20. The night-soil from Paris, where the cesspit system and others closely resembling it almost universally prevail, has for many years been treated by a process partly mechanical and partly chemical, for the purpose of making a saleable manure. We learn, however, that this system has proved so unsatisfactory in its results that it has recently been given up, and that the night-soil is now applied directly to a sterile tract of land at some distance from the city. We are inclined to believe that, under proper regulations, this will be found ultimately the best and most economical system for us to adopt.

21. A Committee has been appointed to examine and report to this Board upon certain localities which have been suggested as suitable places of deposit, but they have not yet been able to report finally. Some place, however, will no doubt be found, though probably at such a distance as somewhat to increase the cost of removal. Until such a place is found, and placed under proper supervision, there can be no security against many of the evils to which we have drawn your attention in this Report.

22. We have decided not to wait for the results of the inquiry by the Committee for fear that the further delay might render it impossible to obtain the immediate Legislative action which seems to us desirable.

23. It may take a few months to make all the necessary arrangements for bringing into operation the new system which we recommend, and there may be Municipalities in which it may not be desirable that that system should be enforced at present. We therefore recommend that the proposed Act for this purpose shall not apply to any Municipality until a certain date, to be fixed in each case by Proclamation of the Governor and Executive Council.

24. We recommend then that an Act be passed with as little delay as possible, providing—

- (1.) That the Council of every Municipality be required to undertake the duty of emptying cesspits and other similar receptacles by means of their own plant and appliances and under the inspection of their own officers.
- (2.) That Municipalities may combine for this purpose, and one Municipality may undertake the duty for another.
- (3.) That owners and occupiers be relieved from all responsibility in this matter, except that of paying the charges according to some rate to be determined.
- (4.) That the occupier be fined for failing to give notice to the proper officer of any nuisance which may occur in connection with any cesspit upon his premises.
- (5.) That Municipal Councils be required to make regulations as to the construction, situation, and size of cesspits, privies and water-closets to be hereafter made, and in the case of new houses to provide that a sufficient accommodation of this kind be supplied.
- (6.) That, in the case of existing cesspits, privies, and water-closets, Municipal Councils be empowered to require that such alterations be made as may in the opinion of the authorized officers be necessary for the sake of health, decency, and facility of emptying and cleansing; and under similar circumstances to require that sufficient accommodation of this kind be provided.
- (7.) That, a place having been fixed upon for the deposit of night-soil from any Municipality either within or without its boundaries, and approved by the Governor and Executive Council, the Municipal Council be empowered to make such expenditure as may be necessary in preparing the said place for the purpose, in making or repairing roads leading to it, and in burying or otherwise disposing of the matter deposited.
- (8.) That any person depositing night-soil from any Municipality in any place, except the one appointed, without special permission from the Municipal authorities, be heavily fined.
- (9.) The Act to come into force in any Municipality at such date as may be fixed in each case at any time, by Proclamation of the Governor and Executive Council, who shall have power in making such Proclamation to exempt such Municipality from the operation of certain clauses of the Act.
- (10.) If the Municipal Council of any Municipality shall, in the opinion of the Governor and Executive Council, fail to carry out the provisions of this Act, the Governor and Executive Council to have power to cause by-laws for such Municipality to be framed, which, being in accordance with this Act and being duly proclaimed, shall have the force of law.

Board Rooms,
Sydney, 24 June, 1875.

M. B. PELL,
Chairman.

LIST OF WITNESSES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SYDNEY CITY AND SUBURBAN SEWAGE AND
HEALTH BOARD.

WEDNESDAY, 26 MAY, 1875.

Present :—

M. B. PELL, Esq.,	DR. ALLEYNE,
W. C. BENNETT, Esq.,	HON. J. B. WILSON,
E. O. MORIARTY, Esq.,	F. BELL, Esq.,

M. B. PELL, Esq., B.A., IN THE CHAIR.

Francis Bell, Esq., City Engineer, further examined :—

(Witness produced a plan and section of tunnel.)

1. *Chairman.*] That is a section of the tunnel called Busby's Bore? Yes.
2. What difference is there between the vertical and the horizontal scale? The vertical scale is 20 feet to the inch, and the horizontal 3 chains or 198 feet to the inch.
3. We have heard your report to the Municipal Council read, Mr. Bell. What kind of weather had you at the time;—was it wet or dry weather? I cannot remember; the work extended over four or five months.
4. The tunnel had not been much used had it before that report was sent in? Yes; but the quantity of water which passed through it was very limited.
5. Is the tunnel constructed entirely through sandstone? Yes, I may say it is; there are some bands of ironstone and some beds of clay through it, here and there, but it is principally through sandstone.
6. Has any attempt been made to render it water-tight? No, none whatever; the culverts that are built in it are built dry.
7. And I think you stated on a former occasion that there is a very slight fall from the mouth of the tunnel to Hyde Park? From the Lachlan Swamp to Hyde Park there is a fall of about 18 inches.
8. Then it is almost level? Yes.
9. Is that sufficient to allow the water to flow from Lachlan Swamp to Hyde Park? Yes, because we have a head of water at the upper end; we have raised it up to 8 feet 6 inches.
10. Did you observe when the tunnel was cleaned out that water percolated into it from different springs in its course? Yes, particularly at the Rifle Range.
11. Did you observe water dripping through it at the far end? No, only at the upper part; the other was comparatively dry.
12. Have you any means of knowing whether more water comes out of the Bore than goes into it at the Lachlan Swamp? Oh yes, a great deal more; it comes from springs and fissures in the rock; we have proved it.
13. So that the water supplied by that tunnel is not really from the Botany watershed, but soakage water from the different localities through which the tunnel passes? Yes. I may mention that there was very little soakage till we came to Park Road, and I attribute that to the other part being thoroughly drained so that no water could percolate. But when we came to the far end of the Rifle Range there was more water; there was not such a height of ground above the tunnel, and it became very wet.
14. How far below the surface is the tunnel along the South Head Road, as far as you can judge? The deepest shaft is about 62 feet; it is immediately opposite the Court House.
15. And then it gradually diminishes—gets nearer and nearer to the surface? Yes.
16. How deep is the tunnel at Riley-street? 23 feet. At College-street it is 15 feet; and at Hyde Park, at the end of the tunnel, it is just 10 feet.
17. And there it is connected with the mains? Yes. There are one or two mains which go off it before that, but there is a main from it there at the very end.
18. You have locks communicating with the mains, so that you can draw off as much as you choose? Just so. They are all open now. There is one at Liverpool-street—a 12-inch main; another in College-street, also 12 inches; and another 12-inch main at the end of the tunnel.
19. When you cleared out the tunnel, you took out, according to your report, large quantities of what you called muck;—what was the nature of it—was it filth or slush? It was filthy stuff, smelling very badly and as black as ink.
20. Do you consider it of such a nature that water passing through it becomes unfit for use? Well, a good deal of it settles. We scraped up a lot of it, but there was always a good deal remaining. There was 18 inches of water in the tunnel when we tried to take this muck up.
21. But that water had been, as far as you could judge from its appearance, in the swamp before? Yes, as far as we could judge.
22. Then where did all this muck come from do you suppose? It was washed down from some drains formerly cut in the swamp. It was black peaty stuff, and we had no means of straining it, and no way of keeping it back.

F. Bell, Esq.,
C.E.

26 May, 1875.

- F. Bell, Esq.,
C.E.
26 May, 1875.
23. Do you think that peaty stuff has an offensive smell? No doubt it has. I have often been surprised at it; but take it from where you will it has a bad smell.
24. Did you suspect at any time that there was a drainage of sewage matter into the tunnel? No. I may say, however, that lately the Paddington Municipality made application to the City Corporation to join them in forming a gutter in Dowling-street, and that gutter would have run right over a shaft on the tunnel. So I had the shaft opened, and all the joints thoroughly caulked, and filled in with cement, so that not a drop of liquid could get in; and I had the covering slabs cemented also.
25. Have any alterations or improvements been made near the Rifle Range, in the tunnel itself? Yes. I had the first shaft on the Park Road opened also. There appeared to be beautiful water coming in, but in case it might be impregnated with sewage matter, I had the shaft all cemented the same as the other. You may see the position of those shafts on this plan (*producing plan of Botany and Lachlan watershed.*)
26. What becomes of the drainage from the Victoria Barracks? It goes across the Park Road through a pipe, and runs down into Moore Park. I can show it to you here (*indicating position on plan.*)
27. Are these drains you have shown us surface drains? Yes.
28. Are these cesspits used in the Victoria Barracks? No, I understand they use earth-closets.
29. You say that the drainage of the Victoria Barracks is carried over the tunnel by means of a pipe? Yes; immediately under the road.
30. Are there many habitations about there? No, it is pretty well open ground, and almost all rock.
31. Is there much population along the course of the tunnel from Victoria Barracks down to this end at Hyde Park? Well, all that portion is drained either towards Woolloomooloo, or in the other direction towards Hay-street. All the houses facing the South Head Road are drained into the sewers. I do not think there are any cesspits along that line.
32. What becomes of the cesspits on the other side? They are drained by a sewer which goes to Hay-street.
33. Are those houses connected with the sewers—are there any cesspits there? None that I am aware of, but my foreman will tell you all about them.
34. What used to be the quality of the water then—as far as you could judge? Well, I cannot imagine any sewage matter getting into it at all. I think it is very good, as far as I can judge of it.
35. Has it frequently happened that you have had to cut the water off and nearly close the sluice at the mouth of the tunnel? Very frequently. If we don't do that it goes through with so much force that it bursts through at College-street. It did so frequently at the corner of Hyde Park, and we had to send out word to shut it off at the Swamp.
36. Then there must be a large quantity of soakage water enter into it? Between the Swamp and the Rifle Range it is very wet, and the water percolates through the masonry. But that is high ground, where there is no possibility of sewage matter getting into the tunnel.
37. Had you any grating or other contrivance to prevent large objects from being carried into the Bore at the mouth, or is there any such grating now? There was an iron grating or network inserted near College and Liverpool streets, Hyde Park. It was put in at first to prevent eels from getting in, but it was found not to answer, because the eels came in when they were small, and lived in the pipes and grew larger; and also to prevent *debris* from getting in. But it got choked up with leaves and other matter, and had constantly to be cleaned.
38. Did you ever attempt to prevent leaves and other matter coming into the tunnel by placing something of the kind at the other end of it? Yes; I had two or three floats placed on the surface of the water for that purpose, to rise and fall with the water; and I have now a man stationed there, who has nothing else to do but to skim the scum and different floating objects from the surface of the water.
39. You have no grating of any kind there? No, there is nothing but the sluice itself. It would retard the flow of the water too much, so that we should not be able to keep up the proper supply. I am wrong though, by the by, in reply to a previous question:—There was one place by the Gaol where we found a hole from the tunnel into a shaft, which was afterwards plugged up. From the bottom of the well there was a heading driven right through to our tunnel, with the object, I suppose, of drawing the water from the tunnel into the well. At all events, while we were cleaning out the tunnel we were annoyed by the water coming from the Gaol, and we got the hole plugged up with pieces of wood. They made great complaints about it, and said we were drawing their water away; but that was only a temporary affair.
40. Do you think the water from springs from a country such as that through which the tunnel passes is a desirable kind of water to be supplied to a town? I would certainly much sooner have an iron main laid through to the town, but that would be a very expensive and difficult job.
41. But independently of that it could be done? Oh, it could be done, but you could not bring the water by gravitation on the surface of the ground. You could not bring it by that route at all; it would be very difficult indeed.
42. You would have the same head of water with an iron pipe, would you not? It would be very expensive; for instance, if you came to a hill you would have to go through it—the water would not rise over it.
43. I mean to lay the main in the tunnel itself? Oh, you could lay it in the tunnel. There are one or two places where there would be a slight difficulty. There is one shaft which would cause a little difficulty by reason of its depth. They had not sufficient rock at the crown of the tunnel to support the shaft, and they had to go down deeper for it. That would be a difficult place, as the pipe would have to go down too, but it could be done by means of a syphon-pipe.
44. *Mr. Moriarty.*] Have you ever tried what the discharge of the tunnel is upon shutting the inlet-valve at the other end? I intended to have tried it, but I found the lock was not water-tight.
45. There would be no difficulty in doing it now? We would have to measure the water there now; we have three mains.
46. These drives to which you refer;—do they branch off to one side from the main channel? They do, going towards the swamp to the right; I fancy they intended to have carried the tunnel that way.
47. The first head from the main tunnel, where it terminates, is driven through a sandy tract of country? Yes.
48. Then, I would ask, is it possible for any drainage to come into the main tunnel from that drive? Oh yes, it is possible; at times the water comes in very strong.
49. Where is the next heading? Somewhere about the old Pound (*indicating position on plan.*)
50. Does that go in a considerable distance from the main tunnel? Some two or three chains; it is stated in my report.

51. And the other also? I think it does, and the other three too; they terminate in soft rock.
52. Do these drives leave the tunnel nearly at right angles? No; some of them are at an acute angle with the tunnel.
53. You don't think the object of these drains was to take the water in stratum? No, I think it was to get the shortest road to the swamp; and then when they got to the sand they had to turn back to get into hard ground again. I may mention that this section is not complete, but I have the data to complete it.
54. *Mr. Bennett.*] In your report you mention that you had to pump a large quantity of water? Yes.
55. In which shaft was that done? On the far side of the Rifle Range, between that and the end of Moore Park—between shafts No. 5 and No. 10 (*indicating positions on plan.*)
56. Had you any pumping at shafts Nos. 18 and 22? I think there was; I am not quite sure; Mr. Stacey will be able to tell you.
57. Do you recollect whether the water pumped out of these places was pure, or whether it was offensive? Well, there was some muck at the bottom at first.

F. Bell, Esq.,
C.E.
26 May, 1875.

Mr. John Stacey called in and examined:—

58. You have the charge of Busby's Bore, I believe? I have, Sir.
59. You assisted when it was cleaned out a few years ago, did you not? I did.
60. Did you go through it at the time? I was the first that went through it from the middle of the Racecourse to the mouth of the tunnel. I had two men with me.
61. What state did you find it in—say between Hyde Park and the Gaol? From the centre of the Racecourse it was just over your ankles—about 8 inches deep of mud and slush.
62. What was the character of the mud? It was a black sort of stuff, of a fatty substance.
63. Did it smell badly? No, it was a black fatty substance. From there to Riley-street it was half way up to your knees.
64. Of slush? Some kind of slush. From there to Darlinghurst shaft, at the corner of Botany-street and South Head Road, it was rock and sand, and an average depth all the way along—half way up to your knees. Then, from the centre of the Racecourse, where we started, to near Riley-street, there were masonry walls built up, and covered with sandstone slabs —
65. But, generally speaking, it goes through natural sandstone? Then about 1½ chain from Riley-street it was shale.
66. Was the roof dry? Yes, and the walls the same.
67. Was there the same kind of slush all the way through? No; towards Riley-street it was sand, and chippings.
68. Not so much slush? No.
69. And as you went higher up from the Barracks? As we came to the "Ice-house Hotel," from the Darlinghurst shaft to the "Ice-house Hotel"—I was on my belly on the sand with my back rubbing against the crown of the niche, and a little water trickling under me.
70. When you got higher up you did not find so much of this muck and slush? No, not towards the sandhill shaft.
71. Higher up did you find it comparatively clean? Yes, clean sand; although in some places there were pot-holes where a little slush had collected.
72. Did you find where this black stuff came from? It was decomposed vegetable matter.
73. Where did it come from? It came from the mouth of the tunnel—it must have come from there.
74. Then matter of that sort may come in now? No; there was nothing then to stop it at the mouth of the tunnel. Every flood brought the sand down from the hills, and when the flats got filled the stuff was drawn into the mouth of the tunnel.
75. You did not accompany Mr. Liversidge when he took these samples of water from the Bore, did you? No sir—I did not.
76. Are you acquainted with the drainage along the South Head Road;—is it any part of your duty to attend to that? No sir, I have only to look after the tunnel—nothing to do with the drainage.
77. Are you aware of any cesspits or other sources from which country such as that through which the Bore passes could be contaminated? There is nothing that could come into the Bore—nothing on that side, only what comes from the mouth.
78. You mean to say that no water comes out of the tunnel except that which goes into it from the Lachlan Swamp? Yes.
79. Are you quite sure of that? Yes, I am; there was at one time a strong stream of water coming in shaft No. 1, at Park Road, about fifteen feet from the surface.
80. This is rather an important question, and I should like to know what grounds you have for supposing that no water goes out of the tunnel except that which enters it at the mouth? Having been in charge of the main workings in it from one end to the other —
81. I am speaking of the present time. What grounds have you for supposing that no water goes out of the tunnel beyond that which enters it at the mouth of the tunnel? Because we have stopped the soakage that did go through it.
82. As far as you could, I suppose? Yes.
83. And that is your only reason? That is the only reason.
84. Are you aware that not many days ago—about ten days—the water was almost completely turned off at the Lachlan Swamp—only two turns of the screw on—and that at the same time a large portion of the city was being supplied from that source? Yes; the tunnel was cleaned out nearly three years ago, and that the soakage we stopped between Nos. 16 and 17 shafts was stopped with clay, some of which may have been washed away by this time. That is the only way I can account for the tunnel being so full.
85. Where do you suppose the water came from? It was in the tunnel. I have a report here which will show that the tunnel was overcharged. (*Producing report.*)
86. For what length of time was the water cut off at the mouth of the tunnel in this way? I think the report shows it—about four days at the longest.

Mr. J. Stacey.
26 May, 1875.

- Mr. J. Stacey. 87. For four days the water was cut off? Yes (*referring to report*), from 6 p.m. on the 6th instant to 6 p.m. on the 7th instant the lock was shut down close. The head of water at the mouth of the tunnel then was 72 inches. At 6 p.m. on the 7th instant it was opened five turns, and it remained at five turns until 6 p.m. on the 10th, and then we shut it down three and that left it open two, and it remained at that until 6 p.m. on the 14th, when we opened it eight turns, leaving the lock open at ten turns.
88. What is the diameter of the thread screw? That I could not tell.
89. *Mr. Moriarty.*] What was the diameter of the spindle? I never measured it.
90. How many turns does it take altogether? I think it is fifty—I would not be sure.
91. *Chairman.*] When there are two or three turns of the screw on only there is very little perceptible current, I believe? Well, not a great one, from what I have seen of the lock of the same size higher up.
92. If you sink a well in the Sydney sandstone you generally get a supply of water, don't you? No sir, not through sandstone, till you come to a bed of clay. You may sink 50 or 100 feet through sand and not get water.
93. But if you come across a bed of clay you get water? Well, you might; it is just according to whether you strike a spring.
94. Are any arrangements made to prevent solid matter from floating into the mouth of the Bore? Yes, there is a man always there with a sieve to gather up leaves or other matters.
95. Is he always there? Yes, constantly at the water's edge, when there is nothing to skim up he is gathering weeds.
96. There has been no grating there at any time? No sir.
97. *Mr. Moriarty.*] What are the general dimensions of the tunnel? It is all shapes and all sizes; you could not average 10 chains of it anywhere. Under the sandhill—between the sandhill shaft and the Hospital shaft in the Barrack yard—you can go along 3 or 4 chains, with the roof 9 feet high, and about 2 feet 6 inches wide, and then it goes down suddenly.
98. You cannot give an average of the height? No.
99. Can you state the average width? All along the South Head Road it averages about 3 feet wide. Then in one place under the brewery it is 16 or 17 feet wide.
100. Are there any means of getting the water up to any fixed height at the lower end of the tunnel? Yes, by regulating the lock.
101. I am speaking of the lower end of the tunnel? I don't know, sir.
102. The water-lock at the mouth of the tunnel is a circular one, 2 feet in diameter, is it not? Yes.
103. So that two turns of the screw would lift the valve a very little? Not much; it is the weight of the water at the back which forces the water in.
104. What head of water at the back have you? About 70 inches.
105. Then there are about 6 or 7 feet of water standing in the conduit? Yes, about 70 inches.
106. The other day when it was screwed down two turns what head of water had you? 64 inches. When it came down to 57 inches we opened out eight turns. I tried to manage to keep a head of 70 inches, but 40 inches gives them a good supply; when there is more than that it runs out at College-street.
107. *Chairman.*] You said when you had two turns there was a head of 64 inches;—do you mean you had 64 inches of water outside the tunnel? Outside the lock.
108. And although that was kept pretty close the whole time the tunnel remained full? Yes, it kept full during those four days.
109. *Mr. Moriarty.*] I think you said that at one of these new headings there was a large quantity of water came down? Yes, there was a great soakage through the masonry at the sides of the tunnel to the height of the roof; but that has all been pointed with cement and stuff.
110. Is there much masonry through the tunnel? Yes, there is a good deal. Between the Court-house shaft and the Ice-house shaft there is a great deal; when I say a great deal, I suppose there are three or four chains in different places.
111. Do you know what the country is in those places through which the tunnel passes, whether it is soil or rock? I don't know. It is rock at both ends; we go through the soil and then come to rock again.
112. We have heard something about the water coming in from the Gaol? Yes; when I found it out there was a drill hole about the size of your finger, and the water from the Gaol side came into us.
113. Through this drill hole? Through the drill hole. The Government thought we brought the water in, because they put a plug in from the Gaol side to stop it, and made the hole larger. I took the plugs out on my side, and took them to the Town-hall.
114. Then this drive must have come close up to your tunnel? About 9 inches or a foot off it; there was solid rock between their drive and our tunnel.
115. What object do you suppose that drive was made with? I understood it was to draw off the water to supply the Gaol, but instead of that we drew the water from them.
116. Did much water come into the tunnel? No, the hole was only the size of your finger, and they plugged it up.
117. *Hon. J. B. Wilson.*] Has it been plugged up since? I don't know; it was when I went through the tunnel.
118. *Mr. Moriarty.*] Is there much or is there any dripping from the roof of the tunnel? Nothing worth mentioning; you could go through now without wetting your shirt.
119. *Mr. Bennett.*] From which shafts were you obliged to pump when you cleared out the tunnel? Mostly from the last shaft on the Racecourse and the second shaft on the Common; we had three Californian pumps there.
120. Did you pump nearer to Sydney at all? Yes, I did; I had two pumps on the other side of the pound paddock, in the shaft next to it, No. 13, at the bottom of the tunnel; there was about 4 feet 6 inches of water in it.
121. Had you to pump No. 18, what you call Provost shaft? No, sir.
122. How did you get rid of the water at the bottom of the shaft? We had to bale it out.
123. Had you to continue baling it? The other part was not up to your knees.
124. But at No. 18 shaft, had you to bale it out against the next instant;—did you continue to bale it during the progress of the works? No, sir.
125. Why did not any more water come in? There was not more coming in than ran off.

126. But it would appear from this section that there was a hole there, and the water could not run off? *Mr. J. Stacey.*
That was about up to your arm-pits.
127. Did the men work in water up to their arm-pits? No, not in the water; we baled it out. *26 May, 1875.*
128. *Mr. Moriarty.*] Had you to bale it sufficiently to keep it dry while the men were working? —
129. *Chairman.*] We are simply speaking about this Provost shaft. Did you bale it out once, or had you to keep baling it out while the men worked? No, we had to work with the water in it.
130. You have not answered my question. Did you bale it out once for all, or had you to keep on baling it? Yes, we baled it out enough for our purpose.
131. Did you observe any more come in after you had baled it? No; there would be water in some places 3 or 4 feet, in pot-holes, and then it passed by.
132. *Mr. Bennett.*] Was the water offensive? No, sir.
133. Had you any difficulty in getting men after you started that work? No, sir, they worked night and day, and I had the same lot of men when I finished that I started with.
134. *Mr. Bell.*] There were two or three places at the bottom of the tunnel you had to excavate in order to let the water pass, I believe? Yes, where there was a bit of a ridge.
135. Where was that? One was between the Ice-house (No. 21) shaft, and the sand hills (No. 20) shaft. We might have taken from 6 inches to 9 inches off the bottom.
136. What was the next place? Between the Provost shaft and No. 1 Park Road, and between No. 1 and No. 2 Park Road (Nos. 16 & 17 shafts) we had to take out some more rock.
137. Where else had you to excavate? I don't think we had to take out any more till we got to the Rifle Range.
138. Had you to take out any more there? Yes, we had to take out some to get the pump to work.
139. *Hon. J. B. Wilson.*] You stated that in the tunnel between Hyde Park and Riley-street there was a considerable amount of masonry? Yes, it is all masonry.
140. Was any cement used, or was it all dry work? Dry work.

Mr. John Doherty, Inspector of Nuisances, called in and examined:—

141. *Chairman.*] Are you Inspector of Sewers? Yes, sir.
142. Are you well acquainted with the old South Head Road and that neighbourhood? Yes. *Mr. J. Doherty.*
143. Are you aware whether there are cesspits or other sources from which soil may be contaminated in that direction? There is one cesspit at the corner of Brisbane-street and the South Head Road—that leads into a pipe-drain which goes down Brisbane-street—an earthenware pipe. It goes down Brisbane-street, and goes to the main sewers in Hay-street. *26 May, 1875.*
144. Are there any cesspits which are cleaned out and the stuff carted away? Once or twice a week to take the flood-water off the streets.
145. You are referring to gully-shafts; I am speaking of cesspits? No there are no cesspits.
146. No cesspits anywhere along the whole line? No.
147. I mean along the line to the Bore;—do you know the course of the Bore? Well, I have been through it once.
148. Are there any cesspits along that line? No.
149. *Hon. J. B. Wilson.*] Are there any privies along the line of the Bore, from South Head Road to Park Road? Well, as you go south they all go into the sewers.
150. Is that the case as far as the Brewery? As far as Botany-street; after that there is no main sewerage.
151. Are there any privies or cesspits along that line to Park Road. Are the houses there, for instance, in Dowling-street, between South Head Road and Moore Park and in that neighbourhood, supplied with these ordinary privies? I believe they are.
152. And there is no sewerage, properly so called, there; the houses are all supplied with these cesspits? Yes, I believe they are.
153. And that is in the neighbourhood of the Bore? I could not say the exact position of the line of the Bore along there.
154. *Chairman.*] Perhaps this map will assist you. This is the course of the Bore (*indicating course on map*); of course wherever there are houses there must be privies of some kind attached to them. Are there any houses there? There are a few.
155. On the South Head Road, just as you come to the corner of Park Road, are there any sewers to carry off foul or closet matter? No, the only sewer that takes any sewage matter near there is at the corner of Park and Botany Streets.
156. Beyond that there is no sewerage at all? No, there is no main sewer beyond that.
157. Then beyond that, on the South Head Road, all the houses would have cesspits? I should say so, sir; and that sewer that runs down Botany-street, goes down Bourke-street, runs away to Woolloomooloo Bay.
158. *Mr. Moriarty.*] But have the houses there water-closets; because there might be a sewer, but it does not follow that they are connected with the sewer? Well, I have been fourteen years connected with the sewerage, and I believe there is not a single house on the South Head Road, from College-street to Botany-street, that is not connected with a sewer.
159. I want to know whether the houses have all water-closets? Well, I should say, and I have been continually among those buildings, that they have all water-closets; and also that they are connected with the main sewer.
160. *Chairman.*] Do you often find common cesspits connected with the main sewer? Well, I'll tell you how that is done —
161. I merely want to know, as a matter of fact, whether these cesspits are connected with the main sewer? I will tell you. Before they are connected with the main sewer, that is, before the drainage is brought into the premises, they are all cleaned out with sand or soil.

THURSDAY,

THURSDAY, 27 MAY, 1875.

Present:—

HON. J. B. WILSON,		E. O. MORIARTY, Esq.,
DR. ALLEYNE,		W. C. BENNETT, Esq.,
		F. BELL, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Mr. R. Seymour, Inspector of Nuisances, called in and further examined:—

Mr.
R. Seymour.
27 May, 1875.

162. *Chairman.*] We have called you to-day, Mr. Seymour, to obtain your evidence as to the best method which, in your opinion, could be adopted for clearing out cesspits in the City of Sydney and its suburbs. You have told us that at some former time some mode of contract was adopted by the Corporation;—will you describe that system? The Corporation, in the month of December each year, called for tenders for emptying the closets for the Corporation. Then, after a tender had been accepted—there would be two or three tenders, perhaps, and of course the lowest was accepted—there was an officer kept by the Corporation (the Assistant Inspector of Nuisances), whose duty it was to look after them, and in every case where there was a closet which was reported, either by letter or verbal complaint, or which we found ourselves to be a public nuisance or a nuisance to the neighbourhood, we gave notice to have it emptied.

163. To the contractor? No, to the owner or occupier of the house. Then an application was made, almost immediately, to the Town Hall, to have the closet emptied. I then gave instructions to the Assistant Inspector of Nuisances to go to the place with a nightman, and have it emptied, and the occupier or owner of the house had to pay the bare cost of emptying it. In that way we had all these closets cleaned to the satisfaction of the public. Afterwards the Council called for tenders again, and no one tendered, and it became a private matter, and was left in the hands of the nightmen, who made the people pay just what they thought fit.

164. Was the contract in the hands of one man, or one firm? One man had it.

165. Was he able to carry out that work for the whole city? He was.

166. Do you think that arrangement worked more satisfactorily than the present one? Yes; it was more satisfactory to the citizens and more satisfactory to us, because we knew when there was an order to clean out a closet, and we knew it was done, for the Assistant Inspector had to go next day to measure the pit, and see the number of feet the occupier or owner of the house would have to pay.

167. Now, I understand, you have nothing to do with the measurement or the payment,—all you have to do is to see that the closets are not in a filthy state? Yes.

168. Would it not be better, in your opinion, that these closets should be cleaned out more frequently than they are at present? Of course it would.

169. Although in some cases they do not create what you would directly call a nuisance, such as would justify your interference, there are a number of these closets, I suppose, which are very objectionable? Yes, it would be much better for the public health if they were cleaned out more frequently.

170. We are inclined to think the Corporation should themselves undertake, by their officers, to clean out these closets, and make a charge of some kind for doing it. Do you think that would be practicable? I do.

171. Then you would recommend that it should be done by the City officers—by their men and carts? Yes.

172. Suppose now that a certain cesspit, which ordinarily requires to be cleaned out, before it becomes nuisance, say once a year—supposing it were found desirable, under the new system, to have it cleaned out every three months—such a case might occur, I suppose? Yes.

173. Would that more frequent cleaning out materially increase the expense? Yes, because there are many of our common cesspits so situated that after a day's rain we have dozens of them overflowing into the yards, but if it is fine for two days they go down again by degrees. Still the smell, after the rain-water gets into the closets, is something very bad.

174. From the rain mixing with the closet-matter? Yes; the smell is sickening.

175. You think then that such a system would materially increase the expense—that it would entail a greater charge upon the owners? I do.

176. But if it were done systematically by the Corporation, under proper arrangements, don't you think that in itself would tend to diminish the expense? I think so, if it were done as you propose, and proper cesspits were constructed.

177. We are not going into that at present? I am speaking of the common cesspits; I think it would be much lighter upon the citizens than it is at present.

178. You mean that the cesspits should be made on an improved system? Yes.

179. Do you think, from your experience in these matters, it would be fair to say that all cesspits should be cleaned out at certain intervals—say once in three months or once in six months; or do you think there should be a distinction made between them? Some closets would not require to be cleaned out so often. I have known instances where closets have had to be cleaned out four times in six weeks.

180. Owing to the imperfect construction of the closets. Have you ever met with a certain kind of cesspit which did not require to be cleaned out at all? Yes.

181. What kind of cesspits were they? Cesspits built on sandy soil, with open brick-work. All the liquid portion of the closet matter went into the sand, and nothing remained but the solid matter. In those cases we have found them to last three or four years without being emptied.

182. It would not be fair in such a case to compel the owners to clean them out, except at long intervals? No.

183. There would be nothing to clean out? There would be nothing to clean out.

184. Do you think it would be a good plan to assess each property for this purpose at an annual sum, and that it should then be simply the duty of the officers of the City Corporation to do the cleaning at the discretion of the Inspector? I think the Corporation should have the powers of cleaning out these common privies, and that a law should be enacted to provide that a charge should be made for doing it; but I think the Corporation should have the power to make that charge. Then it would be the duty of the officers of the Corporation to see that the closets were cleaned out when required.

185. I suggested an assessment, not according to the value of the property but in accordance with the nature of the case: closets that did not require cleaning out should be assessed at a low rate,—which do you think would be the most equitable plan? I think the charge should be according to the work done.

186. And you think it should be left to the discretion of the inspector to decide at what intervals different closets should be cleaned out? I think so.

187. And you think there would be no difficulty in commencing such a system,—that the necessary plant and the labourers required could be obtained? It could easily be done. The Commissioners had all the plant necessary, and then it went to the contractor and from one contractor to another, and it was kept at Carter's Barracks, Haymarket.

188. Are these common closets very close together in many places? Yes; in Sussex-street there are no less than 188 common privies.

189. Is there any sewer there to which connection could be made? Many of them are connected; all that can be are connected, but a good many of them cannot be. We have put a pressure upon the owners by summoning them or threatening to summon them, and that has made them connect their closets with the public sewers wherever they could. I was looking over my instructions this afternoon and I found that from George-street to Darling Harbour, taking in the rocks at Miller's Point and that portion of the north side of Parramatta-street called Athlone-place, and several other smaller streets, there are 1,170 houses in that block which have common privies.

190. And I suppose these privies, although not such a nuisance as to justify you in summoning the parties, are still a perpetual nuisance? They are indeed. We had two cases at the Central Police Court to-day connected with a similar nuisance in Bay-street, Glebe. There were two double privies—common privies—and the stench on approaching was enough to turn your stomach.

191. You say that nuisances are very often increased in these cases by the admission of surface water into the privies? Yes.

192. Would any great additional expense, in your opinion, be involved in taking measures to prevent that? No; it would be a great advantage.

193. And it would have the effect of keeping the closets clean? Yes.

194. Do you think it desirable then that the Corporation should be empowered to insist upon this improvement being made also? Yes. If the closet was made of brick and cement, and about 18 inches above the level of the ground, no rain-water would be able to get in; but at present these closets are mere holes.

195. But that would involve a very considerable expense, would it not? No; the expense need not be so great.

196. Now, speaking generally, if you were making arrangements of this kind, would you consider it desirable to have smaller pits and have them cleaned out more frequently, or larger pits and not have them cleaned out so often? I should consider 4 feet wide and 5 feet deep a proper size; and they should be cleaned out not less than once in every twelve months if they were built in the way I have described.

197. How many persons, speaking roughly, would such a closet accommodate? Say a man and his wife and four children.

198. That would be for one house? For one house.

199. And you think everything that is necessary would be done if it were cleaned out once in twelve months—that no perceptible nuisance would occur? I think so.

200. Now suppose some officer were appointed to take charge of the whole system—not yourself but any officer—we know that officers will occasionally neglect their duties;—do you think there would be any danger of such neglect. Of course the occupier of a house would have no power to compel the Corporation to clean out his privy? I do not think so. I think the tenants would look after that sufficiently, and their neighbours.

201. You think the force of public opinion would be sufficient to prevent any danger from that cause? I believe so.

202. Have you had any experience in the use of any chemicals for deodorising closet matter, such as quick-lime for instance, thrown down the closets? We have what we use now, carbolic acid, and we have a man who gets £2 a week who goes round now and throws some stuff down to destroy the smell.

203. What does he throw down? I cannot say. Mr. Bell may be able to tell you.

204. Some deodoriser? Yes.

205. Under what circumstances do you use the carbolic acid? In common privies or cesspits.

206. Does this man make a regular round of visits for that purpose? No; only when we hear of any nuisance of that sort we send him with a can of stuff which he sprinkles over the place to take away the smell.

207. That is where the closet is not full, but is offensive? Yes.

208. Do you find that plan to be advantageous? We do not.

209. Why does it not answer? In some cases the persons residing in the house do not wish us to use anything of the sort on the premises. We had an instance of that in Kent-street. They said they would sooner have the smell of the closet than have the carbolic acid used. At the same time there was a very severe case of typhoid fever there.

210. Then if you had used something not so offensive as carbolic acid they would not have objected? No.

211. It was not a mere ignorant objection then? No.

212. Was that the only objection? Yes.

213. Then if that could be removed do you think the Corporation might, with advantage, be empowered to use some kind of deodoriser? Yes, they might have the closets cleaned out and deodorised.

214. In speaking of a common privy or closet, you mean not one that is common to a number of people but an ordinary one? Yes.

215. Have you any objection to change the use of the word common to ordinary in your evidence? No; ordinary is what I mean.

216. You think the system you have described would be as effectual, under present circumstances, as any that could be devised? Yes.

217. And of course it would be equally applicable to other Municipalities? I should say so.

218. Have you any knowledge of how the matter taken from these closets is disposed of at present? At present the gardeners take most of it away. A great deal of it goes to Botany Road.

219. It is deposited in a number of places I suppose? Yes, on gardens.

220. Do the people take it away themselves? Yes; we don't take it. The nightmen take it away and sell it to the gardeners.

221. Do you mean to say that these people receive it just as it comes from the closet? Yes.

222. Do you think it desirable that this matter, fresh from the closets, should be taken to these people's premises? I do not.

Mr.
R. Seymour.
27 May, 1875.

- Mr. R. Seymour. 223. Don't you think such a practice must be dangerous, not only to themselves but to their neighbours? I do.
- 27 May, 1875. 224. The Corporation I suppose have no power over these people? Not the slightest; we have no control over them whatever when once they leave the city; except they go anywhere near the watershed, and then we go after them.
225. Has there been any place outside the city set apart for depositing matter of this kind? There was at first, on the western side of Moore Park; there were pits built there some years ago for that purpose.
226. Were they built by the city authorities? Yes; and they had power to compel the contractor to put the stuff wherever they thought proper.
227. That was in his contract I suppose? Yes.
228. That place was not in the city at that time? No; but it is now.
229. How did that system work? It worked very badly; the place was too close to the township. The residents on Surry Hills were always complaining of the stench, more especially when there was a south-east wind.
230. Was the stuff allowed to remain there permanently? No, it went into two large pits close by belonging to the Corporation, and then it was used for plantations.
231. Do you mean that that was done periodically? Yes.
232. How did that end? It ended by the filling up of Moore Park; but previous to that there were so many complaints that the Aldermen had decided to abolish it, and it was abolished.
233. And since that time there has been no place to deposit matter of that kind? No, that was the last place we had.
234. What would be in your opinion the best method of disposing of this closet matter? I think there ought to be a proper place to take it to, and that it ought to be properly cleansed—all the bottles, empty tin cases, and other things taken out of it. I think the soil should be properly cleansed and properly deodorised, and converted to some use.
235. Do you think there is any suitable place sufficiently remote, but not too far from the city, available for such a purpose? I know of no such place at the present time.
236. Do you think such a place could be found? I don't think it is anywhere round Sydney at the present time.
237. But if this matter could be at once deodorised there would be no objection to deposit it almost anywhere, even closer to Sydney? Yes, if it could be deodorised. My opinion is that it will never do to deposit this matter in the neighbourhood of Sydney, or its suburbs; for no matter where it is put the stench will be carried by the wind, if not into the city into some adjoining Municipality.
238. Are you aware whether these gardeners obtain this matter without payment? No, they pay for it in many instances.
239. *Dr. Alleyne.*] When you speak of deodorising this closet matter, you mean depriving it of its disagreeable smell? Yes, of everything offensive.
240. Offensive to the nose? Yes.
241. *Mr. Moriarty.*] You have mentioned, Mr. Seymour, that in many places the soil from the cesspits percolates into the surrounding ground? Yes.
242. Have you noticed anything offensive to arise in the neighbourhood of those places afterwards? Yes; in many instances we found a most deadly smell in those places for days and weeks.
243. Did you attribute that to the saturation of the soil by offensive matter from the cesspits? Yes.
244. You referred to a certain place where this had occurred—Sussex-street and some other place, Parramatta-street, I think;—are there any wells in that neighbourhood from which water is drawn for the use of the inhabitants? I don't think you could find half a dozen wells in Sydney just now. We find that in all instances the wells have been filled up.
245. Then there is no danger of the contamination of wells from that cause? Not that I am aware of.
246. *Mr. Bennett.*] In those closets in sandy places, to which you have referred, you find as I conclude from your answer to Mr. Moriarty, that the sand becomes offensive, and you object to a uniform rate of assessment because it would press heavily upon the owners of such properties. Don't you think it would rather be an advantage to compel them to make their closets retentive? Yes, I think it would be—if not to the owner it would be to the occupant.
247. Do you think these closets which do not require to be emptied so often are more objectionable? Yes.
248. You said you thought there would be a difficulty in obtaining a place near Sydney for the deposit of closet matter. Would the present watershed be a suitable place, supposing that water could be obtained elsewhere? I think it would.
249. Do you know any place on Shea's Creek which would answer? It is on the line of Shea's Creek where it is deposited at present.
250. Do you know any place further on near Cook's River? I do not know any place, because there is a great deal of building all along there. There is one thing you would have to guard against if the soil was brought on to that land. You are aware that we are subject to strong southerly breezes, and the whole of the stench would be brought right into town. It was thought at one time that the Corporation should engage punts and take the stuff out to sea.
251. *Hon. J. B. Wilson.*] You stated, I think, that during the time of the Commissioners, when the night-soil was removed by contract, the parties paid a certain fee for permission to remove it? Yes.
252. Have you formed any opinion which system was the most economical, that or the present plan, of paying the nightmen to do it? The plan carried out by the Commissioners and Corporation, until they were unable to obtain tenders, was much more beneficial.
253. Is it a fact that the charges for removing the night-soil from these closets are very high? Yes; the people have to pay 25s. now or more for emptying a closet, which they used to get done for 10s.
254. Then the system you propose would not be a heavier tax upon the inhabitants than the present one? No, I don't think it would. I think if these ordinary privies are retained there ought to be an arrangement that they should be cleaned out every winter, just at the latter end of the winter, before the summer comes on.
255. *Chairman.*] And at such other periods as the inspector may consider necessary? Yes, because some of them require it oftener on account of bad management.
256. Could any alterations be made, without any great expense, to facilitate the cleaning out of the closets, so that the nightmen could obtain access to them more conveniently? No, I don't think so, sir; they must go through the yard.
- 257.

257. I mean in getting at the pit itself? No, there is no difficulty about it at all. I have been round with the nightmen myself repeatedly.

Mr. R.
Seymour.

258. *Mr. Bennett.*] Was this contract system for the removal of night-soil initiated by the City Commissioners? It was commenced by the City Commissioners, and was carried on for some years afterwards by the City Council.

27 May, 1875.

259. What was the average charge per cubic foot? We used to get it out as low as 2d., and then it went on increasing until we paid 10d.

260. *Chairman.*] What is the charge now? We have to pay 25s. or 30s. up to £2 for what we could formerly get done for 10s. or 15s.

261. Is that in consequence of the high rate of labour, or from the difference in the system? It is from the different system. The nightmen have it all in their own hands; there are only four of them, and they charge whatever they like.

Mr. David Clement Robertson, Inspector of Waste Waters, called in and further examined:—

262. *Chairman.*] Your duties keep you moving about the city pretty frequently, I think? Yes.

Mr. D. C.
Robertson.

263. We have just examined Mr. Seymour respecting the ordinary privies and cesspits. He tells us there are a great many in Sydney, and that they are a great nuisance. Even in many cases where the nuisance is not of such a character as to justify him in interfering with some of the parties, it is still a nuisance, and he thinks it would be desirable to take steps to remedy the evil. Are you of the same opinion? Yes. There are many closets which might not have a foot of matter in them and yet be very offensive.

27 May, 1875.

264. And he thinks that the Sydney authorities might be empowered to clear out these closets by their own servants at such periods as might be determined, or at the discretion of their officers might be thought necessary. And he thinks this duty should be charged according to the work performed, to the owners or occupiers. Do you think that would be an improvement? I think it would. I think it would be a most effectual way of abating the nuisances and keeping the closets clean.

265. And you think that nuisances of this kind existing in the city and the suburbs—for of course you have some acquaintance with the suburbs—are such as to justify immediate action? I do.

266. Do you think the matter is of such importance that if not attended to before next summer the health of the inhabitants of the city is likely to be seriously affected? Yes; these closets are very offensive—you can perceive it as soon as you approach them.

267. Are there not in some crowded parts of the city, and even in the suburbs, places where there is always more or less an offensive smell? There are.

268. I mean not from any particular nuisance which Mr. Seymour might take notice of, but a constant nuisance? Yes; from the fact of there being such a number of these closets close together.

269. Mr. Seymour thinks that, without any very great expense, an arrangement might be made to prevent the percolation of surface water into these cesspits, which he tells us very much increases the nuisance, and also the expense of keeping them clean. Have you observed that? Yes. I have observed that closets that have been cemented outside have not been so offensive—where they have been comparatively water-tight.

270. He tells us that where there is a cesspit in sand or loose gravelly soil, which absorbs all the liquid matter, the closet seldom becomes full, except after a long time? Yes. In sandy places—in parts of the Surry Hills, for instance, there are closets which have not been cleaned out for years.

271. And Redfern also? Yes, in Redfern too.

272. In cases of that kind, where closets have not been cleaned out for years, and where the liquid matter percolates through the soil, is it your opinion that they still become a nuisance, by contaminating the surrounding soil? I think so; of course they are not so offensive as the others.

273. But you think it would be better if such a state of things should not be allowed, and that it would be an advantage to have the closets water-tight? Yes. There is always a fear of the wells in the locality being contaminated.

274. Can you give us any suggestion which occurs to you for carrying out as soon as possible some general scheme, not only for the City of Sydney but for other municipalities? No. That is more in Mr. Seymour's line. I have not had much experience in these things.

275. Have you heard people complain about these privies in the places you have referred to? Yes; and they have called me in to see them. My attention has been called to them, both in the City and in the suburbs. There are places in Sydney where there is only one cesspit for twelve or thirteen houses, occupied, some of them, by forty souls. There are several such places in the city.

276. Is there any difficulty, or is there anything to prevent them from having more privies in such cases? Well, it is very necessary there should be more.

277. But is there anything to prevent them from having more? In some of the places they could have more. In one place off Kent-street, where they have only one cesspit, I think they are now connected with the sewer. In one place near the Gas-works there are two pits for I think twelve houses. Mr. Seymour summoned a party there some time ago.

278. Not for having so few closets but for having them so offensive? Yes.

279. Have you observed where these cesspits exist in friable loose soil, such as you have described at Surry Hills and Redfern, that there are wells near them which are used for household purposes? Yes; at Waterloo the houses are nearly all supplied with wells.

280. Are these wells near the cesspits? Yes, they are generally near, and in some cases the closet stands higher than the well, so that the drainage goes towards the latter.

281. Have you any reason to suppose that the water has been contaminated in these places? No, sir, I cannot say I have. I have never lived there myself.

282. And you have never heard the people complain of it? No.

283. Are these closets very near the wells? They vary according to the size of the allotment. As a rule they are not very far off. The closet is generally in the corner, and the well about fifteen or twenty feet from it, according to the size of the ground. There is a row of closets on Surry Hills within twenty feet of the back door of the houses, and the drainage from the cesspits goes right under the houses.

284. *Mr. Moriarty.*] What is the character of the soil there? It is a loose soil.

- Mr. D. C. Robertson, 285. And the cesspits, are they bricked or cemented? No; just common cesspits.
 286. And the drainage goes under the houses? Yes; I have lived in one of the houses myself.
 287. What is the name of the place? Agnes-terrace, Surry Hills.
 27 May, 1875. 288. Are there many others of a similar character? Oh, yes; numbers. I used to smell the closet as soon as I went down stairs into the back room.
 289. About how far was the closet from the house? About the breadth of this room. About 20 feet.

FRIDAY, 28 MAY, 1875.

Present:—

HON. J. B. WILSON,	E. O. MORIARTY, Esq.,
W. C. BENNETT, Esq.,	F. BELL, Esq.,
G. F. DANSEY, Esq.,	DR. ALLEYNE,

CHAS. WATT, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Charles Watt, Esq., Government Analyst, examined in his place:—

- C. Watt, Esq., 290. *Chairman.*] We wish to take your evidence, Mr. Watt, as to what can be done practically—bearing in mind the expense and the practicability—in the way of disinfecting cesspits and similar receptacles for faecal matter, and also for disinfecting the matter which is removed from closets. Can you give us any information on the subject. For instance, there is dry earth;—would you use that as a deodoriser or disinfectant when applied to faecal matter either in the closet or after it has been removed? I have made a list of the ordinary deodorisers and disinfectants, such as can be obtained here, for of course if they are not readily obtainable it would be no use to think of them.
 28 May, 1875. 291. Such as can be employed at a reasonable expense? Yes, at a reasonable expense. I have divided them into two classes. The first class consists of carbolic acid—common commercial carbolic acid.
 292. Impure carbolic acid? Yes.
 293. A substance called carbolate of lime, and the ordinary chloride of lime. These three substances destroy offensive odours and disinfect; they are deodorisers and disinfectants, but they each of them leave their own peculiar odour—that is the first class. The second class is sulphate of iron, chloride of zinc, and sulphate of alumina. These arrest putrefactive fermentation; they do not deodorise thoroughly, but they leave no peculiar smell of their own. That is the second class. These last would cause the closets to be much sweeter, inasmuch as there would be no putrefaction going on in them—only the ordinary smell of faecal matter. With regard to the sulphate of alumina, there is a great deal in favour of it, as it could be obtained in quantity at a reasonable cost, it being a natural product.
 294. Do you know any one who could give us information on that point? I can obtain it for you.
 295. Can you state roughly what it would be likely to cost? The rough price I understand would be about £3 per ton. It would not be serviceable as a thorough deodoriser, but as preventing putrefactive decomposition. Many persons will not, if they can possibly avoid it, use disinfectants which leave odours of their own; that is my experience. There is an advantage in those chemicals which I have mentioned in the second class, that they fix the ammonia, and they do not in any way—except, perhaps, chloride of zinc—interfere with the value of the product as a manure.
 296. Do I understand you to say that if you use one of these substances, chloride of zinc, which takes away the offensive odour and arrests putrefactive fermentation, it would not destroy the noxious gases arising from the closet matter? With regard to anything that arises from the faecal matter, it would not perhaps have any thorough effect unless it were brought in perfect contact with it. These compounds do not destroy the gases; they arrest decomposition, but not being volatile they are not capable of meeting any gases which pass into the air from the faecal matter.
 297. I should like to understand this thoroughly. Supposing a closet contains a certain amount of faecal matter, and chloride of zinc is introduced into it, it arrests the process of decomposition, but you say it does not destroy the ordinary odour which arises from it? If used in large quantity, so that every particle of the matter was covered with it, it certainly would. But you cannot ordinarily—in an ordinary cesspit—mix it well up with the closet matter.
 298. Do you think it would permanently arrest putrefaction;—how long would it last? It would last until fresh matter was thrown on it.
 299. Are you quite sure it destroys the ordinary stench if properly applied? It certainly does; it is a question with all these substances whether they are used thoroughly or not; the great difficulty is that you cannot expect people to stir up the matter so as to mix the ingredient with it.
 300. In this case it would be applied to matter which was in a highly diluted state? If it were well stirred up it would be effective; these things are chiefly effective in preventing or stopping putrefactive fermentation.
 301. We contemplated suggesting some such arrangement as this, to prevent the necessary consequences attending the frequent cleaning out of closets: That the City authorities should be authorized to use disinfectants in the closets themselves;—is that practicable, do you think; is there any disinfectant which would destroy the smell, and also the effect upon the health of the inhabitants of the vapours which arise from the closet matter? Any one of these I have mentioned would render considerable service. Personally, I should prefer the first-mentioned substances.
 302. I wish to have your opinion as to the most practicable method. You say that in certain cases a great deal of mixing would be necessary, which would be difficult to do; practically, what substance would you recommend? I think I should prefer to use carbolic acid.
 303. A great many persons, I believe, refuse to use carbolic acid, on account of its noxious smell, which is a great objection? In that case I should fall back upon the sulphate of iron or sulphate of alumina, and sprinkle it in every two or three days. I suppose the faecal matter in the closets would be pretty stiff, and this would not sink through it. But fresh matter would be thrown on the top, which would still give out its odour, as you would not be able to stir it about.

304. It is clear that the city officers could not be disinfecting closets every two or three days;—would there be any advantage in using disinfectants, supposing the closets were cleaned out every three months, or say once a month? Well, it would of course do some good. C. Watt, Esq.
28 May, 1875.
305. Do you think disinfectants could be used with much advantage at such intervals as to render it unnecessary to clean out the cesspits so frequently? I do not think so. I think they would have to be cleaned out very frequently.
306. You are aware, I suppose, that they are not cleaned out now until they become a perfect nuisance? I am aware that they are imperfectly constructed and much neglected.
307. You do not think a system of disinfecting these cesspits at certain periods could be carried out successfully? I do not think it could be done with any success.
308. But you think that of all the disinfectants you have enumerated the sulphate of alumina would be the most practicable? Yes, those substances which I have mentioned in the second category, which disinfect but do not thoroughly deodorise.
309. They are not so effective as chloride of lime? No, because that disinfects and deodorises also.
310. Do you think any advantage would arise from the use of quick lime? No, that loses a portion of the ammonia, and it is not a good disinfectant or deodoriser. It sets free a quantity of ammonia, and I think it deceives people in reference to its efficiency on account of the ammoniacal smell.
311. It is not a good deodoriser? No, it sets free the ammonia from the urine, and sends a quantity of it into the atmosphere.
312. You would not recommend the use of lime in this case? No, the most effective thing, but it would cause a great deal of trouble, would be dry burnt clay, as it absorbs the moisture and prevents putrefaction.
313. Would not thoroughly dry clay answer the purpose? No, it would not be so good as burnt clay.
314. But after it was burnt it would still be in a friable state? Yes, if sufficiently burnt to render it more absorbent, but not over-heated.
315. Can you explain the way in which dry earth acts? Simply by absorbing the fluid in which the decomposing matter is suspended.
316. It simply absorbs the moisture from the faecal matter and makes it solid. It has no chemical effect? No.
317. What is the element in dry earth which produces this effect? It is the silicate of alumina principally.
318. The free silica which exists in soil has no such property? When it exists as sand it is of no use.
319. The ordinary clay and loam consists, does it not, of silicate of alumina and free silica? Yes.
320. Then if the free silica were entirely absent it would be equally effective as a deodoriser? If the silica existed as sand it would be useless, but if it existed in the shape of dry powder it would have an absorbing power. It is the compact hard silica which has no power to take in moisture.
321. Would what is the nearest approach to silica in pure clay, such as pipeclay, be of use? Yes, if thoroughly dried; any clay that would absorb moisture.
322. Do you think there is abundance of the proper material for such a purpose in the neighbourhood of Sydney? Yes, in the County of Cumberland.
323. Do you think there would be any advantage in occasionally throwing down into these cesspits some dry earth of the proper kind? Well, if you could put enough of it in to make the closet matter solid, it would be efficacious.
324. So as to cover the stuff in the closets completely? Yes; of course it would entail a good deal more work in removing the soil.
325. About what quantity would be required? Sufficient to make the closet matter not only pasty but to absorb the entire moisture.
326. Are you of opinion that such a plan—to make the matter solid—would be practicable? No, I do not think so; there would be too much of it to remove.
327. I understand generally then that you do not recommend the use of disinfectants in cesspits. We are assuming, of course, the cesspit system to exist as a necessary evil? I may say that if these disinfectants were used by the occupants of the houses regularly they would be useful, but to use them spasmodically, now and then, would be scarcely of any use. I do not think any advantage would be gained by the Corporation employing them once a month.
328. I will now come to another point: Supposing the matter from these cesspits were removed and deposited in some place out of town, and these disinfectants applied to it either when it was removed or afterwards;—would that answer, do you think? Yes; you would have a better chance of dealing with it then.
329. Do you think it could be deodorised in that way at a reasonable expense? I think so.
330. What would you recommend as the most effectual deodoriser? I should recommend sulphate of alumina or sulphate of iron under such circumstances.
331. I don't think the objection to carbolic acid would exist in such a case, because it would not be brought to every man's door? No; I am looking at the question of expense and probable use of the refuse as manure.
332. You think the sulphate of alumina would be the best? Yes, I think so.
333. Supposing a cart-load—containing say two tons of closet matter—were treated in this way, can you give a rough guess as to the quantity of stuff it would take to deodorise it? I could only give a very crude guess, because I have made no experiments of the kind, and it would depend greatly upon how you applied it. At a rough guess I think you might say one hundred-weight of sulphate of alumina—perhaps less.
334. That would cost—how much? £3 per ton—perhaps not so much.
335. If it were obtained on a large scale? Yes. It might be sufficient to throw a little of it on the top of the stuff, if it were deposited in a suitable place, and then it would not take so much.
336. Would that affect the value of the closet matter as manure? I think it would make it rather more valuable, as it would fix the ammonia.
337. If the contents of a cesspit were dealt with in this way, and allowed to remain in a certain depot for a certain time, would it then become valuable as manure? That is a very hard question to answer, because it would depend upon the demand for it. If the persons who made use of it lived close by, it might be of value to them, but it would not be of sufficient value to persons living at a distance, who would have to pay the cost of carriage.

- C. Watt, Esq. 338. Would it be of less value than the ordinary stable manure? Well, it is a different class of manure, and people are not in the habit of using it. It is a very good manure, but having so much fluid in it the weight and the cost of removal would be great objections to its use, unless to persons living close by.
- 28 May, 1876. 339. But still it would be of some value if it were placed in heaps? That would depend upon the demand for it; but in any case there would be some fluid with it, and there would be a great weight to remove for a very small quantity of real manure.
340. What would you recommend as to the conditions under which it should be taken to the receptacles where it would be deodorised in this way? That I am hardly capable of giving an opinion upon. If I were sure the farmers would take it, then I would advise that it be deposited in vessels that would not leak.
341. Suppose it were deposited in hollows in the sand, would the solid matter that remained after the liquid had been absorbed be of any value? Not of much value.
342. Would it be worth anything? Of course it would be worth something.
343. I understand that you do not think it would be of sufficient value to induce people to use it if it had to be transported to any distance—that if there is to be any profit in it, it must be consumed in the neighbourhood of Sydney? Yes; or within a few miles of it.
344. We have had it in evidence that the greater part of the night-soil taken out of Sydney is carried away and sold to market gardeners. If the quantity were confined to what is now taken away for that purpose, could that be treated in the way you describe without much difficulty—could 200 tons of it be so treated without creating a local nuisance—of course not in the neighbourhood of Sydney? That would depend upon a variety of subjects. For instance, during wet seasons it could not well be removed, and it would be considerably increased in bulk. In dry weather I don't think it would create a nuisance.
345. You think this deodorising matter would have completely destroyed the nuisance? If you did not use carbolic acid it would not be thoroughly deodorised. If you only used sulphate of alumina you would still be able to realize what it had been; it would still have what is called a faecal odour.
346. Supposing we had altogether 200 tons a week of this matter, from cesspits to dispose of in the city and suburbs, until some perfect system of sewerage could be devised, what plan would you be disposed to recommend? I think I should lean to the carrying it to sea.
347. And throwing it away in the sea? Yes. I am afraid there would not be a sufficient demand for it by the market gardeners. They would take some of it no doubt, but you would have to remove the remainder. You might let them have a certain quantity until you had made arrangements to take it all away.
348. It appears that at present, as soon as the matter is removed by private individuals beyond the limits of the city, the authorities have no control over it, and the people who take it away put it anywhere they like;—what do you think of that system? That is precisely what I am afraid of. I think it is shocking. That is the reason I think you must keep it out of their hands until a proper use can be found for it. Then comes another question which medical men have been considering a good deal at home, whether this matter is fit for manure for different kinds of crops, or whether it may not lead to some not yet fully realized evils.
349. *Dr. Alleyne.*] Is your objection to the use of quick lime simply a commercial objection? I have no objection to it; but it liberates the ammonia which you want to save if the article is to be used for manure; that is one thing. Then it is not readily soluble, and therefore has no tendency to diffuse throughout the mass to which it is applied.
350. Is it not a powerful caustic? Yes, to anything it touches, but it is not easily soluble.
351. But it is very absorbent—it absorbs the fluids very rapidly; and of course in doing that it comes in contact with animal or vegetable or other matter diffused through the fluids? Oh yes. I may mention a case which has come under my notice, which may be interesting to the Board, as it shows the necessity of making some improvements in connection with the ordinary cesspits: A woman came to me some time ago and brought me some loaves of bread to look at. She said great complaints had been made about the smell of her bread and she did not know what could be the matter with it. She wanted me to find out for her what made it objectionable. I asked her what water she used to make it with, and she said she used water from a well. I then asked her if the closet was anywhere near that well, and she said it was not very far off. I told her to go home at once and have the well emptied, and find out whether there was any connection with the cesspit, and to come back and let me know. She did so and it was found that there was a surface drain running from the closet direct into it, and of course the water was contaminated. She had thus been selling bread to the whole neighbourhood made with polluted water. The matter was rectified and the bread was improved, and there were no more complaints about it.
352. *Chairman.*] Was the water itself offensive? She did not bring me any of the water, but as they were very dirty people I dare say it would have to have been very offensive for them to have complained of it.
353. How was it that the bread was contaminated and not the water? I should say probably water was not an article they used very much.
354. What part of the city was that in? In the upper part of the South Head Road.
355. *Hon. J. B. Wilson.*] What, in your opinion, would be the effect of mixing the ordinary street sweepings with matter from the cesspits in the places to which it was taken. Would it help to make the closet matter less injurious to health. Would the sweepings deodorise it at all? It would tend to part the faecal matter and break it up; I don't know whether it would deodorise it much. It would depend a good deal upon whether it was dry when you mixed it. If it were dry I think it would have a little effect, but not in such weather as this. I look upon the keeping the cesspits water-tight as the most important point to prevent the nuisances we have been referring to.

Mr. Andrew Kayser called in and examined:—

- Mr. 356. *Chairman.*] Are you in the employment of the City Corporation? Yes.
- A. Kayser. 357. In what capacity? I am employed to deodorise closets.
358. You mean public closets and urinals? Yes.
- 28 May, 1875. 359. Do you adopt any particular system of your own in doing so? Yes.
360. Have you any objection to explain to us what the process is? None whatever.

361. Will you explain what the substance is which you use? It is simply a mixture that evolves chlorine.
362. How is it to be made? It is a mixture of my own.
363. Is it an expensive one? No, it is made at a slight cost.
364. It is something which contains an excessive quantity of chlorine? It evolves a large quantity of chlorine, and it keeps working for five days.
365. You are making this stuff yourself? Yes.
366. Do you sell it to the Corporation, or do they pay you for applying it? They pay me so much for supplying it.
367. So much per ton? No, according to the quantity used to deodorise the closets; it does not take anything like a ton.
368. Do you think if it were generally used it would be applicable to the deodorisation of closets—public closets? Yes, provided that wherever you use it you have some little circulation of air.
369. Would it readily mix with the contents of a closet or cesspit? Yes.
370. Would it mix with the fluid—is it soluble? It would not mix with the soil itself, but it would saturate it with chlorine. It is much the same as an effervescing draught; there are three bodies in it which act upon each other just in the same way as anything else which ferments.
371. But when you apply it to a large cesspit would the stuff you put in diffuse itself as a liquid, or would it remain in one place? It would diffuse itself by its gas; the gas would be evolved and saturate the body requiring to be disinfected.
372. The chlorine gas would be circulated through the matter to be deodorised. Then it is simply a contrivance for diffusing chlorine gas? Yes.
373. How much of it would you require to use to deodorise a cesspit containing four or five cubic yards of night-soil? Do you mean to deodorise the whole mass, or simply to deodorise the foul gases arising from it?
374. To do what you can—I do not know whether you can deodorise the whole mass? Not if it were solid.
375. Well to do the best you can with it—how much would you use? It would not require above four pounds.
376. Have you any idea at what price you would be willing to sell this compound? Any quantity of it at sixpence a pound.
377. How long have you been in the employment of the Corporation in this capacity? This is the third month.
378. And what proof did you afford them of the efficacy of your mixture? We had several trials of it—several public trials—in some of the worst places in town. We tried it in the George-street markets.
379. It would not be so applicable, I should imagine from what you say, to a mass of closet matter which had been deposited in the open air, as it would to matter which was confined, as its effect is produced by the generation of gas, and the gas would, in that case, escape? No, the gas would be dissipated to a great extent. The stuff would require to be mixed up with the closet matter.
380. *Mr. Bell.*] In cleaning—emptying out closets, would it be beneficial in any way in keeping down the smell? I think it would.
381. During the process of cleaning out the closets, to prevent the abominable smell which arises? It would perfectly cure that.
382. Would you be able to apply it in an efficient manner? I think so; in fact I think the whole of the matter in the closet could be easily deodorised before the morning; but that is only a supposition—I have not tested it. The offensive savour from the closet could be perfectly cured.
383. *Chairman.*] Am I right in stating that it would take about 1 lb. to the cubic yard of the ordinary contents of a privy? To a cubic yard of solid matter. To deodorise a privy would not take so much. There is a marked difference in the closets; the worst places in Sydney at present cost 6d. per day for each closet.
384. What weight of your substance would be required per cubic yard to deodorise the contents of a closet? As I stated, I have never tried an experiment of that sort, but I should say not over 1 lb., that is sixpence.
385. *Hon. J. B. Wilson.*] Do you put it into the closet in the form of powder? To deodorise the matter in the closet you would require to put it in in a semi-liquid state.

Mr.
A. Kayser.
28 May, 1875.

G. F. Dansey, Esq., City Health Officer, further examined:—

386. *Chairman.*] You have heard the latter part of the evidence? I have.
387. Did you hear Mr. Watt state that he should not anticipate any good results from the use of disinfectants in connection with cesspits? I did, and I believe it.
388. Have you ever made any experiments yourself? I have made one or two trials and have made the inmates of the houses use disinfectants.
389. What substance did you make use of? Sulphate of iron principally, but I had no chance of ascertaining whether the effect was satisfactory, because I persuaded them to try two or three different substances, and I have not yet been acquainted with the results.
390. Do you think the use of disinfectants could be made applicable to mitigate the constant nuisance of these privies? I do not.
391. Is that opinion the result of experience? Yes.
392. You think then that so long as the cesspit system continues there is nothing for it except to remove the contents? Yes, and to prevent the surface water from going into the closets.
393. To make them water-tight? Yes.
394. We find from the evidence we have taken, that a great number of the cesspits which are constructed in sandy soil, where the liquid matter percolates through the sand, do not require emptying for a long time? It is according to where they are placed.
395. Have you ever found any nuisance arise in such cases, from the soil becoming contaminated with faecal matter? I cannot say that I have. I have had my attention drawn to nuisances arising from the deposit of refuse matter upon land. In one case it existed to such an extent that the fumes came up through the chinks of the ground floors of houses in the vicinity, so that they were impregnated with it.

G. F. Dansey,
Esq.
28 May, 1875.

- G. F. Dansey, Esq.
28 May, 1875.
- it. That was where a quantity of refuse of different kinds was deposited on the land; I could not say it was from the closet.
396. In the construction of cesspits, would you prefer that advantage should be taken of this friable soil, or that the closets should be made water-tight? I think they ought to be made thoroughly water-tight, and cleaned out frequently.
397. Have you ever taken into consideration what would be the best method of disposing of the night-soil, after it has been removed from the cesspits? I can see no better method of disposing of it than to carry it out to sea.
398. You have heard what the last two witnesses said upon this subject? Yes; I may mention that we have had this subject under consideration at the Town Hall, and we have come to the conclusion that the only safe plan is to carry it away.
399. And to get rid of it thoroughly? Get rid of it thoroughly, and not risk its being left on our hands.
400. Do you consider it would be desirable that the City Corporation should have the power to remove this stuff, and to clean out these cesspits by their own officers? I do.
401. Irrespective of the wishes of the inhabitants—by their own officers, and in accordance with some fixed rules? Yes.
402. Do you think such a system would be practicable? I am hardly in a position to say how it would work.
403. You have heard what Mr. Watt said about disinfecting this matter at some place where it would be deposited for that purpose? Yes.
404. Do you agree with him on that point? Well, the chloride of alumina was one of the ingredients with which they watered the streets of Westminster, and no unpleasant effects were found to arise from it. I may mention, in connection with this subject, that in Bombay, the earth-closet system was tried largely, and there they found that 800,000 inhabitants required 400 tons daily of dried clay. Each deposit of an individual of faecal matter in the day required 8 lbs. of clay I think, shewing what an enormous burden it would be to supply a large city with earth, to make it thoroughly effective.

MONDAY, 31 MAY, 1875.

Present:—

W. C. BENNETT, Esq.,		E. O. MORIARTY, Esq.,
F. BELL, Esq.,		HON. J. B. WILSON.
M. B. PELL, Esq., B.A., IN THE CHAIR.		

Henry Perdriau, Esq., Mayor of Balmain, and Mr. James Roby, Council Clerk, called in.

Mr. Perdriau examined:—

- H. Perdriau, Esq.
31 May, 1875.
405. *Chairman.*] You are Mayor of Balmain, are you not, Mr. Perdriau? Yes.
406. We are at present directing our inquiry to one point—as to the means which are now adopted for the removal of the contents of cesspits—as to the powers possessed by the municipalities in this matter, and the way they exercise them;—and we shall be glad if you will inform us what measures are adopted in Balmain for emptying cesspits or other receptacles of faecal matter? Well, we have the usual cesspits in Balmain, and we have also the dry earth system.
407. With respect to the cesspits, what system do you adopt for emptying them? They are simply emptied at certain intervals—about once every twelve months.
408. Are they emptied by the municipal officers, or privately, by the owners of the houses? It is paid for by them; we do not take it away ourselves.
409. Have you any control over the matter? We let it to a contractor every year.
410. At so much a yard? At so much a yard for each cesspit.
411. Do you exercise any control over the contractor as to when this emptying shall take place? Yes; it has to be done in the night between 12 and 5 o'clock.
412. But I mean as to the frequency of emptying the cesspits? No; we have no control over them until they are overflowing and become a nuisance.
413. And then have you power to insist upon their being immediately cleaned out? We have in respect to the system we have taken up of dry earth closets.
414. We will come to that presently. It appears to be the opinion of some of the municipal officers of Sydney and others that it would be a better system if the municipal authorities themselves were to undertake the cleaning out of these cesspits at such intervals as may seem desirable, making such a charge for doing so as should be determined to be equitable in each case, and not leaving it to the tenant to allow the place to become a nuisance—to make periodical clearances without waiting for any complaints to be made—and to have it done by the officers of the Corporation;—do you think that would be a good system? Yes, I do; I think it would be much better than the present.
415. Do you think such a system would be practicable? Yes, I think it would; it would throw a great deal of expense upon the Municipal Council.
416. That would be recouped by the charge made for emptying the cesspits? Well, we have made no charge for it up to the present time.
417. But, of course, under a system such as I have suggested, the Municipal Council would make a legal charge, upon a scale hereafter to be decided, which would recoup them for all expenses incurred? I think it would be much better for the health of the inhabitants, and would have the effect of keeping the cesspits much cleaner.
418. Do you think the municipal authorities would cordially concur in such an arrangement, to be conducted under proper supervision? Oh, yes, I think they would.
419. How is this matter disposed of at present at Balmain when it is taken out of the cesspits? We never inquire. The contractor takes it away, and we never inquire what he does with it.
420. You do not care what he does with it so long as he takes it away outside the boundary? Yes.
421. Do you think the charges made by the contractor are reasonable at present? Very reasonable. I do not remember at this moment what they are; the Council Clerk will be able to tell you.

422. Still you think it is desirable that the cesspits should be more frequently emptied? I do.
423. Do they ever become a nuisance—not such a nuisance as would justify your interference—but a nuisance nevertheless? Yes, they are a great nuisance to have about a house.
424. Do nuisances also occur through the defective construction of these cesspits? Yes, frequently; we have cases of that sort frequently brought under our notice where there is a cesspit in one corner of an allotment and a well in the other.
425. You have heard frequent complaints of nuisances of that kind? I do not see how they could help it.
426. As a matter of fact have you heard complaints? Yes, a complaint was recently brought before us.
427. How? One of the inhabitants complained that the water was bad.
428. Is Balmain supplied by wells to a great extent? Oh yes.
429. I suppose there are not many water-closets in Balmain where the matter is washed away by means of water from tanks? No, there is nothing of the sort. It is either a cesspit or an earth-closet where the matter is removed twice or thrice a week. We have no drainage, except surface drainage.
430. All the faecal matter is removed by cart? Yes.
431. And all the other drainage—the kitchen and laundry slops—goes away by surface drains? Yes.
432. Does any nuisance arise from that source? Oh yes.
433. It goes into the street gutters I suppose? Yes, and remains there and becomes very offensive. That is the greatest difficulty we have in keeping our streets clean.
434. Do you find that the matter which goes through these drains becomes very offensive in dry weather. From what you have observed of the drainage, independently of faecal matter, in Balmain, do you think it is offensive or not? Yes, very offensive; the soapsuds and black stuff that runs down the gutters is dreadful in Balmain sometimes.
435. With regard to the earth-closet system, it has been in use for some little time in Balmain, has it not? Yes.
436. How long has it been in use? About six years.
437. It was introduced through the instrumentality of Dr. Elliott, I believe? Yes; I think he was in the Town Council at that time.
438. You have no power to enforce it, have you? No, it is merely voluntary.
439. You simply encourage it? We simply encourage it. We have never passed a by-law to enforce it; we just encourage it by pointing out its advantages.
440. And do the municipal authorities, or persons employed by them, remove the matter from these closets? We let it by contract to one man; he removes the matter and supplies the dry earth, and the ratepayers are charged for it.
441. Have you any means of enforcing the use of the dry earth system? No, the people agree to adopt it, and we compel them to pay for it, at the rate of 9d. a room.
442. For each room in a house? Yes.
443. Has this system been adopted in many cases? Yes; we have about 330, I think, in Balmain.
444. Do the people who use the earth-closets complain of the expense, or do they seem satisfied? Well, some of them do. It is more expensive to the people and also to the Corporation; the system itself does not pay.
445. How often does the removal of the matter from the closets take place? At least twice a week, and in large families three times a week.
446. And you make a uniform charge of so much per room to each family? Yes, the lowest charge we make is for four rooms, and we do not charge for more than ten.
447. And do you think the people who adopt the earth-closet system are satisfied with it, independently of the expense? Well, generally speaking, I think they seem satisfied; there is a good deal of trouble attending it.
448. Trouble to whom? To the householder; for instance, the man has to come three times a week, and of course he must come in the night-time.
449. I suppose these earth-closets are chiefly out of doors at Balmain? Yes, they are mostly in the yard.
450. They take the place of the common privy, I suppose? Yes, they take the place of the cesspit.
451. Are there any in the houses, so as to take the place of the ordinary closet? Yes, there are a few—very few.
452. Have you any knowledge whether they are found to answer—whether they are sufficiently free from bad odour as to be desirable? Yes, when attended to properly; but we have difficulty in getting the people to do that.
453. Have you any difficulty with the contractors? Yes, we had, to commence with. During the first part of the year they were not emptied regularly. There is another complaint about the water—the water that goes into the closet.
454. Too much liquid matter goes in? Yes, that is the greatest difficulty we have to contend with; we can get rid of everything else except the water.
455. You find that there are too many slops thrown in? Yes.
456. Have you any means of checking that? No.
457. Have you ascertained whether the matter removed from these closets is offensive or not, or does the dry earth render it inoffensive? Well, I think it is still offensive in passing through the street.
458. Then you could not recommend such a closet being set up inside a house? Oh yes; I think I should recommend it if it were emptied three times a week.
459. That is if it were properly conducted; but, as a matter of fact, as they are at present conducted, with slops thrown in as you say, which might still be thrown in if the closet were in the house, would there not be still that difficulty? Yes, there would still be that difficulty.
460. Do you exercise any control as to the quantity of earth to be used on each occasion, or as to the quality of the earth supplied? We supply the earth and they use it as much as they like.
461. Does the contractor supply it? Yes.
462. Do you oblige him to supply a certain quantity of a certain quality? Yes.
463. What is the quality of the earth? It is loam.
464. Loam—not sand? Yes, loam—the driest we can find.
465. Is it dried artificially? It is taken to a shed and dried and pulverised.

H. Perdriau,
Esq.
31 May, 1876.

- H. Perdriau, Esq. 466. Is it sifted? It hardly requires sifting; it falls to pieces when it is dry.
467. Are you particular about its being finely pulverised? Yes.
- 31 May, 1875. 468. What size is it reduced to—about the size of peas, or smaller? Oh, quite fine—like the finest loam.
469. Now, from your experience of the working of the dry earth system in Balmain, taking the carelessness of servants and other practical matters into consideration, should you consider it desirable to introduce it into a city where there must necessarily be closets of some kind or other in the houses? I am afraid not; it would require a great deal of supervision; I don't think you could manage it in a large town.
470. Do you think it is better than the ordinary cesspit system? Yes, I think it is better than that—much better—a great deal better. I think it is a decided improvement on the cesspit; when you have a cesspit about a house in a place like Balmain, the water gets into it and it becomes like a well—the water is a most dreadful thing.
471. Do you think the system would be better if you had greater powers to enforce regulations in connection with it;—do you think it could be worked more effectively? I think so. You see at the present time we cannot enforce anything.
472. *Mr. Moriarty.*] You say that the earth-closet system is a decided improvement upon the cesspits? Yes.
473. Do you think that in a town it would be equal to the water-closet system if it were subject to the same supervision? I think the water-closet system in a thickly populated town, where the water carries everything away, is the best.
474. *Mr. Bennett.*] Do you pay the contractor as you charge the householder—by the room? No; we commenced paying by the closet. We said to him, "We have a large number of closets—say 300. What will you undertake them for?" and if there were any additional closets they were added to the amount.
475. In that case you gave him a proportionate increase? Yes, at so much a room.
476. And you do not know what becomes of the matter from the earth-closets any more than you do of the contents of the cesspits? Oh, yes, we have a place to put it, that was given to us by the Government, on the Garryowen Estate, over which we have control.
477. Is that within the municipality? It is just outside it.
478. Is the matter offensive there? No, it is not bad. You would not know there was anything there.
479. Is it utilised in any way? No, nothing comes of it after it is there. Our contract with the man who takes it is that he shall bury it, and put so much earth on the top of it.
480. How often is he bound to bury it? Every time. Every day he takes it away he has to bury it.
481. Would it be a nuisance if it were not buried? I think it would if it were not properly buried.
482. Do you recollect the price paid for doing this? Yes, £5 per week for 330 closets—three times a week if required.

Mr. James Roby examined:—

- Mr. J. Roby. 483. *Chairman.*] You are Council Clerk at Balmain, I believe? Yes.
- 31 May, 1875. 484. You have heard the evidence given by the Mayor? Yes.
485. Have you any further information upon this matter to give us. Do you endorse what Mr. Perdriau has stated? Yes.
486. He has given us a full account of the matter, you think? Yes, I think so.
487. Do you hear many complaints about these earth-closets? Yes, the people send in complaints, and when the contractor is told of them by us he inspects the places, and it is generally found that the nuisance is caused by the parties themselves throwing slops into the closets.
488. And you have no power at present to control this state of things? No. Of course the parties are told of it, and in many cases they rectify it. The great difficulty is in getting plenty of earth.
489. You mean that in consequence of the quantity of slops thrown into the closets it would not pay the contractor to supply a sufficient quantity of earth, or to remove the stuff? No.
490. Do you hear any complaints of the receptacle outside the municipality, where the contents of the earth-closets is deposited;—is it found to be a nuisance? No; I have been there myself several times, and there is no smell there at all.
491. Does it not give a great deal of trouble to cover the stuff with earth? No, an equal amount of earth is sufficient to cover it; he makes a hole and throws the earth on the top of it.
492. Is there any particular place from which he is supposed to take this earth to supply the closets? No, there is no stated place; he just takes it from the surface of the ground wherever he can find it; it is a sort of gravelly loam.
493. Has he any difficulty in obtaining a sufficient supply? Well, it is getting rather scarce now; there was plenty of it two years ago.
494. Then there is no recognized place—he takes it just wherever people will let him? Yes, sometimes off the footpaths, where it collects—where the footpaths are not formed.
495. Have you any knowledge of what is the best kind of earth for this purpose? I believe the earth we have in Balmain is as good as any that could be got for the purpose.
496. What kind of earth would you call it? A sort of clayey loam.
497. Is it gravel? It is gravelly.
498. Does not that interfere with the process—is it fine enough? Yes, when it is kept inside a shed it becomes very fine.
499. *Mr. Moriarty.*] You said, I think, that even now the contractor is beginning to experience a difficulty in obtaining the proper earth;—do you think he will find that difficulty increase? Yes.
500. Do you think that will become a formidable difficulty? Yes, as building increases there will be more difficulty in finding it. A great deal of land is becoming enclosed.
501. Has he not to trespass upon private property to obtain it? Well, he makes arrangements with the owners of the property.
502. You are also of opinion that the house-slops which are thrown into the closets which are supplied with dry earth are a great nuisance? Yes, the greatest nuisance of all.
503. So that practically the dry earth system does not remove one of the greatest sources of nuisance in the town? No; in fact the dry earth that is supplied is not sufficient to cover the faecal matter, unless it is supplied every night.

504. Have you made any estimate of the quantity of this earth used? No, I have not.
505. Is not the contractor obliged to supply a certain quantity? No, only when the boxes they use become empty he is bound to supply more.
506. Is there not some quantity defined by a self-acting apparatus? No, there are the buckets and the scoop.
507. Are not the receptacles for the matter in the closets? There are iron buckets provided specially. The bucket is larger than an ordinary one; it is fifteen inches high and fifteen inches across;—a strong galvanized iron bucket with a handle on the top, and one at the side to draw it out with.
508. *Chairman.*] Don't you think there should be two of these, so that there would be one left when the other was taken away to be emptied? No, sir, the men take it away to the cart, and empty it at once.
509. *Mr. Bennett.*] Then you would prefer the system of sewers with water-closets to this? Yes, in a town.
510. Or even in Balmain? The earth-closets are a great expense and trouble to the Council. We have lost considerably by the system.
511. *Mr. Bell.*] Are any of these earth-closets in Balmain offensive at the present time? Yes, very offensive.
512. And that arises from neglect on the part of the tenants of the houses you think in most cases? Yes, they do not care to use plenty of earth when they get it.
513. And in some cases it arises from neglect on the part of the contractor? Yes, in some cases he neglects to supply the earth, and in others the families neglect to use it and become careless. There are some exceptions where the closets are kept so clean that you might eat your dinner in them.
514. Does the contractor take any pains to clean the pans after using them? No, he just brings them back.
515. Are they offensive when he brings them back? No, I have never experienced anything offensive in them after they are emptied.
516. *Hon. J. B. Wilson.*] There are a great many ordinary privies or cesspits in Balmain, are there not? Yes, a great number.
517. Are they, as a rule, properly constructed, or merely holes in the ground? Only holes in the ground.
518. Supposing they were properly constructed and made watertight, so that no urine could escape, and no surface drainage could enter, and were properly and periodically cleaned out by the Corporation, or under their supervision, do you think they would be as efficacious as these earth-closets for keeping down nuisances? No, I don't think they would, because there would still be effluvia arising from them all the time, whereas the contents of earth-closets would be removed every night, or two or three times a week. The cesspit, on the other hand, would only be emptied about once in six months, and you would still have the nuisance under your nose.
519. Have you heard many complaints of nuisances from these cesspits? Yes, especially where there is a well alongside, and the water has become partially impregnated, and sometimes not fit to drink.
520. That is to say they have found out that the well has been contaminated by the water from the cesspit? Yes.
521. Have any steps been taken to remedy that state of things? The Inspector of Nuisances had his attention called to it, and if he has considered it a nuisance he has taken steps to remedy it by proceeding against the parties.
522. Where a nuisance occurs which is not such a palpable nuisance as that, but the attention of the Corporation is called to it, do you often take steps to remedy it? No, I do not think we do.
523. You have no power to move in the matter unless it becomes a public nuisance? No.
524. Don't you think it would be much better for the health of the inhabitants and more advantageous in every way if you were in a position to enforce a more frequent emptying of these cesspits? Yes; I think it would be much better if a by-law were passed for that purpose.
525. Have you the power to pass such a by-law? Yes, I think we have, under the Act.
526. Do you think it would be practicable to make any regulations, supposing you had the power to enforce them, to prevent slops from being thrown into these places—is it practicable;—could it be done do you think? Yes, I think so, if a by-law were passed. Of course it would require a great deal of supervision.
527. *Chairman.*] How could you enforce it? By proceeding against the parties for a nuisance, I suppose.
528. Against whom? Against the person who did it.
529. It would not be likely to be the householder himself? It would certainly be a difficult matter.
530. I do not know whether it is the same in Balmain, but in Sydney it is a very common thing for one closet or cesspit to be used by more than one house;—don't you think it would be very difficult to enforce such a regulation? Yes, it would be difficult, no doubt.
531. Those earth-closets have been in use, we are told, for six years? Yes.
532. Is the number increasing? Yes.
533. Is the increase in cases of new houses, or are these closets replacing the cesspits hitherto in use? Generally in new houses.
534. Is there any fixed plan of construction for these earth-closets, or do you leave that to the parties themselves? We generally give them some kind of instruction.
535. How much does one of them cost? It costs somewhere about £2 or £3—that is, to convert an old one into one under the new system.
536. When a new house is built does it cost more, as a rule, to make a cesspit or to put up an earth-closet arrangement? Well, I think making an earth-closet would cost less than a cesspit would come to—if you made a proper cesspit—considerably.
537. Do you often find that people who have cesspits abandon the use of them, and adopt the earth-closet system instead? Oh, yes; we have several abandon the cesspits and use dry earth closets.
538. What has led them to make the change? Well, I suppose it has been a nuisance.
539. It has not been as a matter of expense? In some cases I suppose they thought it would cost less, and it is less because it is paid every quarter, while the other is paid for every six months, or twelve months, according to the size.

Mr. J. Roby.
31 May, 1875.

Mr. J. Roby. 540. I gather on the whole then that you do not think this earth-closet system is a very great improvement? No, sir; not as it is worked at present, but it is much better than the common cesspits out of doors.

31 May, 1875.

541. Have you been making any improvements in earth-closets lately? No; there have been no improvements since we started them. (*Witness handed in certain printed regulations relating to earth-closets.*)

Mr. Perdriau further examined:—

Mr. Perdriau. 542. *Chairman.*] You have heard the last witness' evidence, Mr. Perdriau? Yes.

31 May, 1875.

543. Is there anything further you can suggest? I don't think he quite understood the question asked by this gentleman (Hon. J. B. Wilson), when he stated that if the stuff from a cesspit percolated through the surface of the ground and contaminated a well on private property, we could take action to remedy it. We have no power to interfere, except in cases where the parties apply to us for protection. There is another matter I would like to mention in connection with a remark made about enclosed and cemented cesspits. I had one at my house, a very large one, and properly cemented, and I had it emptied only once in two years, when this new system was introduced, and it became very offensive. I was asked repeatedly by the tenant to have this cesspit abandoned and converted into a dry earth closet on account of it being such a nuisance, and I eventually acceded to his request, and had it filled in, and a dry earth closet substituted, which I consider remedied the evil.

544. Suppose that instead of a cesspit, such as you describe, which only requires emptying after two years, it had been one which required emptying twice a week—do you think if a system like that were introduced, the earth-closet system would be an improvement upon it;—would not a cesspit cleaned out twice a week be nearly as good as an earth-closet? Yes, but there would be the difficulty of cleaning it out twice a week.

545. In some towns a system is adopted which is called the "pail" system; the contents of the cesspit are removed frequently by means of a pail. No earth is used, but the cesspit is small and frequently cleaned out. Would such a system as that, in your opinion, answer as well as the earth-closet system? Well, what we are doing now is something similar to that, for there is a great deal more water than dry earth at present.

546. Do you think the dry earth does good practically? Yes, I prefer it in my own house.

547. What I mean is this: Is it not the frequent removal and not the dry earth which does the good? The frequent removal and also the dry earth, because you begin to have water as well from the very first.

TUESDAY, 1 JUNE, 1875.

Present:—

F. BELL, Esq.,

E. O. MORIARTY, Esq.,

Dr. ALLEYNE,

Hon. J. B. WILSON.

M. B. PELL, Esq., B.A., IN THE CHAIR.

G. A. Mansfield, Esq., A. Thornley, Esq., Aldermen of the Glebe Municipality, and Mr. W. C. Wardropp, Council Clerk, Redfern, called in.

Mr. Mansfield examined:—

G. A.
Mansfield,
Esq.

1 June, 1875.

548. *Chairman.*] We are now engaged in investigating one particular point, Mr. Mansfield, in reference to the sanitary condition of Sydney and the suburbs—as to the means adopted at present, and the powers possessed by the municipal authorities for cleaning out common cesspits? Yes.

549. We presume that for some years to come at all events that system must necessarily exist, and we are anxious to advise the Government as to the improvement, should any improvement be found necessary, in the mode of clearing out these places. We understand that in the city it is done by private persons, not under contract, the owners of the premises simply making a bargain with the nightmen to clean out their closets at a charge agreed upon between them. These men are not under the control of the city authorities; at all events the authorities have no control over them when they get beyond the boundaries of the municipality, and when there they deposit the matter wherever they think fit. We are disposed to think, and all the authorities with whom we have hitherto consulted are of the same opinion, that it is much more desirable that the city authorities, and we presume other municipalities also, should be authorized themselves to carry out these operations, and to clean out these cesspits,—not leaving it to the landlords or occupiers of the houses as at present—that they should have no responsibility, but that the municipal authorities should do the work by their own officers; that it should be done during certain hours, and under some fixed system. We are anxious to know what the views of the authorities in other municipalities are in these matters; what system is adopted in the Glebe. What powers do the authorities possess; and what steps do they take to prevent the nuisances arising from overflowing cesspits? The system adopted at the Glebe, if it can be called a system, is precisely the same as that pursued in Sydney. No action is taken by the municipal authorities unless the cesspits are found to be overflowing, when the Inspector of Nuisances summons the parties, and compels them to empty the pits.

550. And with regard to the deposit of matter from these cesspits? It is taken away by private persons, and disposed of as it is in the city, by simply depositing it in a place authorized by the city authorities.

551. The city authorities do not authorize the use of any particular place. They say that when it is beyond their boundaries they do not know what becomes of it, and they do not care—that is to say, they know they have no control over it then, and they do not inquire where it goes to? We are precisely in the same position at the Glebe. These men who make a trade of it take the soil away, and we don't know what becomes of it.

552. Would there be any objection do you think to the responsibility being thrown upon the municipal authorities of keeping these places clean by their own plant and appliances, and by their own servants, under certain regulations, charging the owners or occupiers according to a scale to be determined, and doing it at such intervals as might be fixed upon? I think it is most desirable that the municipal authorities

G. A.
Mansfield,
Esq.

1 June, 1875.

authorities should have that power vested in them, and that they should be compelled to exercise it. As a matter of justice, the expense should be borne by the occupiers or owners themselves. Another regulation, I think, should be made and enforced: that all these common cesspits should be made waterproof; I think they should be clay-puddled or cemented, or by some other means made waterproof.

553. With the view of preventing — ? With a double view: First, of preventing the influx of surface water which floods the cesspits and has the effect of generating foul gases; and secondly, of preventing the contamination of the surrounding soil. I believe such a course would have a very decided effect in lessening the evils resulting from common privies.

554. You do not see any practical difficulty in requiring the municipalities to provide the necessary plant, and in shifting the responsibility from the owners to the municipal authorities entirely. Of course in each case the owner would be liable to be summoned; on the other hand he would have a right to complain if his cesspit were not emptied and kept in proper order? That is a matter to which I have not given any previous consideration. I should say, speaking on the spur of the moment, that there would be no objection. I think it a very desirable arrangement that the Corporation should be empowered to inspect the privies and to clean them out when it was thought necessary. It would be difficult, I think, to fix any stated time for emptying them. I think that would have to be left to the discretion of the officers of the municipality, as the condition of the cesspit would vary according to circumstances; the necessity for cleaning out would be much more frequent in some cases than in others. I attach very great importance to the waterproofing of these places.

555. Our present idea is, that it would be desirable, if possible, to get an Act passed requiring the city and suburban municipal authorities to carry out this matter, so far as cleaning the closets is concerned, and empowering them to pass by-laws regulating the construction of cesspits, not requiring, immediately, that all cesspits should be reconstructed upon some efficient plan, but simply giving power to the municipal authorities to do so. It would be rather a strong measure, involving a very considerable expense, to require that all cesspits should be immediately reconstructed according to the most approved plan? It would.

556. But do you think it would be sufficient to give them power to pass by-laws as to the construction of new cesspits and the reconstruction of old ones, leaving it in some degree to their discretion as to how far and how soon these changes should be made? Yes, I think that would be satisfactory and would work well. I think that in the case of all new cesspits an efficient construction should be made imperative.

557. At once? At once. But as regards existing cesspits I think discretionary power should be left to the municipal authorities.

558. I have been informed that in many of these cesspits not soakage but mere surface water which, of course, at times is in large quantity, goes into them and frequently overflows them into the gutters? Yes, that is the case.

559. Do you think any hardship would arise if steps were taken immediately to prevent that state of things, which, as far as I can see, would be a comparatively simple matter? I can see no objection to it; I do not think any hardship would result.

560. You think the municipal authorities might be empowered to take steps to prevent that overflowing? Yes, I see no objection to it. It should be left to the discretion of the officers, as different places would require different treatment.

561. Are you aware whether the municipalities have any power to prevent persons from allowing the overflow of closets to pass into the street gutters? I believe we have; whenever such a matter comes under our cognizance we always prosecute the parties for a nuisance.

562. That is to say you prosecute them for the overflowing? For the overflowing.

563. But I believe, as a matter of fact, that unless the closet becomes a flagrant nuisance, you have no power to interfere in such cases? We have not.

564. And still you think these closets in a crowded neighbourhood are a continual nuisance? Yes.

565. Has any other system been tried at the Glebe except the common cesspits? Not that I know of, except very partially. I have on my own premises some earth-closets, and I think they are almost the only specimens of the kind on the Glebe.

566. They have not been tried generally then? No.

567. What is your opinion of their efficiency, as you say you have them on your own premises? Very satisfactory where the contents can be made available for a garden, but I don't think they could be made available for the city.

568. The matter is put on your garden by your own servants? Yes.

569. And you find them satisfactory? Yes.

570. They require a good deal of supervision, do they not? Yes. I constantly supervise them myself. Of course in my case the fact that I can dispose of the matter in my garden facilitates the arrangement. Before leaving the subject of disposing of closet matter by the municipal authorities, I may mention that the question arises, where is it to be taken to? The Glebe is a case in point. There is no place available within its boundaries, and before the onus is thrown upon us of removing this material we should be in a position to deposit it somewhere. I apprehend that arrangement can only be made by the Government. Some place should be laid out as a place of deposit; otherwise the municipal authorities will be in a difficulty; they will have to cart the stuff away without knowing what to do with it.

571. Do you know, as a matter of fact, where the nightmen take this soil? I do not.

572. We are informed that some apparently considerable portion of this refuse is sold to market gardeners; that is the only recognized mode of disposing of it that we can learn. Do you see any objection to that system? No, I am not aware of any objection to it. I am aware that scientific men have raised objections to that mode of applying sewage, but I am not prepared to point out the faults in it.

573. Looking at it as a nuisance? Regarding it as a nuisance I do not see that there is any objection to it. Applied to the soil and worked as it should be there can be no objection to it. I may state that on one occasion, some years ago, I visited a large market garden near Parramatta, where the refuse from the Gaol closets was used as manure. The proprietor took me over a large bed, which he told me had been manured that very morning with this refuse, and there was then not the slightest perceptible smell from it.

574. It was buried immediately I suppose? Yes, and well worked up with the soil.

575. *Mr. Mortarty.*] You have just stated, Mr. Mansfield, that on visiting a place at Parramatta, where night-soil had been used as manure, you perceived nothing disagreeable. Is that supported by your own observation

G. A.
Mansfield,
Esq.
1 June, 1875.

observation of what takes place in your own garden, where the night-soil is deposited? Yes, there is no smell whatever there. There is this difference, which may be worth mentioning, that mine is a mixture of night-soil and dried carth or ashes, and is in a diluted state when applied to the earth; the other is pure night-soil, undiluted.

576. *Hon. J. B. Wilson.*] Are there many of the houses in the Glebe supplied with water from wells? Not many, I think—very few. They are nearly all supplied from the town water-pipes.

577. *Chairman.*] Have you heard many complaints about the quality of the water from the Glebe? I have not heard many complaints; I find the water used on my own premises has a very considerable amount of deposit in it.

578. But it is not offensive? I have not tested it. It is not offensive under the conditions in which the water is ordinarily used.

579. There is a separate service now for the Glebe, is there not—a main proceeding almost directly from the reservoir? I think the same main supplies the Glebe and Redfern, coming from the Crown-street Reservoir.

580. What kind of earth is used in the carth-closets which you have in your own house? I use sifted fire ashes.

581. Does that prevent all unpleasant smell? Yes.

582. Do you use these closets inside your house? No, not inside.

583. Can you give us any rough idea how long it would take to make the new arrangement for transferring the duty of cleaning out cesspits from private persons to the municipal authorities? Assuming a place for deposit to be fixed upon, I think it would take three or four months to make the necessary arrangements.

584. Do you think such an arrangement, even if it involved a greater frequency of removal, and was rather more expensive, would be an improvement? Yes.

585. Do you think it would be a relief to landlords to have this responsibility taken out of their hands, even if they paid a little more? Yes, I think they would concur in it very readily.

Mr. Thornley examined:—

Mr. Thornley. 586. *Chairman.*] You are an alderman of the Glebe, Mr. Thornley? Yes.

587. You have heard Mr. Mansfield's evidence? Yes.

588. Do you concur with him generally in the opinions he has expressed? I do.

589. Have you any further suggestions to make on this particular subject? On the cesspits—no sir.

590. Do you concur entirely with what Mr. Mansfield says? Entirely.

591. And you would be glad to see the responsibility of keeping these places clean, thrown upon the municipal authorities, giving them power to make charges to cover it? Yes, in the event of the Government finding some place to deposit it, and as regards making these cesspits water-tight and preventing their overflowing. It would be requisite that the Government should put the municipal authorities in a position to enter a person's premises and take up a portion of the yard if necessary to prove whether the pipes connected with the drains were attached to the closet, as we know that to be the case in some instances.

592. You mean pipes direct from the cesspits to the gutters? Yes; for instance, all the laundry and house slops are thrown out in the yard and go off by means of a pipe into the gutter; connected with this sometimes there is a small pipe to the closets.

593. Is that put in without the knowledge of the authorities? Yes, we are aware of it, but we have not the power to go into the yard and make a search. It is not supposed to be known to the authorities, but it exists nevertheless. We know it as a positive fact, and we could take up some of the yard and find it out, if we had the power to do so, which we have not.

594. There is no underground drainage, strictly speaking, in the Glebe is there? Not much; we have a little. I will show it to you. (*Producing tracings, and indicating position of drains.*)

595. These merely take the surface water from the gutters? Yes, that is all.

596. Then all matters that do not go into the cesspits, such as kitchen and laundry slops, go into the gutters I suppose? Into the gutters.

597. And thence into some of these drains? Yes, such drains as we have already made.

598. They are carried away then principally by surface drains? Yes, principally. (*Referring to plan.*)

599. Do you find any nuisances arising from these slops and kitchen refuse flowing into the gutters? Yes, especially in dry weather, particularly when there is not sufficient rain to flush the surface gutters.

600. And you have no means of remedying that at present? No, at present we have not.

Mr. Wardropp examined:—

Mr. Wardropp. 601. *Chairman.*] Are you Council Clerk at Redfern? Yes.

602. You have heard the evidence of the last two witnesses? I have.

603. Do you concur in the recommendations they have made? Generally I do.

604. Have you any further recommendation to add? I endorse nearly everything they have said; but it strikes me the Council have the power to examine premises of which they are suspicious about the closets. We have done it frequently in Redfern.

605. Can you go into a yard and pick it up, in order to examine a closet? We have done it several times.

606. Do you think the municipal authorities generally would approve of the changes that have been suggested here to-day? I cannot say that.

607. Do you see any objection to them yourself? I cannot say I have any particular objection. It would require an organization to carry them out. It would be necessary to have proper carts and appliances, and a proper place to deposit the soil.

608. Are there many of these cesspits or common privies in Redfern? Of course there are; there is one attached to each house as a general rule.

609. And the system of cleaning them out is done by private persons, as described by one of the witnesses to-day? Yes, entirely by private persons—by these nightmen.

610. What is the name of the Inspector of Nuisances at Redfern? John Hales.
611. Does not he act also for Waterloo? Yes, for Waterloo and Alexandria, I believe.
612. Have you any idea why he is not here to-day? I have not.
613. Could he give us any further information on the subject we are now inquiring into? Perhaps he might give a little more than I can.
614. Do you hear any complaints of nuisances from the existence of these cesspits in crowded localities in Redfern? Oh yes, frequently sir—especially after heavy rain-falls.
615. How does that affect them? By causing the cesspits to overflow. The surface water in many instances flows into the common cesspits, and causes them to overflow, and then the complaints of nuisances arise chiefly. We don't hear so much of it in dry weather.
616. Are many parts of Redfern crowded? Yes, some parts of it are considerably crowded.
617. Are there many wells in Redfern? No, I don't think there are many now.
618. The houses are supplied by town water? Yes.
619. Are there in the neighbouring Municipalities—in Waterloo for instance? I cannot say for Waterloo; it is supplied by wells principally, I believe.
620. It is all sandy soil about there—is it not? Principally to a certain depth from the surface.
621. *Mr. Moriarty.*] Have you had any opportunity of observing whether in dry weather the contents of cesspits soak into the adjoining wells? No, I have had no opportunity of observing it, but I believe they do.
622. Do you know of any cases in which complaints have been made of the effluvia from the contents of cesspits soaking into them? Oh, yes; we had one very recently. The closet belonging to one party was situated near to the kitchen of another party, and a complaint of the stench arising from it was made. The inspector investigated the matter, and the result was that the party to whom the closet belonged had to remove it to another part of the premises. Several cases like that have occurred. In many instances, I believe, persons do not clean out the cesspit at all. They dig a hole in the ground adjoining it, and draw off the matter.

Mr.
Wardropp.
1 June, 1875.

WEDNESDAY, 2 JUNE, 1875.

Present:—

M. B. PELL, Esq.,		E. O. MORIARTY, Esq.,
F. BELL, Esq.,		W. C. BENNETT, Esq.,
DR. ALLEYNE,		HON. J. B. WILSON.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Robert Maze, Esq., Mayor of Darlington; Mr. Charles Harris, Council Clerk, Waterloo; and Mr. John Hales, Inspector of Nuisances, Waterloo, called in.

Mr. Maze examined:—

623. *Chairman.*] We have requested your attendance to-day, Mr. Maze, not only to take evidence upon R. Maze, Esq. a particular point in the inquiry, but to confer upon a matter which is specially engaging our attention, and upon which we have already made some inquiries, and that is, as to the best means of clearing out, and also of constructing the cesspits attached to common privies. It seems to us that whether this system is the best or the worst, it must prevail to a considerable extent in Sydney and the suburbs for some time to come at least; and it is therefore desirable that the best method of managing these places should be adopted. We are told that in Sydney, and some of the suburbs at all events, the municipal authorities have no control over the emptying of cesspits, except when they overflow or otherwise create a nuisance so that the owners can be summoned and compelled to have them cleared out. We find that at present they are cleared out by private persons who make special agreements with the owners for that purpose. It appears to us, so far as we are at present advised, that the municipal authorities by their own servants and with their own plant and appliances should undertake this duty; for we are informed that in many cases these cesspits, although they may not be overflowing, or in such an indecent state as to justify the interference of the municipal officers, are still very offensive, especially in crowded localities; and we think this evil would be much abated if the cesspits were cleaned out by the Corporation at some rate hereafter to be settled. Does a similar system prevail in your municipality? Yes, we have a similar system.
624. And do you concur in what I have stated as being our opinion, and that of the witnesses we have examined, in respect to the state of this and other municipalities? From my own experience of the state of the closets under the present system it is nearly impossible to keep them what we call clean. Sometimes the people try to make them watertight, but they find it very hard to do it.
625. But do you think they might be kept in a better state under such a system as I have described, and that it would be practicable for a municipality—or possibly in case of small municipalities they might join each other for the purpose—to undertake this duty, and to make regulations that the closets should be cleaned out at certain intervals, depending sometimes upon the discretion of the officers as to when it was necessary to do it? Well I believe it would answer. I have not heard of the matter before, and have not given any consideration to it, but I think it would be a great improvement. I was going on to tell you that these closets, when they have been cleaned out, very soon get nearly full of water again, and are as offensive as before.
626. Does that occur from the water flowing in surface water? No, it does not flow in—it oozes in from the bottom principally, so that it is nearly impossible to make them water-tight. Shopherd's Paddock is a place which has all been trenched two feet deep, and I have known closets there which have got full again in a week after being thoroughly cleaned out. I dare say if these places could be made thoroughly watertight, cleaning them out occasionally would be a great help.
627. Do you take steps to compel persons to clean them out? We cannot take steps unless the closets are a nuisance.
628. But if they overflow? Well, they do not overflow very often.
629. They merely fill up? They fill up and there they stand.

630.

- R. Maze, Esq. 630. But still in crowded thoroughfares they are a nuisance? Yes, a great nuisance.
 2 June, 1875. 631. You think the only remedy is to make them watertight? Yes, and to have them cleaned out periodically; that is what I have been thinking of, and I intend, if God spares me till the summer, to try and make mine watertight.
632. Do you think the Municipal authorities should be empowered to compel, at their discretion, persons to construct proper cesspits? I am sure of it.
633. You think no hardship would arise from the exercise of that power? No hardship whatever.
634. Do you think it is necessary to do so in your neighbourhood? I have as many houses there as others, and I can only say I should be most happy. No attention can be given to health or cleanliness without something of the kind is done.
635. You think there would be no practical difficulty in carrying out this arrangement—that the municipal authorities should take the matter into their own hands? None whatever, if we had the power.
636. In about what time do you think the change could be made? It would require some dry weather first.
637. I do not mean that. I mean in taking the matter out of the hands of the nightmen, and giving it to the municipal authorities? I don't think it would signify when the change was made.
638. But it would take some time to get the proper plant and appliances and the requisite number of men? Yes.
639. About how long do you think—about three months? Yes, about that.
640. Would that, you think, be ample time? Yes.
641. You would not anticipate any difficulty in the meantime from the nightmen, if it were known that such a change was about to be made, in getting these places cleaned out? Well, you cannot get these men when you want them, for I have had to wait three weeks for them; and there was no difficulty about the price, as I was prepared to pay whatever they charged me.
642. I want you to understand exactly what we propose: We propose to transfer the responsibility of cleaning out these cesspits from the owner or occupier of the premises to the municipal authorities, so that it would become their duty to see they were kept clean. At the same time it is possible that under this improved system some additional expense would be thrown upon the landlords? Yes, there would be an expense to the landlords.
643. But do not you think the landlords would be glad even with that expense to be relieved of the responsibility? Some of them would no doubt, but a great many would be against it. But if I may interrupt you—supposing we had all these conveniences and the additional powers you mention, we have no place to take the stuff to—where are we to put it?—that is the great drawback; the nightmen have no place to take it to.
644. Of course we should not attempt to obtain Legislative interference without providing some means of disposing of the stuff; that would not be reasonable—that is a matter under consideration. Do you exercise any control over these nightmen as to where they take the night-soil? None, as far as the municipality is concerned—we have no control over them. There is no place within the municipality where they can take it, and they take it wherever they like.
645. They take it away and you know nothing more about it? No.
646. Do you know, as a matter of fact, where they take it to? Sometimes to one place and sometimes another. Any place where they can get rid of it handy, without a breach of the peace. I think it is generally some place in Botany, on this side of the water reserve, belonging to Hardie & Mitchell—private property.
647. They have permission to put it there I suppose? Yes.
648. Have you ever heard of its creating a nuisance? Well, it does if it is left exposed.
649. Are you aware whether there is much of this matter taken away from various places? Yes; there are about 350 houses in the municipality.
650. Is it all taken there, do you think? I do not know. It is not long since they began to take it there. I suppose when they have taken enough there they will look out for a fresh place.
651. Is there any fixed rate of charge, or do these men charge what they like? They charge in proportion to the distance they have to bring the stuff. Sometimes they have to take it into the sandhills, where they have to use two extra horses to draw it. I never thought their charges were unreasonable.
652. Have you ever had reason to suppose that they put the stuff in improper places, where they have no right to deposit it? Well there was a party not long ago fined for shooting a load of it out of his night-cart at a culvert in Myrtle-street I think it was, between Chippendale and Newtown Road. He was fined £2, or a month's imprisonment.
653. You think there should be some place set apart for the deposit of this stuff? Yes, nothing could be done without it.
654. *Mr. Moriarty.*] How are you supplied with water in your municipality? The supply is very good.
655. Is it supplied from the city? Yes, by a pipe.
656. *Mr. Bennett.*] Has any arrangement besides the common cesspit been adopted in your municipality? I do not know of any.
657. *Chairman.*] No earth-closets have been introduced? I never heard of any.
658. Are there any water-closets? I am not aware of any water-closets or earth-closets; they are all open cesspits.
659. And there are very few wells used there? We have no wells at all.
660. Is there not a very great stench from the crowded parts of your municipality in particular localities, in the summer time? Well, I don't believe the stench is greater there than in any other part; we sweep out all the gutters twice a week.
661. I do not mean more in your municipality than in other places, but, as a matter of fact, is there not? Well the closets are tolerably well kept.
662. *Mr. Moriarty.*] Is there any saturation of the soil do you think, from the matter contained in these cesspits? There must be.
663. Do you think it affects the health of any neighbourhood where there are buildings? It is sure to affect the whole neighbourhood, no matter where the locality is.

Mr. Charles Harris examined :—

664. *Chairman.*] Are you Council Clerk at Waterloo? Yes.
665. You have heard the evidence given by Mr. Maze, and you have heard my remarks to him and his replies? I have.
666. Do you concur in the opinions he has expressed? I do.
667. You think it is desirable that some alteration of the present arrangement should be made? I think so.
668. Are there many of these cesspits in your municipality? Oh yes, a great number.
669. That is the general system adopted? Yes, there are 800 houses or more.
670. And the same difficulties are experienced there which Mr. Maze has pointed out? Yes, in a greater degree.
671. Because yours is a larger municipality? Yes.
672. How are you supplied with water? The supply is very indifferent.
673. From what source do you obtain it? From wells.
674. Are those wells close to the cesspits? Yes.
675. Do you think they are contaminated by them? I have reason to believe they are in many instances.
676. Do you know as a matter of fact that they are? Yes; it is low ground in Botany-street, and the water lies on the flat.
677. We are told that in some cases the overflow from these closets is purposely drawn into the ordinary surface drains or gutters by means of underground pipes, without the sanction of the authorities? The Inspector of Nuisances will be able to answer that question better; but with regard to what the Mayor of Darlington said about the filling up of closets, I can speak. They fill up in wet weather, and in dry weather they subside again. There is one thing also I may mention in reference to the time which would be required to bring the improved system you have spoken of into operation—it would be necessary to pass by-laws for that purpose. I may also mention that we applied to the Corporation of Balmain for information about the earth-closet system.
678. You applied to them for information as to their method of carrying it out? Yes.
679. What was the result of your application? The result was that it worked very imperfectly, and they did not think it would be suitable to a place like Waterloo, inasmuch as sand was not a good deodoriser, and therefore the system would not suit us.
680. It would cost too much to bring the proper material from a distance? Yes, it would cost too much to bring the system into operation.
681. Have you any further information to give us? No, sir. - I think if you would call in Mr. Alderman Olive—Ebenezer Olive—of the Waterloo Council, he would give you some very material information.

Mr. C. Harris.

2 June, 1875.

Mr. John Hales examined :—

682. *Chairman.*] You are the Inspector of Nuisances at Waterloo, I believe, Mr. Hales? Inspector of Nuisances for Waterloo, Redfern, and Alexandria.
683. You have heard what has taken place since you entered the room? Yes.
684. Can you give us any further information upon these matters? I am obliged to be out night after night, and I can see the nightmen taking away the contents of these closets all the night through. They shoot the stuff on to different places all about, whenever they have the chance.
685. Does that frequently happen, and can you tell who has done it? You can't tell who it is—there is more work than they can get through. I think there are only eleven carts altogether.
686. You think it is very desirable that such a system as I have mentioned should be introduced? Yes, so long as some place is found to put the stuff. It is no use to summon people for not emptying their closets, when there is no one to do it. You can see carts with this stuff going along all night, sometimes twenty loads in the course of the night; the carts go backwards and forwards as they get emptied, up to 7 or 8 o'clock in the morning—in fact the carts are kept in Sydney.
687. Is there no way of checking this practice? We have no means of checking it; the Police have tried to interfere, but they find they cannot.
688. In fact it has become a very great nuisance in your neighbourhood? Yes; every one is complaining of it. The nightmen get permission to do a garden, and when they shoot the stuff on to the garden they don't cover it over. If the stuff were covered over it would not signify so much, but I have seen as many as thirty loads exposed to the open air.
689. And the nuisance thus becomes offensive not only to the people living on the spot but to the whole neighbourhood? Yes, to the neighbourhood at large. We have summoned them for this, but the cases have always been lost.
690. What has been the cause of that? Because the place was not within a certain distance from a proclaimed road or street. As long as it is within a certain distance from a proclaimed road it is a nuisance under the Act, but not otherwise.
691. Have you any reason to believe that pipes are laid down from some of these cesspits so as to carry the overflow of the water to the gutters? Yes; the week before last I went to the Mayor and got a man to take up portion of a yard where there was one of these pipes, but very likely it was laid down again an hour after I left. It is impossible to do anything; you can't prove it. If you have suspicions of any place and have occasion to go and find it out, all you can do is to give twenty-four hours notice that it must be removed.
692. Do you think much of this matter gets into the gutters? Yes, whenever it rains the closets get full. Two out of every three of them are nothing more than holes in the ground, and the surface water flows right into them. If we have any by-laws on the subject there ought to be a proviso that no cesspit should be nearer than a certain distance to the house or well. At present we cannot carry out our by-laws.
693. Why? Because there is no power to do so. The Municipalities Act is not worth anything.
694. But these places become a complete nuisance don't they? Yes, but what can we do? If we lodge a complaint they only just shift the closet to another part of the ground, so that the whole allotment becomes a deposit of night-soil.

Mr. J. Hales.

2 June, 1875.

- Mr. J. Hales. 695. Do you think it would be a good thing to compel people to make proper cesspits? Yes, but how are you to do it?
- 2 June, 1875. 696. Is there much illness in your municipality? A good deal.
697. You do not consider it a healthy place? No, it lies too low; in fact it is nothing less than a bog.
698. Do the remarks you have made apply in any degree to Redfern also? No, the water is all laid on at Redfern, and I have orders from the Mayor to take a man with me at any time and disconnect any of these places from the street drains if I find them. There are a good many of them connected, and when we know it we put a stop to it as far as we can.
699. Then you think it would be a good thing—to put it generally and finally—that there should be a general system adopted in each municipality under which the municipal authorities should be enjoined and compelled to keep these places in proper order, and cause them to be properly constructed? It would be a good thing to have it done, but I don't see how they could do it. The nightmen have got it all in their own hands.

THURSDAY, 3 JUNE, 1875.

Present:—

M. B. PELL, Esq.,
HON. J. B. WILSON,
DR. ALLEYNE,

E. O. MORIARTY, Esq.,
W. C. BENNETT, Esq.,
F. BELL, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Mr. William Pidcock, Council Clerk, Camperdown; Mr. Charles Banks, Council Clerk, and Mr. John Flaherty, Inspector of Nuisances, Newtown, called in.

Mr. William Pidcock examined:—

- Mr. W. Pidcock. 700. *Chairman.*] You are Council Clerk at Camperdown? Yes.
- 3 June, 1875. 701. We are now engaged in inquiring into one particular matter which concerns a large part of Sydney and also of the suburbs, and that is the management and the cleansing and also the construction of the ordinary cesspits. We feel sure that whatever system may be adopted eventually, this system must continue in a great many localities for some years at all events, and therefore it is very desirable that the best possible mode that can be devised to carry it out should be adopted. We find that all the witnesses we have as yet examined consider the present method a bad one, and are of opinion that it would be much better for the municipal authorities to take the duty of cleaning and looking after these cesspits into their own hands, and that they should do it at such intervals and in such a way as may be considered advisable, the expense of cleaning out each closet of course to be charged to the owner or occupier. We do not learn that there are likely to be any practical difficulties in making this change, and so far as we have examined persons connected with different municipalities, it is thought to be very desirable. They say that they have no control over the nightmen, and they can only take action in reference to these places when they become a public nuisance, in which case they can summon the landlords and compel them to have their cesspits emptied. Beyond that they have no authority, and in crowded localities these privies, although not such a nuisance as to justify the interference of the municipal officers, are a constant offence, not because they are full or overflowing but simply because they are offensive. We think, and we are supported by the opinions of all the witnesses we have examined, that these cesspits should be more frequently cleansed—that this should be done by the municipal authorities—and that the landlords should be relieved of all responsibility in the matter, except in paying for the work when it is done. Do you see any objection to such a plan. Do you approve of such a change being made? Yes, I do; and I think it is very necessary. I know that in our own municipality there are many of these places exposed which become great nuisances, and as we have no control or authority over the persons who own the premises we cannot compel them to clean them out except in cases of overflow.
702. You say that you have no objection to this charge—that the authorities with their own plant and appliances and their own servants should carry out this work? No; there might be some difficulty in the smaller municipalities with regard to the officers required to carry out the arrangement.
703. You mean that there will be a difficulty in the appointment of officers to inspect? Yes.
704. Could not some of these smaller municipalities combine and appoint joint inspectors? That might be done.
705. Do you find that difficulty existing at present? Yes; there is a difficulty with regard to our own municipality in having no place in which to deposit night-soil. A short time ago the contents of the cesspits were conveyed to a paddock belonging to one of the ratepayers, and became a nuisance.
706. Was that within the municipality? Within the municipality.
707. Was it taken there with the sanction of the owner? Yes.
708. Had you no means of abating the nuisance? Not beyond ordering the man to remove it immediately, which was done.
709. Where do they take this stuff to at present? I do not know.
710. You have no control over these persons? None.
711. We find complaints made that in a great many cases the surface water flows into these closets, in consequence of their improper construction, and that every time it rains they overflow into the surface gutters;—do you find that to be the case? Yes.
712. Would there be any special difficulty in preventing the inflow of surface water? I think not; I think there would be no great difficulty with reference to our own municipality.
713. Do you think any hardship would arise from the owners of houses being compelled to make such alterations in the construction of these cesspits as would prevent this inflow of surface water, and consequent overflow of offensive matter? I think there would be no difficulty about it.
714. It is found in some cases, generally where the soil is porous, that there is a continual soakage into these pits; the water goes into them every time it rains, and although they are cleaned out one day they are full again the next;—do you find that to be the case? I do.

715. What remedy would you suggest for that? I would suggest that pipes be laid on at a certain distance from the surface to carry off the water when it rose to a certain height, the pipes to be connected with some drain or sewer.

716. But as sewers cannot be made in a day, don't you think it desirable that for the present these places should be made tight, so that no water could come in, except in the ordinary way, and that they should be cleaned out frequently? I believe it would be a decided improvement.

717. Do you think that all the suburban municipalities should be empowered to carry out such an arrangement? I do.*

718. How are you supplied with water in your municipality? We have recently had the water conveyed from the city.

719. Does that water supply the municipality? A small portion of it only at present. The pipes have not been laid down in many places, although applications have been made for the water to be laid on to various streets. The city authorities are in difficulties, I believe, just now, and cannot accede to the wishes of the people.

720. Are the people supplied from wells where the water is not laid on? Yes.

721. From wells in their yards? Yes.

722. Is there generally a cesspit in the same yard? Yes.

723. What is the nature of the soil? About a foot from the surface it is a stiff clay, with ironstone.

724. Have any complaints ever been made that the water in the wells has been contaminated by these cesspits? We have not heard that it has been contaminated by cesspits, but we have heard complaints of bad water—brackish and so on.

725. But not in itself stinking or offensive? No; some of the wells have very good water I believe.

726. Is the water supplied from the city good? It has been complained of as being very indifferent.

727. In what respect? It has a bad taste and has a quantity of visible animalcula in it, or something of that kind.

728. Is the water thick? Yes.

729. And it smells badly? It smells badly, but I think a great deal of the bad taste arises from the new pipes having been varnished with coal-tar, or something of that kind to preserve them, which affected the water. But complaints have been made that the water has been affected by other causes than that.

730. You mean that there has been some suspicion of filthy matter getting into it? Yes.

731. Are there any other special nuisances which give you trouble in your municipality now and require immediate attention, such as you have no power to deal with at present? We have had certain small matters complained of, arising from smoke and so forth, but they cannot be avoided.

732. Nothing of particular consequence? Nothing of particular consequence.

733. Are there not some very crowded localities in your municipality? In some portions of it they are rather crowded—between the Parramatta Road and Newtown. From the Missenden Road there are a number of cross streets thickly populated and but small tenements.

734. You have no underground system of sewerage I suppose? No.

735. And all the kitchen and laundry drainage goes—where? It is taken down the gutters of the street into a main open sewer, which conveys it down to Johnson's Bay.

736. Does this open drain create any nuisance? No, I have not heard of any nuisance, except in cases of overflow.

737. As long as the closets do not overflow there is no nuisance? No, I have not heard of any.

738. We are told that there are a number of boiling-down establishments, piggeries, and such places in the municipality of Leichhardt—I suppose you know the situation of them? Yes.

739. Have you heard any complaints from residents in your municipality of the smell arising from those places? We have had complaints of a piggery just off Australia-street, in our own municipality, kept by a man named Reddan, but the nuisance has been abated to some extent.

740. But I am speaking of a nuisance in the municipality of Leichhardt—a nuisance said to be felt at a great distance. Have you felt anything of it in your municipality? We have not.

Mr. Charles Banks, examined:—

741. *Chairman.*] Are you Town Clerk at Newtown? Yes.

742. You have heard the conversation that has taken place between the last witness and myself? Yes.

743. Is the system respecting the cesspits in your municipality pretty much the same as that you have heard described? Yes, it is very similar.

744. You have similar nuisances and a similar organization? Yes, very similar.

745. And do you approve of what is proposed to be done to remedy those evils—transferring the responsibility from the landlords to the municipalities? Yes, I think it will be a good plan.

746. Do you think that any hardship will arise from the introduction of this more efficient system, as although the landlords will be relieved of their responsibility in the matter they will have some additional expense thrown upon them;—do you think there is anything in the system which will be unfair to the landlords? No, I think it would benefit a great number of persons.

747. Do you think it would meet with the general approval of the municipalities? I believe so.

748. It is hardly worth while to go through the different points on which we have been examining the last witness. You have heard the evidence and you find a similar state of things existing in your municipality? Yes, very similar, and I quite agree with Mr. Pidcock in what he has said.

