge.

108. *By Mr. Faucett*: Could this channel that you propose be properly carried out without closing up that opening at N entirely? I think not; I think it is essential to keeping the river clear to close all these channels.

109. It is, in fact, the principle of your plan to close up these channels? Yes; because it is in consequence of the tide being divided into all these channels that there is not sufficient water to keep the main channel clear.

110. *By Mr. Plunkett*: Did you ever hear any of these people the Chairman alludes to complain of your stopping up this channel at N? I never heard any objections to it, and I know there are some of them working at it. May I ask what is the amount of accommodation required?

111. *By the Chairman*: Merely for boats and barges? Then it would have been a very simple matter, no doubt.

112. Would it have interfered with your plan? Not for a boat.

113. *By Mr. Parkes*: Could a boat passage have been left there without injuring the stability of the work, whichever channel might have been adopted? I think so. A boat can come through the parts marked M at present.

114. *By Mr. Flood*: Have you estimated the cost of removing these banks tinted pink on the plan? I have.

115. What would it amount to? About £12,417.

116. Does that amount include the cost of the Dredging Machine? The entire cost. I estimated it at so much per yard, which is the usual way of doing these things, taking it for granted that we should have the Dredging Machine from Sydney.

117. You did not contemplate the purchase of a new Dredge? No. I knew we had only £40,000 with which to do a good deal of work at the Flats, the Wharfs at Newcastle, and the Breakwater, and I did not think £10,000 could be spared out of it for a new Dredge.

118. *By the Chairman*: If your plan had been carried out in its integrity, and had failed, would you have held yourself responsible for that failure professionally? Yes, clearly.

119. But supposing that your plan is not adopted as a whole—if the works you suggest should be first undertaken are totally neglected, and another portion of your plan which you consider of secondary importance is commenced, and that fails,—do you feel yourself responsible then? I consider myself responsible for carrying out the work which has been authorized properly, but I do not consider myself responsible for the ultimate effect of that portion of my plan only.

120. Supposing the works themselves are perfectly well executed, but that they fail in the intended improvement of the channel, would you consider yourself responsible for that result, your chief recommendations not having been adopted? Of course it takes off some responsibility from me; but at the same time, I feel that even the portion which has been authorized will produce a certain amount of good, though I believe if my first plan had been carried out it would have produced a greater amount of good.

121. *By Mr. Faucett*: It simply comes to this, that you do not feel your professional character involved to so large an extent at present, on account of the works not being carried out as you originally proposed, as you would have done if they had been so carried out? Of course not, but I believe the effect of the works now being carried out will be to deepen the present channel.

122. *By Mr. Plunkett*: Do you consider that in carrying out the works you are at present employed upon, you are carrying out the plans of the Governor and Executive Council, or your own original design? I am carrying out the orders of the Government, and not acting on my original design. I am in fact carrying out one-half of my original design.

- E.O. Moriarty  
Esq.  
27 Nov., 1856.
123. You divided your recommendations into three parts—did you look upon these as a whole, or could they be separated, and one part be taken up and another part be allowed to stand by? No doubt they could; but one part only having been carried out, has increased the difficulty of carrying out the other.
124. I see it stated in the letter of the Colonial Secretary to you, of the 27th May, 1856, that, "fortified by the opinion of the Governor General, who has personally examined the locality, the Council advised that the work indicated in the two first sub-divisions should be deferred for the present, but that the piling should be at once proceeded with, except at the spot marked K on the plan;" now taking it up in that way, do you think it interferes with your original design? No doubt it does. It is carrying out only part of my original design.
125. Can your design be carried out afterwards? It can; but I would have preferred reversing the order, as it would have much facilitated the closing of those branch channels.
126. *By the Chairman:* With additional expense? I do not know that, taken as a whole; for although it has, perhaps, rendered the piling more expensive, still a good deal of silt has already been scoured away, which would have been taken up by the dredge otherwise.
127. *By Mr. Plunkett:* The two parts laid aside would cost, according to your estimate, £7,660 and £4,757 respectively, so I fancy it was on the ground of expense that the Government deferred them? I fancy so. I think there can be little doubt about the engineering propriety of the plan.
128. The work you are going on with will not be thrown away? No.
129. *By Mr. Faucett:* Your plan was to excavate these sand banks to deepen your proposed new channel at the same time, or almost simultaneously with, the closing up of the small channels? Yes.
130. *By the Chairman:* I beg to call your attention to your own report. You say in words: "As soon as the new channel, above described has been opened to the required depth of say 10 feet at low water, we may then commence to close the upper ends of the branch channels;" therefore it does not appear that you intended to carry on the two simultaneously? I should have commenced them simultaneously, closing the channels H and I simultaneously with the dredging, in order to have a still recess in which to deposit the silt, otherwise it would be washed back upon us; and when the new channel was well opened, I would then have closed the sections N and L, and put the remainder of the silt taken from the new channels about the piling in them.
131. *By Mr. Flood:* Could you not have deposited the debris from the dredging at N without the piling? No; I should not like to do it without the piling, because the flood coming up would be very likely to wash it back. I think it would be necessary to have a dredge even if this the present channel is to be adopted, because the tidal influence is so irregular, that it will be necessary to correct it in some degree by dredging those spots where the ground being harder resists the action of the water in a greater degree than where it is soft mud or sand.
132. *By Mr. Plunkett:* When the piling at present authorized is completed, how much do you calculate the present channel will be deepened? I think it will deepen it a couple of feet in most places; but I doubt whether it will deepen it to be of very much use without dredging, because of the hardness of some portions of the bottom, and the consequent want of uniformity.
133. You mean that it will not be deepened all through? Not uniformly deepened. It will be deepened in those parts where the bottom is softer.
134. Then vessels going up may still meet with the obstructions they do now? Yes, decidedly.
135. *By the Chairman:* I understood you to say that it would be the means of improving the old channel? Yes, deepening it.
136. But I think you said the channel will be more tortuous on account of the current wearing away the bank? That may be; but it will not work into that bank for some time.
137. *By Mr. Faucett:* Would the new channel you propose be more uniformly deepened than the present channel? I propose to make it uniform by means of the dredge, and having made it so once, the tidal action would always keep it so.
138. What would be the difference in depth between the present channel, and the one you propose, if your plan were carried out in its integrity? About three feet.
139. *By the Chairman:* In favour of your channel? Yes. The proposed new channel is now the deepest, with the exception of a small bar.
140. What is the extent of that bar? About five hundred yards.
141. How long would the present dredging machine take to remove the whole of that? About four hundred and ten working days. I am supposing that the whole of it should be cleared away; but if we did only a part of it, it might be done in three or four months, and would be attended with great advantage, because if we could once get the water running that way, it would help to deepen it.
142. *By Mr. Faucett:* How many vessels could pass readily abreast in the new channel? Four or five.
143. *By the Chairman:* Supposing it were found that the portion of your plan that is now being carried out, was acting badly after a year or two, if it were found that instead of deepening the channel it was only obstructing it, and you heard anybody remarking upon it, and saying, "Oh! that is Mr. Moriarty's plan," would you feel that it was just to blame you for the bad result? No, I should not.
144. Then you do not reckon yourself responsible for the consequences of the steps that are now being taken? No, not altogether; but I cannot say that I am free from responsibility.
145. In the other case, the whole responsibility would have attached to you? Yes.
146. Whereas, under present circumstances, the Executive have taken the responsibility of the ultimate effect upon themselves? No doubt they have to a certain extent.

147. *By Mr. Weekes*: This letter from Mr. Elyard seems to adopt your plan, suggesting, however, that you should begin at the third proposition first, but not deviating from your plan in any way? Just so. I do not know that the Government intended to abandon the rest of the plan finally. I think they have adopted the part they thought most likely to produce an immediate effect. They probably thought, that by the expenditure of some thousands of pounds on this portion of the work they would have the benefit of a greater depth in the old channel with the least possible delay.

E.O. Moriarty  
Esq.  
27 Nov., 1856.

148. What you are now doing is still a part of your plan, only reversing the order in which you would have commenced it? Yes.

149. The other parts can be followed out at any time? Yes. There has been no change in my plan whatever, only that they have taken one part of it up without the rest, and have ordered that to be gone on with.

150. *By the Chairman*: Since you sent in your plan, some nine months ago, I think there would have been time to have cleared a good deal of these flats if the Dredging Machine had been put on at once? Yes, certainly.

151. Supposing that the Government had the money at their disposal, and again called upon you to make another report, would you or would you not recommend the very same plans in their integrity as you have already recommended, to secure the effectual navigation of the Hunter at these points? Yes. I would in that case recommend that the Dredge should be immediately employed, in order to carry out these plans in their integrity, with the exception, as I have said, of the substitution of ballast for sheet piling.

152. Then the Government have directed you to pursue a course which on your own judgment you would not have done? No; I should have gone on with the dredging at the same time, and the stuff we would have got from the dredging would have settled about the piling, and protected it from the insects, cobra, and so on, and have eventually formed banks where the channels now run. Hereafter, I believe, we shall find it necessary to fix the banks, and prevent alterations in the channel over the flats, by laying borders of fascines, or ballast on each side of the river; but as that is a matter for future consideration I have not thought it necessary to go into it when considering the plan for deepening the channel, which is the work to be first undertaken.

TUESDAY, 2 DECEMBER, 1856.

Present:—

MR. FLOOD,  
MR. JONES,  
MR. PARKES,

MR. PLUNKETT,  
MR. SCOTT,  
MR. WEEKES.

A. W. SCOTT, ESQUIRE, IN THE CHAIR.

Alexander Bremner, Esq., C. E., called in and examined:—

1. *By the Chairman*: I believe you are a Civil Engineer by profession? Yes, I am a Professional Civil Engineer.

2. You have been, I believe, a long time employed in England as a Civil Engineer? Yes, I have had considerable experience.

3. Will you state to the Committee whether you have had anything to do with rivers, docks, harbours, the currents of rivers, and the opening or deepening of their channels? I may state that my experience has been very considerable in harbours, and I have had my attention very much called to river improvements also. I was brought up with my late father, who was a Civil Engineer, in the north of Scotland, the coast of which is very much exposed to a very heavy sea, and he undertook several harbours there in very exposed situations. Some of them had been driven down frequently, and under his management and superintendence they were built, and have stood to this day like a rock.

4. Will you mention some of these harbours? The new harbour of Wick; the harbour of Wick in Caithness; the harbour of Sarelet; the harbour of Lossiemouth, in Morayshire; the harbour of Pittulie, Aberdeenshire; and I have had to do, indirectly, with the improvement of the Clyde, and have had frequent communications with my late brother, who was the Engineer of the Clyde. I also joined my late father in removing from the strand the "Great Britain" steam-ship, in Dundrum Bay, in 1847. I planned and superintended the building of a pier at Innellan, in the Firth of Clyde; also the repairs and improvements of the harbour of Rothesay; the harbour and pier of Gourack, near Greenock. I have had occasion to travel very much through England, and, of course, as I travelled I took particular notice of the improvements of the different rivers and harbours in the various places I visited. I may mention, particularly, the Rivers Tyne and Wear, in the north of England, where large sums of money have been expended in their improvements for navigation purposes.

5. *By Mr. Weekes*: Were any of the works you have referred to, harbours affected by a great deal of silting, or deposit, such as rendered the navigation uncertain, by forming bars, flats, or shoals? I omitted to state that I was Resident Engineer of the new harbour and docks at West Hartlepool, in Durham. There was a considerable deposit in the channel there. Sir John Rennie's advice was to dam up a large reservoir behind, and to scour it out by sluices at low water. This had the effect of scouring it, and of making the water sufficient at the dock entrance, but it did injury by sending the stuff to sea, where it deposited, and formed a bad bar, so much so, that vessels which formerly could come end on to the waves, after this deposit took place, had to run away to leeward and take the bar in a cross sea for a considerable distance. This, our Company protested against, and pointed out the evil effects.

A. Bremner,  
Esq.

2 Dec., 1856.

- A. Bremner, Esq.  
2 Dec., 1856.
- effects of this scour, and we had some of the members of the Tidal Harbour Commission sent down, Captain Washington of the Royal Navy, and some others, and the consequence was, that the Admiralty put a stop to the scouring process.
6. Your experience then has reference more to harbour improvements, not so much to rivers? To harbour improvements mainly.
7. Has your attention been at all directed to the deepening of tortuous rivers? Yes, I have had my attention directed to that subject, and I have given it very considerable attention.
8. Have you been employed in any considerable works of that nature? Not directly.
9. *By the Chairman:* Is not the River Clyde of that nature? Yes. But it was more indirectly that I was employed on the Clyde; my late brother was directly employed there, and I have had frequent consultations and intercourse with him upon the subject.
10. You have been up the River Hunter I think? Yes.
11. Do you know that portion called the Flats? Yes, I had my attention called to these in passing up.
12. Have you examined this plan? (*Referring to the plan produced by Mr. Moriarty.*) Yes, I have been looking over it slightly this morning.
13. Can you state to the Committee what you would recommend for the clearing out of that channel? (*Referring to the channel marked on the plan.*) I may state here, that I do not consider, so far as I have seen of this Colony, the rivers so called to be what, at home, are considered rivers—that is to say, the water contained in them is more tidal water than inland water, except that coming down by occasional freshes.
14. You do not, of course, mean when there is a fresh or flood? No.
15. But the great body of the water generally? Yes.
16. *By Mr. Jones:* If I understand you, you regard them more as estuaries than as rivers? Yes; and I would apprehend that whatever would tend to exclude the sea water from flowing up, and then, of course from having a body of water to scour down, would be a very great detriment to the improvement of a river. The more the water is encouraged or increased from the sea, the lower the level is kept above, of course, the greater will be the quantity or flow in the upper reaches of the channel, and, of course, the greater will be the scour as it recedes; and I would say, with regard to the Hunter, that great care ought to be taken not to prevent any water from flowing upwards, because, by that means, you reduce the scour in going out at the entrance. Whatever tends to reduce the influx of the water up the river, of course, reduces the outpour again, and, therefore, there will be a danger of its silting up at the entrance; it requires all the current that can be got to carry it out to sea. Land floods are so seldom, the scour from them cannot be depended upon; but the tidal, which in this case is the natural scour, comes regularly every twenty-four hours. The entrance at Nobby's is differently situated from any of the other bar harbours on the coast, judging from what I have seen on charts of the Clarence and Port Macquarie—the latter I have visited. They go direct, or nearly at right angles into the sea, just as if this were cut through here. (*Pointing to the plan.*) Now, I believe what keeps Newcastle harbour open at all, is the projection of Nobby's at this point; the stuff held in suspension is carried down here, and washed on to the beach.
17. You consider that the existence of the breakwater as connecting Nobby's with the mainland prevents the formation of a bar just outside? Yes; if it were not for this breakwater, no doubt there would be a tendency to the formation of a bar. As I have said before, it is important to keep the channel open as much as possible to allow the water to flow, for whatever impedes the water is injurious.
18. If these channels were blocked up there would not be so large a body to go up the river as if they were kept open, and consequently there would not be so much depth above? No.
19. *By Mr. Weekes:* Supposing a wall were built across the water here, would the water that came flowing from the sea be higher because it was stopped by that wall? At that particular place, the water would rise more rapidly, until it attained the sea level.
20. Will not water always find its level—how would the rise of the tide of the sea make it higher because this wall was built across; the height must be regulated by the rise of tide of the sea? Supposing it were high water above the dam, and low water below it, of course, you would have five feet less water below the dam than above it.
21. No doubt there will be less water on one side of the dam than on the other, but I want to know how the building of a dam across the river would deepen the water on the lower side? It will not increase the depth of the water at the dam. I think I understand your question now, it is this, if by putting a dam here, an additional quantity of water would come in here.
22. Would any obstruction here (*pointing to the plan*) prevent the egress of the tide? Yes, because as you obstruct it here you heighten your level here, and then the water would not rise so high up the channel.
23. *By the Chairman:* Have you read Mr. Moriarty's general specification of work to be done, in clearing and deepening the Hunter River at the Flats? Yes.
24. Will you state your opinion with reference to the effect which would be produced upon the river, provided those portions which are tinted on the plan before you, were deepened by the dredging machine? (*The Witness referred to the plan.*) I would say that I cannot from looking at this plan, and from the partial observation I have been able to make of the river, exactly express an opinion that this would be the line I would prefer. The course and rate of the current is not marked on the plan, and it would require some particular study and watching of the currents before I could decide whether this would be according to my idea of an improved line.
25. Have you any other suggestions to make? No further than that I would be very careful about excluding the sea water from any of the channels; and, as a general principle, I would study and watch nature, in order to take advantage of it, but not in any material way to attempt to check it.

## SELECT COMMITTEE ON THE DEEPENING OF THE RIVER HUNTER.

26. Are you aware that all these mud-flats between the sheet piling at N, M1 and M2, are entirely covered at high water? That is a matter to be considered. A. Bremner,  
Esq.
27. *By Mr. Jones*: Do you conceive that if Mr. Moriarty does not interfere with the water passing up the river, but intends simply to direct the current into the main channel, that principle is the correct one? I apprehend it is, without entering into the question as to the carrying out of that principle. 2 Dec., 1856.
28. *By Mr. Flood*: If Mr. Moriarty's plan is carried out by stopping up all the tributary channels, would it not have the effect of scouring out the main channel by the tide both ebbing and flowing? I apprehend not well, because the mere stopping up prevents a large body of water from flowing up the various upper reaches of the Hunter, Williams, and Paterson, &c.
29. Would it, for instance, prevent the water rising so high at Hexham as it does at the present time? There might not be much apparent difference, yet the quantity of water very much reduced because of the checking, although it might be but partially, of the tidal wave. The same volume of water would not be there to distribute itself over other parts.
30. If Mr. Moriarty's plan were carried into effect, would there be any less water at Ash Island than at present? I apprehend there would.
31. Then, of course, the tide would not rise so high? The tide might rise nearly as high, but there would not be the same quantity of water.
32. As a matter of fact, would Mr. Moriarty's plan have the effect of preventing the tide from rising as high at Hexham as it does at the present time? It would prevent the tide from rising quite so high, and there would be a considerable reduction of the scour down.
33. *By Mr. Jones*: When you say it would prevent the tide from rising so high at Hexham, do you give that answer upon the principle that these piles, shewn in the plan, are intended to interfere with the flow of water? Yes.
34. But supposing these piles were a little above low water mark, or equal with low water mark, would they interfere with the flow of water? Not so much; but at the same time I have a great objection to any thing in the bed of a river to prevent the flow of water.
35. *By Mr. Flood*: If below low water mark of what use would they be at all? I do not know that they would be of any use, but they would still be a hindrance to a certain extent.
36. *By the Chairman*: In your opinion would simple sheet piling, as proposed in the plan before you, be effectual for deepening and keeping clear that portion of the Hunter? Certainly not.
37. *By Mr. Plunkett*: If you were called upon to give an opinion, that you would be responsible for as a professional man, what course would you like to take yourself? I would prepare several machines, formed so that they would have the exact specific gravity of water, or a little less, so that they would merely float. I would put a different signal on each, and set a number of persons at different parts of the river to watch them and take the bearings, I should thus ascertain the rate and direction of the current, as preliminary to any other proceedings.
38. *By the Chairman*: What time would that occupy? I do not think it would be long, perhaps five or six days; of course a great deal would depend upon the state of the weather at the time.
39. *By Mr. Weekes*: And upon the strength of the current would depend your future recommendation? Yes; but I would just say, that from the small rise and fall of the tide, there being no land water, except occasionally, there would be very little chance of clearing out the river or of deepening it by the scour; you must dredge it—there cannot be two opinions about that.
40. *By Mr. Plunkett*: Do you know the quality of the soil in the bed of the river, so as to distinguish what portion had mud, and what sand? No.
41. Would not that be a matter of importance for you to consider? Yes, that would be very material, because upon the quality of the soil forming the bed very much depends the action of the current to scour.
42. Would you be able to ascertain all that in five or six days? I think I could by having assistants, which I could depend upon. Of course I would take for granted that this plan was correct.
43. *By Mr. Jones*: Correct in what respect? In its lines and bearings. If I had to survey the lines of the river, of course that would be a very different thing.
44. *By Mr. Plunkett*: You assume these to be correct? I assume these to be correct.
45. *By Mr. Jones*: Then, as far as I understand you, your present impression is, that to make any material improvement the best way will be to dredge the shallow banks? Yes.
46. And that with the slight fall and tide there is there, any great improvement from the scouring process is not to be anticipated? No. The river Clyde has a rise and fall of fourteen feet, and with all that scour, as well as a constant flow from the interior, in addition to which there are a great number of steamers constantly going up and down, and still there is a great quantity of dredging. My late brother invented a double acting dredge, which does double the work of the ordinary dredge; one of these was employed in the river, and, I think, there were seven besides that for a great part of the year constantly dredging.
47. *By Mr. Flood*: Have you seen the breakwater at Newcastle? Yes.
48. Are you able to give the Committee any opinion as to the stability of that work? I can only say that if the same kind of work were where I have seen works of a similar nature carried out, it would not stand five hours; but it is protected by the reefs on the outside.
49. Is there any improvement you could recommend which would give greater permanency to the present structure? Yes. I certainly would recommend that the outer part be roughly coursed; faced on with the same material as is there now.
50. With a plain surface? You need not be particular, just have it roughly done, to give the stones a bearing one from the other, just to prevent the continual breaking and change of the stones.

- A. Bremner, Esq.  
2 Dec., 1856.
51. Are you aware that there are some improvements going on there now? I see they are filling up one of the gaps that was caused by the sea.
52. Have you seen the plan of the works contemplated? No, I have not; but I see that they contemplate groins to project from the present work.
53. Do you think groins will have the effect of securing the pier or breakwater from the approaches of the sea? I think not.
54. Why do you think not? I think the groins proposed to be run out to the south-east, seaward of the breakwater, are all but useless; it would be much more profitable to course the work from the end, and to secure the foundation by tumbling in large stones, roughly, just to prevent its slipping. These groins are useless, I apprehend, because of the action of the tide going north and south any stuff held in suspension is caught by the outlying rocks; so that in fact there are two natural groins. All that I apprehend to be necessary for the security of the breakwater is to course in, with a rough but uniform surface, and just give it time and it will naturally fill up. In fact I am not sure whether these groins will not do more harm than good, because the sea tumbling on the top of them and falling down, there would be a tendency to scoop out the sand.
55. Do you think the breakwater requires to be raised above its present elevation? The higher it is the better, because it gives more stability to the work below.
56. And prevents the rougher seas from rushing over? Yes, and gives greater stability and weight to the stones below, they having less specific gravity immersed than in air. The angle which my late father found to stand best, and which I have found good reason to abide by myself is, about 45 degrees. If the slope be made too horizontal, each stone depending on its own specific gravity, and the confined air, is apt to burst them out, while at an angle of 45 degrees, increased weight is given to the lower portion of the work.
57. The force of the sea is broken by the incline? Yes to a certain extent.
58. Have you anything further to suggest with reference to the breakwater?\*

Mr. John Tredgold Strong called in and examined:—

- Mr. J. T. Strong.  
2 Dec., 1856.
1. *By the Chairman:* You are the contractor for the sheet piling to be used on the Flats of the Hunter? I am.
2. Have you read Mr. Moriarty's specification for clearing and deepening the Hunter, at those portions called the Flats? Yes.
3. Have you completed any of the sheet piling? It is closed in, but not completed, and is being strengthened by putting in some spur piles.
4. Will you state to the Committee where this sheet piling is? It is from Snapper-hole Island over towards Mosquito Island, on to the tail end of a sand bank; it is not in the position shewn in the plan.
5. Will you state where it is? It goes more north-westerly than it is represented to be on the plan.
6. You personally assisted in driving these piles? Yes.
7. And therefore are perfectly conversant with the currents and the effects of the tidal waters on that particular portion? Yes, I was there almost every day.
8. Will you state to the Committee how long that has been enclosed in? It will be a week to-night since it was closed in.
9. What has been the effect of the current acting upon it since it has been closed in? Before we closed it in the current ran close to Snapper Island with great rapidity; it now strikes against the sheet piling and runs along the face of it towards Mosquito Island, and is scouring a deep channel next Mosquito Island.
10. *By Mr. Flood:* At present it strikes on the piling, and forms an eddy? Yes, in the ebb tide, about half tide, there is about six inches difference of level between one side and the other.
11. *By Mr. Scott:* Which side is the highest at half tide? The upper side. In the course of time I believe there will be a regular channel formed at the end next Mosquito Island, as deep as that previously on the other side, contiguous to Snapper-hole Island. Mr. Moriarty intended to prevent that from forming.
12. Have you anything farther to state, as regards this particular piling at this end? We found it working away a little at Snapper Island end, but we have since stopped it.
13. How did you stop it? By bringing the sheet piling up the banks some distance.
14. Do you think that will be effectual? I think so.
15. *By Mr. Jones:* How does the piling stand? In the channel it appears to stand pretty well; we are putting in spur piles to keep it up.
16. Is the rapid current now setting up at the upper end starting it at all? It is a little, near the outer end; one or two bays shewed symptoms of coming over.
17. Do you think as the current works in the channel it will scour away the piling at the upper end? I think it tends to scour away the piling, and to take away from the upper end.
18. When it does take away that, will it not gradually work down and take away the whole of the piling from the other end? Yes, unless some means are taken to prevent it.
19. *By the Chairman:* What is the height of the piling at the other end? A little above high water mark at spring tides.
20. *By Mr. Flood:* How do you account for the difference in the height of the water—for its being six inches higher on one side than on the other? There is not sufficient way out for it through the channel.
21. As soon as the tide gets above the Flats it becomes level? It begins to approach a level after the turn of the tide, but it runs quicker at half tide than at any time.
22. There is a difference in the perpendicular height of six inches? Yes.
23. *By Mr. Jones:* Caused by this acting as a temporary dam? Yes; the flood tide runs much slower, and sets more out of the way.
- 24.

24. *By the Chairman*: I presume the ebb tide is so much stronger than the flood on account of the fresh? The ebb side is always stronger. Mr. J. T. Strong.
25. *By Mr. Flood*: Is there any difference in the height of the water at flood tide? None. 2 Dec., 1853.
26. *By Mr. Weekes*: Have any experiments been made upon the strength of the current? I think Mr. Moriarty made some before the work was begun.
27. *By Mr. Flood*: Does it strike you that there is not a more considerable body of water on the main channel side in consequence of the pile dam? There must be a larger body of water.
28. If the piling had been more towards the north point of Snapper Island, would it not still have had the same effect of keeping the water at the south side lower, in consequence of there being a larger body of water in the main channel? No, I think not; because I think the water would have got away quicker; it comes in here and is dammed, and cannot get back again, because the current is following it up.
29. There is a small space from the piling to the main channel? Yes, a considerable distance; it is, I should think, a hundred yards to the north point of the island.
30. *By the Chairman*: In your opinion, if the piling had been put up exactly as your plan requires, had it the least chance of standing? No, it would not have reached the bottom at all; the fifteen feet piling specified for, in some portions would not have reached the bottom.
31. For what reason? There is twenty feet of water.
32. Is that owing to the water having deepened since the first part of the work was commenced? No; there was that depth of water before the work was begun.
33. Whereas the specification states fifteen feet? Yes, fifteen feet sheet piling.
34. Supposing you had allowed for twenty feet piling, and had merely put in piling, would that work have stood, as it was originally planned? It never would; it ought to have been double row piling.
35. *By Mr. Weekes*: Even if the piles had been of sufficient length, they would not have stood? No; a double row would have been required, and filled in between.
36. *By the Chairman*: Supposing that N was perfectly complete and good work, and likewise M 1 and M 3, what is your opinion in respect to the currents—would they or not force their way in both of these flats? I think they would force a great deal more water into the main channel.
35. Would not the waters have found an outlet in some way or other to join this channel, with these sand or mud flats between? I think in time the bottom would scour away at the ends of this piling (M 3), and eventually take it away.
36. Have you observed that any effect has been produced since the piling has been completed upon the steamers' channel? I cannot say that I have. I have heard that there is deeper water.
37. Does the tide infringe upon these mud-flats? I cannot tell.
38. I see by reference to the schedule of tenders for sheet piling, that your tender was for £3,611 17s.? Yes.
39. For what work was that amount given? I was to execute 880 yards of ten feet, and, I think, 583 yards of fifteen feet.
40. In conformity with that tender have you procured the slabs? Yes, a great portion of them. I have an account in my pocket of the number we have ready in the bush and at the wharfs.
41. Will you state to the Committee whether the Civil Engineer has told you whether all these slabs you have already prepared, according to contract, will be required? He has not stated whether they will all be required or not, but he wrote a note last Saturday to say I had better not prepare any more.
42. Will he take those already prepared? He has not told me.
43. Has he said nothing about ballasting instead of sheet piling? I heard it from the clerk of the works, Mr. Dear.
44. *By Mr. Flood*: Mr. Dear told you, that the Engineer contemplated putting ballast down instead of sheet piling? Yes; he told me that Mr. Moriarty thought of using up the timber cut, and doing the remainder with ballast stone.
45. *By Mr. Weekes*: Were you limited to the quantity you should prepare at any one time, or for any portion of the work? No.
46. Or would you be at liberty under this contract to provide sheet piling for the whole of the works at once? Yes.
47. Was there anything in the conditions that enabled the Engineer to terminate the contract, without reference to anything you might have in hand for the purpose of carrying on the work? There is a clause to the effect that he shall be at liberty to reduce or to add to the quantity of work, if the Government thought necessary.
48. *By Mr. Flood*: Is there a clause in the contract that the Government may stop the work? Yes.
49. *By the Chairman*: Do you consider that whatever piling you have already prepared the Government are bound to take and to pay you for? Yes. Mr. Moriarty has been urging me to get the timber as quickly possible, and to put on a greater number of barges to convey it to the different places required.
50. *By Mr. Flood*: You would be more likely, if you ordered a large quantity of piling, to get it at a cheaper rate than if you bought it from time to time in small quantities? Yes; we could also get the work done at a more reasonable rate by employing a large number of men and lighters at the same time. I have here a memorandum of the timber prepared and on hand for sheet piling on the Flats of the River Hunter. (*The witness handed in the same Vide Appendix A.*)

Mr. J. T.  
Strong.

## APPENDIX A.

MEM. of Timber prepared and on hand for Sheet Piling on the Flats of the River Hunter,  
2 Dec., 1856.MEM. of Timber prepared and on hand for Sheet Piling on the Flats of the River Hunter,

THURSDAY, 4 DECEMBER, 1856.

Present:—

Mr. ARNOLD,	Mr. JONES,
Mr. FAUCETT,	Mr. PARKES,
Mr. FLOOD,	Mr. SCOTT,
Mr. WEEKES.	

A. W. SCOTT, ESQUIRE, IN THE CHAIR.

Mr. J. Scott.

Mr. James Scott, called in and examined:—

1. *By the Chairman*: I believe you are a Civil Engineer by profession? I have been a shipbuilder by profession, but I have done some work in the Civil Engineering line.
2. I have suggested to this Committee that, in all probability, you could afford them some information with respect to the effects of currents and tide ways upon work in rivers? I have been in that line; all my life I have been connected with shipping, rivers, and harbours.
3. Have you ever performed any work with respect to clearing the channels of rivers by removing obstructions? Yes, in the Mauritius, I have had to do with deepening work.
4. Do you know any portion of the River Hunter? Yes; I have been up the River Hunter.
5. Have you ever examined that portion called the Flats? Only going past with the steamers, but I have had information, from time to time, from the captains of the sailing vessels and steamers.
6. *By Mr. Weekes*: Have you had any experience in clearing rivers of obstructions like these flats? No more than that I have been casually amongst them where they were doing it on the Clyde, Sunderland, Tyne, London, and other parts.
7. *By the Chairman*: Will you have the kindness to examine this map, which shews the plan proposed by Mr. Moriarty, for the improvement of this part of the river. (*The Witness here examined the map, which was explained to him by the Chairman.*) In your opinion, from the practice you have had on the Clyde, do you think that a channel following the line suggested by Mr. Moriarty would be more easily kept clear after it had been dredged and deepened than the present tortuous channel? My opinion is that the straight line is the best. I was looking over a plan of the Clyde, since I received the summons to attend this Committee, and I see that all the points are cut off, and all the hollows filled up, making the course of the river as straight as it possibly can be.
8. Therefore, in improving this river, you would naturally adopt the straightest possible course? Yes; I have every belief that the straighter the course be, the more easy it will be to keep the channel clear. It is a well known fact that a large stone, a tree, or a small boat, has been the means of forming a small bank, this bank forming an eddy, and through time a large bank has been, by so small an obstacle, formed.
9. Then you would prefer this proposed channel, although it would cost more on account of the dredging it will require, rather than adhere to the old and more tortuous channel? I would, for various reasons. I find that in all turns of a river, wherever there is the least eddy—an eddy round a point—it always causes a slackening of the water, and there the deposit accumulates; but the straighter the course is the more easily every particle of matter goes along with the current.
10. Now presuming, or taking for granted, that these red lines, placed upon this map by Mr. Moriarty, correctly shew the course of the currents previous to any improvements whatever being made, and then taking it also for granted that certain fencing or sheet piling at N, that is from Snapper-hole Island to a mud flat here, is completed, what in your opinion would be the effect of the current setting into the bight thus formed at N. I may add that we have been told by a previous witness that the water at the upper side of that barrier, at N, is six inches higher than the water on the lower side—what do you think would be the effect of the water being stopped there in that way? I am inclined to think that if the water is stopped there it will strike against the point of Snapper-hole Island, and ultimately take away a portion of it. I would rather have the piling commenced at this north-east corner of Snapper-hole Island, and carried across the opening in a parallel direction to the present channel, though the expense then would be much more than the expense where it is proposed in this plan, but the advantages would be much greater, and deepening the channel at the same time.

11. Supposing we have evidence to the effect that the water striking here against this barrier at N, forms an eddy, and comes back and is forcing a channel round the corner of the piling through the soft mud bank? Undoubtedly the water striking here will find its way on either side of the sheet piling, and form a new opening over the mud bank. Mr. J. Scott.  
4 Dec., 1856.
12. *By Mr. Flood:* That would not have happened, you think, if the sheet piling had been in a line with this north-east point of the island? The stream would then have been in a better position to have followed the channel.
13. The curve would have been much more easy, and the stream would have met with less impediment than it will according to the proposed plan? Yes. This point is just formed as it were by nature to catch the water, which forms an eddy, and accumulates all silt carried down by the current.
14. *By Mr. Faucett:* Is that barrier in the most suitable position for receiving, with the least degree of force, the currents coming down the river according to these red lines, and from Fullerton's Cove? No, I have said just now that I do not consider it in exactly the best position. An idea struck me, and, in fact, I have consulted with parties respecting it, that is, that vessels going down there from Sydney, taking nothing but ballast, and I would just let them heave down their ballast instead of this piling. There could be a ballast bank formed.
15. *By Mr. Flood:* Which would be less costly and more permanent? Yes. If there is to be a dredging machine employed, and if gravel or any hard matter is got up from the bottom, it could all be laid along with the stones, and make a permanent embankment.
16. *By the Chairman:* Now, supposing the piling at N, M, M 1, and M 3, were completed, leaving between each of them sand or mud banks, as you see indicated on the plan, which mud banks are covered at high water, what would be in time the effect of the currents, supposing no other work to be done except the piling? It would be much better to have these places entirely closed up with ballast, otherwise my opinion is, that the uppermost current after high water will still go over these banks and carry them away, that it will force other channels; and the only plan will be to bring the piling more nearly into a line with the channel itself, as I suggested just now, if the present tortuous channel is to be persevered in.
17. Are you aware whether a vessel would experience greater difficulty in a curved and tortuous channel than in a straight one—whether she would not be obliged to go slower and more cautiously than she would with the same amount of water in a straight channel? Doubtless she would require to go slower, in accordance to the angles the vessel has to steer.
18. Supposing Mr. Moriarty's plans had been carried out, and that the portions tinted pink on the plan were dredged to the proper width and depth—could that have been the best plan, or would it not? I am fully of opinion that Mr. Moriarty's line of channel would be the best, but it would be a more expensive one.
19. Had Mr. Moriarty's plan been carried out in its integrity, do you think that this suggestion of yours, about carrying ballast to this very great length over these flats between the piling, would have been required? No, I do not think so. Having not seen the cross sections, I am not so able to judge on the difference of cost.
20. It would have been saved? Yes. My suggestion for carrying the sheetings to this point here, was merely for continuing the old channel. If Mr. Moriarty's channel is deepened in the way he proposes, this other channel must be closed up, or the water will run in the same way. You must either continue one channel or the other. There is not flow enough of the tide here to be of any use in keeping it clear unless one of the channels is stopped up. There are only the freshes to scour the river. I think, if the new channel is adopted, you must fill up the old one, to allow the current to run down as rapidly as possible in the new one.
21. *By Mr. Faucett:* Would the removal by dredging of these tinted sand banks in the proposed new channel cause the water to be sufficiently diverted into the new channel to make it permanently superior to the old one? I believe it will, should a sufficient mouth to the upper end of the channel be constructed by embankments or sheet piling.
22. And will it also have the effect of rendering the old channel unnavigable for the same kind of ships as at present navigate it? It greatly depends on how the old channel is obstructed.
23. Supposing, again, these three tinted sand banks to be dredged away, will there be such a supply of water as to leave the old channel and to make the proposed new channel both navigable, to the same extent as the old channel is at present navigable? No; I do not consider it would be so.
24. *By Mr. Arnold:* Would the natural effect of opening the new channel be to fill up the old one? That would be the effect to a certain extent. The stream being divided, it would only have half the force.
25. Are you also of opinion, that artificially filling up the old channel would have a good effect in clearing out the new one? I am satisfied it would be so.
26. Filling up the old channel would more effectually clear the new channel, although the natural effect of opening the new one would be to fill up the old one? Precisely.
27. *By Mr. Faucett:* I imagine from what you have said, that without dredging these tinted sand banks no real improvement can be made in any channel? No; I think the dredging must be gone on with to make either channel navigable.
28. As a first step? Yes.
29. *By the Chairman:* Have you the least doubt in your mind, now that you have considered this plan, which of these two channels is the best? I am in the belief that Mr. Moriarty's channel would be the best to be carried out, as it would be a straight line.
30. *By Mr. Faucett:* The old one is quite a bending course, and the one newly proposed is, as near as can be, a straight line? Yes. It is well known that where the run of a river is impeded, it is sure to leave off its burden somewhere or other. But I am quite of opinion that

Mr. J. Scott. that this old channel could be much improved by cutting off the projections, and filling up the openings, below Snapper-hole Island.

4 Dec., 1856. 31. *By Mr. Arnold*: Looking at the whole question, are you of opinion that the dredging and the piling ought to go on simultaneously? The one without the other is of very little use.

32. Or, at all events, the piling is of very little use without the dredging? Yes. There is one thing to be said, that the moment you begin to dredge you can heave in the silt to support what piling you have done.

33. The effect of the piling ought to be to divert the current into the dredged channel, and the effect of the dredging ought to be to divert the current from the piling, so that the one would assist the other? Yes. But the piling ought always to be commenced at that portion to be dredged, at the very top of the stream.

34. *By Mr. Faucett*: Then, in fact, this place at N was not the proper place to commence? I do not believe the piling at N ought to have been commenced first.

35. It should have commenced higher up in the stream? Yes.

36. *By Mr. Arnold*: You have said that you think, in order to magnify the force of the current upon the new channel, it would be desirable effectually to fill up the old one—do you not think, that if it were filled up with the soil dredged out, the effect of the current would soon be to carry it away, so that it would not be an effectual bar? It would have that result; but the way to fill up the old channel would be from bank to bank, at the nearest points.

37. Do you not think that piles driven in would form a good nucleus for a bar of that sort? No doubt it would.

38. So that if the dredgings of the new channel were thrown down where the piling is already erected, that would be much more likely to stand as a bar than if put down by itself? Much more so. In all the improvements that were going on in the Clyde, and that has been a river where a great deal of engineering skill has been expended, wherever the river was to be deepened, they made good all the banks before ever they commenced dredging.

TUESDAY, 9 DECEMBER, 1856.

Present:—

MR. ARNOLD,  
MR. FAUCETT,  
MR. JONES,

MR. PARKES,  
MR. PLUNKETT,  
MR. SCOTT,

MR. WEEKES.

A. W. SCOTT, ESQUIRE, IN THE CHAIR.

Mr. C. Paine.

Mr. Charles Paine called in and examined:—

- 9 Dec., 1856. 1. *By the Chairman*: You command the steamer "Illalong"? Yes.
2. Have you been for a long time engaged on the Hunter River, as a commander of vessels or otherwise? About twenty years.
3. Do you know the whole of the River Hunter, both with respect to the deeper portions and the flats? Yes.
4. You are, I suppose, well acquainted with that portion commonly known as the Flats, by Snapper-hole Island? Yes.
5. Will you state to the Committee whether you have, from time to time, had great difficulties in that portion of the navigation of the Hunter? Yes, at the lowest part of the Flats, that is, the part nearest Newcastle.
6. Will you refer to the plan before you [*The witness referred to the plan*], will you point out the spot where you have generally met with these difficulties? On the shoal that lies to the eastward of Snapper-hole Island.
7. Will you state to the Committee the nature of the difficulty you refer to? I refer to the shoalness of the water.
8. Is the difficulty in any measure caused by the tortuous nature of the channel—do you think the navigation would be improved, if the curved line marked on the plan before you were adopted as the channel? No doubt it would be much better if we could get a straighter course.
9. *By Mr. Jones*: Do you not think there is much greater difficulty owing to the bends of the channel, than there would be if you could run a straighter course? Yes, it is much more intricate.
10. Is there not much more chance of grounding on the Flats? Yes.
11. *By the Chairman*: You could not go at full speed, if the channel were ever so deep there? No, you would have to ease off.
12. You have been up and down this channel frequently since the late fresh? Yes.
13. Do you find any difference in the channel—has the depth increased? There is a slight difference, caused by the piling at the end of the island; it has prevented the water from passing between the island, and has shot a current more to the westward.
14. You have to make a greater sweep now, since the erection of the sheet piling at the end of the island? Yes.
15. Where do you think the current is now apt to strike, supposing the sheet piling to stand? The whole strength of the tide runs past this island.
16. Is it approaching that mud-flat? Yes.
17. If so, do you think that will force any channel between Mangrove Island and Snapper-hole

hole Island? I do not think it will; it is a hard foundation there; it has a pebbly, stony bottom. Mr. C. Paine.  
9 Dec., 1856.

18. What will be the result if it strikes there—will it make a greater bend at that portion of the channel, or will it straighten it? It will make a greater bend.

19. If so, will not the difficulty of managing your steamer there be increased? It will.

20. Looking at that plan, do you not, as commander of a vessel trading to the Hunter for so many years, think it would be a better plan to dredge the portion of the river denoted by the tinted portion of the plan? Yes, decidedly so.

21. You can give us no information with respect to the sheet piling, I suppose? No, I have not seen it.

22. *By Mr. Jones*: How long have you been on the river? Since 1837.

23. Has there been any change in the bed of the river since you first became acquainted with it, as to the depth of water on the Flats? There is, after a heavy fresh.

24. You find a greater depth there? Yes, it sweeps away a portion, but it accumulates again.

25. Do you recollect the dredge being there in 1844 and 1845? Yes.

26. Did you, after the dredge had been working there for some time, observe any improvement? Only for a short time. In almost every place where she had worked there was a small bank formed; she had scooped out a number of holes, and the dead trees which came down the river, and the straw and rubbish thrown in from the farms higher up the river, were swept down by the freshes, and coming to these holes, formed small banks.

27. Then, within a comparatively short time after these dredges had been there, there was no greater depth of water in the channel than before? No.

28. You do not find any perceptible shoaling in the water upon the Flats now, as compared with what there used to be? No.

29. *By the Chairman*: What is the depth of water at the lowest tides, over the shallowest parts of the Flats? About seven feet or six feet ten inches.

30. And the channel there, is it a great breadth? No, it is not above fifteen feet wide, or twenty feet.

31. *By Mr. Jones*: So that a vessel swung across stops the navigation? Yes; at a distance of ten feet from where you get the deepest water you will find a difference of six or seven inches.

32. *By Mr. Weckes*: Does the alteration to which you have referred at the end of Snapper-hole Island consist in the widening or the deepening of the channel? It alters the course.

33. Shewing that the current is eating into that bank? Yes.

34. *By the Chairman*: Mr. Moriarty proposes to deepen the channel, which is denoted on the plan by the portion tinted, to a depth of ten feet, by a width of a hundred feet. Supposing that course were carried out, would not that be infinitely better than the present channel? Decidedly. There is a channel now five feet six inches deep at high water, with a rock running across in a straight direction from Snapper Island to the Bluff.

35. Have you any further recommendations to make to the Committee, with reference to the improvement of the Hunter? No. If this were done it would decidedly improve the Hunter; and no doubt, if it were once dredged away, there would always be a good passage kept.

George Boyle White, Esquire, examined as follows:—

1. *By the Chairman*: You are a surveyor by profession, I believe? Yes.

2. And have been so for a long time? Yes.

3. About forty years? Thirty years in this Colony. I arrived here in January, 1826.

4. Were you in the employ of the Government? I was. I was the Senior Government Surveyor when I left the service.

5. Were you at one time employed by the residents of the Hunter River in making a map of the River Hunter? I was.

6. What was their object in having that map made? I made that map in November, 1844. The object was to lay it before Sir George Gipps, the then Governor of the Colony, for the purpose of requesting that something might be done towards deepening the river.

7. At what portion? From West Maitland to Newcastle.

8. In carrying out this survey, of course, you carefully sounded the river throughout the whole course? I did; here is the lithograph map of it. (*Witness handed in the same.*) The original map is in the Court House at Maitland, at present. It is on a much larger scale than this.

9. You know, therefore, very accurately that portion of the Hunter commonly known as the Flats? I do.

10. Will you have the goodness to state what you found the depth of the water to be at low water, at the various obstructions on these flats? It is so many years ago that I can scarcely remember; but I think we had five feet eleven at low water, neap tides, at the greatest obstruction—what I should call the southernmost obstruction on the river, nearest to Newcastle; then it slips up towards Snapper-hole Island, as it is called here—I do not know it by that name.

11. Will you look at the corresponding sections to the 21st section. (*Referring to Mr. Moriarty's sections.*) Did you find that the river was of greater or of less depth at the time you made your survey than it appears to be by Mr. Moriarty's sections at the present time? I have not tried the river myself, but from the sections here, there is very little difference; it depends entirely upon the time when these sections were taken, as there is a difference of four feet at neap tides, and six feet at spring tides. It all depends upon the state of the tides when it was taken.

12. Do you find that there is any difference between your plan and the plan of Mr. Moriarty

as

G. B. White,  
Esq.

9 Dec., 1856.

- G. B. White, Esq.  
9 Dec., 1856.
- as to the depth of the water there, looking at section 21 of your plan, and the corresponding section of Mr. Moriarty's plan? I have not tried the river myself of late years, but there is very little difference in the two plans.
13. What did you propose to be done there in deepening these parts, after making your map? I proposed that, in some parts, the river should be narrowed longitudinally—that banks should be cut, and the subsidiary channels should be blocked up, and the river confined to one channel. But hydraulic engineering is one of the most difficult things a man can deal with. It should never be undertaken without much investigation and consideration.
14. Then, under your original plan, dredging, I presume, was absolutely essential? It was proposed by me, and Sir George Gipps at the time objected, until he came himself and personally went over the flats with me. He was himself employed for two days in these parts. I was perfectly satisfied my plan could have been carried out, and I believe it would have been if he had remained here.
15. Sir George Gipps saw the absolute necessity of dredging? Yes, he did, and sent the Dredging Machine almost immediately afterwards.
16. With your experience, would you commence stopping up the various channels without employing the dredge? I think the first thing I should attempt to do, would be to stop up the channels.
17. Without ultimately employing the dredge? No; I should employ the dredge where the channels were stopped up, in the first instance, to get material for forming new banks.
18. Do you think that the simple act of stopping the channels would render these flats navigable to a greater extent than they are now? No, I do not.
19. The dredge is absolutely necessary? I think the dredge absolutely necessary. It depends entirely from where you commenced deepening the river. I should begin to work with the water, and not against it. I think the reason that the dredge never did any good there was, that it was never worked upon a system. It made one hole, then another, and then another, and never worked upon a system from the beginning. I made a map of the harbour, on a very large scale, at the same time I made the survey of the river. (*Witness produced the same.*) It was made in 1844.
20. To make the Flats permanently navigable, would you continue the tortuous channel at present in use, or would you endeavour to make it a more gentle curve? I would, of course, make a large curve, if I possibly could, in preference to a small one; but there is a sharper curve to the northward. The curve, except from the narrowness of the channel, would not impede a steamer. Perhaps I may not be considered incapable of giving an opinion on this subject, having served as a Marine Surveyor in the Navy for eight years.
21. Do you, as a Marine Surveyor in the Navy, think that the present channel, which you see indicated by the dotted lines in Mr. Moriarty's map——? It is but a gentle curve when you look to this scale; but the other curve would be the best, but would be considerably more expense; it would have a great deal of embanking.
22. Have you ever surveyed that portion that is indicated by the continuous line? I have, the whole of it.
23. But with the idea of forming a channel there? Yes; during the time that Sir George Gipps was there, I ran several transfer sections from shore to shore, not only from Mangrove Island, but I took from Mosquito Island to the main.
24. According to Mr. Moriarty's survey (I do not know how it agrees with yours), it appears there is deeper water in the proposed channel? There is deeper water in the channel now used by the steamers than in the proposed channel that the black curved line indicates in this map, and there would be more "making" necessary where the black line now is, than upon the dotted line, or the channel now in use.
25. You know the various currents of the river, always keeping in mind the Flats? Yes, and they are very variable, varying with the flow of water, and varying with the tidal influences.
26. This channel by Snapper-hole is of considerable depth, I believe? Yes, there is plenty depth of water all down here. (*Pointing to the map.*)
27. What do you consider the depth of water arises from? Merely by the wearing out by the water. These are all shell banks, shell and gravel.
28. It is caused by the scouring? Yes, and the ebb tidal influences. Land water is little affected in that portion of the river.
29. How does the current set towards the sea here at ebb tide? The currents are influenced by the banks of the river. Sometimes the current impinges upon a bank, and goes off almost at an angle. The tide in the channel between Snapper-hole and Mosquito Island runs with great strength. There is a report in some Government papers upon the tidal influence in this channel. They were made by me at the time.
30. How did you propose to block up that channel—was it first by piling or ballast? I should have piled partially by fascines and gabions, ballasted with stone or *debris* from the shell banks.
31. Would you have done so partially to stop up the channels indicated at N, M 1, M, and M 2, or would you have carried it on the continuous line from Snapper-hole Island to Mosquito Island? I should have carried it in a continuous line.
32. If you complete the piling partially to N, M, M 1, and M 2, do you think that the set of the tide, still impinging on these various portions, would force the current through any of these mud or sand banks? Not if what I propose were promptly done.
33. I say if only the channels to N, M 1, M, and M 2, were stopped by sheet piling, or otherwise, and the banks between left untouched, would the river itself, sometime or other, force through it? I am of opinion that it might—that it would scour itself and make a fresh channel through the Flats.
34. Which would, in your opinion, be avoided by the continuous line? Yes, I believe a work of the sort cannot be partially done.
35. *By Mr. Jones:* To be of any service? To be of any service.

36. *By the Chairman*: What is your opinion, knowing the effects of currents, tides, and tidal influences, with respect to the sheet piling put up at N—you will perceive it is not used at the north-easterly end of Snapper-hole, but placed well to the westward—what do you think would be the effect of the action of the water upon the piling now, as it were, caught in a trap? The action of the water will not have so much effect as it would have if the piling had been placed more to the eastward; as it is now placed near the western point of Snapper-hole Island, and going north-easterly to the Flat it is much more likely to stand than if it were placed at the north-easterly point of Snapper Island, and going across northerly to the Flat.

G. B. White,  
Esq.  
9 Dec., 1856.

37. The contractor states to us that it is placed in the position indicated on the map, but going more to the westward; supposing he states also that the water coming here (*referring to map*), meeting with resistance here (*referring to map*), it was working itself there — ? Yes, so it would if it were placed so. Most of the hydraulic engineers writing on the subject, say, when piling in that way you should pile beneath the bifurcation.

38. The contractor also states that he has been compelled to protect Snapper-hole Island by means of sheet piling, and that the current of water being changed, there is caused an eddy, so that it goes this way (*referring to the map*), and is working itself a deep channel at the northern end of the N piling: is that likely to be the case? Very likely; indeed it will strike the water, and the water will fall back with considerable force, and form an eddy, which is likely to excavate the soil beneath.

39. Do you think that sheet piling will stand? No, I do not; I do not agree with sheet piling when the river is so likely to interfere with it.

40. If you think so, and that it is working the channel out here, it will become necessary to prolong N? Yes.

41. Until it will meet M 2? Yes.

42. It will ultimately be necessary to prolong the sheet piling, or make an artificial embankment from N to M 2? Yes.

43. Supposing that this embankment is ultimately completed according to your suggestion, how will it affect the channel at present in use by the steamer—will it approach Snapper-hole Island, or will it still keep the bank it always has kept—have you ever tried, by boring or other means, to learn of what these Flats to the eastward of Snapper-hole Island and Mangrove Island are composed? I have; I did so in the presence of Sir George Gipps. We had a couple of men there during dead low-water—neap tides—who sunk a hole nearly six feet deep, and found the Flat to consist of shells—principally cockle. After getting through the shells we found twelve or eighteen inches of soft mud, and then shells again. On the main land we found the strata to correspond with those of the Flats. We took up the stuff to Newcastle, and weighed it, and made a calculation of the quantity it would be necessary to take away from the Flats.

44. *By Mr. Faucett*: These had been beds of the sea before? Yes.

45. The Hunter is an estuary there? Yes.

46. *By the Chairman*: Your opinion is that the present channel in use will be a stoppage-up of those channels at N, N 1, M 1, M, and M 2,—will approach towards Snapper-hole Island and Mangrove Island? Yes; the principal force of the tide is here.

47. Mr. Moriarty states that he finds since the fresh was made it is impinging upon this bed here, on the north-east point of Snapper Island? Where it impinges it throws off the water at an angle of perhaps from 30 to 45.

48. What effect will it have on the steamer channel; will it make it less tortuous, or more tortuous? It will have very little effect; of course if works are to be done, it will be necessary to protect this place.

49. It is stated that all the works will only cost a certain amount of money? These estimates are difficult to arrive at, even by the most able engineers. The estimates of Stevenson and Rennie are generally doubled or trebled, and I believe it is the same in nearly all the Railways carried on in England; not more than one or two have kept within the original amount.

50. If this channel impinges on this mud flat lying to the eastward of Snapper-hole Island, is the water ever likely to force itself down to Mosquito Island and Mangrove Island? I think not.

51. I do not mean a deep channel, but one that would cause the regular channel to be interfered with as to depth? No, I do not think it would. I think these islands are forming outside. I remember them since 1827. They were very different at that time from what they are now; mangrove is growing all about there now.

52. I presume you never made any estimate of the cost of dredging the flats? I calculated what amount of dredging would be required in the first instance; it was given in the Report dated the 30th of November, 1844.

53. So far as I can comprehend, you are of opinion that first it is necessary an embankment should be made from Snapper-hole to Mosquito Island, and that it should be a continuous embankment the whole way? Yes.

54. Secondly, that it would require the whole of the banks lying to the eastward of Mangrove Island and Snapper-hole to be protected? Yes.

55. *By Mr. Faucett*: By sheeting of a particular character? I would not put sheet piling, but gabions and fascines, and the matter obtained by dredging the river should be thrown upon them, and thus an artificial embankment would be formed. The wash of the river would very soon set it till the materials would almost become a concrete.

56. *By Mr. Arnold*: Do you think gabions and fascines better than piling? Yes, I do; because the teredo is so very destructive. I have seen a tree that had been cut down, and fallen into the river, completely destroyed in twelve months.

57. *By the Chairman*: From your frequent use of the word dredging, I arrive at the conclusion that you consider dredging absolutely necessary? It should be done on some system.

- G. B. White, Esq.  
9 Dec., 1856.
58. *By Mr. Arnold*: Dredging and embanking should go on together? Yes, and with the water, instead of against it.
59. *By the Chairman*: What is the usual ebb and flow of the current of the river, supposing there is no fresh? At Newcastle, as it is stated here (*referring to map*), it is two miles, or two miles and a half; higher up the river it does not run so fast, and gets up to a mile, or a mile and a half.
60. Do you think such a current caused by the tides is sufficient to keep any channel open? I do not think it affects the channel very much.
61. It is not of sufficient strength? No; the tidal influence scours to a certain extent—sufficient to carry away the *debris* washed into it.
62. Is it sufficient to keep open the channel when it is dredged? I should say so: but not to open the channel itself.
63. Supposing there is no dredging at all, are you of opinion that the tidal influence is sufficient to scour the channel? No, it is not.
64. Have you any further suggestions to make to the Committee with reference to the embankment of the river? I do not know that I can make any further suggestions, unless I were to go into the matter and again examine the river thoroughly.
65. Have you cause to suppose that the channel has become either deeper or shallower? I know nothing from my own observation, but from what I hear the captains say, there is very little difference. When I go back to Newcastle I will try some of the soundings across at different points. I will go as far as the flats.
66. Do you think that the partial piling they are putting up, and the other they are intending to put up, will have the effect, without any dredging, of sufficiently stirring the present channel? Certainly not.
67. The plan will not be effective? No, it will not.
68. Have you ever taken the depth of the water from Snapper-hole in a northerly direction to Mosquito Island? Yes.
69. What is the deepest water? I see the water marked here 15, 12, 8, 13, 15 feet. It is very deep there. In fact, all the water of the Hunter turns in there.
70. When were these soundings taken? In November, 1844.

Mr. A.  
Livingstone.  
9 Dec., 1856.

Mr. Alexander Livingstone, called in and examined:—

1. *By the Chairman*: You are Harbour Master at Newcastle? I am.
2. You have likewise had command of a steamer trading up and down the Hunter? Yes.
3. And of sailing vessels? Yes; I think I was the first who went up the river in a sailing vessel.
4. Do you know that portion of the river called the Flats? Yes.
5. You, as Harbour Master, laid down the buoys to mark the present channel? Yes.
6. Will you state to the Committee what you consider the depth of the water at extreme low tide? I was up on Friday last, and I found on the Upper Flat, a little below Snapper-hole, that the depth of water had increased about a foot to what it was when I sounded about three months ago, only it has shifted a little off the point.
7. You mean from Mosquito Island? Yes, farther off Mosquito Island.
8. Did you proceed down the river? Yes; I went till I came to the Lower Flats, to the eastward of Snapper-hole Flat, that is where they are putting the sheet piling now. I found the channel had altered a little, and, in sounding, the least I got was six feet nine and seven feet at low water. At one place I found only six feet nine. The channel is very narrow there; but since the piling has been put up it has altered a little.
9. *By Mr. Jones*: It throws it further over towards the north-east shore? Yes.
10. *By the Chairman*: How is the depth of water now, as compared with what you have known it to be for many years? There is more water now than when I first went up in 1823. I commanded a steamer trading there in 1836.
11. Do you attribute this additional depth of water to the recent fresh, or to tidal influence? To tidal influence; the fresh, no doubt, has some influence; but what astonishes me more than anything else is, where such a quantity of earth as that washed from the different farms goes to; for instance, there are seven or eight acres washed away from Mr. Eales' farm.
12. Do you remember the flood of 1830 or 1831? It was in 1831. I do.
13. Had not that the effect of deepening the river? It had, decidedly.
14. Was it considerable, or was the effect merely trifling? Considerable for some time.
15. Do you think that the recent fresh, which has been pretty strong, has had any effect in deepening the Flats? Yes, it must have had, for the current was very strong.
16. *By Mr. Jones*: Do you account for the greater quantity of water you found on the Flats, by the recent fresh? Yes; no doubt it has shifted to a certain extent; but it has somewhat deepened there.
17. *By the Chairman*: What is your opinion with reference to the tortuous nature of the channel—would you prefer to have it as it is, or to make it as straight as possible? I would make it as straight as possible—the less obstruction the better. There was a line I sounded from Snapper Island to Bluff Head, which was almost a straight line.
18. Is it the continuous straight line marked on this plan you allude to? Yes.
19. Is a gentle curve better than the present channel which is so tortuous? My opinion is, that the straight channel is the better one of the two. The more you contract the channel the more you deepen it; for instance, at Raymond Terrace, where the river expands, it is shallow; between Mosquito and Snapper Island it is again broad and shallow—the steamers often ground there.
20. With respect to the management of a steam vessel—do you experience any difficulty in a channel that bends so much as the present one? Decidedly; it must be a great deal more trouble to steer a steamer through a tortuous than a straight channel.
- 21.

21. You could not go at full speed in a tortuous channel, but would be obliged to ease off? Mr. A. Livingstone.  
Yes; because you can take your mark in a straight channel, but you cannot where the river winds so much.
22. When you were up the river the other day, were you at the sheet piling at N? Yes, 9 Dec., 1856  
last Friday.
23. Did you examine it? Yes.
24. What has been the effect of the fresh and the tidal influence there? It is making the tide in the channel a great deal stronger than it was.
25. In the steamer's channel? Yes.
26. What I wish to ascertain is the actual effect of the tide upon the sheet piling? It has given way, and they are now, in my idea, taking a wise course; they are taking ballast from Newcastle and putting it down there, and I have no doubt that will stand. I have no faith in sheet piling, for I think the cobra will very soon eat it through.
27. What were they doing to support the sheet piling when you were there? Taking stones and ballast from Newcastle and throwing them to the bottom there.
28. Do you know at what cost? At three shillings a ton.
29. What has been the effect of the fresh at the northern end of the sheet piling at N—that is the end farthest off from Snapper-hole? The tide runs up very strong there, and seems to make a deeper channel there. Formerly it was very shallow there, now I suppose it is five or six feet deep along the Mosquito side; but it had not gone so far as the sharp point of the bank. Where the sheet piling is, there is no tide only on flood tides.
30. As far as I understand you, it is forming a channel between Mosquito Island and the sheet piling? Yes.
31. What measures will now be adopted to stop the river going into that Mosquito Island channel? By throwing down stones there; that is very easily done, as there is an immense quantity of ballast to be got there.
32. The stones are thrown down at the end of the piling? At the south-west end of the sheet piling.
32. You are now compelled to throw down this ballast to stop this channel? Yes.
33. When you have stopped the current to some little distance, what is your opinion with respect to its still working round? I believe it will.
34. Until the embankment joins from Snapper-hole Island right to Mosquito Island? Yes.
35. You think that will be necessary ultimately? Yes.
36. The sheet piling was to cost about £693. I now find that the ballast, according to Mr. Moriarty's last return, only to protect the foundation, will cost £195 in addition—that is, nearly thirty per cent. more than the original estimate—how much ballast do you think it will require to finish it? I cannot tell; but I suppose we have 800 or 1,000 tons coming into the Port every week.
37. How much of that will it require to make this bank? I could not say. It is very deep—close to the island fourteen or fifteen feet deep; towards Mosquito Island it is shallower.
38. *By Mr. Faucett*: It will depend altogether upon the different depths in the locality? Yes.
39. It will sink some depth into the sand, will it not? I think not.
40. *By the Chairman*: With respect to the end of the piling that is nearer to Snapper Hole—have they been obliged to protect that? Yes, both sides of that.
41. With what? With stones.
42. At first they had piling? Yes; but they found it did not stand, as there is so much weight of tide coming there; over these soft mud-flats there used to be a little tide, but it is now becoming stronger.
43. Will it, in your opinion, force a channel there? Yes, unless prevented by ballast.
44. *By Mr. Arnold*: Do you conceive it to be necessary to make an embankment from that point to that point? (*Referring to the plan.*) I do not think so, for that sandbank is quite free at half tide.
45. The whole of this outlet will require to be stopped? Yes.
46. *By the Chairman*: If you, as a practical man, had to place this sheet piling, would you put it far to the westward of Snapper-hole Island, or would you have kept it to the north-eastern point? I would have had it from the north-eastern point towards the mud-flat in the direction of the channel.
47. You consequently condemn the situation of the sheet piling? I do not like it at all.
48. *By Mr. Faucett*: Does it not appear that the different forces coming down upon that piling, as it appears there, must have a greater effect in washing it away than if the piling were out farther towards the seaman's channel? The strength of the tide is much greater coming through the channel; it would not have been half the weight if it had been the other way.
49. It has, in fact, more force coming upon it, with less resistance than it would have in the position you suggest? Yes.
50. *By the Chairman*: The present steamer's channel is, you say, shallow? It is, in parts; in one part I got only six feet six, that was the shallowest part, but that was only a short piece; the next lead I got was seven feet, and seven feet and a half.
51. The channel is narrow there? Yes.
52. Is the channel narrow only in parts, or throughout the line at present adopted? In parts.
53. You assisted Mr. Moriarty in taking the depths in the line proposed by him? Yes; I sounded, and he took down the soundings.
54. You, therefore, know the depths in the line proposed by Mr. Moriarty? Yes.
55. Can you state to the Committee which, in your estimation, supposing you had to make a channel ten feet deep and a hundred feet wide, would take the greatest amount of dredging? The present line would take more dredging than Mr. Moriarty's. There is good water there, except in one place, where there is only five feet and a half of water.
56. *By Mr. Faucett*: Can you state how many miles it is from Morpeth to the landing-place at Newcastle by the present channel? About twenty-seven miles.
- 57.

- Mr. A. Livingstone. 57. How many miles would it be by the proposed channel? It would shorten the distance about a quarter of a mile.
- 9 Dec., 1856. 58. In fact, it would not considerably shorten the distance? No; the great object in this matter would be to get a straight line, so that the steamers might go at full speed.
59. Would it shorten the time within which a steamer could go from Morpeth to Newcastle? It takes steamers very little time to go a quarter of a mile.
60. *By the Chairman*: Except they get aground? Yes.
61. And they would be more likely to get aground in a tortuous than in a straight channel? Yes. I think this would make a beautiful channel, as straight as an arrow.
62. Is the fresh subsiding? Yes; there is very little fresh now.
63. *By Mr. Arnold*: Am I to understand, on the whole, that in order to make a sufficient channel on the line you approve—Mr. Moriarty's line—it will be necessary to embark from this point to this point (*referring to the plan*), and to dredge at the same time? Yes.
64. The embankment would be of no use without dredging, and dredging would be of no use without the embankment? Of no permanent use.
65. *By the Chairman*: You see there is piling at N, a little bit at M 1, another bit at M, and another at M 2—that is the way it is proposed to be done. Supposing this piling were completed, and no dredging were to take place of any kind, do you think the present channel of the river would be improved—would that be sufficient without anything further? I do not think it would.
66. It would, in fact, be a failure? Yes, I think so. The steamers that go towards Fullerton Cove go with great force.
67. At what rate does the current of the river run in common tides? Three knots an hour.
68. Where do you mean? Just by Snapper Island.
69. I am speaking of the present channel of the steamer—at what rate does the common tide run? Three knots and a half, I think.
70. Mr. Whyte says it runs only two and a half at Newcastle? It goes much quicker here, where the channel is narrow.
71. Have you any further suggestions to offer to the Committee? I strongly recommend the adoption of Mr. Moriarty's proposed channel as the most efficient and the most easily cleared.

THURSDAY, 18 DECEMBER, 1856.

Present:—

MR. SCOTT,  
MR. JONES,

MR. OSBORNE,  
MR. WEEKES,

MR. PLUNKETT.

A. W. SCOTT, ESQUIRE, IN THE CHAIR.

Edward Orpen Moriarty, Esq., called in and further examined:—

E.O. Moriarty  
Esq.

18 Dec., 1856.

1. *By the Chairman*: Have you been down the Hunter lately, Mr. Moriarty? I was down there on Tuesday last—the day before yesterday.
2. The Committee are desirous to know the effect of the currents upon the sheet piling, in particular with regard to the part marked letter N? The effect of the sheet piling has been to divert an enormous quantity of water down the main channel, so much so that I find the difference of level of water on the upper and lower sides of the barrier of piles is equal to  $3\frac{1}{2}$  inches during the ebb of neap tides, and  $7\frac{1}{2}$  inches during the ebb of spring tides.
3. Is that at half tides? Yes, during the strongest part of the ebb, that is about half ebb, the water rises from  $3\frac{1}{2}$  to  $7\frac{1}{2}$  inches higher on the up stream side of the barrier than on the lower or down stream side.
4. That is during an ebb tide? Yes. With a flood there is scarcely the difference of an inch in the level, shewing that but a small body of flood water comes up the western or Mosquito Island channel.
5. The piles come up the western channel and then go up the southern or main channel, what is the result of this? The evident effect of the barrier of piles is to divert an enormous body of water into the present main channel.
6. Will you state to the Committee the effects of the water at the southern and northern ends of the sheet piling? It is perfect slackwater at the southern end, and at the northern end there is a current running clear of the end of the piles.
7. The water is running at the northern end clear of the piles? Yes.
8. Does it form any channel? It would have formed a channel, but I have dropped ballast at right angles, which tends to stop it.
9. Do you think by putting the ballast at right angles you have effectually stopped any channel? I will not say effectually stopped it, because the difference of level between the waters on the upper and lower sides being 7 inches, the water would always find passages—it would tend to run round.
10. If that is so, what other means will you have to resort to, to check these channels? The only means of checking them is to drop a border of ballast from the north-eastern side of Mosquito Island right away to the sheet piling, in order to fix the bank.
11. You propose in your plan to give up the sheet piling at M 1 and M 3? I excluded this from the contract.
12. You misunderstood me—I am not asking you that question. You intend if you throw the ballast from the north-eastern side of Mosquito Island right away to the sheet piling, which you originally recommended at M 1 and M 3? Yes; I propose using ballast instead for the remainder of the work.

13. Have you calculated the amount of ballast you have already used to protect N sheet piling? Yes; it amounts, I think, to about 1,500 tons.
14. Has the quantity you have already used effectually secured that part? Yes.
15. Have you made any calculation with respect to the quantity you would require with respect to the completion of the embankment if it was carried on to Mosquito Island? No. I have made a calculation of the cost of the quantity of ballast it would take to substitute it for the sheet piling, and I find the cost would be £150 less than for sheet piling.
16. That is with reference to the whole of the contracts? Yes.
17. The question is, what is the difference of price between your present plan of stone ballast and sheet piling at M 1 and 3? I have not made a calculation of that, because they were excluded from the contract.
18. Were they not originally in the contract? No, M 1 and 2 were not a part of the contract.
19. I think I read it in your contract, I will not be certain? I think not. M 3 is the only one included.
20. Then what made you insert in the map M 1? That was done before the contract was made.
21. I thought it was eventually done? No; I did not see the use of contracting for them, as I thought it wiser to wait till I should see if the other sections answered the purpose I anticipated from them, namely, diverting the principal body of the ebb waters into the main channel, as in that case I should not have cared to close the small channels at M 1 M 2, as they would have allowed the flood tide to ascend the river more freely; at all events, till the other channel was well opened.
22. Your contract merely alluded to the sheet piling at N 1 and M 3, with respect to the western channel? Yes.
23. What would be the difference of cost between ballast and sheet piling, from the northern end of the part marked N to the northern end of Mosquito Island, doing away with M 3. That would be about 1,320 yards? I should think it would come to about £1,000, at 3s. a ton.
24. Then the difference between that and the sheet piling at M 3 would be £500 in addition to the original estimate? About £500.
25. And also that the ballast used to protect the sheet piling from end to end would amount to £225 more than what the sheet piling cost; this sum, with the difference of £500, would make, say, £725, in addition to the original estimate expended? Yes; I find that by substituting ballast for the other sections, instead of sheet piling, I would be able to do this work at £147 under the present contract, including the cost of the ballast already laid down.
26. If this plan were adhered to, that the main channel now in use is still to be deeper, you would not require any sheet piling at all? No; I would have the ballast laid as I before stated, and it would be as well to let the channel be blocked up as soon as possible.
27. In your calculation have you allowed for the ballast burying itself? Yes, I have allowed two feet.
28. Will you explain to the Committee what would be the effect of the stoppage at N, as regards the main channel? The effect has been to divert a large body of water into the main channel.
29. What is the effect of that—is it to deepen it? Yes, it will deepen it in the soft places.
30. Can you tell what would be about the depth? I have taken some soundings, but it would be rash to say what it would be eventually.
31. Does there appear to be some change in the depth? There does appear to be a difference. It looks a little deeper in some places; but it is too soon to look for any great change.
32. With respect to your new channel—what effect has the ballast on it? It is deeper in some places; but I believe that the principal change in it as well as the other channel, where any has taken place, is principally due to the late violent floods, as it is almost too soon to look for much result from the tidal action.
33. Has it had more effect on your channel than on the old one? I cannot say it has been of much importance.
34. You will observe that the part marked F is about the worst part of that channel—has it been affected by the blocking up of this channel? It has not been much affected by the blocking up of this channel, because only one of the channels have been blocked up. Until we get the whole of these portions which are above it on the river completed it will not be affected to any great extent.
35. Will you state what effect this additional body of water coming down has had on the undulation and windings of the channel—has it straightened it or not? I do not think it has had any effect as yet; in fact it is too soon to look for any effect on the form of the channel. The alteration in the line of current is, however, very distinctly marked, setting from M 3 partly down the main channel, partly down the channel I proposed to open. That portion of the water passing down the main channel seems to run pretty straight from M 3 to section 18, where it infringes on the edge of the bank extending from Snapper-hole to Spectacle Islands, it is then diverted across towards the long bank from which its direction is again changed, giving it a set towards the "Bluff Head;" the line of current in the channel I have proposed, runs throughout in a fair sweep.
36. To judge from your description, it makes a circuitous winding, or kind of sweep? It is a somewhat tortuous course.
37. Are the Committee to arrive at the conclusion that the sheet piling will not be efficient permanently, unless the stone ballast is carried on to the north-east of Mosquito Island? I think eventually the ballast will have to be carried all the way along.
38. Do you find it necessary that the embankment should be carried to the north-east of Mosquito

- E.O. Moriarty Esq.  
73 Dec., 1856.
- Mosquito Island? I think eventually the whole will have to be ballasted, because the bank is soft and the tide will work into it. I should not, however, care to do it now, or until the main channel was well opened, unless I found the current acting too much upon it, as I would be slow to do anything to impede the upward passage of the tidal wave; besides which, the supply of ballast to be obtained at Newcastle is not more than sufficient for the most important parts of the work, just at present; at some future time, when the ballast can be easily obtained, I should like to lay a border of it on those soft banks on each side of the channel, to fix them, and prevent alterations in the latter.
39. I ask you whether it is necessary that the whole should be ballasted? I said eventually it would.
40. Unless the bank was protected the tide would break into it? I think it would be found, in that case, necessary to protect it with ballast.
41. If the present plan was adopted? I think the whole in time will have to be protected; but, at present, there seems to be no absolute occasion for it. I have not, therefore, thought of proposing anything more than what was necessary for the immediate requirements of the navigation.
42. That is the case in all rivers—I do not see how, if the water is drawn here, it can effect the embankment? It would have to be protected at K in that case; and I say the only effectual way to protect the banks will be by laying ballast along the sides of the channel.
43. Do you think now that the rise and fall of the tidal waters is sufficient, not only to keep any channel clear, but to scour out the channel through—I mean the usual tides? I think it would keep it clear. The channel of all tidal rivers is kept clear as high up as neap tides reach by the tidal action, and, on the Hunter, nature has presented us with a magnificent sluicing reservoir in Fullerton's Cove, which will be of the utmost assistance when its currents shall have been properly directed.
44. How can you account for the freshes not affecting it, for they last three or four hours? These freshes in general do not come far down the river.
45. Suppose now there was no flood but simply the action in common—do you think the water is of sufficient velocity to keep the channel clear, much less to scour it out? I think it would be quite sufficient to keep it clear, but not sufficient to scour it out, so as to make a good navigable channel, without the assistance of the dredge to clear the hard spots.
46. But not to scour it out? It would only scour it out where the bottom was soft. You will find in all rivers the bottom is harder in some places than in others. In the River Clyde, for instance, where the rise of tide is double that of the Hunter, it has been found necessary to straighten and deepen the river by dredging. The same in the Thames, the Liffey, the Lee, in fact all rivers which have been improved of late years.
47. With these facts before you, would you recommend the use of the dredge? Most assuredly I would.
48. Would you recommend the dredge to be used now? I think it essential to have the dredge, in order to make a good channel.
49. You think it already essential? Yes.
50. Suppose you were to make a channel of 10 feet deep and 100 feet wide—I think you recommended the employment of a dredge? Yes; but I purposed to make the channel 200 feet wide at the narrowest part.
51. Which of the two channels, the one that exists, or the one you recommend, would require the greater amount of dredging? I have not made the calculation of the difference in cost for 100 feet wide.
52. Which would require the greatest amount of dredging to make these two channels equally deep? The old channel. There would be a difference of 13,000 cubic yards in favour of the channel I propose.
53. The channel you propose would require less dredging? Yes, 13,000 cubic yards less.
54. You are quite positive that the channel would require that amount less dredging? Yes, in order to make them both equally good.
55. Knowing that, and seeing that the embankments would be required on both sides, would you be prepared to advise the Committee to adopt the original plan, or the one you propose? I should recommend the channel I at first proposed; I have seen nothing to change my opinion in this matter.
56. That is your channel? Yes.
57. Would it be more effective? Yes.
58. Would it be cheaper when made—that is to say, to bring it to the same width and depth as the old plan proposes? Yes, it would.
59. Would it also prevent the injuring and breaking its bank and boundary? Yes; the water by having a few sweeps, would not act so injuriously on the banks; but it would have more effect on the bottom; the navigation too would be much easier. It has another great advantage, the tidal action would not be so obstructed in its passage up and down. The channel would have, in this plan, a fair uniform sweep.
60. *By Mr. Osborne:* What are the red lines? They mark the set of the currents.
61. *By the Chairman:* With respect to the sheet piling recommended at L in particular, is there anything to stop the channel there—is it a simple continuance of the sheet piling as far as high water mark? I only propose it to be up to low water mark. There is no object in having the piling higher than the banks.
62. You cannot fix the piling down very low? It cannot be fixed down more than 12 inches above low water mark.
63. With respect to the experience you have gained of this matter, would you recommend any further improvements than those recommended in your original Report—perhaps you cannot answer this question at the moment? It is a question of such considerable magnitude that I should not like to offer an opinion hastily; I have got a clear notion of what the thing would require, but the only thing to be considered is the expense. I do not feel disposed

disposed to recommend any deviation from the plan first proposed, that is, if it is worth the E.O. Moriarty expenditure; if the present or probable future trade on the river is considered of sufficient importance to justify the outlay, (I believe myself it is, and that what is worth doing at all is worth doing well), but, if it should not be so, then the only course will be to follow up the present plan, shutting up the branch channels so as to confine the water, and then leave the rest to nature—following up and aiding her operations where it may be necessary.

64. The expense was estimated by you at £16,000. So far as I comprehended your plan, if you continue the ballast you say it will be cheaper than sheet piling—therefore, £16,000 would very nearly do the work? I think it would finish it.

65. Would it make a channel of 100 feet wide and 10 feet deep, using the Dredge? Yes, it would make a channel 200 feet wide and 10 feet deep.

66. Perhaps you will state the reason why you place the barrier so far westward? I did that in order to throw the flood current clear of the bank, so as to prevent the formation of a new channel at the north end of the pile barrier, similar to that which we had closed.

67. In practice you found the original idea of yours was not correct, and that the slack water caused it to be in fault? As far as I have been able to judge of the effect of closing the channel at N, I look upon it as completely successful, the body of water diverted into the main channel is even more than I anticipated.

68. Would not what you have stated of the ebb tide have the effect of scouring out the channel? I think not to any considerable extent. Of course when there is such a difference in the level of the water above and below the piles as  $7\frac{1}{2}$  inches, some water must find its way round the end of the barrier, but this cannot be prevented, and the very existence of such a difference as  $7\frac{1}{2}$  inches in the level above and below, is the strongest proof that the barrier of piles is working well, as shewing that it obstructs the run of the ebb waters into the western, or Mosquito Island channel by so much.

69. What would be the objection to carrying this line of piling to M2? In the first place it would take so much money—it is much longer. If I carried the barrier of sheet-piling from that point to M2, I was afraid of having a race of water on the foot of it; I calculated that this would be avoided by putting it further westward, and I have a pocket to drop the silt which I expect to get out of this place.

70. You still adhere to your original idea, that your plan is the best and cheapest? Yes, if you want the best navigable channel at once.

71. *By Mr. Jones:* Have you made an examination of the river higher up than the flats?

No. I was instructed to make a survey for about a mile above Fullerton's Cove.

72. You cannot say what obstructions there are in the river between the upper part of the flats and Morpeth? No.

73. You do not know what the original amount was estimated at for securing a channel of 10 feet deep up to Morpeth? I cannot tell; I was not aware that any estimate had been made. I am quite certain of this, that as soon as the channel at the flats is open to a greater depth than it is at present, it will allow the water now dammed up to run off, and thus develop the shallows higher up the river.

74. So that the deepening of the shoals and flats will render it necessary to deepen the shoals that will appear higher up the river? Yes.

75. Can you see any useful operation will be secured by deepening the flats, keeping in mind that nine-tenths of the vessels go up to Morpeth? Before I could answer this question, it would be necessary to know what obstructions there are higher up; but from all I have heard the obstructions are not of a serious character, or likely to be difficult of removal.

76. Although we might lower the river here three or four inches, still it might not have been so injurious in effect in the northern portion of the river? I think you might.

77. What would be the object of deepening this portion over the flats, with a view to admit vessels up the river going to Morpeth, if you do not deepen the river all the way up? None. You should have the same depth of water all the way up. Deepening the water at the flats would have the effect of developing the shoals higher up the river, and then you would have to go to work with the Dredge on them, in order to keep a depth of 10 feet at all times of tide; but by removing the obstructions on the flats only, the flood tide will be enabled to ascend the river more rapidly, and will rise to a greater height, so that where it now rises perhaps only 3 feet it will then rise 3 feet 6 inches or 4 feet; this has been found to occur on the Clyde, where, by uniformly contracting and deepening the channel for 12 miles, the tide is 37 minutes earlier than it used to be, and the top of high water is 10 inches higher at Glasgow than at Port Glasgow, which is 18 miles lower down.

78. Can you give the Committee any idea of the amount of work, to secure a minimum depth of 10 feet from Newcastle to Morpeth? I can not; I think it would take very little work to do so. It is known that the obstructions exist on two spots, Raymond Terrace and Eales' Flat.

79. *By Mr. Plunkett:* What is the extent of your plan? About three-quarters of a mile from the entrance of Fullerton's Cove.

80. From what point? From the entrance of the Harbour.

81. *By Mr. Jones:* After observing the effect of the work so far as it has gone, you still adhere to the opinion that the channel you recommended is the best? I do.

82. And it would be desirable still to carry on the work, instead of retaining the channel now used? Yes; if I had to dredge them both to a uniform depth, I think the new one would be the best; but, as I have before stated, I believe the entire question hinges on the desirability of expending the money it would cost, on the permanent improvement of the river; perhaps before doing so it might be as well to examine into the nature and extent of the obstructions higher up.

83. You think by making the water of equal depth you would be more likely to keep the channel clear? Yes, because there would be a more uniform sweep, and the tidal wave will ascend more rapidly, and will rise to a greater height.

- H.O. Moriarty Esq.** 84. *By Mr. Osborne*: Can your plan be carried out for less money? Yes, part of it can; we are doing so now.
- 18 Dec., 1856. 85. *By Mr. Jones*: On what ground has the plan laid down in your letters been set aside? It has been deviated from on the ground of expense, I presume, because there was only £40,000 voted for the improvements of the Hunter, and a great deal of this money will be required for the wharfs and the Breakwater of Newcastle.
86. *By the Chairman*: The Breakwater has nothing to do with the improvement of the Hunter? It is paid out of the £40,000.
87. *By Mr. Jones*: Do you think the work decided on by the Government will have the effect of deepening the river unless your old plan is carried out? It may; it is impossible to say. A mere tidal action may be sufficient to deepen it, but I do not think it will deepen it to be of much use. The harder parts of the river will resist the water, and the bottom will thus become irregular.
88. Are you aware of the rise of tide? It rises 4 feet 6 inches at spring tide.
89. *By the Chairman*: What is the average? About 3 feet.
90. Would that amount of tide give any scouring power? It would act favourably on the river, and be quite sufficient to keep the channel clear if once made; but, as I have before stated, the estuary of Fullerton's Cove will be made to serve as a great sluicing reservoir.
91. Do you think by any expenditure the river would be deepened without carrying out your plan in its integrity, so as to secure a channel of 100 feet wide and a depth of 10 feet? I think it would be necessary to use a Dredge.
92. Do you see any reason to delay using the Dredge? No; I think the sooner it is used the better.
93. Do you think your plan should be carried out in its integrity, or only a part of it? I think so, but I may be wrong.
94. Do you still adhere to that opinion? Yes.
95. *By Mr. Jones*: Do you hold yourself responsible for the success or failure of the scheme which is now decided on for the improvement of the Hunter, seeing that a portion has been done according to your plan, and a portion has been dispensed with? No, I do not think I can be considered entirely responsible.
96. If your plan was carried out in its integrity, would you have held yourself responsible as an Engineer for the success of the plan? Yes.
97. You feel relieved from the responsibility of the success or failure of your plan by the alterations that have been made since you sent in your report? Of course I cannot be held responsible for the effect of works carrying out only half my plan.
98. *By Mr. Weekes*: Still this is part of your plan? Yes.
99. Only reversing the order in which you would have begun it? I intended to have had a Dredge and worked it by the time the channel was open, at the same time closing the section marked N, in order to drop silt about the piles, which would form the embankment.
100. The work carried on now is not thrown away, although it is not in furtherance of the plan you proposed? There is no deviation except in carrying out the dredging part.
101. *By the Chairman*: There would have been a saving made of some £500 if ballast had been used? On the contrary, it would have cost much more if ballast had been used to close the channel at N, the depth of water being so great (22 feet) it would have required a very large quantity of ballast to reach this height. The quantity of ballast required would increase as the cube of the depth. Thus, although ballast will be cheaper for shallow places, it would come to much more for the deeper places.
102. Would you have saved this sum of £500? We should have saved the ballast about the piles at section N if there had been silt to deposit about them.
103. The ballast would have cost £225—you would have saved that? Yes.
104. *By Mr. Weekes*: You are not responsible now if your plan is not entirely carried out, although a part of it has been carried out? I am not entirely responsible for the ultimate effect of carrying out a part of the plan.
105. This is one part of your plan, if you are to carry out the other part then your responsibility would be in full force? Yes.
106. *By Mr. Jones*: Do you think it possible, Mr. Moriarty, that a professional man, not having visited the spot and made a personal examination of the channel, or become acquainted with all the features of the river, could describe it as efficiently as a professional man who had made this examination? A good deal would depend on their relative degree of ability. A man might be on the spot three or four years and not know anything about it, another man might see at a glance what should be done.
107. Suppose the person sent down to make this survey was a professional and competent man, do you think his opinion, considering the personal examination he had made, should have more weight than the opinion of the professional man who had not made that examination, even admitting that the professional man who had not made the examination possessed superior ability? That is a difficult question to answer. As I have said before, an able man who understood the business would see at a glance more, perhaps, than would ever occur to a man of inferior ability.
108. *By Mr. Plunkett*: Can your plan ultimately be carried out, although not commenced in the order you recommended it? Of course it can; there is nothing to prevent it. There is nothing to prevent the dredging being carried on two or three years hence if it is found that the barriers of sheet piling, or of ballast, as I propose, are not what they are expected to be.
109. *By Mr. Weekes*: This commencement of the work is contrary to your judgment? It is not in the order I recommended. I would have carried out the dredging of the main channel and closing the branch channels simultaneously.
110. *By Mr. Plunkett*: What effect will the sheet piling have on the present channel? I believe it will have the effect of diverting a large body of water into the main channel, and, no doubt, will deepen it.

111. Would it not have an effect on the general level of the river higher up? It will, to some short extent. E.O. Moriarty  
Esq.  
6 Feb., 1857.
112. If that is the case, it will have an effect on the present channel? No doubt it will act on this channel. The water must be from  $3\frac{1}{2}$  to  $7\frac{1}{2}$  inches deeper in it now than formerly during the ebb tide.
113. Will it not be injurious? If I deepen it in this part it must be beneficial—there is more water there now than formerly by 7 inches during ebb tide.
114. You say, although it is higher here than it is there, the passage being compressed, will bring a greater body of water higher up the river? No, only during ebb tides. I explained in flood tides there was not the difference of an inch, shewing that the ebb currents are affected by the barrier of piles, the water being diverted into the main channel, as we anticipated. Yet, the flood currents are not materially affected by it; it does not seem to impede their upward passage in any way.
115. Is there any difference in the level of the river higher up? There is nothing to impede the passage of the water higher up the river.
116. *By Mr. Jones:* As I understand the principle of your plan, you offer no obstruction if the flood increases to any point—with regard to the ebb tide, you are desirous to confine the water to what is called the main channel? Yes, exactly.
117. From your observations you think the flood and ebb tides are about equal? If you prevent the water coming up it cannot come down, and, consequently, cannot act on the bottom of the channel to keep it clear. I have, on this account, been careful to do nothing which could impede the tidal action.
118. So this pile will have the effect of making deep water there? It will.
119. Previously the river had a tendency to throw some deposit on Mosquito Island? Yes; as the tide sets down it would form a deposit here.
120. *By the Chairman:* I forgot to ask you whether you entered into a contract with Mr. Strong for sheet piling at A, B, C, H, L, M, N, that being the only contract complete? Yes.
121. I believe Mr. Strong stated he had got a great quantity of these slabs according to that contract on hand, can you state what was paid for these slabs—the Government will have to take them I suppose? I do not think the Government will have to pay for all of them.
122. Suppose the unfortunate man had paid for these slabs, and got them already? I think it would be only fair to take some of them. I do not think we are bound, through Mr. Strong's mismanagement, to take all that are specified in his tender—the slabs employed in this work which he thought would be sufficient turned out to be insufficient.
123. *By Mr. Weekes:* What was the effect of his mismanagement—were the piles of insufficient length? When I first went across the channel there was only 8 to 10 feet of water in places, and he left the work open until there was 24 feet of water in these same places.
124. Then the piles designed for this particular spot were found to be too short in consequence of the delay in the work? Yes.

FRIDAY, 20 FEBRUARY, 1857.

Present:—

MR. ARNOLD,		MR. FLOOD,
MR. JONES,		MR. SCOTT,
MR. WEEKES.		

ALEXANDER WALKER SCOTT, ESQUIRE, IN THE CHAIR.

Edward Orpen Moriarty, Esquire, C.E., called in and further examined:—(*Vide Progress Report, dated 20th February, 1857.*)

TUESDAY, 24 FEBRUARY, 1857.

Present:—

MR. ARNOLD,		MR. JONES,
MR. FLOOD,		MR. SCOTT.

ALEXANDER WALKER SCOTT, ESQUIRE, IN THE CHAIR.

Merion Moriarty, Esquire, R.N., Port Master, called in and examined:—

1. *By the Chairman:* You are Harbour Master of this Colony? I am Port Master for the Colony, and Harbour Master of Sydney. I came to the Colony as Port Master; but it was found necessary to give me a local designation as Harbour Master of Sydney, in order to carry out some Legislative enactments.
2. You have been at Newcastle? I have, repeatedly.
3. You are acquainted with the harbour there? Yes; I have a very fair knowledge of it.
4. A Petition has been referred to this Committee, praying for the adoption of some means for the prevention of shipwrecks and disasters at Newcastle—I presume you have studied the subject? I have given it a good deal of consideration for the last thirteen years.
5. Will you state to the Committee what you would recommend more especially to be done, so as to prevent shipwrecks and disasters occurring there in future? My opinion is, that there should be, always, near the entrance of the harbour, at least one life-boat, and that

M. Moriarty,  
Esq.  
24 Feb., 1857.

M. Moriarty, Esq.  
24 Feb., 1857.

warps, of sufficient size to heave up to windward any vessel that might be compelled to anchor in a dangerous position, should also be located at the same spot. I also think that if a public winch, such as was recommended years ago by me, and approved of by the late Legislative Council—I rather think money was voted for the purpose—were established there near the boat-house, it would have a double effect; it would enable them, at all times, to heave up the life-boat, and it should be of such magnitude as to be able to heave up a vessel of from six to eight hundred tons well to windward, if at anchor in a perilous position. There should also be, in my opinion, a heavy mooring chain—in point of fact, I sent one down there for the purpose—stretched along the shore at Nobby's, because the danger is always to be apprehended from the winds from the southward and eastward. These should be under the care of one very active man, whose duty it should be to be constantly on the spot, keeping everything in order, and attending to these matters, of course, under the supervision of the head authority of the port, or of any Local Board which might be appointed. Then there is the light-house at Nobby's, which ought to be in course of erection. It should have been erected fifteen years ago; at all events I recommended its erection fourteen years ago. There should be a light-house placed on Nobby's at once.

6. What is your opinion as regards a steam-tug? No doubt a steam-tug would be highly useful. I have no doubt Newcastle should have a steam-tug, and also two steam dredges. Such a vessel as the "Washington" would be highly useful down there, in various ways; or even a still more powerful tug, for, if you are getting steam-tugs, it is desirable to have them of the best description. No doubt such a vessel would be very useful in preventing accidents.

7. Would a life-boat be necessary if there were a steam-tug? I think so. A life-boat could go out in that harbour when a steam-tug could not. I doubt if any steam-tug could have lived in the sea that was out there at the time of the wrecks—certainly not outside Nobby's.

8. I have always found, from the little experience I have had, that a life-boat has no power to get back to windward on account of the sea-way? She should be sent out with a warp attached to her, and veered to leeward. The warps are there if they would only use them.

9. Do you think a life-boat would be useful in any weather? No doubt they should always be at hand. But I have seen gales there that no life-boat would live in. I have seen a sea on the Oyster Bank that no life-boat could live in. The harbour of Newcastle is a very dangerous one indeed.

10. You mean the sea outside? Yes, beyond the entrance. The Oyster Bank is a little outside of it.

11. *By Mr. Arnold:* I suppose you have had experience on the coast of England? Yes, very extensive. I have been out at sea in every gale that blew for ten years.

12. Do you know the coast off Yarmouth and Lowestoft? Very well.

13. Is the sea at Newcastle much heavier than at those places? It is quite as bad.

14. Did you ever know the sea to be so heavy on that coast as to prevent a life-boat from going out? I have seen seas on that coast that no life boat could go through—on the banks. At Newcastle, the other day, our life-boat went right through an awful sea, and it was not till she touched the ground that she was upset.

15. Is the sea ever so high that a well managed life-boat could not live in it? I think so—on the banks—in the surf.

16. Did you ever see mortars firing lines across vessels? Yes.

17. Would not one of those be a useful thing to have at Newcastle? Yes; I was going to suggest that. There are rockets also used for the same purpose.

18. Do you know that the mortar is used both from the shore and from the life-boat? Yes, it might be used from a boat, certainly.

19. Do you believe that, with a well manned life-boat and mortar apparatus, it would be possible, in any sea whatever, to communicate with a vessel? No doubt. The sea would not affect that.

20. *By the Chairman:* I suppose your experience in England was previous to much steam being used? No; I have commanded steamers in England for ten years.

21. Which is most recommended in England, the life-boat system, or the steam-tug system, for saving vessels? Every place had its life-boat, and in every place life-boats occasionally failed.

22. Supposing it could be shown that a steam-tug would be self-supporting in this harbour, would you recommend the adoption of one? If you will excuse me for saying so, I think the idea of a vessel being self-supporting is beneath the consideration of any country in such a case as this. Whatever is right should be adopted, without reference to the expense. The question of expense would not weigh a feather with me in anything I considered essential to the safety of a port like Newcastle.

23. In the Supplementary Estimate for 1855 I find provided for the harbour of Newcastle a chain cable, anchors, buoys, and hawsers, amounting to £853 18s. 9d.—are you aware whether these were supplied? A great many of them were, certainly. I sent down a large chain cable with the view of its being attached along the shore at Nobby's, so that if any vessel came into the harbour suddenly in heavy weather she could fasten on to it.

24. Did you give directions to that effect? I did.

25. Have they been followed out? No; they say they have not the means.

26. To whom did you give those directions? To Captain Livingstone, the Harbour Master.

27. I see there is also in the estimate a sum of money for the hire of a vessel for laying down buoys? Buoys have been laid down, and no sooner laid down than some were knocked to pieces by the steamers.

28. You recommend a winch, and I see that, in 1855, there is an item for a patent winch, £300? Yes; it was voted, but never supplied.

29. Whose fault was that? It is not for me to say what the Government should do.

30. Did they call upon you in the matter? I furnished the plans.

M. Moriarty,  
Esq.

24 Feb., 1857.

31. Have you anything to do with the purchase of these things? No.
32. It is done by the Executive Government? It is. I cautiously avoid all these matters.
33. I see, also, a sum set down for a new life-boat, with oars, &c.—£160? Yes; that was the life-boat that was lost the other day.
34. Was there not another one, which proved rather inefficient? Yes; one was thrown on the builder's hands, and he did not get paid anything. The boat did not get fair play; she was not fitted with cork fenders, and so on, at the time she was condemned. The truth was, that, being built in Sydney, the people of Newcastle objected to her, and found fault with every thing.
35. I heard she was capsized? That boat, the moment she filled, discharged herself; I saw her do it repeatedly; but the men who tried on the occasion you refer to clung to her side, and did not give her fair play. However, it was no matter; she was returned to the builder's hands, and not paid for.
36. Do you recommend or object to the appointment of a local authority at Newcastle, for the management of matters concerning the Port? My impression is, that wherever there is any harbour of any importance whatever, there should be local management by Harbour Commissioners, or you could call them what you please; there should be a local authority on the spot. How can I know what is going on at Newcastle or Moreton Bay? I give directions, and the moment my back is turned my directions are not attended to, or not attended to in the way I wish.
37. Is the Harbour Master of Newcastle under your authority? He is.
38. Is he not bound to execute your orders? No doubt he is; but if I give an order, and go away, at the end of three months I find the thing is not done as I wished.
39. Have you no means of remedying that state of things? You will find it a very difficult thing, in any place, to get men who are away from you for three months literally to obey the orders they receive.
40. What should be the nature of this local power—can you make any suggestions—should it be under the Harbour Master of Newcastle, or entirely independent of him? Decidedly not under him; rather over than under him.
41. Of course this local power would have the entire management, not only of the winch and warps you recommend, but also of the steam-tug? Yes; the whole directing power should vest in them.
42. *By Mr. Arnold:* The Harbour Master should be, in fact, a responsible officer under them? Yes.
43. *By the Chairman:* If a powerful steam-tug were sent to Newcastle, I presume it could perform other work than merely waiting in case of shipwrecks? No question of it. I think a powerful steam-tug could earn a great deal of money in towing ships in and out.
44. She could be employed in moving vessels from the various coal shoots, and from place to place, whenever necessary? Yes, and would earn a great deal of money.
45. Probably she would be entirely self-supporting? Probably more; as the trade of the port increases I have no doubt a steam-tug would realize more than its expenses.
46. Would you recommend that a small compulsory charge should be made on all vessels entering the Port of Newcastle, for the maintenance of this steam-tug, or that vessels should pay at a higher rate only when they require her services? This is a difficult question to answer. It seems hard to enforce payment for a vessel whose services may not be required, as in the case of small coasters, the profits on which are inconsiderable, and if such payment was enforced, the service would be insisted on, and would thus, possibly, interfere with a more necessary use of the vessel; on the other hand, the advantages which would result from having such a vessel to assist in a case of necessity would more than compensate for a small charge. Possibly, the case might be met by levying a very small charge generally, with a much heavier one when required; this would ensure that a needless application was not made for the vessel, and would secure her services in all cases of absolute necessity.
47. Are there are not certain winds in which vessels cannot get out of the port? Yes.
48. In preference to being detained, waiting for a fair wind, would they not rather pay for a steam-tug to tow them out? Yes, all large vessels would, certainly.
49. Do you know that large sheet of water near Bullock Island, as you go up towards the Flats? I do.
50. What kind of anchorage is it? Very good anchorage.
51. How are vessels in that sheet of water affected by the winds? No ordinary gale can hurt them if they are properly moored.
52. How many large vessels, ships, and barques, could be accommodated in the harbour of Newcastle at one time? Up in that direction a great many vessels might be moored.
53. I mean in every direction, in safe anchorage, inside Nobby's? The best part of the harbour is, in reality, the part you are now speaking of. That is where the large ships should be placed.
54. How many ships could be moored there? I think about fifty.
55. You are not alluding to vessels alongside of wharfs? No; a vessel at a wharf occupies but a small space, but a vessel at anchor must have room to swing. Some of the vessels that come there now are two hundred and fifty feet long, and they must have thirty-five fathoms each way; and when it is blowing hard they will have to veer to fifty fathoms. However, I am satisfied that the Harbour of Newcastle will always accommodate the number of vessels that will require to go there.
56. If your suggestions as to a life-boat, warps, and a steam-tug, were carried out, you think the Harbour of Newcastle would be rendered comparatively secure? No question of it. It would be an immense improvement.
57. And as such you recommend it strongly? Yes, as strongly as I can find language to do it.
58. *By Mr. Arnold:* Do you know whether any steps have been taken towards furnishing Newcastle

- M. Moriarty, Newcastle with mortars for the purpose of firing lines across shipwrecked vessels? I think not.  
Esq.
59. Would you not recommend that they should be furnished at once? I think they should.
- 24 Feb., 1857. 60. *By Mr. Jones:* You were not present at Newcastle at the time the wrecks took place, in October and November last? I was not.
61. You cannot give the Committee any information as to the immediate causes of the wrecks? I cannot take upon myself to give any decided statement on that point. I know the Harbour Master was not there, and I know he ought to have been there.
62. Under whose superintendence are the affairs of the Port of Newcastle at present? Under mine;—that is to say, the Harbour Master at Newcastle is responsible to me; he reports everything to me, but I interfere with him as little as possible; I give him advice, but I do not like to fetter his judgment.
63. In any case of difficulty he has to refer to you, to know what course he is to take? There is nothing to limit his acting on his own authority; the only thing is that he has to report immediately what he does.
64. Do you think it is practicable for an officer at Sydney, who has other duties to perform, to efficiently supervise the Port of Newcastle? I can tell you it interferes with his other duties, and prevents him from being so efficient as he ought to be. At the same time I will say this, that an intelligent man at head-quarters may give a vast deal of good advice to people at these outports, if they would only follow the advice they get.
65. Do you think the affairs of these outports could be better managed by a Board at Sydney? I look upon that idea as all nonsense.
66. You think that whatever may be the evils of having a central officer charged with the management of these matters, those evils would be increased by the multiplication of the number of heads? In my mind it is beyond all question.
67. You think that a Board will not secure the desired advantages? No. I care not how that Board is formed, you cannot get men of equal calibre of mind upon it.
68. You, as the officer entrusted with these things, feel a considerable amount of responsibility? I do.
69. You do not think a Board of four or five persons would feel the same amount of responsibility as an individual officer? I do not believe any Board could ever carry on so well as one efficient head, if he is a man of ability.
70. Your impression is, that the substitution of this Board will only increase the evils which are now complained of at the outports? I do not think a Board at Sydney can manage the outports. I should suggest that there should be Boards appointed at the outports themselves.
71. You are aware that in the Bill now before the House it is contemplated to establish only one Board? I look upon it as so much waste paper. The Board may do a great deal of good in superintending the management of the light-houses, as is done at home, and may relieve the Port Master from a great deal of work that now presses very heavily on him. They will do good in that way, but if they attempt to say where a buoy is to be laid down, or how it is to be effected, or whether a steamboat is to be sent here or there, they will incur expense without understanding what they are about.
72. From your experience, are you disposed to believe that the affairs of the outports will not be efficiently managed until there is a local authority on the spot at each of them? That is my opinion.
73. There should be at each port an officer or Board who should have distinct charge of the port? I think so, in the same way as at home. For example, the Board at London never interferes with the Board at Liverpool, or Cork, or Dublin, or any other port.
74. It comes within your knowledge that the various ports are managed by their own local authorities? Yes. The only thing in which the Trinity Board has a general power, is as to the examination of masters and mates to see to their general competency; and in attending to the Port of London, which extends as far as the Cinque Ports, the Trinity Board has the supervision of all the Lights on the coast of England; the Irish Lights are under the Ballast Officer, Dublin; and Scotland has its Board for the Lights on its coast; and Liverpool has its Board for examination also; so has Bristol, and so has Hull.
75. Do you believe that the various ports in this Colony will be properly managed until some similar provision for local supervision is made here? I think they will not. In fact my opinion is, that the more we adopt the English system here the better.
76. *By Mr. Flood:* Is it your opinion that the Harbour Master at Newcastle ought to be under the control of any officer in Sydney, except the Executive Government? If there is no local Board I think he ought; but, as I have already said, I think there should be a local Board, to whom he should be responsible.
77. If there is a local Board, you think he should be responsible only to that Board? I think so, and that they should communicate with the Government.
78. He should not be in any way under the control of the Port Master at Sydney? No, not when that Board is established.
79. All the Deputy Harbour Masters in the country are immediately under you, are they not? Yes; all their communications come through me.
80. All their movements are under your guidance? They are.
81. You said something, in answer to the Chairman, in reference to a light-house—I think you stated that a light-house ought to be erected at Newcastle? Yes.
82. Are you not aware that a large sum was voted in 1852 or 1853 for the purpose of erecting that light-house? Yes.
83. Have you ever been consulted on the matter? I have given evidence on the spot.
84. Do you know whether the Government have taken any steps towards the erection of the light-house? They have removed the summit of Nobby's with that view.