749. When the nightmen take away the contents of these cesspits do you know where they take them to? No.

750. And you have no control over them? No.

751. Have you ever had complaints made to you that they have deposited this stuff in improper places within your municipality? Not within our municipality I think; there is none of it deposited within the Newtown municipality.

752. Have you heard complaints that they have deposited it without a license in any improper place? No, I have not heard of it.

753.

Mr.
W. Pidcock.

3 June, 1875.

Mr. C. Banks.

3 June, 1875.

* NOTE (on revision):—But I think that the dry-earth system of closets would, if practicable and generally adopted, be the safest and most conducive to health.

- Mr. C. Banks. 753. Is much of it taken out to Cook's River, and deposited there? I could not say; the Inspector of Nuisances is here, and may be able to inform you; he has full control over those matters.
- 3 June, 1875. 754. How are you supplied with water at Newtown? Merely by tanks and wells, made by the owners of properties.
755. Are there many wells in the Newtown Municipality? Sufficient to supply the inhabitants, except in a long drought.
756. Generally speaking, each house has a well, I suppose? Yes.
757. Have you heard any complaints of the water being contaminated at all from the proximity of the cesspits to the wells? No, never.
758. The soil in Newtown is generally stiff clay, I believe? It is something similar to that described by Mr. Pidcock.
759. Is not the water in some cases inclined to be brackish? Yes, that is from the nature of the soil.

Mr. John Flaherty, examined:—

- Mr. J. Flaherty. 760. *Chairman.*] Are you Inspector of Nuisances for Newtown? Yes.
- 3 June, 1875. 761. You have heard the evidence which has just been given, and the conversation we have had on matters relating to these cesspits? Yes.
762. Do you concur in what has been said by the other witnesses? Yes.
763. Do you think the change we propose would be a useful one? I think so.
764. Do you find that these cesspits are a great nuisance? Yes; we have several in Newtown which want cleaning out, and we cannot get them cleaned.
765. Do you mean that the nightmen will not take the stuff away because they cannot sell it? They have no place to deposit it in.
766. Where do they take it to, as a rule? For the last few months they have deposited it in Marrickville.
767. On private property? Yes.
768. By permission of the owner? Yes; and they have abused the privilege by shooting some of it into the street, and the Mayor of St. Peter's and Marrickville communicated with the police and summoned the owner. The case has been postponed four times on a point of law taken by Mr. Gannon that, under the Act 2 Vict., No. 2, the Justices have no control, but it is stated that if the case is dismissed at the Police Court they will proceed against the parties under a by-law.
769. You find the subject a difficult one to deal with? Yes, because there is no place to deposit the stuff. Mr. Langhorn is trying to find a place to deposit it in.
770. You think then it would be a great improvement if an arrangement were made to place the whole thing in the hands of the municipalities? Yes, it is wanted very much.
771. Do the closets overflow very much in wet weather? Very frequently.
772. Do they fill rapidly in wet weather? Yes, in half a day.
773. And overflow into the streets? Yes.
774. What do you do in such cases? We endeavour to stop it. We can summon the owners who are not willing to have them cleaned out, but they cannot do it because there is no place to deposit the stuff.
775. Would it not be better if these cesspits were so constructed that no surface water could flow into them? Well, I cannot see how it is to be remedied; even if you put in two or three inches of cement the surface water will find its way in. I know one gentleman who went to a vast deal of expense in making his closet a kind of tank, but the water would get in.
776. Still it would remedy a great part of the difficulty? No doubt it would. The boiling-down establishments in the Alexandria Municipality are very offensive to the inhabitants of Newtown.
777. The smell from them is offensive you mean? Yes, when there is a south wind. Some of these persons who have boiling-down places keep what they call the soup until it becomes offensive, and generally about 7 o'clock in the evening we find the smell is very bad.
778. About how far from the bridge are these places—from the Railway Bridge? Well, Mr. Bell's would be close up half a mile.
779. In the Municipality of ———? Alexandria. There are three boiling-down establishments there.
780. Do you hear people complain of these places frequently? Yes; Mrs. Dixon has frequently complained, and has written a letter to the Council about them.
781. Can you mention any other nuisance in your municipality which you have not been able to deal with? No, the closets are the principal nuisance.
782. Is any of the refuse from these boiling-down establishments, or the scraps of butchers' shops, or any other kind of refuse, taken out in your direction? Yes.
783. And deposited in your municipality? No; it is taken to the boiling-down establishments I have referred to. They pay so much a pound for the fat and offal.
784. Do they keep pigs in connection with these establishments? Yes.

FRIDAY, 4 JUNE, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,
W. C. BENNETT, Esq.,

E. O. MORIARTY, Esq.,
Dr. ALLEYNE,
P. F. ADAMS, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

P. F. Adams, Esq., Surveyor General, examined in his place,—

785. *Chairman.*] Can you inform us whether there is any land available on this side Cook's River, within a reasonable distance of the city, which would be available for the disposal of night-soil in large quantities—say 200 tons a week? Not Government lands, except upon the watershed of the Botany reserve. P. F. Adams, Esq.
786. Upon what is called the watershed of Shea's Creek is there any land? Not unalienated. 4 June, 1875.
787. Is there any land there which is alienated, but in respect to which the proprietors would be likely to come to an arrangement with the Government? I think it would be too close to Sydney for the purpose. I could hardly recommend such a locality even if it were available.
788. You think then that any land taken for this purpose should be taken beyond Cook's River? I think it would be advisable.
789. Is there any land available to your knowledge beyond Cook's River suitable to this purpose—any Crown Land? There is none either available or suitable.
790. Do you know of any other land within 7 miles of Sydney? I know of none.
791. Is there any land on the other side of Cook's River available for this purpose? Yes, there is.
792. What kind of land is it? It is sandy or loamy soil.
793. And you think it might be applied to this use? Yes.
794. In what way? By trenching the night-soil into the ground.
795. You would put the stuff in fresh from the pits and bury it and then leave it? Yes, and work the land over again some months hence in the same way until the soil became saturated with it.
796. You would propose to do this for the purpose of fertilizing the land? Yes; and I think the owners of the land ought to assist in carrying out such an arrangement; in fact, if they did not assist materially in the matter it would be better to get rid of the stuff altogether by sending it out to sea.
797. It appears to be pretty well determined now in Europe that it is impossible, except under exceptional circumstances, to make a profit out of this matter. But it is equally certain that a considerable saving may be effected by making use of it to fertilize the land. Therefore if the owners were not willing to render considerable assistance in carrying out an arrangement of this kind it would certainly be better to get rid of it? I quite agree with you.
798. Do you know of any large landowners who would be willing to co-operate with the Government in carrying out such an arrangement? I think Mr. Holt would be the most likely.
799. Have you thought over any arrangement which might be made with the owners of land in such a case? I have not. Of course if the faecal matter is dug into the ground it would be no nuisance to the neighbourhood, and the land would be improved considerably.
800. You don't think there is any land in the direction of Canterbury? I don't think there is any within 7 miles of Sydney which is not too much populated to admit of its being used for such a purpose.
801. Now supposing this faecal matter were put into barges, as I am told is done in Paris at present, and transported by water, and, I presume, pumped by steam-power on to the land afterwards;—do you know any land near Sydney which would be available for such a system as that? Very little indeed, because the peculiar feature of the lands approaching Sydney Harbour, or Middle Harbour, or the bays about here, is, that they are unsuitable to agriculture. There are some tracts of land on the Parramatta River which might be available for this treatment—for pumping out of the barges and spreading the manure.
802. Is there a considerable area available for that purpose, because we should require a considerable area to go into such a scheme? No. I think eventually a considerable portion of the night-soil of the city would be absorbed—that is to say, it would be taken away by proprietors of land by and by when they got used to it. At present I don't think they would take much, and it would all have to go out to sea.
803. You do not think there is any considerable tract there of which we could get possession, on which to utilise this matter on a large scale. What is the objection?—are the banks too precipitous? Yes. I think all that could with advantage be disposed of out of barges in that way would be to private individuals. If the people don't want it, it would be much better to send it out to sea. If they do want it, it could be taken to the place where they require it.
804. There is a considerable extent of sandy country between Cook's River and George's River, is there not, close to the 9-mile Beach? Yes; that is the place I proposed, most of it being Mr. Holt's property.
805. What do you think the purchase of that land would cost the Government, supposing it were purchased compulsorily? From £1 to £3.
806. Supposing that the project were once started—to deposit this faecal matter upon a Government farm—do you think there would be a probability that hereafter, at no very distant time, it would come into favour with the public, and that there would be a considerable demand for it by farmers and other persons? That would depend very much upon the nature of the land, whether the application of this stuff would be an improvement to it or not. I know that in clay or sandy clay there are the necessary ingredients to render the introduction of night-soil to it the best thing possible; but I am afraid to say that it would be a success if applied to pure sand, and as a rule we have nothing but this pure sand near Sydney at a low level. All the better class of land suitable to this treatment, as I imagine, lies in the Wianamatta clay.
807. Do you not think it would be a good thing to encourage the use of this rich manure in the county of Cumberland generally, seeing that the land is generally so poor in quality? Yes; and I think if the proposed arrangement is carried out it will in time get into such favour that, instead of going out to sea, the soil will go along the railway line in vast quantities.
808. But before that we must shew its utility by using it on some farm in the way you have suggested? Well, that could be tried.
809. Don't you think that would have the effect of bringing it into favour much more rapidly than if it were left to the farmers themselves to bring it into notice? I don't think it would make much difference; the people would soon find out the value of it. 810.

- P. F. Adams, Esq., 810. But if it is all sent out to sea at once they will know nothing about it? I do not think the fact of its going out to sea ought to prevent any experiments from being made with portions of it. But considering the magnitude of the question—that you have such a large quantity to deal with—you must obtain plant and appliances to take at any rate the bulk of it away; and I don't see that at present you can do anything else but send it out to sea. My views on this subject might be very considerably modified if some of the large proprietors of land would make a liberal offer to take it, so that it would cost no more, or even less, than it costs to send it away. Certainly it would be our duty to recommend that; but I question whether the demand will arise.
811. *Mr. Bell.*] Is there any land do you think within a reasonable distance of Sydney, say 15 or 20 miles along the line of railway? Yes, there is any quantity of private property within that distance which could be resumed by purchase; but I am not aware of any suitable area or situation that is vacant, that is to say, Crown land.
812. *Chairman.*] Is there a large extent of land in the neighbourhood of the Parramatta Junction? Yes, quite sufficient for the purpose without going 20 miles by railway.
813. Is there any suitable land within 14 miles of Sydney, and near the railway, in any quantity? Yes.
814. And I suppose land of that character is of scarcely any value? Very little in its present state, and would be vastly improved by the application of night-soil.
815. And this land you say is all alienated? All alienated.

Francis Bell, Esq., City Engineer, further examined:—

- F. Bell, Esq., C.E., 816. *Chairman.*] I find, from reading different works on the subject, that there are a great many different systems of employing pneumatic receptacles similar to that which you propose to adopt. Have you formed any definite plan as to the construction of the cart which it will be necessary to use? I propose myself to use cylindrical carts or cylinders.
817. There are also various arrangements employed on the continent for creating a vacuum in the cart;—have you decided upon adopting any particular plan for that purpose? Well, I am not wedded to any particular plan; I should like to inquire a little further into the matter. I think it should be done by some steam power or other.
818. By direct pumping? Yes, by direct pumping.
819. If this system is to be applied at once, taking things as they are—and of course they must remain so for some time at all events—do you think this method could be made applicable in the case of some of these cesspits where, from the nature of the soil the liquid has become absorbed and the residue is comparatively solid. Do you imagine it would be too solid to be sucked up in this way? I think we may have a good deal of difficulty in that way; but wherever the cesspits are improperly constructed they should be filled up and proper ones constructed.
820. You think then that, pending the improvement of these cesspits, this system could not be adopted universally, and that we shall be obliged to have recourse to the old method of cleaning them out in the meantime? Yes; perhaps so.
821. Do you not think it might be possible to make use of these pneumatic carts in the case of large well-formed cesspits, and to adhere provisionally to the old method in other cases, and where common carts were used, to transport the contents by land to some place we might be able to find for depositing it? Yes. It might be possible to use these tanks for that purpose also. Arrangements might be made to do it without creating a nuisance. There was a suggestion made by Mr. Moriarty, which I thought was a very good one, that some of these tanks should be made in compartments suitable to the size of the pits. One compartment could then be filled at a time.
822. Do you think that if very small receptacles were used the method would be practically applicable? I do.
823. Supposing the receptacle to be not more than half a cubic yard? Yes; each compartment would have a valve of its own.
824. Have you ever considered the propriety of introducing what seems to be a very common practice in large towns in England in case of large cesspits or other receptacles for fecal matter—that of throwing ashes produced on the premises into the place as a partial deodoriser? Yes, I think that would do very well. I know that a Commission, which lately sat in Birmingham, brought up a report which recommended that this should be done, and the old Midden system done away with.
825. But, without doing away with the Midden system and using the old cesspits the people have still the opportunity of throwing the ashes into the place. I find that this practice obtains greatly on the continent and seems to be admitted as, at any rate, a mitigation of the evil? No doubt it is. I think you might afterwards have a small engine attached to these tanks, and then you could have a vacuum created at once.
826. That is to say you would pump out the air at once? Yes.
827. If these ashes were thrown in they would of course increase the bulk of the matter to be removed? Yes, and they would increase the difficulty of drawing it out of the pits.
828. By increasing the solidity of the matter? Yes.
829. I understand you then that for some little time, at all events until arrangements are placed on a more satisfactory footing, it will be necessary to adhere to the old method of removal in the case of improperly constructed cesspits, where the matter becomes too solid? Yes; but generally speaking I think they could be emptied in the way I have suggested.
830. But in those places in Waterloo, where the soil is sandy and you would have a solid mass to deal with—in most cases you would have some solid matter which you could not pump up? I am not quite sure that would be the case; the pits are so low that I think they are almost always filled with water.
831. It depends, I suppose, a good deal on the situation of the cesspit? Upon the situation. You know you have only to sink a few feet in the sand anywhere to get water.
832. That may be the case in some places, but there must be others where the fecal matter is left dry and solid. How long now do you suppose it would take to make the necessary plant, the tanks, punts, wharves, &c., and to complete all the arrangements for commencing your system? I should say to complete all the arrangements it would take about six months.

833. That would take us into the middle of next summer. Have you prepared any plan of the cart which would be used, or made any estimate of the expense? No, not yet. F. Bell, Esq.,
C.E.

834. *Mr. Moriarty.*] I think you have stated before, but I will ask you now, whether a great deal of the disagreeable smell caused by cleaning out these closets might not be removed by deodorising the matter so as to render it unnecessary to have recourse to this pneumatic system? Well, you might do some good by diminishing the odour, but you could not remove it. 4 June, 1875.

835. I mean temporarily? It might be of service temporarily, but it would not be effectual.

836. *Mr. Bennett.*] As it would take such a long time to bring your system into operation, and as you are not quite certain about the working of the suction carts, what would you think of using them as they are used now. Would it not be well to commence by trying these carts. The punts will be a large investment? I think so. That would be considered by the Municipal Council. The removal would be a much cleaner process than it is at present.

837. You think that plan might be adopted with advantage as a temporary measure? Yes. I would propose that these carts should be cylindrical tanks, and also sloping towards the centre where the discharge valve would be, so that all the matter would fall towards the bottom and be easily discharged.

838. *Chairman.*] Have you taken into consideration that when this faecal matter is drawn into the cart there will be a considerable liberation of foul gas by suction from the vacuum? Yes. I may mention that in Captain Lierhner's system the carriage-frame is hollow, and the exhausted steam circulates through it before entering the chimney, so as to deaden the noise of the blast, while the *exhausted foul air* is passed under the fire-grate in order to purify it by burning.

Mr. David Clement Robertson, Inspector of Waste Waters, called in and further examined:—

839. *Chairman.*] Are you acquainted with the line of Busby's Bore? Yes.

840. Commencing from Hyde Park and going on to the Lachlan Swamp? Yes.

841. Are there any cesspits to your knowledge anywhere near the Bore? There are on the southern side of the Bore, just on the other side of Botany-street.

842. In the street? Yes.

843. That is somewhere just beyond the Gaol? Yes.

844. And from there how far do the cesspits extend? Well I suppose 200 or 300 yards, to the Barrack-wall.

845. Are there many cesspits there? Yes; there is a block of I suppose sixty or seventy houses.

846. All with cesspits? Yes.

847. Are you acquainted with the Bore—can you point out the situation of the different shafts? No. I know where some of them are, but not the whole of them.

848. We are told that in some parts—more especially in the suburbs—the cesspits become full in rainy weather, and overflow, and frequently run into the gutters, and that in some cases this is purposely done by the people themselves when they can do it? Yes, that is carried on to a considerable extent. Some of the cesspits are so constructed that at a certain level there is a pipe to carry off the liquid matter.

849. The pipe is laid on for that purpose? Yes.

850. Is not that illegal? Yes, and when the Inspector of Nuisances is aware of it he prosecutes the parties.

851. Does this create a nuisance? Yes.

852. The faecal matter goes into the gutter? Yes.

853. Are there any places where that occurs which you have seen yourself? Yes, on the Surry Hills, and many other places it frequently occurs, to the annoyance of the neighbours.

854. Where do these gutters discharge themselves? From Surry Hills the gutters discharge into a large open drain in Arthur-street.

855. Where does that lead? Right down past Alderson's, and away down to Waterloo, to Shea's Creek.

856. Have you observed the same thing in Waterloo? No; I have not taken particular notice. It is not part of my duty. It is our duty if we see anything in the city like that to report it to the Inspector of Nuisances.

857. Your duties carry you to the suburbs, wherever the water goes? Yes.

858. Have you heard complaints of the well-water in the suburbs being bad? No, I have never made any inquiries about it.

859. Have you ever heard complaints of nightmen depositing night-soil in improper places? Yes.

860. Where? I have heard of one or two loads being discharged in Elizabeth-street, near Belmore Gardens, and somewhere in the Municipality of Darlington.

861. Are these people found out as a rule? Yes, the Inspector of Nuisances got on their track, and they were fined for it.

862. I think I understood you to say that there are no cesspits along Oxford-street until you come as far as the Gaol? Well they commence there; there may be two or three along Oxford-street. Then taking the Paddington side, from the northern side of Albion-street, the whole of the drainage from the houses in that locality along the eastern side of Dowling-street discharges into the gutter, and thence it is carried along till it gets within a few feet of the Wesleyan Parsonage, and then it is discharged into the sand. Then a little further along there is a block of houses, newly erected, about forty or fifty of them, in Dowling-street on the same side, and there is a gutter which carries the water on about 150 yards, and then discharges itself into the sand.

863. That is house drainage? Yes.

864. Is that in the neighbourhood of the Bore? It is within eighty or ninety feet of it. That is on the Paddington side. Then on the city or west side it is kerbed and guttered, and the drainage is carried away into the sewer.

865. *Mr. Bell.*] With regard to these cesspits we were speaking of along the South Head Road towards the Park wall, does not the ground slope rapidly there? Yes.

866. So that the drainage is carried off there quickly? Yes, it is; there is a great fall there.

867. Does any of the drainage go into Barcom Glen? The surface drainage does.

Mr. D. C.
Robertson.

4 June, 1875.

TUESDAY, 8 JUNE, 1875.

Present:—

M. B. PELL, Esq.,
HON. J. B. WILSON,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,
DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Benjamin Palmer, Esq., Mayor of Sydney, and Michael Chapman, Esq., Alderman, were called in.

Mr. Palmer examined:—

B. Palmer,
Esq.
8 June, 1875.

868. *Chairman.*] I wish to ask you, Mr. Palmer, as we are taking evidence on this subject, whether you consider it desirable that the duty of cleansing the cesspits should be thrown upon the municipal authorities in Sydney and the suburbs? I do. Would the City Council have the power of doing this for the suburbs who have municipalities of their own?

869. I will come to that presently. Is it your opinion that the suburban municipalities would concur in such an arrangement? Yes, I think so.

870. You understand that under such an arrangement the landlords or owners would be relieved of all responsibility in the matter, except that of paying the proper charges for the emptying of these pits? Yes.

871. Do you think it would be reasonable to require that all cesspits should be cleaned out at certain intervals? That would depend in a measure upon the size of the cesspits.

872. It seems to be the prevailing opinion that large cesspits are objectionable—that it is better to have smaller ones, and to clean them out frequently. I may say that the opinion of the Board, as far as we have formed one upon the evidence yet taken, is, that they should be cleaned out at intervals of not more than three months? I think large pits are very objectionable, and I think they should be altered to a certain size.

873. And you think they should be cleaned out frequently? Yes; some might require to be cleaned out much oftener than others. For instance, there might be a cesspit attached to a house in which only a man and his wife were living, while next door the cesspit might be used by a dozen persons.

874. Do you think it would very largely increase the annual expense of keeping these places clean if they were cleaned out more frequently—if one cart, instead of taking away the contents of one, were to take away the contents of a number in the same street, and do it at more frequent intervals. There would be the same quantity to take away, only it would come from a number of different cesspits? I think it is desirable that they should be emptied frequently. I could not exactly say at what intervals.

875. Do you think the city authorities should be empowered to levy a certain rate, in some way or other, to pay for the whole expense of cleaning out these places? I think some specific charges should be made, just enough to cover the actual working expenses.

876. It should be amply sufficient to cover the expense, including interest on the value of the plant, as well as wear and tear? Yes, sufficient to cover the expenses. Of course the amount could only be ascertained by experience.

877. We also propose to recommend that the municipal authorities should have full power to regulate cesspits and water-closets, as to their construction or re-construction, where necessary, and also as to their position;—do you think that would be desirable? I think so.

878. And also as to the sufficiency of accommodation in order to secure decency and cleanliness. Do you think that would be desirable? I think so; I think we ought to have power to regulate these matters, and to fix the size of the cesspits—that they should be so many feet wide and so many feet deep.

879. We understand that at present the municipal authorities have no control whatever over the nightmen to prevent them from placing the contents of these pits wherever they choose; in fact they have no control in the matter at all; the owners may construct what pits they choose, and empty them out as they like? Yes, until they become a nuisance, when Mr. Seymour pays them a visit.

880. We propose to make improvements in all cesspits obligatory upon the owners or landlords—that steps should be taken for instance to prevent the overflow of surface water getting into them;—do you approve of that? Yes, that could be done by raising the cesspit above the level of the ground.

881. And we propose to recommend that this should be done at once? Yes, I think it is very desirable, because there are plenty of cesspits which are only on a level with the ground, mere holes in the ground.

882. We think also that these cesspits should be made watertight, not only to prevent the overflow but to prevent the liquid matter from percolating through the soil? Yes, they should have bottoms as well.

883. But we propose to leave this to the discretion of the municipal authorities? Yes. You must take into consideration the time which would be required for inspection and for our officers to make suggestions as to the improvements which would be required, and also to obtain the men necessary to carry them out.

884. Do you think the municipal officers would be willing to carry out this work as far as possible, and to deal firmly with the people? Yes, I am sure our officers would, but the difficulty will be, if this is to be done at once, to get the men necessary to carry it out.

885. It seems perfectly clear to us that, allowing for the necessary experiments, arrangements could not be made for disposing of the matter from the cesspits in the manner proposed—by sending it out to sea for six months, or probably a year. That is a scheme which could not be carried out until all the arrangements were perfected, even if the Legislature should come to the conclusion that it was the best system to adopt? Yes. I was talking to Mr. Russell the other day about the barges which would have to be employed, and he said they would cost £1,500 each, and of course it would take some time to get everything in working order.

886. It seems to us therefore necessary to make some temporary arrangement for disposing of this matter, which appears to be such a great nuisance? Yes. My own view of the subject is as far as regards temporary arrangements—that if we could get the Government to assist us with the railway and give us some site up the country suitable for the purpose, we might construct trucks with one or two tight compartments and send it up there. There are one or two places on the Harris estate where there is a line already laid down to Darling Harbour. There is some vacant ground there where we might deposit it by means of some kind of shoot, until it could be sent up the line, or otherwise disposed of.

887.

887. Do you know any particular place on the line which would be suitable for such a purpose? Some of it might be taken on the Southern line, and some on the Western. There is plenty of land along the line there, and if you were to send some of our street sweepings along with it, it might be made use of by farmers and other persons in the country. We have hundreds of loads of scrapings off the streets which might be mixed with the night-soil. B. Palmer,
Esq.
8 June, 1876.

888. Do you think the municipal authorities would be willing, in respect to neighbouring municipalities, to undertake, under proper arrangements and with certain fixed charges, the duty of carrying out the provisions I have spoken of, if it were found desirable to consolidate the matter?—Do you think the city authorities would undertake the duty under an equitable arrangement? I think they would. It would be to the interest of the suburban municipalities to combine with us. Bad as the city is represented to be with regard to these matters, some of these municipalities are worse, I believe.

889. We are told that the nightmen take away the night-soil and sell it to market gardeners, but although they profess to do so we are informed that they frequently deposit it in improper places; in fact, nobody knows where it goes to? Yes; we found one man doing that; instead of selling it to a market gardener he deposited it in one of the gully-shafts.

890. We have heard of several other cases, not quite so flagrant as that, where the persons were not detected. Have you reason to suspect that this goes on elsewhere? I do not know. I have heard of some of this stuff being deposited near the Kerosene works. Whether it was done to counteract the effect of the kerosene I cannot say.

891. Could not the evil be mitigated if we could find some place to deposit it at a moderate distance from town?—Would not that improve the present state of things? Yes; there is a good deal of uncertainty as to where it is deposited at present. Some of the nightmen say they take it as far as Bondi, and shoot it over the cliffs, but whether they do so or not I am not of course in a position to state.

892. Do you know the position of certain Church and School lands, not within the Botany watershed, but somewhere near La Perouse's Monument. We have some idea that that would be a good place? I know the Church and School lands as far as the Botany road. It is a long road, and you must consider the distance.

893. Do you think that when once this disgusting job of loading the carts was done the difference of a mile or two along the road would materially increase the expense? Yes; the further you sent it the more you would have to pay.

894. Would it not be better even to incur additional expense than to allow this nuisance to continue? Well, I dare say it would under the circumstances.

895. You do not recommend that this stuff should be thrown over the cliffs at Bondi, do you, but to deposit it on certain land at Bondi? No, to throw it into the sea. There is a place between North Bondi and Mourabray, where people climb down the rocks to fish, where it could be deposited on the land close to the sea, and easily thrown over.

896. How far from Sydney is the locality you refer to? I should say about six miles, and there is a good road all the way. You go down the South Head Road, past Rose Bay, and round the hill, or you can go the other way by Waverley.

897. Would it be necessary to construct a new road for any part of the way? Only from the junction of that road to the sea-coast, about a quarter of a mile.

898. *Mr. Moriarty.*] Would not the cartage of this stuff, if that site were adopted, have to go through a densely-populated part of the city, such as the South Head Road, Rushcutter's Bay, William-street, and that neighbourhood? I don't think it would be so objectionable if it went that way as it would if it went the other way, because in that locality the houses are larger and the premises not so close to each other. If you went to Randwick it would be almost as bad. With regard to the place mentioned by the Chairman, near La Perouse's Monument, the road is very hilly all the way. I believe, too, that Mr. Hill has a house and garden there, and there would be compensation to make.

Alderman Chapman examined:—

899. *Chairman.*] You have heard the evidence given by the Mayor; do you concur generally in the statements he has made? Not in everything. It is one of those questions on which you will find a diversity of opinion. In a great many of his remarks I concur; in others I do not. Alderman
Chapman.
8 June, 1876.

900. Do you approve of what I have stated to be the present intention of the Board to recommend with regard to increasing the powers of the municipalities? Yes, I quite approve of that, and I think it is a step in the right direction. If these cesspits were placed under the direct supervision of the Mayors and Aldermen of the city and suburban municipalities they would be kept much cleaner and there would not be so much pollution.

901. Do you think the City Council will be willing to carry out cordially the provisions of such an Act as we should recommend? I think so; I would make it a matter of compulsion, as it is one which so closely affects the health and even the lives of the citizens; I think they should be made to do it.

902. In respect to certain matters affecting the construction or reconstruction of these cesspits, the Corporation we think should have a discretionary power? That is what I object to. I would not allow the Mayors and Aldermen to say that some cesspits should be allowed and others condemned. I would insist upon every closet being properly constructed and cleaned out after a certain interval.

903. Would not that be rather a revolutionary kind of arrangement? I do not think so.

904. You would have all closets made water-tight? Yes.

905. Would not this involve a very considerable expenditure on the part of landlords? I do not think they would have to expend more than they do now. All landlords ought to have their premises kept clean, and I quite agree with Dr. Wilson, that these cesspits should be cleaned out every three months, and one cart might take away the contents of half a dozen pits.

906. I am referring to the construction of the closets. Would not the reconstruction of these closets entail a considerable increase of expenditure on the part of the landlords? Yes, but it would increase the value of their property; of course they might complain, some of them, of such an innovation upon what they consider their rights, but the improvement is necessary and would have to be made.

907. Do you think the landlords would carry out such an arrangement? I think so; I think they would see the value of it, especially if the Corporation had the power to enforce it.

Alderman
Chapman.

8 June, 1875.

908. You are well acquainted, I believe, with the suburbs as well as the city? Yes.
909. Is it not the case that there are great numbers among the working classes who work for wages, and who with the assistance of building societies become freeholders? Yes, I know numbers of them.
910. These are a very steady and respectable class of men? Very much so.
911. Men whose property in many cases is still under mortgage and whose means are limited? Yes.
912. Would there not be some difficulty in the case of these people if they were called upon to bear an expense, which to a rich landlord would be trifling, but would be heavy to them? No, I think not. The cost of constructing these cesspits would not be so great. In the first place they seldom exceed 4 feet by 4 feet, and they never at any time cost more than 30s. or 35s. to complete; that is for the stone-work; they are built generally of rubble.
913. If cemented to make them watertight would not they cost more? Not much more—a little of course. I don't think the general run of cesspits would cost more than 50s.
914. We find that in Waterloo these cesspits are very often near the wells; in fact they are not regular pits, they are only holes in the ground? We are told by the nightmen that they never have to go there at all, and I should think it must be a terribly unhealthy place. Frequently we find a well not many feet from a water-closet, and the consequence is that the water gets contaminated, and you see a lot of sickly children in the neighbourhood, half of whom, I am sure, will never be reared. I was speaking to a nightman the other day, and I happened to mention Waterloo, and he said, "Oh, we never visit that place; when one pit is filled they dig another alongside it."
915. Don't you think that state of things should be put a stop to at once? Oh yes, certainly.
916. What would you propose to do with a proprietor, supposing he had not the money to reconstruct the place? There is no man who has a house of his own who could not borrow 30s. or 40s. for such a purpose, and it would be his duty as a citizen.
917. It has been suggested that a sufficient arrangement, or at all events something much better than the present pits, might be made by using some of these street pipes? That would be quite as expensive, I think, as it would be to reconstruct the cesspit.
918. I believe that these pits are purposely made porous so as to let the water through? Perhaps so. I apprehend that if they were laid in cement you could get any of them done for £4,—that is, of rubble stone.
919. What would be the best way, do you think, if the municipal authorities undertook the duty of cleansing the closets, to make the charges. Should the price depend upon circumstances—some closets being less accessible and more difficult to empty than others—or upon the actual expense incurred? If you have the closets cleaned out every three months you must levy a rate upon the property, something similar to the sewerage rate, which the Government pretended to give us power to levy.
920. Would it not be better to assess each cesspit? No; you would be continually at war with the people. I do not know how you could collect it in that way. You would have to send a man to examine every closet to see that it was no larger than some other closet, and it would be necessary to have an Appeal Court; whereas, if you levy a rate of so much in the pound upon the property, you make the charge in the easiest and most equitable way, and you adopt the simplest mode of collection. If you compel the Corporation to collect the money in an expensive way you make them lose by this work instead of making it a source of profit. The balance should at all events be on the right side.
921. You think the rates should cover every expense? Yes; I believe myself that the closets ought to be emptied every three months, although in some cases there would not be more than a bucket of stuff to take away.
922. Do you think if that were done it would materially increase the expense? I believe that with a few inspectors or overseers it might easily be done, and the whole city be kept nice and clean.
923. You would require more officers, would you not? Yes, but I would have the work done by contract. I think it would be done much more cheaply and efficiently by contract, taking into consideration the enormous staff as well as the plant which would be necessary if it were done by the Corporation. You might appoint overseers to supervise the work, but my experience is that work done by the Corporation and by public bodies is one-third dearer in almost every case. You might have properly constructed carts for the purpose belonging to the Corporation.
924. It would be necessary to employ certain labourers, and also to exercise a certain supervision over the disposal of the night-soil, to see that every load was deposited in the proper place? Of course that would be necessary.
925. It appears to us that the City Corporation should undertake this duty, receiving of course proper compensation from the other municipalities? Yes, as far as the emptying of the closets and taking the contents and depositing them at the proper place—they would have nothing to do with the construction of closets, except in the city.
926. Would the city authorities, do you think, object to take charge of the ground set apart for the deposit of night-soil, under proper arrangements and with a fair compensation from other municipalities? No, I don't think they would object. It would give them an opportunity of employing a number of idle fellows, who are always hanging about the Town Hall, and who will not work for anyone else.
927. Why do these men prefer to work for the Corporation rather than for anyone else? I do not know.
928. There is a great demand for labour just now, and I understand it is difficult to get men in Sydney? Yes, but these men I speak of have been foisted on the Corporation by the citizens some years ago, and they seem to think we are bound to employ them.
929. *Mr. Bennett.*] Touching your evidence on the subject of contracts, Mr. Chapman, don't you think that in a provisional arrangement, to meet an emergency like this, it might be rather difficult to get the contract system into operation at once, without any delay, and that it might be desirable, if this system is to be promptly enforced, to commence with day-work, hiring the horses only? I believe the Corporation would try it themselves for a few months in order to see what it would cost. I do not mean, if these powers were given to the Corporation, that they should call for tenders immediately.
930. *Chairman.*] You think then it would be better that the Corporation should have their own plant and contract for the labour? Yes, I would have the pits emptied by contract. I think the carts should be supplied by the Corporation according to the improved plan.
931. We have some idea of making some experiments in the construction of carts on the pneumatic principle. Carts of that kind would require very careful management, and it would not do to entrust them to any common labourer;—at all events the men who were employed would have to be thoroughly drilled

drilled in the use of them—would it not be desirable that there should be one such person paid by the Corporation to accompany such a cart? I think it would be desirable to have as little complication as possible. The men you would employ in work of this nature would be men of the lowest class, and you could not expect them to have any very large share of intelligence.

Alderman
Chapman.
8 June, 1875.

932. If the pneumatic system were adopted, there would be very little disagreeable odour attending the operation of emptying a closet, and I think it would be desirable to have a man of the engineer class attending to such work;—do you think there would be any difficulty in that respect? No, I do not suppose there would be much difficulty.

933. And men of that class in charge of such valuable plant would be necessary to the municipality? You would not require a man to go with each cart. If you had one officer to see that the carts were kept in proper order it would be sufficient.

Thos. Henry Bradridge, Esq., City Surveyor, called in and examined:—

934. *Chairman.*] You are the City Surveyor, I believe, Mr. Bradridge? I am.

935. And you have in that capacity frequent occasion to visit various parts of the city? Yes, frequently.

T. H.
Bradridge,
Esq.
8 June, 1875.

936. Do you find that much nuisance is created in crowded localities by the state of the cesspits and water-closets? Yes, and I think it is very prejudicial to the health of the citizens.

937. These cesspits in many cases, though not such a nuisance as to justify interference on the part of the Inspector, are still, a great number of them, in a manner a palpable nuisance? Yes.

938. And you think that is prejudicial to the health of the inhabitants? I do.

939. You think some more systematic mode of cleansing them is necessary to the health of the citizens? I am sure of it.

940. Is there a deficiency of water-closets or common cesspits in different parts of Sydney? I do not know it personally, but it has been brought under my notice that it is so. In some cases there is only one cesspit for a number of tenements. Only this morning I noticed some buildings going on where it was only intended to build one cesspit or privy for the accommodation of four houses.

941. You think it desirable that some steps should be taken to remedy this state of things, and to require the landlords to provide proper accommodation? I think so, and I think that in our Building Act, which has been in course of preparation for about two years, there is some such provision that every house shall have a separate privy, and that such privy shall be at a certain distance from the house.

942. At present the Corporation have no control whatever over these places? No control at all. I think the present system of cleaning out cesspits is most disgusting, and I think the Corporation should have more direct control over them.

943. *Mr. Moriarty.*] Have you formed any opinion as to what would be the most suitable sort of cart to use for emptying these places? Yes; I think we recommended carts of a particular description in our report to the City Council a few days ago. They would be something the shape of a cylinder, so that the pneumatic system of emptying might be resorted to, but they would merely be put on wheels in the ordinary way.

944. Is there anything particular you would like to add to that report as regards the construction of these carts? No; if the pneumatic system is to be carried out of course all the details will have to be gone into very carefully.

945. *Hon. J. B. Wilson.*] You mentioned that you had a Building Act in preparation for two years? Yes.

946. What has been the difficulty in getting that Act brought before the House? I do not know why it has not been laid before Parliament, or whether it has been laid before them or not.

947. Have any steps been taken to present it? I do not know what steps have been taken. I do not think it has been brought before the House, nor do I know the cause of delay, but I know that provision is made in it for dealing with the closets and cesspits, and not only that, but there is a provision that there shall be one for each house, and at a proper distance from the house, and that these cesspits shall be made watertight, so that the liquid matter from them shall not permeate through the soil, which I know is very injurious to health.

TUESDAY, 8 JUNE, 1875.

Present:—

W. C. BENNETT, Esq.,
F. BELL, Esq.,
Hon. J. B. WILSON,

P. F. ADAMS, Esq.,
E. O. MORIARTY, Esq.,
Dr. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

The Honorable Thomas Holt, M.L.C., examined:—

948. *Chairman.*] You have been kind enough to come here to-day, Mr. Holt, to give us some information as to the lands near Sydney which may be suitable for the disposal of night-soil. Is there any land to your knowledge, either public or private, within a reasonable distance of the city, available for such a purpose? I do not know of any public land, but from Cook's River nearly to George's River I think the land is very suitable, as it is all sand, and has a drainage into Botany Bay.

Hon T. Holt,
M.L.C.
8 June, 1875.

949. And it is not sufficiently inhabited to incur any risk of becoming a nuisance if used for this purpose? No, because if it were, that would be an insuperable objection, but there are scarcely any inhabitants. (*Witness handed in a tracing of certain blocks of land.*)

950. I see in this plan you have given us there is one lot marked 300. Does that mean 300 acres? Yes; it comprises 300 acres altogether, but it has been subdivided in smaller allotments. That belongs principally to Mr. George Lord.

951. Is it settled upon at all? No, I think not; I do not think there is a single house upon it.

- Hon. T. Holt, M.L.C.
8 June, 1875.
952. How far is the nearest part of that land from the dam? About two miles.
953. Is there any land available nearer to the dam? There is plenty of land available, but the inhabitants would strongly object to the deposit of night-soil there.
954. Which is the piece of land nearest the dam which you think would be in every respect the most suitable? This piece (*indicating portion on plan*) belonging to Mr. Lord, and marked John Webb, would be the nearest if there were a bridge across Cook's River from the waterworks.
955. That would involve considerable expense would it not? I was told by the late City Engineer that he could construct a bridge across the river there for £1,200, and then from Cook's River very nearly to George's River there is not a single house. The first house you come to I think is Mr. Seymour's, on the Sandringham Estate.
956. The tract of country you are speaking of lies between the road and Botany Bay, does it not? It lies on the beach.
957. Have you any land of your own there of sufficient area for the purpose? I have 40 acres, adjoining Mr. Lord's, formerly John Webb's, and I have 98 acres which are within two miles of the dam. Then I have three other blocks, comprising 208 acres, a little further on; there are two blocks between, one belonging to Mr. Jacob Marks, and I don't know to whom the other, which contains 56 acres, belongs.
958. You do not appear to have any large quantity in one block? I have one block containing 208 acres. You can see it here (*indicating position on plan*.)
959. And that is within two miles you say from the dam? No, about two and a half miles to the side of it; the 98-acre block is about two miles from the dam.
960. Then it must be eight or nine miles from Sydney? The dam is about six or seven.
961. Is that firm land or is it swampy? No, there is a swamp; you will see it marked, but this land is near the beach, and is not at all swampy; it is all sand.
962. It is covered with scrub, is it not? Yes.
963. Are there any large trees upon it? There are some, but not many; it is chiefly scrub.
964. Are there many market gardeners in the neighbourhood? Yes, a great many, and I think they would be glad to send their carts and take away as much of the night-soil as they could make use of. They would cover it over with stable manure until it became fit for use. I believe they would take large quantities of it if they had the opportunity.
965. Where are these market gardens according to this plan? Here (*pointing out position on map of the parish of St. George, Cumberland.*)
966. They are along the main road then? Yes, a great many; some of them are on the other road leading to the bay. But when once you come to the bay there are no inhabitants at all. There is not a single inhabitant, I think, from Mr. Seymour's house, on a portion of the Sandringham estate, to Cook's River, along the line of beach.
967. How far from the public road would this night-soil have to be carted in order to get into this uninhabited district? Immediately after you get over the dam you turn to the left, and it is about two miles from the Rocky Point or Sans Souci Road.
968. After leaving the dam you can follow the main road, can you not? No; you leave that immediately after passing the dam. You can also go on the main road to the Wesleyan Church, but the distance is greater.
969. Is there a road to this tract of land, after passing the dam? Yes, it is a much better road than it was formerly. I have driven over it scores of times. There is a municipality there, I think, who would assist in making that road.
970. That is the Municipality of West Botany? Yes.
971. Would much expenditure be necessary to make that road for this purpose? No. I should think, there being plenty of stone there, that £500 would go a long way towards it. Mr. Bennett can give you an accurate estimate of the cost.
972. Then you would advise the Board to recommend this district as a convenient place on which to deposit night-soil? Well, I can simply point out what I consider its advantages. I think it is very suitable for the purpose. It is very barren land at present, but Mr. Seymour has made a very nice place of his in a short time, by using either manure of this kind or street sweepings.
973. And would you be disposed—as a large portion of that land appears to be your property—to place it or a portion of it at the disposal of the Government? I would not object. I suppose the projected Illawarra Railway will run parallel with the beach.
974. That would not interfere with the project—it would rather facilitate it? Yes; in getting rid of the sewage matter.
975. What kind of arrangement would you be prepared to make with the Government, or with the city authorities, in respect to this land? I do not know; I have hardly considered the matter. I should advise the Government, or the Mayor and Aldermen, if they thought of taking my land, to endeavour to obtain those two blocks adjoining it—Mr. Jacob Marks' block and the other one. They would then have an area of 425 acres altogether. But this might be increased to about 1,000 acres, if they secured the vacant land north of my land.
976. You would recommend that we should get rid of as much of this stuff as we could to the market gardeners, and dispose of the remainder by trenching it into the land which might be selected as a depot? Yes; because there would be no further expense than the mere expense of carting.
977. You see if we make a recommendation that this plan should be adopted, we should be obliged to state whether it is available as well as suitable? I should have no objection to meet one, two, or more members of the Board, and to talk the matter over with them.
978. If a committee were appointed you would be glad to treat with them for the land in question? Yes. I would not sell it at any price; but I should be quite ready to make it over to the Government for a term of years.
979. *Mr. Moriarty.*] Have you any idea of the probable cost of the adjoining allotments of which you spoke, in the event of the Government wishing to buy them out and out from the owners? No. I only know the owner of one of them—Mr. Jacob Marks. I could write to him or the Commission might. It would be an advantage to have the land in one block. There would be, I should think, an area of about 425 acres; but with the unoccupied land south of the Cook's River, which is equally suitable, about 1,000 acres.
980. *Chairman.*] Do you think Mr. Marks would be willing to sell his land? Yes, I think so; he offered it to me once, but I was afterwards told it was settled upon his wife and children.
981. Do you think the Municipality of West Botany, in which this land lies, would raise any objection to the

the deposit of this soil in that locality? I am quite sure if it were on the beach they would not object to have it brought there. Many of them are market gardeners, who would use it in their gardens.

982. You do not think the municipal authorities would make any objection? I think not, as I do not believe that it would be a nuisance to any of the residents in the municipality.

983. Do you think it would be to the advantage of the neighbourhood in promoting the cultivation of the land? Yes, but you should not look upon this as a permanent arrangement. As soon as the Illawarra Railway is finished you will be able to dispose of any quantity of it on Government land, where for miles there are no inhabitants, and I would suggest that a large block of land should be specially reserved for this purpose.

984. But in the meantime we have the contents of some thousands of cesspits to dispose of? Well, no doubt it would be an advantage to this sandy land on the bay, and no inconvenience would arise to any person, as it is so far removed from every house.

985. *Mr. Moriarty.*] Do you think the water in the swamp there would be contaminated in any way from the deposit of this night-soil? No, because the drainage all leads towards the bay; if that were not the case—if the drainage were in the opposite direction—the objection would be insuperable.

Hon. T. Holt,
M.L.C.
8 June, 1875.

TUESDAY, 15 JUNE, 1875.

Present:—

F. BELL, Esq.,	P. F. ADAMS, Esq.,
W. C. BENNETT, Esq.,	HON. J. B. WILSON,
DR. ALLEYNE.	

M. B. PELL, Esq., B.A., IN THE CHAIR.

George Allen Mansfield, Esq., called in and further examined:—

986. *Chairman.*] We have asked you to attend to-day, Mr. Mansfield, to give us some further evidence in reference to nuisances said to exist in connection with certain establishments in the Leichhardt Municipality;—have you heard any complaints at the Glebe of such nuisances? Yes, I have heard a good many complaints, and I have had occasion to complain myself; the nuisance arising from boiling-down and other similar establishments there is a very serious one.

987. Have you any personal knowledge of the localities in which these nuisances exist—have you observed the nuisances in these establishments? No. I cannot give you any evidence as to the character of the nuisances. I know where some of the establishments are, but I have not examined them, or had an opportunity of knowing all about them, by personal observation.

988. But you have found the stench proceeding from these places a serious nuisance at the Glebe? Yes; at times it is almost unbearable.

989. Is it felt in all parts of the Glebe? Yes, more especially on the upper portion of it.

990. Is this nuisance a matter of long standing, or has it occurred more recently? It has been worse within the last two years.

991. It is gradually increasing then? Gradually increasing for the last three or four years, and it is now worse than ever.

992. Are there any boiling-down establishments at the Glebe? None whatever.

993. Are there any establishments where pigs are kept? Not that I am aware of.

994. Are you aware that there are a number of piggeries in the Leichhardt Municipality? I have heard so, but I cannot speak from my own knowledge. When the wind blows from the Leichhardt Municipality towards the Glebe, or in calm sultry evenings, when there is no wind at all, the smell is intolerable, which is pretty good evidence that some serious nuisance exists there.

995. Have you observed any serious nuisance from blood being discharged into the harbour? I have. Upon that point I can speak confidently, for on many occasions, when passing along the bridge or causeway across the Blackwattle Swamp, I have seen the blood lying in coagulated masses on the sand, and left there by the receding tide.

996. Have you noticed that there was much stench proceeding from the Island when you have passed by it in a boat? I have not been near the Island lately.

997. And you have actually seen the blood lying on the sand near the Blackwattle Bridge? Oh, there can be no question about it—bright crimson blood. I have seen the foreshore perfectly crimson with blood, not upon one occasion only but repeatedly.

998. And you think that part of the harbour is polluted by this blood? There can be no doubt of it, to a most serious extent.

999. I would like to have your opinion on a totally different subject while you are here, Mr. Mansfield. What do you think would be the cost of a cesspit, say four feet each way, made of rubble stone, thoroughly cemented? There would be very little difference between the cost of rubble stone and brick. Either of them would cost about £8, made thoroughly waterproof.

1000. *Dr. Alleyne.*] When the tide recedes and leaves the blood on the sands in the way you have described, does the blood become putrescent and stink? Yes.

1001. Have you ever remarked, even at high tide, any evidence of putrescence going on, indicated by bubbles—have you ever paid attention to it, and observed anything of the kind? No. I have noticed it very closely, but I have never observed that. I have seen the blood mixed with water dashing against the stones, but I have not observed any signs of putrescence. But at low tide, after it has been exposed to the sun for some hours, it becomes quite offensive.

1002. Do you know if there are any manufactories connected with the Glebe Island Abattoir, where glue, catgut, and other articles are manufactured? No, not from my own knowledge; I have not seen them. I should say that in addition to the locality I have mentioned, I have noticed similar nuisances from the Glebe Island Abattoir on what is called Glebe Point—between the extreme angle of the Glebe and the end of the public road.

1003. *Chairman.*] All proceeding from the same source? All from the same source. Alderman Thornley, who was here with me the other day, could have given you some very precise information on that subject.

G. A.
Mansfield,
Esq.
15 June, 1875.

G. A.
Mansfield,
Esq.
15 June, 1875.

1004. I presume that the existence of this nuisance is an incontestable fact, and requires no accumulation of evidence to prove it? Oh, no.
1005. *Hon. J. B. Wilson.*] The offensive smells you have observed from the Leichhardt Municipality, if I understand you rightly, are distinct from those proceeding from Blackwattle Swamp—you don't mix them up together as one nuisance? No, they are quite distinct. I am perfectly clear upon that point. Unhappily I know them both too well.
1006. *Chairman.*] Do you think this practice of feeding pigs upon the offal from slaughter-houses or boiling-down establishments should be allowed within any reasonable distance of the city? Certainly not; it should be abolished at once.
1007. And what distance, do you think, should be fixed as a limit, from the General Post Office? Well, it is difficult to fix the distance from any central point. I do not think it should be allowed within two or three miles from any place at all thickly populated: I should say three miles. In my opinion the whole scheme of having the Abattoirs there at all was a great mistake. These things will inevitably collect in the neighbourhood of slaughter-houses, and they should be removed to places where they can offend no one, and be used to make the land valuable.
1008. To go back to the question of cesspits;—which would you recommend, a cesspit made of rubble stone or brick? Brick decidedly.
1009. Would it not be difficult always to make a good job of the rubble stone? Yes. I should recommend the use of brick, because it would be more quickly made and would be more durable and more effective.
1010. Do you not think it would be desirable that the municipal authorities should have a discretionary power as to the reconstruction of existing pits, instead of enforcing their construction upon some specified plan; because some of these cesspits, although not in strict accordance with such specified plan, might not require alteration, while others would have to be altered at once. Don't you think the municipal authorities should be empowered to use their discretion in such cases without partiality? I think so; but it should be made imperative upon them to secure efficiency. Their discretion should only refer to the mode in which the thing was done. It should be imperative upon them to see that the end was attained, one way or the other.

Mr. R. Seymour, Inspector of Nuisances, called in and further examined:—

Mr. R.
Seymour,
15 June, 1875.

1011. *Chairman.*] We learn that you presented a report upon certain nuisances existing in the Leichhardt Municipality some time ago, which was published? I did.
1012. Under what circumstances was that report made, who instructed you to make it? The Mayor of Sydney. An application was made by the Municipal Council of Leichhardt for me to go and inspect the locality in company with their own Council Clerk, and I received instructions from the Mayor to do so.
1013. Then it was done at their request? Yes, I went out and met the Council Clerk of Leichhardt, and we made the inspection.
1014. And the report which appeared in the papers was a correct report of that inspection? Yes, a true report.
1015. Were any steps taken to remedy the evils it referred to? Nothing was done as far as I know.
1016. Was anything proposed? Nothing that I am aware of, except what I proposed myself, that something should be done at once to remedy such a dreadful state of things.
1017. Do you think the use of offal from the Abattoirs, or the refuse from boiling-down establishments to feed pigs with, should be allowed anywhere near the city? I do not think it should; pigs fed on offal can never be wholesome.
1018. What is done with the pigs fed in this way? They are brought to market and sold.
1019. Just as they are, without any subsequent feeding? Yes, in the condition they are in.
1020. You think then there is no remedy, except to forbid the disposal of offal—within what distance of the city should you say? In my opinion none of it should be disposed of in any of the municipalities near the City of Sydney—that is to say, within 10 miles of it.
1021. You would forbid the use of this offal in any such way within 10 miles of the city? I would.
1022. Have not these establishments been forbidden in other municipalities—was not one of them driven out of Balmain for the same reason? Yes.
1023. Why do they not adopt the same course in the Leichhardt Municipality? I cannot say what is their reason for not doing so.
1024. How are the larger sort of dead animals, such as horses and cows, from the city, disposed of? The dead horses found in the streets are removed by the police, if they cannot find the owner; if they do they compel him to remove the animal himself.
1025. Where are they taken to? They are supposed to be taken 8 miles outside the city and burned.
1026. As a matter of fact do you know where they are taken to? As a matter of fact I do not know. I believe a number of them are taken to Mr. Frederick Fewing's place. He is a person who keeps a number of pigs and fancy dogs. I have repeatedly known him to get dead horses and take them to his place, and give 10s. a piece for them.
1027. What does he do with them? He cuts them up and feeds his dogs and pigs with them.
1028. Do you think that ought to be allowed? I am sure it ought not.
1029. Do the nightmen take any of these dead animals away? I don't think so. There is a man—I don't know his name—who lives in Sussex-street, near Hay-street, who carts away dead animals.
1030. Where does he take them to? To the best of my belief he carts them to these different boiling-down establishments.
1031. What becomes of the smaller animals, such as dogs and cats? They are carted out to a place, supposed at one time to be set apart for the deposit of night-soil, at the back of Moore Park. It has a drainage leading towards Shea's Creek.
1032. Do you send them out? Yes.
1033. At the expense of the city? Yes.
1034. Now what would you recommend as the best way of disposing of these dead animals? I think they should be all taken away and burned.
1035. Where? At some distance from the city, or from any thickly populated locality.
1036. Would not that involve a very considerable expense? It would be expensive no doubt; but I think the

the expense would be repaid by the benefit which would result in the health of the citizens if these carcasses were burned, instead of being buried.

Mr. R. Seymour.

1037. Would it not be sufficient to bury them under proper supervision;—would not that be a cheaper and better way of getting rid of them? It would be cheaper no doubt, but I don't think it would be so beneficial as far as the public health is concerned. 15 June, 1875.

1038. You are acquainted of course with the Crown-street reservoir? I am.

1039. It is surrounded, we are told, entirely by streets? Yes.

1040. Is there any system of sewerage in that neighbourhood? I think a portion of Crown-street is sewered, but not by the reservoir. I don't think it is sewered from Crown-street to Albion-street.

1041. Are the houses in that street supplied with cesspits? Yes—ordinary privies.

1042. Are the yards in which these privies are placed on the same level as the reservoir? The yards from Crown-street eastward are all higher than the reservoir.

1043. And on the other side? On the other side they are lower considerably. They are considerably higher on one side, and considerably lower on the other.

1044. How deep are these cesspits as a rule? The ordinary depth is not more than from 5 feet to 6 feet.

1045. What is the nature of the soil? Hard clayey soil—shaley soil.

1046. *Hon. J. B. Wilson.*] Have you any idea of the proportion of offal-fed pigs, as compared with corn or milk-fed pigs, slaughtered in Sydney? Well, from personal experience, I believe that three parts of the pigs sold in Sydney are fed on offal and refuse from slaughter-houses and boiling-down establishments.

1047. *Chairman.*] Fed entirely on that? Entirely on that and nothing else.

THURSDAY, 17 JUNE, 1875.

Present:—

Dr. ALLEYNE,
E. O. MORIARTY, Esq.,

HON. J. B. WILSON,
W. C. BENNETT, Esq.,

F. BELL, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Mr. Walter Beames, Council Clerk to the Leichhardt Municipality, called in and examined:—

1048. *Chairman.*] You are Council Clerk at Leichhardt, Mr. Beames, I believe? Yes.

1049. We have observed that a report has been drawn up relating to a nuisance in your municipality, which you have probably seen? Yes, I accompanied Mr. Seymour when he made the inspection.

Mr. W. Beames.

1050. What was the object of obtaining that report? It was the wish of the Council that some evidence should be obtained in reference to the nuisance more than that which they had before them.

17 June, 1875.

1051. Does that report correctly describe the state of things existing in the Leichhardt Municipality? It is very mildly stated.

1052. Did the Council contemplate any action upon it? Well, I don't know. The Council are not agreed upon that point; two of the aldermen are keepers of pigs.

1053. Has any action in the matter been proposed? Well some little time ago an offer was made to the Glebe and Balmain Municipalities to join us in appointing an inspector of nuisances for the three municipalities at a good salary, but they declined. They said they had work enough in Balmain alone for two inspectors.

1054. So you have no inspector of nuisances? No.

1055. Is that the only obstacle which prevents you from getting rid of this nuisance? Yes, we have passed a by-law to prohibit persons from feeding pigs on offal within the municipality.

1056. Are the resources of your municipality not capable of supporting an Inspector of nuisances—is that the difficulty? Not exactly. As I stated before, two of the aldermen are interested in the matter, and there is a difference of opinion in the Council as to the necessity of appointing an Inspector of nuisances.

1057. How many aldermen are there altogether? Six.

1058. And two of them do not want an inspector of nuisances? Two of them do not want him.

1059. Do any large proportion of the inhabitants object to this nuisance? Yes, a very large proportion of them; it arises chiefly from the offal being brought from Glebe Island to feed pigs.

1060. What remedy would you suggest for this state of things? I would suggest that the Government should adopt the same system they adopt in America, and dry everything before it leaves the Island.

1061. But I mean for your own protection. Would you suggest that persons should be prohibited from feeding pigs upon offal within a certain distance from Sydney—say ten miles. Would that, do you think, prevent it? Yes, I think so decidedly. The first by-law the Council of Leichhardt passed was to prohibit persons from feeding pigs on offal; but the magistrates refused to convict upon it. They called it a restraint upon free trade, and said it interfered with the liberty of the subject. The difficulty with us arises principally from the difference of opinion in the Council; that is the worst thing we have to contend with. We have a law passed which would remedy the nuisance; in fact the common law of the land, 2 Vict. No. 2, does not allow pigs being kept within 40 yards of any house.

1062. Then, as far as you know, the Municipality of Leichhardt have power to abate this nuisance? I think they have.

1063. That is rather a difficult position, is it not? It is a very sad position to be in to suffer this nuisance and not to remedy it, because we will not. The cesspools too are very bad in our neighbourhood.

1064. We have been considering, with reference to a number of nuisances which exist, more particularly what additional powers we should recommend to be given by Legislative authority to the various municipal authorities. We generally find that they complain of the want of additional powers, but with you the case appears to be quite different; you appear to have ample powers to do what is required? Not unless a law was passed prohibiting the keeping of pigs within a certain distance of the city.

1065. Is it a fact that the stench from these piggeries and boiling-down establishments is a nuisance to other municipalities? Yes, I think so. We have had complaints from the Glebe, and it was on account

of

Mr.
W. Beames.
17 June, 1875.

of that that we made the proposal to have an Inspector of nuisances in conjunction with that municipality and Balmain.

1066. Which they declined? Yes.

1067. Is there any way of proceeding against persons for nuisances of this kind without an Inspector of nuisances? Not by the Council. The Inspector of nuisances must prosecute; but the municipalities Act does not prevent private persons from prosecuting; it only provides that two parties shall join in the prosecution. That has been done in two or three cases where the Council did not prosecute.

1068. And was it done successfully? Yes, one man got three months.

1069. For what? For depositing offal on his land.

1070. Then it appears that those persons who object to the nuisance have the remedy in their own hands? Quite so. I agree with you entirely. But very often they don't like to take the matter up themselves.

1071. If all these abominable places were cleared out from the municipalities by Legislative authority, do you think it would be a popular measure? Yes, I think so. There are only eleven of them in our municipality.

1072. Can you give us any idea of the number of inhabitants in the Leichhardt Municipality? About 700.

1073. *Hon. J. B. Wilson.*] Are many of these 700 inhabitants employed in these eleven establishments? Not many—not more than fifty at the outside I should say.

1074. *Chairman.*] Is there any slaughtering going on in your municipality? No, we are too near the Glebe Abattoir. The Abattoir Act extends to within three miles of the Island. I see the cattle are not coming down so healthy as they used to be; that is a matter that sadly wants attending to.

1075. What becomes of these diseased cattle which are brought down? They are principally taken to the boiling-down establishments or to feed pigs with. Some of them, perhaps, find their way into the Abattoir, but not many I think; there are very good officers there.

1076. Independently of this feeding of pigs with offal, you consider the Abattoir at Glebe Island is a great nuisance? Oh, yes. I live a mile and a half from the Abattoir, and when the wind is from the north-east, and the tide goes out, the stench is abominable. The harbour is saturated on all sides with blood and matter from the Abattoir.

1077. How many pigs are kept in the Municipality of Leichhardt do you know? About 600. It is not so much the number complained of as the filth in which they are kept.

1078. It is a thinly-populated district, is it not? Yes, we have about 1,800 acres of land, and about 700 inhabitants. In fact people don't care to go out and live there.

1079. I suppose that common cesspits attached to privies are in use in your municipality? Yes.

1080. Are they used exclusively? No, not exclusively—we have some earth-closets; and I would suggest that if anything is done these cesspits should be done away with altogether. In a thinly-populated district like ours there is nothing to prevent earth-closets being used, though they would not do for a large town. We have about a dozen families who use them.

1081. With regard to these cesspits, it has been suggested that the municipal authorities should take the management of them, and have them cleaned out at regular intervals, charging the owners or occupiers of the premises with the cost of doing it. Do you approve of that suggestion? Oh yes.

1082. But you would prefer earth-closets? Yes.

1083. Are those earth-closets under any sort of control, as to their being kept in good order? No, they are emptied by the owners or tenants and the contents buried in their gardens.

1084. Would you make that cleaning out compulsory? Yes.

1085. But you would not recommend the use of earth-closets in cities? No; but I think we might compel all owners of houses to have earth-closets, giving those persons who have cesspits now a certain time, say a year, to make the change.

1086. You would then have the whole system under municipal control? We should have, under a new Act; I think we should have more power in these matters. At present we have all the night-soil brought from Balmain and buried in our municipality—that is in the Garryowen estate, where they are making new gardens.

1087. Is that complained of? I have heard one person, one of our aldermen, complain; and I wrote to the Colonial Secretary about it; but it appears that if the stuff is buried 2 feet deep it is not considered a nuisance.

1088. *Mr. Moriarty.*] Is there any other nuisance of an exaggerated character, except those you have mentioned, in your municipality? No, none, except those I have mentioned.

1089. *Hon. J. B. Wilson.*] You stated that you have seen a great number of the cattle taken to the Glebe Island Abattoir;—do you often remark to yourself that those cattle are diseased? Frequently.

1090. Supposing an animal is diseased, although able to walk, are you aware what is done with it. Is it taken to the Abattoir, or is it picked out from the rest before it gets there? Well I only see them taken to the paddocks;—they are not killed there. I only see them travelling on the road, and when they arrive in the paddocks. I can only suppose that they go to the Abattoir.

1091. *Dr. Alleyne.*] You spoke of one of your aldermen complaining of the deposit of matter from earth-closets being deposited on the Garryowen estate;—have you ever seen that place yourself? Yes.

1092. Did you find it offensive? Not at all.

1093. Then I presume you make this complaint in anticipation that similar complaints would be made by other persons? That I cannot say. I have been there at 10 o'clock in the morning, and there has been no effluvia whatever from it, but if you could manage to get rid of it in any other way it would be a great advantage.

NOTE (on revision).—

Municipality of Leichhardt.
18th June, 1875.

Sir,

You will please add to my evidence what I have this day learnt, that there are in this neighbourhood cesspits that have not been emptied for ten years.

I would respectfully suggest to the Commissioners that, for the purpose of ensuring sound meat for consumption, the Inspector of the Abattoirs should be a veterinary surgeon, and that all Municipal Councils should be compelled by law to keep their municipalities free from nuisances. This in my opinion, and from my experience, I think it should be enforced by a heavy fine, not on the funds of the Councils but on the individual aldermen.

To the Secretary, Sewage and Health Board.

I have, &c.,
WALTER BEAMES.

Mr.

Mr. Thomas Playfair called in and examined:—

1094. *Chairman.*] We are anxious to have your evidence, Mr. Playfair, as to what is the opinion among the trade in respect to the slaughtering of smaller animals, such as lambs and calves, and in what localities it should be carried on;—have you any suggestions to make? Well, I have consulted with several persons about it, and their idea is, that certain premises within the city and suburbs should be licensed to kill what we call small goods.

1095. What animals would you include? Only lambs and calves.

1096. How would you propose to dispose of the blood and offal? The blood would go into the sewer, but we should take the offal away in our own carts. We could not let the offal go into the sewer; we should have too much regard for our own families to allow that.

1097. You think there would be no difficulty about the blood? No, that would be washed away in the sewer.

1098. Would there be any difficulty in removing it in carts? Yes, there would, because being in a liquid state it would have to be put into casks or tubs.

1099. Do you think that if your suggestion were adopted, and a proper system carried out, these smaller animals could be slaughtered in the city without any nuisance being created? Yes, I think so, because at present the offal is stowed away in bags anywhere out of sight, and becomes putrid in about twelve hours or less in the summer time, whereas if the killing was licensed it would be carted away at once openly.

1100. At present I believe it is a great nuisance, and it is carried on extensively? No doubt of it, because after they kill, the butchers put the offal away at the back of the house and hide it. All the stench which now causes such a nuisance would be avoided if they were allowed to kill.

1101. Do they slaughter sheep in this way? No; very few I think. We have every accommodation for that at the slaughter-house. It is only calves and lambs; they are things which require to be dressed nicely, and that cannot be done if they are killed at the slaughter-house and sent backwards and forwards in a cart.

1102. Does the Inspector of Nuisances endeavour to put a stop to this practice? Yes; scarcely a week goes by but some one is brought up for it.

1103. But still a great number of lambs and calves are killed in the city? Yes; the butchers prefer taking the risk, because lambs and calves are actually damaged by being killed at the slaughter-house. Beef and mutton are very different; you can hang them up and clean them, but lambs and calves require a great deal more care or else they are not fit for sale.

1104. If I understand you, it is not worth while for the butchers to deal in veal and lamb if they are compelled to kill the animals at the slaughter-house? No, it does not pay them to do so. Even if the skin is left on the calf it gets dirty in the cart, and we are fined for that also.

1105. In fact this kind of tender meat will not bear transportation from the slaughter-house? No, it gets tough and disfigured, whereas if it is dressed in the shop it is clean and nice. In fact, you can always tell by the look of it when a lamb is slaughtered on the premises, and that is generally the way in which it is discovered by the Inspector.

1106. Do you think if certain places were recognized and licensed for slaughtering these animals in the city and suburbs, that this clandestine slaughtering would cease to a great extent? I think so; but if the slaughter-house is too far off, especially in wet weather, it is impossible to make use of it for this purpose.

1107. But if a certain number of places—a reasonable number—within the city were licensed, would not that have the effect? Yes, I think so, but people would like to be licensed to kill on their own premises—that is to say, supposing they had proper drainage and everything clean about the place. It would be much better than at a slaughter-house.

1108. That is to say, you would propose to grant a license to any butcher whose premises were suitable? Yes. There are many persons in the trade who have only sheds and small places where it would not answer, and the slaughter-house would be the best place for such persons.

1109. In those cases the butchers do not generally deal in veal and lamb? Yes, more or less. The mere killing a lamb or a calf does not create a nuisance—at least it should not. It is keeping the offal on the premises for fear of detection until an opportunity occurs of disposing of it.

1110. How is it generally disposed of? Well, I may say that every possible contrivance is adopted. Sometimes it is buried in the garden; at other times it is carried away at night; and I believe sometimes it goes away in the sewer.

1111. Does not it go into the cesspit sometimes? Very likely it does; they do all manner of things to get rid of it without being seen, so as to avoid being fined. It takes me all the forenoon to go to the slaughter-house to kill a couple of lambs or calves, and in summer they have to be killed on Saturday mornings, or they will be bad by the Sunday morning. Then they are knocked about so in the carts that the meat gets quite spoiled, and there is no fresh water at the slaughter-house to wash them down with.

1112. *Dr. Alleyne*] The butchers have plenty of opportunities of slaughtering lambs and calves at the Abattoir, have they not? Yes, there is the regular place there.

1113. There are places for that purpose leased at so much a year, I believe, and there are other places where animals may be taken and slaughtered at so much a-head? Yes, what are called beef and mutton houses.

1114. Still, I presume, they can have lambs or calves slaughtered there without much trouble? Oh, it is not the trouble; but when lambs or calves are slaughtered there, and put warm into the cart, the meat is not fit to eat. Beef and mutton will set when they are hung up, but I dare say you have often noticed the difference in lamb and veal, which require to be got up to look nice and clean.

1115. Can you suggest any way of getting rid of the blood besides letting it go into the sewers? Yes; if you liked you could put it into a tub or cask, and have it taken away in a cart. It could be done. In an hour perhaps, or an hour and a half, it would be congealed and could be carted away like any other matter.

1116. *Chairman.*] Have you any knowledge of the way in which butchering is carried on in large towns in England? In London I have.

1117. What is the practice there? The lambs and calves are all killed in the very heart of the city.

1118. How long ago was your experience obtained? About seventeen years ago.

1119.

Mr.
T. Playfair.
17 June, 1875.

Mr.
T. Playfair.
17 June, 1875.

1119. Have you any experience of the effect produced on fresh meat by travelling on a railway? It has a very bad effect in the summer time. It would not be so bad if it were kept separately. I have often had meat brought down by railway, and I have found that meat killed at the Abattoir would keep twelve hours longer than that brought by railway. It is handled and knocked about too much. First it is lifted into the cart, then into the train, then from the train into the railway-shed, then into a cart again, and then into the shop. It is handled five or six times before it gets into the hands of the consumer, and that is very bad in summer time. In the winter it does not so much signify.

1120. *Hon. J. B. Wilson.*] Was the meat which used to be brought down from Duck Creek hung up in the cars? Yes.

1121. *Dr. Alleyne.*] Do you attribute the injury done to the meat from its striking against the cars? Yes, and to its being handled so frequently. We used to notice that meat killed at the Abattoir would keep twelve hours longer than the meat brought down by railway train.

1122. *Hon. J. B. Wilson.*] How often are the bones removed from a butchering establishment in town? They are removed once a day in the winter, and twice a day in summer in my own establishment.

1123. Would it not be possible, if these establishments were licensed, to fix certain days for slaughtering these animals, so that the municipal officers might come on those days and take away the offal? You could not do that in the summer time, because sometimes we have to kill on Saturday mornings, and sometimes even at night, or the meat would not keep for Sunday.

1124. Would not twice a day be sufficient? Would there be any hardship in not allowing this slaughtering on the premises to be done at other times? It would be very inconvenient sometimes, because we must kill lambs just when we can get a sale for them. We only kill lamb when we have orders for it, because it goes bad the next morning unless it is killed overnight. But in the slaughtering itself, if the butcher is careful, there is no nuisance.

1125. I was asking you about the removal of the offal: If the municipal officers remove it, could there not be some particular hours fixed for removing it so as to prevent its being kept on the premises—say twice a day, morning and evening? Yes, that might be done; it would be better, especially in summer time. I have had meat covered with millions of flies in twenty-four hours time.

1126. At present you remove the bones in your own cart? Yes, that is to say we pay a man to do it. They are taken away twice a day in the summer and once in the winter.

1127. Where are they taken to? To the boiling-down establishments.*

Mr. R. Seymour, Inspector of Nuisances, called in and further examined:—

Mr.
R. Seymour.
17 June, 1875.

1128. *Chairman.*] We wish to take your evidence, Mr. Seymour, as to the slaughtering which is said to take place in the city. A considerable number of the smaller animals are slaughtered we believe? Yes, the greater portion of the smaller animals are slaughtered in the city, that is, the lambs and calves.

1129. There seems to be some difficulty in preventing it? Yes, there is a great difficulty.

1130. What is the difficulty? Well, first there is this difficulty: the butchers in winter time generally slaughter on Thursday night or Friday afternoon, for Saturday, not later, and there are two officers of the Corporation looking after them. But while one man is slaughtering in one place there are hundreds slaughtering elsewhere, in all parts of the city.

1131. What kind of nuisance must you prove in order to convict a man? You must either bring evidence to prove that you have seen a lamb or a calf killed—many Magistrates will take no other evidence; you must actually see it slaughtered, and the blood flowing from it, or you must bring evidence which other Magistrates will accept, that you found the animal lying on the premises after being slaughtered with the skin on and the entrails in. Other Magistrates will not take that as evidence, although it is a distinct proof of slaughtering.

1132. Will any of the Magistrates accept as evidence of slaughtering the finding the offal and blood on the premises? No, they will not.

1133. This makes it exceedingly difficult to obtain a conviction? Of course it becomes exceedingly difficult.

1134. Does much nuisance arise from this practice in the city? Yes; only the nuisance is not from the slaughtering itself,—it is from the offal and refuse being hidden somewhere on the premises, in the cellars, and other places, more especially when the premises are not connected with the public sewer. If they are connected with a sewer of course everything goes into it.

1135. Offal and all? Yes, everything. In the Hay-street sewer you can see the entrails floating down. Then where there is no sewer they go into the closets or cesspits.

1136. You mean into the cesspits, not water-closets? Into the ordinary privies, both the entrails and the blood. In order to trace them we carry a box of matches and some newspaper, which we light and drop down so that we can see everything in the privy. There was one case in particular in Cumberland-street, where the man was in the habit of throwing everything into the privy.

1137. What would you recommend to be done to remedy this evil? My opinion is that the butchers should hold licenses from the Municipal Council for killing small goods on their premises—that is, lambs and calves, for I don't see how we could arrive at any means of preventing them, so long as they are allowed to bring the animals into their places. If there was a law to prevent them from bringing any live animals on to their premises it would be a very easy task to put a stop to the slaughtering, but there is no law. When Dr. Lang was in Parliament he was going to bring in a law to that effect, but it never went before the House. I believe if the butchers had held licenses to slaughter on their own premises, under certain restrictions necessary for the purpose of cleanliness, making them liable to a fine if their premises were not kept clean, a great deal of the evil which now exists would have been removed.

1138. And you think you could prevent slaughtering in unlicensed places. Supposing for instance a butcher said he did not deal in these things? I would not believe him, because there is not a butcher in the city or suburbs who does not.

1139.

NOTE (on revision):—I wish to add, upon consideration, that I think it would be better to license every butcher to kill small goods, as if this privilege is given only to a few, the unlicensed butchers would be likely to create the same nuisance. But I think the licenses should be small, so as to be within the reach of every man, and in this way a considerable revenue would arise.

1139. But are all the butchers' premises suitable for it? Would you give a license to a man who had not the conveniences necessary for it? Well there is a good deal of argument in that, because those whose premises are not connected with a sewer would not be so fit to be licensed.

Mr.
R. Seymour.

1140. I am now referring to the difficulty in obtaining a conviction in cases of slaughtering in unlicensed places. Don't you think if a man were prohibited under a penalty from having live animals on his premises, or if the finding the offal and blood was a sufficient proof, you would then be able to check slaughtering in unlicensed places? Yes.

17 June, 1875.

1141. Now supposing some stringent regulations were passed with a view entirely to prevent slaughtering in the city and it was put a stop to, what would be the effect? I do not believe, to tell you the honest truth, that you will ever stop slaughtering in the city. I know a place in Castlereagh-street where a man slaughtered in his bedroom while we were looking out for him week after week, and trying to catch him.

1142. We are told that it would not be worth while to slaughter lambs and calves in the city if the butchers had to go to the Abattoir to do it;—is that correct? Well, from what I have heard from experienced butchers it is correct, because considering the time it takes them to go to the Abattoir, by the time the calves are dressed the meat turns almost black; that would be a great objection.

1143. From your own knowledge don't you think there is a general prejudice against slaughtering in the city; would not there be a great outcry if it were licensed? I dare say there would be in some cases, but it is carried on in the city of London; you can stand on the pavement and see it going on.

1144. How long is it since you had experience of that? I am only speaking from information I have received, not from my own experience.

1145. *Dr. Alleyne.*] Do you propose then to give every butcher in Sydney a license for slaughtering? For slaughtering small goods, yes.

1146. And you think that just having a license would make people more careful in keeping their places clean? No, but I think they would not care about concealing the offal and refuse on their premises. At present they hide it anywhere they can at the back of their premises; they put it in buckets and either empty it into the privies or send it out somewhere at night. I have taken a bucket from a man's back premises and found entrails with hundreds of maggots all over it. Sometimes they keep the offal for days together before they can find an opportunity of getting rid of it. It has been a common practice to put these things into the gully-shafts. If the men were licensed this would be put a stop to, because a cart would go round at a certain time and remove all the refuse at once. At present they always fancy somebody is watching to pull them up for having it on the premises. The only check against any butcher slaughtering on his premises which you can have is to prohibit him from having any live animals there; but I think it is not desirable to stop it; it is carried on in larger cities than ours.

1147. *Mr. Bennett.*] Do you think it is desirable that this blood should be allowed to go into the sewers? No.

1148. Would not it be better to have a proper receptacle for it? My own opinion is that everything should be carted away in close carts.

1149. *Chairman.*] I suppose sucking pigs would be included with the lambs and calves? Yes, sucking pigs. There is no occasion to kill large pigs on the premises; they are things which will keep whatever distance they come from.

1150. *Hon. J. B. Wilson.*] Should there not be some limit as to the age of the animal killed; would it do to have a penalty for every animal killed over six months old? I think nothing should be killed on the premises except lambs, calves, and sucking pigs.

APPENDIX.

No. 1.

To meet the difficulty of making cheap watertight cesspits in the sandy thickly-peopled suburban districts, the adoption of a modification of the largest sized earthenware drain-pipes is suggested.

Mr. Fowler, at Camperdown, is making a sample of what is proposed, consisting of a flat oval bottom, with rim to receive the oval pipe, 2' 3" × 1' 9", and 2 feet long, with collar at upper end to receive a similar pipe, so that by using three a cess-pit, 6 feet deep, could be obtained with a capacity of about 18 cube feet, the cost of which would only be £3 10s. for a perfectly impermeable pit,—£8 being the estimated cost of the ordinary pits, 4' × 4' × 4', of brick in cement, which seldom are made or remain watertight. A pit, 4 feet deep, would only cost £2 10s.

The disadvantage of these pits would be their want of capacity, the 6 feet pit having only one-third of the capacity of the 4' × 4' pit; but as this would necessitate the frequent removal of the soil, though costing more, it would conduce to health and cleanliness, and ultimately, if the periodical cleaning suggested is adopted, would not cost more than the ordinary pit to clean.

Once put up, these pits would be entirely free from liability to leakage, from cracks or settlement, and well burnt earthenware is the best material to resist corrosion in such situations.

Those pits possess the advantage of being able to be set by an ordinary labourer.

No. 2.

SYDNEY MUNICIPAL COUNCIL.

THE following Progress Report, prepared by the officers of the Corporation, was read at a meeting held yesterday :—

"Town Hall, Sydney, 31 May, 1875.

"Sir,

"In accordance with instructions from the Improvement Committee of the 29th October, 1874, on the motion of Alderman Rowe, 'To examine along the sea-coast as to the places eligible for shooting the night-soil from the rocks into the sea, with probable cost'—'To report as to the advisability of collecting the night-soil at certain wharfs, and conveying the same out to sea in covered barges, with probable cost'—and 'To report as to any other mode of removing night-soil which may be considered preferable or advisable',—

"We have the honor to state that we have examined the coast line between Botany Bay and Port Jackson, and find the most suitable site contiguous to the city, and where the least inconvenience would be felt in discharging faecal matter into the sea, is the headland lying to the north of Maroubra Bay.

"If this method be resorted to, the best route, on account of the steepness of the gradients of that by Randwick, would be by the Bunnerong Road, a distance of about 8 miles from the junction of Bourke and Oxford streets. It would be necessary to repair and metal the existing road to the extent of about 190 chains, and make a new road 47 chains in length from the Long Bay Road to the headland before mentioned, and construct discharging chambers, with pipes leading into the sea.

"To bring this plan into operation we estimate the probable outlay at £5,400.

"The quantity to be removed weekly from the city and suburbs is estimated at 80 loads, or 160 tons; and on account of the long lead, we estimate the cost of removing this quantity at 30s. per ton, or £240 per week.

"To dispose of the faecal matter by conveying it in barges to the sea, we propose to construct a wharf on the west side of the Blackwattle Bay embankment, and provide two barges, each to contain 100 tons, with air-tight compartments and the necessary apparatus for discharging, on the pneumatic principle and without smell, the contents of the carts into the barges, which when towed to sea would be emptied in the same manner as the silt punts now in use.

"The site for the wharf was selected on account of its remoteness from habitation, its central position with regard to and easy approach from the surrounding municipalities.

"The estimated cost of carrying out this scheme is for wharf, barges, &c., £4,700; and the cost of removing 160 tons weekly, including cartage to wharf, towage to sea, attendance, &c., £90 per week.

"We have had under our consideration the question of transmitting by railway; but as no demand for this kind of manure has yet arisen along the line, and as no land has been set apart for utilising it, we are not in a position to recommend the adoption of this method.

"As the system of conveying by barges to the sea would not only require a smaller outlay of capital, but would be very much cheaper in its working, and would most effectually dispose of this offensive and dangerous matter, we unhesitatingly recommend it to the consideration of the Council.

"Whatever system the Council may adopt for the final disposal of faecal matter, we would beg to make the following remarks and suggestions :—

"The method now in use in Sydney and the suburban municipalities of emptying the cesspits of privies by means of manual labour, and the use of shovels, buckets, &c., is so repulsive and revolting, and the stench so intolerable during the operation, and householders have so great a repugnance to the system, that they would rather risk the danger to health from the evolving pestiferous gases, with the chance of also being fined for allowing the nuisance to exist, than have their privies cleaned out under such circumstances.

"This method is now nearly exploded in all civilized communities.

"It cannot be expected that the few men at present engaged in this occupation, with inadequate means, and not knowing how long they would be allowed to continue the present pernicious system, could initiate a better. We, therefore, are of opinion that the Corporation should take the control of the removal of faecal matter into their own hands; and we strongly recommend the pneumatic system of emptying closets, as by this method the removal can be effected with great facility, and without creating a nuisance or very little smell in the locality where the operations are being conducted under this system. The mode of emptying the pits is as follows :—A receiving cylinder, placed on a waggon, is exhausted by means of an air-pump, and when a vacuum is obtained it is only necessary to fasten to a coupling socket on the cylinder one end of a 3-inch hose, and lower the other end into the pit. The moment the valve in the socket is opened the air forces the sewage matter into the cylinder, and by the attendant flushing and washing around the pit with some deodorizing mixture the smell would be effectually kept down, and the pit thoroughly cleansed without offence to anyone. The cost of removal would be very much less than under the present system, and the offensive smell being reduced to a minimum, as a consequence householders would be enabled to have their pits cleaned more frequently, with the concomitant advantages to health.

"We have, &c.,

"THOMAS H. BRADBRIDGE, City Surveyor.

"FRANCIS BELL, City Engineer.

"G. F. DANSEY, City Health Officer.

"RICHARD SEYMOUR, Inspector of Nuisances."

"To the Right Worshipful the Mayor."

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD.

THIRD PROGRESS REPORT

OF THE

BOARD APPOINTED ON THE 12TH APRIL, 1875,

TO INQUIRE INTO AND REPORT AS TO THE BEST MEANS OF DISPOSING OF THE
SEWAGE OF THE CITY OF SYDNEY AND ITS SUBURBS,
AS WELL AS OF PROTECTING THE HEALTH OF THE INHABITANTS THEREOF;

ADOPTED BY THE BOARD ON THE 14TH JULY, 1875.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
19 *July*, 1875.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1875.

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

THIRD PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

1. Much discussion having recently taken place on the dry-earth system, we have thought it desirable to report to you at once the result of our inquiries on this subject.

2. We have taken some evidence, which will be found appended to our former Reports; but the whole matter has we find been so thoroughly tried, considered, and discussed for several years past in Europe and in India, that it seems to us unnecessary to take any further evidence here. Any such evidence could only give us the results of a comparatively limited experience.

3. The dry-earth system, under particular circumstances and under very careful management, may be made efficient in country houses and in public establishments, where the inmates are under control, but it is entirely inapplicable in ordinary cases and in large towns, for the following reasons:—

- (1.) It is practically impossible to secure a proper management. It has been found difficult and in some cases impossible to secure this continuously, even in camps and public institutions; and without proper management an earth-closet, especially if within a house, becomes a filthy and dangerous nuisance.
- (2.) It would be practically impossible to procure for a large town a sufficient supply of thoroughly dried and sifted earth of the proper quality.
- (3.) It would be practically impossible to dispose of the refuse, the quantity being so enormous.
- (4.) Earth-closets do not and cannot produce any important effect in diminishing the contamination of the sewers. No sensible improvement is produced where arrangements are made so that the solid matter only shall be retained in the closet; and this is the real dry-earth system, and the only one we believe that any one, entitled by his knowledge of the subject to publish his opinion, would maintain to be even possible in a large town.
- (5.) If the earth-closets become the receptacles of bedroom slops, even if the less offensive kinds are otherwise disposed of, the quantity of dry earth necessary to render the system efficient on a large scale would be so prodigious as to preclude the possibility of carrying it out.
- (6.) It is now acknowledged, even by those who uphold what are called conservancy systems as opposed to the water-carriage or exclusively sewer system, that the product of the dry-earth closets is of little value as a manure. After the earth has been passed three times through a closet, which is possible under proper arrangements, the earth is estimated to be worth in England only 7s. 6d. a ton. On a large scale it would probably be found impossible to use the earth more than once, and in that case it would acquire no value whatever.

4. In the year 1873 a Committee of the British Association "on the Treatment and Utilization of Sewage" issued their 5th Report, from which we submit some extracts.

5. The Committee consisted of Richard B. Grantham, C.E., F.G.S. (Chairman), F. J. Bramwell, C.E., F.R.S., Professor W. H. Corfield, M.A., M.D. (Oxon.), J. H. Gilbert, Ph.D., F.R.S., F.C.S., W. Hope, V.C., and Professor A. W. Williamson, Ph.D., F.R.S., F.C.S.; and their conclusions have undoubtedly the greatest weight.

Their final conclusions respecting conservancy systems are as follows (p. 413):—

All conservancy plans, including midden-heap and cesspool systems, dry-ash and dry-earth closets pail closets, &c., are quite incompetent as solutions of the general question of the removal of the refuse matters of a population.

Such plans deal with only a small part of the liquid manure; towns which resort to one of them require, therefore, to be sewerred, and the sewage requires to be purified.

The manure produced is in all cases (except in that of simple pails or tubs, where no extraneous materials are added) poor, and will only bear the cost of carriage to a short distance, taking into consideration the cost of collection. That produced by the dry-earth system is, even after the earth has been used four times over, but little better than a good garden-mould. Such plans, moreover, all violate one of the most important of sanitary laws, which is that all refuse matters which are liable to become injurious to health should be removed instantly and be dealt with afterwards. With all these plans it is an obvious advantage on the score of economy to keep the refuse about the premises as long as possible; and the use of deodorants of various sorts, or even of disinfectants, proves that this is the case, and that these systems all depend upon a fallacious principle. They should therefore be discouraged as much as possible, and only resorted to as temporary expedients, or with small populations under exceptional circumstances.

They say also (p. 439),

Dr. Gilbert conducted, on behalf of the Committee, some experiments with Moule's earth system. The result showed that earth which had been used even *three times* in the closet could only be considered to be a rich garden-mould; and the Committee remarked "that such a manure, even if disposed of free of charge, would bear carriage to a very short distance only."

And again (p. 440),

While the Committee considered that any such system was impracticable for large populations, on account of the amount of earth that would be required to be carted in and out daily, they added—"It may readily be admitted that it would be a great advantage, in a sanitary point of view, in the cases of sick rooms, detached houses, or even villages, and that it might be even economical where the earth for preparation and absorption and the land for utilization are in close proximity."

6. The following extracts are from a work on the Treatment and Utilization of Sewage, by W. H. Corfield, M.A., M.B. (Oxon.), Member of the Royal College of Physicians, London, Professor of Hygiene and Public Health at University College, London:—

(p. 62.) The Madras Reports have not been so favourable to the system on the whole; they are very important, as they enter in the minutest manner into practical details. In examining carefully these Madras Reports (1867-8-9), we are at once struck with the great practical difficulty that there appears to have been in carrying out this system, even where so much hand-labour can be got cheaply, and with the conviction of every one who has had anything to do with it, that the system inevitably fails where the most efficient supervision is not continually given to it. We find such statements as the following:—

That wherever large numbers of persons *under control* are congregated, Mr. Moule's system of conservancy has been entirely successful, and that it is, so far, a great public benefit.

As in many stations in India a good system of drainage and water supply are both deficient, Mr. Moule's system of dry earth sewage is the best means available for our barracks, hospitals, jails, and other public institutions. (No. 125, 22nd May, 1867, par. 9, 12.)

Great care and constant attention are required in adapting all the parts of the process to each other: mechanical difficulties have been experienced in the use of hoppers for throwing in the earth; scoops for throwing in the earth after using the latrine are imperfectly applied; native servants have had to be appointed to this duty. (*Report on Sanitary Improvements in India*, 1869, p. 209.)

It is insisted in these Reports that 2½ lbs. of dry earth is the least quantity that can be accepted "as the weight of earth necessary to deodorize and maintain in a state of inoffensiveness the solid and fluid dejecta of a healthy adult, as ordinarily passed into a privy-pan or tub of moderate sectional area;" but this, it must be observed, does not include any urine other than such as is passed during the use of the closet. From Surgeon-Major Ross's experiments it appears that 2¼ lbs. of earth are required for each use of the urinal, and that provision must be allowed for three such uses during the twenty-four hours. The aggregate amount of urine passed being thirty fluid ounces or 1½ lbs. (pounds and pints of urine are, practically speaking, convertible terms), it follows that 36 lbs. of earth are required for each gallon of urine, and this is certainly the least estimate. From this it appears that to deodorize the urine of 1,000 men no less than 1,099 tons of earth would be required per annum. It is scarcely wonderful that "in the urinals the Commission think that the difficulty, owing to the enormous quantity of earth to be brought and removed, 'is practically insuperable;'" and that in their suggestions they state that "pans designed to separate the solid and fluid feculence should be adopted if possible." Dr. Ross estimates the total quantity of earth required to deodorize the whole excreta of an adult at 9½ lbs., of which 3 lbs. will be required in the latrines and 6½ lbs. in the urinals. "This raises the amount required to be supplied for 1,000 men to something like 1,588 tons per annum, while the mixed earth and ordure to be removed will amount to 1,995, or say 2,000 tons! This is undoubtedly an enormous mass of soiled earth to transport to the place of deposit." (*Proc. of San. Commissioner for Madras*, 1868.)

(p. 100.) The quantity of earth required in the case of towns would be too great. With regard to this point Dr. Trench states (*First Report, Rivers Pollution Commission*, 1868, vol. 2, p. 305) that Mr. Bateman has calculated "that for London the amount of soil required will be 2,000,000 cubic yards a year, which would

would necessitate the digging of 200 acres to the depth of six feet, or 400 acres three feet deep, every year. The amount required in Liverpool, calculated on the same ratio for population, would be 400,000 cubic yards, or the digging of forty acres to the depth of six feet, or eighty acres to the depth of three feet." If one of the objections to the pail system be found in the blocking of the streets by the scavengers' carts, this objection must hold with increased force where not only the excremental matters have to be removed, but so enormous a quantity of earth has to be brought into the town and taken out again. Mr. Moule indeed believes that this may be done "*without any increase of traffic in the streets,*" by some underground method. Whether it would be likely to cost less, or even as little, to make underground tunnels communicating with the lowest part of every house in a town, tunnels which to be of any use would have to be sufficiently large to allow the construction of a tramway in them, as to use the existing sewers for the removal of excrement, or even to construct a special set (as proposed by Mr. Menzies) of pipe-sewers for this purpose, and leave the large old sewers for drainage, we leave the reader to judge for himself.

7. When the patentee of the earth-closet is driven so far as to suggest, in answer to obvious practical objections to his system as applied to large towns, that the refuse should be removed by some underground method, it appears scarcely necessary to continue the discussion.

8. We add the following extract (p. 103):—

From the First Report (vol. i. p. 50) of the Rivers' Pollution Commissioners, 1868, who, having remarked on the special service and attention which these closets require, thus conclude:—

Add to these circumstances the enormous aggravation of all the difficulties of the plan, when not 50 but 50,000 households have to be provided with the necessary appliances and induced to work them properly, and we can have no hesitation in pronouncing the dry-earth system, however suitable for institutions, villages, and camps, where personal or official regulations can be enforced, entirely unfitted to the circumstances of large towns.

9. On the 21st May, 1874, Professor Corfield delivered a lecture upon the Sewage question before the Chemical Society of London, in which he confirms the opinions expressed by the Committee of the British Association to which we have referred. In this lecture all conservancy systems, including the dry-earth system, are emphatically condemned. In this condemnation Dr. Frankland and several other persons present, distinguished by their knowledge of the subject, cordially concurred. A report of this lecture and of the subsequent proceedings will be found in *Chemical News*, vol. 29, p. 238. The following is extracted from it:—

Of the conservancy systems, three of the most important varieties were—(1) the employment of tubs or pails with or without disinfectants and deodorizers; (2) ash closets; (3) dry-earth closets. In these the faeces were retained, and it was advocated that they would be extremely valuable as manures, especially from the latter. It was found, however, that the earth, after having been used three times in the dry-earth closets, did not contain more nitrogenous matter than a rich garden-mould, viz., 0.446 per cent., and consequently its value as a manure was so small that it would only pay for carriage to a very short distance. Dr. Voelcker had estimated it to be worth about 7s. 6d. per ton. This arises from the fact that the total amount of nitrogen excreted in the faecal matter is not more than one-fifth that in the urine, the former only containing 1.5 per cent. of nitrogen.

On the same occasion it is reported (p. 239) that—

Dr. Frankland said he had very little to add to what Dr. Corfield had already stated in his very lucid treatment of the subject. He quite agreed with him as to the comparatively small value of the manures obtained by the conservancy systems, and he thought that the proportion of nitrogen in the solid and liquid excremental matter was rather under- than over-stated; he should himself be inclined to say that it was six or seven times as great in the latter as in the former.

10. It appears then, and is indeed we believe generally acknowledged by all who are well acquainted with the subject, that the polluting effects of the liquid refuse of which we are speaking are at least four or five times as great as that of the solid, and that if any perceptible purification of the sewers is to be effected by the introduction of earth-closets, and the nuisances arising from cesspits in crowded places effectually removed, it would be necessary to use enormous quantities of earth such as are mentioned in the Indian Reports from which we have quoted.

11. We will now quote a few passages from the writings of E. C. C. Stanford, F.C.S., who maintains the superiority of some conservancy system, and disputes the conclusions of Professor Corfield and of the Committee of the British Association; but although combating their views, he joins with them in a total condemnation of the dry-earth system. From his letter published in the *Chemical News*, June 12th, 1874, we quote the following (p. 261):—

Prof. Corfield, in speaking of dry conservancy, still refers to earth and ashes as the only deodorants, and unfairly criticises *all* dry systems, because he appears to think these must be based on such clumsy and inefficient substances. Now one of the important advantages of a dry carrier over any wet system is that, whilst the latter necessarily confines us to the use of water, the former affords the chemist a large choice of deodorizers, and of these, as I have repeatedly pointed out, earth and ashes are certainly the worst.

The lecturer has not hit the true reason why the manure from earth-closets is so valueless. I fully agree with Drs. Frankland, Gilbert, and Voelcker, as to the poverty of this manure; numerous analyses

have led me to the same conclusion. A manure after three uses in the earth-closet ought to contain at least five times as much nitrogen as it does. The fact is that, while charcoal, for instance, preserves an organic nitrogenous substance, earth decomposes it.

It appears then that, for general use, the dry-earth system is condemned on all hands.

12. We will in conclusion quote one more passage from Professor Corfield's work, from which it appears that Dr. Parkes, an eminent authority on these matters, considers it doubtful whether earth-closets are safe however efficiently managed (p. 334):—

We know that the poisonous ingredient *par excellence* of coal gas—the carbonic oxide—is perfectly inodorous; we know also that the emanations which produce typhoid fever are not offensive or disagreeable to the smell; and it is a *presumption*, as Dr. Parkes says, to suppose that all danger of their production is removed by mixing the excrement with earth. But even were this presumption to become a demonstrated fact, the greatest objection to the earth system (one which is essential to it because it is a dry system) would still be as strong as ever; viz., that whenever the earth supplied happened to be in too small quantity, too moist, or of bad quality, or the air to be very damp, or the compost wetted through carelessness or otherwise, the danger of infection would at once arise. How frequently one or more of these conditions would be fulfilled need hardly be pointed out.

Miss Nightingale well says, in her remarks on the *Progress Reports* in the Indian Sanitary Report (1870), p. 45: "The true key to sanitary progress in cities is, water supply and sewerage. No city can be purified sufficiently by mere hand-labour in fetching and carrying."

"As civilization has advanced, people have always enlisted natural forces or machinery to supplant hand-labour, as being much less costly and greatly more efficient."

Board Room,
Sydney, 14th July, 1875.

W. B. PELL,
Chairman.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

REPORT

TO THE

SEWAGE AND HEALTH BOARD,

UPON THE

SYDNEY CITY AND SUBURBAN WATER SUPPLY.

BY

A. LIVERSIDGE, F.C.S., F.G.S.,
PROFESSOR OF GEOLOGY AND MINERALOGY, SYDNEY UNIVERSITY.

ORDERED BY THE CHAIRMAN OF THE SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD ON THE 6TH MAY, 1875.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
24 *July*, 1875, A.M.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

TO THE HONORABLE THE COLONIAL SECRETARY.

SIR,

I have the honor, at your request, to lay before you Professor Liversidge's very valuable Report upon the state of the Sydney Water Supply on certain dates, and which was presented to the Sydney and Suburban Sewage and Health Board on the instant.

We have been for some time inquiring into the subject, upon which the accompanying Report throws so much light, but we are not yet able to report finally upon it. We have directed our attention particularly to Busby's Bore and to the Lachlan Swamp, but we are not yet in a position to report definitely as to whether the contamination of the water which undoubtedly existed when Professor Liversidge took his samples, can in any practicable way be prevented, or whether this source of water supply for household purposes will have to be abandoned.

Neither are we able to give any decided opinion as to the causes of the very serious impurities in the Crown-street and Paddington Reservoirs. Why the water in them should be so bad in comparison with what is pumped into them it is very difficult to understand, but we will endeavour to ascertain the reason, and if possible to point out how the evil may be remedied.

It seems perfectly clear, whatever else may be doubtful, that the two Reservoirs should be cleaned and examined with the least possible delay.

I have the honor to be,

Sir,

Your obedient servant,

M. B. PELL,

Chairman.

Board Room, Sydney,
23 July, 1875.

THE SECRETARY OF THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD TO PROFESSOR
LIVERSIDGE.

Sydney City and Suburban Sewage and Health Board,
(Office, Colonial Secretary's Department,
Sydney, 6 May, 1875.

SIR,

I am instructed by the Chairman of the Sydney Sewage and Health Board to request that you will do him the favour to procure samples of the water supplied to Sydney and its suburbs, and to make analysis of the same in the manner and for the purposes herein specified.

A sample of water to be taken from the Botany Reservoir as near as possible to where the water enters the mains which supply Sydney.

A sample from the Crown-street Reservoir and another from the Paddington Reservoir, to be taken from points as near as possible to where the water enters the mains.

A sample to be taken of the water at its entrance into Busby's Bore.

Samples to be taken, twenty to thirty in number, from various points in the mains and pipes supplying Sydney and its suburbs, taking care that a fair number be taken from each of the districts supplied from the above three sources.

It is requested that the samples be taken under your own personal supervision, so that you may be able to testify as to the state of the water in the reservoirs and in the mains and supply pipes on certain days.

It is further requested that the samples taken from any one source, and from the pipes and mains supplied from that source, be taken as nearly simultaneously as may be found practicable.

You are requested to direct your attention, in the first instance, to Busby's Bore, taking samples from pipes supplying houses, and also from the Bore itself, with a view to ascertain whether the water therein is contaminated by soakage.

The object of the inquiry entrusted to you is to ascertain whether the water supplied to Sydney is or is not so contaminated with sewage or other deleterious matter as to endanger the health of the inhabitants, and it is therefore requested that your analyses may be conducted with a view to report to the Board upon this point.

The services of an officer of the City Council to accompany you in taking samples have, with the concurrence of the Mayor, been obtained.

I have, &c.,
CHS. H. BARLEE,
Secretary.

REPORT TO THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD,
UPON THE QUALITY OF THE SYDNEY CITY AND SUBURBAN WATER SUPPLY.

The University,

Sydney, 6 July, 1875.

IN accordance with the request of the Chairman of the Sydney City and Suburban Sewage and Health Board, transmitted to me by letter dated May 6th, 1875, I have personally procured samples of the water supplied to the various parts of Sydney and its suburbs, and have submitted the same to a careful chemical and microscopical examination, and the results of which are embodied in the following Report.

The samples collected from each of the sources, and from the mains supplied by those sources, were collected as simultaneously as possible, and, except where otherwise stated, the last sample obtained was taken not later than three or four hours after the time at which the first of the series was collected.

PRELIMINARY REMARKS.

Before considering the results furnished by the examination of the samples of Sydney water, it will, perhaps, be advisable for me to briefly refer to some of the properties which we may reasonably expect a water suitable for domestic use to present.

It should be colourless, tasteless, and free from smell; but a water may answer to each of these requirements and yet be very unwholesome.

Now, all natural waters are more or less impure, and the impurities are of many kinds—some of which may be visible to the senses, and others not.

When the impurities are present in a form visible to the eye: they may either impart a colour to the water; they may render it turbid or milky; or we may merely see isolated fragments and particles of foreign matter.

Water which has a decided colour is usually very impure and unwholesome, unless the tint be due to the presence of peaty matter, a very minute quantity of which has the power to impart a decided brown tinge to a water; such peaty waters are used in many places without any injurious effects upon the inhabitants; all the water supplied to Sydney has a slight brown shade, probably arising from the presence of a similar vegetable colouring matter, so that the colour of the Sydney water need not cause much concern, and more especially as it can be readily removed by proper filtration. The main objection to a peaty water is that it has not a pleasant appearance.

Apart from colouring matter, that portion of the impurity present in a visible form in a water is merely mixed with it, or as it is termed, it is held in mechanical suspension, and it is to impurity thus held in suspension that the turbidity of many waters are due; finely divided clay is one of the most common substances causing turbidity, but in certain cases it may be due to much more dangerous matter, *e.g.* infusoria, decaying animal, vegetable, and other matters.

This turbidity can usually be very easily removed by allowing the water to remain quiescent for a time so as to permit the foreign matter to deposit itself as a sediment. In all well arranged schemes for a water supply this process takes place more or less completely in the "settling tanks" before the water is passed through the filter beds from which it should issue in a perfectly clear and bright condition.

But the most dangerous impurities present in ordinary waters are certain of those which are present in a form invisible to the eye, *viz.*, those which are dissolved or held in solution in the water.

And just as organic matter mechanically mixed with a water is usually more dangerous than inorganic matter, so also is organic matter held in solution generally far more noxious than inorganic matter existing in the same state.

Amongst the more common inorganic substances, which we usually find in water, are common salt or sodium chloride, calcium carbonate, calcium sulphate, magnesium chloride, magnesium sulphate, silica, &c.; these exist in rather small proportion in Sydney water; as an example of which I cannot do better than cite the analysis given in Dr. Smith's Report to the Water Commission of 1869:—

Sodium chloride	2·863 grains per gallon.
Potassium chloride	·112 "
Magnesium	„	·118 "
„ carbonate	·059 "
„ sulphate	·128 "
Calcium	„	·233 "
Silica...	·222 "
Iron oxide, trace of calcium phosphate, &c.	·082 "

3·817 grains per gallon.

Total solids, 5·2 grains per gallon.

The

The quantity of such salts varies exceedingly in different waters; it is often thought that a water containing but a small proportion of soluble saline matter is more wholesome than one containing a moderately large proportion, like the water from chalk and limestone districts, but it does not appear that this is much more than an idea—that such is actually the case remains to be proved. Lime water is often recommended to supply the deficiency of that base in the Sydney water; but it is very questionable whether it be necessary. The native blacks used no other water, and they had notably sound teeth and bones; neither I believe do people in other countries, who have to use similar waters, find any necessity to make good the lack of lime salts; so that the quality of the Sydney water need not be disparaged on that account. But we do know that an excess of salts is bad, *e.g.* sea water is on this account absolutely undrinkable.

Some few forms of organic substances are comparatively harmless; *e.g.* peaty matter and some other vegetable substances may not do much harm; but the presence of animal matter must always be looked upon with the greatest possible suspicion, on account of the readiness with which it undergoes putrefaction or decomposition. Waters which have been proved to carry death and disease with their use have in nearly all cases been found to contain animal matter, or the decomposition products of animal matter.

Animal matters, and the substances to which they give rise when undergoing decomposition, are usually rich in nitrogen; hence animal matter is commonly spoken of as nitrogenous matter. Now the excess of nitrogen, or the excess of any of its compounds, found in a water over and above that naturally existing in what are *known* to be good and wholesome waters, is regarded as the exponent of the contamination due to animal impurities. And it is on this account that every endeavour is made to determine the amount, and, where possible, the form in which the nitrogen may exist in a water.

The quantity of organic matter which makes the difference between a pure wholesome water and a bad one is extremely minute—so exceedingly small is the amount that ordinary methods of chemical analysis have to be rejected.

Formerly the amount of organic matter was estimated in a very expeditious but at the same time very rough and unsatisfactory way, *viz.*, by evaporating a given volume of the water down to dryness in a weighed platinum dish; the increase in weight gave the amount of total solid impurities. The dish and its contents was then ignited, and any loss which the residue might thereby sustain was put down as representing the organic matter which had been burnt off; but in reality the case is by no means so simple:—

- (a.) For in the first place, if the residue left on evaporation be dried at 100° C., *i.e.*, the boiling point of water, then much of the loss on ignition may be due to the expulsion of water of crystallization from such salts as calcium and magnesium sulphates and chlorides—to the volatilization of ammoniacal salts—to the decomposition of nitrites, nitrates, carbonates, magnesium chloride, and other compounds. Some water residues which are *free* from organic matter undergo much loss on ignition.
- (b.) It is sometimes sought to reduce this discrepancy by drying the residue at 130° C. before weighing, so as to get rid of the water of crystallization; but then this only causes another source of error, for there is a danger of some organic matter being thereby destroyed and lost. Some waters even lose organic matter during the process of mere evaporation over the water bath; hence the amount would be under represented.
- (c.) Neglecting many other considerations which might be adduced there is still the possibility of some of the organic matter becoming combined in such a way that it remains fixed in the residue, and does not figure as organic matter at all.

These errors and sources of errors may seem very trifling; but the amount of organic matter in a water residue is usually so exceedingly small that too careful and minute precautions cannot be taken. The error from any one of the above sources of fallacy may easily be far greater than the total amount of organic matter present.

And moreover even if it were trustworthy as a quantitative method its results are almost without value, since it does not tell us the nature of the organic impurity, which, as I have already stated, is of primary importance. Sometimes the behaviour of the residue during ignition yields useful information—certainly far more valuable inferences can be drawn from it, such as when the blackening is very intense and when deflagration takes place than from actual loss exhibited.

The method which would most probably have been employed in this present case is that known as the “Frankland & Armstrong process,” a most delicate and accurate micro-chemical method of analysis; but as the elaborate and rather costly apparatus required was not to hand, Messrs. Wanklyn & Chapman’s process was substituted—one which while it is but little less exact in certain respects is more convenient in others; and perhaps, taking all things into consideration, for the present investigation the better of the two.

By

By this process we are able to estimate the amount of ammoniacal salts, existing as such in the water; and the nitrogenous organic matter is estimated by the amount of ammonia which it can be made to yield by boiling and distilling it with a strongly alkaline solution of potassium permanganate. The ammonia so obtained is termed "albumenoid ammonia."

From the results of the examination of a very large number of water supplies by this process, Messrs. Wanklyn & Chapman draw the conclusion that a water for domestic purposes may reasonably be required to contain not more than 0.08 milligrammes per litre, or .08 parts of albumenoid ammonia in a million; and if it naturally contain more than this, then endeavours must be made to reduce it by filtration or other treatment.

As instances of fair water, the following may be cited:—

During Summer Months.

Thames water (filtered by Companies) ..	.06 to .08 parts of albumenoid ammonia per 1,000,000.
New River water, London05 to .06½ " " "
Manchester06 to .07 " " "
Edinburgh063 to .075 " " "
Glasgow (Loch Katrin)... ..	.08 " " "

And they think, and not unreasonably, that not more than .03 parts of albumenoid ammonia in the million of water might be insisted upon.

.06 parts in the million of course is 6 parts in one hundred millions; but by this process one part of ammonia can be readily and easily detected in two hundred million parts of water.

Now, for the sake of comparison, and in order that we may know the value of these numbers, let us consider a few samples of water known to be bad.

Parts in 1,000,000 (milligrammes per litre).

	Free ammonia.	Albumenoid ammonia.
River Thames, mid stream, London Bridge, after filtration through filter-paper (18th June, 1867)	1.76	0.35
Thames, London Bridge, high-tide	1.02	0.59
Water from a pump, Edinboro'	0.21	0.29
Well-water No. 1	0.12	0.30
" No. 2	0.18	0.36

The well-waters Nos. 1 and 2 are supposed to have been the cause of two attacks of English cholera.

Now we see, from a consideration of the above, that the quantities of ammonia yielded by different waters are extremely small, and the difference between the abominably filthy and stinking water at London Bridge and the clear wholesome water of the New River is represented by the difference between $\frac{1}{1000000}$ of one part of albumenoid ammonia per million in the one case, and $\frac{1}{1000000}$ of one part of albumenoid ammonia in the other, or $\frac{1}{1000000}$ against $\frac{1}{1000000}$.

Determination of the Chlorine in water.

This also is of great importance, for the presence of an unusual amount very often indicates the presence of sewage contamination.

Presence of Nitrites.

Whenever these are present in any quantity the water is usually totally unfit to drink. Even minute quantities should be looked upon with suspicion.

Method of examination employed.

In all cases the samples were collected in stoppered half-gallon bottles (the kind known as Winchester quarts). Usually two such were taken from each point, so that sufficient of each sample was obtained to satisfactorily perform all the operations in duplicate, without any of the inconveniences entailed by a limited supply, and with, of course, diminished chances of obtaining erroneous results.

Except where mentioned otherwise, the samples were examined with the matter which they contained in suspension; that is, any solid matter which they contained was not allowed to deposit as a sediment, but the matter was well shaken up and thoroughly diffused throughout the water, so that it was examined in just the same state as it is used by the consumer who takes it directly from the tap.

TUNNEL OR BORE WATER.

Sample No. 1.—Lachlan Swamp.

A specimen of the water from the Lachlan Swamps was collected on the morning of May 11th. The specimen was taken at the entrance to the tunnel from between the stonework in front of the lock.

The surface of the water was at the time covered with scum, and had a very dirty and uninviting appearance; as I could perceive no motion in the water, I thought that the lock might perhaps be closed, and as a sample taken under those circumstances would not have been a fair one, I sent for the man in charge of the lock and he informed me that the lock was open, and that water was passing through it into Sydney—the lock being “up two turns,” at which height it would be left until he received further orders; on the previous day it was “up five turns.” I could gather no information from him as to the probable size of the aperture, but from the absence of any perceptible current the amount of water then passing through it must have been very small.

To prevent the access of the scum into the collecting bottles as they were being filled, their mouths were depressed some inches below the surface of the water.

Colour.—When viewed in a large clear colourless glass flask it was seen to have a somewhat cloudy appearance, and to possess a brown tinge and to be slightly turbid.

Smell.—None; but on warming it gave off a slight earthy odour.

Residue left on evaporation to dryness.—Brown in colour, and closely adherent to the platinum dish. On ignition this blackened intensely, and deflagrated slightly; after the whole of the carbonaceous matter had been burnt off the residue was whitish with brown spots.

Total solids	97·00	parts per million or milligrammes per litre.
Loss on ignition	65·00	” ” ”
Fixed residue	32·00	” ” ”
—					
Chlorine	24·00	” ” ”
Free ammonia	·06	” ” ”
Albumenoid ammonia	·20	” ” ”
Nitrites	absent.	” ” ”
Nitrogen existing as nitrates	·62	” ” ”

Microscopical examination of sediment deposited by the water.—It was seen to contain various infusoria, such as diatoms, desmids, amœba, paramœcia, and entomostraca, including cypris, daphnia, and cyclops, which were freely swimming about, together with rotifera.

Sample No. 2.—Francis-street plug.

Taken at this point to ascertain the quality of the water in the Bore—after it had travelled some distance—but before it was in any way connected with closets or even houses.

When the plug was opened a thick pea soup-like fluid made its escape—it was allowed to flow until this had all disappeared, and a sample was then taken.

Colour.—As seen in large clear glass flask, the water had a pale brownish tint, and was somewhat turbid from the presence of small particles of pale brown flocculent matter.

Smell.—Somewhat earthy.

Residue left on evaporation to dryness.—Brown, but white in places. On ignition it blackened intensely, leaving a white residue with brown dendritic shaped patches; these consisted principally of sesquioxide of iron. Evolved white fumes; from the volatilization of certain salts.

Total solids	114·00	parts per 1,000,000.
Loss on ignition	40·00	” ”
Fixed residue	74·00	” ”
—					
Chlorine	23·90	” ”
Free ammonia	·06	” ”
Albumenoid ammonia	·21	” ”
Nitrites	barest trace.	” ”
Nitrogen, existing as nitrates, and nitrites	·22	” ”

Microscopical examination of sediment.—Much brown matter without definite structure—a few small organisms, such as diatoms, paramœcia, &c.

No. 3.—45, Stanley-street.

Taken from a tap in the yard at the back of the house.

Colour.—Fairly clear and bright, but on holding it up to the light a small amount of matter could be seen in suspension; it also had a faint brown tinge.

Smell.—None; but on warming it gave off a slight earthy smell.

Residue.—Whitish, with pale brown patches; blackened much on ignition; gave off white fumes; residue white, with hardly a trace of the brownish patches noticed in Nos. 1 and 2.

Total solids	76 00	
Loss on ignition	38 00	
Fixed residue	38 00	
<i>Chlorine</i>	23 80	a slight decrease on 1 and 2.
<i>Free ammonia</i>	04	
<i>Albumenoid ammonia</i>	20	
<i>Nitrogen, as nitrites and nitrates</i>	44	
<i>Nitrites</i>	traces.	

Microscopical examination of sediment.—Loose cases of dead entomostraca, and apparently the remains of organic matter; without definite structure.

No. 4.—“ Grenfell Hotel,” Woolloomooloo-street.

Taken from a tap in the yard at back of house; a patent closet some 15 to 20 feet off (the distance is given from memory).

Colour, &c.—Water fairly bright, but on holding it up to the light was seen to contain suspended flocc. matter; had a faint tinge of brown.

Smell.—Somewhat earthy.

Residue.—Same as last.

On ignition it blackened much, deflagrated slightly, and gave off white fumes; residue white, with brown patches.

Total solids	72 00	per 1,000,000
Loss on ignition	43 00	
Fixed residue	29 00	
<i>Chlorine</i>	23 70	” ”
<i>Free ammonia</i>	03	” ”
<i>Albumenoid ammonia</i>	26	” ” (Increase on 1, 2, and 3.)
<i>Nitrites</i>	traces.	
<i>Nitrogen, as nitrites and nitrates</i>	35	” ”

Microscopical examination of sediment.—Not materially different from last.

No. 5.—702, George-street, corner of Goulburn-street.

Tap in the yard, closely connected with closet, being placed against the closet wall. The yard is apparently surrounded by several small houses, and a number of closets are here grouped together in a small space.

Colour, &c.—Water rather brighter than the previous specimens, but a slight trace of colour, and only a small quantity of flocculent pale brown matter in suspension.

Smell.—Faint unpleasant smell, hardly perceptible.

Residue, &c.—Had same appearances as last; on ignition it blackened much, gave off white fumes, and left white residue with brown patches.

Total solids	80 00	parts per 1,000,000
Loss on ignition	54 00	” ”
Fixed residue	35 00	” ”
<i>Chlorine</i>	25 4	parts per 1,000,000. This shows an increase of nearly two parts per 1,000,000 over the previous specimens.
<i>Free ammonia</i>	02	
<i>Albumenoid ammonia</i>	26	
<i>Nitrites</i>	Present	in rather large quantity.
<i>Nitrogen, as nitrites and nitrates</i>	1 06	

Microscopical examination of sediment.—Very much the same as the others, except that there were numerous worms present (larval entozoa?) cyclops, diatom frustules, and apparently dead vegetable matter; also small particles of grit.

No. 6.—Fowler-square, Sussex-street.

Taken from the tap in the yard, situated some 6 to 8 feet from a patent closet. Occupants complained of the water being sometimes rusty in the summer months.

Colour, &c.—Water fairly bright, with however a slight amount of turbidity, and tinge of brown.

Smell.—None; faint earthy on warming.

Residue.—Much the same as the other. On ignition blackened very much; deflagrated slightly; left a white residue, with but a very small amount of the before mentioned brown stains.

Total solids	92.00	mgms. per litre or parts per 1,000,000.
Loss on ignition	50.00	" "
Fixed residue	42.00	" "
<i>Chlorine</i>	24.50	" "
<i>Free ammonia</i>00	" "
<i>Albumenoid ammonia</i>18	" "
<i>Nitrites</i>	traces.	" "
<i>Nitrogen as nitrites and nitrates</i>62	" "

Microscopical examination of sediment.—About the same as the Stanley-street deposit.

No. 7.—No. 30, Windmill-street.

Taken from a tap in the yard. Occupants mentioned that sometimes the water was full of "hairs" and rusty.

Colour, &c.—Fairly clear and bright, but on holding it up to the light it was seen to be slightly turbid. Had a very slight brown tinge; perhaps the least coloured of any of the samples of Bore water.

Smell.—None. On warming a faint earthy smell.

Residue.—Same as others. On ignition blackened very much; at a red heat gave off white fumes; left a white residue, with pale yellowish brown patches. Evidently contained less ferruginous matter than any of the others.

Total solids	84.00	mgms. per litre or parts per 1,000,000.
Loss on ignition	44.00	" "
Fixed residue	40.00	" "
<i>Chlorine</i>	24.50	" "
<i>Free ammonia</i>03	" "
<i>Albumenoid ammonia</i>18	" "
<i>Nitrites</i>	traces.	" "
<i>Nitrogen as nitrites and nitrates</i>62	" "

Microscopical examination of sediment.—Much the same as last.

It will be seen that the water tends to become somewhat purer during its passage through the mains; *i.e.*, apart from local contamination. This has been observed also in other towns.

Busby's Bore Supply.—Collected May 11th, 1875.

Parts per 1,000,000 or Milligrammes per litre.

No.	Name.	Total Solids.	Loss.	Fixed Residue.	Chlorine.	Free Ammonia.	Albumenoid Ammonia.	Nitrogen, as Nitrates, &c.	Nitrates.
1	Lachlan Swamp	97.00	65.00	32.00	24.00	.06	.20	.62	Absent.
2	Francis-street (plug)	114.00	40.00	74.00	23.00	.06	.21	.22	Barest trace.
3	Stanley-street	76.00	38.00	38.00	23.50	.04	.20	.44	Trace.
4	Woolloomooloo-street	72.00	43.00	29.00	23.70	.03	.26	.35	"
5	Goulburn-street	89.00	64.00	35.00	25.40	.02	.26	1.06	Present in quantity.
6	Fowler-square	92.00	50.00	42.00	24.50	.00	.18	.62	Absent.
7	Windmill-street	84.00	44.00	40.00	24.50	.03	.18	.62	Traces.

Remarks.

An examination of the above tables will show how little reliance can be placed upon the numerical information yielded by the process of evaporation to dryness and subsequent ignition of the water residue. Had those results only been obtainable, the Lachlan Swamp sample would have appeared as the worst of the series, whereas sample No. 5, from Goulburn-street, although it showed less loss on ignition, was in reality far more impure, containing as it did a larger proportion of chlorine, albumenoid ammonia, and nitrates, and moreover nitrites were present in quantity—all of which strongly indicate contamination by sewage matter. The presence of the nitrites alone would have been sufficient to condemn the sample.

The

The water pipes were here evidently in direct communication with a closet or some other source of animal impurity. The increase in the chlorine of Nos. 6 and 7, and of the albumenoid ammonia in No. 4, also indicate contamination.

On taking the results furnished by the seven samples into consideration, the quality of the supply from the Lachlan Swamp and Busby's Bore cannot be considered satisfactory; throughout, the water yields nearly three times as much albumenoid ammonia as a fair average water should, and contains twice as much as the Botany water; this is probably caused by the drainage of sewage into the Lachlan Swamp Reserves and also into the Bore.

Owing to the low pressure of the water supply from this source, I do not think that local contamination from closets takes place to so great an extent as it does in the other services.

By means of a proper system of filtration the quality of this water might be brought up to the requisite standard of purity. In its present state, although examined at the most favourable time of the year, it cannot, as I have before said, be regarded as a good wholesome water, and unless it be properly and effectually purified, its use for domestic supply should be discarded as soon as possible.

LOW LEVEL SUPPLY.

As in the case of the Bore water, samples were taken from various points in the area supplied by this service, and, for the sake of comparison, water was also collected at the Botany Water Works on the morning of the same day.

Seven samples of the water from this service were taken on the 26th May last, and four others subsequently.

Sample No. 8.—Botany Water Works.

This sample was taken on the morning of May 26th, at little before noon, and was drawn from a tap connected with the 30-inch main, and distant some 6 yards from the air vessels. The sample of water from this tap should represent that which is pumped out into the service mains before it has had any opportunity whatever to pick up foreign matter, as it is the first outlet of any kind from the mains after the water is pumped up.

Colour, &c.—Possessed a pale brownish tinge, fairly bright, but a small amount of very finely divided matter could be seen held in suspension.

Smell.—None; slight earthy odour when warmed.

Residue left on evaporation.—White, with brownish patches, which on ignition, blackened, deflagrated somewhat, and burnt white.

Total solids...	124.00	parts per 100,000 or milligrammes per litre.
Loss on ignition	40.00	" "
Fixed residue	84.00	" "
—				
Chlorine	26.40	" "
Free ammonia03	
Albumenoid Ammonia10	
Nitrites	absent	
Nitrogen as nitrates13	

Microscopical examination of sediment.—It was found to contain minute animal and vegetable infusoria, such as we might expect in water from an open reservoir—nothing calling for special comment.

Sample No. 9.—Crown-street Reservoir.

Sample collected at about 11.20, May 26th, from inside reservoir, at a spot as close to the outlet main as possible, and from a few inches below the surface of the water, so as to avoid the scum floating on it. This scum gave a dirty and unpleasant appearance to the water. The air inside the reservoir had a dank and earthy smell.

I was informed by the turncock in charge that the water was running out at the time, pumping into this reservoir having ceased at 6 a.m., in order that the Paddington reservoir might be supplied.

The reservoir was at the time full to within a few inches of the coping stone of the causeway.

Colour, &c.—Of a very faint brown tinge, fairly bright in appearance, but on holding it up to the light in a clear glass flask it was seen to hold a small quantity of brown flocculent matter in suspension, and in a larger proportion than the specimen from the Botany Water Works, taken shortly afterwards.

For convenience the Botany Water Works specimen was obtained after this one.

Smell.—None, but on warming, a faint earthy odour.

Residue

Residue left on evaporation to dryness.—White, with a somewhat crystalline appearance in places. On ignition it blackened, gave off white fumes, and left a white, somewhat incoherent, residue.

Total solids	124.00	parts per million.
Loss on ignition	44.00	"
Fixed residue	80.00	"
<i>Chlorine</i>	28.00	"
<i>Free ammonia</i>10	"
<i>Albumenoid ammonia</i>40	"
<i>Nitrites</i>	Traces	"
<i>Nitrogen as nitrites and nitrates</i>18	"

Microscopical, &c., contained the loose cases of dead entomostraca, dead vegetable matter, vegetable fibre, &c., diatoms, such as *D. triceratium*, *D. vulgaris*, and others.

The amount of albumenoid ammonia yielded by this specimen is unusually high, about five times as much as a good ordinary drinking water should contain; it will also be seen that it contains three parts per million of chlorine in excess of the amount contained by the other low level specimens collected on this day.

Sample No. 10.

On account of the extraordinary amount of impurities in the above, fresh samples were taken from this reservoir at 10.30 a.m. on Friday, 19th June. On this occasion the reservoir was very full, the water rising about 6 inches over the top of the causeway. I was informed that pumping had ceased at 4 a.m. that morning. This sample presented much the same characteristics as the former one. It was considered unnecessary to determine the solid matter, &c., but the amounts of the more important constituents, *i.e.*, the ammonia compounds, and chlorine were estimated.

<i>Free ammonia</i>15	parts per million.
<i>Albumenoid ammonia</i>22	"
<i>Chlorine</i>	23.70	"
<i>Nitrites</i>	traces.	"

Sample No. 11.

A sample of the bottom water, or rather of the sediment, was also obtained on the same occasion, by means of a can attached to a string, the can having a square mouth, around which it was heavily weighted with lead, so that it should scrape the bottom. This arrangement answered fairly well, for it brought up a great deal of the foul sediment from the bottom, the accumulation of which in the reservoir is, I am informed, very great and very rapid.

Under the microscope this was seen to consist mainly of a brown flocculent matter, containing large numbers of infusorial animalcula and confervæ, together with a little sand. Amongst others there were *rotifers*, *amœba*, *paramœcium*, various *entomostraca*, such as *daphnia*, *cypris*, *cyclops*, &c.; also large numbers of small ciliated and non-ciliated colourless worms, a small *acarus* and encysted forms of some unknown infusoria.

Also diatoms and a minute kind of fungoid growth, somewhat like penicillum interlacing the dead matter. For the most part the organisms were dead or dying, but the worms, paramœcia, were very lively.

Sample No. 12—24, Burton-street.

In order to ascertain the quality of the water after leaving the reservoir and before the mains had been connected with many houses, a sample was collected on the same day, 19th June, within two hours time, and as near as possible to the reservoir, *viz.*, at 24, Burton-street, corner of Oxford-street.

Colour, &c.—The water had a pale brownish tinge and slight turbidity, and contained,—

<i>Free ammonia</i>06	parts per million or mgms. per litre.
<i>Albumenoid ammonia</i>10	" "
<i>Chlorine</i>	21.50	" "
<i>Nitrites</i>	traces.	" "

Here we see that a wonderful improvement has taken place in the water after having travelled only the above comparatively short distance. It has lost 2.2 parts of chlorine, 12 parts of albumenoid ammonia, and 9 parts of free ammonia.

Sample No. 13.—Botany Road.—May 26th.

Taken from a tap in an entry or passage opposite to Hudson Bros. factory; could see no number to house.

Colour,

Colour, &c.—Water brighter and less coloured than Nos. 1 and 2 ; also less matter held in suspension.

Smell.—None ; on warming it had a faint earthy smell.

Residue left on evaporation.—Was white with a few brown stains. On ignition it blackened much but did not deflagrate ; gave off white fumes ; left white residue free from brown patches.

Total solids	76.00	parts per million.
Loss on ignition	36.00	"
Fixed residue	40.00	"
<hr/>					
Chlorine	25.00	"
Free ammonia01	"
Albumenoid ammonia11	"
Nitrites	traces	"
Nitrogen existing as nitrites and nitrates35	"

Microscopical examination of sediment.—Same general characteristics as others, but much less in

Sample No. 14.—198, Castlereagh-street.

From a tap in the yard at back of house—pipe connected with a closet some 5 or 6 feet distant.

Colour, &c.—Water just about the same as the last.

Smell.— Do. do.

Residue left on evaporation.—White with brown stains ; on ignition blackened much, and gave off white fumes ; left white residue free from brown stains.

Total solids	124.00	parts per million.
Loss on ignition	84.00	"
Fixed residue	40.00	"
<hr/>					
Chlorine	25.00	"
Free ammonia01	"
Albumenoid ammonia17	"
Nitrites	none	"
Nitrogen existing as nitrates18	"

This specimen of water is rather an unusual one in this series ; for, although containing an exceedingly high proportion of matter lost on ignition, it yet contains but a small proportion of nitrogenous compounds.

Microscopical examination of sediment.—Presented only the general characters—small in amount.

Sample No. 15.—149, Pitt-street.

From tap in yard ; the pipe not connected with the closets.

Colour, &c.—In common with all the low level waters examined it had a brownish tinge. More turbid than Nos. 5 and 6.

Smell.—A very faint earthy smell ; increased somewhat by warming.

Residue left on evaporation.—White, with stains and patches of a brown colour ; on ignition blackened much and left a white residue, with dense patches of brown, mainly consisting of sesquioxide of iron.

Total solids	80.00	parts per million.
Loss on ignition	40.00	"
Fixed residue	40.00	"
<hr/>					
Chlorine	25.00	"
Free ammonia01	"
Albumenoid ammonia10	"
Nitrites	none	"
Nitrogen existing as nitrates09	"

This is the purest of all the Low Level samples examined.

Microscopical examination of sediment.—Principally consisted of brown structureless matter, which probably consists, in part, of ferric hydrate from the pipes, and decomposed vegetable matter ; some diatom frustules were observed, grit and similar substances.

Sample No. 16.—Drinking Fountain, Castlereagh-street, Circular Quay.

Colour, &c.—The clearest and brightest of all ; but still it possessed a slight turbidity and tinge of brown.

Smell.—None ; faint earthy, on warming.

Residue

Residue left on evaporation.—White, with faint brown stains in parts. On ignition, blackened; gave off fumes and left white residue.

Total solids...	76·00 parts per million.
Loss on ignition	34·00 "
Fixed residue	42·00 "
<i>Chlorine</i>	25·10 "
<i>Free ammonia</i>	·015 "
<i>Albumenoid ammonia</i>	·10 "
<i>Nitrites</i>	traces, but largest quantity in this series.
<i>Nitrogen existing as nitrites and nitrates</i>	·13

Microscopical examination of sediment.—Same as last.

Sample No. 17.—54, *Bridge-street*, from tap in a bath-room; closet supplied from a cistern.

Colour, &c.—Same as that from drinking fountain.

Smell.—None.

Residue left on evaporation.—White, with a brown tinge in parts. On ignition, blackened much, deflagrated slightly in several places; gave off white fumes; residue white, free from brown stains.

Total solids...	120·00 parts per million.
Loss on ignition	42·00 "
Fixed residue	78·00 "
<i>Chlorine</i>	25·10 "
<i>Free ammonia</i>	·015 "
<i>Albumenoid ammonia</i>	·14 "
<i>Nitrites</i>	barest trace.
<i>Nitrogen existing as nitrites and nitrates</i>	·13

Microscopical examination of sediment.—Same as last.

ADDITIONAL SAMPLES.

Sample No. 18.—54, *Bridge-street*; collected, April 30th.

This sample was obtained before I had been communicated with by the Chairman of the Commission. It serves to show that the quality of the water is sometimes much worse than at others.

Colour, &c.—Of rather a dark brown; contained an exceedingly large amount of matter in suspension, which, on standing, was deposited as a very thick dark brown sediment.

Smell.—None, but gave off a slight disagreeable odour when warmed and treated with caustic potash.

Residue left on evaporation.—Of a full brown colour; loose in structure. On ignition, blackened intensely; deflagrated a good deal; residue friable in parts; in colour brown, due to presence of sesquioxide of iron.

Total solids...	250·00 parts per million.
Loss on ignition	100·00 "
Fixed residue	150·00 "
<i>Chlorine</i>	30·50 "
<i>Free ammonia</i>	·015 "
<i>Albumenoid ammonia</i>	1·22 "
<i>Nitrites</i>	Present in large amount.
<i>Nitrogen existing as nitrites and nitrates</i>	·71 parts per million.

Microscopical examination of the sediment.—There were not many remains of organisms present. The sediment consisted principally of a dark brown structureless flocculent looking substance, and mixed with it were a few diatom frustules, cases of entomostraca, and living paramæcia.

The almost total absence of life and the small quantity of free ammonia present in this sample of extremely impure water is probably due to its having been kept for so long a period prior to examination, *i.e.*, from April 30th to June 10th.

Sample No. 19.—No. 141, *York-street*.

Sample collected May 31st, taken from a tap in the yard. In this case the closet was situated some distance from the tap, being at the other end of the yard and about 50 ft. distant, but at a higher level. It was found that when the tap was turned on that the flow of water into the closet-pan ceased; hence if the pan were full and the closet tap open or leaky, on regurgitation taking place in the pipe the soil must necessarily

necessarily be drawn up into it and pass into the domestic supply pipes. The analysis of the sample taken on this occasion *proves* that such is actually the case, for it will be seen that faecal matter was present.

I may mention that just before this sample was drawn the water had been momentarily turned off at the main.

Colour, &c.—Comparatively bright after standing; had a brownish tinge, and deposited much sediment of a brown colour.

Smell.—That of sewage, not very strong at first, but after being kept for a few days it became intolerable.

Residue left on evaporation to dryness.—Of a brown colour and possessing a foul faecal smell.

On ignition it blackened intensely, and gave off strong nitrogenous (*i.e.*, like burnt hairs) and urinous smell; deflagrated very much; finally becoming almost white with grayish patches. These represented the former solid particles floating in the fluid.

Total solids	120.00	parts per million.
Loss on ignition	60.00	" "
Fixed residue	60.00	" "
<i>Chlorine</i>	26.00	" "
<i>Free ammonia</i>33	" "
<i>Albumenoid ammonia</i>	1.48	" "
<i>Nitrites</i>	Present.	" "
<i>Nitrogen existing as nitrites and nitrates</i>35	" "

Microscopical examination of sediment.—Contained much brown structureless matter; also the undigested remains of meat fibrillæ, together with both spiral and scalariform vegetable fibres and what appeared to be the empty cases of large starch (probably potato starch) granules. It was teeming with life; the paramæcium and small wormlike forms (larval entozoa?) being particularly abundant.

Low-level Supply.—Collected May 26th, 1875.

Parts per 1,000,000 or Milligrammes per litre.

Concluding Remarks.

The quality of the supply from Botany is on the whole very good, and if it were properly filtered before being pumped into the mains it would satisfy the requirements of even the most fastidious. The water as delivered is somewhat discoloured and turbid, and contains various animal and vegetable organisms; now the majority of these are probably harmless, but some may have a pernicious effect upon the consumer, so that every effort should be made to keep them out of the water supply; neither should the matters washed into the watershed by storm waters be allowed to pass unarrested into the mains. Certain diseases breaking out amongst the residents upon the watershed might readily, in the present absence of proper filtration, be the cause of a serious epidemic throughout nearly the whole of Sydney.

The water, however, in the Crown-street Reservoir was strangely and unaccountably bad, and I think that no time should be lost in having it effectually cleaned out and carefully examined; it may, perchance, be caused by the soakage of sewage matter into it; both the excess of free and of albumenoid ammonia and the presence of nitrites point to this.

There

There is an extraordinary increase in the amount of nitrates present in the sample from Botany Road, strangely unaccompanied by an increase in the other impurities.

Both No. 16 (Drinking Fountain) and No. 17 (Bridge-street) show the presence of nitrites, and a slight increase in the quantity of chlorine, and the latter a larger amount of albumenoid ammonia; and as neither of the pipes from which they were drawn were directly connected with closets, they show how the impurities are disseminated through the water in the mains. It is true the quantities of impurity were but small; but then they had probably been greatly diluted by diffusion through a large body of water.

The York-street sample was the only one from the low level supply in which actual fecal matter was detected.

HIGH-LEVEL SUPPLY.

The samples were all collected on the morning of Monday, May 31st, with the exception of two collected on Friday, June 19th.

For the sake of comparison a specimen, to serve as a standard, was again taken from the Botany Water Works.

Sample No. 20.—Botany Water Works.

Sample taken from the tap, previously mentioned under the Low Level supply.

Colour, &c.—Fairly bright, but seen to contain matter in suspension when held up to the light; but faintly tinged with brown, as before.

Smell.—None; very slight earthy odour when warmed.

Residue left on evaporation to dryness.—Was of a brownish colour, and in the form of a thin closely adherent film; on ignition, this blackened considerably; did not deflagrate; gave off copious white fumes, and left a white residue without any trace of brown matter.

Total solids	76.00	parts per 1,000,000
Loss on ignition	40.00	„ „
Fixed residue	36.00	„ „
<i>Chlorine</i>	23.00	„ „
<i>Free ammonia</i>02	
<i>Albumenoid ammonia</i>11	
<i>Nitrites</i>	absent.	
<i>Nitrogen as nitrites</i>13	

Microscopical examination of sediment.—Presented same characteristics as previous sample.

Sample No. 21.—Paddington Reservoir.

One main I was informed serves both as outlet and inlet pipe to this reservoir. It is allowed to run dry every night, usually being empty at about 12 p.m. At the time this sample was collected the reservoir contained about 5 feet 8 inches of water.

Colour, &c., much the same as the last, but rather more turbid.

Residue left on evaporation to dryness.—Was of a brownish colour; on ignition blackened very much; it also deflagrated very much, leaving a white residue, having a few brownish patches.

Total solids	100.00	parts per 1,000,000
Loss on ignition	40.00	„ „
Fixed residue	60.00	„ „
<i>Chlorine</i>	23.50	
<i>Free ammonia</i>05	
<i>Albumenoid ammonia</i>15	
<i>Nitrites</i>	absent.	
<i>Nitrogen existing as nitrates</i>13	

Microscopical examination of sediment.—Brown flocculent matter; diatoms of several species, &c.

Sample No. 22.—Paddington Reservoir.

Two additional samples were taken from this reservoir on Friday, June 19th, at 10.45 a.m.—one from near the surface, and the other from as near the bottom as possible, which was obtained by means of the weighted can, as mentioned under the Crown-street reservoir water.

Surface

Surface water.—Tolerably clear, but slightly turbid from the presence of floating particles, and possessing the usual brownish tint of Botany water. There was 7 feet of water in the reservoir at the time the sample was taken.

Free ammonia	05	parts per million.
Albumenoid ammonia	22	" "
Chlorine	25.50	" "
Nitrites		traces.

Sample No. 23.—Lower water.

The can brought up a very large quantity of black more or less slimy matter. As it would have been perfectly useless to submit this to analysis, the sample was allowed to stand until the upper portion had become tolerably clear; this was decanted and examined.

This water had an exceedingly bad smell, similar to that given off by the decomposing slime and vegetable matter brought up from the bottom of a stagnant pond—a smell much more powerful than that given off by the waters containing sewage matter, but probably not at all so noxious.

Free ammonia	30	parts per million.
Albumenoid ammonia	52	" "
Chlorine	31.00	" "
Nitrites		Present in large quantity.

Microscopical examination of the sediment.—The principal portion of this consisted of dark brown and black structureless matter, probably of organic origin, mixed with grains of sand. In common with the deposit from the Crown-street reservoir, much of the sediment had a more or less rough cylindrical form, as if it had passed through the intestines of some small creature.

Amongst the living forms present were many small worms (larval entozoa?) paramœcia, amœba, diatoms, and others—just such as we should expect to find in the stinking mud from some foul ditch.

The character of this sediment shows that the reservoir is not entirely emptied in all parts every night, otherwise the deposit would not be of so offensive a nature.

No. 24—19, Botany-street.

From a tap in the yard, situated some 10 or 12 feet from the closet.

I was informed by the occupier of the house that the water was at times very bad, full of brown floating matter.

Colour, &c.—Of a brown tinge; contained a good deal of matter in suspension; some of it in the form of rather large brown particles.

Smell.—None; on warming a hardly perceptible sewage smell was given off.

Residue left on evaporation to dryness.—The main portion was of a brown colour, with darker patches; on ignition blackened intensely, deflagrated and gave off a very strong nitrogenous odour, or the smell of burning hairs, and left a gray residue.

Total solids	100.00	parts per million.
Loss on ignition	44.00	" "
Fixed residue	56.00	" "
Chlorine	23.90	" "
Free ammonia02	" "
Albumenoid ammonia30	" "
Nitrites		absent.
Nitrogen as nitrates18	" "

Microscopical examination of sediment.—This was seen to consist mainly of a brown substance devoid of structure, but mixed with it were other substances which showed that it was undoubtedly faecal matter; amongst such, the remains of partly digested food, were portions of muscular fibres and vegetable tissues, such as spiral and scalariform fibres, together with bodies which have the appearance of empty starch granules, probably potato starch from their large size. And in addition were the common living forms, paramœcia, &c., and the frustules of diatoms.

Some portion of the brown matter in this and in other cases consists merely of rust from the pipes, but under the microscope the differences between the two are perfectly distinguishable.

No. 25.—No. 13, Roslyn-street.

Taken from tap in the yard; closet about 7 or 8 feet distant. The occupant of the house had often noticed the water to be discoloured and full of brown stuff in the summer.

Colour, &c.—But very faintly tinged brown, and but very slightly turbid.

Smell.—None. On warming, the usual faint earthy smell of all the Sydney water.

Residue left on evaporation to dryness.—White, with slightly brown patches. On ignition, blackened; deflagrated slightly; gave off white fumes; residue white.

Total solids...	76·00 parts per million.
Loss on ignition	40·00 "
Fixed residue	36·00 "
<hr/>			
Chlorine	23·20 "
Free ammonia	·02 "
Albumenoid ammonia	·12 "
Nitrites	absent.
Nitrogen existing as nitrates	·13 "

No. 26.—222, Duke-street, off William-street.

From a tap within 2 or 3 feet of the closet.

In order to test the statement I had heard, that the contents of the closet-pans were liable to be sucked back into the water pipes on shutting the water off at the main, I had the lock of the main in William-street closed that I might watch the effect. Immediately that the water was shut off violent suction of air took place through the open tap leading to the closet, and on filling the pan up with water that also was drawn in. The water was at once turned on again at the main, and after allowing it to run to waste for a time a sample was taken.

Colour, &c.—After allowing the matter in suspension to subside, this in a few days became one of the brightest and clearest waters examined.

Smell.—Faint sewage smell. On warming very decided. After this sample had been kept some time the smell was extremely bad.

Residue left on evaporation to dryness.—Of a brown colour, with very dark patches. On ignition, blackened intensely; gave very strong nitrogenous smell; deflagrated; the whole of the carbonaceous matter was difficult to consume; left a loose grey ash.

Total solids	132 parts per million.
Loss on ignition	·80 "
Fixed residue	·52 "
<hr/>			
Chlorine	29·00 "
Free ammonia	·20 "
Albumenoid ammonia...	1·32 "
Nitrites	rather abundant.
Nitrogen existing as nitrites and nitrates	·40 "

Microscopical examination of sediment.—Possessing the same characteristics as the 19, Botany-street sample, only that the faecal matter was present in much larger quantity.

The faecal matter had a flaky structure, such as might be given to it by the passage of water over it when adherent to the inside of a pipe; and it is most probable that the whole of this matter contained in the sample of water examined was detached from the interior of the pipe leading into the closet by the backward flow.

No. 27.—Drinking Fountain in front of Fort-street School.

Colour, &c.—Fairly bright, and with only the faintest tinge of brown.

Smell.—None; faint earthy on warming.

Residue left on evaporation to dryness.—Almost entirely white. On ignition, blackened; gave off white fumes, and left white residue.

Total solids	80·00 parts per million.
Loss on ignition	40·00 "
Fixed residue	40·00 "
<hr/>			
Chlorine	23·10 "
Free ammonia	·02 "
Albumenoid ammonia	·13 "
Nitrites	absent.
Nitrogen existing as nitrates	·09 "

No. 28.—101, *Princes-street.*

From tap in the yard close to the house; closet some distance off, at the other end of the yard. Tap at a lower level than the closet, and when both were turned on the water ceased to run in the closet.

Colour, &c.—Bright, and almost free from the faintest tinge, but contained large masses of brown flocculent and other matter—evidently faecal, together with human hairs.

Smell.—At first faint smell, but after having been kept some days it became extremely bad.

Residue left on evaporation to dryness.—Consisted principally of faecal matter; the smell exceedingly strong. On ignition blackened exceedingly, and deflagrated very much, giving off a very strong nitrogenous odour, the carbonaceous matter burning off with difficulty. The residue left was greyish white.

Total solids	140·00	parts per million.
Loss on ignition	80·00	"
Fixed residuc	60·00	"
<i>Chlorine</i>	24·00	"
<i>Free ammonia</i>	·18	"
<i>Albumenoid ammonia</i>	·70	"
<i>Nitrites</i>	present.	
<i>Nitrogen as nitrites and nitrates</i>	·27	"

Microscopical examination of sediment.—Of the same general character as that met with in Duke-street and Botany-street; but in addition to the remains of partially digested food, human hairs were present with the faeces.

No. 29.—26, *Princes-street, at the far end of the street.*

Taken from a tap in the yard. Pipe not connected with closet, a cesspit being used.

Colour, &c.—Virtually colourless, bright; but a slight turbidity could be seen on holding the water up to the light, but less than that of the Botany Waterworks sample.

Smell.—None. On warming, the usual slight earthy smell.

Residue left on evaporation to dryness.—White, with small patches of faint brown. On ignition, blackened; gave off white fumes, and left a white residue.

Total solids	80·00	parts per million.
Loss on ignition	44·00	"
Fixed residue	36·00	"
<i>Chlorine</i>	23·00	"
<i>Free ammonia</i>	·03	"
<i>Albumenoid ammonia</i>	·11	"
<i>Nitrites</i>	absent.	
<i>Nitrogen existing as nitrates</i>	·18	"

Remarks.

Remarks.

The remarks made upon the necessity for properly filtering the water before delivery to the consumers, under the head of the Low Level supply, apply equally of course to this service.

It will be seen that the Paddington Reservoir water is also less pure than the Botany water, but it is not so bad as the Crown-street Reservoir sample; still it requires immediate attention. The necessity for cleaning it out is shown by the filthy state of the bottom water as brought up on June 19th.

It will be seen also that out of six samples taken, on the morning of May 31st, from different parts of the City supplied by this service, three were most grossly contaminated with faecal matter.

The very large amount of faecal matter is due to the high pressure of this service combined with the practice of nightly allowing the reservoir to run empty. In similar cases at Home, at Lewes and Hull, they have sought to remedy the matter by making the supply constant; but the cases at 101, Princes-street, and at 141, York-street, show that this would by no means be sufficient; the closets must not on any account communicate directly with the water pipes.

It will be noticed that two of the samples were taken from points very close together, viz.:—No. 27, from the drinking fountain in Princes-street, and No. 28, from a house in the same street. It arose in the following way:—No. 28 was collected, next No. 29, from the far end of the street, and as I wanted a sample direct from the main I had to take it from the fountain, the only direct outlet I could see in this neighbourhood.

It must be borne in mind that the above investigation cannot be regarded as an exhaustive one; the results of the examination of the samples only show the state of the water at a few scattered points during the few moments actually occupied in filling the bottles, and although the results are sufficiently alarming, they might have been even more startling. In some of the cases where the water was pretty fair the next lot drawn off might have been of the worst possible character; and where bad samples were obtained there is also the possibility, on the other hand, that fair ones might have been obtained.

The results, however, are quite sufficient to show that a most gross contamination does take place, and this too in numerous localities.

It must also be borne in mind that the examination was made at the most favourable time of the year—when the water supply is most abundant and when the mains undergo less disturbance—for I understand that it is no uncommon thing during the summer months for all the services to be more or less intermittent.

One or two questions of a scientific nature have arisen out of this examination—such as the alteration in quality which the water undergoes during its passage through the mains, and the nature of the deposit which takes place in them. These questions are not new—they have been previously observed elsewhere; but they are well worthy of further investigation, and I hope to be able to take them up at some future date.

I may mention, that while examining the above samples I was three times attacked by sore throat, a complaint to which I am not at all subject, and two of the attacks came on within fifteen or twenty minutes after inhaling the gases given off by the samples numbered 19 and 26. The attacks were separated by an interval of two days, and in each case I managed to remove the ill effects within two or three hours' time by inhaling large quantities of sulphurous acid gas, as given off from a capsule of burning sulphur. As I happened to have a chlorine gas generator at work at the time I occasionally inhaled a little of that gas in a diluted form.

The first attack was also probably due to the same cause; but I could not trace the connection so distinctly. But it is only right to state that the samples had then been kept for a week or ten days. Water containing *fresh healthy* faecal matter would probably have no such effect.

By the courtesy and permission of the Mayor, when collecting the samples I was accompanied by Mr. Robertson, the inspector for waste water, who drew the samples under my supervision. Without the aid of his knowledge of the boundaries of the three services and able assistance it would have been almost impossible for me to have carried out the collection in a systematic manner.

ARCHIBALD LIVERSIDGE.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE AND
HEALTH BOARD.

(REPORT FROM, RESPECTING DISPOSAL OF NIGHT-SOIL IN MELBOURNE.)

Ordered by the Legislative Assembly to be printed, 29 July, 1875.

Sydney City and Suburban Sewage and Health Board,
Office, Colonial Secretary's Department,
Sydney, 26 July, 1875.

SIR,

I have the honor by direction of the Chairman, to furnish, for the Honorable the Colonial Secretary, the following particulars in reference to the disposal of night-soil in Melbourne, just to hand, viz. :—

For the city of Melbourne there are 12,663 tenements.

10,560 overground receptacles for night-soil of about 10 galls. each.

2,103 underground cesspits of the ordinary kind.

Under a contract for the year commencing July 1st, 1875, the smaller receptacles are emptied once a week, or, if oftener, with an additional charge of sixpence (6d.) each emptying.

The underground cesspits are emptied as often as the contractor is required to do so.

The contractor supplies everything except the carts, and is required to deliver the soil at a distance not exceeding eight miles.

The contract price for the year is £7,450.

I gather from the returns that the total cost, all of which is borne by the Corporation, is under (£10,000) ten thousand pounds per annum, and certainly under one pound (£1) per annum for each tenement, or say one pound (£1) for every six of the inhabitants.

No dry earth or disinfectant is required to be used in the receptacles, nor, as a rule, is any used.

This system of emptying has been in operation for about five years, and I am informed that the nuisances on this account still existing in Melbourne are very great, and only tolerable in comparison with the still more horrible state of things previously existing.

I have, &c.,
CHAS. H. BARLEE,
Secretary.

1875.

NEW SOUTH WALES.

SYDNEY SEWERAGE AND WATER SUPPLY.

(EIGHTEENTH ANNUAL REPORT FROM MUNICIPAL COUNCIL—1874.)

Presented to both Houses of Parliament, pursuant to Act 30 Vic. No. 36, sec. 75.

THE TOWN CLERK TO THE PRINCIPAL UNDER SECRETARY.

Town Clerk's Office,
Sydney, 17 February, 1875.

SIR,

I have the honor, by direction of the Right Worshipful the Mayor, to submit, for the information of the Parliament of New South Wales, the Eighteenth Annual Report of the proceedings of the Municipal Council of Sydney, under the Water and Sewerage Acts, during the year 1874.

I have, &c.,
CHAS. H. WOOLCOTT,
Town Clerk.

EIGHTEENTH YEARLY REPORT of the Municipal Council of Sydney, of their proceedings under the Water and Sewerage Acts.

THE Municipal Council of the City of Sydney have the honor to furnish, for the information of the Parliament of New South Wales, the following Report of their proceedings in connection with the Water and Sewerage Works, together with Statements of their Receipts and Expenditure during the year 1874.

WATER WORKS.

The engines and pumping machinery at Botany have been efficiently working throughout the year. Two engines out of the three have been constantly at work, excepting occasionally for three or four hours at a time, when the reservoirs have been signalled full.

Early in December it was found necessary to put on the third engine to keep up the supply, owing to the great demand for water during the dry weather, and since then the three engines have been continuously at work night and day, except when on the high level, when two engines only can be employed.

During the year no casualties have occurred to either the machinery at Botany or the 30-inch main.

In consequence of the heavy floods in the early part of May considerable damage was done to the dams on the Botany watershed. Nos. 1, 2, 4, and 5, with the mill-pond dam, gave way, the rush of water carrying with it the bridge and approaches at Botany Road—the approaches to the bridge over Black-water Creek, with fences, gates, &c.—and injuring house property and lands on the eastern side of the new embankment to the engine-pond reservoir. Immediate steps were taken to effect the necessary repairs, and at the same time great improvements were made, both in the construction of the works and the enlargement of the reservoirs. The alterations are as follow:—In No. 1 dam an additional 24-inch sluice was inserted, with 20-inch iron pipes, through the embankment, to assist the existing one, and which would facilitate the discharge of water during floods. No. 2 dam was restored by making up the embankment as before, the material for which was taken from the inside of the reservoir, thereby increasing its capacity by one million gallons. The embankment of No. 4 dam was raised 4 feet 6 inches higher, and strengthened very considerably, both by widening it and making the slopes much flatter. The weir in the embankment was done away with, and advantage was taken of a natural outlet at the west end of the reservoir to improve and form it into a waste weir 100 feet wide, to discharge into a series of lagoons, with a very gentle inclination, until it reached No. 1 dam. The area of No. 4 has thus been increased from 30 acres and 11 perches to 36 acres and 13 perches, and the capacity from 57 million gallons to 116½ million gallons. Since the repair this dam has been full of water for over three months.

The embankment and sluices of No. 5 dam have been done away with, as by raising No. 4 dam the water was brought to the same level, so that the former two dams are now one large reservoir.

No. 6 dam has been similarly treated to No. 4 by raising and widening the embankment and constructing a new waste weir through the solid ground on the southern side, with the overflow into No. 4. The area of No. 6 has been increased from 16 acres 3 roods to 24 acres 3 roods and 24 perches, and the capacity from 43 million gallons to 68 million gallons.

All the works in connection with the enlargement of the engine-pond reservoir have been completed and have proved most effective. The sluice gates and waste weir have been raised 6 feet 6 inches higher than they were formerly, or 8 feet over the highest spring tides. This precludes the possibility of the salt water ever getting into the dam. The puddling of the embankment down to the bed clay along its entire length has also proved to be efficiently done, as no water now escapes into the sea, and the water has been much longer retained in the dams above than on former years.

The raising of the water in the engine-pond reservoir has necessitated the raising of the wells in the engine house to a corresponding height. This work has also been satisfactorily completed.

There is now no anxiety felt for the safety of the dams during floods, as every precaution has been taken in forming the embankments to keep them sufficiently high above the water, and the width or solidity sufficient to resist the pressure; and by removing the waste weirs away from the embankments altogether the flood waters are diverted entirely from them.

The quantity of water that can be stored in the existing dams for Botany supply, independent of the Lachlan dams for the gravitation supply, is as follows:—

Name of Reservoir.	Area.	Capacity.
Engine-pond reservoir	50 acres.	100 million gallons.
Upper do	15 do	44 do
No. 1 do	20½ do	30 do
No. 2 do	26 do	36 do
Nos 4 & 5 do	40½ do	137 do
No. 6 do	25 do	68 do
Randwick do	35 do	49 do
Total	220½ acres.	464 million gallons.

For the supply of Botany engines, exclusive of the permanent stream, which by measurement has been found to be over 2 millions of gallons per day.

By this it will be seen how largely the storing capacity has been increased. At the time when the Water Commissioners made their report (May, 1869) they estimated the total quantity of water that could be stored in the existing dams to be ninety-seven million (97,000,000) gallons, and now the quantity is four hundred and sixty-four million (464,000,000) gallons.

Great alterations have been made, and extensive works constructed in the Lachlan Reserve to increase the supply by gravitation through the tunnel to the city. The first of the newly constructed dams is across the creek, about half a mile south of Waverley, being No. 1 or Waverley dam. The length of embankment is 5·33 chains—depth of sluice, 14 feet—area, 3½ acres—capacity, 9½ million gallons.

No. 2 dam, or "Fewings," is merely a filter dam, without any pipes or sluices. The embankment is formed entirely of pure sand, and the water escapes by percolation. The length of this embankment is 2·10 chains—depth, 8 feet—area, 1½ acre—capacity, 5½ million gallons.

No. 3, or Spring Creek, is fed entirely by percolation from the sandhills around, and a constant stream is flowing from it. To increase this stream a brick well is being sunk at the very source, the effect of which already, although not finished, is to largely increase the supply. The length of this embankment is 3 chains—depth, 19 feet 2 inches—area, 1½ acre—capacity, 5 million gallons.

No. 4 dam is formed where the waters from the other three converge. Length of embankment, 18·13 chains—depth, 9 feet 9 inches—area, 3 acres—capacity 8½ million gallons.

No. 5 dam is a large receiving reservoir, and has been completed but a few months, and since then no rain has fallen to fill it. Length of embankment, 31·48 chains—depth at sluice, 10 feet 9 inches—area, 15½ acres—capacity, 28 million gallons.

No. 6 dam, or "Cutts," receives its supply from the large area of land above Cutts', as well as from the overflow of No. 5 dam. Length of embankment, 23·29 chains—depth, 10 feet at sluice—area, 7 acres—capacity, 6 million gallons.

No. 7 dam, or "Fenwick's," the lowest of all, directly supplies the tunnel which conveys the water into the city by gravitation. Length of embankment, 27·26 chains—depth of water at tunnel mouth when full, 8 feet 6 inches—area, 13½ acres—capacity, 15 million gallons.

All these works have been constructed during the last three years, and their summarized capacities are as follow:—

Names of Reservoirs.	Area.	Capacity.
No. 1 or Waverley	3½ acres.	9½ million gallons.
No. 2 or Fewing's	1½ do	5½ do
No. 3 or Spring Creek	½ do	5 do
No. 4	3 do	8½ do
No. 5	15½ do	28 do
No. 6 or Cutts'	7 do	6 do
No. 7 or Fenwick's	13½ do	15½ do
Total	44½ do	77½ do

During the year 1874 the estimated quantity of water sent into the city by gravitation alone from this source was five hundred and fifty million (550,000,000) gallons. About the end of November all the water stored in the several dams was expended, and since then the permanent stream has been able to supply all the western parts of the city by Kent and Sussex streets.

The time has now arrived that something must be done, and that soon, to relieve the pumping machinery at Botany, as it will not do to wait until some gigantic scheme for future supply is inaugurated. Additional pumping power is necessary to deliver the requisite quantity of water required during the summer months; the demand for water of late has enormously increased, owing to the great growth of the City and suburbs.

The additional number of houses supplied since the Commissioners made their report in 1869 is three thousand three hundred and eighty-two (3,382), and the length of mains laid since the same period is twenty-five and a half (25½) miles.

The entire engine power has been employed continuously now for over two months, and if anything happened to either of the engines to necessitate its stoppage, the want of water would be severely felt.

Considerable additions and improvements have been made in the reticulation of the mains throughout the City. Formerly the districts of Redfern, Waterloo, Darlington, Camperdown, Forest Lodge, the Glebe, and Pyrmont were supplied by a 12-inch pipe off the 20-inch main, which supplies the City from Crown-street reservoir. A new 20-inch main has now been laid direct from the reservoir down Gipps-street to Elizabeth-street, where a junction has been made with the old mains, thus giving this large district a supply independent of the City supply, and considerably benefiting both.

The districts of Darlinghurst, Woolloomooloo, Potts' Point, Darling Point, and portions of Woollahra and Paddington were supplied off the 12-inch main at the junction of Bourke and Oxford streets, from the high service reservoir. A new 12-inch main has been laid direct from the 20-inch main in Botany-street, along that street to opposite the Darlinghurst Court House, where it joins the old mains, giving this district also a supply independent of the City.

The total quantity of water pumped up from Botany into the service reservoirs during the year 1874 was fifteen hundred and two millions four hundred and forty-four thousand four hundred and fifty eight (1,502,444,458) gallons (weekly average twenty-eight millions eight hundred and ninety-three thousand one hundred and sixty-three (28,893,163) gallons), being an increase on the year 1873 of one hundred and sixty millions eight hundred and thirty-four thousand nine hundred and six (160,834,906) gallons. This increase is accounted for by the extended dry season, and the extension of the mains to different parts of the City and suburbs.

The quantity of coal consumed by the Botany engines during the year 1874 was 6,120 tons, being an increase on the previous years of only 139 tons.

The number of new houses connected during the year was eight hundred and twenty-eight (828), and the total number of houses now receiving and paying for water is nineteen thousand eight hundred and seventy-four (19,874).

The number of meters fixed is two hundred and thirty-three (233); and the quantity of water registered as passing through them was fifty millions nine hundred and seventy-three thousand (50,973,000) gallons, yielding a revenue of five thousand eight hundred and eleven pounds fifteen shillings (£5,811 15s.)

The quantity of pipes laid during the year for the extension of water supply to the City and Suburbs, has been four miles and ninety-eight yards (4 $\frac{1}{2}$ $\frac{1}{2}$ $\frac{1}{2}$). (See Appendix A.)

SEWERAGE.

The main sewers throughout the City are in good order, and no repairs were required during the year.

Many of the minor sewers and pipe-drains were found to be either choked up, burst, or leaking badly, and had to be repaired, or taken up, cleared out, and relaid, whilst in some cases the levels had to be altered, and others puddled all round to prevent leakage. These improvements were effectual in the following places:—William and Forbes streets; Tank Stream, south of Hunter-street; Gipps and George streets; Kent-street, south of Bathurst-street; King-street West; Dowling-street, near William-street; Elizabeth-lane; at Barker's Tweed Factory; Washington-street; Castlemaine-lane; Burton-street and Gordon's-lane; Macquarie-street North; Elizabeth Bay Road; Broughton-place; Sussex-street, from Druitt-street northwards; Liverpool-street, between Crown and Riley streets.

The following additions to the main sewers have been completed or are in progress:—

A 3 feet 6 inch brick sewer opposite the New Post Office, from George-street to the Tank Stream, has been constructed, length, 225 feet.

An extensive sewerage work is now in course of construction for the Government, from the end of the stone sewer in Hay-street, to Darling Harbour, a length of about 1,170 feet. The works consist of an inlet and outlet 10 feet stone sewer, with a silt-pit intervening, which silt-pit is composed of six compartments with inlet and outlet chambers. Three hundred and twenty (320) feet of this sewer are now constructed, and the remainder of the work is being carried out most satisfactorily by the Contractor, Mr. W. Watkins.

Three hundred and four (304) additional house connections have been made with the sewers, making a total of seven thousand two hundred and six (7,206) houses throughout the city.

During the year six hundred and twelve (612) yards of stoneware pipe drains have been laid, of the dimensions and in the localities detailed in Appendix B.

FINANCIAL.

The Annual Statements of Receipts and Expenditure on account of the Water and Sewerage Works for the year 1874, certified by the City Auditors, are attached hereto.

Adopted by the Municipal Council of the City of Sydney, this sixteenth day of February, A.D. 1875.

CHAS. H. WOOLCOTT,
Town Clerk.

B. PALMER,
Mayor.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

METROPOLITAN WATER SUPPLY.

(NEPEAN AND CATARACT RIVERS—RETURN SHOWING QUANTITY OF WATER THAT WOULD HAVE BEEN AVAILABLE FROM 30th NOVEMBER, 1874, TO 31st JANUARY, 1875.)

Ordered by the Legislative Assembly to be printed, 24 March, 1875.

QUESTION FOR TUESDAY, 23 MARCH, 1875.

MR. MACINTOSH *to ask* THE COLONIAL SECRETARY.—

(1.) Will he be pleased to lay a Return on the Table of the House, showing the estimated quantity of Water that would have been available, in accordance with the Report of the Royal Water Commission for the Metropolitan Water Supply in the Nepean River, at the Pheasant's Nest, during each month of 1874?

(2.) The same information with reference to the Cataract River, where the proposed tunnel will intersect that watercourse?

(3.) The quantity of water that would have been available for such supply from each source during each week from November 30th, 1874, to January 31st, 1875, under same conditions as recommended by the Water Commission?

(4.) Has the Government received any information with reference to the engagement of an Hydraulic Engineer from England?

STATEMENT showing the estimated quantity of Water that would have been available, in accordance with the Report of the Royal Water Commission for the Metropolitan Water Supply, in the Nepean River, at the Pheasant's Nest, during each month of 1874; and the same information with reference to the Cataract River, where the proposed tunnel will intersect that watercourse, together with the quantity of Water available for such supply from each source during each week from November 30th, 1874, to January 31st, 1875, under same conditions as recommended by the Water Commission.

Questions 1 and 2.

REPORT	3 to 4
RESOLUTIONS	5 „ 9
MINUTES OF PROCEEDINGS	11 „ 16
PAPERS SUBMITTED	17 „ 52

CONFERENCE of the CHIEF INSPECTORS of STOCK for the Australian Colonies, held in Sydney, in November, 1874.

REPORT OF THE PROCEEDINGS OF THE CONFERENCE.

THE Conference was convened, at the instance of the Government of New South Wales, to consider the best means to be adopted for securing joint and simultaneous legislative action, on the part of all the Australian Colonies, in dealing with Infectious and Contagious Diseases in Stock.

The undermentioned Colonies were represented :—

<i>New South Wales :</i>	MR. ALEXANDER BRUCE.
<i>Queensland :</i>	MR. P. R. GORDON.
<i>South Australia :</i>	MR. C. J. VALENTINE.
<i>Tasmania :</i>	THE HONORABLE JAMES WHYTE.
<i>Victoria :</i>	MR. E. M. CURR.

Mr. Bruce having been appointed the Chairman of the Conference, laid before the Members a Statement of proposed proceedings, which was unanimously adopted, and ordered to be printed, to form portion of the proceedings.

After mature deliberation, the Conference agreed to the Resolutions submitted herewith on the undermentioned subjects :—

- (1.) Definition of Terms.
- (2.) Pleuro-pneumonia.
- (3.) The importation of Stock from places beyond the Australian Colonies.
- (4.) The extinction of Infectious and Contagious Diseases in Stock, and the conduct of the Stock Traffic between the different Colonies.
- (5.) The appointment of Quarantine Stations.
- (6.) Scab in Australia.
- (7.) Inspection Fee on Stock.
- (8.) Catarrh in Sheep.
- (9.) Foot-rot, Worms, and Fluke.
- (10.) Overstocking.
- (11.) Stock Statistics.
- (12.) Experiments for ascertaining the nature, cause, prevention and cure of Diseases in Stock.
- (13.) Co-operation of other Colonies invited.

In reporting these Resolutions, the Conference would earnestly express a hope that the Governments of the several Colonies will take measures, as soon as possible, to carry them into effect.

The Conference have considered it their duty to recommend the continuance of the existing prohibition on the importation of stock, with the exception of horses, and the extension of such prohibition until it shall be ascertained that certain diseases not now in Australia have been eradicated in Great Britain, when importations from thence may be resumed, under strict quarantine regulations, the nature of which are indicated in the proceedings of the Conference.

On

On reference to these proceedings, it will be observed that the Members of the Conference were not unanimous in opinion as to the mode of carrying out an extension of the prohibition. Mr. Curr desired to go further than the resolution arrived at by the majority, and thus continue prohibition until all infectious and contagious diseases, except scab, shall have ceased to exist in Great Britain.

Mr. Bruce was of opinion that importations from Great Britain alone might be admitted, when it has been ascertained that there are no cases of foot and mouth disease, or only a few isolated ones, and no rinderpest or sheep-pox, nor any other infectious or contagious disease in stock not known in Australia.

Mr. Valentine proposed determining the period for which the existing prohibition should be enforced.

Considering the magnitude of the interest involved, and the frightful results that must inevitably follow the introduction of rinderpest, foot and mouth disease, or sheep-pox, into the flocks and herds of Australia, and in view of recent fresh outbreaks of foot and mouth disease in Great Britain, the Conference has come to the conclusion that, for the present, the only safe and prudent course is to continue the prohibition, and watch the course of events there with reference to the suppression of infectious and contagious diseases.

In arriving at this conclusion, the Conference has been influenced by the consideration that foot and mouth disease, if introduced into the stock of Australia, would prove infinitely more destructive than it has done in England, where each individual case can be and is attended to with as much care as would be bestowed upon human beings; whereas in the Colonies any such course of treatment would be altogether impracticable.

The Resolutions arrived at were in most cases unanimously agreed to, but when any difference of opinion existed, it will be made apparent by reference to the proceedings herewith submitted.

The Conference would also draw the attention of the respective Governments to the papers on Pleuro-pneumonia, Scab in Sheep, Catarrh, Fluke, Worm Disease, and Foot-rot, and suggest that publicity should be given to them in such manner as may be deemed most expedient, more particularly for the purpose of stimulating inquiry into the subjects of Fluke, Worms, and Foot-rot.

Many other matters will be found in the proceedings of much interest to stockowners and the public, although the Conference does not consider it necessary to enumerate them in the Report.

In concluding the labours of the Conference, Mr. Bruce, as Chairman, begged to express to the Members of the Conference, on his own behalf, as well as on behalf of the Government of this Colony, his thanks for the careful and attentive consideration they have given to the subjects submitted to them, which he trusted would result in lasting benefit to the respective Colonies.

Votes of thanks were then heartily accorded to the Chairman and Secretary.

ALEX. BRUCE.
P. R. GORDON.

CONFERENCE OF THE CHIEF INSPECTORS OF STOCK OF THE SEVERAL AUSTRALIAN COLONIES.

RESOLUTIONS PASSED BY THE CONFERENCE.

1. Definition of terms—"disease," "infected," and "stock."
 2. Pleuro-pneumonia.
 3. Regulating the importation of Stock from places outside the Australian Colonies.
 4. Principles for Intercolonial Regulations for the extinction of Infectious or Contagious Diseases in Stock, and the conduct of Stock Traffic between the different Colonies.
 5. Appointment of Quarantine Stations.
 6. Scab in Australia.
 7. Inspection Fee on Stock.
 8. Catarrh in Sheep.
 9. Fluke, Foot-rot, and Worms.
 10. Overstocking.
 11. Stock Statistics.
 12. Experiments with the view of ascertaining the nature, cause, prevention and cure of Diseases in Stock.
 13. Co-operation of the other Colonies invited.
-

No. 1.**DEFINITION OF TERMS.**

That "disease" shall mean the diseases specified in the Programme of Proceedings of the Conference calling for legislative interference, as well as any other disease which the Governor in Council may declare to be an infectious or contagious disease for the purposes of the Act.

That "infected" shall mean and apply to stock actually suffering from or affected with any such infectious or contagious disease, or which have within the next preceding six months been in direct or indirect contact with stock so suffering or affected, or been dressed or dipped for scab within that period, and one infected animal in a mob is held to render the mob or flock infected.

That "stock" shall mean horses, cattle, sheep, goats, and pigs, and any animal whatsoever that the Governor in Council may declare to be subject to the provisions of the Act.

No. 2.**PLEURO-PNEUMONIA.****LEGISLATION SUGGESTED.**

1. That every mob of cattle which has become infected be inoculated when the virus can be obtained in the mob or in any cattle within a practicable distance.
2. That owners give notice of every outbreak of the disease to their neighbours, to Inspectors, and to the public.
3. That no inoculators but those authorized by the Government be allowed to inoculate for others.
4. That properly inoculated cattle depasturing on a run, on the expiry of *six weeks* from the last case of disease, be allowed to leave the run and to pass over infected ground without being deemed infected.
5. That all travelling cattle actually affected with or suffering from pleuro-pneumonia be killed immediately they are found to be so.
6. That if the travelling cattle in which any animal is thus found to be actually affected be fat stock, they be taken by day to their destination by the roads least likely in the opinion of an Inspector to spread the disease, and timely notice be given by their drovers to all owners of horned stock on or near the road that the mob is infected.
7. That where the travelling cattle in which any animal is thus found to be actually affected with pleuro-pneumonia are store stock, they be stopped and inoculated as soon as practicable, and afterwards taken to their destination, as provided for in the next preceding regulation; but such cattle be not required to travel more than six miles a day for the first thirty days after being inoculated.
8. That in Colonies in which pleuro-pneumonia exists, the owner of travelling cattle give notice of his intention to cross or pass along runs where stock of the same description are kept, if the road be not separated from the run by a sufficient fence.
9. That drovers do not abandon any travelling stock, nor leave the carcasses of any stock which may die undestroyed.

No. 3.**SUGGESTIONS FOR REGULATING THE IMPORTATION OF STOCK FROM PLACES OUTSIDE THE AUSTRALIAN COLONIES.**

1. That the existing prohibition against the introduction of all stock, except horses, from places outside the Australian Colonies, be allowed to stand.
2. That, with the view of keeping the respective Governments informed on the subject, their Agents-General be instructed to obtain from the Secretary of Her Majesty's Veterinary Department, London, a monthly report as to what infectious and contagious diseases then exist among the live stock of the United Kingdom, and to what extent they are each known to prevail; and that the Agents-General transmit this report by mail, and when necessary by telegram, to their respective Governments.
3. That on the expiry of the existing prohibition it be again renewed, and maintained until it is ascertained that no foot and mouth disease, rinderpest, nor sheep-pox, nor any other infectious or contagious disease in stock not known in Australia exists in Great Britain and Ireland, when importations might be allowed under the conditions hereinafter mentioned.*
 - (1.) That the introduction of all stock except horses shall be absolutely prohibited from all other Countries, except Great Britain and Ireland, and also from all Colonies except those agreeing to these Regulations.
 - (2.) That when importations from the United Kingdom are renewed, all stock intended to be introduced from thence into Australia be examined at the port of shipment by a duly qualified veterinary surgeon, appointed conjointly by the Agents-General for the several Colonies, who shall make a declaration that to the best of his knowledge and belief such stock are free from any infectious or contagious disease.
 - (3.) That the live stock (if any) for the use of the passengers put on board the same ship as the stock intended to be introduced into the Colonies, be examined by the same veterinary surgeon, and certified in like manner to be also free from infection.
 - (4.) That every ship from places beyond the Australian Colonies, on arrival there, be boarded by an Inspector, and all stock intended to be landed from such ship, previous to being so, be examined by a duly qualified veterinary surgeon, or medical man when a veterinary surgeon cannot be obtained.
 - (5.) That if such stock, or any stock whatever on board such ship, be found to be infected with any infectious or contagious disease not already introduced into any of the Colonies, all such stock be forthwith destroyed.
 - (6.) That if apparently free from disease not known in the Colonies, the stock intended to be landed be disinfected on board ship, and conveyed to a thoroughly isolated quarantine, to be there properly disinfected and to undergo a probationary detention, at the owner's expense, of fifty days at least.

* The Conference were not unanimous on this Resolution.

No. 4.

PRINCIPLES FOR INTERCOLONIAL REGULATIONS FOR THE EXTINCTION OF INFECTIOUS OR CONTAGIOUS DISEASES IN STOCK, AND THE CONDUCT OF THE STOCK TRAFFIC BETWEEN THE DIFFERENT COLONIES.

I.—INFORMATION TO NEIGHBOURING COLONIES.

1. That the Chief Inspector in each Colony communicate by telegraph full and distinct information as to the position, extent, and nature of every outbreak of infectious or contagious disease in stock, as quickly as possible, to the Chief Inspectors of the other Colonies.
2. That the Inspectors in the border districts be instructed to send immediate information by telegram to the nearest Inspectors of the neighbouring Colonies of every outbreak of such disease which occurs within fifty miles of the border.
3. That the road by which the disease was introduced, and the history of the outbreak, as well as the possibility of its extension, are to be carefully examined into, and the Inspectors for the districts into which this road leads in the neighbouring Colonies are to be always put in possession of these particulars with the least possible delay.
4. That every Colony in which any such disease exists shall publish quarterly in the Government Gazette a report upon the state of the disease, what prohibitory measures have been issued, their alteration or rescindment.
5. That this report be sent direct to the Chief Inspectors for the different Colonies.

II.—MEASURES FOR THE ERADICATION OF DISEASE.

6. That a Fund to be called the Stock Fund be raised by a contribution on stock, to defray the payment of compensation and other expenses incurred in the prevention and extinction of Infectious Diseases in Stock.
7. That each Colony forthwith initiate such measures as shall effect the speedy extinction of all infectious or contagious diseases in stock which are controllable by quarantine, and shall take such measures with respect to all these diseases not so controllable as shall prevent their spread and tend to their gradual extinction.
8. That while provision should be made in all such measures for the punishment of owners who keep or move infected stock to the detriment of others,—the means chiefly to be relied upon for the eradication of disease should not be the enforcement of penalties, but the initiation and maintenance of such a system of inspection as will insure the discovery by the authorities and the public of every outbreak of disease *immediately it is observable*, with the view to the infected stock being at once placed in quarantine, and steps taken for the speedy eradication of the infection on the ground where the outbreak occurs.
9. That in order to remove every inducement to the owners of infected stock to conceal the fact of their being so, all animals killed and goods destroyed by order of the Government, for the purpose of suppressing disease, be paid for by the Government, at a rate equal to their value at the time they are destroyed; and the expenses incurred in destroying such stock or goods be also borne by the Government.
10. That all conveyances which have served for the transport of live stock, and all fittings and articles which have been used by or with such stock, and from which there is any risk whatever of infection spreading, shall be disinfected before being again used; as well as all conveyances, fittings, and articles which have served or been used in the transport of manure, fodder, litter, or other matters which have had their origin or been in contact with animals suspected of disease.

III.—CONDUCT OF INTERCOLONIAL STOCK TRADE.

11. That where there is no infectious or contagious disease in the stock of any two or more Colonies, nor any risk of infection being conveyed, such stock be introduced *overland*, from one Colony to the other, without being obliged to cross at specified crossing-places or to wait for inspection; and sheep arriving by *sea* from a Colony in which no scab exists, undergo a quarantine of fourteen days with two (2) dressings.
12. That where an outbreak of disease occurs in any Colony, the neighbouring Colonies may, pending the extent and risk of the outbreak being definitely ascertained, at once issue a prohibition against the introduction of stock from such Colony; and the duration of such prohibition shall depend upon the amount of risk arising from such outbreak.
13. That if it be clearly shown that the outbreak in such Colony is only an isolated one, or only of a limited extent, and confined to only one or two districts, and that the measures for isolation and extinction are there being effectually carried out—in that case the stock from the remaining non-infected portions of such Colony, situated at a safe distance from any spot where infection exists, may be introduced into the neighbouring Colonies under the following conditions, namely:—

1. *As regards all stock,—*

- (1) That they are admitted at appointed crossing-places only.
- (2) That the stock be accompanied by a certificate from the Inspector of the District from which they started, containing the following particulars:—(a.) Whether or not the stock are infected. (b.) The place from which they started. (c.) The nearest infected stock to such place. (d.) The nature and extent of the disease affecting such stock. (e.) The route by which the stock intended to be introduced are to travel to the crossing-place. (f.) The nearest infected stock to any portion of such route.
- (3) That they are inspected at such place previous to crossing or landing, and be found to be apparently sound.

2. *As regards sheep,—*

- (4.) That when introduced overland they be branded with a letter, to indicate the Colony from which they are to be introduced,—say N for New South Wales, Q for Queensland, A for South Australia, and V for Victoria.
 - (5.) That where they are conveyed by train, the trucks in which they are carried shall have been thoroughly cleansed and disinfected, to the satisfaction of the Inspector, previous to the sheep being put into them; and when introduced by water, that the portion of the vessel where they are to be penned shall have been cleansed and disinfected in the same way.
 - (6.) That sheep proposed to be introduced by land into any Colony undergo a quarantine of fourteen days within the border of such Colony, and during that period be dipped not less than twice to the satisfaction of an Inspector; but the conditions contained in this suggestion may be modified by any two Colonies by mutual agreement.*
 - (7.) That they do not leave the quarantine until the Inspector in charge shall certify that they are free from disease.
14. That all certificates shall state for how long they are available.
15. That when any disease is equally prevalent in the cattle stock of two or more Colonies, these Colonies allow cattle to cross their borders without compelling them to do so at specified crossing-places, or to wait for inspection.*
16. That the trade in thoroughly dry skins, bones, horns, hoofs, melted tallow in casks or skins, cow-hair, and goats' hair, in so far as those latter objects are packed in sacks or bales, as well as straw, hay, and other substances, between a non-infected and an infected Colony, be exempt from the operation of these suggestions.
17. That a Colony be not bound to compensate for any stock which may be attacked by disease and have to be killed, if such stock have not been the preceding sixty days at least within such Colony, unless it can be proved that the infection took place in the Colony itself.

* The Conference were not unanimous in this Resolution. See Proceedings.

No. 5.

APPOINTMENT OF BORDER QUARANTINE STATIONS.

1. The Conference is of opinion that it is desirable that quarantine stations for the admission of sheep from Victoria and Tasmania into New South Wales should be established without delay at Moama and Albury, inasmuch as the present restrictions operate most prejudicially to the interests of sheepowners in Riverina, Victoria, and Tasmania, without being at all necessary on sanitary grounds, because the same precautions which are now taken against the introduction of disease at the port of Sydney may as easily be observed at quarantine stations on the river Murray.
2. The Conference is also of opinion that a quarantine station should be established at or near Apsley, on the borders of South Australia and Victoria.

No. 6.

SCAB IN AUSTRALIA.

That while acknowledging the magnitude of the undertaking of eradicating scab in Victoria (where the number of infected sheep at one time exceeded 5,000,000) and the innumerable difficulties encountered in carrying out the work, as well as fully appreciating the progress already made in that direction, there being now only about 120,000 sheep in quarantine in that Colony, as well as the fact that nearly the whole of the sheep in Tasmania, amounting to 1,700,000, once infected, have now been reduced to 27,000,—this Conference is of opinion that it is most desirable that all sheep henceforward found scabby in Australia, as well as the flocks in which they are found running, should be destroyed as soon as practicable, but in no case later than the 1st January, 1876.

The reasons that induce the Conference to pass this resolution are the following:—

- (1.) The existence of scab in any of the Colonies is a source of real danger to the flocks in the other Colonies.
- (2.) It entails very great expense on some of the Colonies, and a considerable amount on them all, in the protection of their sheep from infection.
- (3.) It puts a stoppage to free trade in sheep in Australia, and thus causes very heavy losses to all the other Colonies, not only through preventing the trade in store and breeding sheep, but also in the impediments it throws in the way of the introduction of improved stud sheep from one Colony to another.
- (4.) The immense losses that are sustained by all the other Colonies through the existence of scab in Victoria and Tasmania, in various ways, even when the disease is not allowed to spread beyond these Colonies.

These considerations are altogether irrespective of the incalculable losses sustained by Victoria and Tasmania through the continued existence of scab within their own borders.

No. 7.**INSPECTION FEE ON STOCK.**

That it is undesirable that any inspection fee be charged by one Colony on the stock introduced from another Colony, inasmuch as such a charge would tend to prevent the initiation of uniform legislation and combined action by the different Colonies for the eradication of disease.*

* The Conference were not unanimous in this Resolution.

No. 8.**CATARRH IN SHEEP.**

The Conference advise that all sheep infected with catarrh be destroyed.

No. 9.**FOOT-ROT, WORMS, AND FLUKE.**

That although the Conference expresses no opinion on the paper submitted by Mr. Valentine respecting the destruction in South Australia of sheep affected with fluke, they consider that it is unjust towards those owners whose sheep are free from such diseases as foot-rot, worms, and fluke, and especially to those whose country is not decidedly safe from infection (and they amount to about 30 per cent. of the whole), that sheep infected with any of these ailments should be allowed to travel over such country and infect sound sheep; but that with the information at present before them, they are not yet prepared to say how the evil should be met by legislation.

No. 10.**OVERSTOCKING.**

That this Conference desires to point out that the system of overstocking, so generally carried out over the whole of the Colonies, has had a most injurious effect on the pastures and stock; that it has reduced the size and injured the constitution, and is a great source of disease in stock generally.

No. 11.**STOCK STATISTICS.**

That the several Governments be invited to take power, where they do not possess it, to obtain returns from owners of the number of their stock and of all diseases affecting them.

No. 12.**EXPERIMENTS WITH THE VIEW OF ASCERTAINING THE NATURE, CAUSE, PREVENTION AND CURE OF DISEASES IN STOCK.**

That the several Governments be invited to follow the example of Queensland, and authorize the expenditure of a sum of money for the purpose of meeting the expense of making experiments for ascertaining the nature, cause, prevention and cure of Diseases in Stock; and that the Chief Inspectors for the different Colonies regularly transmit the results of these experiments to each other, and otherwise compare experience.

No. 13.**CO-OPERATION OF THE OTHER COLONIES INVITED.**

That, although the Colonies of New Zealand, Western Australia, and Fiji are separated by long distances from the Colonies represented at this Conference, they should be invited to consider the opinions expressed and the Resolutions agreed to at the Conference, with a view to their adoption.

ALEX. BRUCE.
P. R. GORDON.
C. J. VALENTINE.
JAMES WHYTE.
E. M. CURR.

MINUTES OF PROCEEDINGS of the CONFERENCE of the Chief Inspectors of Stock for the several Australian Colonies herein specified, held at the Office of the Chief Inspector of Stock, Sydney, in November, 1874.

Office of the Chief Inspector of Stock, Sydney, 10th November, 1874.

THE undermentioned gentlemen were present, and represented the Colonies named respectively :—

New South Wales : MR. ALEXANDER BRUCE.
Queensland : MR. P. R. GORDON.
Tasmania : THE HONORABLE JAMES WHITE.
Victoria : MR. F. M. CURR.

Mr. Bruce informed the Conference that Mr. Valentine, the Representative of South Australia, would arrive by steamer to-day.

Mr. Whyte moved, and it was unanimously agreed to, that Mr. Bruce be appointed Chairman.

The Conference agreed to meet daily, at $\frac{1}{2}$ past 10 o'clock A.M., Saturday excepted; also, that the proceedings should not for the present be made public, except in so far as the Conference might consider to be necessary.

It was then resolved that the Secretary should prepare Minutes of each day's proceedings, which shall be read over and confirmed at the next sitting prior to any other business being entered upon.

The Chairman laid on the Table a copy of the letter forwarded by the Government of New South Wales to the Governments of the other Colonies calling the Conference,—also a short paper setting forth the reasons for taking that course, and submitting a Programme of Proceedings for consideration, which was adopted by the Conference. (See papers, Nos. 1 and 2, pages 18, 19, and 20.)

The undermentioned papers were then laid before the Conference, and directed to be printed :—

Mr. Bruce, on Pleuro-pneumonia.	} See papers appended.
Mr. Gordon, on Worms.	
Mr. Whyte, on Scab in Sheep.	
Mr. Curr, on Fluke.	

PLEURO-PNEUMONIA.

The Chairman stated his views on this disease, and the conclusions he had arrived at, after the most careful inquiry, and submitted for the consideration of the Conference the following Resolutions on the subject. (See paper No. 5, page 25.)

The Conference having maturely deliberated on the Resolutions in question, and proposed certain amendments, resolved that Resolutions 1, 2, 3, 5, 7, 8, 9, 10, and 11, as amended, be adopted, and that Resolutions 4 and 6 be expunged.

During the discussion on the above subject—

Mr. Whyte stated that pleuro-pneumonia was not known in Tasmania;

Mr. Curr, that it was prevalent to some extent in Victoria;

Mr. Gordon, that it prevailed in the North and Central Districts of Queensland; and

Mr. Bruce, that it was more or less prevalent throughout New South Wales.

PRINCIPLES FOR INTERCOLONIAL REGULATIONS FOR THE EXTINCTION OF INFECTIOUS OR CONTAGIOUS DISEASES IN STOCK, AND THE CONDUCT OF THE STOCK TRAFFIC BETWEEN THE DIFFERENT COLONIES.

The Conference then proceeded to consider the resolutions tabled on these subjects (see paper No. 3, page 21); and, after amending them in several respects, agreed to postpone their final consideration, as well as that of the interpretation of the word "infected," until Mr. Valentine was present.

The Conference adjourned at a quarter past 4 o'clock.

ALEX. BRUCE,
Chairman.

Office of Chief Inspector of Stock, Sydney, 11th November, 1874.

Present:—

New South Wales : MR. BRUCE.
Queensland : MR. GORDON.
South Australia : MR. VALENTINE.
Tasmania : MR. WHYTE.
Victoria : (Absent.)

The Conference having met at $\frac{1}{2}$ past 10 o'clock,—

Mr. Bruce intimated that he had received a communication from Mr. Curr, stating his inability to attend to-day in consequence of indisposition.

The Chairman informed the Conference that the papers ordered to be printed were not quite ready, and suggested that an adjournment should take place until the usual hour of meeting to-morrow, which was unanimously agreed to.

ALEX. BRUCE,
Chairman.

Sydney,

Sydney, Thursday, 12th November, 1874.

Present:—

New South Wales: MR. BRUCE.
Queensland: MR. GORDON.
South Australia: MR. VALENTINE.
Tasmania: MR. WHYTE.
Victoria: MR. CURR.

The Conference having assembled at the usual hour, the minutes of the proceedings on the 10th and 11th instant were read and confirmed.

Mr. Whyte proposed, and Mr. Curr seconded the following motion:—"That the business already decided by the Conference be re-opened, with the view of allowing Mr. Valentine an opportunity of expressing his opinion."

The Chairman then read the order of business agreed to on the 10th instant, which was affirmed.

The Resolutions relating to pleuro-pneumonia were then read *seriatim*, amended in certain particulars, and agreed to.

During the discussion upon "pleuro-pneumonia," Mr. Valentine stated that the disease only existed, in South Australia, in isolated cases, and came from travelling stock.

The Conference then resumed consideration of the meaning of the word "infected" in the Resolutions of the Conference.

Mr. Bruce moved that the meaning attached to the said word be as follows:—"Infected" shall be held to apply to any stock which are actually suffering from or affected with any infectious or contagious disease, or which have within the next preceding six months been in direct or indirect contact with stock so suffering or affected, or been dressed or dipped for scab, within that period; and one infected animal in a mob or flock shall be held to render the mob or flock infected.

"Stock" shall mean and include horses, cattle, sheep, pigs, and goats, as usually defined.

Mr. Curr thereupon moved the following amendment:—"That the meaning of the terms "infected stock" or "infected animals" (for the purposes of an Act) be "any live stock or animals suffering from any disease which at any time shall be declared under such Act or in Regulations thereunder to be infectious or contagious, as also any animal or stock which shall have been lately exposed to a serious risk of contracting any such disease."

After the fullest consideration of the subject, the Conference resolved as follows:—

That "disease" shall mean the diseases specified in the programme of proceedings of the Conference calling for legislative interference, as well as any other disease in stock which the Governor in Council may declare to be an infectious or contagious disease for the purposes of the Act.

That "infected" shall mean and apply to stock actually suffering from or affected with any such infectious or contagious disease, or which have within the next preceding six months been in direct or indirect contact with stock so suffering or affected, or been dressed or dipped for scab within that period; and that one infected animal in a mob or flock be held to render the mob or flock infected.

That "stock" shall mean horses, cattle, sheep, goats, and pigs, and any animal whatsoever that the Governor in Council may declare to be subject to the provisions of the Act.

The Conference then proceeded to discuss the subject of "REGULATIONS FOR THE IMPORTATION OF STOCK FROM PLACES OUTSIDE THE AUSTRALIAN COLONIES," as tabled. (See paper No. 4, page 22.)

And the Resolutions having been put *seriatim*,—

No. 1 was agreed to unanimously.

No. 2 having been proposed—

Mr. Curr proposed the following amended Resolution, viz.:—

"That in our opinion the introduction from Great Britain into the Australasian Colonies of sheep, cattle, pigs and goats, should be prohibited as long as infectious and contagious diseases (excepting scab) exist in that country."

Which having been put to the Conference, was negatived upon the following division:—

Aye.	Noes.
Mr. Curr.	Mr. Bruce, Mr. Gordon, Mr. Whyte, Mr. Valentine.

The following amendment was then proposed by Mr. Bruce:—

"That on the expiry of the existing prohibition, it be again renewed and maintained until it be ascertained that there are no cases of foot and mouth disease, or only a few isolated ones, and no rinderpest or sheep-pox, nor any other infectious or contagious disease in stock not known in Australia, existing in Great Britain."

Upon division the amendment was negatived as follows:—

Aye.	Noes.
Mr. Bruce.	Mr. Curr, Mr. Whyte, Mr. Gordon, Mr. Valentine.

A further amendment by Mr. Valentine for the insertion of the words "for twelve months" in lieu of the words "and be maintained," was then proposed and negatived upon the following division:—

Aye.	Noes.
Mr. Valentine.	Mr. Bruce, Mr. Curr, Mr. Gordon, Mr. Whyte.

The

The original Resolution was then proposed by Mr. Whyte, and carried upon the following division:—

Ayes.	No.
Mr. Whyte,	Mr. Curr.
Mr. Bruce,	
Mr. Gordon,	
Mr. Valentine.	

The sub-clauses were then proposed, and having been amended in a few minor particulars, were adopted.

No. 3 was agreed to.

Mr. Curr handed to the Conference a paper on the subject of Scab in Victoria, which was directed to be printed.

The Conference having reconsidered the "Principles of Intercolonial Regulations for the extinction of Infectious and Contagious Diseases in Stock, and the conduct of the Stock Traffic between the different Colonies," are of opinion that the further consideration of the subject be postponed until the next meeting.

The Conference adjourned at 5 o'clock.

ALEX. BRUCE,
Chairman.

Sydney, 13th November, 1874.

Present:—

<i>New South Wales</i> :	MR. BRUCE.
<i>Queensland</i> :	MR. GORDON.
<i>South Australia</i> :	MR. VALENTINE.
<i>Tasmania</i> :	MR. WHYTE.
<i>Victoria</i> :	MR. CURR.

The Conference met according to adjournment yesterday.

SUGGESTIONS FOR REGULATING THE IMPORTATION OF STOCK FROM PLACES OUTSIDE THE AUSTRALIAN COLONIES.

This subject was recommitted, and after amendment in certain particulars was finally adopted as in Resolutions, No. 3, page 6.

PRINCIPLES FOR INTERCOLONIAL REGULATIONS FOR THE EXTINCTION OF INFECTIOUS AND CONTAGIOUS DISEASES IN STOCK, AND THE CONDUCT OF THE STOCK TRAFFIC BETWEEN THE DIFFERENT COLONIES.

The Conference then resumed consideration of these subjects.

Clauses 1 to 10 having been proposed, were adopted with certain amendments.

Clause 11 was then considered.

Mr. Curr proposed the following Regulation under sub-section 7 of that clause.

"That sheep proposed to be introduced by land into any Colony undergo a quarantine of fourteen days within the border of such Colony, and during that period be dipped not less than twice, to the satisfaction of an Inspector."

Mr. Gordon proposed as an amendment that the words "not less than" be inserted before the words "fourteen days," which was negatived.

Mr. Bruce then proposed, as a further amendment, that the words "thirty days and three dressings" be inserted in lieu of the words "fourteen days and two dressings," which was negatived upon the following division:—

Aye.	Noes.
Mr. Bruce.	Mr. Curr,
	Mr. Whyte,
	Mr. Valentine,
	Mr. Gordon.

Mr. Curr's motion was then put, and carried on the following division:—

Ayes.	Noes.
Mr. Curr,	Mr. Bruce,
Mr. Whyte,	Mr. Gordon.
Mr. Valentine.	

Mr. Gordon moved the following new Regulation:—

"That sheep introduced by water from a Colony in which scab exists into any other Colony shall undergo a quarantine of thirty days, and be dressed not less than twice to the satisfaction of an Inspector."

Upon which an amendment was moved by Mr. Whyte, that "fourteen days" be inserted for "thirty" days, which was carried upon the following division:—

Ayes.	Noes.
Mr. Whyte,	Mr. Bruce,
Mr. Curr,	Mr. Gordon.
Mr. Valentine.	

The Chairman at this stage laid before the Conference a communication addressed by the Chief Secretary of Victoria to the Colonial Secretary of New South Wales, with respect to the establishment of a quarantine ground for sheep at Moama, or one of the other crossing-places on the Murray; and the same having been read by the Secretary,—

Mr. Whyte proposed, and Mr. Gordon seconded the following Resolution, which was unanimously adopted:—

"The Conference is of opinion that it is desirable that quarantine stations for the admission of sheep from Victoria and Tasmania into New South Wales should be established without delay at Moama and Albury, inasmuch as the present restrictions operate most prejudicially to the interests of sheepowners in Riverina, Victoria, and Tasmania, without being at all necessary

on sanitary grounds ; because the same precautions, which are now taken against the introduction of disease at the port of Sydney, may as easily be observed at quarantine stations on the river Murray."

Mr. Valentine proposed the following Resolution, which was unanimously adopted :—

"That a quarantine station be established at or near Apsley, on the borders of South Australia and Victoria."

The Conference having again resumed consideration of the proposed Intercolonial Stock Regulations, Mr. Bruce proposed the following Resolution, to stand as No. 11 :—

"That where there is no infectious or contagious disease in the stock of any two or more Colonies, nor any risk of infection being conveyed, such stock be introduced overland from the one Colony to the other, without being obliged to cross at specified crossing-places or to wait for inspection ; and sheep coming by sea from a Colony in which no such disease exists, to undergo a quarantine of fourteen days and two dressings."

The Resolution was agreed to.

Mr. Bruce then proposed the following new clause, to stand as No. 15 :—

"That where any disease is equally prevalent in the cattle stock of two or more Colonies, those Colonies allow cattle to cross their borders without compelling them to do so at specified crossing-places or to wait for inspection."

And the same having been put to the Conference, was agreed to upon the following division :—

Ayes.	No.
Mr. Bruce,	Mr. Curr.
Mr. Gordon,	
Mr. Valentine.	

Mr. Whyte did not vote.

Mr. Bruce proposed, and the Conference agreed to, the following clause to stand as No. 14 :—

"That all certificates shall state for how long they are available."

INSPECTION FEE ON STOCK.

Mr. Bruce proposed the following new Resolution to stand as No. 7 :—

"That no inspection fee be charged by any Colony on the stock introduced from any other Colony."

Upon which Mr. Curr moved as an amendment,—“That, in the opinion of the Conference, the motion is one affecting matters which do not come within the scope of the subjects to be dealt with by them.”

The further consideration of the subject was postponed until the next meeting.

The Conference adjourned at half-past 5 o'clock, until Monday next, at half-past 10.

ALEX. BRUCE,
Chairman.

Sydney, 16th November, 1874.

Present :—

New South Wales : MR. BRUCE.
Queensland : MR. GORDON.
South Australia : MR. VALENTINE.
Tasmania : MR. WHYTE.
Victoria : MR. CURR.

The Conference having met at half-past 10 o'clock,—

Scab in Sheep.

The paper furnished by Mr. Whyte on the nature, causes, and introduction of “Scab in Sheep” was fully considered.

Mr. Valentine stated that South Australia was clean as regards the disease ;

Mr. Gordon stated that Queensland was clean ;

Mr. Bruce stated that New South Wales was clean ;

Mr. Curr stated that about 120,000 were in quarantine in Victoria ; and

Mr. Whyte that 27,000 were in quarantine in Tasmania.

The Conference expressed its opinion that scab was not a disease of spontaneous generation, but was contracted by contagion ; and concurred in the opinions expressed by Mr. Whyte in his valuable paper, as to its nature and treatment.

SCAB IN AUSTRALIA.

With respect to scab now existing in Australia, the Conference unanimously agreed to the following resolution :—

That,—while acknowledging the magnitude of the undertaking of eradicating scab in Victoria (where the number of infected sheep at one time exceeded 5,000,000), and the innumerable difficulties encountered in carrying out the work, as well as fully appreciating the progress already made in that direction, there being now only about 120,000 sheep in quarantine in that Colony, as well as the fact that nearly the whole of the sheep in Tasmania, amounting to 1,700,000, once infected, have now been reduced to 27,000,—this Conference is of opinion that it is most desirable that all sheep henceforward found scabby, as well as the flocks in which they are found running, should be destroyed, as soon as practicable, but in no case later than the 1st January, 1876.

The reasons that induce the Conference to make the above recommendation are as follow :—

- (1.) The existence of scab in any of the Colonies is a source of real danger to the flocks in the other Colonies.

(2.)

- (2.) It entails very great expense on some of the Colonies, and a considerable amount on them all in the protection of their sheep from infection.
- (3.) It puts a stoppage to free trade in sheep in Australia, and thus causes very heavy losses to all the other Colonies, not only through preventing the trade in store and breeding sheep, but also in the impediments it throws in the way of the introduction of improved stud sheep from one Colony to another.
- (4.) The immense losses that are sustained by all the other Colonies through the existence of scab in Victoria and Tasmania, in various ways, even when the disease is not allowed to spread beyond the infected Colonies.

These considerations are altogether irrespective of the incalculable losses sustained by Victoria and Tasmania through the continued existence of scab within their own borders.

CATARRH IN SHEEP.

Mr. Bruce brought before the Conference a paper which he had prepared and published in the year 1869 on this subject, and the Conference, having duly considered the same, are of opinion that it should be printed and form portion of the series of papers laid before them for consideration.

During the discussion on the subject, Mr. Curr stated that he had been informed upon reliable authority, although he had no personal experience of the matter, that sheep suffering from catarrh camped for several nights upon newly-ploughed ground have, in some cases, recovered.

It was also stated that there had for several years been no outbreak of catarrh in any of the Colonies, and it was believed to have been finally eradicated.

The Conference having maturely deliberated on the subject, resolve that it would be expedient that all sheep infected with catarrh be destroyed.

WORMS IN SHEEP.

Mr. Gordon's paper on this disease was then considered, and the following information as to its extent in the several Colonies afforded.

Mr. Gordon stated that the disease prevailed in the Coast Country, and the southern portion of the western watershed of the Coast Range of Queensland.

Mr. Valentine stated that the disease was not known in South Australia.

Mr. Whyte stated that the disease was not known in Tasmania.

Mr. Curr stated that the disease prevailed to some extent in Victoria.

Mr. Bruce stated that it prevailed in the upland districts of New South Wales, excepting those of the Murray.

The Conference then considered how the disease spread, and, after careful consideration, arrived at the following conclusions as the principal causes:—

1. The deterioration of the pasture through overstocking.
2. The travelling of worm-infested sheep.
3. The absence of salts.

Further consideration and inquiry was however considered to be necessary, and the Members promised to make due inquiry in the Colonies represented by them.

The Conference then proceeded to discuss the best mode of dealing with the disease, and agreed to recommend the following treatment:—

- 1st.—*Preventive*. 1. Light stocking. 2. Debarring sheep infected from travelling. 3. Liberal supply of salt, *i.e.*, as much as the sheep will take.
- 2nd.—*Curative*. 1. Nitre and sulphur. 2. Sulphur and salt. 3. Decoction of horehound. 4. Oil and turpentine. 5. Areca nut.

The opinions expressed in Mr. Gordon's paper, and the conclusions he had come to, met with their entire concurrence.

FLUKE IN SHEEP.

Mr. Curr's paper upon this subject was then brought before the Conference for consideration, when it was elicited that—

1. The disease prevails very largely in Victoria.
2. Is generally prevalent in the upland districts of New South Wales.
3. Prevails in some portions of the Colony of Tasmania.
4. Exists in South Australia, but is confined to part of the south-eastern district.
5. Exists very little in Queensland, in consequence of sheep having been removed from districts in which it was prevalent.

The Conference quite agree with Mr. Curr in his remarks on the subject, and express their opinion that returns should be obtained and published from time to time, for general information, indicating where fluke, worms, and foot-rot in sheep exist, as a step towards staying the spread of these diseases, and the protection of sound sheep.

The Conference also advise the following preventive and curative treatment:—

1. Salt in abundance, and occasional doses of salt and sulphate of iron; or Mr. Thomas's remedy as set forth in Mr. Curr's paper.

FOOT-ROT IN SHEEP.

Mr. Valentine's paper upon this subject was then considered, when Mr. Curr stated that some cases of the disease existed in Victoria; Mr. Bruce, that it prevails to some extent in the upland districts of New South Wales; Mr. Whyte, that none exists in Tasmania; Mr. Gordon, that it is scarcely known in Queensland; and Mr. Valentine, that it does not exist to any very great extent in South Australia.

The Conference are of opinion that the disease in many instances and in several forms is caused by wet weather and the nature of the soil; and they are further of opinion (by a majority) that malignant foot-rot is decidedly contagious.

Mr. Gordon stated his views upon the subject, and promised to supply the Conference with a short statement of his experience in regard to the contagious nature of the disease, which was directed to be appended to Mr. Valentine's paper.

The Conference then considered the means for its prevention and cure, and recommend the following treatment:—

That the sheep be run through arsenic-water at a strength of 2 ozs. to the gallon, dissolved in water, or carbolic acid in proportion of 4 ozs. to 15 gallons, both heated to a temperature of 100° Fahrenheit.

Thorough paring and removing hoof where disease exists.

The Conference expressed their concurrence in the views expressed by Mr. Valentine, and the means for treating the disease recommended by him.

Mr. Valentine then proposed and the Conference unanimously adopted the following motion:—

“That this Conference desires to point out that the system of overstocking, so generally carried out over the whole of the Colonies, has had a most injurious effect on the pastures and stock: that it has reduced the size and injured the constitution, and is a great source of disease in stock generally.”

The Conference adjourned at 5 o'clock, until to-morrow at half-past 10 a.m.

ALEX. BRUCE,
Chairman.

Sydney, 17th November, 1874.

Present:—

New South Wales: MR. BRUCE.
Queensland: MR. GORDON.
South Australia: MR. VALENTINE.
Tasmania: MR. WHYTE.
Victoria: MR. CURR.

The Conference having met at half-past 10 o'clock, the minutes of the proceedings on the 13th and 16th instant were read and confirmed.

The Conference then resumed consideration of the motion respecting the abolition of an “inspection fee,” upon which Mr. Curr had moved an amendment; and Mr. Bruce having obtained permission to amend the motion, proposed the following:—

That it is undesirable that any inspection fee be charged by one Colony on the stock introduced from another, inasmuch as such a charge would tend to prevent the initiation of uniform legislation and combined action by the different Colonies for the eradication of disease.

Mr. Curr proposed the following amendment:—

That the motion before the Conference does not come within the scope of this Conference, and that the levying of inspection fees does not necessarily interfere with uniform legislation on the subject of the suppression of the diseases of animals.

The amendment having been proposed, was negatived upon the following division:—

Aye.	Noes.
Mr. Curr.	Mr. Bruce, Mr. Gordon, Mr. Whyte, Mr. Valentine.

The original motion was then put and carried—Mr. Curr did not vote.

TREATMENT OF FOOT-ROT, WORMS, AND FLUKE.

Mr. Bruce then proposed the following resolution, with respect to the papers laid before the Conference, by Mr. Valentine, on the subject of fluke in travelling sheep in South Australia, which was agreed to:—

“That although the Conference expresses no opinion on the action taken in this case, it considers that it is unjust towards those owners whose sheep are free from such diseases as foot-rot, worms, and fluke, and especially to those whose country is not decidedly safe from infection (and they amount to about 30 per cent. of the whole), that sheep infected with any of these ailments should be allowed to travel over such country and infect sound sheep; but that, with the information at present before them, they are not prepared to say how the evil should be met by legislation.”

Mr. Bruce also submitted the following motions, which the Conference agreed to:—

DISEASES IN STOCK STATISTICS.

That the several Governments be invited to take power, where they do not now possess it, to obtain returns from owners of the number of their stock and of all diseases affecting them.

EXPERIMENTS.

That the several Governments be invited to follow the example of Queensland, and authorize the expenditure of a sum of money for the purpose of meeting the expense of making experiments for ascertaining the nature, cause, prevention and cure of diseases in stock.

That the Chief Inspectors of the different Colonies regularly transmit the result of these experiments to each other, and otherwise compare experience.

Mr. Bruce then laid before the Conference a paper which he had prepared upon “Inoculation,” which the Conference resolved should be appended to, and form portion of, Mr. Bruce’s paper upon “Pleuro-pneumonia.” (See No. 6, page 27.)

Mr. Curr proposed, and the Conference unanimously agreed to, the following motion:—

That although the Colonies of New Zealand, Western Australia, and Fiji, are separated by long distances from the Colonies represented at this Conference, they should be invited to consider the suggestions and resolutions agreed to at the Conference.

The Conference then went into committee upon the subjects brought forward for discussion, and after much deliberation agreed to the Report herewith submitted.

Notes of thanks having been accorded to the Chairman and Secretary, the Conference adjourned
sine die.
ALEX. BRUCE,
Chairman.

CONFERENCE OF CHIEF INSPECTORS OF STOCK OF THE AUSTRALIAN COLONIES.

(HELD AT SYDNEY IN NOVEMBER, 1874.)

PAPERS SUBMITTED TO THE CONFERENCE, VIZ. :—

1. Introductory statement by the Chairman, and proposed programme of proceedings.
 2. Circular letter by the Government of New South Wales to the Governments of the several Australian Colonies.
 3. Principles of Intercolonial Regulations for the eradication of Diseases in Stock and conduct of Stock Traffic.
 4. Suggestions for regulating the Importation of Stock from places outside the Australian Colonies.
 5. Pleuro-pneumonia, by Mr. Alexander Bruce.
 6. Inoculation for Pleuro-pneumonia, by Mr. Alexander Bruce.
 7. Scab in Sheep, by The Honorable James Whyte.
 8. Do. in Victoria, by Mr. Edward M. Curr.
 9. Do. in New South Wales, by Mr. Alexander Bruce.
 10. Do. in South Australia, by Mr. C. J. Valentine.
 11. Catarrh in Sheep, by Mr. Alexander Bruce.
 12. Worms in Sheep, by Mr. P. R. Gordon.
 13. Fluke in Sheep, by Mr. Edward M. Curr.
 14. Foot-rot in Sheep, by Mr. C. J. Valentine.
 15. Do. by Mr. P. R. Gordon.
 16. Letter from the Chief Secretary of Victoria to the Colonial Secretary of New South Wales, in regard to Border Quarantine.
 17. Correspondence with respect to destruction of Sheep for Fluke in South Australia.
-

No. 1.

INTRODUCTORY Statement by Mr. Alexander Bruce, Chairman of the Conference of the Chief Inspectors of Stock of the Australian Colonies, held in Sydney, in November, 1874, and proposed Programme of Proceedings.

I.—THE REASONS FOR CALLING THE CONFERENCE.

These I will give under two heads or branches.

1.—THE IMPORTANCE OF THE INTEREST INVOLVED.

The importance of the pastoral interest will be best seen by taking the latest available returns of the Horses, Cattle, and Sheep in the five Colonies represented at this meeting, and estimating their value and the Annual Return from them.

STATEMENT of the number and approximate estimate of the value of the Horses, Cattle, and Sheep, in New South Wales, Victoria, Queensland, South Australia, and Tasmania, in 1873.

Colony.	Horses.			Cattle.			Sheep.			Total value of Horses, Cattle, and Sheep in each Colony.
	Number.	Average rate per head.	Value.	Number.	Average rate per head.	Value.	Number.	Average rate per head.	Value.	
New South Wales...	328,074	5	1,640,370	2,710,374	4 0 0	10,841,496 0 0	20,000,000	10	10,000,000 0 0	22,481,566 0 0
Victoria	185,796	12	2,229,552	812,289	4 10 0	3,655,300 10 0	10,575,219	10	5,287,609 10 0	11,172,462 0 0
Queensland	90,000	5	450,000	1,400,000	4 0 0	5,600,000 0 0	7,403,334	8	2,961,333 12 0	9,011,333 12 0
South Australia ...	87,455	8	699,640	174,381	5 0 0	871,905 0 0	5,617,419	8	2,246,967 12 0	3,818,512 12 0
Tasmania	22,612	12	271,344	106,308	4 10 0	637,848 0 0	1,490,746	10	745,373 0 0	1,634,365 0 0
	713,877	5,290,606	5,203,352	21,668,549 10 0	45,086,718	21,241,283 14 0	48,138,439 4 0

This makes the total value of the Horse, Cattle, and Sheep Stock of the five Colonies amount to more than £48,000,000,—a very large sum, and, as will be noticed, entirely exclusive of the value of the runs on which the stock are depastured, which of course is also affected to a very considerable extent by the state of the health of the stock.

APPROXIMATE Estimate of the Annual Return from the Horses, Cattle, and Sheep in the Colonies of New South Wales, Victoria, Queensland, South Australia, and Tasmania, taking the Annual "Cost" of Horses at $\frac{1}{4}$ th of the whole number, of Cattle at $\frac{1}{4}$ th, and of Sheep at $\frac{1}{4}$ th; and the average weight of the Clip in Victoria at 3 lbs. of washed wool per Sheep, and in New South Wales, Queensland, and South Australia at 2½ lbs. per Sheep. For Tasmania the average actual quantity of wool exported during the last four years is taken.

Colony.	Horses.			Cattle.			Sheep.			Wool.			Total Value of Annual Return from Stock in each Colony.
	Annual Cost.	Rate per head.	Value.	Annual Cost.	Rate per head.	Value.	Annual Cost.	Rate per sheep.	Value.	Clip.	Rate per lb.	Value.	
New South Wales...	41,011	6	246,066	451,729	5	2,258,645	4,000,000	10	2,000,000	50,000,000	1 6	3,750,000	8,254,711
Victoria	23,224	12	278,688	135,381	6	812,286	2,115,043	10	1,057,521	31,725,000	1 6	2,379,375	4,527,870
Queensland ...	11,250	6	67,500	233,333	5	1,166,665	1,480,666	10	740,333	18,500,000	1 3	1,156,250	3,130,748
South Australia ..	10,931	9	98,379	29,063	7	203,441	1,123,483	10	561,741	14,043,547	1 4	936,236	1,799,797
Tasmania	2,826	12	33,912	17,718	10	177,180	298,149	12	178,889	5,000,000	1 6	375,000	764,981
	89,242	...	724,545	867,224	...	4,618,217	9,017,341	...	4,538,484	119,068,547	...	8,596,861	18,478,107

The sum here shown as the annual return from the pastoral properties in the five Colonies, (say) £18,478,107, is a very large one, and proves the great importance of the pastoral interest to the Colonies. There is no doubt however but this amount, large though it be, might be considerably increased if the stock were as far as possible protected from diseases which are preventable; for were I to estimate the loss now sustained in the five Colonies by preventable diseases at only 5 per cent. of the annual return estimated as above at £18,478,107, that would give £923,905,—nearly a million sterling a year. If this be the case,—and there is very little question but that the loss is more than double that amount,—a determined and simultaneous effort ought surely to be made by all the Colonies to eradicate these diseases as far as circumstances will allow; and where that course cannot be entirely carried out with regard to some diseases, the endeavour should be made to circumscribe their scope and effect as much as possible.

Losses by Disease.

Approximate estimate of the Losses sustained by the Australian Colonies up to this date through preventable diseases in Stock:—

By pleuro pneumonia in Cattle	£8,000,000
By Scab in Sheep	20,000,000
By Catarrh	2,000,000
						<u>£30,000,000</u>

This

This is exclusive of the losses from Foot-rot, Fluke, and Worms, which are also to a certain extent at least infectious or contagious and preventable, and which must amount to a good many millions sterling. While the correctness of the estimate here given of the losses through disease cannot be fully established, it cannot, I am sure, on the other hand, be shown to be far from the truth.

At any rate, the amount set down as loss by Pleuro-pneumonia is within the mark, for it is now allowed on all hands that the first attack of that disease carried off from 30 to 40 per cent. of all the stock in New South Wales, and there have in some instances been two, three, and even four attacks since the first.

As to Scab, the losses from that disease have from first to last in this Colony been very great. In Victoria, some twenty years ago, it was estimated that there were 5,000,000 of infected sheep, and the losses in that Colony alone through the existence of the disease must be over 10 millions sterling. In Tasmania again, four years ago, almost all the sheep were infected, and had been for a great many years; while in South Australia and even in Queensland very severe losses have been sustained through this disease.

The losses from Catarrh,—which is now it is hoped finally eradicated,—were very heavy in this Colony, and also in Queensland and Victoria.

2.—CIRCUMSTANCES OF THE COLONIES.

1. The circumstances of the Colonies, as regards the keeping and moving of live stock, are such as to make the establishment and maintenance of a perfect quarantine impracticable, so far as regards cattle, and to render it a matter of certainty that if an infectious or contagious disease obtain a footing among that description of stock in any of the Colonies, it will soon spread to them all. The circumstances here alluded to are the following:—

- (1.) The extensive and constant intercolonial traffic in cattle, by which, if an infectious or contagious disease exist in any of the Colonies, it is certain to be spread to all the others—passing, as cattle frequently do, over a thousand miles of country, and through perhaps two or three different Colonies.
- (2.) The constant passing of bullock teams all over the Colonies and from one Colony to another, after, it may be, travelling through and camping on infected runs and mixing with infected stock.
- (3.) The straying of stock from one run to another, and from one Colony to another, and thus where they are infected carrying disease with them, in spite of any number of boundary riders.

As, therefore, the maintenance of a perfect quarantine is impracticable, it is useless for one Colony to attempt to protect itself against the introduction of any infectious disease which may appear in the cattle stock of any of the neighbouring Colonies, by issuing a proclamation against the introduction of cattle from the infected Colony.

2. Even where a quarantine can be maintained such as in the case of sheep, the want of similar and simultaneous action by all the Colonies has been a source of constant inconvenience and expense, and has led to the loss of millions of money to stockowners in the different Colonies, in the following ways:—

- (1.) By the issuing of prohibitions against the introduction of stock, and thus stopping the trade in stock which would otherwise exist.
- (2.) By the enforcement of regulations calling for the inspection and quarantine of stock on their introduction from other Colonies, thereby entailing inconvenience, expense, and loss of time.

II.—OBJECTS OF CONFERENCE.

1. To deliberate on subjects relating to the prevention of diseases in stock which are of Intercolonial importance.
2. With that view, to propose and discuss motions relating to such subjects.
3. To submit resolutions for the consideration of the Governments of the different Colonies.

III.—PROGRAMME OF PROCEEDINGS.

With the sole view of expediting the business of the meeting, and without the least desire to forestall the decision of the Conference in regard to the selection of questions for discussion, I beg leave to submit the following list of subjects for your consideration:—

1.—DISEASES CALLING FOR LEGISLATION.

1. What Diseases in Stock call for legislative interference, and which of them have obtained a footing in the Colonies and which not.

Diseases already in Australia.

1. Pleuro-pneumonia.
2. Scab in sheep.
3. Catarrh.

Diseases not yet in Australia.

4. Rinderpest.
5. Foot and mouth disease.
6. Small-pox in sheep.
7. Glanders in horses.

2.—DISEASES CALLING FOR CONSIDERATION.

1. Worms.
2. Fluke.
3. Foot-rot.
4. Cumberland disease.

3.—ORDER OF BUSINESS.

I would also, with the same view, propose that these subjects be discussed in the following order :—

1. Pleuro-pneumonia.
2. Importations from places beyond the Colonies.
3. Scab in sheep.
4. Worms in sheep.
5. Foot-rot.
6. Fluke.
7. Catarrh.
8. Cumberland disease in cattle and sheep.

4.—POINTS RELATING TO DISEASES TO BE DISCUSSED.

With respect to each of the diseases already in the Colonies, the following points might perhaps be discussed :—

- (a.) Nature.
- (b.) Cause.
- (c.) How it was introduced.
- (d.) To what extent it prevails.
- (e.) How it has spread.
- (f.) How it is to be dealt with.
- (g.) And, generally, any other questions relating to diseases in the colonial stock (whether infectious or not), and their prevention.

With respect to the diseases not now in Australia, the following questions will have to be discussed :—

- (a.) Which of these diseases are liable to be introduced?
- (b.) From what parts of the world is their introduction to be guarded against?
- (c.) Effect of their introduction?
- (d.) How is their introduction to be prevented?

5.—GENERAL SUBJECTS.

1. The framing of Intercolonial Regulations for the extinction of infectious and contagious diseases in stock, and the conduct of the stock traffic between the different Colonies.
2. The collection and publication of statistics with respect to disease, under the authority of the law in each Colony.
3. The carrying out, reporting, and comparing experiments for ascertaining the nature, cause, and cure of diseases in stock.

No. 2.

CIRCULAR Letter by the Government of New South Wales to the Governments of the several Australian Colonies.

THE COLONIAL SECRETARY, NEW SOUTH WALES, to THE CHIEF SECRETARY, VICTORIA.

New South Wales.
Colonial Secretary's Office,
Sydney, 14 July, 1874.

SIR,

I have the honor to transmit to you, herewith, a copy of the printed Report of the Chief Inspector of Stock for this Colony on the Infectious and Contagious Diseases in Stock prevailing in Europe, which affect or are likely to affect Australian live stock; and to request that the attention of your Government may be invited to the 6th and concluding section of that Report, in which it is suggested that, with the view of securing joint and simultaneous legislative action on the part of all the Australian Colonies in dealing with those diseases, the Chief Inspectors of all the Colonies concerned (each accompanied by a veterinary surgeon) should be invited to meet in Sydney to consider the question and report to their respective Governments on the subject.

2. The Governments of South Australia, Tasmania, and Queensland have been communicated with on the subject; and I have the honor to request that your Government may be invited to consider Mr. Bruce's suggestion, and that I may be apprised as early as convenient whether your Colony is prepared to assist in giving effect to his proposal.

3. It is proposed that the projected meeting of Chief Inspectors, &c., should be fixed for Monday, the 31st of August next.

I have, &c.,
HENRY PARKES.

Under separate cover.

No. 3.

PRINCIPLES for Intercolonial Regulations for the extinction of Infectious or Contagious Diseases in Stock, and the conduct of the Stock Traffic between the different Colonies, as submitted to the Conference.

I.—INFORMATION TO NEIGHBOURING COLONIES.

1. That each Colony communicate by telegraph full and distinct information as to the position, extent, and nature of every outbreak of infectious or contagious disease in stock as quickly as possible to the Chief Inspectors of the other Colonies.
2. That the Inspectors in the border districts be instructed to send immediate information by telegram to the nearest Inspectors of the neighbouring Colonies of every outbreak of such disease which occurs within fifty miles of the border.
3. That the track by which the disease was introduced, and the history of the outbreak, as well as the possibility of its extension, are to be carefully examined into, and the Inspectors for the districts into which this track leads in the neighbouring Colonies are to be always put in possession of these particulars with the least possible delay.
4. That every Colony in which any such disease exists shall publish quarterly in the Government Gazette a report upon the state of the disease, what prohibitory measures have been issued, their alterations or rescindment.
5. That this report be sent direct to the Chief Inspectors for the different Colonies.

II.—MEASURES FOR THE ERADICATION OF DISEASE.

6. In these suggestions the term "infected" is held to apply to any stock which are actually suffering from or affected with any infectious or contagious disease, or which have within the next preceding six months been in direct or indirect contact with stock so suffering or affected, or been dressed or dipped for scab within that period; and one infected animal in a mob or flock is held to render the mob or flock infected.

The term "stock" shall mean and include horses, cattle, sheep, pigs, and goats, as usually defined.

7. That each Colony forthwith initiate such measures as shall effect the speedy extinction of all infectious or contagious diseases in stock which are controllable by quarantine, and shall take such measures with respect to all these diseases not so controllable as shall prevent their spread and tend to their gradual extinction.

8. That in order to remove every inducement to the owners of infected stock to conceal the fact of their being so, all animals killed and goods destroyed by order of the Government, for the purpose of suppressing disease to be paid for by the Government, at a rate equal to their value at the time they are destroyed; and the expenses incurred in destroying such stock or goods be borne equally by the Government and the owners.

9. That all conveyances which have served for the transport of live stock, and all fittings and articles which have been used by or with such stock, and from which there is any risk whatever of infection spreading, shall be disinfected before being again utilized; as well as all conveyances, fittings, and articles which have served or been used in the transport of manure, fodder, litter, or other matters which have their origin or been in contact with animals suspected of disease.

III.—CONDUCT OF INTERCOLONIAL STOCK TRADE.

10. That where an outbreak of disease occurs in any Colony, the neighbouring Colonies may, pending the extent and risk of the outbreak being definitely ascertained, at once issue a prohibition against the introduction of stock from such Colony, and the duration of such prohibition shall depend upon the amount of risk arising from such outbreak.

11. That if it be clearly shown that the outbreak is only an isolated one, or only of a limited extent, and confined to only one or two districts, and that the measures for isolation and extinction are there carried out according to the same principles and with the same stringency as in neighbouring Colonies,—in that case the export of stock from the remaining non-infected portions of the first-mentioned Colony, situated at a safe distance from any spot in such Colony where infection exists, may be allowed to the neighbouring Colonies under the following conditions, namely:—

1. *As regards all stock,*—

- (1.) That they are admitted at appointed places only.
- (2.) That the drover shall supply a written statement giving the following particulars:—
(a.) Whether or not the stock have within the next preceding six months been in direct or indirect contact with infected stock. (b.) The place from which they started. (c.) The nearest centre to such place of any infectious or contagious disease in stock of the same description as those presented for inspection. (d.) The nature and extent of such disease. (e.) The route by which such stock travelled to the place on the border where they are inspected. (f.) The nearest centre of infectious or contagious disease as aforesaid to any portion of such route.
- (3.) That they are inspected at such place previous to crossing or landing, and be found to be apparently sound.

2. *As regards sheep,*—

- (4.) That when introduced overland they be branded with a letter, to indicate the Colony from which they are to be introduced—say N for New South Wales, Q for Queensland, A for South Australia, and V for Victoria.
- (5.) That they in every case be accompanied by a certificate of their freedom from disease, and of their not having been in direct or indirect contact with infected sheep during the next preceding six months: and that they have not been dressed for disease for six months previously.

(6.)

- (6.) That where they are conveyed by train, the trucks in which they are carried shall have been thoroughly cleansed and disinfected previous to the sheep being put into them; and when introduced by sea, that the portion of the vessel where they are to be penned was cleansed and disinfected in the same way.
- (7.) That they undergo a quarantine of a sufficient duration at the port of debarkation, or on the border, and be properly dressed with some thoroughly effectual dressing, to the satisfaction of the Chief Inspector.
- (8.) That they do not leave the quarantine until the Inspector in charge shall certify that they are free from disease.
12. That the individual Colonies shall communicate to one another by whom and in what manner these certificates have been drawn up, and for how long they are available.
13. That the trade in thoroughly dry skins, bones, horns, hoofs, melted tallow in casks or skins, cow-hair, and goats' hair, in so far as these latter objects are packed in sacks or bales, as well as straw, hay, and other substances, between a non-infected and an infected Colony, is exempt from the operation of these Regulations.
14. That a Colony be not bound to compensate for any stock which may be attacked by disease and have to be killed, if such stock have not been the preceding sixty days at least within such Colony, unless it can be proved that the infection took place in the Colony itself.
15. That the suggestions be recommended for the adoption of and be held to be binding upon the Governments of the Colonies represented at this Conference; and where the law in any of these Colonies does not place the Government in a position to carry out these suggestions, it is further recommended that in such cases the Government take the very earliest opportunity of obtaining the necessary Parliamentary sanction.
16. That the Colonies of Western Australia and New Zealand be invited to adopt these suggestions.

No. 4.

SUGGESTIONS for regulating the Importation of Stock from places outside the Australian Colonies, as submitted to the Conference.

1. That the existing prohibition against the introduction of all stock, except horses, from places outside the Australian Colonies, be allowed to stand.
2. That on its expiry it be again renewed, and maintained until it is ascertained that no foot and mouth disease, rinderpest or sheep-pox, nor any other infectious or contagious disease in stock not known in Australia exists in Great Britain, when importations from these Countries might be allowed under the conditions hereinafter mentioned.
- (1.) That the introduction of all stock except horses shall be absolutely prohibited from all other Countries, and also from all Colonies except those agreeing to these Regulations.
 - (2.) That, with the view of placing the Governments of the several Colonies in a position to carry out these proposals, their Agents-General be instructed to obtain from the Secretary of Her Majesty's Veterinary Department, London, prior to the departure of each mail for the Colonies, a report as to what infectious and contagious diseases then exist among the live stock of the United Kingdom, and to what extent they are each known to prevail.
 - (3.) That the Agents-General transmit this report by each mail, and when necessary by telegram, to the respective Governments.
 - (4.) That when importations from the United Kingdom are renewed, all pedigree stock intended to be introduced from thence into Australia be examined at the port of shipment by a duly qualified veterinary surgeon, appointed conjointly by the Agents-General for the General Colonies, who shall make a satisfactory declaration that to the best of his knowledge and belief such stock are free from any infectious or contagious disease.
 - (5.) That the live stock (if any) for the use of the passengers put on board the same ship as the stock intended to be introduced into the Colonies, be also examined by the same veterinary surgeon, and certified in like manner to be also free from infection.
 - (6.) That every ship from places beyond the Australian Colonies, on arrival there, be boarded by an Inspector, and all stock intended to be landed from such ship, previous to being so, be examined by a duly qualified veterinary surgeon, or medical man.
 - (7.) That if such stock, or any stock whatever on board such ship, be found to be infected with any infectious or contagious disease not already introduced into any of the Colonies, all such stock be forthwith destroyed.
 - (8.) That if apparently free from disease not known in the Colonies, the stock intended to be landed be disinfected on board ship, and conveyed to a thoroughly isolated quarantine, to be there properly disinfected and to undergo a probationary detention, at the owner's expense, of *fifty* days at least.
3. That the Colonies of New Zealand and Western Australia be invited to adopt these Regulations.

No. 5.

PLEURO-PNEUMONIA.

PAPER prepared by Mr. Alexander Bruce, Chief Inspector of Stock, New South Wales.

(Laid before the Conference of Chief Inspectors of Stock, held in Sydney in November, 1874.)

1.—NATURE.

Pleuro-pneumonia in cattle has its seat in the first instance in the blood, being febrile in its earliest stages, but becoming typhoid in its second and third or last stages, with a specific termination in disease of the lungs and pleuræ, the changes in which (in the shape of inflammatory exudation) hold the same relation to the true disease that the eruption in small-pox does to the blood state in that disease.

The best authorities are in favour of not regarding this as a local disease originating in and confined to the lungs and pleuræ. It is, therefore, properly speaking a misnomer to call it pleuro-pneumonia, for it may never reach the second or third stages and affect the lungs, but exhaust itself in the first or febrile stage; and it is upon this fact that the efficacy of inoculation is based.

2.—CAUSE.

It has now been settled beyond all question that the cause of pleuro-pneumonia is infection or contagion conveyed either directly or indirectly from the diseased animal to the sound.

In proof of this I might quote the opinions given by six authorities of the highest standing in Great Britain, in reply to a question put to them by the Directors of the Scottish Chamber of Agriculture, in September, 1868. The gentlemen I refer to were—

James B. Simonds, Royal Veterinary College, London ;
 Professor Williams, Principal of the Veterinary College, Edinburgh ;
 Professor M'Call, Principal of the Veterinary College, Glasgow ;
 Professor Hugh Fergusson, H.M.V.S., Veterinary Department, Ireland ;
 John Edwards, Esq., Abergele, North Wales ; and
 Finlay Dunn, Esq.

The question was—"Is the disease contagious, or how does it continue to exist?" and their answers were as follows:—

Simonds—Infectious.
Williams—Decidedly contagious.
M'Call—Do
Edwards—Very contagious.
Fergusson—Decidedly infectious and contagious.
Dunn—Distinctly contagious.

I may also add that every intelligent unprejudiced stockowner in the Colonies has arrived at the same conclusions from his own personal observations.

3.—INTRODUCTION AND SPREAD OF PLEURO-PNEUMONIA IN AUSTRALIA, AND THE LOSSES CAUSED BY IT.

Pleuro-pneumonia was introduced by a cow brought from England by Mr. Boadle, of the Plenty District in Victoria, and landed in Melbourne in 1858.

When the disease was first discovered among Boadle's cattle, steps were promptly taken to eradicate it. All the cattle on the farm were paid for by private subscription and destroyed, and the farm placed in quarantine; but through a greedy, ignorant neighbour putting some of his cattle into one of the infected paddocks, the measures adopted were rendered nugatory, and the disease spread throughout Victoria and to all the other Colonies. On its doing so, attempts were made one after another to stamp it out; but for the reasons which I have stated in my opening paper—the impossibility of establishing a perfect quarantine—these efforts all proved worse than useless, and the disease is now more or less prevalent in them all, and likely to be so without fresh legislation; for travelling stock are so frequently affected that, no sooner has a fresh race of animals grown up which have neither had the disease nor been inoculated, than they are infected by cattle travelling through their runs.

The losses caused by the disease during the thirteen years it has prevailed (it did not spread to any great extent till 1860) cannot be estimated at less than 40 per cent. of the whole number of cattle (say 5,000,000)—that is about 1,750,000 head, which at (say) £4 10s. a head, makes the total loss to the Colonies, through this disease, amount to nearly £8,000,000.

That

That this is a very moderate statement of the losses sustained throughout the Colonies will, I think, be allowed when it is recollected that the losses sustained by dealers and butchers on the roads are not included in the above percentage—that some herds have, during the period referred to, been attacked two, three, and even four times—and that while there are now three times as many sheep in this Colony as there were in 1862, there were, up to last year, actually fewer cattle in the Colony than in 1862.

4.—INOCULATION IN AUSTRALIA AND THE RESULT.

Upon the failure of these attempts to stamp out pleuro-pneumonia, which was caused, as has been explained, through the impossibility of maintaining a perfect quarantine, stockowners began to look round for some other means of combating the disease. They saw at once that their cattle were too wild, and of comparatively too little value to be doctored; they therefore turned to inoculation, which was recommended by Mr. Cleote, of Zandoliet, Cape Colony, in a letter published in the Sydney and Melbourne papers of December 1861; and the first to make the attempt was Mr. Thomas Mitchell, Little River, Victoria. Shortly afterwards the Messrs. M'Laurin, of Yarra Yarra, New South Wales, and other owners in their neighbourhood, also tried inoculation with decided success. These experiments, which were fully reported by me and published from time to time by the Government of New South Wales, speedily induced other stockowners, in all the Colonies, to try the operation; and inoculation, as a preventive for pleuro-pneumonia, is now generally practised in all the Colonies with decided success. I am quite within the mark when I say that up to this time a million and a half of cattle have been inoculated in Australia.

Notwithstanding that the first attempts at inoculation were made under the most unfavourable circumstances, a very large majority of the stockowners in all the Colonies from the first expressed themselves strongly in favour of the operation, and that majority has since gone on steadily increasing. Thus, when the opinion of the stockowners in New South Wales was asked in 1867, it was found that only in six districts out of thirty-four were they reported by the Inspectors as "not in favour of inoculation," and in only one of these six districts did the owners express themselves decidedly against it.

In April, 1869, again, 1,200 copies of a circular, containing a series of questions with respect to inoculation and its efficacy, were distributed by the Inspectors of Sheep among owners possessed of more than 200 head of cattle.

To those questions 501 replies were received, of which 279 were from owners who inoculated their herds, and 222 from those who did not do so. In the case of the former, the greater part of these replies convey the required information, but in many of the latter they are both meagre and incomplete.

Tabulated lists of these returns by owners were prepared by me, giving the substance of the more important replies; and from these lists again two abstracts were made up, which showed, with respect to owners *who inoculated* their herds, that there were 25 neither for nor against inoculation, 237 in favour of it, and 17 against it; or *about 14 for, to 1 against, inoculation*. Of the returns by owners *who did not inoculate*, there were 75 neither for nor against inoculation, 102 in favour of it, and 45 against it; or *about 7 for, to 3 against, inoculation*. While taking *both classes* of returns together, there were in all 100 neither for nor against inoculation, 339 in favour of it, and 62 against it; or, *upon the whole returns, about 5½ for, to 1 against, inoculation*.

The foregoing figures exhibit a very strong case in favour of inoculation—indeed, they establish its efficacy; but although they do so, it may not, perhaps, be out of place to call attention to an additional fact, elicited by this inquiry, which is strongly confirmatory of that result; it is,—that while the returns by the owners who inoculated show on the one hand that the disease, according to the size of the herd and the extent of the infection when inoculated, disappeared in the course of a *few weeks*, or at most of a few months, after the cattle were inoculated, those by the owners who did not do so show that, in many cases, the disease existed in their herds for *several years*. *In no case can it be gathered that the disease lasted over six months in a herd which had been properly inoculated*. On the other hand, again, it will be seen that the disease has in the uninoculated herds existed in 3 herds for 6 years, in 9 herds for 5 years, in 6 for 3 years, in 2 for more than 2 years, in 13 for 2 years, in 6 for 18 months, in 2 for 15 months, in 2 for 14 months, in 1 for 13 months, in 2 for more than 12 months, and in 11 for 12 months; *while it still exists in 18 of these herds, and has done so for periods of from 2 to 6 years*.

Since that inquiry was made, the practice of inoculation has become still more general in proportion to the extent of the prevalence of the disease,—the number of cattle affected being of course fewer than at first,—while the results have been far more satisfactory, the owners having gained more experience in the mode of inoculating. This is borne out by the returns annually received by me since that time, from the District Inspectors; but I need only trouble you with those for 1872 and 1873.

In 1872 the Inspectors in *twenty-two* districts report the owners as in favour of inoculation; in one district as against it, and in *one*, divided, while in *ten* districts no returns were received from owners on this subject. In 1873 again, the Inspectors in *twenty-six* districts report the owners in favour of that treatment, and in *three* districts as divided, while in *five* districts owners failed to return answers in regard to inoculation.

Stockowners found their belief in the efficacy of inoculation on the following grounds:—

1. That in almost every instance where inoculation is properly tried, the disease shortly disappeared from the herd, in a shorter or longer period, according to the size of the herd, but always before *three months* from the date of inoculation.

2. That while the disease thus disappears in a short time from the herds which are properly inoculated, it continues in those which are not inoculated for periods of from *two to six years*, according to the size of the herd.

3. That cattle which have been properly inoculated when sound, with a few solitary exceptions, never afterwards become diseased, although they may frequently mix and sometimes even be put into the same paddock as inoculated cattle which are dying of the disease.

4. That where the right sort of virus is used and the operation properly performed, and the weather not too hot, the deaths from inoculation never exceed more than *two* and seldom more than *one* per cent.

There have certainly been frequent instances of the failure of inoculation, but these could always be traced to one or other of the following causes:—

1. *To the cattle being badly diseased when operated upon.*—In most cases the owner did not inoculate until he was thoroughly alarmed, and he did not become so until he lost perhaps 15 or 20 per cent. of his cattle by the disease. The consequence was, that when he did inoculate *three-fourths* at least of his herd were diseased, although they perhaps did not appear to be so; and the operation would require to be a cure, as well as a preventive, to be thoroughly or even moderately efficacious under such circumstances.

2. *To the use of improper virus.*—The directions first received for selecting the right sort of lung and virus were very vague and meagre, and a great deal of virus which was worse than useless, in fact actually deleterious, was used by those who were most anxious to perform the operation correctly. Not only was a great deal of virus which was thoroughly unfit used in those ways by owners and others who were most anxious to perform the operation correctly, but many pretended professional inoculators, who knew little or nothing as to how the operation ought to be performed, and who did not care what sort of stuff they used, so long as they made, as they often did, from £5 to £10 a day, went about from station to station inoculating, and it was quite impossible that in their case the operation could be attended with success.

3. *To a wrong mode of operating.*—The first instructions on this head also were very defective, or rather erroneous. Even after better information had been obtained, and considerable experience acquired in taking the virus and inoculating, the operation was frequently badly performed through carelessness and haste.

4. *To the great heat of the weather when the cattle were inoculated.*—At certain seasons of the year the weather in Australia is by far too hot for an operation of this description when performed on quiet cattle, and it can easily be seen how very much worse it would be, and how many more cases there would be of mal-inoculation in such weather, with comparatively wild "bush" cattle, which are always heated and excited when driven into the yard, and almost maddened by the operation in the inoculating pen.

5.—INOCULATION IN ENGLAND.

Until the last few years, Professor Gamgee, late Principal of the New Veterinary College, London, was the only authority of standing in England who upheld inoculation for pleuro-pneumonia, and he is still a consistent supporter of that treatment.

I only met with two other veterinary surgeons in England who were so—Mr. Duguid of "The Browns" Institution, Wandsworth Road, and Mr. Priestman, Caledonian Road, London. Mr. Priestman had inoculated about a thousand cows with uniform success.

Although not an advocate for the practice, Professor Brown, Chief Inspector for Her Majesty's Veterinary Department, London, is a believer to a certain extent in its efficacy. He admitted to me, in December last, that the belief in it was gaining ground in England, and that the best course which could be adopted in Australia with infected cattle was to inoculate them.

Inoculation is also practised by the dairymen in the suburbs of London; and in the end of last year an inquiry was carried out, at the suggestion of Professor Gamgee, by Mr. Morgan Evans, among the dairies in those localities, when he found that of thirty-two dairymen who had inoculated their cattle there were thirty decidedly in favour of the practice.

INOCULATION ON THE CONTINENT OF EUROPE.

So far back as 1863 a resolution was passed by the First International Veterinary Congress of veterinary surgeons from all parts of Europe,—held at Hamburg, in July of that year at the suggestion of Professor Gamgee of London—"That all cattle suspected of being infected with pleuro-pneumonia should be inoculated"; and that while not a single voice was raised against the efficacy of inoculation, some of the members of the Congress—which included such men as Professors Gerlach and Hertwig of Berlin, Roll of Vienna, Nicklas of Munich, Haubner of Dresden, Hering of Stuttgart, and Gamgee of London—went so far as to propose that a law should be passed making the operation compulsory in all such cases.

I also found from personal inquiry, in November and December last, that the efficacy of inoculation was fully established in Belgium, Holland, Germany, Austria, France, and Italy. The heads of the veterinary departments in these Countries one and all expressed themselves decidedly in favour of inoculation, and, on learning from my letter to the "Veterinarian" the manner in which our cattle are kept and managed, strongly recommended its practice in Australia; in fact, they went so far as to say that no veterinary authority of any note on the Continent now disputed the efficacy of inoculation.

I further learned from Professor Muller, of Berlin, that the practice in Germany is,—when an outbreak occurs in such places as the beetroot sugar factories, where large numbers of cattle are fattened off on the refuse of the beet, and where there are, of course, frequent changes of stock,—to kill the diseased animal and inoculate the others. This practice is also generally followed in the case of outbreaks of pleuro-pneumonia in the large dairies where fresh cows are being constantly introduced.

RESOLUTIONS SUGGESTED.

From what has been said it will be gathered that the efficacy of inoculation for this disease is now thoroughly established on the Continent of Europe. I think I may safely say that it has long been so in Australia and also in South Africa, and it has latterly been practised with decided success in the United States of America. As, therefore, cattle affected with pleuro-pneumonia are still frequently kept and travelled, not only by those owners who are prejudiced against the practice of inoculation, but also by many who believe in its efficacy, but who defer inoculating until they send their fat cattle to market, or in other ways suit their own convenience,—I would suggest that a law should be passed in all the Colonies in which pleuro-pneumonia exists, containing some such provisions as the following:—

- (1.) That every mob of cattle which has become legally infected, *i.e.*,—in which there is any one or more animals which have been in direct or indirect contact with infected cattle,—be inoculated when the virus can be obtained in the mob or in any cattle within sixty miles of the place where the mob was found to be infected.
- (2.) That owners give notice of every outbreak of the disease to their neighbours, to Inspectors, and to the public.

- (3.) That none but properly qualified and licensed inoculators be allowed to inoculate for others.
- (4.) That all inoculated cattle be branded as such with a brand to be fixed upon.
- (5.) That properly inoculated cattle depasturing on a run, on the expiry of *six weeks* from the last case of disease, be allowed to leave the run and to pass over infected ground without being deemed infected.
- (6.) That cattle which become infected and are not inoculated should not be allowed to leave their run for *three months* after the last case of disease, nor to travel over infected ground.
- (7.) That all individual travelling cattle showing that they are actually affected with or suffering from pleuro-pneumonia be killed immediately they are found to be so.
- (8.) That if the travelling cattle in which any animal is thus found to be actually affected be fat stock, they be taken by day to their destination by the roads least likely to spread the disease, and timely notice be given by their drovers to all owners of horned stock on or near the road that the mob is infected.
- (9.) That where the travelling cattle in which any animal is thus found to be actually affected with pleuro-pneumonia are store stock, they be forthwith stopped and inoculated, and afterwards taken to their destination, as provided for in the next preceding regulation; but such cattle be not required to travel more than six miles a day for the first thirty days after being inoculated.
- (10.) That the owner of travelling cattle give notice of his intention to cross or pass along runs where stock of the same description are kept, if the road be not separated from the run by a sufficient fence.
- (11.) That the drover do not abandon any travelling stock, nor leave the carcasses of any stock which may die undestroyed, under a penalty not exceeding £1 when the stock are not infected and £50 when they are.

The conclusions then at which I arrive in regard to pleuro-pneumonia and its proper treatment in these Colonies are the following:—

1. That as in all other parts of the world, so in Australia, every attempt to cure this disease has proved utterly futile.
2. That the endeavours which were made in the Colonies to stamp it out by destroying the infected herds were complete failures, through the impossibility of maintaining a perfect quarantine.
3. That inoculation for pleuro-pneumonia is now very generally practised, and has proved a thorough preventive against the disease.
4. That under these circumstances the only course left for us is, either—
 - 1st. To let matters stand as they are, and allow those owners who are either too selfish or too prejudiced to inoculate their infected cattle, to travel them, as they are now doing, from one end of Australia to the other, leaving the dead and dying, and spreading the infection in all directions, whereby the Colonies suffer a loss of something like half a million a year; or,
 - 2nd. We must pass some such measure in all the Colonies as that here indicated, making the inoculation of infected cattle compulsory, and otherwise regulating the cattle traffic.