85. Has there been any correspondence between the Government and yourself, in reference to this light-house, since the money was voted? I believe there have been some letters. M. Moriarty,  
Esq.
86. Can you say whether there is a steam-tug that can be purchased in the Colony suitable for the requirements of Newcastle? There is a suitable vessel in the Colony, but whether she can be purchased or not I cannot say. 24 Feb., 1857.
87. Is the "Washington" a suitable vessel? She is; but I think, if you supply the Harbour of Newcastle with a steam-tug, it would be wiser to build a shorter vessel, with more power, specially for the purpose.
88. Is she worked with two engines? I think she is.
89. Can she work one paddle separately from the other? No.
90. Is not that absolutely necessary for an efficient steam-tug? No, it is not; because by varying the position of the hawser by which you are towing, you can turn her round at once.
91. Would not such an arrangement—a disconnecting shaft—facilitate the movements of a steam-tug in a narrow channel, by enabling her to turn round more rapidly? I do not think it would make much difference.
92. Are not most of the steam-tugs in the mother country constructed in that way? I think not; I never saw one; and I must add, with reference to questions 90, 91, and 92, that I consider it indispensable that a double engine should be attached to every sea-going steam vessel, and that for towing purposes it would be highly improper to let a vessel go into a sea-way with a single engine. I have commanded steam vessels for many years, and I have seen one engine give way several times; there is this great difficulty occasionally in getting the engine over the centre, and if near breakers the vessel had lost her way, she would fall off and be lost. It was in this way the "Sovereign" was lost near Moreton Island. Certainly I think a steam-tug for Newcastle should always be worked by a double engine.

FRIDAY, 27 FEBRUARY, 1857.

**Present:—**

MR. ARNOLD,  
MR. FLOOD,

MR. JONES,  
MR. SCOTT.

ALEXANDER WALKER SCOTT, ESQUIRE, IN THE CHAIR.

Alexander Livingstone, Esquire, called in and further examined:—

1. *By the Chairman*: You are Harbour Master of Newcastle? Yes.
2. You have been there some time? Eleven years as Harbour Master.
3. I believe you were not present when these vessels were wrecked lately? I was in Sydney at the time.
4. Have you made any inquiries subsequently into the circumstances of the wrecks? I have.
5. Will you state what were, in your opinion, the causes of these wrecks? The first was the "Eleanor Lancaster," barque, 487 tons, on the Oyster Bank. She went out of the harbour the same day, and, the wind chopping round suddenly to the south-east, the captain got frightened he would go ashore in the bight; he hove about and came back again, and just as he got to the outer buoy he let go his anchor; but there is not room for a vessel to swing there, and before she got thirty fathoms of chain out, she struck on the Oyster Bank. I asked the captain the reason of his coming back, and he said he was afraid he would get ashore in the bight.
6. *By Mr. Jones*: A south-easter would blow him into that bight? Yes; and a very heavy sea was on.
7. *By the Chairman*: Had you this information personally from the captain? Yes.
8. *By Mr. Jones*: How was the wind when the vessel went out? About north-west, and it went round slap to the south-east.
9. Does it come within your knowledge that the "Eleanor Lancaster" had been ready for sea for some days, waiting for a chance to get out? Yes; she had been waiting a considerable time—I think, nearly a fortnight; she could not get out because the wind was not favourable. When the wind is at north-east, vessels cannot get out.
10. If there had been a steam-tug to tow her out of the harbour, that wind would have been fair for her destination? Yes.
11. The bulk of the trade of Newcastle is with ports to the southward, is it not? Yes, with Melbourne, Hobart Town, and Adelaide. There is also a large New Zealand trade. There are a great number of vessels from Hobart Town just now, but the bulk of the trade is with Melbourne.
12. A north-east wind is a fair wind for these vessels? Yes.
13. But it will not admit of vessels going out of the port? No.
14. If there had been a steam-tug at the Port of Newcastle at any time during the fortnight the "Eleanor Lancaster" was lying there waiting to get out, she would not have been wrecked, but, on the contrary, would probably have reached her destination before the gale came on? Yes.
15. Do you ascribe the loss of the "Eleanor Lancaster" to the want of a steam-tug? Decidedly so; and not only her's, but many others also.
16. Supposing she had only been ready to go out that day, if there had been a steam-tug to have taken hold of her and brought her back when the wind changed and the gale came on, would she have been saved? She would.

A. Livingstone,  
Esq.

27 Feb., 1857.

A. Livingstone, Esq.

27 Feb., 1857.

17. So that the presence of a steam-tug would have prevented the possibility of her being wrecked, and even if she had gone out that day, the tug could have brought her back into safety? Yes. I have known vessels to be lying there for a fortnight or three weeks unable to get out.

18. *By the Chairman*: Will you proceed with the case of the next vessel? The next vessel is the "Rover," a small schooner, of about one hundred and ten tons. She was well in the harbour, and drove on shore in consequence of having bad ground tackling. She drove from her moorings close to the inner buoy, round what is called Scott's Point, and away into the bight on the north shore. She became a total wreck.

19. *By Mr. Jones*: You ascribe the loss of that vessel to the badness of her ground tackling? I think so, because there was smooth water where she was lying.

20. Supposing there had been a steam-tug in the Port of Newcastle at the time she dragged, would she have had a chance of being towed into safety? She could have been towed in with great ease.

21. *By the Chairman*: What was the next? The next was the "Storm King," a schooner of about one hundred and thirty tons. She drove ashore just in a similar way to the other; but she was got off again; I got her off myself, when I went down. The next is the "Sea Nymph," brig, of about two hundred and twenty tons. She was lost in the bight, about eighteen miles from Newcastle, between Newcastle and Port Stephens. She was thrown ashore in consequence of the vessel leaking and the gale of wind. I may mention that I sent a boat with five men down to her to save the crew. The next was the "Herculean," schooner, of about ninety-five tons. She was not lost at Newcastle; but was run on shore at Port Stephens, the vessel making water and the pumps being choked. She went out of the harbour at Newcastle, and when the gale came on she ran for Port Stephens. The next was the "Currency Boy," lost at Bungaree's Nora, during the same gale; all hands drowned except one man. She left the port the day before. The next was the "Maria Theresa," a schooner of one hundred and forty tons, supposed to have foundered at sea between Port Stephens and Newcastle. We sent down towards Port Stephens to look for the wreck, and we found a portion of her on the beach.

22. Were all hands lost? All hands were lost. At least none of them have been heard of since. These were all that were lost at that time.

23. You have stated with respect to the "Eleanor Lancaster" and "Rover," that those two vessels could have been easily saved if there had been a steam-tug? Yes.

24. The other vessels were wrecked at a greater distance off? Yes.

25. How far were they from Newcastle at the time the gale came on? I know from the captain that the brig was off Port Stephens. He was making for Sydney, and when the gale came on he tried to make back for Newcastle.

26. When he tried to get back to Newcastle, how far was he off? About twenty miles.

27. Had there been a steam-tug could she have rendered any assistance to that vessel? No, she was too far off.

28. Out of the whole number of vessels you have enumerated, how many might have been saved if there had been a steam-tug? Three might have been saved—the "Eleanor Lancaster," the "Rover," and the "Storm King." The others could not have been reached even had there been a steam-tug.

29. Your distinct opinion is that, had there been a steam-tug, three of these vessels could have been saved? I am as positive of it as I am sitting here. I may mention another case in which the vessel could have been saved had there been a steam-tug; I allude to the loss of the "Canmore," a brig of one hundred and eighty tons, two or three years ago.

30. How many men were on board of her? Nine men, and they were all lost but two. The schooner "Jessie" was lost about the same time in 1854, with four men. The men left the vessel in a small boat; and, in attempting to rejoin the vessel when she was in the breakers, getting out of the surf the boat filled, and they were all drowned.

31. Had there been a steam-tug they would have been saved? Yes.

32. If there had been a chain fixed along the shore at Nobby's, with warps and a strong winch, could the "Eleanor Lancaster" and some of the other vessels have been saved? Decidedly not; because when she struck she knocked her rudder away, and if we had had any amount of ropes she could not have been saved.

33. Nothing in the shape of warps and winches could have saved her? No; the sea rolls in there so heavily that no boat could live in it to carry out a warp.

34. That is your decided opinion? That is my decided opinion. I have heard a great deal of talk about it, but I have no great faith in it. Those buoys I have there now are useful enough for vessels to hang by for a short time, but the sea rolls in so heavy sometimes that they cannot lay there.

35. But surely, if these winches and warps were at Nobby's, they would be very useful to assist the steam-tug? No doubt of it.

36. The steam-tug could tow in one vessel, and fasten her to this hawser, and then go for another? Yes.

37. *By Mr. Arnold*: What would be the most ready means of sending a line on board a vessel in times when a boat could not live in the surf? The only plan I can see is by rockets; but I cannot speak from experience of them.

38. Did you ever see mortars used for sending lines on board a vessel? No; but no doubt they are useful things.

39. Do you think that, by means of rockets, a line could be sent on board a vessel entering the Harbour of Newcastle, if she was in danger? I should imagine so.

40. In that case, would there be any difficulty in making use of the chain and hawser? No. A small line could be sent off, and the people of the vessel could pull the hawser on board.

41. The only difficulty is in getting the line on board? Yes.

42. If a line could be got on board by means of a rocket or mortar, there would be no difficulty? No.

43. Would there not be times when it would be impossible to make use of a steam-tug? There would. Perhaps you will allow me to impress it on your minds, that a steam-tug would be of no use unless she is very powerful. A. Livingstone, Esq.  
27 Feb., 1857.
44. *By the Chairman*: There was a sum of money voted in 1855 for the supply of a life-boat, buoys, hawser, and winch —? The winch we never got.
45. Do you know the reason why? I do not.
46. Have you had the hawser? Yes.
47. What have you done with it? I have it in a shed.
48. Where is that shed—at Nobby's? No; there is no place at Nobby's to put it in.
49. Then the hawser is of no use to you? We send it out in a boat when it is wanted.
50. There was a large chain sent down for the purpose of laying down along the northern shore of Nobby's? I have that chain laid down, except about twenty-five fathoms.
51. You have fixed a portion of it for use? Yes.
52. There was a life-boat sent down also? She was sent down, but she is all to pieces.
53. Was there not one sent down before that which turned out to be useless, and was returned on the builder's hands? Yes.
54. Why could you not make use of that life-boat? She was not of a proper construction; she was too straight, and had not sufficient sheer; she was more like a whale-boat than a life-boat. I also found fault with her building—she was put together badly. We expect a life-boat, when she upsets in a sea-way, to right herself, but that one did not do so.
55. When she capsized, did she remain bottom upwards? Yes. We had to get a line fast to her, haul her alongside a ship, and put a tackle on to her; and then we could not raise her, but had to take her ashore.
56. Was that life boat capsized when Captain Moriarty was present? He was present. We capsized her on purpose to show him she would not right.
57. How many men were clinging to her when she upset? Ten Maories and one pilot.
58. Did any of these men cling to her after she was upset? Only one man, the pilot; the New Zealanders were swimming about in the water.
59. *By Mr. Arnold*: Did you experiment on her in any other way? I was so disgusted with her that I brought her in and locked her up.
60. Did you fill her with water? She was full of water then.
61. You did not try whether she was manageable when full of water? I thought we had seen enough of her performances.
62. Do you know anything of the life-boats on the coast of England? They are greatly improved since I was in England. It is thirty-five years since I was there.
63. *By the Chairman*: Then, to sum up your evidence; you think it is indispensable there should be a steam-tug at Newcastle? I do, decidedly; for the safety of the port.
64. And that it would be materially aided by warps and a winch? Yes.
65. And also you recommend that there should be the means of communicating with vessels by rockets or mortars? Yes.
66. Would a steam-tug be self-supporting or nearly so? I have calculated that a charge of four pence per ton would about pay the expense of a steam-tug; and I believe no owner would grumble at such a charge. I would suggest that one of the pilots and a boat's crew should always be on board; let them take it turn and turn about, by the week, or month, according to arrangement. By that means very few men would be required on board the steam-tug—only the Engineer, one or two firemen, and a cook; and let the pilot be responsible during the time he was on board. Then we could tow out twenty vessels in a morning. At present we have great trouble in getting vessels down from the coal shoots to what we call the Horse Shoe, but a steam-tug would tow them down as fast as possible. I have known us to be two or three days in warping a vessel down, when it has been blowing from the north-east. Four pence a ton would come to a very small sum on each vessel.
67. *By Mr. Arnold*: Would that be the payment for being towed out? I would make every vessel pay, above thirty tons, whether she had the use of the tug or not.
68. You think it would be better to make them pay one uniform rate, whether they use the tug or not? Yes, let them all pay a certain amount.
69. You would not make them pay any more if they did use it? No.
70. *By the Chairman*: For this four-pence a ton you would take vessels to and from the shoots, and tow them in and out of the harbour, if necessary? Yes.
71. And it would save them also, at the same time, from the chance of wreck? Yes.
72. If a vessel tailed on, like the "Eleanor Lancaster," would you charge more than four-pence a ton? No, I should not be inclined to do so.
73. Four-pence a ton would be the whole expense? Yes.
74. In addition to the usual pilotage fees, I suppose? Yes.
75. What is the tonnage of the "Earl of Dundonald," now lying in the harbour? 1437 tons.
76. You think the owners would not have any objection to pay four pence a ton on a vessel of that size? I think not.
77. In your opinion, would the employment of a steam-tug render insurances on vessels going to Newcastle less expensive? No doubt of it. They will not insure now, except under a heavy premium. If there was a steam-tug it would reduce the rates of premium considerably.
78. Would there be any difficulty in insuring vessels then? I should think not—not the slightest.
79. How many vessels frequent the Harbour of Newcastle in a twelvemonth, on an average, irrespective of steamers and vessels going up the river? According to a return I have had made out, for the quarter ending 31st December, 1856, there were 90,444 tons; but I must mention that that takes in the Company's steamers going to Moreton Bay and the northward, which call in at Newcastle.

- A. Livingstone, Esq.  
27 Feb., 1857.
80. *By Mr. Arnold*: What number of tons would require the assistance of a steam-tug? I should think about forty thousand tons.
81. *By the Chairman*: Do you think this steam-tug should be placed under the Harbour Master or under a local Board? It would be better if there were a local Board. I think we ought all to be under a local Board. I should prefer it.
82. Do you think the Harbour Master ought to be placed under that Board? Yes. The way the Harbour Master is placed there now is a very awkward position. We have to send to Sydney for everything. If a vessel is in distress we hardly dare send her a rope without writing to Sydney.
83. *By Mr. Arnold*: Have you calculated the expense of a steam-tug? I put it down this way—Master, £20 a month; Engineer, £20; two firemen, £8 each; and one sailor £6. Then a pilot and boat's crew would be always on board; or you would find if you had a crew exclusively for the steamer that it would take sixpence a ton to pay the expense.
84. How much do you calculate for provisions and coals? I think I calculated two shillings a day for each man, and three shillings for the Captain.
85. That would be £18 or £20 a month more? Yes.
86. Then there is the coal—how much would that be? I calculated about four tons a day, on the average—some days there would be more, some less.
87. Say about £90 a month for coal? Yes.
88. How much would you calculate for wear and tear and insurance? I would value the vessel at £10,000, and, I suppose, you must pay about eight guineas per cent. premium for insurance, or say about £800 a year. It would be at the option of the Government whether they would insure or not.
89. What would be the wear and tear? I calculate that at ten per cent., or about £1,000 a year.
90. That would make a total expense of about £3,800 a year, against a return of £2,700, or thereabouts, calculating the amount of tonnage that would have to pay the fee at 160,000 tons annually? Yes.
91. *By the Chairman*: Will not the trade increase if the harbour is rendered more secure? No doubt of it. The great drawback now is that large vessels that go down there cannot get out; they have to lay there perhaps a week or a fortnight; and that, of course, is a great expense to them. I know many vessels would have come there for coals had it not been for difficulties of this sort.
92. *By Mr. Arnold*: You think you have enumerated all the expenses of a steam-tug? Yes, I think so. But if it is thought proper to man the vessel fully, it would take three or four extra men.
93. In fact the steam-tug would act as a pilot boat? Yes.
94. Have you any life-boat at Newcastle now which is efficient? No.
95. Is there any intention of building one? Not that I am aware of.
96. Do you think a life-boat is necessary whether you have a steam-tug or not? Yes, I think so. I think we could get a good life-boat built down there by a man who has lately come out from Scotland.
97. Could you not send a life-boat in places where a steam-tug could not go? Yes; in case of a vessel getting on shore we should have a life-boat to save the crew; we could not send the steam-tug, or she might be lost.
98. Would a life-boat be of much value after a vessel got on shore? Yes, I know she would, because I was once taken out of a wreck myself by a life-boat.
99. In some cases, communicating by a line would not be sufficient? No, I do not think so. We could send a line on board, and then let the life-boat go on board by means of the line.
100. You would communicate, in fact, between the vessel and the life-boat by means of a line? Yes.
101. *By the Chairman*: You recommend a steam-tug whether it is self supporting or not? Yes; but four-pence a ton, I am confident, would pay all expenses and leave a sum for the repairs of the boat.
102. *By Mr. Arnold*: In that case you reckon on a greatly increased trade at Newcastle? Yes, I do; I think it will increase twenty or thirty per cent. Vessels will come from California, India, and the West Coast. So many mines are opening now that they will have coals much cheaper; they talk of bringing them down to ten shillings a ton.
103. Supposing a steam-tug to be determined upon for Newcastle, would you advise that she should be kept entirely for towing vessels in and out of the harbour? Yes; she should not go out of sight. She might tow a vessel over the flats, but she should never go far away, so that if a vessel came in sight of the harbour she could return on being signalled to.
104. Do you think anything would be added to her earnings by work of that description? I think so. She might make an extra charge for it.

Thomas Stevenson Rountree, Esquire, called in and examined:—

T.S. Rountree  
Esq.

27 Feb., 1857.

- By the Chairman*: Have you been connected with shipping? I have.
- For many years? I was captain of a ship for fourteen years.
- You are conversant with docks and dockyards? I am.
- You have something to do with Mr. Mort's Dock? I am manager of Mr. Mort's Dock.
- We have—at least I have, on my own responsibility—asked you to come here, because I thought you could give the Committee some information with respect to the prevention of shipwrecks in harbours—Do you know anything of Newcastle harbour? I have no knowledge whatever of Newcastle; I was never to the north of Broken Bay. I thought the Committee wanted to examine me with reference to the Steam Dredge, which I understand is wanted for the Hunter, or I should have written a note requesting to be excused.

6. Have you ever had any knowledge of steam-tugs in England? I have had a little. (The Chairman here exhibited to the witness a chart of the Harbour of Newcastle, and drew his attention to the peculiarities which render it difficult of ingress and egress during the prevalence of certain winds.)

T.S. Rountree  
Esq.

27 Feb., 1857.

7. So far as you can judge from the circumstances I have just explained to you, would you recommend a steam-tug for the Harbour of Newcastle? I think it is highly necessary in such a harbour as Newcastle, from what I hear of it. I was brought up at Sunderland, which is a bar harbour. Most of the coal trade is carried on there. About thirteen hundred sail pass in and out in the week, and most of the work is carried on by steam-tugs. Nothing could be done without them. I think, belonging to Sunderland, there are not less than forty steam-tugs. On the Tyne there are considerably more; Stockton-on-Tees the same; and Hartlepool also. They go through a great deal of work, without much loss of time, through having these steam-tugs.

8. Do you consider that warps and a winch and chains, placed in a proper position, would assist in the prevention of wrecks? It greatly depends on the locality. Where I come from they would be of no use.

9. Can you give the Committee any information with respect to mortars or rockets for throwing lines on board vessels in distress? Captain Manby's apparatus is very useful. I have seen lines thrown a quarter of a mile off, and the people taken out of a vessel by that means. But to use steam-tugs on a lee shore would be a very difficult thing; it would be a chance if they were not lost.

10. Your opinion is that any harbour, situated as you see Newcastle is, would be much benefited by a steam-tug? No doubt of it. We should never do anything in the ports of the north of England without them.

11. Can you state the cost of steam-tugs? A boat of the description that would be necessary would be very expensive. She would require to be about a hundred and sixty horse power.

12. *By Mr. Arnold:* What would be the prime cost of such a boat? To buy a boat of that description would cost about £8,000 or £9,000.

13. It would be under £10,000? Yes.

14. What would be the cost of working her? From the experience I have had of steam-tugs, I know you could not work a boat of that description under £100 a month.

14. Could she be worked for that? Yes, a boat of that description.

15. Paying men and all? Yes; finding a sufficient crew to manage the boat, and the coals also.

16. Is £20 a month too much for the Master? Yes.

17. What could you get one for? £12 a month. He would live on board the vessel, and get provisions.

18. I suppose a boat of the kind you speak of could be brought out from England? Yes.

19. What would she cost in England? About £5,000.

20. Would she pay her expenses out by carrying cargo? No, I do not think she could do anything of that kind. She would require coals to steam part of the way.

21. *By the Chairman:* Supposing you were told that six or seven vessels were wrecked in one gale, and also that the trade of the port is already to the amount of one hundred and fifty or one hundred and sixty thousand tons annually, with an increasing trade, would you recommend that a steam-tug should be sent there immediately? I certainly think that port should not be without a steam-tug, under any circumstances.

22. Do you not think the trade of the port would increase more rapidly still if it were known that there was a steam-tug always ready to tow vessels in and out of the harbour? If I were captain of a ship I should go there with a great deal more confidence if there was a steam-tug, and I would take a lower freight.

23. *By Mr. Arnold:* Do you know anything of the life-boats that are used at home? We had some very fine life-boats at Sunderland.

24. Ought not a life-boat go out at any time? At a place like Newcastle they could get to sea at any time, but at Sunderland they had to be launched into the surf. Once in the open sea, they ought to be able to live for ever.

25. Have you ever seen Manby's apparatus used for communicating with vessels by lines? I have.

26. What is your opinion of it? It is a very useful and simple thing.

27. *By the Chairman:* Would you recommend that the steam-tug and other apparatus should be placed under the Harbour Master, or under the directions of a local Board? I think there ought to be a local Board.

28. Would you place the Harbour Master under the directions of that Board? Yes.

29. Have you had any experience of the working of local Boards? I have not.

30. Do you know any place where they are instituted? We had a Life-boat Committee where I came from, who managed the life-boat entirely. There are so many pilots drafted out every year; they are obliged to attend, and are paid so much a year for it. The life-boat is always mounted on wheels, and if she is wanted a mile or two away they run her along the beach. But the life-boats there are quite differently constructed to what they are here. The first life-boat they sent to Newcastle was a most ridiculous thing—nothing more than a large surf-boat. The last one was a very fair boat, but I think she was not managed properly, and the pipes were not sufficient to carry off the water.

WEDNESDAY, 4 MARCH, 1857.

Present:—

MR. FLOOD,

MR. JONES,

MR. SCOTT.

ALEXANDER WALKER SCOTT, ESQUIRE, IN THE CHAIR.

Charles Bolton, Esquire, called in and examined:—

C. Bolton,  
Esq.  
4 March, 1857.

1. *By the Chairman:* You are Customs Officer at Newcastle? Yes; I am Sub-Collector of Customs at Newcastle.
2. You have been some time stationed at Newcastle? Nearly twenty years.
3. This Committee is considering the causes of the late shipwrecks at Newcastle, and the best means to be adopted for the prevention of future shipwrecks there—will you state to the Committee what you would recommend? I do not think I can recommend anything better than a steam-tug. It would lessen the chances of shipwreck there very much.
4. Were you at Newcastle when these wrecks occurred? I was.
5. Do you know where the "Eleanor Lancaster" was wrecked? Yes.
6. If there had been a steam-tug would she have been wrecked, or not? She would not, because before she went on the bank she might have been towed in. At the same time, I think the vessel should not have returned when she was once out at sea.
7. Some other vessels were wrecked close to the harbour at the same time? Yes. The way vessels are usually wrecked is, that in attempting to come in with a southerly wind they try to get under the lee of Nobby's, cast anchor, and frequently the gale increases, and they drag their anchors and become wrecks. If there were a tug boat to tow them in when they first cast anchor, they could be brought in out of danger in nine cases out of ten.
8. Then you think a steam-tug would have been the means of saving life and property? Most unquestionably, in nine cases out of ten of the wrecks at Newcastle.
9. In 1855 there were put on the Estimates several items, for a chain, buoys, life-boat, and a winch with warps—what is your opinion with respect to the utility of these? The buoys are a very great advantage in pointing out the channel; but with respect to the winch, which, I presume, is to be fixed on the shore, I confess I think very little of it; I do not think it would do much good.
10. Is it necessary, in your opinion, to have a life-boat? I think so, because it may save life after a wreck takes place.
11. *By Mr. Flood:* A tug-boat would dispense altogether with the necessity for a winch? I think so. A tug-boat would do all that could be done.
12. *By the Chairman:* Do you think a steam-tug at Newcastle would be self-supporting? I think it might be made so by doing away with the pilotage fees, and charging vessels something extra per ton for the use of the tug-boat to tow them in; instead—in fact, making the tug-boat a pilot boat. There would be very little use for pilots if there was a tug-boat, and she might be manned by the present boats' crews. I should suppose that one pilot, besides a pilot on board the tug-boat as master, would be sufficient.
13. Can you give the Committee any information with respect to the amount of tonnage entering and leaving the Port of Newcastle? I beg to hand in an account of the number and tonnage of vessels that have entered and cleared, during the year ended 31st December, 1856, at the Port of Newcastle, divided under three heads—vessels seaward, vessels coastwise, and steamers. (The witness handed in the same. Vide Appendix A.) Here is also another return, which I got from Morpeth. They are not separated, but they are nearly all steamers that go to Morpeth. Perhaps about fifty thousand tons may be set down for steamers. (The witness handed in the same. Vide Appendix B.)
14. Since the beginning of January, 1857, is the trade increasing or decreasing, on the average? I think the trade has been increasing for years, but I have not taken any particular notice of it since the beginning of this year.
15. Are you aware that the rates of insurance on sailing vessels going to Newcastle are affected by the absence of the necessary means of preventing wrecks? I have always understood that insurance on vessels going to Newcastle is high. If there were a tug-boat there the risk would be less, and consequently the rates of insurance would be less.
16. Do you think a powerful steam-tug would be an inducement for more vessels to go to Newcastle? I think it would be an inducement to large vessels to go there, which they will not do now. For instance, two large vessels that went there were obliged to get a tug-boat from Sydney to take them in; they would not venture to enter the port under sail.
17. How did the "Earl of Dundonald" go in? I believe she was tugged in.
18. Did she get a tug from Sydney? Yes, I understood so.
19. *By Mr. Flood:* Can you produce to the Committee a return shewing the quantities and value of the imports and exports from Newcastle in 1856? Yes.—(The witness handed in the same. Vide Appendices C and D.)
20. *By the Chairman:* Supposing the Government were to place a steam-tug, together with a life-boat, &c., in the Harbour of Newcastle, under whose direction would you suggest they ought to be placed? I should assume that the Harbour Master is the proper person.
21. Do you think the Harbour Master is better than a local Board? I think not. I would prefer a local Board.
22. There is a Trinity Board suggested, the members of which should reside in Sydney, to manage the affairs of all the ports and harbours in the Colony—would you reckon that so good as having a local Board? I certainly would not. Whatever authority manages the Port of Newcastle should be in Newcastle itself, so that we should not have to refer to Sydney on every occasion.
23. Would you propose that the Harbour Master and pilots should be placed under the exclusive

exclusive control of the local Board. I think so. Probably the Harbour Master should hold a place at any Board appointed to manage the affairs of the port.

C. Bolton,  
Esq.

24. Has your attention ever been directed to the proposed light-house at Newcastle? Yes.

4 March, 1857.

25. Have you thought in what position you would recommend that the light-house should be placed? I think it should be on the top of Nobby's, because it is separated from the land, and is a prominent object seen coming along the coast; it juts out from the general line of the coast, and is seen at a great distance. It would show the light where I think the light is wanted—where the danger is.

26. Presuming that there will be a series of light-houses along the coast, would you recommend that this, amongst the rest, should be placed under the direction of the general Trinity Board at Sydney? Yes; I think all the light-houses should be under the general Board. You can scarcely term a light-house a local matter.

27. *By Mr. Flood:* To whom should the local Board be responsible? I suppose, to the Executive Government. They would be appointed by the Executive, and, I presume, would be responsible to them.

28. You would not allow the Trinity Board to interfere with them? I do not quite understand what powers are proposed to be given to the Trinity Board.

29. Do you not think it would be better for the local Board to communicate with the Trinity Board, at head quarters, than with the Executive Government? I think a general Board and local Boards might answer together.

30. Each local Board would have the general superintendance of its own harbour? Yes, and no alterations should be made without their approval.

31. Would you recommend that alterations or improvements should take place in the Port of Newcastle, under the superintendance of the local Board, without first submitting them to the Trinity Board, if it be established? I would certainly submit them, because we would then gain information, probably, from men of experience, and it might result in improvements which would not originate with the local Board.

32. *By the Chairman:* Have you ever considered Captain Manby's apparatus for throwing lines to wrecked vessels? Yes.

33. Would it be necessary to have one of these at Newcastle? I think it would be a great advantage; because you have always an opportunity of getting within a tolerable distance of a vessel in distress. To use Captain Manby's apparatus with effect at Newcastle it must be thrown from a boat. In the case of the "Eleanor Lancaster" with Manby's apparatus, a rope might have been thrown to the vessel readily from a boat.

34. *By Mr. Flood:* Not from the shore? No; because the distance was too great, and it would have been necessary to get to windward. There would not have been so much difficulty in reaching the "Eleanor Lancaster," if there had been the means of throwing a line by Captain Manby's apparatus.

35. *By the Chairman:* If there were a steam-tug she could be used to place vessels in their various positions in the harbour, and along the coal shoots? I consider that if a vessel required to be moved after she was first brought in, there should be an extra charge for removal. I think the usual way is, that vessels first come in and anchor, and when they make their arrangements, and get a place alongside the wharf, they are then brought to it. For that I would make an additional charge, and I think it is one the masters of vessels would not object to. It would be a clear saving to them, because now they frequently wait for days for a favourable opportunity.

36. *By Mr. Flood:* From your knowledge of the trade of the harbour, you think a steam-tug would be partly, if not entirely, self-supporting? Partly it would certainly be, if not wholly. If it were amalgamated with the pilot establishment it would not be necessary to have so many boatmen.

37. Your reply is in allusion to the trade as it now stands? Yes.

38. Do you not think that when the Hunter River Railway is in operation, the trade will be much increased, especially when the Railway reaches some distance into the interior, say as far as Singleton? Very much indeed, so much so that I will not venture an opinion on it.

39. At any rate, the steam tug would be self-supporting then? It would. I am not sure it would not be self-supporting now.

40. You are aware that the Legislature passed a Tonnage Duties Act, under which, from the beginning of 1858, a rate of sixpence per ton will be charged on vessels entering the port of Newcastle, in order to defray the cost of improvements? Yes.

41. Are you aware whether there is such a law in existence applying to any other port of New South Wales? I have not heard of any.

42. Do you not think this circumstance ought to entitle persons trading to the port of Newcastle to the accommodation of a steam tug without any further charge? I do not like the tonnage duty at all, because other ports have had their improvements made without being taxed specially. For instance, there is the Circular Quay at Sydney, which has been paid for out of the General Revenue.

43. But as we have the law, and as vessels will be called upon in 1858 to pay the tonnage duty, do you not think it will be a hardship, if they have to pay an additional tax for the use of the steam-tug? I do. I would abolish the first altogether, and charge them for that which they have the benefit of.

44. Until the Tonnage Duties Act is repealed, do you not think those who trade to Newcastle will have a just claim for the use of a steam-tug free of expense? I would rather see the Act abolished, because the duty will apply to steamers, which do not require a tug at any time; but, if the tonnage duty is maintained, I think they should have the tug free.

45. If the tonnage duty law is continued, and coal fields should be discovered at other ports, do you not think it will have a most injurious effect on Newcastle? No doubt of it.

46. You are aware that some of the inhabitants of Newcastle petitioned for this Tonnage Duties Act? Yes.

- C. Bolton, Esq.  
4 March, 1857.
47. Do you know whether they are still of the same opinion with reference to it? At the time they petitioned they felt it was so important a matter that they would rather submit to the tax than not have the improvements which it was intended to carry out; but it did not follow from that that they considered it just.
48. Did they not, when they petitioned, yield up their right to have a fair share of the General Revenue appropriated for the improvement of the Port of Newcastle? I think not. I think they did it because they were denied their right.
49. Do you know whether they petitioned at any time to have the port improved, out of the General Revenue? I am not aware of that.
50. I suppose, in reference to what you said about the steam-tug being attached to the pilot department, you do not contemplate dispensing with the present pilot boats? They will always be necessary to fasten warps, and, perhaps, for casting out anchors, and so on; but I think there might be a pilot less, decidedly.
51. How long have you known ships to lay at Newcastle waiting for a fair wind to get out? A week.
52. Do you recollect a large American ship that was there, I think about the beginning of last year—was she not a fortnight or three weeks lying wind-bound after she was loaded? I do not recollect. It was so constant a cause of complaint that my attention was not drawn to particular instances.
53. Do you believe there would be any difficulty in finding a number of gentlemen to form a Board to manage the Port of Newcastle? I do not think so. I have no doubt a competent local Board could be obtained.
54. Are they making any improvement just now to the quay at Newcastle? None. The damages done to the wharf have not even been repaired.
55. Do you believe these matters are neglected in consequence of there being no local body to look after them? I think so. But, unless the local Board have funds placed at their disposal, they can be of very little use.
56. *By the Chairman:* If the Committee have omitted to question you on any point that occurs to you, will you have the goodness to mention it? I do not recollect anything else, except that in the event of a tonnage rate being fixed, coasters should not be charged the same amount as sea-going vessels for the use of the tug, inasmuch as they do not draw the same amount of water, and run less risk than larger vessels.

## APPENDIX A.

NUMBER and Tonnage of Vessels that have entered, and cleared during the year ended 31st December, 1856, at the Port of Newcastle.

	INWARDS.		OUTWARDS.	
	No.	Tons.	No.	Tons.
Vessels seaward . . . . .	256	44,469	335	59,978
Do. coastwise . . . . .	744	60,579	702	52,821
				112,799

John Bingle, Esquire, called in and examined:—

1. *By the Chairman*: You have been long resident in Newcastle? Thirty-six years.
2. You are Lloyds' Agent there, I believe? I am.
3. And you are also Chairman of the Chamber of Commerce at Newcastle? Yes.
4. You have been examined before a Committee of the Legislative Council on Shipwrecks? Yes.
5. Were you at Newcastle during the recent wrecks? I was not; that was the time I was being examined.
6. You have made every inquiry, I suppose, into the circumstances of those wrecks? Yes.
7. And you know the positions of the various vessels that were wrecked? Ycs.
8. Do you think those vessels would have been wrecked had there been a powerful steam-tug to have gone immediately to their assistance? I am sure they would not.

J. Bingle,  
Esq.  
4 March, 1857.

- J. Bingle,  
Esq.  
4 March, 1857.
9. Would not the saving of property and life have been very considerable? Very considerable. If we had had a tug-boat for the last few years there would have been a great saving of property and life also.
10. The insecurity of the port, from the absence of this auxiliary, has rendered the rates of insurance on vessels visiting it much higher than they would otherwise be? Two of the principal companies will not take vessels at all going to the port of Newcastle—the New South Wales Marine Insurance Company, and the Australian General Assurance Company.
11. You are aware of that as a fact? Yes; we are the agents. They will take produce. I suppose the insecurity of the port is the cause of it.
12. If there were a powerful steam-tug you think these companies would then insure? Yes. It is only within the last few months they have withdrawn.
13. Since the late wrecks? No, previous to the late wrecks. The Australian withdrew about twelve months ago, and I think the New South Wales about six months ago.
14. The Government have sent down two life-boats lately, have they not? Yes, I believe they have. One was a failure, and was sent back; but I never saw her, and therefore cannot speak of my own knowledge. The other life-boat was lost, and there was an inquiry, of which I was chairman. That was at the time of the late wrecks, when the "Eleanor Lancaster" was lost.
15. Will you state what was the result of your inquiry—what conclusion you came to as to the reason of the loss of the life-boat? The minor fittings were deficient; I do not believe the valves ever worked properly; and the grummets were rotten; or else the boat itself was a good boat, I believe. It was not to be supposed that, after being turned over in the surf the day previous, she would be fit to go out again. It was imprudent to take her out. However, the poor fellows were hanging on the wrecks at the time; no one was there to give instructions; and I suppose the people were in hopes she would behave better.
16. The trade of the Hunter is very considerable? Very considerable. I think our return for Lloyds' was sixty-eight thousand register tons of shipping, from the first of January to the first of November, not including coasters.
17. Nor steamers? There are some of the outside steamers included—the Moreton Bay and Wide Bay steamers; they are reported to me, and of course the report goes in to Lloyds'; but none of the other steamers—only what we call ocean steamers.
18. Do you think there is sufficient shipping tonnage to make this tug nearly self-supporting, if not quite so? Yes, quite. They have the estimate of the tonnage for the year; it is very easy to ascertain what the expenses of the tug would be, and put on a tonnage duty in proportion. I should say from four-pence to six-pence a ton would pay all expenses.
19. Have you ever calculated what the working expenses of a tug would be? We did go into it, but I cannot tell you from memory. A sixpenny rate would pay it all. The expenses of the tug would be materially diminished, because no doubt both the companies would supply her with coals at a moderate rate, for their own benefit. I should propose to place her under a local Board, and also the Harbour Master and the two pilots. One of the pilots ought always to have her in charge, and his boat's crew could work her.
20. You think there ought to be a local Board for the management of the harbour altogether? Yes.
21. To whom ought this local Board be answerable—do you think it should be responsible to a general Board at Sydney? How would you do if you gave us a Mayor and Corporation? Would you put us under the Mayor and Corporation of Sydney? To whom can they be answerable? All the local Boards in England—at Liverpool, Shields, Hull, and other places—are independent.
22. Are they not under the Trinity Board of London? No.
23. You would recommend, of course, that there should be a light-house at Newcastle? Yes.
24. Would you place that under the local Board, or under a general Board? I think the light-house should come under the general Board, because they correspond with Van Diemen's Land and Victoria, and it is a general thing.
25. Where would you recommend the light-house to be placed? Of course it is desirable to have the light seen as far as possible out at sea. It is a port that no vessel should ever go into at night. I should put it where the obelisk is.
26. On the hill? Yes.
27. *By Mr. Jones*: That is the highest point near to Newcastle? It is, and it can be seen furthest off at sea. I should put a light on the Queen's Wharf—a coloured light—so that it would be a guide to steamers coming in at night. The light-house, placed where I propose, on the obelisk hill, and the light on the Queen's Wharf, brought into one, would be a leading mark right up to the Queen's Wharf.
28. *By the Chairman*: At the end of the Queen's Wharf you would have a lantern? Yes. It would serve for the steamers, and, if vessels were obliged to come in at night, by keeping the two lights in one, they would pass all the rocks and shallows.
29. You stated that no vessel should attempt to come into the harbour at night—you mean, of course, sailing vessels? Yes. It would be imprudent for a man to do so.
30. Could not a steam-tug go out and tow vessels in at night? I do not think it would be necessary. The steamer's work could be all done from daylight to dark.
31. In an emergency—for instance, if heavy weather were coming on—could not the steam-tug tow in a vessel at night, by keeping these two lights in one? Yes; she would have a leading light, of course.
32. With the two lights you talk of, the steam-tug could bring in any vessel? Yes, or any vessel could come in if she had a leading wind. It is very desirable that vessels making the port should see the light as soon as possible. The great mistake that vessels make in coming to our port is, running too close in, and they get into the bight, which is a very deep one, as you are aware. Now, if a vessel coming down with a southerly wind were to sight the light twenty miles off, the captain, if a prudent man, would lay his vessel to until daylight. That
- is

is the very wind a vessel cannot come into the harbour with ; but, if they come too far down, they must attempt it, or go ashore in the bight. But, by seeing the light a long distance off, vessels can lay off until the weather moderates.

J. Bingle,  
Esq.

4 March, 1857.

33. Supposing a steam-tug is granted, would you consider a life-boat necessary also? No; the pilots' whale-boats would be quite sufficient.

34. Would you consider a powerful winch placed at Nobby's necessary? I do not think it is of any great importance myself. The buoys are laid down now, and any vessel getting in and anchoring there can get a hawser to a buoy and warp themselves into safety.

35. *By Mr. Jones:* How do you propose to man the steam-tug? By a pilot's boat's crew, as the vessel would always be in charge of one of the pilots.

36. So that you would require very little more force than you now have to conduct the pilot and harbour service? No; she would be part of the establishment.

37. Her crew would consist of the men now engaged in pulling the pilots' boats? Yes. I think the boats would still be necessary, because we often have five or six vessels coming in together, and although the steam-tug might put pilots on board the different vessels, she could not tow them all in at once.

38. She would not involve an increase to the force, beyond the engineer and a fireman or two? That would be all. I think the coal companies would be very glad, for their own benefit, to supply her with coal at a moderate price, each finding a proportion; say the price is fifteen shillings a ton to the public, I have no doubt they would do it for ten shillings. A steam-tug is indispensable, and with her we should have as good a port as any of the second-rate ports in England, or anywhere else.

39. *By the Chairman:* You reckon Newcastle not a difficult port? There are very few ports in England that are better. Newcastle is superior to all the northern ports—Shields, Hull, and all of them.

40. *By Mr. Jones:* You consider that a steam-tug is really necessary for the preservation of life and property? I do; I think it is the only saving of it.

41. You think it is almost as indispensable, in fact, to make the port secure, as the erection of a light-house? Yes, quite.

42. Have you ever calculated what the power of a steam-tug for that port ought to be? I think a tug similar to the "Washington" would be quite sufficient. She brought down the "Dundonald" lately, and she could have been purchased at one time for £5,000.

43. What is her power? I think it is sixty-horse.

44. *By the Chairman:* Do you think that is sufficient? We would be very glad to have a vessel of her character, at any rate. We should think ourselves very well served if we had such a vessel.

45. *By Mr. Flood:* Do you not think it would be better to send to England for one? If you are going to send to England I should say, get a better one; but if you are going to take what you can get here, I think the "Washington" would do. Of course the more powerful the vessel the better; but she would answer for us in the meantime. Of course I should wish to see a good one there, fit to go out in all weathers. The "Dundonald" was waiting a week to be taken out this time for want of a steam-tug.

46. I think you stated you would prefer the Obelisk hill for the light-house? Yes.

47. You have also given us the reasons why you select that site in preference to Nobby's? Yes.

48. Do you think that Captain King and Captain Lamb are competent authorities for the position of a light-house? I should suppose so, from their standing in the service; but you never find men in any service that will not differ. You can use your own judgment on my reasons. I think a light-house on Nobby's would be like a gas light in any man's eyes, walking along the street; he cannot see anything but the light.

49. Is the obelisk hill at a great elevation? Yes.

50. Above the Nobby? Yes.

51. How much? Very considerably. I cannot say how much.

52. Do you know whether it is or is not considered an objection, by nautical men, to have a light at so great an elevation? There is a question upon that. But although that objection may apply to the fogs in the English Channel, it does not apply here, where there is not a fog once in six months.

53. Are you aware that a Committee, of which Admiral King was Chairman, consisting of Colonel Barney, Captain Lamb, Dr. Alick Osborne, who was once a surgeon in the navy, and others, recommended Nobby's as the best site for the light? I am aware they did so, and I am aware that Nobby's would not be in existence now if we had not made a great stir about it; they had mines and gunpowder already placed to destroy it.

54. You do not agree with Captain Livingstone, the Harbour Master of Newcastle, in his answers to questions Nos. 5 and 6, of his evidence, as given before that Committee, as follows:—  
"5. Where do you think is the best position for a light-house? On Nobby's Island. 6. "Do you think Nobby's, as a position for a light-house, superior to Signal Hill? I think so. "It lies further out, and is nearer the danger. I think the light ought to be there, and the "Signal Station where it is." You do not agree with that? No; the light-house, of all places, ought to be seen as far off as it possibly can be seen at sea. There are other guides to get into the port besides the light-house. Look at Sydney; the light-house is put on the most elevated spot, but it is no guide into the harbour. If they had intended it as a guide into the harbour, they would have put it on the North Head. However, it is a matter of opinion. You can judge if my reasons have any weight.

55. Is not the Nobby the most prominent headland you have near the Port of Newcastle? It is.

56. Your objection is that it is not sufficiently elevated? Yes. And a light there would not be so well placed, because the other would give a leading mark into the harbour. A light on the Obelisk hill would be a leading mark with a light on the wharf to vessels coming in,

J. Bingle,  
Esq.  
4 March, 1857.

in, right up to the wharf, in deep water. A vessel obliged to come in, by taking these two lights into one, could come in safely without a pilot.

57. You stated, in answer to a question put by the Chairman in reference to a tug-boat, that you thought a duty of from four-pence to six-pence a ton on the shipping would pay all the necessary expenses of the maintenance of that boat? Yes, after her first cost.

58. Do you think that persons trading to Newcastle ought to pay any additional tax for this purpose, after the Tonnage Duties Act, passed last Session, comes into operation? I think that was the most iniquitous law that ever was heard of.

59. Supposing that Act, which has been suspended until 1858, comes into operation then, do you not think that persons trading to the Port of Newcastle will be entitled to be accommodated with a powerful steam-tug without any further charge? It is a very heavy charge, but still I think they would prefer to pay it rather than be without a tug. Those tonnage dues ought never to have been imposed on the port. The money is not expended on the port, but strangers are coming to pay for our improvements on the river. I never heard of a more unjust tax. We are as much entitled to a portion of the General Revenue as those in Sydney, where all the improvements have been made out of the General Revenue. The tax falls very hard on strangers. The money is going to be appropriated to the river, not to the port.

60. *By Mr. Jones*: I suppose you are aware that it is not contemplated to apply the whole of the money to the river, but a portion of it to the improvement of the port itself? You should put duties on those that go up to Morpeth, to pay for the improvement of the river.

61. *By Mr. Flood*: You think it unjust that persons trading to Newcastle should be called upon to pay this tax? I call it unjust altogether.

62. But you are quite prepared to pay tonnage dues, to provide funds for effecting your own improvements, if all the ports in the Colony do the same? Yes.

63. *By Mr. Jones*: You conceive that the injustice arises from the fact of the duties being imposed on Newcastle, when all other ports are exempt? Yes.

64. While other ports have been improved largely out of the General Revenue? Yes.

65. You think tonnage dues ought to be imposed on all ports where improvements are going on? Of course, if other places are taxed, then we cannot grumble; but even then we should not be on a footing with Sydney, where everything has been done out of the General Revenue.

66. *By Mr. Flood*: In what state is the quay at Newcastle? It is not in a very good state. It is neglected because there is no one to look after it. In fact, there is nobody in the place to represent anything.

67. You are not aware whether any demand has been made on the part of the authorities? There are no authorities that can do anything. If you see a hole in the middle of the town, there is no one to fill it up. The Police Magistrate will tell you he has nothing to do with it; and Mr. Lewis, the Clerk of Works, says he has no means. There is no one to apply to at all.

68. If you had a municipality at Newcastle, could such a body as that also superintend the port? Yes; I should say so.

69. Do you believe that those who petitioned for the introduction of the Tonnage Duties Act are still of opinion that it ought to be imposed? There were none of them who had to pay the duty themselves, out of their own pockets; and those who were to pay did not know anything about it.

70. You consider that the petitioners had very little interest in the matter? None whatever. They had no ships coming backwards and forwards, and were not connected with shipping.

71. Altogether, you consider it a most iniquitous law? I do.

72. *By the Chairman*: Have you anything further to add, from your experience, relative to shipwrecks, and their future prevention? No; not if there is a steam-tug.

73. *By Mr. Flood*: Can you give the Committee any idea of the cost of a steam-tug, with the necessary appliances? I know the "Washington" could have been bought for £5,000 at one time; but I suppose it would cost from £7,000 to £10,000 to get a vessel out from England.

## RIVERS MURRAY AND MURRUMBIDGEE.

No. 1.

F. CADELL, Esq., to THE COLONIAL SECRETARY.

*River Murray Navigation Company,  
Goolwa, 30 November, 1855.*

"SIR,

It having been intimated to the Directors of the River Murray Navigation Company, by Mr. Geo. Macleay, that His Excellency the Governor General has been graciously pleased to accede to his Motion for placing on the Estimates the sum of £1,000 for clearing the River Murray, and also the sum of £1,000 for clearing the Murrumbidgee, such sums to be expended by the River Murray Navigation Company, under the superintendence of the Crown Lands Commissioner of the District,—I have the honor to request, as Manager of that Company, that you will favor me with instructions, in the event of the vote being passed by the Legislature.

My reasons for thus troubling you must be attributed to a desire to take the *earliest advantage of the dry season*, which is of *short and uncertain duration*; for immediately on receiving your assurance that such sums could be calculated upon, prompt steps would be taken in the organization of the parties who are to perform the work.

The Directors of the River Murray Navigation Company fully appreciate the interest His Excellency has taken in facilitating the capabilities of the river in question, and are anxious to secure the greatest results from the expenditure of the sums placed on the Estimates.

I have the honor to enclose copy of a letter from me to George Norman Lockhart, Esq., Crown Lands' Commissioner of the Murrumbidgee District, on the same subject.

I have, &amp;c.,

F. CADELL.

THE HONORABLE  
THE COLONIAL SECRETARY,  
New South Wales.

[Enclosure in No. 1.]

*River Murray Navigation Company,  
Goolwa, 30 November, 1855.*

"SIR,

I have the honor to address you relative to the motion of Mr. George Macleay, "That an Address be presented to the Governor General, praying that a sum of £1,000 be placed on the Estimates for clearing the Murray River, and that a similar sum of £1,000 be also placed on the Estimates for clearing the Murrumbidgee River, the said sums to be expended by the River Murray Navigation Company, under the superintendence of the Crown Lands' Commissioner of the District."

As the rivers are now in such a state as to justify the commencement of operations, it is desirable that an understanding be at once arrived at as to the plans by which this important undertaking is to be carried out.

With your permission I would advance my course of procedure. "That immediately upon receiving a satisfactory communication from The Honorable the Colonial Secretary of New South Wales, or from yourself, I at once proceed to organize my parties with their necessary equipments at Albury and Gundagai. The parties would, most likely, consist of say eight or ten men, including an officer, furnished with crosscut saws, falling axes, tackles, and a team of horses, &c., &c., and descend the rivers in two flat bottomed boats or punts."

As I am of opinion that the judicious application of fire will be found an important auxiliary in clearing the fallen timber, in a future communication I purpose to request your sanction for burning the snags, we on our part exercising all due care to confine the fire

within

within the banks of the river, so that no damage could be inflicted upon the surrounding country.

I have written to the Honorable the Colonial Secretary this day, enclosing a copy of this letter, and requesting instructions as to the application of sums put down in Mr. Macleay's motion.

GEORGE NORMAN LOCKHART, ESQ.,  
Commissioner of Crown Lands,  
Murrumbidgee District.

I have, &c.,  
F. CADELL.

No. 2.

THE COLONIAL SECRETARY to F. CADELL, ESQ.

55-12,439

Colonial Secretary's Office,  
Sydney, 27 December, 1855.

SIR,

In reply to your letter of the 30th ultimo, I have the honor, by direction of His Excellency the Governor General, to inform you, that the sum of £1,000 for clearing the Murray River, and also the sum of £1,000 for clearing the Murrumbidgee River, have been voted by the Legislative Council, such sums to be expended by the River Murray Navigation Company, under the superintendence of the Crown Lands' Commissioner of the District, and that Colonel Barney has been desired to convey instructions to the Commissioner to take steps, in concert with the Company, for carrying out the intentions of the Legislative Council.

F. CADELL, ESQ.,  
Manager of the River Murray Navigation Company,  
Goolwa, South Australia.

I have, &c.,  
W. ELYARD.

No. 3.

THE COLONIAL SECRETARY to THE CHIEF COMMISSIONER OF CROWN LANDS.

55-12,439

Colonial Secretary's Office,  
Sydney, 27 December, 1855.

SIR,

The Legislative Council having voted the sum of £1,000 for clearing the Murray River, and also the sum of £1,000 for clearing the Murrumbidgee River, such sums to be expended by the River Murray Navigation Company, under the superintendence of the Crown Lands' Commissioner of the District, I am directed by His Excellency the Governor General to request, that you will give instructions to the Commissioner of the District to take steps, in concert with the Company, for carrying out the intention of the Council.

THE CHIEF COMMISSIONER  
OF CROWN LANDS.

I have, &c.,  
W. ELYARD.

No. 4.

F. CADELL, ESQ. to THE COLONIAL SECRETARY.

Albury, 19 January, 1856.

SIR,

I have the honor to acknowledge receipt of your communication of 27th ultimo, relative to the sum of £1,000 voted for clearing the Murray, and also a sum of £1,000 for clearing the Murrumbidgee.

Anticipating the tenor of your letter, I have already put myself in communication with Mr. Lockhart, the Commissioner of the District, and as the flat-bottomed boats, &c., and the gear are now ready, I purpose to commence operations on the 21st instant.

THE HONORABLE  
THE COLONIAL SECRETARY,  
New South Wales.

I have, &c.,  
F. CADELL.

No. 5.

MR. COMMISSIONER LOCKHART to THE CHIEF COMMISSIONER OF CROWN LANDS.

*Murrumbidgee District,  
Crown Lands' Office,  
6 February, 1856.*

SIR,

I do myself the honor to inform you, that Captain Cadell, acting for the "Murray River Navigation Company," has commenced to clear the course of the River Murray from obstructions to its navigation, and has furnished me with a sheet of moneys expended. The Company also purposes immediately to commence operations on the River Murrumbidgee.

2. In your letter of the 3rd January, 1856, (No. 56-15), I am instructed to take steps, in concert with the Company, to carry out the intention of the Legislative Council, which has voted £2,000 for the purpose of clearing the Rivers Murray and Murrumbidgee, to be expended by the River Murray Navigation Company, under the superintendence of the Crown Lands' Commissioner of the District.

3. I do myself the honor to state that the proposed superintendence by me, must of necessity, be only of the most general nature, as the duties already cast upon me are greater than I can, by any possibility, satisfactorily fulfil.

4. It may be assumed, as in the usual nature of things, that the Company will expend the money in the most economical and judicious manner possible, as their own success very much depends upon their so doing, so that any necessity for a minute superintendence is obviated, the more so, as the money is so totally inadequate to the work to be performed, and the chief burthen will lie upon the resources of the Company itself.

5. At the same time I consider it my duty to point out to you, that the operations have (on the River Murray) been commenced at Albury, the highest lying point to which the most sanguine trust that the Navigation of the River Murray can be extended. I think that the public money would be most advantageously expended in working upwards from the lowest lying obstruction, so that if at any time a cessation of the operations had taken place, a positive result would have been obtained, whereas by the mode of operation now adopted, the money expended on the upper part of the river, near Albury, is useless, until the clearing is carried down to the lowest obstructions, and if a cessation of operations should take place, no positive result will have been arrived at. The consequence (probably calculated on by the Company) will inevitably be, that in order to prevent the money now expended from being fruitless, the work done must be connected with the lower available waters by the expenditure of more public money on the river.

6. This continued expenditure may probably be willingly submitted to by the Parliament about to assemble, in so far as regards the Murray River, which has been in a certain degree shown to be navigable, which flows through a rich district, and on which a trade may arise from one part of that district to another.

7. In so far as regards the River Murrumbidgee, however, the case is altogether different; I gather from Captain Cadell's letters to me, that he purposes also to commence the expenditure by clearing from Wagga Wagga *downwards* to the confluence of the River Murray.

8. The main obstacles to the navigation of the River Murrumbidgee are at its mouth, and for thirty miles upwards, and the chief trade to be driven, and beneficial results to be obtained, are from the Lower Murrumbidgee, where the greatest number of sheep are depastured.

9. I would therefore respectfully beg, that it should be made an instruction to the Navigation Company that the £1,000 voted for the clearing of the Murrumbidgee will only be available for work done by clearing from the confluence with the Murray River *upwards*, and thus a positive beneficial result will be obtained should funds not be further supplied. If this condition be not made, the money now about to be expended will be lost, or two great public works will have to be carried on at the expense of the public purse under inefficient superintendence, and, possibly, at some inconvenience to the Treasury.

## RIVERS MURRAY AND MURRUMBIDGEE.

5

10. Captain Cadell, the Agent of the Company, has applied to me to know in *what* manner he is to be reimbursed by the Treasury, and states, that it will be of importance to have payments made on account from time to time. I find that it will be a matter of necessity for me to visit Albury on the whole matter, in order to confer with the Agent of the Company, and in order to see the nature of the work done. This visit I shall probably make after the main body of licenses for February are issued at the Gold Fields, and the Assessment Returns sent in, so as to be able to return to head-quarters early in March.

11. I would propose that £1,000 should be paid into the London Chartered Bank, to my credit, for the special service indicated, and that on my return I should commence making payments to the Company. There only remain a few months during which the money can be expended, before the winter floods stop operations, and I would therefore beg, that the means I have indicated may be adopted, in order to ensure payment to Captain Cadell on the breaking-up of the clearing party in June next.

I have, &c.,  
CHARLES G. N. LOCKHART,  
Commissioner of Crown Lands.

THE CHIEF COMMISSIONER  
OF CROWN LANDS,  
Sydney.

## No. 6.

THE COLONIAL SECRETARY to THE CHIEF COMMISSIONER OF CROWN LANDS.  
56-1792. Colonial Secretary's Office,  
Sydney, 29 February, 1856.

SIR,

With reference to Mr. Commissioner Lockhart's letter, transmitted by you to this office on the 15th instant, respecting the clearing by Captain Cadell, acting for the Murray River Navigation Company, of the Rivers Murray and Murrumbidgee, I have the honor to inform you, that Mr. Lockhart's suggestions seem to the Governor General to be right and proper, and to request, therefore, that you will direct him to call upon the Company to carry on their work from below, upwards in the Murrumbidgee.

2. His Excellency also directs me to inform you, with reference to the last paragraph of the letter, that the Auditor General has been instructed to prepare a warrant for the issue to Mr. Lockhart's credit in the London Chartered Bank of the sum of one thousand pounds, for payment to the Company, from time to time, on account; and it will be necessary for proper accounts and vouchers, for the expenditure of the money, to be hereafter furnished to the Audit Office.

I have, &c.,  
W. ELYARD.

THE CHIEF COMMISSIONER  
OF CROWN LANDS.

## No. 7.

THE COLONIAL SECRETARY to THE AUDITOR GENERAL.  
56-1792. Colonial Secretary's Office,  
Sydney, 28 February, 1856.

SIR,

In transmitting to you the enclosed letter from Mr. Commissioner Lockhart, respecting the clearing of the Rivers Murray and Murrumbidgee by Captain Cadell, acting for the Murray River Navigation Company, I am directed by His Excellency the Governor General to draw your attention to the last paragraph, and to request that out of the £2,000

voted for clearing the rivers in question, you will, if you see no objection, prepare a warrant for placing one thousand pounds to Mr. Lockhart's credit in the London Chartered Bank, to be advanced by him to the Company, from time to time, on account.

2. The Chief Commissioner of Crown Lands has been informed accordingly, and that it will be necessary for Mr. Lockhart to furnish proper accounts and vouchers for the expenditure of the money hereafter to the Audit Office.

I have, &c.,

W. ELYARD.

THE ACTING AUDITOR GENERAL.

No. 8.

THE CHIEF COMMISSIONER OF CROWN LANDS to THE COLONIAL SECRETARY.

*Crown Lands' Office,*

*Sydney, 3 March, 1856.*

SIR,

I do myself the honor to forward herewith, for the information of His Excellency the Governor General, the enclosed report of Mr. Commissioner Lockhart, on the mode of operation and progress made in clearing the Rivers Murray and Murrumbidgee from impediments to their navigation.

2. I have communicated to the Commissioner the contents of your letter of the 29th ultimo.

I have, &c.,

GEORGE BARNEY,

Chief Commissioner of Crown Lands.

THE HONORABLE

THE COLONIAL SECRETARY,  
&c., &c., &c.

[Enclosure in No. 8.]

*Murrumbidgee River,*

*Crown Lands' Office,*

*21 February, 1856.*

SIR,

Since I had the honor of addressing you in my letter of the 6th instant, No. 56-81, on the subject of the clearing of the Rivers Murray and Murrumbidgee, by the River Murray Steam Navigation Company, from impediments to their navigation, I have had a personal interview with Mr. Francis Cadell, the Managing Director of the Company, who is superintending their operations, and I now do myself the honor to report, that—

2. The plan adopted in clearing the rivers is, to cut down everything flush with the surface of the water, at its present level, which, unfortunately, is a high one for summer; any rise above this level, equal to the draft of the vessels employed, will, therefore, form a clear navigable stream for these vessels.

3. The timber lopped off is allowed to sink, and it is presumed that it will never again incommode the navigation.

4. These operations on the River Murray have been carried on as far as Howlong, which, reckoning from Albury downwards, is a distance of about 70 miles by the river.

5. The expenditure hitherto has amounted to about £340, and has been chiefly of a preliminary nature, in building boats, purchase of tools, &c., &c., which have become the property of the Government, and on the close of the operations, being sold, will return something to the Treasury.

6. This expenditure has been defrayed by Mr. Cadell, out of private funds, and he is very anxious to obtain, as soon as possible, some portion of the money voted.

7. I have also arranged with Mr. Cadell, that when, from any freshes in the rivers, the clearing party is prevented from working, that timber for fuel shall be cut and stacked, and paid for by the Company, at the usual rate of fuel; this, I trust, will meet with your approval, so that again some little saving will be effected.

8. I have further to report that, acting under my advice, Mr. Cadell has not commenced operations on the River Murrumbidgee at Wagga Wagga, as he at first intended, but has commenced at the junction of the Lachlan. It is calculated that the money voted will suffice to clear the river from thence to the junction with the River Murray. The preliminary outlay has been £91.

I have, &c.,

CHARLES G. N. LOCKHART,

Commissioner of Crown Lands.

THE CHIEF COMMISSIONER  
OF CROWN LANDS,  
Sydney.

No. 9.

THE AUDITOR GENERAL to THE COLONIAL SECRETARY.

*Audit Office, Sydney,  
17 March, 1856.*

SIR,  
I have the honor to acknowledge the receipt of your letter of the 28th ultimo, No. 261, authorizing me, if aware of no objection, to prepare a Warrant for placing £1,000 to Mr. Lockhart's credit in the London Chartered Bank, out of the £2,000 voted for clearing the Rivers Murray and Murrumbidgee.

In reply I beg to state, that the great difficulty now experienced in raising money by the sale of Government Debentures would seem to indicate the propriety of postponing the payment of this money, which, under the Public Works Loans' Act of last Session, is to be raised by Loan.

I have, &c.,  
JOHN STIRLING.

THE HONORABLE  
THE COLONIAL SECRETARY.  
&c., &c., &c.

No. 10.

THE COLONIAL SECRETARY to THE AUDITOR GENERAL.

56-2623. *Colonial Secretary's Office,  
Sydney, 29 March, 1856.*

SIR,  
In acknowledging the receipt of your letter of the 17th instant, No. 69, respecting the sum of £1,000, authorized to be issued to Mr. Lockhart's credit in the London Chartered Bank, towards clearing the Rivers Murray and Murrumbidgee, I have the honor to inform you, that as arrangements have been made in the expectation of receiving the amount, His Excellency the Governor General approves of payment of it being made as soon as the money is available.

I have, &c.,  
W. ELYARD.

THE HONORABLE  
THE AUDITOR GENERAL.

No. 11.

THE COLONIAL SECRETARY to THE CHIEF COMMISSIONER OF CROWN LANDS.

56-2623. *Colonial Secretary's Office,  
Sydney, 31 March, 1856.*

SIR,  
With reference to your letter of the 3rd instant, No. 85, enclosing a further report from Mr. Commissioner Lockhart, on the subject of the clearing of the Rivers Murray and Murrumbidgee, I am directed by His Excellency the Governor General to inform you, that the sum of £1,000, already authorized to be issued, will be advanced as soon as the money is available. The remaining sum of £1,000, out of the vote for clearing these rivers, cannot, however, be issued for the present, to which effect you will have the goodness to instruct Mr. Lockhart to apprise Captain Cadell.

I have, &c.,  
E. DEAS THOMSON.

THE CHIEF COMMISSIONER  
OF CROWN LANDS.

## No. 12.

GEORGE MACLEAY, Esq., to THE COLONIAL SECRETARY.

*Sydney, 16 April, 1856.*

SIR,

I do myself the honor to draw your attention to the fact, that up to the present time, no portion of the sums voted during the last Session of the late Legislative Council towards the clearing the channels of the Murray and Murrumbidgee Rivers has been paid into Mr. Commissioner Lockhart's hands.

I beg to state, that I have lately received a communication from Captain Cadell, from which I gather that he commenced operations on the Murray nearly four months ago, and on the Murrumbidgee on the 17th of last month;—that he has been doing this, of course, entirely at his own expense; and that his private funds being all but exhausted, he is greatly in dread of being compelled to discharge his laborers, and thus lose the season for beneficially carrying out the work.

I trust that, as the individual who introduced the motion for the grant of these sums in the late Council, as one of the present representatives of the District most interested, and a personal friend of Captain Cadell, who has shewn such untiring energy and devotion in his endeavours to promote the navigation of these rivers, I may be pardoned for thus urging upon your attention the necessity of sending up, without further delay, the funds requisite for carrying out this most important object.

I have, &amp;c.,

GEO. MACLEAY.

THE HONORABLE  
THE COLONIAL SECRETARY,  
&c., &c., &c.

## No. 13.

THE COLONIAL SECRETARY to GEORGE MACLEAY, Esq.

56-3641.

*Colonial Secretary's Office,  
Sydney, 25 April, 1856.*

SIR,

In reply to your letter of the 16th instant, I am directed by His Excellency the Governor General to inform you, that instructions will be given without delay, for the issue of the money (£2,000) appropriated by the late Legislative Council towards the clearing of the Murray and Murrumbidgee Rivers.

I have, &amp;c.,

W. ELYARD.

GEORGE MACLEAY, Esq.

## No. 14.

THE AUDITOR GENERAL to THE COLONIAL SECRETARY.

*Audit Office, Sydney,  
25 April, 1856.*

SIR,

Referring to your letter of the 29th ultimo, respecting the issue of £1,000, on account of the Rivers Murray and Murrumbidgee, I do myself the honor to transmit herewith a Warrant which I have prepared, on the application of Colonel Barney and Mr. Commissioner Lockhart for the following sums, being the amount voted by the Legislative Council, viz. :—

For clearing the channel of the River Murray ... ..	£1,000
For clearing the channel of the River Murrumbidgee ... ..	£1,000

2. The whole amount will be advanced to Mr. Lockhart, in whose favor the Warrant is made out, and it may be proper to explain, that as His Excellency the Governor General

and the Executive Council have now authorized the raising of the money required for these services, and an arrangement has been made with the Commercial Bank for the purchase of the Debentures by which it is to be raised, there seems to be no objection to immediate payment being made to the extent voted, out of the balance in the Treasury, at the credit of the Consolidated Revenue.

I have, &c.,  
FRANCIS L. S. MEREWETHER.

THE HONORABLE  
THE COLONIAL SECRETARY,  
&c., &c., &c.

## SHIPWRECKS AT NEWCASTLE.

---

*Ordered by the Legislative Assembly to be Printed, 19 November, 1856.*

---

To the Honorable the Legislative Assembly, in Parliament assembled.

The Petition of the undersigned Inhabitants of the City of Newcastle—

HUMBLY SHEWETH,—

That the numerous wrecks which have occurred in and near the Port of Newcastle, involving considerable loss of life and great destruction of property, more especially the recent loss of seven vessels in and near the Port, are subjects which demand the most rigid inquiry, both for the cause of humanity and the character of the Port.

Your Petitioners therefore pray, that your Honorable House will be pleased to institute a Committee of inquiry into the general management of the affairs of the Port of Newcastle, and in particular into the circumstances attending the recent shipwrecks, by the examination of competent persons, who may afford your Honorable Committee evidence relative to those disasters, out of which means for their future prevention may be arrived at, and an improved system of Harbour Regulations adopted.

And your Petitioners will ever pray.

*[Here follow 102 Signatures.]*

---

1856.

NEW SOUTH WALES.

## LICENSED WATERMEN.

(PRAYING REDRESS.)

*Ordered by the Legislative Assembly to be Printed, 9 December, 1856.*

To the Honorable the Members of the Legislative Assembly.

The humble Petition of the undersigned Licensed Watermen of the City of Sydney,  
Balmain, Pyrmont, &c., &c.,

RESPECTFULLY SHEWETH :—

That in the *Government Gazette* of May sixth, now last passed, it is set forth that in the Court of General and Quarter Sessions of the Peace, holden at Sydney, in and for the Colony of New South Wales, on Monday, the 28th day of April, and continued by adjournment to Thursday, the first day of May, in the year of our Lord one thousand eight hundred and fifty-six, before Alfred Cheeke, Esquire, Chairman, Samuel North, Hutchinson Hothersall Browne, and Michael Egan Murnin, Esquires, Tables were made according to the Act of the Governor and Council (4 Wm., No. 7, section 60), to regulate and fix the rates and fares to be charged by any licensed boatman for the conveyance of passengers, and to fix and regulate the distances at which such licensed boatmen should be liable to go.

That, contrary to the expectations of your Petitioners, these tables do not show an increased rate of fares on those published in the Port Regulations for the Harbour of Port Jackson, before the discovery of Gold in the Australian Colonies.

That the enormous increase in house rent and the price of the common necessaries of life, consequent on the gold discovery, renders it impossible for your Petitioners to obtain a livelihood under the existing scale of charges.

That the discovery of Gold in this Colony was followed by a largely augmented Steam Communication, both by ferry boats plying across the harbour at various points, and by boats running between this Port and Port Phillip, thereby depriving the coasting vessels from bringing passengers, which vessels, when anchored in the stream, afforded remunerative employment to your Petitioners. The steamers now come direct to the wharfs, and consequently offer no employment to your Petitioners.

That your Petitioners believe themselves to be the only class of men in this City who have not reaped the advantage which others have by being the recipients of increased salaries, and that while labourers, mechanics, clerks, and other bodies, have reaped such additional pecuniary benefits as the state of the times required, the Licensed Watermen of this City and the Hamlets are by law still enabled to charge no more for their services than before the Gold discovery, while at the same time boats, and the gear connected therewith, cannot now be procured at more than double the price charged when the present rates of fares were first published.

That your Petitioners, therefore, humbly pray your Honorable House will be pleased to amend the present tables of fares for boatmen, and to increase the charges to such an extent as will be more suitable to the present expensive state of the times in this Colony.

And your Petitioners further pray, that your Honorable House will insert a clause in the Act, giving Watermen power to sue for unpaid fares at the Water Police Office,—the Act, as it now stands, giving your Petitioners no opportunity of obtaining redress where passengers refuse to pay a legal fare.

And your Petitioners further pray, that the portion of the Act compelling Watermen to take a fare between sunrise and eight post meridian may be repealed, and from sunrise to sunset be substituted in its stead.

And your Petitioners, as in duty bound, will ever pray.

NEW SOUTH WALES.

**STEAM DREDGE.**

(PROPOSAL TO RENT BY MESSRS. ROUNTREE AND CO.)

*Ordered by the Legislative Assembly to be Printed, 13 March, 1857.**Mort's Dry Dock,  
9 January, 1857.*

SIR,

We beg most respectfully to propose that we may be allowed to Rent the Steam Dredge from the Government, on the following conditions:—

Rountree and Co. agree to pay £500 (five hundred pounds) per annum interest on capital or rent, and to remove 10,000 tons of silt per annum for the Government, from any part of the Harbour above Pinchgut Island, free of charge, the Government paying the usual charge to Rountree and Co. for any quantity they may wish removed over and above 10,000 tons; and that the Government lengthen the present ladder 20 feet, which ladder will then make 22 feet water. The Government to build two punts, each to carry 100 tons of silt, with loose bottoms, and alter the two punts already belonging to the dredge.

Rountree and Co. wish for a lease for one year, with the option of three years. Rountree and Co. will build the punts, and make the other alterations for the sum of two thousand pounds.

Rountree and Co.'s object in going to this great outlay is for the Mail Service, and trust that the Government will give this application their early consideration, as much larger boats, belonging to the European and Australian Mail Company, than those already in port, are expected in a few months.

We have, &c.,  
ROUNTREE & CO.

P.S.—In case this is accepted, Mr. T. S. Mort will become surety.

THE HONORABLE  
THE COLONIAL TREASURER.

## LIGHT HOUSES.

(ESTABLISHMENT OF IN THE AUSTRALIAN COLONIES.)

---

*Ordered by the Legislative Assembly to be Printed, 25 November, 1856.*

---

### REPORT

*Of the Commissioners appointed by the Governments of New South Wales, Victoria, South Australia, and Tasmania to confer upon the subject of Light Houses in the several Australian Colonies.*

---

#### MEMBERS OF THE COMMISSION:—

WILLIAM THOMAS NAPIER CHAMP, Esq., THE HON. THE CHIEF SECRETARY OF TASMANIA, CHAIRMAN.

H. H. BROWNE, Esq., IMMIGRATION AGENT OF NEW SOUTH WALES.

J. H. KAY, Esq., COMMANDER R. N., AND PRIVATE SECRETARY TO HIS EXCELLENCY THE GOVERNOR OF VICTORIA.

BLOOMFIELD DOUGLAS, Esq., NAVAL OFFICER AND HARBOUR MASTER, AND MASTER OF THE TRINITY HOUSE OF SOUTH AUSTRALIA.

---

## LIGHT HOUSES.

The Commissioners appointed by the respective Governments of New South Wales, Victoria, South Australia, and Tasmania, to consider the adoption of some general and uniform scheme for the erection and maintenance of the Light Houses on the Australian Coasts, having assembled in Melbourne, proceeded in the first instance to discuss the proposal of His Excellency the Governor General, as to the expediency of appointing a General Board, composed of Delegates from the different Australian Colonies, to which Board it was considered powers might be given similar to those of the Trinity Board in London, or the Commissioners of the Northern Lights in Scotland.

In the official letters from the Colonial Secretary of New South Wales, addressed to the other Colonies interested in this question, the Governor General considered it desirable that the Commissioners from each Colony should be prepared to discuss:—

1. The constitution and powers of the Board.
2. The mode in which the funds which must be placed at its disposal are to be raised.
3. The provisions of the enactments which must be submitted to the Legislatures of the different Colonies, in order to give the Board a legal existence, and such powers as may be necessary for the performance of its duties.
4. The arrangements which must be made in order to enable the representatives of each Colony in the Board, to control and superintend the Lights in that Colony.

In considering the first proposal, viz., what should be the nature of the constitution and powers of the Board, the Commissioners are of opinion that to give such an existence to a Board of this character as will ensure an effective and unanimous management likely to produce the results anticipated, it must be necessary, not only to arrive at a satisfactory conclusion as to the nature of the regulations that will be requisite for its guidance, but also that an unanimity of action should be agreed upon as to the collection and disposal of the funds which it would be necessary to obtain from each Colony interested in its formation.

To arrive at such a conclusion in the present conference appears to be impracticable, for the following reasons: New South Wales at present levies no light dues, her ports being entirely free from the imposition of any dues excepting pilotage; Victoria is similarly situated in respect to light dues, but levies a tonnage duty of one shilling a ton.

South Australia and Tasmania both maintain their lights by special dues levied for that purpose.

Both these latter Colonies object to any interference in the disposal of the sums so raised, Tasmania on the ground that her Legislature would be naturally jealous in allowing interference with the money appropriated by them for a specific purpose; and South Australia, in consequence of the existence of a Trinity Board which retains the power of levying rates only on account of lights erected on their own coasts; whilst at the same time Victoria is unwilling, on account of the existence of large tonnage dues, to increase the burthens on shipping visiting her shores; and New South Wales, although willing to co-operate in a general scheme for such an important purpose, is naturally reluctant to make a retrograde step in the imposition of shipping dues, now altogether abolished.

The Commissioners have considered it hopeless, under the circumstances, to establish a Board that will combine the materials requisite for a vigorous management, and have therefore decided, that in their opinion, the same results may be brought about by ascertaining in the first instance, where additional Light Houses ought to be erected, and then by apportioning the expense of their erection and maintenance between the Colonies interested, in such proportions as the amount of tonnage passing these lights will indicate.

Secondly. The Commissioners are of opinion that the question of providing funds requisite for the support of their own lights, or of the proportions of such other lights as may be allotted for their maintenance, may be fairly left for the consideration of the respective Governments, to be raised in such a manner as may be most in accordance with the views of their several Legislatures.

It does not appear necessary to them to entertain the third and fourth proposals, in consequence of the decision at which they have arrived on the subject of a Central Board.

2. In this view of the case the Commissioners proceeded to avail themselves of the best information of a practical character which could be obtained, by the examination of thirty-nine witnesses, who consisted principally of master mariners, employed both in the coasting and over-sea trade, and who might be considered competent to give such information as would be useful in enabling them to arrive at satisfactory conclusions as to where additional lights might be required.

3. With reference to the Light Houses already in existence, the evidence adduced will justify the Commissioners in arriving at the conclusion that they are suitably placed, and sufficiently powerful for the purposes for which they were erected. The evidence, however, has produced an impression on their minds that the Light on Gabo Island, being only an erection of a temporary character, and therefore liable to destruction by fire, might with advantage to the navigation of the coast, be constructed more substantially, and be at the same time removed to the south-eastern extremity of the Island, at such an increased altitude as would extend its radius of vision to the distance of twenty miles. Some of the witnesses state that this light is not always of such a brilliancy as might be expected from a lantern of its capacity and power, but this deficiency may perhaps be attributable either to its low altitude,

altitude, or to some defect in its management. The necessity of maintaining a Light of the greatest efficiency on this important turning point of the Australian Coast, is obvious to every one.

4. From the tenor of the evidence attached to this Report, the Commissioners consider that the erection of the following additional Light Houses will greatly facilitate the navigation of these coasts, viz. :—

1. Cape Borda.
2. Cape Northumberland, in the province of South Australia.
3. Cape Schank.
4. Wilson's Promontory, in the Colony of Victoria.
5. King's Island, in the Colony of Tasmania.
6. Cape St. George, in the Colony of New South Wales.

---

1. *Cape Borda; and, 2. Cape Northumberland.*

5. The Commissioners have been informed, by the evidence of Mr. Douglas, the officer representing South Australia, that instructions have been already given by that Government for the speedy erection of Light Houses on Capes Borda and Northumberland; and as these two Lights may be considered more immediately beneficial to that Colony, it is thought that the expense of their erection and maintenance may be fairly borne by the Government of South Australia.

---

3. *Cape Schank.*

6. The importance of erecting a light on this portion of the coast of Victoria, has been strongly urged upon the consideration of the Commissioners by nearly every witness that they have examined. Its advantages will not only be felt by the direct trade to the ports of Melbourne and Geelong, but it will also be a benefit to vessels working through the Straits in either direction against contrary winds; and as a guide to vessels seeking shelter in Western Port in adverse weather, its utility will be fully appreciated. The locality was viewed by the Commissioners, on their return from an examination of Wilson's Promontory, and there do not appear to be any engineering difficulties which would prevent its erection at a reasonable cost, or its maintenance by overland communication. The Commissioners recommend that in contradistinction to the Light on Cape Otway, the Light now recommended to be placed on Cape Schank be a first-class intermittent light, with intervals of thirty seconds, to be placed on a tower fifty feet high, and similar in its character to that erected by the South Australian Government on the Troubridge Shoals, at the entrance to the Gulf of St. Vincent; and as this light is urgently required, for the additional safety of the large amount of over-sea and coasting trade entering Port Phillip Heads, the expense of its erection and maintenance should be borne by the Government of Victoria.

---

4. *Wilson's Promontory.*

7. The position of this headland in the most intricate part of the navigation of Bass's Straits, has impressed the minds of the Commissioners with the absolute necessity of erecting a Light House in its immediate vicinity. As the great high road to the over-sea and coasting trade from Victoria to the Colonies of New South Wales, Tasmania, and New Zealand, and from South Australia to New South Wales, Tasmania (by the eastern route), and New Zealand, its position demanded the most attentive consideration. Surrounded as it is by numerous dangers lying in the direct track, some hidden and some of a less dangerous character, the expediency of erecting this Light has been a subject of lengthy investigation.

The principal difficulty which the Commissioners have had to contend with, has been in deciding upon a position for this Light, in which the greatest amount of advantage could be obtained, consistent with what could be practically accomplished. Many of the witnesses most conversant with that locality, were of opinion that the ten foot rock, situated four miles south of the south-east extreme of the Promontory would be the best position. Some recommended the island of Rodondo, whilst others advocated the necessity of placing one light on the Cleft Island, and another on the southernmost of the Seal Islands. The Promontory itself was also suggested, but most of the witnesses were unable to establish, to the satisfaction of the Commissioners, that it would afford a sufficient guide to vessels coming from the eastward to enable them to clear the Seal Islands.

With this conflicting evidence before them, and feeling the importance of satisfactorily deciding upon a matter of so much moment to the Colonies interested, the Commissioners considered it advisable to visit the locality themselves, and ascertain by personal examination the most favorable position.

They accordingly put themselves in communication with the Government of Victoria, who at once, in the most handsome manner, placed the "Victoria," steam-sloop, at their disposal. The opportunity thus afforded enabled them at once to arrive at the conclusion, that the Cleft Island, recommended by some of the witnesses as a site for a Light House, was not only inaccessible, but perfectly impracticable for communication by boats; that the Island of Rodondo was similarly objectionable, not only on account of its inaccessibility, but also in consequence of its extreme height, which would be likely to render a light on its summit frequently obscured; and that the "Ten-foot Rock," (the site most advantageous of all the positions recommended) appeared to present impracticable difficulties, which no engineering skill could surmount, except at an enormous expenditure of money and risk of human

human life. During the visit of the "Victoria," the weather being at the time comparatively fine, the sea was making a clean breach over this rock with sufficient violence to have washed away the commencement of any structure, together with the workmen engaged upon it.

The south-eastern pitch of the Promontory was next examined, and found to afford advantages of position superior to what had been contemplated. The extreme point consists of a bold headland of granite formation, level on its surface, and standing at an elevation of about three hundred feet; landing was effected in its immediate vicinity with facility, and no engineering difficulties appeared to present themselves which could prevent the construction of a Light House at a moderate cost. Observations were taken by the Marine Surveyor from a spot selected by the Commissioners, which gave a clear sea-horizon of 19 points of the compass, viz., from Cape Wellington, bearing north 34 degrees east, to the southern extreme of Cleft Island, bearing south 72 degrees west. To vessels approaching from the north-east this Light will be visible, under ordinary circumstances, at a distance of twenty-five miles, or nine miles to the north-east of the Seal Islands, and when shut in by Cape Wellington, will warn the navigator of a too near approach to the shoals in the vicinity of Corner Inlet. In approaching the Promontory from the westward, the Light open of Cleft Island will enable vessels to shape a course with confidence clear of the dangers in this locality, whilst to vessels from Port Phillip bound to the eastward, this light will be invaluable. Having taken a departure from the Light House on Cape Schank, and continued on the usual course for fifty-two miles, the Light on Wilson's Promontory will shew clear of the south end of Cleft Island, at a distance of fourteen miles. The position of the hidden dangers in the vicinity of the Promontory being within the radius of this Light, will also be clearly pointed out.

In the immediate vicinity of this headland, ample shelter can be obtained in Waterloo Bay, which was found to be not only available during westerly gales, but also capable of affording shelter to *small vessels* in southerly gales. Wood and water are also to be procured in abundance, and in the establishment of this Light, the Commissioners would recommend that it be placed on a tower fifty feet high, and be a fixed catoptric light of the first class.

In consideration of the advantages to be derived from this Light House by the trade of the respective Colonies of New South Wales, Victoria, and South Australia, the Commissioners would suggest that the expense of its construction and maintenance should be borne by those Colonies in equitable proportions.

From authentic information obtained by the Commissioners, they have ascertained that the large proportion of the tonnage to which this particular Light will be beneficial, (beyond a very small fraction which might be fairly chargeable to South Australia,) will be absorbed by the Colonies of New South Wales and Victoria, and by them the Commissioners therefore recommend the expense should be defrayed for its erection and maintenance in equal proportions. In releasing the Colony of South Australia from her proper contribution towards the maintenance and erection of this Light, the Commissioners conceive that as considerable advantage will be obtained by the trade of New South Wales and Victoria in proceeding to the westward from the Light now in course of erection on Cape Northumberland, this may be taken as a reasonable set-off in favor of that Colony for the advantage she will derive from the use of the Light on Wilson's Promontory.

#### 5. King's Island.

8. The establishment of a Light on this island has been frequently urged on the notice of the Governments of Victoria and New South Wales by the Chambers of Commerce in those Colonies, as well as in the neighbouring Colony of Tasmania, in consequence of the many lamentable shipwrecks which have, from time to time, taken place on its iron-bound shores. In the month of August, 1855, the Government of Victoria despatched a Board of Officers to investigate and report as to the most eligible site for a Light House on that island, and the report made by them is hereunto appended, recommending a site for its erection on Cape Wickham, the northern extremity of the island.

Appendix B.

On reference to the evidence given by the witnesses examined by the Commissioners, it will be seen that much difference of opinion exists in the minds of those persons who have frequently visited its neighbourhood, not only as to the position in which the Light might be most suitably placed, but also as to whether such a Light would be at all beneficial in its results, or be more likely to lead the mariner among the dangers situated in the immediate vicinity.

The Commissioners have very carefully considered this most important subject, and although they are clearly of opinion that it is contrary to all general principle to light inside a danger, still they conceive that in this instance the principle may be safely deviated from, and that a Light should be erected on this island to warn navigators of the dangers to be apprehended from a too close approach to the reefs surrounding its northern coast.

It has been urged by some of the witnesses, that the New Year's Islands (lying at a distance of eight miles from the northern extremity of King's Island,) afford advantages for the site of a Light House beyond the position recommended in the report of the Board.

The Commissioners have attached considerable weight to these opinions, more particularly as the majority of the wrecks have occurred to the southward of the New Year's Islands; but having ascertained beyond a doubt that the point recommended by the Board of Officers is not more liable to be capped in bad weather than ordinary headlands, but that the elevation at which this Light is proposed to be placed will afford a radius of vision to the southward of the islands themselves, they coincide in the recommendation of that Board.

In advising the erection of a Light House on this island, the Commissioners wish to guard themselves from affording the public any reasonable supposition that this Light can

be

be at all considered in the position of a great highway Light for the navigation of the Straits. The south coast of New Holland, at the western entrance to Bass's Straits, being free from dangers, affords, in their opinion, the safest shore for the prudent mariner to approach; and they conceive that the Light on King's Island is only to be regarded as a beacon for warning navigators of danger, rather than as a leading Light to a great thoroughfare.

In arriving at this decision they have not been unmindful, that if the Light was placed on the New Year's Islands, it would not be of any service to vessels working through the Straits from the eastward, neither could it become a guide for vessels seeking shelter under the lee of the island during westerly gales; but whilst thus adopting the views of the Board of Officers as to the position of this Light House, the Commissioners would advise that before any expense is incurred in its erection, it should be carefully ascertained whether any real necessity exists for building the tower to the great height of 120 feet (as recommended in that Report), or whether the requisite advantages might not be obtained in constructing a tower of lesser altitude, by which the expense would be considerably diminished.

The Light on Cape Otway being revolving, it will be necessary that the one to be erected on King's Island should be a fixed catoptric light of the highest class of intensity. This Light will be of the greatest service to the Colony of Victoria, in consequence of the great amount of her over-sea trade arriving from the westward; New South Wales will receive the next greatest benefit for similar reasons; whilst Tasmania will secure considerable advantage to her trade to and from Victoria and South Australia, as well as to her over-sea trade coming from the westward, and bound to the River Tamar. On these grounds the proportion of the expense of its erection and maintenance should, in the opinion of the Commissioners, be borne as follows:—

Victoria .....	One half.
New South Wales .....	One fourth.
Tasmania .....	One fourth.

Whenever public notice is given of the Light on King's Island being ready for exhibition, the Commissioners would strongly recommend that it be accompanied by a caution to masters of vessels that this Light is not intended as an encouragement for them to borrow on the Island, under any circumstances that can be avoided, but that it is only placed there as a beacon to enable them to clear a danger, if, by unforeseen circumstances, they find themselves in that locality.

#### 6. *Cape St. George.*

9. This headland, situated on the Coast of New South Wales, has from its position, frequently endangered the safety of vessels bound to Sydney from the southward. A deep indentation lying to the westward of this Cape has been the scene of several wrecks, principally caused by the indraught usually setting in on the coast, assisted by the ocean swell, and also by the want of some distinguishing mark to warn the mariner of his proximity to danger. From the evidence of the witnesses conversant with this coast (more particularly the masters of steam ships and coasters), there is an unanimous feeling that a Light House should be erected on Cape St. George, and in this view the Commissioners agree, believing that it will be of considerable service to the coasting trade of New South Wales. The headland is of a sufficient elevation to give a large radius of vision, and therefore, the tower of the Light House only requires to be of a sufficient height to work the revolving machinery, and the Light should be intermittent, of the second class, shewing its greatest intensity at intervals of 30 seconds.

This Light being beneficial to the coasting trade of New South Wales and Victoria in the same ratio as the Light about to be erected on Cape Schank, the Commissioners consider that as the latter Light is proposed to be erected and maintained by the Government of Victoria, the former may fairly be chargeable on the revenues of New South Wales.

10. With reference to the Lights already in existence and maintained by the Colonies of New South Wales, Victoria, and Tasmania, the Commissioners do not propose to disturb the existing arrangements, believing that the expenses are fairly distributed between those Colonies.

11. In continuing to allot the whole expense of the Goose and Swan Islands Lights to the Colony of Tasmania, the Commissioners have not been unmindful of the benefits which are derived by Victoria in her trade passing through Banks' Straits; but they consider that as the erection and maintenance of the Cape Schank Light is to be borne solely by the latter Colony, and the Light House on Wilson's Promontory is to be erected and maintained at the joint expense of New South Wales and Victoria, the advantages accruing to the Tasmanian trade therefrom will be an equivalent for the proportion which might otherwise be charged to Victoria for the use of the first-named Lights.

12. Some evidence has been given touching the necessity for the erection of a light on the eastern coast of Tasmania, in the vicinity of the Eddystone Point; the trade however which passes this locality being at present of a limited amount, the Commissioners do not see any immediate necessity for its erection.

13. The question of Harbour Lights has not been passed over without consideration, but the Commissioners think the establishment of any additional ones that may be requisite, ought more properly to be suggested by the officers representing their respective Governments.

14. In connexion with the important subject upon which the Commissioners have been instructed to report, they have not been unmindful of the necessity which exists for placing the management of the several Light Houses of the Colonies on the most economical basis

consistent with due and perfect efficiency; and from the evidence of Mr. Douglas, it appears that in the Colony of South Australia, this duty is performed by a Board appointed for that purpose. This Board undertakes not only the management of the Light Houses, but also the collection and disbursement of the funds arising from the dues levied on the shipping for that purpose, and while it appears to retain the confidence of the community, its operations (it is believed) have been beneficial to the trade and navigation of that Colony.

The Commissioners having decided that it will not at present be expedient (for the reasons before assigned) to establish a Central Board, nevertheless consider that should it be practicable to establish an unanimity of management of the Lights in the several Colonies interested, much advantage would be obtained, not only in facilitating the operations of future conferences of a similar character to the present one, but also in securing the best information on all points equally beneficial to each of the respective Colonies.

15. The Commissioners consider that it must be obvious to all persons interested in the navigation of Bass's Straits, that much of the safety to be accomplished by the additional Lights herein recommended must depend, not only on maintaining them in their most perfect efficiency, but also in securing at all times and under all circumstances *their distinctive features*, and they would therefore urge these observations on their respective Governments for their consideration.

16. In arriving at the conclusions already set forth as to the erection and maintenance of the six additional Lights, the Commissioners have been guided, not so much by the actual dangers which exist in their several localities, as by the advantages which will be obtained by the commercial and maritime portions of the communities in the several Australian Colonies; and they fearlessly assert, that if their recommendations are carried into effect, no reason exists for supposing that for many years to come, any additional expense will be required for lighting this great highway.

Appendix C.

17. The accompanying Table exhibits at a glance the several Light Houses already in existence, or recommended to be erected, and also the particular Colonies by which the expense of erection and maintenance is proposed to be wholly, or partially defrayed.

18. In recommending the adoption of catoptric lights, the Commissioners have not lost sight of the advantages, both in brilliancy of effect and in economy of management, which the dioptric principle of lighting possesses; but from the isolated positions in which the majority of the new Lights will be placed, and the difficulty which may exist in appointing trained and efficient Light-keepers to their management, they feel hardly justified in suggesting that system, in consequence of the delicate and very complicated character of the mechanical lamps and concentric burners therein used, more particularly as the catoptric lights at present generally in use in these Colonies are proved, by the evidence they have taken, to be sufficiently powerful and effective.

19. In conclusion, the Commissioners suggest to their respective Governments, that the agreement now entered into between the Colonies for the erection and maintenance of the Australian Light Houses, should be embodied in a Legislative enactment, and made binding upon the Governments of the several Colonies concerned, for a period of ten years.

W. CHAMP, Chairman, and Commissioner for Tasmania.

H. H. BROWNE, Commissioner for New South Wales.

J. H. KAY, Commander, R.N., Commissioner for Victoria.

B. DOUGLAS, Commissioner for South Australia.

Melbourne, 21 August, 1856.

### LIGHT HOUSE ON KING'S ISLAND.

*Laid upon THE COUNCIL TABLE by THE CHIEF SECRETARY, VICTORIA, by command of HIS EXCELLENCY THE GOVERNOR, and ordered by THE COUNCIL to be printed, 28TH NOVEMBER, 1855.*

*REPORT of the Board appointed by His Excellency SIR CHARLES HOTHAM, K. C. B., Governor of Victoria, to examine and report as to the necessity of a Light House being erected on King's Island, and the site best adapted for that purpose.*

#### MEMBERS OF THE BOARD:

Commander Ross, R.N., Chairman.

James Rusden, Esq., R.N.

W. H. Burgoyne, Esq., Clerk of Works, Colonial Engineer's Department.

#### I. AS TO THE NECESSITY OF A LIGHT HOUSE BEING ERECTED ON KING'S ISLAND.

A cursory glance at its dangerous and rocky shores, with the position it occupies at the entrance of Bass's Straits, its proximity to the coast of Victoria, the strong current sweeping towards its shores under the influence of a westerly gale (*found to be a prevailing wind*), and the disastrous shipwrecks that have occurred on its coast, but too strongly point to the vast boon the erection of a Light House would confer on the mercantile interests of Victoria and the neighbouring Colonies.

A beacon light on King's Island, if seen only at a moderate distance, would warn the mariner of his close proximity to a dangerous coast, where no harbour offers even a temporary shelter, and would avert a calamity which has too often occurred along the western shores of this Island by its timely warning.

#### II.

## II. THE BEST POSITION FOR THE PROPOSED LIGHT HOUSE.

A careful examination of the northern portion of the Island, and the adjoining New Year Islets, has induced us to decide that the north end of King's Island is unquestionably the best site for a Light House, and a reference to the accompanying plan will give a weight to this decision, conveying as it does more tangibly the results of our observations, (*the position is tinted yellow thereon*), and from the spot selected the sea horizon is visible around twenty-one points of the compass, even at an altitude of only six feet above the present surface of the ridge, consequently the light when erected, will embrace within its circle a still greater range of the compass, while at the same time it will be distinctly seen over the the New Year Islands; its usefulness will also be further extended by its proximity from the site selected to those dangerous shoals lying off the north end of the Island—the Navarine and the Harbingers.

## III. AS TO THE HEIGHT OF THE LIGHT ABOVE THE SEA, AND THE DISTANCE IT SHOULD BE SEEN.

The site selected for the proposed Light House has been found, by observation, to have an altitude of 171 feet above the sea level, and is on that part of the Mount Wickham Ridge running down to the North Cape, which has been cleared of the dense scrub by some recent bush fire, and lies about a quarter of a mile from the beach.

Mount Wickham, by these same observations, has been found to be only 312 feet above the level of the sea, instead of 595 feet, as shewn on the chart, and by comparison is doubtless the highest point of the Island.

The lantern should be elevated at least 300 feet above high water mark; it should be a fixed light, in contradistinction to that on Cape Otway, and of sufficient power to be seen on a clear night at least twenty-five miles.

Ships, therefore, sailing in either direction through the Straits, would have the advantage of its auxiliary aid in obscure or misty weather.

No objection can be urged to the elevated position we assign to the Light, from the possibility of its being obscured temporarily by a land mist. During our survey this question was made one of special observation, with the wind scarce any two days from one quarter, yet the highest elevation was never once obscured by fogs.

A beacon of tar barrels was burnt on New Year's Island, distant seven miles in a direct line from the site of the proposed Light House, and was found of sufficient power to have been visible at a considerably greater distance, while at a lesser altitude than the site chosen for the Light on King's Island.

## IV.—RESOURCES OF THE ISLAND, PARTICULARLY AS REGARDS BUILDING MATERIALS.

Abundance of good durable stone can be easily procured within a quarter of a mile of the proposed site of the Light House, either compact basalt or sandstone, while granite of superior quality abounds in large quantities on both of the New Year Islands, but no traces of limestone could be discovered, neither shells or coral in sufficient quantities along the shores of the Island as a substitute.

The indigenous timber is wholly useless for building purposes, being crooked and stunted in growth, and not any one specimen we examined exceeded six inches in diameter; it furnishes, however, a ready and abundant supply of firewood, and further, we are glad to report that good spring water is also abundant and near at hand; the positions of some of these streams are shewn on the plan.

In spite, however, of these drawbacks, we are of opinion that a Light House could with ease and facility be erected of masonry, especially when stone of so durable a nature can be procured, and we are further led to this conclusion from the necessity of a durable structure occupying the exposed site selected for the Light House.

## V. MANNER OF INTERCOURSE WITH THE ISLAND, AND FACILITIES FOR LANDING STORES.

Ineffectual attempts were made by us to land on the north and north-east coasts, but were rendered abortive by the heavy surf constantly breaking on the shore, even in the finest weather, and for this purpose the "Loelia" was anchored in Disappointment Bay, but afterwards permanently, during our stay, removed to Franklin Roads, found to be a tolerably safe anchorage for small vessels, and we have since practically ascertained that the only place where a landing can be effected is the small sandy beach close to the wreck of the "Whistler," even here impossible with a strong north-westerly breeze.

This landing place is distant about twelve or fourteen miles from the site of the proposed Light House; the track we pursued to reach the spot is indicated by the red line on the plan; part of the road lay across a heavy sandy beach, impracticable for drays even without a load. This fact, in connexion with the impossibility of effecting a landing on the north coast, induced us to ascertain the practicability of forming a road inland across the flats, and small ranges behind the sand hills, and we are satisfied that it would be a task of little difficulty, involving no great outlay, to open a good bush road sufficient for the purposes required in the conveyance of those heavy articles that would have to be landed and transported to the site of the Light House during the progress of the works.

## VI. GENERAL REMARKS.

We deemed it our duty, before closing our survey, to ascertain the number, the nature, and circumstances attending some of the most remarkable of those shipwrecks that have occurred along the western coast of King's Island during the past two years, which we have gleaned from parties resident on the island, and sufferers from the earliest of these catastrophes.

Thus

Thus we have ascertained that within the past eighteen months the following vessels have been wrecked on the western shores of King's Island, viz.: ship, "Brahmin;" schooner, "Waterwitch;" schooner, "Agnes;" ship, "Whistler;" brig, "Maypo;" schooner, "Elizabeth;" and it is not merely a conjecture when we express our opinion that three of these calamities would, in all human probability, have been avoided had a light been erected prior to that period. These vessels, the "Brahmin," "Maypo," and "Whistler," were driven on shore at night by the force of strong north-westerly gales and a current which we have ascertained to be singularly influenced by these winds.

Their commanders were ignorant of their position; yet within the orbit of that beacon, even in misty weather had it been erected, they drifted on unsuspectingly, and in three instances aduced, not only were the vessels and cargoes lost, but they resulted also in a lamentable loss of human life.

Again we would, before closing our Report, urge the necessity of a Light House being erected on King's Island; fragments of wrecks cover its coast, doubtless the remains of vessels missing, whose fates have never been ascertained, and we are convinced it is a measure the importance of which can only be appreciated by actual examination of the localities, and the result of this examination has convinced us that within the compass of our duties lies an earnest recommendation to your Excellency that this great work be speedily accomplished.

M. G. H. W. ROSS, Com. R.N.,  
Chairman.

JAMES RUSDEN.  
WILLIAM H. BURGOYNE.

Melbourne, 15 September, 1855.

PROCEEDINGS OF THE COMMISSION.

Government Offices, Melbourne.

TUESDAY, 5 AUGUST, 1856

**Present:—**

Mr. Champ in the Chair.

Mr. Browne, | Captain Kay, R. N.

The Commissioners having assembled, proceeded to read the letter of the Chief Secretary of New South Wales on the subject of the establishment of a Board of Officers representing the four Colonies of New South Wales, Tasmania, Victoria, and South Australia, to whom should be entrusted the erection and superintendence of the Lighthouses on the Australian coasts; and the replies from the various Colonies to the same.

Discussion ensued, and the Commissioners present agreed that it would be more desirable and satisfactory to the various Legislatures, and equally effective in obtaining the object contemplated, if an arrangement could be at once made for apportioning the expenses of the erection and maintenance of such Lighthouses as may be considered necessary for the safe navigation of the great highway to the several Colonies interested; and with this view the Commissioners considered it advisable at once to proceed to the examination of witnesses, with the view of determining whether the present lights were sufficient for the purpose, or whether any additional ones were requisite, and if so, in what situations they should be erected.

Mr. R. G. Gilmore, Captain of the steamer "Wonga Wonga," called in and examined.

Mr. W. H. Saunders, Captain of the steamer "Royal Shepherd," called in and examined.

James Rusden, Esq., R. N., Master of H. M. S. "Electra," called in and examined.

W. Morris, Esq., R. N., Captain of H. M. S. "Electra," called in and examined.

[Adjourned to to-morrow, at Ten o'clock.]

WEDNESDAY, 6 AUGUST, 1856

**Present:—**

Mr. Champ in the Chair.

Mr. Browne, | Capt. Kay, R. N.

Arthur Devlin, Esq., called in and examined.

Mr. Hugh Macneikin, called in and examined.

Mr. R. T. Moodie, Captain of the steamer "City of Sydney," called in and examined.

[Adjourned to to-morrow morning, at Ten o'clock.]

THURSDAY, 7 AUGUST, 1856.

**Present:—**

Mr. Champ in the Chair.

Mr. Browne, | Captain Kay, R. N.

Mr. John Lowdon, Captain of the steamer "Maid of the Yarra," called in and examined.

Mr. John B. Sydecrff, Captain of the steamer "Storm Bird," called in and examined.

Mr. Henry Tulloch, Captain of the schooner "Water Lily," called in and examined.

Mr. R. Knarston, Captain of the schooner "James," called in and examined.

Mr. Robert Williamson, Captain of the barque "Lady Hayes," called in and examined.

Mr. Joseph Walsh, Captain of the schooner "Eagle," called in and examined.

Charles Ferguson, Esq., Chief Port and Harbour Master of Victoria, called in and examined.

James Lawrence, Esq., called in and examined.

[Adjourned to to-morrow, at Ten o'clock.]

FRIDAY, 8 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne.

Crawford Pasco, Esq., R. N., called in and examined.

Mr. John Brown, Captain of the ship "Shalimar," called in and examined.