Reduced to these two alternatives the decision must be easily arrived at; for it is simply barbarous that the law should continue to allow mobs of diseased cattle to be driven through, it may be, scores of runs on which the stock are free from infection, and infect them; and the only course left is for all the Colonies to pass some such measure as that here suggested. It is to be hoped that they will adopt this course; and if they do, there is every reason to believe that the losses from pleuro-pneumonia will be speedily reduced to a tithe of what they now are, and that the disease will eventually be eradicated.

While there is no doubt as to the efficacy of inoculation for pleuro-pneumonia, it is very essential that the best mode of carrying out that treatment, both as regards the sort of virus to be used and the manner of operating, should be ascertained; and I would suggest that the different modes of inoculating as practised by the owners in the several Colonies should, wherever the operation is at all properly carried out, be strictly watched by the Inspectors of Stock, and that full and careful reports on each case should be regularly transmitted to their Chief Inspector, who would arrange the information thus obtained, and compare it with that collected in a similar way in the other Colonies.

ALEXANDER BRUCE.

No. 6.

INOCULATION FOR PLEURO-PNEUMONIA.

PAPER prepared by Mr. Alexander Bruce, Chief Inspector of Stock, New South Wales.

MODES OF OPERATING.

The operation has been performed in many different ways. At first a portion of the diseased lung was tied to or inserted under the skin of the tail; but this mode was soon found to be altogether erroneous and was discarded.

At present cattle are usually inoculated on the outside of the tail, about 1 to 1½ inch from the tip, in one or other of the four following ways, namely:—

1. With a lancet or knife dipped into the virus.
2. With a grooved inoculating knife.
3. With a needle like an elongated spaying one, about 5 inches long, and a thread saturated with virus.
4. With a needle fastened in a handle like a bradawl, with an eye in the point, by means of which short threads saturated with virus are inserted in the tail.

Of the four modes, I would give the preference to No. 3, as experience has proved that bad swellings are less likely to arise from the use of the needle and thread than the knife or lancet; and it is impossible to exercise the same care and exactness with the handled needle as with the other.

REMEDY FOR EXCESSIVE SWELLINGS.

The best mode of guarding against losses from excessive swellings is to examine the animals operated upon carefully, once, or, if possible, twice a day, from the 4th to the 30th day after they have been inoculated; and if there is the slightest puffing or swelling at the root of the tail or in the hind-quarters, to cut well into it with a good sized pocket-knife, however small and soft it may be, and insert in the wound a small pledget of tow saturated with Venice turpentine and butyr of antimony, black oil, or blistering ointment. When the gathering has been allowed to become at all indurated, a hot iron raised to a white heat might be tried in an incision made right through the gathering.

VIRUS USED.

Up to a comparatively recent period, the virus used for inoculating has been, (1) that taken from the lung in the second stage of the disease; and (2) that found in the cavity of the chest near the lung, which has just exuded from it. Lately, however, some owners have been inoculating with (3) the water found in the chest in cases where hydro-thorax has set in, and others have been using (4) preserved virus, prepared by adding to Nos. 1 or 2 glycerine in the proportion of 1 to 1.

There is no doubt as to the efficacy of sorts 1 and 2; but there is often considerable difficulty in selecting the animal that will, when slaughtered, yield the right sort of these descriptions of virus; and if No. 3 prove thoroughly effective, there is no doubt but it will be generally used in preference to Nos. 1 or 2, for it is much more easily found; and, as it is a great deal weaker, fewer dangerous swellings will follow its use. If this is the case, the question also arises whether or not the virus from the lung or its surroundings, *i.e.* sorts 1 and 2 is not too powerful, and has caused the dangerous swellings which have not unfrequently occurred even in cases when the inoculation was carefully performed. If this again be answered in the affirmative, a very great advantage indeed will be gained; for not only will virus, as we have seen, be more readily and plentifully obtained and used with less risk, but it will be possible by adding an equal quantity of glycerine to sorts 1 and 2 to preserve the virus for any length of time, and thus have a thoroughly effective virus when required. It is to be hoped that this will be the case, as it would put us in a very much better position for eradicating the disease by inoculation; and every possible endeavour should be made to settle the question by inducing owners to try the water in the chest and report the result.

No. 7.

SCAB IN SHEEP.

PAPER prepared by the Honorable James Whyte, Chief Inspector of Stock,
Tasmania.

(Laid before the Conference of Chief Inspectors of Stock, held in Sydney in November, 1874.)

Having, at the request of Mr. Bruce, undertaken to write a paper on the subject of "Scab in Sheep," embracing at the same time some account of what has been done in Tasmania to eradicate the disease there, I find, on sitting down to redeem my promise, that I am placed in a much greater difficulty than might be supposed, considering I have had considerable experience in connection with the subject.

On various occasions during the last six years, through the Press and otherwise, I have written a good deal on this question, by way of advice and instruction, addressed to the sheepowners of Tasmania; but it has been done in a disconnected and desultory manner, from time to time, to suit circumstances as they arose, and to meet the fanciful objections of those who held to the belief in *spontaneous generation* and the impossibility of completely eradicating scab in a Country with the physical conditions of Tasmania. Such articles, therefore, even if I had them with me to refer to, would not be of much service for the present purpose.

Moreover, so much has been written by others, and written so well, during the last ten years, on the subject of this disease and its cure, that there is really nothing new to be said regarding it which can be expected to prove of much practical value to the sheepowner. I will not, therefore, attempt to travel out of the path so clearly indicated in Mr. Alexander Bruce's Treatise on "*Scab in Sheep and its Cure*," published in 1864, and "*An Essay on Scab in Sheep, its causes, symptoms, pathology, best means of treatment, and practical hints for its avoidance and extermination, &c.*," by Mr. Edward M. Curr, published in 1864 or 1865. In short—I believe it would be sufficient for the present Conference of Inspectors in dealing with "Scab and its Cure" simply to recommend the republication and sale of the pamphlets referred to at a cheap rate, in order to secure to the least informed sheep owner in Australia all the knowledge he requires to enable him to deal speedily and successfully with scabby sheep, if he should be unfortunate enough to become the possessor of such very undesirable property.

At a meeting of this kind composed of practical men, called together for the purpose of devising and recommending to the several Australian Governments the adoption of Regulations for the eradication and prevention of diseases in cattle, horses, and sheep, &c, in a paper on the "Scab Disease" it may be interesting to those I am addressing, and possibly useful to others, if I give a brief sketch of my experience in connection with the working of the Scab Act and the history of previous legislation on the question in Tasmania.

The first effort to free the flocks of Tasmania from scab was made during the government of Sir W. Denison, nearly thirty years ago; when a Scab Act was passed which, like some of the first Scab Acts of New South Wales, failed to accomplish the object of its framer, and remained a dead letter on the Statute Book. It did not provide any machinery for carrying out the law; and, so far as I know, it was never acted upon in a single instance.

The question was often discussed amongst a few of the settlers who had visited the neighbouring Colonies and had observed the superior condition of the flocks there, and the greater advantages derived from clean sheep as compared with the condition of their own flocks and the smaller amount of profit arising from them; but nothing further in the way of legislation was attempted until 1863, when I caused a Bill to be introduced to Parliament which proposed to repeal the obsolete Act of Sir William Denison's time and provide a more practical method of dealing with the subject. When the second reading of this Bill came on, I found so many of my country supporters were opposed to a Scab Act of any kind that it became a political necessity to withdraw the measure. The result was that the matter was shelved for a further period of five years.

In the meantime the necessity for legislation had become more generally felt amongst sheepowners in the Principal sheep districts; and at their instance, I believe, the late Mr. George Gibson, then a Member of the House of Assembly, and a warm advocate for a stringent Scab Act, introduced and carried a Bill through that Chamber in 1868. When this Bill came on for consideration in the Legislative Council, I observed that it was somewhat crude in its nature, and, like its obsolete predecessor, failed to provide the machinery to carry it out. It was therefore evident to me that it would share the same fate as the Act it proposed to repeal. At a meeting of gentlemen deeply interested in the subject, when I pointed out wherein the Bill was, in my opinion, defective, I was asked if I could frame a better one. My reply was, "Yes, I think so, if I have time." It was then agreed that the Bill then before the Council should be allowed to pass, postponing the time for its coming in force until after the next Session of Parliament; and I thereupon undertook to prepare a more practical and comprehensive measure to bring forward in 1869.

During the recess I prepared the "Scab Act 1870," and after meeting a violent opposition in the House of Assembly, arising from a variety of causes it is unnecessary to specify here, the Bill was passed, although in a crippled form, both as to penal provisions and the means for carrying them out.

I felt satisfied, however, that defective and crippled as the measure was, it yet contained sufficient powers for good to prove something more than the "thin end of the wedge," and would demonstrate to the sheepowners, as a body, that it was quite practicable to clean sheep in Tasmania as easily, if not more easily, than in the neighbouring colonies.

One of the difficulties I had to contend with in framing the Bill was to provide for a state of things which did not exist in any of the neighbouring Colonies, where infected and diseased sheep were exceptional, the majority of the flocks being clean when the various Scab Acts then existing were passed. The whole of the Tasmanian flocks being infected, with a very few exceptions, it was necessary so to frame the Act that its operation would not all at once harshly or oppressively interfere with commercial transactions, while at the same time it would check to a large extent the dissemination of infection by the travelling of diseased sheep, and provide compulsory measures for eradicating the disease as rapidly as possible under the circumstances. Another difficulty, and the greatest one of all, was that a very large proportion of the sheepowners were unbelievers in the possibility of effectually curing sheep at all; inasmuch as they thought the disease was one which sheep were always subject to more or less; and that the terms *clean* and *scabby*, were comparative terms dependent upon the amount of scab which might exist in one flock as compared with another; and also dependent upon the amount of care bestowed upon them by their owners in the way of dressing. Another considerable section believed that sheep were clean elsewhere; but they believed at the same time that the nature of the country in Tasmania was such that it was hopeless to expect the sheep could be collected so closely as to ensure a perfect and effectual dipping and therefore anything beyond a mere compulsory dipping Act would be useless and vexatious to boot. The number of sheepowners who thoroughly believed that it was as practicable to cure sheep of scab in Tasmania as elsewhere, and who were earnestly determined to support me in carrying out any measure to that end, no matter how stringent it might be in its provisions, was so small that I believe I could name them on a page of foolscap paper without any difficulty, even if I were to add the names of their residences and the districts in which they reside. Fortunately for the interests of the Country, a considerable number of the latter class had seats in both Houses of Parliament, and their influence effectually defeated the efforts of those who opposed the Bill.

The section of sheepowners favourable to the Bill, although desirous of having a stringent Act, agreed with me that for a period which we fixed at eighteen months the Act should be very mild, not only in its provisions but also in its administration; that it should be, in fact, merely a compulsory dipping Act for that period, combined with the prevention of visibly diseased sheep travelling on the public highways; and when this *probationary period* had expired, then the more stringent clauses of the Act should come into operation. The mode in which this view was carried out will be explained as I proceed.

While preparing the measure, naturally I had occasion to have much correspondence with sheepowners throughout the island, conveying to them on my part reasons deduced from my own personal experience, in the Colony of Victoria, with scabby sheep in the first place, from 1838 up to 1841-2 and 3, and afterwards with the same sheep, clean up to 1854. Doubtless, the fact of my having prepared the Bill, and having in the course of a violent opposition to it shown that I was practically acquainted with the subject, induced a desire amongst some leading settlers that I should undertake the administration of the Act as Chief Inspector. Consequently, the Government proposed to me that I should carry out my own measure. Having committed myself to very confident statements regarding the absolute certainty of success, fully believing in the certainty of results if it should be prudently carried out, and fearing its failure and almost certain repeal within eighteen months, if committed to the care of an inexperienced or injudicious administrator, I undertook to carry out the law.

It must be borne in mind that in 1869 the whole of the Tasmanian flocks were infected and diseased, more or less, with the exception of a few—certainly not embracing a larger number than between 20,000 and 30,000 sheep, chiefly in the Midland and Northern Districts.

The leading features of the Act were—compulsory dipping twice immediately after shearing, at an interval of not less than ten nor more than fourteen days, in some reputed scab-destroying preparation, and the prevention of *visibly diseased* sheep from travelling on the highways or being exposed for sale in public sale yards. The last-mentioned provision was only to remain in force for eighteen months, but was, at my instance, subsequently extended by Parliament to twenty-six months, giving, at the same time, power to the Governor in Council, on the recommendation of the Chief Inspector, to extend the time for any further period not beyond the 1st day of March, 1873. On my recommendation, this period, *which may be termed the probationary period of the Act*, was extended only to the 1st November, 1872.

Up to this date licenses to cleanse were issued without any fee. On the 1st November, 1872, all sheep still infected had their licenses renewed for six months on payment of one farthing per head; and on the 1st of May, 1873, all infected sheep were liable to a license fee of 3d. per head, the Chief Inspector having the power to issue the license for any period not exceeding six months. As a rule they were and are issued for three months only.

The "Scab Act, 1870," was passed during the Session of 1869, and it was intended by me that it should come into operation on the 1st of January, 1870; but, unfortunately, through some misconception of the probable results which might arise if a later date should be fixed upon, an amendment proposed by an enemy of the Bill was carried, which postponed the date when the Act should become law until the 1st of March, 1870.

As the general shearing season terminates early in January, the postponement of the Act taking effect until the 1st of March acted generally as a postponement of the operation of the compulsory dipping provisions for twelve months, or until after the termination of the shearing season of 1870-71. But although this was the general result of the change in the date of the Act becoming law from the 1st January, 1870, to the 1st of March of the same year, there were many sheepowners who acted upon the impression that dipping was compulsory immediately after the shearing of 1869-70, and in many cases with such satisfactory results that some gentlemen who had very strongly and earnestly opposed the introduction of a Scab Act, in the firm belief that it would be so detrimental to the interests of sheepowners that possibly, nay probably, it would involve the ruin of themselves and that of hundreds of others of the same class,—on finding how beneficial their compliance with the dipping provisions of the Scab Act had proved, wrote and otherwise informed me of the fact; and ever after that time heartily lent me the weight of their influence upon public opinion, and the benefit of their advice in enabling me to frame the Scab Act Amendment Act, No. 2, which became law on the 21st December, 1871.

Since

Since then the Act has been amended and added to on three several occasions to meet defects which its working had disclosed, and to have re-inserted the same or similar provisions to those which had been struck out of the first Bill in its progress through Parliament in 1869.

One of the leading features of the Act as it stands now provides that any person found in possession of infected sheep is liable to a penalty of not more than £50, and a license fee of 3d. per head for any period the Chief Inspector may fix, not exceeding six months. An Inspector in any case of this kind may take possession of the sheep and report the same to the Chief Inspector, who may direct such steps to be taken for the purpose of cleansing the said sheep as he may think fit; and if the owner refuses to comply with the directions of the Chief Inspector in any such case, the Act empowers him to destroy the sheep.

Several cases have arisen where it has become necessary to take possession of sheep and have them dipped under efficient direction; but in no case have I found it necessary to destroy a flock, and I believe no such case will ever arise.

When any portion of country has been declared a "clean sheep district," no sheep of any kind can enter therein without a written permit from an Inspector. In other respects the law is much the same as in the neighbouring Colonies with reference to registration of brands, returns, &c., &c.

The owner of infected sheep, in addition to the license fee of 3d. per head, is also, in the event of a mixture with clean sheep through defective fences or otherwise, liable for the cost of dipping the flock so infected, and damage to the amount of not more than £50. This has been felt to be an absurdly low amount in several cases, but nevertheless up to the present time the full amount has never been exacted.

The penalties generally are much smaller than in any of the other Australian Acts, and as a rule there was a strong disinclination on the part of country Benchers to inflict a maximum penalty. This feeling, however, has become very much modified of late—so much so indeed that I shall be in no way surprised, when the several Acts come to be consolidated next Session of Parliament, if I am requested to propose an increase of 50 per cent. at least to some of these penalties. I have no doubt whatever that the disinclination to inflict anything like sufficient penalties during the years 1871 and 1872 considerably retarded the cleansing process. This I took occasion to point out from time to time, but I am sorry to say without much avail.

The progress of the work accomplished by the Scab Act in Tasmania may be shortly stated as follows:—

All the sheep in the island, excepting between 20,000 and 30,000, were infected and diseased, more or less, when the Act was passed on the 22nd of October, 1869, to come into operation on the 1st of March, 1870.

On the 1st of May, 1871, 126,916 sheep were under clean certificates, but double that number were believed to be in a condition to claim it.

In the month of December, 1872, in compliance with an order of the House of Assembly, I furnished a rough progress return of the number of sheep on the 1st of that month in the several sheep districts, as being under clean certificates, clean certificates applied for, and other sheep supposed to be clean at that date, as follows:—

Sheep under clean certificates	688,064
Sheep certificates applied for	120,000
Sheep supposed to be clean, but for which the owners had not applied for clean certificates, or for which strictly they would not be legally entitled to certificates of cleanness	100,000
Estimated number clean on 1st December, 1872...	908,064
On the 1st of May, 1873, the following return was furnished to Parliament:—				
Sheep under clean certificate	1,002,104
90 per cent. of 243,514 sheep for which clean certificates have been applied for	219,162
80 per cent. of 82,992 sheep for which no applications for clean certificates have been made in accordance with the Act	66,393
Estimated number clean on 1st May, 1873	1,287,659
Number under license on 1st May, and other sheep considered doubtful	84,398
				1,372,057

The last return laid before Parliament was made up to the 1st of June, 1874. The summary of that return gives the total number of sheep in the island on the 1st of January last, and their condition on the 1st of June, as follows:—

Number of sheep clean	1,503,846
Number under license	27,396
Total...	1,531,242

The report has the following remarks on the above returns:—

The appended return shows that only 27,396 sheep are now known to be infected. I may observe, however, that all these sheep have been carefully dipped, and I believe that many of the lots are now clean. Certainly 50 per cent. of the 27,396 sheep are only nominally infected. A considerable number of these have been dipped as a precaution, and having come in contact with infected sheep, are consequently under license; but notwithstanding this they may be considered virtually clean, although they cannot be moved as clean sheep under the Act until the expiration of their license, and a clean certificate obtained from the Inspector.

At this date, the 1st of November, I may safely state that the number of sheep actually infected is under 10,000, and I feel assured that it is not an unreasonable thing to believe that in another year the island of Tasmania and the islands in the Straits will be wholly freed from scab disease.

The complete eradication would have been accomplished, I believe, in 1873, but for the postponement of the Act coming in force having postponed compulsory dipping until the shearing season of 1871-72, and the inadequate provision made in the first place for an efficient inspecting staff. Until November, 1870, I could only afford to have two sub-inspectors, then three more were appointed, and in the following year an additional

additional one, for itinerating purposes, and to assist the others on occasions of emergency. In 1873, and for the current year, the assessment was increased from one farthing to one half-penny per sheep, which will barely suffice to maintain the existing staff during 1875, when the assessment will again be reduced to the original amount viz., one farthing per head, unless Parliament may think it requisite to continue the half-penny per head another year. At present I am not prepared to say whether or not it will be necessary. Had the assessment been one half-penny per head from the first, as I proposed it should be, and which would have passed but for the violent feeling against a Scab Act of any kind whatever, which was entertained by a very considerable section of the House of Assembly in 1869, I have no hesitation in again repeating my firm conviction that in 1873 the disease would have been eradicated. It was a wretched piece of parsimony, miscalled, or rather alleged to be economy; whereas, in truth, the real design lurking in the minds of its advocates was an anxious desire and intention to destroy the Bill.

When I began to prepare material to frame the Bill in 1869, I made in the first place a calculation of the loss fairly attributable to the existence of scab, and embodied it in a letter addressed to sheepowners, through the Press. This calculation showed an annual loss of £120,749, arising from the following causes, viz. :—Loss in quantity of wool, loss in value of wool, cost of dressing, cost of profitless labour, and loss on stud and fat sheep.

Another calculation was made at the same time, at my request, without any knowledge of each other's opinions on the several points, by Mr. Robert Clerk, of Malahide, who had had many years experience in Victoria as a sheepowner in the Western District, and his estimate was £145,676 per annum. At the time I had no doubt of Mr. Clerk's estimate being more accurate than mine with regard to the total amount, but I preferred adhering to my own, as the smaller and safer calculation to base arguments upon.

In 1872, after the Scab Act had accomplished much that had been predicted, I revised my calculation of 1869, and arrived at the conclusion that when the scab disease should be wholly eradicated, the increased income of sheepowners would amount to £153,000 per annum, as follows :—

Revised Estimate of probable Annual Gain to be derived from the complete eradication of Scab.

1. Increased quantity of wool, say 562,500 lbs., or 6 ozs. per sheep, at 1s. 4d. per lb.	£ 37,500
2. Increased value of present quantity, taking 5,000,000 lbs. as an average, at 3d. per lb.	62,083
3. Cost of dressing annually for tobacco, drugs, and additional labour in dressing under the old system of spotting every few weeks	13,500
4. Saving of the labour of 500 men at £50 each	25,000
5. Increased number and value of fat sheep, say	10,000
6. Increased export of rams and ewes to the neighbouring Colonies, say	5,000
Total	<u>£153,000</u>

Now I am satisfied that the above amount was fully realized in 1873, and will certainly not fall short of it in 1874 and future years.

The first item I have ascertained by reference to the books of settlers, who were good managers under the old system with scabby sheep, is 8 oz. instead of 6 oz. increased weight of fleece, with hot water washed wool got up in the best style. With regard to the increase of weight on badly managed flocks, in many instances I believe from $\frac{3}{4}$ to 1 lb. per sheep is not an exaggerated quantity. Taking the numbers of sheep for a series of years, from 1863 to 1869 inclusive, with the average quantity of wool produced, and comparing them with the years 1870 to 1873 inclusive, an increase of nearly 10 oz. per sheep is clearly demonstrated as the result of the Scab Act.

The calculations of 1869 and 1872 were laughed at by many settlers at the time, and pronounced to be absurd exaggerations; but now many of these unbelievers who thought them the delusions of mere theoretical dreamers, admit that their own experience has proved to them that the scouted calculations were not the dreams of enthusiasm, but the sober and careful conclusions of practical men, based upon data derived from the results of their own former experience in the early years of the settlement of the Colony of Victoria.

All the items in the calculations, excepting the 4th, are under the mark, the two last more particularly. For instance, in 1873 the value of stud sheep exported to the neighbouring colonies was nearly, if not quite, £20,000. It is true the Scab Act did not make these sheep, but it preserved if it did not create the market for them.

In a letter which I addressed to sheepowners in 1869 or 1870, when I was endeavouring to arouse them to a sense of the enormous loss the Colony had sustained through the presence and almost universal prevalence of scab, I made a statement that during the last forty years a sum of not less than £3,500,000 had been lost from that cause alone. The statement to many minds appeared to be a rash one; but now, after a fuller, and I believe more intelligent and matured consideration of the subject, I feel justified in stating my conviction that if another £1,000,000 had been added it would have been an understated amount instead of an exaggeration.

Ten years ago Mr. Curr, the Chief Inspector of Victoria, stated that that Colony was then losing half a million per annum on, I think, about 5,000,000 of infected sheep, and I have no reason to believe it was other than a moderate estimate. What amount all the Colonies collectively, directly and indirectly, have lost from scab it would be difficult to estimate with any degree of accuracy; but certainly it cannot fall much short of £20,000,000 sterling since 1835,—a sum nearly equal to the cost of construction of all the railways now open in Australia.

CAUSE OF SCAB.

Notwithstanding all that has been written on this subject, we are still utterly in the dark as to the origin of a disease which we have reason to believe existed in Italy in the early days of the Roman Empire. And I think it is of small importance to us what was its origin, when we know from the experience of half a century in New South Wales and over thirty years in Victoria that in the climatic conditions which exist

exist in this part of the world, scabby sheep once freed from the disease never contract it again, unless from contact with diseased or infected animals, or from contact with places where such animals have recently been.

This subject has been so well handled by Mr. Edward M. Curr that I think I cannot do better than give a quotation from his "Essay on Scab." After referring to various authorities on the subject, he dismisses the theory of spontaneous generation with the following observations:—

But however undecidedly Youatt, Gamgee, and others may have expressed themselves on this head, it is stated by some sheep-owners in Victoria, roundly enough, that scab is occasionally the result of spontaneous generation, and that they know instances of it. As far as my experience of sheep has gone in this and the neighbouring Colonies during five-and-twenty years, I must acknowledge I have never been able to hear of scab having appeared in flocks under circumstances which could not be accounted for without having recourse to the hypothesis of spontaneous generation. But on this subject the very loosest ideas obtain; and to such of my readers as interest themselves in the matter, I would recommend the perusal of Carl Theodor von Siebold's remarks in his opening chapter on tape and cystic worms, in which he makes some very pertinent reflections on the whole subject of equivocal generation.

To finish with this subject then. It is clear that the scab could not originally, and in the first instance, have been the result of contact; but that it must either have been created with the sheep, or have resulted from some other principle or process of nature. My ideas lead me to the latter belief, and to the probability of this disease being eventually traced to some other form of living thing, as has already happened in the cases of other parasites. Be this as it may, it will remove all reasonable fears of the frequent occurrence of spontaneous generation of scab by calling to mind that this question may be considered to have been set at rest for all practical purposes by the well-known and undeniable results of sheep-farming in New South Wales. There, upon large tracts of country, subject to many varieties of climate, feed, and other circumstances, millions of sheep have been depastured for forty years, without the occurrence of scab in any one instance until it was imported from this Colony. New Zealand and Queensland verify the same fact. Hence we may conclude that the spontaneous generation of scab, if possible, can only, at all events, be of the rarest occurrence, and that its consideration may be safely left to the man of science, postponing the discussion of "*How does spontaneous generation take place?*" until it be proved that spontaneous generation has actually occurred.

SYMPTOMS AND BEST MODE OF CURE WITH SULPHUR AND TOBACCO.

The symptoms of the disease, and the best mode of cure with a mixture of tobacco and sulphur, have been so fully dealt with in the pamphlets of Messrs. Alexander Bruce and Edward M. Curr, referred to at the commencement of this paper, that I think it would be a mere waste of time, if not a piece of presumption on my part, to attempt to add anything by way of improvement to what they have written. I therefore recommend any person desirous of getting valuable information with reference to the symptoms of the disease and its cure to purchase one or both of the pamphlets referred to.

I may observe, however, that the mode of mixing sulphur and tobacco, recommended by Messrs. Bruce and Curr, does not contemplate the sulphur being dissolved—the tobacco is in fact the cure, and the sulphur is to preserve the sheep from re-infection.

Doubtless if the tobacco is good, and the mixture properly applied, it is a very effective and certain cure; but it is possible for the tobacco to be bad, particularly if home-grown "knock-me-down," cut perhaps at an improper time.

My experience in Tasmania during the last three years leads me to prefer a mixture of sulphur and lime as being the most certain cure, without any risk of the article being bad in quality.

The following correspondence discloses how the subject came under my notice in June, 1870, and how I brought it before the sheepowners afterwards:—

TO THE EDITOR OF THE MERCURY.

Sir,

As the season of the year is rapidly approaching when sheepowners will be called upon to dip their sheep in accordance with the provisions of the "Scab Act 1870," it appears to me to be very desirable that publicity ought to be given to any interesting information bearing upon a question not only of importance to the owners of sheep, but of vast importance to the public at large, from its bearing upon the value of the export of wool from Tasmania, and the supply of wholesome food to its inhabitants.

Notwithstanding all that has been said and written on the subject, and the varied experience of sheepowners not only here but in every Colony in Australia and New Zealand, there is still a great diversity of opinion amongst sheepowners here as to the best and cheapest mode of effecting a cure. There are many known certain remedies, but some of them are highly objectionable on account of the danger to the constitution of the sheep; such as arsenic and corrosive sublimate, both of which are certain remedies if properly applied, but so liable to accidents, and so troublesome to those using them, that I would strongly advise their being abandoned as a dressing for sheep in any shape or form whatever. And as we cannot be certain that some of the "specifics" that have of late years been used in this Colony and elsewhere are not to some extent composed of these objectionable and dangerous drugs, it seems to me unwise to use them when simpler, cheaper, and more certain curative mixtures can readily be procured.

In seeking to clean his sheep the settler ought to satisfy himself that the dress he uses is a certain remedy if properly applied. This is the most important consideration no doubt; but if two mixtures are equally certain as a cure, the next important consideration is, which is the safest for the sheep, as well as the cheapest for the sheepowner.

I have invariably recommended a mixture of sulphur and tobacco, as the cure is certain and it cannot injure the sheep; but from recent observation of the effect of sulphur and lime, as recommended by Dr. Rowe, of Victoria, I am inclined to think that its use as a dipping mixture is well worthy the consideration of sheepowners, before the arrival of the shearing season.

These remarks have been induced by the result of an experiment with sulphur and lime by Mr. Barnard, a settler on the banks of the Tamar, who called upon me in June last, to inspect two sheep very much diseased which had got into his flock.

I visited Mr. Barnard's farm on the 10th of June, and after examining the sheep referred to, authorized him to destroy them. In the whole course of my experience I never saw sheep in a worse condition with scab than one of them exhibited. After some conversation with Mr. Barnard, who appeared to take a lively interest in the question generally, and what was considered the best mode of cure, it struck me that, instead of destroying the two scabby sheep, they would be excellent material to experimentize upon, and on naming this to Mr. Barnard, he readily adopted the idea, and promised to dip them in the mixture of sulphur and lime, the efficiency of which we had been talking about.

The result of the experiment I received in a letter from Mr. Barnard to-day, a copy of which is appended.

The quantity of sulphur per gallon, used by Mr. Barnard, is only half the quantity recommended by Dr. Rowe; and although in the present case two ounces of sulphur per gallon appear to have been sufficient, I should prefer the larger quantity, as the article is so cheap.

August 15, 1870.

I am, &c.,
JAMES WHYTE.

Sir,

In compliance with your request I dipped the two sheep that you examined on the 10th June in a preparation of sulphur and lime, and I have now the honor to inform you of the manner in which I treated them, and with what results.

On the evening of your inspection I dipped them for the first time, using 2 ozs. of sulphur and 2 ozs. of slack lime to the gallon, at a temperature of 120 degrees, allowing the sheep to soak for rather more than a minute. On the 20th of June—ten days—they were dipped again in a mixture of the same strength and at the same temperature. You will remember

remember that one of the sheep was a mass of hard scab across the shoulders and a large part of the back, and there were also many large lumps containing matter, the remainder of the sheep was covered with hard spots of scab; the other sheep was not quite so much diseased. Of course the hard parts were well scarified before dipping. They have been kept apart from other sheep, and now a period of fifty-four days having elapsed since they were last dipped, I believe them to be, after careful examination, perfectly clean. The late inclement weather would surely have caused them to break out afresh if the scab were not completely killed.

James Whyte, Esq.

I remain, &c.,
THOS. BARNARD.

TO THE EDITOR OF THE MERCURY.

Sir,

At the present time when the shearing season is about to commence, and the compulsory dipping provisions of the Scab Act come into operation, any information bearing upon the question of what is an effective, and at the same time a cheap, dipping mixture is of much interest to a large number of your country subscribers. I would, therefore, recommend you to republish the following letters from Dr. John P. Rowe and Mr. John Sanderson, bearing upon the curative properties of a mixture of sulphur and lime.

I have known Dr. Rowe for more than twenty years as a large sheepowner who has had a most extensive experience with both clean and scabby sheep; and from my knowledge of his personal character, I have perfect faith in the truthfulness of his relations as to the results of his own experiments with sulphur and lime.

The cheapness of this mixture is a great recommendation; and the evidence we have of its effects from Dr. Rowe in Victoria, and from those who in several instances used it in Tasmania last season, leaves no doubt whatever on my mind that as a cure for scab, if properly applied, it is a certain one.

There is a diversity of opinion as to its effect upon the wool, if used when the staple has a few months' growth, but this is not of much importance as regards dipping immediately after shearing. To settle the disputed point as to the alleged injury a mixture of sulphur and lime inflicts upon the wool, by depriving it of one of the properties the manufacturer prizes so highly, viz, softness, it would be very desirable if some of our sheepowners would try an experiment with a sufficient number of sheep from a flock, and send the wool home with the bulk of the clip to be examined and tested by the most competent judges in the London market, who could compare the wool from the sheep which had been dipped in lime and sulphur when the wool had attained a considerable, or even a full growth, with wool from the remainder of the flock which had not been subjected to the same application, but had been dipped in some other mixture, say tobacco and sulphur or carbolic acid.

Both of the last-mentioned mixtures are no doubt certain scab-destroying agents, but they are both also more expensive than sulphur and lime. The duty having been removed from carbolic acid will materially reduce its cost, but even then it will prove more expensive than sulphur and lime. There are two advantages, I am told, which carbolic acid possesses over the other mixtures referred to; the first is, that it in no way injures the wool; and secondly, that it may be applied cold with equally certain results as if applied in a heated state. If this be true, and I shall certainly look upon it with doubt until I have fuller evidence of its being a fact, it would give to carbolic the first place amongst scab-destroying preparations, even although its first cost might exceed either of the other curative mixtures I have referred to, inasmuch as the saving of trouble and labour in preparing the heated mixtures would more than counterbalance the extra cost of the article which could be used cold. I am only referring, however, to what I have heard, and not to what I have seen. I should certainly not think of using the cold carbolic acid mixture, excepting by way of experiment.

To the class of smaller sheepowners, if there be a mixture that can be used effectively in a cold state, it would doubtless be of very considerable importance, but to the larger class of sheepowners it appears to me a matter of very small consequence the additional labour and expense of heating the dipping mixture, as compared with the saving which would arise from being enabled to use it in a cold state.

The consideration of every sheepowner at the present time, in my opinion, ought to be not so much which is the cheapest mixture to dip their sheep in, but which is the most certain in its effects, and at the same time not injurious to the constitution of the sheep.

Specifics of all kinds should be looked upon with the greatest suspicion, and be carefully avoided. The makers and vendors of such medicines are in many instances trading upon the ignorance and credulity of their customers. They pretend to be possessed of some superior knowledge. They offer to the settler, in fact, valuable results in a mysterious way, and keep him in ignorance of possible contingencies which may result from the use of their nostrums, the danger of which can be avoided by using simple compounds, the results of which are well known, and are, moreover, more certain than any specifics we have yet seen, and which cannot possibly injure the animals operated upon.

I would strongly advise sheepowners not to use arsenic or corrosive sublimate in any form whatever. They are dangerous applications, although certain cures, if properly applied. With the greatest care heavy losses have often resulted from their use, arising from atmospheric or other causes, which have never been as yet satisfactorily ascertained. Then why use such objectionable drugs when there are so many simple mixtures to choose from, equal, if not superior, as curative applications, and perfectly harmless to the sheep?

I append the letters referred to, which were published in the *Australasian* of the 22nd instant.

Your obedient servant,
JAMES WHYTE.

Hobart Town, 29th October, 1870.

LIME AND SULPHUR CURE FOR SCAB IN SHEEP.

TO THE EDITOR OF THE MANSFIELD INDEPENDENT.

Sir,

The solution of sulphur and lime (hydro-sulphuret of lime) is now pretty well known and acknowledged to be the cheapest and most reliable cure yet discovered for scab in sheep. It is quite equal in efficiency to the old and very unscientific mixture of tobacco and sulphur; is much cheaper and more reliable. The quality of tobacco cannot always be depended upon; sulphur is always genuine. At this period of the year, after our sheep are shorn, all diseases of the skin to which they are liable are more easily cured, and there is less risk of deteriorating the value of the wool by soiling, which all dippings, even in simple hot water are apt to do when the staple has advanced in growth to any extent. It cannot therefore be too extensively known that even one dipping in the above solution is sufficient to cure the most inveterate case of scab in sheep (even when its pelt has assumed the rhinoceros character) without in the slightest degree injuring the health of the animal or the fibre of its wool; and to assist sheepowners in endeavouring to banish at once and for ever the bane of the wool-growing interest, I am induced to ask you to publish again the recipe for its preparation and use.

Take of flour of sulphur 100 lbs., 50 lbs. of quick-lime (a large proportion of it partially slacked.) Put these together in a boiler with 100 galls. of water, keep mixed by constantly stirring for about ten minutes, or until a clear dark-brown orange-coloured solution supervenes. Then mix 1 gull. of this solution with 3 galls. of hot water, and make your dip or bath heated to from 100 deg. to 114 deg. Fahrenheit, and plunge your sheep over head in it, keeping them swimming in it for about one minute; when they are dry the cure is complete; but to prevent risk of re-infection, and to secure a more perfect muster, a second dip after about ten days, in a bath one-half the above strength will render assurance doubly sure. A compulsory simultaneous dipping of all the sheep in Victoria during next January would save the Country thousands of pounds, and render Scab Inspectors and Boards of Advice quite unnecessary. As the most valuable testimony of the effects of this cure on the wool of dipped sheep, I send you a letter I have received from Mr. Sanderson, the eminent wool merchant of Melbourne. It will also be found interesting just now to persons about to wash their sheep in the hot water soak. Mr. Sanderson, I believe, dipped his sheep in lime and sulphur when the fleece was about half grown, and if he is now able to get up his wool, as he says, "in colour perfect," nothing more can be desired. I regret this gentleman has not given us the contents of his soak, as we would then know the quantity of soap requisite; but perhaps he will supply this omission.

Your obedient servant,
JOHN P. ROWE.

Mount Battery, 12th October.

Brio

Brie Bric, Glen Thompson,
8th October, 1870.

My dear Dr. Rowe,

I have purposely delayed, until now, writing to you the result of dipping my sheep with your mixture of lime and sulphur, so that I could speak with certainty as to its effect on the wool when washed. I have now been waiting about a week, and I think I cannot give you a better report upon the wool than by sending you a sample of it, from which you will see that the colour is perfect, and that the dip does not leave the slightest stain. We are, however, obliged to use more soap than when the sheep were undipped. This is to be expected from the presence of sulphur requiring a strong soak to remove it. I began washing with the same quantity of soap as was used last year, and at first could not imagine what was wrong with the sheep, they were so dingy after leaving the spouts. We are using soft soap, which my manager thought was the cause; we then tried hard soap with the same result, but found that as we increased the quantity of soap in the soak the whiter the sheep left the spouts. Last season we used 12 lbs. of soap to the soak, now we use 24 lbs., and the wool was as well washed as I could wish. I was not on the station when the sheep were dipped, but my manager reports as follows:—“I used it in the following proportions —(I should mention we were dipping for ticks):—100 lbs. sulphur and 50 lbs. of lime to 400 gallons of water; put in the sulphur and add the lime as the water begins to boil; let it boil 10 to 15 minutes; let the boiler be only three parts full when the lime is added, else they will boil over. The result is certain destruction of all ticks in the sheep.” I have examined the sheep at various times during the year, and they have thriven well, the fleeces being particularly free and well grown. As to the extra quantity of soap required, the same would apply I imagine to all dips where sulphur is employed [yes, and to all where sulphur is not used.—J.P.R.], as I know from experience of scouring how difficult it is to get it out of the wool, and I have no hesitation in saying that sheepowners are greatly indebted to you for the discovery of the curative properties of lime and sulphur. Happily I have not had occasion to use the mixture for scab, but for ticks I would give it the preference over any other dipping stuff I have ever used.

With kindest regards and many thanks for your hints, believe me, faithfully yours,

JOHN SANDERSON.

J. P. ROWE, Esq.,
Mount Battery, Mansfield.

Since writing the letter to the *Mercury* of the 29th October, 1870, to which is appended Dr. Rowe's and Mr. Sanderson's letters as to the efficacy of the sulphur and lime mixture, I have had many conflicting accounts as to the virtues of carbolic acid. From all that I can learn, it appears to be susceptible of adulteration, and in a number of instances failure has been the result of its use; but at the same time I am not prepared to say that some of those failures may not have been as much to be attributed to want of care on the part of the sheepowner as to the inferior or spurious character of the carbolic acid. There is one thing very certain, that so far as the reports I have received enable me to judge, the great bulk of the flocks in which a thorough cure has been effected up to the present time were dipped in sulphur and tobacco and sulphur and lime. Some few sheepowners have used arsenic in various proportions from $\frac{1}{4}$ an ounce and under down to a very small quantity per gallon of tobacco water and sulphur, and report that they have been successful in effecting a cure without loss of sheep; others who have used arsenic have met with losses by deaths, although not to any considerable extent.

On more than one occasion I have publicly stated my dislike to arsenic,—although I know from my own experience that properly applied it is a very certain remedy,—and my objection to it is as strong as ever. I consider it a dangerous application, inasmuch as you can never be quite certain that from unexplained causes, possibly of an atmospherical nature, a number of sheep may be destroyed when the greatest amount of care has been exercised by the sheepowner both in preparing and applying the mixture.

Specifics and nostrums of all kinds, puff'd in the Press by agents of empirical pretenders, I would strongly advise sheepowners to refrain from using. I could name more than one sheepowner who has had during the past season reason to regret having been induced to use an application, the component parts of which are known only to the compounder. It appears to me to be the height of folly for any sensible man to run the risk of using a mixture, the nature of which he is profoundly ignorant of, when he can choose more than one mixture now well known to be thorough cures, while they are harmless to the constitution of the animal.

There is one point on which I fear some of those sheepowners who fail in the first place to effect a cure do not give sufficient attention to, and that is the necessity for a very minute examination of the sheep for spots of scab before they are dipped. When any exist they should be carefully hand dressed with a stronger mixture than the ordinary dip.

Melbourne, 12 January, 1872.

Sir,

I have the honor to thank you for your Report and copy of amended Scab Act, enclosed in your letter of the 5th instant, which has just reached me.

Whilst doing so I will take occasion to bring under your notice how very effective the lime and sulphur dressing has proved in this Colony. The failures which have followed its use have been fewer than what have succeeded any other sort of dipping; whilst its inexpensiveness, and the simplicity with which it may be prepared for use, and the speed with which it is made ready, are very much in its favour. As compared with tobacco it has another great advantage, that it has no variety in strength or quality, so that no selection of material is necessary.

Congratulating you on the success of your Scab Act,—

The Chief Inspector of Sheep, Tasmania.

I have, &c.,
EDWARD M. CURR.

The above letter from Mr. Curr shows that in the beginning of 1872 lime and sulphur had become the most highly esteemed scab-destroying preparation in Victoria.

I may state with safety that since 1871 more sheep have been cleansed in Tasmania with sulphur and lime than with any other mixture, and for two years past I have invariably recommended its use in preference to all other preparations.

I always recommend at the same time that in addition to the quantity of sulphur required to kill the scab insect, a quantity of raw sulphur should also be mixed with the dipping material, in order to remain on the sheep as a protection from re-infection when turned back on the same run, which generally had to be done in Tasmania, particularly in the case of very small settlers, of which the sheep-owning body there largely consist.

JAMES WHYTE.

No. 8.

SCAB IN SHEEP IN VICTORIA.

PAPER by Mr. Edward M. Curr, Chief Inspector of Stock, Victoria.

(Laid before the Conference of Chief Inspectors of Stock, in November, 1874.)

THE Conference having expressed their wish to be put in possession of the principal facts connected with scab in sheep in Victoria during the last twelve years, I may state shortly that at the end of the year 1862, when the eradication of scab was undertaken, that there were at least 5,000,000 of sheep in the Colony suffering from that malady. With few exceptions these sheep were running in flocks of two or three thousand each, in paddocks which were often insecure, which, coupled with the fact that the law provided no means by which the travelling of doubtful flocks could be prevented, led to the reinfection of runs which had already been cleaned, so that large bodies of sheep had to be cleaned twice over. Notwithstanding those disadvantages and drawbacks, however, the numbers of clean sheep slowly but steadily increased under the pressure of fines and licenses to the extent of (say) £50,000.

In the meantime, about three years since, the Scab Act now in force, in which for the first time power was taken to prevent the travelling of diseased flocks, came into operation, and under it the disease has been reduced to 120,000 sheep now in quarantine. This result has been effected at the cost of a very great (but necessary) inconvenience to the owners of sheep, as it might almost be said that the travelling of sheep during the last three years, except under the authority of an Inspector, has not been allowed. In carrying out this policy the support of the Boards of Advice has been a great advantage. The use of lime and sulphur, as a dressing for scab, has also largely contributed to the eradication of the disease.

Of the 120,000 sheep still in quarantine in Victoria, it may be stated that the majority of them are depasturing in country in which it is most difficult to muster sheep. Still, of these, I am in hopes that the moiety, at least, will prove clean. Could they be all mustered, a fortnight certainly would dispose of this remnant, and finally rid the Colony of scab. The difficulty lies in their collection alone, some stragglers carrying the germs of infection usually being left out. To meet this it will, in my opinion, be necessary in some cases to remove the sheep from the runs in question, so as to ensure the destruction of all the stragglers.

12th November, 1874.

EDWARD M. CURR.

No. 9.

SCAB IN SHEEP IN NEW SOUTH WALES.

PAPER by Mr. Alexander Bruce, Chief Inspector of Stock, New South Wales.

STATEMENT showing the number of Sheep infected during the outbreak of Scab in 1862-3, the progress made in cleansing them, and the result of the several dressings used.

DEALT WITH AND ACCOUNTED FOR UNDER THE ACT OF 1861.

Ascertained Numbers.

Number destroyed and paid for by the Government	40,503
Do. do. by owners of adjoining lands	2,339
	42,842

Estimated Numbers.

Died of poverty and disease	15,000
Drowned in the Floods	8,000
Boiled down	21,000
Destroyed without compensation	1,000
Killed by arsenic and other poisonous dressings	20,349
Do. tobacco and sulphur	2,000
	22,349
Cleansed before the present Act came into force	33,000
	100,349

DEALT WITH AND ACCOUNTED FOR UNDER THE ACT OF 1863. 143,191

Ascertained Numbers.

Number licensed and cleansed	199,809
Destroyed and boiled down	7,000
	206,809

Total number of Sheep infected during the late outbreak ... 350,000

PROGRESS MADE IN CLEANSING.

Cleansed between March, 1864 (when the Act of 1863 came into force), and 30th November, same year	102,252
Do. 30th November, 1864, and 30th November, 1865	82,433
Do. 30th November, 1865, and 14th July, 1866	15,094
	199,809

The Colony was declared clean on 1st July, 1866,—in something less than two years and a half after the Act came into operation,—but an outbreak occurred in a small lot after that in the County of Cumberland, which were soon cleaned.

RESULT

RESULT OF DRESSINGS USED.

Description of Dressing.	Numbers dressed.	Result of Dressing		Result of Dressing.	
		Failure, and other dressings tried.	Cleansed.	Failure, and other dressings tried.	Cleansed.
Allen's Specific	80,021	80,021
Hayes' Specific	87,186	80,931	6,255
Arsenic, and arsenic and tobacco	18,555	9,271	9,284	170,223	15,539
Tobacco and sulphur	184,270	92,530
Do. and lime.....			30,299
Do. and mercurial dip.....			61,441	184,270
			As above		199,809

From this it will be observed that tobacco and sulphur was by far the most effective dressing.

13th November, 1874.

ALEX. BRUCE.

No. 10.

SCAB IN SHEEP IN SOUTH AUSTRALIA.

PAPER by Mr. C. J. Valentine, Chief Inspector of Sheep, South Australia.

In submitting a statement relative to Scab in South Australia, I will confine myself to the last nine and a-half years. At the beginning of that period the flocks were clean but in the latter part of 1865 some doubtful flocks existed, and scab appeared in 1866 in about 4,000 sheep. Several other outbreaks occurred during the next few years. In 1867 over 3,000 sheep were destroyed, when a Quarantine Act was passed, which provided for the detention of infected and doubtful sheep within prescribed boundaries. This proved a very useful measure. Quarantine districts were continued until 1870, when diseased or doubtful sheep no longer existed in South Australia. During the four years referred to, about 70,000 sheep were infected. The sheep were cleansed with tobacco and sulphur, and lime and sulphur dressings. An Act which has been in force since 1859, providing that any travelling sheep found scabby should be destroyed, had a most beneficial effect in preventing the spread of disease.

C. J. VALENTINE.

No. 11.

CATARRH IN SHEEP.

PAPER prepared by Mr. Alexander Bruce, Chief Inspector of Sheep, New South Wales.

(Laid before the Conference of Chief Inspectors of Stock, held in Sydney in November, 1874.)

THE term catarrh is derived from the Greek word, *Karrappeo*, to flow down, and the disease may be described in general terms as a catarrhal fever, attended with an excessive flow of mucus from the nose and eyes.

There are two descriptions of catarrh—1st, what is known as *common catarrh*, a non-infectious disease affecting sheep at times in all parts of the world; and 2nd, *malignant catarrh*, peculiar to Australia. For the sake of convenience, the former will, in dealing with the subject, be termed *common catarrh*, and the latter simply *catarrh*, as it is the name by which it is known in these Colonies—not that it is the correct one.

Common catarrh may be either confined to individual sheep, or it may affect the greater part of a flock. In Australia it usually occurs in the winter or beginning of spring, and the sheep attacked are generally poor and weakly. It is most common among sheep which are housed. Those affected exhibit the usual catarrhal symptoms of discharge from the nostrils, defluxion from the eyes, coughing, and sneezing; but they do not, as in malignant catarrh, altogether stop feeding. This form of the disease is also distinguishable from malignant catarrh by the slightness of the discharge, the mildness of the attendant fever, and the absence of the laboured breathing which is always present in the latter. The chief tests, however, as to whether the disease is *malignant* catarrh are, its infectious character, the rapid development of virulent symptoms, and the large ratio of deaths. A flock should never be pronounced catarrhed because the symptoms in one or two sheep or the *post mortem* appearances are the same as those in some cases of malignant catarrh. In the absence of decidedly characteristic symptoms, the circumstantial evidence (so to speak) must be exceedingly strong to warrant the opinion that the attack is anything but *common* catarrh. Although this description of catarrh sometimes kills through the destruction of the nasal passages and gullet like *malignant*, it is more to be dreaded for its sequel, as the inflammation of the lining of the nostrils and gullet which accompanies the disease extends at times to the wind-pipe and the respiratory organs of the chest, terminating in consumption, which sooner or later carries off the sheep.

Common

Common catarrh is sometimes caused by cold and exposure; and the sheep should, in that case, where practicable, be removed to a more sheltered locality. At other times the affection is clearly epidemic, and must be allowed to run its course. Care, however, should always be taken not to allow sheep showing any catarrhal symptoms to come in contact with others, until it has been ascertained with certainty that the ailment is not *malignant* catarrh.

Malignant catarrh was first observed in June, 1834, among the flocks of Mr. Robert Campbell, of Burrowa; and although that may not have been the first outbreak of the disease, it then assumed a virulence which it never previously exhibited; for such a disease—carrying off as it did more than *three-fourths* of the infected flocks—could not possibly have existed without at once attracting attention. In the following March, April, and May, catarrh showed itself on several stations on the Lachlan River in the Binalong District, and appeared to spread from the one station to the other. It shortly afterwards broke out in the Goulburn and Yass Districts; and from these centres it seems to have spread throughout this Colony, and even to the southern parts of Victoria. To such an extent were its ravages carried that in 1838 a very restrictive Catarrh Act was passed to stay the further spread of the disease, and was renewed from time to time till 1842. It was then amended, and again in 1843 and 1846, and lastly in 1853 by the Act 17 Victoria No. 27, which is still in force. These measures had the effect of greatly diminishing the disease, and of confining it to the more upland and colder portions of the Colony, where, in some instances it seems to be constitutional, but is even there now fortunately of rare occurrence, through the improved management of the sheep, and partly also through some of the runs on which sheep were at one time kept being now stocked with cattle.

CAUSES OF CATARRH.

The causes of catarrh may be considered as *originating* and *existing*.

Originating causes.—Catarrh has been held by some to be a specific disease introduced with Saxon sheep imported shortly before its outbreak in this Colony; by others it is considered to have been caused by the lowering effect which the cross with these importations had upon the stamina of colonial sheep; and by some again the disease has been set down as an epidemic; while others hold that, as it did not appear for a considerable time after the introduction of sheep into this Colony, it is a disease which originated here through mismanagement.

The assumption that catarrh was introduced by Saxon sheep would appear to be unfounded, for there is no record whatever of malignant or infectious catarrh existing in Saxony or in any other part of Europe. It may be, however, that the crossing of the Australian sheep with the comparatively delicate and carefully nurtured Saxon Merino tended to assist the deterioration which the gross mismanagement of some sheepowners was then bringing about; and the opinions of those who take the second view of the question may be so far correct.

The opinion that catarrh is an epidemic, or rather an epizootic disease, is erroneous; for, if it were an epizootic, it would have occurred frequently and generally in all parts of this and the neighbouring Colonies, which it has not, and no legislation could possibly have arrested its spread, as we know the Catarrh Acts have so effectually done.

We now come to the opinion that catarrh originated in Australia, and through mismanagement of the sheep; and there is no doubt but that it did so, in the injurious system of breeding followed, and the maltreatment and neglect of the sheep on the part of some of the sheepowners who had taken to sheep-farming in the colder and more upland districts without any previous knowledge or experience. Those, then, were the true originating causes of catarrh in its malignant form, and would again produce the same disease under similar circumstances. They will be shortly noticed in detail, and for the sake of perspicuity are treated in two sub-divisions—the Predisposing and Exciting Originating causes—which again will be particularized in the order of the degree in which it is considered they affected the sheep.

PREDISPOSING CAUSES.

1. Breeding "in and in" for a lengthened period without selection.
2. Breeding and rearing lambs twice a year from the same ewes.
3. A continued system of breeding from rams or ewes which were weak or sickly, or too old, or too young.
4. The weakening of the constitution of the sheep by the use of mercurial preparations in curing scab.
5. Previous general debilitating diseases, such as fluké or foot-rot.

There cannot be a doubt but that No. 1 under this head was one of the chief, if not the chief predisposing originating cause of the disease. "In and in" breeding, when carried out in a healthy flock or herd under a proper system of selection, by a competent judge of the stock which he is breeding, both as regards their shape and their constitutional organization, need not deteriorate. It is only when attempted by incompetent or careless breeders who fail to make the proper selections, or perhaps, as was apparently done by many of the sheepowners at the time catarrh first showed itself, make no selection whatever, that "in and in" breeding is hurtful. This is now a well established fact; and while we know on the one hand that the healthiest and most valuable flocks and herds in the world are reared up under this system with proper selection, we see on the other the most worthless sheep and cattle produced by "in and in" breeding without selection. We thus find that the rule of like begetting like which pervades this system is a power either for good or evil, according as it is controlled and directed; and we can easily understand how a predisposition to disease would be intensified in the progeny of sheep, where the ewe and ram had, from a lengthened course of mismanagement of the flock to which they both belonged, become constitutionally weak and misshapen, and low comparatively harmless common catarrh became in such sheep, under a system of ill treatment, over-crowding, and exposure, on bleak upland runs, both a highly virulent and infectious or contagious disease.

Cause 2.—*Breeding and rearing lambs twice a year from the same ewes.*—This course was followed to a considerable extent, by many of the sheep-farmers of that period, on runs and in seasons wholly unsuitable for such a mode of management, and it is scarcely possible to imagine anything that would have a more debilitating effect, both on the ewes themselves and their progeny. To withstand the evil effects of even an occasional double crop of lambs in the same year, the ewes must be young and strong, and on the best pasture, while the climate must be mild and the season favourable.

The

The effects of *Clause 3*, although not so apparent in sheep which arrive quickly at maturity as in cattle, are undeniable both on the size and stamina of the sheep. If proof of this were required, it can be readily found in the small size of cattle on stations where breeding and fattening are combined, where there are no heifer paddocks, and where the spaying of the old cows is not followed.

Causes 4 and 5.—Although there is no proof on record that sheep which had been dressed with mercurial preparations for the cure of scab or which had suffered from fluke or foot-rot were more subject to catarrh than others, there is little doubt but that the general and indiscriminate use of preparations of mercury in the cure of scab and prevalence of fluke and foot-rot in sheep depastured on the upland runs, all tended to assist in the weakening of the constitution which preceded many of the outbreaks of catarrh.

That such flagrant violations of the correct principles of breeding as the predisposing causes here mentioned, and especially causes 1 and 2, should have brought on this disease, is only what might have been expected; and when in conjunction with these the exciting causes which will next be enumerated are considered, the only wonder is that the disease did not break out before it did.

SECONDARY OR EXCITING ORIGINATING CAUSES.

These causes may be enumerated as follow:—

1. Disorder of the digestive organs, arising from dry, innutritious, burnt, or frost-bitten food, and bad water.
2. Sending sheep out in cold mornings from an over-crowded yard, causing them to get chilled.
3. Dogging and overheating sheep full of grass and yarding them while a cold wind or frost is prevalent, especially when newly shorn.
4. A long course of dry, cold, windy, or frosty weather, following a dry summer.
5. Sudden changes in the temperature, such as sometimes take place, inducing chills and suppression of perspiration.
6. Folding sheep on low-lying damp ground, on the banks of rivers or creeks, or in wet, dirty yards.

These exciting or secondary originating causes have, like the predisposing, been arranged in the order of the degree in which it is considered they were most liable to have affected sheep at the time catarrh broke out. The bare enumeration of them will be enough to show the deadly influence they must have exercised upon sheep which had been rendered so susceptible to disease by the predisposing causes which have already been mentioned. It may, however, be remarked that, in by far the greater number of outbreaks which occurred in early times, disorder of the digestive organs was the exciting cause, and that it is so in the few cases which now occur.

To show that these exciting causes were prevalent at the time catarrh broke out in the Colony, we have only to remind our readers that sheep farming was then in its infancy, and that even those who had acquired a knowledge of the management of stock in the Old Country had many trials and difficulties to encounter in the Colonies. With Government men for servants, droughts, floods, cold winters, scab, and native dogs, the best managers had the hardest of battles to fight to keep their flocks in health and obtain a fair increase from them. If such was the case, with all their previous knowledge and experience, what, after a few years of these trials, must have been the condition of the flocks of those who commenced sheep-farming without any home or colonial experience,—especially on the cold upland country, on the coast range, where many of the runs were then situated, but one as it actually was of poverty and deterioration, followed by disease of a most virulent and infectious nature.

EXISTING CAUSES.

At the present day the causes of catarrh are hereditary or constitutional predisposition, and infection or contagion. There is no properly authenticated case on record of a fresh outbreak of catarrh originating in sheep after the disease was noticed in 1834, without hereditary predisposition or predisposition arising from the effects of a previous attack. These existing causes are still, of course, materially influenced by—or rather they never operate without—some of the exciting or secondary causes which have been enumerated, and principally, as has already been remarked, by disorder of the digestive organs.

As outbreaks of catarrh, of greater or lesser magnitude, occurred almost every other year in certain localities, it is apparent that the disease must be either constitutional or endemic (local). That it is constitutional and not endemic, is proved by the fact that sheep which have been once affected and removed to another part of the Colony have after a lapse of perhaps six or eight months and even longer, suffered again and again from the disease in the warmer localities to which they were taken, and where no fresh infection could have reached them. Then, again, this predisposition may be either the effect of a previous attack occasioned by infection, or it may be hereditary. That one attack will render sheep liable to another, even although moved to fresh pasture in another part of the Colony—salt bush excepted—is now quite certain; and there is no doubt but the disease is also hereditary; indeed, some good authorities even go so far as to say that it is so to the second and third generations, and instance cases in support of their views.

That catarrh is either infectious or contagious, or perhaps both, there does not now seem to be any doubt, and the general opinion is that the infection (the term is used in a general sense) is spread by the discharge from the nostrils of the diseased sheep. It is most probable, however, that, as in the rinderpest and other plagues, the nature of which have been carefully investigated, the fomites, or germs of the disease, are diffused, to a large extent, by the excretions of the animal, so also the infection, in cases of catarrh, may be spread in the same manner. In whatever way it is conveyed, the most certain means of infecting a flock—even more so than by inoculating the nostrils of the sound sheep with the discharge from the affected—is to put a few diseased sheep into a sound flock; and even feeding sound sheep over infected ground seems more certain to convey the disease than by inoculating in the manner described.

All breeds and ages of sheep are liable to infection, but young sheep under three years old are very much more susceptible than old or full grown. Old sheep not unfrequently escape scatheless where young sheep would have been certain to have been infected. This fact may perhaps account for the opinion still held by some that catarrh is not infectious or contagious. Like every other infectious or contagious disease, however, it spreads by no known certain rule. Sometimes sound sheep have been folded for the night with infected sheep, and for many nights in adjoining yards, without being attacked; and the discharge from the nostril of a diseased sheep has been placed in that of a sound one without communicating

communicating the disease. Again, sound sheep have sometimes been infected by merely crossing a run over which catarrhed sheep have passed, while on other occasions sound sheep have under apparently similar circumstances escaped infection.

The infection or non-infection of sheep must also depend upon the length of time which has elapsed between the passing of the infected and sound flocks over the same ground, the state of the weather in the interval, and the health of the sheep. How long under different circumstances the infection will remain potent in the vehicles in which it is ordinarily transmitted from the one sheep to the other is doubtful, but that it will do so for a considerable time is certain; for sheep have received the infection on ground from which catarrhed sheep had been removed for more than seven months; and it is the opinion of those best qualified to judge that sound sheep ought not to be allowed to go upon ground where a catarrhed flock had been running until twelve months have expired from the time the diseased sheep left it.

It has been found that, by carefully weeding out and destroying every sheep in an infected flock which shows the least symptom of disease, and changing the sheep to other ground, the disease will generally leave them; it is, therefore, reasonable to presume that catarrh is not infectious until the symptoms are pretty clearly developed.

NATURE OF CATARRH.

Catarrh, or as it is sometimes termed Australian catarrh, like consumption in the human subject, as we have seen, sometimes arises from exciting causes working upon a frame constitutionally predisposed to the disease, and, like consumption, the predisposition may be either hereditary or the effect of a previous attack. Here, however, the resemblance ceases, for catarrh may be conveyed from one sheep to another by infection, and its most correct definition seems to be that it is a hereditary or constitutional disease, which becomes on its outbreak a decidedly infectious or contagious catarrhal fever, and runs its course with great rapidity. Of all diseases, however, in the human subject or among the lower animals, catarrh seems to be more analogous to rinderpest than to any other in its origin and cause and the manner in which it spreads—although not so infectious as that terrible scourge, and differing from it also in other respects. Like the spontaneous outbreaks (*i.e.*, outbreaks arising from predisposition and not from infection) of rinderpest, those of catarrh are always traceable to stock or the progeny of stock brought from a cold, exposed, upland country,* and, like rinderpest, catarrh is not nearly so destructive in its natural habitat in that class of country as in a more genial climate. Farther, it is not at all improbable, that the same mismanagement and bad treatment which it is believed were the *originating causes* of catarrh in this Colony may have also originated rinderpest; and we know that the same causes which keep the germs of catarrh alive in our flocks are also continuing to perpetuate rinderpest in Asia and Europe.

Catarrh is rarely seen in the saltbush country, nor does it exist for any length of time when taken there by infected sheep. This is so well known that infected and doubtful sheep were, when it was practicable to do so, removed to this class of country from the higher, and cured, at least during their stay.

Outbreaks of catarrh usually occur in the months from April to September inclusive, and of these most frequently, perhaps, in June and July. Outbreaks in the autumn generally prevail more or less during the whole of the winter,—the weather having a most material effect on the number and virulence of the attacks. When catarrh attacks sheep at other seasons than those mentioned, the outbreak is traceable to some sudden and violent change of the temperature, especially after shearing.

The first outbreak of catarrh noticed (that already alluded to, on Mr. Campbell's station) took place in a dry frosty winter following upon a droughty summer; and a very large majority of the outbreaks which have occurred since that time have done so under similar circumstances in respect to weather.

The deaths in an infected flock range from five to seventy-five per cent., according to the season of the year, the state of the weather, the nature of the feed, the locality in which the outbreak occurs, the age and stamina of the sheep, and their treatment. Summer attacks are much more deadly than winter; but at whatever season and under whatever circumstances they do take place, they are generally comparatively mild at first, and gradually become more virulent till they reach the climax, when they moderate in something like the same ratio as they increase. Young sheep in good condition about the age of eighteen months are found not only to be the most susceptible of infection, but also to lose the largest percentage in deaths. In full-grown and aged sheep, again, fat sheep are both more liable to become infected and to be carried off than poor sheep.

Death occurs in some cases within six hours of the first symptom of the sheep being infected; sometimes in twelve hours, and sometimes not before ninety-six hours. In the majority of cases, however, death occurs in twenty-four hours after the first decided symptoms of the disease are discerned.

Like other infectious or contagious diseases, catarrh neither attacks nor kills by any rule; in fact, it seems even more capricious in this respect, as well as in its spread, than most other diseases. Sometimes the ewe is the victim while her lamb is spared, and at other times the lamb is taken and its mother escapes.

It has been said that flocks crossed with sheep of the coarser breeds, such as Leicester or South Downs, were less liable to catarrh than the Merino. This has been disputed; and some owners who have tried crossing, without getting rid of the disease, have done so by again taking to the Merino. In either case, where the change was attended with success, it is believed that the result was attained more by the introduction of healthier blood into the flocks than by the crossing with any particular breed.

SYMPTOMS.

The course of the disease in catarrh is generally divided into three stages, and that arrangement will be adopted here in detailing the symptoms.

First stage.—In this stage (which lasts from two to twenty-six hours) there may be all or any of the following symptoms:—

1st. Sneezing, snorting, or coughing—especially at night—perhaps as long as thirty-six hours previous to the sheep ceasing to feed. These sounds are to be heard more or less in different forms in all stages of the disease, and a combination of them—a peculiar snorting or croupy cough—is one of the most decided symptoms; but it is more prevalent in the first than in the later stages of the disease.

2.

* The sheep first observed to be affected with catarrh, although then in a comparatively low-lying and warm part of the Colony, had been brought from a run on the Coast Range in the county of Argyll, some twelve months previous to the disease breaking out.

2. Hanging head, drooping ears, general lassitude, listlessness, dulness, lingering behind and hanging back from the flock, unwillingness to move, indisposition to feed, ceasing to ruminate.

3. The nostrils hot and humid, their lining membrane inflamed and red, with increased secretion of mucus from that membrane, and a discharge, at first of a clear limpid colour, but gradually becoming thick andropy.

4. The eyes languid and suffused, in some cases a profuse flow of tears, while in others a discharge of matter encrusts the eyelids, and the inner part of the eyelids of a red or a yellowish red colour.

5. The tongue parched, general fever, perspiration obstructed, pulse quick, hard, and irregular, throbbing of the heart, diminution of secretions, except in the inflamed membranes.

Second stage (duration from four to forty-eight hours).—All the symptoms of the first stage will have increased in force, with the exception of the coughing, which is not always present at this stage; but when it is, it is evidently painful, and is brought on by the least movement. There will now also be all or either of the following symptoms:—

1. Great restlessness, heaviness of the head, and a desire to rest it. No appetite for food, stupid appearance, and frequently symptoms of great pain.

2. External surface and internal membrane of the nose and other portions of the head swollen.

3. The interior of the nose of an intense florid hue, with the blood-vessels filled with minute injections; the secretions from the nostrils—which are frequently large, thick, and of a yellow colour—harden on the nostrils and impede respiration, and they may be from one or both nostrils.

4. Respiration impeded, and evidently painful, through the secretions plugging up the nostrils. The animal gasps for breath, seems in dread of suffocation, and throws the head up in its attempts to clear the nostrils by snorting and sneezing.

5. The eyes are more and more suffused, red, and inflamed, especially at the conjunctiva, and there is generally a considerable discharge from them.

6. The general fever is great, and suppression of the urine and costiveness frequently set in.

Third Stage (lasting from eight hours to four days).—1. In this stage the fever will have passed, and general debility ensued. The sheep will frequently be found lying down resting its head, or it may become stupid and stagger about unable to direct its steps, going up against trees, and into water-holes or camp-fires; and those symptoms increase as death approaches.

2. In some cases the face, lips, and tongue are now much swollen, as are also the nostrils, which exhibit the highest state of inflammation, the deadly purple or leaden hue. These are stopped or nearly so by the discharge from them, which has lessened in quantity, but become thick and glutinous, and sometimes streaked with blood, generally from both nostrils. The snorting and sneezing to clear the respiratory passages will be increased, and will not unfrequently be accompanied by coughing, and expectorations of fetid matter mixed with blood.

3. The eyes are greatly inflamed, and there is generally a profuse flow of tears, while incrustations of hardened mucus are formed around the eyelids.

4. The mouth is dry and parched, the pulse feeble, the eye becomes more and more glassy, trembling, vertigo, blindness, and insensibility ensue, with deliriousness, and wringing and throwing up of the head, and the sheep lies down and dies.

These symptoms will, however, in all the stages, like the *post mortem* appearances, depend in a great measure upon the seat of the disease. If it be in the sinuses of the head and gullet,—then the attack may be termed “nasal catarrh,”—swelling of the nose and lips, with a discharge from the nose and eyes, will be present: while if the lower portion of the bronchial tubes and the lungs are involved—when it may be designated “pulmonary catarrh”—there may be little or no swelling of the head or discharge, and the only noticeable symptoms will likely be coughing and laboured breathing. It would seem also that the climate and season of the year have a considerable influence in determining the seat of the disease and the class of symptoms. Thus, nasal catarrh is more common in a cold country and in winter than pulmonary, while that form is much oftener to be met with in districts where the climate is genial, and during the warm weather of autumn, than in the colder districts and winter season.

In some cases the catarrh kills by the destruction of the windpipe and bronchial tubes, and the head and lungs display little or no symptoms of the disease. In these cases the sheep will die as from suffocation, and on examination the lining of the windpipe and bronchial tubes will display symptoms of having undergone intense inflammation—being completely destroyed, and so rotten as to be easily pinched or torn to pieces. The lungs will be slightly congested, and around them will be a considerable quantity of a pink-coloured frothy mucus.

POST MORTEM APPEARANCES.

The stomach is generally impacted with undigested hard food, while the feces accumulate in both the large and small intestines in large hard lumps, producing abrasions of the mucus membrane. The liver is usually perfectly free from disease, but the gall bladder is frequently very much distended. The rest of the abdominal viscera and bladder are generally in a healthy state. These appearances vary with the different forms of the disease, and may be treated as those of 1st, *Nasal Catarrh*; 2nd, *Pulmonary Catarrh*; and 3rd, of the *Combined form*, partaking more or less of both Nasal and Pulmonary Catarrh.

1. *Nasal Catarrh*.—In this form of the disease the brain is not found to be affected, but the little brain (the *cerebellum*) is, and its blood vessels show decided symptoms of inflammation, being highly injected or gorged with blood. There are also occasional secretions of a serous fluid in the cavity of the little brain, and in the lateral ventricles. The frontal sinuses (the continuation of the nostrils) show indications of intense inflammation, and are plugged up with sero-purulent matter or black clotted blood. The whole of the nasal cavity presents the most intense redness, from a florid to a dark red, mingled with patches of a leaden hue. The turbinated bones (the thin knife-like bones in the nose) are exceedingly florid throughout, as if they had been filled with a very minute injection. This is not confined to the membrane covering their surface, but extends to the whole of their substance. Indeed, the enlarged injected blood-vessels present themselves, in this form of the disease, in every part of the interior of the nasal cavity, and a very thick viscid matter is effused in the turbinated bones as well as on the *septimnaris* (the division between the nostrils), which could be scraped off with a knife. On cutting the substance of the nostrils a quantity of serous fluid or florid blood is discharged. In this form of the disease the heart and large veins are generally found to be gorged with black blood.

2. In *Pulmonary Catarrh* it is found, on dissection, that generally in both the right and left lobes of the lungs, but sometimes in only one of them, and then generally in the right, the mucus membrane is red to a greater or less extent, with the appearance of small red points aggregated closely together; while the pleuræ *pulmonalis* and *costalis* exhibit traces of a high degree of inflammation, and there are frothy mucus effusions in the cavity of the chest. In others again, where pneumonia prevails, the lungs present an increase of weight and density, are infiltrated with a frothy mucus of a bloody tinge and clotted blood, and their external surface is of a gray or violet colour; while in others the lungs assume the density of hepatization, and the vessels are full of hardened lymph, displaying, when cut into, the appearance of marble. In most of these cases the mucus membrane lining the bronchial tubes and windpipe is highly inflamed, and mucus effused all along the course of the respiratory passages. In this—the pulmonary form of the disease—all the large veins are generally full, and the right auricle of the heart is invariably gorged, while the left auricle and right and left ventricles, are empty.

3. *Combined form*.—Here there will be a combination of the different symptoms and *post mortem* appearances which have already been noticed, but they will vary in these cases according to the class of causes which predominate.

Of the two forms of the disease, the pulmonary is not only the most common, but also by far the most fatal.

In some of the cases mentioned by Dr. Bennett in his able Report on the first outbreak of Catarrh in 1834 (from which I have freely culled in compiling the technical portions of this paper) the stomach was healthy and filled with well digested food, while the whole of the alimentary canal was free from disorder, and the gall-bladder filled with healthy bile; the disease carrying off the sheep through the destruction of the respiratory organs of the chest, the bronchial tubes, and the sinuses of the head.

The cause of the difference in the *post mortem* appearances noticed by Dr. Bennett, and those described above as being almost always present in the outbreaks of catarrh which now occur, seems to lie in the cause of the attack. The outbreaks which he then investigated must have originated from contagion or infection, and not, as they almost invariably now do, from secondary causes working upon a frame predisposed to the disease. Thus, where infection or contagion is the cause, the sheep require little or no preparation, so to speak, to enable the disease to incubate and ripen; and therefore, the *post mortem* symptoms and appearances, such as constipation and inflammation of the intestines, which are present in sheep where the attack has been caused by bad food and predisposition to the disease, are not present.

Both classes of symptoms and *post mortem* appearances are to be met with, but that described by Dr. Bennett is now very seldom met with, as the effect of the Catarrh Act has been to confine diseased sheep to their own runs, and to protect the sound flocks from infection and contagion.

PREVENTIVE AND REMEDIAL MEASURES.

If the history, causes, and nature of catarrh be considered, it may with safety be affirmed that the development of fresh cases can be easily prevented, and are unlikely to occur except from infection and contagion. And to show that this is the case, we will briefly review the causes of the disease and the amount of risk which may be now apprehended from them.

In the present day, the prejudice against "*in and in*" breeding is so strong and general as to leave little room for fear of fresh cases of catarrh arising from that cause; for it is unlikely, with the prevalence of this feeling, that even close breeding will be attempted by any but those whose flocks are of considerable excellence; and the fact that they are so is a sufficient guarantee that the breeder is qualified to make the proper selections, and may be safely allowed to follow this system of breeding.

While on this subject, although not strictly within the scope of this paper, it may be remarked that the dislike to "*in and in*" or even "*close*" breeding has in this Colony been carried a great deal too far; and the frequent and sometimes even violent changes in breed and blood which have been made, have prevented owners from obtaining that improvement in their sheep, or that uniformity of type and character, which their heavy outlay for stud rams entitle them to expect. If owners are unable, from the inferiority of their sheep or their want of knowledge, to adopt a system of "*close*" breeding, they might at least obtain their stud sheep from the same breeder, so long as his flocks were of sufficient excellence and were sound and healthy, and thus secure a large share of the advantages of "*in and in*" breeding with comparatively little risk.

In adopting this or any other course of purchasing rams, a careful selection of a well-developed healthy frame, devoid as far as possible of the defects of the ewes to which they are to be put, ought always to be kept in view, as well as a valuable fleece: and if it is so, the risk of catarrh and other disorders would be greatly diminished. The hap-hazard system now followed by many breeders of purchasing stud rams from different improved flocks, both imported and colonial, without regard to the strain of blood, and without selection, is not only a source of disappointment and loss to the purchaser, but also to a certain extent of risk to our flocks.

The practice of *breeding and rearing two crops of lambs in one year* from the same ewes is now seldom or never adopted, for its folly is too apparent, and the inducement, with the present low price of sheep, too small to lead owners to follow it.

Breeding from *too old* or *too young* or *weakly* sheep is still too common; and although the effect is not immediately noticed, and may not of itself bring about catarrh, the practice is a deteriorating and thriftless one, and ought to cease.

Fluke in sheep is still prevalent, but with due care and the use of the proper medicine (sulphate of iron and Liverpool salt in proportions of 1 in 10), stations upon which it was next to impossible to keep sheep healthy are now almost entirely free from fluke. As to *foot-rot*, the turning out of the sheep and ordinary care will in most cases remove all risk from this cause. And with regard to the debilitating effect of *mercurial dressings* for scab, which were so generally used when catarrh broke out, it may be said that the risk from this cause has entirely ceased; for not only are these dressings now never used, but there is no scab in the Colony.

There cannot be a doubt but that the fencing in of the runs and turning out the sheep would be the most effectual way of removing the exciting or secondary causes of catarrh. If left to themselves on an ordinarily large run, even in the colder parts of the Colony, sheep can always, and in all weathers, obtain shelter, and find comparatively dry and comfortable quarters day and night; for not only does their natural instinct lead them to seek the higher ground to camp at night and in bad weather, but it enables them

them also to detect, sooner than any shepherd can, the approach of bad weather, and from what quarter it is to be expected, and to take shelter accordingly. It would thus be scarcely possible, except perhaps in the more thickly grassed intermediate districts, after a long drought, for catarrh to break out, even in sheep predisposed to the disease; and it would certainly never originate in sound sheep managed in this way. It is to shepherding and folding, or rather to the mismanagement to which shepherded sheep are always more or less liable, that we owe the exciting causes of catarrh; and if sheep were turned out and fresh healthy blood freely introduced into the flocks whose blood was tainted with catarrh, that, as well as many other diseases to which sheep are now subject, would with ordinary attention disappear. Great, however, as these advantages would be, they are not a tithe of those which would be secured to the Colony in every way, by fencing in the runs and turning out sheep.*

Till this can be brought about, the best course would be to destroy the native dogs and camp the sheep out; and if a combined and simultaneous effort in this direction were made, either voluntarily or under legislative enactment, by the owners in the different districts, the eradication of the dogs might be readily and cheaply effected. In the meantime, those who continue to shepherd and fold their sheep should erect large brush yards, or rather small paddocks, on the best sites, sheltered from all weathers. Hitherto, the convenience of a water supply for the shepherd, more than the best position for the sheep, has too frequently been the chief study in the selection of sites for sheep stations.

Where again there is a taint or suspicion of catarrh in the sheep, fresh healthy blood should be frequently and freely introduced; and, as the climate of the districts in which the flocks requiring fresh blood are depastured is cold and trying, the introductions should be made, as far as possible, from healthy flocks reared in a comparatively cold climate.

CURE.

There is no really practical cure for catarrh. The immersion and swimming of the sheep in cold water (in a river or lagoon) has been said by some to be a specific for catarrh, while others who have tried it, report that it is utterly useless; and the proof that it is so lies in the fact that this treatment is now never followed. Bleeding and physicing again have been tried with varied results; but here the trouble and cost of the treatment, even if it were successful, would be a bar to its adoption. The only way in which the disease has been successfully dealt with was to take the sheep to fresh pasture, especially to salt-bush, and while doing so, to kill every sheep showing any symptoms of disease. This, however, the law very properly prohibits, as other sheep would be certain to be contaminated by the infected flocks. The next best course is to move them from station to station on their own run, and keep destroying those showing any symptoms of the infection; but, even although this course should be successful in stopping the disease in the infected flock, it would be attended with all but certain risk of infecting the other sheep on the same run, as well as those on the adjoining runs. If, again, the infected sheep are kept upon the ground on which they were depastured when the disease broke out, it is not unlikely that twenty or even fifty per cent. of them will die; and although the sheep are confined in this way, the risk of the infection spreading to other flocks while the disease is running its course is too great to be safely encountered. Besides, as such sheep are liable to periodical outbreaks, all this risk and trouble would, in that case, have to be frequently encountered, for the sheep that recover are almost certain to be again affected. There certainly is not the same risk of the disease showing in such sheep at certain seasons as at others; and, if they were close to market they might then be fattened and disposed of; but by the time they would be allowed by the law to travel, after an attack, the safest season would be over, and the losses and damages which would attend an outbreak on the road are too heavy for the owner who has to drive his sheep any distance to risk.

Looking, therefore, at the subject, in all its bearings, it would seem that the safest course for an owner of catarrhed sheep, both as regards his own interest and that of the Colony, is to boil down the whole flock at once. But while this course is recommended to the owner, it is considered that here, as in the case of scab, the sheepowners as a class should, for the sake of the greater protection this course would afford, come to the assistance of the owner who takes it, and that a measure should at once be introduced into the Legislature dealing with catarrh the same as with scab. Catarrhed sheep would thus be destroyed, and their owner would receive as compensation two-thirds of their market value, supposing they were free from infection when they were destroyed. There are but few districts in which the disease is now likely to show itself, and the compensation required would not amount to a large sum; while it would nevertheless be a great boon to the owners of the catarrhed sheep amidst the heavy losses which such a visitation entails. The present law is, to say the least of it, a rigorous and impolitic one. It quarantines an owner's sheep on his run for six months, and even prevents him from coming within a quarter of a mile of its boundaries, or of any road passing through it, without allowing him any compensation. The consequence is that outbreaks of catarrh have frequently been concealed, and the disease has spread through this concealment.

There is certainly at times considerable difficulty in saying what is catarrh and what is not. This is only what might be expected in outbreaks occurring from predisposition, for in these attacks the part or organ affected would depend upon circumstances, which would of course vary in different flocks. That is, the part or organ in which the disease finds its principal seat would (within certain limits) be the weakest in its frame, and that, of course, would be different in different flocks. The question, however, with which legislation has to deal, is not to what class of disorders an outbreak belongs, but whether or not the disease is infectious or contagious. Whether, therefore, the outbreak be one of catarrh properly so called, or of some other infectious or contagious disorder, means should be adopted to stay its spread; and if sheep showing any of the symptoms of catarrh are quarantined, as they ought to be for a time, the presence or absence of infectious or contagious symptoms will soon determine whether or not the disease is catarrh, or any other calling for legislative control. If this point be settled, the necessary steps for controlling and eradicating the disease could be adopted; and, to avoid all risk of any failure through inability to identify the disease, the measure should be made so comprehensive as to allow the Governor and the Executive Council to issue regulations for the eradication of *any* infectious or contagious disease in sheep, other than scab or catarrh.

ALEX. BRUCE.

No. 12.

WORM DISEASE IN SHEEP.

PAPER prepared by Mr. P. R. Gordon, Chief Inspector of Sheep, Queensland.

(Laid before the Conference of Chief Inspectors of Stock, held in Sydney in November, 1874.)

I do not claim in the following remarks to have made any new discovery as to the causes or cure of worms in sheep—a disease that has occasioned immense losses amongst the flocks in many portions of Queensland. My object is to lay before the Members of the Conference a few practical facts in connection with the disease in the experience of Queensland sheepowners, in the hope that they may assist in directing inquiry on the subject into the proper channel.

Worm disease first made its appearance in Queensland, in its present epizootic form, in 1871; but for fourteen years preceding that date intestinal worms were periodically to be met with in sheep in various portions of the Coast Districts. Many owners recognize the disease as identical with that which decimated the flocks in the Clarence and Richmond Districts many years ago. It is only within the last three years however that the disease has been known to exist west of the Main Coast Range.

OPINIONS AS TO THE NATURE AND CAUSE OF THE DISEASE.

It is now well known that the disease is caused by a description of worm infesting the stomach, intestines, and frequently the lungs of sheep, and known as *Strongylus*.

The opinions of practical men in Queensland—so far as they have come under my notice—as to the cause of the disease, may be summarized as follows:—

First.—The most generally accepted theory is that worms originated from overstocking, and the consequent disappearance from the pastures of many saline herbs and plants.

Second.—That they are due to certain geological formations, and

Third.—By some it is supposed that they are propagated and disseminated by kangaroos, wallabies, and other marsupials.

In support of the first the following facts are adduced:—

- 1.—Worms are unknown in sheep pastured in newly occupied country.
- 2.—That they can to a very large extent be prevented by a liberal use of salt, and
- 3.—They are but of recent development in most portions of Australia.

Those who attribute their presence to certain geological formations point to the well-known fact that whilst sheep pastured on granite or slate formations are the first to be attacked, trap, basalt, or soils abounding in salts of lime, have—except in rare instances, where it has been introduced by travelling sheep—enjoyed an immunity from the disease.

With respect to the third supposed cause, the circumstance already mentioned, of worms being unknown in recently occupied country, would, to some extent, appear to set aside the theory that they originated with the marsupials; but the fact that in some districts the centres of large plains are sound whilst sheep pastured on the margins of the same plains (the feeding grounds of the wallabies and kangaroos) are infested with worms, would seem to indicate that they are in some instances disseminated in this way.

It is now generally believed that, whatever the cause of worms, they are to a large extent disseminated by the dung of sheep, and this opinion is in perfect harmony with the opinions of Cobbold in Europe, and the best authorities in Australia.

My own deductions, based on information supplied me by my staff, as well as by many sheepowners in different parts of the Colony, favour the belief that each of these causes, and all combined, may tend to produce and spread the disease, and for the following amongst other reasons:—

1. In the case of sheep affected with worms travelling from the coast interiorward, it is found that whilst they establish the disease on previously healthy pasturage along their line of route, this has never been found to be the case beyond a point where recently taken-up under-stocked country commences.

2. Having reference to geological considerations, we find that country of trap-rock formation on the margin of the Downs are exempt from worms, although completely surrounded by runs of granite formation, on which the disease has for years prevailed.

A circumstance came within my observation a few weeks ago which I consider valuable, not only as throwing light on this phase of the question, but as verifying in a remarkable manner the correctness of Mr. Farrer's deductions—in his valuable pamphlet on grasses and sheep-farming—as to granite soils being favourable to worms. Mr. Donald Gunn, of Pikedale, forwarded to me a sample of salt collected by him on a run in his District, the soil of which is composed principally of disintegrated granite. The sample was taken from the surface of a small flat which had recently been temporarily under water, the salt having been deposited during the process of evaporation. Mr. Gunn's object in forwarding it to me was to challenge the correctness of my views as to the value of salt in the prevention of worms; because, on the run where this sample of salt was found, worms had to some extent been present in the sheep for years. On my showing the salt to Mr. Staiger, our Government Analytical Chemist, he at once pronounced it to contain a large amount of potash, and the usual test confirmed his statement. Mr. Farrer shows that by analysis granite contains a large percentage of potassic salts, and that the pasturage of soils composed of disintegrated granite must therefore be unhealthy.

Independently of the above incident, my experience confirms Mr. Farrer's statement as to granite soils favouring the presence of worms.

3. I am not prepared with evidence to authorize me in hazarding an opinion as to the worms being propagated by marsupials, nor do I attach much importance to the circumstance, as kangaroos and wallabies have invariably been found to be the prey of parasites infesting cattle depasturing on the same grounds. The same cause would operate alike in both cases.

That the disease has been sown broadcast by means of travelling sheep over country in which, in all probability it never would have originated, is, I think, beyond doubt. I must guard myself against being understood as holding the opinion that worm-disease is contagious in the usual acceptation of that term; but in the sense in which fluke may be understood to be contagious—that is, by contaminating the pasturage,—I consider worms to be highly contagious, and hence my reason for so strongly urging upon my Government, at various times, the necessity for joint action by the Colonies on the matter. In America there does not appear to be two opinions on the subject. It is there believed that the worms were imported with sheep from England, and burning pasture and camping grounds appears to be the only successful mode known to the Americans of checking its spread.

But one or two well authenticated facts in my own Colony would appear to me to establish this beyond a doubt. Thus, for instance, the circumstance before alluded to, of the disease having been established by sheep travelled inland on country previously free from it. And again, the circumstance that in certain districts, the soils of which we should consider inimical to the disease—such for instance as the black volcanic soil of the Darling Downs, through which there is constant traffic in travelling sheep—the disease has obtained a footing, whereas in other districts, possessing exactly similar soil and pasturage, but through which no travelling sheep from diseased districts have passed, worms are as yet entirely unknown.

MEANS OF CURE AND PREVENTION SUGGESTED.

Cure.—In speaking of a cure I would wish it to be understood as referring only to means adopted for destroying worms in the case of sheep already affected. I have had no opportunity of testing the sulphur and nitre cure so highly spoken of in Victoria, although experiments with this and powdered arceonut are being conducted at the present moment in Queensland. Should the latter be successful in effecting a cure, as I have strong hopes will be the case, it will open the question as to the value of strong astringents (of which there is an endless variety in these Colonies) as sheep medicines. Turpentine and linseed oil was found successful, as was also salt and sulphur, in many instances, in expelling the worms in the early history of the disease in Queensland; but strange to say, both completely failed to effect a cure in second and subsequent attacks of the disease on the same runs. Salt, where given in unlimited quantities, has in some instances been successful in effecting a cure in the case of young sheep, but I have been assured that it has failed in others.

Prevention.—As the cause or causes of worms are still matter of speculation, the means of prevention suggested or recommended must also be looked upon as speculative. We have been most fortunate in Queensland in having—in Mr. Haly, of Taabinga—a gentleman who, sparing neither trouble nor expense, has gone into an enquiry of the subject with a determination and intelligence unequalled perhaps by any other sheepowner in the Colonies. To the unceasing exertions of this gentleman we are indebted for the duty on salt having been entirely removed, and also for a vote of £500 to initiate an inquiry by a practical and scientific Board into the causes of disease in animals and plants. Mr. Haly has been a heavy sufferer by worms, but after experimenting with many agents, he has at last, by the unlimited use of salt in his flocks, and by lightly stocking his runs, succeeded in reducing his losses to the smallest minimum, about 1½ per cent. and that in a district where the losses on some of the neighbouring runs have been alarmingly heavy. I consider it also due to this gentleman to state that more than eight years ago, when a Member of the Legislative Assembly, he predicted an outbreak of disease similar to that now decimating our flocks, in consequence of impoverishing our pastures by overstocking.

If, as is very generally supposed, the rapid development of worms is due to the disappearance from our pastures of herbs and grasses which contained more or less of saline properties, the direction in which preventive measures should be attempted is plainly indicated. If, as has been authoritatively stated, some descriptions of herbs and grasses possess the property more than others, of taking up the salts from the soil, enquiry should be directed to such, and means adopted for testing their suitability in different soils. I believe that much can be done in this way and by preventing overstocking. For instance, salt bush and myall have been transplanted to, and found to flourish in soils not the natural habitat of saline plants. And although they are found not to be so strongly impregnated with salt as when grown in their natural soil, they still retain their character as that of salt plants.

Of the value of light stocking, I cannot adduce a more striking instance than that of the land enclosed on each side of the line of Railway traversing the Darling Downs. On that land, in consequence of its being protected from stock of all kinds, the original grasses and herbs of the district have reappeared, and are growing to luxuriance side by side with the stunted and comparatively innutritious grasses which have taken their place in the heavily stocked sheep paddocks.

In conclusion, I would remark that it has long been my conviction, that if a system of spelling paddocks by regular rotation were universally adopted, many of the diseases that infest our flocks would rapidly disappear.

No. 13.

FLUKE IN SHEEP.

PAPER prepared by Mr. Edward M. Curr, Chief Inspector of Stock, Victoria.

(Laid before the Conference of Chief Inspectors of Sheep, held in Sydney, in November, 1874.)

To the naturalist and helminthologist the study of the fluke parasite and the phenomena connected with its being, are matters of interest which have but slight charms for the sheepowner, however important to his welfare they may eventually prove. Perhaps they refer to matters too near home to be to his taste, and as a rule he has no patience but with what we will call the practical side of the subject, to which I propose to confine the few remarks I have to offer on a topic which of late has been worn somewhat threadbare.

The first circumstance which claims the attention of Victorian sheepowners with respect to this disease is its great spread during the last few years. Originally, as is well known, it confined its ravages to certain cold, dank, sour-grassed mountainous localities, whilst of late it has gradually been encroaching on neighbourhoods in which heretofore it had never been heard of, and in which it was believed on all hands that its existence was impossible. It is natural to inquire how this is to be accounted for; and how it has happened that the fluke has of late taken possession of large tracts of country, in which, during the thirty previous years of its occupation it was entirely unknown.

As regards this change, it seems probable that it may be accounted for in this way: that before fluke spread in Victoria, sheep were shepherded; they had as a rule plenty of excellent grass and to spare, and consequently that they lived on wholesome food, the result being, as old residents in the Colony will remember, that the sheep of those days were well-grown and healthy. Neither was it usual at the time to buy store sheep to fatten, so that there was but little travelling of stock, and diseases were, as a rule, confined to the localities to which by some means they had been brought.

This state of things came to an end, however, when paddocks took the place of shepherds; it was then too that overstocking became a general practice, and our sheep first became acquainted with starvation and unwholesome diet. A further consequence of overstocking was that the prime grasses never being allowed to seed, disappeared; the kangaroo grasses were eaten out, the myrnong and yams were almost exterminated, and their places were supplied by the least nutritious of our indigenous grasses, and not a few unwholesome exotic weeds. From that period, too, our sheep, reduced in many cases to a state bordering on chronic semi-starvation, dwindled in size and lost stamina, offering an easy prey to the first disease which might present itself. The purchase of store sheep, which the buyer reckoned on quickly fattening and selling off, also became a very prevalent custom, and as such sheep were obtained from localities in which fluke prevailed the disease gradually obtained the proportions which we now see. In other words, animals suffering from fluke were imported on the hitherto clean runs, on the least healthy portions of which they deposited the seeds of disease, which in due time were taken up by animals driven by hunger to feed in localities which otherwise they would have avoided.

The questions then crop up, where will fluke end? Can it possibly extend to country which has heretofore escaped its ravages? Is it to become general throughout the Colonies? Premising the fluke has already been acclimatized on runs on which a few years ago the owners, who freely purchased fluky sheep, ridiculed the idea of its propagation, it seems to me that we are not yet in a position to determine the possible geographical limits of this disease. On this subject, whilst admitting the probability of a large extent of country, notably our salt-bush plains, being wanting in the conditions necessary to the propagation of fluke, and setting aside the fact that I find it impossible to believe that steps will not soon be taken by owners which will in a great measure put an end to this scourge, I will ask the reader to remember, in considering the possible expansion of which this disease is capable here, that the acclimatization of animals is, as a rule, gradual, but the extent to which it may be carried very large—that a man, horse, dog, or sheep, for instance, transferred direct from the tropics, and subjected to the conditions of nature as they exist in Iceland, would undoubtedly perish, whilst there would nevertheless be no difficulty in the gradual extension of the tropical man, horse, dog, or sheep to that island. In the same manner, it is well known that vegetables will in many instances become gradually accustomed to conditions which at first were found to be very unfavourable to them. As one instance out of many, I may adduce the fact that, of a quantity of English wheat sown in some parts of Western Africa, but a moderate portion will seed, whilst in each ear which matures there will only be three or four grains of corn, but that after a few sowings the produce will gradually become acclimatized, strong, and plentiful. In like manner, I may remark, that many of our vegetables are now readily grown in Victoria in perfection in localities in which, to my knowledge, they could only be reared with considerable trouble thirty years ago. Hence, as modern authors have demonstrated, that in the laws which affect animals and vegetables there are many marked and undeniable coincidences, far from saying that the general plan of nature stops short with parasites, everything would lead to the inference that they are governed by conditions analogous to those of their hosts; so that it seems to me that we are not yet in a position to determine to what portions of this continent fluke might not, if unchecked, eventually extend, the probability being in favour of the increased area of its habitat.

Touching the reduction and prevention of fluke which, in the majority of cases, I am persuaded is a matter easily attainable, the first steps should undoubtedly be the lessening of the number of the sheep on lands on which this disease prevails, the substitution of healthy flocks for those now diseased, the destruction, as far as possible, of the ova of the fluke, and the securing to the flocks conditions of existence directly favourable to general health, and specially adverse to the economy of this parasite. As regards the destruction of ova, I believe it can be effected practically in most cases by burning off all rank vegetation and the drainage of wet grounds; whilst a considerable reduction of stock on fluky runs, by
allowing

allowing the better grasses to grow, and securing the animal a plentiful supply of wholesome food, at the same time taking away from it the necessity for browsing in sour and unhealthy spots, will very much reduce the frequency of this disease. In addition, in many places, as is well known, a liberal allowance of salt to the sheep is not only beneficial but an absolute condition to health. On lands where such measures fail, I think it may be said that the conditions of nature, unassisted by further efforts of art, which are not perhaps at present practicable, are unsuited to sheep; and that the sooner the owner accepts the fact and acts on it, the sooner he will consult his own interest.

In conclusion, I cannot help expressing the opinion that fluke is a disease which proper management will confine to very narrow limits. Along the country verging on the Australian Alps from Victoria to Southern Queensland, and in a few other districts, it will undoubtedly always prevail to some extent; whilst in such localities it may be very much kept under by a liberal use of salt and sulphate of iron, and Mr. Charles Thomas's remedy, which cannot be too much recommended. As a rule, fluke in Victoria is the natural result of improper sheep-farming—in other words, of overstocking; and the sheep-farmer, instead of lessening the quantity of his stock, or increasing the carrying capabilities of his land, has, in too many instances, contented himself with living in hopes that some medicine would be discovered which would enable him to go on defying the laws of nature, as he has been doing; forgetting that even if a cure for fluke were discovered, that, as things are, some other disease would inevitably take its place—that in fact health and unwholesome food cannot long co-exist.

At present, what the sheep-farmer in many cases has to consider is—whether it suits him best to feed five healthy sheep or six unhealthy ones. The great parent of disease in Australia is over-stocking—unwholesome food.

Sydney, 6 November, 1874.

EDWARD M. CURR.

No. 14.

FOOT-ROT IN SHEEP.

PAPER prepared by Mr. C. J. Valentine, Chief Inspector of Stock, South Australia.

(Laid before the Conference of Chief Inspectors of Stock, held in Sydney, in November, 1874.)

In making remarks on foot-rot, it appears to be only repeating common matter which is known to nearly all persons connected with the working management of sheep in the Colonies, and I fear that I shall not be able to throw any new light on the subject. As a disease which causes great depreciation in the value of sheep and entailing heavy expenses on sheepowners, it has been known through most parts of the Colonies, and is dreaded by many more than an outbreak of scab.

Investigations held by professional men in Great Britain have caused them to conclude that there are several distinct affections of the foot which are commonly included under the term foot-rot. True foot-rot prevails on heavy soils during wet weather. The affection generally commences in the skin above the hoof between the digits or clefts of the hoof, thence extending downwards to the membrane of the sensitive foot; inflammation is set up, which increasing, causes an exudation of purulent matter, in which stage the disease is very bad.

One form of foot-rot occurs on dry sandy soils, and is sometimes prevalent in hot, dry summers. Minute particles of grit enter the horn tubes, and ultimately get into the interior of the foot, causing inflammation and exudation, finally extensive separation of the horny covering from the secreting structures.

A third form depends upon the overgrowth of the hoof, and occurs commonly in soft soils in which there is abundant moisture.

Injuries inflicted during journeys, punctures from thorns, nails, wounds from sharp stones, constitute another form of the disease. Such are looked upon in Great Britain as the different causes of foot-rot.

Randall, in his work on Sheep, considers that foot-rot in America is much more virulent than in Europe, where, as described by Youatt, it presents essentially different early symptoms, but is evidently the same disease.

No doubt there are many trifling causes from which foot-rot arises in the Colonies, but I consider the disease arises principally from sheep pasturing on rich soils with plenty of moisture, long wet grass keeping the foot constantly damp (previous to fencing, assisted by camping in dirty yards), the clefts of the foot are filled or choked with dirt, thereby causing much irritation, and consequent on that inflammation of the interior structures of the foot; suppuration then takes place and spreads under the hoof, and in many instances in the advanced stages to the coronet, causing it to separate. Scald by some is considered to be the first stage of the disease, but I am inclined to think such is not the fact in all cases. After scald sheep pasturing on sandy soils with excessive heat in the day after heavy dews, particles are introduced into the foot causing inflammation, and disease is the necessary consequence. Sheep have been pastured over wet plains of rich black soil, but so thoroughly washed have the feet become by the constant moving through water that scarcely any cases of foot-rot occurred. This was in limestone country. Wherever sheep have their feet washed naturally, although on rich soil, foot-rot appears only in isolated cases.

It appears in many instances where it cannot be reasonably accounted for. Some seasons more than others appear to favour the development of the disease, but no record has been kept that I am aware of the different seasons, which might be used as a guide to show when foot-rot might be expected to be more virulent

virulent than usual. I find country on which it was considered impossible to place sheep, in consequence of the disease appearing in so virulent a form, being free from it for some years, notwithstanding that the state of the land was not apparently altered; since which the disease has again appeared. A case occurred in which foot-rot broke out in swampy country, attributed by the owner to the sheep not camping on dry ground. It ran through about 3,000 sheep, in not a very virulent form, but still bad; no other sheep suffered, and no other sheep have suffered on the same country since.

In regard to foot-rot in South Australia, the sheep on country to the north of Adelaide are remarkably free from it, the disease appearing only in isolated cases. On some large properties it is entirely unknown, and but few long hoofs even require paring. Such was not the case on country to the east and south-east of Adelaide, where it was found on some stations in its worst and most destructive form. Much of this country was moist land, with long grass and too often dirty yards; here the staff of foot-rotters was formidable, and a terrible expense to the owner. This staff of men were kept up to pare and dress with all sorts of remedies some thousands of sheep on large stations, and the number of unfortunate animals limping about, poor, haggard, and decidedly unprofitable, was a very heavy percentage on the total number of sheep. All this has been altered since fencing has been introduced and an improved system of management adopted. Fencing has allowed the sheep more freedom and a choice of camps; they are no longer driven in a hurry over sticky, muddy ground, and enclosed in a camp strongly heated with the manure deposited for years. In a report from the worst district, preventative measures have reduced the disease to a minimum, and it is spoken of as trifling, varying slightly with the seasons. Although foot-rot has decreased amongst large holders, I am afraid that it is rather on the increase among small ones. As their number increases in favourable localities for foot-rot, there it appears to come to the front again; they are not so ready to adopt an improved system of management, and are often ignorant of the disease and its cause. Owing only a few sheep, they do not consider it of sufficient importance to inquire or make any outlay to prevent a disease from which they are only beginning to feel the ill effects.

Is it contagious? I am inclined against the opinion, in the general sense of the term. No doubt matter exuded from a diseased foot would inoculate another if placed in it. Foot-rot will run through a flock in a few weeks—yet sheep pastured on the same country shortly after will not become diseased. It appears to me foot-rot arises from the state of the country, the health of the sheep, and the peculiarity of the season, as sheep placed on the same country at different seasons of the year are differently affected.

After all, the most important thing is, can foot-rot be prevented or cured? I am afraid not entirely eradicated. Much may be done to prevent the disease, and sheep may be cured by good management; but this will not prevent the disease from breaking out again and again in the same sheep. The instances of the disease breaking out in different places after the sheep or country have been free from it for a long time show that there are causes producing foot-rot which at present we are not able to explain. In some places the merino suffers more than the long-wooled sheep, and again we find it reversed. As a rule, I think the merino suffers the worst. In others foot-rot disappears for some years and then breaks out without any apparent reason. The disease causes so much loss, and entails such heavy expense on sheepowners, that it would be well worthy for an inquiry to be made by competent persons to trace out the different circumstances which cause the disease.

A number of different remedies have been used, each more or less successful according to the carefulness with which they are applied. Butyr of antimony, bluestone, and quick-lime, were and are still with many favourite remedies. To a great extent arsenic has superseded these; it is a cheap and efficacious remedy, and easily applied to large numbers of sheep. Sheep scalded, if run through a trough with hot arsenic water, are prevented from the disease extending farther, and on those stations where the disease exists, sheep are passed through a solution of arsenic, varying from 2 oz. to 4 oz. to the gallon, about every six weeks, during the worst season of the year. Sheep when in the second stage, and with long hoofs, should be pared, and the diseased foot thoroughly cleansed and washed with arsenic water prior to passing through the trough. Sheep should stand after passing through the trough in a clean yard, to allow the arsenic to take effect. Arsenic is recommended as being efficacious, and, where thousands of sheep require to be treated, cheap and easily applied; but I would impress on all that, no matter what the remedy may be, unless care and attention is paid to the paring of the feet, to the mixing of the solution, and the general application, arsenic will not be of more use than other remedies badly applied. I find that carelessness in the treatment of all diseases is generally the cause of failure.

C. J. VALENTINE.

No. 15.

FOOT-ROT IN SHEEP.

PAPER by Mr. P. R. Gordon, Chief Inspector of Sheep, Queensland.

MEMO.—Having given some attention to the subject of foot-rot, my experience has led me to class malignant foot-rot as a decidedly contagious disease. Several well authenticated instances on the black soil of Darling Downs have shown that it can be communicated by contagion, and permanently stamped out with the sheep immediately affected.

Seven years ago, Mr. E. M. Curr, of Victoria, supplied me with information as to the use of carbolic acid, and, acting on my advice, that agent has been used most successfully in the cure of foot-rot. It combines with water by boiling from ten to twenty minutes, and is used in the trough at a temperature of 110° Fahr., and in the proportion of a pint of the acid to four gallons of water; or it may be applied in the form of an emulsion, prepared by means of soft soap.

Too much importance cannot be placed on the fact that very much of the success of a cure depends on the surgical operation. Every diseased part of the foot *must* be laid open, even if this should necessitate the removal of the *whole of the hoof*.

P. R. GORDON.

No. 16.

LETTER from Chief Secretary, Victoria, to Colonial Secretary of New South Wales,
in regard to Border Quarantine.

Victoria.
Chief Secretary's Office,
Melbourne, 7 October, 1874.

SIR,

With reference to the conversation which some of the Members of this Government had with you during your recent visit to Melbourne, on the subject of a quarantine-ground for sheep being established at Moama, or one of the other crossing-places of the Murray, to facilitate the export of sheep from Victoria into New South Wales,—I have the honor to request that you will, according to your promise, bring this matter under the consideration of your colleagues, with a view, if possible, to meet the wishes of the Government of Victoria.

The grounds upon which it seems reasonable to urge the question at the present time are, that scab has been nearly eradicated from Victoria, after great outlay, and it can be stated with confidence that the disease does not exist at all, and has not for a very lengthened period, among those flocks from which sheep of a high class would most probably be selected for export; such sheep, for instance, as have been sent habitually into the Colony of New South Wales, to a limited extent, *via* Sydney, under the Quarantine Regulations, without any evil effects resulting to the latter Colony from the trade.

And I may also remind you that, when some years ago sheep from Victoria were permitted to enter New South Wales, at Echuca, the precautionary means that were adopted to prevent them conveying infection were so efficacious that in no case, I am informed, did sheep introduce disease into your territory, although the risk then was much greater than it could be now, as scab prevailed extensively in Victoria, while it is confined at the present time to a few districts.

The experience obtained in this Colony confirms the view that, under proper Quarantine Regulations, rigidly enforced, sheep may be moved, without danger, into clean districts.

By the provisions of the Scab Act of Victoria no sheep can be taken into a clean district from one that is uncertain, without being dipped twice under the personal superintendence of a qualified officer; and I have it on the authority of the Chief Inspector of Stock that these means have had the effect of allowing sheep to be transferred without injurious effects resulting in any single instance, though the system has been in operation for some years, and has therefore been thoroughly tested.

I have only, in conclusion, to say that, although it would be a great boon to the breeders of first-class sheep in Victoria to have New South Wales open to them as a market for their stock, it is worthy of your notice that the persons who are the most urgent on this Government to have the existing restrictions removed or abated are the owners of stations in New South Wales, who expect to derive great advantages from introducing improved strains of blood into their flocks.

I have, &c.,
GEO. B. KERFORD.

No. 17.

CORRESPONDENCE respecting Fluke in Travelling Sheep in South-eastern District in
South Australia.

(Laid before the Conference by C. J. VALENTINE, Esq.)

MR. ARCHIBALD COOKE TO THE COMMISSIONER OF CROWN LANDS.

Wellington, 29 June, 1874.

SIR,

I have sent you a copy of an extract from a letter from a Lacepede firm, signed Donald Matheson, a confidential clerk.

I enclose the package of the fluke sent to me. I have no practical knowledge of the disease. It will be a serious matter to allow this plague to get into the country.

I have, &c.,
ARCHIBALD COOKE.

D. Matheson to Archibald Cooke, Esq.

Kingston, 25 June, 1874.

Dear Sir,

I wish particularly to draw your attention to some 7,000 or 8,000 sheep now on the road from McImis's station, taken by Jenkin Coles, and will likely pass through your run and others if permitted. When passing here the butchers bought 200, and the sheep are found to be full of the "fluke," which I believe was unknown in this district before. I enclose you two or three of the fluke, taken out of one of the sheep killed by the butchers here. It was through Mr. Vaughan that the matter was discovered here. It seems some one or two of the sheep were dropped on Morris's run; and, as they had a suspicion about the sheep, they killed those dropped, and examined and found the "fluke," which he brought over here in a vial, and which led to the examination of those killed here. Mr. Vaughan says he will report to the Inspector, but we thought to send you this notice, in case it might be dangerous for these sheep to pass over your country. The sheep will be about the Salt Creek now.

Yours, &c.,
D. MATHESON.

MR.

MR. H. T. MORRIS TO THE COMMISSIONER OF CROWN LANDS.

Anlaby, 7 July, 1874.

SIR,

This morning, I took the liberty of telegraphing to you, intimating that I had heard, on good authority, that a flock of sheep, travelling up from the South-east, were affected with fluke.

It is more than probable that you were acquainted with the fact before my telegram reached you; but, notwithstanding, as soon as the circumstance came to my knowledge, I deemed it my duty to inform the Government of it.

It is certainly a contagious and dangerous disease; and the sheep in this Colony generally being in a most healthy condition, especially north of the River Murray, it would be a great misfortune should any disease be introduced amongst them. I do not know if there is any Act to show how this disease can be dealt with, but I fancy not. Should such be the case, some special and immediate action is necessary, as the ground on which they must depasture may cause the disease to spread to other flocks travelling on the same country.

If a number of persons engaged in pastoral pursuits could be readily got together, probably the best way to meet the difficulty would be for them to subscribe *pro rata*, according to the number of sheep they would buy, and destroy them; but as this cannot be quickly done, and should the sheep alluded to be in such a state as to endanger other flocks, it is to be hoped the Government will be able to step in and destroy them, and compensate the owners.

I have reason to know that the gentlemen who have purchased these sheep had not the least idea of them being diseased; it is therefore a great hardship for them.

I have, &c.,
H. T. MORRIS.

MR. S. DEERING TO THE CHIEF INSPECTOR OF SHEEP, ADELAIDE.

(578/74.)

Crown Lands Office,
Adelaide, 9 July, 1874.

SIR,

I have the honor, by direction of the Honorable the Commissioner, to inform you that the Government have appointed you, in conjunction with the gentlemen named in the margin [H. T. Morris and A. McFarlane], to be a Board of Inquiry in the matter of a flock of about 6,800 sheep stopped on Policeman's Point, on the Coorong.

The Government desire that you will proceed to Policeman's Point and examine the sheep which are reported as being diseased with fluke. It will be desirable that several sheep should be killed to prove practically that fluke exists in them.

You will report—

- 1st. As to whether you consider the flock to be badly diseased?
- 2nd. Whether, in your opinion, there would be danger of contagion to other sheep depasturing over the same land?
- 3rd. Whether it is desirable that the flock should be destroyed; or, if not, whether they might be placed in a locality away from the travelling stock road in quarantine for not less than four months?
- 4th. As to the value of the sheep, and whether you consider that the Government, in the event of the flock having to be destroyed, should pay any portion of the value, and if so what that portion should be?
- 5th. Whether you think that the owners may be supposed to have known of the state of the flock before buying; and, if so, whether they have a claim on the Government in the event of the sheep having to be destroyed?
- 6th. Whether, in your opinion, it is desirable that a part of the South-eastern district in which fluke is known to exist should be declared a quarantine district, with a view to prevent, if possible, the disease being extended to other parts of the Colony which are now free from the evil?

I have, &c.,
SAML. DEERING,
Secretary.

THE BOARD OF INQUIRY TO THE COMMISSIONER OF CROWN LANDS.

Magrath's Flat, 11 July, 1874.

SIR,

We have the honor to inform you that in accordance with your instructions of the 9th instant, we carefully examined the sheep detained at Policeman's Point, on the Coorong, on the 10th instant, and beg to report as follows:—

1st. We selected and killed ten sheep, some fat and, to external appearance, healthy—all were picked to show the general state of the flock; we found them in every instance very badly diseased with fluke, and we are of opinion that there is not a sound sheep in the whole flock.

2nd. We are of opinion there would be danger of contagion, and consider the country on which these sheep have been detained should be immediately proclaimed a quarantine ground.

3rd. It is with reluctance that we have arrived at the conclusion that the sheep should be killed. We are satisfied from the state of the flock that they should not on any account be moved from where they now are. From the nature of this country it would be impossible to keep so large a flock in quarantine; even if this could be done there is no probability of their recovering in country of this description.

4th. We value the sheep at seven shillings per head. We consider the Government should pay to the owners a portion of the value, and that the amount should be four shillings per head. The owners should be required to kill and burn the sheep at their own cost, and be allowed to take the skins and fat.

5th. We believe that the owners were not aware of the sheep being diseased with fluke; but, from the advanced stage of the disease, we are surprised that the seller was not aware of the sheep being in so bad a state. We consider that if the owners had known the sheep were diseased when purchasing, they would have no claim on the Government.

6th.

6th. From the state of these sheep we consider it is absolutely necessary that steps should be taken at once to examine the flocks from which they were brought, and others if deemed necessary, and where fluke is found to exist the sheep should be placed in quarantine, with a view to prevent the disease being extended to other parts of the Colony. We are also of opinion that power should be immediately obtained, authorizing the inspectors to examine the flocks of the Colony for fluke and any other infectious or contagious disease. We think it necessary to state these sheep came from the "Woakwine Run," near the coast, about North of Rivioli Bay, and are now depasturing on the Coorong, near the Salt Creek, about 130 miles from Adelaide. In conclusion we would recommend the immediate necessity of preventing all sheep from crossing the River Murray from the south-east until the state of the flocks can be ascertained.

 ALLAN McFARLANE, } The Board of Inquiry.

Memo. of Sheep Destroyed.

No. 1. Sheep selected as likely to be diseased, from external appearance, on being opened it presented a shocking sight; there was more than a quart of dirty brown liquid in the abdomen—evidently, on examination, from the liver which was much enlarged, and the ducts expanded to a most unnatural size, and filled with "fluke"; the heart and lungs were in an abnormal state; the heart was enlarged, thin, and flabby; the lungs were almost white; the flesh was of a greenish yellow colour; the sides of the sheep were discoloured, and apparently as if granulated; the lips were pallid and bloodless; and the eyes bloodless and dull.

No. 2. Sheep selected as being fat, and one of the most healthy-looking; however, on being opened, the ducts of the liver were distended with "fluke," and the sheep, though fat, presented a most unhealthy appearance, the flesh being of a greenish yellow, showing it to be unwholesome, and unfit for human food.

The whole ten killed were almost equally diseased; in three, the intestines were adherent to the enlarged liver, and in one instance adhered to the side of the sheep. It is apparent that if sheep in this state are allowed to travel, especially at this season of the year, it is more than probable that the germs of the disease would be disseminated throughout the Colony.

Considering it prudent to fix a line across which the diseased sheep should not come, we instructed Mr. Pavey, of Woods' Wells, to draw a plough furrow across the Government Reserve, at the northern end; this will also act as a caution to travelling sheep.

C. J. VALENTINE,
 H. T. MORRIS,
 ALLAN McFARLANE.

MR. S. DEERING TO THE CHIEF INSPECTOR OF SHEEP, ADELAIDE.

(599/74.)

Crown Lands Office,
 Adelaide, 15 July, 1874.

SIR,

With reference to the report of the Board of Inquiry (845/74) appointed to examine a flock of sheep travelling along the Coorong, and said to be badly diseased with fluke, in which it is recommended that the sheep should be killed, and the owners partially compensated, I have the honor, by direction of the Hon. the Commissioner, to request that you will state whether, in your opinion, there is any other course open to the Government to adopt—for instance, could a piece of dry country be found near where the sheep are at present, upon which they could be placed for a time? Or, failing that, would it be advisable to allow the sheep to travel back again over the route they have already come, and on to the run from which they were purchased?

If neither of these courses can be adopted, I am to request you to make any suggestions that may occur to you which would meet the difficulty.

I am, &c.,
 SAML. DEERING,
 Secretary.

THE CHIEF INSPECTOR OF SHEEP, ADELAIDE, TO THE SECRETARY CROWN LANDS.

Inspector of Sheep Office,
 Adelaide, 15 July, 1874.

SIR,

In reply to your inquiry of the 15th instant, as to whether there is any other course open than that recommended by the Board of Inquiry for the Government to adopt in reference to the diseased sheep at Policeman's Point, I have the honor to state the travelling reserve on which the sheep now are, although extending back three or four miles, would be insufficient to keep the sheep on for a few months, and there is no country adjacent on which the Government are able to place the sheep. I understand the owners endeavoured to get country on which to place the sheep, but did not succeed.

If the sheep are allowed to travel back, the owners of clean stations would and do strongly object to their return, and it would be manifestly unjust to owners to allow the sheep to travel again over clean country. Even should the sheep be able to return to Woakwine I think I may state the late owner would not take them.

Should the Government not adopt the recommendation of the Board, they could take a negative position—that is, obtain power to stop all sheep from crossing the River Murray for the present, and decline to interfere with the sheep. This would be right if the whole of the South-east District were diseased; but not being so, I question whether it would be an entirely equitable course.

It

It has been asked by owner of scrub country to the east of Policeman's Point if he could purchase the diseased sheep cheap, to place on scrub country. Although agreeing with the recommendation of the Board, such a course is open for the Government, provided the sheep are placed in quarantine, to prevent their removal until late in December. Although the scrub country is dry, and sheep placed there would be off the general travelling route of sheep, I am of opinion that these sheep remaining on that country so long would leave the germs of fluke on the ground.

I have, &c.,
C. J. VALENTINE,
Chief Inspector of Sheep.

MR. J. M. BORROW to MESSRS. AUSTIN AND COLLS.

(619/74.)

Crown Lands Office,
Adelaide, 18 July, 1874.

GENTLEMEN,

With reference to the correspondence that has taken place on the subject of the flock of six thousand eight hundred (6,800) sheep, diseased with fluke, now at Policeman's Point, on the Coorong, I have the honor, by direction of the Honorable the Commissioner, to inform you that, upon condition that the sheep are killed, and the carcasses burned, the Government will place a sum upon the Estimates to partly reimburse you for the loss you will sustain, such sum to be at the rate of three shillings and fourpence (3s. 4d.) per head for each sheep so destroyed—the number killed to be certified by Mr. Inspector Wells.

The cost of killing and destroying must be borne by yourselves, and the skins, &c., &c., remain your property. No claim to be made upon the Government for anything beyond the sum of 3s. 4d. per head.

I am, &c.,
J. M. BORROW,
Chief Clerk, *pro* Secretary.

THE SECRETARY, CENTRAL BOARD OF HEALTH, to THE CHIEF SECRETARY.

Central Board of Health, Adelaide,
18 July, 1874.

SIR,

I have the honor, by direction of the President of the Board of Health, to acknowledge the receipt of your communication of the 17th instant, containing the report of the Commission appointed "to examine the condition of a flock of sheep at Policeman's Point, said to be diseased with fluke, and asking that the Central Board of Health should report, as soon as possible, whether the sheep referred to are such as should be allowed to be brought to market and killed for human consumption, or whether the Board of Health would not feel justified in ordering such meat to be destroyed."

As the matter appears to be urgent, and the time required to convene a special meeting of the Board would be considerable, the President would venture to make the following suggestion:—That the sheep should be confined to a certain locality, and when the wet season is over the pasturage should be burnt so as to destroy the ova which become attached to the moist pasturage, getting into the stomach of the sheep whilst feeding, and from the stomach passing into the liver.

The whole matter will be brought before the Board at its first meeting on Tuesday next.

I have, &c.,
R. G. THOMAS,
Secretary, C.B.H.

THE SECRETARY, CENTRAL BOARD OF HEALTH, to THE CHIEF SECRETARY.

Central Board of Health, Adelaide,
22 July, 1874.

SIR,

I have the honor to refer to my former communication of the 18th inst., in answer to a letter of the 17th inst., addressed to this Board, and enclosing the report of the Commission appointed "to examine the condition of a flock of sheep at Policeman's Point, said to be infected with fluke, and requesting the opinion of the Board as to whether the sheep referred to are such as should be allowed to be brought to market and killed for human consumption, or whether the Board of Health would not feel justified in ordering such meat to be destroyed."

I am directed, in answer, to forward for the information of the Honorable the Chief Secretary the following resolution of the Board of Health, passed at their meeting of the 21st inst.:—"The Board of Health have to report to the Honorable the Chief Secretary, that from the statements contained in the report of the Commissioners they cannot doubt that the sheep alluded to were not in a state to have been slaughtered for human consumption."

I have, &c.,
R. G. THOMAS,
Secretary, C.B.H.

MR.

MR. H. WELLS TO THE CHIEF INSPECTOR OF SHEEP, ADELAIDE.

Wood's Wells,
8 August, 1874.

SIR,

I have the honor to report that the killing and burning of the fluky sheep, which were travelling from the Woakwine country, and stopped on the country at Policeman's Point by authority of the Government, has been carried out to my entire satisfaction. The work commenced on the 23rd of July, and was finished to-day. The system and care which has characterized Mr. Robertson's proceedings in carrying out this unpleasant task, is worthy of every commendation. During the time I have been here I have endeavoured to find the fluke ova, and also small fluke. I searched the gall, bladder, bile, ducts, stomach, and intestines, without success, which is probably owing to the glass I used not being powerful enough. I observed one case of rot, the liver was adhering to the side of the sheep, and when taken out had the appearance of a large hard oval-shaped lump of disease, which when opened showed a mass of decomposed matter, with a small quantity of fluke. I cannot imagine how an animal could possibly exist in such a state, and yet the sheep seemed in good condition. In every instance in searching for ova and small fluke, I found the latter all of one size, or nearly so,—fully developed.

I would call your attention to the fact, that I found the fluke in large quantities in the intestines, leading immediately from the last part of the stomach; they were very numerous in the entrails, from the junction with it of the pipe or duct, down which the bile flows from the liver. I opened the entrails from this point for six or eight feet downward from the stomach, and found it full of bile and fluke. To show you how easily this parasite can leave the liver, I send by this mail a bottle containing the gall-bladder, with its pipe leading into the ducts of the liver, and from there direct into the intestines; that portion which empties itself into the entrails, though small, is so elastic, that when taken hot from the sheep would almost admit of the fingers being inserted in it. In conclusion, I would beg to say, that although salt herbage may be a cure for fluky sheep, it does not alter the fact, that all clean runs, apart from salt country, are liable to become diseased if fluky sheep are allowed to travel over them.

I have certified to the number, &c., &c.

I have, &c.,
HY. E. WELLS,
Inspector of Sheep.

LIVE STOCK.

REPORT FROM CHIEF INSPECTOR, FOR THE YEAR 1873.

THE CHIEF INSPECTOR OF STOCK TO THE HONORABLE THE MINISTER FOR LANDS.