Mr. John Gover, Captain of the ship "Mindora," called in and examined.

Commander M. G. H. W. Ross, R. N., called in and examined.

Mr. Charles H. Langley, Captain of the ship "Annie Wilson," called in and examined.

Mr. William Bell, Captain of the steamer "Yarra Yarra," called in and examined.

[Adjourned to to-morrow, at Ten o'clock.]

SATURDAY

SATURDAY, 9 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Mr. Douglas took his seat at the Board as the Commissioner appointed by the Government of South Australia, and explained that in consequence of the South Australian Government not having received His Excellency the Governor General's intimation of the date on which the Conference would assemble until the 1st instant, he had not been able to be earlier present at the meetings of the Conference.

Mr. Thomas Wing, Captain of the schooner "Pioneer," called in and examined.  
B. R. Matthews, Esq., called in and examined.

[Adjourned to Monday next, at Ten o'clock.]

MONDAY, 11 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Mr. George Doran, called in and examined.  
Mr. George Kelly, Captain of the barque "Monarch," called in and examined.  
Mr. Edward Reynell, Captain of the ship "True Briton," called in and examined.  
Mr. Francis Rozea, Captain of the brig "Wanderer," called in and examined.  
Mr. William Shepherd, Captain of the "Euphemia," called in and examined.  
Mr. William Watts, Captain of the steamer "London," called in and examined.  
Mr. Anthony Enright, Captain of the ship "Lightning," called in and examined.  
Mr. W. H. Lamont, Captain of the steamer "White Swan," called in and examined.  
Mr. Colin Brown, called in and examined.

[Adjourned to to-morrow, at Ten o'clock.]

TUESDAY, 12 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Mr. G. V. Bentley, Captain of the steamer "City of Hobart," called in and examined.  
Mr. Alexander White, Captain of the steamer "Champion," called in and examined.  
Mr. W. H. Hawkins, Captain of the steamer "Queen," called in and examined.  
Mr. George Gilmore, Captain of the steamer "Telegraph," called in and examined.  
W. H. Norman, Esq., Commander of the Victorian Government steam sloop "Victoria," called in and examined.

Bloomfield Douglas, Esq., Master of the Trinity House of South Australia, the Commissioner appointed by the South Australian Government, examined.

[Adjourned to to-morrow, at Ten o'clock.]

WEDNESDAY, THURSDAY, AND FRIDAY, 13, 14, & 15 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

The Commissioners embarked on board the "Victoria" steam sloop, and proceeded to sea, examining the lights on Shortland's Bluff when passing between the Heads. At an early hour on the 14th, the "Victoria" approached Cleft Island and enabled the Commissioners to view that locality closely. On leaving Cleft Island the Rodondo was neared, and afterwards the Ten-foot Rock. The Commissioners then landed at a small bay to the northward of the south-east pitch of Wilson's Promontory, and proceeded to attain the summit of that point, in order to establish a site for a lighthouse, on which, when selected, a flagstaff was erected. Having re-embarked, the "Victoria" proceeded to Waterloo Bay, where good shelter exists for large and small craft. The examination of the vicinity of Wilson's Promontory being terminated, the "Victoria's" course was directed towards Cape Schanck, which headland was observed from that vessel on the morning of the 15th instant, after which she entered the Heads, proceeded through the south channel, and finally anchored in Hobson's Bay on the same afternoon.

[Adjourned to to-morrow, at Ten o'clock.]

SATURDAY, 16 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Draft Report considered.

[Adjourned to Monday next, at Ten o'clock.]

MONDAY

MONDAY, 18 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Draft Report further considered.  
[Adjourned to to-morrow, at Ten o'clock.]

TUESDAY, 19 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Draft Report further considered.  
[Adjourned to to-morrow, at Ten o'clock.]

WEDNESDAY, 20 AUGUST, 1856.

**Present:—**

Captain Kay, R. N., | Mr. Browne,  
Mr. Douglas.

Captain Joseph Lawson, called in and examined.  
Draft Report further considered.  
[Adjourned to to-morrow, at Ten o'clock.]

THURSDAY, 21 AUGUST, 1856.

**Present:—**

Captain Kay, R. N. | Mr. Browne,  
Mr. Douglas.

Draft Report further considered, and agreed to.

## MINUTES OF EVIDENCE.

TUESDAY, 5 AUGUST, 1856.

**Present :**

MR. CHAMP IN THE CHAIR.

MR. BROWNE,

CAPTAIN KAY, R.N.

Captain Robert Graham Gilmore examined:—

1. Do you command the steamer "Wonga Wonga?" Yes.
2. How long have you been employed in the Australian trade? About two years altogether. I have been about twenty months in the "Wonga Wonga"; and I have been backwards and forwards several times from England—once in the mail steamer "Australian." I have made about fifty voyages now in the inter-colonial trade.
3. Are you aware of any difficulties being experienced in the inter-colonial trade, particularly in Bass's Straits, in consequence of there not being a sufficient number of lights, or of their not being properly placed? We are frequently retarded by thick weather. For the benefit of sailing vessels more than of steamers a light about Jervis's Bay would be of great service.
4. In proceeding to the southward you do not find the want of that light, do you. It is in proceeding from the southward to the northward you find the difficulty? Yes; and in summer time especially, because we keep close into the land to avoid the current which runs generally strong to the southward at that period.
5. Do you ever find an indraught setting into that headland which makes the north head of Jervis's Bay? Yes; there is a deep bay, called Wreck Bay, where several vessels have been lost. It is a large bay.
6. Have you ever found yourself drifted into that bay? Yes, several times; and I have had to haul out.
7. And you think that a light on that head would be of considerable benefit to ships coming from the southward? Yes; or vessels coming from abroad making the land.
8. To any vessel coming from the southward it would be of advantage to have a light at Jervis's Bay? Yes, I think so, decidedly.
9. Has the light on Cape Howe been found to be of much service since it has been established? Of great use; but it is hardly vivid enough. I have been very close to it without seeing it, when a light like that at Cape Otway would have pierced three times the distance through the thick atmosphere or mist then prevailing.
10. Do you think that it is attributable to any defect in the position of the light itself or to the atmosphere that surrounds it? It is not a sufficiently good light for that position, which is excellent. I have been within four or five miles of it and could only just make it out, when I ought to have been able to see it twelve miles off. On a very clear night you might see it eighteen miles off.
11. From Cape Howe to Port Philip Heads what other difficulties have you encountered that would render an additional light necessary? It is a long distance to steer on one course, viz., two hundred miles, the set of current is sometimes strong and always uncertain.
12. Would a light at Wilson's Promontory be a sufficient guide to carry you clear of the Seal Islands? Yes, a first-class light; they are about eighteen miles from the promontory.
13. Do you find the light on Kent's Group of much use? It is a magnificent light. I have seen it forty miles, and it has been seen fifty-six miles off; but it is very frequently capped by vapour.
14. Have you any reason to think that it would be advantageous to remove it to any other site. I have never been on Kent's Group, so that I could not say.
15. Do you think it might be more advantageously put in any other position than on Kent's Group? It must be very useful to vessels going to Van Diemen's Land or through the straits, and I should not like to recommend its removal.
16. Would you place the light at Wilson's Promontory on the promontory itself, or on one of the islands in that neighbourhood? A light on the promontory itself would only guide us in coming from Cape Howe, and from the west or south westward.
17. Then for vessels coming from the northward the promontory would be the proper place for the light? From the north-eastward or south-eastward.
18. But in coming from the westward would that light be equally effective? It would be no use to vessels coming from the north-westward.
19. Is there any other position for a light there which you would recommend? There is a rock there, called the Ten-foot Rock, which would serve for vessels coming from the westward. I landed upon it at the request of Captain Ferguson, some months back, to ascertain if there was a sufficient base for a light-tower, and found there was ample space.
20. Would the island of Rodondo answer as a site for a lighthouse? It would be very difficult to put a lighthouse there and to communicate with it when it was there.
21. Then a light at Wilson's Promontory, in your opinion, would be of no use to vessels coming from the westward, but only to vessels coming from Cape Howe? From the north-westward, the Glennies and other islands would shut it in.

Capt. R. G.  
Gilmore.  
5 A 10, 1856.

- Capt. R. G. Gilmore.  
5 Aug., 1856.
22. If the light were erected on Wilson's Promontory, would it not be necessary for vessels leaving Port Phillip to have some additional light between Port Phillip Heads and the promontory? It would be desirable to have a light on Cleft Island, but that is as inaccessible as Rodondo.
23. Are there any headlands between Port Phillip Heads and Wilson's Promontory that would be available for a lighthouse? No, not for a guide round the promontory.
24. Do you consider an additional light on Cleft Island to be requisite for the navigation between Melbourne and Sydney? Yes, at Cleft Island, if it was possible to get a lighthouse there. There is frequently quite smooth water, but it is inaccessible.
25. Is there any port or beach where a boat could land? No.
26. Are there any of the headlands between that and the heads of Port Phillip, on which you consider it would be advisable to put an additional light? I think there is no necessity for two lights. I think a lighthouse upon the Ten-foot Rock would answer the purpose of both; and in nine cases out of ten it would be accessible.
27. You think a lighthouse on the promontory would not be available for vessels passing both ways; but a lighthouse on the Ten-foot Rock would be available for all purposes? Yes; I think so.
28. A light on the promontory would necessitate the erection of a light somewhere else? Yes.
29. But a light upon the Ten-foot Rock would answer the purpose of all? Yes, if the tower was a good height.
30. What is the area of the Ten-foot Rock? About 60 feet by 40; and it is about 20 feet out of the water at high water on the eastern side, and on the western side perhaps 15 feet.
31. Is there sufficient base to afford fastening for a lighthouse? Yes, quite so, and there is almost a natural landing place. I had very little difficulty in getting ashore, and I have frequently steered down towards it to watch how the surf broke on it, and I have never seen the green sea break over it;—the spray dashes over it sometimes. I think a few heavy stones piled up would test how a lighthouse would stand.
32. You think it would answer for the erection of a lighthouse? I am confident of it. The promontory is only four miles off, and material could be wrought on the promontory and taken to the rock. It is only about eight miles from Refuge Cove, a beautiful little harbour, where there is good anchorage for a vessel in all weathers.
33. Which is the usual passage for vessels going eastward? Between Wilson's Promontory and the Ten-foot Rock for steam vessels.
34. What height would you advise the lighthouse to be made if it was put there? It would have to be a great height.
35. At what distance ought the light to be visible? Twenty-five miles, at least.
36. Why should it be visible twenty-five miles? On account of the Seal Islands; they are very dangerous, and they are to the north-north-east of the Ten-foot Rock.\*
37. Then it is only in coming from the northward you would require to see it twenty-five miles off. In coming from the westward would you require to see it that distance? No; it is only nine miles from the outer rock or island in that direction. I suppose for a light to be visible twenty-five miles it would require an elevation of about 200 feet. The height of the mastheads of vessels averages about 50 feet.
38. Supposing it should be found impracticable to build a lighthouse on this rock, what, in your opinion, would be the next best site? On the promontory itself, because then vessels coming from Port Phillip would go to the southward in thick weather; and when they were far enough, the light would open out clear of the Glennies and Cleft Island.
39. Is the promontory high land? It is about 200 feet in height at the extreme end of it.
40. Are the Commission to understand that, in your opinion, if a light is put on Wilson's Promontory there ought to be two lights, one on the promontory and one on the islands to the westward of it? Yes.
41. Still you think a single light on the promontory would be of great assistance to the navigation? No doubt of it. We should only have to steer more to the southward during bad weather in leaving Port Phillip; now we steer directly for the islands in fine weather.
42. Is Hogan's Island at all dangerous? It is a danger. A light on or about the promontory would lessen it.
43. Do the clouds hang about the lighthouse at Kent's Group, when it is clear below? We hardly ever go close enough to the Kent's Group to see.
44. In approaching the harbour of Port Phillip are you of opinion that anything is wanting in the way of lights? A light on Cape Schanck would be of great service.
45. Do you consider a light on Cape Schanck would be preferable to a light on Point Lonsdale? In coming from the promontory towards Port Phillip Heads, Cape Schanck projects a good deal, and a light on Point Lonsdale might be obscured by it.
46. Do you think Cape Schanck would be a sufficient departure to enable you to open the Shortland's Bluff light without difficulty? Yes.
47. You speak merely as a mariner coming from Wilson's Promontory up to Port Phillip Heads—what would be your opinion as to a vessel coming from Cape Otway. Would not a vessel have to go to leeward of her port with a north-westerly wind if the light were on Cape Schanck instead of Point Lonsdale? There would be no occasion to run to leeward, the Schanck light would be a good and certain guide to prevent that.
48. A light on Cape Schanck would be quite available for ships coming from the east? Yes.
49. And of great service to vessels coming from Cape Otway? Yes, of great service.

50.

\* I quite forgot to mention the eastern Seal Island, although I had often thought of it as an eligible position for a guide to the promontory, and as a beacon for the dangers in its own immediate vicinity.  
R. G. G.

50. Would not you be able to make the Schanck at a reasonable distance without going to leeward? You would make the Schanck on the starboard bow. Capt. R. G. Gilmore.
51. Have you ever considered the question of the lighting of the two points at the entrance of the straits; that is, Cape Otway and King's Island? I have often considered and talked about it. I have never been on shore at King's Island. Aug., 1856.
52. In making the straits did you ever sight King's Island? Yes.
53. During your experience have you generally made the entrance to the straits in fine weather or bad weather? I think most frequently in bad weather.
54. Have you considered whether any light on King's Island would be of assistance to the navigation, seeing that there are extensive reefs running out some seven or eight miles from King's Island? I am afraid if a light was put on King's Island it might bring vessels coming from the southern ocean into danger on a lee shore or amongst the reefs that would be outside the light.
55. Then you think a light there would be more detrimental to the safe navigation of the straits than if the island were left unlighted? It is a matter of opinion.
56. In coming from the westward, would you, if there was a light on King's Island, hug that shore, or would you, as you do at present, hug the northern shore by Cape Otway? I should always keep well to the northward.
57. Is there any particular current, that you are aware of, which sets from Cape Otway in any particular direction? I cannot say as to any particular current; there is a strong tide there.
58. Is there any current which causes ships to be set down a great deal on King's Island? Not that I am aware of. I think a light on King's Island would not be really so advantageous as it is generally considered it would be.
59. Is it not contrary to all principle to light inside a danger? Yes.
60. Would it not be more likely to bring a vessel on those reefs, if, in thick weather, she were trying to make the King's Island light than if she knew there were no light at all on the island, and hugged the northern coast and made Cape Otway? Yes. It would be only in very fine weather they ought to attempt to make King's Island.
61. What would you think of putting a light on the New Year Islands? I think it would be worse. I knew an instance of one vessel which sighted the New Year Islands and passed between the Harbingers and the main land. They thought the New Year Islands was the north part of King's Island, and in trying to avoid it they went in between the reefs and the main land without knowing at the time until they saw the sea breaking outside them.
62. At what distance have you seen the Otway Light? I think I saw it about sixteen miles off last time. It was then very dirty weather.
63. Your opinion has been given principally with reference to vessels running into the straits from the westward? Yes.
64. If you were working out of the straits to the westward, bound to India for instance, do you think then that any advantage would be gained by having a light upon King's Island? Yes, I think it would.
65. In standing across to work out of the straits, you think a light on King's Island would be useful? Yes, I think it would be very useful; and it would also be a guide to vessels in heavy westerly weather to get under the lee of King's Island into smooth water.
66. The passage to the southward of King's Island, between the island and the main land of Tasmania, is seldom or never used, is it? I have never been there myself.
67. If any light were erected upon King's Island, should it not be, of necessity, a very powerful light—the most powerful that could be obtained? Yes.
68. Have you any means of ascertaining your position in the entrance to the straits by the soundings? I never have been able to do so, but the water gradually shoals towards the main land, say at Cape Northumberland, and Portland and Cape Otway.
69. You have no means of knowing whether the soundings would give you any guide when you could obtain no observation? I never attempted it myself. I believe the soundings are very correct, but I think there is too much sameness in them across the entrance.
70. Is there any difference in the soundings which would show whether you were to the northward or the southward? I cannot say from my experience.
71. Generally, the conclusion to be drawn from your evidence is, that for vessels coming from the westward a light on King's Island would be rather dangerous than beneficial? At times it would.
72. On the whole, do you think it would be so? As there is only one light, viz., Cape Otway, now, I do not think it would; but if there was a light on Cape Bridgewater or Cape Nelson, I think it would be better without a light at King's Island.
73. Then on the whole you do not think it would be more dangerous than otherwise? Not on the whole.
74. To vessels going from the eastward, you are clearly of opinion that a light on King's Island would be very useful? Yes; and I think, with caution, a light would not be dangerous on King's Island; but the great anxiety to make a quick passage might lead ship masters to trust too much to the light on King's Island.
75. Supposing the light were visible at twenty miles, would not any man, the moment he saw the light, keep away to the northward? Certainly he would, if he could or thought he could clear the dangers.
76. Have you been also to the westward of Cape Otway; that is, to South Australia? Yes, eight or nine times.
77. Are there any points upon that coast to the westward of Cape Otway which appear to you to be defectively lighted? I think a light on Cape Nelson would be a very useful light indeed.
78. If there were a lighthouse on Cape Nelson, would that give you a good departure to Kangaroo Island? Yes.

- Capt. R. G. Gihmore.  
5 Aug., 1856.
79. Would you think it absolutely necessary that there should be a lighthouse either on Cape Northumberland or Cape Nelson? I think it would be important to have one upon each. Vessels coming from England would not like to haul up to make Cape Northumberland, but they would make Cape Nelson, because they would have Portland under their lee in case of a difficulty; but it would be useful for vessels coming from Adelaide to have a light at Cape Northumberland; there are very nasty reefs all along that coast.
80. Are you of opinion that over-sea ships would endeavour to make the light on Cape Nelson in preference to Cape Otway? It would depend upon the weather; but for safety sake, I think they would try to make Cape Nelson first. If they could make Cape Nelson, if the wind were blowing hard from the southward they could reach off to the north-west; and if blowing from the south-west they could haul off to the south-east.
81. And you think nothing further would be necessary between Cape Northumberland and Kangaroo Island, and Backstairs Passage? If Cape Northumberland and Cape Nelson were lighted, it would at all events give a fair opportunity of reaching the light in Backstairs Passage without much difficulty.
82. Are you to be understood to say, that decidedly you would recommend a light to be placed on Cape Schanck in preference to Point Lonsdale? Decidedly.
83. A light on Point Lonsdale would not be visible to ships coming from Wilson's Promontory until after they got round the Schanck? Not in thick weather; and there is a tremendous indraught from south-westerly gales, so much so that I have had to haul out two points from my course in consequence, to make up for this indraught.
84. A ship in mid-channel, between the main lands, coming from the westward would see Cape Schanck lighthouse? Yes.
85. You say the light on Gabo Island is a very indifferent light? Yes; I think it would be better if it were more powerful.
86. If you placed a light upon some part of the land near the entrance of Jervis' Bay, on which headland would you put it? Either upon George's Head or Point Perpendicular.
87. You give the preference to Cape Nelson over Cape Bridgewater, in the first place in consequence of its being the most southerly point of the two, and because of its being nearer to Portland? Yes; to give a guide to Portland for refuge in south or westerly gales, and to warn off the land in east or south-easterly gales.
88. There is a great deal of difference between its being desirable if possible to have lights and its being to a certain extent necessary for the safety of vessels coming here. Which of the positions you have spoken of do you consider as being the one on which the first lighthouse ought to be erected; which is in your opinion the most pressing of all the points you have alluded to, taking into consideration not only the trade between here and Sydney, and England, but also Van Diemen's Land? For all classes of vessels I should say Cape Nelson or Cape Schanck.
89. A light at Cape Nelson would be of no use to a vessel coming from Launceston or Hobart Town? A light at Cape Schanck would be very useful to them.
90. Do you think that the first light to be taken in hand should be either Cape Nelson or Cape Schanck? Yes; I think so.
91. Considering that a light on Cape Nelson would be of no use to vessels coming from Launceston or Hobart Town, which of the two do you think it would be most desirable to erect first? When passengers come from the westward they come in such large numbers, 500 or 600 in each ship, that makes it more important.
92. Then you would give the preference to Cape Nelson as being the most pressing? Yes.
93. And next to that Cape Schanck? Yes.
94. Cape Schanck is the one in which all the Australian Colonies are most interested? Yes.
95. But the other would be most useful to vessels coming from the westward? Yes.
96. Have you ever been to Hobart Town? Yes, but a long while ago.
97. Are you prepared to give any opinion as to the navigation to that place? No.
98. Do you think it would be more desirable to put a light on Cape Schanck than on King's Island? Decidedly.
99. Have you any other suggestion to make to the Board? I should like to let it be understood that the reason why I object to a light on King's Island is on account of the outlying dangers. I think it would be likely to inveigle vessels on to the reefs which surround King's Island, through their not being able to judge of the distance at which they were from the light. [*The Witness withdrew.*]

Captain William Henry Saunders examined:—

- Capt. W. H. Saunders.  
5 Aug., 1856.
100. What vessel do you command? The "Royal Shepherd."
101. How long have you been engaged in the inter-colonial trade? Since 1840.
102. What ports have you principally traded to? Hobart Town, Launceston, Sydney, and Melbourne; I was trading between Sydney and Melbourne till 1850, and between Launceston and Melbourne for the last five or six years, and I was for a short time trading between Hobart Town and Sydney.
103. Your first experience was in trading between Sydney and Melbourne? Yes.
104. During your experience have you found any difficulty in the navigation of that particular track, in consequence of no part of the coast being lighted except the Howe and Sydney Heads? Yes, I have often felt the want of a lighthouse at Cape George in running up the coast in thick weather.
105. Is that in coming from the northward or running up from the southward? Running up from the southward.
106. Do you conceive that Cape George is a point that ought to be lighted? I think so.
107. That is at Jervis' Bay? Yes.

108. If that part of the coast were to be lighted on which headland would you place the light, would you place it upon Cape George or upon Point Perpendicular? On the southward point, Cape George, because it is higher than Cape Perpendicular and could be seen from the northward as well as from the southward. I knew an instance of a ship running right on shore with 300 prisoners on board, for the want of a lighthouse—that was the "Hive."
109. She was coming from the southward, was she not? Yes. The danger is in coming from the southward, because the south-east swell sets a sailing vessel in.
110. Would not that light be also beneficial in running for that bay in an easterly gale? Yes.
111. It is not accessible now of a night in consequence of not being lighted? Not unless a person is acquainted with the place.
112. Is Cape George the southern head of the entrance of Jarvis's Bay? It is the highest land there: it is to the south of it.
113. A light there would not mark the entrance to the bay? No, it would not. It would be in about the same position as the light at Sydney Heads.
114. Is there any very perceptible difference in the height of the two heads—Cape Perpendicular and Cape George? Cape George is about 200 feet higher than Cape Perpendicular.
115. But you are quite clear that a light on Cape George could be seen over Cape Perpendicular? Yes.
116. Is there any other part of the coast between Sydney and Cape Howe where any additional light would be necessary? I do not think so.
117. As a leading light no other light would be necessary but one on Cape George? No.
118. Have you had much opportunity of seeing the light at Cape Howe? I have seen it four or five times since it has been lighted. Since the erection of that light I have not been in that trade.
119. Have you observed that light? It is a very good light, but it can not be seen far off the deck.
120. Do you think it sufficiently powerful for a turning point? Quite; it is quite sufficiently powerful for a low light.
121. But if it could be made higher it would be very desirable, so as to give a greater radius of vision? Yes; very desirable.
122. After having rounded Cape Howe are there any positions or dangers in the straits which have come practically under your notice as requiring to be lighted? I think there ought to be a lighthouse about Wilson's Promontory.
123. Have you ever landed on the promontory? Yes; I was there about three weeks ago.
124. Would a lighthouse placed upon the promontory be available for the trade both coming from the eastward and from the westward? I think it would be rather a difficult thing to place a lighthouse so as to be seen on both sides of the promontory, and if placed too high it is often obscured by fogs and clouds in bad weather.
125. You think it would be a difficult thing to place a light on the promontory itself so as to be visible on both sides? Yes.
126. Is there any rock near the promontory that you are aware of that would be a better position for a light than the promontory itself? The Rodondo would be a better position if it was possible to put a lighthouse there.
127. Have you ever landed on the Rodondo? No, never.
128. You do not know whether it is accessible or not? Judging from appearances I should say it was not.
129. Do you know Cleft Island? Yes.
130. Would it be possible to put a light there do you think? That is as bad as the Rodondo.
131. Do you know the Ten-foot Rock? Yes.
132. Would it be possible to put a light there? I do not think it would. It would be much worse than the Eddystone.
133. Supposing it possible to put a light on any of those rocks, would it be a better site than the promontory itself? I think it would not.
134. But you are not aware of any rock or island there on which you could put a light? No. You could put one on Hogan's Island, but that is too near Kent's Group.
135. Supposing it practically impossible to put lights on any of those rocks, would you recommend a light being placed on Wilson's Promontory? Yes.
136. So as to be visible on which side, as you say it could not be visible on both? I think it unlikely that it would be visible on both sides; I do not say it would not be.
137. On which side could it be placed most advantageously? I think on the west side.
138. That would be of no service to ships coming from the north-east? No; I have seen the light on Kent's Group from between the Rodondo and Mon Couer; and I have been in between the Judgment Rocks, within ten miles of it, and have not seen it on a night when the stars were out, the lower part would be clear, but the upper part, where the light is, would be in a mist. I think the light on Kent's Group is too high. The other day I passed between the island and the Judgment Rock, close to it, and there was no cloud to be seen anywhere else, but you could not see the light for the mist.
139. If it had been lower would you have seen it then? Yes; but then it is such a large island, that if it were lower you would only be able to see it on one side.
140. Now it is visible all round? Yes.
141. Supposing the engineering difficulties to be got over with respect to the Ten-foot Rock, do you think that it would be a good place to put a light for Wilson's Promontory? No.
142. But in your opinion the engineering difficulties are insuperable? I think so.
143. And in that case you would prefer the promontory? Yes; the pitch of the promontory.
144. In proceeding from Wilson's Promontory, what is the next point that you think deserves the attention of the Colonial Governments with reference to a lighthouse? Cape Schanck.

Capt. W. H. Saundcrs.  
 Aug., 1856.

145. Decidedly Cape Schanck? Yes.
146. Would Cape Schanck be useful, as a headland light in coming both from the eastward and westward? Yes; in coming from the westward, when vessels leave the Otway light they run a certain distance in a course. They can do that in a couple or three hours, and if they gave the western land a good berth they could pick up the Schanck light with a cross bearing.
147. Would it not throw them to leeward of their port? I think the light should be seen twenty miles and give them time not to run to leeward.
148. Do you think it would be advisable to have a light on Cape Lonsdale, or do you think that with the Schanck light the Shortland's Bluff lights would be sufficient? I think the Shortland's Bluff lights would be sufficient. Too many lights would be apt to confuse a stranger.
149. Do you consider that the Schanck light and the promontory lights are absolutely necessary, or do you think with ordinary care the straits are sufficiently lighted without those additional lights? I think there ought to be a light on Cape Schanck under any circumstances. I have no doubt Western Port will come into notice as a coal port, and the Schanck light would serve as a harbour light for Western Port.
150. But would it be required as a leading light for general navigation? All vessels coming from the eastward or southward would make up for Cape Schanck; and vessels coming from the westward it would also be a serviceable light to, in running up the bay.
151. And you think it would really be an effective light and one which would be beneficial to the general navigation of the straits? I do.
152. The promontory light you are not so strongly in favour of as being absolutely necessary? I think there would be some difficulty in putting a light there.
153. But supposing all these difficulties not to be insurmountable, which do you think would be the most advantageous light to erect at once, Cape Schanck or the promontory? Cape Schanck.
154. Do you know anything of the coast between Port Phillip and South Australia? As far as Portland Bay; I cannot go further than that.
155. Are you aware of any necessity for a light on that side? Yes; I should say they require a light going to Adelaide; there are some nasty reefs off a place called Cape Jaffa, and I think a lighthouse below that at Cape Nelson would be desirable.
156. Your experience does not take you beyond Portland Bay? No.
157. And between Portland Bay and Cape Otway you think there is no necessity for any further light? No.
158. Considering the light at present in existence on Cape Otway, do you think it desirable that a light should be placed on the north end of King's Island? No.
159. Or any where in the neighbourhood of King's Island? Not at King's Island at all.
160. Can you give any reasons why you have arrived at the conclusion that a light would not be advantageously placed on King's Island, or any where in the neighbourhood? Ships would be apt to border on King's Island if there was a light there; they border more over to Cape Otway now than they would if there were a light on King's Island.
161. Have you frequently sighted King's Island? In fine weather you can see the island; in fine weather you do not require a light, and in bad weather you would not see the light if it was there. In all the cases of ships that have been lost there, if there had been a dozen lighthouses they would not have saved them. They got down to leeward before they found out where they were, the land being low.
162. And you think that no lighthouses under the circumstances would be available? I think not.
163. In your opinion the fact of there being a lighthouse at King's Island would rather encourage ships to border upon the island, which encouragement should not be given to them? Yes.
164. Then you would not light King's Island at all? No.
165. You would have the entrance to the straits lighted alone by Cape Otway? Yes.
166. Is there any fear in running for the straits in a heavy westerly gale of being thrown upon the main-land? Not with ordinary care.
167. There is, you think, no fear of being placed in a position of not being able to haul off if anything like ordinary attention is paid? I do not think so. If a man has not had a sight for four or five days, I should think it very wrong to run with a westerly gale.
168. Do you know the precise spot where the "Catariqui" ran ashore? No, not exactly.
169. There is an impression favourable to a King's Island light entertained by the Chambers of Commerce of this Colony and of New South Wales, and also of Tasmania; those bodies think it would be advantageous to the shipping interest that a lighthouse should be erected at King's Island; do you think their opinions are well founded or not well founded? I do not think they are well founded. I have been asked to attend the meetings of the Chamber of Commerce, but I have declined to do so on that very score. They were all for a lighthouse, and I was against it.
170. Do you know the Harbinger Rocks? Yes.
171. Are they above water? Yes.
172. Is there sufficient area on them on which a light-house could be erected? I do not think it; and there is too much swell.
173. If it were possible to put a light on the Harbinger Rocks, would that overcome the difficulty, in your opinion? I do not think it would be seen far enough to the southward. On the west side, in a gale of wind, when a ship gets to the Harbingers she is past the danger.
174. Your opinion is, that a ship has no business in the neighbourhood of King's Island at all? Yes; they ought to keep well to the northward, as there are no reefs, and a bold, safe coast; and I think a mariner, with ordinary care, had better border over on a bold coast than run down hap hazard towards King's Island.
- 175.

- 175. Are you aware of there being any particular set of the current in the neighbourhood of Cape Otway? I know there is an ebb and flow in shore, and the currents are occasioned by the winds, either east or west.
- 176. They are purely local, according to the direction of the wind. Yes.
- 177. Supposing it were decided that a light should be erected somewhere or other in the neighbourhood of King's Island, do you think that either of the New Year Islands would make a good site? Yes; the New Year Islands, in my opinion, would be the best site.
- 178. Better than either the northern extremity of King's Island, or the Harbinger Rocks? I have been twenty times within fifteen or twenty miles of the north-eastern extremity of King's Island, and on many occasions it has been hazy and thick.
- 179. And under those circumstances a light would have been valueless? Yes.
- 180. How many times out of the twenty has it been in that state—have you generally found it so, or have you generally had tolerably clear weather? Tolerably clear weather generally.
- 181. On those occasions a light would be of little or no use? No.
- 182. Have you any suggestions to make with reference to the lights generally in Banks's Straits? No, we do not require any more lights on the Launceston side.
- 183. You think the straits are quite sufficiently lighted for all purposes? Yes.
- 184. Even for vessels trading between this port and Launceston and Hobart Town? Yes.
- 185. The light in Banks's Straits is quite sufficient, you think, for vessels trading between Melbourne and Launceston, and also for vessels trading between Sydney and Launceston? Yes; and vessels going to Hobart Town always sight Kent's Gubup.
- 186. Supposing that the Government were only to decide upon putting up one additional lighthouse, which is the one you consider as the most important for the colonial trade; that is, to improve the navigation between Melbourne, New South Wales, Sydney, and Van Diemen's Land? The light at Cape Schanck.
- 187. Would that light be most conducive to the general benefit of the whole colonial trade? I have felt as much want of a light on Cape Schanck as ever I did one on the promontory. I have been more nervous in running for the Heads here with a southerly gale, than I have been in rounding the promontory.
- 188. If two lights were to be erected, which should you say would be the two most important? Then I should say Cape Schanck and the promontory.
- 189. Are you aware of any additional light being required on the east coast of Van Diemen's Land? It is many years since I was there.
- 190. Did you ever find any necessity for a light about Helen's Point, for instance? No.
- 191. Are the approaches to Storm Bay sufficiently clear to require no additional lighting? They have a light at Brunie Island.
- 192. Are there any further suggestions you would wish to make to the Commission? No.
- 193. The lighthouses at Swan Island and Goose Island are useful to all vessels coming from New Zealand to Melbourne, are they not? Yes; because they are driven sometimes through Banks's Straits.
- 194. What course do they generally take from New Zealand? They make for Kent's Group.
- 195. Then, under the circumstances alluded to by you—that Kent's Group is almost the starting point for vessels coming from so many places—is it not better that the lighthouse should be where it is, although it may be occasionally obscured, than to have it on a lower part of the island? I think it is in the best place in which it could be put in the island.
- 196. Are you aware whether the Brunie Island light is of any use to persons going to Sydney from Europe, coming from the westward? I think so.
- 197. Do you happen to know whether they generally sight it? I do not. If they made the land in the evening it would be of great use to them. *[The Witness withdrew.]*

Capt. W. H. Saunders.

5 Aug., 1856.

James Rusden, Esq., R.N., examined.

- 198. Are you the master of H. M. S. "Electra"? Yes.
- 199. Have you been on the coast of New South Wales in the ship to which you are attached? Yes, several times, and in other ships as well.
- 200. In navigating the coast of New South Wales, from Sydney to Melbourne, *vice versa*, in your opinion, to be lighted? The coast is not very dangerous, but a light on Point Perpendicular would be of great use in coming from the southward.
- 201. Have you ever approached that point so as to be able to judge of its extreme trading position? Yes.
- 202. And you think that a light there would be beneficial? Yes; any vessel coming from the south would find itself set in.
- 203. Are you aware whether any ships have been lost in that way? I have not been here at the time of any being lost, but I have always found myself set in there.
- 204. Is there any other point on that coast up to Cape Howe which you would consider necessary to be lighted? A light at the Twofold Bay would be of use.
- 205. Would it be necessary as a guiding light, or only as a local light? Both. Gabo Island is not much use as a turning light, in coming from the northward.
- 206. Would you consider that the light at Twofold Bay should be a first-class light? No.
- 207. Only one that would be available for running into the bay, and as a leading light if a vessel got close into the land? Yes.
- 208. Have you approached Cape Howe very close? Yes.
- 209. Have you had opportunities of judging of the position of the present light, and of its usefulness generally? I have been very close to it several times.
- 210. Have you found it bright? Yes, but it is too low.

J. Rusden, Esq., R.N.

5 Aug., 1856.

J. Rusden,  
Esq., R.N.  
5 Aug., 1856.

211. Would you recommend that it should be placed on a higher point of the island? Yes, or that the lighthouse should be built higher.
212. What is the height now? The Admiralty list of lights places it at 179 feet, but I do not think it is correct.
213. And you think it should be raised how much more? I think it should be raised so as to be seen at a distance of twenty miles.
214. Where would you place the lighthouse at Cape George? I consider that the light in the neighbourhood of Jervis's Bay should be erected on Crocodile Head—it being high table land, and visible over Cape George.
215. After rounding Gabo Island, and going through the straits to the westward, are there any points between Port Phillip Heads and Gabo Island which, in your opinion, are dangerous for want of being lighted? I think there ought to be another light in Bass's Straits.
216. At what point would you place that light? On the Rodondo.
217. Have you ever landed on the Rodondo? No.
218. Do you know whether it is at all accessible, or available for a light? I thought the other day, in passing, that I saw a place where one might land in moderately fine weather, when there was not much surf on.
219. If it were not practicable to place a lighthouse on the Rodondo, where would you place it? Cleft Island is the next best place; but that I think is equally inaccessible, and the Ten-foot Rock I think is worse; I have seen a sea go over it which would carry over a line-of-battle ship.
220. Have you ever considered the propriety of placing a light on the promontory itself? The promontory would be a very good place for all the coasting trade; but I doubt the possibility of placing a light there, to be serviceable to vessels coming from both east and west.
221. But you think it would not be available as a light for a great highway through the straits, either one way or the other—would it be useful if it were placed on the promontory? Certainly, it would be useful there, but it would not be the best position. There is a peculiarity about the Rodondo, which is, that I have never seen it capped, when the promontory has been capped close down to the water.
222. Have you had much opportunity of judging of the way in which the light on Kent's Group shows in ordinary weather? I have seen it an immense distance. It is a magnificent light. I have seen it as much as forty miles off.
223. Do you know whether it is frequently capped? I have never seen it obstructed once.
224. How many times have you passed it? I should think I have been near it eighteen or twenty nights in the last three years.
225. And it was always visible? Yes.
226. Are there any other points on the coast which you consider to be absolutely necessary to be lighted, for the safe navigation of these straits, either in that neighbourhood or more to the westward? Cape Schanck would be a very good coasting light; but I do not think it would be of any use to ships outward bound from England to Sydney.
227. Or to ships bound through the straits to India? Not at all.
228. In coming from the westward, you think no ship would seek to make Cape Schanck after having made Cape Otway? I am certain they would not.
229. In coming to Port Phillip Heads, would it be of any service to a ship to make the Schanck light, after passing Cape Otway? It would be of service in beating up with a north-west wind.
230. There are some slight dangers off the Schanck, are there not? They are above water.
231. You think it would be more useful as a coasting light than as a great highway light? Yes.
232. That would be for the colonial trade? Yes.
233. In ships coming from the westward, speaking now of the over-sea trade, do you think it would be preferable that the light should be placed on Point Lonsdale instead of Cape Schanck? The Schanck would be the preferable place of the two.
234. And you do not think there is any necessity for a light on Point Lonsdale? No.
235. In standing in to Port Phillip Heads any light upon Point Lonsdale would be useless as a leading light to the port, would it not, because you could not enter the harbour until you brought the lights on Shortland's Bluff in one? Yes.
236. And by that time you would be well over to the western land, would you not? Yes.
237. Taking the advantage to be derived, both for the colonial trade and for ships coming over from the westward, you think Cape Schanck is decidedly the most advantageous point on which a light could be erected? Decidedly.
238. And you see no necessity for a light on Point Lonsdale? None whatever.
239. Have you ever been to the north-west of the Otway light? Only in coming from England.
240. You have never been up either by Portland Bay or Kangaroo Island? No.
241. Have you any suggestions to make to the Board with reference to that coast? Not at all.
242. Looking at it as a navigator, would it be any advantage to the over-sea-trade to have a light any where to the west of Cape Otway? Yes; it would be a great advantage to have a light on Cape Nelson.
243. Do you prefer Cape Nelson to Cape Bridgewater? Yes; it is more projecting, and it would be also a good leading mark for Portland.
244. Do you think that ships coming from the westward would try to make the Cape Nelson light in preference to the Otway light, supposing there was a light there? I think they would.
245. Would not that throw them upon the land if they were running with the wind to the westward

westward and made the light at Cape Nelson. Is not there usually a chance of westerly gales coming round to the southward afterwards? To the south-west.

246. Would not that place a ship in an awkward position if she had sighted Cape Nelson? If she was very close in it would, no doubt.

247. You think there would be no danger of a ship being thrown upon that iron-bound coast? Only in case of her being very close in, and then a prudent man would not attempt to make it. You very frequently get thick weather in coming along the coast, and you might see the light when you would not be able to see the land, although steering for Cape Otway. I would not put a light there to steer for, but as a precaution.

248. Would not it be more likely to lead to mischief than to good? "I never think a lighthouse would lead to mischief unless there were so many of them that you did not know which was which."

249. Have you read the account given by Flinders of the way in which they made the land in the "Investigator" somewhere about Cape Nelson, and the gale went to the southward, and the ship was almost totally lost? Yes, but then he was looking out for the land.

250. Might not the same thing be more likely to occur in a merchant ship, under a large amount of canvas, than in a man-of-war with a larger compliment of hands on board than any merchant ship would carry? I cannot say.

251. You do not consider that the light should be steered for? No.

252. You do not consider a light there absolutely necessary? No, except for the Portland trade, and the coasting steamers to Adelaide.

253. That is not for the over-sea trade? Yes.

254. It might be an advantage, but there is no absolute necessity for it? Exactly.

255. Have you been as far as Cape Northumberland? Never.

256. Were you one of the officers who made a report to the Government relative to the erection of a lighthouse on King's Island? Yes.

257. Was that report unanimously agreed to by the officers signing it? Yes.

258. Then you entirely agree with what is stated there? Yes.

259. When you went down on that investigation did you land at Harbinger Rocks? No; they are scarcely above water—the sea breaks constantly over them.

260. Then it would be out of the question to put a lighthouse on them? Yes.

261. In this report you say: "No objection can be urged to the elevated position we assign to the light, from the possibility of its being obscured temporarily by a land mist. During our survey this question was made one of special observation, with the wind scarce any two days from one quarter, yet the highest elevation was never once obscured by fogs." What opportunity had you of judging of the nature of the atmosphere at King's Island? We were there for about twenty days.

262. Was there any rain while you were there? Yes, we had two or three very rainy days, and the wind blowing from all quarters.

263. Do you think the fact of a lighthouse being at King's Island would have a tendency to make ships border upon it more than is desirable? I think it would enable them to keep off the northern shore knowing there was another lighthouse south of Cape Otway. Cape Otway and King's Island are very nearly fifty miles apart. A man might go twenty-five miles farther south, knowing he was safe from the northern land, and he might sight King's Island instead of Cape Otway.

264. Is not that the course a man would take almost under present circumstances of steering for the middle of the straits, conceiving that twenty-five miles would enable him to see the Otway light? No; he would not see the Otway light twenty-five miles in dirty weather.

265. What is the greatest distance you have seen it? From twenty to twenty-four miles in fine weather.

266. Did you land at the New Year Islands? Yes, and went all over them. That report to the Government was drawn up after a great deal of consideration, and after living at King's Island and the New Year Islands for several days.

267. You think there would be no danger to shipping coming from the westward if this light were established there? Most decidedly not.

268. In working out of the straits, would not a light there be a greater advantage than in running in? It would perhaps be more serviceable in working to the westward than in coming from the west; but the number of vessels that work through is so small that it is not an important consideration.

269. You think there would be no fear of a vessel in thick weather, knowing that a light existed on King's Island, being brought into close proximity to the Harbinger Rocks before she was aware of her danger? I do not think she would be in any danger if she knew there was a light on King's Island.

270. Do you think, under any circumstances, that light would be seen outside the Harbinger Rocks in an ordinary gale of wind, misty, and with squalls—the usual style of weather we have when the wind blows strong from the west. Do you think a vessel would be safe in approaching King's Island, with a chance of seeing the light before she got upon the Harbingers? I think quite safe. The Harbingers are within a radius of five miles of King's Island, and a vessel would be sure to see the light within five miles.

271. From your report, it appears that you consider that the lighthouse should be elevated about 100 feet above the land on which it stands? Yes, that it should stand about 400 feet above the level of the sea. The land itself is 312 feet.

272. You have no hesitation in abiding by the report which you gave to the Government last year? Not the least.

273. Have you at all considered the positions in which vessels have been wrecked on King's Island, in regard to the advantage they would have gained if a light had been in existence there? We state in our report that we are confident they would not have been lost, especially the "Whistler," if there had been a light there.

J. Borden,  
Capt., R.N.  
5 Aug. 1856.

J. Rusden,  
Esq., R.N.

5 Aug., 1856.

274. You made yourselves acquainted with the positions of those wrecks when you were on the island? Yes; we saw the remains of some of them, and I am certain the "Whistler" would have been saved if there had been a light there.
275. Were those vessels wrecked in coming from the westward? The "Whistler" was bound to the westward, and the "Elizabeth" had been down to the "Whistler" to save her stores, &c.
276. You think a light would have saved those vessels? The "Whistler" was lost in the night, and I am certain a light on Cape Wickham would have saved her; the "Elizabeth" ran upon a rock in the daytime, and was then run on shore to keep her from sinking.
277. Have you ever heard it stated that there is a set to the southward from Cape Otway to King's Island? I have found a strong set round the north side of the island to the southward from the Navarino Rock, between the Harbingers.
278. You heard the opinion expressed by the last witness as to the danger which he but anticipated would exist from vessels bordering upon the island if a light existed there? Yes; he took an extreme view of the case, that because a light was there everybody must steer for it.
279. But you think that would not be the case? I do not think that would be the case.
280. As master of one of Her Majesty's ships, would you, in running for the straits, consider yourself justified, from what you know of the navigation, in running to make this light? If I knew there was a light on King's Island I should run for the middle of the straits, instead of running for Cape Otway, with the chance of seeing both lights, being certain to see one.
281. What distance do you usually keep off the north coast in wishing to make the Otway light, in coming from the westward? I have been that road so seldom I can hardly answer that question.
282. You agree with the views taken by the Chambers of Commerce of the chief Australian Colonies, in thinking that it would be advisable to have this light established? I think it would be a very great benefit indeed.
283. No ship would use the channel to the southward of King's Island, you think? I have never been down there.
284. Do you consider that the light on King's Island should be a first-class light? Yes; a light that could be seen twenty-five miles off.
285. Have you been through Banks's Straits? Three times.
286. Do you consider the lights are very well placed there? Yes; the straits are very well lit.
287. In going round the south end of Van Diemen's Land does it appear to you that any additional light is required beyond the light on Cape Brunie? Tasman's Island would be the best site for an additional lighthouse, because it would be available for vessels coming from either way, and I think it would be of use to large ships from the westward, going round Van Diemen's Land to Sydney.
288. If you were navigating a vessel round Van Diemen's Land, would you consider it advisable to make Tasmania at all? I would make the eastern part of it, in preference to standing clear of the land, and making the coast of New South Wales.
289. And, therefore, a light there would be of advantage? Yes.
290. You think Tasman's Island would be the most eligible situation on the east coast for a light? Yes.
291. Have you heard of any inconvenience having been experienced from the want of a light on Tasman's Island? No, I never heard it mentioned.
292. Are you aware of any particular inconvenience having arisen from the want of a light in any of the situations you have spoken of? I have felt great inconvenience myself when near Wilson's Promontory for want of a light.
293. Do you know whether that has been experienced by others? I have had very little conversation on the subject, but speak from my own experience.
294. Do you think a light there would be more important than at King's Island? They are both important in their way, one for the coasting trade, and the other for the over-sea trade.
295. If one lighthouse only were to be erected, which would you recommend to be carried out? Wilson's Promontory.
296. And next to that King's Island? Yes.
297. And next to that? Cape Schanck. I think a lighthouse on King's Island would render the necessity for a light on Cape Nelson less.
298. And you think Cape Nelson and Cape George might come afterwards. Yes.
299. Do you think it might be safe to dispense with a light at Cape Nelson if there were a light at King's Island? Yes. You might put a small light there for the benefit of Portland.
300. Have you any other suggestions to offer to the Board on the subject which they have under consideration? I would suggest that the lights both at King's Island and Wilson's Promontory should be set about immediately, and also that an iron beacon should be immediately placed on the Crocodile Rock.
301. How high does the Rodondo Rock stand? 1130 feet it is marked in the chart. [*The Witness withdrew.*]

Captain William Morris, R.N., examined:—

Captain W.  
Morris, R.N.

5 Aug., 1856.

302. You are Captain of H. M. S. "Electra"? Yes.
303. You have been some time upon this coast? Three years and a half.
304. And have you passed frequently between Sydney and Melbourne? Yes, and I have been to Hobart Town once; and we have been cruising in Bass's Straits also during that time.
305. You have, therefore, had ample opportunity of judging of the dangers which exist in the navigation of the straits, and the mode in which those dangers are pointed out by lighthouses? Yes.

306. In navigating from Sydney Heads to Cape Howe, have you experienced any difficulty either in coming to the southward or going from the southward between those two points from the want of any lighthouse? None whatever. I think the lighthouse on Gabo Island is ample between Cape Howe and Sydney Heads: that is, in my opinion, the only light <sup>Captain W. Morris, R.N.</sup> required. 5 Aug., 1856.
307. Have you never seen the necessity for having a light upon Cape George, at the southern part of Jervis's Bay? Not for a vessel like the "Electra;" we give the shore a wide berth. It might be useful for a small coaster. I have never felt any want of a light there.
308. You conceive a large vessel coming out from England with passengers and goods would not necessarily approach the coast near enough for a light there to be of use. It is not absolutely necessary, I think.
309. In steering to the westward through Bass's Straits, after passing Gabo Island, are there any points in the navigation along that part of the coast, between that and Port Phillip Heads, that appear to you to require lighting? The long beach has not been surveyed; it is an unknown coast, and you must keep a great way off.
310. That is the Ninety-mile Beach. Yes. Kent's Group is a beautiful light; it is clear and distinct, and I would always in coming in at night run for Kent's Group. I do not see any very urgent necessity at all for a light either on Wilson's Promontory or the Rodondo. A light there would be an advantage to steamers coming along shore, but I do not think it would be any object to a prudent navigator with a large ship. A light at the Rodondo would be of great advantage to coasting vessels at night. When I have passed the Rodondo close I have always seen it very rough, and I should think that it is very difficult to get access to it.
311. Then in your opinion the Rodondo would be an impracticable spot to put a lighthouse on? Yes, without enormous expense and great difficulty.
312. Have you ever passed between the Rodondo and the promontory? No.
313. Then you have had no opportunity of judging of the nature of Wilson's Promontory? No.
314. Have you ever had an opportunity of seeing what they call Cleft Island? No; we have always given it a wide berth.
315. Having made Kent's Group, do you think that any other lights would be requisite than those which now exist on Shortland's Bluff to enable you to make Port Phillip Heads accurately? I think a light at Cape Schanck would be most desirable.
316. Does your observation apply to vessels coming both ways? I am speaking more with reference to vessels coming from the eastward to Port Phillip.
317. A light at Cape Schanck would be of no use to vessels beating out through the straits? No; it would be merely as a guide in coming to Port Phillip. When they made Cape Schanck light they would know their position, and would be able to make the harbour. I think it would be perfectly useless to have a light on Point Lonsdale.
318. In coming from the westward, do you think the Schanck light would be of any use to a vessel coming to Port Phillip? Not unless she ran to make it. It would be running out of her way, and she would be running too far to leeward; she would have seen the Otway light and King's Island light supposing there was one there. I think the Schanck light would be useful to any vessel beating about the straits, and trying to make Port Phillip harbour.
319. A vessel with a leading wind from Cape Otway would not think of sighting it? No, unless she ran out of her course in the night, and then the captain would know where he was by the light.
320. Would he not be in a very good position for entering Port Phillip Heads, and yet be in sight of the light as a cross bearing? Yes; you would see the Schanck light from the entrance of the harbour, or even from the westward of the harbour.
321. For a vessel bound to the eastward, not intending to enter Port Phillip Heads, the Schanck light would be of no use? No.
322. You think the promontory light would be an unnecessary expense excepting for coasters? Yes.
323. Which do you think would be most useful point for a light for the inter-colonial trade, Cape Schanck or the promontory? I think Cape Schanck generally for large ships as well as small. Cape Schanck light would be of the greatest possible benefit to this port.
324. You cruised about a good deal in that neighbourhood, did not you? Yes, a good deal, looking for missing ships. I have had many anxious nights, when I think a Schanck light would have given me certainty of safety, and have been a great guide to me.
325. Do you see any necessity for a light being placed on Point Lonsdale? None whatever: You can do nothing until you open the other lights, and a number of lights would only create confusion.
326. Have you ever been to the westward of Cape Otway on the coast at all? We made the land about Cape Nelson in coming out. I should myself think that Cape Northumberland would be the most desirable point, if a light were erected upon that coast.
327. Do you think that it would be at all desirable to have a light upon Cape Nelson, or would it not be likely to lead a ship into danger? I think Cape Northumberland would be better.
328. You have been cruising in the neighbourhood of King's Island? I have been a great deal there.
329. Have you sighted the land very frequently there in all weathers? Yes; I have been anchored there two or three times.
330. Have you observed whether the island is frequently obscured by haze, or whether it is usually clear? It has been usually clear when I have had opportunities of noticing.
331. Your observation has been from the ship? Yes. I have not seen it clouded.
332. In your cruises have you sighted the Harbinger Reefs? Yes; I have gone between them and the island two or three times.

- Captain W. Morris, R.N. 333. Do you think it at all practicable that a lighthouse could be erected on the Harbinger Rocks? Quite impracticable. There has been a good deal said about the position of a light at King's Island, and I have read Captain Ross' and Mr. Rusden's report, and I highly approve of the position which is pointed out in that report.
- 5 Aug., 1856. 334. What is your opinion as to the advisability or not of putting a light there at all? I think it most necessary, for the sake of humanity as well as for the protection of property.
335. You think a light there would not necessarily lead a ship into danger? I think it would prevent her being led into danger.
336. You know that it is contrary to all principles of facilitating navigation to light inside a reef, which this would be doing? The distance could be calculated so as to avoid that reef.
337. Do you think the light would be observable in any weather at a sufficient distance to prevent a vessel from getting on the reefs? I have no doubt in my own mind that it would be; and seeing the light they would know exactly where the reefs were, and it would be a guide to them to keep clear of them.
338. Have you seen the position of the New Year Islands? I have.
339. Are you of opinion that it would be desirable to put a light there? It would not show at all to a vessel coming from the eastward.
340. It has been given as the opinion of the master of one of the steamers that has been trading a good deal between Sydney and Melbourne, and also to Adelaide and other places, that a light on King's Island would be a disadvantage, and would be likely to lead vessels more into mischief than out of mischief—you do not agree with that opinion? I do not. To any prudent navigator it would be most useful, as it would point out the position of the Harbinger Rocks, and thereby give an opportunity of keeping well clear of them. The light on King's Island would be seen fifteen or twenty miles off, and never less than ten; and even if you were thrown close into the coast, you could run between the light and the Harbinger Rocks, if the light was there.
341. That is a passage you have taken in the "Electra"? Yes, in the daytime; not at night.
342. Do the Harbinger Rocks appear to you to be very formidable reefs? They are very easily seen, and the surf breaks very heavily there, even in very fine weather.
343. Have you had an opportunity of ascertaining whether any of the vessels which have been recently lost would have been, in all probability, saved from wreck if there had been a light on King's Island at the time, judging from the position they occupy on the beach? I do think that some of those vessels which were wrecked there would have been saved if there had been a light there, with the exception of those vessels which may have been wrecked in consequence of the crew being drunk and the ship not properly attended to. I think if there had been a light there, and the vessels had been carefully attended to, they would have been saved.
344. Do you think that the light ought to have any particular distinguishing feature, or should it be merely a simple fixed light of a high power? I think it would be better to be a light different from Cape Otway.
345. You have been also to Van Diemen's Land, have you not? Yes.
346. Have you passed through Banks's Straits? Yes, I have passed through them three times.
347. Is that highway sufficiently lighted? Yes. I think that the lights at Goose Island and Swan Island are very well placed and well lighted.
348. If one additional lighthouse only were to be erected, which should you suggest should be erected first? First, King's Island; and then, next, Cape Schanck. I think King's Island is the most important.
349. Have you ever considered whether there would be any necessity for a light on the southern part of Tasmania? I do not consider myself competent to give an opinion, not knowing enough of that coast.
350. Have you any further suggestions to make affecting the question under the consideration of this Commission? I would suggest that no time should be lost in getting a light on King's Island, and next to that, on Cape Schanck. I consider that those are the two most important, and I think they ought to be commenced as soon as possible, for the benefit of trade as well as for the safety of life and the prevention of wrecks.
351. Is the current in Bass's Straits, according to your experience, local with regard to the wind, or does it set in any particular direction constantly? I am not at present prepared to say, without referring to the log. I have found different currents, but never had a proper opportunity of testing them. [*The Witness withdrew.*]
- Adjourned to to-morrow, at ten o'clock.

WEDNESDAY, 6 AUGUST, 1856.

**Present:—**

MR. CHAMP IN THE CHAIR.

MR. BROWNE,

CAPTAIN KAY, R.N.

Arthur Devlin, Esq., examined:—

- A. Devlin, Esq. 352. Have you followed the occupation of master mariner for a great number of years? Yes.
353. Have you commanded vessels out of the Port of Sydney and the adjacent Colonies? Yes, for about seventeen years.
- 6 Aug., 1856. 354. At present you are engaged in mercantile operations? I am at present, and have been for the last five years.
355. What trade have you been principally employed in? The inter-colonial trade principally, and I have been to China and India occasionally, and the west coast of America and to the Mauritius. 356.

356. Would you specify the Colonies to which you have traded? South Australia, Van Diemen's Land, New Zealand, Port Phillip, Sydney and Moreton Bay.
357. Then you have had good opportunities of ascertaining the nature of the navigation of both the coasts of Australia and Bass's Straits? I have so.
358. Have you ever traded to the northward of Sydney? I have traded to the northward, to Moreton Bay occasionally, and through Torres Straits.
359. In trading to the northward of Sydney have you found any deficiency in the coast, or any part that required, in your opinion, to be lighted between Sydney and Moreton Bay. Are you aware that a light is now being erected at Moreton Island? Yes; that is necessary.
360. Is there any other point on which you think a light should be erected? Point Stephens, perhaps.
361. Would not that be for a harbour light? Yes. I do not see any actual necessity for it unless for a beacon for the harbour.
362. For vessels proceeding through Torres Straits do you think any other light besides that at Moreton Bay should be erected between Sydney and Moreton Bay? Certainly not.
363. That would be a sufficient light to enable a vessel to take her departure to Torres Straits? Yes, if she had a wish to sight that part of the coast, which I do not think would be necessary.
364. In trading to the southward of Sydney have you found any portion of the coast between Sydney and Cape Howe which, in your opinion, requires to be lighted? Cape St. George would be the only point I should care about lighting.
365. That you are of opinion should be lighted? I think so.
366. Have you ever found yourself embayed on that part of the coast? I have, sometimes.
367. On which point would you consider it advisable to place a light? I should place a light on Cape George, on the southern promontory.
368. Do you think that would be seen by vessels coming from the northward? Yes, it would be seen over the land by vessels in the vicinity of Shoalhaven.
369. With the exception of Cape George is there any other point between that and the Howe which you would consider should be lighted? I do not see any need for it.
370. You think that Point Perpendicular is not too high to prevent a vessel seeing a light on Cape George? Certainly not, if the lighthouse is erected the ordinary height; the land thereabouts is some thirty or fifty feet higher than Point Perpendicular. It seems, in my opinion, necessary to erect a light on Cape George. In shaping a course from Montague Island, I have found it necessary to shape it a point outside the proper one to counteract the indraught. On several occasions I have found my vessel set in a point.
371. Are you aware that some vessels have been lost through that? I may mention the "Hive" and two or three others which were lost in Wreck Bay for want of a light.
372. You think the indentation shewn on the chart is not so great as the tend of the land? No, the chart is not accurate, the indent is greater.
373. You think if a good lighthouse were erected on Cape George the navigation from Cape Howe to Sydney would be very much improved? Yes, and the lights would be abundant.
374. Have you been in command of a vessel since the Gabo Island light has been in existence? No.
375. Do you approve of the position of it? I think it is in an excellent position.
376. In proceeding from Gabo Island, making Bass's Straits from the eastward, where would next be desirable to improve the navigation in the way of lights? Wilson's Promontory, which would show ships from either the eastward or the westward their position.
377. It has been suggested in evidence that a powerful light on Wilson's Promontory might have a tendency to put a ship in such a position as to hamper her on the Ninety-mile Beach when coming from the south-east; do you think that would be likely to be the case? There is more in imagination as to the Ninety-mile Beach than in real danger, I think.
378. If vessels were to look for a light on Kent's Group it has been supposed that it would be safer than if they looked for a light on the promontory? That might be the case.
379. But still you think a light would be beneficial generally? A light would be better, if possible, on the Rodondo.
380. Have you ever landed on the Rodondo? No. I have passed very close to it, and it seemed to be one of those places which it was almost impossible to climb up by any chance.
381. Stokes in his chart places the Rodondo 1,130 feet high, would not that be an insuperable objection to the erection of a lighthouse there? It would.
382. Are you acquainted with the peculiarities of the Ten-foot Rock? I have never landed on it, but I fancy there would not be base enough for a lighthouse there, and a lighthouse would have to be some five or six hundred feet high to show it over the Glennies.
383. You consider a light in the neighbourhood of Wilson's Promontory, wherever it would be most practicable to erect it, would be of great advantage? Yes, very great indeed.
384. In coasting vessels or traders working round from Sydney to Melbourne, which course do they usually take in passing the promontory; do they pass between the Rodondo and the main land, or do they keep to the southward of the Rodondo? They invariably pass between the Rodondo and the mainland.
385. Is that considered the safest passage? Yes; they more particularly shape that course to avoid the Crocodile.
386. Is there any other place further on towards Port Phillip which, in your opinion, ought to be lighted as well as the promontory? If I had money I would light both Cape Schanck and Point Lonsdale. My reasons for that would be, that ships running down from the westward or coming from the southward—the land is very low from Cape Schanck to the White Point—or from Cape Patton to Cape Schanck, and in the night it is very difficult to observe it, and it would be very desirable to have a light on Cape Schanck and another at Point Lonsdale.

A. Devlin,  
Esq.

6 Aug., 1856.

- A. Davlin,  
189.
- 6 Aug. 1856.
387. A vessel standing in for Port Phillip Heads would then be able to ascertain her position by the cross bearings? Yes.
388. Of the two lights, if it were decided only to have one, which point would you think most desirable to be lighted? I would light Cape Schanck, because the present lights on Shortland's Bluff would still give a cross bearing, but it would be very desirable to have a light on Point Lonsdale, for the "Sacramento" no doubt was lost there through the shore being so very low. The state of the weather at times is such that you really cannot see Point Lonsdale.
389. Would it not occasion confusion to mariners to have lights upon Point Lonsdale and Shortland's Bluff also? Not if the lights were properly distinguished.
390. You are aware that there are two lights now on Shortland's Bluff, do not you think the erection of another light would be likely to mislead? It might for a time—it would be only for a time: a ship to the west-south-west of the entrance to Port Phillip Bay would not be able to see the Shortland's Bluff light; the light would be shut in; she would have to stand out more to the eastward before she would open the light, and I have no doubt that was the cause of the loss of the "Sacramento," which was lost on Point Lonsdale.
391. Of the two you decidedly give the preference to Cape Schanck? Most decidedly, because ships in the ordinary way would pick up that light and get their cross bearings with the Shortland's Bluff lights.
392. Would not vessels coming from the westward, not coming to the harbour of Port Phillip, after having passed the Otway, find an advantage in sighting the Schanck light, which would give them a good departure for the promontory—that is, having passed the Otway light, the Cape Schanck light would be a sufficient advantage as a headland light for vessels passing through from the westward? It would be of service, but not at all times, because if they did not pick up Cape Otway they would hardly pick up Cape Schanck light.
393. Was the lighthouse on Kent's Group in existence when you commanded a ship? It was.
394. Do you consider that an available position for vessels coming in to the straits from the eastward? I do; it is rather high, but of course that is necessary.
395. Is it not necessary to have it high, to be seen from all points of the compass? It is quite necessary that it should be so. It is a very good light. Occasionally it is enveloped in mist and fog, but that would be the case with any light.
396. Vessels coming from the eastward can make that light without any fear of consequences? Most decidedly.
397. Have you ever traded to South Australia from here? Yes, for some years.
398. What may be your impression of the lighting of that coast after passing Cape Otway? I should say Cape Northumberland would be the best point to light.
399. Would that be extremely useful to the Adelaide trade? Yes.
400. Some gentlemen we have examined have expressed an opinion that Cape Nelson would be a good position for a first-class light, or Cape Bridgewater? It would be very desirable to have a light there no doubt.
401. Do you think that a light on Cape Nelson would be a light that a vessel coming from the westward would be inclined to make, seeing that they have also a good light on Cape Otway? No; I would not do it; I do not think it desirable. A ship going in to make that light would run out of her parallel; no prudent mariner would attempt to make that light while a light exists at Cape Otway. There's a great deal of heavy swell, and with the wind at south-west of course it would be the height of imprudence to run to the northward, and with the wind from the north-west it would be a fair wind to run down to the Otway.
402. Then you think Cape Northumberland would be the only point on that coast at which it would be necessary to place a leading light? Yes; that would be the point of departure for ships from Adelaide shaping their course in coming to Port Phillip or through the straits.
403. Have you ever had an opportunity of making King's Island on your passages at any time? Many times. I have anchored frequently on the east side of it, and have been beating about all parts of it.
404. The east side of it is Seal Elephants Bay? Yes.
405. Have you had an opportunity of making the land in all weathers? I may say in all weathers. I have circumnavigated it as much as three or four times in one voyage trying to get to South Australia.
406. There is an impression abroad that a light, if erected on that island, would, from the frequent hazy state of the weather in the vicinity of it, be to a certain extent valueless, and liable to lead a vessel into danger instead of out of danger,—what is your opinion as to that? No prudent mariner would go there from choice, but ships are frequently, in running down from the westward, much further to the southward than they expect. They may not have had observations for a few days previously. In my own case on three occasions I found myself south of the New Year Islands when I considered myself some twelve or fifteen miles off Cape Otway; and on one occasion I should have been wrecked but for having a very smart man-of-war brig under me I was enabled to carry a press of sail and get her off the coast. There was a sandy beach which showed me that I was off King's Island, close on a lee shore.
407. In either of those cases would a light upon the northern point of King's Island have given you any warning of your position? I would erect a light upon the New Year Islands if at all, from the fact of its being the extreme western land and to the westward of all dangers.
408. How would a light upon the New Year Islands apply to a vessel running in gale of wind and making the light on that island,—would she not then be in a difficult position to enable her to pass the Harbingers on the north part of the island if a vessel were to make the New Year Islands? She would have the wind quarterly at north-east.
409. Then your idea is that the New Year Islands would be a better position for a light than the northern extremity of King's Island? Yes, for warning ships. One of my reasons for having

- having a light on the New Year Islands would be this, that a ship so far to the southward of her position embayed would see a light, whereas she would be prohibited from seeing a light on the north of King's Island. A. Devlin,  
Esq.
410. It has been given in evidence that a light on the northern point of King's Island could be seen over the New Year Islands, unless you were very close in to the shore? That is quite true; but ships, unfortunately, get close in very frequently. Aug., 1856.
411. What is your opinion as to any light being there at all—do you think that for prudent navigation it would be better to leave the light on Cape Otway, lighting the northern side of the straits, and leaving the southern side unlighted? I certainly would have a light on the New Year Islands, to show danger.
412. You think it would be desirable to light the southern entrance to the straits? Yes, to shew danger. Ships would never border on that coast unless they were driven there. No ships would make that part of the coast from choice, I am quite certain of that.
413. Then you think a light would not be calculated to lead a ship into danger by inducing her to hang to the southward for the purpose of making the light, and thereby being in a position where she might get on the Harbinger Reef, but you think on the contrary that it would warn vessels of their danger when they were there under circumstances which they could not control? That is my opinion.
414. If it should be decided that only one light should be erected of all the lights you have pointed out as being necessary, which light would be the first you would consider it the duty of the Government to erect? I would erect one in the first instance on Cape Northumberland.
415. Are you speaking now merely with reference to vessels coming from the westward, or taking the inter-colonial trade into consideration? More particularly for the inter-colonial trade, but ships coming from the westward would occasionally get down into that position.
416. What use would a light at Cape Northumberland be to vessels going between Sydney and Melbourne? I was speaking as to the trade to Adelaide.
417. The question was generally, which lighthouse of all you have described as being necessary to be erected, would be the most necessary for the interests of the general trade of the colonies? I would have one on Cape Schanck, because the great trade is to Port Phillip at present, and it is necessary to show ships in there beyond all other places, seeing that the great trade is there at present.
418. The light on Cape Schanck would be equally serviceable to the trade from Van Diemen's Land, New South Wales, and South Australia? Yes, from all parts.
419. Then you think that that is the first lighthouse that ought to be erected, and that that ought to take precedence of Wilson's Promontory and King's Island? Most decidedly, for it would be useful for all ships coming to Port Phillip from all parts of the world.
420. Would it be of any use to vessels bound from the westward to New South Wales? It would while running down in the parallel of Cape Otway, about 39°. Ships from England having picked up Cape Otway light would have an excellent departure, but occasionally they get very strong north-easterly and south-easterly winds which are very baffling, and then a light on Cape Schanck would be of great use.
421. Next to that, which do you think it would be most advisable to erect? I think the Cape Northumberland light.
422. In preference to Wilson's Promontory? It is only for the steamers, and in very thick weather, that a light at Wilson's Promontory is necessary.
423. You think the promontory light would be more useful for steamers than for any other class of vessels? Yes; and there is the less danger for steamers, from the fact of their being able to go away in a moment. The large ships do not go down there; they shape their course in the fair way just outside Sir Roger Curtis's Island, and by Kent's Group.
424. In the present day is there not likely to be a very large and continued increasing inter-colonial trade by steam, which the light on the promontory would much facilitate? A light there is very desirable.
425. Where speed is an object would not a leading light of that kind be a considerable advantage? Doubtless it would be desirable, but it is not absolutely necessary.
426. And you think the King's Island light is a matter which may stand over for a time? I think so. We always avoid King's Island for fear of accident. A ship beating about in very fine weather would border over, and very probably sight the island, but ships running with a leading fair wind pass within fifteen or twenty miles of Cape Otway.
427. Have you ever been through Banks's Straits since the lights have been there? Yes.
428. There is a light on Goose Island and a light on Swan Island; are those lights quite sufficient in your opinion? It always occurred to me that they were very good lights indeed. I think I have passed through three times since they have been erected.
429. Do you know the south coast of Van Diemen's Land? I know it, but I have not coasted there much about. I have passed to the southward, making the voyage from Hobart Town to South Australia.
430. Which way did you go round? Round Somer's Cape.
431. Then you have seen the light on Bruné Island? Yes.
432. Is that the general way? No; I had rather a large ship, and I preferred that way. I wanted to avoid Banks's Straits.
433. Then you are hardly in a position to give any opinion as to any additional lights being required on the south coast of Tasmania? No, I have not been a sufficient coaster thereabouts and the south coast, to say.
434. Have you any further suggestions to offer to the Commission with reference to the subject under consideration by them? I think not.
435. You stated in a former part of your evidence that you were distinctly of opinion that a light on Point Lonsdale would be very useful? Yes; I think a ship to the west-south-west of the light would shut in the present light.

- A. Devlin,  
Esq.
- 6 Aug., 1856.
436. A light there would not be of any service to the trade coming from the eastward, because it would be hidden by Cape Schanck? It is not necessary for ships coming from the eastward, or from Van Diemen's Land.
437. Then a light there would merely be a harbour light to guide ships into the harbour? In a gale of wind it would indicate the low shore there is there; and it would be a very cross bearing for ships making the harbour, but it is not absolutely necessary, in my opinion.
438. Supposing it were decided that only one light should be put up, you give the preference to Cape Schanck? Most decidedly.
439. You consider that a light on Cape Schanck is almost indispensably necessary? I think so, most decidedly.
440. And that is the only light that you consider to be really indispensably necessary for the general inter-colonial trade? I think Cape Schanck, number one, and Cape Northumberland, number two.
441. Cape Schank would be advantageous for vessels coming from England, China, and from South Australia? Yes.
442. A light on Cape Northumberland would only be valuable for the trade of South Australia and Port Phillip? Exactly.
443. You would not look upon that as a high road light? No; it is a matter for South Australia and Port Phillip.
444. Would you consider Wilson's Promontory as a highway light? It would be well to have a light there, but it is only for steamers and small ships which really know the coast well—large ships in running through invariably bear more out to sea and take Kent's Group light, and if a light were at the promontory I do not think they would use it.
445. A light there would be of no use to vessels coming from Van Diemen's Land? It would be of use, because it would show ships their position, and they may have shot very much further to the northward than they expect, in thick weather.
446. How far is the light on Kent's Group visible? I have seen it forty-eight miles. It is quite fresh in my memory that I took the cross bearings of the Rodondo and the Kent's Group light, and I was forty-eight miles from the light on Kent's Group. That was in very fine weather.
447. Taking it somewhere about Curtis's Island? I have no doubt in very clear weather it might be seen from Wilson's Promontory.
448. You do not consider a light at Wilson's Promontory to be indispensably necessary? I do not.
449. Vessels coming at present from the westward generally keep this shore for the purpose of making the Otway light, do not they? Yes.
450. And you do not think it necessary that there should be a light on King's Island? I do not think it absolutely necessary; it would be desirable.
451. You do not think it indispensably necessary? I scarcely would say that. I should like a light on the New Year Islands to warn ships of danger.
452. Then do you think it desirable? I would have a light on the New Year Islands.
453. You think that would be the most preferable site? Yes, to the westward of all the dangers. Supposing a ship ran down and got the light to bear north of her, she would be able to clear the land, and it would show her position; or supposing she was running down and saw the light suddenly three miles off, she would be able to clear the Harbingers.
454. No vessel would go into that position intentionally to make the light? Certainly not; they would always try to make Cape Otway. All prudent mariners would keep clear of King's Island.
455. Would a ship in thick weather, that found herself very close to the north point of King's Island, be able to see a light on the New Year Islands? Oh yes.
456. It is seven miles? Yes.
457. A ship in that case might very easily be in a very awkward position with respect to the Harbinger Rocks and yet not be able to see a light on the New Year Islands? A ship running down between the Harbingers and the New Year Islands would see the New Year Islands light, and getting a bearing she would be able to get clear of the Harbingers.
458. A ship running with a gale at north-west would not have a chance to haul up north-east? Having a light there in an extreme case—supposing the case of a ship being there with a north-west wind—as a last resource she might run under the lee of the New Year Islands and anchor, and so be saved.
459. Have you ever anchored in the Franklin Roads? No; I have not anchored there.
460. The only object in your opinion for a light on King's Island or the New Year Islands is with a view to assist a ship into a safe anchorage, and warning her if she happens by chance to get down to the southward out of her course? Yes.
461. As a warning light for the straits you think it would be of no use? Certainly not. A ship on the south-west side of King's Island would be able to see a light on the New Year Islands, but she would not be able to see a light on the northern extremity of King's Island. I wish it to be understood that a light on the New Year Islands I would only have to warn ships of dangers, not for ships to run for; it is always a dangerous part for ships to run to.
462. You think a light on King's Island might be advantageous in saving a ship by enabling her to get into safety or haul off the land? Yes.
463. Do you think there is a set to the southward in that part of the straits? Yes, for the last eighty or ninety miles there is. The ebb and flow of the tide in the straits is about north-east and south-west.
464. You think a light on the upper end of King's Island might lead a vessel into danger? Yes; because you may not see it more than three or four miles, and then you would be in the midst of danger, but if you saw a light on the New Year Islands three or four miles off you would avoid the danger.
465. A light on King's Island is not required then for the navigation of the straits? It would not be actually necessary.
- 466.

466. At present vessels generally keep to the northward, with a view of picking up Cape Otway light? Yes. A. Devlin,  
Esq.
467. If a light were placed any where on King's Island, might not vessels be induced to calculate upon seeing that light and keep further to the southward than they do at present? In fine weather they might. 6 Aug., 1856.
468. Then do you not think that a light on the north end of King's Island would really be dangerous, as vessels might get so far down as not to see the light? I have always thought it would be dangerous.
469. But that danger would not arise if the light were on the New Year Islands? It would not be so dangerous. I have always considered it would be dangerous to have a light on the north end of King's Island. If there is to be a light erected I would erect it on the New Year Islands. A light on the New Year Islands would have saved most of the vessels that have been lost.
470. You are clearly of opinion, on the whole, that if there is to be a light there at all the New Year Islands is the best place for it? Most decidedly.
471. Then you think on the whole it would be more desirable that there should be a light on the New Year Islands, and that it would be beneficial rather than injurious to the general navigation? Yes, I think it would. The advantage of a light on the New Year Islands would be to give a ship earlier warning of her having King's Island under her lee, and consequently giving her more time to get off. [*The witness withdrew.*]

Mr. Hugh Macmeiken examined:—

472. What is your occupation at present? I am living on shore at present. I have been at sea a good many years. Mr. H.  
Macmeiken.
473. Have you been engaged in the inter-colonial trade? I have been backwards and forwards home several times, and commanded the "Havilah." 6 Aug., 1856.
474. Are you familiar with the coast between Cape Howe and Port Jackson Heads? I have been betwixt Port Phillip and Sydney several times.
475. Do you think anything is wanted besides the Gabo Island light between Port Phillip and Sydney Heads? I have generally been going in a large vessel, and have kept pretty clear of the land. I would rather not express an opinion upon that point. My experience of the eastern coast is not sufficient to justify me in offering an opinion upon the matter.
476. Your information is principally confined to the navigation of the straits? Yes.
477. In coming from the eastward, on entering the straits are there any points which appear to you necessary to be lighted, coming either from Tasmania, New Zealand, or New South Wales? For steamers, I should say a light on Wilson's Promontory would be very necessary, but for sailing vessels I think the light on Kent's Group is sufficient.
478. What distance have you seen the Kent's Group light? I should say from thirty to forty miles off.
479. Then any prudent mariner entering Bass's Straits from the eastward would try to make the Kent's Group light, and go through that passage? Yes.
480. Even if there were a light on Wilson's Promontory, do you think a prudent mariner would be inclined to hug the promontory? Even if he did, I think he would see the Kent's Group light, unless he was too close to the promontory.
481. Coming in the opposite direction from the westward—does the same rule apply as to the advantage of the Kent's Group light over any other for large ships? If there was a light on Wilson's Promontory you would see that first.
482. But do you think that absolutely necessary? It is bold land off there—you would generally see it going along the coast. I think a light on the Schanck would be desirable for vessels coming both from the eastward and the westward. Then a vessel coming from the westward, if there were a light upon the Schanck, would come more to the eastward, and be sure of making one of the lights, and get a cross bearing of the Schanck before she bore in for the Shortland's Bluff lights; whereas, now, if you keep a little too far in you shut in the present light at the heads entirely.
483. That is if you stand too much to the northward? Yes, if you are a very little inside your course you would shut out the light.
484. Then you think the Schanck light would be an important light, both for vessels from the eastward and the westward? Yes.
485. And whether coming from Van Diemen's Land, New South Wales, or South Australia? Yes, I think it would.
486. Would it be of any use as a great highway light to vessels coming from the westward, bound through the straits to New South Wales or Launceston? Supposing a vessel had got into the straits with a heavy southerly gale, they might be driven to leeward, and then this light would be a good turning light. And another thing is, if they found they had no chance of weathering the gale they might run for Port Phillip Heads, and it would even guide vessels to Western Port as a harbour of refuge.
487. You think a light on Cape Schanck would be beneficial to all inter-colonial navigation, and would be of some advantage to over-sea navigation? Yes, I think there is every chance of its being useful to vessels bound through the straits, especially in southerly gales.
488. Would it be more useful than the promontory light? The promontory light would not be so useful generally as a light on the Schanck. It would be useful to vessels which cut the corners off, if we may so express it.
489. There is no light on Point Lonsdale at present? No.
490. Would you advise a light being placed there, supposing one is also placed on Cape Schanck? I do not think it is requisite, with the lights we have got, if there were a light on Cape Schanck.

- Mr. H. Maemeken.  
6 Aug. 1856.
491. Would not an additional light be more likely to lead to confusion than to good? I do not think it is possible to have a better guiding star for the heads than bringing the present two lights in one. You would still want a guiding light if you had a light at Point Lonsdale. I do not think a light on Point Nepean, and another on Point Lonsdale, and the present two lights, would be as good as a light on Cape Schanck, and the present two lights. I think nothing can beat the present arrangement of the lights at the heads for making the port.
492. Taking a ship bound from Port Phillip to the westward there is nothing wanted in the way of lights before you get to Cape Otway? No.
493. Then going on to Adelaide is there any point which wants lighting? Cape Northumberland certainly is the point on all the coast where a light is most wanted.
494. Do you think there is any necessity for a light at Cape Nelson or Cape Bridgewater? No, not the slightest; the coast is very bold there and easily seen.
495. If a light were placed on either of those capes, do you think a prudent master of a ship coming from the westward would endeavour to make that light instead of the Otway light? No; it would be going a great deal out of his way.
496. If a man attempted to make the land about Cape Nelson or Cape Bridgewater might he not be driven down upon a dead lee coast, if he had a south-westerly wind? There would be little danger of that, I think, but I can see no advantage in a light there except to make Portland.
497. That would only be a harbour light? Yes. There are two points on the western coast at which I think lights are very much wanted—Cape Northumberland and Cape Jaffa. There are several reefs there running some distance off the island, and it is a disputed point how far they run off the land; it is a very dangerous point to approach. Cape Northumberland is decidedly the point where a light ought to be placed.
498. Would not a light on Cape Northumberland and another light on the outer point of Kangaroo Island, be a sufficient leading mark for vessels bound for South Australia, if they did not go through Backstairs Passage? I do not see that a light is required on the western end of Kangaroo Island.
499. The usual course for vessels is through Backstairs Passage, is it not? Yes for vessels coming from Adelaide, and sometimes from England also.
500. There is a good light in Backstairs Passage, is there not? Yes, but I do not think it is placed in the proper position, because it is in a point which is very frequently shut out by another point. In standing down the Gulf of St. Vincent the high land of Cape Willoughby shuts the light in from view unless a vessel stands close over to Cape Jervis, which might bring her into mischief. Cape Northumberland shows by the rocks that are on it that that is a place which requires a light, and that is the most necessary light on the coast I think.
501. The advantage of a light on Cape Northumberland would be entirely confined to the trade between Adelaide and the colonies, or the over-sea trade with Adelaide alone? Vessels with easterly winds would stand in with more confidence, knowing there was a light there, and expecting to see it.
502. Generally it would be of more advantage to the inter-colonial trade than to the over-sea trade? It would be a great advantage to our overland mail steamers, if we should have them again; they would then run with confidence along the coast. The coast is now all so much alike that you can scarcely know one part of it from another part.
503. Is there any part of that coast where a lighthouse could be erected at a sufficient height to be seen a considerable distance off? Yes; there is high land not exactly at the cape, but you might pick out high land close to the point, and with a first-class light you would see it far enough off to evade the danger. I do not think the actual dangers are so far off the land as is said. I think that what has often been taken for reefs is the edge of the sea breaking the edge of the kelp, where there is seven fathom water.
504. Do you think that a light would be required at Cape Jaffa, as well as at Cape Northumberland? There is a great necessity for a light on Cape Jaffa, but I do not think it is so absolutely necessary.
505. With a light on Cape Northumberland as a leading light, a vessel might, with ordinary caution, clear Cape Jaffa? Yes.
506. The light on Cape Northumberland, you say, would be beneficial to all the navigation of the straits, except to vessels coming from the eastward? It would be useful to all vessels coming from the westward to the eastward, and to vessels bound from Sydney to India; in working up the coast, it would assist them also.
507. It would be useful to vessels going round the Leeuin from Sydney? Yes. As master of a steamer it is the point on the whole coast which I detest most. I dislike to get near it.
508. Your experience in that trade has been considerable? I have sailed the steamer for nine months myself, passing each way every fortnight.
509. That is a steamer between this and Adelaide? Yes.
510. What is your opinion with regard to a light on King's Island? My opinion is that the light ought to be at the north end of the island.
511. Do you think there ought to be a light there at all? Certainly; it would be a guide to a vessel coming in, for a vessel then need not go so near Cape Otway as they generally try to do now, for they would see the light on each side of them. I think there are places on the coast more important to be lighted than King's Island. I should say the Schanck and Point Northumberland are the most pressing.
512. Then the King's Island light you consider might be an advantage under certain circumstances, but you do not consider it absolutely necessary to secure the safe navigation of the straits? No, I do not think it is absolutely necessary; I think it would be a very great improvement if you had it.
513. Do you think it likely to draw a ship into danger? I think a vessel bound in through the straits would prefer making the Otway light to the King's Island light, but if she did get to leeward, the King's Island light would tell her how near she was to danger.

Mr. H. Macmoiken.  
6 Aug., 1856.

- 514. Have you been often at King's Island? I went down with Captain Ferguson, when he went down after the "Flying Arrow."
- 515. What is your opinion of the atmosphere there; is it frequently clouded? It is frequently clouded; in all my experience of going to Adelaide I have never seen King's Island.
- 516. Although you have been within what would be a visible distance of it, if it was clear? I am quite positive I have been nearer to it than Cape Otway without seeing it.
- 517. How near have you been to it without seeing it? Within fifteen miles I should say.
- 518. More than once? I have been only once or twice in that predicament going out with westerly gales.
- 519. Your impression is that the light would be very frequently obscured and valueless in consequence of the haze that hangs about the island? Yes, I think it would.
- 520. Under such circumstances would not a vessel be liable to be down on the Harbinger Rocks before she saw the light at all? It is possible she might.
- 521. Do you think you have ever been within ten miles of the island and not been able to see it? When we went down to bring those people up we were closer than ten miles and could not see it in fine weather.
- 522. What class of weather was it—do you remember how the wind was? The wind was from the south-east I think.
- 523. Would you put a light on King's Island or not, if it was in your power to do so? I think there are many other lights much more wanted.
- 524. Might not a light on King's Island be prejudicial instead of beneficial, many people think it would; what is your opinion on that point? I think a light is scarcely necessary on King's Island with the light we have got at Cape Otway.
- 525. It is not wanted as a guide—that is agreed upon all hands; but do you think it is wanted as a beacon? I think it might lead strangers into danger, knowing there was a light there they might try to make it.
- 526. Is it not contrary to all principles of navigation to light inside a danger, that is, to light on an island inside a reef running out from it? A great many lights are to point out reefs running outside.
- 527. Is not it always advisable that a light should be placed, if possible, so as to show the boundary of the reef? It is so; but you could not put a light on the Harbinger Rocks; it is just a wash.
- 528. Would a light on the New Year Islands be serviceable? I do not think you would see a light there so well as one on the main land.
- 529. Are the New Year Islands as liable to be obscured as King's Island? When we went down to pick up the passengers of the "Flying Arrow" it was a beautiful morning, and until we got close to the New Year Islands we could see neither King's Island or the New Year Islands; we must have been south of Cape Wickham before we saw the land. It was covered with fog.
- 530. Was it that description of fog which usually obscures high land, or merely a haziness produced by the state of the weather? I think it is a haziness produced by the state of the atmosphere.
- 531. And generally hanging about that land? Yes.
- 532. Had you seen it clouded on previous occasions when you had been within so short a distance? I never was so close to it before.
- 533. In standing across with a north-west wind would a light upon that island be any advantage to you? Would you stand over to sight the light if you had the ordinary weather, you meet with about there, or would you stand over, as you do now, and go about when you thought you had gone far enough southwards? I should never go down there to sight the light.
- 534. The light would be no assistance to you in standing over? It might be, for there might be a current setting through the straits which I was not aware of, and the light would be a warning to me.
- 535. There is no very great current setting down there, is there? Yes, I have always found a current setting through, according to the wind.
- 536. Have you found any particular southerly set down upon the island? No, I cannot say. I have ever remarked it.
- 537. It has usually been either east or west? Yes, through the straits.
- 538. Do you know which way the current draws generally? It depends a good deal upon the wind.
- 539. Have you been to Launceston or any part of Van Diemen's Land from this colony? Yes.
- 540. Have you passed through Banks's Straits? Yes, we have done so.
- 541. Will you give the Commission your opinion as to whether you consider those straits sufficiently lighted or not? I should think they are. There are some excellent lights on them.
- 542. Would you give the preference to a light on the northern end of King's Island over a light at the New Year Islands? Yes; and the reason why I say so is that it is nearer to the danger, and it is the nearest point to the opposite light.
- 543. As a warning beacon it is not required as much down to the south-west of the island as on the north. Would not a light on the New Year Islands have been more useful in the generality of cases of wrecks, and quite as useful in all the cases of wrecks as if it had been on the north of King's Island? The higher altitude of the light on the north end of King's Island would render it as likely to be seen as a light on the New Year Islands.
- 544. But it is not proposed in the report to the Government to put it on the highest point of the island, but at a lower point? I think it should be placed at the highest point of the island.

- Mr. H. Macneiken. 545. Your opinion is, that if Cape Northumberland and Cape Schanck were lighted, more substantial benefit would be done to the shipping generally navigating the straits, than if a lighthouse were erected on King's Island? I think so, decidedly.
- 6 Aug., 1856. 546. Are there any further suggestions that you would wish to offer to the Commission on points on which you have not been asked any questions? I think not. A light at Cape Jaffa is wanted; but I think we may do without it for some time, until we are better able to afford it.
547. Do you pay light dues now in going to South Australia? Yes; very heavy ones to South Australia. The port dues are very heavy compared to Melbourne. They make us pay the same dues as a foreign vessel.
548. Is it a good light upon the Trowbridge now? Yes.
549. That has been recently erected, has it not? Yes. [*The Witness withdrew.*]

Captain Robert Troop Moodie examined:—

- Captain R. T. Moodie. 550. You command the steamer "City of Sydney"? Yes.
- 6 Aug., 1856. 551. And have commanded her for some years? Two years and a half.
552. During that time what trade has she been principally employed in? Exclusively between Melbourne and Sydney.
553. Then you have had ample opportunities of studying the present state of the navigation of the straits, and also of the coast of Australia? Yes.
554. Will you inform the Commission whether, in your opinion, any additional light is wanted between Cape Howe and Sydney Heads, and if so, where it should be erected? One at George's Head and one at Twofold Bay would be of great service.
555. Do you consider that Cape George is a necessary point on which a light should be erected? Yes.
556. Would you put it on Cape George or Cape Perpendicular? On St. George's Head, to keep clear of Wreck Bay.
557. Do you think that would be sufficiently high to be seen over Cape Perpendicular in coming from the northward? It is going to the northward that the danger is—not so much coming to the southward.
558. You think a light is more an object in standing to the northward than in coming to southward? Yes.
559. Have you found any particular indraught on that coast? Yes, very often; in the steamer the courses are steered very correctly, and I have several times found myself in Wreck Bay, and have had to haul out.
560. And that in thick weather might lead you into mischief? Yes; in thick weather we give the ship the benefit of a point or two until we pass there; but even in fine weather we have had to haul out.
561. When you have steered only what you have considered a proper course from Montague Island up? Yes.
562. You think that a light would be beneficial also at the entrance of Twofold Bay? Yes.
563. That would be more for a harbour light for vessels running in for shelter? Yes, without this guide they might be driven back as far as the Dromedary.
564. That, if established, would be purely a local light and not a highway light? Yes, because vessels from England have no business near it.
565. A light at Cape George would be a high road light? Yes; it would be useful for all vessels on the east coast, whether bound through the straits or round Van Diemen's Land.
566. After visiting the Howe are there any points on the coast of Victoria which appear to you to be dangerous in their present state? Not until you get down to the promontory.
567. Do you consider that it would be advisable to put a light on the promontory? You would want two.
568. Where would you put them? One on the southernmost Sea Island, and the other on the island adjoining the Cleft Island; it is impracticable to put it on the Cleft Island, and I would put it on the southernmost of the Glennies, adjoining Cleft Island.
569. Would not a light on the promontory answer the purpose of both these? On the point of the promontory the land is so high that you would seldom be able to see a light there.
570. It would not answer the purpose then? No.
571. A light on the Glennies would be useful for all vessels coming from the westward? Yes.
572. If one of the two only were to be erected, which would be the most useful for the navigation both ways? One on Cleft Island would be of no service coming down from the north-east; because we do not see it until we are close up to the promontory.
573. You think if there were a light on the southernmost of the Sea Islands, and one on the southernmost of the Glennies, the passage round the promontory would be then clearly pointed out? Yes, and it would be a great benefit to Port Albert.
574. A sailing ship bound to Melbourne would have no business there? No; a sailing ship would always keep the Kent's Group, because the winds are so very variable in the vicinity of the promontory.
575. Then those lights are more necessary for the communication by steam? Yes.
576. Sailing vessels would generally use the Kent's Group light and would keep more to the south of the promontory? Yes; a light there would always be a guide to them, and then with a leading wind they could take the passage between the Rodondo and the Crocodile. They seldom take the passage between the Rodondo and the promontory with a ship under sail.
577. Do you know the Rodondo? Yes.
578. It is stated in Stokes's chart to be 1,130 feet high? Yes, it is very high.

579. Would it be possible to put a lighthouse there? It would be of no use when it was there. You can never see the top except in very clear weather. Captain R. T. Moodie.
580. Do you know the Ten-foot Rock? Yes.
581. Would it be possible to put a lighthouse there? It might be possible, but the engineering difficulties would be very great. You could not work more than two or three days a week, and then it might all be washed down before you got any more up, and a lighthouse there would have to be an immense height to be of any service even if you could put it there. The only advantage of a lighthouse on that rock would be, that you could see it from both sides; but before you could get it high enough you would have to go 200 feet high.
582. If the engineering difficulties could be overcome, do you think that would be the best position for a lighthouse? Provided it could be built high enough to be seen in reasonable weather two or three miles to the eastward of the Seal Rocks; but that would be twenty miles distant, and that would require an immense height.
583. If the light were actually on the promontory would it be of any benefit whatever? It would be of benefit coming down from the north-east, but then it is eighteen miles off the Seal Rocks.
584. It would be perfectly useless to ships coming from the westward? Yes.
585. Is there any point westward of the promontory where a lighthouse could be put? Then it would be no good to ships coming from the eastward—it would be shut in by the high land.
586. Is there any position on Wilson's Promontory on which a lighthouse could be erected which would serve for the trade both ways? No.
587. The only effectual way of lighting it would be by having a light at both sides? That is the only effectual way in my opinion, and I know of no place in the world where lights are more required than they are there.
588. That is for the Colonial trade between here and Sydney? Yes; or for the ocean steamers, if ever they run again. The mail steamers all take this route.
589. Would not a light on the southern Glennie be also of considerable use to a vessel bound to Launceston? No doubt of it, and especially to a vessel bound to Hobart Town, because in blowing weather from the north-east they hug the land all along. Captain Bentley told me that with an easterly gale he kept close in along the land, and then stood across from Rodondo to Curtis' Island.
590. In such a case as that, what would have been the use of a light to him if he could see the land all the way? In the night time you might not be able to see the land a couple of miles off, when you could see a light twelve miles off.
591. He would not have taken that course except that the wind was easterly? Yes, and he took advantage of the lee which he possessed all the way round to Rodondo.
592. To a vessel with a fair wind running down, would not the light be a considerable advantage as a leading light? It would not be absolutely necessary as a warning, because he would have so much sea room.
593. Then those lights are really only necessary in making rapid passages by steam where you wished to take the most direct route probable? Yes, and to lessen the danger, sailing vessels generally try to keep away from the land and we try to hug it.
594. Do you think it absolutely necessary that a light should be put on the promontory for the sake of the Van Diemen's Land trade? Certainly not.
595. Proceeding from Wilson's Promontory towards Melbourne, is there any point between the promontory and Shortland's Bluff which you consider ought to be lighted? The Schanck, unquestionably, for all parties.
596. Would a light on the Schanck be beneficial to vessels entering the straits, bound to all portions of the Australian Colonies? I think not to vessels going right through.
597. It would be beneficial to the Tasmanian trade, would it not? Yes.
598. And it is indispensably necessary to all vessels coming from the eastward? Yes.
599. And to some extent to vessels coming from the westward? Yes.
600. And to all vessels approaching Port Phillip Heads, from wherever they come? Yes.
601. Do you think a light on Point Lonsdale is necessary as well as a light at the Schanck? No; it can be no guide in coming to Port Phillip, because if we could see the Lonsdale light we should see the Shortland's Bluff lights.
602. It has been stated that a vessel might be in such a position as not to see the Shortland's Bluff lights, and a light at Point Lonsdale would be useful? A light on Lonsdale point would be of service then. It is quite possible to shut the Shortland's Bluff lights out. I have always approached under steam, and come the other way; so that I cannot speak so well as to that; but having a light on the Schanck, there can be no reason whatever for having one on Point Lonsdale, because if you did not see the Shortland's Bluff lights you would only have to borrow a little more to the eastward, until you did see them.
603. And there would be less danger in borrowing to the eastward if there were a light on Cape Schanck? Yes.
604. The cross bearing from the Schanck and Shortland's Bluff would render it perfectly easy for any vessel to approach the heads? Yes.
605. Do you think the light on Cape Otway well placed and everything that could be desired? Yes.
606. Are you acquainted with the navigation to the westward, going up towards Adelaide? I have made several voyages from England to those Colonies.
607. Do you think any points there want lighting? Cape Northumberland, and either Cape Bridgewater or Cape Nelson. Running down here in the winter time you very often get no observations.
608. There being a light at Cape Otway, you think it would be still beneficial to light Cape Northumberland? Yes; I have known a vessel that was actually found by one of the

Captain R. T. Sydney steamers running into the bay to the westward of Cape Liptrap, the captain believing that he was not round the Otway.

Moodie.

609. Do you think if he had had an opportunity of making the land further to the westward he would have known where he was? Yes; because there is a very bold coast there.

6 Aug., 1856.

610. Have you had any experience with reference to sighting King's Island? I never went near King's Island at all; I always hauled in and made the land about Cape Otway.

611. From your experience as a master mariner, would you give your opinion as to the advisability or the contrary of putting a light in the neighbourhood of the north end of King's Island; that is, whether such a light would be beneficial to the shipping, or would be likely to lead more to mischief than to good? I think it would lead more to mischief. By having those two lights—one at Cape Northumberland and one at Cape Nelson or Cape Bridgewater—there can be no difficulty, and I would always recommend a ship to keep the Australian sea-board. I should strongly recommend all parties coming out here to ascertain their position some time during the day. You have 200 miles of coast, and during the day-time you can always run in and see where you are.

612. You think that a light at King's Island would induce vessels to run when they would not run under the present circumstances? Yes.

613. And the lights might possibly be obscured, and might lead them into danger? Yes.

614. Whereas, if they adopted the course they now do, of avoiding King's Island and keeping the main land they would, with the assistance of those additional lights already spoken of, be in a much safer position than they would be in with any light on King's Island? Much more.

615. Take the case of a ship beating to the westward from Bass's Straits going out between King's Island and Cape Otway, is there no other circumstance, under which a light on King's Island would be an advantage to a ship then? Coming from the eastward you know where you are—you know your position to a mile.

616. By what means? Because you are surrounded by land, and you have your reckoning.

617. Ships might be very much thrown out with respect to King's Island, knowing it was somewhere near them; do you think then a light would be of any service? No; because leading from the eastward you know your position so thoroughly, whereas coming from the westward you do not.

618. Do you think a vessel working through and standing on the southward tack would be just as cautious if there were a light on King's Island as now when there is no light at all? No; beating through from here they might get under the lee of King's Island, and having a light on the extremity of it would be a guide to them.

619. Then a light there would be an advantage to afford a good lead into smooth water and shelter? Yes.

620. Do you conceive that to be the only advantage to be gained by that light? Yes; I have never wished to see King's Island in coming from the westward at all.

621. Will you give a decided opinion whether or not you would recommend a light to be placed on King's Island? If two lights were put to the westward, that is, one either at Cape Bridgewater or Cape Nelson, and one at Cape Northumberland, good first-class lights, I should say a light would not be required at King's Island.

622. Are you acquainted with the set of the current between Cape Otway and King's Island at all? I am not.

623. Do you know the nature of the anchorage at the New Year Islands? No; I have never seen King's Island.

624. You consider that a light there would lead a ship into danger? I think it would.

625. Has it not generally happened that the vessels which have been wrecked upon King's Island, in the majority of cases, have been vessels proceeding to the westward? I am not aware.

626. If such be the case, does not it show that a light on the northern extremity of King's Island would have been beneficial to a ship that was working out between that and Cape Otway? A ship could hardly make so great a mistake as to get upon King's Island when she could hardly be twenty-four hours out of sight of land.

627. Are you acquainted with Banks's Straits? No.

628. Or the south coast of Tasmania? No.

629. Have you any further suggestions to offer to the Commission on the points on which you have been examined? No; I think the evidence I have given embraces everything.

630. Your recommendations are, that there should be a light on Cape George, two lights in the neighbourhood of the promontory, a light on the Schanck, a light on Cape Northumberland, and a light on Cape Bridgewater, or Cape Nelson? Yes.

631. Which would you think should be carried out first? Perhaps it would be considered selfish to say the promontory, but I know of no place in the world that requires lighting more than that does. Cape Schanck would be of great benefit too, but still not so much as the promontory; it is not so urgent, in my opinion.

632. That is for the steamers? Yes; and there is a larger amount of steam traffic than sailing ships between here and Sydney.

633. Have you seen the Gabo Island Light? Yes.

634. What quality light is it? I have seen it fifteen miles off. It is not a very good class light; it is not to be compared with Kent's Group.

635. If there were a greater elevation given to it would it be an improvement? Decidedly.

[The Witness withdrew.]

Adjourned to to-morrow, at ten o'clock.

THURSDAY, 7 AUGUST, 1856.

Present:—

MR. CHAMP IN THE CHAIR.

MR. BROWNE. CAPT. KAY, R.N.

Captain John Lowden examined:—

Captain J. Lowden. 7 Aug., 1856.

- 636. Do you command the "Maid of the Yarra"? Yes.
- 637. Is your vessel a sailing vessel or a steamer? A steamer.
- 638. What part of the colonies have you been in the habit of trading to? Mostly in Bass's Straits, between Melbourne and Launceston and Hobart Town; a short time between Sydney and Moreton Bay.
- 639. In command of a sailing vessel? No; I was seaman in a small schooner called the "Ann Mary." I never commanded any vessel from any port except Launceston, from which port I have commanded several vessels for the last seven years.
- 640. How long have you commanded a steamer in the present trade? About nine months.
- 641. That is between Launceston and Melbourne? Yes.
- 642. You have had, therefore, good opportunities of ascertaining the different dangers which you have to pass, which are either pointed out by lighthouses or remain unshown? I have been for nearly seven years constantly backwards and forwards about the straits.
- 643. Do you know the eastern coast from Cape Howe to Sydney? No.
- 644. With regard to the dangers that you have to pass between Melbourne and Launceston (your present trade), are there any portions of the coast of any dangers that you pass which, in your opinion, ought to be lighted? Excepting Cape Schanck, I do not know of any.
- 645. Cape Schanck; you think ought to be lighted? Yes; we have many times lost many hundred pounds worth of property for want of a light. In making the heads, from the southward and eastward, and in running down, you cannot depend upon seeing the light upon Shortland's Bluff.
- 646. Would the Schanck light enable you to make the land with confidence, and place you in a position to make the port with safety during the night? Yes, at any time.
- 647. In proceeding across to Launceston do you make Kent's Group light? Very seldom; we generally steer about south-east half south.
- 648. For the entrance of the Tamar? Yes; that is with a fair wind; but, even with the vessel I have at present, I often get down amongst the islands.
- 649. Is the Kent's Group light of any advantage to you when you get down amongst the islands? It is very seldom that any of the Launceston vessels get so far down as Kent's Group, except in stress of weather; but it is a very good light and in a very good position.
- 650. Is there any other light which you would recommend to be erected, beside the Schanck? A lighthouse would be very useful on Wilson's Promontory, but still the Schanck would be the most useful.
- 651. In trading between Launceston and Melbourne you think the Schanck light is the only light absolutely necessary to be erected? Yes.
- 652. With regard to the passage from Sydney to Melbourne, are you sufficiently acquainted with that route to enable you to give the Commission an opinion whether any additional light should be placed on that coast? I have only been through that passage once, as a passenger, and cannot give an opinion.
- 653. In your voyages across to Van Diemen's Land, do you ever see King's Island? Yes; I came close along the eastern coast of it this time.
- 654. Can you give the Board any opinion as to whether a light on that island would be beneficial or not? I think it would be as well as it is. There is a good light on Cape Otway, and a light on the east side of King's Island would be of little or no service.
- 655. Would a light on the north end be of any service? I do not think it would; for coasting vessels do not require it much, and strangers coming down would be more apt to keep over to King's Island if there were a light there, and might get ashore before they knew where they were. At present, with a good light on Cape Otway, it makes them keep more to the northward; and I think it would be better without a light on King's Island.
- 656. Have you traded on the South Australian coast at all? I was trading for about two years, as mate of a vessel, between Launceston and Adelaide.
- 657. Have you frequently passed King's Island? Yes.
- 658. Did you frequently sight it? Several times; I have been at anchor in Sea Elephant Bay.
- 659. In your voyage between Adelaide and Launceston, would a light on King's Island have been of any service to you? No; we always made it a practice to give it as wide a berth as possible, and hugged the main land. The main land is all such bold high land that it must be very dark indeed if you could not see it before you were in danger.
- 660. Does it appear to you that there are any additional lights required to be erected on the main land between Cape Otway and Adelaide? I think Cape Northumberland would be a very important point to light.
- 661. Is it of sufficient importance to require a light there? It would be a very serviceable light there; that is the turning point to the west coast, the same as Gabo Island is on the east coast, and many times a captain carrying on may think he is going to weather it and it may be so dark that he cannot see the land, and he would not know what to do, whereas he might make a passage easily by a light on Cape Northumberland.
- 662. Is there any other point between Adelaide and Cape Otway, which you think it would be advisable to light? None, excepting Cape Northumberland; you might have one on Cape Jaffa.
- 663. But you do not consider that of immediate importance? No; there is a good light on Cape Willoughby.