Department of Lands,
Sydney, 12 August, 1874.

I HAVE the honor to submit for your consideration a Report on the Horses, Cattle, and Sheep in the Colony, for the year ending 31st December, 1873.

I.—HORSES.

1. THEIR HEALTH.

OUR horse stock are reported as entirely free from any infectious or contagious disease.

2. THEIR NUMBER AND DESCRIPTION.

There appears by the returns to be a considerable increase in the number of horses in 1873 as compared with 1872, but the returns for 1872 were even less reliable than those of last year; and when it is considered how very unprofitable horse-breeding is, and that breeders are almost all inclined to get out of this class of stock, it may be taken for granted that the increase is more apparent than real, and that as to numbers our horses are nearly stationary at about 320,000. This is also borne out by the Statistical Register, in which the numbers, which stood in 1872 at 328,408, stand in 1873 at 328,014. Relatively to each other, the numbers of the different breeds may be stated at (say) one-sixth draught, one-sixth light-harness, and four-sixths saddle.

3. IMPROVEMENT.

With only four exceptions, the Inspectors report that the horse stock in their districts is improving. This is being brought about—1st, by keeping the horses in paddocks; 2nd, by the destruction and sale of weedy mares; 3rd, by the introduction of well-bred entires; and, 4th, by the destruction of wild horses; and I will deal with this branch of my Report under these heads:—

(1.) *Depasturing in Paddocks.*

This is a step in the right direction. No real improvement can be made in our horse stock until they are kept within enclosures. Until they are so they will never be so quiet or manageable as they ought to be, nor can they be kept from coming into contact with wild horses and stray ill-bred entires, which always infest open runs.

(2.) *The culling and sale or destruction of weedy Mares.*

This also is absolutely necessary, but the practice is not followed to anything like the extent it ought to be. Thousands of mares are still allowed to breed, whose progeny, with the sires now available, can do little more than pay the expense of driving them to market. It is to be hoped, however, that as the country is enclosed, and the cost of rearing these useless weeds becomes more apparent, their owners will see the folly of breeding from such mares, and either sell or shoot them. Even if colts from these weedy mares should average £4 or £5 a head—and that for the class of colt is a much higher average than they now make—the return to the breeder is very little more than half what cattle give; for it is generally allowed that *one* horse eats and destroys as much as *two* head of horned cattle, or at least that *two* horses require as much pasture as *three* cattle; while at present rates cattle are fit for market a year earlier than horses, and bring average prices of £2 a head more than the average named, while they require far less looking after.

(3.) *The introduction of well-bred Sires.*(a) *Thoroughbred Blood and Arab.*

Of late years there have been frequent importations of both English thoroughbreds and Arabs, and a good many of the former introduced last year are of very fashionable blood. But besides these, we possess in the Sir Hercules (a Colonial-bred sire), New Warrior, and other families, some of the stoutest and best strains in the World. Unless therefore our blood stock are allowed to deteriorate—of which there does not appear to be the least risk under the able management of our present stud-owners—our thoroughbreds must continue to be, as they have always proved themselves—the best of that breed out of England.

(b)

(b) Draught Horses.

So far as the draught stock are concerned, the horses which have lately been introduced have generally been of the right description—being principally of the Clydesdale breed, the best draught horses in the World for general purposes; and a decided change for the better is noticeable during the last few years; but any improvement must be comparatively slow, for the mares to which these entires can be put are mostly light in the frame, leggy, and wanting in bone below the knee.

The best of our draught stock went to Victoria some twenty years ago, on the outbreak of the diggings there; and although several of our breeders—such as Mr. Towns of Richmond, Mr. Bell of the Upper Hunter, Mr. Rouse of Mudgee, Mr. Wade of Goulburn, Mr. Brown of Bowenfels, Mr. Stephenson of Maneroo, Mr. McLeod of Moruya, Mr. Massie of Gundaroo, and other breeders who might be named—have again formed studs and are breeding first-class heavy horses, our draught horses generally had become so deteriorated that it will take a great deal of time, money, and care to make them as a class anything like what they ought to be. However, with the extension which has taken place of late years in farming, and the macadamizing of the roads (which has had the effect of driving the bullock teams off them), there is now a good demand for serviceable carriers' and farmers' horses, and every prospect that this demand will not only continue but increase, while heavy dray horses are bringing long prices for town work.

(c) Light-harness and Saddle Horses.

There is a very great scarcity of good sires of this breed. In fact, if the returns received from the different districts be correct, there are only two or three pure-bred coaching sires in the whole Colony. At any rate, with the exception of a very good horse re-introduced by Mr. Woodhouse, of Mount Gilead, Campbelltown, from Tasmania, and another of the same stamp imported by Mr. Rouse, of Guntawang, no entire of this stamp has been imported for several years; and pure-bred coaching mares are even scarcer than the entires.

To supply the demand for coaching and light harness horses therefore, a cross-bred animal is being produced. The thorough or well-bred blood horse is put to draught mares, and the draught horses to light well-bred mares. The progeny is the ordinary light-harness horses of the present day, which, taken as a class, are very far from being the right sort even for work, and so far as good looks go they have little to recommend them. Of the two the cross with the blood horse and the heavy mare is the better; and where the sire is thoroughbred or nearly so, and of fair strength and substance, a good many useful animals with passable action and fair shapes are bred. Very few of them, however, are fit for the side of a carriage. In the other cross again the chances are still farther against the breeder; and it is no uncommon thing to see some of the stock bred in this way with what might be termed the sire's head, the dam's legs, the sire's straight cloudy shoulder, and the light middle piece of the dam, with a general coarseness all over, and neither style nor endurance.

The fact is this cross is by far too sudden, *i.e.*, the animals making it are a great deal too much unlike each other to amalgamate properly in their progeny. And it is to the fact of our breeders being reduced to either of these alternatives, or to that of breeding from mares the produce of this cross and a blood horse—when the progeny almost always runs small and weedy, with anything but showy shapes or good carriage—that the great scarcity of well-bred serviceable carriage and buggy horses is attributable.

To remedy this state of matters the pure bred coaching horse or Cleveland bay ought to be introduced from England. That horse is described by a writer on the breeding of carriage horses, who is evidently master of his subject, in a recent issue of the *Town and Country Journal*, as follows:—"The coach horse, sometimes called the "Cleveland," is an upstanding clean-limbed animal, with lofty crest, high action, and the general appearance of an enlarged blood horse. His head is light and well formed, well set on a long high arched neck. His shoulders are oblique to a degree rarely seen but in the best hacks or hunters. His legs are clean and flat, though tolerably substantial. His barrel is good, with a well-sprung rib. The quarters are in proportion to the fore-hand, with well-bent hocks; the croup is high, and the tail well set on. He has considerable courage, and a spirited air and manner. With his magnificent shoulders of course he has good action and plenty of it. His dam, foaled in the green fields of Beverley, was such another, and his sire had taken many a prize as the best coaching sire and so on all over Britain."

In purchasing in England, however, great care should be taken that the horses selected are of the pure coaching blood, and sprung from progenitors which have for many generations been bred from that blood without any admixture whatever. If this is not done, a more stylish, and perhaps somewhat handsomer horse in some respects may be palmed off for the Cleveland. I allude to a horse got from a light clean-legged mare by a thorough-bred sire. Horses bred in this way are comparatively useless for stud purposes, for they are themselves but cross-bred, and there is no certainty that their progeny will be like themselves—the certainty is rather that they will be unlike. Their use, therefore, only leads to disappointment and loss; and it is to overlooking this fact that so many of our breeders of horse stock have been unsuccessful.

If the Cleveland were put to good-sized mares as nearly as possible of the same type as himself, the progeny as a rule would be a fair coaching size, with good action and good looks. If again he were put to mares of the upstanding saddle or well-bred light-harness type, the progeny would in most cases be a well-bred light-harness horse fit either for the side of a carriage or for a dog-cart or buggy. And if put to the smaller well-bred, or even the comparatively light or weedy mares (of which we unfortunately have tens of thousands) the progeny would be either a fair buggy horse or a good-sized hack.

There would even with these sires be still of course a good many comparatively low-priced and worthless animals bred from such mares as are now in the Colony, but the proportion of low-priced ones would every year be less and less.

Besides the true coacher or Cleveland bay there is a breed of horses in the eastern portions of Hanover and the middle districts of Saxony (in the neighbourhood of Brunswick and Magdebourg and in the country lying between these towns) which if introduced would be of great service in improving our lighter breeds. This horse shows more breeding than the Cleveland, and looks very like what a cross between the English thoroughbred blood horse and the Cleveland would be; but he is of a confirmed type, and as such is of course far more valuable for breeding purposes than the cross-bred animal I have mentioned

mentioned would be. He is what might be termed a well-bred, stylish, carriage horse, about 15 hands 2 inches to 16 hands high. He has a good head, a long well-shaped well-set neck, sloping withers, fair barrel, and handsomely turned hind quarters, with good clean legs, and plenty of bone below the knee; and his action is both good and stylish.

Another horse whose introduction would be of immense advantage to the Colony is the Norfolk cob. He stands from 15 hands to 15 hands 3 inches high, and is what may be termed a thoroughbred cob. His head and neck are all that could be desired, while his expression indicates courage and durability; his withers are high and well set back; he is thick at the heart, broad on the loins, and well ribbed home; his quarters are full and round, and his arms and thighs full of muscle; his knees and hocks are strong, and his cannon bone is remarkably short and stout, while his pasterns are strong and elastic; his style and action as a trotter is superior to that of any other breed, and his speed would be considered under the average if he could not trot 14 miles within the hour.

The Norfolk cob is a distinct type of horse, and would be certain to convey his shapes and qualities to his progeny, as he can be obtained pure bred for generations without any cross whatever. He is therefore just the horse we require to put to our light well-bred mares to breed horses suitable for the Indian market, and to give more compactness, greater strength, and more bone under the knee to our saddle horses generally. If, again, the Norfolk cob were put to our larger saddle and light-harness mares, the progeny would be a strong, well-knit, stylish, carriage or buggy horse, with great spirit and durability.

Not only would these direct benefits accrue to our studs by the importation of the Cleveland, the Brunswick carriage horse, or the Norfolk trotter, but very great indirect advantages would also follow their introduction. Thus the next generation of our well-bred brood mares would be considerably stouter, more roomy and larger every way than they now are—more like what they were twenty years ago; and if a good thoroughbred could be put to them,—instead of the progeny being as it now is, with such a sire, light and weedy, it would in nine cases out of ten be a good, serviceable, well-bred, upstanding hack, or light-harness horse, with plenty of style and spirit.

4. EXPORT TO INDIA.

India has always been a good market for the right class of horses, such as a well-bred, compact saddle horse, about 14 hands 2 inches to 15 hands 1 inch, suitable for the Indian Cavalry—handsome, upstanding, well-bred, well-broken, saddle horse, fit for a gentleman's town-hack—thoroughbreds for racing purposes, and well-matched, well-bred carriage pairs; and lower-priced horses of the same sorts have usually sold well in Ceylon.

If the report be correct that the Government in India have ceased to breed, or more correctly speaking, to rear their own horses for the cavalry, the market there must improve. Until very recently it was customary for the Indian Government to purchase English or Australian thoroughbred, and I believe also Arab entires, and give the farmers in those parts of India most favourable for horse-breeding the use of them for their native mares, on the understanding that they sold the foal to the Government when twelve months old at from £10 to £12. The foal was then taken to some of the Government stud farms till it was old enough to be broken in, when it was handled, and at the right age sent to the cavalry as a troop horse. It is now stated that, after a long and thorough trial, it has been found that what with the carelessness of the natives, who are employed on the stud farms as grooms, the great expense these farms entail, and the frequent losses through deaths and accidents, these native bred and reared horses cost more than horses can be imported for from Australia, while they are inferior to them in size, shape, and endurance—the native mare being as a rule a very poor dam.

If this report be correct with regard to the Indian breeding establishment, and the prices for horses suitable for their market keep up, we may expect that the spirit of improvement which has begun to pervade our breeders will continue to strengthen and develop, and that before long our horses will regain the very high reputation they at one time possessed in all parts of India.

5. WILD HORSES.

Notwithstanding that a great many wild horses are annually destroyed, the number of these pests, owing to the natural increase, shows comparatively little diminution. Last year the number stood by the returns at 109,242 for the whole Colony. This year it is given at 106,815.

It is very much to be regretted that the existing law does not empower—as the new Impounding Bill, which has been more than once before Parliament, proposes to do—the occupants of runs to destroy wild or unmanageable *branded* horses after notice has been given to remove them. The existing Act allows occupants to destroy *unbranded* horses over two years old; but this is not enough, as the occupants of runs are now frequently prevented from destroying unbranded wild horses through the fear of killing the few branded wild ones which are almost always running with them.

At a very moderate calculation something like 150,000 head of cattle might be kept on the country which the wild horses now occupy, and the annual return from that number of cattle, or an equivalent number of sheep, would amount to from £150,000 to £200,000, all which is now lost to the Colony through the prevalence of these worthless scrubbers.

Then if to this be added the loss they occasion through decoying away quiet horses, the injury they occasion the owners of well-bred studs through the wild entires coming among the brood mares, and the expense, trouble, and accidents, not unfrequently fatal, which occur in running in wild horses, it will be seen that it is high time thoroughly effective measures were adopted—such as has been mentioned—for their extirpation.

Even these do not complete the catalogue of the evils and losses wild horses occasion to the Colony. Wherever there are wild horses, duffing and stock-stealing are almost certain to be common. Not only do those who follow these practices make the running of the scrubbers an excuse or blind for their nefarious practices, but the mere existence of the wild mobs of horses tends to make our youths duffers and cattle-stealers. Thus, those lads who are good riders run in the wild horses and begin by branding the foals and clean skins they can yard. Among the unbranded horses there may however be some branded mares with foals at foot belonging to owners residing at a distance from the place where the horses are running, and as there is very little fear of detection their foals are branded as well as those belonging to the wild unbranded mares; and these youths are led on in this way from bad to worse till they become downright duffers and stock-stealers.

6. HORSE TAX.

Two propositions have been made to improve the breed of our horses by taxation. Mr. Rossi of Goulburn, and a few other breeders, propose that a tax should be imposed on all brood mares, while other breeders, and I believe the majority, consider that it would answer the purpose to tax entires.

There is little doubt but that the first proposal would be the most effective, but the tax would fall rather too heavily on men of small means if *all* brood mares were to be taxed, and if owners possessed of only a few, say three head, were to be exempted from payment, the law would be certain to be evaded as it is in the case of the registration of dogs, where owners with more than one dog not unfrequently register them in the names of the different members of their families.

It would seem, therefore, that the latter proposal, the taxing of the entires, is the more practicable one, and, as its effect would be indirect as well as direct, it would be very much more efficacious than it appears at first sight likely to be. Thus, if a good heavy tax, say £20 each, were imposed on entires, none but well-bred suitable horses would be kept, and for such sires both the price and cost of service would be comparatively high—too high in fact for the owners of weedy and inferior mares to pay. They would, therefore, sell such mares or only use them for work, and the breeding of the ugly useless weeds and scrubbers which now sell at from 10s. to 40s. would cease, greatly to the advantage of these owners themselves and to the Colony generally.

The money thus contributed by the owners of entires ought not to be paid into the General Revenue, but should be expended for the benefit of the breeders of horses, and to do this it might be distributed among the different local Agricultural Societies, with the understanding that it was to be disbursed in prizes for exhibits in the horse section, and not to meet in the general expenses of these Societies.

II.—CATTLE.

1. THEIR NUMBER.

The number of cattle in the Colony for the year 1873 and the eleven years preceding, as given in the Statistical Register, is as follows:—

Year.	No.
1862	2,620,388
1863	2,032,522
1864	1,924,119
1865	1,969,105
1866	1,771,809
1867	1,728,427
1868	1,761,411
1869	1,795,904
1870	2,195,096
1871	2,014,888
1872	2,287,660
1873	2,710,374

As explained in my Report of 1870, the great falling off in the number of cattle is attributable partly to the losses sustained in 1861 and the four following years through pleuro-pneumonia, but principally through owners changing their cattle runs into sheep stations. This they did for two reasons,—from a dread of the disease, but principally because sheep paid much better than cattle. To see how very powerful these reasons must have been with stockowners, it is only necessary to state that while the number of cattle was very little more in 1873 than it was in 1862, the sheep had increased from 6,550,896 in 1862 to 18,990,595 in 1873; in other words, that while in 1873 there were very few more cattle in the Colony than in 1862, eleven years previously, there were very nearly three times as many sheep at the latter date than at the former.

Cattle are now reported by the Inspectors in almost all the districts as increasing; but what between the number still lost every year by pleuro-pneumonia, the heavy drafts of store cattle which are being constantly sent into Victoria, the increased demand for beef for the Preserving Companies, and the increasing requirements of the Colony generally for butcher meat,—the reported increase from breeding may be taken as nearly wiped out; and if the numbers were correctly taken, it is believed that the increase in 1873 over that of 1872 would be very trifling indeed.

2. THE DIFFERENT BREEDS.

These may now be put at (say) eight-tenths Short-horn, one-tenth Hereford with a few Devons, and and one-tenth Crosses.

It will be seen that a new breed or rather class of cattle has now to be noticed,—the “crosses.” A good many of our breeders of late years have been putting Hereford and Devon bulls into their Short-horn herds and breeding again from the cross progeny,—instead of adhering to the Home practice, and keeping a set of cows of one breed and a bull of another, and never going beyond the first cross. The breeding from crosses is contrary to rule, and is only allowable in a case where an owner has made up his mind to change from one breed to another, and keeps putting (say) pure Hereford or Devon bulls into his herd for perhaps seven or eight years until his cattle have all the characteristics of either of these breeds. To use Hereford or Devon bulls for a few generations and then resort again to the Short-horn, as, I believe, a good many breeders intend to do, will be certain to result in disappointment and loss. It is only in the first cross that the breeder has any decided certainty that he will have a combination of the good qualities of both breeds. In every generation after that the probability is that the bad qualities of both breeds rather than the good will be the outcome of the mixture, and the more the breeds are commingled the more certain becomes the uncertainty. Unless therefore an owner is in a position to take the one (the first) cross and fatten off, or dispose of, and not breed from it, or has made up his mind to change the breed of his cattle, he should not put either Hereford or Devon bulls to his Short-horn cows, nor Short-horn or Devon to Hereford, nor Hereford or Short-horn to Devon.

At the same time, there is no doubt but the very best beast both for the breeder and the butcher—that is, the most profitable to both—is the first cross. This seems to have escaped the notice of our breeders,

breeders, in their recent discussions on the paper read by Dr. Jenkins on "The Considerations which should guide Breeders and Graziers of Cattle," in the zeal with which they advocated the superiority of their favourite breeds.

The fact is, no one breed possesses all the good qualities which can be obtained in the cross. Thus, the Short-horn stands the highest of all the breeds in size, shapes, early maturity and aptitude to fatten on good or even fair pasture. He is inferior, however, in quality of meat to the Devon, the Black-poley, and even somewhat to the Hereford. He is also less active, and does not perhaps stand hardship so well as the other breeds, while he no doubt requires better pasture than either of them. If, however, the Short-horn bull be put to cows of either of these breeds, an animal combining the good qualities of both is to a very large extent obtained. That the Short-horn ought to be in the cross there cannot be the slightest doubt. The London Market and the British Farmers' Dr. and Cr. Account have settled that point years ago. The next question then is, which of the other breeds should be used with the Short-horn; and that, if we go into the same Court, has also been determined for a good many years in favour of the Black-poled breed. To see that this is the case, it is only necessary to turn to the weekly account of the Smithfield Market in the *Mark Lane Express* and other London papers, where it will be found that the "prime Scotch" and "Crosses," principally from Aberdeen and the neighbouring counties, and almost in every case the produce of Short-horn bulls and Black-poled cows, regularly "top the market," and sell per lb. as high if not higher than the little Devons, while taking the weight for age they are equal to the Short-horn, heavier than the Herefords, and about a *fourth* weightier than the Devons.

Thus, in the aged Fat Cattle Class at last Smithfield Show the average weights of the different breeds were as follows:—

	cwt.	qrs.	lbs.
Crosses	21	3	3
Short-horn	20	0	16
Herefords	18	4	23
Devons	15	3	4

In the Steer Class, under two years and six months, the average weights were—

	cwt.	qrs.	lbs.
Crosses	16	1	21
Short-horn	15	2	1
Herefords	14	3	12
Devons	11	2	18

When again we recollect that this cross inherits, as it does, the large frame, good form, aptitude to fatten, and early maturity of the Short-horn sire, with the robustness and soundness of constitution, thickness and evenness of flesh, and well-marbled small-grained meat of the Black-poled dam, it is easy to see why it is such a favourite both with the butcher and the breeder.

The Devon makes a better cross with the Short-horn than the Hereford. It is liked quite as well by the butcher as the Poley cross, but they are not so profitable to the breeder, as they do not come to nearly such good weights.

The Short-horn and Hereford cross is also for fattening purposes an improvement on the pure Hereford. He is, however, inferior as a cross to both the Poley and Devon, as he stands higher on the leg, is lighter in the thighs, twist, and flank, and indeed in all the boiling pieces, and does not generally "die" so well.

Crossing the other way—putting Black-poled Hereford or Devon bulls to Short-horn cows, makes a very good beast both for the grazier and butcher, although inferior to the cross got by the Short-horn bull out of cows of these breeds.

There is a very common error into which breeders introducing Hereford and Devon bulls into their Short-horn herds have fallen. On the produce of these bulls—especially where they were pure or nearly pure bred, turning out (as first crosses always do) very well—these breeders, instead of recollecting this, and giving the Short-horn cow her fair share of the credit of the successful cross, have as a rule, unthinkingly attributed the whole of the success to the new blood, and gone on introducing it into their herds, while in reality the larger proportion of the success may most probably have been due to the Short-horn blood of the cow. If the breeders who have taken this course are not in a country where Short-horns do not thrive, they will be certain to find that they have made a mistake.

There is another feature in these recent discussions on the breeding of stock which also appears to call for notice. It is the frequent allusion by the advocates of the Hereford and Devon breeds to their superior hardihood in bad seasons, and their activity on the road. Now these are good points, but they are only of secondary importance compared with the very valuable qualities of good shapes, early maturity, and aptitude to fatten; and any one will see that cattle high in the points alluded to cannot possibly be very high in these more important qualities, for it is impossible there can be very great activity with the very wide forequarters, the fullness and roundness of shapes, and the great depth of flesh and fat which they must have if they possess in a very high degree the qualities there indicated; nor can there be much softness and aptitude to fatten with very great hardiness and robustness of constitution. This is exemplified in our common comparatively unimproved bush herds. They have a great deal too much hardiness and activity, and we have no need to introduce stock into our herds wholly or even mainly for the sake of giving them either the one quality or the other; in fact, we require to breed these qualities *out* of them. Although, therefore, the Herefords, Poles, or Devons, do in themselves possess to a large extent the qualities of good shapes, early maturity and aptitude to fatten, together with those of hardiness and activity, our herds generally stand in so very much greater need of having their points of quality and form improved than their hardiness and activity increased, that it is to the breed which would most effectually and expeditiously bring about this much to be desired improvement that our stockowners as a rule should look. It will be a long time before our herds generally become so very full of quality and so very well developed in shapes as not to be able to withstand the vicissitudes of our climate or to travel to market. When they are, it will be time to think of increasing their hardiness and activity. Indeed, when we consider their comparatively round, bare, plain shapes, and the fine grain and good quality of their meat, it must be evident that the generality of our bush cattle, although with more of the Short-horn blood in their veins than that of any other breed, can scarcely be looked upon as anything else than a distinct breed from the pure Short-horn, and the progeny for several generations at least as crosses. If this view be correct, then

then the putting of well-bred Short-horns into our common herds now running on even poor or inferior country, would for a time at least show nearly as good results as putting these bulls to Hereford, Poley, or Devon cows, and of course proportionately better where the pasture is good.

Still, owners must be guided by the position and class of country which they occupy, in determining what breed of cattle they should put upon it. On this point, supposing the herd is a breeding and fattening one, it may be said that the *Short-horn* will answer best on country ranging from good to superior, not too far from market. The *Hereford* again will thrive and fatten on a poorer class of country, will stand a cold climate better, and travel better long distances to market. The *Black-poley* is as active as the Hereford, and is hardier and more robust, and would do remarkably well in the colder and higher lying portions of the Colony. How this breed would answer on the plains is yet to be tried, but there is no reason why it should not do as well there as the others. If it did, the fat cattle would carry their condition well to market. The *Devon* seems admirably adapted for our great outlying salt-bush plains, and if Devon herds were formed there, and Short-horn bulls put to the cows, the produce would be stock that would stand very high with both grazier and butcher.

3. THEIR IMPROVEMENT.

The very marked desire for the improvement of their herds, which some years back set in so strongly among owners, still continues, and our cattle are every year becoming better and better, through close and judicious culling, the purchase of pedigree bulls, and the fencing in of the runs.

(1.) Introduction of pure Stock.

Last year, as many as 1,000 pure and well-bred bulls, and over 200 cows and heifers, were introduced into the different districts.

In nine districts the introductions are reported as all Short-horns; in nine as Short-horn and Hereford; and in six as Short-horn, Hereford, and Devon.

Among the pedigree stock thus introduced were the following animals imported from England:—

(2.) Imported Cattle.

Number.	Shorthorn.		Herefords.		Devon.		Importers.
	Males.	Females.	Males.	Females.	Males.	Females.	
1	...	1	Captain Swanson.
5	2	3	Barnes & Smith.
1	1	Dr. Jenkins.
5	5	H. C. White.
1	1	Fanning, Griffiths & Co.
1	...	1	A. A. Dangar.
1	...	1	E. H. Woodhouse.
1	1	Gilchrist, Watt, & Co.
1	1	T. Yeo.
1	1	1	...	J. C. Irving.
3	2	Walter Lamb.
1	...	1	Barnes & Smith.
7	5	2	J. D. Macanah.
6	2	4	Gilchrist, Watt, & Co.
6	6	H. Bell.
2	2	Australian Agricultural Company.
3	3	T. Yeo.
2	1	1	Barnes & Smith.
2	1	1	A. Loder.
6	2	4	C. Bagott.
9	1	3	1	4	T. Yeo.
2	1	1	Gilchrist, Watt, & Co.
4	4	H. C. White.
7	1	6	W. J. Dangar.
2	...	2	A. A. Dangar.
2	...	2	W. Russell.
1	1	Codrington & Wyndham.
6	2	4	J. J. R. Gibson.
3	1	2	Fraser & Anderson.
1	1	S. Dight.
1	1	Barnes & Smith.
4	1	Fanning, Griffiths, & Co.
4	4	E. H. Woodhouse.
3	...	3	M. Joseph.
4	2	2	Gilchrist, Watt, & Co.
6	3	3	Charles Baldwin.
1	1	
	43	30	4	5	7	24	

There were thus:—73 Short-horns, 9 Herefords, and 31 Devons.

Besides the importations from England, 10 Short-horns, 40 Herefords, and 102 Devons came from Tasmania; 12 Short-horns from Victoria; and 2 buffaloes from India.

(3.) Fencing in the Runs.

It would appear that the enclosing of the cattle-runs is steadily progressing. The returns under this head are as follows:—In seventeen districts the cattle are kept on both open and enclosed runs, in seven districts they are all in paddocks, in three districts they are principally in paddocks, in two they are chiefly on open runs, and in two more they are all on open runs. The advantages of fencing in the case of cattle are very numerous. The following may be noticed:—(1) The country, especially if cut up in moderately sized paddocks, will carry more cattle; (2) fencing of course prevents the losses which occur on open runs through the cattle—especially store stock—straying; (3) it saves in their case breaking in to the run, and thus reduces the time the cattle take to fatten by at least one-half; (4) it tends to make the cattle quieter and larger

(5) it saves expense in management; (6) it prevents cattle-stealing; (7) it prevents the spread of infectious diseases; (8) it enables the owner to keep his fattening and breeding stock separate, and thus enables him to turn off his fat stock at a much earlier age; (9) it enables him to classify his stock and keep the heifers from breeding at too early an age; and (10) it renders the general management of the station so regular and easy as to allow the owner to devote the principal part of his time to the improvement of the breed of his stock.

4. AILMENTS AND DISEASES IN CATTLE.

Cancer.—This ailment has been reported as only occurring in four districts. It is quite a common one in many parts of the Continent of Europe. The treatment which has been found most successful there is excision and burning the wound with a hot iron brought up to white heat.

Ophthalmia.—This disease is not reported last year as existing in any of the districts.

Fluke and Worms.—Only in one or two of our most unsound districts does fluke or worms affect cattle, and there, although they have a prejudicial effect on the animals' health, they very seldom prove fatal.

Cumberland Disease.—This affection, which at one time was so fatal in some of the districts, is now of comparatively rare occurrence, and the losses from it but slight. During last year only in three districts were there any outbreaks, and the losses were very trifling.

Blackleg.—As might have been expected from the favourable season, this disease was last year unusually prevalent, and the losses in several instances comparatively heavy. Here as in every other ailment the proper treatment is prevention. This may be effected in several ways, but chiefly by taking care that cattle, especially young stock, are not allowed to lay on condition with too great rapidity, particularly in the spring or beginning of summer; for the disease is caused by what may be termed a rapid plethora of condition. Clater says on this subject—"Where the vegetable creation springs up in all its perfection, the young animals are not able to stand against such luxurious living, particularly those which have been much reduced with bad keeping and scanty food during a long and severe winter." These remarks apply with very great force to the stock kept on some of the best pasture lands of the Colony, where the soil is deep and rich, and the feed in summer very luxuriant and fattening, while the land is at the same time comparatively high, lying exposed, or cold in winter. In situations such as these the cattle are often greatly reduced in the winter-time; and when the great flush of luxuriant grass comes up with the warm weather of early summer, the animals change so rapidly from a state of leanness and poverty to one of high condition and fatness that their constitutions fail to stand the strain, and blackleg is the result.

Treatment.—Looking at the causes of this ailment, it is plain that a good deal can be done to prevent its occurrence by seeing that the young stock running on strong rich soil are subjected as little as possible to the risk which attends their grazing on the luxuriant feed which grows on these lands; and if they must be kept on such pasture, care should be taken to send them occasionally to poorer land, or even to yard them at night, as it would seem that such a change as this is beneficial, both through checking the rapidity with which they would otherwise lay on condition, and through the beneficial effects arising from the change from the one locality to the other.

This in fact is almost all that can be done with a large proportion of our stock, as there would be very great difficulty in bleeding, setoning, and physicing our comparatively wild bush cattle. "Putting a seton in the dewlap of sufficient length from above downwards, and giving to each animal, when required, the following medicines,—

<p>"Crude antimony, in powder, $\frac{1}{2}$ oz. "Brown sugar and nitre in powder, each, 1 oz. "Myrrh in powder, $\frac{1}{2}$ oz. "Flower of sulphur, 2 ozs.</p>	} or {	<p>Nitre and madder, each in powder, 1 oz. Alum in powder, & flower of sulphur, each, 2 ozs. Treacle, 4 tablepoonsful.</p>
--	--------	--

"with a change of pasture," is the treatment recommended by Armatage in his recent edition of "Clater." Both medicines are for one drink each, and to be given fasting in the morning in a quart of warm gruel. Bleeding to the extent of from 2 to 3 quarts from each beast, according to its size, condition, and strength, physicing and change of run, was the old treatment; but it is now considered unnecessarily severe.

Where, however, either of these modes of treatment can be applied to the young stock, it ought to be so regularly every year in those localities where the disease is liable to occur; for it gives very little warning of its approach, and it is generally the best as well as the fattest that are first carried off.

It ought to be borne in mind that cattle which have died of blackleg are, like those affected with Cumberland Disease, dangerous to handle, and ought not to be skinned.

Pleuro-pneumonia.—This disease was very general last year. It is reported as prevailing in twenty-four out of thirty-four districts, but usually of a mild type; and the losses comparatively few, when the cattle were allowed to remain quiet on their runs, and not mustered or travelled. This, of course, they could not always be; and the losses were then frequently severe.

Bleeding is reported to have been tried in a good many instances as a cure; but although favourably reported of, its efficacy is more than doubtful; for it was tried again and again in England and on the Continent, and given up by the profession as worse than useless. It was found to do no good, and to weaken the animal.

Inoculation as a preventive is now all but universally believed in, and generally practised with the best results. Mr. Ogilvie, of Yugalbar, Clarence River, reports that he has been inoculating very successfully with a different sort of virus from that generally used; and, as the virus he recommends,—the water in the chest,—is not only to be obtained in very much larger quantities than the virus from the lung, but is also much more easily found, *i.e.* the animal from which it can be procured is far more readily selected,—owners inoculating should try this virus on a few head of their cattle and carefully note the result.

Mr. Ogilvie thus describes the sort of virus he uses, and the mode of obtaining it:—

"It is not, I think, generally understood that the liquid which (as all who have any acquaintance with pleuro-pneumonia will know) is so frequently found secreted in large quantity within the cavity of the chest of affected animals, is the best and safest description of virus to use for the purpose of inoculation. By the use of this liquid, instead of that obtained from the diseased lung, the risk of loss from swelled tail is almost entirely avoided. In fact, the dangers attendant upon inoculation are to a very large extent

extent escaped, while the beneficial influence of the operation is in no degree impaired. Of this so little doubt is entertained in the Clarence District that the use of virus taken from the lung was very early, and I believe I am justified in saying very generally, abandoned. In obtaining the liquid spoken of, care has always been taken to procure it in a bright and pellucid condition; but I am not prepared to say that such precaution is really necessary. In the virus obtained from the lung, pellucidity and a pale colour were so generally acknowledged to be indispensable conditions, that it was taken for granted that similar conditions must also be requisite in the new kind of virus or lymph when it was adopted; and as far as I am aware, no one has hitherto, in using this lymph, thought it expedient to venture to dispense with these conditions. This description of lymph is moreover readily obtained in the required condition—much more so than the lung virus. I have usually been able to obtain it from the first or second animal killed for the purpose, and have never found it necessary to go beyond a third. In short, I think this is to be so much preferred to the lung virus that I cannot too strongly recommend its use."

III.—SHEEP.

I. NUMBER AND DISTRIBUTION.

The number of Sheep in the Colony during each of the last *thirteen* years stands as follows:—

1861	6,119,169	1868	16,000,000
1862	6,550,896	1869	16,848,217
1863	7,169,126	1870	16,218,825
1864	9,089,463	1871	16,766,012
1865	9,650,106	1872	17,873,696
1866	11,644,593	1873	18,990,595
1867	15,066,377		

The following Tabulated Statement shows the number of Sheep returned to the Clerks of Petty Sessions throughout the Colony in 1872 and 1873, with the increase and decrease for the latter year.

District.	No. of Sheep, 1872.	No. of Sheep, 1873.	Increase, 1873.	Decrease, 1873.	District.	No. of Sheep, 1872.	No. of Sheep, 1873.	Increase, 1873.	Decrease, 1873.

Menindie	578,850	547,116	31,734	the year 1872

These returns show that, notwithstanding the large numbers of sheep killed for home consumption and for preserving at the various establishments now at work in the different Colonies, there was an *increase* in the number of sheep in the Colony in 1873 compared with 1872 of 1,116,899. This increase arises partly from the stocking of new country, but principally from the improvement of the carrying capabilities of the runs by fencing and water-making—especially by fencing; and as these improvements are every year becoming more general we may expect that the increase which has again fairly commenced will be a steadily progressive one.

It would be interesting to know,—and next year the Inspectors' returns might be made to show,—how many sheep are now depastured on land held in fee simple, and on selections, and how many on runs and grazing rights. The Inspectors' reports give the number of sheep held by owners of less than 500, but they do not give anything like a correct idea of the number of sheep in the two classes mentioned, or even of those owned by the comparatively small holders; for although these owners have at first generally less than 500 sheep they very soon own more than that number, and are then of course included in the large class of contributing owners.

In the foregoing general total of the whole number of sheep, something over a quarter of a million (264,000) of them are coarse-woolled or large-framed sheep. These coarse-woolled sheep consist of Leicesters, Lincolns, crosses with these breeds and the Merino, and a sprinkling of South Downs, Cotswolds, Cheviots, and Romney Marsh. The number of large-framed sheep is increasing, although the rate of increase is not so rapid as it was at one time expected to be. The owners, with comparatively poor country, who have recently tried this breed have been disappointed. They imagined that all they required was a large supply of feed, and that if the quantity was ample and not far to travel for, the quality was not a matter of much moment. That, in fact, these sheep would do well on the rank coarse grass growing on poor country, where the Merino would not thrive. They have discovered their mistake, for these large-framed sheep not only require a plentiful supply of feed, but it must be of a nutritious description, and they must not have to travel far for it. When, however, these conditions are obtainable, Leicesters and Lincolns do remarkably well when kept pure, and are much less liable to foot-rot on what may be termed unsound country than the Merino. It has also been found very profitable to put pure rams of these breeds to Merino ewes. The progeny (the first cross) possess a fair share of the good qualities of the wool and carcass of both breeds, and on good thickly-grassed country pay the breeder a good deal better than the Merino. The single cross, however, is all that ought to be taken, and the progeny (of the two breeds) ought to be sent to the butcher—not bred from, as deterioration and uncertainty would be pretty certain to follow such a course.

2. FENCING AND SHEPHERDING.

The Inspectors' returns show that in eighteen districts the sheep are both shepherded and paddocked. In five districts (in the south-western portion of the Colony) they are all paddocked; in five more they are principally paddocked; in two they are all shepherded, and in two more they are principally shepherded.

The advantages of fencing are even greater in the case of sheep than of cattle; and they are now so well known and generally appreciated that it is only a question of a comparatively few years when all the runs—except perhaps those which are peculiarly liable to be selected—will be enclosed. It may not, however, be out of place here to enumerate some of the advantages of fencing sheep stations. They are, among others, the following:—

1. The country will carry one-third more sheep.
2. The wool will be longer and sounder, and the flecce as a whole one-third better.
3. The feed will be cleaner and less liable to grass-seed.
4. The lambing on the average of years will be better.
5. The sheep will increase in size.
6. They will live longer, and continue longer profitable.
7. They will be freer from foot-rot and other diseases.
8. The expense of working the station will be less than one-quarter of what it would be if the sheep were shepherded.
9. The owner will be able to devote the principal part of his time to improving his sheep, instead of spending it in attempting to manage a lot of careless shepherds and hut-keepers.

3. THEIR IMPROVEMENT.

In all the districts except one the flocks are reported by the Inspectors as improving, through the careful close culling of the breeding ewes and the introduction of well-bred rams. Their returns show that no less than 35,000 stud sheep were introduced last year into the different districts (exclusive of purchases from local breeders not included in those returns). They were principally from the Mudgee and Merriwa flocks; a good many came from Victoria; some from Mr. Gibson and other breeders in Tasmania, and some from Mr. Fisher, South Australia; while there were a good few importations of large-framed sheep from England.

The following is a detailed statement of the various importations:—

IMPORTED SHEEP.

3295	1800	516	324	262	280	84	17	12		

It will be seen from the above statement that the total number of sheep which passed through Quarantine in Sydney, last year, was 3,295. Of these, 2,316 were Merinos, 586 Leicesters, 364 Lincolns, 16 Shropshire, and 13 Southdowns.

4. LAMBING.

The average lambing last year for the whole Colony was a very good one—78½ per cent. It was made up as follows:—Albury 74½; Armidale, 70; Balranald, 84; Bathurst, 81; Bourke, 89; Braidwood, 65½; Carcoar, 82; Cooma, 70½; Coonabarabran, 88½; Corowa, 77½; Deniliquin, 83½; Dubbo, 82; Eden, 77½; Forbes, 87; Glen Innes, 63½; Goulburn, 76; Grafton, —; Gundagai, 77; Hay, 77; Maitland, 90; Menindie, 84; Merriwa, 70; Mudgee, 81½; Narrabri, 86½; Port Macquarie, 30; Singleton, 89; Tamworth, 89; Wagga Wagga, 75; Warialda, 80½; Wentworth, 92; Windsor, 80; Yass, 75; and Young, 81½.

Looking again at the averages of the shepherded compared with the paddocked sheep, the following results appear:—In the districts where the sheep are all shepherded the average lambing was 77 per cent.; while in those where they are all paddocked the average was 82. In those districts where the sheep are principally shepherded the average is given as 82 per cent., and in those where they are principally paddocked the average is 80 per cent. This makes the average lambing in paddocked upon the whole better than in shepherded sheep, but not so much as it really is, for fully three-fourths of our flocks are now running in paddocks, and the expense of lambing in that case is only a fourth of what it is where the sheep are shepherded.

The six highest average lambings are Wentworth (paddocked), 92; Maitland (paddocked), 90; Bourke (shepherded and paddocked), 89; Singleton (both), 89; Tamworth (both), 89; and Coonabarabran (both), 88½.

5. THE CLIP.

The clip of last year was lighter than that of 1872. Last year the average clip for the whole Colony, compared with that of 1872, stands as follows:—Greasy, 4 lbs. 12 ozs. in 1872, against 4 lbs. 9½ ozs. in 1873; pool-washed, 2 lbs. 14 ozs. in 1872, against 2 lbs. 11 ozs. in 1873.

As usual, the highest averages are in the Western and South-western portions of the Colony. Wentworth heads the list for greasy wool, with the extremely high average of 7 lbs.; Bourke and Deniliquin are next, with 6 lbs. each; Balranald next, with 5 lbs. 13 ozs.; Cooma next, with 5½ lbs.; and Menindie next, with 5½ lbs.; while the lowest are—Braidwood, 3½ lbs.; Forbes, 3 lbs. 12 ozs.; Mudgee, 3 lbs. 13½ ozs.; and Yass, Windsor, and Gundagai, 4 lbs. each.

The

The highest averages in hot-water washed wool are—Hay, 3 lbs. 3 ozs. ; Dubbo, 3 lbs. 1 oz. ; Albury, Demiliquin, and Singleton, 3 lbs. each ; and Merriwa, 2 lbs. 13 ozs. ; while the lowest are—Glen Innes, 2 lbs. 7 ozs. ; Warialda, Narrabri, Forbes, and Cooma, 2 lbs. 8 ozs. each ; and Menindie, 2 lbs. 8½ ozs.

This year the returns fix the difference in weight between combing and clothing fleeces in favour of the former by 8 ozs. each.

Here again the depasturing of the sheep in paddocks tells, the higher averages being nearly all in those districts where the sheep are running at large ; and, as has been stated, it not only gives additional weight, but it is even more beneficial as regards the quality of the wool, the staple being longer and sounder, and the fleece very much cleaner.

6. DISEASES AND AILMENTS.

Scab.—I have much pleasure in reporting that our flocks are still entirely free from this disease. The reports received from Victoria are also of a more favourable character, although a considerable number of sheep are yet in quarantine in that Colony, and it is still considered necessary to maintain a full staff of boundary riders on the Murray. There is no scab in South Australia or Queensland, and no risk of disease being introduced from either of these Colonies, except perhaps in the case of South Australia, through which the infection might possibly pass from Victoria. But this has been foreseen and provided against.

Catarrh.—No outbreak of this disease has occurred in this Colony for upwards of three years ; and it is hoped that it has been finally eradicated.

Cumberland Disease.—This disease only showed itself in four districts, and in each instance the losses were very slight.

Fellows and Redwater.—No case of either of these ailments occurred during last year.

Foot-rot.—This ailment is reported as very virulent in one district, as prevalent in seven districts, slightly so in fourteen districts, and the rest are reported as entirely free from it.

The variety of dressings tried for this ailment is very great—no less than twenty-seven different chemicals and combinations having been used. Of these, arsenic, butter of antimony, carbolic acid, bluestone, and lime, were most generally used, while the other dressings were only tried in a few cases. In the combinations, again, the most in favour were arsenic and bluestone, bluestone and tar, carbolic and tar, and carbolic and oil.

In all cases prevention is better than cure, but here it is especially so, and owners should be careful, when the season threatens to be such as to induce foot-rot, to harden and protect the sheep's feet from scalds, by running them through shallow baths with arsenic water or a decoction of wattle-bark or some other astringent as frequently as may be necessary while the damp weather lasts. With properly constructed shallow baths and races, the expense and labour of these dressings would be comparatively small, and would, if applied in time, be repaid tenfold, through saving the expense, loss and trouble which an outbreak of confirmed footrot always entails.

Fluke.—In regard to this affection—in fourteen districts there were no cases ; in five it was very slightly prevalent, in nine it was slightly, in four it was generally prevalent, and in one it was very prevalent.

Five different medicines are stated to have been used as preventives namely:—Liverpool salt and sulphate of iron ; Liverpool salt, sulphate of iron, and turpentine ; sulphur and Liverpool salt ; sulphur, and turps ; and rock-salt. Of these again—salt and sulphur have been used in seven districts ; salt and sulphate of iron in six ; and salt and sulphate of iron, salt, sulphur, and turps, and rock-salt, in one district.

Worms.—These pests are reported as being very prevalent in one district, generally so in five, slightly in three, very slightly in four, and non-existent in twenty districts.

The medicines and preventives used for worms were as follows:—salt, sulphate of iron, and turps, in three districts, salt and sulphate of iron in two, Liverpool salt in two, and tobacco-water, gunpowder and Liverpool salt, Hargan's specific, sulphate of iron and salt, and salt, sulphate of iron and sulphur, in one district each.

Both from the experience of this Colony and of that of Queensland, as given in Mr. Chief Inspector Gordon's valuable Report lately published, this disease, as well as that of fluke, can only be successfully dealt with by prevention ; and this, as Mr. Gordon has shown, can only be effected by a thoroughly liberal and regular supply of salt in all parts of the Colony except the true salt-bush country. On very inferior or saltless pasture he considers sheep should receive at least 2 tons per annum per 1,000 ; and great care must be exercised that every sheep regularly receives its proper quota.

Of course, where the sheep have been allowed to become affected, the other medicines mentioned, such as turpentine, sulphate of iron, sulphur, &c., will require to be used along with the salt, and in such cases a mixture of nitre and sulphur in the proportions of one to ten, and a strong decoction of horehound, might also be tried, as they are said to be very effective.

In administering turpentine to sheep, it would be safer to give it in a mucilage of starch or flour and water ; and sheep to whom this medicine or nitre and sulphur have been given should not be allowed to drink for at least six hours after they have been dosed.

There is one circumstance connected with this ailment which is very disquieting. It has been the custom of late years for owners in the upland parts of the Colony, where worms frequently infest the sheep, when they find them affected, to travel them into the salt-bush districts by way of cure ; and worms have in several instances appeared among the sheep in different portions of the salt-bush country through which these worm-infested sheep have passed. Indeed, so frequently has this occurred that the owners in these districts have begun to protest against sheep affected in this way being allowed to travel over the same ground as their sound flocks, and have mooted the question of legislating to prevent them from doing so. There are, no doubt, good grounds for immediate inquiry into the matter. Indeed attention was several years ago called to the danger of the spread of the worm disease in this way, by Dr. Morris of Sydney, in his very able paper on that subject, published in the journal of the Agricultural Society of New South Wales ; and I am collecting all the information I can through the Inspectors, with the view to settle the question as to whether or not the ailment is infectious.

IV.—GENERAL.

1. LOAFING SHEEP.

Last season was too favourable, and the feed and water too plentiful, to induce loafing.

2. RESERVES FOR TRAVELLING STOCK.

These Reserves are very far from being in a satisfactory state.

A great deal too few have been proclaimed, and the most suitable land for them is being fast taken up by selectors along the main droving roads; while those that have been proclaimed are rendered comparatively valueless to the drovers by the occupants of the adjoining land consuming the grass.

The first portion of the evil here noticed would of course be remedied by the proclamation of additional reserves, and the Survey Department are doing all that an overworked staff can do to survey and proclaim the necessary sites.

The second portion might be remedied by giving the Inspectors into whose charge these reserves have lately been placed exact descriptions of their boundaries, and empowering them to impound all except travelling stock found upon these reserves.

There is no doubt but that the proposal made by Mr. Forster, in his Impounding Bill, of enclosing the principal reserves on the main droving roads, and charging a small fee per head per night for the sustenance of the stock, is a sound and practical one, and ought to be carried out; but perhaps public opinion is not yet ripe for this alteration, and the best thing that can in the meantime be done is to place the Inspectors in a position to keep all but travelling stock off these reserves so far as they can.

3. CHANGE OF STOCK ON RUNS.

In a few of the higher-lying wet portions of the Colony cattle have taken the place of sheep, and it would be well perhaps, in country of the same sort, where the sheep require such great care to keep them sound and in a profitable condition, that more owners, and especially the careless and incompetent, would follow the example of those who have already done so, and get rid of their sheep for cattle.

4. TAME DOGS.

The loss through tame dogs is steadily on the increase; and if a measure be not shortly passed extending the provisions of the Dog Act to the whole Colony, and making owners responsible for the depredations their dogs commit, sheep-farming in the more thickly settled districts will have to be abandoned. Indeed, it has already been so on this account in a good many cases. The owners in almost every district throughout the Colony are strongly in favour of some such measure, and it was very unfortunate that the House took the view they did of the Bill introduced last Session by Mr. Nelson, and did not amend instead of throwing it out.

It is to be hoped, however, that the matter will be taken up at an early period of the coming Session, and that before the end of the present year the law will be remedied.

The Inspectors' returns show that in five districts the losses through tame dogs were excessively heavy, in ten they were severe, in four they were slight, in eight they are not given, and in five they are returned as nil.

5. DINGO.

Although native dogs are nearly exterminated in the districts where the sheep have been turned out, they are returned as still very troublesome in six districts, troublesome in twelve, slightly so in seven, very slightly in two, and in the others not at all.

In some of the outlying and newly settled districts, as well in the mountainous country near the coast range, the losses by native dogs have been severe; and it would even yet be advantageous to adopt and carry out some general and simultaneous plan for their extermination, such as I have already suggested, under the management of the Boards of Sheep Directors in the different districts, on the model of the Municipalities Act.

There is not of course very great necessity, in those districts where the sheep are turned out and the native dogs already nearly exterminated, for such a measure as that now pointed out; but even in these districts it would be much cheaper, and a great deal more effectual, if the destruction of the dingo was carried out in this general and simultaneous way than it now is by individual and fitful efforts; while the contribution to be paid by the owners would be the merest bagatelle, and the trouble to the Board of Sheep Directors very trifling.

6. COAST SCAB DISTRICT.

The alteration of the boundary of this district from the Hawkesbury River to a line in the neighbourhood of the sale yards at Homebush has been more than once mooted, with the view of enabling sheep which are too low in condition to be sold as fat, to be sent back without being dressed as required by the Act. If this alteration was carried out according to the views of those who have been moving in the matter, the object of the Coast Scab District provision of the Act would be completely defeated, as town sheep, and sheep which may have for a long time been kept in the neighbourhood of the sale yards, would be certain to mix with those which would thus be taken back without dressing, and disease would again be carried into the interior, as it has been in the case of every outbreak by sheep taken back from the Sydney and Maitland sale yards.

Then again, the convenience of the inhabitants in the towns situated in the present Coast Scab District, such as Parramatta, Liverpool, Campbelltown, Penrith, and Richmond, must be considered in settling the boundaries of the Coast District. If the Coast Scab line were brought as proposed up to the neighbourhood of Homebush, no sheep whatever could be taken back from the sale yards there to any of these towns for slaughter unless they were dressed and kept twenty days in quarantine, which is of course entirely out of the question.

Before, however, entertaining a request such as this and altering the boundary from the Hawkesbury River, which forms both a thoroughly safe and well-defined line, as well as one that entails the least inconvenience on the people in the County of Cumberland and the Coast District generally, it would be well to ascertain if there be really any necessity for such an alteration; and I think it will be very easy to show that the operation of the law as it now stands tends rather to the advantage than otherwise of the sheep-owner; for it leads him or his agent to ascertain sooner than might otherwise be done the actual condition

condition of the sheep; and—if they be too poor to sell as fat—to send them back to the station they started from, or dispose of them as stores, instead of turning them back from Homebush after they have been knocked about, and a great deal of unnecessary expense incurred in taking them to a market in which they were quite unfit to be offered.

Even though there were no Coast Scab Regulations, there never would be a market for store sheep near Sydney, and every mile they come, after they are too poor to sell to the butcher, is needlessly increasing expense, and taking them away from their run or their market.

It is not, therefore, for a moment to be imagined that the salesmen who have the interests of their constituents at heart (although they may now and then when caught with a few sheep which are too poor to dispose of to the butcher complain against the present Regulations) will seriously think of altering the existing boundaries. In fact, most of the salesmen have agents at different stages along the main droving roads, from whom they receive regular intimation of the description and condition of the sheep which are sent them for sale; and if the drovers are not sufficiently trustworthy to be depended upon for information, they are kept advised by these agents as to the real state of the sheep, and as to whether or not they should be allowed to proceed beyond the place where they are inspected. If, therefore, they are found to be too poor for the butcher, they are either sent back to their run or stopped until their owner is communicated with.

In this way sheep which are only fit for stores, which were intended to come down by rail, need never be allowed to come on beyond Wallerawang, and those intended to be travelled, if they pass that place, can at any rate be stopped before crossing the Hawkesbury.

When, therefore, the interests of the owners of the sheep are studied as they ought to be, it must be evident that there are no good grounds for the complaints which are now at times made with regard to the boundaries of the Coast Scab District; and that while the salesmen can duly attend to their constituents' interests by stopping the sheep before they come near the boundary of the Coast District, the provisions of the Sheep Act can be so administered as to render it impossible for the scab to spread again, as it has often done, from the town or market sheep. At the same time it must be allowed that, however careful a salesman may be, there will be times when little lots of sheep which have been waiting the market in the Coast District will fall away and become too poor to dispose of to the butcher; and it would be well if the provisions relating to the dressings of Coast District sheep, which are unnecessarily protracted and severe, were relaxed. It is to be hoped that an opportunity will be obtained during the coming Session of Parliament to amend the Sheep Act in this and in several other of its provisions which require alteration, now that there is no scab in the Colony.

7. DUTY ON SALT.

From what has been said with regard to the prevention of fluke and worms in sheep, it will be seen how very essential it is that the sheep in a large proportion of the Colony,—in all of it in fact except the true salt-bush country,—should receive a very liberal supply of salt to keep them in good health.

I would therefore suggest that the duty on rock and Calcutta salt be repealed. Taking both sorts together they bring only a small amount—some £3,000 or £4,000 per annum—into the Treasury; and all classes would participate in the advantage of its repeal,—the stockowners by the improvement in the health of their stock and better returns from them, and the public by avoiding the risk they now run of consuming mutton affected with worms and fluke, and in participating in the advantage which would accrue to the Colony generally by the increase in the quality of our beef and mutton, and the improvement of the clip in those districts where the stock are more or less affected with worms and fluke, or at least not in such vigorous health as they would be if they had a full supply of salt.

8. DRAINING.

Both for fluke and worms, as well as for foot-rot, the real remedy is draining, and especially under-draining the land. Under-draining, however, at the present cost of labour cannot be thought of, especially on Crown lands; but surface draining on purchased land and on some portions of Crown lands, by drawing plough furrows and helping them a little here and there with the spade, would be comparatively inexpensive, while it would do a vast deal of good by preventing surface water from lodging and forming, as it now does, nurseries and breeding pools for the fluke and worm. If open furrows were run and helped as proposed, the rain would soon form them into natural channels, and where there was much fall and the water threatened to cut too deeply into the ground, a few branches placed in the ruts would at once stop the soil from being washed away, and prevent the drain from going beyond the proper depth.

9. MEAT-PRESERVING.

As this is a subject in which our stockowners are both directly and indirectly deeply interested, I made it my business while in Europe to obtain all the information I could as to the state and prospects of the trade in Australian preserved meats.

On doing so I was disappointed to find that the prices our meats realized were only about half what the best Home-made meats brought; and I was led to believe from what I heard that this extraordinary difference in price, although partly owing to the superiority of the quality and flavour of the Home meat at certain seasons of the year, was mainly attributable to the mode in which the Colonial Meat-preserving Companies have conducted their business.

The stock in the Colonies have, as a rule, to travel long distances to the preserving establishments, and they not unfrequently suffer on the road from want of feed and water, as well as from overdriving. Our beef and mutton, therefore, can scarcely rank as to quality and flavour with the best Home-fed meat; and no pains ought to have been spared by the preserving Companies, especially when it is considered that the trade in preserved meats as now carried on at Home is a comparatively new one,—to put up as little inferior meat as possible, and to dispose of any of that class which they did preserve, as *second* or *third* quality,—in order that consumers might have no grounds for complaining, as it is now currently reported at Home they often have, that they have been deceived in the article they were purchasing. Such a precaution as this has unfortunately not been taken. The Companies have never made any classification of their meat; and as they have all, in order to keep their works going and their hands employed, not unfrequently put up inferior meat, and allowed it, so far at least as the consumer is concerned, to go into the market as if it were *first* quality, the consequence is, that the character of our Australian preserved meat has been unnecessarily damaged, and its market value so much depreciated as that, while the best Aberdeen preserved meat sells readily at 1s. per lb., the best Australian never exceeds 7d.

This unfortunate state of matters has been accelerated and aggravated by some of our colonial preserving establishments purchasing and putting up a great deal of inferior meat, and flooding the Home market with a most inferior and worthless article, but for which, on an average, now that there is no classification as to quality, they obtain nearly as good prices as the meat preserved by the Companies who as a rule put up nothing but the best; for the people at Home—at any rate, the consumers—have little or no knowledge of the relative merits of the different brands, and purchase the one nearly as readily as the other.

In this way the general average price of our preserved meat is pulled down to the level of the inferior, and the value of the difference in quality between the best meat and the inferior is lost to the careful preserver. If, however, the Companies that are doing the largest business, and who of course desire to do it in the best manner possible, would combine to classify their meat, and bind themselves never to allow any to be labelled as *first* or even *second* quality that was not fairly entitled to be marked as belonging to those grades, consumers would seldom or never be disappointed, as they now not unfrequently are, through the want of this classification in the quality of the meat of an established brand, and would not only always ask for such a quality and brand, but would largely increase their purchases; and the general result would eventually be that, while the Companies who adopted such a classification and strictly adhered to it obtained the prices they now get for their *third* quality, their *second* would fetch $\frac{1}{2}$ d. to 1d. per lb., and their *first* 1 $\frac{1}{2}$ d. to 2d. per lb. more than they now bring; while the dishonest preservers, who are shipping little else than inferior meats, would find them unsaleable, and quit a business in which their continuance only tends to lower its character and ruin its prospects.

ALEX. BRUCE,
Chief Inspector of Stock.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LIVE STOCK AND AGRICULTURE.

(RETURNS FOR YEAR ENDED 31 MARCH, 1875.)

Ordered by the Legislative Assembly to be printed, 1 June, 1875.

LIVE STOCK.

ABSTRACT of Live Stock in the several Police Districts of the Colony on the 31st of March, 1875.

HY. NEWCOMBE, Compiler.

E. G. WARD, Registrar General.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

DISEASES AFFECTING LIVE STOCK.

(SKETCHES OF BILL FOR PREVENTION OF, &c.)

Ordered by the Legislative Assembly to be printed, 29 July, 1875.

RETURN (*in part*) to an *Order* made by the Honorable the Legislative Assembly, dated 16 July, 1875, That there be laid upon the Table of this House,—

- “ (1.) Copies of the Sketches of a Stock Disease Prevention Bill which
 “ have been framed and circulated amongst the Members of the Conference
 “ of the Chief Inspectors of Stock held in Sydney in November last, with
 “ the view to their coming to an agreement on the details of the resolutions
 “ they had passed on this subject.
- “ (2.) A copy of the Correspondence which has taken place between the
 “ Chief Inspector of Stock for this Colony and the other Members of the
 “ Conference with respect to these Sketches.
- “ (3.) A Return from Stockowners, showing the effect of Inoculation for
 “ Pleuro-pneumonia in Cattle.
- “ (4.) Returns from Sheepowners as to the nature, symptoms, prevention,
 “ and cure of worms, fluke, and foot-rot in Sheep.
- “ (5.) Copies of any Memoranda which have been submitted by the Chief
 “ Inspector of Stock to the Honorable the Minister for Lands in regard to
 “ retaining the services of the Inspectors of Stock in the Inland Districts.”

SCHEDULE.

NO.	PAGE.
1. Chief Inspector, Sydney, forwarding Synopsis of Bill for prevention of Diseases in Stock to other Members of Conference, for their consideration. 8 January, 1875	2
2. Chief Inspector, Melbourne, returning above Synopsis with notes. 29 January, 1875	20
3. Chief Inspector, Adelaide, same with same. 11 March, 1875	20
4. Chief Inspector, Hobart Town, same with same. 3 April, 1875	21
5. Chief Inspector, Brisbane, same with same. 14 April, 1875	21
6. Chief Inspector, Sydney, forwarding above notes to the several Chief Inspectors, for reconsideration. 20 May, 1875	21
7. Chief Inspector, Melbourne, returning notes with remarks. 2 June, 1875	21
8. Chief Inspector, Adelaide, same with same. 15 June, 1875	22
9. Chief Inspector, Hobart Town, same with same. 21 July, 1875	22
10. Chief Inspector, Brisbane, same with same. 23 July, 1875	23

DISEASES AFFECTING LIVE STOCK.

Return No. 2.

No. 1.

THE CHIEF INSPECTOR, SYDNEY, TO THE OTHER MEMBERS OF THE CONFERENCE.

*(Non-official.)*Stock Branch,
Department of Lands,
Sydney, 8 January, 1875.

DEAR SIR,

I beg to send herewith for your consideration the accompanying Synopsis of a Bill for the prevention of Diseases in Stock.

Until the members of the late Conference come to an agreement with respect to the details of the subjects which were discussed at that meeting their resolutions will bear very little fruit, and joint action cannot be taken; while again this agreement will never take place until an attempt is made to frame a measure which will in the main at least be adopted by all the Colonies. I have therefore drawn up the accompanying Synopsis, and I will feel obliged by your taking the subject up at your early convenience and giving me your opinion in regard to its provisions and the form in which they have been arranged, with the view to the preparation of such a measure as all the Colonies will approve.

The Bill goes very much into detail, but not more so than I think is necessary to enable stockowners and the public to understand plainly the duties they have to carry out under it, and to place the officers who are appointed to see its provisions enforced in a position to do so.

If a measure such as this so full of details is to work well and efficiently, it must either be a very long one or be worked principally by regulations; and surely it is much better that Parliament should settle these details than that they should be left to the Government of the day, or more properly speaking to the Minister charged with the administration of the Act, for the other Members of the Cabinet seldom interfere.

Even although these details might be as well and satisfactorily settled by regulations,—the convenience of having them in the Act instead of scattered, as they would likely be if the measure were worked principally by regulations over a series of proclamations and in so many different Gazettes, would be worth all the additional trouble of embodying them in the Act; for regulations are sure to be lost sight of, and the public would in many instances be ignorant of what the law really was.

Besides, legislating in this way gives the law quite an unsettled character, and the Government would be continually urged to make fresh regulations which would frequently alter the law in some of its most important respects; and it is feared that regulations would thus, through political influence, be promulgated, which would not be for the interest of stockowners.

While advocating the embodying of these particulars in the measure itself, the disadvantage of going much into detail, and thereby making the measure stiff and inelastic, has not been overlooked. This has been provided against by taking power in the Act to alter almost any provision in it by regulations. But although this power is taken, it would not of course be acted on unless it was very necessary to do so; and the Government could very well plead, where an application was made for an alteration of the Act which they did not think called for, that as the Parliament had settled the details which were asked to be altered, they would not take it upon them to make such an alteration unless it was clearly the wish of a majority of stockowners that such a regulation should be made.

In this way the measure would have all the advantages of going fully into details, while these details could be very soon altered by regulation should it be found that there was any real necessity for doing so; for instance, that they defeated the objects for which the Act was passed, that they did not give sufficient power to enforce its provisions, that they imposed unnecessary restrictions on the stock traffic, or pressed too heavily on the owners of stock.

With respect to this question of long or short Acts, it is surely very much better that a measure should be full and explicit than short and vague. If it is brief, it is almost certain to be ambiguous, or at least to leave hundreds of matters not settled which ought to be so by positive enactment; while if it goes into details, the chances are that it will be free from doubt and give the lawyers little or nothing to do.

Nor is there any good reason why a measure should be short. The extra printing costs little, and the extra paper still less; and if it be so arranged in parts and under headings that reference can be quickly and easily made to any of its provisions, there can be no possible objection to an Act being comparatively long. One thing is quite certain that, both here and in the Mother Country, Acts are now being framed at greater length every year; and that, through the division and arrangement alluded to, reference can be far more easily made to every provision in the short plain sections of the Acts now framed than could be done to those passed some twenty years ago, with single clauses occupying whole pages, and no division into parts, nor any arrangement under headings.

You will observe that I have adopted a good many of the provisions contained in the Imperial Contagious Diseases (Animals) Act, 32 and 33 Victoria, chapter 70, to which I would beg to refer you as bearing out what I have said with respect to short and long Acts.

I am, &c.,
ALEX. BRUCE.

Return No. 1.

Return No. 1.

STOCK DISEASE PREVENTION BILL, 1875.

PART I.—PRELIMINARY.

PART II.—STOCK DISTRICTS.

PART III.—STOCK DIRECTORS.

1. *Election or appointment of Directors.*
2. *Meetings of Board.*
3. *General powers and duties of Directors.*
4. *Appeals and applications to Directors.*

PART IV.—INSPECTORS OF STOCK.

1. *Appointment.*
2. *Powers and duties.*

PART V.—QUARANTINE OF INFECTED STOCK AND RUNS.

1. *Infected stock on runs.*
2. *Infected travelling stock.*

PART VI.—QUARANTINE STATIONS.

PART VII.—STOCK ON RUNS.

1. *Uninfected stock.*
 - (1.) Duties in regard to *all* such stock.
 - (2.) Additional duties when stock are *sheep*.
2. *Infected stock.*
 - (1.) Duties in regard to *all* such stock.
 - (2.) Additional duties when stock are *sheep*.
 - (3.) *Inspection of stock and declaration of infection.*
 - (4.) Which stock are to be *destroyed and when*.
 - (5.) How cattle infected with *pleuro-pneumonia* are to be dealt with.

PART VIII.—TRAVELLING STOCK.

1. *Uninfected travelling stock.*
 - (1.) Duties in regard to *all* such stock.
 - (2.) Additional duties when stock are *sheep*.
2. *Infected travelling stock.*
 - (1.) Duties in regard to *all* such stock.
 - (2.) Additional duties when stock are *sheep*.
 - (3.) *Inspection of stock and declaration of infection.*
 - (4.) Which stock are to be *destroyed and when*.
 - (5.) How cattle infected with *pleuro-pneumonia* are to be dealt with.

PART IX.—COAST, OR INFECTED DISTRICT, AND COASTWISE STOCK.

1. *Coast or infected district.*
 - (1.) *Sheep.*
 - (2.) Stock in *general*.
2. *Coastwise stock.*
Stock in *general*.

PART X.—COLONIAL STOCK INTRODUCED ACROSS THE BORDER.

1. *Rules as to admission of such stock when uninfected.*
 - (1.) In regard to *all* stock.
 - (2.) Additional rules in regard to *sheep*.
2. *Rules as to admission of such stock when infected.*
 - (1.) In regard to stock in *general*.
 - (2.) Special rules when stock are infected with *pleuro-pneumonia*.

PART XI.—COLONIAL STOCK INTRODUCED BY SEA.

1. *Rules as to admission of such stock when uninfected.*
 - (1.) In regard to *all* stock.
2. *Rules as to admission of such stock when infected.*
 - (1.) In regard to stock in *general*.
 - (2.) Special rules when stock are infected with *pleuro-pneumonia*.
 - (3.) Special rules when stock are infected with *scab*.

PART XII.—FOREIGN STOCK.

1. *Rules of admission of such stock into the Colony.*
 - (1.) In regard to *all* stock when *uninfected*.
 - (2.) " " " *infected*.

PART XIII.—TRANSHIPPED STOCK, AND STOCK LANDED FOR TRANSHIPMENT.

1. *Transhipped stock.*
2. *Stock landed for transhipment.*

PART XIV.—EXPORTED STOCK.

Rules of exportation.

PART XV.—STRAY INFECTED STOCK.

Rules of seizure and disposal.

PART XVI.—LAND, PREMISES, CONVEYANCES, EFFECTS, ETC., INFECTED OR LIKELY TO BE.

PART XVII.—PENAL AND PRECAUTIONARY PROVISIONS.

1. *Money penalties.*
2. *Imprisonment.*
3. *Confiscation of stock, &c.*
4. *Apprehension of offender.*

PART XVIII.—COMPENSATION FOR STOCK, EFFECTS, ETC., DESTROYED.

PART XIX.—PROCLAMATIONS AND REGULATIONS.

PART XX.—CONTRIBUTIONS AND EXPENSES.

1. *Contributions.*
2. *Expenses.*

PART XXI.—LEGAL PROCEEDINGS.

1. *General.*
2. *Appeals against Justices' decision.*
3. *Protection of persons carrying out the Act.*

SYNOPSIS OF STOCK DISEASE PREVENTION BILL, 1875.

Preamble.

PART I.—PRELIMINARY.

1. Commencement and title.
2. Repeal of unrepealed sections of 17 Victoria, No. 27 (the Catarrh Act), and of the Acts 27 Victoria, No. 9 (the Cattle Export Act), 30 Victoria, No. 16 (the Sheep Act), and 35 Victoria, No. 6 (the Imported Stock Act); but this repeal not to affect anything done or purporting to be done in virtue of repealed Acts, and all appointments to stand.
3. Interpretation clause.

PART II.—STOCK DISTRICTS.

4. The Governor in Council may proclaim or alter Stock Districts, and alterations not to affect Directors in Districts altered.

PART III.—STOCK DIRECTORS.

1. *Election or appointment.*

5. Seven Directors—four sheep-owners and three cattle-owners—to be elected annually from contributing owners or their superintendents.

Mr. Curr: I do not place much dependence on Boards, though they have answered pretty well in connection with our Scab Act, in the position therein assigned them. *In no other way* do I think them at all desirable, especially as regards their having anything to do with the appointment or nomination of the Inspectors.

Mr. Bruce: As will be gathered from my remarks in the notes on the other sections relating to Directors, I am inclined to agree to a considerable extent with *Mr. Curr* as to curtailing the powers and duties of these Boards, and am willing to omit some of the sections to which he has the greatest objections.

Mr. Valentine: If this system is adopted, and it is quite possible it may be, although many will not see the use of introducing an entirely new system into a clean Colony, cleansed under the present one; this will be a strong argument against it, coupled with the objection to be taxed separately. I have no alteration to suggest excepting under 4, Appeals, &c. It is against all the workings of our Acts to allow of appeals against stock being diseased; cut down your appeals; any improvement in the working of a directorate you would now be able to see after working the New South Wales Act.

Mr. Bruce: As stockowners will, under the proposed measure, have to contribute to a special tax, it is only reasonable that they should have some say in its administration through Directors elected by themselves.

6. If no election take place, or if a fewer number than seven be elected, the Minister to appoint on the nomination of the Chief Inspector.

7. Owners with *one hundred* cattle or *five hundred* sheep, or superintendents of owners of *two thousand* cattle or *eight thousand* sheep, to be qualified as electors.

8. Owners and superintendents, *bonâ fide* residents in the district, with similar qualifications, to be eligible as directors.

9. No owner or superintendent of infected stock to have a vote or be a candidate, and no owner and his superintendent to be appointed to the same Board.

Mr. Whyte: Right.

Mr. Gordon: I agree generally with the principle that no owners of infected stock should have a voice at the Boards; but in the case of pleuro-pneumonia when at times it is spread all over a Colony, it would appear hard to debar owners who have been powerless to prevent it spreading in their herds. Might not the disqualification be removed in the case of pleuro-pneumonia, in the case of those owners who have inoculated, although the herds have not been yet considered as free from disease?

10. Mode and place of election.

11. Vacancies in the Board to be filled up in the same manner as original appointment; but vacancies not to affect powers of Board while there is a quorum.

12. The Chief Inspector to be a Director at all Boards *ex officio*.

Mr. Whyte: Quite right.

2. *Meetings of Board.*

13. Mode of calling and conducting meetings, the place of meeting, quorum of Directors, mode of deciding questions, election of Chairman, and record of proceedings.

14. When disease is in a District, Directors to meet at least once a month—when it is not, annually.

Mr. Gordon: What penalty? They never meet once in any of my districts, although the Act expressly provides for it.

Mr. Bruce: I do not think that any penalty could in this case be enforced, except that of removal from the Board; and in the scarcity of fit men for Directors, it would often be inexpedient to take that course.

Mr. Gordon: In Queensland, Boards cannot be got to meet even once a year, except in cases of disease. Dismissal from the Board is no penalty. At same time, when occasion requires, such as an outbreak of catarrh, they have at all times met on the shortest notice, and been of the very utmost service to me and to the District Inspectors.

3. General powers and duties of Directors.

15. Directors may nominate qualified person as Inspector; but Minister may refuse to appoint if person not qualified, or may appoint one Inspector for two or more Districts.

Mr. Carr : As already stated, I think this highly objectionable, and would only recommend Board of advice. See our Scab Act.

Mr. Bruce : It is not a very material point as to whether or not Directors should nominate the Inspector, but, speaking from the experience of this Colony, where both systems have been tried, nominations by the Directors answer best. In either case, however, I would now propose that every candidate for the office of Inspector should pass a test examination before a Board composed of (say) a medical man, a veterinary surgeon, and the Chief Inspector.

16. Directors to advise and assist Inspector in his duty, and if Inspector refuse to carry out advice offered by Directors, Inspector may be reported to the Chief Inspector.

17. Every Director to be *ex officio* an Inspector, but without remuneration, except as after-mentioned.

Mr. Bruce : This section ought to be retained, as a Director could often take action at once as Inspector, instead of waiting for the regular Inspector.

18. Director receiving notice of an outbreak of disease to visit locality, and, in absence of the Inspector, do duty as such.

19. Directors acting as such, or as Inspectors, to be allowed travelling expenses, but no payment for time, at a rate to be fixed by Regulation.

Mr. Whyte : Reasonable.

Mr. Gordon : I strongly recommend Directors being paid when acting as Inspectors, and also that the rates be fixed by Schedule to the Act, and not by Regulation. This has acted well, and given satisfaction to all parties for seven years in this Colony.

20. Director not to act as such, nor as Inspector, when personally interested, nor as a Director where he has acted as an Inspector.

Mr. Whyte : Right.

4. Appeals and applications to Directors.

21. An owner may appeal to the Board of Directors against any decision, refusal, or valuation, of an Inspector, or of an Inspector and Director, on lodging expense of appeal.

Mr. Valentine : Does not this include too much? I don't like appeals against a decision that stock are infected—I should prefer it left out. If wrongly declared infected, let Director or Inspector suffer. I do not agree with allowing too many appeals.

Mr. Bruce : The advantages of appeals, as here proposed, are—1st, that when they are allowed the Inspector may with safety be invested with greater powers than when they are not, which enables him to discharge his duties much more effectively than when they are less; and 2nd, that practical questions relating to stock and their management are under this system of appeals heard and decided by men thoroughly acquainted with these matters, and of course much more interested in seeing the Act faithfully carried out than Justices of Peace usually are. I am, however, inclined to yield to the objections urged by Mr. Carr and Mr. Valentine; and omitting sections 21 to 23 inclusive, to allow such matters to be settled as they would then be by the Petty Sessions.

22. In appeals against a decision that stock are infected, the appeal must be lodged with one of the Directors within forty-eight hours of the notice of the decision, and the Director and Inspector interested must receive notice at the same time of its being so. And any other appeal shall be lodged in like manner, and notice given to the Inspector within ninety-six hours of the receipt of the notice occasioning such appeal.

Mr. Gordon : I think seventy-two hours is short enough. We should make provision for a little indecision on the part of those acting to orders, and who may have to use the wires or post in receiving instructions how to act.

Mr. Whyte : Promptitude is doubtless desirable in all cases in carrying out this Act, but to me the proposed time seems rather short.

Mr. Gordon : I think at least three days short enough notice, as in many cases it will be found stations are in charge of superintendents, who before appealing will be anxious to communicate with their principals.

23. An owner making application to the Directors shall give the Inspector notice as aforesaid; and applications for compensation must be made within two months of the date of the destruction of the stock or effects.

Mr. Valentine : If appeals are allowed and there is truth in the practical knowledge of Boards, their powers should be curtailed to very moderate limits, but I think it immaterial as to the form of the Boards being the same in all the Colonies, provided the working provisions of the Bill are similar.

24. Every Board of Directors is hereby empowered to receive appeals, to fix the place and date of hearing applications, and to summon witnesses.

25. Appeals against the decision that stock are infected shall be heard not earlier than the *third* nor later than the *fifth* day after the appeal is lodged; and all other appeals and all applications not earlier than the *seventh* nor later than the *fourteenth*, at some convenient hour and place. And due notice in writing shall be given to the appellant or applicant, to the other Directors, to the Inspector, and to such witnesses as may be required.

Mr. Valentine : Don't like it. Refer to in former remarks; better left out. In our far north districts it would be a difficult matter to get two to meet to form a quorum.

Mr. Whyte : The same observations made at 22 seem to me applicable here, where Directors, and it may be all the parties, are widely separated. But on this point I have no decided opinion, in the absence of practical knowledge of the working of Boards of advice.

Mr. Bruce : As two form a quorum this difficulty would seldom occur.

26. Every Board of Directors shall have full power to hear and determine all such appeals and applications, and shall do so in the same manner as appeals at Quarter Sessions, and shall award damages or compensation and assess and tax the costs and expenses; and may inflict a penalty not exceeding £20 for non-attendance of witnesses.

27. A record shall be taken of the proceedings; and decisions to be given in the form of Schedule or

Mr. Carr : I think it probable that the views of Boards would frequently have reference, not to Victoria and the Colonies at large, but to their own immediate neighbourhood and interest, than which nothing could possibly be worse in a matter of this sort.

Mr. Bruce : It would only be as regards purely local matters that the Government would be guided by the opinion of any single Board. Of course, where the Boards generally expressed the same opinion, it would be a different matter.

Mr.

Mr. Carr: As regards these sections, I must repeat that I consider them bad in principle and in practice. You have stated respecting them that the Government would only be guided in *local matters* by a local Board. Besides that such has not been my experience, I will add that nothing almost connected with disease can be confined to local results. Disease on the smallest farm in Victoria has or may have a bearing on the whole of the stock in New Holland.

28. In appeals or applications relating to any stock, run, conveyance, matter, or thing, the Directors shall personally examine into circumstances and hear the same as near as may be to where the circumstances occurred.

Mr. Gordon: (clauses 21 to 28) It has been proposed to omit these clauses. I think this a mistake. A Director and Inspector will always be found to act with more promptitude and decision when they are in a position to say to owners—"You can appeal against our decisions." In fact, their decisions, when appeals are permitted, are virtually the decisions of the whole Board. I would, however, add a proviso to the effect that, in case of decisions being given by an Inspector and *more than one Director*, no appeals be allowed.

PART IV.—APPOINTMENT AND GENERAL POWERS OF INSPECTORS.

1. *Appointment of Inspectors.*

29. The Chief Inspector to be appointed by the Governor in Council.

Mr. Whyte: Correct.

30. Inspectors nominated by Directors to be appointed by the Governor in Council, to be liable to be suspended by the Chief Inspector or the Directors, and to be dismissed by the Governor in Council, who may appoint Inspectors where necessary if the Directors neglect or refuse.

Mr. Carr: I never knew such conflicting arrangements to succeed. The whole staff should, in my opinion, be on the Civil Service, and be appointed by the Governor in Council.

Mr. Whyte: Will there not be a clashing of powers here?

Mr. Bruce: See remarks on notes to section 15. No hitch such as that here anticipated has occurred under the New South Wales Act, where for ten years the Boards have nominated and the Government appointed. This arises through the appointment being really in the hands of the Minister, when he chooses to exercise the power conferred on the Government.

Mr. Carr: I cannot but think that the reason that the system of Directors worked well in New South Wales was that there was but little to be done in that Colony; disease never brought any strain on the system. Divided powers—the delays occasioned by Boards—the impossibility of carrying through any system under such a variety of management and circumstances—the isolated standpoint from which each separate Board takes its view—their *want of responsibility*—are all matters hostile to vigorous, well-ordered, and sustained action. Boards of advice, pure and simple, I should consider desirable, and none others. As regards officers, they should, I think, be independent of local influence; and I would prefer them being strangers in their districts at starting. If real work had to be done, I should place little confidence in an Inspector who had been appointed or recommended by the very people he might have to coerce.

2. *Powers and duties of Inspectors.*

31. Inspector to have power to enter and inspect stock, premises, vessel, conveyance, or anything else in any part of the Colony—to carry out the law at the owner's expense when he neglects—and to possess all the other powers conferred by the Act.

Mr. Valentine: This involves taking possession of stock to cure them. I entirely disapprove of such a course. I am satisfied it is much better the Inspectors should not step in and clean. Inflict penalties if not clean within a certain time; make it too hot for a man to keep diseased animals; destroy the stock. Severe as you like, but do not ask the Inspector to cleanse the stock.

Mr. Bruce: I do not think that this section can quite bear the construction here put upon it by Mr. Valentine; at any rate, it need not do so when drawn in the Bill. All that is required is to give the Inspector power to order the dressing, disinfecting, or destruction of stock called for by the Act, and where necessary to place some one on the run to see that his order is duly carried out; for all which the owner of the stock would of course have to pay.

Mr. Valentine: With such a construction I agree with the clause.

32. Inspector and his assistants in certain cases to have the same powers as Officers of Customs and Health Officers.

Mr. Valentine: On what grounds? Is it not mixing up different Acts? I do not see the value of this.

Mr. Bruce: The powers here proposed to be taken are absolutely necessary in regard to imported and border stock; and taking them in this way saves repeating all the details so minutely laid down in the Customs and Health Acts.

33. Inspector may in certain cases kill stock for evidence, and may seal up and mark, and make owner mark, any portion of stock killed, for the purpose of its being produced in Court.

Mr. Valentine: Don't believe in this clause at all—consider it quite a mistake. I have known men drive through cases worked under this clause. I think it weakens the position of the Inspector. We have always done without it.

Mr. Carr: I think an Inspector should be allowed to kill stock to ascertain the presence of disease; but as for producing parts for evidence in Court, I think the less said about it the better. To the Scab Act, for instance, such a course would have been fatal.

Mr. Bruce: It often occurs that it is impossible for Inspectors to obtain witnesses who would speak to the necessary facts in regard to the infection of stock, in cases brought before the Court; and the production of the lung, skin, or other part of the stock showing symptoms of the disease would settle the question.

34. Inspector may employ assistants, who will have the same powers of entry and seizure as himself; and the expense of their employment to be paid by the owner in fault.

35. No Inspector to be owner or dealer in stock, except in so far as sanctioned by the Minister; and Inspector shall not receive any fees other than those authorized by this Act.

Mr. Valentine: Don't see any objection to his being an owner. Think that should be left out, if not all of it, as no Chief or Minister would allow an officer to be dealing, and thereby neglecting his work—quite sufficient grounds for dismissal, and, taken literally, he can hardly buy and sell a horse. Why put it in at all?

Mr. Bruce: I think this might as well stand, but I do not insist upon it.

PART V.—QUARANTINE OF INFECTED STOCK, RUNS, &c.

1. *Infected stock, &c., on runs.*

36. Inspector may place infected or doubtful stock, fodder, &c., on a run, and the run on which the same are, as well as any other infected run, in quarantine, by giving due notice to the owner and the public; and such quarantine may extend as far beyond the infected run as the Inspector thinks necessary, and may when necessary include portions of other districts.

Mr. Carr: Infected stock should be defined.

Mr. Bruce: Yes; it will be defined in the interpretation clause, as settled at the Conference.

Mr. Whyte: Extreme power; but I do not say it may not be necessary; only, in such case, what would be considered a run? A paddock of 100 acres, or a run of 10,000 acres?

Mr. Bruce: Any farm or station; the term "run" being a convenient one for "land" or "place."

37. With respect to quarantines the Inspector has the following powers:—(1), to remove infected stock back from a road on to land not infected; (2), to extend or alter the quarantine where necessary for the sake of food or water for the stock; (3), to bring other infected stock on to the same ground, with proprietor's sanction; and, (4), to allow the removal of hay, straw, fodder, fittings, or effects.

Mr. Valentine: This clause must be modified considerably before I could accept it. In the outside pastoral country no doubt you can use it, but as the country becomes cut up in smaller areas, and sheep are kept largely by "stock farmers," it becomes of very little value, because unworkable.

Mr. Bruce: These powers are discretionary, and the Inspector would only attempt to put them in force where it was practicable, *i.e.*, on the larger runs and properties—not on the smaller farms.

38. The Inspector may place doubtful stock or run in temporary quarantine till their actual state be ascertained.

2. Suspected or infected travelling stock.

39. The Inspector may, with the approval of the Directors, place infected or doubtful travelling stock in temporary quarantine as aforesaid on any safe and suitable land, until they are destroyed or otherwise dealt with, as required by the Act; and the proprietor on whose land they are quarantined will receive compensation from the owner of such stock for any loss he may thereby sustain; and failing recovery of such loss from the owner, the amount shall be paid as compensation from the Pastoral Contribution Fund, as hereinafter provided.

Mr. Curr: What is to become of the stock pending meeting of Directors? Who is to decide when land is safe and suitable? I think an Inspector should have power to quarantine infected travelling stock at once, on the nearest land which he may deem convenient.

Mr. Bruce: There is force in this objection. The Inspector should, in the first instance, as Mr. Curr suggests (at 40), have power to place the stock where he considers best, and then, if it be necessary for them to be detained for any length of time, the place where they are to remain should, as here proposed, be approved by the Directors, as it is on questions like this that their advice would be of the greatest value.

Mr. Whyte: Absolutely necessary.

Mr. Gordon: "Approval of Directors" would be very difficult to get in such cases, especially in Queensland, where they usually reside hundreds of miles apart.

Mr. Valentine: I think Mr. Curr is right here, otherwise disease would spread, unless, as with us, stock are liable to be destroyed if travelled after found diseased.

40. The provisions of this Act relating to Quarantine not to apply to stock carried by railway, except they be stopped in any infected place. Infected stock found at railway station to be taken to fit place and quarantined.

Mr. Curr: *Idem.*

Mr. Valentine: Do you mean the quarantine provisions?

Mr. Bruce: Yes.

41. Such quarantines shall be binding on all persons whomsoever, and shall continue and be in force for the periods respectively set forth in Schedule hereto; and any want, defect, or irregularity in publication shall not invalidate any quarantine.

42. Before a run or stock can be released from quarantine the owner must first obtain a certificate from the Inspector that they are free from infection, and then apply to the Directors, who will consider and decide, but the Governor in Council may grant release although refused by Directors.

Mr. Curr: I think they should only be released by the Governor in Council.

Mr. Bruce: This would make the action too tedious, and I do not think any harm could arise were the section allowed to stand, as under it the Government could interfere when necessary.

Mr. Valentine: I think the Directors might recommend to the Chief Inspector.

Mr. Gordon: Chief Inspector should have power to release; it will be found difficult to get a Board together to release; at least I found it impossible, although they turned up well when the disease was in the sheep, and when there was fears of its spreading.

Mr. Bruce: See remark on Mr. Curr's note. The giving this power to the Government amounts to about the same thing as if it were conferred on the Chief Inspector, as he would not act contrary to the wishes of the Government, but generally with their express sanction.

Mr. Gordon: As stated in notes to clause 14, the Directors always muster and work well in cases of disease, but in the matter of releasing runs from quarantine I have found it impracticable to do so by means of Board meetings. In all cases I had to resort to getting the written consent of each member of the Board. I would advise that they be released by the Chief Inspector, with the written consent of a majority of the members of the Board; failing the Board meeting for the purpose. In case no written consent received, Chief Inspector to release within (say) fifteen days.

PART VI.—QUARANTINE STATIONS.

43. The Governor in Council may proclaim uninfected and infected Quarantine Stations where required.

Mr. Curr: For what purposes are these stations intended?

Mr. Bruce: For "imported" (foreign) and "introduced" (intercolonial) stock.

44. The necessary yards, sheds, and appurtenances, to be erected at quarantines, and to be under the charge of the Inspector.

45. The owner of stock placed in quarantine to find the necessary food and attendance for them, or to pay for the same in whole or in part as the Government may decide.

Mr. Valentine: I think Government should provide and owners should pay.

Mr. Bruce: It would generally be best for the Government to provide as here suggested, but in some cases that would be impracticable; such as those of large lots of sheep, say 400 or 500 placed in special outside quarantines.

Mr. Valentine: Perhaps there would be difficulty in providing for large lots, and it might be arranged as most suitable.

46. All quarantine stations to be marked as such, and no person to enter on them without authority from an Inspector.

PART VII.—STOCK ON RUNS.

1. *Uninfected stock on runs.*

(1.) Owner's duties in regard to all such stock.

47. All owners of stock to make such returns to the Chief Inspector as to their number, breed, condition, treatment, and state of health, as the Minister shall, from time to time, direct by notice in the Gazette.

Mr. Valentine: I look on this as utterly useless so far as this country is concerned; it would never be done, and it is asking too much. In asking too much we defeat the object.

Mr. Gordon: For what object? Will not this make the Act distasteful to many, and then what value will a declaration as to health of stock be from their owner?

Mr. Bruce: The provisions of this section are framed to carry out Resolution 11 of the Conference. A vast deal of highly valuable information would be obtained in this way as to the nature and treatment of diseases in stock, and with respect to pastoral matters generally. For instance, if owners would, as a rule, make these returns, and favour the Inspector with their experience in regard to the nature and treatment of foot-rot, and the Inspector were to keep a correct and systematic record of the particulars supplied to him, a great many questions which are now mere matters of surmise with respect to the nature of that ailment, and the best modes of dealing with it under all the different circumstances and phases in which it occurs, would soon be settled. So with respect to all other diseases, and also in regard to pastoral matters generally; the collecting and exchanging the experience of all the Colonies would be of incalculable value, although of course that relating to the health of the stock is of the most vital importance, and its collection is absolutely necessary if any progress is to be made in eradicating these scourges which are now causing our stockowners so great loss.

Mr. Valentine: I withdraw my objection, but at the same time still think it almost an impossibility to carry out this section.

Mr. Gordon: These returns would be most useful; but unless it is specified in the Bill that the Inspectors or Chief Inspector be bound only to publish them *in globo*, with a penalty for making individual cases public, I fear it will not pass the Legislature, and, if it does, the returns will not be reliable.

Mr. Bruce: From the imperfect manner in which the returns which I annually ask from owners are made, I am persuaded that unless they are obliged by law to give such information as here alluded to, owners will never voluntarily supply it, although so far as they are individually concerned it has been kept strictly private.

48. Every owner not liable to contribute, and every butcher, dealer, and salesman of stock, to register his run and premises, with the number of his stock, at 1st of January in each year, with the Inspector of the district.

Mr. Valentine: May be useful, as it only refers to a class of men who are not reached by assessment.

49. Every owner placing stock of a new description on his run to give the Inspector notice.

Mr. Valentine: Won't do; don't like it, and would never be carried.

Mr. Bruce: This is very little trouble, and it enables the Inspector to know what stock are in his district. If he does not know this, it would not be fair to hold him responsible (as he ought to be) that he does not allow disease to exist in it for any length of time without detecting it.

Mr. Curr: I agree with Mr. Valentine.

(2.) Owner's additional duties when such stock are sheep.

50. All sheep above the age of six months, and all lambs which have been weaned, whatever their age, to be branded and kept branded. All brands and ear and other marks to be registered with the Inspector for the district.

Mr. Valentine: Clauses 50, 51, and 53, are better in Brands Act. No business here. I do not consider it advisable to have these clauses here.

Mr. Bruce: The provisions are inserted here to insure their becoming law, as they are greatly wanted in the management of stock, and would assist very much in proving ownership in prosecutions under this measure. As remarked by Mr. Valentine, however, their proper place is the Brands Act, and if passed in it they might be repealed in this.

51. When similar brands or marks are applied for, the Inspector may give modifications.

52. No owner shall use any of the letters A, C, Q, S, T, nor V, as a sheep brand, nor brand with paint for a red colour.

53. No owner shall cut ear straight across, nor cut off more than $\frac{1}{4}$ of the ear in ear-marking.

2. *Infected stock on runs.*

(1.) Duties in regard to all such stock.

54. If stock on a run are infected, or suspected of being infected, the owner to immediately carry out the following duties, namely:—

- (1.) Separate as far as possible infected from uninfected.
- (2.) Strictly confine his infected stock to their own ground, and keep them as far as necessary from his neighbour's and from public roads.
- (3.) Destroy all infected carcasses.
- (4.) Post notices of outbreak on roads through or along his run.
- (5.) Send notices of the outbreak to the following persons:—
To the owners of all the adjoining runs.
To the nearest Inspector.
To the nearest Director.
- (6.) Advertise the outbreak in the local newspapers.
- (7.) And take such other steps for staying the infection as the Minister may from time to time direct.

Mr. Curr: How can these things be done by small owners?

Mr. Bruce: These duties could be carried out where practicable, and that will be sufficient for the purposes of the Act.

Mr. Valentine: This (7) is very open, and involves regulations which I understand you consider very objectionable, and the fewer the better in such a Bill as this.

Mr. Bruce: Although measures which are worked principally by regulations are objectionable, and it has been the endeavour in drawing up this sketch as far as possible to do without them, still cases arise where regulations are necessary, *i.e.*, in matters of detail, which I think those here referred to are.

Mr. Gordon: Would it not be well to confine 1 and 2 to sheep, and give a penalty for breach? You cannot inflict a penalty in case of cattle on unfenced runs, and No. 2 ought to have a penalty, with the use of the words "strictly." I think the words "as far as possible" should not occur in an Act of Parliament, but in regulations or instructions.

Mr.

Mr. Bruce: Yes, I think the alterations here suggested should be made.

Mr. Gordon: I think 1 and 2 should only apply to sheep, and be stringently enforced, and have the words "so far as possible" only to apply to cattle.

(2.) Additional duties in regard to infected sheep on runs.

55. If sheep are infected or suspected of being infected, the owner shall carry out the following additional duties, viz.:—

- (1.) Cause his sheep to be shepherded where practicable; and where not, to be kept in securely fenced enclosures.

Mr. Curr: 1 and 2 hardly practicable at all in Victoria, as they would die for want of feed if shepherded, &c.

Mr. Bruce: Shepherding is only called for where practicable.

Mr. Valentine: As shepherding is not always practicable, power should be given to enforce the fences being kept in good order.

- (2.) Where sheep are infected with catarrh or scab, he shall brand all above the age of one month with the letters C or S, and in such a manner as to distinguish between different flocks.

Mr. Valentine: As we decided that all sheep of this description should be killed in any outbreak, particularly catarrh, is this not an anomaly?

Mr. Bruce: This is the case, but an owner can very much more quickly brand than destroy these sheep; and although he at once makes arrangements to kill them, the first thing he ought to do is to brand them with the letter C, lest any of the infected sheep should join his other flocks, or stray on to other runs.

Mr. Whyte: According to Conference Resolution, all sheep with catarrh are to be destroyed.

Mr. Bruce: Yes.

(3.) Inspection of stock on runs and declaration of infection.

56. The Inspector and a Director to examine stock and decide if they are infected, and if so, give their owner notice to destroy or otherwise treat them.

Mr. Curr: Government Veterinarian (in place of Director).

Mr. Bruce: As regards ordinary diseases Directors would be quite competent, and their services could be very much more readily obtained in country districts. In difficult cases the Veterinary Surgeon could be called in.

Mr. Gordon: Substitute for "a Director" the words "at least one Director." There appears a necessity for compelling a Director to attend with an Inspector in such cases.

Mr. Curr: The land on which they have been running should be kept without sheep for a period to be determined by circumstances.

Mr. Bruce: Yes. This might be done by defining "infected run," when such land as that here alluded to would as a matter of course be placed and kept in quarantine until it was safe.

57. What is to be considered service of notice to owner by Inspector and Director.

58. Owner may appeal against decision that stock are infected, but on that score only.

Mr. Valentine: Don't believe in this; it interferes with the working of the Act.

Mr. Bruce: This would now be omitted, with the other provisions relating to appeals.

Mr. Gordon: Add "except when two or more Directors acting with Inspector."

(4.) Which of such stock are to be destroyed, and when.

59. The following infected stock to be destroyed within the time specified in Schedule hereto:—

- (1.) All stock infected with glanders, farcy, rinderpest, foot and mouth disease, sheep-pox, or any other new disease proclaimed as such by the Governor.

Mr. Valentine: This would of course be under certain conditions.

Mr. Bruce: Stock with any of these diseases would be at once destroyed.

Mr. Whyte: Catarrh should be included.

- (2.) All sheep infected with catarrh, and also all sheep infected with scab (except sheep infected with scab introduced by sea); but sheep infected with catarrh or scab may, with the sanction of the Minister, be boiled down.

Mr. Valentine: Clause 55 and this are contradictory. You don't want them branded if you are going to kill or even boil down.

Mr. Bruce: See remarks on Mr. Valentine's notes on section 55 (2).

Mr. Whyte: Previous note unnecessary.

(5.) How cattle infected with pleuro-pneumonia are to be dealt with.

60. In addition to the duties hereinbefore prescribed with respect to infected stock, owners of cattle infected with pleuro-pneumonia shall carry out the following, namely:—

- (1.) No cattle infected with pleuro-pneumonia shall be allowed to leave their runs until six months after the last case of disease, unless they are inoculated as hereinafter mentioned.

Mr. Valentine: How do you carry this out?

Mr. Bruce: The outbreak would be reported so soon as it was discovered, as the owner would be liable to a penalty if it is not, and the Inspector would then visit and examine the cattle, and as often afterwards as necessary.

- (2.) All cattle on runs infected with pleuro-pneumonia shall be inoculated when virus is procurable.

Mr. Curr: If the cattle are infected cannot the virus be obtained from them?

Mr. Bruce: Not always; at any rate, not until the cattle are actually diseased as well as infected.

- (3.) The Inspector shall receive due notice before inoculation is commenced.

Mr. Valentine: It appears to me that if a person intends to inoculate, he should not be obliged to send notice to an Inspector before commencing—in many instances it would cause unnecessary delay. I think notice being sent of the intention to commence on a certain day, or of having commenced during the week, is quite sufficient for all purposes required.

Mr. Bruce: Yes. With the notice alluded to in the previous remark, the alteration here suggested might, I think, be made; but unless there is some supervision the operation may be negligently or ineffectively performed.

- (4.) The cattle shall be marked as directed from time to time by the Minister.

Mr. Valentine: Cannot carry this out unless you have an ear-mark for inoculated cattle, and forbid owners to use it, and then it would be doubtful.

Mr. Bruce: Some permanent mark must be adopted; I would suggest either the firebrand "I" on the near cheek, and if that be already branded on, then on the near arm, or a slit in the near ear, as Mr. Valentine proposes.

Mr. Gordon: This would imperil the measure. I think we must trust to the Inspector's certificate, or to the common square tail.

Mr. Bruce : See remarks on Mr. Valentine's notes to 60 (4) as above.

Mr. Gordon : I withdraw my previous objection to this sub-clause. Since it was advanced we have set apart the "crop" ear-mark for an inoculation ear-mark for the whole Colony, and that too at the request of stockowners. This has been done under the Brands Act. The "crop" ear-mark was selected because being the "duffers" ear-mark it was considered advisable to withdraw it from use as a station ear-mark. Some permanent mark is necessary to assist owners in watching the effects of inoculation, whilst it will be found beneficial to cattle-owners, as inoculated cattle (stores) are worth more in the southern markets than those not inoculated. This is the experience of Queensland owners, and in consequence I would recommend that the same ear-mark "crop" should be used by all the Colonies as the distinctive mark for inoculated cattle.

(5.) No person unless he be duly authorized by the Minister, or be the owner's superintendent, overseer, or stockman, shall inoculate for another.

Mr. Curr : It will not be difficult to evade this. I would suggest that authorized inoculators be gazetted.

Mr. Bruce : Yes.

Mr. Valentine : An owner may make any man his overseer or stockman for the time being.

Mr. Bruce : This evasion could be prevented by enacting that overseers or stockmen must have been three months in their employer's service before they would be considered as such under the Act.

(6.) Cattle duly inoculated may leave their run and travel on the expiry of six weeks after last case of disease.

PART VIII.—TRAVELLING STOCK.

1. Uninfected travelling stock.

(1.) Owners' Duties in regard to all such stock.

61. Owner starting stock from a district in which infection exists, or adjoining a district in which it exists, or a Colony proclaimed infected, to obtain a permit.

Mr. Curr : If "infection" refers to herds in which pleuro exists, I think this clause would be a useless nuisance.

Mr. Bruce : The term "infection" here refers to districts, and not to herds.

Mr. Valentine (clauses 61 and 62) : I do not see the use of these clauses ; in fact I think it is interfering with the movements of clean stock to too great an extent. My idea is that the movements of stock should not be hampered more than can possibly be avoided, when both country and stock are clean. Into or out of an infected district is a very different matter. I cannot agree to these. They cannot be carried out with us ; any stock leaving an infected district might obtain a permit ; and an Inspector should always receive notice of stock travelling into a diseased district. No stock should be allowed to leave an infected district.

Mr. Bruce : No infected or doubtful stock would, under this measure, be allowed to leave quarantine, although that always includes some adjoining runs or portions of runs and stock not actually infected. But in an infected district, again (the proclamation of which is an additional precaution), there would of course, outside the quarantine be no stock known to be actually infected ; and when such stock are really sound, and there is no risk attached to their removal, it ought to be allowed. While this is the case, there is still some doubt with respect to them, and they should only be allowed to travel after they have been duly inspected, and their state and character well ascertained. It is to provide for such cases as these that the section is proposed ; and it would work as follows :—A disease breaking out on a run, it and those portions of the adjoining runs at all likely to be infected would, as a matter of course, be placed in quarantine. Then the district in which this run or runs are situated would be held to be "infected" ; and if the infected run were near the border of the district the next district would also be declared "infected." No stock would be allowed to leave quarantine till they were formally released ; and none could be removed from these "infected" districts till they are examined, as mentioned above, by an Inspector and received his permit to travel.

62. Owner starting stock from any other district to give the Inspector such notice as will enable him to inspect the stock.

Mr. Curr (62, 63, 64, 65, 66) : I do not think these clauses desirable ; it seems to me that over-legislation is proposed. The enforcement of any act of this sort should, in my opinion, be entrusted to the officials appointed under it only.

Mr. Bruce : The notice called for by this section enables the Inspector from whose district the stock start to examine them if he thinks necessary ; and whether he does so or not he is required, in this Colony, as regards sheep, to send notice of their approach to the Inspector for the district through which they are next to pass. He again examines them, and sends on notice to the next Inspector ; and so on till the stock reach their destination. In this way every Inspector has intimation of the approach of travelling stock, without the drover being put to any trouble in giving notice.

63. The owner shall forthwith, at his own expense, destroy the carcasses of all such stock as may die.

Mr. Valentine : Query.

Mr. Bruce : This section is very necessary.

64. Owner driving stock through or along a run of 2,000 acres not separated from the road by a fence, to give not less than twelve hours' nor more than seven days' written notice ; and notice to state the time when stock would approach run, and stock not to do so more than six hours before nor six hours after such time.

Mr. Bruce : So is this ; and it is now in force both in New South Wales and in Victoria.

65. The owner to give a like notice to the Inspector when passing within _____ miles of his station.

Mr. Gordon : I would advise this being struck out—it would be vexatious. You could not expect overlanders to post themselves up to the residences of Inspectors.

Mr. Bruce : Yes.

Mr. Gordon : Recommended to be struck out.

66. Every owner of travelling stock shall, when required by an owner or proprietor, allow and assist his stock to be examined ; and if owner or proprietor consider them infected he may, on giving a written notice to that effect to owner of stock, detain them, and their owner shall send immediate notice to the Inspector.

Mr. Valentine : Through whose country they are travelling.

Mr. Bruce : These powers are proposed to be conferred on the proprietor of the run through or along which the stock are passing, and on the owner of other stock travelling by the same road as the first-mentioned stock.

Mr. Gordon : It would be well to restrict the use of the word "proprietor" to the owner of runs and stock, and the term "owner" to stock only. This clause seems confusing. Proprietor should, I think, send notice to the Inspector.

Mr. Bruce : I think with Mr. Gordon that it would be better to make the person detaining the stock send notice to the Inspector.

Mr. Gordon : Recommend that "owner" be applied to person in charge of or owning stock only, and that "proprietor" apply to runholders.

67. If travelling stock are detained as infected, the owner and the person detaining them shall take due precautions to prevent the spread of infection lest the stock should be infected.

Mr. Curr : What precautions is it possible to take?

Mr. Bruce : The person detaining the stock might do so negligently, and allow the infection to spread, if the measure did not contain such a provision as this.

68. All expenses incurred by proprietor or owner detaining such stock to be recovered by him from their owner if they are infected; if not, and no reason for stopping them, person doing so to be at the expense and pay compensation.

Mr. Valentine : Add,—And liable to a fine of £200, not less.

Mr. Bruce : Yes. But I think the amount might be fixed at £100.

(2.) Additional duties in regard to uninfected travelling stock.

69. Besides having a station brand, all sheep above the age of six months, and all weaned lambs travelling more than forty miles, shall be branded with the letter T.

Mr. Curr : Unnecessary interference.

Mr. Valentine : Don't think much of this.

Mr. Bruce : This is not a very material provision, but our sheepowners who have complied with it for upwards of ten years consider that the trouble and expense of branding with the letter T are much more than repaid by the readiness with which stray travelling sheep are detected in a flock.

2. *Infected travelling stock.*

(1.) Owner's duties in regard to all such stock.

70. If any travelling stock are infected or suspected of being infected, the owner shall immediately carry out the following duties, namely:—

- (1.) He shall stop the stock at or near where outbreak occurs.
- (2.) As far as possible keep the infected from his own uninfected stock and from those belonging to others.

Mr. Gordon : This, as far as cattle are concerned, and even sheep, would be impossible.

Mr. Bruce : This is only asked where practicable; and, where it is so, it ought I think to be insisted upon.

- (3.) Destroy all carcasses.
- (4.) Send notice of the outbreak to nearest Inspector, and in his absence to the nearest Director.
- (5.) Give notice to owners of run on or near which his stock are when stopped, and to owners of adjoining runs.
- (6.) Carry out all regulations promulgated for staying infection.

Mr. Curr : I do not know to what section this refers.

Mr. Bruce : To section 59.

Mr. Valentine : I don't think that "suspected" should be included here—it leaves an opening for abuse. An owner may stop his stock merely for the purpose of resting them.

Mr. Bruce : I do not think that owners would run the risk of damaging the character of their stock for the sake of being allowed to "loaf" on a run; but lest they should, a penalty might be added rendering owners liable if they gave notice of a suspected outbreak without sufficient grounds for doing so.

(2.) Additional duties in regard to infected travelling sheep.

71. If any travelling sheep are infected or suspected of being infected, he shall execute and perform all the additional duties hereinbefore prescribed with respect to infected sheep on runs and travelling uninfected sheep.

(3.) Inspection of travelling stock and declaration of infection.

72. The provisions hereinbefore prescribed relating to the declaration of infection, valuation of stock, action to be taken, and the service of the notice with respect to infected stock on runs, to apply also to infected travelling stock, except that it shall not be necessary for a Director to join with an Inspector when the value of the stock to be destroyed does not exceed £20.

(4.) Which infected travelling stock are to be destroyed and when.

73. The following travelling stock declared infected shall be destroyed within the time specified in Schedule hereto:—

- (1.) All travelling stock of the same description and infected with the same diseases as the infected stock on runs hereinbefore directed to be destroyed.
- (2.) All travelling stock actually affected with or suffering from pleuro-pneumonia.
- (5.) How travelling cattle infected with but not suffering from pleuro-pneumonia are to be dealt with.

74. In addition to the duties hereinbefore prescribed, the following action shall be taken in regard to all travelling cattle declared infected but not actually affected with nor suffering from pleuro-pneumonia, namely:—

- (1.) Such cattle, if not more than miles from the run from which they started, to be sent back to it by the Inspector.
- (2.) All such cattle if fat to be travelled by day to their destination, by roads approved by Inspector; and questions as to whether or not stock are fat to be settled by nearest Director.

Mr. Valentine : Is it not sufficient for the Inspector to decide whether they are fat or not?

Mr. Bruce : It is better that the settlement of this question should be left to some third party, and one of the Directors seems to be a fit person to decide it.

- (3.) All such cattle, other than fat cattle, to be stopped and inoculated as hereinbefore provided with respect to cattle inoculated on runs as soon as practicable, but before they have gone more than fifty miles, and to be taken to their destination as aforesaid. And such cattle not to require to travel more than six miles a day for first thirty days after being inoculated.

Mr. Curr : "Practicable" is quite indefinite.

Mr. Bruce : See remarks on Mr. Gordon's notes to section 70. I do not think that a fit place for inoculating could always be found sooner than required by this section, and some limit must be fixed.

Mr. Valentine : I cannot see that this clause can be worked, and I know many will object to it. My Commissioner would not consent to it. Utterly impracticable in this Colony.

Mr. Bruce : If not inoculated what could be done with them? The course proposed is the only practicable one; in no other way can the infection be eradicated.

- (4.) Cattle duly inoculated may, thirty days thereafter, travel over infected ground without being held to be infected.

Mr. Valentine: Is not (6) of 60 contradictory, six weeks in (6) of 60, and 30 days here?

Mr. Bruce: Sub-section (6) of section 60 is right, and 30 days are wrong, as here noticed. The correct time is six weeks.

PART IX.—COAST OR INFECTED DISTRICT AND COASTWISE STOCK.

1. *Coast or infected district stock.*

(1.) As regards sheep.

75. The Governor in Council may from time to time proclaim and alter coast or infected districts, but alterations not to affect appointments of Directors in neighbouring districts.

76. Sheep in coast or infected districts to be inspected and dressed before being allowed to leave it.

77. Sheep treated as imported not to be held to be coast or infected district if removed in twenty-eight days.

Mr. Gordon: (75, 76, 77) This may be necessary in New South Wales and Victoria, but should not be insisted on in Queensland. To pass this here would be to imperil the measure. I have thought much on this subject, but cannot see the use of it where the term "infected" has such a wide definition and such ample powers are given to Inspectors.

Mr. Gordon: I think 75, 6, and 7 should be cut out. When the Colonies are clean they are of no use, and the stringent provisions proposed by this measure will render the distinction unnecessary.

78. No wool, skin, or other portion of the carcass of a sheep, shall be removed from the coast or infected district without the sanction of the Chief Inspector.

Mr. Valentine: From an infected district only.

Mr. Gordon: All required by the three preceding clauses is embodied in this clause if the words "coast district" are expunged and "ports" substituted.

(2.) As regards all coast district stock.

79. On the outbreak of disease in the Colony, all or any of the provisions of the four next preceding sections may by proclamation be made applicable to other stock than sheep.

Mr. Curr: (75, 76, 77, 78, and 79.) No such provisions desirable in Victoria.

Mr. Valentine: I do not think a coast district workable here. What I think we want more in all the Colonies is a middle or temporary district—something between clean and infected, where stock could be detained, dressed, &c., as might be thought necessary, although not showing disease or as being infected.

Mr. Bruce: (Mr. Curr 75 to 79 inclusive, Mr. Valentine 75, and Mr. Gordon 75, 76, 77). Such provisions as those are very necessary with respect to seaports; and it is better to make a coast-line at once to prevent stock from being smuggled into the Colony at places other than seaports. Every outbreak of scab in this Colony has been occasioned by diseased sheep being taken up the country from seaport towns; and, if the Colonies were all clean—as it is hoped they will now very soon be—a more essential provision than this could scarcely be passed. The coast-line in this Colony at a distance of some thirty miles from the seaboard, with all our exceedingly strict regulations as to detention and dressings *does* cause considerable inconvenience; but by contracting the district where practicable, and relaxing the requirements as to detention and dressing, this inconvenience would be almost wholly removed; while, as I have said, the existence of a coast line would add very much to the safety of our flocks and herds; for, with such a safeguard disease, although it did break out on the coast, could almost always be prevented from spreading into the interior. When it is considered how very few stock there are which require to be taken up into the interior from seaport towns, it will be seen how comparatively little inconvenience this line would occasion; while on the other hand, we know that only a few head of diseased stock taken inland will spread infectious diseases far and near. When, again, disease has been eradicated in all the Colonies, dressing and detention might be dispensed with, and the stock allowed to proceed inland on inspection and certificate.

Mr. Gordon: Expunge.

2. *Coastwise stock.*

All stock.

80. On an outbreak of disease occurring among any stock in the Colony, regulations may be made for the inspection of the stock at the ports of shipment and landing, and for otherwise regulating the traffic.

Mr. Gordon: Should not a new clause be inserted giving free trade in all coastwise sheep within the respective Colonies? At present they must undergo quarantine even if shipped from Newcastle to Grafton. Or is this provided for by the absence of all mention of them?

PART X.—INTERCOLONIAL STOCK TO BE BROUGHT ACROSS THE BORDER.

1. *Rules as to admission of such stock when uninfected.*

81. Persons intending to introduce stock across the Border shall do so under the following rules:—

(1.) In regard to all such stock.

- (1.) That the stock be brought to proclaimed crossing-places only, or to those specially sanctioned by Directors.
- (2.) That twenty-four hours' notice of their intention to cross, be given to an Inspector in this Colony by their owner.
- (3.) That no stock cross without a certificate from such Inspector that he examined them previous to crossing.
- (4.) That all stock be accompanied by a certificate by the Inspector for the district in the Colony they left, as to—(1), whether the stock are infected; (2), the date and place they left; (3), the nearest infected stock to such place; (4), the nature of such infection; (5), their route to the border; (6), nearest infected stock to route; and, (7), the term of the certificate.
- (5.) That such certificate be confirmed by the Inspector in the other Colony for the district in which the crossing-place is.
- (6.) That the certificate be delivered up to the Inspector in this Colony.
- (7.) That where they arrive by train, they shall have been conveyed in thoroughly clean and properly disinfected trucks.

(2.)

(2.) Additional rules in regard to sheep.

- (8.) That the sheep be branded with a letter, to denote the Colony from which they come.

Mr. Valentine : And the letter T.

- (9.) That on crossing they undergo a quarantine of thirty days, and be
- three*
- times dressed as Chief Inspector shall direct.

Mr. Valentine : Fourteen days and two dippings.*Mr. Whyte* : I think fourteen days and two dressings under supervision of Inspector sufficient, where the presumption is the sheep are clean.*Mr. Bruce* : When all the Colonies are clean, I have no doubt but New South Wales will agree to fourteen days and three dressings.*Mr. Valentine* : I am inclined to think that the Regulations relating to Intercolonial Stock Traffic should be in force only when disease exists in any adjoining Colony, and be put in force by proclamation. This reverses your rule of making it law and then suspending. But under these rules we are continuing, and even extending the restrictions, and preventing anything like free trade in stock.*Mr. Bruce* : Although I prefer the course proposed in the sketch, I have no objection to adopt Mr. Valentine's suggestion. See my remarks on notes to 80.

- (10.) That they do not leave the quarantine till certified by the Inspector to be clean.

Mr. Carr : 80 and 81. (2.) Unnecessary. (5.) Unnecessary. (8), (9), (10). If I understand Mr. Bruce, those are suggestions for a Disease in Stock Act to be general in the Colonies. If so, it will not suit us to dress clean wethers from Riverina, which would become necessary under these clauses.*Mr. Bruce* : The operation of these sections would, when Victoria is clean, be suspended by New South Wales with respect to sheep from Victoria, as they now are under our Sheep Act in regard to sheep from Queensland ; and Victoria would, of course, be expected to suspend them with regard to sheep coming from New South Wales, as that Colony is clean. So that the dressing here alluded to would not be necessary.

It is considered safer to frame the measure so as that these restrictions and requirements would always apply, unless suspended, as they can be by section 87. If, however, it be considered best to make them only apply when occasion required, as proposed by Mr. Valentine at 81 (9), that course could be adopted.

2. Rules in regard to admission of infected colonial stock.

82. The following rules shall apply to colonial stock intended to be introduced into this Colony across the Border, and found to be infected :—

(1.) In regard to such stock in general.

That no stock which the Inspector considers infected (except cattle infected with pleuro-pneumonia) be allowed to cross ; and if any are found on inspection to be infected, notice be at once given to the Chief Inspector for the Colony they are in.

Mr. Valentine : Excepting in regard to pleuro-pneumonia, I do not see the use of these rules. I should certainly object to infected colonial stock being introduced ; and, if introduced, should prefer to provide for their being immediately destroyed and the introducer heavily fined.*Mr. Bruce* : I think the sections as sketched carry out Mr. Valentine's idea. No stock with any infectious disease but Pleuro are proposed to be admitted, and then only after they have been inoculated. This might perhaps have been stated more briefly than in the sketch, but it was considered better to put the provisions in this shape, in order to preserve uniformity of arrangement and make reference easy.

(2.) Special rules in regard to cattle infected with pleuro-pneumonia.

That cattle infected with but not actually suffering from pleuro-pneumonia, after being duly inoculated, may be introduced.

Mr. Valentine : Can this be carried out with all cattle ?*Mr. Bruce* : Yes.

83. Notwithstanding anything herein contained, any of the provisions of the two next preceding sections of this Act relating to the introduction of uninfected stock across the Border from the neighbouring Colonies may be suspended by proclamation, in regard to any Colony in which disease is not known to exist ; and any of the provisions of this Act relating to cattle infected with pleuro-pneumonia may in like manner be suspended.

84. The Governor may in like manner absolutely prohibit the introduction across the Border of stock from any Colony.

Mr. Valentine : I think a clause should be introduced providing for how apparently sound stray stock from adjoining Colonies should be dealt with.*Mr. Bruce* : Yes.

PART XI.—INTERCOLONIAL STOCK INTRODUCED BY SEA.

1. Rules of admission of such stock when uninfected.

85. Stock from other Colonies arriving in any port shall be introduced under the following conditions, namely :—

(1.) In regard to all such stock—

- (1.) That they be landed at proclaimed ports only.

- (2.) That they be accompanied by the same certificate as stock brought over the Border.

Mr. Valentine : I think this certificate should be modified ; it is hardly suitable for stock by sea.*Mr. Bruce* : Yes.

- (3.) That the captain give notice to the Inspector within twelve hours of arrival of stock.

Mr. Valentine : Not necessary.*Mr. Bruce* : Where many vessels are arriving, or where the Inspector resides at any distance from the port, such notice as this is very necessary, and very little trouble to the ship's agent.*Mr. Whyte* : I think notice should be given some time before arrival as well.

- (4.) That they are not landed till permitted by Inspector.

- (5.) That they be so under such regulations as the Minister may publish.

(6.)

- (6.) That, if apparently free from infection, the stock be sent to quarantine, and kept and treated there as prescribed by Schedule hereto.
- (7.) That if the stock exceed five head of cattle or twenty sheep, they may be sent to an outside quarantine and kept there at their owner's expense and risk.

Mr. Valentine : What is an outside quarantine ?

Mr. Bruce : An "outside quarantine" is some isolated place or paddock where large numbers of sheep (say 400 or 500 in a lot) are placed in special quarantine—the regular quarantine yards being too small to contain them.

Mr. Valentine : Call it a "special quarantine."

2. *Rules as to admission of such stock when infected.*

86. The following rules shall apply to infected colonial stock arriving by sea in any port in the Colony, viz. :—

(1.) In regard to such stock in general.

- (1.) If the stock are found to be infected with any new disease, or with catarrh, they shall be destroyed, whether it was intended to land such stock or not.

Mr. Valentine : Query—if not landed.

Mr. Bruce : Yes ; because there would be great risk of the infection spreading through the intercourse which is kept up between the vessel and the wharf, if the stock with the disease be allowed to remain undestroyed.

Mr. Whyte : Right.

(2.) Special rules in regard to such stock when infected with pleuro-pneumonia.

- (2.) All cattle actually suffering from that disease shall be destroyed.
- (3.) If the cattle are infected with but not suffering from that disease, they shall be sent to quarantine for 6 weeks and inoculated.

(3.) Special rules in regard to such stock when infected with scab.

- (4.) If any such sheep are infected with scab, they shall be sent to the proper quarantine for three months and dressed as directed.

Mr. Valentine : I cannot agree with this ; won't have them at all ; let them go away or die.

Mr. Bruce : There would be no difficulty whatever in cleansing a few stud sheep infected with scab ; and there need be no risk of the disease spreading, if a proper site—such as an island—be selected for their quarantine. It would, I think, be wrong under such circumstances to destroy valuable stud sheep.

87. All or any of the provisions of the next preceding sections may be suspended by proclamation in regard to a clean Colony.

Mr. Gordon : I think this clause should precede all the clauses to which it relates, and I also think clause 83 should precede the two preceding sections, otherwise there will be misunderstanding in passing the Act through Parliament, as those in charge do not post themselves up.

Mr. Bruce : Yes ; or *Mr. Valentine's* suggestion as at 81 (9) could be adopted, leaving the admission usually open, and only putting on restrictions against stock from Colonies in which disease appeared.

Mr. Gordon : In order to prevent misunderstanding and debate during the passage of the Bill through Parliament, all suspension clauses should, I think, precede the clauses to which they refer. This remark will apply to clause 83.

88. The Governor may issue absolute prohibition against any Colony when necessary.

PART XII.—FOREIGN STOCK.

1. *Rules of admission into the Colony.*

89. Foreign stock intended to be introduced shall be so in terms of the following rules, namely :—

Mr. Whyte : A definition of the word "foreign" seems necessary.

Mr. Bruce : Yes. It might be defined "stock from any port or place other than a port or place in the Australian Colonies."

(1.) In regard to all such stock when uninfected.

- (1.) That they be accompanied by a certificate from the Inspector for the port where they were shipped that neither they nor any other stock on board were infected.

Mr. Whyte : What is to be done if they come from a port where there is no Inspector of Stock ?

Mr. Bruce : I do not think that this is likely to occur after the Regulations passed in the Colonies have been published in London, as they would be certain to be soon after they are so in the Colonies.

Mr. Valentine : You have not carried out the recommendation of the Conference in this matter as to veterinary certificate. I think their recommendation meets the case best.

Mr. Bruce : The provision as to the certificate of a veterinary was overlooked ; it ought to have been provided for.

- (2.) That the captains of all vessels arriving from ports outside the Colonies make declaration as to the stock they had on board.

Mr. Valentine : I do not think the captain's declaration worth the paper it is signed on.

Mr. Bruce : Much reliance cannot be placed on the captain's declaration in every case, but it always gives the Inspector an opportunity of obtaining information which he would not otherwise get.

- (3.) That the officer of Customs receiving the declaration forward it to the nearest Inspector, or intimate captain's refusal to sign ; and if captain refuse, the officer to detain stock and attendants.