- Captain J. Lowden.  
7 Aug., 1856.
664. For all purposes of navigation between South Australia and the other Australian Colonies, you think a light on Cape Northumberland would be sufficient? I think so.
665. If only one lighthouse were to be erected, which one would you give the preference to as being the most necessary? I think Cape Schanck.
666. Have you ever paid any attention to the set of the current between Cape Otway and King's Island? No.
667. You are not prepared to say whether it sets ships in any particular direction or not? No; we have always had strong winds, and never had an opportunity of trying the currents, we are so quickly across, and in sailing vessels we generally make it a practice to keep well to windward, and I do not think I was ever becalmed between the island and Cape Otway since I have been in the trade.
668. Have you ever been close to Wilson's Promontory? Within six or seven miles of it.
669. Have you ever landed there? No.
670. Do you know the Rodondo? Yes.
671. Would it be practicable to put a lighthouse on it? I do not think you could land on it.
672. Do you know the Ten-foot Rock? I have never been close to it; I know within a trifle where it is.
673. Did the sea break heavily on it when you saw it? Yes.
674. How often have you been round there? I often get down that way, but never closer than five or six miles from the promontory.
675. Have you always observed a heavy sea breaking on the Ten-foot Rock? Yes.
676. Do you know Cleft Island? Yes.
677. Have you ever landed on it? Never.
678. Can you give an opinion as to whether it would be possible to put a lighthouse on Cleft Island? I never landed there.
679. You are not familiar with the character of any of the land about there—the Glennies, the Seal Rocks, the Rodondo, or Cleft Island? No; I never landed on any one of those islands. I have landed on Rabbit Island, but that is too far in.
680. You are clearly of opinion that it is not desirable to put a light on King's Island or any part of it? I think it is not desirable.
681. For what reason? I think vessels would be more apt to give it a wider berth if there were no light on it.
682. You think a light might induce vessels to take liberties with it? Yes, particularly a vessel coming down from the westward. The only place you could put a light would be on the New Year Islands, but I do not think a light there would be of any use so far inside the Harbinger Rock.
683. Have you been between the Harbingers and the main? No, I never went inside.
684. Have you ever seen the Harbingers? Yes.
685. Are they always a wash? Yes; the rocks are in many places above water and a very heavy sea breaking over them.
686. Have you any further suggestions to offer to the Commission? No, except that I should very much like to see a light on Cape Schanck. I have often found a strong set of current setting on to Cape Schanck and into Western Port.
687. If only one light were erected by the Governments you decidedly would recommend the erection of a light on Cape Schanck first? Yes. [*The Witness withdrew.*]

Captain John Buchan Sydserff examined:—

- Captain J. B. Sydserff.  
Aug., 1856.
688. You command the steamer "Storm Bird"? Yes.
689. In what trade is she employed? Between Melbourne and Port Albert.
690. How long have you been employed in that trade? About three years and a half; but not all the time in a steamer.
691. But between Port Albert and Melbourne? Yes.
692. Have you been sailing a vessel on any other portions of the coast of Australia? Not as master.
693. But as mate? Yes; off and on the coast since the beginning of 1849, in Colonial vessels.
694. In navigating that particular track which you have been made acquainted with, are there any points of the coast which appear to you to require to be lighted? Yes; I think that a light on the Schanck and another on or about the promontory would be very desirable.
695. You think a lighthouse ought to be erected on the Schanck? Yes.
696. Would that enable you to run for the entrance to Port Phillip Heads with a greater degree of certainty than you can at present? Yes, it would facilitate it greatly; in coming along we have to come close along shore with small vessels to keep out of the sea, and there is a strong set into and off from Western Port, and sometimes we find ourselves set up close to Black Head or *vice versa*.
697. That is in consequence of the set into Western Port? Yes.
698. In passing the promontory, either going to the westward or coming from the westward, is there any part of that land which requires to be lighted? I think that a lighthouse would be a very good thing on one of the islands near the promontory.
699. On which island you put it? I would put it on one of the southern Glennies, within a mile of Cleft Island.
700. What benefit would that light be to you if you were coming from the eastward? It would not be so beneficial then, because it would be hid by Wilson's Promontory, but then a man coming that way gets upon bold land.
701. Are there not the Seal Islands there? Yes.

Captain J. B. Sydesriff. Aug. 1856.

- 702. If there were a light upon the Seal Islands and one upon the southern Glennie would the promontory be able to be made in safety? Yes, perfectly; because you would keep the one light in view till you opened the other, and a light there would be of service to vessels going into Corner Inlet and Port Albert. Vessels frequenting Port Albert at night have to run down upon very low land, over shoal water, across the mouth of Corner Inlet, out of and into which a very strong tide sets, the tides of the turn and strength of which are very irregular, running the risk of being set on to extensive sand banks to the eastward or those at the mouth of the inlet to the westward. Any light on the promontory to the southward of Cape Wellington will not assist any vessel bound to Corner Inlet or Port Albert after passing a line drawn through Rabbit Island and the White Rock, the cape having shut it in.
- 703. With a steamer trading to Port Albert you always go between the Rodondo and the promontory, do you not? Sometimes I go right inside of all the islands if I wish to get the assistance of the ebb tide.
- 704. When you commanded a sailing vessel what course did you take then? I always kept between the promontory and the Rodondo.
- 705. You did not keep the open sea to the southward of Sir Roger Curtis's Island? Not unless I was driven there.
- 706. Have you ever landed on any portion of the promontory? I have been in all the bays round the promontory.
- 707. Is there any part of the promontory on which a light could be erected so as to be visible both ways; eastward and westward? Not without putting it up at such a height as that it would be very often clouded.
- 708. Do you know the Rodondo? Yes.
- 709. Is it accessible? I think it might be got up to, but I think it is very doubtful.
- 710. Stokes's chart says it is 1,130 feet high—do you believe that to be correct? Yes.
- 711. Do you know the Ten-foot Rock? Yes.
- 712. Is there sufficient base there to put a lighthouse? I never have been very close to it.
- 713. In working through the straits have you ever found an advantage from Kent's Group lighthouse? I never sighted it but once.
- 714. Then it is not a useful light for the coasting trade? No.
- 715. Would it not be in sight in fine weather in rounding the promontory? In very fine southerly or easterly weather it would.
- 716. Are you of opinion that a light upon Seal Island would be desirable? Upon the northern Seal Island I think it would be very useful, and it would be a good leading mark for the harbour of Corner Inlet.
- 717. Might not a light there be the means of inducing a ship to place herself in that corner of the continent, and have the Nifty-mile Beach under her lee if the wind came round to the eastward? I think she would always have time to get round the promontory. A swell invariably sets in long before the easterly wind comes up with any great force. Several vessels have been stranded on the east side of the banks off Port Albert bay; amongst which a steamer figures bound from Sydney to Melbourne. Others have only been made aware of their proximity by the sound of the breakers, or the sharpness of the swell setting over their extremities. A light on the Seal Islands would in such cases have rendered great service.
- 718. Are you familiar with any other portion of the coast? No, not sufficiently so to give an opinion.
- 719. If only one light were to be erected by the Governments in Bass's Straits, which would you recommend to be done? The Schanck.
- 720. Have you ever sighted King's Island? Play wind bound in Sea Elephant Bay once.
- 721. Is that the only time you ever sighted the land? I think so.
- 722. Do you at all feel yourself competent to give an opinion to this Commission as to the advisability or not of erecting a light on that island or in its neighbourhood? If I were coming that way myself I should never ask for it.
- 723. Do you, from the knowledge that you have of the position of the reefs off the northern end of that island, consider that a light there would be more dangerous than useful? No; because I think any man with judgment would always try to make the other side; and it might correct an error if seen off some time.
- 724. The Otway light? Yes.
- 725. Do you know whether the land in the neighbourhood of King's Island is clouded or not? No; it was very bad weather when I was there, and the Island kept below all the time.
- 726. Are the lights that at present exist at Shortland's Bluff sufficient for guiding a ship to the entrance of Port Phillip? Quite so, I think.
- 727. Do you think a light would be desirable on Point Lonsdale? It would rather be a little two as they now stand.
- 728. You think the two lights now in connection with a light on the Schanck would be quite sufficient for all purposes of entering the heads at night? Yes.
- 729. Would not a light on Point Lonsdale be of great assistance if a vessel lost sight of the Shortland Bluff light? I think the cross bearings of the Schanck would be sufficient to enable her to get the two bluff lights in one.
- 730. You think that a light upon the Schanck would be all that could possibly be required? Yes.
- 731. And with regard to the promontory, you think that would be a useful light—but you do not think it absolutely necessary? It would be a very useful light; but I do not think it absolutely necessary, because the promontory is so bold, you could generally pick it up except in dark weather.
- 732. If it is not so absolutely necessary for steamers it can hardly be at all necessary for sailing vessels? Many sailing vessels would run through them that have to now.
- 733. It would afford facilities for passing which do not exist now? Yes.

- Captain J. B. Sydsorff. 734. And would give greater confidence to the coasting trade in that part of the navigation? Yes; with a steamer we always feel that we can get off it, but a sailing vessel cannot rely upon that.
- 7 Aug., 1856. 735. You have never landed on the Seal Rocks, have you? No.
736. Then you do not know whether it would be possible to erect a lighthouse on them? Judging from appearances, and from the knowledge that there have been sealing parties living on them, I should say there would be no difficulty.
737. Are they very high? No, about 300 or 400 feet.
738. Have you any other suggestions to make to the Commission with respect to that particular part of the coast with which you are familiar? No. [*The Witness withdrew.*]

Captain Henry Tulloch examined:—

- Captain H. Tulloch. 739. Do you command the "Water Lily"? Yes.
740. A schooner? Yes; trading between here and Circular Head.
- 7 Aug., 1856. 141. How long have you commanded a vessel in that trade? Two years last April.
742. Have you ever commanded any other vessels on the coast of Australia or Tasmania? I never have commanded any other vessel but the "Water Lily", but I have been to many places with her. I have been to Launceston continually, once to Sydney, once to Adelaide, and three times to Portland Bay.
743. In going to Sydney after sighting Gabo Island and rounding Cape Howe, is there any point on the coast between that and Sydney which you think ought to be lighted? I think not. I never wished for a light when I was up there; I do not see any reason why there should be one.
744. You did not make the land in the neighbourhood of Jervis's Bay? I was in at Shoalhaven. A light at Jervis's Bay certainly would be of advantage to coasters beating up the coast, as it is required to keep as close in shore as possible on account of the very strong current there.
745. Where would you put the light? On Point Perpendicular.
746. That you think would be an advantage? Most decidedly, to coasters.
747. Is there any other point between Gabo Island and Melbourne Heads that you consider it would be advisable to light? Nothing except Cape Schanck. I am a strong advocate for that light and always was.
748. Do you consider that if a light were erected on Cape Schanck, the present existing lights would be ample for the navigation of the straits when coming from the eastward? Yes; a light there would be useful to all parties, because the present lights at the heads you can only see for about six or eight miles, and that is not sufficient for an important place like this.
749. You are speaking of the Shortland's Bluff lights? Yes; and vessels coming down from the eastward are running right down upon the Otway land, and get right on the top of it before they open the heads, and if they should happen to be six or seven miles out of their reckoning to the southward, they do not see the Shortland's Bluff lights at all.
750. Do you think that the Schanck light would enable a vessel, in coming from the eastward, to pick up her position so clearly and satisfactorily that she could make the harbour at any hour of the night? Yes; and she could run in, in any weather.
751. And in coming from the westward, would it be equally advantageous? I think so. Many times I have seen large ships hove to off Cape Patton for two or three days in thick weather. I recollect one time a large mail ship was hove to three days. I beat up myself and got in easily, and there was she knocking about looking for Port Phillip Heads; whereas if there had been a light on Cape Schanck she would have run for it without any hesitation.
752. Then it is a most important point to be lighted? I think so.
753. Do you think it desirable that a light should be placed upon Point Lonsdale? Most decidedly not. I do not see the least use of it. It might have been of use before the second light was put at Shortland's Bluff.
754. Do you think that is all that any mariner would require? Yes.
755. With regard to the promontory, do you consider that it would be at all necessary that a light should be placed there? I do not.
756. You think it is quite sufficiently clear, bold, and approachable without any light? Yes, and if a man is leaving Port Phillip Heads, considering the short distance between this and the promontory, he must know where he is within two or three miles, and coming from the eastward they have got the lights at Kent's Group and Gabo Island, which are quite sufficient.
757. In passing over to Circular Head do you ever sight King's Island? I have done so several times.
758. What is the description of atmosphere that generally surrounds that island? I have seen it in all kinds of weather, very clear and very thick.
759. What is the peculiar feature as to any light which might be erected there—would it be likely to be continually clouded? No; from what I have seen of it I think it would not be more clouded than any other land would be in bad weather.
760. What is your opinion with regard to the erection of a light on that island? I think to ourselves as coasters, it would be of no great benefit, but to vessels coming from home and from Adelaide, after being a long time at sea, it would be very beneficial. I think myself that the New Year Islands would be the best place for a light.
761. If any light were to be erected at all you think that the New Year Islands would be the better spot, as being more available for vessels coming from the westward than if it were erected on Cape Wickham? Cape Wickham would be the best for the coasters, but for the general navigation of the straits I think the New Year Islands would be the best site.
762. You think it would be an advantage to the shipping to have a light on the New Year Islands? Yes.
- 763.

763. Do you know the position of the Harbinger Reefs? Yes.
764. Do you think a light on the New Year Islands would induce a vessel to borrow on King's Island unnecessarily, and thereby bring her into danger? If there were a light on the New Year Islands the master of a vessel would know his position at once.
765. You think it would not lead him into danger? No. My object in recommending the New Year Islands is, that vessels making the land to the southward would have an opportunity of seeing their position, which they would not have if the light were erected upon Point Wickham, which being very high would probably be clouded, and the light would be obscured by the intervening of the New Year Islands.
766. You say the New Year Islands would obstruct the vision of a light on Point Wickham if a vessel were to be southward of them? I think so.
767. What is the height of them? I should suppose that they are about 200 feet high.
768. And you think if a vessel were to be southward of the New Year Islands they would prevent her seeing a light on the north point of King's Island, even supposing it were clear weather? Yes; and from the distance, they would hardly be able to see it even if they did not intervene. There are many lights on this coast which cannot be seen above fifteen miles off.
769. Are you aware that the principal wrecks which have occurred on King's Island have been to the southward of the New Year Islands? I do not know. I know that ships have frequently made to the southward of King's Island.
770. Would a ship in a heavy westerly gale, if she was near the Harbinger Reefs, be able to see a light on the New Year Islands? Yes.
771. Do you know the anchorage in Franklin Roads? I have never been in there.
772. You do not know whether it would be available for a large ship to take shelter there? I do not.
773. If a light were erected on King's Island at all, you say you would recommend its being erected on the New Year Islands, and not on the North Cape? Exactly.
774. Do you think it would be better to have a light on the New Year Islands, or to leave King's Island altogether unlighted? I think it ought to be lighted. It is surprising that with a northerly wind, when a man is coming along this coast, he will find himself set in eight, or ten, or twelve miles to the southward in twenty-four hours, and the wind right off the land.
775. With the wind at the north there is always a strong current setting to the south? Yes.
776. You say that you have been between Port Phillip Heads and Adelaide? Yes.
777. And also from Circular Head to Adelaide? Yes.
778. In your opinion is there any point on the coast between Cape Otway and the entrance to Spencer's Gulf where it would be desirable to place a light-house? Cape Northumberland.
779. Most decidedly? Yes.
780. Is there any other point between Cape Northumberland and Cape Otway on which you would recommend a light-house to be placed? No. I do not think a man ventures in-shore there sufficiently to render a light necessary. It is a very nasty coast there.
781. You think that a ship has no business to approach there at all? No, not unless it was particularly fine weather.
782. Then you think sufficient would be done by the erection of a light on Cape Northumberland for the safe navigation of that part of the coast? Yes; and a light there would be a great advantage to vessels from home.
783. You would recommend one to be placed on the Schanck and one on Cape George, as the other two points? Yes.
784. Are you acquainted with the southern part of Van Diemen's Land? No, I was never round there.
785. Or the eastern coast? I was never round there.
786. Have you been to Launceston? Yes.
787. Are there any lights required between Melbourne Heads and Launceston, or between Launceston and Sydney? No.
788. Are you familiar with Banks's Straits? Yes.
789. Do you consider the lights sufficient there? Yes; and a beautiful light it is at Swan Island.
790. Have you any further suggestions to make to the Commission? No. Cape Schanck, I think, most decidedly, should be the first place to be lighted. [*The Witness withdrew*]

Captain H.  
Staloch.  
7 Aug., 1856.

Captain Robert Knarston examined:—

791. You are the commander of the schooner "James"? Yes.
792. Where have you been in the habit of trading? To Launceston and Adelaide chiefly. Principally between Launceston and Melbourne, and Melbourne and Adelaide.
793. Always in a sailing vessel? Yes.
794. What trade are you employed in now? Between Melbourne and Adelaide. This last voyage I went from Adelaide to the Mauritius, and returned to Adelaide again, and I am going into the trade again.
795. Are you quite familiar with the route between Melbourne and Adelaide? Yes.
796. Is it your opinion that any thing is desirable in the way of lighting between Cape Otway and Kangaroo Island? Yes; I consider that a light would be requisite on Cape Northumberland.
797. That is the turning point after passing Cape Otway in getting to the northward? Yes.
798. You think Cape Northumberland would be a good position for a lighthouse, and that it would be beneficial to the navigation of vessels proceeding to Adelaide from here? Yes.
799. Cape Northumberland is a low point, is it not? Yes; but it is generally a place from which we have to keep away in coming from Adelaide with the wind at south, when if there were a light there we should be bolder than we are, and should be able to save time.

Captain R.  
Knarston.  
7 Aug., 1856.

- Captain R. Knarston.  
7 Aug., 1856.
800. Have not a good many vessels been wrecked on that point? Yes; vessels coming from England.
801. Would a light have prevented them from going on shore? It might.
802. Is that a part of the coast where vessels coming from England or from the westward would have made the land? No; it is for the benefit of the coasters principally that a light would be needed there. I do not see that any vessels from England would have any business there, unless driven there by the wind.
803. Would vessels that were likely to be wrecked off Cape Northumberland be bound here or to Adelaide? They would be bound here.
804. On this side of Cape Otway is there any additional light required on this coast—between Cape Otway and Wilson's Promontory? There is Cape Schanck. A light may be requisite there.
805. Do you think a light on Cape Schanck would be a useful light? I think it would.
806. Would you, in making for this port in coming from Adelaide, consider that having a light on Cape Schanck would enable you to stand over with a greater degree of confidence than you do now? It would, undoubtedly.
807. Would it enable you to place your ship in a position to make the port? By seeing a light on Cape Schanck we should know better our position. By getting the bearings of the Schanck and the Heads it would give us exactly our position, whereas now we must guess our distance from the lights.
808. The Shortland's Bluff lights are not of such a character as to be seen at any great distance, are they? On a clear night you may see the high light ten or twelve miles.
809. The light you would suggest to be placed on the Schanck should be a powerful light, so as to be seen at a considerable distance? Yes.
810. Have you had an opportunity of judging respecting King's Island? No.
811. Did you ever sight it? Yes, I have sighted King's Island.
812. In coming from Adelaide to Melbourne do you ever approach it at all? No.
813. Would a light on that island be of any service to ships coming from Adelaide? I do not think it would be of any service to ships coming from Adelaide, because vessels always try to make Cape Otway; I think that if there were a light on King's Island vessels would make more bold with it than they do at the present time.
814. Do you think it would be an advantage to make bold in approaching the island with reefs of the nature that there are there? It would be an island I should try to keep away from.
815. Do you think it desirable that a light should be placed on King's Island? It might suit vessels from Launceston bound here, or from Hobart Town, or that way; it might answer for them, and it would be desirable for those vessels.
816. Would they approach King's Island unless they were driven there? Unless they were driven there I do not think they would approach it.
817. Would a light on King's Island be of any considerable advantage to them? It would be certainly of advantage. It would be a different light to Cape Otway, and it would even be an advantage to vessels coming from the westward.
818. Then you are decidedly of opinion that it is desirable to put a light on King's Island? It would be desirable to have a light there.
819. Where would you propose to place it, or have you ever considered that subject? I have not thought of it much.
820. The Schanck light you think would be a great advantage, and also Cape Northumberland light? Yes.
821. Have you ever passed out of the straits on the east coast of Australia towards Sydney? I have been once round Wilson's Promontory.
822. In a sailing vessel? Yes.
823. Were you master of her at the time? Yes.
824. You cannot say that you are familiar with Wilson's Promontory? No.
825. You consider that all the purposes of safe navigation with Adelaide would be answered if there were a light on Cape Northumberland? Yes.
826. Have you any further suggestions to offer to the Board with reference to the improvement of the navigation between Adelaide and Melbourne? No.
827. Have you seen the Cape Otway light frequently? Yes.
828. Is it a good light? It is a very good light. [*The Witness withdrew.*]

Captain Robert Williamson examined:—

- Captain R. Williamson.  
7 Aug., 1856.
829. What vessel do you command? The "Lady Hayes," barque.
830. Where do you trade? I have made several voyages from England here and from Hongkong here.
831. Have you ever been round the straits up to Sydney? Never.
832. You always entered Bass's Straits from the westward? Yes; I have always come in by Cape Otway.
833. Has it ever occurred to you that it is desirable that any other lights should be put on the coast of New Holland? On Cape Northumberland; that, I think, is the only spot at which it is necessary; when we are going back from here we may sometimes get out of our way in rounding the Leeuwin, and a light there would be of great advantage to vessels passing round there.
834. It is a long low point, is it not? Yes; and in the night-time you might get ashore before you were aware of it.
835. Would that light show at a sufficient distance to prevent a vessel from approaching sufficiently near to be in danger? Yes; if it is any sort of a light you might see it twenty miles off.
- 836.

836. In coming from the Isle of France or from England, and running for the straits, will you be kind enough to give the Commission your opinion as to whether any advantage would be gained to navigation by placing a light upon King's Island? I think it would be very requisite for vessels coming from England or the Mauritius.

Captain R.  
Williamson.

7 Aug., 1856.

837. Coming from the westward? Yes.

838. You think a light on King's Island would be a benefit? It would.

839. You are aware that this subject—of a light on King's Island—is one that has been very much criticised and discussed in these Colonies: have you ever turned your attention to the subject? I have. In this last passage we had a long tack round the Leeuwin, and we fell in with a set which, if it had been thick weather, might have set us ashore on King's Island before we knew it. I had the wind pinched, and I just made Cape Otway, and by the dead reckoning we found a set of forty miles every twenty-four hours going right away to the south-east, and if we had not been able to get a sight for three or four days we might have been right ashore on King's Island.

840. Looking at this chart of King's Island here, would you give your opinion as to the position in which a light should be placed? I think the New Year Islands would be the better place to put a light. I have studied the island a good deal in my chart.

841. Have you ever anchored in the Franklin Roads? Never.

842. Are you aware that there are two formidable reefs that lie a short distance from the north end of the island? Yes.

843. Do you think that any light on the island would lead a vessel into danger from those reefs? No. It would take her clear of danger. It would warn her of it.

844. You opinion is, that it would be beneficial to have a light there? Yes; for all vessels coming from England, or the westward, bound for here or Sydney, or Launceston.

845. In making Port Phillip Heads, coming from the westward, have you found any difficulty? I never found any difficulty in making the land.

846. Or in making Shortland's Bluff light? No; I always made it very accurately.

847. Have you ever had the light so shut in by Point Lonsdale that you could not see it? Yes; I had it this time shut in.

848. Then you got to the eastward as soon as you could? Yes.

849. Do you think any advantage would be gained by having a light on Cape Schanck? Yes.

850. Would not a ship then be able to pick up her cross bearings much quicker? Yes, it would be a great improvement then.

851. Then you are decidedly of opinion that a light on Cape Schanck is very desirable? Yes.

852. Are you familiar with any other portion of the coast? No.

853. You say you have thought over this question of a light on King's Island very considerably? Yes; and I have been wondering that there is not a light on it. When I found the set this season, owing to the prevailing north-east winds, if thick weather had come on we should have been down on the island before we knew it. I never found so great a set as this year. The light there would have to be a standing one, in contradistinction to the revolving light at Cape Otway.

854. Has it ever occurred to you that a light on Cape Nelson or Cape Bridgewater would be any advantage as a guide to Bass's Straits? I do not think it is necessary to place a light there.

855. Supposing a light were placed on Cape Nelson, do you think the masters of ships coming from the westward would try to make it in preference to the Otway light? No; I think they would make the Otway light in preference to any; it is a very fine light, and a very fine place to make.

856. Have you any other suggestions to offer to the Commission with respect to any other portion of the straits? No; I am not well acquainted with the straits generally. [*The Witness withdrew.*]

Captain Joseph Walsh, examined:—

857. Do you command the "Eagle" schooner? Yes; trading between Sydney and Melbourne.

858. How long have you been in that trade? About eighteen months.

859. Usually commanding sailing vessels? Yes; this is the third vessel I have had in the same employ between here and Sydney.

Captain J.  
Walsh.

7 Aug., 1856.

860. Have you been trading to any of the other Australian Colonies? Not to the southward. To the northward, I have traded between Sydney and Newcastle.

861. In coming from Sydney, or proceeding from Melbourne to Sydney, are there any parts of the coast between the Howe and Sydney Heads which you consider should be lighted? I consider that a light somewhere about the promontory would be very requisite.

862. Taking up to the northward, between Gabo Island and Sydney Heads, is there any part of the coast that you think should be lighted? I think a light would be very convenient on Cape George at Jervis's Head.

863. Have you ever found in standing to the northward that the land about Cape George apparently runs further to the eastward than the charts would justify you in supposing? Yes; in many instances in running down from Sydney, I have often found the heads extend much further than I thought by the course I was steering.

864. Do you think there is an indraught there? There is a great indraught into Jervis's Bay.

865. Do you think a light there would be beneficial to ships passing and repassing? Yes, it would.

866. Is that the only point you would recommend to be lighted? No; I would recommend that Twofold Bay should be lighted.

867. That would be merely with reference to running into the bay for shelter? That is all; so that you could take it in all weathers. You cannot take that bay at night time now if it

Captain J.  
Walsh.

7 Aug., 1856.

is blowing hard, and it is often very requisite to take it, but a stranger cannot attempt it at all, if it is after dark.

868. You would consider a small harbour light all that was necessary there? Yes, just to point out a refuge port for vessels coming round in heavy weather.

869. Do you think that the position of the pillar which was erected by Mr. Boyd would be a proper place to erect a light? No; I think there is a point further to the northward that would answer better; there is another turn in the bay there.

870. After passing Gabo Island is there any other portion of the coast of Australia that you consider it would be requisite to light? Yes, there ought to be a light at the promontory; on one of the islands if it was possible to put it there—I should say on the Redondo if possible.

871. Have you ever seen the Rodondo? Yes, very often.

872. Do you think it would be possible to put a light there? It is very inaccessible, but there is nothing impossible to be done.

873. Do you think it would answer all the purposes of navigation to have a light at the promontory? Yes that would be quite sufficient for any man to run through the straits in any weather at all.

874. In sailing vessels do you pass near the promontory or do you keep out to sea? I always take the channel between the Rodondo and the main, because it is much shorter.

875. Have you ever seen the Ten-foot Rock? Yes.

876. Have you ever landed on the Ten-foot Rock? No, I have been drifting about it half a night.

877. Is there a heavy sea breaking over it? No; I have been in there at all hours, and all times of the day and night, and I never saw any heavy sea there.

878. Do you think that the Ten-foot Rock would be a good position for a lighthouse? It would be the best position in the neighbourhood.

879. Do you think it would be possible to put a lighthouse there? Yes; there are worse places than that with lighthouses on. I think it would be very easy to put a light there.

880. What height is the rock? I suppose the place where a lighthouse might stand is twenty-five feet high.

881. If it could be accomplished would not that answer the purpose? There would be no danger then at all in the straits if a light were there.

882. Have you seen the Rodondo frequently? Yes.

883. Is it very high? Yes.

884. Do you know Cleft Island? Yes.

885. Have you ever landed on it? No.

886. Would that be a good position for a lighthouse? It would be for vessels coming one way, but many times you would have the light shut out. If the light was on the Ten-foot Rock I think that would be the best position.

887. Do you consider that the navigation of the straits is attended with much danger for want of a light on that point? Only in thick weather; in thick weather a light there would be very useful.

888. Is there any particular set of the current about Wilson's Promontory, or are the tides regular there? On one occasion I was set from the promontory up to the southernmost Seal Island, showing a strong set to the northward and eastward.

889. In passing from the promontory towards Port Phillip Heads, is there any other point on the coast that strikes you as requiring to be lighted? Cape Schanck is the only point I think necessary to be lighted.

890. Do you think the Schanck is an important position to be lighted? Very, on account of not opening the Shortland's Bluff lights till you are quite abreast of the harbour.

891. A light on Cape Schanck would give you great confidence in making the port? Yes; in south-east and south-west gales it is a lee corner, and you have no guide until you open the lights. You can see them at sea bearing about north and by east clear of Point Nepean. I think north and by east is the first point you can see them in.

892. Have you been from Port Phillip Heads to Adelaide? No.

893. Have you made many voyages as an officer of a ship from the westward? I have been out from England to Portland Bay and back.

894. Have you ever considered the question of putting a light upon King's Island? I was driven one time in sight of King's Island, and at that time I was reading something about a light being erected there, and I thought it would be a very useful thing. I left Port Phillip very light in ballast and with the wind from about south-east, and I was driven over to Cape Wickham.

895. You have not given much consideration to the question of a light on King's Island? No.

896. Are you prepared to give an opinion as to whether you think it desirable that a light should be put there or not? I would recommend a light being put there.

897. Looking at the chart, at the north end of King's Island, can you offer any opinion as to where you think that a light should be placed there? I have not given the subject much consideration, and I should hardly like to give a positive opinion without considering it more.

898. Are you acquainted with the coast of Van Diemen's Land at all? I have been down the east coast.

899. Has it ever struck you that any necessity exists for a light on the eastern coast of Van Diemen's Land? I think a light on St. Helena Point would be very desirable. That is the point we steer for in coming from the northward in making Van Diemen's Land.

900. Do you know Banks's Straits? No, I have not been through there.

901. Have you any further suggestions to offer to the Commission? No.

902. If only one lighthouse is to be erected in Bass's Straits which do you think is most important? I think the light on Wilson's Promontory or one of the islands adjacent to it.

[The Witness withdrew.]

Charles

Charles Ferguson, Esq., examined :—

C. Ferguson,  
Esq.

- 903. You are the Chief Port and Harbour Master of this Colony? Yes.
- 904. And have traded as commander of vessels to these colonies in the early part of your life? Yes, from 1838 to 1850, when I settled here.
- 905. And you have a very general knowledge of the coast on both sides, including Sydney and Adelaide? Yes.
- 906. In entering Bass's Straits from the westward, is there any additional lighthouse anywhere on the coast west of Cape Otway that you think desirable with reference to the over-sea trade? I think a light is wanted now at or in the neighbourhood of King George's Sound to commence with, mainly with a view of benefiting the ocean line of steamers and vessels working round the Leeuwin and vessels looking for shelter. I believe that the next light on the coast that would be beneficial would be at Cape Borda, at the north end of Kangaroo Island, or on the Neptune Island.
- 907. Might that light at Cape Borda be considered a high road light? Certainly.
- 908. Then, passing on, what is the next point? Cape Northumberland.
- 909. That you consider an important position not only for the over-sea trade, but for all vessels coming from Adelaide here, or bound to Adelaide from here? Yes; I consider it is the turning point in the coast navigation, and is beset by adverse currents; the magnitude of the trade and the number of wrecks which have occurred there renders a light highly necessary.
- 910. Would not that also be a useful light for vessels working round the Leeuwin bound to India during the summer months? The main use of a light there is for the coasting trade; but I think if there were a light there a man knowing that would stand in and be benefited by it.
- 911. Is not the coasting trade from the Colonies of Victoria, New South Wales, and Tasmania to Adelaide, very considerable? Yes; very considerable.
- 912. There is no other part of the coast that you consider requires a leading light between Cape Otway and Adelaide, excepting the points that you have now stated? I think a light would be serviceable to the general over-sea trade on Cape Bridgewater or Cape Nelson. If a light at Cape Northumberland were decided upon I think Cape Nelson would be the better position of the two.
- 913. Do you think it is absolutely necessary that a light should be placed upon either of those capes supposing a light be placed upon Cape Northumberland? I think the time will come when it will be necessary; and in settling the general scheme of lights I think it should be considered, or you might hereafter find a difficulty in giving that light a proper character, either revolving or fixed. I think, considering the trade now between here and Adelaide, and the keen competition which exists, a light on Cape Nelson and another on Cape Northumberland would generally benefit the trade both ways.
- 914. If there were a light on Cape Nelson would the master of a vessel coming from the westward, entering Bass's Straits, try to make the light at Cape Nelson instead of the Otway light? I think not. A man might make it from accident, and if a light were there it would be serviceable to him, more especially the larger steamers from India would keep the coast aboard and make the light.
- 915. But for a safe entrance into Bass's Straits the light upon Cape Otway is the main light? Yes.
- 916. And in the right position? Yes.
- 917. Supposing a light to be placed on Cape Nelson, would not that, to a certain extent, be serviceable to the harbour of Portland? Yes.
- 918. And for that reason would you give the preference to Cape Nelson over Cape Bridgewater? Yes; but I think that is a question which could better be answered by a person aware of the relative heights of the two capes. I know that Cape Nelson is some three miles further south than Cape Bridgewater, and I have a doubt in my mind whether the height of Cape Bridgewater, and the danger of that bight between the two capes, might not call for a light to be at Cape Bridgewater instead of Cape Nelson.
- 919. Then you would not like to give a positive opinion as to which of those two capes it would be desirable to put a light upon until you have visited them? Not until I have been and stood upon the two capes.
- 920. In approaching the western entrance of Bass's Straits have you ever found a ship that you commanded receive any particular set from the current? Yes; in nearly all my voyages I have found that I was set to the southward, and I have found in two instances that where I calculated upon making the Otway land, I have made the northern point of King's Island rather disagreeably close, arising from a set to the southward.
- 921. You have, of course, considered the question of a light on King's Island,—would you favour the Commission with your opinion upon that much disputed question? My opinion, I fear, will be adverse to most of the opinions expressed. My opinion is that there should be a light there, and that it should be on the New Year Islands. A light on the New Year Islands is not so much needed as a guide as to warn men of the danger which they are in, resulting from this very current; and the light ought to be on the most weatherly part of the danger. A light there would assist vessels subjected to the southerly set which is experienced there. It is my impression, borne out by conversing with men who have been wrecked there, and from observations and noticing it for a period of something like sixteen years, that all the wrecks which have occurred there have arisen from men being largely out in their reckoning, and if the light were on the northern end of the island it would not help them much, because a man might be so far to the southward as not to see the light; he would run probably with a greater amount of confidence from the fact of a light being there, and he would be equally liable to lose his ship by being beyond the range of the light.
- 922. Because if he made the land to the southward of the northern part of the island he would

7 Aug., 1856.

C. Ferguson,  
Esq.  
7 Aug., 1856.

would have no opportunity of seeing the light, whereas if it were on the New Year Islands he would see it? Yes.

923. In sailing round the island, and being in its neighbourhood, have you observed whether it is subject to be capped or clouded by fogs, or whether it and the neighbouring islands are sufficiently clear to justify the supposition that the light would be seen in anything like ordinary weather? I think the middle of the island is liable to be enveloped in fog from the marshy land in the interior of it, but both the northern point and the New Year Islands would be visible in ordinary weather when other land is visible.

924. The New Year Islands are tolerably high? Yes.

925. Have you ever landed on them? No, but I have passed close round them.

926. Do you know the nature of the anchorage in Franklin Roads? I have never anchored there, but there is good refuge for vessels, and a light being there would be of very great service. The master of the "Flying Arrow" told me that one of his objects was, to get round there, cut away his masts, and save his ship. The "Whistler" was beating about all night to and fro, and at daylight he was too far in shore to get into the anchorage. My opinion is, that had there been a light there, the captain would have calculated his position and run for it, and either let go both anchors, or have done those things that a sailor would do under such circumstances, and so have saved his ship.

927. Supposing a ship to be in a heavy gale from the westward, with the Harbingers under her lee, would she see the light on the New Year Islands in thick weather? If a vessel were caught with a westerly gale midway, between the New Year Islands and the Harbinger Rocks, the bearing of the light on the New Year Islands would enable him to clear the Harbinger Rocks easier than a light on the north end of King's Island would, inasmuch as he could not estimate his distance from the north end of King's Island, and consequently could not say how far he was from the rocks in a direct line.

928. You think that the light should be erected upon that island? I do.

929. You know that there is an impression abroad that a light in that neighbourhood would be more likely to bring vessels into danger than to carry them out of danger? There is that impression.

930. You think that is not a well-grounded objection? No, if proper care be taken.

931. Do you believe that there are any practical or engineering difficulties in erecting a lighthouse on the New Year Islands? No. I think the expense of erecting a light on the New Year Islands would be something like half what it would be on King's Island, because in the one case you could land the supplies on the island without any difficulty, and in the other case you would have to carry them fourteen miles overland, and have a road to make.

932. From your experience, in your judgment a light on the New Year Islands would be more advantageous to ships coming from the westward than a light on King's Island? Certainly.

933. Have not the majority of the wrecks on King's Island been to the southward of the New Year Islands? They have all been to the southward; and in the case of the unfortunate "Catariqui," I knew the second officer, and I ascertained that the cause of the wreck, in his opinion, was that the ship was considerably south of the position they calculated she was in, and in my opinion a light on the New Year Islands would have saved that ship at that time. In the case of the "Rebecca," a vessel that was wrecked close to the New Year Islands, the master's reckoning was out somewhere about thirty miles; he was south of his reckoning, and a light on the New Year Islands I believe would have saved him.

934. Do you know that at the time the lighthouse was erected on Cape Otway it was contemplated also to erect one on the New Year Islands? Yes.

935. What was the reason that that intention was not carried out? There was some impression that a light there would induce men to seek the coast which they should rather avoid; there was also a dread at that time of our own coast, between Moonlight Head and Cape Otway, and it was supposed that men knowing there was a light at the north end of King's Island would steer for it and get into difficulties.

936. If one light only was to be erected, you think Cape Otway was the most judicious site? Yes.

937. Have you ever seen the Navarino Shoal? I have seen the wash of it.

938. Have you examined the Harbinger Rocks? I have been quite close to them. The southernmost is a wash, the other one the sea breaks upon, and there is a considerable tide there. It is hardly a regular ebb and flow, but is governed mainly by the winds.

939. You think it would be perfectly impracticable to erect a lighthouse on one of the Harbingers? I fear it would be perfectly impracticable. In these days nothing is impossible, and could a light be put there it would be the point for it, but I think it is not worth while to entertain the idea, the roll of the swell washing over it is so great.

940. In entering Bass's Straits from the westward and approaching Port Phillip, what other lighting do you think desirable to render the approach to the port more easy than it is now? It is a point which I have considered a good deal, and now that we have got a leading light erected I think the question of a light on Point Lonsdale is settled, but I do think that to guard against casualties, although it may not be urgently required, a light should ultimately be placed on Sandy Point, or if the high light at Shortland's Bluff could be elevated it would be very desirable.

941. You think that either the present high light should be heightened, or an additional light be placed upon Sandy Point? Yes, in order to illuminate the Barwon Bight.

942. That you do not consider a high road light, but only a harbour light? Only to serve vessels bound to Port Phillip.

943. What is your opinion of a light on any of the points eastward of Port Phillip? One on Cape Schanck certainly is desirable. I think the Schanck light should be the first to be erected.

944. As being the one of the greatest and most urgent necessity? Yes.

945. Do you consider that a light on Cape Schanck would be any assistance to vessels bound through the straits, as well as to those bound into Port Phillip? Yes, occasionally; but I look upon it more as a Port Phillip light than an over-sea light, but there would be times when men beating in the straits would be guided by it, and knowing it was there they would stand in with greater confidence.
946. Would it not be ultimately of importance to Western Port? Of very great importance to Western Point, and a man might frequently run in there and take shelter.
947. Is there much trade between Western Port and Melbourne? There is a growing trade, and I have no doubt it will increase. Quarries are being opened up there, and the old cry of coal being found is revived again, and may cause a considerable traffic there.
948. If there were a light placed upon Cape Schanck, a ship, by getting a cross bearing to that, and another to Shortland's Bluff light, would have very great confidence in entering the harbour at all times? Yes.
949. In point of fact, the advantages of a light on Cape Schanck are so manifest that there can be no doubt about its necessity? None whatever.
950. In proceeding from Port Phillip to the eastward, what point of the coast would you next consider it advisable to have a light placed upon? Cleft Island, or the Ten-foot Rock, if practicable.
951. Is the light that you would propose to erect there a light necessary for sailing vessels as well as for steamers, or is it merely a light for vessels which cut off the corners? No; all the traders that pass through the straits would benefit by that light; over-sea vessels would benefit largely by it. A ship from England to Sydney would benefit largely by it, for in strong westerly gales a man finds himself down there and is unwilling to heave to, and with this light there instead of heaving to he would run.
952. You think the light should either be erected on Cleft Island or upon the Ten-foot Rock? Yes.
953. The promontory itself you would not recommend? No, the promontory is too great a bluff; it is not a sharp jutting point, and it would not benefit all the trade.
954. It would only be available for one side? Yes, I fear so.
955. It may become a question in considering the general over-sea lights, whether instead of thinking of a light on the Ten-foot Rock, a light on Cleft Island, and another on the southernmost of the Seal Islands would not benefit the over-sea trade more, you would then have bearings that would carry you in perfect safety round? Yes, that would be the best arrangement.
956. Would a light on Cleft Island be always visible to vessels coming from the westward under ordinary circumstances? Yes, I think so; there is nothing to obstruct the view; there is no high or marshy land to cause the vapours which sometimes cover such points.
957. In the case of a vessel being up by Cape Liptrap the light would be obscured by the Glennies, would it not? It might be for a short time, but I do not think any danger would result from it.
958. Would a light on the Seal Islands be serviceable for the approach to the harbour of Corner Inlet? Very serviceable, and for Port Albert also.
959. Might not the effect of a light on the Seal Islands be to induce a stranger to go into that bight, and might not be occasionally be placed in a disagreeable position with respect to the Ninety-mile Beach? I think not. I think the absence of a light leads many men down to that bight when, if they had a light, it would warn them against it.
960. Supposing a large vessel, just to the eastward of the Seal Islands, being suddenly caught with an easterly gale, which we know occasionally comes in with great violence and very suddenly, would not her position then be one of considerable difficulty? With a wind in that direction she could stand to the southward and get away off at once; she would then open the Cleft Island light and run for it.
961. In your opinion would the master of an over-sea large ship make use of the passage round Wilson's Promontory in preference to making use of the Kent's Group light in passing through the straits? A total stranger, I think, would not. There is a dread of that beach in most men's minds. With a north-west wind every man would, because it takes some time before it hauls round much to the southward; but I think a man with a south-west wind would keep Kent's Group light aboard, knowing that the wind would probably souther as the day increased; but I believe that the greatest benefit of those two lights I have spoken of would be to the coasting trade.
962. Would they not be of great service to the large ocean steamers which may be expected here? They would be of great service. The "Melbourne" had a most narrow escape under Waterloo Bay, thinking they were well to windward; and a light on Seal Island would certainly have saved them; and I think a similar difficulty was experienced by Captain Mathews in the "Great Britain"; in iron vessels the difficulty of ascertaining the error of the compasses is very great, and an error there of a quarter of a point would be a serious matter; and as the bulk of the trade are iron vessels, I think it is a very important point that they should be guarded there by a light.
963. But supposing the engineering difficulties could be overcome, a light on the Ten-foot Rock would be preferable to the two lights you have mentioned? No; I do not think so. There is a distance of about twenty miles from the Ten-foot Rock to the Seal Islands, and in thick weather you could not see that distance.
964. Therefore you think the most advisable way of lighting that turning point would be by having two lighthouses, one to the east and the other to the west of that promontory? I do; but if it is decided to have only one light I would prefer the Ten-foot Rock to Cleft Island. The only difficulty with the Ten-foot Rock might be that the Rodondo would intercept for a small space the rays of light passing from the lantern on the Ten-foot Rock.
965. Do you think it is perfectly impracticable to put a light on the Rodondo? No; I do

C. Ferguson,  
Esq.

7 Aug., 1856.

C. Ferguson, Esq., not think it is impracticable; but I think when it was there it would be useless, from its great height.

7 Aug., 1856. 966. You say another advantage would accrue to the coasting trade from a light on the Seal Islands which would be the guide to Corner Inlet and Port Albert, two ports which are of growing importance? Yes.

967. Would you in such a case, if it were decided to put two lights, one on each side of the promontory, select the southernmost Seal Island for the position of one? I would, because my endeavours would be to guard men coming to the northward, and consequently I would push the light as far south as possible.

968. Have you ever landed on the Ten-foot Rock? No.

969. Have you seen it frequently? I have watched it passing in a steamer as a passenger. I have not seen it as a commander.

970. Do you think it practicable to put a lighthouse there? I do, from what I have heard from others, and from the shelter I think a vessel could get in the neighbourhood of Waterloo Bay. Although it would be a work of difficulty I think it would be quite practicable, and if a lighthouse is not placed on it I should recommend that an iron beacon be erected on it.

971. At the time you passed the Ten-foot Rock was it blowing hard? No, it was very fine weather.

972. Then you cannot say what the effect of a sea there would be? No.

973. Have you landed on the promontory? No, I have sailed very close to it.

974. The high land on the promontory is to the south-east part of the promontory? Yes.

975. Then any light placed there would be useless to vessels coming from the westward? I fear it would be shut out, otherwise that would be the best place, in consequence of the facility of landing supplies at Waterloo Bay.

976. What, in your opinion, is the height of Wilson's Promontory, judging by estimation? 500 or 600 hundred feet. I think the promontory would not answer; it would be only available for vessels coming from the eastward, I do not think it would be of much service to vessels coming from the westward.

977. If it were found from actual survey that a point of the promontory could be found at which a light would be visible in both directions, do you think it should be placed there? Yes, decidedly, because of the facility with which you could communicate with the lighthouse.

978. If a light could be erected there so as to show both ways, do you think a light there would answer the purpose as well as two lights showing, one to the east and one to the west? No; I think the two points I have named would warn a man before he got into any of the dangers, which the promontory would not do, for he might get into danger before he saw the light.

979. Do you know whether there are any engineering difficulties with respect to the erection of a lighthouse on either of the two islands you have spoken of? I do not.

980. You have not landed on either of them? I have not.

981. You do not know whether they would be difficult of approach or the contrary? I think there would be no great difficulty in approaching Cleft Island; I have heard from others that it could be easily approached. The other I have no knowledge about.

982. Have you ever been across to Launceston or any part of Van Diemen's Land from here? I have been to Hobart Town, never to Launceston.

983. Have you passed through Banks' Straits? Yes.

984. Do you consider that that channel is sufficiently lighted? I think so.

985. Do you think that the Kent's Group lighthouse is any assistance to vessels leaving Port Phillip for Launceston and Hobart Town? It is not in the direct route, but I think it is a decided assistance to them, and largely an assistance in the Port Albert and Sydney trade.

986. You think there is no occasion for any further light in Banks' Straits? No.

987. Do you think it desirable that any light should be placed on the eastern coast of Tasmania? My impression is that a light should be placed on the Eddystone Point. A vessel making a voyage over-sea would also derive a great benefit from a light on the south-west cape.

988. Have you been round the coast since the Gabo Island light has been placed there? I have not.

989. Do you think that light is placed in a proper position? I have not seen it; I think it is placed in a proper position, but the light is inefficient, from all I hear. A wooden structure so liable to be destroyed by fire should not be permitted to remain, but there should be a stable iron or stone structure put there at once. It ought to be a higher and better light.

990. You think the point is so important that it is time something more than a temporary lighthouse should be erected? I think it should be one of the best lighted points on the coast, from being at the end of a deep bight, and one of the main turning points in the coasting and over-sea trade to New South Wales.

991. Does it strike you that any light should be placed between Cape Howe and Port Jackson? Yes. I think there is no doubt about the necessity of a light on Jervis's Head or Cape St George. The actual position I cannot say, but I have a deep recollection of being led down there on one occasion in going to Sydney, a good many years ago, and finding my ship very close in under the land when I expected to be some distance farther off. There is a great indraught there. I believe the Twofold Bay tower if lighted up would be most beneficial to ships taking refuge.

992. That is merely as a local light? As a local light, and it would be of service to vessels passing also.

993. Would there be any difficulty, in your opinion, in keeping up a communication by the Government of Victoria with the Wilson's Promontory lights, supposing them to be erected? No; but to prevent casualties those two island lights and King's Island light should always

have

- have six months stores in advance. We have that at Cape Otway; when I send twelve months supply, and that is landed, there is eighteen months supply on the station.
994. What oil do they burn in the lamps there? The best sperm oil.
995. Do you think there would be any difficulty in the Government of Victoria forwarding the supplies to any lights at Wilson's Promontory? Certainly not, if we keep our own steamer, but I would not trust to sailing vessels.
996. Considering the large amount of traffic by steam ships that there is between here and Sydney, would there be any difficulty in keeping up a communication with the promontory lights? No.
997. Cape Otway is already provided for by this Colony? Yes, and paid for out of this revenue.
998. Would it be desirable that this Colony should undertake the supply of the Cape Northumberland lighthouse? No; it is too far distant from the centre of Government, and I think it would be approachable overland from one of the South Australian ports.
999. And that is in the territory of South Australia? Yes.
1000. How would you propose that the lights on King's Island should be supplied, bearing in mind that it is in the Van Diemen's Land territory? By the Van Diemen's Land Government consenting to the Government of Victoria having the management of the light; but I do not think we could do it better than they.
1001. Are there not greater facilities for supplying the stores from this Colony than from the north end of Tasmania? Yes, we have greater facilities, but my opinion is, that if the Van Diemen's Land Government would take charge of the light they should do so.
1002. Is not King's Island more accessible from Victoria than from Van Diemen's Land? Much more so, and if a casualty did arise, there would be many ways of communicating with Victoria, by signalling and so on, more than with Van Diemen's Land, for the ships that would sight King's Island coming to Port Phillip would be as twenty to one in comparison with those that were going to Van Diemen's Land.
1003. Supposing an arrangement were come to for laying down a line of telegraphic wires from Port Phillip to Van Diemen's Land, through King's Island, would they not have an opportunity of communicating with Van Diemen's Land? Yes; but the relief would be quicker, I think, from here than from Van Diemen's Land.
1004. In the case of the wreck of the "City of Melbourne," was not Launceston the first port they communicated with, although the steamer belonged to this port? Yes; but that was on the very opposite side of the island to where the lighthouse would be; and they could get a boat easily to Circular Head. There is no doubt that those who will benefit most by a light at King's Island would be the vessels going to Sydney. A vessel going to Sydney would run down in mid-channel, whereas in coming here they keep the main-land aboard. The only two occasions I went in sight of King's Island upon an over-sea voyage were when I was bound to Sydney.
1005. Are there any good sailing instructions for the entrance of Bass's Straits published? I am not aware of any containing any wrong information; they are just those that were drawn up by Flinders.
1006. Do you remember whether there is any strong advice to vessels not to borrow on King's Island in them? I think there is sufficient in them upon that subject.
1007. Would it not be very necessary to warn strangers that a light put on King's Island was not put there for them to steer by? I think that should be very clearly stated.
1008. Have you any suggestions to make to the Commission on the subject of the great highway lights? No more than to refer the Commission to the correspondence I have had with the Government upon the subject of these and other lights during the last four years. King's Island light has been talked of for fourteen years, and every now and then the public have been startled by the loss of vessels and lives, and then then the question is revived. I certainly think that a light should be erected without loss of time either on King's Island or on the New Year Islands.
1009. You have stated it as your opinion that if a light had existed on some part of King's Island some of the wrecks which have taken place might have been avoided? Yes; had there been a light there the facilities would have been so great to traffic that the advantages would have been immense compared with the small expenditure, and there ought to be no time lost in erecting it. I would observe that all the new lights about to be erected should be catadioptric lights, and be all of the same kind, and under one management, if possible.
1010. The light on Cape Otway is a revolving light, is it not? Yes.
1011. What kind of light would you recommend to be placed on King's Island? I think there should be two fixed lights there. My reason is, that the Cape Otway light has a triangular frame with the usual revolving apparatus, and one of the instructions to the keeper is, that in the event of the machinery going wrong he is to stop the light and make it a fixed light and that has been done once or twice; I think the consequence would be so terrible if that happened, and if there were two fixed lights, one at Cape Otway and one on King's Island, and a man mistook the one for the other, that in order to avoid that, the King's Island light should be a double light, to prevent all doubt; I think that with a revolving light so distant from head quarters as Cape Otway, and not frequently looked at by the engineer, it is likely to be stopped, therefore, I think the light at King's Island ought to be of so definite a character that there should be no doubt about it; it is a light that a man will suddenly see when he does not expect to find a light, and the character of it should be so clearly defined that a man should not be left in doubt whether it was Cape Otway light or not.
1012. Is there any other kind of light that would assume a more startling appearance than two fixed lights? No; I think the distinction between the revolving and the intermittent light is not sufficiently great.
1013. What kind of a light would you recommend at Cape Schanck? A catadioptric flashing light of the best construction.
- 1014.

C. Ferguson,  
Esq.  
7 Aug., 1855.

- C. Ferguson,  
1851.  
7 Aug., 1856.
1014. What distinguishing mark would you make between the two lights to be erected at Wilson's Promontory? If there is only to be one it should be a first class catadioptric fixed light; if you have two lights, one must necessarily be fixed, and there should be the greatest distinction you could get between the other and the Kent's Group light.
1015. The light on the western side of Wilson's Promontory you would have a first class fixed light? Yes.
1016. Then what would you have on the Seal Rock? A flashing light on the southernmost of the Seal Rocks.
1017. You think a light at Cape Northumberland would be more easily managed by the Adelaide Government than by this Government? Yes; it is a distance of nearly 300 miles from us, and it is within something like 40 miles of a port in South Australia; moreover, each Government should manage their own lights.
1018. Have you any further suggestions to offer to the Commission? I have not. (*The Witness withdrew*)

Mr. James Lawrence examined:—

- Mr. J.  
Lawrence.  
7 Aug., 1856.
1019. You are a merchant in this town? Yes.
1020. You formerly commanded the "Burra Burra"? Yes.
1021. Trading between where? Between Adelaide and Melbourne.
1022. How long were you in command of that vessel? Twelve months.
1023. And during that time you traded entirely between those two ports? Yes.
1024. Then you have had ample opportunity of ascertaining whether any difficulties exist in reference to the want of lights on portions of the coast you have passed? Yes.
1025. Will you point out the points on which you think it absolutely necessary that lights should be erected? Cape Northumberland, I think, of all other parts of the coast is the most important point to be lighted, not only for vessels from Adelaide, but for all vessels from Europe and coming from the westward.
1026. You think that is the point on which it is most expedient a light should be erected? Yes, not only for coasting vessels, but for over-sea vessels. In fact, a light there is more desirable, I should say, than on King's Island.
1027. You are aware that some vessels have been wrecked in the neighbourhood of Cape Northumberland? Yes.
1028. Have those wrecks been frequent? They have been frequent, and might have been all avoided if there had been a light. All the wrecks have taken place in the dark, and nearly all within the range of a light.
1029. And you think if a light had been erected there some, if not all, of those vessels would have been saved? I believe they all would have been saved. The "Varoon" is the only one that was out of the range of a light, and she might have seen a light before she went on shore.
1030. Have you been close to the point? I have. Before I commanded the "Burra Burra," I had a little steamer of my own, which was chartered by the underwriters to save the cargo and wreck of the "Nene Valley."
1031. Your vessel was chartered to go down to the wreck of that vessel to save property? Yes.
1032. What was the result of that? The result was most unfortunate, certainly. In order to save all that we possibly could, we anchored inside the reef at night within range of a light, had there been one there. During the night a gale sprung up upon us, and if we had had a light to guide us we could have come out with safety; that not being the case, we were unfortunately wrecked in trying to come out.
1033. A light would have been a sufficient guide to have enabled you to go clear of the land? Distinctly so.
1034. Do you think that if that point were lighted there would be a sufficiency of lights on that coast with those already in existence? I should think so. The principal reason why a light should be put there, is that the coast is rather low there for fifty miles on each side of it, and it is very deceiving. It juts with that sort of prominency into the southern ocean that the prevailing winds from the south and west strike upon the corner and send the current at right angles with it, and if there was a light upon Cape Northumberland it would show vessels where they were.
1035. Is it your opinion that there is any necessity for a light between Cape Northumberland and Kangaroo Island? I should say not an immediate necessity, because it is like crossing a bay.
1036. Between Cape Northumberland and Cape Otway are there any points that ought to be lighted? I should say that a light on the Lawrence Rocks, in the neighbourhood of Portland, would be of great service.
1037. Would not that partake more of the character of a harbour light? Probably it might be partially a harbour light, but if there were a light there it would be of great service. A light on the Lawrence Rocks would do double service; it would enable vessels in dark stormy nights to pick up Portland Bay, and to vessels passing in that neighbourhood it would answer the same purpose as if placed on Cape Nelson or Cape Northumberland.
1038. In passing out of Port Phillip or coming from South Australia to Melbourne, have you found the want of any light in the immediate neighbourhood of the Port of Melbourne? I have felt the want of a good light at Port Phillip Heads. It is a wretched light there; it is only like a pier light. You can only see it eight miles outside the Heads instead of twenty miles. I have repeatedly felt the want of a light there in thick weather or boisterous weather of any kind. You cannot see the light there until you are quite down upon the Heads. The bluff overlooks the Heads, and to a stranger it is very deceiving.

1039. Have you ever considered whether any light is wanting on the Schanck? I think not. The Schanck is a piece of land that is very prominent, and no stranger could mistake it.

1040. Would not a light on the Schanck give confidence to vessels approaching Port Phillip Heads? Most distinctly.

Mr. J.  
Lawrence.

7 Aug., 1856.

1041. In standing round from the westward—in coming round from Adelaide, if you knew there was a powerful light on the Schanck, would you not run with the greater confidence to get a cross bearing of that light than you can now, having only an indifferent light at the Heads? Undoubtedly so, but still I should say if there was a powerful light on Shortland's Bluff there would be no occasion for a Schanck light.

1042. Have you ever observed in standing in, when you have been over to the north-east side of the bay, whether that light was shut in altogether? It is shut in far to the southward.

1043. Is it not shut in until you can bring it to bear something like north half east? Yes; it ought to be seen over Point Nepean coming down from Cape Otway. We have to open it about north half east before we can see the light.

1044. You are aware there is a double light there? There is a leading light. I am speaking with reference to the lighthouse, not with reference to the leading light.

1045. Is there not a disadvantage if you make use of two lights as a leading light in having one light very much above the other? Not at all. If you pick up the upper light you can always get hold of the other.

1046. If the upper light was very much elevated above the lower light, would it not cease to have the effect of a leading light for the purposes for which it is intended? Not by any means. The first thing is to see the light, then, when you know that is the light, you know very well there is a second light. When you pick the first light up you are in a position to have the ship in good command, and when you see the second light you can put the ship in good position.

1047. You would rather improve the light on Shortland's Bluff in preference to erecting a light upon the Schanck? I should say so.

1048. You only allude to the case of a vessel coming from the westward. To a vessel coming from the eastward would not the Schanck light be of importance? Seven-eighths of the vessels coming from the eastward are coasters, and they all know the course they have to steer; but strangers coming from the westward are much more at a loss in picking up the heads.

1049. But if a stranger knew there was a powerful first-class light on Cape Schanck that would give him great confidence in making the heads, and he would borrow on that shore even in thick weather, would he not? No doubt he might; but with strangers I think it would be apt to mislead them; they might take the Schanck light for Port Phillip light unless there was some marked distinction in the character of the light.

1050. Have you had any opportunity of judging of the advantage or disadvantage of placing a light upon King's Island? I should say that a light upon King's Island would be a great desideratum, on the same principle that I speak of the Port Phillip Heads lights, picking up King's Island, would enable vessels to be guided into the straits.

1051. Are you aware that a nasty reef lies off the north of the island? Yes, I have seen it, and I should not like to see it again under the same circumstances.

1052. Do you think that a light there would be at all likely to lead a vessel into that danger, or would it enable her to get clear of it? I should say that it would enable a vessel seeing the light to have more confidence. Supposing she had been in a storm and received damage, I should say if a light was there it would enable the commander to have more confidence either to put his vessel in a position to save the lives of his crew or to run clear of the reefs.

1053. In placing that light can you at all give an opinion as to whether it should be upon King's Island or upon one of the adjoining islands. Are you acquainted with King's Island? Not particularly.

1054. Have you considered the subject as to where a light should be placed, supposing one was placed there at all? I have passed within a very short distance of the Harbinger Rocks, and I should say a light upon Point Wickham would be of great service.

1055. Do you think that would be preferable to placing it on the New Year Islands? Decidedly so.

1056. You are decidedly of opinion that Cape Wickham would be the best place where to put a light? Most distinctly.

1057. And you are decidedly of opinion that it would be beneficial to navigation that a light should be placed there? Yes, and a lighthouse at Cape Northumberland would be very desirable. The course from Cape Otway to Cape Nelson is west and by north, and from there to Cape Northumberland about west-north-west, and then the coast tends about north-north-west half west, and I consider Cape Northumberland to be the great turning point upon the west side of Australia as Cape Howe is on the east, and I think it ought to be lighted.

1058. Would that light be of assistance to the large ocean steam vessels coming up with the mails? Yes, the utmost importance.

1059. Do you think there would be any difficulty in erecting a lighthouse on Cape Northumberland? Not the slightest; there is plenty of timber, stone, and lime there.

1060. Is there any shelter for a small vessel there? Very little shelter; but it could be supplied from Rivoli Bay, which is about forty-five miles from Cape Northumberland.

1061. Then you think there would be no difficulty in erecting a lighthouse or supplying it from Rivoli Bay? Not the slightest. The "Nene Valley," the "Young Australian" steamer, the "Iron Age," the "Varoon," and two other vessels have been lost within ten miles on each side of Cape Northumberland within the last two years, and the "Varoon" was lost with every soul on board.

1062. Is there any particular set of the current in entering Bass's Straits from the westward, between Cape Otway and King's Island? There is a current running from the westward.

- Mr. J. Lawrence. 1063. Is there any southerly set between Cape Otway and King's Island? I think there must be, but I do not know it from experience. The "Young Australian" steamer was my own; and when I went down to save the wreck of a vessel at Cape Northumberland, I had to make several trips round to Portland for shelter, and I have coasted close along the beach as near as the breakers would allow, and I am sure if the light had been erected at Cape Northumberland it would have saved these ships.
- 7 Aug., 1856. 1064. If there were a light at Cape Northumberland you would not consider any other light necessary between there and Cape Otway for the over-sea trade? No; Cape Bridgewater is high land, and you can see it some fifteen miles off, but Cape Northumberland is a nasty, low, rocky coast.
1065. Are you familiar with the coast to the eastward of Port Phillip? No; I have been from Wilson's Promontory to Sealer's Cove, but I do not profess to know much about that part of the coast. [*The Witness withdrew.*]
- Adjourned to to-morrow at ten o'clock.

FRIDAY, 8 AUGUST, 1856.

Present:—

CAPTAIN KAY, R.N. | MR. BROWNE.

Crawford Pasco, Esq., R.N., examined:—

- C. Pasco, Esq. 1066. You are Water Police Magistrate of the Colony of Victoria? Yes.
- 8 Aug., 1856. 1067. Were you employed in H.M.S. "Beagle" in surveying this coast? Yes, I was specially detached from the "Beagle" for the survey of Bass's Straits.
1068. A great portion of the survey of Bass's Straits was conducted under your superintendence, was it not? I assisted Mr. (now Commander) Forsyth, who was my superior, and conducted this portion of the survey.
1069. Do you know the east coast of New South Wales also, from Sydney downwards? Partially; merely by having made passages between this and Sydney. I was not engaged in the survey of that coast.
1070. Perhaps from your passages up and down the coast you will be able to give the Commission your opinion as to whether you consider that there should be any additional light on that coast between Sydney Heads and Cape Howe? It occurred to me in the last trip I made that a light would be desirable on Cape George.
1071. That is the southern entrance of Jervis's Bay? Yes; Point Perpendicular I think is too elevated for a light.
1072. Are you aware that vessels experience a considerable indraught or setting to the southward so as frequently to bring them considerably to the westward of the course which they anticipate making, and that sometimes in consequence get into Wreck Bay and are lost? I am not aware of that fact.
1073. Supposing a light to be erected on Cape George, would you then consider that the coast between Port Jackson and Cape Howe was well lighted? I should think it sufficiently lighted. As the resources of different localities become developed it may eventually become necessary to have harbour lights.
1074. But speaking of the great highway lights, you think that then the coast between those points will be well lighted? Yes, sufficiently.
1075. Have you had opportunities of observing the light on the Howe since it has been erected? No; I have never seen that light.
1076. From its position do you think that it is beneficial to navigation? Decidedly. I had understood from one shipmaster in the trade that it was not a good light; but from others I have understood that it is an excellent light, and they approach it with confidence. I have never seen it myself.
1077. Was the light on Gabo Island originally suggested by Captain Stokes? I am not aware of that.
1078. It was not suggested at the time you were with him in the "Beagle"? I am not aware; Captain Stokes was in the vicinity of Cape Howe in the "Beagle" at the time that I was detached from her.
1079. In proceeding to the westward what is the next point at which you think it would be desirable that a light should be established? I think a light is necessary for vessels rounding Wilson's Promontory.
1080. In the course of your surveys did you ever land on Wilson's Promontory? Not on the extremity of the promontory. I have landed at Corner Inlet.
1081. Have you ever had an opportunity of judging of the geological features of the cape itself? I have been very close to it, and it appears to be all granite boulders.
1082. As it must be very evident that the placing of a light on Wilson's Promontory would require that it should be in such a position that vessels could see it in coming both from the east and from the west—is there any spot on the coast which you could suggest as desirable for a light? I should not recommend a light on the promontory itself. The point I have always felt would be most useful for a light would be on the Ten-foot Rock, if it be practicable.
1083. Have you seen the Ten-foot Rock? Yes.
1084. Have you landed on it? I have not.
1085. Do you think it would be practicable to erect a lighthouse there? I think there is ample base for it.
1086. Does it stand above the water to any considerable height? More than ten feet, I think.

1087. Is there not a very heavy sea breaking over it in both easterly and westerly gales? I should think the sea must break over it in heavy gales.
1088. You are not aware as to that from your own observation? No.
1089. Supposing it were not practicable to erect a lighthouse on the Ten-foot Rock, what is the next spot you would suggest? I think Cleft Island; that is an awkward point to pass from the westward, it being so much lower than the promontory.
1090. A light on Cleft Island would only be serviceable to vessels coming from the westward? Vessels coming down from the eastward might avoid the Seal Islands, which lie on the eastern side of the promontory, by shaping a course to open Cleft Island clear of the promontory, checking their position by Kent's Group light and an occasional cast of the lead.
1091. Then you think a light on Cleft Island would afford advantages to vessels coming from the north-east as well as from the westward, because they could shape their course in order to open the light? Yes; I am not sure of the elevation of Cleft Island; I should think it must be seventy feet high.
1092. Do you know whether that island is also of an impracticable character for the erection of a lighthouse? It is also rocky, but I should not say impracticable.
1093. Is it of such a description as that you would be able to land on it? Yes, I think the "Beagle's" boats have landed on it.
1094. And found shelter? Yes, the "Beagle" anchored under the Glennie Islands for some time.
1095. Supposing it were considered desirable to erect two lighthouses for the lighting of the passage round the promontory, what are the positions you would select for those lighthouses—one to the east and the other to the west? I think Clifty Island, the southernmost of the Seal Islands, would be a desirable point for one, for vessels coming down from the north-east, and it would also be serviceable for vessels approaching Port Albert.
1096. It it could be carried out, you would suggest the propriety of two lights, if the Ten-foot Rock should be found to be impracticable for the erection of a lighthouse? Yes.
1097. If a lighthouse could be erected on the Ten-foot Rock would that answer the purpose of the two lights? I should say not, unless the light could be sufficiently elevated to be visible from the Seal Islands, which being a distance of seven leagues should be at least 200 feet above the sea.
1098. Would not a vessel knowing there was a light upon the Ten-foot Rock be enabled to keep clear of the Seal Islands? I think they might by shaping a course to sight Kent's Group light and then making for the Ten-foot Rock.
1099. Are you of opinion that there is no one spot upon the promontory upon which a lighthouse could be erected which would be available for the purposes of navigation both ways? I do not remember to have noticed such available spot, but the importance of the question is worthy an examination of the locality before deciding; keeping in view the danger which exists in Cleft Island being obscured under the high land of the promontory.
1100. If only one light were decided on to be carried out at present at the promontory, which would you suggest as being the most useful site for it? I should say the Ten-foot Rock, if practicable, otherwise the Cleft Island.
1101. And you believe the Cleft Island to be accessible and of sufficient base for a lighthouse? Yes, ample base.
1102. Do you know the Rodondo? Yes.
1103. Is it practicable to put a light upon it? No; it is inaccessible, and its altitude would be too great. The great objection to the light at Kent's Group is that it is so elevated as to be frequently obscured.
1104. What is the passage usually taken by large sailing ships, proceeding either east or west through Bass's Straits in that particular part, do they hug the promontory or not? No; I think they all make for the centre of the straits and keep to the southward of Curtis's Island, in consequence of the Kent's Group light. Before there was a light at Kent's Group that was the beaten track between Curtis's Island and Kent's Group.
1105. Supposing a light was placed at the promontory would a prudent master of a large ship coming from the westward proceeding to New South Wales be likely to make use of the promontory passage in preference to the other? I think so; there is ample room, and having a light for his guide he would make for the light.
1106. Because the channel although narrow is clear and free of danger? The light could be approached very close, and there is a distance of nearly five miles between the rock and the promontory.
1107. All the large ocean steamers would use the passage round the promontory, would they not? I see no objection to their doing so when lighted.
1108. And do at the present time, do they not? The "Great Britain" did so, I think.
1109. Therefore it would be very desirable for them that lights should be placed there? I think if lights were elsewhere that passage would be used, because masters of steamers, however large they are, always make the shortest turnings they can, and if the lights were elsewhere I think they would still endeavour to shave the promontory.
1110. The Commission may understand your evidence to be, that supposing the engineering difficulties are insuperable in putting a light on the Ten-foot Rock, you think it desirable that there should be one light placed on Cleft Island and the other on Clifty Island? Yes.
1111. Do you think that the lighting of Seal Island would be sufficiently important to justify the imposing of a tax on shipping navigating the straits, in order to maintain those lights? I think any master navigating the straits would be only too happy to pay for those lights if they were erected.
1112. Is shelter to be obtained for a vessel taking down supplies for those lights? Yes, anywhere, and in case of a westerly gale, which is the most to be dreaded, supposing there to be a light on Cleft Island, there is Glennie Island close by within five miles, and there is shelter

C. Pasco,  
Esq.

Aug., 1856.

- C. STOKES,  
Esq.
- 5 Aug., 1836.
- shelter under Glennie Island; and then on the eastern side of the promontory there is anchorage in Waterloo Bay and Refuge Cove.
1113. What shelter would there be for a vessel with an easterly gale? I have never anchored in either of these places, but Captain Stokes describes Refuge Cove as being capable of affording shelter from easterly winds, and that the anchorage is not good under Glennie Island.
1114. Then there is good anchorage for any weather either easterly or westerly? Yes.
1115. Would the fact of a light being placed upon Clifty Island be likely to lead a stranger into such a position as that he might be awkwardly placed with the Ninety-mile Beach in case of a gale of wind coming suddenly on from the eastward, he having gone into that bight to look for the light? That might be the case, but, I think, from the distance at which the light might be made he need not approach it. If he was in the parallel of Clifty Island by the time he would make the light he would have ample sea room to haul off.
1116. Are you aware of there being any set of current along that line of coast in any particular direction? No. I think the arrows on Captain Stokes's chart are correctly laid down.
1117. Do you find the current running according to the strength of the wind? There is a regular ebb and flow of tide through the straits, but its force is affected by the prevailing wind.
1118. Is there any considerable rise and fall? No; it is very trifling.
1119. Is the rise and fall on the northern shore of Bass's Straits trifling throughout? It is in the open straits. It varies in the ports.
1120. Taking it on the southern side, the Tamar rises and falls very considerably, does it not? Yes, but in the straits the rise and fall is pretty uniform.
1121. On the north coast of Tasmania there is not a very great rise and fall, is there? No.
1122. Do you imagine that if the Ninety-mile Beach were well surveyed, and the soundings laid down, that would almost obviate the necessity for a light at Wilson's Promontory? I think it would tend to diminish it.
1123. Do you know whether the ground in Bass's Straits varies sufficiently to enable a master of a ship to know whether he is to the north or to the south of the position which he contemplates? I think so.
1124. Have you been off the Ninety-mile Beach; are you familiar with it? No, only towards the east end of it.
1125. Do the soundings, so far as you know, gradually diminish as you approach the land? I never had any soundings in that part.
1126. Do you consider that the position of the light on Kent's Group is good? No, I think it is too elevated to be so useful as a light should be.
1127. Is there any other position in which it could have been placed except being so elevated as it is, that would have been useful as a light to be seen all round the compass? It has an immense radius.
1128. Proceeding towards Port Phillip what is the next point that you think deserves attention on the part of the Colonial Governments with a view to lighting the coast? From the present position of the light at the entrance of Port Phillip Harbour, it being in at Shortland's Bluff, a light on Cape Schanck is often found necessary to show vessels their position.
1129. A cross bearing from the light on Cape Schanck would enable vessels to approach the heads with confidence? Yes; but if the light instead of being at Shortland's Bluff were at the point of Lonsdale Reef a light at Cape Schanck would not be necessary.
1130. Then would you recommend the Shortland's Bluff high light to be shifted to Point Lonsdale? Yes.
1131. Are the Shortland's Bluff lights ever hidden by Point Lonsdale? The point is too low to hide them; but a vessel to the eastward of the entrance at night would not see the light.
1132. Having a light on Cape Schanck would not a vessel get hold of the Cape Schanck light and have greater confidence in standing to the westward until she did open the Shortland's Bluff lights? Certainly.
1133. Would not the Schanck light be an advantage in coming round the promontory, that if there were a light there, and one could not be erected at the promontory, the Schanck light would be a good departure for a vessel? It would.
1134. But generally it would be more useful to vessels coming to Port Phillip than as a great highway light? Yes; I should not call it a highway light.
1135. A vessel getting to the eastward of the entrance to Port Phillip loses sight of the Shortland's Bluff lights, does she not? Yes, by Point Nepean.
1136. Would not that be another reason why the Schanck light would be a valuable one? It would be a valuable position to any vessel between Cape Otway and the port, or to vessels coming from the eastward to Port Phillip.
1137. Would not it give great confidence to a stranger, after making the Otway light to feel that he had a light on the Schanck to get hold of? Yes.
1138. Do you know whether vessels in coming from the westward from Europe bound to New South Wales usually use the straits, or whether they generally come round Van Diemen's Land? They invariably come through Bass's Straits, unless in the summer season, when the easterly winds hinder them.
1139. Have you ever landed on Cape Otway? Never.
1140. Have you seen the light there? Yes; and it is a very good light.
1141. In proceeding to the westward from Cape Otway, what is the next point on the coast that has attracted your attention as requiring to be lighted? I think Cape Nelson. I do not think there is anything between the Otway and the Backstairs Passage that is desirable except that.
1142. Does not the land run more to the northward after rounding Cape Northumberland, which would make it more advisable for a highway light to be placed at Cape Northumberland than

than at Cape Nelson? A light at Cape Nelson would serve the double purpose of a highway and of a light into Portland.

1143. Cape Northumberland is a low sandy point, whereas Cape Nelson and Cape Bridgewater are high bold headlands? I have never seen Cape Northumberland.

1144. It has been given in evidence that all the vessels lost on that coast within the last few years have been lost within the radius of a light from Cape Northumberland? I have never seen the coast at Cape Northumberland, but if it is a low coast I think a light would be better there than at Cape Nelson.

1145. Have you seen Cape Nelson or Cape Bridgewater? Yes, both of them.

1146. Are they bold rocky headlands? They are.

1147. Then if Cape Northumberland is in such a low point, as it appears from the evidence to be, you think a light would be more advantageous there? Yes.

1148. And the land trends away to the north north-west directly you are round it? Yes.

1149. You are not acquainted with the coast much beyond Cape Northumberland? No.

1150. With regard to the great debatable point of a King's Island light—what is your opinion respecting that, speaking with regard to vessels coming from the westward more particularly in the first instance? I think that for vessels coming from the westward a light being already on Cape Otway it is unnecessary to have a light at King's Island; I think if there were a light on Cape Wickham vessels might be induced to shape a course for it, and in thick weather be led into danger by the Harbingers, whereas having a light on Cape Otway, which can be approached with confidence, they would make for it and avoid danger.

1151. Have you ever considered whether a light upon the New Year Islands would be preferable to a light on Cape Wickham? I think the same objection would stand good in that case, particularly with westerly gales prevailing. If a vessel made for the New Year Islands she might be driven into the north-west corner of the island before she could have a chance of working off; I think vessels invariably should make for the Otway light.

1152. In case of a light being put upon King's Island, would it not be very desirable to give a very positive sailing instruction that ships are not, under any circumstances, to borrow upon King's Island, that the light is not put there to induce them to make it, but only to warn them of their danger if they are caught there? That should be very distinctly put forth.

1153. Do you know whether any sailing instructions for Bass's Straits lay any stress upon the point of not borrowing upon King's Island? I rather think they do.

1154. You think a light upon the New Year Islands would be more prejudicial than a light upon the North Cape? Yes.

1155. And you are also of opinion that a light there is unnecessary? I think so.

1156. Do you think that a light if placed upon King's Island would be any advantage to vessels coming from the westward, working out of the straits? Working to the westward, a light on Cape Wickham would be advantageous.

1157. Have you at all made yourself acquainted with the positions of the wrecks that took place last year and the year before on King's Island? Yes.

1158. Do you think if there had been a light there it would have saved either of those vessels? They were wrecked, I think, on the east side, more to the southward.

1159. The great number of wrecks have been on the west side? I am not aware of the circumstances of those wrecks having been investigated, in order to show that if there had been a light it would have been used.

1160. But might it not be put upon the charts at the same time that the light was marked that vessels were cautioned not to approach the island? If they are so cautioned, and observe that caution, they need not come within ten miles of the light—with a strong caution that on sighting the light they should avoid it and not think of borrowing on it, I do not think there would be so much danger.

1161. Might it not be marked on the charts by order of the hydrographer that ships are especially cautioned not to borrow on King's Island? As a general rule I think where lights are vessels will make for them, and if there is a place of safe approach to put lights on, it is always preferable to putting them where there are dangers.

1162. Then you would really hold out the only inducement to keep the safe side by making Cape Otway light the only light to the entrance of the straits? Yes; but then a vessel may be so placed that she is upon the King's Island coast when the Otway would not be visible.

1163. Then in case of your so far modifying your opinion, as to think that probably under the circumstances a light ought to be placed on King's Island, would you favour the Commission with your opinion as to where you think it should be placed? I should think on the promontory of Cape Wickham.\*

1864. Were you surveying in the neighbourhood of King's Island? Not at all.

1165. Are you aware whether the island is affected at all by the different states of the atmosphere—whether it is always clouded, or the contrary? No; the only time I was under King's Island was in coming from Europe in 1838; that was in a heavy westerly gale, and it was extremely thick; and on that occasion we made Cape Otway in the morning, to satisfy ourselves of our position, and then stood to the southward and got under King's Island, and it was very thickly enveloped in mist.

\*I have more maturely considered the question of the propriety of a light being established on King's Island, although, at first, I was in favour of no light on that point, for the reasons I then assigned, viz.—that there being already a good one on Cape Otway, ships would endeavour to make it, and thereby avoid the dangers which exist in the vicinity of King's Island. However, on reflection, I think that vessels may often be driven, when approaching Bass's Straits from the westward, by northerly winds in the neighbourhood of King's Island before they can make sufficient northing to sight Cape Otway, when a light on King's Island would be very serviceable. The site I would prefer for this light would be on Cape Wickham, on such elevation as to be visible over the New Year Islands, but the notice informing the public of the establishing such light should be accompanied by a distinct caution to mariners not to approach the cape at night.—C. P.

- C. Pasco, Esq.  
8 Aug., 1856.
1166. Where were you bound to? Sydney.  
 1167. Was there any light upon Cape Otway then? There was no light.  
 1168. Can you give the Commission any information about the set of the current at the western entrance of Bass's Straits, with reference to direction? I think it is chiefly governed by the wind. In moderate weather the ebb and flow is felt—the flood setting up to the north-east, towards the entrance of Port Phillip.  
 1169. Are you at all aware whether any particular set to the southward has been experienced by ships in approaching the entrance to Bass's Straits? No.  
 1170. Have you frequently entered Bass's Straits from the westward? Three times only.  
 1171. And have you never experienced that southerly set? No.  
 1172. Have you ever landed on King's Island? Never.  
 1173. Are you familiar with the lights in Banks's Straits? I know their positions. I have never seen them lit. I was there when the lighthouse on Goose Island was building, in 1842.  
 1174. Were they erected in those positions chiefly on the recommendation of the survey on which you were employed? I am not aware of Captain Wickham or Captain Stokes having suggested their erection.  
 1175. Are you familiar with the east and south coasts of Tasmania? Not very. My work commenced from the Bay of Fires northward.  
 1176. Then you are not in a position to give any opinion as to the advisability of establishing a light on the eastern coast of Tasmania anywhere? I would not, without experience in that particular part, like to give any decided opinion.  
 1177. Have you any further suggestions to offer to the Commission upon the subject under consideration by them? In the event of a light being established on Cape Wickham I think it may be desirable to exhibit a lower light, to be visible at a distance of three or four leagues in the direction of the Harbinger and Navarino Rocks, in order that vessels approaching either of those dangers may have warning to haul off; such light should not be either red or green, lest it be mistaken for a steamer's side light. I would also suggest for the improvement of the navigation of Bass's Straits, that the soundings in the neighbourhood of the Long Beach and for sixty miles off shore be taken.  
 1178. Supposing the Government were only in a position to erect one lighthouse for the improvement of the trade in Bass's Straits, which do you think should be the one to command superior attention? One in the neighbourhood of Wilson's Promontory.  
 1179. And next to that? As a high road light probably Cape Northumberland; because vessels bound to Port Phillip or New South Wales get up there sometimes with south-east and easterly winds.  
 1180. If a light were placed at Cape Northumberland you would not think it necessary to have one at Cape Nelson or Cape Bridgewater, would you? I think not, unless it became necessary to have a mere local light for Portland Bay.  
 1181. What class of lights would you recommend to be erected if you were establishing any new light—the catoptric, or dioptric, or catadioptric? I am not sufficiently versed with the peculiarities of each of them to say. [*The Witness withdrew.*]

Captain John Brown examined:—

- Captain J. Brown.  
8 Aug., 1856.
1182. You command the "Shalimar"? Yes.  
 1183. How many voyages have you made to these colonies? I have made four voyages here.  
 1184. All of them to Melbourne? Once I went to Adelaide first; I had some passengers for Melbourne but I sent them round by another ship, and then I proceeded from Adelaide through Backstairs Passage and Bass's Straits to Sydney.  
 1185. The other three voyages you made to Melbourne? Yes.  
 1186. In most of your voyages, on entering from the westward have you sighted any part of the south-west coast of Australia before making Cape Otway light? No. Twice before this last time I was in the "Briseis." We had very strong winds outside and the maintopsail went out of bolt ropes; the first land we made was Cape Otway.  
 1187. When bound for Adelaide did you make any part of the west coast of Australia before you made Kangaroo Island? I made nothing until I made Kangaroo Island a point on the starboard bow.  
 1188. In coming round from Adelaide do you think there are any parts of the coast that require lighting? My opinion is, that there is no part of the coast a man requires to sight after leaving Kangaroo Island, where there is a light, until he sights Cape Otway. I sighted the light about eleven o'clock at night, seventy-two hours from Adelaide, I had a running wind the whole of the night.  
 1189. If you had had a beating wind all the way and had had to stand off and on would you have found any particular advantage from having a light on Cape Northumberland? It would have been an advantage then, and it would be an advantage to the coasters; they are not always correct about their position when they have been off the land some time.  
 1190. The course you would steer after rounding Cape Northumberland in coming down from Adelaide or in going from Melbourne to Port Adelaide would be an alteration of some four or five points of the compass, would it not? Yes.  
 1191. It is a considerable elbow to turn? Yes.  
 1192. Have you ever seen Cape Northumberland? Nothing further than seeing it on the chart.  
 1193. You do not know of what character it is? No.  
 1194. In making the straits, do you believe any benefit would be derived by over-sea ships from having a light on any portion of King's Island? I consider it would be a very great advantage to have a light on the New Year Islands.

1195. That is some few miles to the westward of King's Island? Yes.

1196. Why do you consider there would be additional advantages to vessels coming from the westward, in having a light on the New Year Islands instead of on the north end of King's Island? If you were coming from the westward, through the straits, endeavouring to make Cape Otway, and being too far to the southward, you could not make Cape Otway, you could scarcely get through without making one or the other.

1197. Do you think that a light upon the New Year Islands would be sufficiently demonstrative of the position of the shoals off Cape Wickham, to lead you clear of them better than if the light were on Cape Wickham—do you know the position of the Harbinger Rocks? Yes.

1198. You think a light upon the New Year Islands would be a greater advantage to a ship coming from the westward to make that and then haul up to the northward, than if he had to make a light upon Point Wickham, which you think he might not make until he was down upon the reefs? Exactly.

1199. But the distance from the Harbinger Rocks to the New Year Islands is greater than the distance from the Harbingers to Point Wickham—would not a ship be much more likely, therefore, to see a light on Cape Wickham, if she were in danger from the Harbinger Rocks, than she would be to see a light on the New Year Islands—have you ever sighted the New Year Islands? Yes, I sighted them on my last voyage in the "White Star."

1200. Have you considered this subject carefully? Yes; I think the best place for a light would be on the New Year Islands.

1201. Did you not in your last voyage make the land to the southward of King's Island altogether? Yes.

1202. Was that caused by any particular set of the current, or was it caused by prevailing northerly winds? Prevailing northerly winds and the current as well.

1203. You experienced a strong southerly set? Yes.

1204. Are the currents generally governed by the winds? I should say generally they are.

1205. If there had been a light upon the New Year Islands, do you think that would have been any assistance to you in running through the southern passage? No; I should not have attempted to sight that light; I should have endeavoured to have kept sufficiently to the westward of it.

1206. Supposing you had not sighted the land before dark, what course should you have adopted? I should have tacked and stood off to the southward.

1207. You were perfectly confident of your position? Yes.

1208. Had you had observations? Yes.

1209. Did you observe the north end of King's Island, in passing, whether it was clear or hazy? Generally hazy; the only thing you could discover was like bushes or trees standing in the water.

1210. Was the top part of the island clouded? Yes.

1211. The upper part of the land was covered, and you saw the lower part? Yes.

1212. Will you give the Commission, a little more positively, your reasons for preferring the light to be placed at the New Year Islands instead of at Cape Wickham? My principal reason would be, on account of coming down from the westward and those islands lying to the west of Cape Wickham. It would be a very hazy day, or even in the night time it must be very dark, if you could not discover the New Year Islands or Cape Otway; and seeing either the one or the other would be a sufficient guide to escape the reefs.

1213. And you think a light on those islands would be more easily seen than a light upon Mount Wickham? I should certainly say so, because of the elevation.

1214. Do you think you would have a greater elevation on the New Year Islands? I should say so, from what I have seen.

1215. From examination it would appear that that is not the case—the position proposed for the lighthouse at the north end of King's Island is 50 feet higher than the New Year Islands—might it not be possible that a ship in a heavy westerly gale, finding herself caught off the north end of King's Island, might be in such a position with respect to the Harbinger Rocks under her lee, that she might see a light on Point Wickham, when she could not see a light on the New Year Islands? Certainly she might.

1216. Supposing there was a light either on Mount Wickham or on the New Year Islands—if you were coming from Liverpool, would you think of attempting to border upon that island, or would you try to make Cape Otway in preference? I should certainly try to make Cape Otway in preference.

1217. You would not, under any circumstances, think of bordering upon King's Island, even if there was a light there? Not unless the wind compelled me to do so.

1218. Do you think the fact of a light being there might draw a ship into danger, from a stranger not knowing the peculiarity of the coast—knowing there was a light there and trying to make it? My opinion is, that any ship coming from the westward would not attempt to make it, unless the wind compelled her to do so.

1219. The light would actually only be a light to warn from danger, and not a leading light for entering the straits? Yes, that is what I mean.

1220. A ship having unfortunately got into a difficult position, you think it would be a great assistance to her to find there was a light there? Yes; more especially in the night time.

1221. In entering Port Phillip, after rounding Cape Otway, or in coming through the channel you have spoken of as having passed through in your last voyage, does it strike you that any additional light is requisite in the neighbourhood of the entrance to Port Phillip? I do not think there is great occasion for any other light there. No vessel would attempt to run in in the night time.

1222. The coast is sufficiently bold for you to stand in with a view of making the Shortland's Bluff light, and you would stand in there until you made it, and then haul off till the morning? Yes; the first time I came here I came in about ten o'clock at night,

1223.

Captain J.  
Brown.

Aug. 1856.

- Captain J. Brown.
1223. What distance off have you seen the Shortland's Bluff lights? About nine miles.
1224. Can you see both lights from nine to ten miles, in favourable circumstances? You can see them both if it is very clear; but if it is not very clear you can only see the upper one distinctly from nine to ten miles.
1225. Would you have any doubt with the ship you command, in standing straight for Port Phillip Heads, after having got well hold of the Otway light, and standing on—supposing the wind to be a leading one—until you opened the Shortland's Bluff light? I should not hesitate for a moment.
1226. Would you have any additional confidence in consequence of a light being placed on Cape Schanck? Not in the least.
1227. Would not a light placed on Cape Schanck enable you, by a cross bearing, to take your position, which would give you more confidence? Yes; but then I should not attempt to run in so close as all that, to be compelled to take bearings; I should endeavour to stand off; and after I had got a sufficient distance off, lay off and on till it came daylight.
1228. But if a light were on Cape Schanck, would you not be able to stand much closer in and save time? It would not make a difference of more than an hour.
1229. Have you ever considered the question of a light on Point Lonsdale? No, I have not.
1230. You are quite satisfied with the lights on Shortland's Bluff, as being good leading lights? Very good indeed. For my part, as far as I am personally concerned, I would wish for no other than making Cape Otway light, and coming right in.
1231. In passing through to the eastward you went through the straits to Sydney, did not you? Yes; and I have gone home once to England by Banks's Straits.
1232. In passing the promontory, what channel would a large ship take? They go right past Hogan's Island.
1233. That is where Kent's Group lighthouse is? Yes.
1234. If you were bound from Port Phillip to Sydney or England, how would you pass the promontory? I passed close to the promontory.
1235. Between that and the Rodondo? Yes.
1236. And would you do so again if you had to make the passage? I should have no doubt about it at all; it is a safe passage.
1237. Did you pass it in the daytime or at night? In the daytime.
1238. Do you consider it would be any advantage to shipping if a light were erected upon that promontory or is it sufficiently safe to enable a vessel to pass without one? It is so high it is scarcely possible for a vessel to go upon it.
1239. But there are other dangers besides the promontory in the vicinity of it, are there not? The rocks to the eastward of it are very dangerous, and I think a light on one of them would be very desirable.
1240. Did you sight Kent's Group? I saw the light distinctly, and a very fine light it is.
1241. What distance off did you see it? About seventeen or eighteen miles.
1242. It is at a great elevation, is it not? It is, and a very fine light indeed it is.
1243. You think that for a vessel going from the westward through to Sydney or India, or New Zealand, there is no necessity for a light on the promontory? I should not say there was.
1244. You think the navigation is sufficiently safe without it? Yes; Wilson's Promontory is a place that, even on a very dark night, you must keep no look out at all before you could run upon it. I remember that when I sailed out in my command, I lost sight of it.
1245. In proceeding along the coast, you know there is a light upon Gabo Island? Yes.
1246. Do you know the coast of New South Wales, I know it from Twofold Bay; but I would rather decline giving an opinion as to that part of the coast, having been only once along there.
1247. If only one lighthouse were to be erected between Adelaide and Sydney, passing through Bass's Straits, which point or headland would you give the preference to, as being the first light that should be erected? I should say the rocks just to the eastward of Wilson's Promontory.
1248. That you think would be the most important, that is, more important than King's Island or Cape Northumberland? I should say the rocks about the promontory would be the most suitable place for a light.
1249. Supposing a light placed on either Cape Nelson or Cape Bridgewater, do you think that any prudent master of an over-sea ship would attempt to make either of those points in preference to Cape Otway? He might make Cape Nelson.
1250. What advantage would there be in his doing so? Merely to know his position.
1251. Would he not throw himself into an awkward position? No; but still I prefer making the land just to the westward of the Otway light, or sighting the Otway light for the first time.
1252. Have you any further suggestions to make to the Commission? No; there is nothing I would wish to add.
1253. You are not familiar with the south coast of Van Diemen's Land? No; I have been through Cook's Straits to Wellington, New Zealand. [The Witness withdrew.]

Captain John Gover examined:—

- Captain J. Gover.
1254. You are commander of the "Mindora"? Yes.
1255. Where has she arrived from? From Liverpool.
1256. How many voyages may you have made to Melbourne? This is my first.
1257. You have never entered Bass's Straits before? No.
1258. And never been on this coast before? No.
1259. What was the first land you made? I made Cape Otway, in the daytime.

1260.

1260. In arranging for placing your ship in proper position for entering the straits, had you known that there had been a light upon King's Island, would you have thought it advisable to have attempted to make that side of the straits, or would you have considered it more desirable to make the north land? I should have thought it best to make Cape Otway.
1261. From the position of King's Island, forming as it does the south-west entrance to the straits, do you think it would be advisable to place a light there, seeing the position of the Harbinger Reefs? I should.
1262. Where would you suggest a light should be placed, on King's Island or on the New Year Islands, in the immediate neighbourhood? I would suggest that a light should be placed on the New Year Islands, for it is a bold spot.
1263. Do you know that the reefs running off the north end of King's Island are of considerable extent? There ought to be a light there, and one on the New Year Islands as well.
1264. Would not two lights within seven miles of each other be apt to mislead a ship? I would let one be a fixed light, and the other a revolving light.
1265. If you had had hazy weather and no observations, and you were to the southward of the position you anticipated, and you were standing in, fancying you were making to the north side of the straits, and you made this light, and supposing it were a revolving light, the same as Cape Otway, would it not be likely to lead you into danger if either of the two lights at King's Island had the same character as the Cape Otway light? I would not have a light of the same character as the Cape Otway light.
1266. You never sighted King's Island? No, and I did not see Cape Otway. I made the land considerably to the westward of it. The weather was hazy, and I ran into Port Phillip without a pilot.
1267. What wind had you? I had a wind from the westward.
1268. And you made the land somewhere up by Cape Patton? Yes, as near as I can tell.
1269. Then you gave Cape Otway a wide berth, and hauled well round it? Yes.
1270. You have never passed through the straits? No.
1271. And you cannot give the Commission any information as to the navigation of the straits? Not at all.
1272. In coming down from the westward, being bound for Port Phillip, had you ever any intention of making the land before you made Cape Otway? No; I had a fair wind, and I steered a course for Cape Otway.
1273. Do you think that is the spot that all prudent mariners would make for, on entering the straits? Yes, because it is a bold coast. [*The Witness withdrew.*]

Captain J.  
Govea.  
8 Aug., 1856.

Melville G. H. W. Ross, Esq., R.N., examined:—

1274. You are a Commander in the Royal Navy? Yes.
1275. And you are now employed as the Marine Surveyor of Victoria? Yes.
1276. Have you had ample opportunities in the course of your duties of obtaining information respecting the different points at the entrance of Bass's Straits? Yes.
1277. Will you be good enough to give the Commission your opinion as to the necessity, or not, of a light on King's Island? I was sent down with two gentlemen, Mr. Rusden, the Master of the "Electra," and Mr. Burgoyne, in the Public Works Department, I think last September, by order of the late Governor, to fix the site for a lighthouse there. We examined the north end of the island, and also the New Year Islands, and from the position of the Harbingers, as men always like to have lights as near danger as possible, we chose Cape Wickham as the best site for a lighthouse.
1278. Were you unanimous in your opinion? Yes. We had the opinion of a great number of captains of merchant ships before we went down. It was Sir Charles Hotham's wish that we should get all the information we could before we started, and the opinions were so different that we determined we would go and judge for ourselves. The great objection to the New Year Islands that we found was, that vessels coming from the westward cannot see them until they are pretty close in.
1279. They are not sufficiently high to be observed? The highest is only 121 feet.
1280. And you think the islands themselves would be obscured by the land? I think if a light were put upon the New Year Islands it would be attended with great danger, because a vessel running with a strong westerly gale, and with the wind in from the westward, if she missed Cape Otway light, and a light was placed upon the New Year Islands, in running to make that light she would get too far in and get embayed in Franklin Roads, and she could not weather the danger; whereas if she made the light on Cape Wickham, the furthest reef being only four miles from where the proposed site of the lighthouse is, she would have time to haul up and clear the reefs.
1281. If she were embayed in Franklin Roads she could not clear the land on either tack? No; there is a tremendous sea running in there.
1282. Have you satisfied yourself that the reefs lying to the north-west of King's Island do not extend beyond four miles? Yes.
1283. And you are satisfied that there is no detached passage beyond them? We did not go round them, but from what we could see from the proposed site of the lighthouse I think there are no dangers outside.
1284. Do you think in ordinary circumstances a light on the site on which you propose to place it could be seen in sufficient time to prevent a vessel running on the danger? Certainly.
1285. You lived on the island for some time, did you not? We were away from Melbourne about three weeks; we were on the island about a fortnight.
1286. Could you judge during that time whether the island was enveloped in haze at all? That was one subject we paid particular attention to, and during the fortnight we were there we never had two days with the same wind; and during all that time Cape Wickham was always visible.

Melville G.  
H. W. Ross,  
Esq., R.N.  
8 Aug., 1866.

McKillop G.  
H. S. Ross,  
Esq., R.N.

S. A. G., 1856.

1287. From the position in which you propose to erect the lighthouse it would be visible not only from the westward, but from the eastward? Certainly. If a light were placed on the New Year Islands it would be only seen by vessels coming from the westward.
1288. By reference to the chart accompanying your report it appears that a very large number of the vessels that have been wrecked, have been wrecked to the southward of the New Year Islands: did it ever occur to you whether, in consequence of the southerly set having evidently thrown vessels very much more to the southward than they contemplated, a light on Mount Wickham might be of no assistance to a man making the land about the middle of the island, whereas if the light were upon the New Year Islands he would have every probability of seeing it? If the light were on Cape Wickham, where it is proposed to erect it, and at the elevation proposed, vessels would see it nearly all round the coast; a light at Cape Wickham, if of the height recommended, would show over the point just to the southward of the New Year Islands.
1289. You say it would not only be seen over the New Year Islands, but over the cape to the southward of it? Yes; vessels from Van Diemen's Land, coming up the west side of King's Island, would make the light nearly as far south as Freemantle Bay.
1290. Then you think from the positions in which the principal number of vessels have been wrecked, that had a light been erected at Cape Wickham, they would have been warned of their danger, and would have been saved? Yes; every one of those vessels would have been saved.
1291. Would you consider it necessary that any particular description of light, either two or three lights, or any thing of that kind, should be erected? I think one good standing light, of a first-class character, would be what would be required—a light that could be seen twenty-five miles.
1292. You have no doubt in recommending the position which you pointed out last year in your report to the Government, as being the best position? Certainly not; and I consider the light on Cape Wickham would be a very great boon to the mariner, both coming from the eastward and from the westward.
1293. You do not think that a light being placed on King's Island would entice mariners coming from the eastward or westward to border upon that island when they ought to border upon the bold shore? Certainly not; no seaman would make for a light at King's Island instead of the light at Cape Otway.
1294. You think that it should merely be a light to warn a man of his danger, and not for him to steer for? Yes; seeing that light would show him his position, and if he was in mid-channel, if the light was visible twenty-five miles off, he would see the two lights.
1295. Supposing a light was erected at Point Wickham, would not it be a very good thing to make it a point in the sailing directions for strangers that they never should borrow on King's Island, although a light was there? Certainly.
1296. It would be perfectly competent for the Governments of these Colonies to ask the hydrographer of the Admiralty to have such a notice put upon the charts? Certainly.
1297. And with such a notice there could be no excuse for a man looking for the light on King's Island, unless he was driven there by stress of weather? Certainly.
1298. Do you anticipate any difficulty in carrying out the erection of a lighthouse there, if it is decided to be erected on Cape Wickham? Not the slightest. There is a splendid quarry of compact basalt close to it, and plenty of water, and the only thing that would be required would be the timber and lime.
1299. Would it be difficult to land that there? No, I think not. There is a little cove there where the timber might be landed, if a fine day were picked out for it.
1300. Would there not be a perpendicular cliff there to drag it up? No; there is a slope there.
1301. Could that be used for landing stores as well? I would not recommend it, I should say land the stores at Whistler's Point.
1302. Would it be absolutely necessary to go to the expense of making an expensive road between Whistler's Point and the lighthouse before the communication could be carried on? I do not think it would require a great deal of expense to make a road; you would only have to cut down a few trees. It is over a hard sandy soil.
1303. What is the distance? About twelve miles.
1304. Are you to be understood to say that if a light were put upon Point Wickham, at the site selected by the Board of which you were a member, it would be visible over the projecting cape which lies south of the New Year Islands? Certainly, if erected of the height we have recommended. That point of land is not very high, and from the elevation of the lighthouse I have no doubt you could see all down the coast.
1305. Has it struck you that there is any necessity for any additional lights at Port Phillip Heads besides those at Shortland's Bluff? The present lights are quite sufficient, but there might be a great improvement made in them. I think for a place like Port Phillip a light ought to be seen much further than the present Shortland's Bluff lights show; the high light ought to be seen at least twenty-five miles. From the westward I do not think I have ever seen that light above fifteen or sixteen miles on a very clear night.
1306. What course would you recommend with regard to that light? I would recommend a new light being erected at the back of the present light.
1307. On the same bearing? Yes, at the back of the present one; and then when the new lighthouse was completed and the lantern was fixed the old one might be removed, so that no obstruction should take place.
1308. You would still have two lights? Yes.
1309. You say the position of the present lights is very good, but the quality of the lights is bad? Yes and they are not sufficiently high. I would have both of them higher, and I would have the upper light at a greater altitude from the lower than it is at present. There would be another advantage also from that, because now if you are coming from the eastward the

1310. Have you ever considered whether any considerable advantage would be gained to the navigation if the lights at present existing were left as they are, and an additional light were erected on the Schanck? There is no question that a light on Cape Schanck would be very useful, but as far as being of any use to Port Phillip is concerned, it should be of no use whatever.

1311. If the present lights were raised to be seen a sufficient distance off from there would be any benefit to the heads? I do not see that a Schanck light would be of any use to a vessel coming from the westward after having made Cape Otway, because they cannot possibly require it unless they are blown off the land.

1312. It is only eighteen miles from Point Lonsdale to the Schanck? About that. A ship running down from the westward always keeps the land in sight.

1313. But if the wind were from the eastward he would be obliged to stand off, because he would be on a lee shore? There is no doubt that a light at Cape Schanck would be very useful, but I do not see that it would affect the entrance to Port Phillip at all.