Mr. Valentine : If possible, omit reference to Customs officers.

Mr. Bruce : This is necessary, and gives the Customs officers very little trouble.

- (4.) The captain of any vessel with stock on board to send immediate notice of his arrival to the Inspector.

- (5.) That no such stock be landed without being examined by the Inspector and a veterinary surgeon and receive a permit to land.

Mr. Valentine : Veterinary should only be employed when necessary.

Mr. Bruce : Yes.

- (6.) That all such stock found infected be sent at the owner's expense to quarantine for fifty days, and dressed or disinfected as directed by Chief Inspector.

- (7.) At expiry of quarantine the stock be examined in the same manner before being allowed to leave.

(2.) In regard to such stock when infected.

- (8.) That all such stock found to be infected shall be dealt with according to the description of such stock and the disease with which they are infected as heretofore provided, with respect to colonial stock brought by sea found to be infected. But all foreign cattle placed in quarantine shall remain in quarantine fifty days at least.

Mr. Valentine: As to stock when infected, I have never admitted them, and do not like the principle. I think it much more advisable to provide for the destruction of all diseased stock which arrive in our ports. If we intend to keep out disease, we must not be too nice about killing a few because they are valuable. The admission of any diseased animals is a mistake I am sure.

Mr. Bruce: Under this sub-section, the only infected stock admissible would be cattle infected with pleuro and sheep infected with scab; and it was resolved at the Conference that both these sorts of stock might be introduced under certain conditions.

Mr. Curr: I am of opinion that stock should not be allowed to be introduced from countries in which infectious disease (scab excepted) exist.

Mr. Bruce: See preceding remark.

(3.) In regard to prohibition.

- (9.) The Governor may at any time for a period of twelve months absolutely prohibit or restrict to any extent he may think necessary the introduction of all or any particular kind or description of stock from any country outside the Australian Colonies.

Mr. Valentine: Why not from the Australian Colonies as well, if necessary?

Mr. Bruce: This is provided for by section 88.

PART XIII.—TRANSHIPPED STOCK, AND STOCK LANDED FOR TRANSHIPMENT.

1. *Transhipped stock.*

90. Stock arriving from any of the neighbouring Colonies where they have, within the next preceding thirty days, been released from quarantine as colonial or foreign stock, shall on landing only undergo such additional quarantine and disinfecting as the Minister shall direct.

Mr. Valentine: Query—Chief Inspector.

Mr. Bruce: Yes.

2. *Stock for transhipment.*

91. If stock arrive from any of the neighbouring Colonies for transhipment to any of the other Colonies, and be found free from infection, they may be landed and kept at the owner's expense for twenty days, at a place to be approved by the Inspector.

92. If foreign stock arrive for transhipment and are sound, they may be landed for twenty days at the quarantine set apart for that class of stock, and kept at owner's expense.

93. If stock arriving for transhipment prove infected, or if they are not removed within the twenty days, they shall be dealt with as if they were intended for this Colony.

Mr. Valentine: Infected stock should not be landed.

Mr. Bruce: Infected stock of this sort would be dealt with as required by the Act.

PART XIV.—EXPORTED STOCK.

Rules of exportation.

94. Persons intending to send stock out of the Colony by sea shall give the Inspector hours' notice, and pay the authorized fees for inspection.

95. The Inspector on examining stock to grant a certificate which owner shall transmit with stock.

PART XV.—INFECTED STRAY STOCK.

96. Any person may seize and detain any stray infected or suspected stock, and shall on doing so send immediate notice to the Inspector, who shall hold such stock to be travelling stock, and deal with them accordingly.

97. While detaining such stock, the person doing so shall take every precaution against the spread of disease, and shall hand the stock over to the Inspector.

Mr. Curr: What will the Inspector do with it?

Mr. Bruce: A large proportion of such stock would be seized by persons other than Inspectors, and it would not be right to allow these persons to destroy such stock, as it were, privately. On being delivered to the Inspector the stock would be dealt (publicly) with by him, as required by the Act.

Mr. Valentine: I think a clause should be introduced referring to uninfected stray stock from adjoining Colonies, so that they might be seized and dealt with.

Mr. Bruce: Yes. See note to 84.

PART XVI.—LAND, PREMISES, CONVEYANCES, EFFECTS, ETC., INFECTED OR LIKELY TO BE INFECTED.

98. Any land, run, premises, erection, conveyance, vessel, food, fittings, effects, or other matter or thing which has been in direct or indirect contact with infection, or in such a position as to have been liable to be in such contact, or which has been placed in quarantine, shall for the purposes of this Act be held to be infected.

99. All such land, matters or things as aforesaid shall, according to the disease with which the same is infected, be dealt with, so far as practicable, in the same manner as it is by this Act provided that stock infected with the same disease shall be dealt with.

100. When a vessel arrives which has, or has had, stock infected with any new disease on board, the Governor in Council may place such vessel in quarantine, until the vessel, stock, attendants, passengers, and crew are disinfected.

Mr. Valentine: Query.

Mr. Curr: It seems to me no community would put up with such a law, especially when the efficacy of disinfectants is held to be doubtful at least.

Mr. Bruce: This is an extreme power, and would be very seldom exercised. It is, however, in safe keeping,—that of the Governor and the Executive Council,—and cases *might* arise where they would deem it right to call it into operation.

Mr. Curr: Insert—"and their clothes and everything by which infection may be carried," after the word "crew."

Mr. Bruce: Yes.

101. The Governor in Council may from time to time make regulations for prohibiting or regulating the introduction of wool, skins, hair, horns, bones, hoofs, fodder, hay, straw, or other article by the introduction of which he considers there is any risk of introducing disease.

102. The Inspector may, where he thinks necessary, direct the disinfecting or cleansing of any premises, conveyance, vessel, food, fitting, or effects, which the owner shall carry out, unless the Inspector's decision is altered on appeal.

Mr. Valentine: Why have it for appeal? Surely an appeal is not necessary.

Mr. Bruce: This provision, relating to appeals, would with the others on that subject now be omitted.

103. The provisions of this Act shall not apply to thoroughly dry hides or skins, bones, horns, hoofs, melted tallow in casks or skins, nor to horse, cow, or goat's hair, packed in bags or bales, or to any other thing not known to be infected.

104. The Governor in Council may, by proclamation, restrict or absolutely prohibit, for any specified time not exceeding twelve months, the introduction into this Colony of any fodder, hay, food, straw, fittings, effects, matter, or thing used for, with, or about stock, which he considers in any way likely to introduce the infection.

PART XVII.—PENAL AND PRECAUTIONARY PROVISIONS.

1. Money penalties.

105. If any person does any of the following things, he shall be deemed guilty of an offence against this Act, and on conviction shall forfeit and pay any sum not exceeding that mentioned in the sub-section describing such offence.

Mr. Valentine: *In re* penalties. I think it would be much more satisfactory to name the minimum fine—not less than £50, or as it may be. I find Magistrates are very apt to let men off when Government is prosecuting.

Mr. Bruce: Yes. I think a minimum penalty should in most cases be adopted, but there are some sections where the expediency of doing so is doubtful.

- (1.) If he acts in contravention of any of the provisions of this Act relating to the election, powers, duties of Directors, or disturbs any meeting of Directors—a penalty not exceeding £20.
- (2.) If he refuses to admit, obstructs, impedes, or interferes with an Inspector or his assistants, or refuses to carry out any lawful direction or request of an Inspector under this Act—a penalty not exceeding £100.
- (3.) If he, contrary to this Act, takes or assists to take any stock, carcass, matter, or thing, in or out of quarantine, or in any manner breaks quarantine, or negligently allows stock to stray in or out of quarantine, or trespasses on any quarantine station—a penalty not exceeding £100.
- (4.) If he acts in contravention of any of the provisions of this Act in regard to stock on runs, travelling stock, colonial stock, foreign stock, transhipped stock, or exported stock, or in regard to any run, matter, or thing by which the infection is spread or likely to be spread, when such stock, run, matter, or thing are uninfected, a penalty not exceeding £50; and when infected, a penalty not exceeding £200.
- (5.) If he abandon any stock, or if he casts any stock in any stream or water, or leaves the carcass of any such stock on a road, or within half a mile of it, undestroyed—a penalty not exceeding £5, if the stock are uninfected; and not exceeding £100, if they are infected.
- (6.) If he has in his possession, without the sanction of the Chief Inspector, any infected stock for sale or slaughter, or exposes the same in any shop, stall, or market—a penalty not exceeding £20.
- (7.) If he introduces, otherwise than by sea, any wool, skin, or other portion of stock from a Colony declared to be infected—a penalty not exceeding £50.
- (8.) If he pack or remove any wool, skins, bones, or other portion of infected stock, without giving the Inspector notice, and putting the same securely up in boxes, casks, bags, or bales, marked "infected"—a penalty not exceeding £100.
- (9.) If, through culpable negligence, he allows his infected stock to stray—a penalty not exceeding £100.
- (10.) If he destroy or obliterate any brand, or ear or other mark required by this Act to be put on any stock, or deface, pull down, or destroy any placard required by this Act—a penalty not exceeding £50.
- (11.) If he dig up, or remove, or interfere with any stock or carcass destroyed, buried, or otherwise disposed of as infected—a penalty not exceeding £50.

106. If infected stock of an owner come into direct or into indirect contact, or mix with clean stock, whereby their owner incurs any loss, damage, or expense, the owner of first-mentioned stock shall pay to owner of clean stock all loss, damage, or expense—the amount to be determined by the Directors.

Mr. Whyte: The Inspector should have power to enforce these provisions. In Tasmania owners will not generally do so.

Mr. Bruce: The Inspector would have this power—he could insist upon the stock being dressed or disinfected.

107. Any Inspector of slaughter-houses to give to nearest Inspector immediate notice of any stock being infected, and to aid Inspector in tracing outbreak, under a penalty not exceeding £20.

108. If any person acts in contravention of, or is guilty of any offence against this Act, or any proclamation or regulation, he shall, where a penalty is not specially provided for such offence, be liable in a penalty not exceeding £20.

109. If any offence against this Act or any proclamation or regulation be committed in respect to more than four head of stock, a penalty not exceeding *one-fourth* of the lump penalty mentioned in the Act, proclamation, or regulation, may, at the discretion of the Court, be imposed for each head of stock instead of the said lump penalty.

2. *Imprisonment.*

110. If any person commits any of the following offences he shall be deemed guilty of a misdemeanor, and shall, on conviction thereof, be liable at the discretion of the Court to imprisonment for any period not exceeding five years :—

- (1.) If he wilfully communicate, or attempt to communicate, or aid, or be concerned in communicating any infectious or contagious disease to or among stock.

Mr. Carr : How then can inoculation be performed ?

Mr. Bruce : This objection is valid. Inoculation should have been specially exempted.

Mr. Whyte : It is three years in the Tasmanian Scab Act.

- (2.) If he knowingly permits or connives at the travelling of any infected stock (except cattle infected with pleuro-pneumonia).
- (3.) If he knowingly ship or put on board any vessel for exportation any infected stock.
- (4.) If he make any false return or report under this Act, or sign any false certificate respecting any stock, knowing such return, report, or certificate to be false, or shall forge, or alter, or utter, or put off any return, report, notice, certificate, permit, brand, or mark, knowing the same to be forged or altered.
- (5.) If he by force or violence obstruct an Inspector or his assistants.

111. If a person knowingly offer for sale any infected stock without informing the purchaser that they are infected, or if any person offer for sale any uninoculated cattle without informing the purchaser, such person shall be deemed guilty of fraud.

112. When, by this Act, or by any proclamation or regulation thereunder, a penalty is fixed at any sum not exceeding £50, the Court may, at its discretion, instead of such money penalty, inflict imprisonment for any term not exceeding two months ; and where the money penalty is fixed at any sum not exceeding £100 for any term not exceeding four months, and where the money penalty is fixed at any sum not exceeding £200 for any term not exceeding six months.

Mr. Whyte : I suspect you will find it difficult to carry this. In default of payment of a fine under our Act in Tasmania, the person may be sentenced to imprisonment for any period not exceeding six months.

Mr. Bruce : This section is not absolutely necessary, but it would add to the efficiency of the measure.

3. *Confiscation of stock.*

113. All stock of any of the following descriptions, driven, travelled, landed, or moved in contravention of this Act, or of any proclamation or regulation thereunder, and all fittings, fodder, effects, and things used for, with, or about such stock, may be seized by any person whomsoever, and handed over to the nearest Inspector, and shall be destroyed or otherwise disposed of as the Minister may direct, without any compensation to the owner of such stock :—

- (1.) All stock placed in quarantine, all coast district and coastwise stock, and all colonial, foreign, transhipped, and exported stock ; and all fodder, fittings, effects, and things used for, with, or about such stock, moved, travelled, or introduced in contravention as aforesaid, whether such stock, fodder, fittings, effects, or things be infected or not.
- (2.) All infected stock knowingly or wilfully moved or travelled, or allowed to stray, or otherwise dealt with in contravention as aforesaid, and all fodder, fittings, effects, and things used for, with, or about such stock, or which has been in direct or in indirect contact therewith.

4. *Apprehension of offender.*

114. An offender may be apprehended under any of the following circumstances :—

- (1.) If he obstructs or impedes an Inspector or his assistants.
- (2.) If he commits or attempts or aids in committing any breach of this Act relating to quarantine.
- (3.) If, after being warned, he persists in travelling infected stock.

Mr. Carr : By whom warned ?

Mr. Bruce : By an Inspector or owner.

PART XVIII.—COMPENSATION FOR STOCK, &c., DESTROYED.

115. Owners whose stock, &c., have been destroyed, if they have complied with the Act, will receive compensation to the extent of the value of such stock, &c., when destroyed ; and proprietors who have sustained loss through infected travelling stock being quarantined on their land will also receive compensation.

116. Mode of application to Directors for compensation.

117. Mode by which Directors investigate claim for compensation and fix the amount to be awarded.

118. How claim is to be paid from Pastoral Contribution Fund at the Treasury.

PART XIX.—PROCLAMATIONS AND REGULATIONS.

119. The Governor in Council may by proclamation declare the provisions of this Act, and of any proclamation or regulation thereunder, to apply to any disease in domesticated animals other than those mentioned in the definition of the word "disease" in the interpretation clause of this Act ; and also to any domesticated animals other than those mentioned in the definition of the term "stock" in the said interpretation clause.

120. The Governor in Council may from time to time make, alter, or repeal such proclamations or regulations as he may think expedient, in respect of any of the following matters or things, namely :—

- (a) The place of meeting and mode of voting for the election of Directors.
- (b) The powers, duties, and travelling expenses of Directors and Inspectors.
- (c) The placing of land, stock, and other matters and things in quarantine, and releasing the same ; and the establishment and regulating quarantine stations for the reception of coastwise, colonial, foreign, and any other stock.
- (d) The duties of owners with respect to stock on runs, travelling stock, intercolonial stock, transhipped stock, and exported stock, and the action to be taken with respect to such stock when uninfected or infected.

- (e) The opening and closing of temporary roads for uninfected or infected travelling stock.
- (f) The conditions to be imposed on the landing of or subjecting to inspection or to quarantine of any colonial or foreign stock, fodder, fittings, or effects, or any specified kind thereof, brought from any specified colony or country.
- (g) The insuring for stock brought by sea a proper supply of food during the passage and on landing; and protecting them from unnecessary suffering.
- (h) The protecting stock from unnecessary suffering during inland transit, while being kept at slaughter-houses, and wherever else they may be.

Mr. Valentine : (g and h). I think these matters do not affect the Inspectors—it is the owner's business. If you could provide for the punishment of cruelty and starvation, it might be of value for Government to take notice, but only in quite exceptional cases.

Mr. Bruce : These regulations are not essential, but if passed would benefit the owner and tend to the comfort of the stock. They are copied from the English Act.

- (i) The prohibiting, or regulating the movement and quarantining of stock, and the removal and destruction, when necessary, of dead stock or parts thereof, and of hay, straw, fodder, dung, litter, and other things likely to spread disease among stock.
- (j) The cleansing and disinfecting of stock, premises, yards, sheds, stalls, stables, stable utensils, fields, and other premises.
- (k) The disposal, mode of destruction, and burial of stock dying while affected with disease.
- (l) The prohibiting or regulating the holding of markets, exhibitions, or sales of stock.
- (m) The detaining and keeping of infected or suspected stock which are being travelled or moved.
- (n) The valuation of stock and effects, and payment of compensation for them when destroyed.
- (o) The payment and collection of contributions.

And generally, any proclamations and regulations deemed expedient for the better execution of this Act, or for the purpose of in any manner preventing the introduction or spreading of disease among stock in the Colony (whether any such proclamations or regulations are of the same kind as the kinds enumerated in this section or not): And may in any such proclamation or regulation direct or authorize the slaughtering of stock that are affected with any new infectious or contagious disease, or that have been in direct or in indirect contact with stock so affected: And may in any such proclamation or regulation direct and authorize payment of compensation for any stock so slaughtered: And may in any such proclamation or regulation impose penalties for offences against the same—not exceeding the sum of £50 for any such offence.

121. Every such proclamation or regulation shall be published in the Gazette, and on being so shall have the like force and effect as if it had been enacted by this Act. And any want of or defect or irregularity in the publication of any such proclamation or regulation shall not invalidate the same.

PART XX.—CONTRIBUTIONS AND EXPENSES.

1. Contributions.

122. To defray the expenses of this Act, there shall be levied an annual contribution at the rate of 1d. per head on all owners of *horses* with twenty-four head or more, at the rate of $\frac{1}{4}$ d. per head on all owners of *cattle* with forty-eight head or more, and at the rate of 2s. per 100 on all owners of *sheep* with 500 head or more. And every such contribution shall be a preferential charge on all stock whoseever's possession they may be in; but contribution may be reduced or wholly remitted, as the Governor in Council may decide.

Mr. Gordon : In our case we have a fund of £7,000 at Cr. Sheep Act, equal to £21,000 in your Colony. If you are similarly situated, how do you intend to compromise—will you do so by remitting contributions on sheep for a few years?

Mr. Bruce : There is only a small balance at the credit of our Sheep Act.

Mr. Whyte : The limit as to numbers, of course, is only for convenience and saving of trouble. It may suit the great Colonies, but would not answer in Tasmania; here a much smaller limit would be required.

Mr. Bruce : Yes.

123. The contributions to be payable together on the 31st day of May to the Colonial Treasurer, or any one he may appoint, and to be paid into an account at the Treasury to be called the "Pastoral Contribution Fund Account."

Mr. Valentine : What is the object of making 31st May pay day?

Mr. Bruce : None, beyond giving time for the returns being received and dealt with by the C.P.S., as here proposed.

124. Owners to make returns before the 1st of January in each year, of the numbers of their stock to the nearest C.P.S.

125. If the owner fails to make a return, the Inspector may make an estimated one, which shall be binding on the owner.

Mr. Gordon : Owner may appeal against this, but if he does so the cost of appeal must be borne by the owner himself.

Mr. Bruce : All appeals are now proposed to be omitted.

Mr. Whyte : Quite right.

126. C.P.S. to make up a list of the owners making returns,—calculate the amount of contribution due by the several owners,—and make up and forward General Return to the Colonial Treasurer and Auditor General.

Mr. Gordon : Why not make the C.P.S. receive the money and forward to you, to be by you paid into Treasury monthly, as we do with Brands Act. It affords us a good check, and works really well. I have a Bank account for the purpose.

Mr. Bruce : The alteration here suggested would be a decided improvement if contributions were all paid in the country districts; but by far the greater portion of them is so in town, in this Colony at least, at the Treasury; and the course proposed in the sketch is, under these circumstances, I think, the more convenient.

127. The Clerk of Petty Sessions shall, on or before the 31st of March, send each owner notice of the amount of contribution which he owes.

Mr. Gordon : This should be paid at time of making returns. The calculation is simple, and may be made by any one.

Mr. Bruce : See remarks on notes on 126.

128. Owners may appeal to the Directors against the notice sent to them by the C.P.S.

(122—128.) *Mr. Gordon*: I would suggest that owners pay assessment at time of making return to the C.P.S., who shall send monthly remittances to Chief Inspector, who in like manner pays monthly into Treasury from a public Bank account. This answers admirably with the brands assessment account in this Colony, and affords the only possible correct check on defaulters.

129. Mode of recovering contributions if owner fail to pay.

2. Expenses.

130. The balances standing at the credit or debit of the "Cattle Disease Fund" and the "Cattle Export Act" in the books of the Treasury, shall be carried over to the said "Pastoral Contribution Fund Account," and all claims due under the Acts hereby repealed shall be paid out of the said last-mentioned account.

Mr. Valentine: Don't understand this clause.

Mr. Bruce: It relates to Acts now in force in this Colony and Queensland.

131. The Colonial Treasurer shall, under warrant of the Governor, pay out of the said "Pastoral Contribution Fund Account" (or in the event of such fund being inadequate, out of such moneys as shall be appropriated for the purposes of this Act) all claims for compensation and all expenses hereunder. And all such appropriations shall be recouped to the "Consolidated Revenue Fund," when there is a sufficient balance to the credit of the said "Pastoral Contribution Fund."

PART XXI.—LEGAL PROCEDURE.

1. General.

132. For the purposes of this Act, or any proclamation or regulation thereunder, every offence against the same shall be deemed to have been committed, and every cause of complaint under this Act, or under any proclamation or regulation as aforesaid, shall be deemed to have arisen, either in the place in which the same actually was committed or arose, or in any place in which the person charged or complained against happens to be.

133. What is to be held to be service of notice, intimation or summons.

134. Mode of recovering penalties, awards, and sums of money incurred, due, or payable under this Act, or any proclamation or regulation.

135. When it is uncertain who is the owner of any stock in respect of which a penalty or sum of money is sued for under this Act, or if an order be obtained with respect to any such stock and the same is not immediately satisfied, such stock, or as many thereof as may be necessary, may be levied upon in satisfaction of such order.

136. Half of penalty to be paid to the person who sues or proceeds for the same, and half to the "Pastoral Contribution Fund Account."

Mr. Whyte: Very good, but could not be carried in Tasmania.

137. For the purposes of the Act a station or registered brand on stock shall be *prima facie* evidence of the ownership thereof; and such brand, in conjunction with its colour, position, or shape, shall be *prima facie* evidence that the stock are of the description denoted by such colour, position, or shape.

Mr. Whyte: In Tasmanian Scab Act, "brand" is *prima facie* evidence of ownership. The *onus probandi* should rest with the accused.

Mr. Bruce: Making a notice or decision by an Inspector *prima facie* evidence, as proposed in this section, throws the *onus probandi* to a large extent on the defendant.

138. The Schedules to this Act shall be construed and have effect as part of this Act.

139. In all questions as to whether stock are quarantine, travelling, coastwise, coast, colonial, foreign, or transhipped, and whether they are or are not infected, *prima facie* evidence adduced by an Inspector to show that any of such stock are of either of the classes here mentioned shall be conclusive evidence, unless the owner of such stock shall satisfactorily prove the contrary. And any stock with which stock of any of the descriptions hereinbefore mentioned shall have come into direct or into indirect contact shall be deemed to be of the class with which they shall have so come into contact, and shall be dealt with accordingly.

140. The written certificate or notice of an Inspector shall for the purposes of this Act be held to be *prima facie* evidence of the fact therein stated.

141. Any decision, order, license, certificate, permit, notice, or other instrument made under this Act, or under any proclamation or regulation thereunder, may be in writing or in print, or partly in writing and partly in print.

142. Any public notice, proclamation, or regulation under this Act may be proved as follows:—

(1.) By the production of a newspaper containing a copy of such public notice, proclamation, or regulation.

(2.) By the production of a printed copy of such public notice, proclamation, or regulation, purporting to be certified to be a true copy by Inspector or by the nearest C.P.S., or to have been printed by the Government Printer.

And every such public notice, proclamation, or regulation shall, until the contrary be proved, be deemed to have been duly made and issued at the time at which it bears date.

143. No proceedings under this Act taken before any Justices shall be quashed for want of form: and no conviction, decision, order, appeal, or application made under this Act shall be removed by writ of *certiorari* or otherwise into the Supreme Court.

2. Appeal against Justices' decision.

144. Any person feeling aggrieved by the order or decision of any Petty Sessions—if the amount of such order or decision exceeds £20—may appeal therefrom to the County Court, and from that to the Supreme Court, subject to the following conditions:—

(1.) The appeal must be brought not sooner than fifteen days nor later than four months after the decision or order.

(2.) The appellant shall give notice to the C.P.S., within three days of such order or decision, that he intends to appeal.

(3.)

- (3.) He shall immediately after enter into a recognizance before a Justice, with two sufficient sureties, to try such appeal, abide by the judgment, and pay costs.
- (4.) The Court may adjourn the appeal and make such order as they see fit.

Mr. Whyte: I do not like an appeal to the Supreme Court in such cases.

Mr. Valentine: Avoid all appeals to the Supreme Court; if possible, let it stop before it gets there.

Mr. Bruce: I also am doubtful as to the policy of allowing this appeal, but the section is copied from the English Act.

3. Protection of persons in executing the Act.

145. In actions against persons executing this Act, or any proclamation or regulation thereunder, a month's notice must be given, the action must be begun within four months, and must be tried in district where the cause arose.

146. Defendant may plead that it was done or omitted under the authority of _____ or in carrying out Act—and may give special matter in evidence.

147. On trial, plaintiff shall not give evidence of any cause of action not stated in notice.

148. The plaintiff not to succeed if tender of amends is made before action; and after it is commenced defendant may pay any sum into Court, and the Court shall make such order as if the money were paid into Court in an ordinary action.

149. If the plaintiff does not succeed in obtaining judgment, the defendant shall receive full costs, charges, and expenses; and though a verdict is given for plaintiff, he shall not have costs unless the Judges approve of action and verdict.

150. Where any such action is defended under the direction of the Minister, the costs, charges, and expenses, and any damages or other moneys recovered against or payable by him, shall be deemed to be expenses under this Act.

SCHEDULES.

No. 2.

THE CHIEF INSPECTOR, MELBOURNE, to THE CHIEF INSPECTOR, SYDNEY.

Melbourne, 29 January, 1875.

SIR,

At your request I have cursorily gone through your Synopsis of a proposed Disease Prevention Bill. With much of the policy and many of its details I cannot at all agree, as you will perceive by my marginal notes on copy returned herewith. On looking through such notes, I am aware that they may appear, and in fact are less considerate than they should have been, having been hurriedly penned as if only for myself; but I trust you will not attribute this to any other cause than haste, and to my idea it is well in such cases to hear unvarnished opinions.

As a whole, I do not like the Bill; I think it by far too diffuse, whilst, were I a stockowner, I should consider a great number of the provisions uselessly vexatious.

I do not think that such an Act would ever be passed in Victoria, and I am quite sure it never could be enforced if it were.

The Minister has directed me to state that the Government of this Colony will not hold themselves to be in any way committed to the remarks made by me on this subject.

I have, &c.,
EDWARD M. CURR.

No. 3.

THE CHIEF INSPECTOR, ADELAIDE, to THE CHIEF INSPECTOR, SYDNEY.

Adelaide, 11 March, 1875.

DEAR SIR,

By this mail I return your Synopsis of Stock Disease Bill. You have gone thoroughly into the matter, and in doing so have evidently carried on your present system as far as possible. I am very doubtful if our Parliament will introduce a new system, but if not done I must try and assimilate our new Bill as near yours as can be done. This can be worked out after your final draft is in print. At present we are not doing much. So far as length is concerned, I do not see how it is possible to deal with all the subjects and the different animals without making a long Bill, and I quite agree with you that it is better to set out distinctly and in one Bill in different parts what is requisite. I do not think I need recapitulate in this non-official letter the remarks I have made in additional memo. I may say, I think we ought to deal with fluke and worms so far as I have drawn out. All I want to do is to force people to take some steps to improve the health of their sheep, and that can only be done by law unfortunately; it ought not to require more than losses, but I find the general scheme of these sort of men is to palm off their unhealthy stock on other parties and grumble at the Inspectors for exposing them. I have no objection to their selling these sheep if it does not injure the public, but when the many are to suffer for the few, then, I think, we may step in and have our say.

I am, &c.,
C. J. VALENTINE.

21

No. 4.

THE CHIEF INSPECTOR, HOBART TOWN, to THE CHIEF INSPECTOR, SYDNEY.

Tasmania.

Inspector of Sheep Office,
3 April, 1875.

MY DEAR SIR,

I return your Synopsis, with a few general remarks on it. I have gone over it several times with much care, and certainly it appears to me to have been very carefully considered, and the subject thoroughly reviewed in every point of view. If you can get this Synopsis carried out in a well-drawn Bill I think it will fully carry out the opinions expressed in the suggestions of the Conference.

I am informed by Mr. Curr that the Victorian Government are disposed to carry out the suggestions of the Conference.

I have, &c.,
JAMES WHYTE.

No. 5.

THE CHIEF INSPECTOR, BRISBANE, to THE CHIEF INSPECTOR, SYDNEY.

Brisbane, 14 April, 1875.

DEAR BRUCE,

I have forwarded your draft Stock Bill by this post. I have gone carefully over it many times, and take no exception whatever to its form and provisions, with a few minor exceptions noted in the margin, and which do not affect the principle.

The measure to be recommended by me to my Government will embody the same principles throughout, although as yet I do not see my way clearly to embodying the Sheep and Cattle Acts in one measure. This, however, is only my own opinion and that of a limited number of owners to whom I have had an opportunity of speaking.

Yours truly,
P. R. GORDON.

No. 6.

CIRCULAR TO THE CHIEF INSPECTORS.

Sydney, 20 May, 1875.

Sketch of Stock Disease Prevention Bill.

DEAR SIR,

As I proposed in my circular letter of January last, I now beg to send you herewith a copy of the notes by the members of the late Conference on the several clauses of the above sketch, and of my remarks on these notes for your further consideration, with the view to our coming to an agreement on the more important details of a measure which we can join in recommending to our respective Governments; and I will be glad if you will favour me at your early convenience with any additional marks you may have to offer on the questions raised in the paper now sent you.

Looking at these notes, the divergence of opinion among us on the principal provisions of the sketch does not appear to be very great; and perhaps the better way will now be for each member, in replying to this communication, to state the section or sub-section to which he is opposed, and his reasons for being so; and with respect to the other provisions of the sketch to which no reference is made, it will be taken for granted that he agrees to them.

Little or nothing has been said in the notes as to the form which the measure should assume. I am quite willing to agree to its being drawn up in any shape which may be deemed best.

Although I may have again to trouble you in this way, I trust that when the explanations which have been offered are considered, the agreement on the whole will be so general as that my next paper will be a very short one.

I am, &c.,
ALEX. BRUCE.

No. 7.

THE CHIEF INSPECTOR, MELBOURNE, to THE CHIEF INSPECTOR, SYDNEY.

(Non-official.)

Melbourne, 2 June, 1875.

MY DEAR SIR,

In reply to your letter of the 20th May, I beg to state that I have gone through a considerable portion of the enclosure with some attention, and find no reason to alter what I have previously stated on this subject. As, however, there is no certainty that ever this matter will come before the Government of Victoria, I have not paid that attention to it which I should have done had I seen that my labours were likely to produce any fruit. With many of the remarks made by Mr. Gordon and Mr. Valentine I also agree; though, however, I have not, for the reason stated, entered fully into the subject, I think it well to make some remarks, which may be of use to you if preparing a Bill on the subject.

I will begin then by stating in a general way, that it seems to me that the measure which you propose is excessive, and that comparatively few clauses would effect all that can be done under the circumstances; and, secondly, I much prefer in these cases regulations to provisions in an Act. It is a fact that the work done in Victoria has been under regulations, and that the Acts themselves (the Scab Acts) were always failures.

As

As regards sections 5 to 28, I must repeat that I consider them bad in principle and in practice. You have stated respecting them that the Government would only be guided in *local* matters by a local Board. Besides that such has not been my experience, I will add, that nothing almost connected with disease can be confined to local results. Disease on the smallest farm in Victoria has, or may have, a bearing on the whole of the stock of New Holland.

Section 30.—I cannot but think that the reason that the system of Directors worked well in New South Wales was that there was but little to be done in that Colony: disease never brought any strain on the system. Divided powers—the delays occasioned by Boards—the impossibility of carrying through any system under such a variety of management and circumstances—the isolated standpoint from which each separate Board takes its view—their *want of responsibility*—are all matters hostile to vigorous, well-ordered, and sustained action. *Boards of advice*, pure and simple, I should consider desirable, and none others. As regards officers, they should, I think, be independent of local influence, and I would prefer them being strangers in their districts at starting. If real work had to be done, I should place little confidence in an Inspector who had been appointed or recommended by the very people he might have to coerce.

Section 33.—I think an Inspector should be allowed to kill stock, to ascertain the presence of disease; but as for producing parts for evidence in Court, I think the less said about it the better. To the Scab Act such a course, for instance, would have been fatal.

40.—*Idem*.

49.—I agree with Mr. Valentine in his remarks on this clause.

I will not, however, trouble you further with details, as I could not agree with the principal features of what you propose.

I want to see an Act which is so elastic that it can be made to suit all cases—an Act which works, therefore, by regulations. I want to see the power provided, one which can be wielded easily and effectually, and Boards existing whose advice can be asked when wanted,—with officers who can be expected to administer the Act without fear or favour.

Your proposal does not seem to provide for such a state of things. From it would result a lengthy, weak law, one which could only be amended by Parliament, no matter how great the emergency, which locally-appointed Inspectors and the intermeddlement of Directors would thoroughly emasculate.

Trusting, my dear Sir, that you will find the freedom of my remarks, which are given straightforwardly and honorably, proper to the question before us, and as the result of my wish for a real good law,—

I beg to remain, &c.,

EDWARD M. CURR.

No. 8.

THE CHIEF INSPECTOR, ADELAIDE, TO THE CHIEF INSPECTOR, SYDNEY.

Inspector of Sheep Office,

Adelaide, 15 June, 1875.

DEAR SIR,

Herewith I return notes and Bill forwarded. I have read them over, and do not think I can say much more or suggest other alterations than I have done. There appears to be very little difference between us. After all, Mr. Curr's objections are not such as to prevent a Bill being drawn in Victoria of a character very similar.

The general provisions of the Bill meet with my approval, excepting the "Coast District" section, which is unsuitable to this Colony. At one time I thought it would work well, but now I am of opinion we are better without it. There are certainly clauses to which I may take exception, but not of sufficient importance to hurt the Bill. Those clauses which are arbitrary are likely to be struck out, yet I do not see how we can have a good serviceable Bill without having clauses which are very objectionable to many.

Regarding the system of Boards, either as in New South Wales or as in Victoria, I do not see that it matters which is adopted, so long as they are *ex officio* Inspectors. I have had no experience in working them; but looking at your outside Boards in places, I have not formed a favourable opinion of the working, but with an assessment I do not think the Bill would pass without allowing stockholders some word in dealing with the money.

As to form of the Bill, I would merely suggest that cattle of all kinds should be kept as distinct as possible from Sheep.

My Commissioner will not look at the Bill until it is in print. Without wishing to hurry you, I would suggest that if you can put the Bill in form on the present notes and print it, it would be of great advantage. Let each have an extra copy and return—one to you with the Bill altered in such way as he intends to recommend to his Government; this will advance the matter. Unless I get a printed copy before my Commissioner, who is the head of the Government, shortly, I shall not get it on the Table of the House this Session.

I am sorry you do not see your way to have clauses dealing with fluke and worms. I still think we ought, and, if possible, shall endeavour to carry my point; by means of regular examinations we may be much better able to deal with them. Gordon will of course wait for the Report of the Commission.

I am, &c.,

C. J. VALENTINE.

No. 9.

THE CHIEF INSPECTOR, HOBART TOWN, TO THE CHIEF INSPECTOR, SYDNEY.

Tasmania.

Inspector of Sheep Office,

21 July, 1875.

SIR,

I am directed by the Chief Inspector (who I am sorry to say is unable to leave his room through illness) to return the "Notes by the several Chief Inspectors of Stock, on the 'Stock Disease Prevention Bill, 1875,'" and also to state that he has no further suggestions to offer at present, though perhaps may do so on further consideration.

I have, &c.,

J. COMPTON PENNY.

No. 10.

No. 10.

THE CHIEF INSPECTOR, BRISBANE, to THE CHIEF INSPECTOR, SYDNEY.

Office of Chief Inspector of Stock,
Brisbane, 23 July, 1875.

SIR,

I have the honor to forward herewith my notes on the sketch Stock Disease Prevention Bill submitted by you. With the principle and arrangement of the measure I now entirely agree, and the few objections I have offered to the details are made more with the hope that they may be seen to improve the Bill than with any intention of pressing their adoption upon you.

I may state that I have not consulted the Minister on the matter, and that my notes are given as the result of my own experience.

It is my intention to commence at once to draft a Bill for this Colony, under the headings and in the order laid down in your sketch, in order that I may be able to compare it with your rdaft Bill when elaborated.

I have, &c.,

P. R. GORDON,
Chief Inspector of Stock.

P.S.—It is to be understood that these notes are substituted for those formerly offered on the sketch. It will also be understood that I fully agree with all the clauses on which I offer no remarks.—
P.R.G.

Returns Nos. 3 and 4.

No. 3.—A Return from Stockowners, showing the effect of inoculation for pleuro-pneumonia in cattle.

No. 4.—Returns from Sheepowners, as to the nature, symptoms, prevention, and cure of worms, fluke, and foot-rot in sheep.

The information ordered by Parts 3 and 4 will require to be obtained from stockowners, and will be furnished as soon as it is procured.

Return No. 5.

INLAND INSPECTORS.

THE REASONS for retaining these officers are the following :—

Sheep Act.

1. There is a certain amount of risk that, although there are Border and Coast Inspectors, sheep infected with scab might be allowed to pass them unobserved, and thus spread the disease throughout the Colony, without its being detected,—if the Inland Inspectors were all removed.

2. There is also still some risk of outbreaks of catarrh occurring.

3. There are many provisions in the Sheep Act relating to the branding and travelling of sheep which require to be carried out, even when there is little or no risk of disease, and which would fail to be so if there were no Inland Inspectors. Owners will never be at the trouble of looking after each other with regard to these matters; and, as a rule, they would much rather pay Inspectors to prosecute than do so themselves. The Directors, again, would neither have the time nor the inclination to see these provisions of the Sheep Act enforced.

Worms and fluke.

Discussion has lately arisen as to whether sheep affected with these ailments should not be prevented from travelling into districts in which they do not naturally exist, as there is no doubt that sheep infected with these parasites carry the infection to sheep which would not otherwise be affected; and it is very probable that some action will ere long require to be taken to prevent this.

Cattle disease prevention.

It is universally admitted that something ought to be done with pleuro-pneumonia. That at any rate cattle actually affected with that disease should not be allowed to travel, and thus sow the infection broadcast as they go. Indeed, some go so far as to propose the compulsory inoculation of all herds infected with pleuro; and there are certainly very strong grounds for advocating that course, as the returns lately received at this Branch show that, taking the owners in all the different districts in the Colony who have inoculated, there are *eighteen* "for," and only *one* "against," inoculation.

If any measure were passed for dealing with this disease, cattle-owners would require to contribute to the payment of the Inspectors' salaries; and if they did, 5s. per thousand, or one-fourth of a farthing per sheep, would then be sufficient as contribution under the Sheep Act.

Brands and Cattle-stealing Prevention Acts.

1. Under the Brands Act the Inspectors assist owners in registering their brands.

2. They see the provisions of the Act in regard to branding, droving, &c., carried out. If they did not, the Brands Act would very soon become a dead letter, and the trouble and expense of registering in a great measure lost.

3. They aid the police in the detection of sheep- and cattle-stealers. This is especially the case in regard to sheep-stealing, which, with the turning out of sheep, is becoming rife in many parts of the Colony, as they examine the stock in the course of their duty as Inspectors, and can take notice of any suspicious brands and marks with which they may meet.

Impounding

Impounding Act.

It has been proposed that Inspectors of Stock should be Inspectors of Pounds, and a Bill giving them supervision of Pounds and Poundkeepers has been in type for the last four or five years.

A Pound now, instead of being a convenience to a district, is often only a nuisance; and this arises almost entirely from the want of supervision—Poundkeepers in many instances doing to a great extent as they like.

Droving roads and reserves.

Inspectors have recently been called upon to report upon these roads and reserves; and these officers are in the best possible position to do this duty, and to protect the interests of the public, so far as travelling stock are concerned.

When the question was put to the different Boards of Directors, in 1872, as to whether the service of the Inland Inspectors could be dispensed with,—twelve answered in the negative, four answered in the affirmative, two sent no reply.

Although there was a considerable majority in favour of retaining the Inspectors, it is probable that it would have been still larger if the Boards had been aware of the proposal to give the Inspectors other work to do, and reduce the sheep contribution.

A.B., 22 April, /75.

DISEASES AFFECTING LIVE STOCK.

No. 1.

THE CHIEF INSPECTOR, SYDNEY, to THE CHIEF INSPECTOR, MELBOURNE.

Sydney, 10 June, 1875.

(Non-official.)

DEAR SIR,

You say that the Bill as sketched is too long, and that you prefer a short measure worked by regulations. As this is the case, I think it would tend very materially to further the object in view if you would make a sketch of such a measure as you think would meet the case, and send or allow me to send copies to each of the other members for their consideration and remarks.

2. As I said, I am not at all wedded to any particular form of a Bill; and if you will frame and forward a short measure such as you describe, containing the necessary provisions for binding the several Colonies to such a course of action as will result in a combined and simultaneous effort to eradicate the infectious diseases now prevailing among our live stock and prevent the introduction of fresh ailments, it will have my most cordial support.

I am, &c.,
ALEX. BRUCE.

No. 2.

THE CHIEF INSPECTOR, MELBOURNE, to THE CHIEF INSPECTOR, SYDNEY.

Melbourne, 2 July, 1875.

Sketch No. 2.

SIR,

I have the honor to reply to your non-official letter of the 10th ultimo, on the subject of a Diseases in Stock Act. Whilst so doing, you will be good enough to remember that I only offer my own private opinion on the subject in question, by which, of course, the Government of this Colony are in no ways bound.

Proceeding then to give you my views on what I think would be a suitable law, I have started with our Diseases in Stock Act of 17th December, 1872, of which I send you a copy, in which you will find certain written alterations and erasures. To this Act I have the honor to make the following additions in short. I have not thought it necessary to go so completely and methodically into the matter as you have done in your sketch, but I hope that I have done enough to put you practically in possession of my views on the subject. I proceed then with my proposed additions to our present Act:—

- 1st. That the Governor in Council may divide the Colony into districts for the purposes of this Act, and may alter and annul such districts.
- 2nd. That the Governor in Council may appoint Boards of advice in each district of not less than five members, whose duty it shall be to advise with the Inspector of the district and report to the Chief Secretary on the subject of disease in the district when necessary. Members of such Boards to be resident in the district, and owners of not less than 100 cattle or 1,000 sheep in a satisfactory state as regards their freedom from disease.
- 3rd. Inspectors to have power to kill animals in performance of their duty of examining for disease. Compensation in this case for the animals killed to be made to the owner.
- 4th. Inspectors of Stock to be empowered to seize and destroy unwholesome meat offered for sale.
- 5th. Here insert substance of section 34 of Mr. Bruce's sketch of Diseases in Stock Bill.
- 6th. In lieu of clause 10 of our Diseases in Stock Act herewith, insert "That the Governor in Council may to prevent the spread or introduction of any disease cause to be destroyed or placed in quarantine in any place which he may deem fit any stock whatsoever."
- 7th. That when any person suffers any loss in respect of any stock not his property so quarantined or destroyed on his land, that such loss should be made good by the Government.
- 8th. That any expense or loss incurred by the Government under the foregoing section shall be made good by the owner of the stock so dealt with.
- 9th. Here insert clause 35 of Mr. Bruce's sketch.
- 10th. In addition to the powers taken under clause 4 of our Diseases in Stock Act, add the following:—
K.—For the purpose of preventing the introduction of disease through the medium of ships arriving in harbour.
L.—For dealing with markets, shows, exhibitions, &c.
- 11th. Stock placed in quarantine to be entirely at the risk and cost of their owner.
- 12th. Here insert sections 47, 48, and 49, of Mr. Bruce's sketch; also sections 67, 68, and 69 of same.
- 13th. That captains of vessels on arriving in harbour furnish Chief Inspector of Stock with the statutory declaration as to health of stock on board and deaths which may have occurred during the voyage.
- 14th. Penalty of not less than £100 on captains of vessels if any stock be landed contrary to regulations in force, such penalty to be no bar to prosecution of the owner of such stock.
- 15th. In all cases minimum and maximum penalties to be stated in the Act or regulations.
- 16th. Mode of procedure by which penalties may be recovered.
- 17th. Insert sections 109, 110, 113, and 114 of Mr. Bruce's sketch; also section 139 of same.

Whilst begging you to accept of my want of leisure as my excuse for not going into this matter in a more systematic manner I hope that what I have written will put you substantially in possession of my views
on

No. 1.

See No. 3.

By regulation.

on the subject. There is one point, however, to which I think it necessary to draw your attention once more, as I frequently did that of the Conference, namely, my strong objection to the policy of allowing stock from Europe to be introduced into these Colonies on any terms whatever. If such a course be persisted in, it is my conviction that in spite of any quarantine which may be devised, we shall end by acclimatizing here all the diseases to which European stock is subject.

I have, &c.,
EDWARD M. CURR,
Chief Inspector of Stock.

No. 3.

VICTORIAN SCAB ACT, ALTERED BY CHIEF INSPECTOR, MELBOURNE.

No. CCCCLI.

An Act for the Prevention of Diseases in Stock. [17th December, 1872.]

BE it enacted by the Queen's Most Excellent Majesty by and with the advice and consent of the Legislative Council and Legislative Assembly of Victoria in this present Parliament assembled and by the authority of the same as follows (that is to say) :—

1. This Act shall be called and may be cited as "*The Diseases in Stock Act 1872.*" Title of Act.
2. Part III of the "*Prevention of Diseases of Animals Statute 1864*" and the "*Prevention of Diseases of Animals Statute 1872,*" No. 418, are hereby repealed. Repeal.
3. In the construction of this Act the following words shall if not inconsistent with the context or subject matter have the meanings hereby respectively assigned to them (that is to say) :— Interpretation.
 - "Inspector of Stock" shall include the Chief Inspector of Stock or person employed under the Act.
 - "Stock" shall include any bull cow ox calf stallion mare gelding foal ass mule ram ewe wether lamb pig goat dog or other animal whatsoever alive or dead.
 - "Drive" shall mean drive conduct or convey whether by land or by water.
 - "Disease" shall mean any contagious or infectious disease to which any animal is subject, which the Governor in Council may from time to time by order declare to be a contagious or infectious disease for the purposes of this Act.
 - "Diseased stock" shall mean all stock proclaimed by the Governor in Council to be diseased as well as all stock suffering from any disease the Governor in Council has proclaimed to be infectious or contagious.
 - Insert the word "owner," as per our Scab Act of 1870 ; altering the word "sheep" into "stock."
 - "Fittings" shall mean any sheep pens, cattle or horse-boxes and any materials used for penning, yarding, or confining stock ; as also any halters, brushes, clothes, buckets or other articles whatever which shall have been brought in contact with any diseased stock.
 - "Fodder" shall mean any food or bedding used or which shall have been brought in contact with any stock.
4. The Governor in Council may from time to time make such regulations under this Act as may be deemed expedient for all or any of the following purposes and may rescind the same :— Governor in Council may make regulations.
 - A. For extending all or any of the sections of this Act to any particular stock or kind of stock.
 - B. For prohibiting the introduction into the Colony, either by sea or land, of any stock.
 - C. For regulating and fixing the conditions upon which certain kinds of stock may be introduced into the Colony.
 - D. For the inspection of newly introduced stock.
 - E. For taking such steps as may be deemed expedient to prevent the spread of any disease which may have obtained a footing in the Colony and to eradicate it.
 - F. For placing any stock in quarantine for such periods, at such places or buildings, and within such limits as may be deemed expedient, and for declaring any such place or building a quarantine district.
 - G. For the purpose of subjecting any stock to such restrictions or veterinary treatment, remedial measures as may be deemed necessary to prevent the introduction and spread of disease.
 - H. For the seizure and destruction of any stock diseased or supposed to be diseased.
 - I. For the purpose of proclaiming any portion of the Colony a quarantine or a clean district.
 - J. For prohibiting or regulating the introduction into the Colony of any fodder or fittings, and for the seizure sale or destruction of any such fodder or fittings landed without the written authority of an Inspector of Stock.
 - K. For the purpose of preventing the introduction of disease through the medium of ships arriving in harbour.
 - L. For dealing with markets, shows, exhibitions, &c.
5. The Governor in Council may from time to time appoint and remove a Chief Inspector of Stock, Inspectors of Stock, and such other officers as may be necessary to carry out the provisions of this Act. Governor in Council to appoint Inspectors and other persons.
6. Inspectors of Stock shall have power to enter at any time into any ship or on any land or into any building for the purpose of inspecting any stock, or enforcing the provisions of this Act or the regulations made in pursuance hereof. Any person who shall obstruct or hinder any Inspector in the performance of his duty shall, on conviction before two Justices of the Peace, forfeit and pay a penalty not exceeding fifty pounds for every such offence. Powers of Inspector, and penalty for hindering and obstructing him.
7. Stock newly introduced either by sea or land shall not travel until it has been inspected by an Inspector appointed for that purpose, and until he has authorized it to travel. The cost of such inspection and of carrying out the several provisions of this Act shall be defrayed by a charge to be imposed of one shilling per head for every head of cattle and horses, sixpence per head for every head of calves and foals, and one penny per head for every head of sheep and pigs so inspected ; and such charge may be recovered in a summary way before any two Justices. Charge on inspection of newly introduced stock.

Driving stock into clean district without written authority of Inspector.

8. Any person who shall allow to stray or shall drive or cause to be driven any stock into a quarantine or clean district without the written authority of an Inspector of Stock shall, on conviction before two Justices of the Peace, forfeit and pay a penalty not exceeding one hundred pounds for every such offence.

Introduction of fodder and fittings into the Colony.

9. Any person who shall introduce into the Colony any fodder or fittings without the written authority of an Inspector of Stock shall, on conviction before two Justices of the Peace, forfeit such fodder and fittings and pay a penalty not exceeding fifty pounds for every such offence.

Expenses connected with diseased stock to be borne by the owner.

10. Whenever the Governor in Council shall have ordered that any stock shall be placed in quarantine or under restrictions for the purposes of this Act, or that remedial measures shall be taken to prevent the introduction or spread of disease, the cost and expense thereby incurred shall in every case be borne by the owner of the stock dealt with, if it shall be proved to the satisfaction of the Governor in Council that such stock are or have been diseased, and such cost and expense may be recovered in a summary manner before any two Justices of the Peace on complaint by an Inspector of Stock.

Driving stock into quarantine districts, and removal from same of fodder, &c.

11. Any person who shall drive or cause to be driven into through or out of any quarantine district, or shall remove from any quarantine district any fodder or fittings, or any soil, sand, or other material upon which any diseased stock, have been kept, or any dairy produce of diseased stock, without the written authority of an Inspector of Stock, shall upon conviction before two Justices of the Peace forfeit and pay a penalty not exceeding fifty pounds for every such offence.

Breach of regulations.

12. Any person who shall be guilty of a breach of any of the regulations made under this Act by the Governor in Council, shall on conviction of the same before two Justices of the Peace forfeit and pay a penalty not exceeding five hundred pounds for every such offence.

Effect of regulations.

13. Any regulation made or to be made under this Act shall have the full force of law until the same shall have been disallowed by resolution of both Houses of Parliament, and thereupon such regulation or any part thereof so disallowed shall cease to have any force or effect in law: Provided also and be it enacted that this Act shall continue in force until repealed.

Duration of Act.

No. 4.

THE CHIEF INSPECTOR, SYDNEY, TO THE CHIEF INSPECTOR, MELBOURNE.

(Non-official.)

Sydney, 15 July, 1875.

DEAR SIR,

See Nos. 2 and 3.

I have considered the sketch of the measure forwarded by you with your letter of the 2nd inst., for carrying into effect the resolutions passed at the Conference of Chief Inspectors of Stock, held at Sydney in November last; and I now beg to offer the following remarks on your paper:—

1. The measure sketched by you would be worked entirely by regulations, and would give the Governor in Council power to make *any regulations*; to do absolutely *anything*, and deal with *any sort of stock*, and any diseases he may consider necessary.

2. Now I do not think that our Legislature could ever be induced, unless perhaps in the case of a very great emergency, and *temporarily* to give the Governor in Council such powers as these, and it is not every Government that would like to have the responsibility imposed upon them of administering such an Act.

3. But supposing for a moment that such a measure as here proposed by you were passed in this and the other Colonies, I think you will on consideration see that, so far as the objects of the Conference are concerned, it would be utterly valueless, for it would in no way bind any of the Colonies to a uniform course of action.

4. To show that this would actually occur, we have only to recollect that under such a measure one Colony might make a regulation compelling the owners of sheep infected with scab to destroy them, while the next only enforced their cleansing, and the third made no regulation whatever, but allowed owners to do what they liked with their infected flocks.

5. Again, under such a law one Colony might compel owners to destroy cattle affected with pleuro-pneumonia, while another might only enforce compulsory inoculation, and a third might take no cognizance whatever of the disease.

6. Or again, one Colony might admit all sorts of stock from places outside Australia and Tasmania, another might admit only certain sorts of stock, and a third might admit stock from only certain Colonies and countries.

7. If then this is the case—and I do not think it can be disputed—the several Colonies would be in no way bound to adopt the same law, with respect to the infectious and contagious diseases existing among our stock; and the very heavy losses these diseases now annually occasion would be certain to continue, while fresh ailments, even of a more malignant character, might perhaps be introduced.

8. With regard to the length of the measure, as first sketched, and the minuteness of its details, I think it will be seen, on reference to the Imperial Contagious Diseases (Animals) Act of 1869, that I have followed, to a large extent at least, a very good precedent in both these respects; and so long as reference can easily and readily be made to any of the provisions of a measure—which it can be in this case through their being arranged in Parts, and under distinct headings—its length is no objection whatever.

9. Besides we have, I think, all had sufficient experience to enable us to judge how far these details are necessary and practicable; and so far as they are so, it is certainly very much better that they should be embodied in Acts of the several Legislatures, than left to be promulgated from time to time, in the shape of regulations, which may be made without due consideration.

10. It is a fact too that regulations are lost sight of by the public, while every one becomes acquainted with the provisions of the Acts of Parliament which in any way affect their calling or property.

I am, &c.,
ALEX. BRUCE.

5

No. 5.

THE CHIEF INSPECTOR, MELBOURNE, TO THE CHIEF INSPECTOR, SYDNEY.

Melbourne, 19 July, 1875.

SIR,

I have the honor to acknowledge your letter of 15th instant.

In replying to it I hope you will agree with me that there can be little use in my going into your objections categorically, when there is no probability of such a step altering my opinion on the subject. After a full consideration of the matter, it is my *unalterable* opinion that no law will ever satisfactorily settle every important particular of an Act such as the one in question, and yet be suitable to half-a-dozen Colonies whose circumstances are so diverse as those of the Australian group.

For many reasons it is clear to me that disease must be dealt with by regulation.

Fleming, the best authority on such subjects, has taken just the same position in this matter which I have and always shall advocate; he objects to the English law on this very score.

When this subject was discussed at the Conference it was admitted a hundred times that some course which was admirably suited to one Colony would not answer in another, from which it resulted that from Queensland, for instance, some benefit was to be withheld, as the step proposed was unsuited (say) to Tasmania; so that the recommendations of the Conference were to *some degree* emasculated, in order that they might be uniform.

My opinion is that it would be wiser were each Colony to take all possible means *at its command* to stay and reduce disease irrespective of others, recognizing at the same time the necessity for each Colony helping the other, and working together as far as practicable.

As regards the advantages of regulations, I will remark that it was tried for ten years to extirpate scab by law from Victoria, and proved a failure. We were then allowed to go to work with regulations, which (as far as is known) succeeded in four years.

I have, &c.,

EDWARD M. CURR.

No. 6.

THE CHIEF INSPECTOR, SYDNEY, TO THE CHIEF INSPECTORS, QUEENSLAND, SOUTH AUSTRALIA, AND TASMANIA.

(Non-official.)

Sydney, 27 July, 1875.

DEAR SIR,

Mr. Curr having stated, in the course of his correspondence with regard to the Bill sketched to carry out the resolutions of the Conference, that he thought a very much shorter measure might be framed, I asked him to favour me with the outlines of the measure he would propose.

2. He has kindly complied with my request; and I now send you herewith a copy of his letter of the 2nd instant, in which he gives the outlines of such a Bill as he thinks would answer the purpose. I also send you a copy of my reply to his letter, and I will be glad to have your opinion upon his proposals and my letter at your earliest convenience, as the present Session of our Parliament will very soon terminate, and I should like that the whole of the correspondence relating to the Conference were laid upon the table of the House and ordered to be printed, before it rises, in order that the Members of the Select Committee which has been appointed to inquire into and report upon the prevention of Diseases in Stock may have an opportunity of considering the resolutions of the Conference and the relative correspondence during the recess.

3. I was in hopes that I would be able to send you with this a copy of the Victorian Stock Disease Prevention Act of 1872, to which Mr. Curr refers in his letter of the 2nd; but the copies of that Act, for which I wrote some time back, have not yet reached me, and I can only send you, as I do with this, a list of the alterations he proposes to make in that measure, and refer you to the copy of it, which I have no doubt you will find in your Parliamentary Library, if you have not one in your own office.

I am, &c.,

ALEX. BRUCE.

TELEGRAM FROM THE CHIEF INSPECTOR, BRISBANE, TO THE CHIEF INSPECTOR, SYDNEY.

30/7/75.

HAVE carefully considered Mr. Curr's proposed measure, I consider it totally unsuited to any of the Colonies. I strongly object to working the Act by means of regulations.

No. 8.

THE CHIEF INSPECTOR, BRISBANE, TO THE CHIEF INSPECTOR, SYDNEY.

(Non-official.)

Office of Chief Inspector of Stock,
Brisbane, 2 August, 1875.

DEAR SIR,

I am in receipt of your letter of 27th July, enclosing Mr. Curr's sketch of Stock Diseases Prevention Bill, and of your memo. of 28th, forwarding copy of Victorian Prevention of Diseases Act, No. CCCCLI, with Mr. Curr's proposed amendments thereon.

Prior to receipt of the latter I had carefully gone over the Act in the Parliamentary Library here, and on the 30th I forwarded you a telegram to the effect that I considered his proposed Bill totally unsuited to the circumstances of any of the Colonies.

I consider that his proposal to work the Act by regulations is altogether a mistake, and I cannot adduce stronger evidence in favour of my opinion than by stating the fact that many persons who have travelled Queensland stock into Victoria have, on their return, complained loudly to me of the impossibility of finding out the law as regards the travelling of stock in that Colony, and that the information on the subject received from constables and Police Magistrates is never to be relied on. More than once overlanders have consulted me as to whether our Government should not suggest to the Victorian Government the propriety of having their Act assimilated to that of New South Wales and Queensland so far as it relates to travelling stock.

I cannot see what serious objection Mr. Curr can have to the mere length of the Bill. All experience goes to prove that unless well elaborated, no Act is workable. Our Insolvency Act of last Session drawn up by the present Attorney General contains nearly 200 clauses.

I return herewith the copy of the Victorian Act.

Yours truly,
P. R. GORDON,
Chief Inspector of Stock.

TELEGRAM FROM THE CHIEF INSPECTOR, SYDNEY, TO THE CHIEF INSPECTORS, ADELAIDE AND HOBART TOWN.

5 August, 1875.

FOR reasons in my message of 19th ultimo, I would be obliged by your telegraphing shortly, on receipt, your opinion on Mr. Curr's sketch.

No. 10.

TELEGRAM FROM THE CHIEF INSPECTOR, ADELAIDE, TO THE CHIEF INSPECTOR, SYDNEY.

5 August, 1875.

IN reply *in re* Mr. Curr's sketch. Leaves too much to regulation. Feel obliged to reject it. The two sketches might be modified by Mr. Curr, and the main principles adopted leaving less to regulations; so that all important matters could be fixed in all Colonies by Bill. By this means his sketch would be brought nearer Conference resolutions as a basis.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

LIVE STOCK.

(REPORT FROM CHIEF INSPECTOR RESPECTING INOCULATION FOR PLEURO-PNEUMONIA.)

Ordered by the Legislative Assembly to be printed, 13 May, 1875.

THE CHIEF INSPECTOR OF STOCK TO THE UNDER SECRETARY FOR LANDS.

MEMO.

I have the honor to submit for your consideration the accompanying tabulated statement, showing the opinions of the owners of cattle in the different districts of the Colony who have replied to the questions addressed to them by circular in the end of last year, as to the efficacy of Inoculation for Pleuro-pneumonia.

From this statement it will be seen that, in the opinion of our stockowners, the previous experience of the beneficial effects of inoculation is fully confirmed, as this statement shows that, of those who have practised inoculation, *there are 18 in favour of that treatment to 1 against it*, and that even of those who have never tried inoculation *there are nearly 4 for, to 1 against it*. By these returns it also appears that, of those owners who have inoculated, 216 have done so *once*, 36 *twice*, 13 *three times*, 4 *four times*, 13 *several times*, and 16 *often*, while 51 owners state that they inoculate their young stock annually when virus can be obtained. It will be noticed that the Inspector for Coonabarabran—one of the two districts in which the largest number of inoculating owners declare against the practice—gives as a reason for so large a percentage of owners being opposed to it, that "they killed their cattle through not understanding the process." The same thing has occurred in many other instances; and this fact, and that of many of the cattle being diseased when they were inoculated, although they showed no symptoms of being so, easily account for the want of success on the part of the few owners who have tried and are still opposed to inoculation.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

GOULBURN CATTLE SALE-YARDS BILL.

(PETITION AGAINST—STOCKOWNERS AND AGENTS.)

Ordered by the Legislative Assembly to be printed, 11 May, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Stockowners, Stock Agents, and others interested in the sale and purchase of live stock,—

SHOWETH:—

That your Petitioners have observed that there is now before your Honorable House a Bill intituled "The Goulburn Municipal Sale-yards Bill."

That your Petitioners are opposed to the said Bill, on the following grounds, viz. :—

1. Because accommodation is provided at the existing sale-yards (erected at considerable cost by private enterprise), not only ample for present wants, but commensurate for probable requirements for years to come.
2. Because the erection of public yards would not only be a direct interference with private enterprise, but be also the means of deteriorating the value of those now in use, and thereby entitle the owners to look for compensation.
3. Because as the City of Goulburn is becoming a central cattle depôt, stock being sent there from the western and surrounding districts in large numbers, any tax, no matter how small, would induce owners to seek other places for the disposal thereof where they would not be subjected to municipal imposts.
4. Because, as your Petitioners believe, the opening of the Railway to Yass and Wagga Wagga will enable buyers from those places and the districts beyond to attend the Goulburn cattle sales; but if the tax which it is proposed by "The Goulburn Municipal Sale-yards Bill" to place on stock be sanctioned by law, and owners take their stock to places where there is no such Act in force, the traffic of the Great Southern Railway and the general revenue of the Colony will be materially interfered with.
5. Because the tax will not only be difficult to collect, but in some cases vexatious, as, for instance, any one living or being within a radius of ten miles and selling a single beast to a neighbour would be compelled to pay the tax, whilst at the same time he would not have occasion to avail himself of the accommodation of the public sale-yards.
6. Because the municipal authorities will not realize from this tax a revenue much in excess of the cost of collection, as the number of cattle sent for sale will be greatly diminished; and it is therefore, as your Petitioners consider, highly impolitic to impose restrictive regulations unless with a fair hope of corresponding advantages.
7. Because your Petitioners are opposed to one class of producers being taxed for the benefit of others, as this Bill imposes a tax upon cattle and sheep owners bringing their stock to market, whilst farmers and others will be allowed to dispose of their produce without taxation and without interference.

Your Petitioners therefore humbly pray that your Honorable House will withhold its sanction from the Bill intituled "The Goulburn Municipal Sale-yards Bill."

And your Petitioners, as in duty bound, will ever pray.

[Here follow 99 signatures.]

GOULBURN CATTLE SALE-YARDS BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred, on 27th April, 1875,—“*the Goulburn Cattle Sale-Yards Bill,*”—beg to report to your Honorable House,—

That they have examined the Witnesses named in the margin* (whose evidence will be found appended hereto); and that the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the several Clauses and Schedule of the Bill, in which it was deemed necessary to make an Amendment.

Your Committee now beg to lay before your Honorable House the Bill, with an Amendment.

WILLIAM TEECE,
Chairman.

No. 3 Committee Room,
Sydney, 27th April, 1875.

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 27 APRIL, 1875.

MEMBERS PRESENT:—

Mr. Teece,
Mr. Farnell,

Mr. Macintosh,
Mr. Booth.

Mr. Teece called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, read by the Clerk.

Printed copies of the Bill referred, and original Petition to introduce the same, before the Committee.

Frederick Horn, Esq., called in and examined.

Witness withdrew.

F. W. Rutter, Esq., called in and examined.

Room cleared.

Preamble considered.

Question,—“That this preamble stand part of the Bill,”—put and passed.

Clauses 1 and 2 read and agreed to.

Clause 3 read, amended,* and agreed to.

Remaining clauses and Schedule read and agreed to.

Chairman to report Bill with an Amendment to the House.

*See Schedule of
Amendment.

SCHEDULE OF AMENDMENT.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

GOULBURN CATTLE SALE-YARDS BILL.

THURSDAY, 29 APRIL, 1875.

Present:—

MR. BOOTH,		MR. MACINTOSH,
MR. FARNELL,		MR. TEECE.

WILLIAM TEECE, Esq., IN THE CHAIR.

Frederick Horn, Esq., called in and examined:—

1. *Chairman.*] You are one of the Aldermen for the city of Goulburn? I am.
2. Were you an Alderman at the time the Goulburn Cattle Sale-Yards Bill was first introduced to Parliament? I was Mayor of Goulburn at that time.
3. How long have you resided in Goulburn? For about seventeen years.
4. Do you know anything about the principles of the Bill upon which this Committee is now sitting? I do.
5. Do you think the Bill is a necessary one? I do.
6. Will you assign your reasons for thinking so? The principal reason is this:—A petition signed by a large number of stockowners and auctioneers of the district was sent in to the Council, asking the Council to take steps for the establishment of cattle sale-yards. It was considered that it would be to the interest of the vendors of stock, as well as to the buyers of stock and consumers of meat, to establish cattle sale-yards.
7. Do you know whether there are any persons opposed to the Bill? I do not know of my own knowledge that there are any persons opposed to the Bill. I have heard it rumoured that there is one person opposed to it. It is only a rumour.
8. Have you heard any grounds assigned for opposition to the Bill? No just grounds.
9. Is the land on which it is proposed to erect the yards suitable for such a purpose? Yes, very suitable. The ground was granted for the purpose by the Government, upon an application made by myself, when I was Mayor some years ago.
10. Have you no authority under the Municipalities Act to erect cattle sale-yards? No; we cannot erect them without a special Act of Parliament.
11. *Mr. Macintosh.*] By the third clause of the Bill, I see the Council wish to have this power: "So soon as sale-yards shall be established and by-laws shall be made as hereinafter provided it shall be lawful for the said Council to take and demand from the owner of every head of cattle brought to any sale-yards established under this Act or yarded or brought to any sale-yard or premises within the Borough of Goulburn or within ten miles thereof whether the same be intended for sale by public auction or private contract and whether the same be intended for slaughter or otherwise the fees or charges mentioned in the said by-laws";—do you not think it arbitrary that by-laws should extend so many miles beyond Goulburn? I think that some limit should be fixed outside the boundaries of the city of Goulburn, for this reason: the boundaries of the city are very small, and if the yards were erected within those boundaries the money would be thrown away. The whole of the auctioneers at present rent the premises they use—they do not use their own freeholds; and the chances are that if the Municipal Council erect cattle sale-yards within the city boundaries, the auctioneers may go just outside the boundaries and erect sale-yards of their own.
12. What expense do you propose to incur in the erection of the yards? We think the yards will cost nearly a thousand pounds.

F. Horn, Esq.
29 April, 1875.

- F. Horn, Esq. 13. And you believe that it would be to the benefit of the district generally for the Municipal Council to erect cattle sale-yards? We have every reason to believe that it would be a very great benefit.
- 29 April, 1875. 14. Would the Council have any objection to the Bill if that portion of the clause to which I have referred was struck out—that is, if they simply had power to collect dues within the municipal area? If that portion of the Bill was struck out, I do not think it would be of any service to us, for the reasons I have already assigned.
15. Would not a radius of five miles be sufficient? It might, perhaps. The reason that ten miles was named is that there are very few people within a radius of ten miles who would be likely to hold private sales. The land is principally in the hands of large landowners.
16. Your Council would not attempt to erect yards unless they had power to collect dues outside the municipal area? No.
17. Does it not appear to you arbitrary to go so far outside to collect dues? I think ten miles was named merely for the purpose of describing some distance outside the municipal area. I think the Council would be satisfied with a 5-mile radius. I will give you an instance, to show what might take place: A nuisance was caused at a slaughtering establishment just inside the boundaries of the municipality; the gentlemen whose property adjoined the slaughtering establishment lodged a complaint against the butcher, and the butcher was ordered to remove. The butcher only removed about fifty yards; he opened another establishment just outside the boundary, and immediately opposite the entrance gate of the grounds belonging to the gentleman who had complained.
18. Has your Council had this question of distance under their consideration—have they determined not to work the Bill unless they get power to collect dues outside the municipal area? I do not think the Bill would be of any use to us, unless we had power to collect fees some distance beyond the municipal area.
19. Do you speak now for your Council? Yes, I do. I speak the opinion that has been expressed generally by the whole of the Council.
20. *Mr. Parnell.*] Have the necessary notices been given in the Government Gazette and local newspapers? Yes. There is one very strong reason why we should have some such power as this Bill would confer upon us. At the end of the year our endowment from the Government will cease. We laboured under great disadvantage in consequence of some informality that took place when the Municipal Council was first formed; through that informality we were deprived of Government endowment for two or three years. We were not able to collect the rates. We are now nearly £3,000 in debt; at the end of the year the Government endowment will cease, and we shall not have sufficient means to maintain the municipality unless we have some other sources of revenue.
21. *Mr. Macintosh.*] Have you a schedule of the rates you propose to charge when the sale-yards are established? I think it was threepence a head for cattle and a farthing a head for sheep. I should suppose that was a matter of detail which would have to be determined afterwards.
22. *Mr. Parnell.*] With what funds do you propose to erect these sale-yards? We have a sum of money set apart for it; it has been set apart for the last year, and we have made provision on the estimates this year.
23. I understood from your reply to a question put by Mr. Macintosh, that you wish this Bill to extend ten miles beyond the municipal boundaries in order to prevent competition—is that so? It is so.
24. Do you not think if you were to put up sale-yards on the allotment of land described in the schedule to this Bill, with sufficient accommodation, that that would not be sufficient in itself to prevent other people putting up sale-yards? I do not think it would.
25. Are you aware that they have large cattle sale-yards in the city of Melbourne? Yes.
26. And that their power does not extend further than the city of Melbourne? Yes, but the population of Melbourne is very different to that of Goulburn.
27. The population does not affect the sale of cattle coming from the interior? Most of the cattle sold in Melbourne are, I presume, sold for killing purposes; but Goulburn is a kind of depôt, where country people derive all the advantages of citizenship without paying anything towards the municipality.
28. If you were to afford sufficient accommodation, is it not likely that people would prefer to send cattle to your yards than to any other yards? I do not think so. There are three auctioneers in Goulburn, all of whom have their own places of business. There would be a little jealousy created in all probability by their having to give up their own places of business and coming to the sale-yards.
29. Where do they sell now? In their own yards.
30. Do not their yards afford sufficient accommodation? Two of the auctioneers have petitioned the Council to erect central sale-yards. The yards at present used are all rented. None of the auctioneers are selling on their own freehold property; in fact one of the yards is upon the estate of the late Mr. Bradley, which is now being subdivided and sold. It may be sold for villa sites.
31. You say that money has been set apart for the erection of these yards—do you mean that it has been voted by the Council? Yes.
32. And that you have it in hand? Yes.
33. Has it been borrowed? No, not that money; we did borrow £5,000 to make improvements.
34. Are you aware that an Act has been passed, called “An Act to authorize the erection and maintenance of Cattle Sale-yards at Bathurst”? Yes.
35. And are you aware that that Act only gives the Municipal Council jurisdiction within the borough of Bathurst? Yes.
36. Are you aware whether that Act is working well or not? I have not heard. The petition that was sent in to the Goulburn Municipal Council was signed by stockowners within a radius of 10 miles of Goulburn. At a meeting of stockowners held at the Court House, one of the largest stockowners, in my presence, said he should like to see the power of the Council extended to 20 miles beyond the city boundaries. It is principally on account of those gentlemen who lived within a radius of 10 miles, and the auctioneers, that the Council has taken action—and with the view also of supplementing the revenue of the Council.
37. *Mr. Macintosh.*] Do you know the area of the borough of Goulburn? I do not recollect it; we have 65 miles of streets.
38. Are there any cattle sale-yards or places where cattle are sold by auction at stated periods outside the municipal boundaries? Yes.
39. What part? About 14 miles away.

40. *Mr. Booth.*] The present sale-yards are within the boundary of the municipality? Yes.
41. Whereabouts is the land on which you propose to erect sale-yards situated—at the extreme end of Goulburn? Yes, on the Yass Road.
42. If you erect cattle sale-yards, would cattle going to them have to pay tolls? No, we have no tolls.
43. There is a toll-bar near the city, is there not? That is a Government toll. We have no tolls.
44. Then I gather that you do not propose to interfere with the toll-bar, but merely wish to erect sale-yards for the convenience of stockowners and buyers, and as a means of obtaining revenue to keep your streets in order? Yes, that is it.
45. Would cattle also have to pay the toll? Not to the Council. They would have to pay coming along the Government road.
46. Are you aware in what part of the city of Melbourne the cattle sale-yards are situated? I do not know.
47. *Mr. Macintosh.*] Suppose the sale-yards in Melbourne are 4 miles outside the municipal area of the city—that would be equal in extent to the area within which you wish to collect rates? Yes, we should be satisfied with that.
48. *Mr. Booth.*] If you do not erect sale-yards, what will become of the 9 acres 1 rood which the Government has given you? I presume the Government will resume it if we do not use it for the purposes for which it was dedicated.
49. The reason you have not used the 9 acres 1 rood of land granted you by the Government is that you consider that, unless you get an Act, as soon as you put up sale-yards, some one else will erect yards a short distance from the city boundary, and charge no fees, and thus deprive the municipality of a revenue? Yes.
50. That is one of the reasons for your not having established sale-yards? Yes. I may state that one of the principal auctioneers who petitioned the Municipal Council to erect sale-yards is renting yards on the estate of the late Mr. Bradley, which I believe is to be cut up and sold. The chances are that he or some others, if they thought they could drive a better business, would use this as an argument to the vendors.—“If you send your cattle to me I shall only charge you so much for selling, but if you send them inside the town you will have to pay the commission and also fees to the Municipality.” The Council could not exact a toll unless their powers extended beyond the municipality.
51. Do you know of your own knowledge, or by hearsay, that the Melbourne cattle sale-yards have benefited the stockowners by gathering them all at a central place at one particular time? I have heard it from a great number of people, that they believe it is greatly to the interest of the stockowners to have their stock sold at one yard and on particular days. I may state, from my own knowledge, that the auctioneers in Goulburn frequently have sales on the same day, and perhaps within an hour of each other. The buyers are therefore divided, and the owners of stock do not get so much for their stock as they would do if the buyers could all be brought together at one time.
52. *Mr. Macintosh.*] But any number of auctioneers may use the yards you propose to erect? Any auctioneer may use them without charge. The charge would not be made to the auctioneer, but only to the vendors. Vendors would have to pay a sum of money for the privilege of having their cattle sold in the yard, and also for the accommodation.
53. And several auctioneers might use the yards on the same day? Yes; the yards will be sufficiently large to allow the whole of the auctioneers to do their business there.
54. And you believe that the regulations and by-laws that would be framed by the Council would control the auctioneers, and enable trade to be conducted in a more systematic manner, and for the greater benefit of the stockowners and public? I do.
55. With regard to the thousand pounds which the Council has set apart for these yards, is it a part of the £5,000 which the Council has borrowed? Yes.
56. So that you have still to pay interest on it? Yes.
57. And, if you were to erect yards, you would have no means of ensuring your getting compensation for the outlay unless this Bill is passed? No, we should not.
58. Is the site upon which you propose to erect the yards a convenient one? Yes, very.
59. Both for the vendors and consumers? Yes.
60. *Mr. Booth.*] I presume you would fence in the whole of the 9 acres? Oh yes.
61. Is there water on the land? There is a creek running close by. We have land on the opposite side, granted by the Government in lieu of some that was promised but which was sold; I know the creek runs through that.
62. You mentioned a petition that was sent in to the Municipal Council by the stockowners, asking them to erect the yards—is that put in as evidence? No.
63. Has your Council any objection to send it here? None whatever.
64. *Mr. Macintosh.*] No petition has been sent in to the Council against the erection of the yards? No.

Frederick William Rutter, Esq., called in and examined:—

65. *Chairman.*] You are a draftsman in the Surveyor General's Office, I believe? Yes.
66. Do you know whether any land has been dedicated to the Municipal Council of Goulburn as a site for cattle sale-yards? Yes, land has been granted for that purpose.
67. What quantity of land? 9 acres 1 rood and 2 perches.
68. Has the dedication of the land been gazetted? Yes.
69. When was it gazetted? On the 15th of August, 1871.
70. Do you know whether any persons have been appointed trustees of the land? The Borough Council of Goulburn have been appointed trustees; notice of their appointment was published in the Government Gazette on the 24th November, 1871.
71. Will you read the Schedule attached to the Bill, and say whether the description of the land there given is correct? Yes, the description is correct. The land shown upon the plan extends to Bourke-street, and it might be necessary to reserve that. I think that has been lost sight of.
72. Have you got Mr. Twynam's letter with you? Yes.
73. What alteration of the description would you suggest? The addition of the words “with the resumption of so much of Bourke-street as is included within this description.” Mr. Broughton, the owner of the adjoining ground, might object, as it disturbs access to his property.
74. *Mr. Farnell.*] Then this street that subdivides the land is a right-of-way? Yes.

F. Horn, Esq.
29 April, 1875.

F. W. Rutter,
Esq.
29 April, 1875.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

REGISTRATION OF BRANDS ACT.

(RECEIPTS AND DISBURSEMENTS UNDER.)

Ordered by the Legislative Assembly to be printed, 8 July, 1875.

RETURN to an *Order* made by the Honorable the Legislative Assembly, dated 8th April, 1875, That there be laid upon the Table of this House,—

- “ (1.) A Return showing the amount annually received since the passing
“ of the ‘ Registration of Brands Act of 1866 ’ up to present date.
- “ (2.) A detailed annual statement of the disbursements that have taken
“ place under the said Act.
- “ (3.) The present amount to credit of Registration Brands Account.
- “ (4.) The like information under ‘ Diseases in Sheep Act of 1866,’ showing
“ the present amount to the credit of Sheep Account.”

(Mr. T. G. Dangar.)

REGISTRATION OF BRANDS ACT.

No. 1.

RETURN showing the amount annually received since the passing of the "Registration of Brands Act of 1866," up to the 31st December, 1874:—

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

UNHEALTHINESS OF SYDNEY HARBOUR.

(REPORTS FROM COMMODORE GOODENOUGH AND CAPTAIN NARES.)

Ordered by the Legislative Assembly to be printed, 9 August, 1875.

No. 1.

COMMODORE GOODENOUGH to GOVERNOR SIR HERCULES ROBINSON.

Her Majesty's ship "Pearl,"
Sydney, 13 April, 1875.

SIR,

I have the honor to ask your Excellency's attention to the large number of cases of enteric fever which have recently appeared in two ships of this squadron during, or immediately after, their remaining at anchor in Farm Cove, Sydney.

2. I have been for some time in doubt as to whether the probabilities were in favour of the disease having been contracted on shore when men were on leave, or on board and at the anchorage, the early cases seeming to show that the men might well have contracted it on shore, as they were traced to have slept in low and poisonous parts of the town, while the officers, who almost invariably slept on board their ships, were not attacked.

3. But as this fever has now attacked a man of the "Pearl," who has not yet put his foot on shore at Sydney since the arrival of that ship from Adelaide on the 22nd February, it seems that there can be no doubt that in some cases the fever has been contracted on board the ship, and I have no doubt that in such cases it is due to the very foul state of the harbour in Sydney Cove and Farm Cove.

4. There can be no question that this condition of those anchorages is due to the fact, that the drainage of a great part of Sydney is delivered into the harbour all around the head of Sydney Cove, where the water is always in a black and stinking state; and also off the end of Fort Macquarie, where a strong smell is nearly always apparent by day and constantly by night.

5. It seems highly probable that the unhealthy parts of the town where seamen sleep, have also contributed to produce these fevers, which, beyond the shadow of a doubt, have had their origin in Sydney.

6. The cases of fever which have appeared in the ships whose crews have been attacked are as follows:—

H.M.S. "Pearl," arrived at Sydney, 25 October, 1874. Left Sydney for South Australia, 15 January, 1875. Returned to Sydney, 22nd February, 1875:—

Cases of Fever.

Date of appearance.	Result.
26 January 1 case... ..	Invalided.
27 " 1 "	Died 14 February.
3 February 1 "	Died 11 February.
4 April 1 "	Sent to hospital.

H.M.S. "Barracouta," arrived at Sydney from Brisbane, 9 February, 1875. Left Sydney for Hobart Town, 13 March, 1875. Returned to Sydney, 10 April, 1875 :—

<i>Cases of Fever.</i>					
Date of appearance.					Result.
25 February	1 case...	...	} Sent to Sydney Infirmary, where one patient died.
8 March	1 "	
31 "	1 "	
29 March	2 cases	...	} Cases all on board "Barracouta" in Quarantine, at Sydney.
30 "	1 case...	...	
2 April	1 "	
1 "	1 "	
4 "	1 "	
5 "	1 "	
6 "	3 cases	...	
7 "	1 case...	...	
8 "	6 cases	...	
9 "	3 "	...	
9 "	1 case...	...	
10 "	1 "	

Two additional cases, which appeared during "Barracouta's" passage to Hobart Town, were left in hospital at the latter place.

I have, &c.,
J. G. GOODENOUGH,
Captain and Commodore, 2nd class, Commanding Australian Station.

No. 2.

R. HALL, Esq., to THE UNDER SECRETARY OF STATE FOR THE COLONIES.

Admiralty, 18 January, 1875.

SIR,

I am commanded by my Lords Commissioners of the Admiralty to transmit, for the information of the Secretary of State for the Colonies, extracts from a report dated 19th November last from Captain Nares, of H.M.S. "Challenger," in regard to the sanitary condition of Sydney Harbour, New South Wales, with reference to the contemplated Commissariat Store and Military Hospital at that place.

I am, &c.,
ROBERT HALL.

[Enclosure in No. 2.]

EXTRACT from letter of hydrographic proceedings of H.M.S. "Challenger," dated from Hongkong, 19 November, 1874—Captain G. E. Nares.

I FOUND the anchorage in Farm Cove to be far less healthy than it was during my last visit in 1867, and I attribute the number of cases of sickness which occurred amongst the ship's company on our first arrival there in the "Challenger" to the effluvia arising from the drain which is constantly discharging its contents in the Harbour at Fort Macquarie. I believe it is contemplated to build a new Commissariat Store on Garden Island and to establish a hospital there; if so, I should wish to warn the authorities against choosing that site. It is astonishing how quickly the floor of the anchorage in the neighbourhood of Farm Cove is being covered with the refuse and filth of the town, carried off by the drain and spread over the anchorage by the ebb tide.

The moorings in Farm Cove have already had to be moved in consequence of the unhealthiness of the previous position, and even at the moorings off Lady Macquarie's Point the smell is frequently offensive. Considering the ever advancing bank of filth and the compound rate of increase in the amount of the discharge of the drain in consequence of the increase of the population, it is certain before another twenty years have elapsed, unless the drain is diverted, the whole anchorage, extending from Fort Macquarie to Garden Island, will be in an unhealthy state, and that the island itself, however conveniently situated, will not be a healthy building site. On the other hand, considering that the whole drainage of the city is well known to be in the most shameful state, requiring only an epidemic to awake the authorities up to a better scheme, and that the Governor's family living at Government House already feel the effects of the present arrangement nearly as much as the navy do, it is most probable that before the time I have mentioned has elapsed, the drainage will be diverted from its present outfall, in which case no better or more convenient site could be chosen than Garden Island.

1875.

NEW SOUTH WALES.

HARBOUR OF REFUGE AT TRIAL BAY.

(REPORT RESPECTING EMPLOYMENT OF PRISON LABOUR IN FORMING.)

Presented to Parliament by Command.

THE COMPTROLLER GENERAL OF PRISONS AND THE ENGINEER-IN-CHIEF FOR HARBOURS AND RIVERS to
THE COLONIAL SECRETARY.

Department of Prisons, New South Wales,
Comptroller General's Office,
Sydney, 14 April, 1875.

SIR,

In pursuance of instructions, we do ourselves the honor to report upon the project of forming a Harbour of Refuge at Trial Bay by means of prison labour. The work having already been determined upon by Parliament and by the Government, it appears to be only necessary for us to submit the views as to carrying it out at which we have arrived after a careful consideration of the subject, and chiefly from a prisons administrative point of view.

The project affords the first condition needed for the establishment of a Public Works Prison, as shown by Mr. Maclean's Report of the 4th of August, 1870, upon the Prisons of the United Kingdom. The formation of the harbour will afford continuous work for a period beyond fifteen years, and so warrant the erection of a prison according to the model of the English Public Works Prisons, providing the means of properly carrying out prison discipline.

The advantages of establishing such a Public Works Prison are numerous. There will be provided, without difficulty, abundant remunerative employment for the longer sentenced criminals of the Colony, together with the means of working them in the open air, and thus the treatment of that class of offenders would be brought into accordance with the modernly accepted ideas and the practice of other Countries.

The character of the employment will be, not the mere casting of stone into the sea, as the work will be effected by mechanical means, and the least skilled form of instruction to be imparted will be quarrying,—an occupation that commands at all times in this Colony a high rate of wages; consequently the very important desideratum will be gained of the prisoners being ultimately discharged with a knowledge in handicrafts enabling them to obtain an honest livelihood.

Furthermore, there will be afforded the means of amelioration of the punishment of long sentences, in a mode midway between tickets-of-leave (to which there are serious objections in the conditions of semi-liberation in the Colony) and final release, by granting licenses for employment upon the works at gradually increasing rates of remuneration, the men having licenses to be hutted outside the prison.

Such a plan would enable men to be discharged, not only with training to earn a living acquired under a system inculcating self-control, but with means to start advantageously in their future life. This plan in some degree assimilates to the purposes of the well known intermediate prison of Lusk, in Ireland, and is a large extension of the ideas upon which that prison was founded. It was verbally suggested by Mr. Maclean to Sir Walter Crofton, who warmly commended its adoption.

While advocating the project, we are not insensible to some disadvantages to which it is right that the attention of the Government should be directed. Experience has condemned the formation of important penal establishments at distances remote from the seat of government and central authority. This objection is in part met by telegraphic and steam communication. The question of expense of management comes also into account. In a locality so isolated from extraneous assistance as Trial Bay, the staff must be upon a scale competent within its own resources to maintain a complete control over the prisoners. All the officers must be lodged and provisioned, and where in the neighbourhood of Sydney the duties of Surgeon, Chaplain, and other officials could be performed by visiting officers, resident and fully salaried officers must be provided. Nevertheless, as there does not appear to be any other public work having the condition of permanency warranting the erection of a proper prison upon which prisoners could be employed, we think that the disadvantages must be accepted as being out-balanced by the advantages.

An important consideration presents itself, as to the extent of prison labour that would be available. By data recently obtained, the number of prisoners under sentences to hard labour upon the roads or other public works was..... 235

Exempt from first class labour by reason of illness or other causes 52

Not available by reason of being in first stage of probationary separate treatment in Berrima Gaol—an essential part of prison administration 30

82

Leaving the number available 153

At the commencement of the undertaking, there is estimated to be of these 153 some thirty-six who have not two years of their sentences to complete, and whose removal to Trial Bay would not therefore be attended with any advantage. This would leave the number practically available at 117.

In that view, the plan for the prison which has been separately reported upon provides in the first instance for 128 prisoners.

In the contemplated criminal legislation it is anticipated that all sentences beyond two years will be to "penal servitude," as in England. This would furnish an additional 120 prisoners, according to existing circumstances, for the works. Provision for the 128 having been made by free labour, we have acted upon the idea that these prisoners could themselves erect the necessary extension for the others to follow, and this could be done simultaneously with the harbour works, and by degrees.

The founding of a Public Works Prison, capable of containing the number of prisoners indicated above, would bring about a most important result affecting the general prison administration of the Colony. With the present means of accommodation in Darlinghurst, and extensions in progress at Parramatta Gaol, these establishments, assisted by the Gaols at Maitland, Bathurst, and Goulburn, would be capable of accommodating in separate cells, all the prisoners under sentences up to two years whose periods of service would warrant their removal from the lesser country gaols. Thus would be introduced the system of separation, now in operation in England, superseding the difficulties of classification, and breaking up the associations of prison life, so conducive to the propagation of crime, and bearing with it effects of good, not readily to be understood by those who have not given the subject a careful study.

It may be in place here to mention that the first cost of the prison for 128 men is estimated at £28,000. Of this, only £14,600 is the amount estimated for the actual accommodation of the prisoners. The difference in cost of such a prison as compared with one providing only for large dormitories within a stockade, and which at all times has been productive of such mischief, is £6,500, an amount that, having in view the advantages to be gained, must be regarded as comparatively immaterial. The plan has been prepared with a most careful attention to economy, all the buildings, other than for the security of custody, being proposed to be constructed of timber, which indeed, with iron sheeting, we were prepared to adopt for the cells, had there appeared to have been any material economy in so doing.

We have, &c.,

HAROLD MACLEAN.
E. O. MORIARTY.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ENCROACHMENT OF THE MURRUMBIDGEE AT WAGGA WAGGA.
(PETITION—MAYOR, ALDERMEN, AND OTHERS.)

Ordered by the Legislative Assembly to be printed, 10 May, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the Mayor and Aldermen of the Borough of Wagga Wagga, and the Inhabitants of the Town and District,—

RESPECTFULLY SHOWETH:—

That a piece of land, the property of the Government, and known as the Wharf Reserve, is situate in the most central portion of the South Ward of the Borough of Wagga Wagga, immediately upon the bank of the Murrumbidgee, and bounded thereby northerly.

That owing to the natural curvature of the channel, the stream at all times, but especially when its volume is increased by rains, strikes with considerable force against the perpendicular face of the Reserve in question.

That the recoil of the water at this point produces a powerful eddy, which by its continuous action upon the peculiarly friable deposits of which the Reserve is composed, is rapidly and certainly eating its way into the centre of the town.

That this destructive process has been going on steadily for years, and the inhabitants, fully and keenly alive to the danger threatening them, have made repeated and earnest applications to the Government for assistance to check the ruinous advance of the river, but without any practical result.

That, by the engulfment of the bank, the encroachment of the stream has at length assumed such proportions as reasonably to alarm the owners of valuable properties in the immediate neighbourhood, and excite an intense anxiety in the minds of the inhabitants generally, in view of the evident result. It is clear to your Petitioners that if the advance of the river be not stayed, the total destruction of the western portion of the town is merely a question of time, but one which must be determined finally in a very few years.

That your Petitioners are utterly unable to raise the means required for securing the bank, and thereby checking the danger which imminently threatens them.

That your Petitioners believe their case to be a peculiar and exceptional one, which should command the immediate attention and aid of the Government, one which in effect should long since have met with the consideration it merited at the hands of the authorities.

In support of this view your Petitioners desire to point out that every inch of land in the vicinity of the Reserve in question has long since been purchased and is very highly improved.

That the Reserve being Crown Land, your Petitioners conceive it to be most unjust that the Executive should allow the interests of the inhabitants to be threatened with destruction by the inroad of the river through Government land, without an effort to arrest the advancing mischief.

In view of the indifference with which all applications have hitherto been treated by previous Governments, your Petitioners humbly and earnestly pray the intervention of your Honorable House in this very pressing and emergent case, and that you will suggest and recommend such measures for the immediate and practical relief of your Petitioners as to your Honorable House shall appear necessary and equitable.

And your Petitioners, as in duty bound, will ever pray.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

STEAM-TUG, RICHMOND RIVER.

(PETITION—RESIDENTS OF RICHMOND RIVER.)

Ordered by the Legislative Assembly to be printed, 8 April, 1875.

To the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Delegates of the Richmond and Tweed Rivers League, appointed by authority conferred at Public Meeting,—

HUMBLY SHOWETH:—

That your Petitioners beg to draw your attention to the acknowledgment by your Honorable House of a steam-tug being urgently required to be stationed at Ballina, Richmond River, by the fact of the sum of £5,000 having been voted for the building of such a vessel as it was supposed would be suitable for the purpose.

That, as your Petitioners believe, independent of other reasons, it was owing to the smallness of the sum voted no one was willing to tender for the work, and that, therefore, the late Ministry promised a further sum of £4,000 should be placed on the Estimates for the purpose of supplementing the former grant, which promise, however, unfortunately, could not be kept in consequence of the sudden dissolution of Parliament.

That in appeals made from time to time to your Honorable House, praying that some improvement might be effected at the bar at the entrance of the Richmond, long lists of losses of vessels and of casualties to others were fully set forth, and that even since the promise of a tug-boat was made by the late Ministry two valuable vessels have been lost on the bar, and two damaged; which, as well as many of the former losses, could not have occurred had a tug been granted years ago, when prayed for.

That a powerful tug, "The Challenge," built of timber in Victoria, and now stationed at Moreton Bay, was employed by a Company for a time at Ballina, and, from experience of her serviceable qualities during her stay there, your Petitioners are of opinion that a similar vessel would better meet the requirements of the port, be more suitable for a bar, and be less expensive to maintain than an iron vessel, for the construction of which plans and specifications were drawn up and tenders invited.

That, therefore, your Petitioners humbly pray your Honorable House to take these promises into your favourable consideration, and direct such steps to be taken as to your Honorable House may seem expedient, in order that the port of Ballina shall be supplied, with as little delay as possible, with a powerful steam-tug suitable in every way for a shifting bar harbour.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 7 signatures.]

NEW SOUTH WALES.

NANUKU PASSAGE, FIJI GROUP.

(PLAN OF, AND REPORT ON ISLANDS IN.)

Presented to Parliament by Command.

COMMODORE GOODENOUGH to HIS EXCELLENCY THE GOVERNOR.

Her Majesty's Ship "Pearl,"
Sydney, 31 December, 1874.

SIR,

I have the honor to forward, for your Excellency's information, copy of a plan* of the Nanuku passage, the N.E. entrance to the Fiji Group, together with some remarks on it and the adjacent islands, which have been made by Lieutenant Rendell, commanding Her Majesty's schooner "Beagle," who has been engaged in surveying that portion of the group.

I have, &c.,

JAMES G. GOODENOUGH,
Captain and Commodore (2nd class),
Commanding Australian Station.

REMARKS ON THE ISLANDS IN NANUKU PASSAGE.

Taviuni.—There is anchorage off Vuna Point in 10 fathoms, sandy bottom, with Hamilton's store, a prominent zinc building on the beach, in line with a small house on the hill behind, about E.S.E., and close into the beach a long reef extends $1\frac{1}{2}$ mile in a westerly direction from the S.W. Point, which always breaks. The South Point of Taviuni is laid down nearly 2 miles too far south on the present chart. It is steep-to, and may be approached within 2 cables. The east coast is precipitous and steep-to (except a small reef off the S.E. part, where Salia Levu is situated) for 13 miles, the coast trending N.E. $\frac{1}{2}$ N., where it forms a point with a reef running off it about $\frac{1}{2}$ of a mile, and then runs back into a deep bay with a fringing reef. Abreast of Qamea there is a small promontory, with good anchorage to the northward of it in Vuri-Vuri Bay, 15 fathoms, level sandy bottom. This bay is well protected from nearly all winds, and there is a good fresh-water stream discharging itself into the S.W. part of the bay. There are one or two outlying reefs in the Straits off this promontory, but they are easily distinguished on a clear day. There is a long reef running off from the Point to the northward of Vuri-Vuri Bay, which reduces the width of Tasman's Straits to less than a mile. The tidal streams are very strong here—the ebb to the northward and the flood to the southward—and it is dangerous for sailing-vessels to attempt to pass the Straits, unless with a commanding breeze.

Vuna Point is in lat. $16^{\circ} 42' 10''$ S., and long. $179^{\circ} 51' 30''$ E.

Qamea is a well-wooded island indented with deep bays, and divided from Laucala by a narrow strait, impassable except by boats. The two islands are nearly surrounded by a reef, from a mile to a mile and a half from the shore. There is good anchorage in nearly all parts inside this reef to the southward of the islands. It can only be entered from the westward where it is open, and where there are two detached patches which form entrances. The N. and N.E. parts of these islands were not examined.

Thane Reef is about $\frac{1}{2}$ a mile in diameter, and is situated $6\frac{1}{2}$ miles from Laucala, with south point of that island bearing S.W. by W. It breaks heavily.

Nanuku consists of the small coral islets about $\frac{1}{2}$ of a mile apart, lying N. by E. $\frac{1}{2}$ E. and S. by W. $\frac{1}{2}$ W. from each other. They are situated about $\frac{3}{4}$ of a mile from the end of a long reef which runs away from the N.N.E. 3 miles, then trending N.E. for 6 miles, it turns off abruptly W.N.W. Numerous detached patches were seen to the westward of the reef, reaching as far as could be seen from the mast-head, but they were not examined. No anchorage could be obtained in the neighbourhood of these islands, the reef being steep-to on both sides. The south islet is in lat. $16^{\circ} 42' 30''$ S., long. $179^{\circ} 29'$ E.

Nuku-Basaga—consists of two small islets lying N.E. by E. and S.W. by W. $\frac{1}{4}$ a mile apart; they are situated at the edges of a coral reef extending $1\frac{1}{2}$ mile N.E. by N. and S.W. by S., and 1 mile N.W. by N. and S.E. by E. There is an entrance on the west side for small vessels, but it is full of coral patches and not recommended. H.M.S. "Beagle" anchored on the north side of the reef in 10 fathoms coral bottom, but it is a very unsafe anchorage on account of the heavy swell caused by the strong tides which run round these islands. There are detached patches stretching towards Nuku-manu, which island appeared to be laid down about 3 miles too far to the northward. The large island is in lat. $16^{\circ} 34' 45''$ S., and long. $179^{\circ} 16' 45''$ W. By true bearings taken from Taviuni and Nuku-Basaga, Budd Island would appear to be placed 5 miles to the northward of its position.

Nuku Levu or Qele Levu, called also Miku Balavu, is the largest island in this part of the group. It is in lat. $16^{\circ} 9'$ S., long. $179^{\circ} 10' 30''$ W. It is of coral formation, principally coral rock, rising in some places to the height of 30 feet. It is about 3 miles in circumference, and there are several small islets and rocks off its western end. It is steep to on the east side, and is situated at the N.E. point of a long coral lagoon running east and west, which is 12 miles long by 5 miles wide in its broadest part. There are several entrances at its western end, the best one being about 8 miles W.S.W. of the larger island. The lagoon is perfectly clear of dangers, and good anchorage may be obtained in any part of it in from 12 to 13 fathoms. The island is covered with cocoa-nut trees, but no fresh water was found in it.

Korotuna is in lat. $16^{\circ} 4'$ S. and long. $179^{\circ} 26'$ W.; it is about $\frac{3}{4}$ of a mile long, N.E. and S.W., and is surrounded by a fringing reef, extending not more than $\frac{1}{2}$ of a mile from it.

Wailagilala consists of two small coral islets in lat. $16^{\circ} 45'$ S., long. $179^{\circ} 8'$ W. The islands are joined by a sand-spit, and are situated at the N.E. part of a coral lagoon extending 3' N. by W. and S. by E., by $1\frac{1}{4}'$ W. by S. and E. by N. and having an entrance on the western side. There is good anchorage in the lagoon in 15 to 18 fathoms (sand and coral), and it appears to be free from dangers. The entrance is $\frac{1}{2}$ a cable wide, with 7 fathoms in the centre, and the island bearing N. 38° E.

The whole of these islands bear the same character. They are low coral islands covered with tropical vegetation, but no fresh water could be discovered on any of them. They are uninhabited, but are visited periodically by the natives to collect the cocoa-nuts.

The Rock marked dangerous in the Nanuku passage was searched for without success by H.M.S. "Beagle."

Naitaba is a high basaltic island, nearly triangular, with its apex to the S.E., on which point there is a remarkable peak. It is entirely surrounded by a reef, having deep water inside, but no entrance except for boats. Owing to the heavy swell, it was impassable when the "Beagle" was off the island.

Yacata, or Cap Island is inaccessible except in very smooth weather, for the same reason. There are several islands inside the reef.

Nuga-tobc Reef consists of three small islets on a small coral reef, the western of which is in lat. $17^{\circ} 15' 40''$ S., long. $179^{\circ} 40'$ W.; it is 5 miles W.S.W. from the west point of Yacata.

The Tidal Streams are very strong between the northern islands of the group, and are a good deal affected by the islands and reefs, but their general direction is the flood to southward and the ebb to the northward; they are also much affected by the prevailing winds—a strong surface current to the westward having been met with to the north of Wailagilala after a continuance of strong trade winds.

FREDK. J. RENDELL,
Lieut. Command. H.M.S. "Beagle."

[One plan.]

FIJI GROUP

NANUKU PASSAGE.

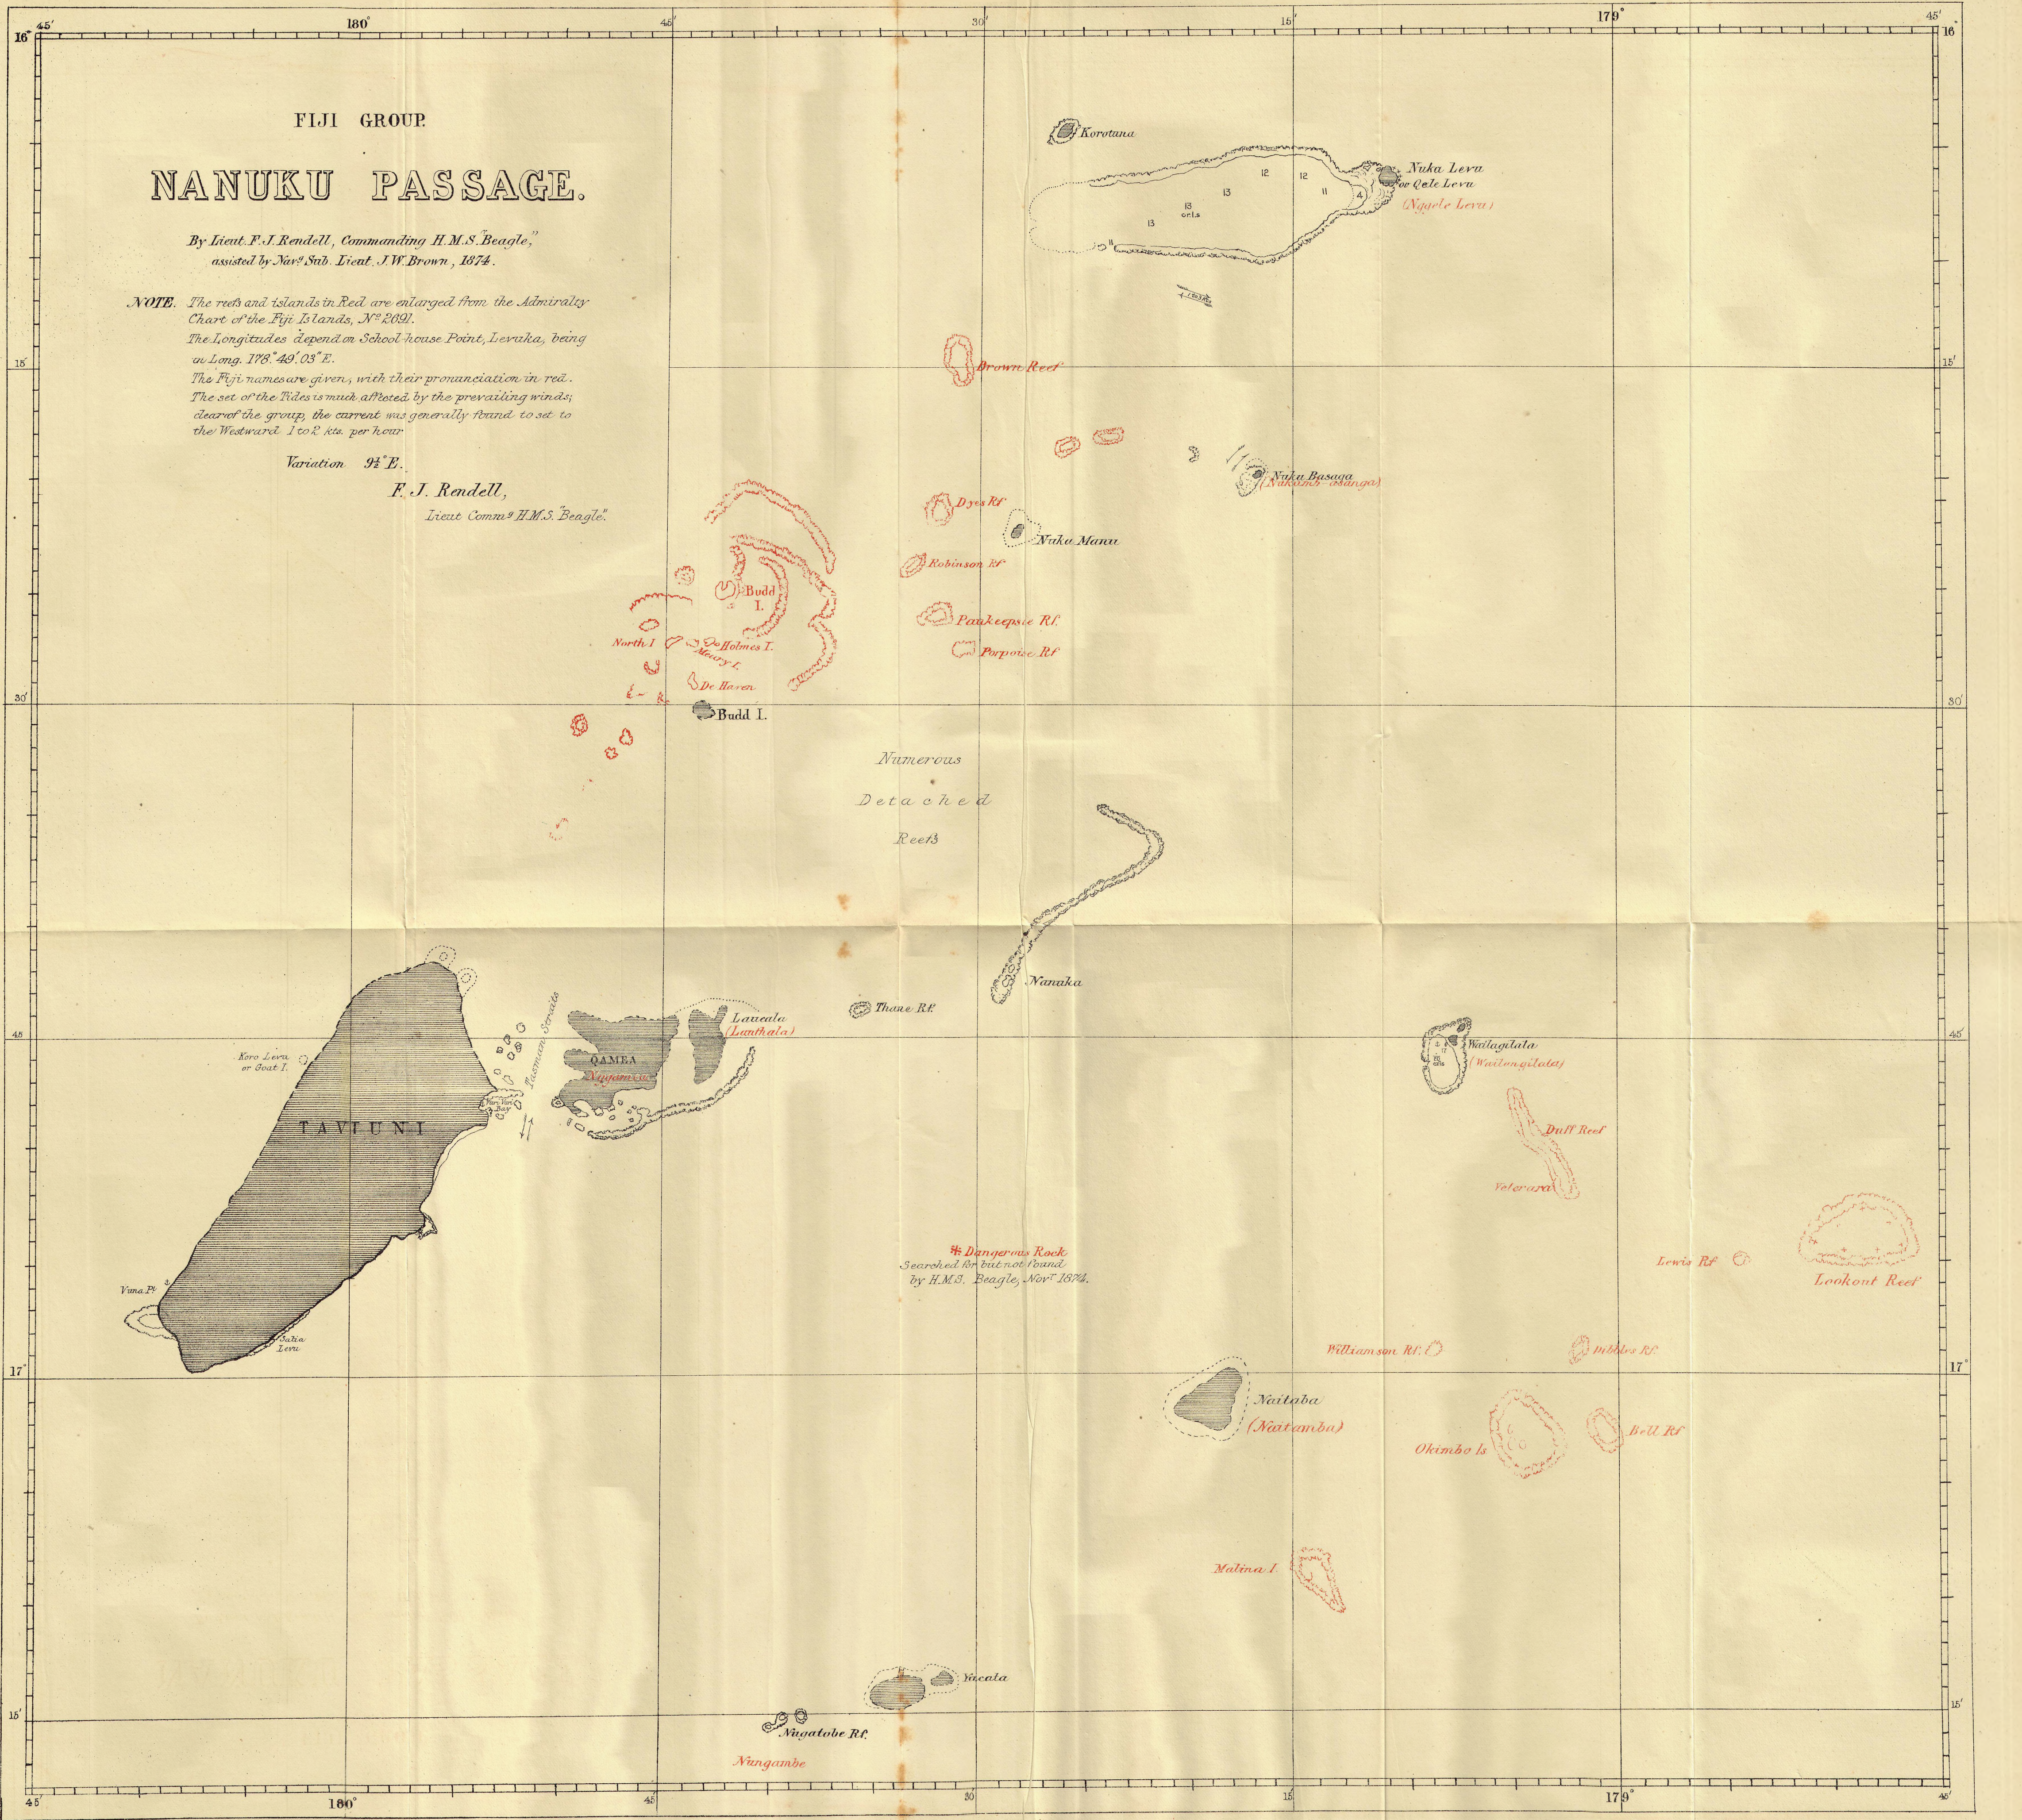

By Lieut. F. J. Rendell, Commanding H.M.S. "Beagle,"
assisted by Nav^y Sub. Lieut. J. W. Brown, 1874.

NOTE. The reefs and islands in Red are enlarged from the Admiralty
Chart of the Fiji Islands, N^o 2691.
The Longitudes depend on School-house Point, Levaka, being
in Long. 178° 49' 03" E.
The Fiji names are given, with their pronunciation in red.
The set of the Tides is much affected by the prevailing winds;
clear of the group, the current was generally found to set to
the Westward 1 to 2 kts. per hour.

Variation 9½° E.

F. J. Rendell,

Lieut. Comm^d H.M.S. "Beagle."

1875.

NEW SOUTH WALES.

VOYAGE BETWEEN NEW SOUTH WALES AND CHINA.

(REPORT FROM CAPTAIN NARES RESPECTING BEST ROUTE.)

Presented to Parliament by Command.

CAPTAIN NARES to GOVERNOR SIR HERCULES ROBINSON.

H.M.S. "Challenger,"
Wellington (N.Z.), 2 July, 1874.

SIR,

During the stay of the "Challenger" at Sydney, knowing how important it would be to the trade of the Colony that all the information obtainable relative to the best course for vessels to pursue in making the voyage between New South Wales and China should be compiled with a view of publishing it for general information, Navigating Lieutenant Tizard, belonging to this ship, who has had great experience in the navigation of the China Seas, undertook the task; and I have the honor to forward the result of his investigations to your Excellency, for the benefit of the many interested.

I may add, that I fully endorse the recommendations contained in the paper, which has been drawn up with much thoughtful care.

I have, &c.,
G. S. NARES, Captain.

ROUTE BETWEEN AUSTRALIA AND CHINA.

The passage between Australia and China is yearly becoming of more importance, owing to the increase of traffic between the two Countries; and, as the best route to follow is yet doubtful, any light that can be thrown on the time taken, and the wind and weather experienced on the voyage, must be useful information to vessels pursuing this track. Captain Allen, the Harbour Master at Newcastle, has collected for the past four years an epitome of the log of each vessel leaving that port; and he has kindly placed at my disposal the abstract logs between Newcastle and the ports in China and Japan, from which I have plotted the track of each ship. The following remarks and tables have been compiled after a careful study of the logs and the routes adopted.

During these four years, four different routes have been taken to China; three of them are to the eastward of New Guinea, and one (the Torres Strait route) to the westward.

The easternmost route east of New Guinea, which I shall call the "outer route to China," follows a line on the chart from Newcastle to Norfolk Island; from thence to Matthew Island, then north along the 171st meridian to 11° S., then N.N.W. to Pleasant Island, crossing the equator in 166° east, then through the Eastern islands of the Caroline Group to their destinations. The length of this route is—

From Newcastle to Hongkong	6,150 miles.
" Shanghai	6,000 "
" Yokohama	5,500 "

Ten vessels have adopted this route, and their average passage is sixty-four days. The shortest passage (forty-nine days) was made in the "Zenobia," which ship left Newcastle 2nd April. The longest passage was made by the "Windhover," which ship left Newcastle December 21st; she took seventy-four days on her voyage to Hongkong.

Another route east of New Guinea, which I shall call the "middle route to China," follows a line on the chart from Newcastle, midway between Lord Howe's Island and the Elizabeth Reef, from thence to the D'Entrecasteaux Reef on the N.W. extreme of New Caledonia, then between the Solomon and Santa Cruz Islands, and from thence N.W. by N. to the equator, which is crossed in 159° E. From the equator a northerly route is taken through the middle of the Caroline Group, and then a course is shaped for the port bound to.

The length of this route is—

From Newcastle to Hongkong	5,500 miles.
" Shanghai	5,400 "
" Yokohama	4,900 "

Twenty-nine vessels have adopted this track, and their average passage is forty-eight days, or sixteen days less than that of the "outer route." The quickest passage made was by the "Thermopylae," which ship left Newcastle on February 10th, and arrived in Shanghai 10th March, or in twenty-eight days. The longest passage recorded is sixty-five days, or the average passage by the "outer route." This passage was made by the "E. J. Spence," which ship left Newcastle in April.

The third route (east of New Guinea), which I shall call the "inner route to China," follows a line from Newcastle N.E. to the 157th meridian, then due north on that meridian to the latitude of the Pocklington Reef in 11° S., then either to the N.W., between New Ireland and the Solomon Group, or to the N., through the Bougainville Straits, between Bougainville and Choiseul Islands, then north to the equator, which may be crossed in about 153° E., from which position a straight course may be shaped for either Shanghai or Yokohama; but for Hongkong a course to the northward of the straight line to the Balintang Channel.

The length of the route is—

Newcastle to Hongkong	5,000 miles.
" Shanghai	4,900 "
" Yokohama	4,600 "

Five sailing-vessels and one steamer have adopted this track. The steamer made the passage in twenty-three days to Shanghai. The average length of passage of the sailing-vessels is forty-eight days, the same as the "middle route"; the shortest (thirty-four days) having been made in April, by the "Erie," and the longest (seventy-five days) in July, by the "Helen Malcolm." In the same month, however, another vessel, the "Woodlark," made the passage in thirty-nine days.

The fourth, or Torres Strait route, follows a line from Newcastle N.E. to the 157th meridian; then north on that meridian to the latitude of the Mellish Reef; then N.W. for Bligh's entrance to Torres Strait. When through the strait, the route is between the Tenimber and Arrow Islands for the passage between Ceram and Bouru into the Molucca Channel; then round the N.E. end of Celebes Sea, through the Basilan Channel into the Sulu Sea; and then through Mindoro Strait into the China Sea. The distance from Newcastle to Hongkong by this route is 5,300 miles, and it has been taken by only one ship, the "England," which made the passage in forty-one days in the month of July.

The annexed Tables give the statistics of each ship whose track has been plotted.

TABLE I.

STATISTICS of the "Outer Route to China."

Ship's Name.	Port in Australia sailed from.	Destination.	Date of Leaving.	Date of Arrival.	Number of Days on Passage.	Latitude of getting S.E. Trade	Latitude of losing S.E. Trade and getting West Monsoon.	Longitude of crossing Equator.	Latitude of getting N.E. Trade.	Latitude of losing N.E. Trade.	Remarks.
Greyhound ...	Newcastle	Hongkong	12 Jan.	10 March ...	57	25° S.	15° S.	167° E.	Equator	Carried the N.E. monsoon to Hongkong. Three days in a hurricane, lat. 15° S., between New Hebrides and Fiji Islands.
Catherine Jane	Newcastle	Hongkong	22 Jan.	27 March ...	64	None	14° S.	159° E.	3° 0' S.	Experienced variable winds from Newcastle to 14° S. lat. No S.E. trade.
Leicester	Newcastle	Shanghai	6 March ...	11 May	66	20° S.	11° S.	167° 30' E	Equator	23° N.	S.E. trade light and variable. West monsoon squally with rain.
Rattler	Newcastle	Hongkong	18 March ...	18 May	61	20° S.	13° S.	166° E.	Equator	20° N.	No west monsoon, but light N.E. and east winds from 13° S. to the equator.
Zenobia	Newcastle	Hongkong	2 April ...	21 May	49	20° S.	15° S.	163° E.	5° 0' S.	17° N.	Had south and S.E. winds on first starting, which carried her into the trade. From 15° S. to 5° S. light variable winds and calms.
Jno. Nicholson	Newcastle	Yokohama	20 Sept.	20 Nov.	61	26° S.	13° S.	166° 30' E.	6° 0' S.	20° N.	Light variable winds from 13° S. to 5° S., then N.E. winds to 6° N. From 20° north to Yokohama experienced variable winds.
Loch Lec	Newcastle	Hongkong	26 Sept.	26 Nov.	61	25° S.	12° S.	166° E.	8° 0' S.	From 12° S. to 8° S. experienced light variable winds; but at 8° S. got the N.E. monsoon, which carried her to Hongkong.
Burnsides	Newcastle	Yokohama	4 Oct.	9 Dec.	66	23° S.	12° S.	166° 30' E	10° 0' S.	30° N.	From 12° S. to 10° N. lat. experienced light winds; baffling when to the southward of the line, and from the eastward when to the northward of the line.
Araby Maid ...	Newcastle	Shanghai	15 Oct.	16 Dec.	60	21° S.	9° S.	168° E.	4° 40' S.	24° N.	From 9° S. to 4° 40' N. latitude experienced variable winds. From lat. 24° N. to Shanghai northerly and north-westerly winds.
Windhover ...	Newcastle	Hongkong	21 Dec.	4 March ...	74	19° S.	13° S.	164° 30' E.	Equator	From 13° S. to the equator experienced variable winds from the westward, with heavy rains. From the equator carried the N.E. monsoon to Hongkong.

TABLE II.
STATISTICS of the "Middle Route to China."