1314. To vessels coming from the eastward would not a light at the Schanck be of considerable advantage after leaving the promontory? Yes.

1315. And to all the trade from the opposite coast of Tasmania, would not a light be very useful? Certainly, but vessels coming from Hobart Town generally make the promontory.

1316. But do you think that it is necessary to have a light at the Schanck? I do not think that it is necessary to have a light at the Schanck, but I think that it would be a great benefit to the trade.

1317. A light on the Schanck would be a great benefit to the trade? Certainly, there is no question about that, but I think there are lights to be looked for before Cape Schanck.

1318. Have you ever been in the neighbourhood of Wilson's Promontory? I have surveyed all Corner Inlet.

1319. Have you a pretty thorough knowledge of the promontory? Yes, it was my duty to do so.

1320. Do you consider that that is a point which requires to be lighted, or is it certainly, for the promontory and King's Island ought to be the first light? I do not see that it is necessary to have a light at that point.

1321. Have you seen the Seal Islands, lying off Corner Inlet? I have not seen them.

1322. Are the other islands on the west side? Yes, they are all on the west side.

1323. Have you ever landed on the Ten-foot Rock? I should think it is a large enough for the base of a lighthouse. There are five rocks there; the one in the middle is the largest.

1324. Are you decidedly of opinion that it would not be possible to erect a lighthouse on the Ten-foot Rock? Yes.

1325. If a lighthouse were to be erected in the middle of the Ten-foot Rock, would you prefer it to the lighthouse on the Seal Islands? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1326. Do you think the lighthouse would be practicable? I think it would be practicable, but I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1327. Is not the lighthouse on the Seal Islands a better one? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1328. Do you think it would be possible to light the Seal Islands? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1329. Then you presume there is a base on the top sufficient for a lighthouse? There is no question about it. If the lighthouse were to be erected on the top of the Seal Islands, it would be of no use to a vessel coming from the eastward after leaving the promontory.

1330. Would that be of use to vessels coming from the eastward after leaving the promontory? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1331. In coming from Corner Inlet you do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1332. Do you think a light on the Seal Islands would be of any use to a vessel coming from the eastward after leaving the promontory? I do not see that it would be of any use to a vessel coming from the eastward after leaving the promontory.

1333. It would also serve as a guide to Corner Inlet? Yes, it would be of use to a vessel coming from the eastward after leaving the promontory.

1334. Have you ever been on the promontory? I have not been on the promontory.

1335. You do not know what its geological features are, and whether it would furnish some objection to the erection of a lighthouse? I do not know what its geological features are, and whether it would furnish some objection to the erection of a lighthouse.

1336. Have you landed on Cliff Island? No, I have not. The cave is the only place where you could land.

1337. Would there be any shelter for a boat in case of a landing being effected there? Not for a boat to remain there.

1338. Would the promontory itself answer at all as a light? The great objection to the promontory is that to vessels coming from the westward to go through Bass Straits the Glenie Islands and the Cliff Islands would shut the light out—they would not see the promontory light.

1339. If a light were erected upon Cape Schanck would they not have a sufficient departure coming?

Messrs. G. H. W. Ross, Esq. R.N. 8 Aug. 1856.

Melville G.  
H. W. Ross,  
Esq., R.N.

8 Aug., 1856.

coming from the westward to enable them to go clear of Cleft Island before they opened the light? Vessels leaving Melbourne for Banks's Straits generally steer a course to sight Rodondo, leaving it on the port hand. There is another advantage in the Rodondo, I have seen it on a clear day forty-five miles off.

1240. But on an ordinarily clear night it is always a very distinct feature, is it not? Very distinct.

1341. Then you think that if a light is to be erected in the neighbourhood of the promontory the Rodondo is the most eligible sight for it if it can be satisfactorily placed? Yes; and after the Rodondo Cleft Island, but certainly not on the promontory, not on the main-land.

1342. But if a light were erected on Cleft Island, would you recommend the erection of a second light? Yes; but if a light can be put on the Rodondo there would be no occasion for a second light.

1343. Or if a light could be put on the Ten-foot Rock there would be no occasion for a second light? I do not think you could put a light of sufficient height on the Ten-foot Rock.

1344. The tower would have to be so excessively high, would it? Yes; the light on Shortland's Bluff is 109 feet high, and you cannot see that a sufficient distance. There ought also to be a beacon, I think, on the Crocodile Rock, and I would particularly draw the attention of the Commission to that subject.

1345. How would secure that beacon? I suppose you would secure it the same as all other beacons are secured. There are plenty of beacons on rocks on the coast of England. I am not sufficient of an engineer to say how you would secure it.

1346. Would it not be very difficult to secure a beacon that would stand any length of time, considering the enormous westerly gales you would have there? You would have to watch your time for working, the same as they did in building the lighthouse on the Eddystone.

1347. Have you ever seen the Crocodile Rock? No, I have been near it.

1348. It is under water is it not? You do see the rock sometimes.

1349. The Rodondo appears by the chart to be 1130 feet high? It is very high. Kent's Group is, I think, about 700 or 800 feet high. The height was the great objection to King's Island; it was said that it was always enveloped in mist, but we never saw it enveloped in mist whilst we were there. We all know that every coast in the world is enveloped in fog some time or other in the year.

1350. You think the Rodondo has usually been clear? Yes; I have been there for a twelvemonth, off and on, seeing it every day.

1351. And you never saw it capped? Every coast is liable to fog some time or other, but certainly not the Rodondo more than usual.

1352. What class of lights would you recommend to be adopted in any new lighthouses to be erected in the Colony? I would have lights of the first order on the promontory, King's Island and Cape Northumberland; but for Cape Schanck, being so near to Port Phillip, a light of the second order would be sufficient.

1353. Have you ever had an opportunity of judging of the dioptric light? No.

1354. Do you know whether any estimate was made of the expense of carrying out the erection of the light at King's Island? I think Mr. Burgoyne estimated it at about ten thousand pounds. He was the engineer.

1355. Have you ever been much round to the eastward of Australia? I have been as far as Sydney.

1356. Do you think that coast requires any additional light? We anchored in Twofold Bay, and I think a light would be very useful there for vessels running for refuge.

1357. As a harbour light? Yes. There is a tower built there, and I believe it only requires the light.

1358. You are not acquainted with the coast to the northward of that? No; but I think that as Cape George is the turning point, a light there would be very beneficial, particularly as there is no light between Cape Howe and Sydney.

1359. If that is your opinion with regard to a cape of that nature, do not you think that is more strongly exemplified at the turning point on the west coast by Cape Northumberland? As far as over-sea ships bound to Victoria are concerned I do not see the necessity for that light.

1360. But the ships coming from Adelaide or from India, would not that be advantageous? For vessels coming from Adelaide it would be very beneficial, but vessels from India have no business near Cape Northumberland.

1361. Have you ever been across the straits to any part of Van Diemen's Land? No. I have been up as far as Portland, to the west.

1362. Supposing the Governments of these Colonies decided upon the erection of lights in the neighbourhood of Wilson's promontory, do you think there would be any difficulty in communicating with them? There would be just the same difficulty at all the places proposed; vessels conveying stores and provisions would have to watch for fine weather.

1363. But there are plenty of places for shelter in the neighbourhood of the promontory? Yes; from westerly winds, for instance, Waterloo Bay, Refuge Cove, and Sealer's Cove; but with easterly winds they are open, and there is only Corner Inlet along that coast where a vessel could get shelter with an easterly gale unless she went round the promontory to the westward.

1364. Would the "Victoria" steamer be able to lie in either of those places? Waterloo Bay and Sealer's Cove with westerly winds. Supposing the "Victoria" were sent with provisions or stores to supply the lighthouse, Corner Inlet would be the safest place for her to anchor.

1365. And if the lighthouse were on the promontory itself, it could be communicated with over land, could it not? No, not as regards stores and provisions, they would have to be landed close to the light from seaward.

Melville: G.  
H. W. Ross,  
Esq., R.N.

8 Aug., 1856.

1366. If it were determined to erect only one lighthouse, which do you consider the most important one to be erected first? Certainly King's Island. I should give that the preference; because, in the first place, the trade and emigration to these Colonies is very large, and I think you would find all vessels going to Sydney from England generally come that way.

1367. You think King's Island is the most important position? Certainly; and then after that the promontory. Those are the two first lights that, in my own opinion, ought to be put up.

1368. Supposing a light were placed upon the Seal Islands to the east of the promontory, and a stranger coming down from New South Wales had gone in there to look for it, would not a ship be caught in an awkward position, supposing an easterly gale came on suddenly? Yes; if she got to the northward of the islands; but if not she would have ample room to haul up and go round the promontory; and in the daytime she could run for Corner Inlet with perfect safety.

1369. Do you think that the tendency of a light on the Seal Islands would be to draw strangers into that position? Certainly; with an easterly wind.

1370. That is an objection to it? Yes.

1371. Whereas now large vessels always look for the light upon Kent's Group and take that passage? Yes.

1372. The easterly gales come on with great suddenness, do not they? Yes.

1373. And great violence? Yes; there is a tremendous sea about the promontory.

1374. Have you ever seen anything of the Song Beach? No, I never have been near it.

1375. Do not you think if that beach could be surveyed and sounded out it would be a great advantage as having a light upon the island? No; I do not see that vessels coming from the eastward have any business in there.

1376. But do not you think if it were sounded and the entire soundings were known that a man, in thick weather, would know his position by the soundings? Yes, if it were properly sounded and the soundings fixed, as in the English Channel, a man would be able to tell where he was.

1377. Do you think it advisable that a survey should be made of the Ninety-mile Beach? I think it would be desirable; I do not think it is such a frightful place as is generally imagined, no doubt there is always a very heavy swell sets in there with a south-east wind.

1378. Is there any point on the promontory itself on which a lighthouse would answer the purpose of guiding vessels, both from the eastward and from the westward? No; if a light were placed on the promontory it would be seen by vessels coming from the eastward, but it would be shut out from vessels coming from the westward by the Glennie Islands and Cleft Island.

1379. Are they high? Yes.

1380. What height does Cleft Island stand out of the water? I think it is about two hundred and fifty feet.

1381. Are the Glennies higher? They are higher than that now.

1382. Have you examined Wilson's Promontory with reference to the erection of a lighthouse there? Yes; I sent in a report to the Surveyor General, and I recommended its being placed at the Redoubt.

1383. Have you any further suggestions to offer to the Commission? In conclusion, if any lighthouses are to be erected, I would urge the necessity of making King's Island and Wilson's Promontory decidedly the first places at which lighthouses should be erected.

1384. You think they are more important positions than the Schanck? Certainly; I look upon the Schanck as quite a secondary consideration.

1385. Are you aware whether coloured lights are ever used for ocean or over-sea lights? No, I think not. I think they are generally white lights, either flash, revolving, or stationary, or two lights parallel, or two lights vertical.

1386. What kind of light would you suggest to be placed on King's Island, to make it as marked as possible, in contradistinction to Cape Otway light? I would have a fixed light there.

1387. Might not an objection to that arise in the event of the machinery of the light on Cape Otway getting out of order, and that becoming a fixed light, might not something of a still more marked character than a single fixed light be used there? There might be a couple of lights on the same tower, one below the other.

1388. Would not that be open to objection because the upper light would become visible first, and a man might take it for a single light instead of a double one? If the light were of the first order and it could be seen twenty-five miles off on a clear night, they would see the second light when they were within fifteen or sixteen miles, and that would clear them of all dangers.

*The Witness withdrew.*

Captain Charles H. Langley examined.

Captain G. H.  
Langley.

8 Aug., 1856.

1389. What ship do you command? The "Annie Wilson."

1390. Where was she last from? From London.

1391. How many voyages has she made here? This is her second voyage.

1392. And both times she has come from England? Yes.

1393. You have of course considered the nature of the entrance of the straits before you put your ship into a position to bring her in; do you consider that the light upon Cape Otway is a sufficient demonstration of the entrance to the straits to prevent any possibility of accident? I think not; I think there should be a light upon King's Island.

1394. In making the straits from the westward where have you usually made the land? At Cape Otway generally.

- Captain C. H. Langley.
- 8 Aug., 1856. 1395. Did you find at any time that the current had set you out of what you contemplated to be your proper position by your reckoning? No, I made the point exactly both times.
1396. If there were a light upon King's Island would you consider it advisable to borrow upon that island, or would you still continue to make the land in the same way as at present? I should prefer to make Cape Otway.
1397. Then what would be the usefulness of a light upon King's Island? Supposing your chronometers were not quite correct, and you were a little further to the eastward than you imagined yourself, you might, in thick weather, make King's Island, and consequently a light upon King's Island differing from that at Cape Otway would of course guide you.
1398. Have you ever considered the subject as to what part of King's Island you would recommend a light to be put on? I should say about the north-west point. I should prefer it upon the New Year Islands, if it were possible to erect it there.
1399. Supposing you were out of your reckoning and made the island to the southward, running with a heavy gale of wind from the westward, what position would your ship be in, in hauling to the northward, with the Harbinger Reefs right a-head of you? If it was a sufficiently good light you could make the light sufficiently far to haul clear to the north-north-west. I can say nothing about the navigation on the east side of the coast.
1400. Then you would not give an unqualified opinion as to the best position for a lighthouse being on the New Year Islands? No, I only spoke as to a ship coming from the westward; from the eastward I know nothing about it. For a ship coming from the westward I should have it on the north-west part of the island.
1401. Then you do not attach great importance to the New Year Islands? I would have it on the north-west part of the island, so that you could see either it or Cape Otway in running in; I should myself prefer the New Year Islands. My opinion is that if a ship was well under command you would have plenty of time if you sighted the light on the New Year Islands to clear the reefs at the Harbinger Rocks.
1402. Have you passed through the straits? I have gone through Banks's Straits.
1403. Are the lights of a good character there? Yes.
1404. Did you see them? I saw the lighthouse at Goose Island when it was just getting dark. The Swan Island light I saw, but it was hazy when I passed through.
1405. Do you think that those straits are sufficiently lighted? I made the Goose Island light just before dark, and I was so quickly through the straits that I had no time to observe the character of the lights.
1406. Do you think the lights at the entrance of Port Phillip are sufficient? Cape Otway light is a very good light.
1407. But coming further up the bay? You can hardly see the Shortland's Bluff lights far enough off. The last time I came in, from what I recollect of them, I should have preferred them to be larger lights, that you could see them a farther distance.
1408. Supposing you had had a light on Cape Shanck at any time when you had been coming in here at night, would it have given you greater confidence? If it was a different light from the other I should think it would.
1409. By a cross bearing would it give you greater confidence? By a cross bearing it certainly would, because if you had even made Cape Otway on running up the current might set you one way or the other, and then with a light on your starboard bow you would feel greater confidence of your position, if it was thick weather or a dark dirty night you might be set a point or two points from your course on the starboard side, and then instead of making Port Phillip Heads you would see a light on your starboard bow and you would immediately haul to the north-west.
1410. Then you think a light on Cape Shanck would be of very great service? Yes, decidedly; because you could pick your position up and stand in boldly at once. The lights upon Shortland's Bluff should be a little more distant—one above another, they are not elevated enough, especially the back light.
1411. In coming down from the westward before you make the coast of New Holland is there any other prominent cape which you think it would be an assistance to over-sea ships to have a light placed upon. As a prudent man commanding a large ship, would you in coming to Port Phillip always try to make the Otway light in preference to anything else? Yes.
1412. Even supposing other lights did exist on the coast to the westward? Yes, I always come up with Cape Otway bearing about east-north-east.
1413. Have you any further suggestions to offer to the Commission? I think it of the utmost importance that a light should be placed on King's Island.
1414. But you are not very much wedded to the opinion whether it should be on the New Year Islands, or the north end of King's Island? On the whole I should prefer the New Year Islands. (*The Witness withdrew.*)

Captain William Bell examined:—

- Capt. W. Bell.
- 8 Aug., 1856. 1415. You command the steamer "Yarra Yarra"? Yes.
1416. Which vessel you have commanded for some years? The "Shamrock," the "Waratah," and the "Yarra Yarra," I have commanded one or other of them for five years.
1417. Previously to that did you command sailing vessels on the coast? Yes, trading between Sydney and Van Diemen's Land, and Van Diemen's Land and this place. I have made 176 voyages from Van Diemen's land here, and 256 in all to this port.
1418. During the time you have been employed in the command of those steamers you have traded between Wide Bay to the north, and Swan River to the west? Yes.
1419. Are you aware that a lighthouse is about to be erected on Moreton Island? Yes.
1420. In coming down to the southward from Moreton Bay, considering that the erection of that lighthouse has already been decided upon, are there any points or positions between  
Moreton

- Moreton Island and Sydney Heads which, in your opinion, ought to be lighted? I should <sup>Capt. W. Bell</sup> almost think none, but if there should be one I would recommend a light on the Solitary Islands. There is no necessity for that except that sometimes we get a little farther off the land than we ought to do. There is another very important point—the Seal Rock Point. <sup>8 Aug., 1856.</sup>
1421. Then if you lighted the Seal Rock Point, you would not light the Solitary Islands, would you? Yes; but there is not a very urgent necessity for either. The most urgent point, I think, of the two, is the Seal Rock Point, to the northward of Port Stephens, because we there alter our course from north-east and by north to north, and we very often go out of our way in order to avoid the rock which lies off Seal Rock Point two or three miles from the land.
1422. From Sydney Heads to Gabo Island, are there any points either for vessels coming to the southward, or going to the northward, which in your opinion ought to be lighted? Yes, there is one very important point; there is a bight in by Cape St George, and another bight into Shoalhaven, and I have known several wrecks occur in Wreck Bay.
1423. Have you found the difficulty of wearing that point, more particularly in standing to the northward than in coming to the southward? Yes.
1424. Have you found that there is a certain indraught there which very frequently obliges you to haul your ship more out than you originally anticipated, when shaping your course from Montague Island? Yes.
1425. On which point would you consider it advisable to place a light; would you place it on Cape St. George, the southern point, or Point Perpendicular, the northern end? I think on Point Perpendicular a light would show both north and south, and would guide you sufficiently clear of the heads. We want a light to get us clear of Point Becroft in coming southward, and in going to the northward we want a light to clear us of Wreck Bay Bight.
1426. Then you think it would be a great consideration for all sailing vessels as well as steamers if a light were erected on Point Perpendicular? Yes. If a lighthouse is put on Cape St. George, unless it is very high, you would not be able to see it coming from the northward, but if on Point Perpendicular you would see it both from the northward and the southward. In coming from the northward a man would have to come right past Point Perpendicular before he could open the light on Cape St. George.
1427. Do you think that an absolutely necessary light to be carried out without delay? Almost as important as Gabo Island; I have often wished that there was such a light there. In dirty thick weather we very often make our distance greater than we otherwise should do.
1428. Is there any other point as a great leading thoroughfare light that you would consider to be necessary between that and Gabo Island? None at all. Should Twofold Bay become important, or even as a place of safety in heavy weather, a light there would be very important to guide vessels to the port.
1429. Then you would advise that a small harbour light should be erected sufficient to guide a vessel into the bay at night? Yes. There are many vessels driven off to New Zealand when if they could get into the bay it would save them making those long voyages, and if there were a light there any stranger could go into that bay night or day.
1430. Have you had ample opportunity of judging of the efficiency of the light on Gabo Island? Yes.
1431. Do you think that light is properly placed? It might have been at the point of the island. It would have been better there.
1432. Which point? The southernmost point, but at the same time it is farther seen where it is now placed.
1433. Where is the light now placed? Upon the north-east side, or nearly in the centre of the island. I think it would have been better placed at the end of the island, so that vessels coming from the northward could see it sooner.
1434. Is it some time before you open the light after passing Cape Howe? Yes; the light can be seen at present about sixteen miles.
1435. You are aware it is only a temporary lighthouse, would you consider it advisable to erect the permanent lighthouse on the southerly point? Yes; and sufficiently high for it to be seen about the same distance as the present one.
1436. In passing along to the westward from Gabo Island where is the next point in your opinion which requires to be lighted? It becomes then a question whether there should be two lights at Wilson's Promontory or whether one only should be erected there.
1437. Would you recommend a light at or in the neighbourhood of Wilson's Promontory? Yes.
1438. Supposing only one light to be erected, where would you consider it advisable to place it? Either on Hogan's Island, which would serve as a light for any vessel coming from the westward, or on Monœur's Island. If on Monœur's Island it would be open to vessels coming from Melbourne or vessels bound to Melbourne round the Howe, but it would do probably greater benefit if two lighthouses were erected.
1439. Where would you recommend the two lighthouses to be placed? If there were two lighthouses I would recommend one to be on Seal Island and one on the Glennies.
1440. Do you consider that some light or lights in that position is absolutely necessary? Quite so.
1441. Would a light upon Cleft Island, or on the Glennies to the west of the promontory, be of any use to vessels coming from Hobart Town, through Banks's Straits, or from Launceston? To vessels coming from Hobart Town it would, because then they would make the lights one after the other. They would pass Goose Island light, and then Kent's Group light, and then they would get hold of the promontory light.
1442. You consider it would be a considerable advantage to the Van Diemen's Land vessels, as well as to vessels coming from Sydney? To the Hobart Town vessels, not so much to the Launceston vessels; because it is only in a contrary wind that they would be obliged to approach the promontory in coming from Launceston.

- Capt. W. Bell. 1443. Have you ever considered, or had an opportunity of judging, whether those islands on which you have suggested that lighthouses should be placed are of such a character that that could be done without any engineering difficulties? I think the greatest difficulty would be with Moncœur's Island. I do not think there would be any difficulty with Hogan's Island.
- 2 Aug., 1850. 1444. Do you think if one light were erected on Moncœur's Island, it would answer all the purposes of both lights? That would be the best position if there were only one; but the most useful course would be to have two. There is a distance between Hogan's Island and Moncœur's Island of about twenty miles; so that we should be more anxious when we were coming up towards Hogan's Group, and the distance would be too great; I consider, that, if there were only one light there, Hogan's Group would be the best place for it, because a man abreast of Hogan's Group, with a light on that group, could steer his course so as to pass clear of all dangers round the promontory. In coming down from the north-east, we could always sight the Hogan's light, although we might not be able to sight the light upon Moncœur until we had approached it very near.
1445. What channel would sailing vessels use in going from the eastward or coming from the westward? Hogan's Island would be the most beneficial one for vessels coming from the westward.
1446. Sailing vessels would keep near Sir Roger Curtis's Island? Yes; and thereby have a channel of fifteen miles to go through clear of all dangers.
1447. But the steamers always use the channel between the Rodondo and the main, do not they? Yes; and I do not see any place more eligible if there is to be only one light than the Hogan's Group. A stranger would prefer the passage between Hogan's Group and Kent's Group to the passage between Kent's Group and Wright Rock. I have seen the Kent's Group light when I have been forty-eight miles off and within 200 yards of the promontory.
1448. In passing from the promontory is there any other point which is not now lighted which you would consider it advisable to light? I think Cape Schanck is a very important point in connection with all the Australian Colonies; I consider a light there so important that I told some gentlemen that if a lighthouse was built there by subscription I would put my name down for £50.
1449. Do you think Cape Schanck light would also be useful for vessels coming down from the westward and rounding the Otway, would they not be able to pick up their position with Cape Schanck light, and so run for the heads sooner than they now do? Yes, coming from the westward you would see Cape Schanck light.
1450. If a man running from the westward could make the Schanck light, he would be able to pick up his position, take a cross bearing, and run straight to any point he liked within a stone-throw of the shore? Yes.
1451. Then, with a light on Cape Schanck and the Shortland's Bluff lights, and the new light on the Spit, a man would be able to come up the bay at any hour of the night? Yes.
1452. Which do you consider the most important, the Schanck light or the promontory light—which would you recommend to be first adopted? As far as I am concerned, speaking only for the trade from Sydney, I would recommend the one in the vicinity of the promontory.
1453. Have you at all passed round the west coast? Yes, to Swan River.
1454. In turning the great continent to the westward, are there any considerable points of land which deserve to be noticed, presuming that you were going to Adelaide or Swan River? In coming from Adelaide down to Portland Bay, I would have given anything for a light on Cape Northumberland or some of those places.
1455. Would not Cape Northumberland be the most important point to be lighted, being as much a turning point to the west as Cape Howe is to the east? Yes.
1456. Have you ever seen Cape Northumberland? Yes, often.
1457. It is a low sandy shore there, is it not? Yes.
1458. Have you found the need of a light there at any time? Yes; I was once trading for a twelvemonth between Launceston and Adelaide.
1459. Is any other light necessary in that neighbourhood? Yes, at Cape Nelson.
1460. But that more with a view of running to Portland Bay than as a great highway light? Yes; Portland Bay is a capital place of shelter for any vessels coming from the west, and unless they have some light to be able to go in there at night they would get blown past the place, and then they would have no alternative but to run down to King's Island or to Port Phillip. I have been at anchor for shelter under Point Bunbury and Cape Patton.
1461. Do you think that if the lights you have recommended were undertaken—those at Point Perpendicular, Wilson's Promontory, Cape Schanck, and Cape Northumberland—the coast of Australia would be sufficiently lighted for some years to come? I consider so. I think a lighthouse is required at Seal Rock Point more than at any other place.
1462. As you have of course had opportunities of conversing with owners of vessels as to the impost of a small due upon vessels to meet the expense of lights, can you say whether you think that would be popular or unpopular? Every expense a vessel goes into is of course out of the owner's pocket; but I should say, that as far as we are concerned in the colonies, we can always make the public pay for it—that is, by adding so much more for freight and passage money; but I do not think any owner will be against contributing towards a lighthouse for the safety of his vessels.
1463. Do you not think they would often save in the matter of insurance if the coast were properly lighted, so as to ensure absolute security for anything like ordinarily competent persons? Yes, they would save in that.
1464. In trading between Launceston and Portland Bay—which trade you said you have been employed in—have you ever come near the north end of King's Island? Very often.
1465. Have you had opportunities of seeing that island? Often.
1466. Can you say whether it is liable to be clouded by fogs, or whether it is sufficiently clear

- clear in ordinary weather to ensure a light being seen? It is quite clear in ordinary weather. Capt. W. Bell.  
I seldom or never have seen it clouded.
1467. It is not more likely to be clouded than other headlands in thick weather? No. 8 Aug., 1856.
1468. Have you occasionally taken shelter under that island in gales of wind? Yes.
1469. Have you been by Sea Elephant Bay? Yes.
1470. Have you at all considered the question of the propriety of placing a light on King's Island? I think a light ought to be placed on the south point of the island, because in the north point of the island you come almost within range of Cape Otway lighthouse; but for vessels bound to Sydney, Port Phillip, or any of those places, I think the most important point would be the north end. I am speaking more as to the trade between Launceston and Portland and Adelaide, which I have been engaged in.
1471. Do you think the placing a lighthouse on the north end of the island would be likely to warn a vessel, or would bring her into danger? It would be likely to warn her.
1472. You would advise the erection of a lighthouse there? Yes; on the north end of the island.
1473. The channel to the southward is not very generally used, is it? Not unless you are bound to Launceston. No vessel would ever go past the south part of the island if bound to Sydney.
1474. Would not a vessel bound to Launceston, knowing that there was a light on the north end of King's Island, much sooner take that passage if it was lighted, than the southern passage if it was not lighted? Yes, it would induce them to go to the north. No man would take the southern passage unless he was really obliged to do so. A man being able to bring a light on King's Island to bear to the westward of south would feel that he was clear of the Harbingers, and he would be able to run through the straits with confidence. The Harbingers appear to be a great deal farther off than they are laid down on the chart.
1475. Have you ever considered the position of the New Year Islands—whether they would be preferable to the north end of King's Island as a site for a lighthouse; some masters of vessels have given it as their opinion that the New Year Islands would be a preferable site? I never was in that vicinity, but I should say not.
1476. Are you aware that the majority of the wrecks that have occurred have been to the southward of the New Year Islands? Yes.
1477. Would not a light on the New Year Islands have been of great service to the vessels that were lost there? It might have been; I know most of the wrecks have been to the southward of those islands, and at the time the "Catariqui" was wrecked they had no observation for four days before she was wrecked. The chief officer told me that it was his watch when they filled upon her at four o'clock in the morning, and the vessel being under close-reefed topsails, the question was whether, if they kept her lying to all night, they would have had sufficient room to clear the rocks in the morning.
1478. Then she must have been lost under any circumstances? That was his opinion.
1479. Do you think it would be a great boon to navigators to have a light upon the north end of King's Island? I think so.
1480. And you never have seen the land there more clouded than land usually is in thick weather? No; I have been there many times and never saw it clouded at all.
1481. Have you ever seen the Ten-foot Rock? Yes; I have been between that and the Rodondo several times.
1482. Do you think it would be practicable to erect a lighthouse on that rock? No; I think not.
1483. Does the sea go over it? Clean over it.
1484. Would it be practicable to put a lighthouse on the Rodondo? No; it would be inaccessible.
1485. Is it not too high for a light? No; but I should say in the months of December, January, and February, two-thirds of the Rodondo at the top is covered.
1486. Do you think it would be possible to put a light on the promontory itself so as to make it available for navigation both ways? I am afraid the Glennies would be too high for a light on the promontory to be seen, and if you went further in shore it would be too high for the fogs.
1487. Are the Glennies high? Cleft Rock is one of the Glennies.
1481. If it was possible to put a light on Cleft Rock, would that be the most eligible spot in your opinion? I should think so.
1489. Would it not be shut to vessels coming from the eastward? Yes.
1490. Have you found the currents to be very strong in the straits? There is a current about King's Island and about Kent's Group. There is no current in the open straits.
1491. Will not steam vessels always cut off corners when they can? Always.
1492. Then a light on Hogan's Island would not be so useful to steam vessels which shave round Wilson's Promontory as having two lights off the promontory? No; steam vessels when it is blowing hard to the westward usually keep along the Ninety-mile Beach, as close in as possible, and therefore the Seal Island light under those circumstances would be very useful.
1493. Did you ever land on Wilson's Promontory? No, I landed just inside of it. It is not generally known that on the east side of Cape Liptrap there is a much deeper indentation than is shown on the chart, and the anchorage in heavy westerly gales is very good, and the holding ground is good, and the depth of water is good.
1494. Are you satisfied with the lights on Shortland's Bluff now? Nothing could be better; they are excellent for the purpose.
1495. You do not consider there is any necessity for another lighthouse being erected on Point Lonsdale? None, whatever; I should consider it a useless expenditure of money; but a light on the Schanck I should think very necessary for all vessels coming from the eastward; and for vessels coming from Launceston a light upon the Schanck would be most important.

- Capt. W. Bell. 1496. Of all the lights you have pointed out as being advisable to be erected, which do you think are the first that ought to be taken in hand? I think the light in the vicinity of the promontory.
- 8 Aug., 1856. 1497. And you think that would be more important than the King's Island or the Schanck light? Yes, and the light upon Cape George or Cape Perpendicular should be also taken in hand as well; but, certainly, the most important light would be the one on the promontory. [The Witness with-res.]
- Adjourned to to-morrow, at Ten o'clock.

SATURDAY, 9 AUGUST, 1856.

Present:—

CAPTAIN KAY, R.N., | MR. BROWNE,  
MR. DOUGLAS.

Captain Thomas Wing examined:—

- Captain T. Wing. 1498. What vessel do you command? The "Pioneer."
1499. Is she a steamer? No, a sailing vessel; a clipper fore-and-after.
- 9 Aug., 1856. 1500. Where has she been trading to? To Van Diemen's Land, lately.
1501. Have you for the last ten or twelve years been in command of different vessels trading to most of the Australian ports? For the last twenty-six years.
1502. What ports in the Australian Colonies have you traded to and from in those twenty-six years? I have been several voyages to Sydney, and from Sydney to Melbourne, and from Sydney to Hobart Town and Launceston, and from Melbourne to Hobart Town, and Melbourne to Adelaide, and Sydney to Adelaide.
1503. Then you have a tolerably good knowledge of the nature of the dangers which you have to contend with in the navigation of this part of the world? Yes. When the Crocodile Rock in the straits was for a long time considered doubtful, it was in 1827, when I was coming out in the ship "Ferguson, we corrected the position; we lowered boats down and took the proper bearings of it; the position was marked "doubtful" at the time on the chart.
1504. Have you ever traded to the northward of Sydney at all? Merely in going through Torres Straits.
1505. Your principal voyages have been to the southward? Yes.
1506. In coming to the southward from Sydney to Cape Howe, or in going from Cape Howe back to Sydney, are there any points on the coast of New South Wales which, in your opinion, require to be lighted beyond those that are already lighted? There is one particular point, called Cape St. George, at which I think a light would be desirable.
1507. Have you found in proceeding to the northward that there is a considerable indraught setting in under that point? There is a very strong indraught; I have often noticed it in fact.
1508. Have you found that, in making what you might consider your proper course, from Montague Island to Cape Howe, your vessel has been thrown into the land, and you made Cape George upon your weather bow? I have noticed it so often that the latter part of my voyages here I used to make a regular allowance to avoid it, by steering a point more to the eastward. I have many times been drawn in there by the indraught.
1509. And you think it would be desirable to put a light there? Yes; I think so, very much so indeed.
1510. And it would be a great boon to mariners standing to the northward? Yes.
1511. Where would you propose that the light should be placed—on Cape George or on Point Perpendicular? From what I recollect of it, I think somewhere about the head of Cape St. George would be the best place.
1512. Do you think then that it is more important in going from the southward than it would be in coming from the northward? Yes, decidedly; it is in going from the southward that you fetch it up so.
1513. Then you would not care about the light at Cape St. George being seen over Point Perpendicular in coming from the northward? If that point could be gained, I think it would be very desirable.
1514. In coming from the northward, if the light were on Cape George until you opened Cape Perpendicular, you could not open the light? I am not prepared to speak as to the height of the land, but if the light could be placed so as to be seen from the north as well as from the south I think it would be the best.
1515. Then you think, if the ground be not too high, Point Perpendicular would be the best point? Yes; I think a light in that locality would be very useful, and would prevent many accidents. I have known very many vessels get into that bight, particularly in easterly weather, when it was thick.
1516. That is into Wreck Bay? Yes.
1517. Have you navigated the straits since the erection of the Gabo Island lighthouse? I have.
1518. Do you think that lighthouse is in its proper position? I think it is very good in position, but the light is very dull sometimes.
1519. Do you attribute that to the atmosphere? No, I think it is from defective management; I have noticed it several times very dull indeed.
1520. Do you think the light is high enough to be seen at a sufficient distance? Yes; there are many times when the weather is hazy that you can see a low light when you could

not

not see a high one; there is the light on Kent's Group for instance, I have been within a mile of the island and could not see it.

1521. That light in clear weather can be seen an enormous distance? Yes.

1522. After passing Gabo Island, coming to the westward, either bound to Melbourne or Adelaide, are there any points in the straits which strike you as being of sufficient danger to require lights to be erected? About Wilson's Promontory I think there ought to be a light.

1523. That will always be the turning point for the trade? Yes; the last time that I gave my evidence upon this subject I was very much inclined to think that Cleft Island would be the best position, because you could always sail direct for it, and go within a few fathoms of it and be in perfect safety; there are no dangers round about it.

1524. Are you not of that opinion now? I am still of that opinion, because vessels can steer direct; and if the weather is a little thick there is no danger in the way, and you can steer direct for the light from Port Phillip Heads.

1525. But a light on Cleft Island would not be visible in coming from the eastward until you opened the promontory? Certainly, if a vessel was well in shore she would not get sight of it. I was certainly wavering a little in my opinion on that subject, on account of the difficulty of having the light placed so high. I thought there might be the same fault as at Kent's Group.

1526. Do you think if the light could be placed on some island or rock, or in some position where it could be seen both from the eastward and from the westward, that would be the best position? Decidedly.

1527. But if the engineering difficulties are so great and the promontory so high, that you could not erect a lighthouse on the south of the promontory, you would recommend Cleft Island? Yes, Rodondo is too high. You could certainly get a light low enough on one side, but it would be obscured from the other side.

1528. Do coasting vessels coming from the eastward and westward generally use the passage between Wilson's Promontory and the Rodondo? Yes, steamers particularly.

1529. Do you think the great ocean line of steamers, when established here, would be sure to use that route? I think so. It is a nice clear channel, and every rock about it is very bold.

1530. Do you know the Ten-foot Rock? Yes.

1531. Is that ever clouded? I have never seen it clouded, and I have been very close to it.

1532. Do you think it would be possible to put a lighthouse there? I think it would, but I fancy it would be shut in very much. I think the erection of a lighthouse there could be accomplished easily, particularly one of the iron lighthouses.

1533. You think the sea in a westerly gale would not be so destructive as to prevent its erection and maintenance? No. There are three rocks—it is not one solitary rock. I think it is sufficiently above water to break any heavy sea, such a sea as would do a lighthouse any injury.

1534. You think that if the engineering difficulties are not insurmountable the Ten-foot Rock would be the best position for a lighthouse? I think so.

1535. That would command an excellent view in both directions? It would indeed; it appears very close to the Rodondo when you are near it.

1536. But even supposing it was rather close to the Rodondo, the Rodondo would only shut it out from the southward, and that only for a very short time? Yes; from what I have seen of the rock I think it would be quite possible to put a lighthouse on it.

1537. At all events you conceive that it is urgently required that there should be a lighthouse in the neighbourhood of the promontory on whatever might be found to be the most eligible spot? Yes. I have been very much taken by the appearance of Cleft Island, there being a large cave on it; that cave is all overgrown with grass, and the sea never seems to fetch up into it, and it struck me that there might be as it were a pair of davits or sheers rigged to hook a boat up, and that a winding staircase might be made right through the solid rock, and a lighthouse be placed on the top of the rock, and the stores might be kept in the cave.

1538. Could you see the light on both sides from Cleft Island? You could see it a long way out—it is only when you are embayed that you would not see it. A vessel steering down in her proper course would be sure to open the Cleft out.

1539. What is the bearing of the promontory when you open the Cleft out? West-south-west; steering a course from the cape to the promontory you would open the Cleft Island with the promontory bearing about west-south-west. Supposing a light was on Cleft Island a ship would see it when she was fifteen miles to the eastward of the promontory, when steering a direct course from Cape Howe, and she would not shut the Cleft Island light in unless she got right in amongst the islands.

1540. Is the Cleft Island high? It is a fine bold rock; I should think about 150 feet high.

1541. In passing round the coast to the westward is there any other point upon the coast which requires any additional lighting? I should think a light at Cape Schanck would be very desirable.

1542. Do you think a light there would be equally serviceable to vessels coming from the westward and vessels coming from the eastward? I do.

1543. And would not it be particularly useful to vessels coming from Launceston and Hobart Town? From all quarters of Van Diemen's Land.

1544. If a light were erected there, would not a man run with great safety, so that he might pick up the cross bearing of the Schanck light, and run with confidence for the entrance to the heads? Yes. With reference to the Shortland's Bluff light, I wish to point out that there is a gap in Point Nepean where we get a glimpse of the light for a second or two, and then it is shut in; and I have often thought that if the light was raised a little higher, or if the trees that are there could be moved, we should get a sight of the light much sooner and much longer.

- Capt. T. Wing  
 9 Aug. 1836.
1545. Would the removal of the trees on Point Nepean effect that object? I think it would be better that the light should be raised, because at present when the light does open out you are close down upon the beach. I think it would be a very great improvement to raise the high light at Shortland's Bluff so as that it could be seen over the low land.
1546. Do you think a light at Cape Schanck is an important light to be erected? Yes.
1547. With a light at Cleft Island and another at the Schanck would the lighting of the straits be then almost perfect? I think so. I am not exactly prepared to say how far the raising of the light could be carried out, but I think it would be a very great improvement if it could be raised so as to be seen over the low land, and that, I think, would do away with the necessity of putting a light any where about Flinders' Point.
1548. Did you ever give your attention at all to the necessity for any light after passing Cape Otway when bound to South Australia; is there any point on that coast which requires a light? I think a light is very much wanted about Cape Bridgewater. I am not exactly prepared to say which of the two capes, Cape Bridgewater or Cape Northumberland, would be the best, but to the best of my recollection I think it would be better at Cape Bridgewater.
1549. Would not Cape Northumberland be the point at which a vessel bound to Adelaide would alter her course? It would.
1550. Would not it be the turning point? It is a turning point.
1551. Would it not, therefore, be of great importance that that point should be lighted? I do not know any part of the coast where a light would be of more service than it would there.
1552. Are you aware that a very considerable number of vessels have been wrecked there of late years? Yes; there are some very nasty patches of foul land along the coast there in the neighbourhood of Cape Northumberland, with not more than from five to seven fathoms of water upon them.
1553. With a light upon Cape Northumberland, Cape Schanck and the promontory, do you think that the south coast of Australia would be sufficiently lighted for many years to come? Yes; but I should like attention to be drawn to the Shortland's Bluff lights, and the desirability of the higher light there being raised still higher, so that it might not be eclipsed as it at present is after showing through the gap at Point Nepean.
1554. How much do you think it would require raising? That must be a matter of observation.
1555. Do you think the two lights at Shortland's Bluff are sufficiently wide apart for leading lights? Yes.
1556. Would it be sufficient to raise one light? Only one light; the red light is merely a leading light, the other would be a guide at sea.
1557. Which is the light you would recommend to be raised? The upper light.
1558. Have you ever given your consideration at all to the advantages or disadvantages which would accrue to the navigation of the straits by the erection of a light on King's Island? I think a light would be very useful there.
1559. You have in your voyages sighted the island frequently, have you not? I have been on it. I have many times anchored round about King's Island, and the anchorage there is very good.
1560. On the east side of it? Yes. In westerly gales a person might, if he could see a light there, bear up and run right round to leeward of the island with perfect safety.
1561. Having given such a decided opinion that a light is desirable there, on which part of the island would you recommend its being placed? On the north point, near Cape Wickham; there is a sort of hill there where it could be very well placed.
1562. Have you ever considered the question of putting a light on the New Year Islands? Yes, but I do not think it would answer at all.
1563. Do you not fancy that the erection of a light upon King's Island would tend to bring vessels into danger instead of taking them out of danger, in consequence of the immediate vicinity of the Harbinger Reefs? The Harbingers lie but a short distance from the land there, and in almost any weather you would be able to see the light before you got near the Harbingers.
1564. Have you had an opportunity of judging of the state of the atmosphere which surrounds King's Island? Yes.
1565. Is it sufficiently clear for the purposes of a lighthouse, or is it generally clouded and capped? Generally pretty clear.
1566. Not more clouded than other high lands generally are? No, not at all. In heavy westerly gales, if there was a light there, a vessel could run without danger and come right round under the lee of the island, and a man might strike his sails, let go his anchor, and come to at once.
1567. And ride there in perfectly safety? Yes.
1568. Now you have no shelter there, nor can you take advantage of the anchorage unless in the daytime? No. Everybody is so much alarmed about getting near the Navarino and Harbinger Rocks that they keep out in open sea, and of course get blown so far to leeward that they cannot pick themselves up again.
1569. The majority of wrecks on King's Island have taken place to the south of the New Year Islands? Yes.
1570. Would a light on Point Wickham be available for vessels in such a case as that? Yes; they could see that light as clearly as possible, because the land is sloping down to the water on both sides.
1571. Are you sure that the light on Mount Wickham could be seen over the New Year Islands? Yes.
1572. And well to the southward, to warn them of their danger? Yes, the bearing of that light would show them where they were.
1573. Do you consider it imperatively necessary that there should be a light erected there for the safe navigation of the straits? I do.
- 1574.

1574. Do you look upon that as being as important a light as any of the others you have been recommending? No, I consider the Schanck light more important than one on King's Island, since we have got one on Cape Otway, because if they would only keep the north shore aboard, they could sight the Otway light with perfect safety.

Captain G.  
Wing.

9 Aug., 1856.

1575. Then, although an important light for assisting vessels which wished to run under the lee of the island, you think other lights, such as the Schanck and the promontory, would be more important? I do, but I think a light on King's Island would be a very great service, and be of advantage to the safety of the navigation of vessels coming from Adelaide to Hobart Town; the first thing they would look to make after losing the Otway light, would be to pick up the King's Island light.

1576. Would it be more important to vessels bound from Adelaide to Launceston and Hobart Town than to others? No, I think it would be equally important to ships coming from England right through the straits.

1577. Then you think it is of equal importance to all vessels entering or going out of the west end of Bass' Straits? Yes.

1578. Whatever trade they may be in? Yes. I have been very much perplexed myself coming into the straits when I have got into a great deal of sea in rough weather, whereas if I had had a light there I might have got into smooth water.

1579. Are there any other suggestions with regard to the navigation of the straits on which the Board have not examined you, on which you would favour the Commission with your opinion? No; I think you have touched upon the principal points that I am aware of; I do not know any other places that require lights which remain unlighted.

1580. You think with the enormous trade now passing backwards and forwards through these straits, those lights which you have suggested ought to be carried out at once? I do. I think it would be a great benefit to the trade.

1581. Would not the effect of the erection of the additional lighthouses be, that it would have a tendency to reduce the rates of insurance as giving greater facilities to the navigation? I think it ought to do so, but the underwriters do not do it.

1582. Are you familiar with the set of the current in the neighbourhood of Cape Otway and King's Island? Yes.

1583. Does it take any distinctive feature at all that you could point out? No more than I think there is a general set to the eastward, more particularly in the winter season when the south-west winds prevail.

1584. Then the currents are very much governed by the direction of the winds? Yes.

1585. Have you ever noticed a strong southerly set on King's Island setting down on it from Cape Otway? Yes, the current does set along in that direction.

1586. It does set to the south? Yes.

1587. That would account to some extent for the number of ships that have been caught on the west side of King's Island in heavy weather? Yes, the tide through the straits between King's Island and the Hunter's Island is very strong at times. I should think the tide goes at least five knots.

1588. A regular ebb and flow? Yes; I have been for hours there, and could not get ahead with the tide going five knots.

1589. You are of opinion that a light placed in an elevated position near Cape Wickham could be seen over the point of King's Island which lies just south of the New Year Islands? Yes; Cape Wickham is the highest land on the whole of King's Island.

1590. Can you give the Commission any information as to whether water can be obtained on Cleft Island? There is no water there, but you could have a cistern there that in the winter season would supply them with water. A cistern could be excavated in the rock, which would give them ample water. The sea is so very bold on King's Island, that even in rough weather there would be no difficulty in landing.

1591. Is the cave at Cleft Island protected from the westerly gales, or on which side of the island is it? I think it is on the southern side of it.

1592. Then it would be open to the south-west gales? Yes; but I think it would be found also that there would be very good shelter on the lee side of the island.

1593. Sufficient to land the stores? Yes, or to land with boats. If it were closely inspected I think many advantages which I am not aware of would be found as to landing on the lee side of the island, because it is completely sheltered by rocks attached to the base of the island, and places might be found which I am not aware of. Another advantage of a light being placed on Cape Schanck would be, that in heavy south-west gales a vessel would run down towards the light, and in case of an accident she could bear up and run into Western Port. The land is pretty bold there, so that they could feel their way in very well with a lead. The light on Shortland's Bluff, I think, would be very much improved by being raised, if it could be raised sufficiently to be seen over the low land, or if not, I think if the top of the low land, the brush or scrub, could be cut away on Point Nepean, you would get a greater angle, and you would have pretty well ten or twelve miles in which you could see the light. If you could gain that object, it would do away with the necessity of having another light anywhere else about there on Sandy Point or Flinders' Point. This very last trip of mine I made the land well up towards White Point. I ran along, steering a course as I thought for the gap, and I could not see the light until I opened the gap. If the light had been higher I could have seen it over Point Lonsdale, because it is all low land there.

1594. But supposing you had known there was a light on the Schanck, would you not have made that light? No; because there being a westerly wind I was hugging the westerly shore. I think if the light was raised it would be seen over the low land. It is a nasty low dangerous shore, and on a dark night you are right upon it before you know where you are, whereas, if you could see that light it would give you a distance of fifteen miles off, that is, if the light was raised to the proper height. What that height might be could only be ascertained by observation. [*The Witness withdrew.*]

Barnard Robert Mathews, Esq., examined :—

- B. R. Mathews Esq.**  
9 Aug., 1856.
1595. You are now Lloyd's Agent in Melbourne? Yes; I originally commanded the "Great Britain" steamship to these Colonies.
1596. Had you made any voyages to these Colonies previously to that? No; my first voyage was in the "Great Britain" in 1852; there was no light then on Cape Howe.
1597. You came from Liverpool to Melbourne and from Melbourne to Sydney, then from Sydney back again to Melbourne, and then home, did you not? Yes.
1598. Did you go home round to the eastward? No; the first voyage I took the north west route, round the Cape of Good Hope, and the next time I went through Banks's Straits; there is a very good light there.
1599. In entering Bass's Straits from the westward have you ever considered the question of the necessity of a light on King's Island? I did on my voyage coming out in the "White Star," also on my last voyage with the "Great Britain"; the wind was very scant, and I was afraid I should have to shave King's Island very close. I was timid when near the west end of it, in consequence of the rocks which are there. I was getting short of coals. If there had been a light there I should have made the island and saved a little time, but fortunately as I was approaching the land the wind came up and I fetched the Otway.
1600. Seeing that there are dangers existing to the northward of King's Island, do you think that a light there would at all induce a master of a ship to borrow upon that island and so lead him into danger, or do you think a light would be an advantage to keep him out of danger? It would be a warning to keep him out of danger and also give him confidence when there has a scant wind, whereas if he knew there was no light there he would be more cautious, knowing that he was near the island; the currents thereabouts vary very much. Sometimes indeed there is no current, and there is no dependence on the current, and I do think if a light were there a man might keep on his course and make his port instead of standing out and losing the night.
1601. Then you have no hesitation in recommending the erection of a light on that island? Not the least.
1602. On what part of the island would you recommend its being placed? I have had a great deal of conversation on the subject with Captain Ross, and the part he has pointed out I quite agree with him in thinking would be about the best spot for a light to be placed.
1603. On the north point? On the north point, decidedly. I think it would be visible there earlier than at any other part, and would be more serviceable to vessels coming either way.
1604. Have you considered the question of putting a light on the New Year Islands? I have; and although I differ from other parties who have expressed an opinion on the question, still it is a matter of opinion, and mine is that the north cape of King's Island would be the best position.
1605. Are there any sailing instructions for the use of mariners that you are aware of warning them not to borrow on King's Island? I do not remember; I have always been cautious of King's Island.
1606. Would you think it a desirable instruction to be given if a light were placed there that ships should be taught not to make use of it too freely? I think it would be advisable.
1607. And that the light should be merely used as a beacon to warn them from danger? Yes; in case they were driven in, in bad weather, and warning them not to approach the island unless driven there unavoidably by currents or winds, and then if they knew there was a light on King's Island it would guide them free of danger. In coming out in the "White Star" we made the island, and stood to the westward.
1608. At what portion of the island? About the centre; from the quarter-deck I saw it clearly; we were about thirty-four miles to the southward and westward of it.
1609. Had your vessel been set down by any particular current? Yes; we had had strong winds to the northward, and then it fell calm all of a sudden. My reason for recommending a light to be placed on the north end of King's Island is, to steer clear of the dangers which exist there.
1610. Are you aware that the great majority of the wrecks that have taken place on King's Island have taken place to the southward of the New Year Islands; how do you account for that? I expect they have been farther to the eastward than they expected to be, and have got close to the island before they have about.
1611. Do you think a light on the northern end of the island would be advantageous for vessels making the middle of the island, where most of the vessels have been lost which have been wrecked there? Vessels coming in would see this light in time to warn them of danger, if sufficiently elevated.
1612. Would they see it over the New Year Islands? They would.
1613. And over the cape that juts out just south of the New Year Islands? I think, if high enough, it would be seen over all. If you have a lighthouse there it should be visible from all those points seaward.
1614. You think it would be advisable to have a light upon King's Island? I strongly recommend it.
1615. Do you think it actually necessary to have a light there? I do consider it absolutely necessary.
1616. But you do not consider if a light were placed there it would lead a ship into danger? Not at all.
1617. It would act as a beacon to her? It would facilitate trade. My object for recommending a light there is, that a man coming in at night time if he should happen to be near the spot, instead of heaving to all night, not exactly knowing where he was, by making this light he would have confidence and make his passage by a reasonable time in the morning.
1618. In proceeding into Melbourne from Cape Otway, are there any points there that you think

think require to be lighted more than they are now? It is a blind port until you get very close to it, and I have frequently heard strangers make use of the same remark, that they have taken Western Port for the entrance into Port Phillip; and until you get well up towards the entrance you cannot see which is the entrance to the harbour, until you make the lighthouses in the daytime. At night whether you can see the lights at the entrance coming in from the Otway or not I cannot say, but I should imagine it would be very much easier to approach the harbour at night than in the day. I have never approached the harbour at night time, and therefore I can hardly state whether the lights are sufficient or not, but I should imagine that if the lights are good at the entrance they would be quite sufficient for a man to run in a certain distance and heave to for a pilot; I would not approach too near the mouth of the harbour before I heave to, and the harbour lights would be sufficient I think. I have heard a light at Cape Schanck advocated as being useful for the coasting trade; I am also of the same opinion, and more especially for large ships working up from Cape Otway.

B.R. Mathews  
Esq.  
9 Aug., 1856.

1619. Would not a light at the Schanck be of importance to a stranger approaching the port? I think it would be very valuable as giving a cross bearing.

1620. You think it would be useful principally for the coasting trade? Yes.

1621. What would be the effect of a Cape Schanck light as a great highway light for vessels proceeding through the straits to the eastward either to New Zealand or Sydney, do you think it would be of any use to them? Coming to Melbourne it would be valuable, it would be the leading mark for the entrance; by the time you got well abreast of that light you would pick up the harbour lights.

1622. For a great highway light would it be valuable? I have no doubt that for a great highway light it would be equally valuable.

1623. You have stated already that you have not made use of the Shortland's Bluff lights at all at night? No, not in command of a ship; I think a light at Cape Schanck would tend to give confidence to all mariners, speaking from my own observation and from the observation of others.

1624. Have you ever considered the question of a light on Point Lonsdale, considering that there are already two leading lights on Shortland's Bluff? I do not think it necessary.

1625. Have you heard any complaints from masters of vessels that the upper light at Shortland's Bluff is not high enough, and does not command a sufficient radius of vision? No.

1626. In proceeding to the eastward of the passing the entrance of Port Phillip, what is the next point that you think should command the attention of the Colonial Governments with regard to lighting? Cape Schanck.

1627. In proceeding from Melbourne after passing the Schanck, you think the promontory would be the next place at which a light ought to be erected? I think it very important that there should be a light there.

1628. You have commanded a large steamer and taken her through Bass's Straits? Yes.

1629. Would a light upon Wilson's Promontory have given you much greater confidence in doing that? I should have found it valuable.

1630. Therefore it would be very valuable for the ocean line of steamers when they are established in running from Sydney to Melbourne? Yes.

1631. Are you familiar with the peculiarities of Wilson's Promontory? No.

1632. Do you know the Ten-foot Rock? Yes.

1633. Have you ever landed on it? No.

1634. Would that be a good position for a lighthouse if it were possible to erect one there? I imagine the Ten-foot Rock would be a very good position; I think it would be seen going from the westward, also coming from the eastward.

1635. Supposing it should not be practicable to put a light upon the Ten-foot Rock what do you think would be the next best point? The promontory.

1636. Do you not think the Rodondo would be likely to interfere with the light upon the Ten-foot Rock? The Rodondo would shut it in for a short time, but you would very soon have it open again; the Rodondo is a very small island, and when you shut it in it would only be shut in from the south, it would not shut it in for vessels passing from the straits east or west.

1637. Have you ever considered the position of Cleft Island, which is situated to the south-west of the promontory? Yes, that would be more out of the way than the promontory; it would be very little use in going from Melbourne, when you can see the Cleft Rock you can see the promontory, if you keep a good offing.

1638. Then you think either the Ten-foot Rock or the promontory itself would be the better position? Yes.

1639. Have you ever seen the Cleft Rock? Yes.

1640. What height should you think it is? About 100 feet. I have gone close to it.

1641. Then if it is only 100 feet high, and it is possible to see it to the eastward of the promontory, of course it would be available for vessels coming from the westward? Yes.

1642. With regard to all steam communication between these various colonies, then you are of opinion that a light on Wilson's Promontory or near it is most indispensable? Yes.

1643. If you commanded a large ship under sail would you hug the promontory. I would.

1644. When there is a light at Kent's Group and no light on the promontory? You must have clear weather to see the light on Kent's Group as you are entering the straits from the westward.

1645. In coming from the westward what passage would you take in a large ship? I should shave the promontory with a leading wind.

1646. With a ship under sail? Yes, if I had anything of a leading wind; beating through I should certainly not; but with a leading wind, if I could go round comfortably full sail, I think I should borrow close round the promontory.

1647. A steam ship would do so under all circumstances? Yes.

- B.R. Mathews Esq.** 1648. After passing Cape Howe, when bound to Sydney, does it appear to you that there are any points on that coast which deserve consideration and upon which it would be advantageous to have lights besides Cape Howe and Sydney Heads? I do not know how you are situated for a light at Twofold Bay. That bay is used as a harbour of refuge, and should be lighted; a light there would also answer for a highway light.
1649. This Commission is not instructed to deal with anything but highway lights. Have you ever found any difficulty in approaching Sydney from the southward for the want of any lights upon any points of the coast? None. I have always shaped a straight course in steamers, I have never been beating up or in shore.
1650. You do not know how the want of a light might apply to coasting vessels? No, I cannot give an opinion upon that subject.
1651. Have you seen the light on Cape Howe? Not on Cape Howe. It is on Gabo Island. I saw that when it was erecting and since its completion.
1652. Do you think that is sufficient as a turning light? Yes.
1653. Is it sufficiently powerful? As far as I can judge, it is.
1654. What is the greatest distance at which you have seen it? I have seen it some seven or eight miles I think.
1655. Have you ever been to Adelaide from Melbourne? Never. I have been up the coast going to the westward round Cape Leeuwin, *en route* to the Cape of Good Hope.
1656. In going up from the Leeuwin, what additional lights would be necessary? In my opinion a light at Cape Bridgewater or Cape Northumberland would be desirable. I should imagine Cape Bridgewater is the most projecting point. I think it very desirable that a light should be placed on one of those points, but I am not prepared to say which.
1657. Looking at the trend of the land which should you imagine to be best? I should think Cape Bridgewater would be the best place.
1658. Have you ever seen either of those capes? Yes, I saw them on the first voyage of the "Great Britain," I made the land about that part; it was in a very thick fog, and directly I made the land I shaped a course for Cape Otway.
1659. Would a light on either of those capes be of any service to over-sea ships approaching Bass's Straits from the westward? I think it would be very advantageous to vessels coming along the coast. If they made the land preparatory to making Cape Otway, I think it would be valuable.
1660. If there were a light on Cape Bridgewater or Cape Northumberland, would you prefer to make that light before making the Otway light? No, I should not prefer it.
1661. Supposing you had northerly winds, and you were in command of a sailing vessel, would it not be advisable to make Cape Northumberland? Yes, if the light was placed there.
1662. As a general rule you think a mariner would always make for Cape Otway in entering the straits? Yes; a light at Cape Northumberland would be more serviceable for the coasting trade than for anything else.
1663. Would not a light on Cape Northumberland be advantageous in the summer time to vessels meeting a south-easterly wind and being thrown in upon the land? Yes, it would be valuable in that case.
1664. Have you any further suggestion to offer to the Commission? None whatever; I think everything I intended to suggest has been anticipated by the questions that have been put to me. [*The Witness withdrew.*]

Adjourned to Monday next, at ten o'clock.

MONDAY, 11 AUGUST, 1856.

Present:—

CAPTAIN KAY, R.N., | Mr. BROWNE,  
Mr. DOUGLAS.

Mr. George Doran examined:—

- Mr. G. Doran.** 1665. You formerly commanded the "Queen" steamer? Yes; for the last eighteen months.
1666. In what trade has she been running? From here to Warrnambool, Port Fairy and Portland Bay.
1667. Have you ever been in command of any other vessels trading to any other ports of the Australian Colonies? Yes; I had the command of a barque called the "Margaret," trading between this and Adelaide, and a brig called the "Louisa."
1668. In the same trade? Yes.
1669. During the time you have been occupied in that trade have you had ample opportunities of judging of the positions of the different points on the coast that are lighted, and those that are not lighted? I have.
1670. In coming from Adelaide to Melbourne, in a sailing vessel, are there any points of the coast that strike you as requiring to be lighted? I should think if it is intended to light the coast generally, a light on Cape Northumberland, and a light on Cape Bridgewater also would be desirable.
1671. But if the coast were only to be lighted with a view of ensuring a sufficiently safe navigation you would recommend a light on Cape Northumberland? If there was only one light I should say Cape Bridgewater would be the best site for it.
1672. Would you say that with reference to the voyage from Adelaide, or more with reference to making the voyage to Portland? It would apply to vessels coming from the westward

westward generally, inasmuch as they would run into their latitude, and allowing themselves a few miles of an offing if they missed seeing Cape Northumberland they would be sure to make Cape Bridgewater. Mr. G. Doran.

11 Aug., 1856.

1673. Do you think a light on Cape Bridgewater would be equally useful for vessels from the westward? I should think so. Coming round from Adelaide they would have to clear themselves of Cape Jaffa, and the master of a sailing vessel giving that a good berth would throw himself more to the southward.

1674. Do you not consider Cape Northumberland the first turning point from Adelaide? Yes.

1675. Is it not the principle generally adopted to have the lights at the turning points? Yes. For vessels from Adelaide perhaps Cape Northumberland would be the most favourable position; but for vessels from the westward generally, large vessels bound to Melbourne, Sydney, or Van Diemen's Land would, I should think, prefer Cape Bridgewater, and I should think that would be a good leading mark for Portland.

1676. Would it be at all advisable for vessels coming from the westward, bound to Melbourne or Sydney, to make the land so far westward as either Cape Northumberland or Cape Bridgewater? I do not think it is universally adopted by masters of vessels to make the land so far to the westward; they generally make the land somewhere about the Otway in preference.

1677. The prevalent westerly gales generally tend to the southward after blowing from the westward, do they not? Yes, invariably.

1678. Then if a vessel were making Cape Bridgewater, and the wind southered on her, she would be likely to be thrown upon a lee shore? She would have Portland to make for, but otherwise if she got into the bight she would be in an awkward position.

1679. Then would it not be advisable to light only Cape Northumberland so as not to induce her to go into the bight at all? For a particular purpose, taking Adelaide merely into consideration and the number of vessels making the land down about there, perhaps it would be as well; but I am taking into consideration also that it would be a famous leading mark for Portland, being a safe harbour, in south-west gales particularly.

1680. Then you would advise that there should be two lights—one on Cape Northumberland, and one on Cape Bridgewater—as a leading mark for Portland? Yes.

1681. Supposing there is a light on Cape Northumberland, and as there is one on Cape Otway, does any necessity exist for putting a light either on Cape Nelson or Cape Bridgewater, in your opinion? Cape Bridgewater is particularly remarkable going round to the westward from the east, that is with any vessels bound round the Leeuwin; I should think if it was intended to light the coast generally there ought to be a light on each headland.

1682. Would not a light on Cape Northumberland be useful to vessels from the westward in the summer season in the event of south-easterly gales? It would, and there is no hidden danger about Cape Bridgewater, whereas there is about Cape Northumberland—the reefs extend a good way out from Cape Northumberland.

1683. Have you ever been close in there? Yes, within four miles of the shore. I have seen all the vessels that are ashore there lying on the beach.

1684. Did you ever sound off that coast? No; I have seen the breakers a long way out, a couple or three miles at least.

1685. After rounding the Otway, bound to Port Phillip, does it appear to you that there is any light required in the neighbourhood of Port Phillip Heads? Not on the west side I should think, because you can go within half a mile of Cape Patton, and a man must be blind if he did not see it.

1686. On the east side do you think there are any points upon which a light would be advantageous? I cannot exactly say; I do not know so much of that coast.

1687. Would you advise that a light should be placed on Cape Schanck? Yes.

1688. Have you ever stood over to the east side of the bay in coming from Portland? When it is blowing strong from the north we have to reach over there sometimes.

1689. Would not a light on Cape Schanck be of considerable advantage to vessels bound to Melbourne if the wind hung to the eastward and they were obliged to keep a good offing from the western land, would they not have an advantage in picking up their position if there were a good light on that point? Unquestionably; but it would be necessary to have it well distinguished from the lights on Shortland's Bluff.

1690. That could easily be accomplished by making it a different class light, could it not? Yes.

1691. Are not the two lights on the Shortland's Bluff shut in by the neck of land at Point Nepean until you get into a particular position; is it not what is called a blind harbour? Yes, until you open Shortland's Bluff over the low points. The prevalence of northerly winds in winter renders a light on Cape Schanck desirable.

1692. In coming in from the westward, or in passing out to the eastward, have you had occasion to sight King's Island? I have, repeatedly.

1693. Have you ever considered the question whether any considerable advantage would be derived by shipping, in the way of preventing them from running upon the Harbinger Reefs, if a light were erected upon that island? I should think the best position on King's Island for a lighthouse would be at Cape Wickham.

1694. Do you consider that it would be a great advantage to the shipping that a light should be erected there? Most undoubtedly, especially for vessels from the westward and vessels beating out. The prevalent winds being from the south-west, vessels beating to the westward invariably sight King's Island.

1695. It has been given in evidence that the effect of a light upon Cape Wickham would be that it would be more likely to attract vessels into danger than to lead them from it, are you of that opinion? No; I am firmly of opinion that the last three principal wrecks on King's Island would have been avoided if a light had been there.

1696. You strongly recommend a light on King's Island? I do.

- Mr. G. Doran. 1697. Have you had any opportunity of judging whether the point on which it is proposed to place a lighthouse is frequently clouded and capped, or whether it is generally sufficiently clear for a light? I have never seen it capped.
1698. Have you seen it many times? I have, repeatedly.
1699. Do you think in heavy westerly gales that the effect of a light on that north point of the island would be to enable vessels to run into smooth water under the lee of it with facility? Unquestionably.
1700. You conceive that if a light had been erected there the vessels that were lost would have had opportunities of ascertaining their position before they got into the danger they did? No doubt of it. The three wrecks—the “Mapo,” the “Waterwitch,” and the “Whistler,” I think would have been avoided.
1701. Are you aware that the majority of the wrecks have been to the south of the New Year Islands? Yes.
1702. Do you conceive that a light on Cape Wickham would have given them notice of their danger? I think so. I have never sighted any other part of King’s Island than that in going to the westward.
1703. You are not aware whether a light on Point Wickham would be visible to a ship that happened to be on the west coast, south of the New Year Islands? It would be advantageous; it would show sufficiently far to clear the New Year Islands, I think.
1704. You do not know the character of the land there? No, I do not; I have not sighted the land so close to the westward as to judge of it.
1705. You think that, to vessels coming from the westward, it would be an advantageous position for a light, and would be likely to warn them from danger, and not lead them into it? I think so, unquestionably.
1706. You would not advise a vessel being bound from the westward to border upon that island unnecessarily, but that she should border upon the mainland? Yes.
1707. You look upon that light as more indicating a danger than a leading light? Unquestionably. Vessels bound from the westward could not be far wrong in their latitude; because, if they were a few miles out of their course for want of an observation, they would be sure to make either one light or the other.
1708. And you would advise the erection of a lighthouse there? Yes, on Cape Wickham I would.
1709. Have you considered the question carefully, where a light should be placed on King’s Island? I have for the last two years. I have thought it would be a great advantage to have a light on Cape Wickham.
1710. Have you heard it proposed to put a light on the New Year Islands? I have.
1711. But you still think Cape Wickham to be the most preferable position? Yes.
1712. Are you aware of any particular set of the current from Cape Otway toward King’s Island? A current runs through between the island and the main; the ebb and flow is east and west. It depends very much upon the weather.
1713. Is there frequently a set to the southward? Yes.
1714. Produced by northerly and north-westerly winds? Yes.
1715. Do you think a light on Cape Wickham would be very useful to vessels bound to the westward, in the event of meeting a strong westerly gale? I should think a light there would be of the greatest use.
1716. Your knowledge of the straits is confined principally to the navigation which you have now described to us? Yes. I have been once or twice at Sydney, but at pretty long intervals.
1717. You are not very familiar with Wilson’s Promontory, and the islands and rocks about it? No. I have been once or twice through there.
1718. Do you know the coast of Tasmania at all? No.
1719. Have you ever been through Banks’s Straits? I have, once or twice, but not to make any particular remark as to them, or the proper position for a light in the straits.
1720. Have you any further suggestions that you would like to make to the Board with respect to the erection of lighthouses anywhere? I think the feeling amongst ship masters is universally in favour of having the coast lighted thoroughly. I should not have hesitated to pay £10 or £20 a year myself to have additional lights on the coast, and I have spoken to many shipmasters who are of the same opinion. I think the lighting of the coast would be well supported, without the slightest murmur, and that any additional expense would be readily borne by masters and owners of vessels. Harbour lights at Warrnambool and Port Fairy are very much needed; their cost would be readily borne by masters trading there. *[The Witness withdrew.]*

Captain George Kelly examined:—

- Captain G. Kelly. 1721. Do you now command the “Monarch”? Yes.
1722. Trading between Sydney and Melbourne? Yes.
1723. Have you commanded other vessels in the colonial trade? Yes.
1724. For about how many years? For seven years I have been in command of vessels here.
1725. Between Melbourne and Sydney? Yes.
1726. Have they been all sailing vessels? Yes.
1727. During these seven years has your experience pointed out to you many points on the coast which you had to travel round which appeared to you to require to be lighted? Yes, there are two or three points where it would be very advantageous to have a light.
1728. In coming from Sydney or in going from Cape Howe to Sydney are there any points along that portion of the coast which in your opinion require to be lighted? Yes, there is one place I think which would be better for having a light, that is Cape George, at Jervis’s Bay head.

1729. Have you found, in proceeding to the northward, bound to Sydney, any considerable indraught, particularly off that point? No, I cannot say that I have, except when there is a heavy swell in from the south-east. I have frequently been set into Wreck Bay with a south-easterly swell; and the land is very low there and you cannot see it on a dark night; I have frequently made the land on the starboard bow when I anticipated making it on the port bow, and in two or three instances it has been as much as I could do to weather the cape.

1730. If you had made the land during the night you might have lost your vessel if you had been unable to see the land on your starboard board? Yes; even with light winds a vessel will scarcely come round.

1731. Are you aware that several vessels have been lost in Wreck Bay? I do not know of any having been lost in my time.

1732. You think that a light upon Cape George would be a considerable advantage to vessels trading between here and Sydney? I think so.

1733. On which point would you recommend the light to be placed—on Cape George or upon Point Perpendicular? Cape George I think would be the best.

1734. How would that show in coming from the northward—would not the height of the land on Point Perpendicular shut out the light on Cape George? If you were very close in shore it would, but otherwise it would not.

1735. Have you ever found the same difficulty in rounding the cape in coming from the northward that you have in coming from the southward? Never.

1736. After passing Cape Howe, which is now sufficiently lighted, what is the next point coming towards Melbourne that you would consider requires to be lighted? Nothing nearer than the promontory.

1737. Do you consider that the promontory ought to be lighted? It would be a great advantage, more so than at Cape George I think.

1738. The navigation of the neighbourhood of the promontory is rather intricate, is it not? It is.

1739. Have you at all considered where you would place the light, if you decided upon placing one in the neighbourhood of the promontory? Yes; the Rodondo would certainly be the best place to put it for the position of it, but I think it would be impossible to place a light on the Rodondo, it seems inaccessible all round it. If it were possible to erect one there it would be decidedly the best place.

1740. But if the engineering difficulties there were insuperable, where would be the next best position to place the light? I think the next best place would be the Ten-foot Rock, because you could see it from both sides then. If a vessel got in amongst the Seal Islands she would see it, and from the other side of the promontory, if you were in between the Liptrap and the promontory, you could see it.

1741. Have you ever gone near enough in passing through the straits to express an opinion whether the Ten-foot Rock is a practicable position on which a lighthouse could be erected? Yes, I have been often close to it.

1742. Have you ever landed on it? No, but I have been very close to it.

1743. Does it appear to you to have sufficient base on which a lighthouse could be erected? I think so. There is a very good foundation for one, but there is not much of it above water.

1744. Have you any idea of the area of it? I have not; but I should say it is not less than from 300 to 400 yards in circumference—that is the rock that is level with the water; the one out of the water is not so large.

1745. Have you ever observed whether the sea breaks with any considerable violence over the rock? It does over the lower one—that is a wash with the water; but the other one I have never seen covered.

1746. You never saw the green sea over it? No; not over the top of it. I think a lighthouse would be safe enough on it in any weather if it was built on the upper rock.

1747. And that position you think would be the very best in which a lighthouse could be erected? I think so.

1748. That would answer for vessels coming from either the eastward or the westward? Yes; if it was put on Cleft Island a vessel would not see it in coming from the northward.

1749. Supposing the Ten-foot Rock and the Rodondo were both found to be impracticable, would Cleft Island be the next best place? It would be rather an awkward place, for it would be perfectly useless for vessels coming from the eastward; there is another island which I think would obstruct the light.

1750. You think the island inside the promontory would shut out the light from a lighthouse erected on Cleft Island? Yes.

1751. Have you ever considered whether the promontory itself would answer for the erection of a lighthouse, or whether the light there would be shut in by any of the islands? I do not know any part of the promontory where you could see it on both sides, and it would be too high to erect it on the top of the hill. If it was erected on Cape Wellington it would be useless for vessels coming from the westward, and if erected on the western side of the promontory it would be useless for vessels coming from the eastward, as it would be entirely hidden by the other portions of the promontory. I think a light on the promontory would be more useful to coasters, as large sailing vessels coming from England usually steer for Kent's Group.

1752. Do they not do that because there is a light there? No; I think they do not like to get into the promontory, because there is a strong current between the promontory and the Rodondo, and it is rather an awkward place for a large vessel to get into.

1753. A steam ship at all times would take the route by Wilson's Promontory, would she not? Yes; I should imagine so.

1754. If the great line of ocean steamers were again established would they not take that route? I should think they would.

1755. Can you make any suggestion to this Board, in case it is found impossible to put a light

Captain G.  
Kelly.

11 Aug., 1856.

- Captain G. Kelly.  
11 Aug., 1866.
- light on the Rodondo or the Ten-foot Rock, as to what would be the most desirable way of lighting the passage round Wilson's Promontory? I should say the Ten-foot Rock would be the best place.
1756. But supposing the difficulty of erecting a lighthouse there to be so great that it could not be erected? I should not imagine there would be any difficulty about it; there are lighthouses erected on the English coast in much worse positions.
1757. The Rodondo is generally clear, is it not? Yes; it is very high; I have frequently passed it and could not see the upper part of; there is a kind of fog settled on it.
1758. In passing from the promontory down to Melbourne, are there any points on that coast which strike you as being also requisite to be lighted? Yes; there is a place where a light would be very useful, where we should very often save a passage when we do not get one—that is Cape Schanck.
1759. Would a light there be of considerable use to vessels proceeding from the eastward? Yes, both for vessels bound from Hobart Town and from Sydney. I have heard masters of Hobart Town vessels speak of it, and I myself have felt the want of it.
1760. Are not the lights at the Melbourne Heads difficult to make out until you open them in a particular point? Yes, until you are close to them.
1761. Are they not shut in by the high land of Point Nepean? Yes, they are only open for a few points. You can see them better if you are coming round the Otway, but in coming from the eastward we cannot open them until we are almost in a line with the entrance.
1762. Then you think that Cape Schanck would be an important position for a light? Yes, I think it would be more important in fact than the promontory.
1763. Have you ever been through the straits to the eastward, between Cape Otway and King's Island? I have, but it is some time ago, so that I cannot say anything at all about it.
1764. Have you ever given your consideration to the matter of any light being necessary on King's Island? I have not. I cannot say anything at all about it.
1765. Can you give an opinion, as a nautical man, without any positive knowledge of King's Island, whether you think it desirable that a light should be placed there or not? I have not the slightest doubt it would be advantageous to vessels to have a light on King's Island.
1766. You do not think it would have a tendency to lead strangers into danger? I think any stranger, whoever he might be, bound from the westward, would always run for the Otway in preference to King's Island, even if there was a light on both.
1767. You would consider the light on King's Island more in the shape of a warning beacon, and not as a leading mark? Exactly.
1768. And merely to be useful in case of having been driven to the southward out of his proper position, when intending to make the Otway? Yes; I remember a steamer being lost on King's Island, I think, or getting ashore there, the "City of Melbourne," some few years back.
1769. That was on the east side? Yes.
1770. And in an easterly gale? Yes.
1771. Do you think any light would have saved her? I think so, although there are times of course when a light would not be seen; but still it might have been the means of saving her.
1772. Do you think that instead of standing to the southward she might have stood to the northward? Yes; if she had seen the light she might have gone about on the other tack.
1773. Have you ever been to the westward of Cape Otway? Yes.
1774. Have you ever been to Portland? I have been to Portland.
1775. Have you ever considered whether it would be more advantageous to place a light upon Cape Bridgewater or upon Cape Northumberland? It is a long time since I was down that way, and I remember very little of the coast to the westward of Cape Otway, so that I could not form any opinion upon that at all.
1776. Of all the lights that you have spoken of as being requisite to be erected, if only one were to be erected, which would be the first you would recommend to be put up? Cape Schanck.
1777. Is that merely with reference to coasting vessels, or with reference to the general navigation of the straits? The general navigation of the straits. It would be useful for all vessels, no matter where they were going from.
1778. Do you think that it would be of any service to a vessel bound through the straits direct to Sydney? No; but it would be extremely useful to all vessels bound to Melbourne. I do not think it would be of any service to any other vessels except those bound to Melbourne; but it would be serviceable to vessels bound from the westward to Melbourne.
1779. And it would be of service to all vessels bound to the westward through the straits? Yes, if they were tacking about it might be. Western Port has been not unfrequently mistaken for Port Phillip. I know one vessel which run into Western Port and the master thought it was the entrance to Port Phillip Bay, and she lost both her anchors.
1780. Have you any other suggestions to offer to the Commission? No. I think those three points would be the only points on which lighthouses would be necessary on that part of the coast.
1781. Do you think a light on Cape Northumberland, one on Cape Schanck, one on the promontory, and one on Cape George would be of as much importance as a light on King's Island? Yes, I think they would.
1782. Would you recommend the erection of those lights prior to the erection of a light on King's Island? Yes; I think they are of more consequence.
1783. And more important than King's Island? I think so. A vessel is never down on King's Island except when she is driven down by stress of weather, and in the other instances the lights would be in the regular route where vessels are constantly going backwards and forwards.
1784. Have you ever considered the question of putting two lighthouses, the one on the east  
and

and the other on the west side of Wilson's Promontory? No, I have not considered that, because I did not think it likely that the Government would erect two because of the expense; two, of course, might be put in very good positions to answer both ways, but if one was erected on the Ten-foot Rock it would answer the purpose of both.

1785. But supposing that to be impracticable, what points would you select for two light-houses? Two points on the promontory.

1786. You would put them on the main-land, one to the eastward and the other to the westward? Yes; on the south-west and south-east angles of the promontory, because then you could see them from any position; and even then a light on the east side of the promontory would not be of so much use as a light on the Ten-foot Rock, because you could not see it so far in as the Seal Islands then. [*The Witness withdrew.*]

Captain G.  
Kelly.  
11 Aug., 1856.

Captain Edward Reynell examined:—

1787. You command the "True Briton"? Yes.

1788. How many voyages have you made to Melbourne? This is my first voyage.

1789. Your first voyage to the Australian Colonies? I have been to New Zealand on several occasions.

1790. This is the first time you have come into Bass's Straits? Yes.

1791. Did you see the Otway light in coming in? Very distinctly.

1792. If a light had been placed on King's Island would you have endeavoured to make it? Certainly not. I am of opinion that the only service of a light on King's Island would be in the event of a vessel being driven down there in stress of weather, to warn her she was so near the land.

1793. As a running light you think it would be of no service? Certainly not in coming to Melbourne. I think it might be of service to a vessel going through the straits to New South Wales, because they would endeavour to keep in the mid-channel.

1794. As commanding an over-sea ship coming to Port Phillip, you would decidedly make for the Otway? Undoubtedly.

1795. In approaching the entrance to Port Phillip Heads, do you think any additional light would be desirable? I made Cape Otway late in the night, and had a sight of the land all day coming up, so that I could hardly say.

1796. Then you did not see the Shortland's Bluff lights? No; I came in just at one o'clock in the day. No doubt the lighthouse at Cape Otway is of great service, and a very good light.

1797. In coming from the westward, do you think a light upon Cape Northumberland would be of any service to vessels bound to Melbourne? I think it would, because if you were not certain of your chronometer, and you had not had any lunar observations, you would naturally endeavour to make the land a little to the northward that you might not miss it altogether, and therefore it would be of service.

1798. Would it be of any service to vessels beating up the coast? Most assuredly, for you would be standing on and off the land.

1799. Have you ever sighted Cape Northumberland? No.

1800. As a general rule, the first land sighted by a prudent navigator would be Cape Otway? Decidedly. I think a light on King's Island would be of service, to give a vessel warning that she was approaching the land, and enable her to take means to get off the coast.

1801. You think a light would be calculated to warn a ship of the dangers that there are on the north end of King's Island, and enable her to avoid them? Yes. [*The witness withdrew.*]

Captain E.  
Reynell.  
11 Aug., 1856.

Captain Francis Rozea examined:—

1802. Do you command the brig "Wanderer"? Yes.

1803. Where do you trade from? Between here and Sydney.

1804. Have you been long engaged in that trade? About five or six years.

1805. Trading between Melbourne and Sydney all the time? Yes.

1806. Has it ever appeared to you, in your voyages backwards and forwards, that there was any light requisite on the coast of Australia, after passing Cape Howe? My opinion is that there ought to be one at Jervis's Bay.

1807. You think either Cape St. George or Point Perpendicular ought to be lighted? Yes.

1808. Have you ever found your vessel set more into the land there than you expected? Yes; three times I have been served the same way with easterly winds.

1809. What do you attribute that to? To the swell setting in; and there is an indraught round the head.

1810. If you were thrown into that bight during a dark night, as the cape is at present unlighted, would you be likely to lose your vessel? Yes.

1811. A light there would warn you of your danger? Yes.

1812. Is there any other part of the coast between Sydney Heads and Cape Howe which you think deserves consideration with respect to lighting? No. If there is a light on St. George's Head, or anywhere about Jervis's Bay, I think the coast will be very well lighted from Sydney to Cape Howe.

1813. After rounding the Howe, is there any point which you think ought to be lighted between there and Melbourne? The promontory; and there are only two positions where you could get a light there to do any good on both sides—those would be the Rodondo and the Ten-foot Rock.

1814. Have you ever approached the Ten-foot Rock? Yes; I have been often on both sides of it.

1815. Do you think a lighthouse could be erected there? Yes, I think so, after the cavities were filled up. It is a very broken surface; I do not think the cavities are very deep.

Captain F.  
Rozea.  
11 Aug., 1856.

- Captain F. Bozea.  
 11 Aug., 1856.
1816. Do you think that those cavities could be filled up, and sufficient base be formed to build a lighthouse on? I think so.
1817. Have you ever observed whether the sea breaks over that rock? I have seen it run pretty high on it, but I never saw it break over.
1818. Have you passed it in a westerly gale? Yes.
1819. Do you consider the Rodondo to be inaccessible? I have been quite round it, and I cannot see where a vessel could land.
1820. Have you ever examined Cleft Island? Yes.
1821. Have you considered whether a light might be efficiently erected on that island? It would be no good coming from the eastward; it would be shut in by the promontory. It would be of service after you opened the promontory; but it would be of no good, coming from the eastward, until you opened the promontory, and then a light on the promontory would be as good.
1822. You think a light on the Ten-foot Rock would be open on both sides? Yes.
1823. Do you often sight Kent's Group? Occasionally, but not without I am driven down by westerly winds.
1824. Usually vessels bound either eastward or westward hug the promontory, do they not? Yes.
1825. Sailing vessels as well as steam vessels? Yes.
1826. If you commanded a large ship would you hug the promontory? So well acquainted as I am with the coast, I should; I cannot say that as a stranger I should. You are sooner out of the dangers, if you have a commanding breeze going round the promontory, than going down to the southward.
1827. After passing the promontory, and bound to the westward, are there any other points on which you would advise a lighthouse to be erected? On the Schanck, decidedly; I think a light is required on the Schanck more than anywhere else.
1828. That is more with reference to the trade with Port Phillip? Yes; and it is a very good mark for vessels bound to the westward, to Adelaide and that way.
1829. Do you think a vessel bound to Adelaide would come so far northward as to sight it? Yes, if the light were of any range at all; and in thick weather they would try to make that light, and take their departure from it. If you have the wind south-westerly or south-erly, you are obliged to get as much fling as you can. If you get set into Western Port there is no getting out again. The tide runs in there very strongly, and strangers coming from the eastward are apt to take the land at Western Port for the Otway land, and run right in and lose the vessel.
1830. Do you think it would be a useful light for vessels passing through the straits not bound to Port Phillip—that is, working through the straits, bound to Adelaide or India? Yes; it would give the masters of ocean vessels more confidence when they had a light there, and they would stand across the straits.
1831. You would recommend a light of sufficient power to be seen at a considerable distance? Yes; I should say a radius of twenty miles would be sufficient.
1832. A first-class light? Yes; vessels coming from Van Diemen's Land all try to make the Schanck.
1833. Then you are decidedly of opinion that a light on Cape Schanck is very desirable in every way? Yes.
1834. Both as a highway light and as an entrance to Port Phillip? Yes; in coming from the eastward, we do not see the Shortland's Bluff lights until we open them off Point Nepean.
1835. Have you frequently been into Port Phillip Heads? Yes, constantly for the last six months.
1836. Are the lights there well placed? They are, as a leading light; but they are of no use until we approach the heads.
1837. A light on Cape Schanck would give you great confidence? Yes.
1838. Do you think the Shortland's Bluff lights are not powerful enough? As leading lights they are very well placed, but you cannot see them far outside the heads.
1839. Are you familiar with the Cape Otway light? No.
1840. Have you ever seen it? I have seen it.
1841. Have you ever been to the westward of it? No.
1842. What is your opinion about a light being placed on King's Island? I never sighted it but once, when I got driven down there in a north-westerly gale, and I cannot give an opinion upon that.
1843. Would not a light there have been of service to you then? If it had been night it might have been, but it was in the day-time. I think it is requisite to have a light there more as a safety light than as a leading light.
1844. Are you familiar with Banks's Straits? No.
1845. Or with the coast of Tasmania? No; all my-trade is between Sydney and Melbourne.
1846. Supposing it is not practicable to put a lighthouse on the Ten-foot Rock, what point near the promontory would you next recommend as being desirable? The Cleft Rock it would be impossible to put one on; I think it is inaccessible, or else that is the place where I think it would be desirable to have one; because, if you had it on the pitch of the promontory, it would be more liable to lead vessels coming from Port Phillip into danger than out of it, because it would lead a man amongst the islands, if he was not very well acquainted with the position of them.
1847. Supposing there were one put on each side of the promontory, where could you put them? One on the south-east point, and one on the Glennie Islands; because he could take across from the Glennies until he opened the other one out, and then shape his course from that again.
1848. Would it be possible to put a light on the Glennie Islands? Yes, quite easy; there would be good landing, and plenty of stone and everything.

1849. Will you point out which particular island you would suggest? The westernmost of the Glennie Islands. The only useful place, unless you had two, would be either the Ten-foot Rock or the Rodondo, and that is inaccessible.
1850. Of course you have seen Cleft Island? Yes.
1851. Is it very high? Yes.
1852. What height should you estimate it at? I should say about 200 feet, or more.
1853. Supposing it was accessible, a light might be placed on that island 200 feet high? Yes, if it could be placed there.
1854. In coming down from the eastward from Cape Howe, would you not open the light on Cleft Island clear of the promontory, a long way before you got to the promontory? Not without you were a long way to the southward; you must have it bear west before you open Cleft Island.
1855. Did you ever land on the Ten-foot Rock? Never.
1856. Have you ever made King's Island? Yes.
1857. Under what circumstances? In northerly gales.
1858. When bound where? When bound to Melbourne.
1859. Have you ever considered whether any advantage would be gained by having a light there? I have never been knocking about there. Of course it would be a great guide to a person if there were a light on the northern end of it, but I should not like to express an opinion upon it.
1860. Have you any further suggestions to offer to the Commission? No; I think lights at those three points would be all that would be necessary—Cape St. George, Wilson's Promontory, and Cape Schanck; and Cape Schanck, I think, before any of them. [*The Witness withdrew.*]

Captain F.  
Rozen.

11 Aug., 1856.

Captain William Shepherd examined:—

1861. What ship do you command? The "Euphemia."
1862. Where does she trade to? Hobart Town.
1863. Have you been in any other trade? The Port Albert trade.
1864. Have you been further to the northward than Port Albert? No.
1865. Or to the westward of Port Phillip? Yes; I have been to Portland Bay and Port Fairy.
1866. Then you have a competent knowledge of Bass's Straits? Yes.
1867. How long have you been in the Hobart Town trade? Ever since 1839.
1868. Trading between Melbourne and Hobart Town? Trading between Hobart Town and Port Albert the principal part of the time, and latterly between Hobart Town and Melbourne.
1869. Have you repeatedly passed through Banks's Straits? Yes.
1870. Are they well lighted? As far as the straits themselves go they are; the Goose and Swan Island lights are very good lights.
1871. And sufficient for the purposes of navigation? Yes, for where they are.
1872. Have you ever felt the want of a light on the eastern coast of Tasmania? Very much so.
1873. About what point? I should say the Eddystone Point would be the best position for a light.
1874. Between the Eddystone and Cape Pillar is there any necessity for a light? No.
1875. Do you think a light upon the Eddystone would be useful to any but coasting vessels? It would be useful to any vessel from New Zealand, or from the eastward; if they were coming through the straits, to come to Melbourne from the eastward, they would very often make that light.
1876. You would recommend a light on the Eddystone, as being useful to navigation generally? Very much so, I think myself it is the only place where there is any danger on the east coast of Van Diemen's Land at all; it is almost the easternmost point and would just get you clear of all the islands in the straits; in running down the east coast of Van Diemen's Land you can go no further on that course than the Eddystone Point, if you happen to run a few miles too far you are apt to run right ashore on Cape Barren.
1877. What is your usual line of course in coming through Banks's Straits, bound to Port Albert or Melbourne, and what lights do you generally sight? In westerly weather, which is the prevailing wind, we generally sight the Curtis', we keep as near Van Diemen's Land as we can and it is very seldom we sight Kent's Group unless we are driven there.
1878. The usual course with westerly weather is to keep along the north coast of Van Diemen's Land, and to stand across and try to make the Schanck? Yes; that is generally what we try to make, and with south-west or westerly winds we are forced to keep off as far as we can to make the westerly shore, because we do not like to get down on the shore with a south wind because of the lee shore and the indraught into Western Port. If bound to Port Albert we steer from the Goose Island to Kent's Group.
1879. That is your starting point? Yes; in coming through Bass's Straits we generally start from Goose Island and steer a straight course right across.
1880. Is there any part of the coast which you make after passing through Banks's Straits bound to Melbourne which you consider it would be very desirable to light? I think it would be very desirable to light the Schanck.
1881. For all vessels? For all vessels coming to Melbourne, let them be bound from which way they will, either coming from the westward or the eastward; vessels may not see the head lights at all, and then they would stand over until they saw the Schanck.
1882. Do you think the Schanck an important light to be erected at once? I think more so than any other.
1883. The head lights, you state, are not always visible until you get pretty close in? No.

Captain W.  
Shepherd.

11 Aug., 1856.

1884.

- Captain W. Shepherd.  
11 Aug., 1856.
1884. They are no considerable altitude, and therefore are not seen a great way off? Vessels would see them a long way coming down from the westward, but not from the eastward.
1885. If you made the Schanck during the night, would it enable you to take up your position so that you could run with safety for the Shortland's Bluff light, and not get too far to leeward? Yes, in any weather.
1886. It would give you great confidence in approaching Port Phillip at night to have a light on the Schanck? Yes, you could always steer then right for the heads.
1887. Are the Shortland's Bluff lights well placed as leading lights? I think they could not be placed better as leading lights.
1888. What is the greatest distance you have seen them off? I have seen the high light about twelve miles off; in fine clear westerly weather you may see it as much as fifteen miles.
1889. In going to Port Albert from Van Diemen's Land is there any point that you think requires lighting? I do not remember any place where a light would be requisite for vessels bound to Port Albert after you leave Kent's Group with the exception of a light on the promontory.
1890. Do you think a light is desirable on the promontory? A light on the promontory would be a great benefit to all vessels bound to Port Albert, or for vessels bound from the eastward coming to Melbourne.
1891. And to vessels from the westward going through the straits? Yes.
1892. Are you familiar with Wilson's Promontory? Yes.
1893. Have you landed on it? I have.
1894. In what position would you advise that a lighthouse should be placed? If a lighthouse could be erected on the Ten-foot Rock I do not see a better place for it, but I am afraid it could not be erected there. It might be with a great deal of trouble.
1895. What size is the Ten-foot Rock? I should say, that as far as it above water, it would not be more than about 300 yards round.
1896. How high does it stand out of the water? I should say somewhere about twenty feet.
1897. Have you ever seen the sea break over it? In heavy south-westerly gales of wind I have seen the sea go right over it.
1898. Sufficient to carry away a lighthouse? No; I have seen the wash and froth of the sea go over it.
1899. Merely the spray or the body of the water? Only the top; the white of the water.
1900. Not the green sea? No.
1901. Do you think a heavier sea would go over it in a heavy westerly gale than would go over the Eddystone in a south-west gale in the English Channel? No; nothing like it.
1902. Do you know the Rodondo? Yes.
1903. Is that accessible? Yes; the sealers used to live on it at one time I can remember.
1904. Do you know any man that used to live there? The pilot's man that used to be in Port Albert buried a man on it, and used to live there. There is a large cave on it where they used to kill the seals, and Long Tom, who used to be a pilot in Launceston, scaled on it. Captain Bently can tell you a great many that scaled on it. They used to land on it in fine weather in a boat, and they used to stop there until such time as they could get an opportunity of getting away again.
1905. It is very high, is it not? Yes.
1906. Do you think it would be too high for a lighthouse? I think it is; if it were not for the height of it I think it would be the best place in which a lighthouse could be put. But in north-easterly weather I think it would be very difficult to see it; it would be capped, I think; in easterly weather we very seldom see the top of it now. I do not think a light there would be seen one time out of twenty when it would be needed the most, because in clear weather it is so high and bold that is no matter whether there is a light on it or not.
1907. Do you consider the promontory as an important point to be lighted for the navigation of the straits generally? I should say it would be a very good thing to have a light there to warn vessels from going close in, particularly vessels bound from Sydney.
1908. A light on the promontory would not be any advantage to over-sea vessels bound from England or India through the straits to Sydney or New Zealand, would it? Yes, I think it would be very much so; many times in thick easterly weather they would not see the Kent's Group at all, and then coming through between Kent's Group and Hogan's Group they would be able to see the light on the promontory as they came up to the westward.
1909. Then you would advise a light on the Schanck and on the promontory also? Yes.
1910. Do you consider those the most important lights that should be erected at once? I do not see at the present time any points where lights would be more advantageous on the same line of coast.
1911. Do you think a light on the Eddystone equally necessary? It would be a great benefit, particularly to coasting vessels.
1912. Have you ever been round the Otway to the westward? I have been to Portland Bay and Port Fairy.
1913. Have you been to Adelaide? No.
1914. Have you ever considered the necessity of a light on that part of the coast near Portland? When I went up to Portland, I went round the west side of Van Diemen's Land, and we made the land a long way up to the westward of Portland.
1915. Do you think a light would be serviceable on Cape Northumberland? I think it would be very serviceable to all large vessels coming from the westward.
1916. Do you think English vessels would sight Cape Northumberland? A great many of them would.
1917. In the summer season with easterly winds, do you think they would be likely to sight it? I think they would.
1918. Do you think Cape Northumberland would be a preferable position for a light to Cape Bridgewater? The two places are so close together I think it would not make much difference

difference which it was at. A light there would be very useful for vessels bound to Adelaide, or large vessels coming down from Adelaide here.

1919. You think it would be equally useful for coasters and over-sea ships? Yes, and it would be very useful for vessels beating round the Leeuwin.

1920. Bound to India? Yes.

1921. Have you ever sighted King's Island? Yes, many times.

1922. Have you ever considered the question of that island being lighted or not? When we come round from Van Diemen's Land we very often come round to the westward, and I think a light on King's Island would be very useful.

1923. Even for the Hobart Town trade? Yes.

1924. You sometimes come round the south-west cape? Very often, and we very often go round from here that way.

1925. Have you approached the land frequently and seen it? Yes; I always go down inside between the Hunters and the south end of the island.

1926. What part of the island would you recommend to be lighted? I think the south end, on account of the Otway light being on the other side of the channel.

1927. That would be only serviceable to vessels passing round the Hunter's Channel? It might be put more to the south-west.

1928. What use would that be to over-sea vessels bound through the straits? It would be of no use to them except as a land mark.

1929. Would a light on Point Wickham be of use to you in proceeding to Van Diemen's Land? No.

1930. You pass through from the eastward generally? Yes.

1931. If the wind were blowing strong from the eastward, and you passed to the westward of King's Island, would not a light then on the north end of the island be of considerable advantage to you? Yes.

1932. And would it not even in passing to the eastward enable you to take up your position and to pass through the straits with safety? Yes.

1933. If you were running with the wind to the eastward, and got your departure from a light on the north end of the island would it not enable you to run with safety? Yes; from the eastward, but it would be no benefit to any vessels from the westward trying to go in that way.

1934. But if bound from Melbourne to Hobart Town passing either on the east or west side of King's Island, would not a light on the north end of the island be a considerable advantage? Yes; as a mark going either way.

1935. And would it not also be of advantage if you wanted to take shelter under the island, also in a heavy westerly gale, by enabling you to pick up your position? Yes; it would be of use either in a heavy westerly gale or a heavy easterly gale.

1936. For your particular line of trade, coming up from the southward, you would like a light on the south end of King's Island? Yes; I should like it more particularly there.

1937. Have you observed whether the land on the north end of King's Island is clear or clouded usually? I have never seen it except in very heavy south-west thick weather when it is clouded, it is not so high that it ever gets capped.

1938. Is it liable to be more clouded than any other high land of a similar description? No, I think not. I have seen it a great many times and been round it a great many times.

1939. Have you any further suggestions to offer to the Commission? No.

1940. The two lights you think desirable are one at Wilson's Promontory and one at Cape Schanck? Yes, as far as the Australian Coast goes, and one on the Eddystone Point for the Tasmanian trade. [*The Witness withdrew.*]

Captain William Watts examined:—

1941. You are Commander of the "London" steamer? Yes.

1942. You formerly commanded an ocean steamer belonging to the General Screw Company? Yes, the "Hellespont."

1943. And you made some voyages through Bass's Straits in that vessel, did not you? Yes, one.

1944. Since that what trade have you been principally engaged in? The trade between Sydney and Melbourne.

1945. How many voyages have you made in the "Hellespont" and in the "London" between Sydney and Melbourne? Between sixty and seventy.

1946. Then you have a tolerably good knowledge of the navigation of the straits and also of the coast of New South Wales? Yes.

1947. Between Port Jackson and Cape Howe are there any points of land which create difficulties in the navigation, either in going from the southward or coming from the northward which, in your opinion, require to be lighted? Yes, there is one close to Jervis's Bay, Cape St. George.

1948. Have you found difficulty in going from the southward in the way of an indraught there that frequently has required you to alter your course a point or two to the eastward? Very frequently. We steer one course one voyage and find ourselves many miles outside, and steer the same course another voyage, and find ourselves close in. I have had to haul out four points.

1949. Then a light on that point is, in your opinion, absolutely necessary? Yes, absolutely necessary.

1950. Are you aware that some vessels have been lost by not being aware of that indraught? Yes; it was impossible for them to get out of Wreck Bay.

1951. Is it on Cape St. George that you would recommend a lighthouse to be erected? Yes.

Captain W.  
Shepherd.

11 Aug., 1853.

Captain W.  
Watts.

11 Aug., 1854.

- C. G. W.  
W. G. W.  
4 Aug., 1836.
1952. Do you think that point would be seen sufficiently in coming from the northward as well as in going from the southward? Yes, unless a vessel were very close in.
1953. If a light were erected on Cape St. George, would a vessel in standing to the southward keep a sufficient offing, so as to open the light without interfering with the land on Point Perpendicular? Yes, by giving it one mile of offing you would go clear of everything.
1954. But in going from the southward the greatest benefit would arise, because the indraught sometimes is excessive and sometimes there is none at all? Yes.
1955. Have you had opportunities of judging of the Gabo Island Light? Yes.
1956. Do you consider that that light is properly placed? Very much so.
1957. Is it sufficiently high and brilliant? Yes, I think it is quite sufficient for all the purposes that are wanted.
1958. What distance have you seen it? Fifteen or sixteen miles, and perhaps a little more than that on a clear night.
1959. After passing that light is there any dangerous point at the entrance of the straits that, in your opinion, requires to be lighted in proceeding to Port Phillip? Yes, I think it would be advisable to have a light on or about the promontory.
1960. Can you from your own experience, point out any spot that would answer the purpose? I think the promontory itself appears to be the best position.
1961. But in that case you could only light it on one side? Yes, that is all.
1962. On which side of the promontory would you put the lighthouse? On the extreme point.
1963. Do you think that would be visible in coming down both from the eastward and the westward within a sufficient offing? No; a vessel coming up close to Cape Liptrap would have it shut in by the Glennie Islands until she got nearly in a line with it. The promontory projects out about three or four hundred yards from the main land, and that would not be too high to erect a lighthouse upon.
1964. Is that point to the eastward or westward of the promontory? I should say they bear from each other east and west.
1965. Then a light there would be distinctly visible in coming from the eastward? Yes.
1966. But would be shut in, in going from the westward? Yes, by the Glennie Islands.
1967. Do you think it is more important that it should be open to the eastward than to the westward—would there be less danger in a vessel running from Melbourne Heads than in running from the eastward? Much less danger.
1968. You would rather have it open to the eastward than open to the westward? Yes.
1969. Have you ever considered the position of the Ten-foot Rock? Yes, I have noticed it several times; it is laid down in the chart too near the promontory, it is more in a line with the Monocœur and Rodondo.
1970. Then it is not laid down far enough south? It wants to go further to the southward and westward; it is nearly in a line with the Monocœur and about one and a quarter mile from the Rodondo; it is laid down in the chart as being two miles.
1971. Have you ever considered whether that would be a good position for a lighthouse? It would be the best position, but I do not think it would be practicable to put a lighthouse there.
1972. Have you ever passed it when the sea has been washing over it? Frequently.
1973. Have you ever seen the green sea going over it? I have seen the spray going over it ten feet.
1974. What is the height of it at the highest part? I should say from twenty-five to thirty feet; it is only a small portion of the rock that stands that height.
1975. Sufficient for the base of a lighthouse? Yes. It is a square stone, I should say about ten yards each way.
1976. But you think it would answer all the purposes if a lighthouse were erected on the southernmost point of the promontory? Yes.
1977. Is not the land on the eastern side of the promontory very high? Yes.
1978. Would a light on the promontory be quite obscured in coming down from Cape Howe? No; you can see the promontory in six fathom water; it is open a long way inside the Seal Islands.
1979. Do the steamships ever go inside the Seal Islands? Never.
1980. And any vessels coming outside the Seal Islands would sight a light on the high part of the promontory? Yes.
1981. Have you ever considered the position of Cleft Island as a site for a lighthouse—can that be seen clear of the promontory in coming from the eastward? No, you cannot see it until you are past the promontory, and then it is covered by one of the other islands.
1982. Is there any island that is visible to the eastward of the promontory until you get the island to bear nearly west of you? When you get the promontory to bear north and one of the small islands west, then Cleft Island is partly shut in.
1983. Is the island that opens out when you get the promontory to bear north accessible at all or suitable for a lighthouse? Not any better than the promontory, because you would not open a light on it until you were past the Cleft Island.
1984. Therefore it would be of no use any more than the promontory in coming from the westward? No.
1985. Would you consider that a light on the promontory would afford all the advantages you would require for navigating that channel? Yes.
1986. Both coming from the eastward and from the westward? Yes.
1987. The radius of vision would be about equal from the westward and from the eastward? Yes.
1988. In steering your course from Melbourne, how do you come down after passing the Schanek—how near to the Glennie Islands do you pass? We make them about a mile off Cleft Island.
1989. You pass about a mile to the south of Cleft Island? Yes.

1990. That course would enable you to pass the promontory lighthouse, would it not? Yes, and as soon as the promontory lighthouse was opened we should steer direct through.
1991. It would be a mark as soon as you opened the lights; you could run each way and in your direct course? Yes.
1992. Do you often sight Kent's Group lights? Very seldom.
1993. Steam vessels always use the promontory passage? Yes.
1994. Would the ocean steamers in coming from England or India use that passage past the promontory in preference to going through by Kent's Group? Yes; there is nothing in the way except the Ten-foot Rock.
1995. Then really the promontory would be just as serviceable for the ocean navigation as for coasters? Equally so.
1996. Supposing a light to be placed on the promontory itself, when would a ship coming down from Port Phillip first see it? Soon after passing Cape Liptrap; she would see it in between the islands and she would soon know whether she was clear of Cleft Island by the bearing of the light.
1997. It would be a leading light? Yes.
1998. Would that be of use to sailing vessels as well as to steam vessels? I think it would; it would likewise point out a fine anchorage at night in Waterloo Bay if they were in distress, or they might run round the promontory and there lie in shelter.
1999. In proceeding towards Port Phillip, what is the next point on the coast that you consider requires the attention of the Government? I think the Schanck requires attention. I have met ships that have over-run their port frequently in coming down from the Otway bound from the westward.
2000. Have you ever fallen in with vessels that have over-run the port? I fell in with one of the mail ships, the vessel that came in before the "Joseph Tarrett." She ran close in Western Port, and found that was the wrong entrance, and then she ran down to the eastward, and I fell in with her down to the eastward.
2001. That would not have been the case if he had had a Schanck light to guide him? No; masters of vessels are very fearful of running down into the bight at night.
2002. Which of those lights that you have now mentioned would you consider it would be desirable first to undertake—the one on Cape St. George, the one on the promontory, or the one on the Schanck? I think the Schanck light would be the most generally useful light, particularly for Melbourne.
2003. Are the Shortland's Bluff lights equal to what they are required for? Yes, they are very good lights indeed.
2004. But you do not open the Shortland's Bluff lights until you get quite clear of Point Nepean, do you? We open them with a north-east bearing.
2005. They are shut in by the high land except at a little break in the land? Yes, there are three or four little breaks that you can see them through in coming from the eastward.
2006. Does any necessity exist in your opinion for a light on Point Nepean? None, whatever.
2007. Has it ever occurred to you that the lights on Shortland's Bluff are not visible for a sufficient distance? I think they are quite sufficient, the high light is visible certainly for twenty miles.
2008. You think they are quite sufficient for all purposes? Yes.
2009. Do you know the Cape Otway light? I have only seen it once.
2010. Will you favour the Board with your opinion upon the question of the necessity or otherwise of a light on King's Island? I can only speak by looking at the chart; I have never seen the island.
2011. As a master of a vessel running for the straits from the westward, as a stranger, knowing that there was a light upon Cape Otway, and no light upon King's Island, would you consider that the navigation of the entrance of the straits would be improved or otherwise by having a light upon both of those headlands? Decidedly improved.
2012. Are you aware that there are considerable reefs that run off the north end of King's Island? Yes.
2013. Do you think a light on that island would tend to lead vessels into danger or warn them of their danger? I think it would warn them.
2014. It is as a warning light you would have a light placed there and not as a running light? Exactly.
2015. You are not familiar with the coast of King's Island? No.
2016. Then you would hardly feel yourself in a position to give an opinion as to where a light should be placed, whether on the North Cape, or on the New Year Islands? I would rather not give an opinion upon that question.
2017. You have never been along the coast to the westward of Cape Otway? Never.
2018. In your over-sea voyages which you have made here, would you, under any circumstances, have thought it desirable to make the land before you made the Otway light? No.
2019. You think, as a general rule, a prudent mariner would steer for Cape Otway? Yes, but it would be all according to whether he had had good observations a day or two before.
2020. The question was put more with reference to the necessity for the erection of a light on Cape Nelson or Cape Bridgewater? I do not know that coast.
2021. When you came out here you went straight for the Otway? Yes.
2022. And that was the first land that you made? Yes.
2023. Do you know the coasts of Tasmania? I have been to Hobart Town once.
2024. Through Banks's Straits? Yes.
2025. Did you pass through the straits in the night? No, in the day.
2026. As you have only made the voyage once, probably you would not like to give an opinion as to the necessity for any additional lights there? No.

Captain W.  
Watts.  
11 Aug., 1856.

Captain W.  
Watts.

11 Aug., 1856.

2027. Have you any further suggestions to offer to the Commission? I think, certainly, it would be advisable to get a light on Cape Schanck as soon as possible.
2028. That you think there should be no time lost about? No.
2029. Do you think a light on Cape Schanck would be available as a highway light for vessels passing through the straits? Yes it would, very much so. Ships would be able to approach the land and be ready to enter in as soon as the tide turned, whereas now they may lose two or three days.
2030. To a vessel not bound to Port Phillip but proceeding through the straits against a contrary wind, would a light on the Schanck also be a great assistance? Yes. [*The Witness withdr.w.*]

Captain Anthony Enright, examined:—

Captain A.  
Enright.

11 Aug., 1856.

2031. You command the royal mail ship "Lightning"? Yes.
2032. How many voyages have you made to this port? Three.
2033. In command of the same vessel? Yes.
2034. And you have gone home from Melbourne with that ship also? Yes.
2035. In proceeding home which way have you gone? Generally through Banks's Straits.
2036. In coming from the westward bound to Melbourne have you ever considered the dangers that lie in the vicinity of King's Island? I have considered them, and I thought it strange that there was no lighthouse on that Island. The first voyage I came from the southward and westward, and the wind happened to be from the eastward, and, of course, if I had approached Cape Otway I should have been on a lee shore. I approached King's Island and had a very heavy gale of wind, which tore the best part of my sails away, and I was obliged to keep to windward. I was afraid to approach Cape Otway, so that I was obliged to keep in the mid-channel as much as possible, but then I could not keep far enough away from the coast because I was afraid of setting over to King's Island.
2037. Would a light on King's Island have been of very great advantage to you then? Yes.
2038. You had at that time an easterly gale? Yes; it blew very hard indeed.
2039. As a stranger coming to this port you experienced, in your own mind, some astonishment that so important a position as the north end of King's Island should not be lighted? Yes.
2040. And you think it would be advisable that it should be lighted? Yes; because coming from the westward and southward you cannot depend on being within ten miles of your reckoning. I generally try to make Cape Otway, but if the wind is from the eastward you cannot fetch up to Cape Otway, because you would then be on a lee shore.
2041. If there were a light on King's Island you would still make Cape Otway if you possibly could? Yes.
2042. But in the event of not being able to make Cape Otway, and making the land to the southward, you think a light on King's Island would be a considerable advantage? Yes.
2043. You speak in general terms of a light on King's Island, do you mean the north end of the island? Yes.
2044. Have you considered the question of its being placed in any other part of the island? No.
2045. Do you think in coming from the westward in your large ships a light about Portland would be of service—say on Cape Bridgewater or Cape Northumberland? I never tried to make that coast. We generally keep on the parallel of 45°.
2046. And come up in your great circle course? Yes.
2047. And that frequently necessitates your making King's Island? Yes; we haul up as much as north-north-east.
2048. That is sailing on the arc of the great circles? Yes.
2049. What is the highest southern latitude that you touch on that arc if you can keep it? 51°.
2050. Then you would approach the land of New Holland from that latitude coming up north-north-east? We begin to haul up about 35° or 40° east from the cape.
2051. In proceeding to the entrance of Port Phillip, have you experienced any difficulty for want of additional lights there? Yes; as a stranger I did.
2052. Where? Off Cape Schanck. The first time that I came here, reading the directions I found that Arthur's Seat was the most remarkable headland, and by that I found the entrance taking the bearings of Arthur's Seat; I went up aloft and saw the entrance afterwards.
2053. That was because you happened to make it during the daytime? Yes; I lay to during the night, and made it about half-past five in the morning.
2054. Supposing you had stood in during the night you would have been unable to judge of your position and might have been to leeward before you were aware of it? Yes.
2055. A light on Cape Schanck would have shown you your position to a nicety? Yes.
2056. If bound through to Sydney or New Zealand, would you think a light on the Schanck would be desirable? I could not say. I should try to make Cape Otway and shape my course to the Rodondo.
2057. But if you had easterly winds and had to beat through the straits, would it be of service? Yes.
2058. Is not Port Phillip what is called a blind port? It is difficult to enter, but I have always found the Shortland's Bluff lights very good leading lights; so much so that in bad weather if a pilot was not available I should venture to bring my ship in.
2059. In leaving Port Phillip bound home a light at Cape Schanck would be of great service to you, would it not? Yes.

2060. Particularly if bound through Banks's Straits? Yes.
2061. In making the passage round the south end of Van Diemen's Land a light on the north end of King's Island would be of service to you, would it not? Yes.
2062. Are the lights good which you have fallen in with in Banks's Straits? Very good.
2063. Do you think these straits are sufficiently lighted? Yes. I passed through both times at night, and both Swan Island and Goose Island are very good marks in going through the straits.
2064. Have you seen Kent's Group light at all? I have.
2065. Have you ever been through by the promontory? No.
2066. Your impression is, as master of one of the large ocean sailing ships, that if the entrance to the straits were lighted on both sides considerable facilities would be afforded to navigation? Very much so indeed. I remarked to many gentlemen, the first voyage I made, that it was quite backward not having the coast lighted better.
2067. What light dues do you pay in Liverpool? £42 in and out; that includes all the channel lights.
2068. If you were proceeding with the "Lightning" from Port Phillip to New South Wales, what course would you take? I would take the channel close by Wilson's Promontory.
2069. Then, in the event of a light being placed upon Wilson's Promontory, would that form a very valuable leading light for large ships as well as for coasters? Yes.
2070. You have never been round the promontory? No.
2071. But you would have no hesitation in taking the passage by the promontory? No.
2072. Do you know where the "Schomberg" was lost? Yes; just to the westward of Cape Otway.
2073. Then a light upon Cape Bridgewater, or Cape Nelson would not have been of the slightest service to her? No. [The Witness withdrew.]

Captain A.  
Erwigat.

11 Aug., 1856.

Captain William Harrison Lamont examined:—

2074. Do you command the "White Swan"? Yes.
2075. Trading between here and Adelaide? Yes.
2076. In your passages from Adelaide to Melbourne have you ever considered the question of the necessity for a light on Cape Northumberland? Yes; I think it is one of the most necessary lights on the coast.
2077. Preferable to Cape Bridgewater? Yes, much; it is the turning point of the coast there. It is low land, and a very dangerous coast.
2078. It is the point you are most anxious about in passing? Yes; I frequently lose a considerable distance by not hugging it close in the night.
2079. The reefs do not extend a long way out from Cape Northumberland, do they? No.
2080. Do you think a light on Cape Northumberland would be useful to over-sea ships from the westward? I have heard of ships making Cape Northumberland, and on the occasion of the wreck of the "Schomberg" it was given in evidence that she made Cape Northumberland two days before she was wrecked, with an easterly wind.
2081. Do you know any of the circumstances connected with the loss of vessels at Cape Northumberland? No; I suppose they ran on in the night, or in thick weather.
2082. You think a light might have saved them? Yes.
2083. Would a light on the north end of King's Island, at Point Wickham, be of any service to you in coming from the westward? None at all; I never go near King's Island.
2084. You always steer for the Otway? Yes. I keep straight along the coast.
2085. In meeting with strong westerly gales after leaving Melbourne, bound to the westward, would a light on the north end of King's Island be of any service to you? It might; we often have to set sail and stand off when we cannot steam against the sea.
2086. Then you might be able to get under the lee of the north end of King's Island, and make a slant round between the Otway and the north end of the island? We seldom stand so far off; with steamers we generally hug the land.
2087. In a sailing vessel a light on the north end of King's Island would be of great service to you? Yes; I have gone round to the westward of King's Island myself in going home from here. I commanded a ship between here and London for six voyages, and it is a very desirable point to have a light upon. I never made King's Island in coming from England.
2088. Or from Adelaide? No.
2089. Did you ever make it when bound to Adelaide in a steamer? No.
2090. Then you are of opinion that there is no necessity for a light on King's Island? There is a necessity, but not so immediate a necessity as there is for the Northumberland light. I think the Northumberland light would be far more useful; vessels always avoid King's Island in coming from the westward.
2091. An opinion has been expressed by some nautical gentlemen, that a light on King's Island would be more likely to lead a ship into danger than out of it; do you think that would be likely to be the case? I think not. The first voyage I came here there was no light on the Otway, and no leading light to the heads either.
2092. Have you been through the straits frequently? On homeward passages from Melbourne.
2093. Which way did you usually go? Two passages round the promontory and through Kent's Group, and three times by Banks's Straits.
2094. Have you formed any opinion as to whether a light is wanted in the vicinity of the promontory? I think a light is very much wanted there.
2095. Have you given the subject sufficient consideration to say where it would be best placed—whether on the main-land or on any of the islands? I think one of the islands would be preferable, if it could be erected there.

Captain W. H.  
Lamont.

11 Aug., 1856.

- Captain W. H. Lamont.  
11 Aug., 1850.
2096. So as to be seen from the eastward or the westward? Yes.
2097. Do you mean one of the islands to the south of the promontory? Yes, either the Ten-foot Rock or the Rodondo. I think the Ten-foot Rock is high enough to place a light-house on.
2098. Have you seen the Ten-foot Rock? Yes.
2099. Have you expressed any opinion as to whether a light at the Schanck would be beneficial? I never saw the necessity for it.
2100. That is coming from the westward? Yes; I always kept up close along the land, and have always made Port Phillip lights; I have heard of vessels getting down to the eastward, but they must have been strangers. I had read of them, before I came here, mistaking Western Port for Port Phillip, and therefore I guarded against it on my first trip, and after that I could not mistake it, because there is a bold shore all the way up from the Otway to the Heads.
2101. Would not a light on Cape Schanck be very useful to vessels from Adelaide in the event of strong easterly gales, as they would be afraid then to keep over to the Otway shore? Yes.
2102. But in making a direct course through the straits it would be no guide at all? No.
2103. It could hardly come under the head of a high-road light for a passage through the straits? No; for passages from Melbourne to Van Diemen's Land or Sydney, I should say it is most necessary.
2104. The establishment of a light on Cape Schanck would tend to give great confidence to strangers approaching the entrance to Port Phillip, would it not? I think it would; they could not then mistake Western Port for Port Phillip, which has frequently been done, and if they could not reach Port Phillip Heads there is a good harbour of refuge at Western Port, which the Schanck light would enable them to run for, but I think there are more necessary lights on the coast than that; I do not consider that a light ought to be put there first—I should say Cape Northumberland or the promontory would be the most important points.
2105. Would you consider the Cape Northumberland light a fair-way light? Yes.
2106. A fair-way for where? Anywhere to the westward; for instance, take the mail steamers—if they come round the Leeuwin it would be most necessary for them.
2107. You think they would find an advantage from making the Northumberland light? Yes, I think so, especially if they touched at Adelaide, they would be obliged to make it or go a long way out of their course.
2108. A ship generally coming from the westward would make Cape Otway in preference? Yes.
2109. Have you ever experienced any southerly set off the Otway, sufficient to be remarkable? No. The current, I think, generally runs from the westward, but it depends very much upon which way the wind has been blowing. In a westerly gale we find a very heavy sea there, caused by the current setting round the point; there is sometimes an indraught and sometimes an offset running along between Portland and the Otway. It depends upon the wind; if the wind is off the shore there is a strong offset.
2110. Have you ever been drifted down on to the north-end of King's Island in going towards Adelaide? No.
2111. Have you always commanded steam ships? No.
2112. Have you commanded a sailing vessel in this trade? Yes, for six voyages between Melbourne and London. I have only been nine months in the steam trade on this coast.
2113. Then you have frequently entered Bass's Straits from the westward in a sailing ship? Yes, I have entered them before there was a light on the Otway at all.
2114. If you were bound to New South Wales, in coming through Bass's Straits from the westward, which passage would you take—would you hug Wilson's Promontory or would you go through by Kent's Group? I would go through by Curtis's Island. It would depend very much upon the wind. I would go the most direct course. There is a fine light on Kent's Group: I have gone through there in the night with a sailing ship.
2115. You would not avoid Wilson's Promontory? I would if I could get through any other way at night.
2116. If a light were placed there would you feel confidence in going round by Wilson's Promontory? I think so.
2117. Would not a light on the north end of King's Island be very serviceable to vessels working out to the westward against a westerly gale? Yes, I think it would be; King's Island lies rather to the eastward of Cape Otway, I think, so that we should never approach it, because we steam so close to the wind that even standing off we should make a course to the westward of it very much.
2118. Are you familiar with the coast of New South Wales from Cape Howe to Port Jackson? No.
2119. Have you any suggestion to make to the Commission with reference to the question under consideration by them? No; I would only say, as I have said before, that Cape Northumberland is the most necessary place that I know of on the coast for a light. Some advocate a light on Cape Bridgewater, but I think it would be much better on Cape Nelson.
2120. Supposing a light to be placed on Cape Northumberland do you think it necessary that a light should be placed on either of the other capes, either Cape Nelson or Cape Bridgewater? It would not be so necessary then, but it would be a good mark for vessels bound to Portland. Cape Nelson would be a better mark than Cape Bridgewater, because it lies so much further to the south, and it is sufficiently high for a light. [*The Witness withdrew.*]

Captain Colin Brown examined:—

2121. In what trade are you engaged at present? I have been in the coasting trade latterly with my own vessel, but I have been in the colonial trade to Van Diemen's Land and Port Phillip since 1843.

Captain C.  
Brown.

2122. Where have you been trading lately? Between here and Adelaide and Newcastle.

11 Aug., 1856.

2123. Then you are familiar with the navigation of Bass's Straits? Yes; I feel myself tolerably well acquainted with the navigation from Port Stephen to Adelaide.

2124. Will you give the Commission your opinion as to any points where you think additional lights may be required for that navigation, starting from Adelaide? In Adelaide, I believe, the very last voyage I was up there, they had just put a light at Trowbridge Shoal; I believe it was talked about also to have a light on the west end of Kangaroo Island. I am familiar with Backstairs Passage. I had been in Adelaide twice or three times before the light on Cape Willoughby was erected, and when I went down the last voyage I was not very conversant with where the light was fixed; the light is fixed to the westward a little, and it occurred to me when I saw the rocks off the east side of Anti-chamber Bay, that the light would have been better there. Taking the bearing of the light I found that it was not very convenient to get the bearing of it, having a very shy wind, and wanting to keep the shore aboard.

2125. Then you consider that the light might be advantageously shifted? I would not suggest that it should be shifted, but I am giving my opinion that it would have been better either upon the very point where the rocks are, or upon the Pages, than where it is.

2126. It is a great benefit where it is, is it not? Yes, and it is a splendid light.

2127. Proceeding from Cape Willoughby across the Gulf, are there any other lights required? Across the Gulf the lighting is complete now, I think. Then, proceeding to the eastward, I think it is absolutely necessary to have a light at Cape Northumberland; it is the turning point, and it is a low deceiving point. I was close in there, tacking along up there, and I fancy that it is necessary to have a light there.

2128. Do you think a light there would be preferable to a light at Cape Bridgewater? Yes; I think Cape Bridgewater is a secondary consideration, compared with Cape Northumberland.

2129. Do you think that a light on Cape Northumberland would be of service to vessels bound from England? Very great service. In my first voyage that was the land I made. Mount Gambier was the first land I made. I think it is indispensable to have a light there for the sake of the navigation. With regard to any further lights here, if there was to be another light, I think a light upon the Lawrence Islands would be the thing.

2130. Where do they lie? They lie at the turning point into Portland Bay.

2131. That would be a light especially for Portland Bay? Yes, and it would be a fine leading mark for a man coming up along shore to look for, and to see when he was out clear of the point.

2132. Then you think it would not only be advantageous to vessels bound to the eastward, but that it would be also particularly advantageous to vessels wishing to take shelter in Portland Bay, or running for Portland Bay? Yes; I think a light at the Lawrence would be a greater advantage than a light either at Cape Bridgewater or Cape Nelson; if a man has a light at Cape Northumberland he cannot get far out of his reckoning between that and Portland; and I think a light at Cape Nelson or Cape Bridgewater would be unnecessarily close to Cape Northumberland; it would be a fine leading mark for a man going to Port Fairy or Warrnambool.

2133. Have you ever gone close to the Lawrence Islands? Yes, as close as I could sail.

2134. Are they high? Yes; there are two or three broken islands.

2135. What height do you suppose they are by estimation? I should say 200 or 300 feet high, but there might be positions found on which to place a light; it would not require to be seen in every direction; it would not require to be seen to the westward of east-and-by-south, and you do not want it after you are in Portland Bay, because you can see the lights at Portland if it is night time going in. I think with reference to a light at Cape Bridgewater or Cape Nelson, that it is not necessary.

2136. Supposing a light is placed on Cape Northumberland you do not think it necessary to put one at Cape Nelson or Cape Bridgewater? Certainly not.

2137. Then proceeding to the eastward, is Cape Otway light a good light? Yes.

2138. And very well placed? Yes.

2139. Proceeding from there towards Port Phillip, are there any other points which require lighting? Then there might be a light at the north end of King's Island; that has been talked of for the last twelve years, to my knowledge.

2140. You are of opinion that there should be a light there? Yes.

2141. Are you familiar with King's Island? Yes, I have sailed all round it.

2142. Have you ever considered the position in which a light should be placed on King's Island? I think it should be placed on the most convenient extreme north point; the Harbingers run out a long way. I have heard people talk about a light on the New Year Islands, but that is not the thing at all, because that would be of no use to a man coming from the eastward.

2143. You think it beneficial that a lighthouse should be placed on King's Island? Most beneficial.

2144. For all trades? Yes; I have traded to Launceston for some years, and three times out of four I went in to the south of King's Island by the Hunter Islands, but still that is not the best channel.

2145. Do you think vessels bound to Launceston from England would derive great advantage from a light at King's Island? They certainly would.

2146. And also vessels bound to Melbourne? Yes; a ship bound to Melbourne may enter  
the

Captain C.  
Brown.

11 Aug., 1856.

the Nelson Channel with a strong southerly wind, and a man might not like to run down upon the Otway; he would rather borrow upon King's Island; and if he could keep to windward and make King's Island light, he would bear away with confidence; whereas if he steered to the Otway, and was to the northward of his position, he might find he could not weather the Otway, therefore a light on King's Island would be of great service.

2147. Do you think a light on King's Island would be likely to lead a vessel into danger and not out of it? Not the slightest. My opinion is, that if there had been a light on King's Island, and it had been known to the men who brought out the ships that were lost, those ships would not have been lost. If a man had known there was good light there he would have steered with more confidence between the two lights, with a southerly wind he was afraid to make the Otway, and therefore he steered more weathery, and was lost on King's Island.

2148. You think a light there would be advantageous to all navigation? Yes, to every ship passing and re-passing from any part it would be most important.

2149. Would you consider it to be a proper high road light? Yes.

2150. Presuming that you were bound to Port Phillip is there any light that you would consider necessary farther on beyond the Otway? Yes, I think it is necessary to have a light on the Schanck.

2151. Do you conceive that that light would be beneficial to vessels making Port Phillip? Yes, very much so.

2152. Do you think a light on King's Island would be of any benefit to vessels bound to the westward? It would.

2153. Trading to all parts? Yes; for vessels bound from Launceston to Adelaide, for instance, and vessels bound from Adelaide to Launceston also.

2154. Do not coasters generally steer for the Otway? Not if the wind is to the southward, you are then down upon a lee shore. Coming down from Adelaide this last voyage I had a strong gale; at last the wind rather southered and I made the land at Moonlight Head with a very great deal of doubt. It was blowing hard, and I did not like to tack. I was anxious to make the reach if I could get round, and I did weather it. I should have derived no advantage from a light at that time; but if it had been a northerly wind a man bound to Launceston from Adelaide might have kept his reach and made his passage, whereas without a light he might have lost his passage.

2155. You think it is necessary to have a light on the Schanck? Yes, I think it is necessary. Last voyage I did not make a mistake, but a great many did.

2156. Where were you coming from? From the eastward to Melbourne. There were a good many vessels got down upon the western shore, about half way between the heads and Cape Otway and took two days to beat up. I kept the weather shore on board, and one tack brought me in; but seven or eight vessels got down and I beat them in. They were all to a man complaining of the want of a light on Cape Schanck.

2157. Was the wind blowing from the eastward? North-east.

2158. If you were bound from the westward, through the straits, to any part of New Zealand or New South Wales, would the Schanck light be of any service to you? That would be a doubtful matter. I might see it or I might not. It would be convenient if the wind was easterly, and a man was tacking and standing in, and he saw the Schanck light, he would know where his ship was. It would not be of so much importance to vessels navigating the straits generally as to vessels arriving at Melbourne.

2159. But still a man navigating the straits with easterly winds would be able to pick up his position by a light on the Schanck? No doubt.

2160. If you were bound from Melbourne to New South Wales what channel would you take in crossing the promontory? That would depend upon the wind. I have taken all the channels. There is a great difficulty in speaking as to how the navigation ought to be rendered complete off the promontory.

2161. How do you think it would best be done? When the wind is shy from the northward the master of a coasting vessel is anxious to keep his weather shore on board, consequently he wants to pass close to the promontory; and when the wind is shy from the southward, being the turning point, he is also anxious as quickly as possible to make a fair wind of it, and therefore he wants to cut the corners as close as possible. A man who had confidence in his navigation would not wait to go through a wide channel, he would pop through the narrow channel if he could, either night or day, with any degree of safety. The great thing depends upon whether it is contemplated to put two lights, to make the navigation complete, or only one.

2162. Start with the presumption that it is only intended to put one light? It is not every one of those rocks that a light could be placed on; there might not be wood and water, or a landing place, and that is all to be considered. If a light could be placed on one of the Cliff Islands that, in my own opinion, is the best position for the navigation of a vessel coming from the westward; a light on the western Cliff Island, not the Cave Rock. I do not know that that would be too high, and I believe there is sufficient shelter between the two islands to put a ship in with provisions.

2163. You think that to obtain the advantage of a light in coming from the westward Cliff Island is the best place? Yes, to render the navigation complete as far as one light would do it for ships coming from the westward.

2164. How would that answer for ships coming from the eastward, round Cape Howe? It would not be of so much service to them certainly; it would be of service coming from the eastward, but not by any means so much as coming from the westward.

2165. Have you considered at all whether a light might not be judiciously placed on the extreme southern point of the promontory, that would afford advantages beyond the advantages pointed out by placing it on Cleft Island? I think if you put a light upon the

extreme

extreme point of the promontory it would be obscured by Cleft Island for a good many points of the compass.

Captain E.  
Brown.

2166. That is from the westward? Yes; I have not remarked how many, but it has struck me that it would be obscured and that you would approach the Cleft and Glennie Islands before you would observe the light at all. 13 Aug., 1856.

2167. It would be more obscured in coming on a south-west course for Port Phillip than it would be for vessels steering a nearly due west course bound through the straits? Yes.

2168. They would probably open the light on the promontory in sufficient time to clear the Cleft Island? Yes, but I think it would be considerably intercepted.

2169. If the light were on the promontory there would be nothing to obscure it in coming from the eastward? I think not; I think it might be placed on the promontory with every advantage to a ship coming from the eastward.

2170. Is not the land on the east side of the promontory just south of Waterloo Bay very high? Yes.

2171. Would it not obscure the light to vessels coming down from the neighbourhood of the Seal Islands? It would.

2172. Has a vessel any business near the Seal Islands? Coasters always keep up close to those islands with the object of getting into Waterloo Bay or Refuge Cove for shelter.

2173. Then a light on the promontory would be obscured both ways, unless a vessel was either east or west of it? I think it would be obscured considerably to a westward vessel, but not so much to a vessel to the eastward.

2174. But a vessel must bring the promontory to bear nearly west before she could see it? Yes. With regard to the navigation here I would suggest that the light on Kent's Group is of no use at all. I think whoever put it there threw away so much good Government money. It stands up I believe nearly 1000 feet high. I have been within ten miles of the island and could not see the light, and some nights I have seen it forty miles off, clear like a star, in fact, any stranger not knowing the nature of the light, would have said it was a star.

2175. Do you think that it is not useful for the general purposes of the navigation in consequence of its continual chance of being obscured? Yes, and I think it often happens that the atmosphere below is tolerably clear when you can see the land of Kent's Group but you cannot see the light.

2176. Have you found that to be the case? Yes; I have been within ten or twelve miles of the island when I could see the land, and could not see the light because it has been capped with fog. I know that it is outrageous to talk of doing away with the light, but the first evil is the least evil, and I would do away with that light and take all the materials belonging to it and put it on Hogan's Island; there is wood and water there, and all the appliances for maintaining a light with ease and comfort; and there it would afford a much more ample direction for the wide passage than the light on Kent's Group does.

2177. Do you think a light upon Hogan's Island would be equally serviceable for vessels bound through Banks's Straits to Melbourne as the light on Kent's Group? Yes, I believe that they could see that light as a general thing after leaving Goose Island, especially knowing they would have a light either on the promontory or Cleft Island.

2178. Then you think that the Kent's Group light is one of those lights, which from its continued obscurity no mariner would consider himself safe in standing for, for fear of not being able to make it? Yes.

2179. In your opinion then it is next to useless? Yes, it is too high. If there was a light upon Hogan's Island it would be in a more central position, and you could steer directly for that light whether bound for Adelaide or Port Phillip, or Launceston, you could steer right plump for the Hogan's light and make it in the night, and after passing it you would have a fine channel fifteen miles wide to steer through, and you could depend upon seeing the light.

2180. If a light was placed on Hogan's Island would not that also be an additional reason for placing the other light for the promontory upon Cleft Island? Yes, because I consider if there were a light upon Hogan's Island, taken from Kent's Group, there would be a necessity for only one light at the promontory, because then a guide would be given to the westward; coming from the north-eastward they would have Cleft Island and from the westward the light on Hogan's Island would be sufficient.

2181. If economy were to be studied as well as utility, you would suggest that the light on Kent's Group should be shifted to Hogan's Island, and a light be erected on Cleft Island? Yes.

2182. That you think would make the navigation perfect? Yes, I think it would make it as complete as would be required.

2183. Is not Kent's Group light of great service to ships proceeding to the coast of Tasmania from New South Wales by giving them a guide for Cape Barren? No, I have gone down to Hobart Town three or four times, and never came near it. For that purpose a light should be placed on the Babel Islands. A friend of mine once lost his vessel from that cause; he made the land on the eastern part of Great Flinders' Island, and he steered down and mistook the Babel Islands for Cape Barren. He was bound to Hobart Town, and he steered his ship ashore off Vansittart Island and lost her.

2184. If he was not quite certain about the land, do you think he was a prudent mariner in taking that course? I do not think he was very prudent; but it is not one time out of ten that any mariner going from Sydney to Hobart Town will see Kent's Group, it is so far to the westward.

2185. Have you rounded the promontory frequently? Four or five times.

2186. Have you ever seen the Ten-foot Rock? Yes, as close alongside as I dared go.

2187. What is your opinion of that as a position for a light? If a light could be placed there, I think it would be the best position of all; but to put a light there would involve an enormous expense; everything would have to be taken to it.

- Captain O. Brown.
- 11 Aug. 1856.
2188. But if it could be done you think it is the best spot for a light near the promontory? Yes, because you could see it in any point of view, either from the eastward or the westward.
2189. Are you familiar with the Rodondo? Yes; you could not build a lighthouse there. I do not believe a seal could land there, let alone a man.
2190. It has been given in evidence that some men have lived there? I should not think any body could land there. If you could put a light on the top of the Rodondo, it would be too high to be seen well, the same as Kent's Group light; the Rodondo would be a good position, but the Ten-foot Rock would be a better.
2191. What is the size of the Ten-foot Rock? It appears about the same size as a good sized ship—the flat on the top deck of a ship.
2192. What height is it? It is marked ten feet on the chart, but I think it is twenty; a lighthouse could be made to stand very well upon it.
2193. Would the difficulties of erecting a lighthouse on the Ten-foot Rock be anything to be compared to the difficulties of erecting the lighthouse on the Eddystone? No; a lighthouse could be built there of course—no doubt about it; and if expense was no consideration I should say the Ten-foot Rock, but I thought the object would be to place a light in the most judicious position at the least possible expense.
2194. Supposing there were to be two lights at the promontory, which would you suggest as the most desirable positions for them? I would have a light placed on one of the Cleft Rocks for the western approach, and the light taken from Kent's Group and put upon Hogan's Island.
2195. That is, if it is found impossible to put a light on the Ten-foot Rock? Yes; but I think the Ten-foot Rock would be the best position, because there is nothing to fall in with in the channel but the Ten-foot Rock.
2196. In coming down from Cape Howe towards the promontory, is there any spot on the eastern side of the promontory where a light would be of service? A light would be of great service on the southern Seal Island, for the very reason I have before named, that coasters coming up from the Howe with a shy wind off the land generally try to keep that land on board in order to get under the promontory for shelter.
2197. Would a light there also be very serviceable as a leading light for Port Albert and Corner Inlet? Yes, it would be an excellent leading light for Port Albert.
2198. Going on towards Sydney, is there anything between the promontory and the Howe that requires particular notice? I think it is a shame, at this time of day, to have a piece of coast 150 miles unsurveyed, as is the case along that coast. I understand the light on Gabo Island is only a temporary light; I think, if it was ever contemplated to build a substantial stone lighthouse it ought to be carried as far out on the south-east point of the island as practicable, in order to get a bearing at the earliest moment. In coming round the Howe I have not been ashore to examine the island; but the further out the light is the better.
2199. Proceeding on from Gabo Island, is there anything else you would call attention to? There is nothing that can be improved at all until you get to Jervis's Bay: but there wants a light either on Point Perpendicular, Cape St. George, or Crocodile Head. My opinion is that it ought to be on Point Perpendicular, for two reasons. Cape St. George would be better for vessels approaching from the southward; and if it was possible to erect it at Crocodile Head, it would be better for vessels from the northward: but then, when I place it on Point Perpendicular, I have quite as good an approach as to Saint George's Head coming from the southward, and I have quite as good an approach coming from the northward: but there is the advantage of going into Jervis's Bay in a dark night.
2200. As a leading light, do you think that a light at Jervis's Bay is absolutely necessary? Yes.
2201. Have you ever observed any particular indraught there which caused you to make the land on the starboard bow when you expected to make it on the port bow? Yes.
2202. Had that been the case during the night time, might you have lost your vessel, thinking you were steering a straight course for Sydney? Yes, when if I had seen a light it would have saved me: and there is a very beautiful harbour of refuge there which, I think, ought to be lighted.
2203. Have you ever been in there? Yes; and anchored under Bowen's Island.
2204. Is there anything else between Cape Howe and Port Stephen that you think necessary, bearing in mind that there is a new lighthouse being erected on Nobby's Island at Newcastle? I see there is a light tower on the south end of Twofold Bay, and I think it would be very judicious to light that as a harbour light. There is no part of the coast where coasting vessels are more in than at Twofold Bay—coasters are always in there.
2205. Do you know whether the pillar there is in a proper position for running for the bay? I have never considered that, but a light is necessary there for a man might lose canvas and be blown off to New Zealand, whereas if there were a light he might make it and be in safety, and a light there would be a directing light for the coast as a man would know by the light how he approached towards the Howe, and how he approached from there to Point Perpendicular; it would be of the same use as a light on Point Perpendicular.
2206. Is there any other suggestion you have to make to the Commission? No; I think not. The navigation as between Jervis's Bay and Sydney is pretty good. It has occurred to me that the light at Sydney is placed on the wrong head of the bay; it ought to be on the north head instead of the south head. I have seen that light, and then afterwards it has been obscured by the land; if it had been on the north head it would have thrown the light so-much farther out and would have made a more pointed approach to the entrance; it is not now at the entrance to the harbour; however, it has been standing there for ages and I suppose will have to remain so. If they ever contemplate removing it the best thing would be to put a red light on the north head and not to do away with the present light, which is a beautiful light.
2207. Have you any further observations to offer to the Commission? No, I think there is nothing else that I can suggest at all.
- 2208.

2208. Are you familiar with the south coast of Van Diemen's Land? No.  
 2209. Do you think there is any necessity for a light there? A light on the south-west cape would be a very convenient thing, not only for ships approaching from England, but there are a great many whalers in that neighbourhood, and I think a light on the south-west cape might be judiciously placed if the trade was thought of that importance to require a light.  
 2210. Do you know the Bruny Island light? That I think is not necessary.  
 2211. Not as an approach to Storm Bay? The light ought to be placed on Tasman's Head, I think.  
 2212. Is it not placed on Bruny Island with a view of showing large ships where Dentrecasteaux Channel is? If there were a light on the South Cape and a light on Tasman's Head that would render the navigation of that part of the land complete.  
 2213. In going from the Derwent, up the eastern coast of Tasmania, is there any point where a light is required? Not unless a light could be placed on the turning point of Tasman's Island, but I think it would be too high, like Kent's Group. If a light could be placed there it certainly would be a fine turning point, but I do not think it could be put there. I am not aware of any spot on the eastern coast that requires a light; it is a straight coast; if there was a light at all it should be upon some of the projecting points in the neighbourhood of the Schouten Islands; that would be a good point if it was thought the navigation warranted such a thing.  
 2214. Before entering into Banks's Straits the Eddystone is a very important point, is it not? Yes; and it is a low point.  
 2215. Has it ever occurred to you that the facilities of the coasting trade would be very much improved by having a light there? Either on the Eddystone or St. Helen's Point.  
 2216. There is a great deal of trade passes the Eddystone, is there not? Yes.  
 2217. And a light there would be of service to ships taking their departure for the coast of New South Wales, would it not? Yes.  
 2218. On the whole of the eastern coast of Tasmania is the Eddystone the point of all others which you would select for a lighthouse? Yes, if it were intended to put another light; the Schouten Islands would be merely an approach to that part in case of ships being taken of a dark night; but there are very few vessels navigating that coast, comparatively speaking. [*The Witness withdrew.*]
- Adjourned till to-morrow, at Ten o'clock.

Captain C.  
Brown.  
11 Aug., 1856.

TUESDAY, 12 AUGUST, 1856.

Present:—

CAPTAIN KAY, R N., | MR. BROWNE,  
MR. DOUGLAS.

Captain Godfrey Vaughan Bentley examined:—

2219. You command the steamer "City of Hobart"? Yes.  
 2220. And you have commanded other vessels? I have commanded vessels since the end of 1836.  
 2221. Trading in these Colonies? Yes, from 1836 to 1843 I was trading between Sydney and this and between Launceston and this alternately, excepting one year when I was in England, and then for ten years, up to 1853, I was trading between Hobart Town and Port Albert and from that to Sydney.  
 2222. Are you familiar with the western entrance to Bass's Straits? Not so much so as the eastern one, but I have been several times close round Cape Wickham and at anchor inside the New Year Islands.  
 2223. What is your opinion with respect to the erection of a lighthouse on King's Island? I have heard before of that, and the purpose then stated was in consequence of the number of wrecks occurring on the west side of the island—whether you want a light for a leading light to the straits or a light to preserve vessels that get too far south from shipwreck, that is two different things.  
 2224. Do you think it would be highly beneficial that a light should be placed on the north end of King's Island? I do not think it is necessary there at all.  
 2225. Is there any part of the island on which you think it necessary to place a light? If it is to prevent shipwrecks I should place it either on the New Year Islands or about the centre of the west coast of King's Island.  
 2226. If there had been a light on the North Cape visible over the New Year Islands, would not it have been a benefit to the vessels that have been wrecked there? It might or might not, for in heavy weather you depend upon the strength of the light; a light on the New Year Islands would show as far as one on King's Island, as far as strength goes, and therefore farther south in bad weather; and there is another objection to King's Island, that when the rain holds up a low cloud covers King's Island at the height of 300 or 400 feet, it is perfectly clear at the bottom but you cannot see the top.  
 2227. Is it obscured by mist more than any other part of the straits? Not the same as the other rocks in the straits are. A cloud would form on Curtis's Island, and on Kent's Group, and the Rodondo, when there is no cloud anywhere else, that is not the case at King's Island; but in heavy weather, particularly after rain, the whole of King's Island top is obscured when it is perfectly clear below.  
 2228. Are you of opinion that a light on the north cape of King's Island might tend to lead a ship into danger instead of warning her of her danger? That would not be a bad place for a light if you wanted one to light the entrance of the straits, but it would not be the thing  
 for

Captain G. V.  
Bentley.  
12 Aug., 1856.

Captain G. V. Bentley. for vessels that found themselves too far to the southward of their course; a light there would not pick them up effectually. The objection to a light at the north end of King's Island is that the light would not be visible over the point just south of the New Year

12 Aug., 1854, Isl-nds.

2229. It has been given in evidence that a light could be well seen over that point and over the New Year Islands also? I doubt it very much, the distance between the two points is nine miles, and it does not require a very high point to shut in a light at a distance of nine miles. I think if a light is required for the purpose of saving vessels from shipwreck, the New Year Islands would be the proper place. It is always prudent to put a light outside a danger and not inside, and the position of a light on the New Year Islands would give the outside danger and show the point a ship would have to clear that had made the coast of King's Island to the southward of the New Year Islands.
2230. A light on the New Year Islands would not be at all available to ships coming from the eastward, would it? No, but they would not require it, the principal object in my opinion is for vessels running in from the westward towards the straits that have not had an observation for some days; vessels working through the straits are always sure of their position, and in working to the westward, after opening the New Year Islands from Cape Wickham, the light on the New Year Islands would be most useful, as it would mark the extreme western point of land, and also lead coasting vessels into the good roadstead under those islands, where a crippled ship or moderate sized vessels would find good shelter from all westerly winds.
2231. In the event of any light being placed on King's Island, you are of opinion that it should only be as a warning light and not as a leading light? Yes.
2232. Do you not think a light on the north end of King's Island would be useful to vessels bound to the westward? It might be useful, but I do not think it would answer the purpose for which a light is required.
2233. You say you should never light inside a danger, would not you be doing that in respect to the Harbingers by lighting the New Year Islands? A light on the New Year Islands would keep you clear of the Harbingers by its bearing, much better than a light on King's Island, which would be useless to vessels coming from the southward in enabling them to clear the Harbingers.
2234. What is your opinion as to the desirability of a light on King's Island at all? It would be useful to save vessels from shipwreck if they were out of their course to the southward.
2235. Do you think a light on King's Island would have the effect of saving vessels from shipwreck? I think it would if it were half way down the island, or on the New Year Islands, but I do not think it would have that effect if it were placed on the north end of King's Island.
2236. Supposing you were bound from Adelaide to Launceston, and the weather was thick, the wind hanging well to the northward, if you could just fetch round to the north end of King's Island, would not a light upon the north end of that island be of considerable service to you when you were not quite satisfied of your position? Yes, no doubt if the weather were clear enough to see it; but if we go to that we may have a light on every point of the straits. I should not consider a light on King's Island as a light for coasting vessels; I should merely consider it as a light to pick up foreign ships coming from the westward that have not had observations for several days. I do not think that it is requisite on the north end of the island, though no doubt it would be useful.
2237. You do not think that it is actually necessary to have a light there at all, excepting for the assistance of vessels that may get out of their course in coming from the westward? No, I do not think it is advisable to encourage ships to come down there.
2238. Do you think a light there would have that tendency? Of course men would borrow more on that coast with a light being there. The New Year Islands are the most western land, and a man is naturally more anxious to know the position of those islands than any thing else, because the safety of his vessel would depend on her weathering them.
2239. You say that King's Island is liable to be clouded more often than any other points on the coast? It is clouded the same as all high land is.
2240. But not more so? No; it does not cloud the same as the islands at the eastern end of the straits. A light on the New Year Islands would very often be visible when a light on King's Island would not be visible. A low light is generally more visible in thick weather than a high light, and on the New Year Islands would always be visible except in a fog.
2241. It has been stated in evidence here that a ship standing in, twenty-five miles to the southward of Point Wickham, would see a light on that point over the low lands and over the islands also; are you of that opinion? No, I do not think so. If you know the height of the points by measurement I cannot say it would not be so. A vessel might see it at twenty-five miles out; but the question is, would she see it at five or six miles out under the point inside the New Year Islands.
2242. If you could see it twenty-five miles, you could see it in approaching before you got close in under the land? No, you might not, particularly in squally weather. I have often been within six or seven miles of Swan Island light in such weather before seeing it.
2243. A man might get so close in under the light as to shut it in? At the extreme point of twenty-five miles you might see the light over the hill, but if you got anything inside that you might not see it over the land of King's Island.
2244. Would not the soundings tell a man where he was? You could not have much soundings in heavy weather, on a lee shore in such deep water as is close to the island.
2245. Supposing a light is to be erected on King's Island, for all the purposes of navigation, the coasting trade and every other trade, which should you consider the most eligible position, taking all the circumstances in every point of view into consideration—the case of vessels proceeding to the westward, vessels coming in from the westward, vessels being carried down

on the west coast, or vessels coming up through the passage by the Hunter's Islands? There is no doubt the position on Point Wickham is the best position as a leading light for going through the straits, but I do not think it would answer the purpose of picking up vessels getting too much to the southward.

Captain G. V.  
Bentley.

12 Aug., 1856.

2246. As a leading light, and as an ordinary light to warn vessels of danger, you think Point Wickham would be the best? It would be the best for vessels coming from the eastward; but I do not think vessels coming from the eastward require a light there at all, because there would be no vessel coming in that direction but what would know her position well enough to be able to borrow upon King's Island without danger; but for vessels getting in on the land to the southward of the New Year Islands, I think a light on the New Year Islands would be the best. I think the New Year Islands would be more advantageous to vessels coming from the southward, because they would see it as far to the southward as they would the light at Point Wickham, and in hazy weather I believe you would see the New Year Islands light when you could not see the light upon Point Wickham, because you would depend more upon the strength of the light than the height of it in showing through the haze; but for the purpose of picking up vessels that have got in on King's Island and have been lost, I believe about the centre of the island would be the best position, as it would be seen either from the southernmost point of King's Island or from the Harbingers.

2247. Would not it be so high that it would be always capped? No, you might choose your position for it.

2248. Then it could not be seen all round? No, but north or south the entire length of King's Island.

2249. Strangers should be warned under all circumstances not to approach King's Island, should they not? There would be no danger in approaching King's Island if there were a light on the New Year Islands, because you could always see that light except in thick weather, and in such weather when you could not see the light no man would run his ship near unless he were compelled to do it.\*

2250. Supposing you were in the trade between Van Diemen's Land and Melbourne, besides the lights at Swan and Goose Islands in the straits, which you may use in coming from Hobart Town, and the Kent's Group light which you may use in coming from Launceston, are there any other lights that you think should be erected? Yes, Cape Schanck, I think a light there is more important than any light in the straits.

2251. Do you believe that the Schanck light would be a beneficial light not only for vessels bound to Port Phillip direct, but for vessels bound through the straits? No, I do not; except they were working through.

2252. You think, in many cases, a light at Cape Schanck would be most important? Yes; I believe two-thirds of the tonnage coming to the port of Melbourne comes from the eastward; and all those vessels want to make the Schanck; and to vessels coming from the westward that run down to the heads at night, the Schanck light would give them their cross bearing with the lights on the heads, so that they could always tell their position and lay to off the heads at a proper distance.

2253. A cross bearing on the Schanck would give them their position? Yes; a master of a vessel would be perfectly comfortable, as he could keep his ship in position. The great danger to vessels coming from the westward towards the heads at night is, that the master is afraid to lie to in case he might get into the indraught into the heads.

2254. Would it not be an advantage in preventing vessels mistaking Western Port for Port Phillip? Yes.

2255. That has been the case sometimes, has it not? Yes.

2256. Is there not a great indraught into Western Port? Yes.

2257. Are the lights on Shortland's Bluff good lights? Yes.

2258. You have no fault to find with them? No.

2259. And the Schanck light, you think, should be a powerful light? Yes.

2260. Are the Shortland's Bluff lights of sufficient radius of vision? I should think you could see them eighteen or nineteen miles. I have never run a course to dip those lights. I have always turned away to the eastward. I conceive a light on Cape Schanck would be a most valuable light for all vessels; because, with vessels coming from the eastward, if they miss the Schanck, they miss the light in the heads; and in easterly weather it would be very desirable to pick up the light on the Schanck.

2261. Would a light on the Schanck be of any service to vessels passing through the straits? Not unless they had beating weather.

2262. In proceeding to New South Wales would you recommend any additional lights? I would recommend a light on the south-east point of the promontory—I do not see any means of placing it elsewhere. The lights I should propose to place would be a good strong light on the south-east of the promontory, and a harbour light on Cloumel Island, at the entrance to Port Albert.

\* In all the remarks which I have made with reference to the proposed light on King's Island, I have considered that the principal object in view was the preservation of such vessels as had the misfortune to make the land to the south of the New Year Islands in bad weather, and I am of opinion that a light on the New Year Islands would be almost their only chance of safety. It would be seen off a ship's deck about eighteen miles, as it would be about 200 feet high above the water, and from the position of the islands I feel confident that a light on them would be visible in bad weather very much farther to the southward than one on Cape Wickham; it could not possibly be shut in by any land, and it is in bad weather it is most required. I believe there would be but little chance of seeing a light on Cape Wickham in such weather at any great distance; another objection to that light would be, that it would be of no use to enable a vessel coming from the southward to clear the New Year Islands if she were in shore in a dangerous position. I have a great objection to any light being placed on a mainland at an elevation of five or six hundred feet, as when most required it is generally fogged in and not to be seen, and when visible it is most difficult to judge one's distance from it. I believe 300 feet is as high as any light should be placed on a mainland.—G. V. Bentley.

- Captain G. V. Bentley.  
12 Aug., 1856.
2263. Have you rounded the promontory very often? Yes.
2264. Do you think in placing a light on the promontory itself it would be visible to vessels coming from the westward? It would be sufficiently visible to a sailing vessel, because no sailing vessel goes close in shore.
2265. Do you think that a sailing vessel coming from Melbourne would usually keep such an offing as to sight the light clear of the Glennie Islands? Yes, if the weather was clear she would see the light at a distance of eighteen or twenty miles, and then she could run for it, the promontory is so clear, and bold, and steep that she might run right under the light without any danger.
2266. Is the south-east point of the promontory very high land, or does it run out in a sort of tail? There is a sort of hummock runs out there. There is one thing to be considered—the landing the stores; and there is a little cove in Waterloo Bay, on the eastern side of the promontory, that the smallest vessel might lie in with perfect safety, and a road could be made along the edge of the hill.
2267. Have you ever landed on the promontory? Yes, many times, I have been in Waterloo Bay, but I never walked down that way, where it is proposed to place the light.
2268. Is there plenty of stone there? Yes.
2269. There would be no difficulty in finding the stone for a lighthouse? No, and there is plenty of water.
2270. Have you ever considered the possibility of putting up a light on the Ten-foot Rock? I do not think it would be possible to put one there or to land stores at any time.
2271. Have you passed it in bad weather? Yes, at all times; I never saw the sea running over it; I have seen the head of the sea going over it.
2272. Do you think, in heavy weather, the sea would be so heavy as to destroy the commencement of a lighthouse during its erection? The spray would go over it, and the salt water would destroy the mortar.
2273. If it should not be possible to erect a lighthouse on the Ten-foot Rock, you would say the point of the promontory? Yes, anywhere on the south end of the promontory would do.
2274. In preference to Cleft Island? You could erect nothing on Cleft Island without an immense expense.
2275. The Rodondo is also impracticable? It might be landed on perhaps, but there is not a spot there for a boat to go into.
2276. It has been given in evidence that some people used formerly to live on the Rodondo, and the witness said you would be able to give the Commission some information upon that subject? I never heard of any one living there; there was a sealer living on Curtis's Island; I never heard of any one living on the Rodondo; I have no doubt the sealers' boats used to touch there and look round it, but I do not think there is any place where a boat could lie off.
2277. Have you had great experience of Wilson's Promontory? I made 160 voyages in the Port Albert trade.
2278. From Van Diemen's Land? Yes; and Sydney.
2279. Have you well considered the question of a light on the promontory? Yes; I wrote to the harbour master some two or three years ago about it.
2280. In coming from the eastward do you consider that a light on the promontory would be well open to all vessels approaching from the Howe? Yes; and if a harbour light, that could be seen ten or twelve miles off, were put on Port Albert entrance, then any vessels might beat down along the beach, I have done so in knoth water, when I could do nothing in the offing; and there is no danger in the coast after you pass the Lake entrance coming from the eastward; but to the eastward a few miles there are one or two rocks, and the Snowy River comes down somewhere about there. Any vessels coming in a direct line from the Howe, if they get the least out of their course to the northward get into danger on the Port Albert banks; a light at Port Albert would pick them up, and if they got too far to the southward Kent's Group light would pick them up.
2281. Have you ever considered whether it would be advisable to remove the light from Kent's Group to Hogan's Group? I think it is better where it is, because all large ships steer to the south of Curtis's Island until they make Kent's Group.
2282. If there were a light on the promontory do you think large vessels would avail themselves of it? No; I think it would be more for the coasting trade.
2283. The large mail steamers which may be expected from Europe shortly would all shave the promontory, would they not? Any steamer would use the passage round the promontory.
2284. You think over-sea ships bound to Sydney or New Zealand would not go by the promontory although it was lighted? No; not large ships.
2285. Your experience induces you to urge upon this Commission the necessity of placing a light on Wilson's Promontory, and one on Port Albert bar? Yes, the coast by Port Albert is very dangerous, and there have been several instances of vessels getting in there and some being lost.
2286. You see no objection to the light on Wilson's Promontory being shut in by the Glennie Islands? No; because no vessels would keep down upon that coast except steamers, and they would always know where they were, and in bad weather they would keep nearly the same offing as sailing ships.
2287. After passing the promontory do you know the Gabo Island lighthouse? Yes.
2288. Is that in a satisfactory position? I think so.
2289. And does it give a good and sufficient light? Yes.
2290. Between that and Sydney Heads is there any point that strikes you as also requiring to be lighted? I think Cape George should be lighted.
2291. Have you ever observed, in passing to the northward, that your vessel experienced any considerable indraft in the neighbourhood of Cape George, so that you frequently made the land on your starboard bow when you expected to make it on your port bow? Yes; there is no doubt that some vessels have been lost through that.

2292. Where would you recommend the placing of that light? I should place it on Cape George, because you cannot see Point Perpendicular if in shore south-west of Cape George; a light placed there would have the same fault as the Sydney light, has now—that a vessel getting in shore to the southward of Botany could not see it. Captain G. V. Bentley.  
12 Aug. 1856.
2293. You would recommend that a light should be placed on Cape George? Yes; it should not be placed too high, because if the wind is any way from the eastward it clouds in very heavily there.
2294. With that light do you think that the eastern coast of Australia would be well lighted? I think a harbour light at Twofold Bay would be beneficial, as it is very difficult to find the entrance to that bay in a dark night.
2295. Of all those lights which you have been examined about, supposing it were only intended to erect one, which should you suggest should be erected first? Cape Schanck.
2296. You think that would be the most useful light of the whole? Yes; I think that is most required.
2297. Next to that which light would you say? I should say a light on the west coast of King's Island would be the next best, because we have had no losses through the want of a light on the promontory.
2298. You would consider that if all the lights you have recommended were put up, the navigation of the straits would be much simplified, and great advantages would be obtained by those who navigate them? No doubt of it. There would be no danger then in running boldly down to the promontory.
2299. Have you ever considered the question of putting a light on each side of the promontory? No; I do not think it at all necessary. Some people would want a light on every rock in the straits to make a comfortable passage through.
2300. Do you frequently make the passage through Banks's Straits? Yes.
2301. Do you think those straits to be well lighted? Very well.
2302. On the eastern coast of Tasmania is there any point on which you consider it desirable that a light should be placed? I think a light should be placed at the Eddystone Point, that is the only dangerous part of the coast.
2303. That is a great turning point, is it not? Yes.
2304. And should be lighted? Yes.
2305. Then in proceeding to the southward from the Eddystone, is there any other point on the coast of Tasmania that you think deserves attention? None except the Hippolyte Rock.
2306. Where is that? Off the pillar. Some have suggested a light on the pillar, but I do not think that is practicable.
2307. Do you think the Hippolyte Rock is practicable for the erection of a lighthouse? Yes, I think so.
2308. Do you think the trade there is sufficient to warrant the expense of a light at that place? I hardly think it is; but a light on the Eddystone is very much wanted. I am continually falling in with vessels in those straits coming in from South America and New Zealand bound to this port, and also from Sydney.
2309. Have you any further suggestions to offer to the Commission? No, only I think all the rocks in the straits ought to be properly laid down in the charts. They are now all marked "p.d." (at least those rocks surveyed by the "Beagle"), and I think their position ought to be accurately ascertained and laid down. There are several rocks that I can point out that are not laid down at all; and if you look over the chart you will see that almost every danger is marked.
2310. Then you think Bass's Straits require re-surveying? I do not know whether it requires re-surveying, but I think the position of those rocks should be pointed out, and another error in the chart is that in the anchorages in the straits, although giving the soundings, they have not given the character of the bottom; the bottom is given on the outside, where it is of no use, but in the anchorages it is not given at all.
2311. Have you ever been to the westward of Cape Otway? Yes; but a good many years ago. There are men more conversant with that trade, that could give better opinions than I could.

Captain Alexander White examined.

Captain A. White.  
12 Aug. 1856.

2312. What ship do you command? The steamer "Champion."
2313. In what trade? Warranbool, Port Fairy, and Portland.
2314. Have you been in any other trade? Not in the coasting trade.
2315. Then you are acquainted mostly with the coast from Melbourne to Portland? Yes.
2316. Have you been to the eastward at all? Not coasting. I have made several voyages out from home to Sydney.
2317. Have you been to Adelaide? I have.
2318. Have you considered the question of a lighthouse on Cape Northumberland? I have heard a great deal of talk of it, and I think it would be a great improvement.
2319. Do you think a light upon Cape Northumberland would be preferable to a light on Cape Bridgewater or Cape Nelson? Yes.
2320. Do you consider that the great turning point on that part of the coast? Yes.
2321. Have you ever been close to Cape Northumberland? Yes, within ten miles.
2322. Do you think a light on Cape Northumberland would be also beneficial to over-sea ships from the westward? Yes.
2323. Even ships bound to Melbourne? Yes.
2324. Under what circumstances would ships bound to the eastward of the entrance of Bass's Straits derive advantage from a light on Cape Northumberland? Strong southerly westerly winds might blow them down on the coast.

- Captain A. White.  
12 Aug. 1856.
2325. In approaching Bass's Straits from the westward, with the intention of proceeding to Port Phillip, is it desirable that a ship should make any land in preference to the Otway? No, I should not attempt it.
2326. You think, except from necessity, no ship would attempt to make the land except at Cape Otway? No.
2327. You consider Cape Otway a leading light? Yes, and a capital light it is.
2328. During the summer season, in a continuation of easterly and south-easterly gales, might not a light at Cape Northumberland be very useful? Yes, a vessel might work up along the land then.
2329. With reference to the coasting trade, is there any light which you think would be desirable in any harbours that you frequent? Merely a harbour light at Warnambool or on the jetty at Port Fairy.
2330. Is there any harbour light at Portland? No.
2331. Is one required? No, I think not.
2332. Would not a light on the cliff to the northward of the jetty at Portland be very useful? I do not think it necessary.
2333. It has been suggested that a light might be put on the Lawrence Rock? I think a light would be more useful there if one was placed anywhere.
2334. You have constantly seen the Cape Otway light of course? Yes.
2335. Have you ever considered the question of a light on King's Island? I do not see that it is necessary for my trade, but for the general trade I think it desirable.
2336. On which part of the island would you recommend its being placed? On the north-west corner. I should say on Point Wickham.
2337. Could you give the Commission any reasons why you have come to that conclusion? No, excepting that it would be useful for vessels making the land in thick weather.
2338. Have you well considered the subject? I have not considered it very particularly. It never affected me.
2339. Then you are not prepared to enter into any nice discussion as to whether it should be on the north-west or on any other point of the island? No.
2340. Do you think a light on King's Island would be useful to coasters? No.
2341. As a fairway light in the western entrance of Bass's Straits you think it might be of service? Yes.
2342. Are you aware that a great many wrecks have taken place on King's Island? Yes.
2343. Do you know the circumstances under which any of them occurred? No.
2344. Are you of opinion that if a light had been put at the place you have pointed out any of those wrecks might have been prevented? Yes; I think the American ship "Whistler" might have been saved.
2345. Except in general terms you are not prepared to give any particular evidence as to where a light should be on King's Island? No.
2346. Your opinion inclines to Point Wickham? Yes.
2347. Are you familiar with the coast to the eastward of Port Phillip? No.
2348. Is there any necessity existing in your opinion for any additional light near Port Phillip? No, I cannot say that I see it.
2349. Do you consider the lights on Shortland's Bluff to be quite sufficient? I think a light on Cape Schanck would be a great advantage to vessels lying off during the night.
2350. Have you any difficulty in seeing the Shortland's Bluff lights at night? None whatever.
2351. Is there any part of the bay, in approaching Port Phillip, where you cannot see the Shortland's Bluff lights? When you are to the westward of them they are not opened.
2352. And you think a light on Cape Schanck would give confidence to vessels approaching Port Phillip? Yes; and it would even be useful to vessels coming up from the westward.
2353. Are the leading lights on Shortland's Bluff well placed in your opinion? I think so.
2354. Have you ever known a vessel mistake the entrance to Western Port for the entrance to Port Phillip? No.
2355. A coaster would not be likely to do so? No, I think not.
2356. Have you any further suggestions to offer to the Commission? The light on Cape Bridgewater I think is very desirable, as well as on Cape Northumberland for Portland Bay.
2357. Merely as a guide light for Portland Bay? Yes.
2358. The Commission understood you to say just now that a light in Portland was not necessary? Not in Portland.
2359. But you think a light on Cape Bridgewater is necessary? Yes; in the case of a vessel running for Cape Northumberland, she might miss a light there.
2360. Do you speak merely with reference to the over-sea trade? Yes; I do not think it is necessary for the coasters. [The Witness withdrew.]

— Captain William Horatio Hawkins examined —

- Captain W. H. Hawkins.  
12 Aug. 1856.
2361. What trade are you employed in? Between here, Warnambool, and Port Fairy.
2362. What vessel do you command? The "Queen" steamer.
2363. Are you familiar with Bass's Straits? I have been through the straits several times in command of ships going through the straits bound home round the Horn.
2364. Did you usually take the course through Banks's Straits? No, to the northward of Kent's Group.
2365. Then you can hardly say that you are familiar with Wilson's Promontory? Not as a coaster, but I can give my opinion upon it.
2366. Upon approaching Bass's Straits from the westward, is there any point on the coast of New Holland where you think it necessary to have a light erected on which there is not one.

- one placed at present? I think Cape Nelson and Cape Northumberland are the two points I should suggest. Captain W. H. Hawkins.
2367. Would that be for the over-sea trade? Yes, and also for the coasting trade. Cape Nelson would be a guide for Portland, and Cape Northumberland for Adelaide. 12 Aug., 1856.
2368. Do you think lights at both those places are required? I think they are required; but if you were to ask me distinctly which of the two I think most necessary, I should say Cape Northumberland. Cape Nelson would be more for a guide to Portland Bay.
2369. But Cape Northumberland would be no guide to Portland? No. It would be a guide to Adelaide.
2370. As a prudent mariner, in approaching Bass's Straits, bound to Port Phillip, what land would you try to make first? The Otway, decidedly.
2371. Are you of opinion that no master of a ship bound to Port Phillip would attempt to make any other land than the Otway? Not unless he had sustained some damage.
2372. Supposing he had easterly gales? Then I should not go to the northward of the latitude of the Otway in working to the eastward; I have worked along in easterly winds and kept as near as I could in the parallel of the Otway until I got close to Moonlight Head, and then worked along the land from there to the Otway.
2373. Have you seen the Cape Otway light? Frequently; I see it every time we pass.
2374. Is that a good light? A very efficient light.
2375. Have you considered the question of a light on King's Island? Yes.
2376. What is your opinion as to that? I think there should be a strong fixed light on Cape Wickham.
2377. You give that opinion as the result of great consideration on your part? Yes; I think that then with a light on the Schanck, when you come to have the light down on Swan Spit, even in the night time a vessel with a fair wind might go right up Port Phillip harbour.
2378. You are aware that there is considerable difference of opinion as to where a light should be placed on King's Island? I am.
2379. Have you heard the New Year Islands suggested as a place where the light should be put? Yes.
2380. You think that is the wrong position? Yes, I think Cape Wickham would be the best point.
2381. You are quite decided in your opinion as to Cape Wickham being the best spot? Yes.
2382. Do you think a light there would be more generally serviceable to the navigation of the straits than one on the New Year Islands? Yes, with a good light on Point Wickham a ship bound up the straits would see both that and Cape Otway.
2383. If a ship found herself, in thick weather, to the south of the New Year Islands do you think she would see a light on Cape Wickham? I think a light on Cape Wickham would be sufficiently elevated for that because it is the highest point of the island.
2384. Are you aware that the majority of the wrecks on King's Island have been on the west coast, to the south of the New Year Islands? Yes. I think a powerful light on Cape Wickham would be a protection to ships on the coast south of the New Year Islands, the distance is not great.
2385. You are decidedly of opinion that it is necessary to place a light on King's Island? Decidedly; I have always thought so.
2386. In approaching Port Phillip, coming from the westward, is there any point on which you would recommend that a light should be placed to facilitate the navigation? After rounding the Otway I think there ought to be a light on the Schanck.
2387. Would that be of service to vessels bound through the straits as well as to vessels bound to Port Phillip only? It would not be of much service to them, I think, because after rounding the Otway they would always shape a course for Curtis's Island.
2388. But vessels bound direct to Port Phillip would derive great advantages from it? Yes; they might run with a strong wind with safety, and with the Swan Spit light go right up.
2389. Is there any difficulty in seeing the lights on Shortland's Bluff now? No, there is no difficulty.
2390. If a vessel gets blown to the eastward of the port she cannot see them, can she? Then the light would be shut in by the land, and I do not think the light is very powerful there; as leading lights they are well placed, but they do not command a sufficient radius of vision.
2391. If a stranger outside of Port Phillip Heads could get a cross bearing of the Schanck light he would have great confidence in standing in for the Shortland's Bluff lights? Yes; he would know his position exactly.
2392. In proceeding to the eastward from Port Phillip, what is the next point on which you consider it necessary to have a light? I should say on the promontory; with that and the light in Kent's Group, I should say the straits would be well lit.
2393. Where would you place the light? On the extreme point of the promontory.
2394. Are you familiar with the land at the promontory? I have sighted it in going past.
2395. You do not know the land particularly? No.
2396. You think for the safe navigation of Bass's Straits a light on or close to the promontory is very desirable? I think so, decidedly.
2397. Have you been up to the eastward also? Only in command of ships bound home, passing through between the promontory and Kent's Group.
2398. Do you know the light on Kent's Group? Yes.
2399. Is that light, in your opinion, well placed? Yes.
2400. In passing through to New South Wales, would a light on the promontory be of any service to you? Yes.
2401. As master of an over-sea ship if a light were placed on the promontory would you make for it in preference to Curtis's Island? No, but it would be a very good guide, because with

Captain W. H. Hawkins. with strong southerly gales you might find yourself set up there. I was steering for Banks's Straits once in the "John Taylor" and picked up the Rodondo.

12 Aug., 1856. 2402. Have you found the set of the current in the straits generally controlled by the winds? Mostly so; I think that the current sets mostly to the eastward, but stronger of course when the wind is blowing from the westward.

2403. In making your passage through, would you still make for Curtis's Island with a large ship under sail bound through to Sydney? Certainly, I should give the promontory a wide berth.

2404. Would the promontory light be of any advantage to you if you were steering that course? Yes; it would give the position of the other dangers.

2405. Have you ever been round Cape Howe? No, not coasting. I have been round that way in going up to Manila.

2406. Have you ever been through Banks's Straits? No.

2407. Did you ever sight any of the coast to the northward before entering the straits? No, I kept out.

2408. You have stated that you have been a great deal in the coasting trade between Melbourne, Portland and Port Fairy? Not a very great deal; I am engaged in that trade now.

2409. Have you any suggestion to make to the Government of Victoria with respect to harbour lights? I think Warrnambool would be much the better for a light.

2410. Have you any further suggestions to make to the Commission? No. [*The Witness withdrew*].

Captain George Gilmore examined:—

Captain G. Gilmore. 2411. You command the "Telegraph" steamer? Yes.

2412. And you have commanded other steamers in the trade between Sydney and Melbourne, have you not? I have.

12 Aug., 1856. 2413. For how many years? Fifteen.

2414. How many voyages may you have made during that time? I have been engaged across the straits as well, and I suppose I have made 300 voyages.

2415. Have you also been engaged in the trade between Launceston and Melbourne? Yes.

2416. Then you have a thorough knowledge of the dangers which exist in the navigation of the straits in those particular routes? Yes.

2417. On the voyage from Sydney to Cape Howe, whether in coming to the southward or in standing back from Melbourne going to the northward, is there any point on the coast which, in your opinion, requires lighting, which is not now lighted? It is a fine coast; a light perhaps would be desirable on Cape St. George, but I do not know that it is absolutely wanted.

2418. Have you ever experienced in your voyages, when standing to the northward, that there is a considerable set in towards the land which might induce you to make the land on the starboard bow when you expected to make it on the port bow? During the summer months you make take it as a rule that there is a strong southerly current that will set a ship in a point or two to the westward of her course.

2419. If allowance is made during the summer months by steering a little more to the eastward than the true course, that danger may be avoided? Yes.

2420. Do you think it would be of assistance to the navigation generally to have a light on Cape St. George? Yes. It is an abrupt point, and the land runs out to the eastward some nine or ten miles; and it would also be an advantage in consequence of the shelter which Jervis Bay affords in easterly gales.

2421. Is there any other point on that coast that you think it would be advisable to light? No.

2422. After passing Cape Howe, bound to Melbourne, is there any point on the coast which you think should be lighted? The promontory is the next point.

2423. Would you advise a light on the promontory? From the position of Kent's Group light, being so far from the promontory, it is very rare that we see it, except in very clear weather, and a ship is liable to be set in towards the Seal Islands. Seven or eight months ago one of our vessels went ashore there, and another of our vessels, the steamer "Clonmel," was lost there.

2424. Then you would advise that a light should be placed on the promontory? Yes.

2425. Where would you advise that it should be placed? I think two lights would be requisite to make the navigation complete.

2426. Where would you place the lights if you placed one on each side? I would have one on the eastern Seal Island and the other on Cleft Island.

2427. Would it be possible to place a light on Cleft Island? I do not think it would. There are some of the Glennie Islands where it might be possible to place a light, but Cleft Island is extremely abrupt.

2428. If it were only intended to place one light, do you think that the south-east point of the promontory would be the best position for it? Yes, I think so; and it would be very desirable to have a light there.

2429. That would be open to vessels coming from the north east? Yes.

2430. Would not a vessel, if she approached within the neighbourhood of Seal Islands and did not open the light, haul out, supposing that her position was inside the course that she anticipated? It would be advisable to do so, but still you might be deceived by the inset.

2431. Would that difficulty be removed in any way if the light were put upon the Clonmel Rock? It would to some extent.

2432. You would place one light upon the south-easternmost Seal Island, and also one upon the island immediately on the west side of the promontory, Cleft Island if possible? Yes.

2433.

2433. And if not possible on Cleft Island, what next point would you suggest? Any one of the Glennie Islands. Captain G. Gilmore.
2434. Have you ever considered the possibility of putting a light on the Ten-foot Rock? I have; but I think it would be too low. 13 Aug. 1856.
2435. Have you passed by it frequently? Yes.
2436. Supposing the engineering difficulties could be overcome, a light at the height of 100 feet would give a radius of fifteen miles, would it not? Yes; but that would not take in the Seal Islands.
2437. Then you conceive it is absolutely necessary that whatever light should be placed upon the promontory its radius should extend to the Seal Islands? Certainly; the end of the promontory would do that. The extreme point of the promontory is quite defined in coming down from the eastward and not shut in by the high land. The light on Kent's Group is at too great an elevation, and in my opinion it ought to have been placed on Hogan's Island.
2438. Then you would have required no further light on the east side of the promontory? No; a light on Cleft Island then would have been quite sufficient.
2439. Do you think it is absolutely necessary for the safe navigation of the straits, considering the enormous trade that now exists between the two colonies of New South Wales and Victoria, that that point should be lighted in the best manner in which it can possibly be effected? I do.
2440. You say the south-east end of Wilson's Promontory is a well-defined point in coming from the eastward? Yes.
2441. But it would be obscured by the Glennie Islands to all vessels coming from the westward? Yes.
2442. But if a vessel had the advantage of a light on the Schanck, taking a fair departure from there, would she not in all probability pick up the light, and open it clear of the Glennie Islands without any fear of running upon them? I do not consider that for all steam purposes coming from Port Phillip down to the promontory the navigation is at all dangerous as compared with coming from the Cape Howe side; it is only a short distance from Port Phillip to the promontory, and you have bold headlands on the port land coming down—Cape Schanck and Cape Liptrap.
2443. Supposing a light were placed on Cape Schanck, would it better to light that part of the promontory that would be observed from the east side in preference to that which would be observed from the west? I should prefer lighting it on the east side. I never found any difficulty in going down to the promontory from the Port Phillip side.
2444. What is the distance from Gabo Island to the promontory? 200 miles.
2445. And you have also there the chance of the indraught into Corner Inlet? Yes.
2446. And that is the real danger which requires to be provided for? Yes, and the number of shoals and shoal water. I remember the circumstances of an Englishman, some years ago, running right into Corner Inlet. He thought he was round the promontory, and shaped his course and went right into Corner Inlet.
2447. You think the best way would be to put a light on one of the Glennie Islands and one on Seal Island? Yes.
2448. That would be the most perfect way of lighting the promontory? Yes; I would have the light on the Glennies as far south as possible; but I do not think Cleft Island would be accessible.
2449. Would it be possible to put a light on the Rodondo? I never landed on it, but I think it would be inaccessible.
2450. Would it not also be too high for a lighthouse? On the summit it is frequently capped with clouds.
2451. If it were possible to select a position on the Rodondo at the south of the promontory and not on the top of the Rodondo, would that be available for vessels coming in both directions? I think it would be.
2452. Is the Rodondo often capped? Yes.
2453. Would you advise that any further lights should be placed on the coast between the promontory and Melbourne Heads? I think a light at Cape Schanck would be very desirable.
2454. Would Cape Schanck be a useful point to light for vessels trading from Launceston as well? Yes.
2454. Would it be of great service to the Van Diemen's Land trade? Yes; because you do not open the lights at Shortland's Bluff until you are right abreast of the port.
2456. The lights on Shortland's Bluff are good leading lights are they not? Capital.
2457. Do they require any improvement in your opinion? I do not think so.
2458. Have you been to the westward at all from Port Phillip? No.
2459. Have you ever been to Adelaide? No.
2460. Have you ever considered the question of placing a light on King's Island? Yes; have been examined upon that before.
2461. Would you give the Commission the opinion which you have arrived at on that point, whether a light on King's Island would be advantageous to vessels using the straits either coming from the westward or going to the westward, coming from the eastward whether it would be likely to lead a man into danger in consequence of the position of the Harbinger Reefs, or whether it would be a beacon to warn him from danger, and therefore be beneficial? I decidedly think a light upon King's Island would be extremely beneficial.
2462. For vessels bound either to the eastward or the westward? Yes.
2463. Where should it be placed in your opinion? I think the northern point of the island would be the best position.
2464. Do you think that the vessels which have been lost there would have been saved if there had been a light at the north end of King's Island.
- 2465.

- Captain G. Gidmore.  
13 Aug., 1856.
2465. You conceive it would be beneficial to have a light there? I think it would.
2466. Have you considered the question of putting a light at the New Year Islands? I have, and I consider the northern point of King's Island would be the best position for a light.
2467. Have you any doubt that Cape Wickham would be the most desirable point? No, I have no doubt in my own mind upon that point.
2468. Have you been through Banks's Straits at all? Yes.
2469. Do you think they are sufficiently lighted? Very well lighted indeed; Goose Island and Swan Island are capital lights.
2470. Then with the exception of the lights you have mentioned which you think would be serviceable to navigation, that is the Schanck, the promontory, Cape George, and King's Island, are there any other suggestions as to lights which you would like to make? I do not think there are any other lights required, but with respect to the light on Gabo Island, it ought not to be in the centre of the island, in shore, it ought to be at the extreme point.
2471. Then you think the light is not properly placed there? I think it is not properly placed.
2472. Do you know whether there would be any engineering difficulties in placing it on the point of the island? No, on the contrary, the point of the island is a solid rock, whereas in the centre it is sand.
2473. Which lighthouse of all those you have mentioned do you think is most necessary to be erected in the first instance? I should prefer the Wilson's Promontory light, so far I am concerned.
2474. But for the general navigation of the straits do you think Wilson's Promontory should be the first point to be attended to? I think it would be the first light required. A good steady powerful fixed light it must be there, as Kent's Group is a revolving light.
2475. A first-class light? Yes; the point of Wilson's Promontory is beautifully adapted for a light, it is about an elevation of 200 feet.
2476. And it would be clearly visible to vessels north-east of the Seal Islands? Yes.
2477. In passing through the passage at the promontory, a light on the promontory itself would afford the best guide, would it not? Yes.
2478. Is there any shoal water on the western side of the promontory? No.
2479. And no danger but what is bold and easily seen? None at all.
2480. Have you frequently been on the eastern coast of Tasmania? No; I am not very familiar with that coast.
2481. Are prepared to give an opinion positively as to that coast? No. [*The Witness withdrew.*]

William Henry Norman, Esquire, examined:—

- W. H. Norman Esq.  
11 Aug., 1856.
2482. You are commander of the Victorian Government steam sloop "Victoria"? Yes.
2483. Are you familiar with Bass's Straits? No, not very.
2484. You have made a voyage through them, have you not? I have made two voyages through them, to and from Sydney.
2485. In one of the ocean mail steamers? Yes, one, and one in a sailing ship.
2486. Has it ever struck you as desirable that any light should be placed on the coast of New Holland to the westward of Cape Otway? Yes; I should consider it desirable that there should be a light on Cape Northumberland decidedly.
2487. Would that light be useful for over-sea ships? Yes, as well as for coasters.
2488. Did you ever make the land there? Yes.
2489. In a sailing ship? Yes, in working round from Adelaide.
2490. Not in coming from Europe? No, I made Cape Otway in coming from Europe; still it would be good land to make, it would be a weather light always to you.
2491. If you were proceeding to Melbourne from Europe, would you make Cape Northumberland light in preference to Cape Otway light? It would depend upon the weather. The weather permitting I would steer for the Otway light, but there are circumstances when a light on Cape Northumberland would be very useful, particularly if you had a scant wind. Supposing the wind to be from the south you might steer boldly on to that light, when you could not do so without that light.
2492. Would not a south-west wind give you a long range of coast under your lee if you made the the Northumberland light? Still you might go about. The coast there is, I believe, pretty well north-west and south-east. By making the Cape Northumberland light you would have the benefit of being able to stand so much further in towards Portland.
2493. That coast is very much dreaded by navigators, is it not? Yes, because there is no mark on it, and it is very low.
2494. In the event of a light being placed there, you think there would not be that degree of dread that there is at present on the part of vessels making that part of the coast? Certainly not.
2495. Have you ever considered the question of putting a light on King's Island? Yes, I have.
2496. What is your opinion with respect to that? There ought to be one there, certainly, and a first class light. It should be a true beacon light, a good strong first-class light. I cannot give an opinion as to the best position for a light, not being acquainted with the character of the island itself.
2497. In passing through the straits, which you have done on two occasions, has it appeared to you necessary to light any other part of the straits? Cape Schanck, I think, ought to be lighted, both for Port Phillip Heads and for the general navigation of the straits, particularly for sailing ships; that would give them a cross bearing, so that they might be in a position to get in next day.

2498. You think that a light on Cape Schanck would be advisable? Certainly.  
 2499. Going further to the eastward, is there any other point that strikes you as requiring to be lighted, if bound through the straits either to New South Wales or New Zealand?  
 Wilson's Promontory. I should certainly think a light would be very desirable either on the promontory, or on one of the islands that may be best situated for it, according as it may be proved by examination of the locality.

W. H. Norman Esq.  
 12 Aug., 1856.

2500. Do you think that is a point surrounded by dangers? Yes, and I think it would facilitate the trade between the two ports if there were a light there.

2501. But you are not prepared to say exactly where it would be best to put the light? No; that must, of course, be determined on by examination.

2502. After rounding Cape Howe is there any other point of the coast to the northward where you would recommend a light to be placed? I kept too far off the coast to judge of it, so that I cannot give an opinion.

2503. Have you seen the Shortland's Bluff lights? I have just seen them, and that is all. I only saw them once, and that was about two o'clock in the morning.

2504. Have you any further suggestions to offer to the Commission? No. [The Witness withdrew.]

Bloomfield Douglas, Esquire, a member of the Commission, examined:

B. Douglas, Esq.  
 12 Aug., 1856.

2505. Are you Master of the Trinity House of South Australia? Yes.

2506. Will you be good enough to state whether you are aware of any additional light-houses to those already established in South Australia, being necessary, and if necessary, whether any steps have been taken to erect them? Yes, a light is necessary on Cape Borda, at the western extremity of Kangaroo Island; the money has been voted by the Legislature, and immediate steps will be taken for its erection. The light will be a revolving light, with intervals of a minute. A light is also to be erected on Cape Northumberland, the money has been voted by the Legislature, and orders have been sent home for the lantern; and, I believe, at this time the tenders are accepted for the erection of the tower and other buildings. The Cape Northumberland light will be a bright red and green revolving light, with intervals of a minute.

2507. At what height will it stand above the level of the sea? The Cape Borda light will be about 350 feet above the level of the sea, and the Cape Northumberland light about 280 feet.

2508. Will they both be first-class lights? Yes; visible for a radius of twenty-five miles.

2509. Do you believe that the absence of a light in that particular locality has been the means of causing some of the wrecks that have taken place on that coast? Several wrecks have taken place in consequence of there being no light at Cape Northumberland.

2510. Which you think would have been obviated by the erection of a lighthouse there? Entirely so.

2511. Those lighthouses were contemplated by the Government of South Australia, and steps were taken to carry them out, before any idea was in existence as to this conference taking place? Yes, the money was voted for Cape Borda in the session of 1854; and I drew the attention of the Government to the necessity of a light on Cape Northumberland in April, 1855, and the money was voted the next session.

2512. Speaking from your experience of the coast, you having previously commanded a steam vessel on this coast, are there any other points at the entrance of the straits, or between Cape Northumberland and Port Phillip Heads, which you consider should be lighted in addition to the light on Cape Otway? I consider a light would be very useful on the north end of King's Island for over-sea ships; and, under certain circumstances, such as in the event of a continuation of heavy north-westerly gales and thick weather, that light might be also useful for coasters; there is no doubt that a light on King's Island would be very useful to vessels bound to the westward during strong south-westerly gales.

2513. From the evidence that has been adduced before this Commission, are you inclined to believe that the north point of the island would be a preferable position for a lighthouse to the islands situated in its immediate vicinity? I think so, for it appears that Point Wickham is considerably higher than the New Year Islands, and with a radius of vision of twenty-five miles a light would in all probability be seen over them from a certain distance.

2514. Have you ever sighted King's Island yourself? Never.

2515. In making for the straits, even although a light were erected upon King's Island, would you not recommend that in any sailing directions that should be drawn up after the straits were finally lighted, instructions should be given not to border on King's Island, unless it were necessary from the continuance of prevailing winds which brought vessels into that neighbourhood? Yes; but I think that in the event of a light being on the north end of King's Island ships might be able to keep further to the southward than they do now, and not run the risk of falling in with a lee shore between Moonlight Head and Cape Otway. With a strong southerly wind they find it difficult to scrape the land, and during the southerly gales there is a set to the northward and eastward.

2516. Do you consider that any additional light would be beneficial for the navigation of Port Phillip in addition to those already erected on Shortland's Bluff? I think for steamers there is no other light necessary beyond the leading lights into the heads, but for sailing vessels I think a light on Cape Schanck would be very desirable.

2517. That would enable them to take up their position with greater accuracy, by taking the cross bearings of the light without allowing themselves to be thrown too much to leeward as they are now occasionally? Yes; and a light there would be very useful in preventing a vessel getting too near the heads when it might not be the intention of the master to enter.

B. Douglas,  
Esq.

12 Aug., 1856.

2518. Do you think a light on Cape Schanck would be of any service to vessels bound to the westward? I do not think it would be of any service to vessels bound to the westward.
2519. But in working through to the eastward you think it would be beneficial? Yes; because vessels in strong easterly gales would be able to borrow on that shore and keep in smooth water.
2520. You have passed Wilson's Promontory, have you not? Yes, both in day and night. I consider a light would be very desirable upon the extreme point of Wilson's Promontory, and my impression is that a light there would answer all purposes. There is no doubt it would be shut in by Cleft Island and the Gleennie Islands in a certain bearing, but a vessel wishing to make it would only have to haul a little further to the southward, and she would then make the light, and might steer a direct course through; and for vessels from the eastward I think it would answer all the purposes for which a light would be required.
2521. The principal dangers are in coming from the north-east and not from the westward? Exactly.
2522. And you conceive that the point of the promontory would be the most useful and effective position on which a light could be placed? I think so.
2523. During the time you were navigating the coast of Australia was the Gabo Island light in existence? Yes.
2524. Do you consider that that light is a good and efficient one and properly placed? When I saw it it was very dim indeed. I saw the high land of Cape Howe before I saw the light.
2525. Have you at all observed the position of the lighthouse as to whether you think it is placed properly upon the Island? I have not been sufficiently close to observe that.
2526. In proceeding to the northward, after passing Gabo Island, if bound to Sydney, is there any part of the coast which, in your opinion, requires to be lighted? Yes; I think a light is requisite on Cape George.
2527. Have you ever observed, in standing to the northward, that there is a considerable indraught on that part of the coast? Not in standing to the northward, but in coming from the northward I have fancied that there was a considerable indraught from the eastward, in fact I made Gabo Island upon the port bow instead of upon the starboard bow.
2528. From your knowledge of the land on which point would you recommend the lighthouse to be erected? I cannot give a very valuable opinion upon the subject, but I think Cape George would be the most desirable point, having looked at the chart with some degree of attention.
2529. That point you think ought to be lighted? Yes, considering the amount of traffic and the great range of coast unlighted.
2530. With the exception of those lights which you have already stated that your Government has undertaken to erect, which of the other lights that you consider it advisable to put up should, in your opinion, be erected first as the most useful fairway light? Wilson's Promontory.
2531. That, in your opinion, is an important light? A very important light I think. I think many masters of vessels are extremely nervous in passing through Bass's Straits, and that they would prefer coming up the channel under the promontory if there were a light there.
2532. In establishing any new lights on the coast what class of lights would you recommend to be erected, the dioptric or catoptric? The catoptric. The dioptric lights are so much more difficult to repair, and the management of the concentric burners is so much more delicate, that I think the catoptric light would be the best.
2533. Do you know which light is the most economical of the two? No. I never had any of the dioptric lights under my control.
2534. You think the catoptric lights are sufficiently brilliant and are easily kept in repair? Yes; they should have very deep parabolic reflectors.
2535. What class of oil is used for the lighthouses in South Australia? We have tried several descriptions. We have tried cocoa-nut oil, and that we found answer very well in the summer, but it smokes very much; the colza oil also smokes a great deal. The oil we now use is the tea seed oil from China, and that answers very well, so much so, that a short time ago I purchased twelve months' supply for the different lighthouses.
2536. Is that oil obtainable at a lower price than the sperm or colza oil? It is about a shilling a gallon cheaper—it should not cost more than 7s. a gallon, we bought it at 7s. 6d. and we have since had it offered at 6s. 8d.
2537. Do you think it might be imported direct at a cheaper rate? Yes, at about 6s. 6d.
2538. Where is it principally brought from? From China.
2539. Does that oil continue in a fluid and useful state during cold weather? Always. I do not know at what temperature it would congeal, but we have never found it do so.
2540. At all events it is more economical in its use than either sperm or colza? Yes, and burns much cleaner; it has not a tendency to crack the cylinders, and the lantern is generally free from smoke. In my opinion it is the best oil that can be used for lighthouses.
2541. What course do you think ought to be adopted in the event of a revolving light ceasing to revolve from any defect in the machinery in order to enable that light to continue to revolve until some repairs can be effected? The lighthouse keeper should turn the wheel by hand, or he might assist in turning the frame.
2542. Do you consider it would be dangerous, if the revolving machinery got out of order, to allow the light to become a fixed light? Certainly; because when you got between the angle of the reflectors there would be no light visible.
2543. Is not the revolving portion of the machinery extremely simple? It is merely a weight and chain round a barrel and a couple of cog wheels.
2544. Could not any stoppage of the machinery be repaired by even an ordinary workman? I cannot imagine any stoppage except from the jamming of the weights in the trunk or the breaking of the chain. I do not imagine any accident can take place to the wheels, because  
there

there is no strain upon them; it would be almost an impossibility unless the metal used in the construction of the wheels was extremely faulty.

2545. Would it not be very easy to obviate the liability to accident by having a spare chain in each lighthouse? Yes. In fact I see no difficulty in the matter without difficulties are made.

B. Douglas,  
Esq.

12 Aug., 1856.

2546. Are you familiar with what is called the intermittent light? Yes; we have an intermittent light on Troubridge Island, but the term that is now adopted is always "revolving;" they are not called "intermittent," they are all called "revolving."

2547. What is the distinction between the light on Troubridge Island and the ordinary revolving light? Only that the intermission is so much more frequent—the light is visible every half minute which makes a flash, and the revolving light, generally speaking, is a minute and a half or two minutes, or two minutes and a half.

2548. Then it is nothing more than a quicker revolution? Yes; with the Troubridge light we have eight lamps with very deep reflectors and each lamp is presented to view every thirty seconds.

2549. Have you any colours in that light? None at all.

2550. You propose your Northumberland light to be a coloured light, do you not? Yes.

2551. In what way do you manage your lights in South Australia? By means of a Trinity Board.

2552. Do you levy a tax upon shipping for the support of them? Yes, a tonnage rate.

2553. Do you find that that course is not objected to by owners of vessels? Not at all; I think that owners and masters of ships are always very ready to pay light dues.

2554. If similar boards to that in existence in South Australia could be established throughout the whole of the Australian Colonies, do you conceive that a unity of action in the management of the lighthouses could be better obtained than can now be possibly obtained under the different systems of management which exist in all of them? Yes; I think it easier to communicate with established bodies like a Trinity Board than with the Government, where it would have to pass through so many departments.

2555. Then you consider that the Trinity Boards when once established should be independent bodies, capable of governing themselves? Yes, only amenable to the Legislature.

2556. Could not the masters of the several Trinity Boards meet occasionally on points involving the interests of the several Colonies, and decide matters for their mutual benefit which cannot now be decided? I think such a conference would be very useful.

2557. Have you any further suggestions to offer which you think would be useful to the Commission in arriving at a satisfactory conclusion on the several points which they have met to consider? No, I think any further suggestions I may have to make will be as a member of the Conference.

Adjourned.

WEDNESDAY, 20 AUGUST, 1856.

Present:

CAPTAIN KAY, R.N., | MR. BROWNE,  
CAPTAIN DOUGLAS.

Captain Joseph Lawson examined:—

2558. You command the "Ocean Monarch"? Yes.

2559. Have you made several voyages to these Colonies? Only two—one to Sydney and one to Melbourne.

Captain J.  
Lawson.

20 Aug., 1856.

2560. On both which voyages you came through Bass's Straits? Yes.

2561. During either time that you visited these Colonies have you ever had an opportunity of seeing King's Island or of considering whether it would be advisable or not to place a light on that island? Yes, I have seen it on both occasions, and on this last occasion it made such an impression upon me that but for other troubles that occurred afterwards, I should have written in the newspaper about it.

2562. Will you describe to the Commission under what circumstances you made the land on that occasion, and whether you conceive that if a light had been established on the island it would have been a guide to you, and would have enabled you to get out of the position with greater facility than you did? Yes. On Friday, the 30th May, I shaped my course for Cape Otway, bound for Port Phillip; during the middle of the night the vessel broke off from her course and laid down with her head towards King's Island; I found the vessel breaking off during the night, and being satisfied of my position I stood on towards the island; I made the land about daybreak, and judging from my experience, I thought I was a good deal farther off than I afterwards found I was, I stood close in and put my helm down with what I considered the New Year Islands, bearing north-and-by-east-half-east by compass.

2563. At about what distance? I should say at the distance of five or six miles, I could not recognise the place by the bearings at all, I could not make out where I was even then, not dreaming I was in the bight at all. I stood close in until I had the New Year Islands bearing north-and-by-east-half-east as I thought, and then I tacked and I suppose after I had stood out at least four or five miles, I was thunderstruck to see the Harbingers on the weather beam, about two or three miles distant, with the sea breaking mast head high over them.

2564. Then you found that instead of the New Year Islands bearing north-and-by-east as you anticipated, the north end of King's Island was bearing north-and-by-east? Yes. Then standing

- Captain J. Lawson.  
 29 Aug., 1856.
- standing out again, when I began to open the land outside the New Year Islands I at once saw where I was, and I was so astonished that it almost made my blood curdle.
2565. Then if it had not been daylight, your vessel would probably have been in considerable danger? No question about it.
2566. If there had been a lighthouse there you would have seen the tower and known your position directly? Yes.
2567. Do you consider that it would be advisable to place a lighthouse on King's Island? I think in all my experience I have never seen anything so dangerous as King's Island in its present unlighted condition. I think if a light were placed on Cape Wickham a vessel could not well be deceived wherever she brought up, because a vessel is never so far out of her latitude; any man can ascertain his latitude when he cannot ascertain his longitude.
2568. Do you think the north point of the island, Cape Wickham, would be a good place for a lighthouse? I do.
2569. Some persons have suggested the New Year Islands as a more desirable site for a lighthouse, what do you think of that? If the light were on Cape Wickham it would carry you clear of the dangers at the Harbingers, but a light at the New Year Islands would not do so well, a light on the north end of King's Island would enable you to stand in to make a fair course into the channel.
2570. Would it not also aid you in taking shelter under the lee of the island if you required to do so in heavy westerly gales? Yes. I think a light could not possibly be placed on the New Year Islands so that it could give any aid on the other side of the island, the land is far too high there.
2571. It has also been suggested to the Commission that a light situated on the north end of King's Island, being within the large reefs, the Harbingers, which lie off the north portion of it would be more likely to lead a ship into danger than out of it, what is your opinion on that point? Allow me to instance the Wolf Rock at Home; that is considerably farther off from any of the lighthouses than the Harbinger Reefs would be. I conceive that a light on King's Island would be the very thing to prevent a ship being lost on the island. It is absurd to say that because there is a danger and a light cannot be placed in front of it, therefore you should have no light there at all.
2572. Do you think it is a light that should be erected with all possible expedition? It should, indeed.
2573. As you have had no great experience beyond Melbourne Heads, perhaps you would not like to offer an opinion as to any further lighting? In working up from Cape Howe I felt the want of a light on Cape Schanck very much, because it would guard you from mistaking the position of Port Phillip, and it would enable you to stand across with a beating wind with great safety and comfort to yourself, but a light on King's Island is indispensable.
2574. And you would also advise a light on the Schanck? Yes; a light there would be an advantage to heavy vessels.
2575. Have you at all remarked the lights at the entrance of Port Phillip Heads? No; I came in in the daytime.
2576. Have you ever been to any of the Colonies to the westward? Never; I have spent the whole of my life in the India trade.
2577. In coming out to Melbourne or Sydney have you ever considered the necessity for a light on Cape Northumberland? No; it was only as to King's Island that I wished to express a very strong opinion, because I have had a great opportunity of judging of it, and I have seen the absolute danger of it; the Harbinger Reefs are fearful reefs. I look upon it as one of the most dangerous places I ever saw unlighted in my life. [*The Witness withdrew.*]

## NEW SOUTH WALES

## MASSACRE AT WOODLARK ISLAND,

(OF CREW AND PASSENGERS OF BRIG "GAZELLE.")

*Ordered by the Legislative Assembly to be Printed, 27 February, 1857.*

RETURN to an *Address* from the Honorable the Legislative Assembly, dated 10 February, 1857, requesting that His Excellency the Governor General would be pleased to cause to be laid upon the Table—

“Copies of all Correspondence between the Government and all other persons with reference to the massacre of the crew and passengers of the brig “Gazelle,” at Woodlark Island.”

## SCHEDULE.

	Page.
1. Mr. Charles St. Julian, Hawaiian Commissioner and Consul General, to the Colonial Secretary, 14 March, 1856, suggesting that a search should be made after the Passengers and Crew of the “Gazelle” .. .. .	2
2. Colonial Secretary to Captain Denham, 17 March, 1856, requesting a Report on Mr. St. Julian's Statement .. .. .	2
3. Captain Denham to Colonial Secretary, 19 March, 1856, in reply .. .. .	3
4. Colonial Secretary to Port Master, 26 March, 1856, to report probable expense of sending the Steamer “Torch” to Woodlark Island .. .. .	3
5. Port Master to Colonial Secretary, 7 April, 1856, in reply, and forwarding Tenders for a small Vessel for the service .. .. .	3
6. Colonial Secretary to Port Master, 12 April, 1856, in reply .. .. .	4
7. Mr. Charles St. Julian to Colonial Secretary, 1 April, 1856, in continuation .. .. .	4
8. Colonial Secretary to Mr. St. Julian, 3 April, 1856, in reply .. .. .	5
9. Colonial Secretary to French Consul, 8 April, 1856, suggesting that the French Naval Establishment, not very far from the locality, could perhaps make inquiry into the matter .. .. .	5
10. Colonial Secretary to Mr. St. Julian, 8 April, 1856 .. .. .	6
11. Mr. St. Julian to Colonial Secretary, 14 April, 1856, in reply .. .. .	6
12. Mr. St. Julian to Colonial Secretary, 18 April, 1856, in continuation .. .. .	7
13. Mr. E. Bingham to Colonial Secretary, 21 June, 1856, respecting the massacre of the crew of the brig “Gazelle” .. .. .	11
14. Colonial Secretary to Mr. Bingham, 28 June, 1856, in reply .. .. .	12
15. Colonial Secretary to Mr. St. Julian .. .. .	12
16. Colonial Secretary to Captain Freemantle, 3 November, 1856, transmitting the papers in the case .. .. .	13
17. Captain Freemantle to Colonial Secretary, 12 November, 1856, in reply .. .. .	13
18. Colonial Secretary to Captain Freemantle, 15 November, 1856, in reply .. .. .	14
19. Colonial Secretary to Crown Law Officers, 15 November, 1856, for their opinion .. .. .	14
20. Crown Law Officers to Colonial Secretary, 22 November, 1856, in reply .. .. .	14
21. Colonial Secretary to Captain Freemantle, 25 November, 1856, forwarding copies of the Crown Law Officers' Report .. .. .	15

## MASSACRE AT WOODLARK ISLAND.

---

### No. 1.

CHARLES ST. JULIAN, ESQ., HAWAIIAN COMMISSIONER AND CONSUL GENERAL, to THE  
COLONIAL SECRETARY.

56-50.

*Hawaiian Commission and Consulate General,  
Sydney, 14 March, 1856.*

SIR,

I have the honor to request that you will call the attention of His Excellency the Governor General to the case of the Reverend John Mazzuconi, and the crew of the British brig "Gazelle," supposed to be detained in a state of destitution, if not captivity, either on Woodlark Island (near New Guinea) or on some of the islands in that vicinity.

2. The "Gazelle" sailed from Sydney on the 18th of August last, with supplies for the Roman Catholic Missionary Establishment at Woodlark Island, having been chartered for this purpose by the Reverend J. Mazzuconi, a priest of that establishment, who went in her a passenger. But soon after the departure of this vessel the other members of the Mission arrived here, having broken up their establishment in consequence of the severe illness with which they had been afflicted.

3. Since then nothing has been heard either of the "Gazelle" or of any of those on board of her; the probabilities are, that she has either been wrecked upon the reef at Woodlark Island, or (those on board of her not being aware of the Mission having been broken up, and being consequently off their guard,) that she has been captured by the natives of that island. In either case it may be reasonably supposed that some, at least, of those who sailed in her are living among the islanders, and in the most urgent need of relief. To say nothing of the Italian Missionary, there was a crew of fourteen persons on board the "Gazelle," all, I believe, British subjects, and many leaving families in Sydney.

4. Should His Excellency be pleased to send the "Torch," (as in the case of the lamented Mr. Strange and his companions,) to make the necessary search, the best time for so doing would be towards the close of the present month, or the beginning of April; at that season of the year the passage would be speedily made; and I am authorized to state, that of the three Missionaries from Woodlark Island now here, one, or, if necessary, two, would most gladly go with the vessel, to point out localities and to interpret.

Respectfully entreating the favor of an early reply,

I have, &c.,

CHARLES ST. JULIAN,

H. H. M. Commissioner, &c., and Consul-General.

THE HONORABLE

THE COLONIAL SECRETARY,

Sydney.

---

### No. 2.

THE COLONIAL SECRETARY to CAPTAIN H. M. DENHAM, R. N.

*Colonial Secretary's Office,*

*Sydney, 17 March, 1856.*

SIR,

I am instructed by His Excellency the Governor General to refer to you the enclosed letter from Mr. St. Julian, H. H. M. Commissioner and Consul General at Sydney, soliciting a search for the crew of the brig "Gazelle," and to request that you will have the goodness to favor me with your opinion as to the probability of the statement contained in that communication, and as to the time which it would take to make the necessary exploration.

I have, &c.,

CAPTAIN H. M. DENHAM, R.N.,

H. M. Ship "Herald."

CAPTAIN H. M. DENHAM, R.N., to THE COLONIAL SECRETARY.

*Her Majesty's Ship "Herald,"**Port Jackson, 19 March, 1856.*

SIR,

In reply to your letter of the 17th instant, enclosing, by desire of His Excellency the Governor General, a letter from Mr. St. Julian, H. H. M. Commissioner and Consul General at Sydney, soliciting a search for the crew of the brig "Gazelle," and requesting my opinion as to the probability of the statement contained in that communication, and as to the time which it would take to make the necessary exploration; I have to submit for the information of His Excellency,—

That, looking to the interval of seven months which has elapsed without any tidings of the people who left this port in the "Gazelle" last August, there is little hesitation in my mind to conclude that they have been detained, after losing vessel and boats on Woodlark Island, or the contiguous coast of New Guinea, or on some island in that vicinity; to determine which, I consider it would occupy a vessel three months, including the passage to and fro. In the event, however, of ascertaining the fate of the "Gazelle" at once, at her destined point, Woodlark Island, this service might be accomplished in six weeks; and it will greatly facilitate the issue if any of the recent resident Missionaries at Woodlark Island, and who are now in Sydney, were to go in the search vessel to point out localities and to interpret.

I beg leave to return Mr. St. Julian's letter.

I have, &amp;c.,

THE HONORABLE

THE COLONIAL SECRETARY.

H. M. DENHAM,

Captain R. N.

## No. 4.

THE COLONIAL SECRETARY to THE PORT MASTER.

*Colonial Secretary's Office,**Sydney, 26 March, 1856.*

SIR,

It having been suggested to send the "Torch," or some other suitable vessel, to Woodlark Island, or the contiguous coast of New Guinea, in search of the crew of the brig "Gazelle," I am directed by His Excellency the Governor General to request that you will furnish me, as soon as possible, with an estimate of the probable expense of the "Torch," or of a sailing vessel, for the voyage to and from Sydney, assuming it to be of three months' duration if sent.

I have, &amp;c.,

THE PORT MASTER.

W. ELYARD.

## No. 5.

THE PORT MASTER to THE COLONIAL SECRETARY.

*Port Master's Office,**Sydney, 7 April, 1856.*

SIR,

I have the honor to acknowledge the receipt of your letter of the 26th ultimo, No. 51, requiring, for the information of His Excellency the Governor General, an Estimate of the probable expense of the "Torch," or of a sailing vessel, for the voyage to and from Sydney to Woodlark Island, assuming it to occupy three months. In reply, I have to state, that the expense of the "Torch" would more than double that of a sailing vessel equally, if not better, suited for this purpose, as she could not carry a sufficiency of coal, and must resort to her sailing qualities.

I beg to forward two propositions which have been made, in consequence of the intention of His Excellency being known in town, and as that of Mr. Joubert is £380—certainly not unreasonable—I would respectfully recommend its acceptance, as there is no probability of cheaper terms being obtained, if there was any pressing necessity for an immediate decision.

If,

If, however, there was no such necessity, the "Spitfire" would answer the purpose, in my opinion, and the expense of sending her would be very trifling, as part of her establishment is permanent, and I think the vessel well suited for any such purpose. The saving would exceed two-thirds of the demand made by Mr. Joubert.