Ship's name.	Port in Australia sailed from.	Destination.	Date of Leaving.	Date of Arrival.	Number of days on passage.	Latitude of getting S.E. Trade.	Latitude of losing S.E. Trade and getting West Monsoon.	Longitude of crossing Equator.	Latitude of getting N.E. Trade.	Latitude of losing N.E. Trade.	Remarks.
E. M. Young.	Newcastle	Hongkong	16 Jan.	26 Feb.	41	26° S.	15° S.	157° E.	4° 0' S.	Carried the N.E. monsoon to Hongkong. Experienced a hurricane in lat. 14° S.
Thermopylae	Newcastle	Shanghai	10 Feb.	10 March	28	25° S.	14° S.	167° E.	0° 19' S.	20° N.	A strong westerly monsoon from 14° S. to 3° S.
Norham Castle	Newcastle	Shanghai	4 March	17 April	44	25° S.	15° S.	164° E.	4° 0' S.	20° N.	From lat. 15° S. to 4° S. experienced northerly winds with heavy squalls. Between the Lin Kin group and Shanghai experienced a typhoon.
Thermopylae	Sydney	Shanghai	7 March	16 April	40	None	12° S.	165° E.	7° 0' N.	Had no regular S.E. trade, but variable winds to 12° S. lat., from whence to the equator had the west monsoon with heavy squalls and rain. Carried the N.E. monsoon to Shanghai.
Thermopylae	Melbourne	Foo-choo-foo	8 March	17 April	40	25° S.	17° S.	164° E.	2° 0' S.	23° N.
Iuverdrue	Newcastle	Hongkong	11 March	20 April	40	25° S.	15° S.	160° E.	3° 0' S.	Carried the N.E. monsoon to Hongkong. From lat. 10° S. to 3° S. experienced light northerly and north-easterly winds.
Titania	Newcastle	Shanghai	20 March	3 May	44	23° S.	15° S.	154° E.	8° 0' N.	20° N.	No westerly monsoon, but light N.E. and E. winds from 15° S. to the equator.
Thermopylae	Sydney	Shanghai	20 March	4 May	45	20° S.	161° E.	4° 0' N.	18° N.	From 20° S. to the equator had variable winds from N. to E.S.E., with occasional heavy squalls and rain. Delayed by fog three days off Shanghai.
Thermopylae	Newcastle	Shanghai	30 March	8 May	39	26° S.	16° S.	159° E.	Equator	Carried the N.E. monsoon to Shanghai. Had no regular westerly monsoon, but light variable airs from N.E. from 16° S. to equator.
Apelles	Newcastle	Hongkong	13 April	12 June	60	20° S.	9° S.	158° E.	1° 0' N.	20° N.	From 9° S. to 1° N. experienced light variable winds and calms.
E. J. Spence	Newcastle	Hongkong	16 April	20 June	65	20° S.	4° S.	158° E.	2° 30' N.	16° N.	From 4° S. to 2° 30' N. experienced light variable winds and calms.
Fire Queen	Newcastle	Hongkong	22 May	10 July	49	24° S.	0	159° E.	2° 0' N.	15° N.	From 15° N. to Balintang Channel experienced S.W. winds.
Ardentiny	Newcastle	Hongkong	5 June	28 July	53	25° S.	7° S.	159° E.	7° 0' S.	12° N.	Variable winds from 12° N. to Hongkong.
Corinne	Newcastle	Yokohama	9 June	5 August	57	None	164° E.	6° 0' N.	Had no regular S.E. trade. From 9° S. to 3° N. had north-easterly winds. From 6° N. carried fair winds to Yokohama.
Thyatira	Newcastle	Shanghai	10 June	1 August	52	25° S.	16° S.	152° E.	7° 0' S.	Pelew Is.	From 16° S. to the Pelew Islands experienced E. and N.E. winds. From the Pelew Islands to 17° N. the S.W. monsoon. From 17° N. to Shanghai, E. and N.E. winds.
Formosa	Newcastle	Cheefoo	20 June	20 August	61	20° S.	7° S.	158° E.	From 7° S. to 5° N. experienced light variable easterly winds. From 5° N. to 21° N. variable winds, from thence to Cheefoo the S.W. monsoon, strong with squalls.

TABLE II—continued.

Ship's name.	Port in Australia sailed from.	Destination.	Date of Leaving.	Date of Arrival.	Number of days on passage.	Latitude of getting S.E. Trade.	Latitude of losing S.E. Trade and getting West Monsoon.	Longitude of crossing Equator.	Latitude of getting N.E. Trade.	Latitude of losing N.E. Trade.	Remarks.
Flying Eagle...	Newcastle	Hongkong	1 July	26 August ...	57	20° S.	10° N.	158° E.	The S.E. trade unsteady, both in force and direction. From 10° N. to Hongkong variable light winds, principally from the eastward.
Thomas Bell...	Newcastle	Hongkong	7 July	8 Sept.	63	20° S.	7° N.	140° E.	The S.E. trades unsteady, both in force and direction. From 7° N. to Hongkong N.E. winds.
Oberon	Newcastle	Shanghai	10 August ...	20 Sept.	41	25° S.	5° S.	161° E.	From 5° S. to 26° N. experienced the S.W. monsoon, with heavy rain squalls, then east wind to Shanghai.
Ocean Beauty..	Newcastle	Hongkong	18 August ...	21 Oct.	64	24° S.	17° S.	156° E.	From 17° S. to 5° S. experienced light winds from N. to E., then light variable winds to 12° N., then E. winds to Hongkong.
Whittington...	Newcastle	Shanghai	27 August ...	20 Oct.	54	23° S.	13° S.	162° E.	From 13° S. to the equator she experienced light E. winds and calms. From the equator to 10° N. variable light winds. From 10° to 17° N. the S.W. monsoon strong, then light fair winds to Shanghai.
Lauderdale ...	Newcastle	Hongkong	16 Sept.	7 Nov.	52	20° S.	5° S.	161° 30' E.	5° S.	15° N.	Experienced light winds from 5° S. to 15° N., then S., E., and N.E. winds to the Bashee Channel.
B. Constitution	Newcastle	Hongkong	24 Sept.	20 Nov.	57	19° S.	5° S.	159° E.	Equator	Carried the N.E. monsoon to Hongkong.
Lennox Castle..	Newcastle	Hongkong	27 Sept.	7 Nov.	41	20° S.	4° N.	159° E.	14° N.	17° N.	The S.E. trade well to the eastward, with gloomy rainy weather. From 4° to 14° N. experienced southerly winds, varying to the westward and eastward of S. From 17° N. to Bashee Channel the S.W. monsoon.
Zaretza	Newcastle	Hongkong	24 Oct.	2 Dec.	39	23° S.	10° S.	164° E.	3° N.	From 10° S. to 3° N. experienced variable winds. Carried the N.E. monsoon to Hongkong.
Selim	Newcastle	Hongkong	22 Nov.	9 Jan.	48	None	163° E.	2° N.	Experienced no regular S.E. trade, but variable winds from the northward and eastward from 23° S. to 12° S., then light variable winds to 2° N., after which she kept the N.E. monsoon to Hongkong.
Lennox Castle..	Newcastle	Hongkong	7 Dec.	18 Jan.	42	None	8° S.	166° 30' E.	1° N.	Had no S.E. trade, but variable winds from the northward and eastward from 22° S. to 8° S., then got the W. monsoon light and variable with squalls to 1° N., then the N.E. monsoon to Hongkong.
Maris	Newcastle	Hongkong	22 Dec.	9 Feb.	49	29° S.	16° S.	166° E.	3° S.	From 16° S. to 3° S. had the westerly monsoon, then variable winds to 3° S.

S.S. Bernard...	Newcastle	Shanghai	31 Aug.....	23 Sept.....	23	20° S	9° S.	149° E.	1° N.	From 9° S. to 1° N. variable winds were experienced. From 1° N. to Shanghai N.E. winds.

TABLE IV.
STATISTICS of the "Torres Straits Route to China."

England	Newcastle	Hongkong.....	12 July	21 Aug.....	41	23° S.	Equator	Molucca Passage.	From the equator to the Molucca Channel experienced variable winds to the Mindoro Channel, and then the S.W. monsoon.
---------------	-----------------	---------------	---------------	-------------	----	--------	---------	------------------	-------	-------	---

A careful study of these Tables, and the Wind Charts published by the Admiralty in 1872, have led me to the following conclusions:—

During the months of January, February, and March, the average passage by the "outer route" is sixty-two days, the longest recorded passage being sixty-six days, and the shortest fifty-seven days.

The average passage by the "middle route" is forty days, the longest recorded being forty-five days, and the shortest twenty-eight days. No passage by the "inner" or the Torres Strait route has been attempted during this season, and a glance at the Wind Charts will show that neither of these tracks are suitable during the first three months of the year.

The question of the route to be adopted during these months therefore rests between the "middle" and the "outer" routes, and, as the passage by the "middle route" is performed in *twenty-two days less* than that by the "outer route," there can be no question that the "middle" is the proper route to China for vessels leaving Australia in January, February, and March.

During the months of April, May, and June, only one passage has been made by the "outer route," viz., in April, the time occupied being forty-nine days.

The average passage by the "middle route" is fifty-seven days; the longest recorded being sixty-five days, and the shortest forty-nine days; whilst during the same three months two passages were made by the "inner route," one in thirty-four days, the other in thirty-eight days, or an average of thirty-six days. No passage is recorded by the Torres Strait route.

A careful study of the Wind Chart for these months, in conjunction with this information, will, I think, show satisfactorily that neither the "middle" or the "outer" routes are suitable for ships at this season, but that the "inner route" offers the greatest facilities for making a rapid passage to China, for ships leaving Australia in April, May, and June.

During the months of July, August, and September, two vessels took the "outer route," and each ship made the passage in sixty-one days. The average passage by the "middle route" is fifty-four days; the longest recorded being sixty-four days, and the shortest forty-one days.

The average passage by the "inner route" is fifty-six days; the longest recorded being seventy-five days, and the shortest thirty-nine days, whilst one passage was made by the "Torres Strait route" in forty-one days.

It will be evident, therefore, that in these three months a better passage will be made by following the "middle" rather than the "outer route" to China; the question as to which is the most advantageous track rests, therefore, between the "Torres Strait," the "middle," and the "inner route."

If a ship leaving Australia can enter Torres Strait *before* the end of August, this will be found the best track to take; if, however, she cannot get through those straits by that time, she should adopt either the "inner" or the "middle" route; probably the inner will be found the quickest, if every means are taken to get north after crossing the equator until the 10th parallel is reached; as the vessel that took seventy-five days on the voyage wasted a fortnight by trying to work to the westward against light N.W. winds when between the equator and 5° N. latitude. There appears, however, very little to choose between the "middle" and "inner" routes, and either of them may be followed if too late in the season to enter Torres Strait.

During the months of October, November, and December, the average passage by the "outer route" is sixty-seven days; the longest recorded being seventy-four days, and the shortest sixty days. The average passage by the "middle route" is forty-four days; the longest recorded being forty-nine days, and the shortest thirty-nine days. No passage has been made at this season of the year either by the "Torres Strait" or "inner" routes. The "Torres Strait route" is certainly unfit to take, but until we possess more information regarding the "inner route," I am not certain as to its fitness or otherwise.

The "outer route," occupying an average of *twenty-three days* more than the "middle route," should on no account be taken by ships leaving Australia in October, November, and December.

Briefly, then:—Ships leaving Australia in the months of January, February, or March, for China or Japan, should adopt the "middle route," and may expect to make the passage in about forty days; leaving in April, May, or June, they should adopt the "inner route," and may expect to make the passage in about thirty-six days; leaving in July, August, or September, they should, if they can reach Torres Strait before the end of August, take that route; and if not, either the "middle" or the "inner route," and may expect to make the passage *via* Torres Strait in forty days, and by the other routes in fifty-five days; and finally, ships leaving in October, November, and December, should adopt the "middle route," and may expect to make the passage in forty-four days about.

Two other passages to China have been mentioned in the Sydney papers; one to the west of Australia, and through Sunda Strait, the other a modification of the "inner route," through some of the channels lately discovered by Captain Moresby, of H.M.S. "Basilisk."

The western route is only practicable for sailing-vessels during the months of January, December, and February, as they may then get easterly winds to the southward of Australia. I should not, however recommend this route even to Singapore, as during the months of November, December, January, February, and March, northerly winds and a southerly current prevail in Sunda, Banka, and Gaspar Straits, and the Carinata Channels, and it is a tedious and heart-breaking process endeavouring to get to the northward under such adverse circumstances. I have known a ship thirty days from Sunda Strait to Singapore—a distance of 500 miles.

With

With regard to the modification of the "inner route" rendered advisable by the discoveries of Captain Moresby, I am unable, at present, to give an opinion, as the charts are as yet unpublished.

It is as well, perhaps, for me to point out, in conclusion, that in recommending what I consider should be the route adopted at each particular season of the year, I have been entirely guided by the logs of the vessels I have perused, in conjunction with the Wind Charts published by the Admiralty, and have not taken into consideration their relative value of facility in navigation; nor am I able, of course, to judge of the passages made by ships whose logs I have not seen, and who *may* have made quicker passages by other or the same routes.

Viewing then the different tracks in regard to their freedom from danger, there is no doubt that the "outer route" is the clearest, and *that* probably is the reason it has been adopted by so many ships.

The "middle route," however, is nearly as free from difficulty as the "outer," and will be, in my opinion, quite as safe when the survey of the D'Entrecasteaux Reef is completed,—a work I understand the present hydrographic staff in New Caledonia are engaged on.

The "inner route" is at present the least known, and unquestionably that portion of it between the Solomon Islands and New Guinea requires to be surveyed; still, however, the passage between the Solomon Islands on the eastern, and the Louisade Archipelago and New Ireland on the western side, is a wide channel apparently free from danger (with the exception of the Pocklington Reef); and in the months of April, May, and June, during which ships gain the greatest advantage by using it, the weather is fine, so that I see nothing to deter vessels taking this track provided a good look-out is kept; and it must likewise not be forgotten that should it be found the quickest, as it is the shortest highway to China, a vessel would probably soon be employed in properly surveying it.

The "Torres Strait route" although not free from danger, may be navigated with facility by captains who have had any experience amongst coral reefs, and who are accustomed to con their vessel from the masthead; a precaution which is absolutely necessary. Once through the strait there are but few dangers on the track to China, as although the islands are many of them doubtful in position, they are of sufficient height to insure their being seen readily.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SEAMEN'S LAWS CONSOLIDATION ACT.

(PETITION FOR AMENDMENT OF—OFFICERS AND SEAMEN OF PORT JACKSON.)

Ordered by the Legislative Assembly to be printed, 16 April, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned officers and seamen of the Port of Sydney,—

SHOWETH:—

1. That your Petitioners are engaged in the Colonial and Intercolonial trade of New South Wales, and in justice to themselves, their families, and others depending upon them for a livelihood, they deem it their duty to bring under the notice of your Honorable House the shocking condition of that portion of many ships termed the "forecastle," which is set apart for their use as sleeping and eating apartments, which is frequently leaky, has little or no ventilation, and insufficient room, so that in tempestuous weather it becomes highly detrimental to your Petitioners' health.

2. That an injustice is done to seamen in permitting ships' articles to be signed on board vessels where there is no one to look after their interests, which the Shipping Master could do if all the shipping were under his supervision. It would, moreover, be a great boon to the seamen if all engagements were made at the Shipping Office only, which is the seamen's legitimate depôt of labour, whereas as the law at present stands the seamen most in want of employment are frequently the very last to hear of it, and thus much distress is occasioned.

3. That under section 20 of the Seamen's Laws Consolidation Act, masters or owners of vessels may engage seamen for any two or more ships, which is detrimental to the interests of the unemployed, and often causes serious injury to those so engaged, through their being shifted into ships with officers who had no part in shipping them, and who generally have special favourites, for whom they wish to provide. Consequently the men so shifted are driven out of the ships, or are aggravated to that extent that they give insolence to the officers and are discharged without a character, which renders it almost impossible for them to obtain employment. "Driving men out of a ship" is a term well known to every officer and seaman, and has caused more mutinies at sea than all other causes put together. It is therefore desirable that the portion of the Act above referred to, making it legal for the masters and owners of ships to engage a single crew for more than one vessel, should be repealed.

4. That a large number of masters and owners of ships make it a regular and systematic practice to have their ships thoroughly cleaned outside and inside on the Sabbath day, to the moral degradation of both officers and seamen, who are equally with other men entitled to the enjoyment of the privileges of the Lord's Day, and are under equal obligations to observe it; and this unnecessary working on the Sabbath, by which the sanctity of that day is violated, and the men caused to view God's commandments with indifference, is an occurrence which takes place on board some vessels every Sunday in the year. The seamen belonging to a vessel recently lying in the Macleay River had to choose whether they would on a Sunday take in cargo or wash the vessel, and they decided as the lesser evil to take in cargo (25 tons), which they had to carry on their backs from the shore to the vessel.

5. That a portion of part 6, section 72, of the Seamen's Laws Consolidation Act, gives power to the master of a ship to prevent his crew from going ashore to visit their wives and families, or for any other purpose, for twenty-four hours before the vessel's departure, notwithstanding that the ship may be safely moored alongside of a wharf; and your Petitioners consider this power both unjust and tyrannical.

Your Petitioners therefore respectfully pray your Honorable House to take their grievances into your consideration, and to grant them such relief in the premises as your wisdom may direct.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 744 signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ELECTRIC CABLE BETWEEN NEW ZEALAND AND
NEW SOUTH WALES.

(MESSAGE No. 21.)

Ordered by the Legislative Assembly to be printed, 10 June, 1875.

HERCULES ROBINSON,
Governor.

Message No. 21.

In accordance with the 54th clause of the Constitution Act, the Governor recommends to the Legislative Assembly that provision be made for a sum adequate to meet the cost of constructing an Electric Cable between New South Wales and New Zealand.

*Government House,
Sydney, 10th June, 1875.*

1875.

NEW SOUTH WALES.

SOUNDINGS FOR TELEGRAPHIC CABLE BETWEEN
NEW SOUTH WALES AND NEW ZEALAND.

(REPORT FROM CAPTAIN NARES.)

Presented to Parliament by Command.

CAPTAIN NARES TO GOVERNOR SIR HERCULES ROBINSON.

H.M.S. "Challenger,"
Wellington (N.Z.), 2 July, 1874.

SIR,

As many in New South Wales are interested in the best telegraphic route between that Colony and New Zealand, I have the honor to enclose tracings of charts showing the soundings I lately obtained on a line between Sydney and Cook's Straits, with remarks on the conditions of the bottom with regard to its suitability for a telegraphic cable.

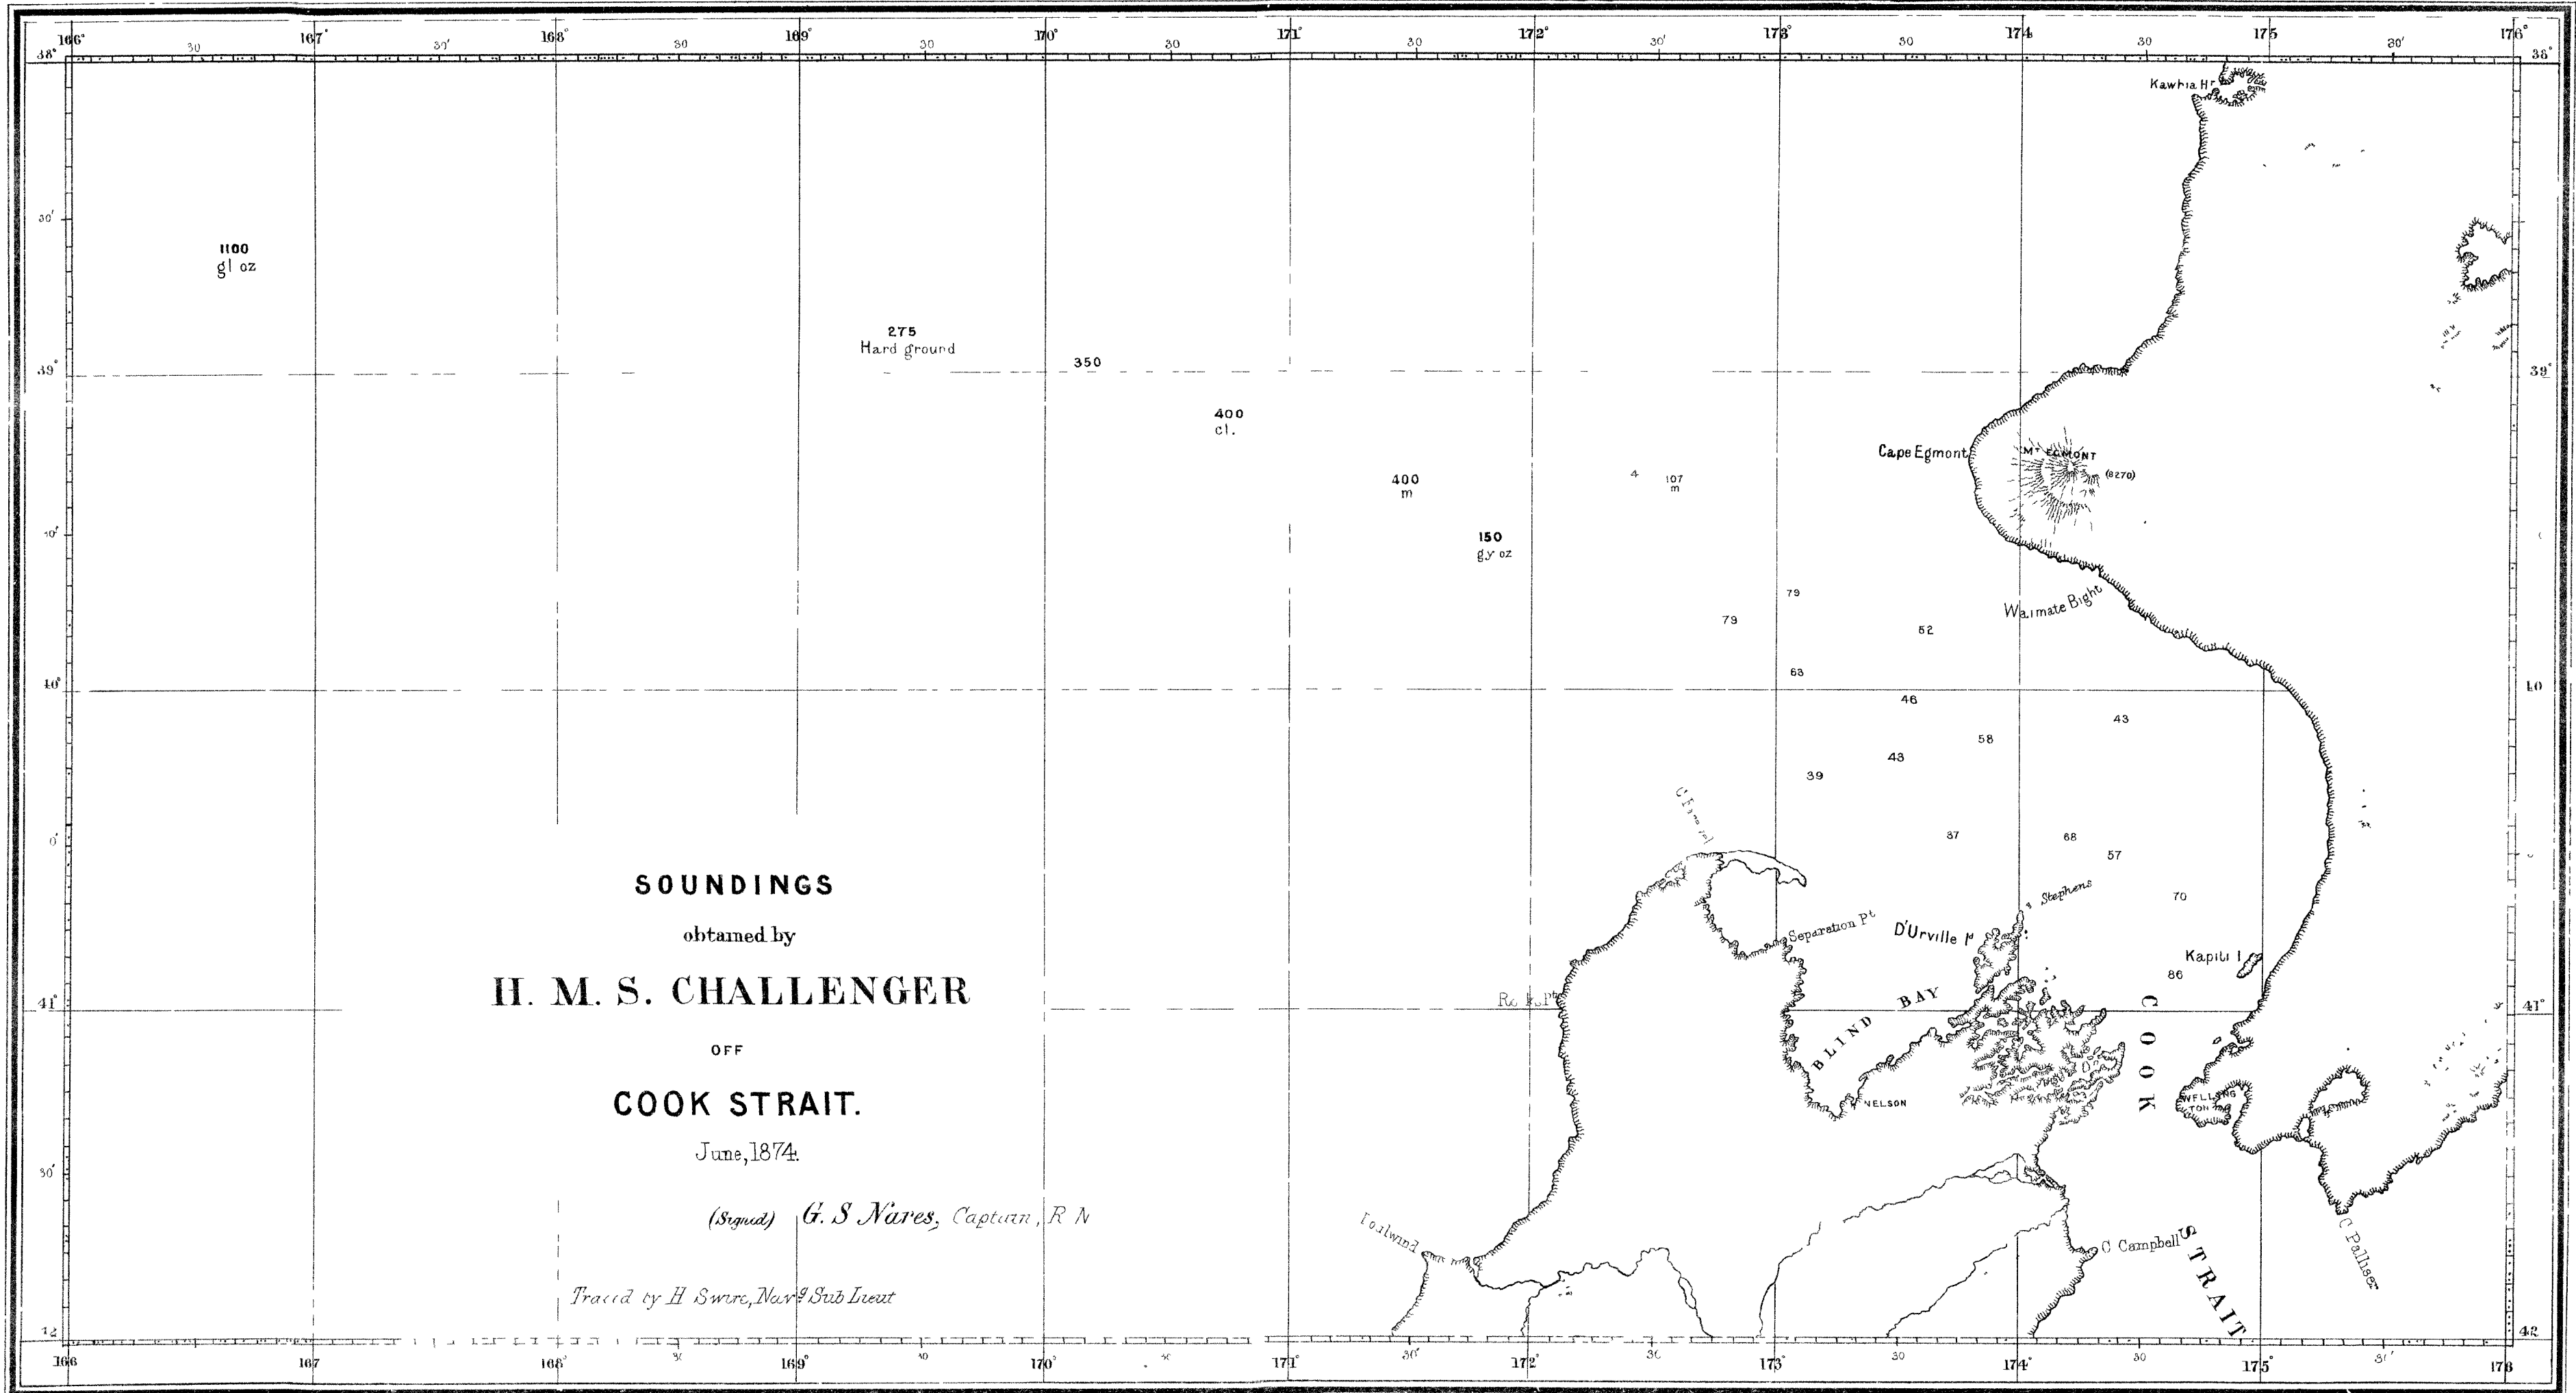

2. On the Australian coast the incline from the 100 fathoms line, which was 17 miles from the land, into a depth of 2,100 fathoms at 57 miles distance, was about 1 in 20, which is less abrupt than we had previously found to be the case further to the southward of Twofold Bay, where it was about 1 in 6. The bottom, which consists of soft ooze, then slopes down to a depth of 2,600 fathoms, at a distance of 240 miles from the coast, the temperature being 33°, which conditions continue for 140 miles.

3. From this extreme depth the bottom slopes upwards, with a gentle incline, with soft ooze, for 400 miles, until, at a position 780 miles from Sydney, and 335 miles from the entrance to Cook's Straits, we obtained soundings in 1,100 fathoms. Between this and New Zealand only shallow soundings below 400 fathoms, with hard bottom, were obtained. The most westerly of these, 275 fathoms, was 200 miles from the land, and 125 miles to the eastward of the 1,100 fathoms sounding. The shoal water evidently extends for some distance farther to the westward, probably as much as 100 miles, which would give a total breadth of shallow water of 300 miles. The bottom on the shoal was extremely hard—so much so that we obtained little or no samples in the sounding rods; but as both the dredge and trawl dragged freely along, without catching in any irregularities, it must have been of a smooth nature.

4. On reference to former soundings on the general chart, it is evident that a somewhat similar bank extends for a considerable distance to the westward of the north cape of New Zealand; such being the case, the shoal is probably continuous, and shallow water may be expected all along the western side of the North Island; but I see no reason to suppose that deep water does not extend to within a very short distance of the south-west cape of the Middle Island, which is also the nearest land to Australia.

I have, &c.,
G. S. NARES, Captain.

VOLUNTEER FORCE REGULATION ACT OF 1867.

(MONEYS EXPENDED UNDER, IN 1874.)

Presented to Parliament, pursuant to Act 31 Vic. No. 5, sec. 51.

VOLUNTEER FORCE—NEW SOUTH WALES.

STATEMENT of all Moneys paid on account of the above Force during the year ending 31st December, 1874, furnished in accordance with paragraph 51 of the Volunteer Act of 1867.

Particulars.		Amount.
		£ s. d.
Salaries and allowances	Amount paid	4,769 14 1
Forage	Allowances paid in lieu thereof to three Majors and one paid Adjutant, at 3s. 6d. per diem each	255 10 0
Travelling expenses.....	For General Staff and Volunteer Officers	541 5 8
Compensation in lieu of uniforms...	For Staff Sergeants—Instructors	76 10 0
Capitation allowance—		
Uniforms	Amount paid to Contractors	4,542 13 5
Balance	Amount paid over to Officers commanding Batteries and Companies... ..	1,009 5 2
Marksman's Badges	Amount paid to Contractors and incidental expenses	124 0 9
Hire of horses.....	For mounted Officers of Artillery and Infantry on Field Parades	84 0 6
Do.	For Artillery Field Guns	168 15 6
Contribution to	Volunteer Brigade Band	250 0 0
Do.	Rifle Association	500 0 0
Armoury—Repairs and materials...	Freight and cartage of ammunition and incidental expenses	521 14 9
Collecting and cleaning arms.....	Annual allowance to each Country Corps of £5.....	85 0 0
Rifle ranges	For constructing new Butts and keeping in repair the several Rifle Ranges	136 14 10
Sheds	Constructing on Paddington Rifle Range.....	300 0 0
Office rent	Office for General Staff	100 0 0
Do.	Office—Central for all Corps	200 0 0
Brigade Office	Allowance to Watchman and Office-keeper	16 0 0
Offices in use by Head Quarters Corps.	Allowance to Office-keeper.....	16 0 0
Encampment	Cost of	1,569 9 2
Offices for three Majors in command of Country Battalions.	Hire of, at £15 per annum each	45 0 0
Rifles and ammunition	For the purchase of twelve Match Rifles and Ammunition	1,034 13 5
Butts on Paddington Rifle Range...	Altering to safer principle	180 0 0
Tents and great-coats.....	For the purchase of, for Volunteer Encampment	974 0 0
		£ 17,500 7 3

NEW SOUTH WALES.

VOLUNTEER FORCE REGULATION ACT OF 1867.
(AMENDED REGULATION.)

Presented to Parliament, pursuant to Act 31 Vict. No. 5, sec. 50.

Colonial Secretary's Office,
Sydney, 3rd March, 1875.

His Excellency the Governor, having been pleased, with the advice of the Executive Council, to make the following Regulation for the Volunteer Force, in substitution of No. 124 of the Regulations published in the Supplementary Government Gazette of the 29th April, 1871, directs its publication in accordance with the 50th section of the Volunteer Force Regulation Act of 1867, viz.:—

124. No claim to these allowances shall be admitted at the commencement of any year, unless specially authorized, if the number of "efficient" in any Corps be below the minimum establishment shown in the tabular forms of these Regulations; and the services of such Corps shall be liable to be dispensed with.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

VOLUNTEERS.
(NON-GRANTING OF SECOND LAND ORDERS TO.)

Ordered by the Legislative Assembly to be printed, 11 May, 1875.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 27 April, 1875, that there be laid upon the Table of this House,—
“Copies of all Correspondence and all opinions that have been given by
“the Crown Law Officers with respect to the non-granting of second Land
“Orders to Volunteers.”

(*Mr. Davies.*)

No. 1.

LIEUT.-COL. J. S. RICHARDSON to THE COLONIAL SECRETARY.

Brigade Office,
Sydney, 11 January, 1875.

SIR,

Several applications for a second Land Order having been recently made to me by members of the Volunteer Force, who having completed a second period of five years efficient service, and claim to be entitled under the Volunteer Act to the grant of a second Land Order, I have the honor to request I may be informed whether the issue of a second Land Order is contemplated by the Government?

I have, &c.,
JOHN S. RICHARDSON,
Lieut.-Col., Commandant.

No. 2.

MINUTE OF THE PRINCIPAL UNDER SECRETARY.

SUCH, it is believed, is not the intention of the Act. The opinion of the Attorney General is desirable.—
2/2/75.

The Under Secretary, Crown Law Department, B.C., 2nd February, 1875.—H.H.

No. 3.

OPINION of Attorney General respecting the issuing to Volunteers of a second Land Order.

THERE is only *one* free grant of 50 acres of Crown land provided for under section 44 of 31 Vic., No. 5. There is only one service spoken of as the title to this grant, and there is only one period fixed within which this title accrues. The service must be continuous for five years, dating from the 1st January, 1868. The consideration of the efficient service during this term is “a free grant of 50 acres”; nothing is said of any other term, of any other service, of any other grant. No Volunteer is entitled to another grant.

W. B. DALLEY,
Attorney General,
18 March, 1875.

The Principal Under Secretary, B.C., 18th March, 1875.—W.E.P.

No. 4.

THE PRINCIPAL UNDER SECRETARY TO LIEUT.-COL. J. S. RICHARDSON.

Colonial Secretary's Office,
Sydney, 24 March, 1875.

SIR,

In reply to your letter of the 11th of January last, reporting that several applications have been made to you by members of the Volunteer Force who, having completed a second period of five years efficient service, claim to be entitled under the Volunteer Act to the grant of a second Land Order, and inquiring whether the issue of a second Land Order is contemplated by the Government, I am directed by the Colonial Secretary to inform you that this question has been referred for the opinion of the Attorney General, who has advised upon it in the following terms:—

“There is only *one* free grant of 50 acres of Crown Land provided for under section 44 of 31 Vic., No. 5. There is only one service spoken of as the title to this grant; and there is only one period fixed within which this title accrues. The service must be continuous for five years, dating from the 1st January, 1868. The consideration of the efficient service during this term is a free grant of 50 acres. Nothing is said of any other term, of any other service, of any other grant. No Volunteer is entitled to another grant.”

I have, &c.,

HENRY HALLORAN.

No. 5.

THE PRINCIPAL UNDER SECRETARY TO THE UNDER SECRETARY FOR LANDS.

Colonial Secretary's Office,
Sydney, 24 March, 1875.

SIR,

I am directed by the Colonial Secretary to communicate to you, for the information of the Secretary for Lands, a copy of an opinion which has been obtained from the Attorney General on a question propounded by the Commandant with respect to certain applications made to him by members of the Volunteer Force who, having completed a second period of five years efficient service, claimed to be entitled under the Volunteer Act to the grant of a second Land Order.

2. Upon the question proposed by the Commandant the Attorney General advised in the following terms:—

“There is only *one* free grant of 50 acres of Crown Land provided for under section 44 of 31 Vic., No. 5. There is only one service spoken of as the title to this grant; and there is only one period fixed within which this title accrues. The service must be continuous for five years, dating from the 1st January, 1868. The consideration of the efficient service during this term is a free grant of 50 acres. Nothing is said of any other term, of any other service, of any other grant. No Volunteer is entitled to another grant.”

I have, &c.,

HENRY HALLORAN.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

LETTERS OF REGISTRATION OF INVENTIONS

UNDER

16 VICTORIA, No. 24;

FOR

1873.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
9 *July*, 1875.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1875.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

LETTERS OF REGISTRATION OF INVENTIONS.

(DESCRIPTIONS, SPECIFICATIONS, &c., ACCOMPANYING APPLICATIONS FOR.)

Ordered by the Legislative Assembly to be printed, 9 July, 1875.

RETURN (in part) to an *Address* of the Honorable the Legislative Assembly of New South Wales, dated 10 May, 1861, A.M., praying that His Excellency the Administrator of the Government would be pleased to cause to be laid upon the Table of this House (in addition to the Return already upon the Table),—

“(1.) A copy of the Descriptions and Specifications accompanying any applications for Letters of Registration of Inventions under the Act of Council 16 Victoria, No. 24, together with the date of application for such Letters of Registration, and when granted; also, copies of the Plans or Sections annexed, and of the Report, in each case.

“(2.) That His Excellency will cause similar Returns to be laid before Parliament annually.”

(Mr. Hart.)

**IMPROVEMENTS IN THE ORDINARY SYSTEM OF PRESERVING MEATS
KNOWN AS "THE CHLORIDE OF CALCIUM PROCESS."**

LETTERS OF REGISTRATION to Robert Andrew Loughnan, for Improvements in the ordinary system of preserving Meats known as "the Chloride of Calcium Process."

[Registered on the 8th day of January, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ROBERT ANDREW LOUGHNAN, of Green Island, near Dunedin, in the province of Otago and Colony of New Zealand, Manager of the Otago Meat-preserving Company there, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of Improvements in the ordinary system of preserving Meats known as "the Chloride of Calcium Process," which is more particularly described in the specification which is hereunto annexed, and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of twenty pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Robert Andrew Loughnan, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Robert Andrew Loughnan, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Robert Andrew Loughnan shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this sixth day of January, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in the ordinary system of preserving Meats.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, ROBERT ANDREW LOUGHNAN, of Green Island, near Dunedin, in the province of Otago and Colony of New Zealand, Manager of the Otago Meat-preserving Company, limited there, send greeting:

WHEREAS I am desirous of obtaining Royal Letters Patent for securing unto me Her Majesty's special license that I, my executors, administrators, and assigns, and such others as I or they should at any time agree with, and no others, should and lawfully might, from time to time, and at all times during the term of fourteen years to be computed from the day on which this instrument shall be left at the office of the Patent Officer, make, use, exercise, and vend within the Colony of New South Wales, an invention for improving on the ordinary system of preserving Meats known as "the Chloride of Calcium Process," and in order to obtain the said letters patent, I must by an instrument in writing under my hand and seal particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed, and must also enter into the covenant hereinafter contained: Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement (that is to say),—the meat-preserving pans used in the Chloride of Calcium process are converted into vacuum pans, where the ordinary heating and steaming processes of that system are effected at lower temperatures in a vacuum more or less perfect, with or without modifications of the duration of those processes, and the air prevented from re-entering the canisters by accompanying the gradual diminution of the vacuum with a gradual increase of temperature, thereby keeping the steam jets stronger than the atmospheric pressure during and after the destruction of the vacuum, after which sealing is performed in the ordinary way: And I do hereby, for myself, my heirs, executors, and administrators, covenant with Her Majesty, Her Heirs and Successors, that I believe the said invention to be a new invention as to the public use and exercise thereof, and that I do not know or believe that any other person than myself is the true and first inventor of the said invention, and that I will not deposit these presents at the office of the Patent Officer with any such knowledge or belief as last aforesaid.

In witness whereof, I have hereunto set my hand and seal, this twenty-second day of July, one thousand eight hundred and seventy-two.

R. A. LOUGHNAN.

Signed, sealed, and delivered by the said Robert Andrew Loughnan, in the presence of,—

J. R. SINCLAIR,
Clerk to Messrs. Smith & Anderson,
Solicitors,
Dunedin, Otago, N.Z.

This is the specification referred to in the annexed Letters of Registration granted to Robert Andrew Loughnan, this sixth day of January, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 9 December, 1872.

Sir,

We do ourselves the honor to recommend the issue of Letters of Registration securing to Robert Andrew Loughnan the exclusive enjoyment, for a term of fourteen years, of a certain invention for improving on the ordinary system of preserving Meats known as "the Chloride of Calcium Process," in accordance with his Petition and specification, herewith returned.

We have, &c.,
CHAS. WATT.
GOTHEK K. MANN.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1873, 7th February. No. 344.

**IMPROVEMENTS IN MACHINERY OR APPARATUS FOR STAMPING ORES
AND OTHER HARD SUBSTANCES.**

LETTERS OF REGISTRATION to William Willoughby, Joseph Willoughby, and Samuel Willoughby, for Improvements in Machinery or Apparatus for stamping Ores and other hard substances.

[Registered on the 10th February, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS WILLIAM WILLOUGHBY, JOSEPH WILLOUGHBY, and SAMUEL WILLOUGHBY, all of Plymouth, in the County of Devon, England, engineers, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Machinery or Apparatus for stamping Ores and other hard substances," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Willoughby, Joseph Willoughby, and Samuel Willoughby, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said William Willoughby, Joseph Willoughby, and Samuel Willoughby, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Willoughby, Joseph Willoughby, and Samuel Willoughby, shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of February, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Machinery or Apparatus for stamping Ores and other hard substances.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, we, WILLIAM WILLOUGHBY, JOSEPH WILLOUGHBY, and SAMUEL WILLOUGHBY, all of Plymouth, in the County of Devon, England, engineers, send greeting :

WHEREAS we are desirous of obtaining Letters of Registration for the Colony of New South Wales, securing unto us Her Majesty's special license that we, our executors, administrators, and assigns, and such others as we or they should at any time agree with, and no others, should and lawfully might, from time to time, and at all times during the term of fourteen years next and immediately after the date of the said Letters of Registration, make, use, exercise, and vend within the said Colony of New South Wales an invention for "Improvements in Machinery or Apparatus for stamping Ores and other hard substances"; and whereas, in order to obtain such Letters of Registration, we must, by an instrument or specification in writing under our hands and seals, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed: Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement in writing, and on reference to the accompanying sheet of drawings (that is to say) :—

This invention relates to Improvements in Machinery or Apparatus for stamping Ores and other hard substances, whereby such substances are more advantageously and efficiently stamped or crushed than by the means hitherto used.

In order that our invention may be distinctly understood, we have annexed hereunto one sheet of drawings illustrative thereof, and have marked the same with figures and letters of reference corresponding with those in the following explanation thereof (that is to say),—

On the accompanying drawings—

Figures 1 and 2 respectively represent the front and a side elevation of the improved machine.

a represents a strong frame, of either wood or iron, above which is placed, in suitable bearings, *b*, a crank shaft, *c*, having two or more throws or cranks, *d* (according to the number of stampers required), which are so arranged that the connecting rods *e* and their attachments carrying the stamp heads *f* balance each other and lessen the power necessary to impart the requisite motion.

The rods *e* are made so as to admit of their being lengthened or shortened at the joint *g* according to the wearing away or renewal of the stamp heads, and are attached by bushes, *h*, to the cranks *d*, and by saddle-pieces, *i*, to the top of metal springs, *j*. The saddle-pieces are provided with a joint, *k*, to allow of the necessary motion for the swing of the rods *e*, and also with bushings, *l*, which work freely over the stamp rods *m* and allow full liberty for the stroke of the springs, but prevent the latter being moved from their vertical position.

The stamp rods *m* are each suspended or attached to its spring *j* by means of connecting rods, *n*, a boss, *o*, and pin, *p*, to which are attached guide blocks, *r*, working in slides, *s*, and which serve to keep the rods *m* in their proper position, the latter working also in additional extensions, *t*, of the framing *s**, and in loose bushings, *u*, placed in the cross-piece *a**, which protect the rods and guides from any sudden jar or shock which may sometimes occur in stamping, and which, being placed above the coffer *v*, are free from the action of the water and grit therein.

The coffer consists of a strong frame, *v*, surrounding the stamp heads *f*, and provided with the necessary gratings or sieves, *w*, through which the ore stuff passes when sufficiently pulverized.

The machine is actuated by a strap and pulley, *x*, keyed on the shaft *c*, and when the full or necessary speed is obtained, the stroke of the stamp rods *m* is about four times the throw of the cranks *d*.

The ore stuff is shot in at the back, *y*, of the coffer, together with a sufficient quantity of water, and the pulverized stuff passes through the gratings into a trough, to be conveyed to the buddles or other washing apparatus.

A stream of water is or may be conveyed by a pipe down by the sides of the rods *m* and through the bushings *u*, and so serve for the double purpose of lubricating and washing.

When crushing dry, however, the water supply is dispensed with, and in place of the gratings or sieves *w*, covers or flaps of suitable material are or may be applied to the openings in the coffer in the usual way.

The stamp heads or dies may be of any form, and the arrangement for actuating the same varied according to special circumstances or requirements.

Various methods may be employed for feeding the machine, amongst which may be mentioned that of setting a shoot behind the coffer at such an angle as to allow the ore stuff to fall gradually toward the heads of the stamps, and which, after being sufficiently pulverized thereby, is washed through the gratings by the water, or again by means of a trough or cylinder containing an Archimedean screw driven from the shaft *c*, and of such pitch and diameter as will allow of the ore stuff being freely passed down, or the ore stuff may be passed into a shaking shoot capable of being raised or lowered to regulate the supply under the stamp heads.

Having

Improvements in Machinery or Apparatus for stamping Ores and other hard substances.

Having now particularly described and ascertained the nature of our said invention, and the manner in which the same is to be performed or carried into practical effect, we have to state, in conclusion, that we claim as our invention the general combination and arrangement of the machinery or apparatus for stamping ores and other hard substances, substantially as hereinbefore described, and as illustrated on the accompanying drawings, and especially the particular combination and arrangement of the component parts thereof as above described and shown on the accompanying drawings, or any mere modification thereof.

In witness whereof, we, the said William Willoughby, Joseph Willoughby, and Samuel Willoughby, have hereunto set our hands and seals, this twenty-eighth day of October, in the year of our Lord one thousand eight hundred and seventy-two.

WILLIAM WILLOUGHBY. (L.S.)
JOSEPH WILLOUGHBY. (L.S.)
SAMUEL WILLOUGHBY. (L.S.)

Signed and sealed in the presence of—

JOHN GARD EDMUNDS, jr., No. 5, Courtenay-street, Plymouth, Notary Public.

This is the specification referred to in the annexed letters of Registration granted to William Willoughby, Joseph Willoughby, and Samuel Willoughby, this seventh day of February, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 6 January, 1873.

SIR,

The Petition of Messrs. W., J., & S. Willoughby for Letters of Registration for Improvements in Machinery or Apparatus for stamping Ores and other hard substances having been referred to us, we have examined the drawings and specifications accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH.
E. C. CRACKNELL.

A.D. 1873, 18th February. No. 345.

IMPROVEMENTS IN BOTTLES.

LETTERS OF REGISTRATION to Henry Perry, for Improvements in Bottles.

[Registered on the 18th day of February, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HENRY PERRY, of London, in Great Britain, late of Lonsdale-street, Melbourne, Victoria, machinist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Bottles," which is more particularly described in the specification and drawing which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Henry Perry, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Henry Perry, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Henry Perry shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighteenth day of February, in the year of our Lord one thousand eight hundred and seventy-three.

(i.s.)

HERCULES ROBINSON.

Improvements in Bottles.

SPECIFICATION of HENRY PERRY, of London, in Great Britain, late of Lonsdale-street, Melbourne, Victoria, machinist, for an invention intituled "Improvements in Bottles."

It is well known that bottles having a popular trade-mark upon them are frequently put to a fraudulent use by being refilled with an inferior article after they have been emptied of their original contents. Now this invention has been designed for the purpose of preventing this, by constructing the bottles in such a way as to preclude the possibility of the contents being abstracted without their being broken or materially damaged. This is accomplished by constructing them with a solid top, provision being made for the reception of the fluid with which they are to be filled, by making a perforation at the top or the bottom of the bottle. This perforation is made by preference in the top, and in a conical form. When the bottle is filled this perforation is to be fitted with a conical plug or stopper, by preference of the same material as the bottle, and cemented in so as to prevent its extraction, thus preventing the removal of the contents except by the breakage of the bottle. To do this without loss they are each made with a projecting flange at the top, so as to permit of their being knocked off with the greatest facility and the contents poured out through the neck, but yet utterly destroying the bottle for fraudulent purposes. The plug should not project above the top of the bottle. If preferred, a cork may be compressed so as to enable it to be pushed through the conical hole and take its place in the neck of the bottle. The drawing hereto attached shows a bottle with both plug and cork, A being the plug, and B the cork; C being the flange by which the top is knocked off so as to get at the contents.

Having thus described the nature of this invention, and the manner of performing same, I would have it understood that I do not confine myself to the precise details herein set forth, such as the size or shape, or materials of which my invention may be made or manufactured, but I claim—

The construction and use of bottles having a solid top, with a projecting flange, and a perforation at the top or bottom fitted with a plug, substantially as herein described and explained.

In witness whereof, I, the said Henry Perry, have hereto set my hand and seal, this twenty-first day of November, one thousand eight hundred and seventy-two.

HENRY PERRY,
By his Attorney duly authorized,
NICHOLAS LA FEUILLADE.

This is the specification referred to in the annexed Letters of Registration granted to Henry Perry, this eighteenth day of February, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 20 January, 1873.

SIR,

We do ourselves the honor to recommend that Letters of Registration be granted, securing to Mr. Henry Perry, of London, in Great Britain, late of Lonsdale-street, Melbourne, Victoria, the exclusive enjoyment of his invention, intituled "Improvements in Bottles," in accordance with the specification, drawing, and claim transmitted for our report, under your B.C. communication of the 3rd January, 1873, herewith returned.

We have, &c.,
E. C. CRACKNELL.
GOTHEK K. MANN.

THE PRINCIPAL UNDER SECRETARY.

[Drawing—one sheet]

Perry's Patent.

*This is the Drawing referred to in the annexed Letters
of Registration granted to Henry Perry, this eighteenth
day of February, 1873.*

A.D. 1873, 18th February. No. 346.

AN IMPROVED METHOD OF PURIFYING AND DECOLOURIZING STEARIC ACID.

LETTERS OF REGISTRATION to Theophilus Kitchen, for an Improved Method of purifying and decolourizing Stearic Acid.

[Registered on the 18th day of February, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THEOPHILUS KITCHEN, of Melbourne, in the county of Bourke and Colony of Victoria, soap and candle manufacturer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "An improved method of purifying and decolourizing Stearic Acid," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Theophilus Kitchen, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Theophilus Kitchen, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Theophilus Kitchen shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighteenth day of February, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

An Improved Method of purifying and decolourizing Stearic Acid.

SPECIFICATION of THEOPHILUS KITCHEN, of Melbourne, in the county of Bourke and Colony of Victoria, soap and candle manufacturer, for an invention intituled "An improved method of purifying and decolourizing Stearic Acid."

THIS invention consists of the use of mineral oil, such as kerosene, petroleum, or paraffine, as a hardening and decolourizing agent in the treatment of stearic acid. If the oil is not of a tolerably light colour itself, it will only harden—not decolourize; but if it is of a light colour it will do both.

It is well known that various processes are in use by candle manufacturers for the manufacture of the stearic acid, and although mineral oil is equally efficacious, no matter by what process it is produced, yet I prefer to work by what is known as the sulphuric acid saponification process. According to this method, the fatty bodies in use are made into fatty acids by admixture with sulphuric acid, at a heat which varies according to the judgment or fancy of the operator; the sulphuric acid being used either strong or diluted with water. After this the acids so produced are washed, and are then more or less of a black colour. To remove such colour and impurities it is usual to submit the same to distillation. This is attended by considerable waste, and is a costly process, while at the same time it is admitted that the percentage of such candle material on the fatty body used is decreased and its quality lowered; whereas by the use of mineral oil instead of distillation, the candle material is not injured and suffers no decrease in quantity.

My mode of procedure is as follows:—When the black acids have been made as above, I at once subject them to pressure in the usual way, for the purpose of removing the oleic acid. The stearic acid is then melted and mixed with a quantity of a light-coloured mineral oil, such as that known as kerosene, petroleum, or paraffine (but I prefer kerosene), and again submitted to pressure, when it is found that all the dark colour and impurities are carried away in the oil, leaving the stearic acid white and ready for use. The percentage of oil I use depends upon the quality of the stearic acid and the temperature of the atmosphere, decreasing as the quality of the acid improves, and increasing as the heat of the atmosphere lessens. In the ordinary way I should use ten hundredweight of oil to double the quantity of stearic acid.

The omission of the distillation in the sulphuric acid saponification process permits of the manufacture of stearic acid as good as, if not superior to, that produced by what is known as the open lime process, while the yield of candle-stuff is greater, and the cost of the chemicals about 80 per cent less.

Care should be taken to keep the temperature of the mixed materials as low as possible, to avoid loss by evaporation of the light oil.

I purify the used oil by distillation, and use it afresh, although any other of the well-known processes of purifying might possibly answer as well.

Having thus described the nature of my invention and the manner of performing same, I would have it understood that I do not confine myself to precise details, so long as the nature of my invention be retained; but I claim the use of mineral oil, such as kerosene, petroleum, or paraffine, as a hardening and (in the event of its being of a light colour) a decolourizing agent, in the treatment of stearic acid, substantially as herein described and explained.

In witness whereof, I, the said Theophilus Kitchen, have hereto set my hand and seal, this twenty-fifth day of November, one thousand eight hundred and seventy-two.

THEOPHILUS KITCHEN.

This is the specification referred to in the annexed Letters of Registration granted to Theophilus Kitchen, this eighteenth day of February, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 17 January, 1873.

SIR,

The application of Mr. Theophilus Kitchen for Letters of Registration for an improved method of purifying and decolourizing Stearic Acid having been referred to us, we have examined the specification accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH.

MACHINE FOR GOLD AND SILVER QUARTZ CRUSHING AND AMALGAMATING, AND FOR GEM-WASHING.

LETTERS OF REGISTRATION to Eugene Roehn, for a Machine for Gold and Silver Quartz crushing and amalgamating, and for Gem-washing.

[Registered on the 27th day of February, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EUGENE ROEHN, of Sydney, in the Colony of New South Wales, naturalist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of a Machine for "Gold and Silver Quartz crushing and amalgamating, and for Gem-washing," which is more particularly described in the specification and the sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Eugene Roehn, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Eugene Roehn, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Eugene Roehn shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-seventh day of February, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Machine for Gold and Silver Quartz crushing and amalgamating, and Gem-washing.

APPLICATION for Letters Patent by EUGENE ROEHN, of Sydney, in the Colony of New South Wales, gentleman, several Medals of Honor, Member of the National Academy of Paris, Member of the Polytechnic Institute, Paris, ex-Vice-President of the National Academy, Bolivia, Corresponding Member of the Agricultural Society of Albany, U.S., &c., &c., &c., for a Machine for crushing Gold and Silver Quartz, for amalgamating the same, and for washing Gold and Silver sands or dust, or alluvial earth containing Gold or Silver, and for crushing or washing Tin Ore or alluvial Tin, or other metals and minerals; and also for washing Gems and Precious Stones.

The process or processes herein described may be carried on either simultaneously or separately, as may be desired. The machine may be worked by hand or horse, or any other animal power, or by steam or water power, or by any known mechanical power.

SPECIFICATION and description of the Machine, and explanation of the accompanying Drawings referring to it.

- O trough. The letter O refers to that portion of the drawing which represents a trough, the bottom of which is the fourth part of a circle of 12 feet in circumference, and is 1 foot deep and 10 inches long. This trough may be constructed of timber and iron, or of iron altogether, and is intended to work on an angular iron axis or pivot, between two steel rollers, A; thereby enabling the circumference of the circular part of the trough, when in motion, to touch at all and every point in succession the iron floor of the lower trough B, by which means any angle can be obtained. The trough O may be partly or entirely filled with wet sand or other heavy material, to increase its weight while at work.
- A steel rollers.
- B lower trough.
- C C arms.
D D stampers.
- E guide for stampers.
- F anvil.
- G box.
H slide.
- I pivot or axis.
- K amalgamating machine.
- M iron receiver.
- N separator and distributor.
- P drawer.
- Q gauze wire.
R receiver.
S handles.
T hopper.
U distributor.
W drawer.
- C C represent the arms of the machine, to each of which is attached one or more stampers, D D, working either singly or collectively, as may be required.
- E is a guide or slot, in which the axle of the stampers works. These stampers may be composed of timber, in the form of a hollow box, as shown, bound with iron, and shod with cast or wrought iron shoes, and may be filled with wet sand or other heavy material, or they may be composed entirely of iron, and of any weight the machines of different sizes may require. The reason for filling the stampers with wet sand or other heavy material is to give additional force and weight to their descending blow when at work. The sand or other material may at any time be emptied from the trough and stampers, and when it is desired to move the machine from place to place, its portability is thereby greatly increased, as the machine is thus rendered much lighter.
- F is the anvil on which the stampers strike, placed on a solid foundation of wood or stone, which forms part of the machine. It is faced with steel or case-hardened iron, and is enclosed in a box, G. The foundation referred to may be strengthened and increased, if necessary, to suit the character of the ground on which the machine is to work. The box G receives the quartz or stone, which is therein subjected to the first crushing process, being treated by the stampers. It then passes through the slide H into the trough B, and is there treated by the crushing trough O and reduced to powder; after which it passes through the opening in the pivot or axis I into the amalgamating box. It is by causing the trough O to oscillate on its axis that the stampers D D are brought into contact with and crush the quartz, which, after being crushed, is reduced to powder by the trough O.
- K is a dry amalgamating machine, composed of a timber box or receiver, of dimensions to suit the different sized machines, and fitted with a wrought-iron screwed pipe, securely fixed to an iron plate, and screwed to a cast-iron receiver, M, which is partly filled with mercury, and which can be unscrewed whenever it may be necessary. N a separator and distributor. This being occasionally worked by means of the handle attached to it, keeps the material contained within it in an amalgamating state, and prevents any settling or adhering to the amalgamator. In the body of the trough O, and secured as seen in drawing, is a drawer, P, the bottom of which inclines from the centre to each side. A zig-zag, or strips of wood, placed at an angle, as shown, acts as a distributor of the alluvial gold or silver, or tin, or of the gems or precious stones, or other material subjected to the process of washing. A plate of gauze wire, or of perforated metal, Q, is placed at each end, through which the fine particles of the metal pass into the receiver R, which can be taken out and emptied through the diagonal bracing on the side of the trough.
- S, handles to take out washing tray.
T, hopper to supply the washing tray with material.
U, distributor.
W, drawer for emptying washing tray.

NOTE.—Under the anvil there is placed a square piece of lead, to prevent the jump of the stamper on striking the anvil.

The principle adopted in the construction of the machine herein described may be adopted in the construction of similar machines of any size. The length of the arms may be increased for the purpose of carrying the stampers to whatever extent is desirable, thereby securing additional power; and the stampers themselves may be disconnected and worked by the leverage caused by the oscillation of the trough.

CLAIMS for the novelty and utility of the invention.

The adaptation of the principle of using stampers or hammers for breaking stone or quartz or other minerals in this manner is entirely new, no such stampers or hammers having been worked heretofore by an oscillating motion. The principle of reducing to fine particles the material broken by the hammers or stampers, by means of a partly cylindrical trough, the motion being obtained by an angular axis working on anti-friction rollers, is also new, and it enables the entire lower surface of the lower part of the machine to come into contact successively with every point of the bottom of the trough. The principles made use of in the working of this machine are quite new in their application, and have never been

Machine for Gold and Silver Quartz crushing and amalgamating, and Gem-washing.

been applied to any machine for the purpose to which I now propose to employ them. The machine is unique of its kind, and has not been invented by any other person in any part of the world. The portability of the machine when not weighted for the purpose of crushing, and the power of immensely increasing its effective force by filling the trough and stampers with wet sand or other heavy material, are great recommendations to its use. The number of stampers can be augmented as required. It can be repaired on the spot where it is at work by any miner, in the event of any part of it being broken.

Its small size and portability enable it to be easily carried over parts of the country where the conveyance of crushing machines, such as now are in ordinary use, would be almost impracticable. It can also be worked under ground, saving the trouble and expense of raising quartz to the surface, and thus causing great economy in money, time, and labour.

It may be made of wood or iron, or solely of iron.

Any quantity of quartz, from one ton to thousands of tons per day, can be treated without changing anything in the principle of the machine or its form. It requires but a minimum force to crush, wash, and amalgamate simultaneously or separately, at pleasure, and it sends into a receiver charged with mercury the most minute particles of gold or silver (which often escape from the best machines hitherto constructed), as the ore revolving over the mercury deposits itself at the bottom of each receiver.

The trough, or quarter of a circle, has never been used for the purpose herein described, and the peculiar axle, on each side of which is a roller to facilitate the oscillatory motion and to obtain greater degrees of angle, have not been adapted to such an amalgamating machine with its receiver under it. The zig-zag, or diagonal strips of wood, contained in the drawer P, to force the ore attracted by the mercury, and thus deposited in the small receivers, has not been used for the purpose expressed ever before. Respecting the stampers, the blow given as described in the sketch would be from 14 to 16 inches, but the blow can be augmented to 24 or 26 inches, according to the velocity given to the trough and the stamper, and the stamper left independent after being lifted by the trough, the full weight of the stamper falling on the stone or quartz.

The cheapness of this machine places its purchase within the reach of working miners, and enables them to gain daily earnings on their claims—a great boon to those whose limited means do not allow them to purchase the large and expensive machines used for quartz-crushing at the present time.

This machine will benefit the entire mining population, and assist in developing one of the greatest branches of industry in the Colony.

EUG^E. ROEHN.

This is the specification referred to in the annexed Letters of Registration granted to Eugene Roehn, this twenty-seventh day of February, 1873.

HERCULES ROBINSON.

REPORTS.

No. 3, Spring-street,
Sydney, 13 August, 1872.

SIR,

We have the honor to return herewith the Petition of Mr. Eugene Roehn, forwarded to us by your blank cover, under date 31st ultimo, with specification and drawings descriptive of a Machine for "Gold and Silver Quartz crushing and amalgamating, and for Gem-washing," of which he claims to be the inventor, and for which he is desirous of obtaining Letters of Registration.

We have now to state that, after perusal of the specification and examination of the accompanying drawings, we are of opinion that the claimant should be called upon to set out more particularly in his claim the several parts of the said machine which he holds to be novel and of his own invention, or the particular combination (if such be his claim) of known appliances composing the machine, in the use of which he claims the protection of the Letters applied for.

Pursuant to your instructions, we have considered, in connection with the foregoing, the Petition also forwarded to us from Mr. Henry Esplen, claiming to be the author or designer of the machine in question, and requesting that the Letters of Registration thereof may not be granted to Eugene Roehn, but to himself.

Conceiving the latter to be a counter-claim to the property in the invention, the question would not be one within our province to deal with, even were it shown that precisely the same appliances were contemplated by the respective parties; but of this there is no evidence before us, the sketch forwarded by the latter claimant, though apparently disclosing some features of resemblance, being unaccompanied by any specification or details of illustration such as would enable us to arrive at an opinion as to the identity of the proposed appliances.

We have, &c.,
CHAS. WATT.
A. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

No. 3, Gresham-street,
Sydney, 21 November, 1872.

SIR,

We have had the honor to receive the letter of Messrs. Watt & Johnson, transmitted to us by your blank cover of the 18th instant, and purporting to supply the further particulars with reference to the application of Mr. Eugene Roehn for certain Letters of Registration, which we had reported to be necessary to admit of his application being dealt with.

We

Machine for Gold and Silver Quartz crushing and amalgamating, and Gem-washing.

We regret to have still to report that the specification and drawings, even with the additions or explanatory remarks now made, are so general, and devoid of detail and precision, as to render it impossible for us, with any proper regard to the responsibility thrown upon us in the interests of the public, or even of the applicant, to deal with the claim.

It is quite possible that some portion of the processes or machinery (of which the claimant has only given a general description, illustrated by a pen-and-ink sketch of a character such as it is difficult to understand and impossible to recognize as a proper drawing of machinery) may be novel, and a proper subject for Letters of Registration, but at present we cannot do more than state that the applicant has not complied with the requirements of our former Report.

We have, &c.,
CHAS. WATT.
A. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

No. 3, Gresham-street,
Sydney, 14 January, 1873.

SIR,

We have now the honor to return the letters of Messrs. Watt & Johnson, forwarded to us by your blank cover, No. 73-76, of the 7th instant, with amended specification and drawings of a certain invention of Machinery for Gold and Silver Quartz crushing and for Gem-washing, for which Letters of Registration are claimed by Mr. Eugene Roehn.

We regret to have to state that even now the specification is far from satisfactory as regards the precise claims which the Letters of Registration are designed to secure; but as the nature of the machinery is described with sufficient precision, and illustrated sufficiently in detail for general information in the revised drawings, we do not feel warranted in further opposing the issue of Letters of Registration for an invention which appears to be novel, solely on account of objections which are now mainly matters concerning the inventor and those who are interested with him in the application.

We have, therefore, the honor to recommend that Letters of Registration be granted as applied for, for the machinery and appliances as a whole, set forth in the amended specification and drawings herewith returned.

We have, &c.,
CHAS. WATT.
A. O. MORIARTY.

A.D. 1873, 18th March. No. 349.

IMPROVEMENTS IN TREATING FIBROUS SUBSTANCES FOR TEXTILE PURPOSES AND FOR THE MANUFACTURE OF PAPER STOCK.

LETTERS OF REGISTRATION to Thomas Routledge, for Improvements in treating Fibrous Substances for Textile purposes and for the manufacture of Paper Stock.

[Registered on the 18th day of March, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS ROUTLEDGE, of Ford Works, near Sunderland, in the county of Durham and Kingdom of England, paper manufacturer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in treating Fibrous Substances for Textile purposes and for the manufacture of Paper Stock," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Routledge, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Routledge, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Routledge shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighteenth day of March, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in treating Fibrous Substances for

SPECIFICATION of THOMAS ROUTLEDGE, of Ford Works, near Sunderland, in the county of Durham and Kingdom of England, paper manufacturer, for "Improvements in treating Fibrous Substances for Textile purposes and for the manufacture of Paper Stock."

THE objects of this invention are the preliminary preparation and the subsequent treatment of raw vegetable fibrous substances, in order to reduce them into a fibrous condition suitable for "textile" purposes and for "paper stock," as also for the utilization of the by or secondary products resulting therefrom.

The said preliminary preparation consists in a process or series of processes whereby the gluten, starch, and other amylaceous, gummo-resinous, and extractive compounds which more or less constitute a large proportion of the bulk and considerable percentage of the weight of all raw vegetable fibrous substances, are decomposed or partially decomposed so far that the ultimate fibres may be separated or eliminated wholly or partially therefrom, thus constituting "paper stock"; or the said ultimate fibres so preliminarily prepared may be further disintegrated by heckling, willowing, carding, or other analogous process, so as to be adapted for spinning and various other "textile" purposes, the residuary amylaceous and proteine compounds being, if desired, collected and utilized.

It is well known that most fibres employed in "textile" manufactures, with the exception perhaps of silk and cotton, are separated or prepared for separation from the attaching stalk or parenchyma with which during their growth they are naturally combined, by a process of steeping or retting in water, which induces a species of fermentation whereby the parenchymous, amylaceous, or gummo-resinous compounds or matters are so decomposed, or partially decomposed, that by the further mechanical processes of rolling, breaking or beating, scutching and heckling, the ultimate fibres are separated therefrom. Such steeping or retting processes, however, as now practised, occupy a very considerable time, and require to be very carefully conducted and watched.

I have discovered that when a certain class of raw vegetable fibrous substances are subject to a preliminary alkaline steep, and from that transferred to a fermentative steep produced artificially as herein-after described, the time necessitated for such steeping is very much reduced; and further, by adjusting the temperature of such steeping operations, the desired decomposition and subsequent separation and elimination of such parenchymous and other extraneous substances or compounds combined with the ultimate fibres is materially expedited and promoted, and at the same time readily controlled.

The class of fibrous substances to which I have found the above preliminary system of treatment more especially applicable are those combined with or containing a large proportion of gluten, starch, and similar amylaceous and gummo-resinous compounds, such as begasse or sugar-cane refuse, maize straw and leaves, rice straw, musa or plantain, pine-apple, yucca, phormium tenax, &c. It is also applicable to the treatment of flax, hemp, jute, rhea fibre, and similar fibrous substances used more especially for "textile" purposes.

According to my said invention, the preliminary or first steep is composed of lime water, that is, water in which caustic or hydrate of lime has been dissolved. I use lime for economy, but any other alkaline steep may be employed. I immerse the fibrous substances to be treated in a tank or one of a series of tanks or vessels hereinafter described, filled with the alkaline steep liquor, taking care that they shall be submerged or covered, and allow them to remain therein from about twenty-four to thirty-six hours; if at the ordinary temperature of the water where such fibrous substances are produced, say from about 50 to 70 degrees Fahrenheit, by the action of such alkaline steep the parenchymous covering and amylaceous and proteine compounds combined with the fibres will be so far attacked or affected as to admit of and facilitate the action of the following or fermentation steep, which (the lime or other alkaline steep liquor being drained or pumped off) may be conducted in the same, but, by preference, in one or more of another adjacent series of tanks or vessels, the fibrous substances being placed therein and ferment liquor added thereto, so as to cover the fibrous substances. The time required for this second or ferment steep will be from thirty-six to seventy hours, according to the atmospheric temperature. Such ferment steep is composed of water to which has been added a portion of the ferment resulting from a previous ferment steep, or fermentation may be induced by adding yeast or other fermenting substance thereto, the natural previously created ferment being preferable; and such ferment in the first instance may be created by allowing a certain portion of the fibrous substances previously treated by an alkaline steep to remain under steep until fermentation has been naturally induced, when by using the ferment thus created the process of steeping may thereafter be conducted continuously from one steep vessel to another, through the series of vessels, with fresh charges indefinitely.

It will be remarked that both the alkaline and fermentative steeps may be effected by using water at the natural temperature; but in order to expedite both the said steeping processes and economize the plant or apparatus required, I prefer the application of heat, as, according to the elevation of temperature of the steep liquors, the time required for steeping is materially reduced or abridged, and more readily controlled. For example, the best results are obtained by alkaline steeping from about 110 to 120 degrees for about ten to twelve hours, and ferment steeping at about 100 degrees for about ten to twelve hours; sufficient decomposition of the extraneous compounds, without injurious action on the ultimate fibres, being thereby attained, with most convenient and regular working of the steeping plant or apparatus and succeeding processes.

The plant or series of tanks or vessels in which the aforesaid steeping processes (as also those for the subsequent boiling, washing, and bleaching processes hereinafter to be described) are performed may be constructed of any convenient form of wood, masonry, concrete, or metal sunk into or placed on the surface of the ground; but as crude or raw vegetable substances in their normal condition are generally extremely bulky, for economical considerations, especially when mere steeping alone is desired, it will be found most convenient to construct them in the ground, and of capacity sufficient to contain a ton or thereabouts of the fibrous substances to be treated. The vessels should be water-tight, furnished with perforated false bottoms, and connected together by pipes or channels fitted with the necessary cocks or valves in order to connect or disconnect each vessel as desired, in such manner that the warm steep or other liquor being run into the top of the first vessel of the series (charged with the material to be treated),

which

Textile purposes and for the manufacture of Paper Stock.

which is connected by a pipe or otherwise from under the false bottom to the upper portion of the second vessel of the series by hydrostatic pressure is forced or gravitated downwards, and then upwards successively and continuously through eight, ten, or more vessels constituting the series, the eighth or last vessel of the series being connected by a return pipe or other channel with the first of the series, so that the steeping, boiling, or other processes may thus be proceeded with continuously; and, as each vessel is also provided with a connection fitted to and under the false bottom, it may be emptied as desired. By this system the steep or other liquors may be used again and again until they have become inoperative or surcharged with extractive matter, meanwhile, however, utilizing the heat, if heat be employed, and thus economizing fuel and water; or the whole or a certain portion of the liquors in either case may be run off to waste, or otherwise utilized, and fresh added to supplement the portion thus run off and revivify the steep or other liquors; or the steep or other liquors may be pumped or syphoned from one vessel to another as may be desired; but I have found the continuous system as described most convenient in practice. The temperature of the steep liquors is maintained by blind pipes, laid under the false bottoms of the vessels, heated by steam or water, or naked steam may be employed for such purpose.

It will be known when the effect desired has been attained by taking a portion of the fibrous substances which have been treated in the hand, when, if they are found to have lost their natural harshness, and to have become soft, viscous, or greasy, and the fibres readily separated or detached from the parenchyma and from each other by rubbing, they may be removed from the steep and subjected to pressure in any convenient manner, or without pressure, trodden on a paved floor, passed through stampers or rollers, or otherwise treated to complete the disintegration resulting from the steeping processes previously described, washed in water, when the glutinous and other compounds or substances will separate freely therefrom. The comparatively clean fibre or fibrous material may be pressed into cakes in any convenient manner, and dried artificially or otherwise, or by preference, especially if the cost of carriage is an object, the fibres may be reduced materially in bulk and still further deprived of extraneous matter after being pressed to extract the excess of moisture, by passing them when dried, or partially dried, through a willow or carding machine, by which they will be converted into a fibrous or tow-like condition, when they may be baled, forming in this condition crude "paper stock." The glutinous proteins or other compounds left diffused in the washing waters will deposit in the vessels, and may be collected and utilized.

If the fibres are desired only for "textile" purposes, neither the alkaline nor the ferment steeping processes should be carried so far as when the fibres are desired for "paper stock"; partial decomposition of the parenchyma and protein compounds having been sufficiently effected, further disintegration of the fibres should be produced by greater mechanical manipulation of the rolling and washing processes, and by subsequent scutching, heckling, &c., &c.

The crude "paper stock" prepared as described is suitable for conversion into brown wrapping and other common papers; but when it is desired to manufacture therefrom printing, writing, or other bleached papers, such "paper stock" must be subjected to a process of boiling in alkaline leys, as ordinarily practised, or by the peculiar system of boiling which I now proceed to describe. The system of boiling which I prefer, not only for such crude "paper stock" prepared as described, but for other fibres or fibrous materials to which the foregoing preliminary steeping processes are not applicable, consists as follows:—I employ for the said boiling and subsequent washing processes a similar series of eight or more vessels to those hereinbefore mentioned, so connected together that I can employ the alkaline ley for boiling again and again until the free alkali therein is completely neutralized, by which I effect a great saving, not only in the original relative percentage quantity of alkali employed, but I save fuel, and enormously reduce the quantity of water required by the ordinary process as now followed, besides producing the desired effect upon the fibrous material under treatment, with the minimum of waste or loss to such material.

The vessels may be heated in any convenient manner, by injection of either low or high pressure or superheated steam, or by blind pipes with steam or water circulating therein. I prefer employing the Bowking or vomiting system, as it is desirable that circulation of the alkaline leys be from time to time kept up during the boiling process, the same being also necessary to maintain the requisite temperature of the leys. This is most conveniently effected by injecting steam into the kier or vessel immediately under the ordinary vomiting pipe, which is fixed in the centre of the kier and attached to the false bottom thereof; this system being applicable with either low or high pressure steam, and to either an open or a closed vessel or boiling-pan. It is desirable the bonnet superimposed over the vomiting pipe should be adjustable, to control the flow and circulation of the vomited leys; and where fuel is costly, I prefer the special arrangement of blind pipes for producing boiling and circulation hereinafter described.

In commencing the boiling process, one of the vessels of the series being filled with the fibrous materials to be treated, I run thereon the boiling ley, filling the vessel above the level of the pipe or channel connecting it with and to the next vessel of the series; which second vessel being charged, I again run a charge of ley into the first vessel, which the valve of communication being then opened from under the false bottom of the first vessel, an equivalent quantity of ley is forced by gravitation from it into No. 2 vessel, by which time No. 3 vessel is charged, and so on progressively and continuously; so that assuming ten hours would, by the ordinary system, be employed for boiling with one charge during such period of my system five successive charges would be run on over and through the fibres in No. 1 vessel, which would then be found to be sufficiently boiled. I then disconnect No. 1 by closing the connection between it and No. 2 vessel, thus constituting No. 2 for the time being No. 1 vessel, and run water into No. 1 for washing. No. 2 having received its full charge of ley, is then disconnected from No. 3, which in its turn becomes as it were No. 1, and No. 2 is connected again with No. 1, and a fresh charge of washing water being run into No. 1 forces over a corresponding quantity into No. 2. By this system it will be seen that both the leys and the succeeding rinsing or washing waters will be used again and again. By the time the first ley introduced has reached No. 5 or No. 6 vessel it will be found to have become neutralized by the gummo-resinous colouring and extractive matters, and may then be run off to waste or evaporated, to recover the alkali therefrom, and when the succeeding washing waters have been run progressively in the

Improvements in treating Fibrous Substances for

same manner from vessel to vessel it will be found that by the time they have reached (say) the sixth or eighth vessel, they will have attained the same strength as the original ley. The fibrous material in No. 1 being perfectly cleansed, and if desired, cooled by a final rinsing water, may then be removed from the pan or vessel, and is ready for bleaching without further mechanical or other washing.

By this means I am enabled to employ concentrated leys, thus saving at least two-thirds the quantity of water usually employed, thereby insuring economy of the fuel required for maintaining the necessary temperature during the boiling process, reducing also the quantity of water to be subsequently evaporated, and thus effecting a further saving if it is desired to recover the alkali employed. Moreover, as each fresh charge of alkali removes and (so to speak) pushes forward the proteine and colouring matters, every successive charge acts on fresh surfaces, and the ultimate cleansing and purification of the fibres is insured, with a saving of 30 per cent. and upwards of the alkaline now employed, and, as previously remarked, with less injurious action upon the fibrous materials under treatment.

For instance, with esparto, the present practice is to use not less than 8 per cent., and frequently 10 per cent. and upwards of soda to the ton of fibre under treatment. By the foregoing system, I find from about 5 to 7 per cent. sufficient, or even less, and I also am enabled to recover a larger proportion of the effete alkali after it has been used in the boiling process, and from the washing and rinsing waters which are also by being thus used again and again concentrated to nearly an equal strength of contained soda to the original leys employed.

In the ordinary process of boiling now practised in single or detached kiers or other vessels, the charge of alkaline ley requisite to treat a ton of fibrous material such as esparto is from about 900 to 1,000 gallons, such alkaline ley being constituted by from about 8 per cent. to 10 per cent. of soda to the fibre treated. By my continuous system, as hereinbefore described, I am enabled to use the ley in a far more concentrated form, the quantity of liquor being reduced to about 300 to 400 gallons, and its relative percentage strength of soda to the fibre treated to about 6 per cent. to 7 per cent., thus saving about three cents of alkali and more than half the water to be boiled and ultimately evaporated, if the soda is intended to be recovered.

Having thus so far described the preliminary preparation by alkaline and fermentative steeping, and the subsequent system of boiling and washing, I have now to add that when fuel is not an object of economy a material reduction in the time required for the said preliminary steeping processes, and a consequent saving of the plant or apparatus employed therein, may be effected by still further elevating the temperature of the lime or other alkaline steep to from about 160 degrees to 180 degrees, and continuing the same from about eight to ten hours, the warmth mellowing, softening, and swelling the fibrous substances, so that the covering silicious coating and their pores are more readily permeated and acted upon, the parenchyma and proteine compounds being thereby sufficiently decomposed to allow of their being readily removed by the processes hereinbefore described.

It is desirable when subjecting bogasse or similar harsh ligneous fibres to the above treatment to increase the quantity of lime present in the steep liquors, not, however, exceeding from about 15 to 25 per cent. of the fibre treated; but in treating maize and similar fibres of a more delicate texture, the lime or other alkaline steep liquor should be clear or nearly clear.

Bogasse thus treated, or by the alkaline and fermentative steeps as first described, can then be efficiently boiled by my peculiar continuous or other system, and manufactured into fibrous "paper stock" fit for bleaching and conversion into pulp and paper with one-half or less than half the quantity of soda were such preliminary processes omitted.

With maize and similar fibres the saving of soda will be in the same proportions, and with such fibres when thus preliminarily treated the soda may be used in its mild or carbonated form.

When it is desired to utilize the glutinous and amylaceous compounds produced, they should be washed in fresh water to purify them from the alkaline and fermentative steep liquors; such water, however, need not be wasted, as if allowed to repose these compounds will be deposited, and can then be removed and reduced to a compact condition and dried for transit.

When it is desired to bleach the "paper stock" or fibrous substances, I prefer to employ a continuous system by hydrostatic percolation, in a similar series of vessels connected together as previously described with respect to the boiling and steeping processes; such "paper stock" purified by washing may then be dried and prepared for transport in any convenient manner. The special arrangement of blind pipes hereinbefore referred to for boiling is as follows:—I take wrought-iron tubing, say of 1 to 2 inches diameter, and bend the same into a helix or coil proportioned in height to the size of the vessel in which the materials are boiled, the internal diameter of the said helix being kept from about 5 to 8 inches, and its exterior surrounded with thin sheet iron, when it forms as it were the vomit pipe. I connect the bottom of the said helix with a coil of pipe formed into a flattened worm or volute, corresponding with the diameter, and placed under the false bottom of the pan or boiling vessel, the extremity of said worm or volute being protruded through the bottom of the pan, and furnished with a tap, so that steam being admitted into the upper portion of the helix passes through the whole coil of pipe, the tap being so regulated as merely to allow the condensed steam as water to escape.

The washing arrangement hereinbefore referred to consists of a drum or cylinder with open ends mounted on bearings driven in any convenient manner, covered with wire cloth or similar reticulated material, the said drum revolving in a case or trough, and its interior being filled with shelves placed diagonally or transversely thereto, four, six, or more in number, forming as it were a hollow screw, so that the material being fed thereto will be rotated therein, and gradually passed through the drum, and a pipe or stream of water being supplied to the interior of the drum, such material during its passage is cleansed from the glutinous and other compounds which pass through the exterior reticulated surface of the covering of the drum into the exterior case, from which they can be removed, while the cleansed fibre is discharged from the further end of the drum. A convenient size for such drum will be (say) from 9 to 12 feet long, and 4 to 5 feet in diameter.

Textile purposes and for the manufacture of Paper Stock.

CLAIMS.

First.—The preliminary preparation of raw vegetable fibrous substances, in order to reduce them into a fibrous condition suitable for "textile" purposes and for "paper stock," by steeping the same in an alkaline bath, and subsequently subjecting them to a fermentative steeping, substantially as and for the purpose hereinbefore described.

Second.—The continuous system of boiling in a series of vessels connected together, substantially as and for the purpose hereinbefore described.

Third.—The continuous system of bleaching vegetable fibrous substances, substantially as hereinbefore described.

Fourth.—The peculiar construction and arrangement of apparatus for steeping, boiling, bleaching, and washing vegetable fibrous substances, as hereinbefore described.

Fifth.—The utilization of the by or secondary products resulting from vegetable fibrous substances when treated in the manner hereinbefore described.

This is the specification referred to in the annexed Letters of Registration granted to Thomas Routledge, this eighteenth day of March, 1873.

HERCULES ROBINSON.

REPORT.

No. 3, Gresham-street,
Sydney, 10 February, 1873.

SIR,

We have the honor to return the Petition of Thomas Routledge for a grant of Letters of Registration for "Improvements in treating Fibrous Substances for Textile purposes, and for the manufacture of Paper Stock," transmitted to us for our report by your blank cover of the 30th ultimo.

We now desire to state that, having considered the claims set forth in the Petition and accompanying specification, we are not aware of any objection to the granting of Letters of Registration as applied for.

We have, &c.,

CHAS. WATT.
A. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

MEALER OR PULVERIZER.

LETTERS OF REGISTRATION to George Bishop, for a Mealer or Pulverizer.

[Registered on the 5th day of April, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS GEORGE BISHOP, of Sydney, in the Colony of New South Wales, Esquire, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of a process for the reduction of all metallic ores and quartz to an impalpable powder, which invention is more particularly described in the specification and drawing which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said George Bishop, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said George Bishop, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said George Bishop shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fourth day of April, in the year of our Lord one thousand eight hundred and seventy-three.

(I.S.)

HERCULES ROBINSON.

Mealer or Pulverizer.

SPECIFICATION of GEORGE BISHOP's invention for a Mealer or Pulverizer for pulverizing mineral ores and reducing them to an impalpable powder.

THIS invention consists of an improved machine for the pulverization of all mineral ores to an impalpable powder, which machine consists of a pot or mortar with a shaft or pestle with a nearly fitting semi-circular base, the rapid revolving of which gives it an oscillating and smearing motion which completely perfects the powdering of the mineral ores, and which discharges the powder through a hole in the bottom of the pot.

The drawing of such a machine as that described is annexed to this specification.

What is claimed is the machine as already described for use, in the exclusive operation of pulverizing mineral ores.

GEO. BISHOP.

This is the specification referred to in the annexed Letters of Registration granted to George Bishop, this fourth day of April, 1873.

HERCULES ROBINSON.

REPORTS.

Sydney, 4 March, 1873.

SIR, We do ourselves the honor to return to you the documents transmitted under your B.C. communication of the 26th ultimo, No. 1,470, and to report that we are of opinion, on examination thereof, that the claims set forth in Mr. George Bishop's specification are untenable, with the exception of so much thereof as relates to the use of the "Pulverizer," detailed in the drawing annexed, for the exclusive operation of pulverizing mineral ores, and we therefore recommend that Mr. Bishop be requested to revise his claims accordingly.

We have, &c.,

GOTHEK K. MANN.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

Sydney, 13 March, 1873.

SIR, We do ourselves the honor to recommend the issue of Letters of Registration securing to Mr. George Bishop the right to his invention of the "Mealer or Pulverizer for the exclusive operation of pulverizing mineral ores," as detailed in the specification, drawing, and claim, transmitted for our report under your B.C. communication of the 12th instant, No. 1,984, herewith returned.

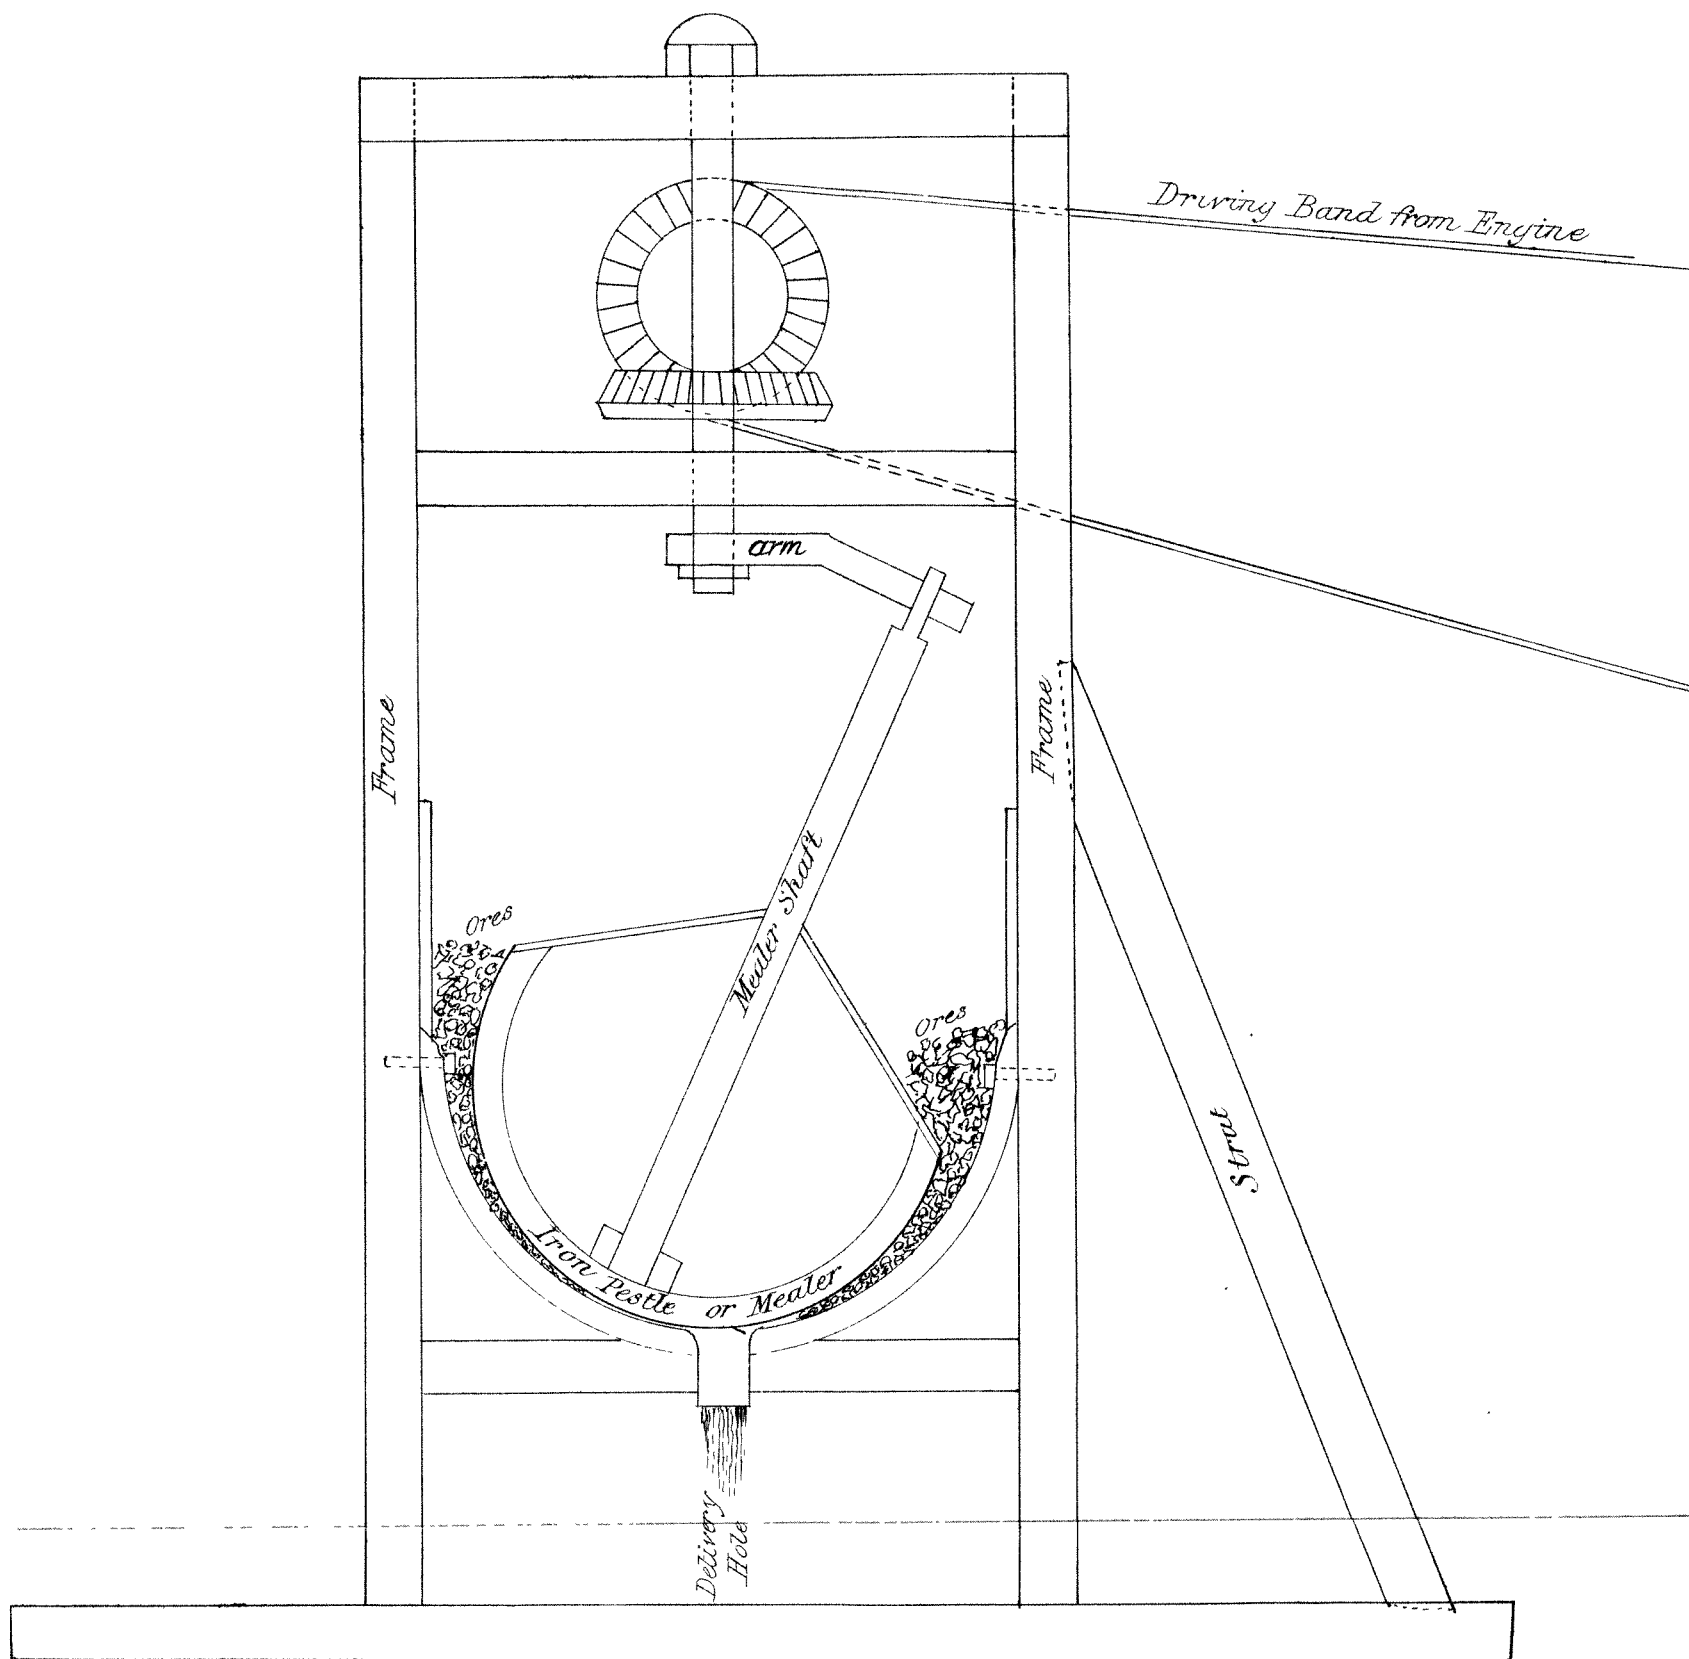

We have, &c.,

A.D. 1873, 7th April. No. 351.

INVENTION FOR THE SAFETY OF TRAINS RUNNING ON NARROW GAUGE RAILWAYS.

LETTERS OF REGISTRATION to Nicholas Trengrouse, for an Invention for safety of Trains running on Narrow Gauge Railways.

[Registered on the 8th day of April, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS NICHOLAS TRENGROUSE, of Stanmore Road, Marrickville, near Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention or improvement to the safety of Trains running on Narrow Gauge Railways, which invention is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Nicholas Trengrouse, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Nicholas Trengrouse, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Nicholas Trengrouse shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of April, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Invention for the Safety of Trains running on Narrow Gauge Railways.

SPECIFICATION of an Improved Safety Invention for Narrow Gauge Railways.

THE object of this invention is to prevent the possibility of a railway train overturning upon any contracted gauge of railway (however contracted the same may be), by having attached to the framework of the permanent way safety wings, of either wood or iron, or of wood and iron combined (see drawing lettered CCC, and transverse section tinted pink, lettered DD) and by safety wheels mounted and attached to rolling stock, lettered EE on drawing; the safety wheels to act vertically upon the underside of the safety wings (should there be any inclination to overturn), and thus comparatively clamp the rolling stock down to the permanent way. The safety wheels acting on the outside of the permanent way, and on the opposite side to the train-carrying wheels (as shown by dotted red lines on transverse sections), lengthens the leverage from the centre of gravity, and consequently adds to safety.

The advantages of my claim are as follows, viz. :—The narrow gauge as now before the public has this disadvantage,—the safety wheels act horizontally, and are only kept to the guide plates by side pressure, without anything to prevent the wheels rising above the line. This omission, together with the fact of these wheels being so close to the rail-level, acts as a lever to force the rolling stock off the line, whilst with my invention it is impossible for the safety wheels to rise up to within 4 inches of the rail, being stopped by the underside of the safety wings.

Having described the nature of my invention, and its effect, I declare that what I claim is—

Firstly.—The principle, the application, and arrangement of the safety wings, of either wood or iron, or of wood and iron combined, and of the projection required (the projection of which will be regulated by the gauge of railway) lettered CCC and DD, tinted pink on drawing, to all railway lines of such gauge as may require this apparatus.

Secondly.—I claim the principle, the application, and arrangement of the safety wheels revolving vertically, with the necessary iron-work connected therewith, lettered EE on drawing, for all rolling stock.

NICHOLAS TRENGROUSE,
Stanmore Road, Marrickville.

This is the specification referred to in the annexed Letters of Registration granted to Nicholas Trengrouse, this seventh day of April, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 6 March, 1873.

SIR,

We do ourselves the honor to recommend the issue of Letters of Registration securing to Mr. Nicholas Trengrouse the exclusive right to his invention "for the safety of Trains running on Narrow Gauge Railways," in accordance with his Petition, specification, drawings, and claim, transmitted for our report, under your B.C. communication of the 4th instant, No. 1,674, herewith returned.

HARWOOD AND MITCHELL'S SLUICING MACHINE FOR TIN AND GOLD.

LETTERS OF REGISTRATION to Thomas Soutter Harwood, Robert Harwood, and John Mitchell, for a Sluicing Machine for Tin and Gold.

[Registered on the 9th day of April, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS SOUTTER HARWOOD, ROBERT HARWOOD, and JOHN MITCHELL, all of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention termed "Harwood and Mitchell's Sluicing Machine for Tin and Gold," which invention is more particularly described in the specification and sheet of drawings which are herewith annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration, grant unto the said Thomas Soutter Harwood, Robert Harwood, and John Mitchell, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Soutter Harwood, Robert Harwood, and John Mitchell, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Soutter Harwood, Robert Harwood, and John Mitchell shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of April, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Harwood and Mitchell's Sluicing Machine for Tin and Gold.

SPECIFICATION of "Harwood and Mitchell's Tin and Gold Sluicing Machine."

PATENT applied for by THOMAS S. HARWOOD, of Ultimo, Sydney, ROBERT HARWOOD, of Sydney and Inverell, and JOHN MITCHELL, of Newtown, Sydney.

THE Patent is required to protect the invention as a whole, as set forth in accompanying drawing; and also the several separate inventions included in the design, viz. :—

1. The horizontal-action machine, "forking" or separating apparatus, the principle of which is applicable to any ordinary sluice-box.

2. A pierced or wired metal termination "ripple" at outlet of box, preventing the escape of the ore, but allowing the free escape (with the water) of the sand and other particles of wash-dirt up to a certain size, as the ore becomes separated therefrom.

3. A corrugated bottom (of wood or iron) to sluice-box, laid beneath where the separating machine works. The use of this principle (a partially corrugated bottom) is also applicable for ordinary sluice-boxes; and the inventors propose to use the same laid either longitudinally, diagonally, or transversely, according to the description of ore to be cleaned.

4. A self-acting screen or sieve for separating the larger stones from the wash-dirt before it enters the sluice-box proper.

5. The method of delivering the wash-dirt *with* the water upon the screen and thence into the sluice-box, instead of the ordinary method of depositing the wash-dirt in the box proper and then acting upon it with the water.

DESCRIPTION OF THE WORKING OF THE MACHINE.

A steady flow of water being admitted from the receiver *b* (see plan), it at once acts on the wash-dirt as it is thrown into the main shoot *a*, and is carried with force upon the curved screen or sieve *P*, the openings in which will allow the wash-dirt containing the ore to pass through but reject the stones, the latter falling by their own gravity to the ground. To prevent during rapid working any wash-dirt from escaping the action of the screen, there is fixed at the foot of the screen a hinge-stop, *cc*, extending right across the screen, and regulated by the lever arm *G*. In ordinary working, the wash-dirt if not driven through the upper part of the screen at once, will by reason of its adhesiveness follow the curve of the screen and be blocked by the stop—when the flow of the water from the supplementary shoot *C* will at once act and wash the dirt and ore through the interstices of the lower part of the screen. Should the stones collect in the stop, it will tilt from the over-weight and clear itself, being brought back to its ordinary position by the action of the lever-arm.

After passing through the screen, the wash-dirt falls upon a false bottom having a considerable downward incline, and is then carried on by the water to the main bottom of the machine, where it is at once subjected to the action of the forking machinery, which works continuously in a horizontal line over a space of about 4 feet 6 inches. The forks or separators are constructed of seven bars of iron of the length of the whole width of the box, and in each of these are screwed or riveted at a right angle alternate rows of seven and eight (or more) prongs or spikes. The forks thus completed are fixed across the box to three endless chains supported and carried by *V* pulleys. The apparatus may be used either on a flat or corrugated bottom; but when corrugations are used that run longitudinally (as in drawing) the forks are made of suitable lengths to work alternately row by row upon the top and bottom of the corrugations. Suitable speed and regularity is insured in the working of the forking machine by the use of a small cog-wheel (to which a winch-handle is fixed) working in a larger cog-wheel keyed to one of the shafts carrying the *V* pulleys. A strong lad at the winch-handle is sufficient to drive the machine.

The forks are of such a form and so arranged that the resistance offered to the flow of the water near the surface is only moderate; but beneath the surface various cross and counter currents are caused by the joint action of the forks and the corrugations; the effect of which is to deposit the ore on the bottom, while the wash from which the ore has been separated, being held by the commotion in a state of partial suspension, is acted upon by the main current of the water and carried onwards through or over the perforated ripple-plate at outlet of box.

The forking apparatus is fixed to an independent framing, and may be removed from the sluice-box bodily at pleasure. When in work it rests upon the sides of the box, supported by the cross-pieces *M*, and is fixed in position by two hinge-rods, *mm*, which admits of its being raised at either end for the purpose of removing the clean ore.

In working the sluicing-machine, two men feeding with wash-dirt will keep it at full speed, and the only other labour required is a strong lad at the winch-handle, or any other power at hand could be substituted.

The machine will pass through in the same time as much stuff as three or four ordinary sluice-boxes attended by two men each, and will save all the ore and clean it thoroughly.

An ordinary size machine, as shown in drawing, will be 3 feet in width; but larger machines can be constructed for mines having an adequate force of water.

THOMAS S. HARWOOD.
ROBT. HARWOOD.
JOHN MITCHELL.

Sydney, 13 February, 1873.

This is the specification referred to in the annexed Letters of Registration, granted to Thomas Soutter Harwood, Robert Harwood, and John Mitchell, this seventh day of April, 1873.

HERCULES ROBINSON.

Harwood and Mitchell's Sluicing Machine for Tin and Gold.

REPORT.

Sydney, 5 March, 1873.

SIR,

The application of Messrs. Thomas Harwood, Robert Harwood, and John Mitchell, for Letters of Registration for a Sluicing Machine for Tin and Gold, having been referred to us, we have examined the specification and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH.
GOTHEK K. MANN.

ALLUVIAL TIN AND GOLD WASHING MACHINE.

LETTERS OF REGISTRATION to Joseph Justin Brenan and Cornelius Stanley M'Glew, for Machinery for the purpose of washing Tin and Gold from Alluvial.

[Registered on the 10th day of April, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JOSEPH JUSTIN BREMAN and CORNELIUS STANLEY M'GLEW, both of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention of "Machinery for the purpose of washing Tin and Gold from Alluvial," which invention is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Joseph Justin Brenan and Cornelius Stanley M'Glew, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Joseph Justin Brenan and Cornelius Stanley M'Glew, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Joseph Justin Brenan and Cornelius Stanley M'Glew shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighth day of April, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Alluvial Tin and Gold Washing Machine.

SPECIFICATION of Joseph Justin Brenan and M'Glew's Patent Tin and Gold Washing Machine.

This machine can be used for tin or gold, or for both.

The hopper is three (3) feet wide, two (2) feet high, and six (6) feet long, and runs on four (4) wheels on a tramway into a frame of iron or wood, which frame oscillates.

When the stones are washed and free from all the wash-dirt, and you wish to get rid of the stones in the hopper, there is a socket near each end that two bars fit into, with a loop on the end of each to hook on a rope, which passes through a block made fast above you. Haul the rope, and the hopper runs on the tramway until the two wheels are caught by the curves on the end of the tramway, on which are slides and pins which clasp the two wheels, thus forming a hinge. By pulling the rope you tilt out the stones.

The water wash-dirt—tin or gold—passes through the holes in the bottom of the hopper (which is made of iron) into a trough or receiver six (6) feet long, three (3) feet high, and three (3) feet wide, through which, from end to end, passes a shaft, attached to which are rakes or disturbers which keep all the matter in motion. This agitator or disturber is kept revolving by a belt on a pulley from a pulley on the main shaft of an engine, or otherwise as may be deemed fit.

The bottom of the above trough or receiver is curved, with a door in the centre of the bottom, to take out the tin or gold.

There is an opening from end to end in the trough next the table, for the dirt and water to escape, to which there is a slide to regulate the discharge as required.

The table can be attached to the trough or receiver; it is six (6) feet wide and eighteen (18) feet long, with sides about eight (8) inches high. About five to six feet from the trough or receiver there is another disturber or agitator, constructed upon the same principle as the above described one, but only a foot in diameter, and is also kept in motion by a belt or pulley on the main shaft of the engine, or otherwise as may be deemed advisable. Further down the table there are pocket ripples to receive anything that may escape from the upper receivers.

We claim for the whole machine, all of which is original.

We claim for the drawer-hopper, for the wheels, the tramway, the bars by which the hopper is run back, the slides and pins at the end of the tramway to form the hinges to discharge the hopper.

We claim for the oscillating frame which the hopper runs into.

We claim for the trough or receiver, for its capacity, its shape of the bottom, for the open to let out the water and matter, the slide to regulate the said opening, the shaft, with the rakes, disturbers, or agitators attached to the shaft, the door in the bottom of the trough or receiver to take out the gold and tin.

We claim for the length, width, and construction of the table.

We claim for the second receiver, for its form, its peculiar construction, and for the shaft and the rakes, disturbers, or agitators which work therein.

We claim for the pocket ripples or receivers on the table, for their formation; also, for a trough receiver at the bottom or end of the table.

JOSEPH JUSTIN BRENAN.

CORNELIUS STANLEY M'GLEW.

This is the specification referred to in the annexed Letters of Registration granted to Joseph Justin Brenan and Cornelius Stanley M'Glew, this eighth day of April, 1873.

HERCULES ROBINSON.

REPORTS.

Sydney, 10 February, 1873.

SIR,

We do ourselves the honor to recommend that the specification and drawings of Messrs. J. J. Brenan and C. S. M'Glew of "certain Machinery for the purpose of washing Tin and Gold from Alluvial," transmitted for our report, under your B.C. communication of the 4th instant, be returned to those gentlemen for revision and more distinct description.

We would draw attention to the fact that the specification and drawings are without signature, and without letters of reference indicating the various parts of the machinery referred to.

We also recommend that applicants be required to affix to their specification a definite claim or claims.

We have, &c.,

CHAS. WATT.

GOTHER K. MANN.

THE PRINCIPAL UNDER SECRETARY.

Sydney, 13 March, 1873.

SIR,

We do ourselves the honor to return to you the documents transmitted to us for our report, under your B.C. communication of the 11th instant, and to recommend that Letters of Registration be granted, securing to Messrs. Joseph Justin Brenan and Cornelius Stanley M'Glew the exclusive right to an invention "of certain Machinery for the purpose of washing Tin and Gold from Alluvial," in accordance with their specification, drawing, and claim.

We have, &c.,

**AN IMPROVED METHOD OF CONSTRUCTING CAMS AND DISCS FOR
STAMPING MACHINERY.**

LETTERS OF REGISTRATION to Thomas Sutcliffe Mort, for an improved method of constructing Cams and Discs for Stamping Machinery.

[Registered on the 9th day of May, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS SUTCLIFFE MORT, of Sydney, in the Colony of New South Wales, Esquire, hath by his Petition humbly represented to me that he is the assignee of James Watts, of Sandhurst, in the Colony of Victoria, engineer, who is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "An improved method of constructing Cams and Discs for Stamping Machinery," which is more particularly described in the specification, marked A, and the two sheets of drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Sutcliffe Mort, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Sutcliffe Mort, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Sutcliffe Mort shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighth day of May, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

An improved method of constructing Cams and Discs for Stamping Machinery.

A.

SPECIFICATION of THOMAS SUTCLIFFE MORT, assignee of the within-named James Watts, for an Invention intituled "An improved method of constructing Cams and Discs for Stamping Machinery."

The first part of my invention consists of an improved method of constructing Cams for Stamping Machinery. Hitherto it has been the custom to make these articles in one piece, whilst I propose to make them in more than one piece, so that the wearing parts may be renewed and replaced as may be required, without disturbing the cam itself or the shaft on which it works.

These renewed parts may be fastened in position in any approved way, say with bolts or keys; but of course I do not confine myself to any particular method of fastening, as this of itself forms no part of my invention.

The second part of my invention consists of an improved method of constructing Discs for the shanks of Stamping Machinery.

Instead of constructing the disc in one piece as heretofore, I construct it in two pieces, which I prefer to be of equal size. These two pieces I bolt together, and on the face of the disc I also bolt a steel face.

This method of construction is clearly illustrated in the accompanying drawings, where figure 1 shows elevation, and figure 2 shows plan of my disc as applied to a screwed shank.

Of course, if my invention be applied to a plain shank, it would have to be fastened by bolts, wedges, hoops, or some other approved method; and, if desired, more than two pieces might be used in its construction.

Having thus described the nature of my invention and the manner of performing same, I would have it understood that I do not confine myself to the precise size or shape, or the materials of which my invention may be made or manufactured, but I claim--

- 1st. The construction of Cams for Stamping Machinery in more than one piece, in order to permit of the renewal of the wearing parts, substantially as herein described and explained.
- 2nd. The construction of Discs for the shanks of Stamping Machinery in two or more pieces or halves, substantially in the manner herein described and explained.

THOS. S. MORT.

This is the specification, marked A, referred to in the annexed Letters of Registration, granted to Thomas Sutcliffe Mort, this eighth day of May, 1873.

HERCULES 'ROBINSON.

REPORT.

Sydney, 24 March, 1873.

SIR,

We do ourselves the honor to recommend the issue of Letters of Registration, securing to Thomas Sutcliffe Mort, of Sydney, the exclusive right to an invention for an improved method of constructing Cams and Discs for Stamping Machinery, in accordance with the specification, drawing, and claim, transmitted for our report, under your B.C. communication of the 20th instant, No. 2,204, herewith returned.

**IMPROVEMENTS IN APPARATUS FOR WASHING ALLUVIOUS AND
AURIFEROUS EARTHS.**

LETTERS OF REGISTRATION to Alphonse Allain and Alfred Riviere Dejean,
for Improvements in Apparatus for washing Alluvious and Auriferous Earths.

[Registered on the 9th day of May, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS ALPHONSE ALLAIN, of Paris, in the Department of the Seine, and ALFRED RIVIERE DEJEAN, of Alais, in the Department of the Gard, both in the Republic of France, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "certain Improvements in Apparatus for washing Alluvious and Auriferous Earths," which is more particularly described in the specification and sheet of drawings which are herunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Alphonse Allain and Alfred Riviere Dejean, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Alphonse Allain and Alfred Riviere Dejean, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Alphonse Allain and Alfred Riviere Dejean shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighth day of May, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Apparatus for washing Alluvious and Auriferous Earths.

SPECIFICATION of the Invention of ALPHONSE ALLAIN, of Paris, in the Department of the Seine, and ALFRED RIVIERE DEJEAN, of Alais, in the Department of the Gard, both in the Republic of France, for "certain Improvements in Apparatus for washing Alluvious and Auriferous Earths."

NOW KNOW YE to whom these presents shall come, that we, the said Alphonse Allain and Alfred Riviere Dejean, do hereby declare the nature of our said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement:—

Our invention relates to a system of washing Alluvious and Auriferous Earths, which may be termed the system of fixed angles, having for principle a cavity represented by a parallelogram united at its base with a triangle, preferably an isosceles, and the lines of which have always an angle of from 40 to 50 degrees, that is to say, a mean of 45 degrees.

Figure 1 of the accompanying sheet of drawings is a vertical section, at A B, fig. 2, of an apparatus embodying our invention.

Figure 2 is a horizontal section of same.

Figure 3 is a diagram illustrating the principle of formation of a cavity or groove according to our invention, and—

Figure 4, a groove or cavity embodying our invention.

Figures 1 and 2 are drawn to a scale of $\frac{1}{12}$ of the ordinary size, and figures 3 and 4 full size.

The apparatus consists of a long box or trough combining a puddling compartment, A, and a washing-table, B, having hollow transversal grooves or cavities, C, of a geometrical and fixed shape (hence the designation of apparatus with fixed angles), each of these grooves resulting, as above stated, from a parallelogram and a triangle of any kind, the common base of which is the lower main line of the parallelogram, the said cavity being summed up by the figure represented by the lines *a b, c d, d a, d e, e c*, figure 3 of the drawing.

The fore-part of the box forms a water-tank, D, separated by a movable sluice-gate, E, from a second compartment constituting a puddling trough without mechanism of any kind, and the extended part which follows receives the washing-table, composed of several segments, which it is only necessary to place by hand on the bottom of the box to form the table. Each segment has a hollow groove. The apparatus thus combined may rest upon two wheels, and be moved from place to place like a hand-barrow, or be drawn by a horse.

The entire apparatus may be made of wood, using boards of equal thickness held together by wooden or other screws. The thick parts, such as the segments, may be formed by the union of several boards, and the grooves (see drawing, figures 3 and 4) be obtained by the juxtaposition of boards cut at one of their ends to an oblique face giving a fixed angle. This carefully studied arrangement renders the construction and repair of the apparatus very simple; it further affords the advantage of resisting the tendency to warp, common to all apparatuses alternately wet and exposed dry to the heat of a burning sun.

The mode of construction above described is that which is preferred, but it will be evident that other material might be used, and the combination of the parts be otherwise effected, while retaining the main features of this invention.

WORKING OF THE APPARATUS.

The apparatus being brought to the soil to be washed and to the stream of water, the requisite inclination is given to it, say from 10 to 14 degrees, according to the quantity of water at command, the nature of the soil, and of the metallic particles, whether in dust, nuggets, or other form. This is done by resting upon the ground the end of the box opposite to that at which the water is admitted, and if necessary the ground is slightly hollowed with a shovel, either under the wheels to lessen the inclination, or under the end of the table to increase it.

After having introduced a suitable quantity of water, which is regulated by the sluice-gate E, the earth to be washed is shovelled into the puddler A. The soil to be washed is taken into the apparatus as it comes, stones, earth, sand, without sorting or rejection. The coarse sieve found at the head of all apparatuses for gold-washing is not here considered necessary, but deemed a complication of which the safety of the grooves permits the suppression.

The water passing beneath the sluice-gate attacks the mass to be puddled, its action being assisted and directed by the labour of a workman armed with an iron scraper. During the puddling the matters are drawn beyond the projection or partition separating the puddler from the table B, and undergo the action of the table B and of its grooves C. When the puddling leaves no fear of carrying forward entire lumps or balls of earth, the workman, by means of his scraper, causes the entire mass to pass on to the table, precipitating this forward movement with a roughness of manœuvre and an absence of precaution which render the work very simple and very rapid. While the operation is progressing, the action of the scraper is brought at one time on to the puddling, at another on to the cleansing of the table. The extreme facility of this work results from an absolute dependence upon the retention of the metallic particles. It will be understood that the greater the number of grooves, the faster the working may be conducted without increasing the losses of metal.

The operation usually continuous may be arrested by simply stopping the flow of water and ceasing to scrape, the operation being recommenced at the point at which it was arrested. When it is desired to end the operation, a stronger flow of water is given, by lifting the sluice-gate sufficiently to sweep away all that is on the table outside the grooves, a corner of the scraper is even passed into the grooves to cause the major part of the gravel and stones to pass out, leaving the sand retained at its maximum of richness.

The operation is finally stopped when the sand in the grooves is deemed sufficiently enriched to render further outflows dangerous. Practice alone can fix the limit to be chosen for each kind of auriferous earth.

Each segment carrying a groove is then removed by hand and plunged into a trough full of water in such a manner as to cause the fall of the enriched sand. The product of the grooves and that of the last washing or scouring of the table are considered rich, and are preserved to be further treated in a finishing apparatus such as the washing pan or bowl.

Improvements in Apparatus for washing Alluvious and Auriferous Earths.

At the end of each day the segments are removed and the box washed, care being taken to introduce the water in such a manner as to collect the particles of metal which may have entered the joints; this will yield a few more quarts of sand to be treated.

Technical Details.

We deem it desirable to further dilate upon the play of the grooves, in order to show how this apparatus, notwithstanding its apparent and real simplicity, borrows from the complicated apparatuses hitherto used in the mechanical preparation of ores their most fruitful principles.

After the puddling, the matters carried or pushed on to the table undergo the action of a series of elements of fixed table and a series of grooves. The water which descends on to the table divides into two sheets, the work of each being very different: the first, superficial and continuous, carries with it all the light bodies, and all those which offer sufficient surface to the shock; the second sheet undergoes a succession of refluxes and eddyings as it meets the grooves. The first therefore tends to classify by density the naturally heavy matters, and the second strives to classify by equal fall delivering to the continuous stream of the superficial sheet all the matters which may issue from the grooves or simply rise to the zone of forward impulsion. The various cases which may arise cannot here be discussed, but persons familiarized with the apparatuses of mechanical treatment will with slight consideration realize that the soils to be washed are submitted in this apparatus to the double and repeated action of a fixed table and a series of small rudimentary sieves; the grooves really act like small continuous sieves, and further, they cover the metallic substances like "pointed boxes," or boxes with grooves coming to a single point.

It is only necessary to mention these latter to render apparent the favourable influence of the lower angles of the grooves. The result obtained under such simple conditions is due to the great difference in density between gold and stony matters. It is sufficient that the movement be started in a favourable direction to effect the separation with certainty, notwithstanding the presence of pieces of very different dimensions.

We do not limit ourselves to the use of any particular material in the construction of our washing apparatus, but we claim as our invention—

Firstly—The construction of the grooves or cavities C, substantially as and for the purpose hereinbefore set forth.

Secondly—The combination of the table B and grooves C with puddling compartment A and reservoir D, substantially as and for the purpose hereinbefore set forth.

In witness whereof, we, the said Alphonse Allain and Alfred Riviere Dejean, have hereunto set our hands and seals, this twenty-first day of November, in the year of our Lord one thousand eight hundred and seventy-two.

ALPH. ALLAIN. (L.S.)

ALFRED RIVIERE DEJEAN. (L.S.)

This is the specification referred to in the annexed Letters of Registration granted to Alphonse Allain and Alfred Riviere Dejean, this eighth day of May, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 27. March, 1873.

SIR,

We do ourselves the honor to recommend the issue of Letters of Registration securing to Alphonse Allain, of Paris, and Alfred Riviere Dejean, of Alais, the exclusive right to an invention for "certain Improvements in Apparatus for washing Alluvious and Auriferous Earths," in accordance with the drawings, specification, and claims, transmitted for our report, under your B.C. communication of the 24th instant, No. 2,308, herewith returned.

We have, &c.,

AN IMPROVED PROCESS OF AND FURNACE FOR CHLORIDIZING AND TREATING SILVER AND COPPER AND OTHER ORES.

LETTERS OF REGISTRATION to Samuel House and Carl A. Stetefeldt, for an improved Process of and Furnace for chloridizing and treating Silver and Copper and other Ores.

[Registered on the 17th day of May, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS SAMUEL HOUSE, of Melbourne, in the Colony of Victoria, merchant, hath by his Petition humbly represented to me that Carl A. Stetefeldt, of San Francisco, in California, is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention intituled "An improved Process of and Furnace for chloridizing and treating Silver and Copper and other Ores," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D, respectively, which are hereunto annexed; and that the said Carl A. Stetefeldt, by agreement dated the eighth day of October, one thousand eight hundred and seventy-two, authorized the London and St. Arnaud Gold and Silver Mining Company (Limited) to apply for and receive Letters Patent for the said invention in and for all the Australasian Colonies, in the joint names of the said Carl A. Stetefeldt and the said Company, or such party as might be appointed to represent the said Company; and that he, the said Petitioner, is one of the Directors of the said Company, and has been appointed its representative for the purpose of obtaining such Letters Patent; and that he, the said Petitioner, has deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him the said Petitioner and the said Carl A. Stetefeldt for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Samuel House and Carl A. Stetefeldt, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Samuel House and Carl A. Stetefeldt, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Samuel House and Carl A. Stetefeldt shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this sixteenth day of May, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S)

HERCULES ROBINSON.

An improved Process of and Furnace for chloridizing

A.

SPECIFICATION of an Invention intituled "An improved Process of and Furnace for chloridizing and treating Silver and Copper and other Ores," invented by Carl A. Stetefeldt, of San Francisco, in California, and one-half interest therein sold to the London and Saint Arnaud Gold and Silver Mining Company (Limited), of whom Samuel House, of Melbourne, in the Colony of Victoria, is the authorized representative.