The "Spitfire" will be ready to go to-morrow with coals and stores for Gabo Island, and I hope will be back in a week or ten days, when, if approved of, she could be despatched in two days.

I have, &c.,

MERION MORIARTY,

Port Master.

THE HONORABLE

THE COLONIAL SECRETARY.

[Enclosure 1 in No. 5.]

Sydney, 7 April, 1856.

SIR,

Having heard that the Executive Government had instructed you to make some inquiries as to the expense of sending a vessel to the Island of Woodlark, in search of the missing brig "Gazelle," Captain Parkin, supposed to have been wrecked on that island, I beg to inform you, that the French Roman Catholic Missionaries, who had chartered the brig "Gazelle" on account of their brother Missionaries of Woodlark, had requested me to make the same inquiries on their behalf, with the view of submitting, themselves, a definite plan to the Government, and that I have offered to them to send the schooner "Favorite," of 90 tons, under the command of Captain Barrack, who is perfectly acquainted with the island and the natives of Woodlark, for the sum of three hundred and eighty pounds, including the passage of a Missionary formerly residing at Woodlark, who volunteers to accompany the expedition in search of his missing friend, the Rev. M. Mazzuconi.

As I stated above, the object of my inquiry was to enable the Missionaries to claim the Government's assistance in this matter, as the brig "Gazelle" is a British vessel, and entirely manned by a British crew.

I have, &c.,

D. N. JOUBERT.

Merion Moriarty, Esq.,  
Port Master, Sydney.

[Enclosure 2 in No. 5.]

Packet Office, George-street,  
Sydney, 7 April, 1856.

SIR,

We beg to offer the schooner "Wave," or the brig "Triton," the former 160, and the latter 250 tons burthen, for the conveyance of passengers, stores, &c., from Woodlark Island to this port, either, at the rate of £150 per month. The passengers to be provisioned by the vessel, or otherwise, at your option, at a fixed rate per head, hereafter to be determined upon.

We remain, &c.,

LAIDLEY, IRELAND, & Co.,  
Agents.

Captain Moriarty, R.N.,  
Sydney.

CHARLES ST. JULIAN, ESQ., to THE COLONIAL SECRETARY.

Hawaiian Commission and Consulate General,

Sydney, 1 April, 1856.

SIR,

I beg respectfully to re-call your attention to my letter, No. 56-50, of the 14th ultimo, having reference to the case of the Rev. J. Mazzuconi, and the crew of the British brig "Gazelle," supposed to be at present detained in a state of destitution, if not of captivity, either on Woodlark Island or on some of the islands in its vicinity.

2. As I had the honor to point out, in that letter, the best season for sending a vessel to the relief of these men would be at the latter end of March, or at the beginning of the present month. It is absolutely necessary, therefore, that not another hour should be lost; and if His Excellency is not in a position to render any assistance, *immediate* efforts must be made, by subscription or otherwise, for the charter of a small merchant vessel.

3. I must beg, therefore, most respectfully, the favour of an answer during the present day.

I have, &c.,

CHARLES ST. JULIAN,  
H.H.M. Commissioner, &c., and Consul General.

THE HONORABLE  
THE COLONIAL SECRETARY.

THE COLONIAL SECRETARY to CHARLES ST. JULIAN, ESQ.

*Colonial Secretary's Office,  
Sydney, 3 April, 1856.*

SIR,

In acknowledging the receipt of your further letter of the 1st instant, respecting the case of the Rev. J. Mazzuconi, and the crew of the brig "Gazelle," supposed to be at present in destitution or captivity on Woodlark Island, or some of the islands in its vicinity, I am directed by His Excellency the Governor General to inform you that the matter is now before the Executive Council.

I have, &c.,

W. ELYARD.

CHARLES ST. JULIAN, ESQ.,  
H.H.M. COMMISSIONER AND CONSUL-GENERAL,  
Sydney.

No. 9.

THE COLONIAL SECRETARY to THE FRENCH CONSUL.

*Colonial Secretary's Office,  
Sydney, 8 April, 1856.*

SIR,

I have the honor to inform you that the Governor General has laid before the Executive Council a letter, of which I enclose a copy, from Mr. St. Julian, Commissioner and Consul General for the Hawaiian Government, requesting that a vessel may be despatched in search of the passengers by the brig "Gazelle," which left the Port of Sydney for Woodlark Island on the 18th August last, with supplies for the Missionary Station there, and has not since been heard of. His Excellency has also laid before the Council a letter from Captain Denham, of H. M. S. "Herald" reporting the probable time that the proposed search would occupy if undertaken.

2. I have further the honor to inform you, that the Council cannot discover from the papers laid before them anything beyond the merest conjecture to shew that the passengers by the "Gazelle" are detained by the natives on Woodlark Island, as supposed by Mr. St. Julian, and that it is even more probable that the vessel was lost at sea. The Council cannot, therefore, recommend that a vessel should be specially sent for the purpose, but, under their advice, His Excellency has instructed me to bring the circumstances of the case under your notice, as the French Government have a Naval Establishment not very far from the locality indicated, and may, therefore, without much inconvenience, be able, perhaps, to cause inquiry to be made as to the fate of the vessel and her passengers and crew.

3. I beg to add that Mr. St. Julian has been referred to you, in order that he may furnish you with any further information which he may be able or desirous to afford on the subject.

I have, &c.,

W. ELYARD.

MONSIEUR SENTIS,  
CONSUL FOR FRANCE  
AT SYDNEY.

## No. 10.

THE COLONIAL SECRETARY to CHARLES ST. JULIAN, ESQ.

*Colonial Secretary's Office,  
Sydney, 8 April, 1856.*

SIR,

I have the honor to inform you that the Governor General has laid before the Executive Council your letter of the 14th ultimo, requesting that a vessel may be despatched in search of the passengers of the brig "Gazelle," which left the Port of Sydney for Woodlark Island on the 18th August last, with supplies for the Missionary Station there, and has not since been heard of. His Excellency has also laid before the Council a letter from Captain Deuham, of H. M. S. "Herald," reporting the probable time that the proposed search would occupy if undertaken.

2. I am further directed to inform you, that the Council cannot discover in the papers laid before them anything beyond the merest conjecture to show that the passengers of the brig "Gazelle" are detained by the natives of Woodlark Island, as supposed by you, and that it is even more probable that the vessel was lost at sea. The Council cannot, therefore, on such imperfect information recommend that a vessel should be specially sent for this purpose, but, under their advice, His Excellency will cause the circumstances of the case to be brought under the notice of the French Consul, as the French Government have a Naval Establishment not very far from the locality indicated, and may, therefore, without much inconvenience, be able to cause inquiry to be made as to the fate of the vessel and her passengers and crew.

3. In conclusion, I have the honor to refer you to the French Consul, in order that you may furnish him with any further information which you may desire to give.

I have, &amp;c.,

W. ELYARD.

CHARLES ST. JULIAN, ESQ.,

H. H. M. COMMISSIONER AND CONSUL GENERAL,  
Sydney.

## No. 11.

CHARLES ST. JULIAN, ESQ., to THE COLONIAL SECRETARY.

*Hawaiian Commission and Consulate General,**Sydney, 14 April, 1856.*

SIR,

On the receipt of your letter of the 8th instant, No. 421, conveying the decision of the Executive Council as to the matter referred to in mine of the 14th March, the supposed present condition of the crew and passengers of the British brig "Gazelle," and referring me to M. Sentis, the Consul of France, with a view to an appeal for assistance from the French establishment at New Caledonia, I *immediately* communicated this decision to those gentlemen interested in the fate of the persons alluded to, at whose instance I had written to yourself. It was by these gentlemen, and not by myself, that an application to the Consul of France, if judged expedient, would best have been made.

2. I have the gratification, however, of being able to inform you, that arrangements have been completed for causing the necessary search to be made without the hazardous delay of an appeal to New Caledonia, satisfied, it would seem, that there is strong ground for hope, and feeling that too much time has already been lost, the gentlemen alluded to had secured the services of the schooner "Favorite" prior to their receipt of my communication. She has either sailed, or is upon the very point of sailing, on her errand of mercy, and you will, I am sure, join with me in the earnest hope that this errand may be successful—that, with the blessings of Divine Providence, it may result in restoring to their homes the fifteen persons who left Sydney in this ill-fated vessel, and of whom, as I am informed, fourteen were British subjects.

3. It only remains for me to request that you will convey my most respectful thanks to His Excellency the Governor General for his kind attention to this matter.

I have, &amp;c.,

CHARLES ST. JULIAN,

THE HONORABLE

H. H. M. Commissioner, &amp;c., and Consul General.

THE COLONIAL SECRETARY.

No.

## No. 12.

CHARLES ST. JULIAN, ESQ., to THE COLONIAL SECRETARY.

*Hawaiian Commission and Consulate General,*

56-74.

*Sydney, 18 June, 1856.*

SIR,

Understanding that you have inquired, or purpose to inquire, into the circumstances under which the brig "Gazelle" was said to have been lost, and her crew murdered, at Woodlark Island, I beg to hand you herewith a copy of my own memoranda relative to these events. Although my inquiries have not been of a judicial character, and their results have been simply minuted for my own (official) use, they may, perhaps, be of some service in guiding your inquiries. It is with view only that I submit them.

2. I had the honor, by a letter to your predecessor in office, bearing date the 18th March last, to solicit attention to the (then) *supposed* loss of the "Gazelle," at or near Woodlark Island, and the presumed detention there of her passengers and crew. I had also, by a letter to the same honorable gentleman, on the 1st April, the honor to re-call attention to this subject, and to point out the necessity, as I then conceived, for some immediate aid. By a letter (No. 407) of the 3rd April, it was intimated to me that the matter had been laid before the Executive Council. By a second letter (No. 421) of the 8th April, I was informed that, for reasons therein stated, the Council could not recommend the despatch of a vessel to Woodlark Island, and an application to the French authorities at New Caledonia was recommended. To that letter, I had the honor, on the 14th April, to reply. It was on (I think) the following day that the "Favorite" sailed.

3. I had hoped, with a considerable amount of confidence, for a far happier result from the "Favorite's" voyage. There is, however, I am sorry to say no well-founded reason to doubt the truth of the melancholy tidings she has brought. Assuming them to be correct, and that the wreck and massacre were in September last, it is but too clear that the despatch in April of a ship of war could not have saved a single life. Should it be deemed expedient to make a further investigation upon the spot where the murders were perpetrated, or to take any steps for the punishment of the murderers, there is still time.

4. I have only, in conclusion, to beg, that if, at any time, any information or assistance which I can afford seems likely to prove useful, you will not hesitate to command it.

I have, &amp;c.,

CHARLES ST. JULIAN,

H. H. M. Commissioner, &c., and Consul General  
for New South Wales and Tasmania.

THE HONORABLE

THE COLONIAL SECRETARY.

## HAWAIIAN COMMISSION TO THE INDEPENDENT STATES AND TRIBES OF POLYNESIA.

*Sydney, 16 June, 1856.*

MEMORANDA relative to the loss of the British brig "Gazelle," of Sydney, and the murder of her crew at Woodlark Island—supposed to have taken place in September, 1855—and to the general character of the Woodlark Islanders.

(L.S.)

CHARLES ST. JULIAN,

H. H. M. Commissioner, &amp;c.

A.

*EXTRACT from the Sydney Morning Herald, of 14th June, 1856, said by the Rev. Pere Raimondi, (therein referred to,) to be, so far as it goes, "quite correct."*

## LOSS OF THE BRIG "GAZELLE," AND MURDER OF HER CREW BY THE NATIVES OF WOODLARK ISLAND.

The following account is an extract from the log of the schooner "Favorite," which was despatched from Sydney, to ascertain if possible, the fate of the "Gazelle," and her crew:—

At noon, Sunday, May 4th, in latitude 9°14' S., and longitude 153°27' E., off Woodlark Island. At 1 P.M., light breeze from E.N.E., all possible sail set. Discovered a wreck—apparently a brig—lying on her beam-ends, the lowermasts and bowsprit standing, and lower-rigging swinging about. The wreck then bore about W.N.W., distant 5 miles. At 2:30 P.M., abreast of the wreck, then distant 2½ miles, and made out that part of her stern was knocked away, and a portion of the copper torn from the port side, also several of the planks in her bottom gone, with the daylight showing through her.

At

At 4 P.M., off the entrance, hauled up for it, and stood in, when inside hove to for a canoe to come alongside with six native boys in it; one came on board, and was questioned by Mr. Raimondi; he (the boy) brought some cards with him, on which was engraved "Mr. W. T. Parkins," on one side, and in pencil on the reverse side was written "Gazelle." This boy's answers to the Missionary were very vague and unsatisfactory, so much so as made us think it not advisable to go up the harbour that night, and therefore we anchored near the entrance in 10 fathoms, sheltered from the eastward by an island. Loaded all the fire-arms, and clewed the sails up; set a double anchor-watch, and the night passed off quietly. Large fires were seen on shore, which the boy said were lit on account of the natives being afraid we intended to burn the village.

Mr. Raimondi gives the following account of the native boy's first tale to him:— "The brig "Gazelle" came on shore on the reef about the middle of September, 1855. The crew never landed, but went away with the boats at noon, the brig having been stranded in the morning. The crew went to the westward to Tronbiea, or Cape Denis, and two of them were killed at an island called Maddan, and he believed the rest were also killed at an island called Javonsee." But this tale, and the manner of telling, excited our suspicions further. This boy stopped on board, the rest went to their village.

Monday, 5th.—7 A.M., light winds from E.S.E. A canoe came off with four boys in it, most of them having been in Sydney with the missions. Two were taken in the cabin by Mr. Raimondi to be questioned. They both said "two men were killed at Maddan and the rest at Javonsee;" but all their reports were so vague, contradictory, and incredible, that they strengthened our suspicions as to the truth of the stories concerning this terrible murder. The boys then said they had some money which they had found in a trunk in the cabin. The money proved to be 8s. 6d. in silver and 9d. in copper, English coin. The old men at the village had told the boys to ask us if we were angry? as they wished to trade in pigs and yams—wishing us to come near the village. This request we believed to be only a decoy, as none of the old men had come off, and no canoes, excepting the one alongside. Their real intent, as since proved, was to get us up the harbour, separate us from the ship by trading, and then take the vessel. Our fears were still more awakened, on our telling the boys we intended visiting the wreck to judge for ourselves as to whether the crew were murdered on board or not, for they seemed greatly alarmed, and asked us—"How—how—how—how—will you tell—how can you know?" At 2 P.M., got the boat ready to go to the wreck, when one of the native boys previously belonging to the mission, said to Mr. Raimondi that he wished to speak with him before the ship sailed for Sydney. The boy was taken to the cabin, and on being offered a reward was induced to give the following particulars:— "The brig "Gazelle" being close to the reef, missed stays and went on shore. Shortly afterwards—on a plan already formed by the chief—eight canoes went off to the ship, six men in each, armed with concealed tomahawks, but without spears. Those savages were allowed to go alongside, with the intention of murdering all hands. The crew of the "Gazelle," at this time, had one boat out, and a second was being got over, in fact, all were employed about something when the natives boarded them; to all appearances quite friendly. The attention of Captain Parkins was first attracted by a cry behind him, when on looking round, he saw a native strike his tomahawk into the head of the Missionary on board; the Captain took a belaying pin from the rail to fell the savage, when another from behind struck him dead with his axe. The rest of the crew were all tomahawked in a few minutes—the vessel plundered of everything the natives fancied, and the rest destroyed. The dead bodies were left where they fell—but the boys who had no hand in this affair, shortly after threw them overboard." This story was corroborated by another boy. This prevented us from visiting the wreck, for when the boat was manœuvred there would only have been two hands left on board the ship. Having now received all the information we could, we hoisted in the boat, and made ready for sea. The boy who gave the account requested to be brought to Sydney, which we therefore did.

(Signed)

{ E. RAIMONDI, Missionary.  
A. BARRACK, Master.  
J. BENNETT, Mate.

## B.

*MINUTES of Inquiry relative to the loss of the Brig "Gazelle," of Sydney, and the Murder of her Crew, at Woodlark Island.*

## No. 1.

MINUTE of statements, by Puarer, a native of Woodlark Island (examined by Commissioner)—the Reverend Pere Raimondi interpreting, and making (in reply to questions from Commissioner) such explanatory statement (herein also minuted) as seemed necessary for the proper understanding of Puarer's account.

One morning about the middle of September last,\* declarant saw a Brig sailing near the reef at Woodlark Island. Went off, with four companions, with a canoe. Observed, on nearing the brig, that she was very close to the reef, and cried out to warn the Captain that she was "near to be wrecked." The Captain tried to put the vessel about, but she missed stays, and went on the reef. Declarant, with his companions, returned to their village—the village of Guasup. The young men asked them what was the matter with the vessel, and they replied she was wrecked on the reef. The Chief of this village, whose name is Origiuiamai, proposed

\* Pere Raimondi explains that the natives of Woodlark Island are able to distinguish and to point out, to those who understand them, the different months of the year, by the progress of cultivation, in their plantations.

proposed to his people to go and kill the crew. The villagers agreed to this.\* They left their spears and shields at home, to avoid suspicious appearances, and took only their tomahawks † which they hid under their garments. The natives went in ten canoes, five men in each canoe, to the brig. Declarant was compelled to go by his brother, who was anxious to participate in the attack and to share in the plunder, but paddled slowly, so that their canoe did not reach the reef until after the murder had been commenced; but saw the whole. As the natives approached the brig they made signs professive of friendship, and of a desire to afford help. While the fleet of canoes were nearing the reef other canoes were approaching which had been sent by the villages of Guasup, Berraquab, and Amanot, to assist (as declarant understood), in case of conflict. At this time three of the sailors were in the brig's boat, baling her out, so that the strength of the white men was divided. The natives saw that the whole of the crew, and the Captain in particular, were frightened and "flurried" at their position, and had lost presence of mind. They (the natives) left their canoes on the landward side of the reef, as it was impossible to get them alongside. Some of the natives stopped on the reef, but about thirty swam off to the vessel. The first native who tried to get on board was a man from Berraquab, whose name is Avicoar. The Captain, seeing him try to get on board, struck him with a rope. But at the same time a man named Tanar, a brother of Avicoar, and also from Berraquab, attempted to get on board, on the other side, and distracted the Captain's attention. This enabled Avicoar to get on board, and at the same time many others succeeded in getting on board in various places. Avicoar drew near the Missionary (the Reverend Pere Mazzuconi) holding out his hand, and taking that of the Missionary, to disarm suspicion. At the same instant he, with the other hand, proceeded to draw forth the concealed tomahawk, and the moment he had done so struck the Missionary with it on the neck. The Captain, apparently hearing the blow, turned round and endeavoured to pick up a belaying pin, but while doing this was struck on the back of the neck by Tanar with his tomahawk. ‡ Tanar had been appointed by the Chief to the especial duty of killing the Captain. The Missionary was killed by the first blow—Avicoar having a heavy tomahawk. But the Captain was not killed by the blow which struck him down; a second blow was struck by Tanar while the Captain was on deck, and this killed him. At the same time the three sailors in the boat were murdered. One of them knocked down a native by a blow with his fist. But they were surrounded by numbers, and were immediately killed by blows from the tomahawks of the natives. The men who *actually* killed these three sailors were Taguasup, Teekun, and Maiouam—all from Guasup. Almost at the same moment, the other men on board the vessel, all of whom were on deck, were murdered by the natives by blows from their tomahawks. The *actual* murderers were Aragné, Cumbruadeo, and Manoman, from Guasup; Tubut and Davao, from Berraquab; and Tamudot and Warenis, from Amanot. Others were close at hand ready to help, if necessary. The natives left the bodies where they fell, as not worth burying. § Declarant and some of his companions soon afterwards went on board and cast the bodies into the sea, "thinking it a pity they should lie on the "deck unburied." After the murder the people who had been engaged in it proceeded to strip the brig of everything removable. There was no division of the spoil; every one kept what he got, the strongest getting the most.

Declarant heard the Chief directing the attack, and heard the plan of it determined. Tried to dissuade the people from carrying it out, knowing from his residence in Sydney all about "men-of-war"—knowing also that it was the law of white men to kill those who had killed others—and knowing, and liking the Missionary whom he had seen on board, and with whom he had lived at Rook. The men laughed at declarant, however, and did not believe what he said about men-of-war; || all the women, also, were against the murder, but were not attended to.

Saw no arms or preparations for defence on board the vessel. There were ten muskets on board, which fell into the hands of the natives, but which have all since been broken, the natives not understanding them.

When the "Favorite" hove in sight the women were alarmed, and cried out that she was a vessel of war come to take vengeance; but Tanar and Tubut (two of the leaders in the "Gazelle" massacre) cried out that they "were ready for the man-of-war—were not afraid "but quite ready to fight." These men proposed to the people when the "Favorite" had stood in, to go and take her, so that she "might not get back and tell of what had happened to the "Gazelle." The Chief of Guasup ¶ was also willing, but some of his people were opposed to it, because, as the vessel was not wrecked, the crew "would not be troubled," and would be on their guard against surprise. After consultation it was arranged to allure some of the people of the vessel on shore, so as to divide their strength, and, first killing those on shore, to capture the vessel and kill the others.

The natives destroyed the boats of the "Gazelle," "smashing and sinking" them, and they tried to destroy the vessel, but could not succeed. Did not use fire.

\* Pere Raimondi states that it is a *law* among the people of Woodlark Island to kill those who are wrecked.

† Pere Raimondi states that these tomahawks were obtained from vessels by trade, for supplies, &c. The garment, he states, is a species of cincture, much more full than the ordinary "mars" of the Central Polynesians, and quite capable of concealing a tomahawk.

‡ Pere Raimondi states that Tanar is a very powerful man, and the natives, observing that the Captain was a big man, had, it is presumed, on this account, entrusted the killing of him to Tanar.

§ Pere Raimondi states that this is a mark of contempt for the slain. When the natives respect those whom they have killed their custom is to bury the bodies.

|| Pere Raimondi states that it is not the custom of the natives to attach any importance or credit to the sayings of young men; and that Puarer, in particular, was not a person at all respected by his countrymen.

¶ Pere Raimondi states that the chiefs on this Island have little real authority.

## No. 2.

*MINUTE of Additional Statements by the Reverend Pere Raimondi (in reply to Questions from Commissioner).*

Declarant believes the story of Puarer to be true. Puarer lived with declarant for three years at Woodlark Island, and warned declarant thrice when the natives had arranged (on three *separate* occasions) to kill declarant and his colleagues. Pere Mazzuconi resided at Rook. Puarer was in Sydney five years ago, and stayed for about fifteen days. Puarer is of a timid character, and was not generally liked among his countrymen because he was attached to the white men. Declarant does not believe that Puarer would or could conceal the truth from him. If Puarer had gone back he would doubtless have been killed for giving information. When the "Favorite" was leaving Woodlark Island, many of the natives followed her in their canoes. The "Favorite" had left in the morning, and was near the wreck of the "Gazelle," when those on board of her saw six canoes coming towards her, the natives on board of them paddling, apparently, as fast as they could. At the same time, by the aid of a spy-glass, they perceived many people on the point and on the reef. The natives considered, declarant has no doubt, that the people on board the "Favorite" were going to the wreck. The canoes and people were beyond range, but the "Favorite's" people fired towards the Islanders a small gun which was on board. At the report the men who were on the reef and on the point ran into the woods, while the canoes, which had hitherto been scattered, drew near each other. The gun was fired again, and the Islanders went back, while the "Favorite" continued her voyage.

MEMO.—Although I have taken every pains to elicit the truth, and believe that I have succeeded as fully as if, with the means of inquiry at my disposal, I had judicially investigated this case, these Minutes are only to be regarded as notes or memoranda of statements made by the persons therein named. They are neither guaranteed by oath nor solemn affirmation; but, as I have already intimated, I have no reason whatever to believe that the administration of oaths or the requirement of solemn affirmations would have changed a single statement. I do not suppose, indeed, that Puarer could have been made properly to understand the nature and obligations of either one or the other; and I cannot presume that Pere Raimondi would have said anything different, on oath, from what he has said on his word of honor.

Judging from his demeanour, I should think that Puarer was speaking truly. But he is palpably a mere savage, without the slightest feeling of horror or compunction in reference to the matters to which he refers. I do not doubt that, as he says, he took no part in the murder; but this was clearly more from fear than from gratitude or disinclination to commit crime, for he neither warned, nor attempted to warn, the missionary or the crew of the "Gazelle" of the natives' murderous intentions; and, when hastening back to tell his countrymen of the wreck, he must have pretty well foreseen the result. The attack of the natives was simultaneous—the result, as is usual in such cases, of a settled plan. The circumstantiality of Puarer's account arises, doubtless, in a great measure, from his having heard all that took place repeatedly and boastfully discussed among the murderers—as is their custom. I took care to inquire into and compare the statements which Puarer had made to others, and found them to correspond with those which I have minuted here.

(Initialled) C. S.

## C.

*MINUTE of Statements by the Reverend Pere Raimondi, affecting the general character of the people of Woodlark Island; and, in reference to two other Massacres of Shipwrecked Seamen.*

The French Mission was eight years upon the Island, but made no progress. Declarant considers the people of this Island to be hopelessly, or almost hopelessly, treacherous, ferocious, and hypocritical; but they are not cannibals. This is the third massacre in that quarter, of which declarant has heard. Fifteen years ago a whaler, called the "Mary," was wrecked on the Lachlan Islands, (small islands in the same neighbourhood) and the crew came with two large boats to Woodlark Island. They arrived at noon, and were all soon afterwards murdered, being divided from each other, and killed in detail.

Two years ago, when declarant was himself living at Woodlark Island, a canoe came from Tokun, and those who came by it acquainted declarant with the arrival at the latter place of a boat and seven white men, and that the natives had murdered these men; some of the Woodlark Islanders being there, and assisting. The moral effect of every such massacre among the Islanders is to make them boastful and self-confident, and to incite them to other deeds of blood.

Long impunity has induced the natives to disbelieve all they have heard about vessels of war, and the general power of the white men to protect their own race, and to punish those who injure them.

## No. 13.

E. BINGHAM, ESQ., to THE COLONIAL SECRETARY.

*Little's Cottages, Balmain,*  
21 June, 1856.

SIR,

When I had the honor of an interview with you, on the part of the friends and relatives of the Captain and some of the crew of the Mission brig "Gazelle," in company with the Rev. Mr. Raimondi, though the latter gentleman's narrative is so clear and circumstantial, I submit that it does not clear up, in any way, the strange writing on the cards; the Captain got those in a packet only two days ere he left Sydney—his vessel had a large house on deck, and in that they lived. Now, on board her there was nothing to smoke them; the light of the cabin was given by the binnacle lamp; it is very improbable that, for no apparent purpose, he should mutilate his cards thus; and we find that, after the vessel struck, he had no time—"one boat was out, and they were getting out the other"; if the tale is true. There was no time for thus writing, but one of the cards left with you for His Excellency's inspection was discolored, and then written on, and the writing, in the opinion of many, is recent, the pencil marks sharp and clear, leading us to infer that it was smoked in a native hut, and then written on.

You remarked to me, that if he or any of the crew were in a position to write "Gazelle," why not say more? To this I can only say, that it may have been done by the boy Duchie, or some of the men, unable to do much more, or knowing that the Missionaries were so many years there, and not aware of how much instruction they imparted, the writer may have been afraid of doing more. The complete massacre of all hands is quite a new feature to me, and not customary among the chain of islands westward of Papua, in the Arafura Sea, among whom, some years ago, and the Moluccan Archipelago, I have often been.

The very inadequate means at the disposal of the Rev. Mr. Raimondi prevented his making further inquiries; the wreck of the brig, no doubt, helped to make him credit the boy's story; but, I maintain, that although we have the fact of the murder of the three other crews who visited this barbarous island, it does not follow that this style of thing is to continue for ever; in either case, the supposed existence of any of the crew still at Woodlark, or their total massacre, I should hope that the Government will deem it only their duty to us to send down a strong force to make the necessary inquiries, and to punish the murderers; true, if gone they cannot improve matters so far as the "Gazelle" is concerned, but a severe punishment would deter them from doing so again. At this time there are some of our traders close there—the "Post Boy," the "Oberon," and others—any of them calling there, or even at the neighbouring islands, may share the same fate, for among all the groups the destruction and plunder of the "Gazelle" is known, and, small doubt of it, magnified.

The Dutch Government have, from similar atrocities, been compelled to use harsh measures towards some of the westward islands; but the effect on the natives has been in most cases very satisfactory. It would seem three of the principal villages are situated in one bay, a short half-mile apart. The burning of those, the canoes, which enable them to do so much harm, and from the difficulty of getting them, will be felt, and the destruction of the cocu-palms, would teach them that there was a power that could and would punish atrocities. If they have a law of this kind, it must be shewn to them that such a course brings a positive loss—the only convincing proof to a savage. This boy was afraid to join; he knew our power to punish, and a severe lesson would have a similar effect on his countrymen. The distance is small, and I would suggest to you that a steamer would be most effectual; one, I should think, could be easily obtained.

The "Gazelle" was well-manned, armed, and found in every respect, and Mr. Cuthbert had just refitted her, in his usual workmanlike style. Captain Parkin knew the character of the islanders, some of them at least, for I know, when a few years younger, he lost his uncle among them, and narrowly escaped himself. The effect on our Island trade will be very serious if this is allowed to pass unnoticed. We will be unable to get men to go there, and one of our principal trades will be suspended. I trust, Sir, you will enable me to inform the mothers, sisters, and wives of the crew, that the Government will take active measures to recover, or punish them, as the case may be.

The

The hurried visit of the "Favorite," and her narrative, though minute and circumstantial, save in the wreck of the brig, is far from satisfactory.

I have, &c.,

E. BINGHAM.

THE HONORABLE  
THE COLONIAL SECRETARY.

No. 14.

THE COLONIAL SECRETARY to E. BINGHAM, ESQ.

*Colonial Secretary's Office,  
Sydney, 28 June, 1856.*

SIR,

I beg to inform you that since the receipt of your letter of the 21st instant, I have conferred with M. Sentis, French Consul, and Captain Morris, of Her Majesty's Ship "Electra," now in this port, with a view to some measures being adopted with reference to the case of the brig "Gazelle," supposed to have been wrecked on Woodlark Island.

2. The orders under which Captain Morris is acting will not permit him to employ the "Electra" on this service; the French Consul is also unable to take any steps in this matter, as besides that there being but one French Ship-of-War at New Caledonia, which is required for that settlement, it would be necessary for him to refer to the Governor of Tahiti to obtain the required assistance.

3. Under these circumstances, I regret that as this Government does not feel authorized to charter a vessel for the purpose, it is not in a position to meet your wishes; but on the return of Captain Freemantle, of Her Majesty's Ship "Juno," now absent at the Islands, his attention will be drawn to the subject, and the information furnished by yourself and other gentlemen submitted to him.

I have, &c.,

STUART A. DONALDSON.

E. BINGHAM, ESQ.,  
Little's Cottages, Balmain.

No. 15.

THE COLONIAL SECRETARY to C. ST. JULIAN, ESQ.

*Colonial Secretary's Office,  
Sydney, 28 June, 1856.*

SIR,

With reference to my private communication to you, in reply to your letter of the 18th instant, relating to the case of the "Gazelle," supposed to have been wrecked at Woodlark Island, I have the honor to inform you that your letter will remain in this office for reference, and be submitted with other papers on the subject for the information of Captain Freemantle, of Her Majesty's Ship "Juno," now absent at the Islands, on his return to port.

I have, &c.,

STUART A. DONALDSON

C. ST. JULIAN, ESQ.,  
Commissioner and Consul General for the Hawaiian Government.

P.S.—I beg to add that I have conferred with M. Sentis, French Consul, and Captain Morris, of Her Majesty's ship "Electra," with a view to some steps being taken in this matter. The orders under which Captain Morris is acting will not permit him to employ the "Electra" in this service. The French Consul is also unable to take any steps with reference to this case, as besides that there is but one French Ship-of-War at New Caledonia, which is required for that settlement, it would be necessary to refer to the Governor of Tahiti to obtain the required assistance.

Under these circumstances, and as this Government does not feel authorized to charter a vessel for the purpose, it is not in a position to move in the matter; but the papers will be submitted, as above stated, to Captain Freemantle on his return.

No.

No. 16.

THE COLONIAL SECRETARY to CAPTAIN FREEMANTLE, R. N.

*Colonial Secretary's Office,**Sydney, 3 November, 1856.*

SIR,

I am directed by His Excellency the Governor General to transmit for your perusal the accompanying papers relating to the brig "Gazelle," wrecked at Woodlark Island, and to an application made to the Government for a search to be made for the passengers and crew.

You will observe that the Government was not in a position to comply with the application, and that it was decided to defer any proceedings in the matter until your return; and I am therefore now desired to request that you will favour His Excellency with your views on the subject.

I have, &amp;c.,

W. ELYARD.

CAPTAIN FREEMANTLE, R. N.,

H. M. Ship "Juno."

No. 17.

CAPTAIN FREEMANTLE, R. N., to THE COLONIAL SECRETARY.

*H. M. Ship "Juno," at**Sydney, 12 November, 1856.*

SIR,

I have to acknowledge the receipt of your letter dated the 3rd instant, enclosing several documents in reference to the loss of the brig "Gazelle" on Woodlark Island, in September, 1855, and requesting me to favour His Excellency the Governor General with my views on the subject.

This atrocious outrage can only be viewed in one light, nor can there be two opinions of the expediency of resorting to any practicable measures for putting a stop to similar acts of aggression on defenceless persons. I have carefully examined the papers which you have submitted to me, and I presume that I am required to state to what extent the services of the Navy can be rendered available to redress the injuries, and to inspire the savages on Woodlark Island with awe and respect for the power of the white man.

I must first observe that Woodlark Island is situated beyond the limits of the Australian Station, and that, under the peculiar circumstances of being left with no other cruiser under my orders besides the "Juno," I should hardly feel myself justified in departing from the Regulations of the Service by leaving the Station altogether destitute of any Ship-of-War to receive and act upon instructions from England by proceeding myself to an island in a remote locality and of intricate approach. It is also to be borne in mind that the appearance of a ship like the "Juno" off Woodlark Island would drive all the male inhabitants, if guilty of the alleged murders, into the bush, more especially those most deeply implicated in the crime; and that the only retaliation that could be obtained would be by the destruction of houses and canoes, and, perhaps, capturing innocent parties as hostages. The same may be said of any man-of-war. It therefore remains to ascertain from sound legal authority to what extent the evidence, so carefully collected by Mr. St. Julian, may be considered valid for undertaking a crusade against the inhabitants of Woodlark Island.

As the Supreme Court of New South Wales takes cognizance of criminal acts committed amongst the Polynesian Islands, and as the case, as far as it is known, can be laid before the Chief Justice, I am very desirous, before finally determining what measures I ought to adopt in the matter, to be instructed with the law as the case now stands, for it is most unlikely that any more direct or reliable testimony can be obtained here or on the spot. It is well known that no native of any of the South Sea Islands, when confronted with a Chief, will dare to say one word that would injure him.

I have been given to understand that both Father Raimondi and the boy Puarer have left Sydney, and, therefore, one of the chief channels for unravelling the facts connected with the fate of the "Gazelle" is shut off. Nevertheless, should the vessels expected to replace the "Fantomé" and "Electra" arrive on the Station, and His Excellency be satisfied

with

## MASSACRE AT WOODLARK ISLAND.

with the legality and propriety of a ship-of-war being sent to act summarily, and recommend the adoption of such a course after so long an interval, I shall not shrink from the responsibility of despatching a cruiser off the Station, provided always more urgent duties do not interfere, and that all suitable arrangements in the way of interpreting, and evidence for identifying the murderers, can be procured, so that the Officer in charge of so invidious a task may receive distinct and decisive instructions for his guidance.

I have, &c.,

STEPHEN G. FREEMANTLE,

Captain, and Senior Naval Officer in Australia.

P.S. The several documents which were forwarded in your letter are returned herewith.

THE HONORABLE

THE COLONIAL SECRETARY.

## No. 18.

THE COLONIAL SECRETARY to CAPTAIN FREEMANTLE, R.N.

*Colonial Secretary's Office,*

*Sydney, 15 November, 1856.*

SIR,

I am directed to acknowledge the receipt of your letter of the 12th instant, respecting the loss of the brig "Gazelle," and the massacre of her crew at Woodlark Island; and to inform you that, in compliance with your request, the correspondence and evidence collected in the case have been referred for the opinion of the Crown Law Officers, upon the receipt of which, a further communication will be made to you.

I have, &c.,

## RAILWAYS.

(RETURN TO AN ORDER RELATIVE TO PURCHASE, RECEIPTS, AND EXPENDITURE.)

*Ordered by the Legislative Assembly to be Printed, 14 August, 1856.*

RETURN to an *Order* of the Honorable the Legislative Assembly, dated 8 August, 1856, for—

“(1.) A Return shewing, the total amount expended in the purchase and construction of the Railway from Sydney to Parramatta, and in the purchase of land on account of the said Railway, up to the 30th June, 1856; the amount payable on account of contracts in course of execution on the 30th June, 1856, and also on account of any which have been entered on since that date; and the estimated cost of all further works, buildings, land, and rolling stock, which will be required to thoroughly complete the said Railway.

“(2.) A similar Return, of the sums which have been expended, and which have yet to be expended, on account of the Railway from Newcastle to Maitland.

“(3.) A similar Return, except as to the purchase, of the sums which have been expended, and which have yet to be expended, on account of the Railway from Parramatta to Liverpool.

“(4.) A Return shewing, the amounts received from Passengers, and for Goods and Parcels, on the Sydney and Parramatta Railway, from the 26th September, 1855, to the 30th June, 1856; the Expenditure incurred on account of working the line, during the same period, specifying the items of such Expenditure, and including the cost, if any, of renewing permanent way, buildings, or rolling stock; and the balance of Receipts from traffic on said Railway, paid to the Colonial Treasurer during the same period.

“(5.) A Copy of the Agreement made between the Railway Commissioners and Mr. Randle, for the working of the Sydney and Parramatta Railway, for the period of twelve months, from the 26th September, 1855.”

*Bligh-street, Sydney.*

I hereby agree to accept of a lease from the Commissioners for Railways, of the line of Railway from Sydney to Parramatta, for one year from the opening of the line, at the rate, and subject to the several stipulations and conditions mentioned in the annexed document; and I agree to execute, on demand, a formal lease, containing all usual and proper covenants.

WILLIAM RANDLE.

(True Copy.)

*Bligh-street, Sydney,  
August 14, 1855.*

To the Commissioners for Railways.

GENTLEMEN,

I beg to submit for your consideration, the following offer for working and maintaining the Sydney Railway, for a period of twelve months from the day of opening.

1. To maintain the permanent way and works, including locomotives, carriages, &c., in good order.
2. To work the line, running as many trains, and at such times as may be agreed upon, and at such rate of charges as shall be fixed by the Commissioners, and approved by me.
3. To find all Station-masters, Engine-drivers, Firemen, Guards, Signalmen, Policemen, Gatekeepers, Porters, Pointsmen, Cleaners, and all other labor whatsoever necessary for the efficient working of the line; also to provide proper uniforms for the above men, of a pattern to be approved of by the Commissioners.
4. To provide all oil, grease, tallow, waste, and firing.
5. To provide a Manager, whose time shall be entirely devoted to the proper working of the traffic, and the safety of the Public.
6. Commissioners to provide money takers, who shall receive all moneys for charges on merchandise, and the transit of passengers.
7. Commissioners to furnish locomotive engines, carriages, trucks, and all other rolling stock and machinery for the proper working of the line, and to provide means of water supply at the Sydney and Parramatta Stations.
8. In payment for the foregoing, I propose accepting 55 per cent. of the gross receipts.

I am, Gentlemen,

Your obedient Servant,

WILLIAM RANDLE.

9. The rolling stock to be kept in good repair, and to be returned in good order at the expiration of the agreement.

W. R.

*Sydney*

To the Commissioners for Railways.

*Sydney, 28 August, 1855.*

GENTLEMEN,

Having received an intimation from you, that the terms offered by me for the working and maintaining the Sydney Railway have been accepted, I beg to inform you that the line will be ready for opening to the Public on the 26th of September.

I remain, Gentlemen,

Yours obediently,

WM. RANDLE.

## No. 5.

(Copy)

Bligh-street, Sydney.

I hereby agree to accept of a lease, from the Commissioners for Railways, of the Line of Railway from Sydney to Parramatta, for one year from the opening of the Line, at the rate, and subject to the several stipulations and conditions mentioned in the annexed document; and I agree to execute, on demand, a formal lease containing all usual and proper covenants.

(Signed) WILLIAM RANDLE.

(Copy.)

Bligh-street,  
Sydney, 14 August, 1855.

To the Commissioners for Railways.

GENTLEMEN,

I beg to submit, for your consideration, the following offer for working and maintaining the Sydney Railway for a period of twelve months from the day of opening:—

1. To maintain the permanent way and works in good order.
2. To work the line, running as many trains, and at such times, as may be agreed upon; and at such rate of charges as shall be fixed by the Commissioners, and approved by me.

## FURTHER RETURN RELATIVE TO RAILWAYS.

5

3. To find all station masters, engine drivers, firemen, guards, signalmen, policemen, gatekeepers, porters, pointsmen, cleaners, and all other labour whatsoever necessary for the efficient working of the line; also to provide proper uniforms for the above men, of a pattern to be approved of by the Commissioners.

4. To provide all oil, grease, tallow, waste, and firing.

5. To provide a manager whose time shall be entirely devoted to the proper working of the traffic, and the safety of the public.

6. Commissioners to provide money takers, who shall receive all moneys for charges on merchandise, and the transit of passengers.

7. Commissioners to furnish locomotive engines, carriages, trucks, and all other rolling stock and machinery for the proper working of the line, and to provide means of water supply at the Sydney and Parramatta Stations.

8. In payment for the foregoing, I propose accepting 55 per cent. of the gross receipts.

9. The rolling stock to be kept in good repair, and to be returned in good order at the expiration of the agreement.

I am, &c.,

WILLIAM RANDLE.

True Copy—GOTHER K. MANN.

*Sydney, 28 August, 1855.*

To the Commissioners for Railways.

GENTLEMEN,

Having received an intimation from you that the terms offered by me for the working and maintaining the Sydney Railway have been accepted, I beg to inform you that the line will be ready for opening to the public on the 26th of September.

I remain, &c.,

WILLIAM RANDLE.

At a cost of £5,243 3s. 3 $\frac{1}{2}$ d.

J. S. HAWKINS, Capt. R.E.

6 February, 1857.

## REMARKS.

Working pay is only issued when the men are actually employed.

A Field allowance of 1s. per diem is granted to the men employed in the field, when actually at work.

Rations, or an allowance in lieu thereof, is granted to the men employed in the field.

An allowance for rations, and fuel, light, and water, is supplied to the men, and their families, at Parramatta Barracks.

The articles of equipment prepared were:—

Plate engraved for protractors.  
Ditto ditto for graduated paper, for levelling staves.  
Levelling staves.  
Camp tables.  
Portable drawing boards.  
Boxes for levelling staves.  
Ditto for stationery.  
Ditto for medicines.  
Station staves.  
Offset ditto.

Set of pigeon holes for office.  
Triangles.  
Straight edges.  
Handles for tomahawks.  
Ditto for axes.  
Tents.  
Covers, for same.  
Brands, for marking equipment.  
Handling tools, for carpenter's shop.

When first employed in the field, and while arrangements for equipping the field parties were in progress, the Sappers were themselves employed as staff-holders, chainmen, &c., instead of hiring labourers for those purposes.  
The whole of the tracings, &c., required for the use and guidance of the Surveying parties have been prepared by the Sappers themselves.

## RAILWAY TRAFFIC.

(BY-LAWS, RULES, &c.)

---

*Ordered by the Legislative Assembly to be Printed, 25 November, 1856.*

---

RETURN to an *Order* of the Honorable the Legislative Assembly, dated 31 October, 1856, for :—

“ Copy of any Rules, Regulations, Orders, or By-Laws made by  
“ the Commissioners of Railways, relating to the conduct of the  
“ Traffic to or on the Railway between Sydney and Liverpool.”

---

## RAILWAY TRAFFIC.

### BY-LAWS, RULES, AND REGULATIONS, TO BE OBSERVED ON THE SYDNEY RAILWAY.

*Under Authority of Act of Council, 19 Victoria, No. 32.*

#### CONVEYANCE OF PASSENGERS ON THE RAILWAY.

1st.—No Passenger will be allowed to take his seat in or upon any of the Railway Carriages, or to travel therein upon the Railway, without having first paid his fare.

Each Passenger, on paying his fare, will be furnished with a ticket, which he is to show when required by any authorized servant of the Railway, and to deliver up, on demand, to the Guard or other servant of the Railway authorized to collect tickets.

Each Passenger not producing or delivering up his ticket, as aforesaid, will be required to pay the fare from the place whence the Train originally started, or, in default of payment thereof, shall forfeit and pay a sum not exceeding forty shillings, in addition to the fare.

2nd.—Any Person who shall travel, or attempt to travel in any of the carriages, without having previously paid his fare, and with intent to avoid payment thereof; or who, having paid his fare for a certain distance, shall knowingly and wilfully proceed in any such carriage beyond such distance without previously paying the additional fare for the additional distance, and with intent to avoid payment thereof; or who shall knowingly and wilfully refuse or neglect, on arriving at the point to which he has paid his fare, to quit such carriage; or who shall in any other way attempt to evade payment of the proper fare, is hereby subjected to a penalty not exceeding forty shillings. (Clause VII, 19 Victoria, No. 32.)

3rd.—Passengers at intermediate stations can only be booked conditionally, that is to say, in case there shall be room in the Train for which they are booked. In case there shall not be room for all the Passengers booked, those booked for the longest distance shall have the preference; and those booked for the same distance shall have priority according to the order in which they are booked.

4th.—Smoking is strictly prohibited both in and upon the carriages and in the Stations. Every person smoking in a carriage is hereby subjected to a penalty not exceeding forty shillings; and every person persisting in smoking in a carriage or station after being warned to desist, shall, in addition to incurring a penalty not exceeding forty shillings, immediately, or if travelling, at the first opportunity, be removed from the Railway premises, and forfeit his fare.

5th.—Any person who shall jump from, or leave the carriages, or get on or into, or attempt to get on or into, any of the carriages when the train is in motion; or who shall leave the carriages at any other place than the regular passenger platforms or other places appointed for Passengers to leave the carriages, shall be liable to a penalty not exceeding forty shillings for such offence.

6th.—Any person found in any of the Railway Carriages or Stations in a state of intoxication, or committing any nuisance, or otherwise wilfully interfering with the comfort of other Passengers; and any person obstructing any of the Railway Officers in the discharge of their duty, is hereby subjected to a penalty not exceeding five pounds for each offence, and, shall, in addition, immediately, or if travelling at the first opportunity, be removed from the Railway premises, and forfeit his fare.

7th.—Any person who shall wilfully cut the linings, remove or deface the number-plates, or remove or extinguish any of the lamps in the carriages, break the windows, or otherwise damage any of the Railway Carriages, is hereby subjected to a penalty not exceeding five pounds for each offence, over and above payment for the damage done.

8th.—Every person travelling on the Railway may take with him his ordinary personal luggage, not exceeding the weights following, that is to say, if travelling in a first class carriage, 100 lbs.; in a second class carriage, 60 lbs.; and in a third class carriage, 40 lbs.; without any charge being made for the carriage thereof.

9th.—No responsibility will, however, be recognized for Passengers' luggage unless it has been booked and separately paid for. On booking, a ticket will be given to the owner, and a corresponding ticket affixed to the luggage, and the luggage will be delivered only to the person producing such ticket.

10th.

10th. The porters belonging to the Railway will render every facility to Passengers for loading and unloading luggage; but no fee or gratuity of any kind is permitted to be taken by the Railway servants under any circumstances whatever.

---

CARRIAGE OF GOODS ON THE RAILWAY.

1st.—Any person who shall carry upon, or send, or cause to be sent by the Railway, any Aquafortis, Oil of Vitriol, Gunpowder, or other goods or articles which, in the judgment of those having charge of the Railway, are of a dangerous nature, without distinctly marking their nature on the outside of the package containing the same, or otherwise giving notice, in writing, to the book-keeper or other servant of the Railway with whom the same are left at the time of so sending, is liable to a penalty not exceeding fifty pounds for each offence, under Clause IX, 19 Victoria, No. 32.

2nd.—All tolls or charges for goods shall be paid in advance, or on demand, and any person who shall refuse or neglect, on demand, to pay the rates, tolls, or other sums due in respect of goods, articles, or other things carried along the Railway to the Collectors or other persons appointed to receive the same, at the respective places appointed, is liable to have the said goods, articles, or other things detained until such payment shall be made, with all reasonable charges for the seizure and detention.

3rd.—No carriage or waggon shall carry at any one time upon the Railway, including the weight of such carriage, more than eight tons.

---

GENERAL REGULATIONS.

Any person who shall travel or pass on the Railway (except in directly crossing the Railway by any road or footpath on the level thereof appointed for that purpose) shall be liable to a penalty not exceeding five pounds for each offence.

Any person neglecting to shut and securely fasten any gate set up across or at either side of the Railway, as soon as he and any carriage, cattle, or animals under his charge have passed through the same, is liable to a penalty not exceeding five pounds for each offence.

Any person wilfully or maliciously destroying or injuring any part of the Railway or works, shall be, over and above the amount of damage done, liable in a penalty not exceeding ten pounds for each offence.

Persons wilfully obstructing any engine or carriage, or endangering the safety of persons in or upon the same, are liable, under Clause XVII, 19 Vict., No 32, to ten years imprisonment with or without hard labor.

Any person wilfully defacing or destroying, or who shall aid or assist in defacing or destroying any board or milestone, post or mark, set up to denote distances on the Railway, or obliterating any of the letters or figures thereon, is liable in a penalty not exceeding five pounds for each offence, besides the expense of restoring such boards, stones, posts, or marks.

Any person found on any part of the Railway, or within any part of the stations, warehouses, or premises in a state of drunkenness, shall be liable in a penalty not exceeding five pounds sterling for each offence.

Any person found selling, or offering for sale, any article whatever, upon the Railway or at any of the stations, without having received special permission from the Commissioners or their authorized agents, shall be liable to a penalty not exceeding forty shillings for each offence.

The drivers and conductors of all public coaches, omnibuses, or other carriages that may be admitted into the Railway premises, shall conform to the regulations to be from time to time made by the Commissioners, and every driver or other person acting contrary thereto, shall forfeit and pay a sum not exceeding five pounds for each offence.

The Seal of the Commissioners for Railways was affixed hereto by

GOTHER K. MANN, Chief Commissioner.  
 THOMAS BARKER, }  
 CHARLES KEMP, } Commissioners. (L. S.)

In the presence of CHARLES J. NEALDS, Secretary.

10 January, 1856.

**RULES AND REGULATIONS TO BE OBSERVED BY OFFICERS AND MEN  
EMPLOYED ON THE SYDNEY RAILWAY.**

*September, 1855.*

Every engineman, fireman, guard, gatekeeper, pointsman, policeman, and platelayer is required on entering the service of the Railway, to subscribe to an agreement to obey the following Rules and Regulations, as also to comply with the orders of his superior officers, and shall keep a copy of these Regulations (with a Time Table) constantly on his person while on duty; and shall produce them when required to do so. Every servant of the Railway shall make himself conversant with *all* the following Regulations, and shall frequently read those specially affecting the department to which he is attached.

Any person neglecting to comply with these Rules and Regulations will be immediately punished by *dismissal*.

**SIGNALS.**

I. Red is a signal to stop. Green, to go slowly. White, to go on.  
In addition to the regular signals, it is to be distinctly understood that *any flag, lamp, or other object waved up and down*, by a person on the Line, is a signal to stop the Train. Any lamp, flag, or other object waved to and fro, is a signal to go slowly.

**DISTANCE SIGNALS.**

II. The signal posts are furnished with cross boards, painted red and white, and with lamps, shewing red, green, and white lights.

1. If a coming Engine or Train is not required to stop at a station, the white board *by day*, and the white light *by night*, shall be turned on.

2. Whenever the cross board stands up and down the Line, or edgways, as seen by an approaching Engine Driver, it is a signal to proceed *slowly into the station, and stop at the platform.*

*By night*, the green light will be turned on for the same purpose.

3. The danger signal, always to stop, is shewn by the red board standing across the Line *by day*, and by the red light at night, when the Engine or Train shall never upon any account, pass beyond the signal post.

4. Enginemens must invariably sound the whistle on coming in sight of the signal of each station.

#### SEMAPHORE SIGNALS.

##### *By day.*

III. These signal posts are furnished with two arms, one moving out on one side, to give signals to Trains on the Down Line of Rails, and the other moving out on the other side of the signal post, to give signals to Trains on the Up Line of Rails.

1. The signal all right, is shewn by the left hand side of the signal post, as seen by an approaching Engine Driver, being clear, thus.

2. The caution signal, to slacken speed, is shewn by the arm on the left hand side being raised half way to the horizontal position, thus.

3. The danger signal, always to stop, is shewn by the arm on the left hand side being raised to the horizontal position, thus.

4. The position of the arm on the right hand side, has reference to the right hand Line, and is consequently a signal to Trains running in the contrary direction.

##### *By night.*

5. The signals will be made by red, green, and white lights.

IV. One red tail lamp shall be hung behind every Train, or Engine without a Train, when used upon the Main Line at night, or during fog; the Guard of the Train, or the Engineman, if the Engine be without a Train, to be responsible for the same.

V. A red board or flag *by day*, or an extra tail lamp *by night*, or in foggy weather, hung at the back of an Engine or Train, denotes that an extra Train is to follow.

VI. In approaching junctions, every Engineman shall sound the whistle, to give the Pointsman notice of his approach, and shall stop his Train before coming to the points and crossings, unless the proper signal, caution, be exhibited.

In clear weather, neither Engine nor Train shall approach or pass any junction at a greater speed than ten miles an hour.

In foggy weather, neither Engine nor Train shall approach any junction at a greater speed than that at which it can be stopped before arriving at the points and crossings, should a signal to stop be exhibited.

Every Engineman, Fireman, and Guard, must keep a strict look-out when approaching a junction.

VII. Whenever, and wherever a signal to stop is made by a Policeman, Gatekeeper, Platelayer, or any other person on the Line, the Engineman shall bring his Engine to a complete stand, whether or not he comprehends the reason for the signal being made.

Any Engineman or other person disobeying or not observing signals, is always to be reported by the person making the signal, such report to be made in writing, and sent to the Office of the Manager.

#### INSTRUCTIONS TO ENGINEMEN.

I. The Engineman shall be on duty half an hour before the time appointed for starting with the Train, to see that his Engine is in proper working order; sufficiently supplied with fuel and water; and that the necessary tools for repairs are in their proper places.

II. Every Engineman shall have at all times, in his tender, the following tools, viz.: a complete set of screw keys, one large, and one small monkey wrench, three cold chisels and a hand hammer, two half-round files, one crow-bar, a screw jack, two short coupling chains with hooks, two coupling links, spare pins and cotters, large and small plugs for tubes, oil cans, some flax, gaskin and string, two fire buckets, a bright red flag, a signal lamp, and a tail rope.

The Engineman will be held responsible for having the above tools in working order, and in the event of any of them being lost, he shall immediately get the same replaced.

III. The Engineman having assured himself, by a careful examination, that his Engine, lamps, and tools, are all in good order, must cross over to the departure Line, in front

front of the Train, *ten* minutes before the time of starting. Great caution must be used in placing the Engine against the Train, which should be done without moving a single carriage, in order to guard against injury to any passenger who may be in the act of stepping into a carriage at that moment.

While the Engine is standing, whether before starting or at a station, or on the Line, for however short a time, the slides must always be thrown out of gear, and the tender brake screwed tight on, until the signal be given for starting.

IV. Enginemen shall *afford every assistance* with their Engines that may be required for the arrangement and despatch of the Trains, and shall follow the *directions of the Guards* in working the Trains.

V. Except the proper Engineman and Fireman, no person shall be permitted to *ride on the Engine or Tender*, without the special license in *writing*, of the Manager.

VI. Guards will give the Enginemen a signal to start the Trains by blowing a whistle. Every Engineman, on receiving the signal from the Guard to start, *must sound his whistle* before turning on the steam.

VII. Enginemen are strictly enjoined to start all Trains *slowly*, to prevent the jerking of carriages, or breaking of draw chains, and not to shut off the steam too suddenly, so as to cause a concussion of carriages or waggons, to the risk of passengers; and in cattle Trains, to the injury of the animals.

VIII. Enginemen must pass along the proper line of road, which is the *left hand side* of the permanent way.

IX. Upon the main line, no Engine shall run with the *Tender foremost*, except under special circumstances.

X. No Engine shall be allowed to *push* a Train of carriages or waggons, but shall *draw* the same, unless in cases of shunting, or when required to start a Train from a station for a short distance only; or in case of any Engine being disabled on the road, then the succeeding Engine may *propel* the Train *slowly* as far the *next shunt or turn out*, at which place the said propelling Engine shall *take the lead*.

XI. Every Engineman shall *stand up* and keep a *good look out all the time the Engine is in motion*, and likewise the Fireman, except when his duties cause him to be otherwise engaged upon the Engine or Tender.—The Fireman shall frequently look back for any signals which the Guard may make, and communicate the same to the Engineman.—Enginemen shall regulate the working of the Engines *as accurately as practicable* according to the Time Table, so as to avoid *extreme speed*. They shall *approach* all stations *carefully*, and not *overrun* the platform where they have to *stop*; and they shall use particular *caution* in *passing* stations where they have not to stop; and should a passenger Train be *standing* at a station, it shall *not* be passed at a greater speed than *eight miles an hour*; the approaching Enginemen making constant use of the whistle.—Enginemen are on no account to make up time, by increased speed, without special instructions from the Manager.

XII. No Engine nor Train of any sort shall stop on the road, nor at any but the *appointed* stations, except only when a *signal* is given, or in case of *accident* to any part of the Engine or Train, or when, in the judgment of the Engineman, it is necessary to prevent accident or collision.

XIII. Engines running alone or with empty carriages or waggons, shall *not* exceed a speed of *twenty-five miles an hour*, without distinct orders (in writing) in each case, or from urgent necessity; nor shall they pass any station where there is a siding, at a greater speed than *ten miles an hour*.

XIV. When Engines are working together, the second Engineman must watch for and take signals from the leading Engineman; but, should the second Engineman perceive any thing wrong with the Train, he must sound the whistle, that the Engines may check and stop together. Neither Pilot nor any other Engine, to be detached nor shunted in front of a Train, without the Train being previously stopped.

XV. Enginemen and Firemen are strictly prohibited throwing small coke on the road.

XVI. No Engineman shall, under any circumstances, *leave his Engine or Train, nor any part of his Train* on the line, without placing a *man in charge* of the same, and if on the *main line*, he must send a man with a signal *half a mile* behind the last vehicle, to prevent other Engines running against it.

XVII. All Engines travelling on the same line, shall keep at least half a mile apart from each other, that is to say, the Engine which *follows*, shall not approach within half a mile of the Engine which *goes before*; and in coming down any incline, the Engine *following* shall not come within three quarters of a mile of the Train which *precedes* it.

XVIII. In the event of the road being obscured by steam or smoke, any approaching Engine shall not pass through the steam or smoke, but shall stop at a sufficient distance to prevent collision, and the Engineman shall ascertain that the way is clear and safe, *before attempting* to proceed.—If any Engineman perceive a Train stopped or stopping from accident or other cause, on the opposite line, he must immediately *slacken speed*, so that he may pass such Train *slowly* or *stop* altogether before reaching it, if necessary.

XIX. If from any special cause the Engineman requires the *brakes to be used*, he shall give *two short sharp whistles*; and if the Guard should require to *stop* the Engine, the signal from him shall be a *red flag or a red light*.

XX. A goods, mineral, or ballast Train, when *likely to be overtaken* by a passenger Train, shall *shunt* at least fifteen minutes before the Passenger Train is due, and *wait there till five minutes after the Passenger Train has passed*; and *before shunting*, care must be taken that *signals are made* in one or both directions, as the case may require.—Wherever there is a siding of sufficient length to contain the Train, it shall *not be shunted* from one main line to the other, but shall be *placed in the siding*.

XXI.

XXI. When an Engine or Train is stopped from any cause on the main line (except at stations,) the Guard, or in his absence the Fireman, or some other competent person, shall immediately go half a mile back with a red signal to stop any coming Train.—When from any cause a Train is unable to proceed at a greater speed than four miles an hour, the Guard or Fireman shall be sent back half a mile, and continue walking at that distance behind his Train, with his danger signal shewn, so as to stop any following Train, until assistance arrives, or the Train is shunted.

XXII. In the event of accident blocking one Line of Rails, and requiring all the Trains to pass over the other Line of Rails, the utmost caution must be exercised, and no Train shall be permitted to proceed on the wrong Line without a memorandum in writing from a person in authority on the spot or nearest station where the accident has occurred.

So liable are verbal messages to misinterpretation, that should a verbal message be received, to send a Train forward on the wrong Line, the messenger must be sent back for a written memorandum before the Train is allowed to move.

XXIII. In case of accident, or when the passage of a Train is obstructed, or when an Engine shall be obliged to move in the wrong direction on either Line, the Engineman shall send his fireman or some other competent person with a signal half a mile, before the Engine moves, to stop any Engine coming on the same Line in the opposite direction; and whilst moving, the Engineman shall make frequent use of the whistle, and shall run at a speed not exceeding four miles an hour, so as to enable the person sent in advance, to keep half a mile before the Engine. Enginemen shall not run on the wrong Line, on any pretence, farther than to the nearest shunt, when the Engine shall pass on to the proper Line.

XXIV. Whenever part of a Train is left on the Line from accident, or from inability of the Engine to bring on the whole, the Engineman shall not return for it on the same Line, except by special instructions from the Guard, but shall go on to the proper Line, and cross at the nearest points to the part left.

XXV. Enginemen and Guards must immediately report any defect in the works, also any delay or unusual circumstances that may have taken place on the journey, to the proper authorities at the next Station, and also at the Terminus.

#### INSTRUCTIONS TO GUARDS.

I. No Guard who is to proceed with a Train, or who is on Station duty, must appear at the Station without the Railway Uniform.

II. The Guard of every Train must be in attendance half an hour before the time of starting.

III. The Guard shall see that he has his signals, flags, and hand signal lamp, on every Train.

IV. He will receive his instructions from the Superintendent, to whom he is to make known whatever is wanting, and by whom he shall be directed when to start the Train.

V. The Train will be under his control, the Passengers and their property under his charge, and he will be responsible for the safety and regularity of the whole; he must take care, previously to starting, that there are a sufficient number of carriages attached to the Train; that they are properly coupled; that an adequate number of covers for luggage are provided, and that the Signal and roof lamps are attached.

VI. He must keep the time of running, and be answerable that every carriage or waggon which is to be left at an intermediate Station is detached. He must take care that if a carriage or waggon be attached to, or detached from a Train on any part of the Road, the requisite change be made so that the signal lamps may always be in the rear of the last carriage or waggon.

VII. The doors of the carriages on the off side, are always to be locked, and in case of any stoppage on the road, Guards are charged to request Passengers to keep their seats except when necessary to alight.

Passengers are not allowed to ride on the outside or top of carriages.

VIII. When the train is in motion the Guards shall keep a good look out, and note any irregularity in the running, any particular oscillation of a carriage or waggon, or any signal made by a Passenger; and be at all times prepared to communicate with the Fireman, which they must do by motions with a red flag or lamp, or if absolutely indispensable, by getting to the Engine; and they are desired to look back at Gatemen, Policemen and Platelayers, to see if they observe anything wrong in the passing Trains.

Guards shall examine the carriage covers to see that no fire lodges while travelling.

Any carriage or waggon in a Train, which may appear to be unsafe to travel with that Train, shall be left at the first convenient station or siding.

IX. Guards with Goods Trains are ordered to refuse to take up waggons containing goods of a nature to take fire by a spark or hot cinder, unless such goods are completely sheeted. Before starting their Trains, Guards shall assure themselves that the waggons are greased, and are in a safe and fit state for the road. They shall constantly keep a good look-out, especially as to fire and the loading of the waggons.

X. Guards are forbidden to pass over the tops of the carriages when in motion, without the most urgent necessity.

XI. In case of any sudden emergency, the Enginemen will give two short sharp whistles, when Guards must immediately apply the brakes, and do all they can to stop the Train.

XII. When a passenger or luggage Train comes to a stand on the Main Line, or is only enabled to proceed at a very slow pace, the Head-Guard is to send back notice by the Under-Guard to the nearest Policeman or Ganger of platelayers, if within distance for prompt communication;

communication; but if too far, then the Under-Guard shall remain not less than half a mile in rear of the Train, shewing his red signal, until recalled.

Should the Train have only one Guard, he will perform this duty.

XIII. On the arrival of a Train at a Terminus, the Guards are not to leave the platform until they have delivered over all *parcels*, as well as *luggage*, to the porters appointed to take charge of them, and if any article is missing they are immediately to report the same to the Officer in charge of the Station.

#### INSTRUCTIONS TO STATION MASTERS.

I. On the *passing* or *arrival* of every Train at a Station, the *Red* or *Danger Signal* shall be turned on in the direction from which the Train has come, and shall remain so for *five minutes* after the passing or departure of the Train, for the purpose of *stopping* any following Train: after which time the *caution signal* shall be exhibited, and shall remain until necessary to shew the red or white signal.

II. Neither engine, carriage, nor waggon is to *cross* or *shunt* on the *Main Line*, without the *proper signal* being *previously exhibited*.

III. Neither Engine nor Train shall be allowed to *leave* or *pass* a station within less than *five minutes* after another Train on the *same Line*.

IV. The Station Master shall direct the Guard when to *start* the Trains, and he shall use every exertion to *ensure punctuality*.

No Train is to leave any station *before* the time stated in the Time Tables.

V. Waggons and carriages are never to be allowed to *stand* on the *Main Line* at a station, but must be placed in a siding; and no part of the carriage or waggon shall be allowed to stand within *six feet* of the *Main Line*; and at night the wheels must be chained and locked, or *securely scotched*.

VI. Station Masters must examine the action of their signals, both by day and night, and immediately report any defect that they may observe at the Office of the Manager.

VII. No Station Master is allowed to *absent* himself from the duties of his Office unless with *leave from the Manager*, except from illness, in which case he must immediately inform the Manager, and in the mean time he must take care that some *competent person* is entrusted with his duties.

VIII. Station Masters will be held responsible for all the points at or near their respective stations being in proper working order; for which purpose the Pointsman shall clean and oil the points and the open chairs upon which they slide, at least once every day.

If from any cause the points should not act freely, the Station Master must immediately report the same in writing at the Office of the Manager.

#### INSTRUCTIONS TO GATEMEN AT LEVEL CROSSINGS.

I. Each Gateman will be provided with *day* and *night signals*, which he must keep in proper order, and *always* in readiness for use.

II. The gates to be always *kept shut* across the road, except when *required to be opened* to allow the Railway to be crossed.

III. Whenever the Railway is *required to be crossed*, the Gateman shall, before opening his gate, satisfy himself that the Train is *not* in sight; he shall then shew his red signal (to stop the Train), and in all cases allow the signal to *remain* until the Railway is *properly clear*; he must then close the gates, and alter the signal.

IV. On all occasions, when signalling, the Gatemen are to stand on the opposite side of the Railway to that on which the Train is passing, that they may be seen by the Driver of the Train.

#### INSTRUCTIONS TO PLATELAYERS.

In every gang of Platelayers or Laborers there shall be a Ganger or Foreman, and the Contractor for the maintenance of way shall take care that every such Ganger or Foreman shall be provided with a copy of these Regulations, and with the proper signal flags and lamps as herein required, and with accurate gauges for gauging the Line.

II. The Contractor will be held responsible for having these Regulations duly attended to by every person employed by him.

III. Every Ganger or Foreman shall constantly keep a copy of these Regulations on his person while on duty—and he must read and explain them to every man engaged under him—and must produce them when required to do so.

IV. Each Platelayer will be held responsible for keeping his portion of the Line clear and safe, and shall see that all gates are kept shut, and the fences safe, and that no *sheep*, cattle or other animal stray within the fences, or upon the Railway.

V. Platelayers shall walk over their respective lengths every morning and evening, and see that all keys and other fastenings are tightened up, and they shall pay particular attention to the joint chairs, and keep the joint of the Rails in the centre of the chairs, and the two ends of the Rails perfectly level.

VI. The signals to be made use of by Platelayers are two, viz.—one green and the other red.

Every gang of platelayers or laborers shall have one or more sets of red and green signal flags to be used during day light, and one or more sets of red and green signal lamps

to be used after night fall, or during fogs. The green signal is to indicate caution, and is to be used when necessary to slacken the speed of a Train. The red signal is to indicate danger, and is to be used when necessary to stop a Train.

*The red signal must not on any account be used except in cases of danger, and where it is considered necessary that a Train should be stopped.*

VII. Previous to any rail being taken up, or any truck, lorry, waggon, or other impediment being placed on the Line; or in the event of any Ballast Train, or other Train being obliged to remain on the Main Line, or to move slowly, so as to be in danger of being overtaken; or in case of any slip or failure of the works; or if from any other cause the Line is not safe, the red signal shall be conspicuously exhibited in the direction of a coming Train, (even if no Engine is expected,) at a distance of one half mile from the point where such impediment or danger exists, by a man appointed to the duty, who shall continue to exhibit the signal until a messenger arrives with express orders to withdraw the signal, but which orders shall not be sent till the impediment is completely removed.

VIII. When, in repairing a road, it becomes necessary for a Train to proceed cautiously, a man is to go a quarter of a mile from the place under repair to meet the Train, and exhibit the green signal so as to be plainly visible to the driver of the approaching Train.

IX. A red board or flag, or an extra tail lamp hung behind an Engine or Train, denotes that an extra Engine is to follow.

X. If a passenger Train approach within ten minutes of a coal, goods, mineral or ballast Train, the platelayers shall exhibit the caution signal. All signals to be held in the hand, and not stuck into the ground.

XI. When necessary to use ballast Trains at night, or during a fog, a powerful red signal lamp must be attached to the tail of the Train; but no ballast Train, waggon, truck or lorry shall be used, nor shall any rail be displaced, if it be possible to avoid it, unless it be by daylight, and the weather sufficiently clear for a signal to be distinctly seen at a distance of half a mile.

XII. When a lorry or truck is used for conveying materials or men along the line, it must be taken in the same direction as the Trains, and must be followed at a distance of half a mile by a man with a red signal.

XIII. No lorry, truck, waggon, ballast Train, nor other impediment must be allowed to be on any part of the line within fifteen minutes of a Train being due; and except in cases of accident or absolute necessity, all repairs must be effected and the line made clear and safe for the passage of Trains, fifteen minutes before Train time. No lorry is, under any circumstances, to be attached to the end of a Train.

XIV. In raising the permanent way, no lift shall be greater than three inches at once, and then it shall be effected in such a manner as not to occasion any sudden change of gradient. Both rails shall be raised equally and at the same time, and the ascent shall be made in the direction in which the Trains run. Platelayers are cautioned not to have more than one length of rails opened on the outside during the passage of Trains.

XV. On every occasion when lifting is done, a man must be stationed at a distance of a quarter of a mile from the place, with a green signal, to slacken the speed of any coming Trains.

XVI. All broken chairs, rails, sleepers, or other defective materials shall be removed from the road with the least possible delay, and sound materials substituted. In case of a broken joint chair, or of any other defect of a dangerous nature, a new chair must be immediately introduced; or the defect, whatever it is, must be immediately remedied: and the red signal must be exhibited at the proper distance, so long as any danger exists.

XVII. No ballast shall be thrown up to a higher level between the rails than three inches, and shall be thrown as much as possible on the outside of each line and between the two lines, and the rails must be kept clear of gravel, ballast, and other materials.

XVIII. Platelayers engaged in repairing the road must get out of the way when a Train is approaching, so as to prevent the Engineman being in any doubt as to the line being clear.

XIX. Platelayers must report to the Inspector of permanent way every case in which any of the signals are disregarded by the Engine Drivers.

XX. Each man shall every night remove all his work tools, barrows, and planks to some safe and convenient place, clear of the line.

XXI. Platelayers will be held responsible for keeping all points, switches, levers, &c., in their respective lengths, well cleaned and oiled, and in perfect working order.

No siding or switches of any kind shall be laid down without express orders, in writing, from the Engineer.

No temporary switches shall be used excepting of such construction as shall be approved by the Engineer.

No siding is to be nearer than six feet to the nearest Rail.

XXII. No waggon of any description shall stand in any siding without having an approved scotch before one or both wheels of the waggon nearest to the entrance into the Main Line; and in the night time, or when not in actual use, one or both of the end wheels shall be fastened to the Rails by a chain and padlock.

XXIII. Any luggage, goods, or articles of any kind falling off the Trains, are to be conveyed without delay to the nearest Station Master.

XXIV. Any accident to an Engine or Train, or any failure of any part of the works, is to be immediately reported by Special Messengers to the Manager, and to the nearest Station Master on each side of the point at which the accident occurs; and signals of stoppage must be exhibited at the distance of half a mile from the point of accident, by men stationed there for the purpose.

XXV.

## RAILWAY TRAFFIC.

11

XXV. Every Ganger is required to order off all persons *trespassing* within the Fences, and if such persons persist in remaining, he is to take them to the nearest Station, and give them into the charge of the Station Master or the Police.

By order of the Commissioners for Railways,

CHARLES J. NEALDS,

Secretary.

Sydney, 11 September, 1855.

I, \_\_\_\_\_ being this \_\_\_\_\_ day of  
 18\_\_\_\_, engaged as \_\_\_\_\_ in the service of the Sydney Railway, do  
 hereby bind myself to observe and obey the foregoing Rules and Regulations, which I have  
 read, or heard read, and understand; and also all others that may from time to time be issued  
 for the better government of the Railway, so long as I remain in its service.

Signature \_\_\_\_\_

1856.

## NEW SOUTH WALES.

## RAILWAYS.

(REPORT FROM COMMISSIONERS OF SYDNEY, AND HUNTER RIVER RAILWAYS.)

*Ordered, by the Legislative Assembly, to be Printed, 3 June, 1856.**Railway Office,  
Sydney, 19th February, 1856.*

SIR,

1. In accordance with the provisions of the 12th clause of the Government Railway Act, the Commissioners for Railways do themselves the honor to transmit a Balance Sheet, duly audited, of the Receipts and Expenditure of the Commission, during the year ended 31st December, 1855.

2. In attention to your letter, No. 59-9, of 9th instant, the Commissioners also submit, for the information of His Excellency the Governor General, a statement of their proceedings in continuation of their Report of the 2nd July last.

3. On the 3rd of August the Commissioners reported upon the state of the Surveys for the extension of the Line to Liverpool, and were instructed to call for tenders for the execution of the work. It was necessary, however, before this could be done, to revise the plans and specifications, which had been prepared for single way works, His Excellency considering it advisable to construct double way works, though in the first place only to lay down a single line of permanent way.

4. On the 19th October, advertisements were inserted in the *Government Gazette* and two daily papers, inviting tenders for the construction of the Line, to be delivered before 12 o'clock on 1st November.

5. But one tender was received in reply to this advertisement; this was from Mr. Randle, and amounted to £76,119 16s., being at the rate of £9,308 per mile, for a Line in accordance with the revised specification, but exclusive of the cost of building the stations. This tender was finally accepted on the 8th November, as detailed in the Chief Commissioner's letter of the 24th November last; and on the 31st December the progress of the work was as per statement in margin.

6. On the 18th July the Commissioners received from the Colonial Treasurer the Government Debentures to be paid to the proprietors of the Hunter River Railway Company, and on the 30th the deed transferring that property to the Government, was formally executed and handed over to the Commissioners by the Deputy Chairman of the Company.

7. The Commissioners, on the 14th August, finally accepted the tender of Mr. Wright for the extension of the Line from Hexham to East Maitland, as referred to in the 6th paragraph of their Report of 2nd July, and on the 21st the contract for the performance of this work was duly signed by Mr. Wright, the total amount being £76,240, or at the rate of about £10,000 per mile, exclusive of station buildings. The Commissioners have much satisfaction in informing His Excellency that these works are progressing rapidly, as shewn in the margin, and they confidently expect that the Line will be completed well within the specified time, viz., the 1st October, 1856.

8. The Commissioners, on 17th August, transmitted to Messrs. Flower & Co., an indent for Rolling Stock, as per margin, estimated to amount to £22,000, principally for the service of this Line.

7,220 c. yds. cutting,  
13,730 c. yds. side cutting,  
93 acres cleared, 330 rods  
fencing, 100 c. yds. exca-  
vation at dam, also cul-  
verts in brick to the  
amount of £368 4s.

103 acres cleared, 65,680  
c. yds. cutting, 25,093  
c. yds. side cutting, 2,430  
rods fencing, 796 c. yds.  
ditching and £2,703 worth  
of brick work in culverts  
completed to 31st Decem-  
ber.

3 Locomotives with ten-  
ders, 34 carriages, 10 zinc  
covered good trucks, 20  
open high sided trucks,  
3 passenger luggage vans,  
20 low sided trucks, 2 36  
foot turn tables, 10 14 feet  
turn tables, 4 sets 3 throw  
joints and crossings 30  
sets single joints and  
crossings, 50 springs and  
axles.

9. On the 31st August the Colonial Treasurer delivered to the Commissioners the Debentures payable by the Government for the Sydney Railway Stock, and on the 3rd September, the President of that Company made a formal transfer of their property to the Commissioners.

10. An arrangement having been entered into with Mr. Randle for the working of the Sydney and Parramatta Railway, whereby he undertook to keep the permanent way and rolling stock in repair for twelve months, and to pay all expenses, excepting the salaries of the principal, and half the salaries of the intermediate station masters, also, some minor expenses, on condition of his receiving 55 per centum of the gross proceeds. The Commissioners opened the Line to the public on the 26th September, and they have pleasure in reporting that Mr. Randle has hitherto satisfactorily carried out his agreement. The gross proceeds up to the 31st of December amount to £9,248 10s. 3d., the total number of passengers 98,846, or at the rate of above 30,000 persons per month travelling by rail.

11. The Commissioners would however remark, that the Line cannot yet be considered in full operation, the arrangements for goods traffic being incomplete, and three and a half miles of the second line, authorized by your letter of the 26th October, requiring still to be permanently laid.

12. The Commissioners nevertheless take pleasure in drawing the attention of His Excellency to the favorable result of this very partial introduction of Railway Transit, the net balance deposited in the Colonial Treasury being equivalent to  $2\frac{3}{4}$  per cent. upon an outlay of £500,000.

13. The Commissioners propose issuing season tickets, which they consider, by offering a ready and economical means of conveyance between the several stations and the City, will ultimately be the means of materially adding to the passenger traffic.

14. The Fitz Roy Iron and Coal Mining Company have intimated that they would shortly be able to supply to order iron rails at a reasonable rate, but their works do not appear at present to be sufficiently advanced to enable the Commissioners to enter into any definite arrangements with that Company.

15. Finding from the multiplicity of land claims at present requiring immediate settlement, and the large amount of business accruing from this source alone, that the existing system would shortly involve the Government in a very considerable expenditure, the Commissioners, on the 15th November, entered into an agreement with Messrs. Norton, Son, and Barker, for three years, to transact the legal business of the Commission, for the fixed annual sum of £800.

16. On the receipt of your letter No. 106-55, the Commissioners immediately placed themselves in communication with the Surveyor General, and requested that officer to proceed with the following surveys, viz. :—

From Parramatta to Penrith *via* Pennant Hills.

Continuation of Southern Line from Campbelltown to Menangle.

Continuation of the Hunter River Line to Singleton.

From a navigable point on the Brisbane to the Downs, including the Survey of the country between Ipswich and Brisbane.

The Commissioners have the assurance of the Surveyor General that these Surveys will be proceeded with without delay.

17. The Commissioners have also placed themselves in communication with Mr. McGowan, and they will lay before His Excellency the measures they propose for the establishment of Electric Telegraph along the lines of Railway in the Colony.

18. The Commissioners are desirous also of reporting to His Excellency, that as the state of the Survey from Liverpool to Campbelltown will admit of that line being immediately marked out, they have directed the immediate attention of their Engineer to this extension, in order that they may be in possession of the necessary information for the completion of the plans and specifications on the receipt of instructions from His Excellency.

I have, &c.,

(Signed) GOTHER K. MANN,  
Chief Commissioner.

THE HONORABLE  
THE COLONIAL SECRETARY.

NEW SOUTH WALES.

---

# RAILWAYS.

(REPORT OF CHIEF COMMISSIONER.)

---

*Ordered by the Legislative Assembly to be Printed, 13 March, 1857.*

---

THE CHIEF COMMISSIONER OF RAILWAYS to THE HONORABLE THE SECRETARY FOR LANDS  
AND PUBLIC WORKS, *transmitting Report for 1856.*

*Railway Office, Sydney,  
25 February, 1857.*

SIR,

I do myself the honor to forward, for the information of the Government, Capital and Revenue Balance Sheets, duly audited, of the Receipts and Expenditure of the Commissioners during the year ending 31st December, 1856.

2. I also submit a Report of the Proceedings of the Commissioners during the same period.

3. The extension to Liverpool, the contract for which was accepted on the 8th November, 1855, was opened to public traffic on the 26th September, and has continued in uninterrupted operation ever since. The formation of this line is for a double way, but only a single line is laid. The description of rail on it differs from that of the Sydney line, being the double headed rail, with fished joints and chairs, a description which, the Commissioners have reason to believe, will form a much more durable and perfect permanent way than the Barlow pattern of the Sydney and Parramatta lines. This opinion is borne out by that of the Engineer-in-Chief, Mr. Whitton, and by the hitherto working of the line.

4. The Campbelltown line has been marked out, and plans and estimates for this extension were forwarded with my letter to the Honorable the Colonial Secretary, No. 31, of the 1st August, in which permission was requested to proclaim.

5. This measure was authorized by the Colonial Secretary's letter, No. 59, of the 16th September, 1856, and the Commissioners accordingly issued the notice required by law, on the 29th October.

6. No further advance has been made for the completion of this important work, no funds being available for this service. The Commissioners regret the delay the more, being of opinion that this extension, with that on to Menangle, would have intercepted the traffic of the Southern Road, and made the present lines remunerative. The Government would thus have been placed in possession of information that would have fully determined the question of Railway extension, as applicable to the present wants of the Colony.

7. The Commissioners have great satisfaction in being able to report, that no accident has occurred to prevent the full working of the line from Sydney to Liverpool, since it was first opened.

8. The passenger fares are now based upon a charge of 4d. 3d. and 2d. per mile,—the English rates being 3d., 2d., and 1d. nearly, for 1st, 2nd, and 3rd class respectively. It will thus be seen, that the excess of the rates charged by the Commissioners over those of England, is not commensurate with the rates of wages, and consequent great additional cost of working a line of Railway in this Colony.

9. These rates are nearly the same as those fixed at the original opening of the line. They were subsequently reduced. On the opening of the Liverpool extension, and before the termination of Mr. Randle's contract for working the line, they were again advanced to the original standard. The reduction did not materially affect the number of passengers, but the increase caused a falling off in this respect, with an augmentation of the gross receipts.

10. The Commissioners are decidedly of opinion that the rates, as now fixed, are as low as they are justified in going, and in this opinion they are borne out by Mr. Whitton, who has gone very carefully into the subject.

11. The works on the extension from Hexham to East Maitland have been satisfactorily carried out by the contractor, Mr. Wright. The Commissioners have not finally taken over these works, but they are in so advanced a state, that were the terminal arrangements and rolling stock complete, the line might be opened for traffic at an early date.

12. On careful consideration of the whole question, the inapplicability of Honeysuckle Point for so important a Terminus as that of Newcastle became evident, and that the site should be at the Sand Hills, beyond Watt-street.

13. On the 31st July, 1856, the Commissioners submitted plans and an estimate (amounting to £70,235) of the arrangements they proposed to carry out in accordance with this view, and requested permission to proclaim this extension. The question still remains unsettled, and a subsequent modified proposition is now before the Government, reducing the expenditure, in the first instance, to a sum not exceeding £25,000.

14. Mr. Wright's contract terminates about one mile from East Maitland. The Commissioners recommended that the extension from this point should be carried on through East to West Maitland, with a station at each town. Funds for this service are included in the estimate, of which the £200,000 vote forms a part. This extension has been now fully surveyed and marked out, and is only awaiting the determination of some minor matters preparatory to its being submitted to Government for proclamation. It is highly expedient that this extension, and also that through Newcastle, should be proceeded with, with all possible despatch; without them the line between Newcastle and East Maitland can hardly be expected to offer an inducement for traffic.

15. The Commissioners have the following Rolling Stock on the Southern Line, viz. :—

- 23 Passenger Carriages, capable of holding 728 passengers.
- 5 Locomotive Engines, of which 4 are for mixed traffic.
- 6 Luggage Vans.
- 4 Horse Boxes.
- 1 Sheep Van.
- 1 Meat Van.
- 2 Carriage Trucks.
- 46 Goods Waggons.

Four of these engines, built by Stephenson and Co., are much larger than necessary for the present traffic of the line, even for the conveyance of goods; but for the passenger traffic, the traffic for which they are chiefly used, their great weight and power render them most objectionable as engines. One half the weight would be quite sufficient to run the ordinary passenger trains, which consist of about six carriages and luggage van.

16. On an analysis of the accounts for three months, ending 31st December, the cost per train mile run for working the traffic (both passenger and goods) is—

	s.	d.
Wages to Station Clerks, Porters, Enginemen, Firemen, Guards, and all wages chargeable to Revenue, per train mile run.....	3	6½
For materials, firewood, oil, tallow, waste, stationery, and general stores, per train mile run.....	2	2½
Permanent Way, for repairs and ballasting, per train mile run .....	1	5¼

## REPORT FROM CHIEF COMMISSIONER OF RAILWAYS FOR 1856. 3

17. The receipts for October, November, and December, are 8s. 4½d. per train mile, or a total of £9,705 2s. 4d.

	£	s.	d.
Out of this sum there has been paid for Wages .....	4,116	2	8
Materials, Stores, &c.....	2,564	19	8
Permanent Way 13½ miles, Sydney to Parramatta.....	1,666	6	0
Total .....	8,347	7	11

18. The receipts over actual expenditure for three months being £1,357 14s. 5d.; but it must be noted that the line between Liverpool and Parramatta (8½ miles) has been maintained by Mr. Randle, under his contract for the construction of that portion of the line.

19. The expenditure for the last three months has been much beyond a fair average amount for repair to Rolling Stock, as two of the large engines have undergone extensive repairs since the termination of Mr. Randle's contract for working the line, and are now in very good working condition.

20. Mr. Whitton is of opinion that steps ought to be taken to obtain the service of the following officers from England, as men thoroughly experienced cannot be engaged in the Colony, viz.:

Locomotive Superintendent, who would also act as Traffic Manager.

For the Permanent Way, a thoroughly practical man, accustomed both to the maintenance of Permanent Way and the construction of all kinds of Railway Works.

An Accountant experienced in the most approved and established mode of keeping the detailed account of the working of the line.

The probable salaries for these officers he puts down as under:—

Locomotive Superintendent	... ..	£800 per annum.
Permanent Way Inspector	... ..	400 "
Accountant	... ..	400 "

21. The Commissioners concur with Mr. Whitton in the expediency of this step, and should this recommendation meet with the approval of the Government, that gentleman's great experience would ensure the engagement of most competent officers.

22. The total number of passengers, &c., that have travelled by rail during the year, is as under, viz. :—

Passengers, 1st Class	... ..	31,434½
„ 2nd Class	... ..	39,328½
„ 3rd Class	... ..	279,960½
Total		350,723½
Horses	... ..	2,838
Dogs	... ..	1,942
Carriages	... ..	770

Total weight of goods 4,657 tons.

23. Mr. C. Kemp having resigned his commission on the 29th of February, previous to leaving the Colony for England, Captain J. S. Hawkins, R. E., was appointed to the vacancy, and took his seat at the Board on the 11th March.

24. Mr. Wallace, the late Engineer-in-Chief both to the Sydney and the Hunter River Railway Companies, and subsequently to the Commissioners, resigned his appointment on the 29th February. Mr. Whitton, who had been engaged at home, arrived in the Colony in December, and the Commissioners have, by a Board Minute of the 15th January, appointed that gentleman Engineer-in-Chief to the Railway Department, in accordance with the terms of his agreement.

25. In concluding this Report, I am desirous of alluding to the fact, that a diversity of gauge exists between this and that of the neighbouring Colonies, New South Wales being 4' 8½", Victoria 5' 3", and South Australia 5' 6", the magnitude of the evils that must ultimately arise at no distant period, and be entailed on the future inhabitants of the Colonies, from this circumstance, can hardly be overrated, and I would submit, therefore, that it is a question deserving the attention of the different Governments.

I have, &c.,

GOTHER K. MANN.

## NEW SOUTH WALES.

## RAILWAY LINES IN THE SOUTHERN DISTRICTS.

(REPORT OF DEPUTY SURVEYOR GENERAL.)

*Ordered by the Legislative Assembly to be Printed, 13 March, 1857.*

THE DEPUTY SURVEYOR GENERAL to THE SURVEYOR GENERAL.

10 June, 1856.

SIR,

In attention to that part of your memorandum of the 28th March, 1856, in which you observe, that in passing through the country I should keep in view the great object of obtaining the most accurate information as to the best lines for trial surveys, more particularly as to the crossing points of ranges, and embrace every opportunity of obtaining information from the surveyors, on all points relative to Railway lines in their respective districts,—

I have the honor to inform you, that although in visiting the Railway surveyors on the Goulburn line (the particulars I have already reported), I did not fail to pay attention to the course they were pursuing, and to give such directions as appeared to me to be required, still, as the line to Goulburn had already been determined by the inspection of different engineers and surveyors, I did not consider it incumbent upon me to make any particular examination of that part of the Southern line. When, however, I was at Goulburn, I looked over the neighbourhood for the purpose of ascertaining the best position for a Terminus, and the best course for entering and leaving the town. I also took advantage of Mr. Mann's being at Goulburn to go down the Wollondilly some five miles with him, and ascertain his views as to the approach to Goulburn, which presents considerable difficulties. Mr. Mann was so obliging as to furnish a sketch, which I sent to Mr. Condon for his guidance, with an explanatory memorandum.

My inspection for Railway lines commences, I consider, at Goulburn. I examined the country as I went along, made such detours as appeared to be necessary, and obtained all the information I could; and I was particularly indebted to Mr. Hamilton Hume, who, being thoroughly acquainted with the country between Goulburn and Yass, suggested to me a line to Yass, which, although it may be somewhat circuitous, still, as it is entirely level and passes through a fine agricultural district, seems a very desirable one. On leaving Goulburn at the town boundary, this line would follow the Yass road for about seven miles; it then takes the track towards Lake George, which passes the south end of Wollongorong Lagoon and the north end of Tarrago, and onwards through Colledgar to the Gap of Carrigal, a pass in the Cullarin Range which I am led to believe could be surmounted without any great difficulty. At this gap you leave the waters of the Lake George Basin and come upon the head of Gundaroo Creek, a tributary of the Yass River; following the course of Gundaroo Creek the line crosses the Yass River, which is followed downwards on its south bank to the confluence of Morumbateman Creek; crossing that creek it would still keep the river as far as possible, or perhaps entirely, as far as Yass; but considerable difficulties are presented on entering and leaving Yass, which can only be solved by accurate surveying and levelling; hence the line follows the road, and with some cuttings would reach the village of Bowning.

Another, and more direct line, also pointed out by Mr. Hume, would, on leaving Goulburn, keep the line already alluded to as far as Tarrago Lagoon, and thence passing through Milbang Plains and the Dairy Flats it reaches the Cullarin Range at Rose's Gap, a pass which Mr. Hume describes as being far from formidable; it then crosses Lerida Creek, and, avoiding Mount Dixon, passes through a somewhat level country to Gardiner's Inn, on the Yass Road; crossing that road it seeks the old pass in the Munday Range—(what the nature of this pass is, and whether it would require tunnelling, I could not accurately ascertain, but it was said to be far from difficult; it is still used by up-country drays in preference to the present pass);—hence the line is straight on through Bargo to the village of Bowning, before mentioned; so that this line would involve a Terminus at Bargo, and a Branch Rail to Yass, unless the line were to terminate at that town. From Rose's Pass the country traversed by this last mentioned line is nearly all barren and useless, and it will be perceived, that although more direct than the line by Gundaroo it has two mountain passes to get over, whereas the Gundaroo line has only one; moreover, it does not lead towards, or open up, any populous or agricultural country, whereas the Gundaroo line would facilitate the intercourse with the Lake George country, and lead towards the high road to Queanbeyan and Maneroo, and, as far as I can see, is far superior in every respect to the Milbang line. The Munday Range extends east and west; the Yass River, which is

on its south side, runs also east and west, and therefore presents a level for the Gundaroo line, which follows its course; but on the north side of the Mundoonen Range the rivers flow northerly from it, and, consequently, the Milbang line, which is on its north side, must pass over a broken country; so that the physical geography of the country is entirely in favour of the Gundaroo line.

At Bowning village the possibility of continuing a line of Railway in the direction of the high road ceases. The ranges are so formidable, and great portions of the country so broken, that any Railway line in that direction is impracticable. Thus, between Bowning and Bookham is Conroy's Gap; just out of Jugiong is Cooney's Hill, and then the Money Money Ranges; whilst beyond Gundagai, on the road to Albury, is the Tarcutta Range; all these are most formidable obstacles to Railways. Nor is it possible to follow the Murrumbidgee itself; for where the ranges do not press upon its banks—wherever there are flats—they are subject to the most fearful inundations. In every way the thing is impracticable, and it is very significant that the people on this road are fully impressed with the idea that a Railway can never pass through their country. Having ascertained this, I took whilst at Jugiong a trip to the north, and there, from reliable information which I obtained, I found that by carrying the line of Rail to the north, not only was the country practicable, but almost a dead level. Thus, on leaving Bowning there is a level line to Binalong, recently discovered and travelled by the Commissioners; from Binalong to Cunningham Plains a level straight line may be taken; and onwards in the same direction to the reserve at Wollondoon, and by Coolamundary, Hurley's station; beyond Hurley's there is a low range to get over, and the line then reaches the waters of Hooligun's, or Jewnee Creek, by following which you get a dead flat to the Murrumbidgee River, near Wogga Wogga. Thus, from Bowning to Wogga Wogga the line would pass through about 110 miles of country almost level; and although the line appears to be circuitous, still, were it possible to follow the Murrumbidgee, the bend to the south would be as great as is the bend to the north, for even the road from Bowning to Wogga Wogga is 100 miles long. Probably it might not be necessary to go so far north as Cunningham Plains; but this will be ascertained when the country comes to be examined, and levels taken. Of course it was incumbent upon me to see, and to inquire, whether, on leaving Lake George or Yass, it might not be possible to keep to the south side of the Murrumbidgee, and so, by way of Tumut, reach Albury by a straighter and more direct line; but all the answers to my inquiries on this subject were to the effect that it was utterly impracticable; and, indeed, when the physical geography of this portion of the country is considered, there can be little doubt on the subject. The sources of the Murrumbidgee and the Murray Rivers being in the highest part of the Australian Alps, the ranges which divide those rivers are most formidable; whilst the tributaries of the Murrumbidgee are so numerous, large, and deep, that neither road nor Railway can be taken on the south side of the Murrumbidgee, nor is it likely that the course of that river could be followed on its south side. Having sketched out the line as far as Wogga Wogga there is no difficulty in crossing the country to the Murray River at any point below Howlong; but the further course of the Railway to Melbourne, presuming that to be the ultimate intention of any continuation of the line beyond Goulburn or Yass, must in a great measure depend upon the views of the Victorian Government.

On my arrival at Melbourne I ascertained that the Government there had determined upon commencing a Railway to Bendigo, and thence down the Campaspe River, reaching the Murray at Maiden's Punt, a point about 120 miles lower down the Murray than where our line would touch that river, provided the Railway were taken in a straight line to Melbourne. Unless, therefore, the Government of Victoria would take their line from Echuca (Maiden's Punt) up the Murray, so as to supply their Gold Fields at the Ovens and meet the Sydney line, it would, if I may offer an opinion, be scarcely worth while at present to contemplate an extension of our line beyond Goulburn or Yass.

The advantages that would result to both colonies, were the direct line between the two capitals carried out, are sufficiently apparent; but the line to Bendigo is evidently so essential to the people of Victoria that the straight line cannot be looked for at present. Still, seeing the great income that would result from such a work, by its at once absorbing all the steamboat and shipping traffic between Melbourne and Sydney, independent of other important considerations, the connexion of the two lines does appear to warrant the serious consideration of both Governments.

The Ovens Gold Fields are very rich, and likely to prove very extensive. There is already a considerable population—some (11,000) eleven thousand; and I apprehend that were the yield of those Gold Fields and the yield of Bendigo to be compared with the amount of their respective populations, it would be found to be much the same. It may, therefore, be assumed that the population at the Ovens will increase, and that it might then be worth while to carry our Railway to the Murray, with a view partly to the supply of those Gold Fields, should the Victorian Government decide upon leaving that district out of their present Railway arrangements. The connection of the two points, viz., Echuca and Albury, by means of the navigation of the Murray River, must not, however, be lost sight of.

I may add, that in passing through Victoria I did not perceive any difficulty in the way of a straight line of Railway from the neighbourhood of Albury to Melbourne, through the numerous towns on the road to that capital. The country is almost level, with the exception of the dividing ranges near Kilmore, through which, after the taking of numerous levels, a passage has at length, as I understand, been found.

A sketch, exhibiting the features of the country as far as surveyed, and showing the lines for trial survey suggested in this Report, is herewith.

I have, &c.,

JOHN THOMPSON,  
Deputy Surveyor General.

1857.

NEW SOUTH WALES.

## RAILWAY EXTENSION.

(REPORT OF CAPTAIN HAWKINS ON SURVEYS, &amp;c.)

*Ordered by the Legislative Assembly to be Printed, 17 March, 1857.*

*GENERAL REPORT on the Explorations and Surveys made by the Detachment of Royal Engineers under the command of Captain J. S. Hawkins, R.E., with a view to Railway Extension in the Colony of New South Wales.*

Sydney, 24 February, 1857.

The duty assigned to the Detachment on its arrival in the Colony was the prosecution of Railway Explorations and Surveys. As, however, the examination of the country between Campbelltown and Goulburn, of the intended prolongation of the Hunter River Line, and of the Moreton Bay District, had already been entrusted to a staff of Civil Surveyors recently arrived from England, my attention was at first directed solely to the proposed western extensions from Parramatta to the Hawkesbury and Bathurst. Subsequently, at the request of the Superintendent of the Australian Agricultural Company, two Surveyors were sent to Port Stephens, to undertake a trial survey from that place, through Stroud, in the direction of the Manning River and Armidale; these men are rationed, their chainmen paid, and means of transport, &c., provided by the Company. The exploration of the country between Goulburn and Yass, and thence to the Murrumbidgee, with the view to ulterior extension to the River Murray and Colony of Victoria, has also been undertaken by the men of the Detachment.

2. On their first arrival, as soon as the men were quartered at Parramatta, the first duty undertaken, was to prepare the numerous tracings requisite for their guidance in the performance of a difficult duty in an intricate and but partially surveyed country. I may here observe, that every portion of their work has been performed by the sappers themselves without any extraneous assistance whatever. A considerable portion of their field equipment was also prepared by them, including the construction of levelling staves and the engraving of copper plates for the graduation of the staves and for protractors for plotting plans—duties requiring extreme care and skill.

3. The first field duty undertaken was the survey and levelling of two lines previously contemplated, and now pointed out for examination, leading from the Parramatta and Liverpool Railway to Prospect Hill. It was at that time thought probable that an experimental tramroad would be laid down to Prospect, for the purpose of conveying blue metal for the construction and repair of the streets of the City, and other similar purposes, to Sydney. As I think that the line of Railway to Penrith and Windsor will not follow either of the lines indicated, and that any rail or tramway laid down for the abovementioned purpose, will necessarily form a branch from the main line, but little remark seems called for upon the result of these proceedings. The first line branches from the Parramatta and Liverpool Railway, about a mile beyond the Parramatta Station—at a distance of nearly  $4\frac{1}{2}$  miles it forms a junction with the second trial line. The country it passes over is not very favorable, being very irregular and undulating; but there is nothing very formidable or impracticable in it for a Railway, though the necessary works would be too costly for a tramway. It would have to surmount about 100 feet in a third of the distance, which would give a general gradient of nearly 1 in 80 as probably the most severe. I am, however, not prepared to state

that the line surveyed was selected by the Surveyor with sufficient judgment to ensure its being the best that can be obtained in this direction, which has the material advantage of forming a much better and more convenient junction with the Parramatta and Liverpool Railway than the second line now considered. This second line starts from the Fairfield Station,  $4\frac{1}{4}$  miles from the Parramatta Station—it forms a junction with the first line at a distance of about  $3\frac{3}{8}$  miles; and, supposing the Penrith line to follow this course, the branch to the Prospect quarries would leave the main line about  $\frac{3}{8}$  mile beyond this junction. This line follows the valley of the Prospect Creek, and is most favourable throughout, having a gradual rise of about 82 feet in the distance,  $4\frac{1}{4}$  miles, giving a general gradient of 1 in 270. The branch to the quarries is not favourable, there being a rise of 235 in about  $2\frac{1}{4}$  miles. The survey of this  $2\frac{1}{4}$  miles has been taken to the quarries, standing on 2 acres of land belonging to the Government; but other and much more convenient quarries would probably be opened should facilities for the conveyance of the stone and metal with which this neighbourhood abounds be offered. All this work, amounting to  $10\frac{3}{8}$  miles in length, has been cross levelled.

4. Trial lines of levelling were continued from the end of the work above alluded to in the direction of Penrith and Windsor. Two lines have been levelled, to the extent of  $28\frac{3}{8}$  miles, to the south of the main road between Parramatta and Penrith, but with unsatisfactory results. The Surveyor has not displayed any judgment in adapting the direction of his surveyed lines to those points in the ranges between the several streams intersecting this district nearly at right angles to the course of the lines, which would offer the lowest summits and greatest facilities for the construction of a Railway; but the sections show that there are considerable elevations to be surmounted, which though modified could not be avoided. As the country on the north side of the Western Road is much more favourable, and presents other important advantages in connexion with a line through it, the levels already taken will probably be found to supply sufficient information as to the character of the district; and therefore this portion of the work seems at present to require no further remark.

5. A main line, and several alternative lines in connexion with parts of it, have been levelled to Penrith on the north side of the Western Road. This work shows the practicability of obtaining a perfectly satisfactory line from the Eastern Creek to Penrith over a distance of about  $12\frac{1}{4}$  miles. In this distance two summits occur which do not exceed about 100 feet in elevation above the intervening valleys, and which can be surmounted by very favourable gradients. The extent of levelling performed in this section of the work amounts to  $22\frac{3}{4}$  miles.

6. From the neighbourhood of the Eastern Creek a most favourable and direct line can be obtained to Windsor, over a distance of about 10 miles. The sections taken are generally very favourable; the main difficulties to be obviated being the prevalence of inundations on the low lands, and the necessity for crossing several of the principal streams. The amount of levelling performed in this section amounts to  $30\frac{1}{2}$  miles.

7. The suggested junction of the Penrith and Windsor lines at or near Eastern Creek seems to present a favourable position for a station in communication both with the Penrith and Richmond Roads; there being already a communication between those roads in use on the eastern side of the Creek—such a station will, of course, be necessary to work the branch line. The main line of Railway between this junction and the Sydney and Parramatta Railway remains to be considered. With this view a series of trial levels are now in progress and are nearly completed, but the plans and sections have not yet been supplied. However, I may venture to state, that I entertain no doubt whatever that a favourable line can be obtained—branching from the Sydney and Parramatta Railway about a quarter of a mile from the Parramatta Station, passing through the narrowest and least objectionable part of the town of Parramatta, through the Government Domain between the Government House and the river, and thence following a direct course, or as nearly so as the intervening country will admit, to the suggested junction at Eastern Creek. Such a line will present the important advantages of securing a station for the town of Parramatta and its extensive and populous neighbourhood, especially that on the north side of the river, affording a direct course for the main line as far as the suggested junction, equally advantageous to the interests both of Penrith and Windsor; and thence to those towns favourable branch lines can be obtained. The length of the main line from the Parramatta junction to Eastern Creek would be about 10 miles; from the creek junction to Penrith,  $12\frac{1}{4}$ , and to Windsor, 10 miles,

miles, or in all about 33 miles. No trial levels have yet been taken between Windsor and Richmond, but they will shortly be put in hand. No difficulties are to be apprehended, and such an extension would add about  $4\frac{1}{2}$  miles to the Windsor line.

8. With respect to surveys and explorations beyond the Hawkesbury, in the direction of Bathurst, I am not in a position to offer a very favourable report. Surveys and levelling of the main line of road over the Blue Mountains, and of the Currajong or "Bell's" Road, have been undertaken. In the absence of reliable information as to the elevations over which these roads pass, accurate longitudinal sections of them were considered very desirable as data to which to refer any other work, or to assist in the exploration of the immediately intervening districts; and they also had for their object the question of laying down tramways on existing roads. Plans and sections of about 26 miles of the main road from Penrith Bridge have been received from the Surveyors, and that road has been levelled as far as Hartley, but the plans, &c., of the latter part have not yet been furnished. In the first 26 miles the ascent is 3,022 feet above Penrith Bridge, averaging 116 feet per mile, or about 1 in 45 for the whole distance. The ascent of the Lapstone Hill is about a mile in length, and the elevation is 420 feet, or about 1 in  $12\frac{1}{2}$ . This would slightly modify the average of the remaining 25 miles to 104 feet per mile, or 1 in 50. The road continues to rise for several miles further, attaining its greatest elevation about half a mile beyond the Toll-bar, which exceeds 4,000 feet above Penrith Bridge, from which it is distant about 41 miles. The survey &c., of Bell's Road has been carried beyond Mount Tomah, where it reaches an elevation of 3,257 feet above Richmond Ferry; but no plans and sections have yet been furnished by the Surveyors. I have had the district over which the main road passes carefully explored, with the view of striking out some modified lines for examination and survey, presuming it to be very desirable to obtain the *most direct possible* line to the westward; the result of this exploration has been altogether unsuccessful. The Surveyor has suggested one or two modifications of the immediate ascent from the Hawkesbury, which I have directed to be put in hands immediately, more to complete our information on this point than from any hope of its proving practically useful. The watershed of the Grose and Cox's River, which is now traversed by the road, cannot be departed from without encountering such a succession of ravines and torrents as to render such a course totally impracticable. A similar exploration of the district through which the Currajong or Bell's Road passes has not been made, for as that road, throughout its length or nearly so, occupies the watershed between the Grose and Colo Rivers, precisely the same objection would apply to the practicability of leaving it. The valley or *ravine* of the Grose has also been explored, but, as I expected, without success. This was undertaken in consequence of the Surveyor having suggested the possibility of obtaining a practicable line (with the necessity, however, for two tunnels) from the western foot of the Blue Mountains to Bathurst, *if* connected with the head of the Grose by a tunnel 3 miles in length, provided that a Railway could be carried up the valley of that river. I may here observe that I do not think it will be found practicable to make use of the valleys of any of these rivers; but neither do I think it will be found possible to carry out Railways to any extent in this or most other countries without having recourse to tunnels, notwithstanding the very great expense attending their construction. In concluding this portion of my Report, I must express my conviction that no practicable line for either a railroad or tramway from the Hawkesbury to Bathurst exists between the Cox and Colo Rivers; and, consequently, that a direct line between Sydney and Bathurst cannot be obtained.

9. Plans and sections of about 28 miles of the levelling performed from Port Stephens through Stroud, in the direction of the Manning River have been received, and much more field-work has been done, the results of which have not yet been furnished. I am not in a position to say much about this section of the work. The sections shew some formidable obstructions, both from ranges and rivers, which would have an important bearing on the practicability of a line in this direction; but in so extensive a district, and between such distant points, very much more complete exploration must obviously be necessary before an opinion of any value can be hazarded. I would suggest that some communication be had with the Superintendent of the Australian Agricultural Company respecting the continued employment of the Surveyors engaged on this duty. It may not be the intention of the Company to undertake so important and expensive a work, and the work already done will probably shew that the course hitherto followed by the Surveyor leads over a country which would involve expenses in the construction of a tramroad which they would not under any circumstances be disposed to incur. The information obtained may prove useful to the  
Government

Government with regard to the question of future Railway Extension, especially as Port Stephens is a harbour of considerable importance and value, and it is situated in a coal producing district.

10. The exploration of the country between Goulburn, Yass, and the Murrumbidgee River, is in progress; but no surveys will be undertaken until the probability of obtaining a favourable, if not the best line in that general direction is ascertained. The Surveyor's instructions provided for his first turning his attention to two courses between Goulburn and Yass, pointed out in a Report presented to you by the Deputy-Surveyor General as the result of his exploratory journey in the beginning of last year, dated 10th June, 1856. The first of these lines, the "Gundaroo line" has been minutely explored, extending over a distance of about 70 miles; the result is very unfavourable, and the Surveyor recommends that the survey of it be not undertaken pending further explorations. He is now engaged in exploring the Deputy-Surveyor General's second line, the "Millbang line," and in his last Report he states that, as far as he had then had an opportunity of examining, it seemed likely to prove the more desirable of the two as far as facilities of construction are concerned. The Deputy-Surveyor General recommends a circuitous course from Yass to the Murrumbidgee by way of Cunningham's Plains, &c.; and the Surveyor states his opinion that this will probably be the best line, but that it may also prove most desirable to proceed in a more direct course from Goulburn to Cunningham's Plains, thus passing considerably to the north of Yass. Nothing very definite can, however, be said at present on this very important question until we are put in possession of much more complete information, when the surveys can be proceeded, with without delay.

J. S. HAWKINS,  
Captn. Royal Engineers.

THE SURVEYOR GENERAL,  
Sydney.

---

1856.

NEW SOUTH WALES.

## RAILWAY EXTENSION.

(MINUTE OF HIS EXCELLENCY THE GOVERNOR GENERAL.)

*Ordered by the Legislative Assembly to be Printed, 4 December, 1856.*

W. DENISON,

*Governor General.**Message No. 11.*

In accordance with the advice of the Executive Council, as expressed in the Minute herewith submitted, the Governor General lays before the Legislative Assembly a Memorandum expressive of his views with relation to the extension of Railways in New South Wales.

*Government House,**Sydney, 4 December, 1856.*

### ENCLOSURE TO MESSAGE NO. 11

Proceedings of the Executive Council, on the 24th November 1856, with respect to the future construction of Railways.

Minute No. 56-62, confirmed 1st December, 1856.

His Excellency the Governor General lays before the Council a memorandum, in which His Excellency explains his views upon the subject of the future construction and extension of Railways in New South Wales.

2. The general results arrived at by His Excellency may be briefly stated to be as follows, viz., that it is desirable, under present circumstances, that lines of Railway for locomotives should only be continued southward to Campbelltown, northward to the intersection of the Wollombi Road, about 8 miles west of Maitland, and westward to Penrith or Richmond, and that beyond those points a less expensive system of Railways, worked by horse-power, should be introduced, at a probable cost of £4,000 per mile, including rolling stock. His Excellency estimates that in this manner lines to Albury on the south, to Easthurst on the west, and Armidale on the north, may be completed for a sum of £2,770,000, but that if allowance be made for the extension of the Sydney Terminus to the northern end of Pitt-street, £3,000,000 will be required, in addition to the sums inserted in the Estimates for 1857.

3. Although the Council without further information on the subject, and without being placed in possession of the result of some actual experiments to test the feasibility and cost of constructing and working Horse-railways upon the principle indicated, are not prepared to advise the adoption of the very extensive measure proposed in His Excellency's Memorandum, yet they consider it desirable that a proposal of such vital importance to all the principal districts of the Colony, and involving so very large an increase of the Public Debt, should be brought without delay before both Houses of Parliament, in order that the important question involved may be publicly discussed before the Government resolves on taking any action upon it.

EDWARD C. MEREWETHER,

Clerk of the Council.

### MEMORANDUM—RAILROADS.

The time, I think, has arrived when the Government should be prepared to ask from the Legislature an approval of some general scheme with relation to Railroads, upon the strength of which approval, (by resolution or otherwise), arrangements might be made for the execution of the work as a whole, instead of by contracts embracing small portions of 8 or 10 miles, as at present.

In the adoption of some general scheme of this kind, the whole Colony will feel an interest. Each district will comprehend that its particular welfare is cared for, whereas the present mode of carrying on the work excites no general feeling in its favour, and leads to suspicions that the interests of the more distant parts of the Colony are postponed to those of the districts in the immediate vicinity of Sydney.

The nature and amount of the work already executed will be made sufficiently clear to the Members of Council by the following précis, in which will also be included an account of the preparations which have been made for the further extension of Railways in different directions, with this information, and with the data which I propose to submit for consideration, the Council will be in a position to advise as to the character of the general scheme which it will be desirable to adopt, and as to the extent of the guarantee to be sought for from the Legislature, in order to enable the Government to go into the English market, holding out such inducements to men of capital to embark in the work of constructing these Railroads as would ensure a sufficient amount of competition, and be a guarantee for the rapid completion of the work.

#### PRESENT STATE OF RAILROADS.

The line from Sydney to Parramatta is completed throughout its length with a double line of rails. It is continued as far as Liverpool as a single line, but the cuttings, bridges, embankments, &c., are made wide enough to receive a double line. The accommodation at the Sydney end of the line is not sufficient for an extended goods traffic, such as will naturally result from the continuation of the present line to the southward and westward. Neither has there been any adequate preparation made for carrying the goods, (should it appear to be desirable so to do,) along the branch line to Darling Harbour, or for prolonging the line into Sydney either to the Haymarket, where it would be possible to make an extensive Depot for agricultural produce of every kind, or still further by a line down Pitt-street to the Circular Quay. Provision has, however, been made in the Estimates for 1857 for the erection of additional buildings and workshops at the main station; but the question of the continuation into the City, or towards Darling Harbour, should be taken up without delay.

Preparations have been made to continue the single line from Liverpool to Campbelltown, a distance of about 12 miles, and a sum has been inserted in the Estimates for the execution of this work in the course of 1857.

A survey has been carried on for about 4 miles beyond Campbelltown, as far as the bridge over the Nepean at Menangle.

Beyond Menangle the surveyors are at present employed in levelling and marking out the road as far as Goulburn, a distance of about 88 miles, but the country is rugged and mountainous for a portion of the distance, and the cost of constructing the line for Locomotives will be proportionably great.

As, however, the surveys which are now making have for their object the determination of a line which will answer for Locomotive power, it would be very desirable that the character of the traction to be employed should be *at once decided*, in order that the labour of the Engineers and Surveyors should be directed to the particular object for which their assistance is required, and not be wasted on lines which may never be carried out, or, at all events, not for several years to come.

I propose, hereafter, to call the attention of the Council more particularly to this branch of the subject. Directions have been given for the employment of parties in reconnoitring the line beyond Goulburn towards the Murray River, where it is proposed to connect it with the line from Melbourne.

Beyond Parramatta, to the westward, lines have been surveyed towards Penrith and towards Windsor, and levels are now being taken along both the present lines of road from the valley of the Hawkesbury to Bathurst, viz., the road up Lapstone Hill from Emu Plains, and that by Carrajong or Bell's Line. No active steps have been taken to commence work upon these lines; neither are they included in any Estimate for 1857.

From Newcastle to Maitland the line is nearly completed; the stations, however, are not built at either Terminus. It is proposed to carry the line through Newcastle, in the rear of the line of wharf about to be constructed under the powers given in the Hunter River improvement Act, and this arrangement will give great facilities to the coal trade of the Port, a large portion of which will be brought down by the Railroad; it will also afford great convenience to the passengers landing at Newcastle. Money is placed upon the Estimates for the completion of this work during the present year. There is one question to be decided with reference to this extension, and that is, the amount which should be contributed by the Railroad towards the construction of the wharf. By the alteration proposed in the position of the Terminus, the Railroad gets the benefit of the wharfage in front of Newcastle, of which it may be said to monopolize a large portion. It would have been necessary to construct an extensive wharf for the coast traffic, which will come down the line, the expense of which has now been spared. I think, therefore, that it would be advisable to charge the cost of a portion of this wharf to the Railroad.

At the Maitland end of the line, it is proposed to carry the road through East and West Maitland, placing a station at both Towns. The necessary plans have been made, and the money for the work will be provided out of the £200,000 to be raised during the present year.

Surveys have been made for the continuation of the line for Locomotives, for a distance of about 8 miles beyond Maitland, and money has been provided in the Estimates of 1857 for the completion of the work.

Surveyors are employed upon the road beyond Maitland, in the direction of Armidale; but the remarks made with reference to the line from Menangle to Goulburn apply here with equal force, and point out clearly the necessity of coming to some definite understanding as to the description of power which is to be employed, whether horse or locomotive.

A party has been employed in surveying a line from Port Stephens towards Armidale, towards the cost of which the Australian Agricultural Company has contributed.

Parties

Parties are also employed in surveying lines of road from Brisbane to Ipswich, and onward to Darling Downs, on the upper country to the west of the coast range.

All these surveys are in progress, and the results will be in the possession of the Government (at all events as regards large portions of these lines) before the end of the present year.

Preparations have been made, or are making, for lines of Railway in various directions, to the extent shewn in the following table :

	DISTANCE.	LOCOMOTIVE.	HORSE.
Sydney to Goulburn .....	125	33	92
Goulburn to Albury .....	255	...	255
Parramatta to Bathurst .....	100	20	80
Newcastle to Armidale .....	230	30	200
	710	83	627

I have not alluded to the lines which it may be desirable to carry out from Brisbane into the interior, as the information in my possession is too scanty to enable me to express an opinion *with* regard to them.

The distance from Brisbane to Ipswich may be taken at 30 miles, and which it might be as well to work with locomotives, but beyond that there are no data as to directions or distances.

There will, therefore, be 710 or 720 miles of Railroad required to complete the communication between Sydney and the frontier between New South Wales and Victoria, between Sydney and Bathurst, and between Newcastle and Armidale; of these 63 either have been, or will be, completed in the course of the year 1857, money having been inserted in the Estimates for the work; there will then remain to be constructed 647 miles, of which 20 are shewn in the above table as locomotive lines, leaving 627, which, in my opinion, should be constructed on a much cheaper plan, and be worked by horse-power. I think that the lines which have been constructed have been wisely adapted for locomotive power; they are trunk lines, and into them will be poured an amount of traffic, in a few years, of which at present we have but little conception. I do not, however, think, that for many years to come the traffic upon the southern line beyond Menangle, on the western line beyond Penrith or Richmond, and on the northern line beyond the intersection of the Wollombi Road, will be sufficient to compensate for the increased outlay in making and maintaining a locomotive line; and as it is desirable to push these useful roads into the country with as much expedition as possible, I would suggest that the Government should at once decide not to construct the expensive line of road beyond Campbelltown to the southward, beyond the Hawkesbury to the westward, nor beyond the point about 8 miles to the west of Maitland on the northern line; that from these points the lines should be continued, either along the present roads, making such deviations as may be advisable, or by such new lines as may be selected. The cost, however, of such lines should not exceed, on an average, £4,000 per mile, including in that sum the cost of the rolling stock required to transport the full amount of passengers and goods likely to be conveyed for the first year.

The completion of the line to Albury would require, in addition to the sum inserted in the Estimates for 1857, £1,388,000, or, in round numbers, £1,400,000; from Parramatta to Bathurst, 20 miles of locomotive line would cost about £250,000, and 80 miles of horse-line £320,000. Total, £570,000.

From Maitland to Armidale, 200 miles of horse-road, £800,000	
Making a total of	£1,400,000
	570,000
	800,000
	£2,770,000

And if allowance is made for the establishment which it will be necessary to create for the extension at the Sydney Terminus, &c., if we say in round numbers that three millions will be required, in addition to the sums inserted in the Estimates for 1857, I do not hesitate to express my belief that for such an amount the lines in question may be completed.

The following Estimate will shew the ground upon which I have formed my opinion that £4,000 per mile will be sufficient to cover the cost of laying down a line of rails along a road already cleared and fenced, or of laying down a similar line across the plains between Goulburn and Albury, where the country is open, and where no fencing will be necessary.

Earth works, including some extra work in levelling, slight deviations here and there, in order to avoid too steep a gradient, &c., £1,000. This, of course, must be an arbitrary amount. In some places more will be required, in others much less, but I think that the sum taken will be a full average; and across the plains, from what I have heard of them, it will be more than sufficient to cover all the work, including the dams or bridges which may be required.

Cross sleepers, one every 4 feet, 7 feet in length. Each mile is taken to measure, including sidings, 2,200 yards, an allowance of one-fourth, which is more than sufficient, making 1,650 sleepers, at 2s. 6d. each, £206 5s.

Longitudinal

Longitudinal sleepers 6 by 6, treenailed upon cross sleepers, 13,200 feet run, equals 3,300 cube feet, at 2s. 6d. per cube foot, £462 10s.

Both these items may, I am convinced, be reduced very much by the application of steam power to cut the sleepers into the proper size and form. A locomotive engine with a circular saw will supply sawn stuff in the bush at less than half the price named.

4,400 yards of iron rail spiked down to longitudinal sleepers, weight 28 lbs. to the yard, 55 tons per mile, at £11 per ton, £605.

730 cube yards of broken stone for road between rails, laid complete, at 12s. per cube yard, £438.

I have put this at a high figure, for any stone or any material will answer, sand with clay mixed, gravel, broken sandstone, ashes, &c. All that is wanted is to keep the horses feet clear of the cross sleepers.

880 yards at 5s., £220.

I have put this high also. The material from the ditches for draining the road across the plains will answer in most instances. It is to be observed that the necessity for the careful packing which is essential when the road is to be used by heavy locomotives at a high rate of speed, will not accrue on roads to be worked by horse power at low rates of speed.

Laying sleepers, spiking rails, &c., including spikes and treenails, £300.

Add for stables along the line from distance to distance, if necessary, £100.

It may be advisable that the Government should go to this expense, as it will enable more persons to compete for the contracts for conveyance.

Add for rolling stock, say 3 carriages per mile, at £150 each, £450.

#### SUMMARY.

	£	s.	d.
Earth work .....	1,000	0	0
Sleepers, (cross) .....	206	5	0
Do longitudinal .....	462	10	0
Rails, iron .....	605	0	0
Roadway .....	438	0	0
Ballasting .....	220	0	0
Laying rails... ..	300	0	0
Buildings .....	100	0	0
Carriages .....	450	0	0
	£3,781	15	0

Of this sum the following items may be looked upon as *material*, that is, as articles required for the Railway to be furnished at no cost to the Contractor, viz:—

	£	s.	d.
Sleepers, (cross) .....	206	5	0
Do longitudinal .....	462	10	0
Iron Rails .....	605	0	0
Rolling Stock .....	450	0	0
	£1,723	15	0

Making the cost for labour only about £2,277 per mile, of which a portion, say one-third, will be skilled labour, or that of mechanics, that is the labour required for a mile of Railway, will not exceed 13 labourers or 3 mechanics, or for 100 miles of Railway 1,300 labourers and 300 mechanics, for a year. A small sum will have to be added to the above for Superintendence: about £25 per mile will be ample.

I should be glad to see the work progress at the rate of 150 miles annually at the least. For this the Government would have to raise £600,000 by loan annually, the interest of which would amount to about say £35,000. If Contractors could be found to undertake to execute the work with greater rapidity, there could not, I imagine, be any objection to push it forward with all possible speed, for the more quickly the work is completed the sooner will the Country begin to derive a benefit from it, and as the money has to be borrowed, it matters but little whether it is borrowed at the rate £3,000,000 in five years or in three years. I think, however, that for the first year, at all events, we shall not be able to spend more than £600,000 properly.

I should wish, however, to commence the Western Line next year, and to add therefore £200,000 to the amount to be borrowed in 1857 for the commencement of the Locomotive Line to the Hawkesbury. The difficulty which the Government will have to encounter in the construction of so many Lines of Railway will be that of getting a sufficient number of Contractors whose competition will bring down the cost of the work to a minimum.

It will be hopeless to attempt to induce capitalists to venture out from England unless they are assured that they will be provided with work for some years to come, and that such a sum of money will be expended annually upon the work as will afford them a good profit upon their investments.

Should the Legislature pledge itself to the *completion* of the line above alluded to, and to the expenditure of say *not less* than £200,000 per annum upon each of them, time would be given between this and the end of 1857 for perfecting all the arrangements for making the Plans and Estimates, for communicating with Capitalists in England, &c.; but unless some specific understanding is had, first, as to the character of the Railroad to be made, and next, as to the amount of money to be annually expended upon it, it would be impossible to make any arrangements for pressing the work forward at a much more rapid rate than has been done hitherto.

W. DENISON.

NEW SOUTH WALES.

---

# RAILWAY EXTENSION.

(INHABITANTS OF COUNTY OF ARGYLE.)

---

*Ordered by the Legislative Assembly to be Printed, 19 December, 1856.*

---

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the Inhabitants of the County of Argyle, in Public Meeting assembled,—

SHEWETH :—

That the difficulty and expense of consigning merchandize between the county of Argyle and Sydney, arising from the absence of even a tolerable road, is operating most prejudicially to the interests of the Colony generally, and of the Southern District in particular; and that, unless measures are taken to facilitate the transit of goods, the whole custom and traffic of that portion of New South Wales which lies to the west and south-west of the County of Argyle, will shortly be diverted to the neighbouring Colonies of Victoria and South Australia.

That the traffic of goods between this county and Sydney consists of about nine thousand tons annually, the cost of the carriage of which amounts to nearly one hundred thousand pounds—this estimate being exclusive of all intermediate and passenger traffic—and that this quantity would be greatly increased, even with the present population, if any outlet existed by which produce could be sent to a market; and your Petitioners respectfully urge that a Railway would be cheaper to maintain, and better adapted to the necessities of the Country, than any other kind of road whatsoever, and that there is every probability that a line, constructed in an economical manner, between Goulburn and Sydney, would prove, not only a self-supporting, but a remunerative undertaking.

Your Petitioners beg respectfully to remind your Honorable House, that the extension of the Railway communication to Goulburn would partake of the character of a national work in a greater degree than any other line, in consequence of this being the great high road between the adjoining Colonies of Victoria and South Australia.

Your Petitioners commend these facts to the consideration of your Honorable House, and respectfully entreat that early measures may be taken to extend the benefits of Railway communication to the south-western districts of the Colony.

And your Petitioners will ever pray.

NEW SOUTH WALES.

## EXTENSION OF HUNTER RIVER RAILWAY.

*Ordered, by the Legislative Assembly, to be Printed, 16 September, 1856.*

To the Honorable The Legislative Assembly of New South Wales, in Parliament assembled.

The Humble Petition of the undersigned, the Members of the East Maitland Improvement Committee.

RESPECTFULLY SHEWETH:—

That at a Public Meeting duly convened of the Inhabitants of the Town of East Maitland, held on the nineteenth day of September, one thousand eight hundred and fifty-five, your Petitioners were constituted and appointed a Committee to watch over and protect the interests of the said town.

That your Petitioners having in view the general welfare of the whole Hunter District, and that of East Maitland in particular, on the nineteenth day of July now last past, convened a Public Meeting of the Inhabitants of East Maitland, to consider the expediency of petitioning His Excellency the Governor General for the extension of the line of the Hunter River Railway to Singleton, and thereby to open up the traffic of this vast district to a spot where first its advantages to the public might be experienced. This movement on the part of your Petitioners was deemed necessary in consequence of measures taken by the Inhabitants of a neighbouring town to endeavour to secure the benefit of the line *to that town alone*, and to induce the authorities altogether to *prohibit* the use of the Rail, so far as already completed, until it should have reached their own locality, finished and in working order.

That at such last mentioned meeting a Petition was prepared and adopted, to the same purport and effect as this your Petitioners' humble Petition, and concluding with the same prayer for presentation to His Excellency the Governor General; which Petition has been forwarded to His Excellency, bearing the signatures of six hundred and ninety-two Inhabitants of this and the surrounding District.

Your Honorable House is doubtless aware that the original line of Railway, for which the Act of Council was passed, was from Newcastle to East Maitland, and that it was intended such line should afterwards be extended towards Singleton, and, eventually, towards the Dividing Range; and that at the last Session of the Legislative Council a sum was voted towards the extension to Singleton, but was subsequently recalled.

Your Petitioners would humbly submit, that when the present line is extended, the original intention of the Government should be carried out in its integrity, and the extension be made to Singleton with all convenient speed.

That the opening up of the line to Singleton would be productive of great benefits to the whole District, by affording the means of speedy transit of produce from the upper country to the sea; and until it is so opened up, no revenue, at all commensurate with its enormous cost, can be safely anticipated; but when once the trains run through to Singleton, from the large quantities of merchandize that will be carried on the line to and fro, a paying return for the capital invested will arise.

Your Petitioners therefore humbly pray your Honorable House, that the extension, if any, beyond the Government Township of Maitland, may be made to Singleton, with such stations along the line as may be found advisable.

And your Petitioners will ever pray, &c.

[Here follow 22 signatures.]

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

---

VOTES No. 56. TUESDAY, 9 DECEMBER, 1856.

21. Railway Terminus and Wharfs at Newcastle:—Mr. Flood moved, pursuant to *amended* notice—

(1.) That a Select Committee be appointed to inquire into the propriety of any alteration in the originally proposed Terminus of the Railroad at Newcastle; into the expense consequent thereon; and whether, in connexion with the Railway Terminus at Honeysuckle Point, and since the abandonment of the Jetty, any steps have been taken towards ascertaining the eligibility of Bullock Island as a site for the construction of wharfs; and whether any estimate has been made of the probable cost of such operations, in comparison with the contemplated outlay to be incurred by the present plan of the Commissioners.

(2.) That such Committee consist of Mr. Buckley, Mr. Barker, Mr. Gordon, Mr. Jones, Mr. Hay, Mr. Piddington, Mr. F. T. Rusden, Mr. Weekes, and Mr. Arnold.

Question—(1) That a Select Committee be appointed to inquire into the propriety of any alteration in the originally proposed Terminus of the Railroad at Newcastle; into the expense consequent thereon; and whether, in connexion with the Railway Terminus at Honeysuckle Point, and since the abandonment of the Jetty, any steps have been taken towards ascertaining the eligibility of Bullock Island as a site for the construction of wharfs; and whether any estimate has been made of the probable cost of such operations, in comparison with the contemplated outlay to be incurred by the present plan of the Commissioners—put and passed.

Question—(2) That such Committee consist of Mr. Buckley, Mr. Barker, Mr. Gordon, Mr. Jones, Mr. Hay, Mr. Piddington, Mr. F. T. Rusden, Mr. Weekes, and Mr. Arnold—put and passed.

---

VOTES No. 76. FRIDAY, 23 JANUARY, 1857.

19. Hunter River Railway:—Mr. Barker moved, pursuant to notice, That the Petition of the Chairman, Deputy Chairman, and Committee of the Newcastle Chamber of Commerce, praying for certain extensions of the Hunter River Railway, presented by him on the 21st instant, be referred to the Select Committee on the Railway Terminus and Wharfs at Newcastle, now sitting.

Question put and passed.

Ordered to be referred accordingly.

---

VOTES No. 89. WEDNESDAY, 18 FEBRUARY, 1857.

17. Newcastle Railway Terminus:—Mr. Flood moved, pursuant to *amended* notice, That the Petition presented by him on the 11th instant, in reference to the Newcastle Railway Terminus, be referred to the Committee now sitting on that subject.

Question put and passed.

---

VOTES No. 92. FRIDAY, 20 FEBRUARY, 1857.

5. Railway Terminus and Wharfs at Newcastle:—Mr. Piddington, as Chairman, brought up the Report from, and laid upon the Table the Evidence taken before, the Select Committee on the Railway Terminus and Wharfs at Newcastle, appointed on the 9th December last.

Ordered to be printed.

1857.

## RAILWAY TERMINUS AND WHARFS AT NEWCASTLE

## REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 9th December last, "to enquire into the propriety of any alteration in the originally proposed Terminus of the Railroad at Newcastle; into the expense consequent thereon; and whether, in connexion with the Railway Terminus at Honeysuckle Point, and since the abandonment of the Jetty, any steps have been taken towards ascertaining the eligibility of Bullock Island as a site for the construction of Wharfs; and whether any estimate has been made of the probable cost of such operations, in comparison with the contemplated outlay to be incurred by the present plan of the Commissioners;"—and for whose consideration was referred, on the 23rd ultimo, "the Petition from the Chairman, Deputy Chairman, and Committee of the Newcastle Chamber of Commerce, praying for certain extensions of the Hunter River Railway;"—and on the 18th instant, "a Petition from certain Inhabitants of Newcastle and suburbs, in public meeting assembled, praying that Railway facilities may be afforded to the up-country Districts, before incurring the expense of establishing the Terminus of the Newcastle Railway at the Sand Hills;"—have agreed to the following Report, viz. :—

Your Committee have come to the conclusion, founded upon the evidence of the Chief Engineer of Railways, Mr. Whitton, as well as that of other witnesses examined by them, that the original proposal of the Railway Commissioners, to construct an expensive double line of Railway from Honeysuckle Point to Watt-street, Newcastle, at an estimated cost of £70,000, taking into consideration the limited amount of traffic that may reasonably be calculated upon, in connexion with the proposed Coal Line, is inexpedient, and ought to be abandoned. It seems that the Commissioners contemplated, in addition to a Goods and Passenger Line, upon a level with the road, another Line, called the Coal Line, constructed upon framing, at an elevation of twenty feet above the road level, and necessarily very expensive, for the delivery of coal. The objection to this proposal is, that the two principal Coal Companies at Newcastle—viz., the Australian Agricultural Company, and the Newcastle Coal and Copper Company—will have no inducement whatever to pay for the use of the Government Railway, as the Companies alluded to have made arrangements for steam power of their own, entirely independent of the Government Line, and at present little or no other traffic on the Coal Line could be relied upon. Your Committee, therefore, have felt no hesitation in arriving at the above conclusion.

Your Committee beg to recommend that a single Line of Railway for goods and passengers only, from Honeysuckle Point to the Wharf at Watt-street, should be laid down, in the most economical manner consistently with strength and sufficiency, and that the Railway buildings necessary at the Terminus at Watt-street should be of the most inexpensive description, more especially as your Committee feel impressed with the conviction, that if the shoal adjacent to Bullock Island be recovered from salt water, that no spot could be found better adapted for the accommodation of shipping, and for affording a large space of anchorage ground;—the land reclaimed would afford the merchant community of Newcastle, and the public in general, most desirable sites for wharfs, stores, and trading establishments.

Your

Your Committee have examined several witnesses, among whom is Mr. A. W. Scott, a Member of your Honorable House, and feel persuaded that the Harbour of Newcastle would be very greatly improved by the gradual construction of an embankment from the north end of Bullock Island to the neighbourhood of the Australian Agricultural Company's staiths; this might be accomplished by driving piles along a line to be determined by the Engineer, and then making it compulsory "that all vessels discharging ballast in the Port shall be obliged, under a penalty, to discharge their ballast behind the line to be marked out by "piles;" this operation would involve the Government in but a small expense, compared to the value of the land retrieved. The process would, unquestionably, reclaim a large breadth of the low land, between the line of embankment and Bullock Island; and, as the work proceeded, the land gradually reclaimed from shoal water might be sold by the Government, thus not only reimbursing the current expenses of the undertaking, but effecting a vast improvement in a Port increasing every year in importance.

As it is doubtful where the chief Terminus at Newcastle will be ultimately fixed, your Committee is of opinion that it would be undesirable for the Government to take up more land at Honeysuckle Point than is strictly required for Railway purposes.

W. R. PIDDINGTON,  
Chairman.

*Legislative Assembly Chambers,  
Sydney, February, 1857.*

---

PROCEEDINGS OF THE COMMITTEE.

---

THURSDAY, 11 DECEMBER, 1856.

**Members Present:—**

Mr. Flood,		Mr. Barker,
	Mr. Jones.	

Committee appointed Mr. Piddington to be their Chairman.  
Mr. Flood, in the absence of Mr. Piddington, was called to the Chair.  
Committee deliberated as to their course of Proceedings.

Motion made and *Question*—“That G. K. Mann, Esquire, Chief Commissioner of Railways, be summoned before this Committee, as a Witness, on Tuesday next, with instructions to bring with him the Plan of the originally proposed Railway Terminus at Newcastle, and that of the Terminus now proposed, together with any other Plans, Papers, &c., relating thereto”—*agreed to.*

[Adjourned till Tuesday next, at Eleven o'clock.]

---

TUESDAY, 16 DECEMBER, 1856.

**Members Present:—**

W. R. Piddington, Esquire, in the Chair.		
Mr. Flood,		Mr. Weekes,
Mr. Jones,		Mr. F. T. Rusden,
	Mr. Buckley.	

The Clerk, by direction of the Chairman, read the Minutes of Proceedings taken at the last meeting of the Committee.

Resolution of the House, appointing Committee, read by the Chairman.  
Committee deliberated.

Mr. G. K. Mann, Chief Commissioner of Railways, examined.  
[Adjourned till Thursday next, at Twelve o'clock.]

---

THURSDAY, 18 DECEMBER, 1856.

**Members Present:—**

W. R. Piddington, Esquire, in the Chair.		
Mr. Jones,		Mr. F. T. Rusden,
Mr. Weekes,		Mr. Buckley.

Mr. E. O. Moriarty, Civil Engineer, examined.

Motion made and *Question*—“That Dr. Brookes, of Newcastle, be summoned before this Committee, as a Witness, for Friday, 2nd January”—*agreed to.*

[Adjourned till Friday, 2nd January, at Twelve o'clock.]

---

FRIDAY, 2 JANUARY, 1857.

**Members Present:—**

W. R. Piddington, Esquire, in the Chair.		
Mr. Jones,		Mr. Weekes,
	Mr. F. T. Rusden.	

By direction of the Chairman, the Clerk read a letter from Dr. Brookes, requesting the Committee to excuse him from attendance before them, as a Witness, *this day.*

Committee deliberated.

Motion made and *Question*—“That Dr. Brookes be now summoned before this Committee, as a Witness, for Wednesday next”—*agreed to.*

[Adjourned till Wednesday next, at Twelve o'clock.]

---

WEDNESDAY, 7 JANUARY, 1857.

**Members Present:—**

W. R. Piddington, Esquire, in the Chair.		
Mr. Flood,		Mr. F. T. Rusden,
Mr. Weekes,		Mr. Arnold,
	Mr. Buckley.	

Dr. Brookes, of Newcastle, examined.  
[Adjourned till to-morrow, at Eleven o'clock.]

---

THURSDAY, 8 JANUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.

Mr. Flood,		Mr. Buckley,
Mr. Jones,		Mr. Arnold,
Mr. Weekes,		Mr. F. T. Rusden.

Mr. *William Crossdill*, of Newcastle, examined.  
[Adjourned till Wednesday next, at Eleven o'clock.]

WEDNESDAY, 14 JANUARY, 1857.

Members Present:—

Mr. Piddington, | Mr. Hay.

Mr. *J. Whitton*, Chief Engineer to the Railway Commissioners, was in attendance, as a Witness;—

But a Quorum of the Committee not being present,  
[Adjourned till Tuesday next, at Eleven o'clock.]

TUESDAY, 20 JANUARY, 1857.

Members Present:—

Mr. Piddington, | Mr. Jones.

Mr. *J. Whitton*, and Mr. *W. Keene*, were in attendance as Witnesses;—

But a Quorum of the Committee not being present,  
[Adjourned till Friday next, at Eleven o'clock.]

FRIDAY, 23 JANUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.

Mr. Arnold,		Mr. Weekes,
Mr. Flood,		Mr. Barker,
Mr. Buckley,		Mr. Jones,
		Mr. F. T. Rusden.

Mr. *J. Whitton*, and Mr. *W. Keene*, who were summoned before the Committee, as Witnesses, for this day, being both present in the Room, and a Question arising, on the Chairman calling Mr. *Whitton* for the purpose of commencing his examination, as to the expediency, under the peculiar and conflicting nature of the Evidence given with respect to this inquiry, of permitting Mr. *Keene* to be present during the examination of Mr. *Whitton*,—Committee deliberated, and being of opinion, that it was unadvisable to permit Mr. *Keene's* presence during such examination,

The Chairman directed Mr. *Keene* to withdraw, and

Mr. *Keene* withdrew accordingly.

Mr. *J. Whitton*, Engineer-in-Chief, to the Railway Commissioners, then examined.

At the close of his examination, the Chairman directed Mr. *Whitton* to withdraw, and Mr. *Whitton* withdrew accordingly.

Mr. *William Keene*, Examiner of Coal Fields and Coal Mines, then examined.

[Adjourned till Wednesday next, at Eleven o'clock.]

WEDNESDAY, 28 JANUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.

Mr. Jones,		Mr. Barker,
Mr. Weekes,		Mr. Buckley,
Mr. Flood,		Mr. F. T. Rusden.

By direction of the Chairman, Resolution of the House referring to the Committee, on 23rd instant, a Petition from the Chairman, Deputy Chairman, and Committee of the Newcastle Chamber of Commerce, praying for certain extensions of the Hunter River Railway,—read by the Clerk.

Petition then read. (*Vide Appendix A.*)

Mr. *J. Brown*, ship owner of Newcastle, and Mr. *George Tully*, examined.

[Adjourned till Tuesday next, at Eleven o'clock.]

TUESDAY,

TUESDAY, 3 FEBRUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.	
Mr. Arnold,	Mr. F. T. Rusden,
Mr. Gordon,	Mr. Buckley,
Mr. Barker,	

The Clerk, by direction of the Chairman, read the Minutes of Proceedings taken at the two previous meetings of the Committee.

Mr. *Alexander Brown*, Manager of the Coal and Copper Company, and Mr. *M. Bell*, Engineer in the Hunter River Railway Department, examined.  
[Adjourned till Friday next, at Eleven o'clock.]

FRIDAY, 6 FEBRUARY, 1857.

By direction of the Chairman, the Meeting of the Committee to be holden *this day*, was postponed till Wednesday next, at Twelve o'clock.

WEDNESDAY, 11 FEBRUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.	
Mr. Jones,	Mr. F. T. Rusden,
Mr. Arnold.	

Mr. *A. W. Scott*, M. P., examined.

Committee deliberated respecting the tenor of their proposed Report.

Motion made (Mr. *Jones*) and *Question*,—"That the Chairman be requested to draft a series of Resolutions for the consideration of the Committee, such Resolutions, if agreed to, to form the basis of their Report"—*agreed to*.

[Adjourned till Tuesday next, at Eleven o'clock.]

TUESDAY, 17 FEBRUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.	
Mr. Weekes,	Mr. Jones,
Mr. F. T. Rusden,	Mr. Buckley,
Mr. Arnold.	

The following Draft Resolutions, brought up by the *Chairman*, were read 1<sup>o</sup>:—

"1. That there is no evidence in possession of the Committee to justify the Government in expending the large sum of money necessary for the purpose of constructing a double line of Railway from Honeysuckle Point to Watt-street, as recently proposed by the Railway Commissioners; one for goods and passengers, and another upon framing, at an elevation of twenty feet above the road level, for the delivery of coal;—the estimated cost of both lines amounting to £70,000, exclusive of Rails."

"2. That a single line of Railway, for goods and passengers, from Honeysuckle Point to the Wharf at Watt-street, should be laid down in the most economical manner consistent with strength and sufficiency, and that the Railway buildings necessary at the Terminus at Watt-street, should be of the most inexpensive description."

"3. That, in the opinion of this Committee, the Harbour of Newcastle would be very greatly improved by the gradual construction of an embankment from the north end of Bullock Island to the neighbourhood of the A. A. Company's staiths. Your Committee believe that the ships entering the Port ought to be compelled, under penalty, to discharge ballast along a line, to be marked out by the Port Master, at Newcastle."

"4. That the gradual operation of this process would unquestionably reclaim a large breadth of the low land between the line of embankment and Bullock Island, and that, as the work proceeded, the land gradually recovered from shoal water might be sold by the Government, with the view to pay the current expenses of the undertaking, and thus ultimately secure the most ample wharf and shipping accommodation to the growing commerce of Newcastle; there being off Bullock Island a larger area of deep water than in any other portion of the harbour."

"5. That, as it is doubtful where the main Terminus at Newcastle will be ultimately fixed, the Committee are of opinion that it would be undesirable for the Government to take up more land at Honeysuckle Point than is strictly required for Railway purposes."

Motion made (Mr. *Jones*) and *Question*—"That these Resolutions be now read 2<sup>o</sup>, and considered *seriatim*"—*agreed to*.

*First Resolution* read.

Whereupon Committee *Resolved*:—

"That the purport of this Resolution be embodied in the Report."

*Second Resolution* read.

Motion made (Mr. *Weekes*) and *Question proposed*—"That this Resolution be amended by the omission of all the words after the word "That," at the commencement, "with

“ with a view to the insertion of the following words :—‘ the evidence of the various witnesses examined does not justify the adoption of so unusual a proceeding as running a Railroad on street level through the Town of Newcastle, to Watt-street, more especially when it is proposed that such Railroad should be fenced in with a close fence,—thus shutting out the inhabitants from all access to water frontage, whilst the accumulation of shipping at the proposed Terminus, which is at the mouth and narrowest part of the harbour, would inevitably tend to increase the difficulties to vessels entering thereinto’—instead thereof.”

Committee deliberated.

Question put—“ That the words proposed to be omitted stand part of the Resolution.”

Committee divided.

Ayes, 3.  
Mr. Buckley,  
Mr. Jones,  
Mr. F. T. Rusden.

Noes, 1.  
Mr. Weekes.

Whereupon Committee Resolved :—

“ That the purport of this Resolution be embodied in the Report.”

Third, Fourth, and Fifth Resolutions then read.

Whereupon Committee Resolved :—

“ That the purport of these Resolutions be embodied in the Report.”

Motion made (Mr. Jones) and Question—“ That the Chairman be now requested to prepare a Draft Report, embodying the purport of these Resolutions, for the consideration of the Committee”—*agreed to.*

[Adjourned till Friday next.]

FRIDAY, 20 FEBRUARY, 1857.

Members Present:—

W. R. Piddington, Esquire, in the Chair.

Mr. Weekes,  
Mr. Flood.  
Mr. Barker,

Mr. Arnold.

Mr. Buckley,  
Mr. Jones,  
Mr. F. T. Rusden,

The Clerk, by direction of the Chairman, read the Minutes of Proceedings taken at the last meeting of the Committee.

By direction of the Chairman, Resolution of the House, referring to the Committee, on 18 instant, a Petition from certain Inhabitants of Newcastle and its Suburbs, in public meeting assembled, praying that Railway facilities may be afforded to the up-country districts before incurring the expense of establishing the Terminus of the Newcastle Railway at the Sand Hills, read.

Petition then read. (*Vide Appendix B.*)

Committee deliberated.

Motion made (Mr. Flood) and Question—“ That the Committee is of opinion that it is expedient to recommend the printing of this Petition, together with the one referred for their consideration on the 23rd ultimo, in an Appendix to their Report”—*agreed to.*

The Chairman then brought up, and laid before the Committee, a Draft Report.

Motion made and Question—“ That the Draft Report proposed by the Chairman be now read”—*agreed to.*

Report read accordingly.

Committee deliberated as to the advisability of inserting a paragraph at the end of the Draft Report, having reference to the two Petitions referred to them, and considered that the insertion of any such paragraph was unnecessary.

Whereupon Motion made and Question proposed—“ That this be the Report of the Committee ”

Committee divided.

Ayes, 5.  
Mr. Flood,  
Mr. Jones,  
Mr. Buckley,  
Mr. Barker,  
Mr. F. T. Rusden.

Noes, 2.  
Mr. Arnold,  
Mr. Weekes.

Chairman requested to Report to the House, together with the Minutes of Evidence.

## NEW SOUTH WALES.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

## RAILWAY TERMINUS AT NEWCASTLE.

TUESDAY, 16 DECEMBER, 1856.

Present:—

MR. BUCKLEY,  
MR. FLOOD,  
MR. JONES,

MR. PIDDINGTON,  
MR. F. RUSDEN,  
MR. WEEKES.

W. R. PIDDINGTON, ESQUIRE, IN THE CHAIR.

Gother Kerr Mann, Esq., called in and examined:—

G. K. Mann,  
Esq.

1. *By the Chairman:* I believe you are one of the Railway Commissioners? I am the Chief Commissioner.

2. Can you inform the Committee where the Terminus of the Railway is situated—the exact position of the present Terminus? There is, in fact, no Terminus at present; the line extends on to Honeysuckle Point; it does not run on through Honeysuckle Point, on to the Australian Agricultural Company's land, but terminates short of it about forty or fifty yards.

3. Then I understand that the Railway Commissioners have not fixed upon any Terminus at present? The Railway Commissioners propose that the line should be extended through Newcastle, to land beyond Watt-street; and they have prepared plans and estimates in accordance with that proposition.

4. To what land beyond Watt-street? To Government land, at the foot of the sand hills, near where some old Government buildings exist.

5. How near is it to the breakwater? The eastern boundary of Watt-street is the western boundary of the Terminus.

6. It does not extend beyond Watt-street? A portion of it will extend beyond Watt-street; but the Station itself will be to the eastward of it.

7. The Station itself is fixed in Watt-street; what I wish to know is, the proposed extreme point of the Terminus? The line itself would run some considerable distance beyond the Station buildings. The extreme point of the permanent way, and the arrangements for the coal traffic, will probably extend beyond those for the passenger traffic; the former would terminate, at present, at that portion of the wharf where the sheep and cattle are shipped.

8. Then the eastern side of Watt-street will, in reality, be the Terminus of the Railway? You may call the whole of that part of the ground the Terminus.

9. But merely for the purpose of convenience? Excuse me—if you would call the whole of that land the terminal station; the station itself cannot be defined to so near a point; it will extend over a considerable area.

10. Is the present proposed Terminus at Watt-street the original Terminus agreed upon? The idea originally, when first I joined the Commission, and which I believe was the intention of the Company, though it was not matured, was to have formed station arrangements at Honeysuckle Point; the Company proclaimed a large area of land there for that purpose.

11. If the proposed line along the edge of the harbour to Watt-street is finally fixed upon, will not that line very much interfere with the convenience of the inhabitants of Newcastle, by intersecting the various streets, which I believe all run from north to south? I do not think it will.

12. In what manner do the Commissioners propose to construct the line—upon embankments, arches, or piles? The proposition they design to carry out is, that the passenger traffic shall be upon the general level; the arrangement for the coals will be at an elevation of from one

G. K. Mann,  
Esq.420  
16 Dec., 1856.

to two and twenty feet above the level, upon framing. It is necessary that the coal traffic should be delivered at that elevation; the arrangements for the staiths require it.

13. Then the passenger traffic will be conducted upon the level of the land? Upon the present general level of the Railway.

14. That, perhaps, will necessitate an embankment, but not very high? Yes, the general level.

15. If embankment is necessary for the purposes of passenger traffic, will not that interfere with the convenience of the inhabitants, by cutting them off from the harbour? No; the embankments will not be above their level, or the level that the wharf will have to be made up to; and the coal traffic, upon which there would be the greatest amount of daily or constant traffic going on, will be at such an elevation that the town will have free access under it to the wharf. As regards the passenger traffic—it will be only at stated periods that the trains will pass during the day, and being on the general level, can easily be crossed at other times.

16. Notwithstanding that the passenger traffic will be that which will the least interfere with the traffic of the inhabitants, still, as the city is now built, I presume that parties having to go to the harbour will have to cross the Railway? Yes.

17. To that extent, will it not interfere with the convenience of the inhabitants? I do not see how it can be inconvenient when the trains are not running; it will only be at stated periods, for a few minutes, that the Railway crossings would be shut off to the town, and the Railway opened for the passage of the train.

18. Unless it be absolutely necessary that the line of Railway should intersect, as this must do, the entire line of streets of the town, is it not desirable to avoid any danger that may possibly be incurred by passengers or persons crossing the various lines of streets to the harbour, at the time when a passenger train was passing? For that time the street would be necessarily shut off, until the train had passed.

19. It would be shut off by an iron rail? No; it would be shut off by an arrangement of the gates. These are so arranged, that when the train is passing, or about to pass, they shut off the crossing from the Railway; and when the train has passed, they cross the Railway, and prevent passengers from going on to other portions of the line.

20. Will the whole of the proposed line towards Watt-street be fenced in? It will all be fenced in—entirely fenced in.

21. Will not that of itself be an impediment to free communication with the harbour? Not at all; the fences would not be carried across the lower crossings; the lower crossings would be protected by gateways, as I have stated.

22. By the lower crossings, you mean the terminus to the street? The lower crossings will be the prolongation of the street to the wharf.

23. Are you acquainted with the capacity of the harbour at Newcastle for the accommodation of shipping in the immediate vicinity of Watt-street, and opposite Watt-street? Do you allude to its area or to its depth of water?

24. To its area—to the harbour accommodation? I have not gone into that point. I have considered more the depth of the water. I do not know the number of vessels the harbour would accommodate.

25. Should it be found that at that particular part the harbour accommodation is more limited than at any other part, would not that in itself be an objection? There will be no more vessels there at one time when the Railway is there than at present. In fact, they will not be detained alongside the wharf so long as at present.

26. Is it not reasonable to suppose that when this Railway shall be completed and in working order, that it will increase the commerce of Newcastle? I anticipate it will, to a very great extent; but if that is found to be the case, the wharf accommodation can also be increased. It can be carried out as far as the Breakwater, if necessary—the whole sweep. The line proposed for the improvement of the harbour by Mr. Moriarty has been followed in the plans, and that sweep could be carried on to meet the Breakwater.

27. I do not doubt, in any way, what you state with regard to the extent of wharf accommodation simply, but my question goes to the area of harbour accommodation, not to the possibility of extending the line of wharf accommodation; and upon that I understand you are not in a position to inform the Committee? I am not.

28. You also state that no greater number of ships will be likely to enter the port of Newcastle when the Railway shall be completed than enter now? I beg pardon, I did not say that; I meant to say that I did not think that portion of the harbour would be more obstructed in consequence of Railway traffic than it is at present, on account of the extra rapidity with which vessels will be loaded from the more complete arrangements for delivering goods and coals.

29. Is it not natural to suppose, and is not that supposition confirmed by experience, that wherever a Railway Terminus is fixed, to that point all traffic is concentrated? Then it would be necessary to extend the wharf frontage.

30. My questions are directed more with reference to harbour accommodation, with the view of learning from yourself, if you can inform the Committee, whether the proposed Terminus will or will not concentrate the traffic, the presumed and expected traffic of Newcastle, at the point where the Terminus is fixed? No doubt.

31. If it does concentrate the traffic at that point, the number of ships at that point will necessarily have a tendency to increase? We hope so, but under any arrangement we can only take a limited number of ships alongside the wharf, the others must haul off into the stream until they can come alongside the staiths to load. Under such circumstances, I do not think the objection to that point could be greater than it is at present. There is no doubt that the general obstruction of the harbour by the increase of traffic must be expected.

32. Have you never heard of collisions even now between steamers and merchant vessels in the

the

the immediate neighbourhood of the proposed Terminus at Watt-street? I do not remember. G. K. Mann, Esq.

33. If any other portion of the harbour of Newcastle can be pointed out where the harbour accommodation is very much more extensive than in the neighbourhood of Watt-street, would not that of itself be a reason why that part of the harbour should be fixed upon in preference to another part where the harbour is less extensive? If equally accessible, it would certainly be a reason why it should. 16 Dec., 1856.

34. Have you ever contemplated a place called Bullock Island with respect to its eligibility as a Terminus for the Newcastle Railway? I cannot say I have ever contemplated it as a Terminus, but I have had it examined merely to satisfy myself about it; in fact, that I might leave no point unturned in settling this question, which I considered a momentous one. Bullock Island, I found to be altogether inapplicable; it would entail an enormous outlay, even supposing the Railway had not already been carried into the town. The whole level of Bullock Island, according to surveys which were made, is some four or five feet under the level of our line, and to make a Terminus where the surface would have to be raised to that height would, I think, be most objectionable. Besides, it would be necessary to have an extensive jetty from the main to the Bullock Island, and also an extensive jetty to reach into deep water. These two jetties together would be equal to nearly three-quarters of a mile; and if these had been completed, there would be no possibility of extending the accommodation as the traffic increased, without a further enormous expenditure for jetties. Also, in an engineering point of view, it is very doubtful how these jetties, if carried out, would affect the harbour of Newcastle; in fact, it is a question with me whether they would stand there at all.

35. You are acquainted, I suppose, with a place called Honeysuckle Point, near the Australian Agricultural Company's coal establishments and coal shoots? Yes; I know them well.

36. Would it not be possible, by piling or otherwise, to reclaim a considerable portion of what is now scarcely more than a swamp, between the coal-shoots and Bullock Island? It would be possible, but the expense would be something enormous.

37. The expense of the embankment from Honeysuckle Point to the end of Bullock Island? Yes; the piling itself would amount to a very considerable sum, and as to reclaiming the land, if it were done at once, it would be almost impossible to estimate the expense, but it would be something enormous. If it were left to be done gradually, the work must extend over some period of years before any area was reclaimed, and then it would be a question how far it would affect the harbour of Newcastle. It is a very dangerous thing to meddle with the waters of a tidal river.

38. Is it your opinion that this would affect the tidal waters? It is difficult to say.

39. Have you considered the subject—can you give a decided opinion that it would interfere with the tidal waters? I think it would.

40. Have you any idea of the expense of an embankment from the coal-shoot to the north end of Bullock Island? I have not made any estimate, and, in fact, I never contemplated making any estimate of the sort; but from the experience I have had in these works I believe that the cost of such a work would be something enormous—that really the advantage gained would not compensate for the outlay for years to come, even if it did then.

41. Do you limit your opinion to the reclamation of the entire surface of the ground, or to the expense of the embankment from the coal-shoots to the northern point of Bullock Island? I would combine both. The embankment would have to be the first work necessary to be done, and that, in itself, would be a work of considerable magnitude.

42. Have you any idea of the value of land at Bullock Island, or in the immediate neighbourhood? I have not.

43. Have you any idea of the acreage that might be reclaimed if the proposed embankment from the coal-shoots to the northern point of the island were carried out? I have not, but it is something very considerable.

44. Taking it for granted that it would reclaim a space of land equal to 640 acres, do you not think such a vast extent of valuable land, in the immediate neighbourhood of Newcastle, available for purposes of repayment—do you not think the sale of that land alone would be sufficient to reimburse any outlay? It might; but these are subjects that I did not consider, and upon which I hardly came prepared to give an opinion. It is probable, from the value of land at Newcastle, at the price it has lately been selling, that it might be a profitable speculation, but I have not considered that at all in connexion with the Railway works or the Railway Terminus.

45. I think you have not expressed a positive opinion as to whether that proposed embankment would in reality interfere injuriously with the current of the Hunter River? No; I am not prepared to express a positive opinion at present without going into the subject. It would be necessary that I should observe the set of the waters up the river, the general tidal set, before I could express an opinion.

46. *By Mr. Flood:* How long have you filled your office of Chief Commissioner of Railways? Somewhere about a year; a little more.

47. When you entered upon office did you find any plans in reference to the Railroad at Newcastle, including the Terminus? We had plans with reference to the Railroad, but we had no definite plan or arrangement with reference to the Terminus.

48. No definite plans? There were a number of suggestions and propositions with reference to the Terminus, and I believe there were sketches by different parties, and among others one for running out a jetty from Honeysuckle Point.

49. Was not that jetty commenced with the intention of making the Terminus at Honeysuckle Point? It never was commenced; nothing has been done to it.

50. I suppose you have never made a calculation as to the cost of a Terminus or chief station at Honeysuckle Point? Calculations for an approximate estimate were gone into, and I found

G. K. Mann, Esq., found a sum upon the Estimates for the erection of that jetty of £37,500; but from the rough estimates I have made I am thoroughly convinced that amount never would have built the jetty.

16 Dec., 1856.

51. That was the estimate you found in the office? That was put upon the Estimates of Expenditure to, and voted by the Legislature; it was put down as an approximate sum.

52. Was there any charge expected to be made upon the public in addition to the cost of construction of the jetty? Compensation for land at Honeysuckle Point, and the station arrangements.

53. Do you know what was the amount of compensation sought? There were very considerable land claims for Honeysuckle Point. There were twenty-two acres there, and the original claim by the trustees for this, I think, was £1,500 an acre; an application was afterwards made to the Commissioners to revise their claim, and to put it down at £2,000 an acre, which the Commissioners refused. When the land was taken possession of by the Company originally it was found to be in possession of numerous tenants; these tenants sent in a claim, in the aggregate amounting to, I think, £38,000, in addition to the claim made by the trustees.

54. Who are the trustees to whom you allude? Mr. Scott and Mr. Croasdail.

55. To what estate are they trustees? I think it was land purchased for some church or school, purchased by a society.

56. These gentlemen have no other interest than as trustees? No, I believe not. I will just proceed, if you please, to state how that claim stands; it is very complicated, and it has been impossible hitherto to arrange it. The tenants were found in possession, and when their claims were looked into, it was found that they had no legal title, or that their legal title was disputed. I understand that they had none. The Commissioners then proposed to treat with the trustees, in the first instance, leaving it to the trustees to settle with the tenants; but the trustees, as I understood, refused to acknowledge the title of the tenants. Subsequently, I believe, there was a proposition made by the trustees, on condition that they should receive £2,000 an acre for the land, that they would make some arrangement with the tenants.

57. *By Mr. Jones:* As between the trustees and the tenants? As between the trustees and the tenants; but there was another difficulty, arising from one of the trustees declining to act.

58. *By Mr. Flood:* Then, altogether, the amount would be about £70,000; the amount of claims made by both trustees and tenants? It would be fully £70,000 for twenty-two acres of land.

59. That, in addition to the £37,500, the cost of the jetty, would be upwards of £100,000? Yes, and that £37,500 would not include any station or arrangement further than the jetty.

60. Merely for the construction of the jetty, without buildings or staiths? Yes, or permanent way, or coal arrangements, or staiths at the end of it.

61. What distance is Honeysuckle Point from the Terminus, or site for the Terminus, which has been adopted since you have been in the office? I think about a mile. (*The witness produced a plan, and pointed out the course of the Railway.*)

62. Will this proposed line interfere with private property from Honeysuckle Point to Watt-street? The only parts are the Australian Agricultural Company's property, and I think they are willing to give it to us on favourable terms, and the allotments between Perkins-street and the Bank of Australasia. These allotments are not built upon or fenced in.

63. Will you state what it will cost the public to resume these lands you speak of, the allotments as well as the Company's land? I cannot.

64. You state that you believe the Agricultural Company will allow the Commissioners to take the land on favourable terms? I am under that impression.

65. Can you state what those terms are? No; there are no terms in existence at the present moment.

66. These are the only lands the public will be required to purchase? That is all; all the rest is Government property.

67. Can you inform the Committee the cost of the proposed line from Honeysuckle Point to the proposed Terminus in Watt-street? Yes; the works here are estimated at about £70,000, from the present termination of the Railway to Watt-street.

68. Does that merely include the permanent way and the embankment? It merely includes the work; it does not include the iron.

69. It is exclusive of the rails? Yes.

70. There is no other iron than the rails? The rails and turn-tables, &c.

71. It is for the embankment, the permanent way, and the sleepers, but does not include the iron? Just so.

72. *By Mr. Jones:* It includes all the permanent way except the rails? Yes.

73. *By Mr. Weekes:* What portion of that will be for the station buildings? About £18,000; by this plan the passenger arrangement will cost about £25,000, and the coal arrangement about £40,000. I have said the stations would cost about £18,000, but there is a sum of £2,511 for a stopping station at the end of the line near Honeysuckle Point. It is desirable to stop there to take tickets and also to take up passengers.

74. Will you hand in the estimate you have now before you? I am hardly in a position to do so, as it is now before the Government, but I can give you the amount.

75. *By Mr. Flood:* The £70,000 you have mentioned, does that include any work for a wharf, if that might be required? Yes, it includes a portion of the wharf opposite Watt-street.

76. Will that include the necessary shoots for loading vessels? It includes the arrangements for two extensive shoots.

77. Will that afford ample accommodation for the number of vessels that are in the habit of trading to Newcastle? According to the present trade I think it will.

78. Is not the point in question, opposite Watt-street, particularly limited for ship accommodation? The channel is confined, but the vessels will be loaded much more quickly than at present. We expect to load a three-hundred ton ship in a tide. Now there is no other place in the harbour where a ship of that size can load alongside a wharf; they are obliged to take in their coals by lighterage.

G. W. Mann,  
Esq.  
16 Dec., 1856.

79. Can a ship swing from the wharf clear of the sandbank? Yes, she can haul out from that easily.

80. Is there room for a ship to swing lying at anchor in the channel? I do not think ships anchor there.

81. Is there room for a ship to swing? I am not aware.

82. Is it not the fact that the channel is particularly contracted at that point? Yes, there is a horse-shoe shoal that closes up the harbour considerably.

83. I would like to know if you can give the Committee the probable cost, in addition to the amount of £70,000 you have already given, of the iron work you allude to, including the turn-tables? I cannot now, but I can fill the cost in when I have my evidence for revision.—About £5,000.

84. I suppose there is no possibility of the city of Newcastle extending to the eastward of Watt-street to any great extent? It cannot extend much unless a great portion of the land below the sand hill be reclaimed; it can extend in this way for some distance.

85. Do you not think it would be desirable to retain that as a place for a public promenade for the health of the inhabitants? I think there are much better spots for that purpose.

86. At all events the area is very limited in that direction between Watt-street and the sea? No, there is a considerable area; the breakwater runs out some distance.

87. How many acres do you suppose you have there? Seventy or eighty acres might easily be reclaimed there.

88. Do you not think the town is more likely to increase ten or twenty-fold to the west of the present boundary of Newcastle, rather than to the east of Watt-street? It is probable that it may, but the shipping and the goods traffic must necessarily be down at that end of the town, for that is the only part where there is sufficient depth of water to get up to the wharf.

89. Has not the population of the suburbs immediately adjoining Newcastle increased considerably within the last two years? I have understood that it has.

90. Do you not think that by having a Terminus at the extreme end of Newcastle it will be a great inconvenience to the inhabitants both in the city and suburbs, as they will have to cart all their goods to the Terminus at Watt-street? They need not cart them; we propose to meet that by our arrangement for passenger traffic, at Honeysuckle Point. There will be a goods arrangement at the same point, if necessary.

91. Then you propose to have a Terminus at Honeysuckle Point? No, a small stopping station.

92. Will not that create great inconvenience as well as delay to stop the trains there? No, quite the contrary; it is for the extra convenience it is done. If the Terminus were at Honeysuckle Point it would be desirable to have a small stopping station further down the line.

93. Is it the object of Government to have a station for the purpose of receiving goods upon the line merely to take them a mile? That station is proposed merely as a passenger station at present; the goods station will be at Watt-street, where the steamers will deliver them, and where they must be shipped, but goods could be picked up at Honeysuckle Point.

94. Whose design is this that the Terminus should be at the east side of Watt-street—is it a site of your own? The design has been drawn out by Mr. Bell, the engineer of the line. The proposition of carrying it through was arrived at after every careful and mature consideration on the part of the Commissioners, and I believe they are unanimous, indeed I know they are, as to the necessity of adopting the present site.

95. I think you stated that Bullock Island is four or five feet below the level of the permanent way? Yes, below the permanent way; that is according to my present information.

96. For the purpose of coal traffic it would be necessary to elevate the staiths? Yes; they will have to be placed twenty feet above the delivery.

97. Bullock Island being four or five feet lower than the permanent way, it will put you to the additional expense of raising your staiths, supposing you adopted that as the site for loading ships? The same remark applies to the whole of this level—the remark that I previously made with regard to the applicability of Bullock Island as a site for a station. What I said, or meant to say, was, that it would involve the necessity of bringing up the entire level of our station ground to the level of our line. Under any circumstances our coal delivery will require to be elevated.

98. Then it is not the amount of the various sums that have been demanded by individuals that have caused the Government to adopt the present site? The expense of the land has had its due weight with the Commissioners, but had that been the most eligible spot for the coal arrangements, there is no doubt that the Government would have been justified in paying a larger compensation, if necessary.

99. *By Mr. Jones:* When you entered on your duties as Chief Commissioner of Railways, what did you understand to be the intention of the Railway authorities in reference to the Terminus of the Newcastle Railway? There was no decided intention, in fact, it was quite undecided—quite unsettled—an open question. The original intention of the Company was, no doubt, to have made the Terminus at Honeysuckle Point. It must have been so, or the land would never have been proclaimed or taken; the land must have been taken by the Company with the express intention of forming a Terminus there; but I think it must have been done, in fact, it is very evident it was done, without mature and careful consideration of the locality.

100. Have you found that a common feature in the mode in which the railroad works have been carried on in this Colony—that land has been taken possession of, and arrangements have

G. K. Mann, have been made, without the plans having been matured. No; this is the only instance of consequence that has yet occurred, where any land has been taken and it has been afterwards considered advisable to recommend that it should be relinquished again.

Esq.

16 Dec., 1856.

101. You had, as I understand, some estimates of the probable expense of carrying out the jetty into deep water at Honeysuckle Point? Yes, for the purpose of landing goods and passengers, and the delivery of merchandize, coals, and other goods, to the shipping in the harbour.

102. In deep water? In deep water.

103. As I understand, there was a line of Railway to run along this jetty? Yes.

104. The probable expense of making this jetty was estimated at £37,500? Yes; a sum of £37,500 was placed upon the Estimates and voted for the work, but I am of opinion that sum would not have been sufficient.

105. What was it supposed this £37,500 would construct? That it would construct the timber work of the jetty.

106. Did you assume that it would not have included the cost of laying the lines along this jetty? It could not have included it; it could only have included the timber-work.

107. What would have been the length of the railroad from the point at which the Railway has now arrived to the extreme end of the proposed jetty? The jetty itself would have been three-quarters of a mile long.

108. From the point at which the Railway has now arrived to the point from which the jetty would have started, what would have been the distance? The whole distance would have been upwards of a mile to the end of the jetty.

109. What is the distance from this same point to the Terminus proposed at Watt-street? Just a mile.

110. Then, in point of fact, the length of the Railway would be equal in both cases? Yes, nearly.

111. But in one case it would be carried through much along the same level as the high road—? The formation would be upon the level of the high road.

112. In the same direction? In the same direction.

113. While in the other case it would have taken a curve from the main line of the road to a portion of Honeysuckle Point, and from that, by means of a jetty, to deep water? Yes.

114. The length, in both cases, would be about the same? Yes; the jetty would involve a separate locomotive arrangement for passengers and goods, because it could not have been worked by the ordinary engine and carriages of the line. It would have been very injudicious to work along the jetty with a heavy engine and the ordinary carriages. It would have been absolutely necessary to have made a separate locomotive arrangement, on account of the distance from the station.

115. Can you state what would have been the total cost of that mile of Railway to the extreme point? I think no clear and definite estimate was ever made of the cost of that work.

116. You cannot put the Committee in a position to judge what would have been the relative cost of making this mile of Railway, including the jetty, as compared with the cost of making the mile of Railway now estimated for, ending at Watt-street? I can not; but I am prepared to say that it would have been much more expensive than the line now proposed. Besides it is very doubtful whether the jetty would have stood after it had been constructed.

117. Did I understand you to say that the claims sent in by the tenants and trustees for land taken at Honeysuckle Point, amount to a sum of from £40,000 to £70,000,—that is, that in one case, according to the original claim, the trustees required £44,000, and the tenants £23,000, making together £67,000? The first claim of the trustees was £33,000 and of the tenants £38,000; the second claim of the trustees was £44,000.

118. And that subsequently a proposition was submitted by the trustees, claiming £2,000 an acre, at the same time stating, if that were granted, they would undertake to arrange with the tenants? Yes; I believe that was the object of their request—to be allowed to amend their claim. It is very doubtful whether the terms of the application of the trustees to augment their claim would have relieved the Commissioners from any claim the tenants might have against them; in fact, the increased claim of the trustees appears to be based upon the fact of the enhanced value of the land to them, consequent on the tenants not being able to establish their title.

119. The claim in the one case would have involved a payment of £67,000, and in the other of £44,000? Yes; if the trustees settled with the tenants.

120. Can you inform the Committee whether the amounts which would be claimable for the land through which the line is now intended to run, would amount to so great a sum as £44,000 or £67,000? The land required along this line is so trifling, compared with the area of Honeysuckle Point, that I conceive it would not approximate to the lowest amount. The only land we take is a small portion of this allotment here (*pointing to the plan*), for widening the street, and a small portion from the Australian Agricultural Company.

121. Do I understand that the Commissioners have departed from the intention originally formed by them of constructing the Terminus at Honeysuckle Point, on the ground that the cost of extension to Watt-street will not be so great as the cost of forming a termination here; and also, because the claims for compensation along the now proposed line will not be so great as if the original intention were carried out, and further for the purpose of giving greater convenience for the shipment of passengers and traffic? The first consideration was, which was the best site for terminal arrangements, and this point (Watt-street) was found, on due consideration, to be the best. The heavy claim from the trustees weighed considerably with the Commissioners in arriving at the decision; indeed it is probable that had that land been procurable at a reasonable rate this design might have been modified. Repairing shops and large establishments for various purposes might very well have been there, as it is not absolutely necessary that they should be at the extremity of the line; it is sufficient if they

are

are in the vicinity of it. If the land had been procurable at Honeysuckle Point I conceive that some arrangement of that kind might probably have been proposed; but the whole of the land in the neighbourhood of Watt-street belonging to Government, that point was at once decided.

G. K. Mann,  
Esq.  
16 Dec., 1856.

122. For the purpose of receiving or delivering goods, would not the original design have been much more convenient; I mean as regards the extent of deep water that would have been available off the jetty at Honeysuckle Point as compared with the extent of deep water at the point now proposed? Quite the contrary; at the jetty it would have been very limited indeed, and there would have been no means of extending that accommodation as the traffic increased, without a considerable outlay in adding to the jetty, and piling and building at a vast expense, at its extremity.

123. Would there not have been a much greater expanse of deep water at, and adjacent to, the jetty as compared with the expanse of deep water off the wharf at Watt-street? The expanse of deep water in that place was rather objectionable. In fact it was one of the objections to the head of the jetty being out there. Heavy vessels are necessarily obliged to come alongside the wharf without any ballasting, to receive coals, and sometimes, I believe, it would be impossible for them to have warped alongside the jetty in that open bay. At the entrance of the river where the jetty would have been, they would have been exposed to the winds so much that I doubt whether they could have come across without their ballast.

124. Are you well acquainted with the portion of the harbour that lies off the now proposed Terminus? Yes; we have examined it carefully along the line of proposed wharf.

125. Is not the deep channel between that point and the point of Horse-shoe Spit, which lies in the middle of Newcastle Harbour, of very limited extent? It is very narrow.

126. Is it not a natural presumption, that while the whole of the goods, including the coals, are shipped there, there will always be a considerable number of vessels lying there? Yes; but I should remark that this is not the main channel of the river.

127. But it is the main channel by which vessels come up to take their cargoes in at the Port of Newcastle? They would take their cargoes in at the Railway stations; it would be merely small vessels that would require to pass up here. The Australian Agricultural Company have already made overtures to us for the delivering the whole of their coals, so that that will do away with their staiths altogether.

128. Would there actually be room for the number of vessels that would come for coals, to lie in and about the proposed Terminus? In the vicinity of it, I presume, they would lie across, as they do at present. I presume that to be as deep and as advantageous a part of the harbour as any, and, in fact, at present the heavy vessels lie out here, and the coals are taken off to them by lighters. By the proposed arrangement heavy vessels could come alongside, and be loaded direct from the shoot.

129. In regard to the coal and passenger lines, of which you have spoken, is it intended to construct common lines of Railway from near Honeysuckle Point? Yes.

130. There will then be on the present level a passenger and goods' line? Yes.

131. And from that point, or thereabout, there will be a coal line, which will rise on an inclination to a height of about twenty feet above the ordinary line? Yes.

132. And that upper line will be carried along to the Terminus at Watt-street? To the Terminus at Watt-street.

133. With a view to the delivery of coals by the staith into the vessels? Yes.

134. And the cost of the upper line, roughly estimated, will be somewhere about £40,000, without the rails? Yes.

135. The cost of the lower line, for passengers and goods, will be about £30,000? Yes.

136. Whence do you expect to derive your traffic for this coal line of the Railway? We know of one line, from the proprietor of which we have received communications, Mr. Eales, of Minmi; he proposed to come upon our line. The Agricultural Company have also communicated with us, and we expect some direct official communication upon the point, proposing that we should take the delivery of their coal. We have also had indirect overtures from the Coal and Copper Company, and there is a proposed arrangement for bringing their line upon ours. It is, besides, imagined that other mines will be opened, and we anticipate that Mr. Scott will give us some considerable traffic.

137. You are of course aware that the Australian Agricultural Company have already their arrangements complete for the delivery of their coal by means of their tramway to their staith in the harbour? Yes.

138. You are also aware that the Newcastle Coal and Copper Company have similar arrangements for the delivery of their coals at their staith? Yes, they have temporary arrangements; they cannot be considered as permanent.

139. What advantage would they gain by going on to your line, and giving up their present arrangement—what inducement would they have to give you a consideration, as I presume they would have to do, for the use of your Railway? The Agricultural Company are obliged now to load vessels by lighters out here, owing to their not having a sufficient depth of water at their staith to load vessels of any considerable tonnage—in fact their arrangements are so imperfect that they can only be considered as temporary. It takes them more time to load vessels now than it would do under our more perfect arrangements, and I conceive that it is within the power of the Government to prevent the Coal and Copper Company using their present staiths; they are now there only upon sufferance; and they are in the same position as to depth of water. They occupy a wharf that they do not expect to be able to retain, unless they pay for it to the Government, or make some arrangement respecting it. They therefore contemplate our picking up their coals and delivering them, and they have made overtures to us to take the haulage from the mines. If we pick up their coals we shall be able to deliver them at the works at a cheaper rate than the cost to them at present. The Company

is

G. K. Mann, is now at great expense after bringing the coals to the wharf, in delivering them; they have to keep up a large establishment for that purpose, at considerable cost.

Esq.  
16 Dec., 1856. 140. Your arrangement would be a cheaper and better arrangement to the Company if you undertook the delivery than the present? Yes.

141. Do I understand you to imply that the Government would be in a position, and would be justified to some extent, to compel them to have recourse to the Railway, by withdrawing their sufferance? I believe so; I have had no communication of the sort from the Government, but I have heard it spoken of as the intention of Government that those who retained the wharfs should pay rent for them. The Agricultural Company have directly stated that they are anxious to do away with their staiths and to come upon our line.

142. Have you made any very careful estimates of the probable cost of the two lines of Railway, the general and the coal line? Yes.

143. Sufficiently careful to justify you in laying them before the Assembly, as the data for a vote for completing the lines? Yes, for completing them to the present proposed extent. If the traffic should increase hereafter, it may be necessary to add to them.

144. Do I understand these lines to be single or double? Single; there are a number of sidings and lay-bys for the coal that is brought in.

145. *By Mr. Weekes*: Is it not a very unusual thing to run a Railroad on a level along the whole water frontage of a town—do you know an instance where the entire water frontage of a town is in a measure cut off by a Railway running on the road-level? I do not know an instance, but—

146. Would you not think it very undesirable and inexpedient, except for some very strong special reasons? I think it is very desirable that a Railroad should be as much to itself as it possibly can be, but I do not think that any great amount of inconvenience could be felt in this particular instance.

147. Do you not think it liable to place the lives of the inhabitants—children, and others—in jeopardy, from the easy access to the line, the line being open to the road at various hours? I think not; near the station there will be such a perfect look-out, and the line will be so completely and thoroughly fenced in throughout the town, as effectually to prevent danger.

148. But when the coal line is in operation, then, I understand you, that the gates of this lower line will be open? No; I said the line would be shut off. The coal line might remain open, for it will be twenty feet above the level; but on the passenger line the streets will be shut off when a passenger train is about to pass, and the crossings to the wharfs will be opened when it has passed.

149. Do you not think there would be great danger of children straying on to the line during the time the gates were open? No; I do not think so.

150. Not in a town full of inhabitants, where there was nothing to keep them off the rail? But they would be kept off the rail, by the rail being fenced off; the rail will never be open to the public.

151. I thought you said there were side gates? When the gates are closed across the street the rail is open, but when the crossing is open the gates close across the rail.

152. Then there is no possibility of getting on the rail except by getting over the fence? There is not without getting over the fence purposely, and near the station the arrangements are more complete and a more perfect look-out is kept; the train would run so cautiously through the town, any obstacle would be seen, especially as the line is straight.

153. Do you think after a town has been laid out by the Government as this has, with water frontage, although that water frontage is not sold, that it is any breach of faith with the parties who have bought land in the streets leading to the water to construct a railway which intercepts access to it? Quite the contrary; I should say it was anything but a breach of faith, as no doubt the Terminus would add considerably to the value of property in the Town of Newcastle.

154. Do you believe that the placing of the Terminus at the now proposed site tends to enhance the value of property in Newcastle more than the fixing the Terminus at Honeysuckle Point? I think it does; it will be the means of reclaiming land and adding considerably to the accommodation of the town here, by forming water frontage to a portion of the harbour which the town at present derives no benefit whatever from.

155. *By Mr. Flood*: It is the most exposed part of the harbour at that point, is it not? It is perfectly secure for shipping; it is the only part of the harbour where vessels can lie. They now lie out in the harbour there, and receive coals from lighters.

156. *By Mr. Buckley*: How far is the place where the steamers take in their coals from Watt-street, the present proposed Terminus of the Railroad? I believe the majority of the steamers take in their coals at the Agricultural Company's Shoot here—that would be about half a mile.

157. Would they have the same facility for swinging at the Watt-street Terminus as they would have at the other? I believe they would have considerably greater facilities.

158. More water than they have where they at present take in coals? Yes, deeper water.

159. What effect would it have upon the traffic of the Railway to have a Terminus at Honeysuckle Point—would it have a good or bad effect? I do not see how a Terminus is to be made at Honeysuckle Point.

160. You stated that you do not consider if the work were constructed at Honeysuckle Point it would be lasting? I do not think the jetty would.

161. Why do you think it would not? Because it would run out into deep water where there would be a strong set of the tide; it would have to go over a sand bank, which probably may be a portion of it quick sand.

162. Piling you think would not be substantial or secure? I think it is very doubtful.

163. Would the vessels incur considerable risk in warping alongside a wharf of that sort? I think it might be attended with considerable danger.

164. Would vessels require to have anchors in addition to a warp? I think it would require anchors, steam-tugs, and warps. G. K. Mann, Esq.,
165. Is the effect of the tide very great at that point? Yes, very great, indeed.
166. Have you any idea of the rate at which the tide runs at that point? I do not know the rate, but it is very strong, part of the tide. 16 Dec., 1856.
167. If the Agricultural Company were to do away with their staith, do you think the steamers would have greater facilities for getting their coals in either for the Hunter River or for Moreton Bay? Yes.
168. Is there more room to swing at the one place than at the other? I think there is more at Watt-street than at the other place.
169. What sized vessels can take in coals at the present staith? I think a vessel can take in from 150 to 200 tons. I think 200 tons is in excess of what they can take; for when vessels have taken in that quantity they haul off from the wharf, and the remainder is taken to them by lighters.
170. Do you know the tonnage of the "Boomerang"? No. I am talking of vessels trading to Newcastle for coals.
171. Supposing the "Boomerang" to be 400 tons burden, and to draw from ten feet to ten feet six water, could she load there? I am not prepared to say, but what I allude to more particularly is the fact, that no heavy vessels trading there for coal, and there are some of 500 tons, can take in all their coals at this staith. Whether a steamer of the draft you mention could take in coal there I am not prepared to say at the present moment.
172. Do you think she could come at any time of the tide to the Terminus you propose, and take in coal? It is a portion of the arrangement that she should be able to do so.
173. You are aware that there is a considerable embankment constantly forming at the wharf by the dropping of coals when vessels are being loaded? I am aware that there is a bank there, but I am not aware that it has been formed in that way. The vessels cannot continue up the river by this channel; they are obliged to come back and find their way round by the opposite shore.
174. Supposing the Railway completed, and that coals were delivered there, would it be possible to avoid that—do you think arrangements could be made to avoid the possibility of coals falling into the water, and forming a bank by the wharf? We propose to make our arrangements so perfect, as to reduce that evil to the minimum.
175. You conclude that, instead of having a Terminus at Honeysuckle Point, as originally proposed, a considerable saving would be effected by having it, as now proposed, at Watt-street? Yes.
176. With regard to its effect upon trade, do you think it will increase and facilitate the traffic? Yes; if the proposed Terminus at Honeysuckle Point were carried out, it will eventually be necessary to carry out this plan, and to bring the goods' traffic and goods' arrangement through the town, for sea-going vessels must necessarily deliver their goods at this portion of the town, near Watt-street, and they must then either be carted to Honeysuckle Point, or a line must be laid down.
177. In your opinion, there would be sufficient traffic, by combining goods and passengers, to render a line advantageous there? Yes, I am very sanguine as to that.
178. You think it much more likely to pay by the present proposed construction than if it terminated at Honeysuckle Point? The line is without a Terminus at the present moment, and this arrangement is absolutely necessary for the completion of the line; the terminal arrangement must be made somewhere before the line can be thoroughly and properly worked; and this terminal arrangement I believe to be the cheapest and best.
179. What was the object of naming Bullock Island as a proper place for a Terminus? I do not know; it was suggested at one time; in fact, the difficulty of fixing upon a Terminus led to the naming of different points.
180. What is the nature of the arrangements of the Australian Agricultural Company for the delivery of coal? They have two staiths there, where they have delivered coal for some years.
181. You stated that they had a large establishment there for the delivery of coal, which was kept up at a large expense—what is the necessity for that large expense? The expense of labor for the delivery of the coal; the coal has to be brought here, and then it has to be delivered by their coal arrangement. There is the expense for manual labor, horse power—each single waggon being raised by horse power, or by manual labor—and superintendence.
182. In your opinion, it would be cheaper for the Company to co-operate with the Government than to deliver their coals by their own arrangement? It is not only mine, but it appears to be the opinion of the Company themselves.
183. They would have nothing to do, then, but to get them at the mines, and to hand them over to you to deliver? Yes; we might take the whole coal traffic.
184. With reference to bringing the Terminus here—if the line were laid from the mines to the staith, would there be any inconvenience to steamers that required immediate despatch? We propose that our arrangements shall be so complete that we shall be able to give them their coals forthwith. There would be a constant delivery of coals along this line, and as I suppose the steamer would make arrangements with a particular Company for her supply of coals, we should deliver them as speedily as possible.
185. Do you propose having a number of staiths? Yes; this plan is drawn for two, in the first instance; and we conceive that, with the more complete arrangement we shall have, we shall do as much as is done with the whole of the present inefficient arrangements.
186. Are you aware that, by the present arrangement of these staiths, the steamers are sometimes put to great inconvenience from being unable to get coal? I have heard so.
187. Do you know that considerable damage is done to shipping by being obliged to haul off? I know that vessels have in some instances been delayed three or four months in waiting for their turn to go under the shoots.

- G. K. Mann, Esq.  
16 Dec., 1856.
188. Have you not heard of considerable difficulty having been caused to steamers which must go on, by vessels lying under the staiths? I have heard incidentally, but I am not cognizant of any particular instance of it; but, generally speaking, I know that there is a want of facility in loading vessels.
189. Are you aware whether the Australasian Steam Company have made any complaints with regard to that? I am not.
190. *By Mr. Rusden*: Does not the road from Maitland to Newcastle run through Hunter-street? Yes.
191. That is the main communication with the City of Newcastle? It appears to be so.
192. From the sand hills to the Bank of Australasia, is not the town backed in by an elevated range? Yes.
193. Does not that range cease at the Bank allotment? I do not think it does; that range continues round there (*referring to the plan*) a considerable distance.
194. Is it not nearly flat from here (*pointing to the plan*) to the next reach of the sea—the Coal and Copper Company's line runs upon the flat to the next ridge? This is a range all round here.
195. The land opens considerably to the westward? I think it does, after you get a considerable distance out of town.
196. Is not the town extending very much in that direction? I am not aware that it is; there are no houses here towards Maitland.
197. Will not the proposed line or lines from Honeysuckle Point, along the water frontage, interfere very much with the comfort of the inhabitants of the town? I think not.
198. Does it not cut off the frontage by fencing? I think not.
199. Does not the proposed line cross nine different streets? Six.
200. Then there are to be six gates and six keepers to those gates—would not that enhance the permanent cost of the Railway very much, from the attention that would be required? I do not think it will be necessary to give a level crossing to each of these streets; if there were ample and sufficient access to these wharfs, that is all that would be required.
201. Then do you propose to have only one crossing? I am hardly prepared to say the number, but certainly more than one.
202. Is not that included in your estimate of cost—have you estimated for one or more? The gates are put down; the arrangements as to the number is a mere trifle. The number of crossings are not definitely fixed; in fact, it would be unadvisable until the level of the work was actually carried out, to fix the sites for the level crossings.
203. That has not come into your arrangement yet? Not the number of crossings.
204. Do you not think, if the Terminus were kept at Honeysuckle Point, that eventually, from the increase of population, it would be placed in the centre of the town? I do not think it is possible to make a Terminus at Honeysuckle Point for the delivery of goods, for the coal arrangements communicating with the harbour, and for the traffic of the harbour itself.
205. Has not great expense been incurred by cutting and placing piling for Honeysuckle Point—there are a number of trees lying on the ground there? The Commissioners have nothing to do with those trees. I believe that is timber brought there by the contractor originally with the idea of forming a jetty.
206. Some expense has been incurred, I suppose, in preparing this piling? Not by the Commissioners.
207. By whom has that expense been incurred? I suppose by the contractor.
208. He has to be paid? He has not done it for us, but on his own speculation.
209. Was all that timber cut without any order? It was not cut for us. The timber for this viaduct has been used and paid for.
210. Would not a double object be gained by carrying out this jetty into deep water—that there would be two places for loading vessels instead of one; and would not that object in such a town as Newcastle be worth some thousands of pounds? I do not know exactly how it could have been possible to have had two places without increasing the head of the jetty.
211. That is a matter I thought was intended in the proposed construction of the jetty? Some additional arrangements would necessarily have been made at the head of the jetty.
212. If the jetty had been run out, was it not the intention to have continued it from the point of the jetty, where deep water is, to Queen's Wharf? The Commissioners never had any intention of such a scheme, nor do I believe it hardly possible to have carried it out.
213. You have stated that overtures had been made by the Agricultural Company to the Railway Company to ship their coals—why should they do this when they already have private wharfs of their own? I presume that with our more complete arrangements we shall be able to deliver their coal with greater advantage to the Company; that it would be cheaper to them to deliver their coal by means of an arrangement with the Government than by keeping up establishments of their own.
214. The Coal and Copper Company could not make such overtures, for they have no private arrangements—they have no private wharfage? I am under the impression that they are there on sufferance.
215. It is Government wharfage? Yes.
216. Therefore they would be compelled to come on your line? They would come in as a matter of course.
217. Therefore, it is not necessary for them to make overtures, as they would be obliged to come? Without mooted the question whether they will be deprived of their wharf they have made overtures, not only respecting the delivery of coal, but to take the whole haulage of it from the mine.
218. Is it not intended to keep a great deal of wharfage in the hands of the Government, and to charge rent or wharfage dues? It is the intention, I believe, but whether they will be required to pay rent, or what other arrangement will be made, I cannot say.

219. I have understood it is the intention of the Government to keep nearly all the frontage? G. K. Mann, Esq.
220. You cannot say it is the determination of the Government? I cannot.
221. If this were done would it not cause great dissatisfaction? That is a question I cannot answer. 16 Dec., 1856.
222. Have they the wharfage free at present? It generally is the case. I believe that when persons have had nothing to pay for an accommodation when called upon to pay for it they are dissatisfied.
223. It is cutting off a frontage that they have up to the present moment enjoyed? I was hardly prepared to give you evidence upon these points, for I have not heard what is the determination of the Government with regard to this wharf; I know nothing about it.
224. Still you would naturally imagine it would have that effect upon the inhabitants? Well, if I had myself had the use of one of these staiths for nothing I should very likely grumble; I believe that is human nature; but I do not see why the Government should not resume possession if it is to the public interest to do so.
225. If this proposed jetty at Honeysuckle Point had been carried out, ships of what burden would be able to load there? It was proposed to carry the jetty out in order that the heaviest vessels that came into the harbour might load there.
226. Of what burden? I believe vessels of four or five hundred tons are the largest vessels that come into the harbour.
227. The only reason that I heard in favour of this Railway being carried to the sand hills, when I was at Newcastle, was that large ships after having filled to a certain extent at the proposed jetty, would afterwards have to be filled up by lighterage? If the jetty were not carried for three-quarters of a mile out into deep water, you think it would not be necessary to fill vessels by lighterage? I think that three-quarters of a mile would not give above thirteen or fourteen feet of water.
229. Will the foundations for the buildings be good at these sand hills—has it been tried? It is a rocky foundation, with a sandy covering.
230. What is the depth of sand? In some places the sand is of considerable depth, but in others there is merely a covering of sand on the surface.
231. Is it intended to ship the coals at Watt-street? Beyond Watt-street.
232. I understood that the coal wharfs were intended to be nearly where they are at present? The fact is, that a great number of plans have been drawn, and designs made, in considering these questions, and trying to get over these difficulties. It was designed at first to have had the coal shoots here (*pointing to the plan*), and eventually to have carried them on.
233. I understand your present plan to be, to carry out these two lines, only having one elevated and the other depressed? Yes.
234. Then what use is to be made of this water frontage? It will be for wharfage for the general use of the town.
235. If all the goods and coals are intended to be shipped near Queen's Wharf, is not the main channel there too confined to contain half-a-dozen ships at once? We cannot enlarge the harbour.
236. But is it not concentrating to one point all the shipping? Still there will be a considerable amount of wharfage here for the coasting traffic not engaged in the coal trade, and we conceive that our arrangements for goods and coals will be so much more perfect, that vessels will be able to get away more quickly than they do at present. They do not necessarily lie alongside the wharf until it is their turn to come under the shoot, but lie off out of the channel.
237. Do you not think it objectionable to draw all the traffic to one place in a harbour so particularly confined? The traffic must come to our Terminus wherever we have it.
238. That is the only place that will be used by the public, and if you concentrate the traffic there you must necessarily confine all the business to that particular spot, which is not the case now, because there are the wharfs at present used by the Coal and Copper and other companies? These wharfs would still be available.
239. How, if you have an elevated and lower line will they be available? In drawing out this plan, one of the designs we had was, not to interrupt the coal traffic at these parts of the harbour, and the line does not interfere. Here is the Coal and Copper Company's line (*pointing to the plan*) running parallel to the Agricultural Company's land; they cross our line here, and come upon their own staiths without interfering at all with our line. This might remain, if the Government chose, for years. If that line of their's were abandoned, they would come in here (*pointing to the plan*).
240. Then, if they adopt your line, these wharfs will be done away with? Yes.
241. That is a proof that it will concentrate all the traffic to one point? I believe the traffic will concentrate. No doubt the goods and coal will all be taken and delivered both up and down by the rail.
242. If the intended jetty had been carried out, was it not proposed to run it out to the main channel? That would have been the only use in putting a jetty there.
243. Is not the general feeling of the inhabitants of Newcastle against the Terminus being at the sand hills? I think not.
244. How is it that the houses built by the tenants, or rather, how is it that the house built by Dr. Stacey—for I refer particularly to him—has been taken from him and occupied by the Government for nine months without compensation? The question of compensation is unsettled at present.
245. Compensation for land—but it is a strange thing to take a man's house away from him? The Commissioners have been unable to compensate Dr. Stacy.
246. That is for the land, I suppose, but I am talking of his house? They have not been able to give anything in compensation, for it is not yet decided who is to be compensated.
- 247.

- G. K. Mann, Esq.  
16 Dec., 1856.
247. By means of piling from the extreme end of Bullock Island over the edge of the shallows to the Company's Wharf, would not the channel have been much deepened and improved, and was not that the original intention? I am not prepared to answer the question as to the probable improvement of the channel, but the design has never been the design of the Commissioners.
248. I understood that if the jetty had been thrown out here the original intention was to reclaim this by a system of piling; would not that be an advantage? It might be, or it might not; I cannot say whether it would be advantageous or not.
249. You would get all this (*referring to the plan*) as a harbour? I am not prepared to give an opinion.
250. You would have 23, 24, and 25 feet depth, and plenty of room for shipping? I do not believe that piling could be put in there for £100,000. It is a very intricate engineering question whether it would improve the harbour or not.
251. If such a plan were adopted would it not afford a large harbour; does it not run to all the deep water in the harbour, and the greatest expanse of water. Therefore, in considering a permanent work, such as this under discussion, would it not be advisable to look into all the capabilities of the harbour, and make this work a permanent and enduring one, that it might be to the advantage of the country eventually? I do not think the plan proposed would answer; it is one I am not at all disposed to recommend; before doing so, it would be necessary to give serious and mature consideration to it.
252. Still it is worth consideration? Not at the present stage; at some future day it might be advisable, but not at the present moment.
253. Would it not be advisable to ascertain what the cost of that piling would be? If it would improve the river it would be.
254. Do you not think it would improve the river? I am not prepared to say.
255. It is worthy of investigation? It is worthy of investigation.
256. *By the Chairman*: I think you stated that there was some dispute with respect to the legal proprietorship of Honeysuckle Point. I presume the Commissioners would treat only with the legal proprietors? They could only do so.
257. They would not enter into any equitable claims that the tenants might have as against the proprietors? We have not the authority to deal with the tenants: there may be many cases of hardship in respect to tenants found upon the land; but the Commissioners have not the means of taking that into consideration.
258. The estimate for the construction of the jetty you stated to be £37,500? That was the amount put down in a rough estimate that was made for a vote, but I believe myself it would cost more than that; I believe it would cost £50,000 or £60,000.
259. If it would have cost £50,000 that would not have been equal to the sum that the mile of railway to the proposed Terminus at Watt-street, according to your own estimate, would have cost? I think it would have been more than £50,000; that would only have constructed the timber work of the jetty, besides, all the terminal arrangements would still have had to be made.
260. You have stated that the inhabitants of Newcastle will derive great benefit from the reclamation of the sand hills at the point beyond Watt-street? That is my opinion.
261. In what way will they be benefited by that? There is now a large area of ground here which is swampy and unavailable for any purpose, and the sand hills would be reclaimed to a certain extent.
262. With respect to the swamp, do the Commissioners intend to reclaim that? This will be reclaimed by the Commissioners as they require it.
263. When they have reclaimed it, in what way will the public be benefited? The very occupation of land which is now a waste will be a benefit to the town.
264. In no pecuniary way would they be benefited? I think they would be by the bringing of traffic, which would necessarily follow the formation of a Terminus.
265. That is derivable from the formation of the Railway and not from the reclamation of the land? It would add considerably to the available land there.
266. Whatever land may be reclaimed by the Commissioners, I presume if it were sold the proceeds would go into the general Treasury? Yes. It would not be any direct, but merely an indirect advantage to the townspeople.
267. The land would, in fact, be as it is now, the property of the Government? Yes. But when I spoke of benefit I referred to the general improvement of the town, which, of course, would enhance the value of property in it.
268. You believe that the extension of the Railway from the point where it is now finished to that you now propose would be an improvement of the town? Yes.

THURSDAY, 18 DECEMBER, 1856.

Present:—

MR. PIDDINGTON,	MR. JONES,
MR. WEEKES,	MR. F. RUSDEN,
MR. BUCKLEY.	

E.O. Moriarty  
Esq.

18 Dec., 1856.

WILLIAM RICHMAN PIDDINGTON, ESQUIRE, IN THE CHAIR.

Edward Orpen Moriarty, Esq., called in and examined:—

1. *By the Chairman*: You are a Civil Engineer, I believe? I am.
2. Are you acquainted with the proposed extension of the Railway from any settled point through the centre of Newcastle to the Terminus at Watt-street? Yes, I know the ground.
3. Are you acquainted with the proposal generally? Generally, I am. I do not know anything about the details of it.
- 4.

4. What is your opinion with respect to the question whether that line would not interfere with all the streets through which it has to pass to reach the edge of the harbour, from south to north? It would cut off the water frontage from the town. E.O. Moriarty  
Esq.
5. If that line is adopted it will interfere with the access from the town to the harbour? Yes, unless it is carried on a viaduct. 18 Dec., 1856.
6. Suppose the line was carried on a level with the roadway, what would be the effect? It would affect the communication between the wharfs and the town in some degree.
7. Are you acquainted with the area of accommodation in the harbour of Newcastle in the neighbourhood of Watt-street and Queen's Wharf? Yes.
8. Is the accommodation of that part of the harbour sufficient for the shipping now frequenting that port? Do you mean wharf accommodation?
9. The harbour accommodation and anchorage? It is very limited close to Watt-street, between the wharf and the bank.
10. *By Mr. Jones:* That is called Horseshoe Bank? Yes.
11. *By the Chairman:* Then it is a natural presumption, that when the Railway is completed, the demand for shipping anchorage will increase with the commerce of the town? No doubt of it.
12. In the event of any increase in the commerce of Newcastle, the anchorage ground and the proposed Terminus of Watt-street must be inconvenient? Yes.
13. Are you aware that the Commissioners propose a double line of Railway? I do not know the details of what they propose.
14. If they propose a double line of railway, one a coal line at a considerable elevation, and another for the transit of goods and passengers, will it not entail a very heavy expense? Yes, it will cost a good deal of money.
15. Have you considered whether any other Terminus to the Railway might be adopted with advantage to the public beside the Terminus at Watt-street? If I were doing it I should have my main Terminus at Honeysuckle Point, or in some other place likely to be central to the town, with a branch to the water side.
16. If you were the Engineer, your plan would be to have the Terminus at Honeysuckle Point? I would have the main Terminus there, or in some other place equally convenient, and the carriage shed and the goods shed out of the town. The practice at home is never to put a large station in the heart of the town, because the ground is too expensive and valuable.
17. By what mode would you secure the means of shipment at Honeysuckle Point? I should carry on a branch line to some convenient spot near the water's edge.
18. Have you ever considered the eligibility of Bullock Island as a Terminus for the Railway? Well, I did think of it once; in fact, I mentioned the matter to the Chief Commissioner of Railways at one time.
19. Do you still continue to be of opinion that Bullock Island might be used as a Terminus? I do not think it would be so convenient for the public generally as the new wharf.
20. Would there be more or less accommodation for ships at Bullock Island, than at the new wharf? Yes; there would be far more accommodation.
21. If there were more accommodation at Bullock Island, would that not be a greater convenience for the public than having a Terminus at a point where there was a very limited accommodation for the shipping frequenting Newcastle? I do not think it would, and for this reason, I think it is a mistake to fancy the railway people are to be shippers as well as carriers of goods. I think eventually all the goods that come down the Hunter will be shipped direct to England, and will therefore be shipped by the merchants to whom they may be consigned, and from their stores.
22. If that is the case will not the goods come down to be shipped by the Railway? The goods will be consigned to the merchants and not to the Railway Commissioners. It will never do for the Railway Commissioners to store goods for months until vessels are found to convey them away.
23. My question does not assume that the Railway Commissioners are to be shippers of goods, but whether shippers of goods would not use it? Bullock Island would afford greater accommodation to the public, on account of the greater depth of water there than at the proposed Terminus at Watt-street. I think the Railway Terminus should be in the most central part of the town with regard to all the wharfs.
24. Have you considered the question as to which point is the most central position? I think Honeysuckle Point is the most central to where the town is likely to be in course of time. It may be months before the goods that come down by Railway are shipped.
25. Whether the goods are detained in Newcastle or not, they might be shipped at this port by the Railway? No, I think not; the goods that are sent down are not consigned to the Railway but to the merchants, who carry them from the Railway to their stores. The position of the Terminus ought to be central with reference to the wharfs of the town.
26. The question of the general area of harbour accommodation ought to be considered in reference to a Terminus? Most certainly.
27. Without any reference to the harbour accommodation of the ships? I would have reference to the two, because the business part of the town eventually follows where the best harbour is.
28. You stated if you were the engineer of the line you would fix on Honeysuckle Point as the Terminus? Yes.
29. Would you fix on Honeysuckle Point, without any reference to harbour accommodation? I look on it as more central to where the town is likely to be.
30. Do you think the accommodation of harbour at Bullock Island is counterbalanced by Honeysuckle Point being more central? Yes; I think the town will extend from Bullock Island as far as Nobby's. The vessels can land their goods along the entire front of the town; and these goods will be carried to the merchants' stores which are scattered about the

B.O. Moriarty the town. These goods will always go the merchants' stores and not direct to the Railway stores.

Esq.  
18 Dec., 1856. 31. You are acquainted with Newcastle—in what direction will the town extend? I think in the direction of Honeysuckle Point.

32. Is there no chance of its extending to the eastward? No, none.

33. Have you considered whether any portion of land could be reclaimed from the Hunter River, from Bullock Island and a line drawn north of Honeysuckle Point? I have long looked on that as a valuable piece of land.

34. Have you formed any opinion of the probable expense of running a line of embankment from where the Hunter River is to be deepened to the north point of Bullock Island? No, I have not.

35. Can you give any estimate of the probable expenditure of such an embankment? I suppose it may cost about £20,000, at a rough guess; it would require some calculation to state the amount with anything like precision.

36. You say it would cost £20,000, at a rough guess; can you give the Committee some more definite idea of what the amount would be—do you think it would amount to £40,000, that is double your rough guess? Do you mean including the wharfs?

37. No, the mere construction of the embankment? No, it would not.

38. How much land could be reclaimed between Bullock Island and the proposed embankment? I do not know where that is to be.

39. How many acres could be reclaimed from Honeysuckle Point to the northern part of Bullock Island? I think about 700 acres.

40. Would that land be reclaimed gradually by throwing ballast there? Yes it would; there can be no question that it would be reclaimed in the course of a few years, if the colliers coming down with ballast were to drop the ballast all along the bank, first forming the sea side of the harbour, and eventually carrying it in further and further as the matter accumulated.

41. Do you think for £40,000 a very secure embankment could be formed from Honeysuckle Point to the north point of Bullock Island? Yes.

42. Would that sum be sufficiently large to carry on the line of Railway? Yes, quite sufficient.

43. Are you acquainted with the level of Bullock Island above water mark? Yes.

44. Is it below the Railway line as it at present exists? There may be a difference of a few inches, perhaps a foot.

45. *By Mr. Jones:* You are merely guessing now? Yes.

46. *By the Chairman:* If so much as 700 acres could be reclaimed, the value of that land would much more than reimburse the expense incurred by the construction of this embankment? I do not think the construction of the railway embankment would tend to reclaim the land. The land could only be reclaimed by the ballast which is brought down by the return colliers and dropped all along the bank. It is that ballast that I look upon to reclaim this land.

47. Would the ballast increase the inclination or impede the vessels? I do not see how it can, unless they have to bring the earth down from the interior.

48. How far as it from the end of the existing line of Railway near Honeysuckle Point to the centre of Bullock Island, or to the centre of any proposed embankment? That question is very vague. I do not know where the embankment goes to, or where it is proposed to carry it to.

49. It is proposed to carry it to the centre of Bullock Island from Honeysuckle Point where the line of rails is laid? About a mile.

50. I presume it is the same distance from the same spot to Watt-street? Not so much; it is only two-thirds of the distance.

51. Have you any reason to suppose that it would be more expensive to construct a line of Railway from Honeysuckle Point to Bullock Island, than from Honeysuckle Point to Watt-street? I think it would be cheaper to construct a line of Railway to Watt-street, if it was kept on a level, and you had not to purchase ground at a high cost.

52. Would you oblige the Committee with your reasons for thinking a line to Watt-street would be cheaper? The distance is shorter if the Railway is kept on the level in both cases; and there would be less embankment required in going on to Watt-street than in going on to the centre of Bullock Island. If the ground belongs to the Crown, and you can cut off the water frontage of the Town of Newcastle, it would be cheaper to carry on the line to Watt-street.

53. Suppose the same probability of expensiveness existed in both cases, would there then be any difference? I think the Watt-street line would be the cheapest if the line was constructed the same in both cases.

54. You think the level of Bullock Island is only a few inches above water mark? I think it is not more than one foot; I speak only from looking at it; I have not levelled it.

55. If it was not more than one foot, the increase of embankment would not be very great? It would be very small; the rise of tide is not more than 4 feet 6 inches; about 8 feet of embankment would be sufficient.

56. An embankment of that height is not a very expensive work? It would also require a bridge over the creek that runs at the back of Bullock Island.

57. Do you know the depth of water in the neighbourhood of Bullock Island? Yes.

58. What is the depth, taking the centre of Bullock Island as the point in the channel? Twenty-three feet.

59. And is the width of the river from the North Shore to the centre of Bullock Island very much wider than from Watt-street to North Shore? It is not so wide, but the river at Watt-street is obstructed by the Horse-shoe Bank. So far as the obstructions go it is limited at that part.

60. But without any of these obstructions is the river wider, or is there more accommodation at Watt-street than there is at the North Shore? No, on account of these obstructions Watt-street has not so much accommodation as there is at the centre of Bullock Island. E.O. Moriarty  
Esq.  
18 Dec., 1856.