This invention consists of an improved mode or process for chloridizing silver and copper ores preparatory to amalgamation for silver ores or leaching for silver and copper ores, and also of an improved furnace for carrying out this and other kindred processes.

The process consists in dropping a mixture of finely pulverized ore and salt through a heated chamber, shaft, or flue, either against or with the flame and products of combustion.

The best mode to accomplish this object is to use a furnace and apparatus as hereinafter described. This will give the best results at the least expense.

The operation of the process is as follows, to wit:—The ore and salt (from three to eight per cent.) are best mixed together and pulverized in a dry crushing battery, through a No. 40 wire screen (forty meshes per linear inch). From the battery the pulp is taken by conveyors and elevators to the hopper of the feeding machine on top of the roasting shaft. The heat of the furnace is so regulated that the roasted ore is red hot but does not bake or sinter. A considerable amount of ore is allowed to accumulate at the bottom of the shaft before discharging, so that the chloridizing gases emanating from the charge are utilized.

In chloridizing copper ores the roasting should be done at a low heat, or the chloride of copper is again decomposed at a high temperature. The chemical process which takes place in this mode of roasting may be described as follows:—

Considering the old, or rather the usual theory deduced from the roasting process in common reverberatory furnaces, that sulphates must be formed before the salt can be decomposed, and not till then will the chlorination begin, it would seem that for these chemical reactions more time is required than a few seconds; but this is not the case. As soon as ore and salt enter the furnace each sulphuret particle ignites in the glowing atmosphere, evolving at the same time sulphur, which in presence of the oxygen of the atmospheric air coming undecomposed through the grates, is turned into sulphurous acid, and the metal into an oxide, or in part directly into a chloride. The sulphurous acid in contact with the ore particles and oxygen becomes sulphuric acid. The temperature is nearly from the start too high to permit the formation of sulphates, so that the sulphuric acid turns its force on the red hot salt particles, setting the chlorine free. All these reactions are performed instantaneously. The whole space in the furnace is filled with glowing gases of chlorine, hydrochloric acid, sulphurous and sulphuric acid, oxygen, steam, volatile, base metal, chlorides, &c., all of them acting, decomposing, and composing on the sulphurets with great vigour. The chlorine decomposes the sulphurets directly, forming chloride of metals and chloride of sulphur; it attacks decomposingly also oxides and sulphates, if present. The hydrochloric acid performs the same office. Also metallic silver, if it should occur in the ore, would combine with the chlorine. The sulphuric acid, besides decomposing the salt, oxidizes partly the sulphurets directly, &c.

Considering now an ore particle in a red hot condition attacked simultaneously by all these gases while falling, the final chloridizing result is inevitable. The finer the ore particles are, the more perfect the chlorination; but even if some coarser parts (to a certain degree) should reach the bottom not thoroughly chloridized, this would be finished in the pile as the chlorination and evolution of chlorine gas continues in the red hot accumulation on the bottom of the furnace.

The improved furnace is for desulphurizing, chloridizing, or reducing ores. It consists of a shaft with one or more fireplaces near the bottom. Into this shaft the finely pulverized ore is fed by proper machinery, and falls against the rising flame and gases. Near the top of the shaft, which is closed by the feeding machine, the gases descend into a flue. This flue is connected with a small fireplace near the bottom, which is intended to heat and roast the fine ore dust escaping from the main shaft through the flue. The flue leads into a system of dust chambers which are connected with a high chimney.

To more fully illustrate and describe this furnace, reference is had to the accompanying drawings and letters marked thereon, of which figure 1 is a ground plan of the feeding machine, and figure 2 a vertical section thereof; figure 3 is a ground plan of the furnace, and figure 4 a vertical section thereof. The feeding machine A (in figures 1 and 2) represents a hollow cast-iron frame, which rests on the top of the furnace, and through which water circulates, in order to keep the machinery above cool. Into this frame is inserted a cast-iron grate, B, which supports a punched screen of sheet-iron, with holes of about the three thirty-second part of an inch in diameter. Above the punched screen is a coarse wire screen with meshes of one-third of an inch. This screen is fastened to the frame C, which rests upon friction rollers D, fastened to the hopper E, and is set in motion by the crank F. The plates G, which nearly touch the wire screen, are for the purpose of keeping the ore in place when the frame C is set in motion. H is a damper which is inserted in case the screens have to be renewed.

In figures 3 and 4 the furnace itself is shown. A represents the shaft, which, when working, is covered at the top with the feeding machine. B is a fireplace near the bottom of the shaft. In order to effect a complete burning of the flame, and to introduce a surplus of oxygen for desulphurizing and chloridizing, roasting air is introduced through the channels C, which are in connection with the slit D. E is the flue near the top of the shaft, heated by the auxiliary fireplace F. The flue G (where most of the dust accumulates) leads to the dust chambers.

The operation of the furnace is as follows, to wit:—Fire is made in the fireplaces B and F, and as soon as the inner walls of the shaft are hot the feeding machine is put in motion. The coarse wire screen cutting through the pulp between the plates and the punched screen, rubs the ore through the holes of the latter into the shaft. By the time the ore has dropped to the bottom it is roasted. After a charge has accumulated the roasted ore is drawn out through the door H. The dust is discharged through the doors JJJ.

The only attention which the furnace requires is the keeping of a proper uniform heat. The furnace is at a "proper" heat when there is a bright red flame passing up the shaft, and when its outer walls are so hot as to enable you to barely hold your hand on it.

A

and treating Silver and Copper and other Ores.

A furnace of the size represented in the drawing will roast from twenty to thirty tons of ore in twenty-four hours, at considerably less expense in fuel and labour than the reverberatory furnaces.

The furnace can be used for various purposes, to wit:—

- 1st.—For oxidizing or desulphurizing roasting of sulphuretted ores. For instance, roasting of zincblende for manufacture of zinc; pyrites of copper previous to smelting or leaching; gold-bearing pyrites of iron preparatory to amalgamation, or Plattner's chlorination process.
- 2nd.—For chloridizing roasting of silver and copper ores preparatory to amalgamation for silver ores or leaching for silver and copper ores. In this case a proper percentage of salt is mixed and pulverized with the ore before it enters the furnace.
- 3rd.—For reducing iron ores. In this case the furnace has to be constructed with gas generally, and a surplus of oxide of carbon has to be introduced into the shaft for reducing the iron ore.

What is claimed is:—

- 1st.—The improved process for chloridizing silver and copper ores by dropping a mixture of the finely pulverized ore and salt through a heated chamber, shaft, or flue, either against or with the flame and products of combustion, substantially as herein described and explained.
- 2nd.—The combination of a shaft having fireplaces near its bottom, with a flue provided with an auxiliary fireplace for the purposes described.

—

This is the specification, marked A, referred to in the annexed Letters of Registration granted to Samuel House and Carl A. Stetefeldt, this sixteenth day of May, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 3 March, 1873.

SIR,

We do ourselves the honor to recommend the issue of Letters of Registration, securing to Samuel House and to Carl A. Stetefeldt the exclusive enjoyment, for a term of fourteen years, of an invention intituled "An improved Process of and Furnace for chloridizing and treating Silver and Copper and other Ores," in accordance with the Petition, specification, drawings, and claim transmitted for our report, under your B.C. communication of the 26th February, 1873, No. 1,511, herewith returned.

We have, &c.,
GOTHER K. MANN.

AN INVENTION FOR CONVERTING CYPERUS VAGINATUS, &c., INTO A FIBROUS SUBSTANCE PRINCIPALLY FOR USE IN PAPER-MAKING.

LETTERS OF REGISTRATION to Thomas Wearne, for an Invention for converting *Cyperus vaginatus*, Cat's-tail Grass, Imphee trash, Sugar-cane megass, Grass-tree, Knotty Water-reed or Sedge-grass, and other vegetable fibres, into a fibrous substance, principally for use in Paper-making, and technically known as "half-stuff."

[Registered on the 20th day of June, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS WEARNE, of Sydney, in the Colony of New South Wales, ironmonger, hath by his Petition humbly represented to me that he is the assignee of William Frederick Thomas, of Liverpool, in the said Colony, paper-maker, who is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for converting *Cyperus vaginatus*, Cat's-tail Grass, Imphee trash, Sugar-cane megass, Grass-tree, Knotty Water-reed or Sedge-grass, and other vegetable fibres, into a fibrous substance, principally for use in Paper-making, and technically known as "half-stuff," which said invention is more particularly described in the specification and sheet of drawings which are herewith annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Wearne, as such assignee as aforesaid, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Wearne, as such assignee as aforesaid, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Wearne shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have herewith set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighteenth day of June, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

An Invention for converting Cyperus vaginatus, &c., into a

SPECIFICATION of Mr. William Frederick Thomas's Invention for converting *Cyperus vaginatus*, Cat's-tail Grass, Imphee trash, Sugar-cane megass, Grass-free, Knotty Water-reed or Sedge-grass, and other vegetable fibres, into a fibrous substance, principally for use in Paper-making, and technically known as "half-stuff."

THE nature of my invention and the manner in which I perform the same are particularly described and ascertained in and by the following statement, that is to say:—

To convert *Cyperus vaginatus*, cat's-tail grass, imphee trash, sugar-cane megass, grass-tree, knotty water-reed, or sedge-grass, or other such like raw vegetable fibres, into "half-stuff," for use in paper-making, I first pass the material to be operated upon through rolls, similar to sugar rolls, but having, in addition to the usual revolving motion a lateral side motion, so as to more effectually crush or open the fibres by the grinding pinch thus obtained, and by which means the after process of boiling is much facilitated and more economically effected. I next cut the material into lengths, varying from 1 inch to 3 inches; an ordinary chaff-cutting machine being sufficient for the purpose. The crushed and cut material is then conveyed to the reducing boilers, which may be either open or enclosed, and may be boiled with either low or high pressure steam, or even direct fire heat may be employed. The boilers I now purpose using are constructed from $\frac{3}{4}$ wrought-iron plates, 12 feet long by 6 feet diameter, hung or suspended by the centre on two cast-iron trunnions, fitted with stuffing glands for the admission of high-pressure steam; in fact, a "tumbling boiler." The material is then placed in this, the reducing boiler, and an alkaline lye, consisting of 5 per cent. soda and 15 per cent. stone lime to every 100 lbs. of fibre, is added. The boiler is then closed, and the boiling proceeded with; the material being subjected to a pressure of steam from 15 to 30 lbs., varying according to the nature of the fibre used—its freshness, soundness, strength, and other contingent circumstances, which can only be determined by the operator at the time. The time of boiling varies from four to eight hours, and at times even longer, but the material cannot be said to be sufficiently boiled or reduced until the fibre will separate from the vegetable-gummy mucilagenous matter by a gentle rubbing between the hands. The boiling being completed, the "stuff" is at once withdrawn, and drained on a floor suitable for the purpose. It is then put into an ordinary washing or breaking engine, for the purpose of heating the water previous to the boiled fibre being put into the engine, and also for the purpose of allowing the washing for the first half-hour being done with warm water, which much assists the washing and getting rid of the disengaged gummy and colouring matter. The washing being completed, it is then, in the same engine, reduced to "half-stuff," which operation being concluded, the half-stuff is run off by means of a valve in the bottom of the engine into drainers adjacent for the purpose. I then place the drained "half-stuff" in layers in a perforated lever press, for the purpose of freeing it from water and getting it into a consistent form for further manipulation. The layers or sheets of "half-stuff" are now removed and subjected to a still greater pressure, in either an hydraulic or screw-press, from whence it is taken and placed on edge in the drying-room, where, when quite dry, it is packed in bales or cases for either home or foreign consumption.

I wish it understood that I do not limit myself to the precise form or method of operation herein described, but may make such variations therein as will facilitate the accomplishment, under any circumstances, of the object of my invention; and I claim—

- 1stly—The discovery that the best and most abundant of the before-mentioned fibres—*Cyperus vaginatus*—is adapted for paper-making, as also the method or process herein stated by which it is to be converted into "half-stuff" for the paper-maker's use.
- 2ndly—The use of rolls with the combined lateral side motion for opening or crushing the fibres preparatory to boiling, and the economy of chemicals thereby effected.
- 3rdly—The extraction of silica, colouring matter, &c., contained in these raw vegetable fibres, by subjecting them to the action of steam in a closed rotary vessel, as specified, for the purpose set forth.
- 4thly—For the simple and efficient manner my "half-stuff" is converted into millboards, in the wet press, as compared with the ordinary process of millboard-making with hand moulds, &c.

This is the specification referred to in the annexed Letters of Registration granted to Thomas Wearne, this eighteenth day of June, 1873.

HERCULES ROBINSON.

REPORTS.

No. 3, Gresham-street,
Sydney, 27 February, 1873.

SIR,

We have had the honor to receive the Memorial of Mr. William Frederick Thomas which you transmitted for our report, by blank cover, under date 21st February instant, with accompanying specifications of an invention for converting *Cyperus vaginatus* and other vegetable fibres into a fibrous substance, principally for use in Paper-making, and technically known as "half-stuff," for which Letters of Registration are applied for by Mr. Thomas Wearne as assignee of the invention.

We

A.D. 1873. No. 359.

fibrous substance principally for use in Paper-making.

We desire respectfully to state that having considered the several claims set forth in these documents, we are of opinion that the claimant should be required to illustrate his specification by drawings or diagrams showing the apparatus or machinery which he purposes to employ, and for the protection of which the Letters are required; this more particularly with reference to the claims Nos. 2 and 3 appended to the Memorial. It would also, in our opinion, be desirable that the claimant should indicate more precisely than he has done, at what stage of the processes described the manufacture of millboards is completed, forming the subject of his 4th claim.

THE PRINCIPAL UNDER SECRETARY.

We have, &c.,
GOTHER K. MANN.
A. O. MORIARTY.

No. 3, Gresham-street,

NICOLLE AND MORT'S FRIGORIFIC MACHINE.

LETTERS OF REGISTRATION to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, for an Invention for utilizing the Waste Cold from Frigorific Mixtures, &c.

[Registered on the 24th day of June, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EUGENE DOMINIQUE NICOLLE and THOMAS SUTCLIFFE MORT, both of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "utilizing the Waste Cold from Frigorific Mixtures, and for applying the same, and in combination with a plan for the continuous recovery of the salts employed for producing the cold, by an apparatus styled Nicolle and Mort's Frigorific Machine," which said invention is more particularly described in the specification, marked A, and the two sheets of drawings or plans, marked B and C respectively, which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Eugene Dominique Nicolle and Thomas Sutcliffe Mort shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of June, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Nicolle and Mort's Frigorific Machine.

A.

Our invention consists of a mechanical combination, at once simple, novel, and useful, which enables us to utilize the waste cold resulting from frigorific mixtures, whereby we can follow up the lowering of temperature to the extreme point at which the salts used will dissolve.

Our method of availing of this power enables us to freeze water and refrigerate generally, with certainty, safety, and economy; the apparatus being instantaneous in its results, requiring only a trifling power to work it, whilst its continuous action may be perpetuated without any manual interference beyond the attention required in keeping the motive power going, the water and the salts for each successive manipulation being (where the evaporating apparatus is used in combination with the freezing power) mechanically and continuously supplied as the evaporation of the spent liquor goes on.

It is well known that the lower the temperature of the liquid used in cooling mixtures for the dissolving of the salts, the more intense the cold produced; and we avail of this fact and utilize it in a temperature exchanger, by which we are enabled to impart to the water and salts next to be used, the surplus cold of the liquid last used. In this way we can effect refrigeration with the most simple and familiar ingredients, such as common salt, sugar, washing soda, or any other crystallized salts which produce cold during liquefaction, the range of cold attainable, as before stated, being only limited by the temperature at which the salts employed will liquefy.

For example, common salt producing only three degrees of reduction of temperature at 75° Fahrenheit, by the use of our apparatus reduces it from 75° to 28°, or four degrees below freezing point. Then again, chloride of calcium giving only 31° reduction starting from the same point, with our apparatus gives and maintains a point considerably below zero.

The cold-producing machine shown upon the annexed plan and herein described is designed for household purposes, and to be worked by hand, but it may of course be made of any size, according to the work required of it, and be driven by any form of motive power which may be at command, and may be worked in combination with the evaporating apparatus or not.

The shape of the vessels and the position they occupy may also be varied to suit circumstances and conditions, so long as the general principle be observed.

In working the apparatus, we use, by preference, simple fixed salts which are soluble in water and only requiring to be evaporated to be again fit for use, such as nitrate of ammonia, chloride of calcium, &c., &c.

Care must be taken to use only such pipes and vessels as are not affected by the salts employed. This is easily ascertained by placing a bit of the metal proposed to be used in a solution of the salt intended to be employed: if the solution be discoloured by the metal, then that metal must be avoided.

We now proceed to describe our apparatus styled "Nicolle and Mort's Frigorific Machine," reference being had to the plans hereunto attached, and to the description of the evaporating apparatus hereinafter given, as used in connection and combination with the Frigorific Machine.

SPECIFICATION.

Fig. 1 shows a sectional elevation through the centre of the apparatus.

2 is a ground plan of the apparatus.

A is a salt receiver, fitted with a cone or inverted funnel, in order to lead the salt to the distributing slide E.

B is a vertical shaft, fitted at the base with an eccentric, to give backward and forward motion to the slide E.

C is a pulley fixed on the shaft B, to which it gives motion.

D is a spade, to which a circular movement is given by an arm attached to the upper part of the shaft B. This spade fills the aperture in the slide E with the salts every successive stroke.

E is a distributing slide, which moves freely between two dovetails, receiving its motion from the eccentric above referred to. This slide is made with an opening (by preference oval), which is filled with salt each time it enters the vessel A, emptying itself on its return into the inclined shoot J.

F is a water tender, fitted at the base with a small pipe, which serves to convey the water through the exchanger and into the inclined shoot J.

G is a temperature exchanger, composed of a metallic cylinder, with an external spiral channel and a coil containing one pipe within another, the cylinder and the coil being connected and both enclosed in some good non-conductor. The cylinder is made of a good conducting metal, having a broad but shallow spiral recessed on its outer side, such recess being covered with an outer casing so as to form it into a channel into the upper part of which the spent liquor is made to enter on its return from its work, and after having performed the circuit of the spiral to continue its course through the outer pipe of the coil on its way to the tank S. The water next required for the dissolution of the salts enters the inner pipe of the coil at the point where the spent liquor discharges, and passing in an opposite direction exchanges temperature with that liquor, entering the cylinder at its base at or about the temperature at which the spent liquor left that vessel. Upon entering the cylinder the water comes in contact by conduction with the more intense cold of the spent liquor, which it absorbs, and if the cold be sufficiently intense it will cause the congelation of the water against the inner surface of the cylinder. The ice thus formed is continuously detached by a revolving knife or scraper (which also acts as an agitator) and as detached is, owing to its lighter gravity, continuously passed into the tube K, where it joins the salt on its way into the refrigerating well. If the refrigerated liquor be made to return to the spiral of the cylinder without robbing it of too much of its cold on the way, the whole of the water may speedily be passed into the tube in a frozen state, whereby a very low range of temperature may be obtained; indeed, if crystallized chloride of calcium be the salt employed, 49° below zero, or thereabouts, will be the result. In simple ice-making, the spiral cylinder may be dispensed

Nicolle and Mort's Frigorific Machine.

dispensed with, as the temperature of the spent liquor after having done its work will never be at freezing point. We may here state that we do not confine ourselves to the form of this vessel, as a similar result may be obtained by the spent liquor being made to surround a metal vessel, by coil of round or flat pipe, the water entering the inner vessel, or one vessel may hold the water and be placed in another vessel receiving the spent liquor, but by preference we use the form first described. The coil is composed of two pipes of different diameters, the smaller pipe being placed inside the larger one, and of such proportions as to allow the water from the tender F to circulate freely, whilst sufficient space is left between the inner and outer pipe to allow the overflow from the refrigerating well H as it passes from the spiral of the cylinder also to circulate freely. The principle of the exchanger is the circulation of a warmer and a colder liquid in opposite directions within separate metallic pipes or spaces; and if the pipes or spaces be in harmony as to size and the lengths be properly adjusted, say from 25 feet to 100 feet, according to the quantity of liquor to be passed, a perfect exchange of temperature will be effected between the two, one liquid leaving at one end at the temperature the other entered, and *vice versa*. It may be observed that the pipes being in excess of the length required will not be injurious to the working. By preference we use one pipe within another, but we do not confine ourselves to this sort of exchanger, as any other form of temperature exchanger may be used, such for instance as a coil or spiral placed in a vessel, one liquid flowing through the coil, and the other entering and leaving the vessel in opposite directions; or one metal vessel may be placed within another vessel, the spent liquor being made to enter one of the vessels and the liquid next to be employed in dissolving the salts to enter the other.

- H is the refrigerating well, made of wood or other material, and by preference lined with lead or other metal not affected by the salts used, into which the salts and water pass by the tube K.
- H¹ is a freezing box, made by preference of wood, lined with tin or lead or other metal which the salts used will not affect, in which the ice moulds (filled with water) or other articles requiring to be refrigerated are placed. It is made with divisions so as to ensure the gradual application of the cold and the discharge of the spent liquor at a temperature at which the water on its way to the water tender will not freeze.
- I is a small metallic pipe, which conveys the water from the tender F through the outer coil of the exchanger into the inclined shoot J. This pipe is fitted with regulating cock, in order to regulate the flow of water into the shoot J.
- J is an inclined shoot which leads the water and the salts into the central tube K.
- K is a central tube which leads the salts and the water on to the centre of the agitator L. This tube is essential to the proper working of the apparatus, as without it the water would escape without proper contact with the salt, and if the water were introduced at the bottom it would congeal.
- We specially claim this central tube.
- L is an agitator, working in the refrigerating well H, made with several blades in the form of a screw propeller, and of such shape or angle as will counteract the centrifugal force and give a retrograde motion to the projected particles towards the centre, thus causing a rapid dissolution of the salts employed.
- M is a vertical shaft, on which the agitator L is fixed, revolving in a step fixed on the bottom of the refrigerating well H.
- N is a small driving pulley, revolving freely on the shaft M, fitted with a strap or band encircling the pulley C, and giving motion to the shaft B.
- N¹ is also a driving pulley communicating its rotary motion to a corresponding pulley on the shaft of the scraper or knife in the spiral cylinder of the exchanger G.
- O is a clutch fitted with a square hole on to the shaft M which enables the salt spade and distributor to be thrown out of gear, without interfering with the motion of the shaft M. A thumbscrew serves to keep the clutch in or out of gear as required.
- P is a bracket in which the shaft M revolves freely.
- Q is a handle for working the machine, which can be replaced by pulley where the machine is of a size requiring more than hand power.
- R is a V pipe rising to the level of the overflow to ensure the exchanger pipe into which the spent liquor overflows being kept full so that the inner pipe containing the water may be in full contact with the cool liquor.
- S is the spent liquor tank, into which the spent liquor flows, after exchanging its temperature with the water coming from the tender F.
- T is a delivery cock.
- U is a fresh water tank, placed in the spent liquor tank S, for the purpose of cooling the water next to be used for ice-making, utilizing any remaining cold which may be in the spent liquor.
- V is a supply pipe, for the purpose of admitting water into the tank U.
- X is a cock for withdrawing the water from the tank U.
- Y is a cock for drawing off the spent liquor from the well H.
- Z is a cock for drawing off the liquor from the freezing box.

MODE OF WORKING THE MACHINE.

The salt tank A must be filled with the salt intended to be used, and the water tender F with water, and be replenished as required.

This may be effected by mechanical means such as elevators, and be made actually continuous in its operation by being worked in combination with the evaporator.

The ice moulds must be filled with water, and placed in the freezing box H¹ with any other articles requiring to be refrigerated.

These

Nicolle and Mort's Frigorific Machine.

These things attended to, the cock in the pipe I at the bottom of the water tender must be opened, and at the same time the machine must be put in motion by turning the handle Q. This action must be continued until the refrigerating well H and the freezing box H' are full, when the temperature of the liquid, if nitrate of ammonia be the salt used, will be about 46° below the temperature of the water at starting; but should this not be the case, before proceeding with the work the flow of water must be lessened, by adjusting the regulating cock so as to increase the quantity of salt, and should it be found as the work proceeds that the salt admitted is in excess of what the water will take up, then the clutch must be thrown out of gear and screwed to the shaft by the thumbscrew provided for that purpose, and so kept until the salt in the refrigerating box is dissolved.

In this way the quantities may be adjusted so that the flow of the water may be equal to the proper dissolution of the salts as they are admitted.

The vessels H and H' being full, the overflow will begin to empty itself into the outside pipe of the exchanger G, through the centre of which the fresh water from the water tender is flowing in an opposite direction through the pipe I on its way to the shoot J, and an exchange of temperatures between the two will commence, the spent solution discharging into the tank S at the temperature the water left the water tender, and the water entering the shoot J at the temperature the spent liquor left the freezing box H.

Fresh water may be introduced through the pipe V into the fresh water tank U, from whence the ice moulds may be supplied by the pipe X.

It will be found that this water has taken up any cold which was left in the spent liquor.

The operation will go on so long as the salt and water is supplied and the apparatus kept in motion, the spent liquor being as continuously withdrawn for evaporation through the pipe T; but in order to prevent the spent liquor from freezing the water on its way to the shoot J, it will be necessary, where the spiral cylinder is not used, to remove the ice mould next the refrigerating well (which it will be found will be first frozen) and to move on the others, replacing the space at the end with the same mould filled afresh with water.

We would here particularly observe that when artificial refrigeration is required for purposes other than those referred to, the room or space requiring to be kept cold is more or less surrounded with piping, which is connected at the cock Z, and through which the refrigerated liquor is made to flow—if needs be by a pump, and on its return to enter the exchanger G.

In working with the piping, we arrange for the passage of the liquor through two properly protected chambers so as to give the extreme cold to the centre or frozen one, and then passing it through the outer chamber in which the articles next to be frozen or other articles requiring to be kept cool may be placed, we utilize the remaining cold in reducing their temperature in the outer chamber. In this way we work most effectively and ensure the return of our cooling agent to its entrance at the exchanger at a temperature which will not freeze the water from the water tender on its way to the shoot J; this latter, however, will be of no importance where the spiral cylinder forms part of the temperature exchanger, except where very low temperatures are sought.

If preferred, the ice moulds may be removed and replaced by a coil, through which brine or any other vehicle for cold may be passed by action of a pump or other mechanical contrivance, the cooling agent entering the coil where the freezing liquor leaves the freezing box, and leaving that vessel on its way to do its work, where the freezing liquor enters; but where the salt employed for producing the cold will not injure the metal through or over which it may have to pass, it may of course be made to perform the work direct, and so do away with the necessity for the coil just described.

To avoid the expense of piping, air may be made the cooling agent.

In this case we pass air through the refrigerating well H or the refrigerating box H', and then through, over, or around the vessels required to be cooled, the air being made to pass by means of a common air-pump.

The description given up to this point has reference only to the working of the apparatus for the production of cold; we now propose to describe the plan for continuously evaporating the spent liquor whilst working, and recovering the salts, reference being made to the plan hereunto annexed. We employ the following vessels, viz. :—

- A is an exchanger (made by preference of wood lined with lead or tin) containing a metal coil, E, through which the spent liquor coming out at the cock Z is forced on its way to another exchanger, B. The spent liquor is forced through the coil E, meeting the evaporated liquid on its way from the still C to the crystallizing drum D, with which liquid it partly exchanges temperature.
- B is another exchanger, made by preference of like material to A, through which the coil E passes; the liquor in that coil taking up additional heat from the vapour passing into the vessel through the pipe F from the still C. The condensed water from this vessel is conveyed by a coiled pipe through the condenser G.
- C is a still, the upper chamber of which is somewhat after the fashion of Coffey's still, and made by preference of wood, lined with lead or tin, and fitted with ten or more perforated evaporating metal plates on to which the spent liquor falls, having in its course through the exchangers A and B acquired a large amount of heat. The liquor passes from plate to plate, receiving additional heat from the vapour arising from three or more steam-plates occupying the lower portion of the still, and into which steam is admitted at suitable temperature, by the pipe H. These lower plates are best made of copper, tinned outside, and of sufficient strength to bear the pressure of steam employed. In passing over the steam-plates the necessary amount of water is driven off and the liquid leaves the still, and entering the exchanger A, imparts its heat to the liquor next to be acted upon.
- D is a revolving drum, made by preference of tinned copper, through which cold water is made to pass, by the cooling power of which the salt is crystallized, and which coming in contact with a scraper, is made to fall into a receiver, from whence, by endless belt or other mechanical contrivance, it is carried into the salt receiver of the Frigorific Machine, thus keeping up the supply in that vessel.

Nicolle and Mort's Frigorific Machine.

E is the metal coil through which the spent liquor is forced, through the exchangers A and B, on its way to the still C.

F is a metal pipe, through which the steam and vapour from the still C is conveyed into the exchanger B, in which vessel it is partly condensed.

G is a condenser or cooler (made by preference of wood), into which cold water is allowed to flow for the purpose of condensing the vapour and cooling the condensed water coming from the exchanger B through the coil K, which latter is a continuation of the pipe F. The condensed water falls into a closed vessel, L, from which it is pumped to the water tender of the Frigorific Machine, which latter may thus be kept continuously supplied with water, whilst a vacuum is maintained in the chamber L.

H is a metal pipe (by preference copper), by which steam is admitted from any steam boiler to heat the steam-plates in the still C. The steam after passing through these plates is carried back to the water space of the boiler through the pipe I.

The mode of working the evaporating apparatus is as follows, viz. :--

First,—pass steam by the pipe H, at a temperature of about 275°, so as to thoroughly warm the still C, and then begin to pump the spent liquor (which leaves the Frigorific Machine at the pipe X) through the pipe which conveys it through the exchanger coils to the still C.

As soon as the liquor gets into circulation, open the cock at the bottom of the vessel L and let out the air; this repeat until all the air is expelled. Now admit the cooling water into the condenser G and into the crystallizing drum D, which drum set in motion at such a speed as will best ensure crystallization, at the same time pumping the water from L.

By this latter and the condensing of the vapour in the vessel G, vacuum will be produced, thereby ensuring a more rapid evaporation of the liquor in the still C.

A regulating cock will allow of the evaporated liquor to fall on to the drum D at such rate as will ensure crystallization.

The speed of the spent liquor force pump must be regulated according to the evaporating power of the still and cooling power of the drum.

We do not confine ourselves to the proportions shown on the plan, or to the size or shape of any of the vessels, which will of course have to be varied according to the amount of work to be performed.

The temperature at which the steam is admitted may have to be varied according to the salts employed, but 275° or thereabouts is what we should use for evaporating chloride of calcium and nitrate of ammonia liquors.

It will be found that a still of the size of the plan, and made as herein described, will be capable of evaporating a much larger amount of salt than a Frigorific Machine of the size described could dissolve.

The still described is designed for the recovering of salts which, during desiccation, will absorb the quantity of water necessary for their crystallization, such as nitrate of ammonia, chloride of sodium, &c.

In recovering other salts which are capable of absorbing a larger amount of water of crystallization, and which amount is necessary for their full frigorific power, such as chloride of calcium, we substitute for the revolving drum D a crystallizing vat, into which the liquor, after having been sufficiently evaporated (say, if under atmospheric pressure, 255° or thereabouts), is allowed to run.

If the salt be required for immediate use, a coil or other cooling contrivance, with a current of cold water, must pass through the vat, to carry off the heat necessary to be removed to effect crystallization.

The bottom of this vessel is fitted with a cock for the purpose of drawing off the drained mother liquor, which liquor must be returned to the still for further evaporation.

The salt as recovered must be passed into the elevator as before described, and the process in that way may be made continuous.

CLAIMS.

First.—We claim in its general combination the apparatus herein described and set forth, styled "Nicolle and Mort's Frigorific Machine," and which we claim to work with or without the evaporating apparatus.

Second.—We specially and separately claim the application of our temperature exchanger for the utilization of the waste cold resulting from frigorific mixtures.

Third.—We specially and separately claim our central tube as described herein and marked K on the plan, whereby we prevent the overflow of the mixing water until saturated with the salt, and also by its union with the salt, as the two find their way into the refrigerating well, also prevent its being frozen.

Fourth.—We specially and separately claim our mode of utilizing the cold left in the spent liquor or other agent after having done its work in or over or around the frozen chamber, and on its return therefrom, by passing it through or over or around a second or outer chamber, by which we effect among other results, the following, viz. :—

1st. We present a valuable barrier against the infiltration of heat into the frozen chamber.

2nd. We utilize the surplus cold possessed by our agent in cooling the articles next requiring to be frozen, or in the temporary preservation of articles of food, or in the cooling of rooms or spaces.

THOS. S. MORT.
E. D. NICOLLE.

This is the specification, marked A. referred to in the annexed Letters of Registration granted to Eugene Dominique Nicolle and Thomas Sutcliffe Mort, this twenty-third day of June, 1873.

IMPROVED MEANS AND APPLIANCES FOR LIGHTING BY ELECTRICITY.

LETTERS OF REGISTRATION to Alexander Nicolaievitch Lodighin, for Improved means and appliances for lighting by Electricity.

[Registered on the 24th day of June, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ALEXANDER NICOLAIEVITCH LODIGHIN, of Saint Petersburg, in the Empire of Russia, gentleman, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of "Improved means and appliances for lighting by Electricity," which said invention is more particularly described in the specification and sheet of drawings which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Alexander Nicolaievitch Lodighin, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Alexander Nicolaievitch Lodighin, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Alexander Nicolaievitch Lodighin shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of June, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improved means and appliances for lighting by Electricity.

SPECIFICATION of ALEXANDER NICOLAIEVITCH LODIGHIN, of Saint Petersburg, in the Empire of Russia, gentleman, of an invention for the "Improved means and appliances for lighting by Electricity."

NOW KNOW YE, that I, the said ALEXANDER NICOLAIEVITCH LODIGHIN, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement or specification thereof (that is to say) :—

This invention relates to the production of regular and steady burning of carbon bodies within a case hermetically closed and charged with a non-supporter of combustion by electric currents, for the purpose of lighting public and private roads and places, signalling on railways and on board ship, illuminating light-houses and buildings generally. The invention consists in the employment of a single carbon stem in lieu of two carbon points as hitherto, one of which burnt away very rapidly and necessitated clock-work to keep them in contact to establish a light at their tips. This plan, also, by reason of the broader points forming increased contact surfaces, increased the brilliancy of the light, which gradually died faint and dim, and produced a flickering flame, not only injurious to the eyes of persons but of an unsuitable character for any practical purpose.

Now, by my invention, a light of almost any required degree of brilliancy can be obtained and maintained for any length of time without flickering, without destruction of carbon points, and without the aid of clock-work. The invention will be well understood by reference to the accompanying drawings and by the following detailed description thereof. Figures 1 and 2 are views of a lantern, with respectively one and two of my carbon stems arranged in the interior. Figure 3 is an outside view of the lantern with two stems. Figure 4 is a plan view of the same. Figure 5 is a plan view taken through the line A.B of figure 2. Figure 6 is a plan view taken through the line C.D of figure 1; while figure 7 is a separate view of the carbon stem which I prefer to use for these sort of lanterns. The stem is composed of a composition of the usual description, compressed or formed with a reduced diameter at or near its central part as at *b*, the ends *cc* being of larger diameter and clipped or held in socket frames, *dd*, which pass through the lantern ends *ee*, and are connected to the circuit wires from the magnets or from the battery. Any number of the carbon stems can be employed in the same lantern, and the current of electricity may be made to pass from one stem to another until the whole or any two or more of them are charged for lighting as desired.

The lanterns are composed of two ends, *ee*, the lips of which receive the glass *f* of the required shape, and in such a manner that the whole can be hermetically closed for preventing electrical contact with the atmosphere, which is essential for the purposes of practically carrying my invention into effect; and in order to fulfil this object more completely, I fill the lanterns with nitrogen or other gas which does not support combustion.

I prefer to use the magneto-electric apparatus known as Ladd's or that of Wild, but I do not limit myself to employing these, as others having the same properties can be employed.

In some cases I connect the two wires or frames of neighbouring stems by a claw attachment, *g* (figures 2 and 3), which is free to be turned on its pin or stud *h* for its claw to engage over or upon the pin or stud *i* of the other, and I establish the continuity of the electric current from one frame to the next by that means. In other cases, if desirable, I fit a metallic strip or wire, *k*, to the two ends of the lanterns as in figure 1, to put the two ends in connection. To ensure the passage of the electric current in the proper direction, I insulate the lantern ends by means of glass or other non-conductable body arranged upon the socket-frames, so as to close the openings through which the stems are inserted, as will be understood.

Figure 8 is a section, and figure 9 a plan view with the top cap removed, of another form of lamp or lantern.

In this lamp the carbon stem is V-shaped, the electric current passing down one side and up the other of the V, the light being formed at the angle at the bottom. This stem is suitably supported and enclosed in a glass lamp or case filled with nitrogen or gas incapable of supporting combustion as before, and the current of electricity is applied as in the first instance or in any convenient manner.

Having thus set forth the nature and object of my invention, I desire to claim,—

Firstly.—The production of light by electricity from carbon stems enclosed in a case charged with a non-supporter of combustion, and hermetically closed, substantially in the manner hereinbefore described.

Secondly.—The apparatus shown in figures 1 to 7 of the accompanying drawings, in which light is produced by electricity from carbon stems hermetically closed in vessels charged with a non-supporter of combustion as described, and—

Thirdly.—I also claim the modified arrangement of carbon stem described and shown with reference to figures 8 and 9 of the accompanying drawings.

In witness whereof, I, the said Alexander Nicolaievitch Lodighin, have hereunto set my hand and seal, this fourth day of January, one thousand eight hundred and seventy-three.

A. N. LODIGHIN.

H. GARDNER, }
E. L. DANIEL, } 166, Fleet-street, London, England.

This is the specification referred to in the annexed Letters of Registration granted to Alexander Nicolaievitch Lodighin, this twenty-third day of June, 1873.

A.D. 1873, 4th July. No. 362.

A NEW METHOD OF AND APPARATUS FOR CLOSING THE POINTS OF WORN SHEEP SHEARS.

LETTERS OF REGISTRATION to Charles Sargeant, for a new method of and apparatus for closing the Points of worn Sheep Shears.

[Registered on the 5th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS CHARLES SARGEANT, of Geelong, in the county of Bourke and Colony of Victoria, builder, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "a new method of and apparatus for closing the points of worn Sheep Shears," which is more particularly described in the specification and the two sheets of drawings hereunto annexed, and marked A and B respectively ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Charles Sargeant, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Charles Sargeant, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Charles Sargeant shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fourth day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(I.S.)

HERCULES ROBINSON.

A new method of and apparatus for closing the Points of worn Sheep Shears.

SPECIFICATION of CHARLES SARGEANT, of Geelong, in the county of Grant and Colony of Victoria, builder, for an invention of "a new method of and apparatus for closing the Points of Worn Sheep Shears."

The present method of closing the points of worn sheep shears is to reduce the "hammers" by filing, and the width of the blades at the heels by grinding. My method is to bend the neck of each shear; by the neck I mean that portion of the handle which adjoins the blade. This brings the points of the shears together without the loss of time and waste of metal incurred by the old process of filing and grinding.

The apparatus which I use for this purpose is of the simplest description. A semi-cylindrical inclined rest is provided for the support of the straight portion of the handle which adjoins the blade. The blade is held in position by a slot at the end of a vertical rod, and a lever is made to descend upon the semi-cylindrical portion of the handle with a gradual pressure sufficient to give the necessary bend at the neck. In order, however, that this portion of my invention may be distinctly understood, I will proceed to describe the drawings hereto attached, where the same letters indicate the same parts wherever they occur. Figure 1 is a front elevation, and figure 2 a side elevation of my apparatus. A is a flat iron plate for affixing to the side or wall of the wool-shed; B is a vertical rod moving freely in cylindrical bracket C, held in position by pin D, and having a vertical slot in its lower end; E is the semi-cylindrical inclined rest; F is the lever supported on pin G; H is the blade of the shear; I, the semi-cylindrical portion of the handle; and J is the neck; K is the hammer.

When about to be used, the rod B must be turned partly round so as to receive the blade of the shear, and back again, so as to admit of the handle resting on the rest E; the lever F must then be brought down, and a sufficient pressure gradually exerted on the semi-cylindrical portion of the handle to give the required bend at the neck as before explained.

Having thus described the nature of my invention and the manner of performing same, I would have it understood that, although I have shown the best apparatus I know of for the purpose, I do not confine myself to it, nor to any of the details of my invention, so long as the nature thereof be retained, but I claim,—

- 1st. Bending worn sheep shears at the neck for the purpose of closing the points.
- 2nd. The apparatus for accomplishing this purpose, substantially as herein described and explained.

This is the specification referred to in the annexed Letters of Registration granted to Charles Sargeant, this fourth day of July, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 20 May, 1873.

SIR,

We do ourselves the honor to return to you the documents transmitted to us under your B.C. communication of the 5th May, No. 73-2,898, and we recommend the issue of Letters of Registration, securing to Mr. Charles Sargeant the exclusive right to his claim for bending worn Sheep Shears for the purpose of closing the points by the apparatus for accomplishing this purpose, as described and explained in the specification and plan accompanying the application of this claim only, namely, the apparatus for accomplishing this purpose substantially as therein described and explained.

We have, &c.,

A.D. 1873, 7th July. No. 363.

IMPROVEMENTS IN APPARATUS FOR HEATING AIR AND GASES.

LETTERS OF REGISTRATION to Thomas Whitwell, for Improvements in Apparatus for heating Air and Gases.

[Registered on the 7th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS WHITWELL, of Thornaby Iron Works, Stockton-on-Tees, in the County of Durham, England, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Apparatus for heating Air and Gases," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D, respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Whitwell, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Whitwell, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Whitwell shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

HERCULES ROBINSON.

Improvements in Apparatus for heating Air and Gases.

A.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN, Be it known that I, THOMAS WHITWELL, of Thornaby Iron Works, Stockton-on-Tees, in the County of Durham, England, engineer, am in possession of an Invention for Improvements in Apparatus for heating Air and Gases, and I, the said Thomas Whitwell, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

This invention has for its object improvements in apparatus for heating air and gases.

The apparatus consists of two furnaces, ovens, or chambers, each enclosed by walls contained in an iron case, and divided by other walls into several narrow compartments. The furnace, oven, or chamber, and the iron case which contains it, is of a cylindrical form, with transverse partition walls, and longitudinal walls to stay and support the partition walls. The partition walls are constructed with openings alternately at the top and bottom, so that the air and gas passing the furnace, oven, or chamber, is led alternately under and over the walls. The furnace, oven, or chamber, is first heated by admitting gas and air, and burning them as they traverse the compartments, and then afterwards the air to be heated for the blast is forced through the furnace, oven, or chamber, in the contrary direction. I form zig-zag passages in the partition walls, and pass through the passages the air for burning the gas, so that it becomes highly heated before it meets the gas in the furnace, oven, or chamber. In this way a more intense combustion is obtained. The furnace, oven, or chamber, may be of elliptical form in place of cylindrical, but the cylindrical form is preferred. I place the cleaning doors at the bottom of the furnace, oven, or chamber, by which the dust which the gas deposits is readily removed.

Having thus stated the nature of my said invention, I will proceed more fully to describe the manner of performing the same.

DESCRIPTION OF THE DRAWINGS.

Figure 1, sheet 1, is a side elevation of apparatus, constructed and combined, according to my invention, showing the burning gas inlet, and the outlet for the heated airs or gases. Figure 2, sheet 1, is a side elevation of apparatus, showing the burning gas outlet, and inlet for the airs or gases to be heated. Figure 3, sheet 1, shows a plan of one of the furnaces or heating chambers.

Figure 1, sheet 2, is a vertical section of a furnace or heating chamber, and figure 2, sheet 2, is a sectional plan of the same. In each of these figures the same letters of reference are used to indicate the same parts.

The apparatus consists of two or more similar furnaces, ovens, or heating chambers, whereof one only is shown.

The furnace, oven, or heating chamber, consists of an air-tight shell of iron, enclosing a circular wall constructed of fire-brick, or other material suited to the temperature it will have to bear. The furnace, oven, or heating chamber, is divided by several transverse walls, at varying distances from each other, which are crossed at right angles by longitudinal walls, for the more perfect support of the same, the whole being properly bonded together. The alternate transverse walls are open at the top and bottom, so that the airs or gases to be heated entering the chimney end of the furnace, oven, or heating chamber, are by the construction of the walls caused to ascend, then to descend, then to ascend, and so on till the heated airs or gases leave the furnace, oven, or heating chamber, at the opposite end of the furnace to that at which they entered. At the top of each furnace, oven, or heating chamber, are iron doors, KK, which are protected by fire-plugs or lumps, LL, which fit the openings on the top of the furnace, oven, or heating chamber.

These openings on the top of the furnace, oven, or heating chamber, are by preference formed over the walls which do not come to the top of the furnace, oven, or heating chamber, by which means the surfaces of the walls situated below the opening can be cleaned with facility.

These openings, when the airs or gases to be heated are passing through the furnace, oven, or heating chamber, are kept closed. In the section shown there are nine of these transverse walls, but the number and also height of the same may be varied according to the extent of surface over which is desired that the airs or gases to be heated shall pass; at the lower part of the walls which ascend to the tops of the furnace, oven, or heating chamber, there are openings for the passage of the airs or gases to be heated. Two or more furnaces, ovens, or heating chambers, are used in combination, in order to maintain a regular stream of heated airs or gases. Gas from any suitable source is supplied to one furnace, oven, or heating chamber, whilst the airs or gases to be heated are passing through another furnace, oven, or heating chamber, and the arrangement of the passages and valves in connection with the furnaces, ovens, or heating chambers is such that the airs or gases to be heated pass through the furnace, oven, or heating chamber, in the opposite direction, and over the identical surfaces of the brick walls previously traversed by the burning gases, on heating the furnace, oven, or heating chamber; by these means the airs or gases to be heated absorb heat from the walls in ascending or descending, and thus become of the same or nearly the same heat as the walls of the furnace, oven, or heating chamber, prior to leaving the same. The dust carried by the burning gas employed in heating the furnace, oven, or heating chamber, accumulates on the walls, and requires to be scraped or removed from time to time. The scraping or removal from the walls is performed by proper tools, introduced through the top openings KK, as above described, and the dust is removed from the bottom of each chamber or oven through the openings closed by the doors DD, by means of convenient tools.

I will now describe the process of the heating of the furnace, oven, or heating chamber:—The gas from any suitable source is made to enter by the gas inlet, valve B, whence it is conducted to the furnace, oven, or heating chamber, by the pipe C. The hot outlet E is closed, and also the cold inlet F, whilst

Improvements in Apparatus for heating Air and Gases.

whilst the chimney valve G is opened, as also the air inlet valves H and I, for assisting in the combustion of the burning gas; by this means the walls of the furnace, oven, or heating chamber, are made red hot to a proper proportion of the whole furnace, oven, or heating chamber, during which time the airs or gases to be heated have been traversing other furnaces, ovens, or heating chambers, heated previously in a similar manner.

The air admitted at H and I for assisting in the combustion of the burning gas is conducted to and fro by long air-passages MN, formed in the thickness of the vertical walls in such way that the air becomes red hot before it meets the burning gas, and hence the combustion is made more intense.

I will now describe the heating of the airs or gases. The furnace, oven, or heating chamber, having been made red hot, as above described, the burning gas inlet B is closed, as also the air inlets H and I; the chimney valve G is also closed. The hot outlet E, which is lined with refractory material, is now opened, also the cold inlet F, by which means the airs or gases to be heated are made to enter the furnace, oven, or heating chamber, at the coldest end, and by the construction of the furnace, oven, or heating chamber, the airs or gases to be heated ascend and descend the walls in rotation till they attain to the required temperature, and issue from the furnace, oven, or heating chamber, by means of the hot outlet E. After a proper interval of time, that is to say, before the airs or gases to be heated cease to be sufficiently heated, they are shut off from the furnace, oven, or heating chamber, and made to pass through another similar furnace, oven, or heating chamber, previously heated, by which means a constant current of heated airs or gases is maintained.

Figure 1, sheet 3, is a vertical section, and figure 2, sheet 3, is a sectional plan of a furnace, oven, or heating chamber, differing from that shown on sheet 2, in that in place of the cleaning openings and doors D, at the lower part of the side openings and doors D', at the bottom of the furnace, oven, or heating chamber, are employed, in which case passages are provided beneath the structure.

Having thus described the nature of my invention, I would have it understood that I claim the construction of furnaces, ovens, or heating chambers, for heating airs or gases, of a circular or elliptical form, and with upright walls or partitions, stayed by cross walls, and with openings capable of being closed by means of plugs and doors or valves, for the purpose of cleaning the interior of such furnaces, ovens, or heating chambers, from dust, substantially as described.

I also claim the admission of heated air, substantially as described, for the combustion of gas in the furnace, oven, or heating chamber.

I also claim the construction of furnaces, ovens, or heating chambers, for heating airs or gases, with cleaning openings in the bottom, in the manner substantially as shown on sheet 3 of the drawings.

In witness whereof, I, the said Thomas Whitwell, have hereunto set my hand and seal, this twenty-eighth day of February, in the year of our Lord one thousand eight hundred and seventy-three.

THOMAS WHITWELL.

This is the specification referred to in the annexed Letters of Registration granted to Thomas Whitwell, this seventh day of July, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 21 June, 1873.

Sir,

The application of Mr. Thomas Whitwell for Letters of Registration for "Improvements in Apparatus for heating Air and Gases," having been referred to us, we have examined the specification and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
E. O. MORIARTY.

IMPROVEMENTS IN ROCK OR STONE DRILLING, TUNNELLING AND BORING APPARATUS.

LETTERS OF REGISTRATION to Frederick Edward Blacket Beaumont and Charles James Appleby, for Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus.

[Registered on the 10th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS FREDERICK EDWARD BLACKET BEAUMONT, of No. 2, Westminster Chambers, Victoria-street, in the city of Westminster, Captain in the Royal Engineers, and CHARLES JAMES APPLEBY, of Emerson-street, Southwark, Surrey, engineer, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus," which is more particularly described in the specification, marked A, and the seven sheets of drawings, marked B, C, D, E, F, G, and H, respectively, which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Frederick Edward Blacket Beaumont and Charles James Appleby, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Frederick Edward Blacket Beaumont and Charles James Appleby, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Frederick Edward Blacket Beaumont and Charles James Appleby shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this ninth day of July in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

*Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus.*A.
SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN, be it known that we, FREDERICK EDWARD BLACKET BEAUMONT, of No. 2, Westminster Chambers, Victoria-street, in the city of Westminster, Captain in the Royal Engineers, and CHARLES JAMES APPELBY, of Emerson-street, Southwark, Surrey, engineer, have invented or discovered new and useful "Improvements in Rock or Stone Drilling Tunnelling and Boring Apparatus"; and we, the said Frederick Edward Blacket Beaumont and Charles James Appleby, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

This invention has for its object improvements in rock or stone drilling, tunnelling and boring apparatus.

For the purpose of drilling-rock or stone, we employ diamonds or gems set around a tubular holder pressed against the rock or stone, and rotated; the gems are thus caused to cut an annular groove, leaving a cylindrical core which is broken away from time to time.

The cutter is mounted on a drilling-bar having a screw-thread cut upon it, and passing through a nut which is so held by the frame of the apparatus that, whilst it is free to rotate, it cannot move in the direction of the axis of the drilling-bar. The drilling-bar and nut are both driven from an axis parallel to the bar, and carrying two pinions to drive the bar and the nut respectively.

The speeds given to the bar and nut are somewhat different, and from this difference the longitudinal motion of the drilling-bar results. The speed of rotation of the drilling-bar in relation to that of the driving axis is invariable, but the gearing or connection of the nut with the driving axis is through parts which are simply in frictional contact; and when the resistance to the rotation of the nut on the drilling-bar is sufficient to overcome the friction of these parts, they yield the one on the other and the longitudinal motion of the drilling-bar ceases.

The driving pinions are connected with their axis through clutches, and either of them can be disconnected from the axis and held fast by a break, and then the longitudinal motion of the drilling-bar is rapid either to or from the work, according as the one or other of the pinions is held fast whilst the other rotates.

Such then is the combination and arrangement of parts constituting our improved rock or stone drill. It is represented in the annexed drawings.

Figures 1 and 2 are longitudinal sections of the apparatus taken on the lines *a b*, figure 2, and *c d*, figure 1, respectively; figure 3 is a front elevation; figures 4 and 5 are transverse sections, taken respectively on the lines *e, f, g, h*, and *i, j, k, l*, in figure 2; figure 6 is a partial section, taken on the line *m n* in figure 2.

A is a bevelled wheel on an axis carried by a face plate, *x*, to which the cast frame, *o*, of the machine is clamped. The wheel A may be driven in any convenient manner, and it gears with a wheel, A¹, which is fast on the axis B. C is a clutch sliding on a feather on the shaft B, and serving when the apparatus is at work to lock the loose wheel D (which has thirty-four teeth) on its axis. E and E¹ are friction discs, alternately of wrought iron and copper; the discs E are caused, by means of a feather, to rotate with the axis; and the discs E¹ are similarly connected with the wheel F, which also is loose on the axis, and thirty-five teeth. By means of the worm, worm-wheel, screw and nut marked G, the discs E E¹ can be pressed together, and the wheel F then revolves with the axis B, unless the resistance to its rotation is capable of overcoming the friction between the discs. HH are steel rings to lessen the friction between the parts G which remain stationary and the parts in connection with the axis B which rotate.

In addition to these frictional holding parts we sometimes provide means for clutching or locking the pinion F upon its axis B at the will of the operator. I is the hollow drill-bar; it has a screw-thread upon it, and a groove from end to end. J is a wheel and tube carried in a bearing on the frame *o*; it has forty teeth, and is driven by the wheel D, and by an internal feather it communicates its motion to the drill-bar I. K is an outer tube with a toothed wheel upon it mounted on the tube J; this wheel has thirty-nine teeth, and it gears with the wheel F. L is a driver carried round by the wheel K and taking with it the brake-strap M, which encircles a disc forming the head of the nut N on the drill-bar I; this nut rotates in a bearing on the frame, and between the bearing and the head of the nut a ring of conical rollers is interposed, to take the thrust of the drill and reduce friction; these parts are marked O, and the ring is shown separately at figure 7.

By these arrangements it will be seen that the drill-bar and its nut are both rotated in the same direction, but at a slightly different speed, and the bar consequently moves slowly forward through the nut so long as it can overcome the resistance to its advance; but when this resistance is sufficient it checks the rotation of the nut N, and the brake-strap M slips on the head of the nut N; the nip of this strap is regulated by a screw and nut and springs, and is so adjusted that it will slip before there is any risk of injury to the gem-cutters or breakage of the parts. In starting a hole the discs E E¹ are allowed to slip the one on the other. P is a screw brake for checking the wheel D when the clutch C is out; it stops the rotation of the drill-bar, whilst that of the nut continues, and so the bar advances at a rapid speed. R is a similar brake on the wheel F; it holds this wheel stationary whilst the wheel D is driven through the clutch C; the drill-bar then rapidly recedes.

The diamonds and gems are set at the end of the hollow holder, both on its external and internal edges, and project so that as they revolve they clear a path for the drill-bar, leaving, however, a core, which is easily removed.

The driving axis may be kept in motion by any power or description of motive-power engine, either attached to the frame of and forming part of the borer proper or detached from it.

For tunnelling we construct a frame or carriage to support and transmit motion to a number of such drills; the carriage is mounted on wheels running on rails laid in the tunnel; it carries an engine worked by compressed air or other fluid, and driving a transverse horizontal axis, which by bevelled gear, drives an inclined axis projecting to the front of the carriage. A bevelled wheel on the axis drives similar wheels on horizontal axes mounted on a transom or base beam which, when the machine is at work, stands

Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus.

stands across the floor of the tunnel in front of the working face; the transom carries two standards, which can be traversed along it by screws, and in each standard is a vertical axis driven from the horizontal axis in the transom; there are face plates on the standards to receive the drills, and they can be traversed up or down on the standard to suit the position of the hole to be drilled, and the standards can be turned round to attain any inclination which may be required. The vertical axis on the standard drives the drills by means of bevelled gear. When at work, the standards are fixed by screws at their upper ends, which bear against the roof of the tunnel, and adjustable ties connect the upper part of the standards with the carriage.

In moving from place to place, the transom and uprights are carried by an axle and pair of wheels, connected by links to the front of the carriage; other links connect the axle with the transom. The ties from the upper ends of the standards pass to screws running lengthwise of the carriage on either side, and these screws can be driven by the engine; and to put the transom upon its wheels they are rotated, and then the ties draw back the standards, and cause them to incline towards carriage, the transom inclining to the same degree.

The links connecting the transom with its wheels are so jointed to it that after a certain inclination has been attained (sufficient to give headway to fit the standards) the joints become stiff, and then as the ties still pull back the upper ends of the standards, the whole—the transom and standards, and the parts connected with them—are lifted off the bottom of the tunnel, and their weight is thrown upon the wheels.

The machine can then run freely along the rails which support it, to any place which it may be desired to take it. Thus, when a set of holes have been drilled, the machine is without loss of time removed to a place of security, where it remains whilst the face of the rock is blasted. When the machine returns to its work, the screws on the carriage are driven by the engine in the reverse direction, and the ties then hoist the standards and place the transom on the floor of the tunnel. The standards are then secured by causing the pressure screws at their upper ends to bear against the roof of the tunnel, and the machine is ready to be again set to work. The inclined driving axis is jointed, to admit of the operation just described.

The facility and rapidity with which the machine can be set up at the working face and retired when the holes have been drilled is an important advantage attained by the novel combination and arrangements of parts in which this part of our invention consists.

In the annexed drawings, figure 8 is a side view of the machine, figure 9 is a plan, and figure 10 a front elevation; *aa* is the carriage frame, mounted on wheels, *b*, running on rails; *cd* are brakes on the wheels; *ee* are cramps to cramp the carriage to the rails, to give it greater steadiness when drilling; *f* is the cylinder of the engine, and *g* its crank shaft. It has fly-wheels upon it, and also the bevelled wheel *g*¹ driving the corresponding wheel *h*¹ on the inclined axis; *h*, *h*², *h*³ are universal joints on the axis *h*, and *h*³ is a telescope joint; these joints are all to admit of the tipping of the standards and transom, as already described. A bevelled pinion, *h*⁴, drives pinions *i*¹ *i*² on horizontal axes *ii* in the base beam or transom *l*. Bevelled pinions, *i*², are able to slide with groove and feather along the axis *i*, and they drive pinions on the vertical axis *l* within the standards *m*; these standards are clamped down in the positions required on to the saddles *n*, and the saddle can be traversed by the screws *o*. *pp* are face plates (corresponding with the plates *x* in figure 1); they are able to slide in guides on the standard. *qq* are fixed screws, and there are nuts upon them—one carried by each face plate; and to bring the face plate to the height required, the nut is turned by means of a small handle and bevelled gear. In connection with each face plate there are also two bevelled pinions, one of which is able to slide with a feather on the axis *l*, and the other in gear with it is mounted on an axis, to which it can be rendered fast by a clutch; this axis corresponds with the axis of the pinion *A* in figure 1. The handle which works the clutch is marked *r*. It will be seen that there is great freedom for the adjustment of the drills. The position in a horizontal direction is attained by traversing the saddle *n*, and in a vertical direction by traversing the face plate on the standard. The inclination of the drill bar in a horizontal plane is adjusted by varying the position on which the standard is clamped down to the saddle on which it stands, and the inclination of the drill-bar in a vertical plane depends on the position in which the drill is clamped to the face plate. In whatever position the drills are set, they are with equal facility driven by the toothed gearing from the air or other engine. *ss* are the axle and wheels for carrying the transom and standards. *s*¹ are the connecting links passing from the axle to the transom. The joint at *s*¹ allows a certain amount of motion, which is limited by the side of the transom coming against a stop on the link. *t* are the ties passing from the top of the standards to the carriage, where they are connected with nuts, *t*¹, on the screws *t*². The length of the ties is adjustable by means of right and left handed screws, as is shown.

When the nuts are caused to traverse along the screws towards the rear of the carriage, they first incline the standards and transom, the movement being on the joints *s*¹, and when this joint becomes fast the links *s*¹ move around the axle *s*, and the transom is lifted so that its weight is taken by the wheels. *uu* are the screws on the standards, which jam them fast in their working positions by penetrating the roof of the tunnel.

On the inclined axis *h* is a toothed wheel, *h*⁵, gearing with a wheel, *v*¹, on an axis, *v*, running from end to end of the carriage. From the axis *v* the governor of the engine is driven in the manner shown; and there is also a bevelled pinion, *v*², on this axis driving other pinions, *w*¹ *w*². On an axis, *w* *x*, is a clutch with a lever handle, by which either of the wheels *w*¹ *w*² can be made fast with the axis, which thus can be driven in either direction. *w*³ *w*⁴ are bevelled pinions on the axis in gear with pinions *t* on the screws *t*². *f*¹ *f*² are pump barrels cast with the cylinder; they force water which is conveyed by flexible pipes into the hollow drill-bars. *y* is the starting lever.

The usual method of working is to form several rows of holes, the holes of the two centre rows inclining more or less towards each other; and first by means of these holes an opening is blasted out, then the remaining rows of holes are blasted successively to complete the heading.

If the tunnel is not wide enough to admit of this method of working, the bottom of the working face is first blown outwards by firing charges in a line of inclined bore-holes, and then by means of other holes the rock above is thrown down. When this method of working is resorted to, the transom is so constructed that the standards can be traversed right across it from end to end, so that the lower row of holes may be drilled sufficiently close together. The inclined axis *h* in this case drives an intermediate

axis

Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus.

axis passing along at the side of the transom, and this by spur gear drives the axis *i* within the transom. This axis extends from end to end of the transom.

In well-sinking the drills are similarly mounted on "standards," which, however, in this case are horizontal, and the axes *ii* are driven by a travelling rope passing to the surface.

Another part of this invention consists in a novel combination and arrangement of parts for the purpose of applying the drills hereinbefore described to the production of deep bore holes to serve as wells, or to give indications of the strata through which the hole is sunk.

The drill-bar is lengthened from time to time as the work progresses, by the addition of boring rods, consisting of drawn steel tubes or welded wrought-iron tubes with screw sockets, and the upper length of the boring rods passes through an outer tube which has a keyway cut along it. The boring rod is firmly held in a clamp at lower end of the outer tube, and the outer tube is carried in a bearing which slides on the upright frame of the machine, and has weights connected with it by chains to regulate the pressure on the drill so that it may be either more or less than the weight of the boring rods. The outer tube also passes through a hollow axis having a key or feather within it entering the keyway in the tube, so that the tube is compelled to revolve with the axis. The axis is carried in a bearing fixed on the frame, and is driven by bevelled gear from an inclined shaft, and this shaft is itself driven from a horizontal shaft, receiving motion by a driving strap from a steam-engine or other convenient source of power. The lifting chains pass over chain wheels, which can be driven by a hand rope and wheel or by power to lift the boring rod or its holder.

Figure 11 is a front view, and figure 12 is a side view, both partly in section, of this apparatus. *aa* is the frame, consisting of the uprights *a*¹, the struts *a*² and *a*³, and the base beams, *a*⁴. On the struts *a*² the horizontal axis *b* is mounted; it is driven by a belt, *b*¹, passing around the belt pulley *b*²; *b*³ is a spur wheel on the same axis driving a pinion, *c*¹, on an axis *c*. The wheel *b*³ and pinion *c*¹ can be changed for others of different sizes to vary the speed of rotation of the boring rod; *c*² is a bevelled wheel on the axis *c*, driving another bevelled wheel, *d*¹, on the inclined axis *d* carried in bearings which are supported by the struts *a*². The wheel *d*¹ at the upper end of this axis drives a pinion, *e*¹, on a hollow axis, *e*. The bearing of the hollow axis *e* is fixed to the uprights *a*¹, and through this axis the slotted tube *f* passes. The tube can slide freely through the axis, but is compelled to turn with it by a key or feather within the axis entering a slot in the tube. The lower part, *f*¹, of the tube *f* is a separate piece connected with the upper part by flanges and bolts; it is carried in a sliding bearing, *g*, which is able to traverse up and down on the uprights *a*¹. *f*² is a clutch on the bottom of the part *f*¹; it is for the purpose of holding firmly the boring rod *h* which passes through the tube *f*, *f*¹. This clutch is made like a lathe chuck, with a series of jaws receiving radial motion from screws. The screws have bevelled pinions upon them, all gearing with a similar pinion mounted on *f*¹ so that the screws turn simultaneously, and the jaws hold the boring rod concentrically within the tube *f*, *f*¹. The boring rod may conveniently be, as already mentioned, of drawn steel or wrought-iron welded tube with the ordinary external screw sockets. At its lower end the gem-drilling tool is fixed, and at its upper end a cone or plug, *k*¹, like that of an ordinary water tap. This cone or plug enters a corresponding shell, to which water is supplied from a pump, *k*, by a pipe, part of which is flexible. The upper end of the water pipe is carried by a block which is able to slide along guides, *ll*. These guides also serve to steady the top of the boring rod. The weight of the boring rod *h* and the outer tube *f*, with its sliding bearing *g*, tends to press the drill down to its work, and, to diminish or augment this pressure, chains are passed upwards and downwards from the sliding bearing *g* around pulleys, *m*, to suspended weight-receivers, *n*, each made to receive a number of separate weights. The adjustment of the pressure on the drill is effected by loading one or other of these receivers. The chains which pass upwards from the sliding bearing *g* pass over chain wheels, *o*¹, on an axis, *o*, on which is a spur wheel, *o*², gearing with a pinion, *p*¹, on an axis, *p*. *p*² is a pulley on the same axis; it receives an endless rope which may be used to turn the pulley by hand, or it may be driven by placing around the pulley *p*² on the axis *b*. *q* is a treadle acting on a break strap to retain the axis *o*; this gear is used in raising the tube *f*, *f*¹ either with or without the boring rod. It is convenient that the tube which forms the boring rod should be in long lengths, so that the joints may be as few as possible. When such tubes are used a light scaffold is erected over the machine, to steady the upper end of the tube, and to facilitate the screwing on and off of the successive lengths; this scaffold may carry tackle for lifting the tubes.

After the drill has been worked for some time, the boring rod is lifted, carrying up with it the cores, which are caught by wedges or clips; and also by an enlargement in the boring tube immediately and for some distance above the cutting tool. The debris formed during the boring is entirely removed by the circulation of the water forced down the tube *h* by the pump *k*.

For deep borings the pressure may be put on in the same way as in drilling and tunnelling, and as is fully described in respect to figure 1 to 10. In such case the weights represented in figures 11 and 12 would be dispensed with.

In place of controlling the pressure on the boring tool by movable weights, as in the machine above described, the pressure on the drill may be controlled by hydrostatic apparatus.

Figure 13 shows a vertical section, figure 14 a side view, figure 15 a plan partly in section, and figure 16 a horizontal section (on the line GH, figure 14) of the hydrostatic machine. In these figures *aa* represents the framing of the machine carrying a cylinder, *b*, in which works a piston, *c*, fixed on a hollow piston rod, *c*¹; this piston rod passes out through a stuffing-box, *b*¹, at the lower end of the cylinder. The hollow piston rod fits over a tube, *d*, which hangs down from the top cylinder cover, as shown; and it is through this tube that a stream of water is supplied to the boring rod. The lower end of the piston rod has connected to it the cross head *e*, which can rise and fall on the guides *f* formed on the framing of the machine. The cross head carries a short vertical tube, *g*, concentric with the piston rod, and capable of being revolved in the bearings in which it is mounted; to this tube the upper end of the boring rod carrying the drill is attached. On the exterior of the tube is a toothed wheel, *h*, which is driven by a wheel, *h*¹, carried by the cross head, and is capable of sliding up and down on the vertical shaft *h*², whilst at the same time it is caused to revolve with the shaft by a key or feather upon it. The shaft *h*² receives motion from the shaft *h*³, and this is driven by a bevel-toothed wheel, *h*⁴, on the main driving shaft *k*. The toothed wheel *h*⁴ is loose on the shaft, but can be made fast therewith by the sliding friction clutch *h*⁵, and thus a continuous

Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus.

continuous rotary motion can be imparted whenever desired to the boring rod. The lower end of the boring rod may either be a diamond crown cutter, such as hereinbefore described, or other construction of cutter may be used. When the boring rod is at work, and it is desired to put pressure upon it to force it downwards, water under pressure is admitted to the top of the cylinder *b*, through the pipe *l* which leads from the bottom of the cylinder *m*; this cylinder forms an accumulator; its upper part containing compressed air, whilst water is pumped into its lower part by the pump *n*¹, the plunger of which receives motion from an eccentric on the main shaft, as shown. The suction pipe of this pump draws water from the tank *r* which forms the lower part of the bed or framing of the machine. *n*¹ is an outlet safety-valve to allow of the escape of water supplied by the pump when the pressure in the accumulator has arrived at the limit desired. The amount of pressure put upon the boring tool can thus be regulated by varying the pressure in the accumulator, or the pressure on the boring tool can be controlled by causing the water in the lower part of the cylinder to escape through a loaded escape valve on the pipe *q* which leads from the bottom of the cylinder *b* to the tank *r*.

On the opposite side of the framing of the machine to that which carries the accumulator *m* is another air vessel or accumulator, *o*, similarly supplied with water under pressure from a pump, *p*, the suction pipe of which is supplied with water from any convenient water supply. From the accumulator *o* a stream of water is supplied whenever desired to the hollow boring rod, by the pipe *p*¹. A branch pipe, *p*², fitted with a cock, is also led out from this pipe to the bottom of the cylinder; by opening this cock, water under pressure can be admitted to the lower part of the cylinder, for the purpose of raising the hollow piston rod together with the boring rod carried by it.

When the piston is being raised by the admission of water to the lower end of the cylinder, the communication between the accumulator *m* and the top of the cylinder is cut off by closing a cock on the pipe *l*, and at the same time a cock on a branch pipe, *s*, leading out from it is opened, and thereby the water in the upper part of the cylinder is allowed to escape and pass away through this branch pipe. It will thus be seen that the boring rod can not only be raised whenever desired, but can also be lowered steadily, and have any desired amount of pressure placed upon it when the boring tool is cutting.

The machine above described may also, with slight modifications, be employed for working an ordinary jumping boring tool.

When such a tool is to be employed, we make provision for admitting steam alternately to the two ends of the cylinder *b*, so as to give a reciprocating rising and falling motion to the boring rod; and in place of imparting to the rod a quick revolving motion as in the machine shown at figures 13, 14, 15, and 16, we modify the gearing, by which a revolving motion is given to the boring rod so as only to give to it a slow continuous revolving motion.

Another part of our invention relates to the construction of the cutter. Heretofore, the gems have been set in a cylinder of soft steel so as to project beyond it, both on the inner and outer circumference, and also at the end of the cylinder; when set in this way the gems are liable to break from being insufficiently supported. To obviate this difficulty, we increase the thickness of the cylinder at the part where the gems are set, both on the inner and outer side, and the end of the cylinder is rounded.

In setting the gems they are sunk into the metal, so that they do not project, or project but slightly above the surface, and then afterwards on the cutting side of each gem the metal is removed to expose the part of the gem which is to operate on the rock, leaving the gem completely supported at the back.

Figure 17 is a side view, figure 18 is a plan, and figure 19 is a longitudinal section of a cutter thus constructed. The gems are marked *a a*.

Having thus described the nature of our said invention and the manner of performing the same, we would have it understood that we do not make any general claim for the use of gem-cutters in drilling, tunnelling and boring rock, but we claim—

First.—The construction of the rock drill, substantially as described.

Second.—The construction of the tunnelling machine, substantially as described.

Third.—The construction of the boring or prospecting machine, substantially as described, and illustrated at figures 11 and 12.

Fourth.—The construction of the boring or prospecting machine, substantially as described, and illustrated at figures 13, 14, 15, and 16; and also the modification herein described of this machine to adapt it for working with an ordinary pumping tool.

Fifth.—The construction of the cutters, in manner substantially as described in respect to figures 17, 18, and 19.

In witness whereof, we, the said Frederick Edward Blacket Beaumont and Charles James Appleby, have hereunto set our hands and seals, this twenty-third day of December, in the year of our Lord one thousand eight hundred and seventy-two.

REPORT.

Sydney, 20 May, 1873.

SIR,

We do ourselves the honor to return to you the documents transmitted to us under your B.C. communication of the 9th May, No. 73/3521, and we recommend the issue of Letters of Registration, securing to Frederick Elward Blacket Beaumont and Charles James Appleby the exclusive right to their invention of "Improvements in Rock or Stone Drilling, Tunnelling and Boring Apparatus," as set forth in their Petition, drawings, specification, and claims.

We have, &c.,

E. O. MORIARTY.

**IMPROVEMENTS IN MACHINERY FOR DRILLING OR PERFORATING ROCKS
AND OTHER HARD SUBSTANCES.**

**LETTERS OF REGISTRATION to Thomas Brown, for Improvements in Machinery
for drilling or perforating rocks and other hard substances.**

[Registered on the 10th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS THOMAS BROWN, of London, England, civil engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Machinery for drilling or perforating rocks and other hard substances," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Brown, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Brown, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Brown shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this ninth day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Machinery for drilling or perforating rocks, &c.

A.

SPECIFICATION of THOMAS BROWN, of London, England, civil engineer, for an invention entitled "Improvements in Machinery for drilling or perforating rocks and other hard substances."

THE said invention relates to machinery for drilling or boring rocks and other hard substances, and is designed to render the said machinery more efficient, convenient, and economical than other machines heretofore used for similar purposes. I will first describe the parts of my invention illustrated in figures 1 to 12 of the accompanying drawings, in which figure 1 is a side elevation of my improved machine; figure 2 is a plan of the same; figure 3 is a vertical section through the centre of the same; figure 4 is a transverse section on the line *xx*, figure 1; figure 5 is a transverse section on the line *yy*, figure 1; figure 6 is an enlarged view of the under side of the valve-chest and valve; figure 7 is a horizontal section on the line *zz*, figure 6; figure 8 is a transverse section on the line *ww*, figure 6; figure 9 is an elevation of one end of the piston-bar with its annular cam; figures 10, 11, and 12 are detached portions hereinafter described.

A is the cylinder, within which works a piston driven by compressed air or steam; this cylinder is provided with projecting ribs, *a*, fitting into grooves, *b*, in a slide or drill frame, B, and on this frame the cylinder and parts connected therewith are made to advance as the work progresses. The drill-frame B is bevelled on its under side, and slides in a dovetailed recess in a clamp, C, which is constructed as follows: *c* is an ordinary box which embraces the column or bar D whereon the drill is mounted, and is made in two parts held together by screws, by which the box may be secured in the required position; on one portion of this box *c* is a bevelled disc, *d*, to which is fitted the upper portion of the clamp; this clamp is made in two pieces, A' and B', held together by bolts *e* and nuts *f*; by loosening which the machine can be revolved around the disc as a centre, or advanced or withdrawn in line with the drill; it will thus be seen that by means of this clamp a universal motion is obtained, together with a movement towards or from the work. E is the piston-bar attached to the piston *g*; it carries at its forward end the drill F, the piston-bar being made solid except at its rear end, which is hollowed out for the reception of the feed-screw G; this screw G is secured to and revolves in a bar, *h*, at the end of the drill-frame B, by which it is supported, as seen in figures 2 and 3, and it is held with sufficient friction to prevent its turning when the drill is in operation; *i* is a winch by which it may be revolved by hand when required. To the rear end of the cylinder A is secured a hollow tube or casing, H, which acts as a guide for the feed and valve gear, and also for the ratchet which rotates the drill. Upon the rear end of this casing H is screwed a cap, I, containing the feed nut and ratchet J, either made in one piece or permanently secured together, the nut J being held in place by a washer, 14, which rests against a shoulder on the inside of the cap I, thus allowing the nut to revolve freely as required. Instead of the feed-screw passing into the end of the piston bar as above described, it may be attached permanently to a ratchet J and screw through the bar *h*.

A partial revolution is given to the drill after each blow, as follows:—At the rear end of the piston-bar E is cut a spiral groove, *j* (figure 9), into which projects a feather on the inside of a ratchet ring, *l*, through which the piston-bar passes; this ratchet *l* is supported in the casing H in a slot which is pivoted to the pawl *m*; the latter engages with the teeth of the ratchet, being kept in contact with the same by a spring, 15. The ratchet is confined on one side by a shoulder, 16, on the inside of the casing H, and on the other side by a washer, 17, which rests against a shoulder, 18, and thus allows it to be revolved freely. As the piston-bar moves forward towards the rock, the ratchet *l* is turned so that the pawl *m* falls into the next succeeding notch, there being more weight and friction on the piston-bar than on the ratchet, and consequently the latter is turned as required. In the backward stroke, however, the ratchet is held stationary by the pawl *m*, and the feather causes the piston-bar to be partially revolved by means of the spiral groove, *j*. Instead of a spiral groove the piston-bar may be made polygonal in cross section and twisted, so that in passing through an opening in the ratchet of corresponding form it will be turned as required; or instead of the piston-bar being grooved or twisted, a piece attached thereto may be turned in a similar manner by passing through the ratchet or rotating device. By these contrivances I am enabled to protect the working parts from the effects of the concussion, and consequently lessen the liability to be broken.

The valve K through which the compressed air or steam is admitted into the cylinder A is a hollow, double-acting rotary valve; it works in a chest or casing, L, seen enlarged in figures 6, 7, and 8, and is so constructed that the pressure of the air or steam will hold it firmly upon its seat. The valve K is formed with two ports, *n*, figure 10, which connect with the exhaust passage *o* in the interior, and is also provided with longitudinal bars or toes, *p*, to cover the ports *q* in the valve-chest L, which communicate with the interior of the cylinder, there being a space, *r*, around the valve, so that the air or steam may pass through the holes *s*, figure 6, on both sides round to either port in the valve-chest. When the valve is in a position to take air or steam at either port, the port at its opposite end will be in such a position that the exhaust will pass through it into the interior of the valve, and this valve being in line with the cylinder, the exhaust air or steam is discharged towards the drill, and serves to blow away the dust or water from the working parts of the machine.

The required motion is given to the valve K by means of a rod, *t*, supported in standards 19 on the casing H and cap I, and is rocked or partially revolved by means of the jointed tappets *u* *v*, whose lower ends project through slots in the casing H; these tappets are raised at the required times by an annular cam, M, secured to the rear end of the piston-bar E, which passes under them as the bar E is reciprocated. By moving the rear tappet *u* on the valve-rod *t* towards or from the cylinder the air or steam will be cut off sooner or later, so that the drill may be operated to advantage in any desired position, either vertically or horizontally. Instead of the cam M being attached directly to the piston-bar E, it may be secured to a piece connected thereto. The feed of the drill is effected in the following manner:—*a'* is a lever pivoted at *b'* to the casing H, and carries at one end the spring-pawl *c'*, which engages with the ratchet-teeth of the feeding-nut J; the opposite end of the lever *a'* passes through a slot, 20, in the casing H into a position to be struck and raised by the annular cam M as it passes beneath it; the pawl *c'* thus revolves the nut J on the screw G which feeds forward the drill as required. The end of the lever *a'* which passes through the slot 20 is so curved and formed that the annular cam M does not lift it sufficiently to effect the feed until after it has raised the tappet *v* on the forward stroke to shift the valve; by this means I am enabled to regulate the

the

Improvements in Machinery for drilling or perforating rocks, &c.

the feed to correspond with the penetration of the drill—the valve, however, will be shifted at each stroke without reference to the feed. The rear end of the drill *F* is enlarged to give it an increased bearing surface, and is formed with a taper shoulder, 21; over the shoulder fits a clasp-nut, *N*, figures 3, 11, and 12, which is screwed into the end of the piston-bar *E*. The nut *N* is made in two pieces, hinged together at 22, so that it may be easily fitted over the drill, and when screwed down serves to hold the latter in a central position with regard to the piston-bar. The nut *N* is provided with a groove, 23, into which fits a feather or projection on the drill, so that as the latter is revolved it tends to tighten the screw-nut; by this means the drill is held tightly in place and prevented from becoming loose while the machine is in operation. Instead of the spline and feather above described, a portion of the drill may be made polygonal and the inside of the clasp-nut of a corresponding form.

I will now proceed to describe the modifications of my invention illustrated in the remaining figures of the drawing. Figure 13 is a plan of a machine constructed according to this part of my invention. Figure 14 is a longitudinal central section of the same on the line *z z*, figure 13. Figure 15 shows one end of the said machine, and figure 16 shows the other end. Figure 17 is a longitudinal central section on the line *y y*. Figure 15 shows the feed mechanism, and figure 18 is a cross section showing parts in elevation.

The body, *a*, of this machine made in one casting constitutes the steam or air cylinder, and covers and protects most of the feeding and turning mechanism. This body or cylinder has two wings, one on either side, fitted in ways planed in a trough-like bed, *b*, provided with a “frusto” conical plate, by which the machine is clamped to a box or bearing fitting on a cylindrical bar forming part of a support or carriage, so that the drilling machine may be presented to its work in any direction and at any angle. The cylinder *a* has its front end closed by a head, *c*, into which a long stuffing-box, *d*, is screwed. The rear head of the cylinder is an annular sleeve, *f*, held from endwise movement by screws, *g*, the ends of which enter a groove turned in the periphery of the sleeve, the joint between the sleeve and the piston being made tight by the ring-packing *h*, which receives on its outer surface air or steam pressure from within the cylinder to force the packing closely upon the piston-rod. The piston rod and head are made of one steel forging, two metallic packing-rings being used in the piston-head, which are pressed outward by the entrance of steam or compressed air against their concave surfaces. The drill is secured to the protruding end of the piston-rod.

The ratchet-wheel *i* by which the drill is turned is placed upon the piston-rod at some distance from the rear piston-head, and is kept from endwise movement with respect to the head by the sleeve *f* and the collar *k*. Between the collar *k* and the ratchet-wheel *i* is a friction ring, *l*, whose purpose will be hereinafter explained. The sleeve *f* forms part of the rear cylinder-head, and affords facility for placing and removing the packing shown in the rear cylinder-head. In one end of the sleeve *f* a score is turned to receive the ends of screws *m*, which aid in preventing endwise movement of the rear cylinder-head. The collar *k* has also a groove turned in its periphery to receive screws *n*, which prevent endwise movement of the said collar. The ratchet *i* has a feather over which the inclined slot at the rear end of the piston-rod *e* can slide freely, effecting the turning of the drill, piston-rod, and piston-rod head, in the back stroke of the piston-rod. During the time the piston-rod is making its back stroke the rotation of the ratchet-wheel is prevented by a pawl which engages therein, consequently the piston and drill are turned by reason of the traversing of the inclined groove in the piston-rod over the inclined feather in the ratchet-wheel. When the piston makes its forward stroke it does not turn, but the ratchet does.

Besides the inclined groove in the piston-rod, there is a straight groove in which fits a feather fixed in the friction ring *l*. This ring serves as a brake on the piston to prevent its turning back during its forward stroke from the position given it by the inclined feather and groove before mentioned. In its backward stroke the ring *l* serves as a medium through which to make the friction on the piston greater than the friction on the ratchet *i*, so that the ratchet *i* will turn in the forward stroke of the piston rather than the piston. On the cylinder *a* is pivoted a bent lever, the long arm of which is provided with an adjusting screw, and the short arm with a copper pad or face. By adjustment of the said screw the face is forced with more or less pressure upon the periphery of the friction-wheel *l*, so that the resistance to turning the piston can be made greater than the resistance of the ratchet *i* in the direction permitted by the form of its teeth under the pawl when riding or slipping over the ratchet-teeth, and without having to depend for the necessary friction on the piston in tightening up the packing in the front head *c* of the cylinder. Provision is made to prevent breakage in the case of obstruction by the debris, by making the pawl *p* which acts to detain the ratchet *i* as a bent spring of sufficient stiffness to prevent its yielding under the normal conditions of action, but capable of yielding when obstructions occur. The form given to the pawl *p* to allow it to yield when necessary is best seen in figures 15 and 18.

The machine is provided with the ordinary slide-valve, which is operated by a rod attached to a pivoted or momentum piece, *q*, made sufficiently heavy to possess considerable momentum when in motion. This piece and the valve-gearing are most clearly seen in figure 14. Two arms of the piece *q* extend through a slot in the rear end of cylinder *a* to a position where, in the stroke of the piston, they are acted upon by an annular or elliptical projection or tappet, *r*, fixed on the rear end of the piston-rod *e*. The arm of the piece *q* to which the valve is connected extends upward, and serves as a handle whereby the valve may be shifted as the piston moves rapidly to and fro. The tappet *r* strikes first one of the lateral arms of the piece *q* then the other, thus rapidly, effectively and simply operating the valve. When the tappet *r* strikes either of the lateral arms of the piece *q*, the arm and the valve connected therewith are moved by momentum much beyond the distance which they would travel if the tappet *r* moved slowly; but owing to the rapidity with which the tappet *r* moves, the lever *q* is thrown at each stroke of the piston a distance clearly indicated in figure 15, and so quickly shifts the steam-valve as to make it almost an instantaneous operation.

On the sides of the rear of the cylinder-holder *b* are fixed the ends of a staple-formed strap, *s*; in a bearing formed therein is fixed by suitable collars the end of the feed-screw *t*, so that it can freely turn but cannot move endwise. In the rear end of cylinder *a* is screwed a head, *u*, fixed by set screws, and in which is made a bearing for the nut; the latter, on being turned, moves the cylinder *a* towards the rock or other substance to be drilled. On this nut is fixed a ratchet-wheel, *v*, operated by a pawl, *w*, to move the cylinder *a* towards the rock or other substance to be drilled. This pawl *w* is hung on the short arm of a pivoted lever, *a'*, the long arm of which extends through a slot in the cylinder *a*, so formed and placed that, when the piston makes its back stroke, the tappet *r* may come into contact with the arm moving the lever *a'* to cause

Improvements in Machinery for drilling or perforating rocks, &c.

cause the pawl *w* to turn the ratchet *v* and the nut connected therewith, thus moving the cylinder *a* and all parts connected therewith towards the rock or other substance to be drilled. To create enough frictional resistance on the nut connected with the ratchet *v* to prevent the turning of the nut by the vibration of the machine, small spiral springs are located in the rear head *w*, which are compressed between it and a friction ring bearing against the ratchet, as clearly shown in figure 14. The rear end of the piston-rod is bored to receive the feed-screw *t*.

The feeding of the cylinder towards the rock or other substance to be drilled is automatically effected as described, but the withdrawal of the cylinder is accomplished by turning the screw by a hand-crank at the rear end of the same.

During the time that the drill is being automatically fed forward toward the rock, the turning of the screw in the staple-formed strap *s* is prevented by the friction of the nut on the outer end of the screw, which is tightened for that purpose; but when the drill is to be drawn back, by turning the hand-crank the said nut is loosened, and the ratchet *v* fixed on the feeding-nut will remain without rotating by reason of the friction thereon.

To prevent any injurious variation between the feed and the penetration of the drill, I employ mechanism which automatically preserves a practical uniformity of feed and penetration. In the slot in the cylinder in which the long arm of lever *a'* vibrates is fixed a trigger, *b'*, figure 17, that springs into position to hold and sustain the lever *a'* out of reach of the tappet *r* when the feed of the cylinder is in excess of the penetration of the drill. In this case the tappet *r* does not in the forward stroke of the piston reach and displace the trigger *b'*, and the said lever *a'* remains supported so that the tappet *r* will not act fully thereon but only raises the lever slightly from the trigger, consequently no feed takes place on the next back stroke of the piston, and the reciprocations of the piston and drill continue without further advance of the cylinder until the penetration of the drill equals the previous feed or advance of the cylinder, then the tappet will on a forward stroke of the piston reach and displace the trigger so that the lever *a'* will be left free to spring into the path traversed by the tappet *r*, so that on the back stroke of the piston the lever *a'* is worked by the tappet, and the pawl *w* takes into the teeth of the ratchet *v* and gives a partial turn of the feed-screw; when the long arm of the lever *a'* is raised by the tappet the trigger *b'* will catch and sustain the said lever out of reach of the tappet, so that no feed will be again effected until the penetration of the drill allows the tappet to reach and displace the trigger *b'*. When a feed of the cylinder takes place, the piston on its back stroke might possibly come into contact with the back cylinder-head *f'*; I therefore place a rubber cushion, *c'*, against the rear head *u*, to check the back stroke of the piston.

In connection with the machine illustrated in figures 1. to 12 I claim—

First.—Passing the piston-bar E or an attachment thereto through the ratchet-ring *l* or rotating device, substantially as and for the purposes set forth.

Second.—The hollow valve K with its chest L, constructed and operating substantially as described.

Third.—The clamp C, consisting of the box *c* and pieces A' and B', constructed and operating substantially as described.

Fourth.—The clasp-nut N for holding the drill in place, operating substantially as set forth.

And in connection with the machine illustrated in the remaining figures of the drawing I claim—

Fifth.—Actuating the slide-valve by means of the pivoted or momentum piece *g* in combination with the annular or elliptical tappet *r*, described and shown in figure 14.

Sixth.—The feed-lever *a'* and qualifier *b'* acting in connection with the tappet *r*, as described and shown in figure 17.

Seventh.—The combination of the spiral and straight slots formed in the piston-rod in the manner and for the purpose above described, and shown in figure 14.

Eighth.—The universal clamp, by means of which the machine is set and secured at any desired angle, substantially as above described.

Ninth.—The general construction and arrangement of the parts of the hereinbefore described machine or apparatus, substantially as above set forth.

In witness whereof, I, the said Thomas Brown, have hereunto set my hand and seal, this twentieth day of February, in the year of our Lord one thousand eight hundred and seventy-three.

**IMPROVEMENT FOR PULVERIZING AND CONCENTRATING FOR THE SURE
SAVING OF GOLD AND PYRITES.**

LETTERS OF REGISTRATION to Thomas Denny, for an Improvement for
pulverizing and concentrating for the sure saving of Gold and Pyrites.

[Registered on the 10th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THOMAS DENNY, of Bathurst, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for an "Improvement for pulverizing and concentrating for the sure saving of Gold and Pyrites," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years; and I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Thomas Denny, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Thomas Denny, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Thomas Denny shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L's.)

HERCULES ROBINSON.

Improvement for pulverizing and concentrating for

SPECIFICATION of THOMAS DENNY, of Bathurst, in the Colony of New South Wales. Improvement for pulverizing and concentrating for the sure saving of Gold and Pyrites.

My invention of certain improvements in the construction of the buddle, and in the combination of a pulverizer so constructed and attached to the buddle that the whole of the material passed through them shall by the action of the pulverizer be so reduced before going into the buddle that a buddle one quarter of the diameter of those now in use will be sufficient for the same quantity of material. For the reason that the ones now in use receive the crushed material as it leaves the stamper box, they possess no power of further reducing, but simply concentrate the coarse and imperfectly crushed quartz, consequently a very large quantity of useless material is retained, which must be further reduced or pulverized in some way before the gold it contains can be got from it, whilst with my invention the whole of the substance treated is reduced to such a state of minute divisions that the whole of the precious metal and auriferous pyrites it may contain is completely released from the matrix with which it was associated before it enters the buddle, and in passing through which a complete separation is effected.

I commence my description with the vertical shaft A, the middle portion of which is square, the bottom being turned and fitted into the centre of bottom of discharge pan. In order to prevent the oil used for lubricating this from mixing with the tailings, two recesses have been left in the castings for passing the oil through the centre. The top part of this shaft is turned also for working in a bearing, and for receiving the crown wheel which will be keyed on at the top; said crown wheel will receive motion from the pinion wheel, which is keyed on to the horizontal shaft, which also carries the driving pulley. On the square part of the vertical A the cast-iron receiver B (shown half in section) will work loose, whilst connected with the receiver are four arms, C; said arms are semi-circular on the top side for receiving the wrought-iron arms D, which are bolted through C with two bolts, EE.

At the extremity of the arms D a set screw is fitted, for the purpose of fitting and keeping the rollers always in the same position; this being necessary in consequence of the whole weight of the rollers bearing on the brass washers F. The corresponding brass cap G is the adjusting one. When the brass washer F wears, so as to let the roller down, the cap is set up by means of the set screw, this having the effect of keeping the roller always in the one place.

The regulating discharge pipes are bolted on to the receiver B (as shown in section and plan), so as to equally distribute the material to be treated under each of the four rollers H. The material so discharged under the face of the rollers is reduced immediately, because the angle of the roller and basin is such that no quantity of material can lodge on the basin I; but should any of the material be not sufficiently reduced after the rollers having passed over it once, it is again brought up under the face of the roller by the swirl of the water, which acts more powerfully on coarse particles than on that which is reduced to the required degree of fineness.

I may here explain that this peculiar and advantageous result is owing to the shape of the rollers, whose outside diameter is one-fourth greater than the inside diameter (being the frustum of a cone whose apex is the vertical centre of the vertical shaft A). As these revolve they have the effect of forcing the water and material from the outside of the circle to the inside, thus always keeping it under the rollers till fine enough to flush over the edge of the pan with the water. I mention this, because in all other pans it is necessary to fix scrapers for the purpose of shifting the uncrushed material from the outer circle to the centre of the pan. In this pan it is shown above that the swirl of the water acts in place of the scrapers, and much more efficiently. So complete is the action of the swirl of the water, that the mercury in the lower rifle or lower angle of the pan is kept perfectly clear from sand, and ready to receive any gold that may be in the material treated. Too much cannot be said in favour of this basin or pan, because in every respect it has the advantage over all other basins made, some of which advantages I will here mention.

The objections to the Chilian mill is the bottom of the pan is horizontal, it receives the material to be operated on in mass, and in one spot. The quicksilver which is put in is generally ground to flour and destroyed, carrying away with it large quantities of fine gold. The wear and tear is likewise great, because the rollers are square across the face, that is to say, the two diameters are alike in both the inside and outside of the roller, and thus when revolving, as they have to travel different distances in the same space of time, a grinding motion is the consequence, which flours the quicksilver, destroys the rollers and basin, reduces its efficient action, and vastly increases the friction and strain on the machinery; thus wasting much power. All the objectionable qualities are set aside by this invention. The face of the rollers are made at such an angle that they may be compared to a Chilian roller running on a plane; the pan being made at such an angle that it protects the silver in the well J so completely that it is impossible for the rollers to injure it at any time. After the material is sufficiently reduced it flows over the edge of the pan K into the outside pan L, thence under the angle pan M through the radiating depressions in the surface of the bottom of the outside pan L, such depressions being made with sufficient area to discharge the same quantity as will pass through the pipes in the receiver. After passing through these channels it falls with a drop of five inches into the silver well N, it then passes under the adjusting slide O, passing over the mercury P, thence into the outer circle Q of the buddle, thence over the stop into the second circle R of the buddle, thence over the stop into the third circle S, thence over the stop into the discharge pan T.

The outside pan L, the silver N, the buddle pan Q R S, are all one casting; the pulverizing angle pan M is a separate casting, and sits on the outer pan in two places, U V, no fastening being required.

The rakes W are made of wrought iron, with adjusting screws, also adjusting screws in the centre of rake arms, so arranged that one turn of the two screws lifts it to any required height.

I do not bind myself to the precise details herein stated, as it is evident that they may be altered or varied without departing from the nature of my invention, but I claim as my invention the combination of pulverizer with buddle, the peculiar shape of the rollers and pans (which of course will vary according to the diameter of the pan).

The adjusting brass cap and washers at the extremity of the wrought-iron arms. The distributing of the material by means of the receivers and pipes, said material being discharged immediately under the face of the rollers to be pulverized. The depressions in the outer pan for passing the pulverized material into the silver well.

the sure saving of Gold and Pyrites.

The silver well at the outer periphery of the buddle basin, and the right to make them to any diameter required, and with any number of arms, pipes, and rollers, also with any diameters of rollers, pipes, pans, and arms.

The arrangement for self-cleaning consists of fitting pieces of wrought iron fitted into a gap in each of the buddle stop circles No. 2, 2, 2. I take one wrought-iron rake off the arms for each circle, and fix a cleaning brush in its place. I then take out the fitting piece 2 2 2, to allow the mercury, gold, pyrites, &c., to pass through the gaps; said mercury, gold, pyrites, &c., forces through by action of the brushes aforesaid into the bottom pan.

I also claim as my invention the self-acting cleaning out of the top pan by means of a properly fitted brush, said brush to revolve, sweeping the pan till all materials are clean swept out, the means of egress being through a properly fitted pipe and cock, fitted into the pulverizing pan, and passing out through the outer pan. I also claim the right to make the pan flat if necessary, and the rollers cone-shaped, the arms for which would be depressed, so as the rollers would coincide with the pan.

THOMAS DENNY,
Denison Foundry,
Bathurst.

This is the specification referred to in the annexed Letters of Registration granted to Thomas Denny, this seventh day of July, 1873.

HERCULES ROBINSON.

AN IMPROVED METHOD OF COLLECTING AND RETAINING GOLD AND SILVER, &c.

LETTERS OF REGISTRATION to Allen Hollinshed and James Smith Norrie, for an improved method of collecting and retaining Gold and Silver, by the process of amalgamation from quartz and other mineral substances.

[Registered on the 10th July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS ALLEN HOLLINSHED and JAMES SMITH NORRIE, both of the city of Sydney, in the Colony of New South Wales, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for the better method of collecting and retaining Gold and Silver, by the process of amalgamation from quartz and other mineral substances containing those metals, which said invention is more particularly described in the specification which is hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Allen Hollinshed and James Smith Norrie, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Allen Hollinshed and James Smith Norrie, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Allen Hollinshed and James Smith Norrie shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(T.S.)

HERCULES ROBINSON.

An improved method of collecting and retaining Gold and Silver, &c.

SPECIFICATION of an improved method of collecting and retaining Gold and Silver, by the process of amalgamation from quartz and other mineral substances.

INSTEAD of the usual process of passing quartz and other mineral substances over the surface of mercury, we convey them, together with the water used in the process of washing, through a tube, at a sufficient elevation to overcome the pressure of a column of mercury, whereby the lighter substances rise to the surface and are conveyed away, while the precious metals are effectually retained in the amalgamator, which may be of any convenient shape or size, provided with perforated diaphragms, for the better distribution of the passing current. By this means any alluvial soil or tailings may be expeditiously and effectually treated.

We claim by this principle to extract the precious metals from quartz or other mineral substances by passing them through mercury obtained by pressure of a column of water or other mechanical contrivance. We also use sodium amalgam with the mercury in cases where its presence is found desirable, and especially in mineral substances containing pyrites.

ALLEN HOLLINSHED.
JAMES SMITH NORRIE.

Dated at Sydney, this 27th day of May, one thousand eight hundred and seventy-three.

This is the specification referred to in the annexed Letters of Registration granted to Allen Hollinshed and James Smith Norrie, this seventh day of July, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 19 June, 1873.

SIR,

We do ourselves the honor to return the documents transmitted for our report, under your B.C. communication of the 4th instant, No. 73/4149, and which have reference to an improved method of collecting and retaining Gold and Silver, by the process of amalgamation from quartz and other mineral substances; and we do ourselves the honor to recommend the issue of Letters of Registration securing to Messrs. Allen Hollinshed and James Smith Norrie the exclusive right to their invention, in accordance with their Petition, specification, and claim.

A.D. 1873, 7th July. No. 369.

**A METHOD OF REDUCING ALL MINERAL ORES AND QUARTZ STONE TO
A POWDER, &c.**

LETTERS OF REGISTRATION to Edward Reading, for an Invention for reducing mineral ores and quartz stone to a powder, by means of which all the Gold that may be therein may be readily extracted therefrom.

[Registered on the 10th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS EDWARD READING, of the city of Sydney, in the Colony of New South Wales, dentist, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for reducing mineral ores and quartz stone to a powder, by means of which all the Gold that may be therein may be readily extracted therefrom with a great saving of labour, which said invention is more particularly described in the specification which is hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Edward Reading, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Edward Reading, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Edward Reading shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supremo Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

A method of reducing all mineral ores and quartz stone to a powder, &c.

SPECIFICATION.

THE invention consists of a method for reducing all mineral ores and quartz stone to a powder. The mineral ore or quartz stone is burnt or roasted; while in a heated condition it is submitted to an acid bath made with sulphuric acid, or any other strong acids, by which means the mundic and sulphur contained in the stone is destroyed; this reduces the mineral ore or quartz to a rotten state, and it may then be easily converted to an impalpable powder. The stone is now crushed in the mills, and while being crushed an alkaline solution may be used which is composed with any strong potash. After grinding, the quicksilver can be used for amalgamation.

EDWARD READING.

This is the specification referred to in the annexed Letters of Registration granted to Edward Reading, this seventh day of July, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 13 June, 1873.

SIR,
The application of Mr. Edward Reading for Letters of Registration for a "method of reducing all mineral ores and quartz stone to a powder, by means of which all the Gold that may be therein may be readily extracted therefrom," having been referred to us, we have examined the specification accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.

A. O. MORIARTY.

A.D. 1873, 15th July. No. 370.

LYONS'S CHLORO-ALKALINE DEODORIZER AND DISINFECTANT.

LETTERS OF REGISTRATION to John Christian Lyons and Frederic John Christian Lyons, for Lyons's Chloro-alkaline Deodorizer and Disinfectant.

[Registered on the 16th July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JOHN CHRISTIAN LYONS and FREDERIC JOHN CHRISTIAN LYONS, both of Botany, near Sydney, in the Colony of New South Wales, operative chemists, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention styled "Lyons's Chloro-alkaline Deodorizer and Disinfectant," which is more particularly described in the specification which is hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Christian Lyons and Frederic John Christian Lyons, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said John Christian Lyons and Frederic John Christian Lyons, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided-always, that if the said John Christian Lyons and Frederic John Christian Lyons shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fifteenth day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Lyons's Chloro-alkaline Deodorizer and Disinfectant.

SPECIFICATION for manufacturing Lyons's Chloro-alkaline Deodorizer and Disinfectant.

NOW KNOW YE that the process we employ for making our patent chloro-alkaline preparation, and the mode or manner of using the same, is ascertained in and by the following description, that is to say,—we take two parts by weight of a certain natural deposit, which is chiefly composed of chlorine, iron, alumina, and silica, and is found at Bass's Straits and on the sea-shore generally, and one part by weight of dolomite or native carbonate of lime and magnesia—both articles should be perfectly well dried; we then have them crushed and prepared into a very fine powder and thoroughly well mixed; this forms No. 1 powder and is intended for deodorizing and disinfecting purposes generally, but more particularly for destroying all foul and putrescent smells from whatever cause arising, arresting the decomposition of animal and vegetable matters, by the fixing of the ammoniacal and also the nitrogenous elements of fertilizing elements, intended by these means to utilize all fecal and decayed garbage or other waste of our soap-works, tanneries, abattoirs, cesspits, and gas-works, &c., in combination with certain chemical substances, as they may be found necessary according to the kind and particular special character of each concentrated manure required for the soil or crop, by the employment of the chloro-alkaline deodorizer and disinfectant in the large way for the effectual treatment of water-closets, gases principally composed of hydrogen, sulphur, and ammonia. We propose to avail ourselves of our invention either in the form of powder or in solution. For water-closets, and for the purpose of cleansing drains and sewers, we cause a funnel-shaped box with self-acting valve which is made to open and close for the purpose of delivering the powder simultaneously with the water, to be fixed in such a manner that the ordinary motive power employed to discharge the one shall also effect a discharge of the other, and thus a perfect and cleanly system of disinfection will be developed at one and the same time, without giving rise to any other smell or mal-odour whatever, as is found to be the case in the use of most preparations for a similar object. For the use of sick rooms, fever-wards in hospitals, barrack quarters, ship's use, &c., &c., we simply to every given quantity by weight of our No. 1, or the chloro-alkaline deposit, add sufficient rain or soft water to saturate until a corresponding quantity of solution filters or percolates through the filter, and is then bottled for use. This solution of chloro-alkaline is non-odorous, and also non-poisonous to animal life, and the way to use it to arrest all kinds of pestilential effluvia or noxious gases from cholera, typhus, scarlatina, or other infectious or contagious disease, is to sprinkle it about the walls or floors of sick rooms, &c., or it can be very effectually distributed through the surrounding atmosphere by means of a spray distributor or any similar mode. Diluted with equal parts of water and solution, it will remove and prevent all taint in fish, meat, fowl, and most perishable articles for culinary use, as it is an antiseptic and preservative. Although we have named and described the composition of our No. 1 preparation, we also for cheap use and effectual treatment of night-soil, blood, offal, and sewerage generally, mix the chloro-alkaline deodorizer and disinfectant with fresh burnt lime, dried peat, charcoal, wood ashes, bone dust, dolomite, or other convenient absorbent material.

RIDER A.

We therefore claim as our invention the admixture of a certain natural compound described above with dolomite in various proportions, as a disinfectant, which is of an entirely new and improved character, and which we propose to carry into effect in the manner hereinbefore described.

Dated this eighth day of May, A.D. 1873.

JOHN CHRISTIAN LYONS.
FREDERIC JOHN CHRISTIAN LYONS.

This is the specification referred to in the annexed Letters of Registration granted to John Christian Lyons and Frederic John Christian Lyons, this fifteenth day of July, 1873.

HERCULES ROBINSON.

REPORTS.

Sydney, 26 May, 1873.

SIR,

The application of Messrs. John C. Lyons and Frederic J. C. Lyons for Letters of Registration for a "Chloro-alkaline Deodorizer and Disinfectant" having been referred to us, we have the honor to report thereon as follows:—

The specification is not so explicit as we should desire in defining what it is exactly that is to be protected, and we have endeavoured to communicate with the applicants on this subject, but without success. On the understanding, however, that Messrs. Lyons propose to take a certain natural product, composed chiefly of "chlorine, iron, alumina, and silica" found on the sea-shore, and to mix this with "dolomite or native carbonate of lime and magnesia" for the purpose of forming a disinfectant, and that this mixture is what they claim in their specification, we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

P.S.—We have just seen Mr. John C. Lyons, who explains that our letter of date May 19th was not delivered to him till this morning. He is willing to accept the definition of his claim as expressed above.

J. S.
C. W.

Sydney,

A.D. 1873. No. 370.

Lyons's Chloro-alkaline Deodorizer and Disinfectant.

Sydney, 8 July, 1873.

SIR,

In the matter of Messrs. Lyons's application for Letters of Registration for a Deodorizer and Disinfectant, we have the honor to report further that an amended specification has been submitted to us (enclosed herewith), and that with this specification we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
CHAS. WATT.

**IMPROVEMENTS IN TOOLS FOR BORING, AND IN APPARATUS FOR WORKING
THE SAME.**

LETTERS OF REGISTRATION to John Melton Black, for Improvements in
Tools for boring, and in apparatus for working the same.

[Registered on the 2nd day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JOHN MELTON BLACK, of Bedford-place, Russell-square, in the county of Middlesex, England, hath by his Petition humbly represented to me that he is the assignee of Jean Rodolphe Leschot, of Paris, in the Republic of France, who is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Tools for boring, and in apparatus for working the same," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Melton Black, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said John Melton Black, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said John Melton Black shall not, within three days after the granting of these Letters of Registration, register the same in the proper office at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(r.s.)

HERCULES ROBINSON.

Improvements in Tools for boring, and in apparatus for working the same.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, JOHN MELTON BLACK, of 26, Bedford-place, Russell-square, in the county of Middlesex, England, send greeting:

WHEREAS I am desirous of obtaining Letters of Registration under the sign manual and seal of the Colony of New South Wales, for the exclusive enjoyment and advantage, for a period of fourteen years, of an invention for "Improvements in Tools for boring, and in apparatus for working the same," invented by Jean Rodolphe Leschot, of Paris, in the Republic of France, and of which I am the assignee: Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement, that is to say:—

This invention relates to the construction of and means for employing boring tools which are intended to be used for boring rocks, for blasting, for "prospecting," and for other purposes. These tools are armed with diamond-cutters, to which a rotary and an advancing motion are simultaneously communicated. The tool consists of a metal tube with a ring (preferably of iron or steel) at the working end, into which the cutters are fitted. This tube is connected by a bayonet joint or otherwise to a hollow rotary shaft, which, on rotary motion being communicated to it, carries forward the tool and causes it to cut out from the rock, stone, or other material acted on, a core of the material, which core is disengaged and severed from time to time, thus allowing of the inspection of the rock as the boring operation proceeds. This annular rock drill is studded at its cutting end with diamonds or equivalent hard natural substances, as for example that known as "bort," which substances are embedded in the face of the ring so as to utilize in the best manner their cutting faces, and channels or grooves may be formed on the exterior and interior surfaces of the ring to facilitate the passage of the water and detritus.

In the accompanying drawing, fig. 1 is a side view of the annular cutting tool, fig. 2 is a plan view of the same, and fig. 3 is a section taken in the plane of the axis of the tool, and showing it attached to its rotary shaft; *a* is a tube of steel or iron or other metal, *b* is a ring or crown carrying on its face two or three rings of cutters, *cc*, consisting of hard minerals, by preference of the carbon series in their natural state.

This ring is shown as formed with a bayonet joint to fit on to the hollow shaft by which it is operated. The mechanism for presenting the tool to its work, and imparting a simultaneous rotary and advancing motion thereto, admits of various modifications to suit varying circumstances. I will, however, describe but one arrangement, as it will sufficiently indicate what is required to put the invention into practical operation.

Fig. 4 shows in side elevation an arrangement of mechanism for adapting the tool for boring in mines. *A* is a standard rising up from a wheel-carriage, *B*, and fitted at its upper end with a screw, *A*¹, for operating a clamp, *C*, and causing the same to bind against the roof of the "cutting" and hold the mechanism firmly in position. On the side of the standard is mounted an adjustable rocking-plate, *D*, which is movable round the vertical upright *A*, and capable of being raised or lowered to enable it to be worked at all heights. By means of three bolts, *a*, the conical heads of which slide in a circular groove or slot, the tool may be also inclined to bore holes at any angle or in any direction. The plate *D* carries at its extremities bearings, *dd*, for receiving a hollow shaft, *E*, which has an endway motion in its bearings, and also a driving shaft, *F*. The shaft *E* carries at its forward end the annular cutting tool *G*, and at its rear it is threaded left-handed as at *E*¹ to fit into a stationary nut, *e*, which carries a spur pinion.

Fitted on to the shaft *F* is a flanged pinion, *f*, provided with a feather which enters the groove in the shaft *F*, and thus allows the pinion to travel from end to end of that shaft. *f*¹ is a bevelled pinion gearing into a bevelled pinion, *h*, on the boss of the pulley *H*, which pulley is mounted on a stud axle carried by the plate *D*. This pulley is shown as driven by a strap, *I*, from any first mover. By its rotation rotary motion will be communicated through the bevelled gear *h f*¹ to the shaft *F*, and thence to the spur pinion *f*. In gear with this pinion is a spur pinion, *e*¹, on the shaft *E*, and through it a rapid rotary motion is given to the cutter. Made fast to the shaft *F*, by means of a friction clutch, is a pinion, *f*², which gears into the spur teeth on the nut *e*, and serves to rotate that nut. This arrangement of gearing is intended to give a rapid rotary and a slow advancing motion to the cutter, but in order to effect this it is necessary that the pinion *e*¹ and nut *e* should vary slightly in their speeds. The nut *e* is therefore arranged to overrun slightly the pinion *e*¹, and in case the tool should meet with an undue resistance, the pinion *f*² is allowed to slip on its shaft, and thus retard the advance of the tool. As the tool advances in its cut, the pinion *e*¹ will be carried forward, and with it the flanged pinion *f* until they have reached the end of their traverse. The rotary motion of the apparatus is still continued, but on slackening the friction clip *f*² without reversing the rotary motion of the apparatus, the now quiescent nut will reverse the direction of traverse of the shaft *E*, and bring back the spur pinions to their starting position.

Attached to the rear end of the hollow shaft *E*, by means of a box coupling in which the shaft freely rotates, is a flexible tube, *K*, in connection with a force pump or head of water.

By means of this tube a stream of water is caused to pass into the boring and discharge the detritus therefrom, whereby the tool will be prevented from choking, and will at the same time be kept well lubricated. It will be understood that, according to the work it is to be put to, the boring tool may be single or multiple, that is to say, any number may be fitted on one frame, being so arranged as to work at all angles and in all directions, parallel, convergent, or divergent. Motion may be communicated by hand, steam, or other power.

Having now described the nature of the invention of "Improvements in Tools for boring, and in apparatus for working the same," I wish it to be understood that I claim—

First.—Constructing boring tools with a ring or crown at the working end, armed with diamond or equivalent cutters, as hereinbefore described and illustrated in the accompanying drawing.

Secondly.—The apparatus for imparting simultaneous rotary and advancing motions to boring tools, substantially as hereinbefore described, and illustrated in the accompanying drawings.

In witness whereof, I, the said John Melton Black, have hereunto set my hand and seal, the twenty-first day of February, in the year of our Lord one thousand eight hundred and seventy-three.

J. M. BLACK. (L.S.)

This is the specification referred to in the annexed Letters of Registration granted to John Melton Black, this twenty-first day of July, 1873.

HERCULES ROBINSON.

REPORT.

Improvements in Tools for boring, and in apparatus for working the same.

REPORT.

Sydney, 12 June, 1873.

SIR,

In returning to you the enclosed documents, being the application of Mr. John Melton Black for Letters of Registration securing to him the exclusive right to an invention of certain "Improvements in Tools for boring, and in apparatus for working the same,"—we do ourselves the honor to report that we find, on examination, that so much of this invention as involves the principle of forming the boring tools in the form of a tube is embodied in the clauses attached to Messrs. Beaumont and Appleby's application, 73/3521, but we recommend Mr. J. M. Black's claims for registration in their entirety, it appearing on reference to dates that they have priority to those of the former applicants.

We have, &c.,

GOTHER K. MANN.
E. C. CRACKNELL.

THE PRINCIPAL UNDER SECRETARY.

PERRINS'S PATENT HYDRAULIC CEMENT.

LETTERS OF REGISTRATION to James Bishop Perrins, for "Perrins's Patent Hydraulic Cement."

[Registered on the 23rd day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JAMES BISHOP PERRINS, of Melbourne, in the Colony of Victoria, brewer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention known as "Perrins's Patent Hydraulic Cement," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said James Bishop Perrins, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said James Bishop Perrins, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Bishop Perrins shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Perrins's Patent Hydraulic Cement.

SPECIFICATION.

THE materials to be used are limestone and bluestone, or limestone and any basaltic rock, the proportions being sixteen pounds of bluestone to forty-nine and a half pounds of limestone, or in other proportions as the materials may be required to set or harden slowly or more quickly. They are first ground to a fine powder and properly mixed, water is added sufficient to form the mixture into a plastic state, then moulded into bricks or slabs, and subjected to pressure, after which it is baked and then re-ground.

This is the specification referred to in the annexed Letters of Registration granted to James Bishop Perrins, this twenty-first day of July, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 28 June, 1873.

SIR,

The application of Mr. James B Perrins for Letters of Registration for the manufacture of a Cement known as "Perrins's Patent Hydraulic Cement," having been referred to us, we have examined the specification accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
JAMES BARNET.THE PRINCIPAL UNDER SECRETARY.

A.D. 1873, 25th July. No. 373.

IMPROVEMENTS IN APPARATUS FOR WORKING BRAKES FOR RAILWAY AND OTHER CARRIAGES.

LETTERS OF REGISTRATION to Jacob Heberlein, for Improvements in Apparatus for working Brakes for Railway and other Carriages.

[Registered on the 25th day of July, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JACOB HEBERLEIN, of Munich, in the Kingdom of Bavaria, engineer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Apparatus for working Brakes for Railway and other Carriages," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D, respectively, which are hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expuse of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Jacob Heberlein, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Jacob Heberlein, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Jacob Heberlein shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-fifth day of July, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Apparatus for working Brakes for Railway and other Carriages.

A.

SPECIFICATION.

TO ALL WHOM IT MAY CONCERN: Be it known that I, JACOB HEBERLEIN, of Munich, in the Kingdom of Bavaria, engineer, do hereby declare the nature of the said invention for "Improvements in Apparatus for working Brakes for Railway and other Carriages," and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, reference being had to the accompanying drawings, and to the figures and letters marked thereon, that is to say:—

This invention applies to that kind of brakes which are worked by the frictional contact of drums fixed on some of the running axles with other drums which are brought in contact with them, and which are thereby caused to revolve and to wind up chains attached to the brake levers and so to press the brake blocks against the wheels.

Certain brakes of this kind are already known, but they are in some respects defective. The object of the present improvements is to remedy those defects, and to secure simplicity and efficiency in the working of the apparatus and control of its action.

The accompanying drawings represent brake apparatus constructed so as to embody these improvements and show their application on railway trains and tramway cars.

Figure 1, sheet I, represents a side view of the invention applied to a locomotive and tender. Figure 2, sheet I, shows it applied to two carriages of a train. Figures 3 and 4, sheet II, represent, respectively, a side view and plan of details to a larger scale. The remaining figures show modifications which are hereafter referred to.

In the figures 1 to 4, A is one of the running axles, on which is fixed a drum, B, having its periphery formed of numerous wedge-shaped pieces of wood laid with the fibres radial, or nearly so, and held between two metals rings, CC, by means of bolts which pass through the rings and the wooden segments. The rings CC are made in halves, so that they can be put on the axle without taking off either wheel. By preference the wood is put on in two widths, and the pieces of the one width breaking joint with those of the other.

It is to be understood that either the drum fixed on the running axle may have a wooden periphery as above described, or it may be of iron, the wooden periphery being applied to the drum driven by it; also, instead of putting such wooden periphery on in segments, it may be made in tenon-shaped pieces driven into mortises in the rim of the drum, and secured by cross-pins in a manner similar to that adopted in putting in and fixing the wooden cogs of mortise wheels. D is a friction drum, which may be of cast-iron with a wrought-iron tire. This drum is fixed on an axle which is mounted in bearings in a forked lever, E. Upon each end of the axle of the drum D is fixed a pulley, D², to which one end of a pitch chain, F, is fixed by a pin passed through its last link and the cheeks of the pulley, so that when the pulley is caused to revolve in either direction the chain is wound thereon. The chain being nearly of the same width as the space between the cheeks of the pulley, it cannot jam when it is wound thereon. The other end of each chain is attached to the arm of a lever, G, which is forked so as to receive both chains, and from which rods are connected to the brake levers. In the case of the locomotive and tender (as shown in figure 1, sheet I) the chains F are connected by rods to the middle of an equal armed lever or sway-beam, G¹, from the ends of which rods, G² and G³, are connected respectively to the brake levers of the locomotive and tender, so that when the chains F are pulled the strain is divided equally over both sets of brakes.

In the case where the brakes of two carriages are to be worked, the connections from the lever G to the several brake levers are arranged as shown in figure 2, sheet I. The lever G has jointed to it two rods, H and H¹. The rod H works the brakes of the brake carriage, and the other rod, H¹, is carried through a guide bracket, M, and is coupled to the brake rod of the next carriage. When it is so coupled the strain of the chains F on the lever G causes it to act on both sets of brakes; but when the hinder carriage is detached from the brake carriage, the coupling of the brake rod is hooked on to one end of a lever, K, which is thereby turned so that its other end butts against the bracket M¹, as shown in figure 2^a, sheet I. In this condition the rod H¹ becomes fixed, so that the lever G turns on the pin at its end as its fulcrum, and acts only by the rod H on the brakes of the brake carriage itself.

The lever E, on which the friction drum D is mounted, stands in a vertical position for the locomotive, as shown in figure 1, sheet I, and a weight, E², is placed on a lever, E¹, connected with the lever E by levers E³ in such a manner as to press the drum D against the axle drum B. A rod, I, is carried from the lever E along the boiler to a point within reach of the engine-driver, and is made with a catch or projection which can be engaged on a tumbler, I¹. When it is so engaged, the lever E is held in such a position that the drum D is clear of the axle drum B; but when the rod I is released from the tumbler I¹, either by being lifted off it by the hand of the driver, or by the tumbler I¹ being turned by the pull of the cord i connected to it so as to be disengaged from the catch on the rod I, then the weight E², acting on the lever E, causes it to swing, so as to bring the drum D in contact with the axle drum B.

For a brake carriage of the train, the lever E has a horizontal position, as shown in figure 2, sheet I, and is loaded with a weight, E². The end of the lever E is held up by a rod, K, which catches in a tumbler, K¹, and in this position the drum D is clear of the axle drum B; but when the rod K is released, either by the guard pushing its catch off the tumbler K¹ or by the tumbler itself being turned by the pull of a cord or chain k connected to it, the lever E descends and brings the drum D in contact with the axle drum B.

When the two drums D and B are thus brought into contact with a pressure which may be regulated by adjusting the weight of the load E² or its position on the lever, the rotation of the axle drum B, acting by frictional contact on the drum D, causes it to rotate. The chains EF are thus wound on the pulleys D²D², and pull the brake levers and rods so as to put on the brakes. The chains F are carried in such a direction, as shown, that their tension when the brakes are on tends to increase the pressure of the drum D against the drum B, and thereby to sustain or augment the frictional working power.

When, by the action of the brakes, the train has been brought to rest, the frictional force relieves itself, and the lever E can then be moved by hand so as to take the drum D out of contact with B, and the rods I and K being again secured on their respective tumblers I¹ and K¹, the brake apparatus ceases to operate.

In

Improvements in Apparatus for working Brakes for Railway and other Carriages.

In addition to the weight on the lever E, it is useful to apply also a spring, E⁴, which has the effect of diminishing oscillation when the apparatus is in action.

In figure 5, sheet III, is represented a side view, and in figure 6, sheet III, a plan of a modified form of the brake apparatus, wherein two friction drums, N N¹, are mounted on one lever, E, so as to wind chains, F F¹, which extend backwards and forwards, and are coupled to rods, F² and F³, for working the brakes of carriages before and behind that in which the drums are mounted. Either of these rods F² may be made to act on the brakes of two carriages, by connecting it to the middle of a way beam, G¹, from the ends of which the rods are connected, one to the brake lever, G, of each carriage.

Figure 7, sheet III, represents a side view of apparatus, such as has been described above, applied to a tramway car. In this case the lever E is connected to an upright rod, K, at each end of the car, which can be raised or lowered by the driver or conductor, and held either up or down by a set screw in a guide bracket, K², through which it passes. In this case, as in those described with reference to railway trains, the ordinary screw gear L can be employed to work the brakes; the holes at L¹, in the rods or levers through which the screw gear acts, being for that purpose slotted so as to leave the brakes free to be put on either by the screw gear or by the friction apparatus as above described. In the case of a tramway car there is a like slotting of the holes in the connections K³ to the rod K at one end of the car, so that the friction brake apparatus can be put on from either end of the car, and likewise the brakes can be put on by the action of the screw hand gear.

The weight E², used for loading the bar B, may be slid along the lever and fixed in any required position by a set screw, and thus the frictional pressure of the drums may be adjusted. In some cases, however, it is desirable to alter this pressure during the action of the apparatus on the locomotive and tender, as when the train runs down an incline of greater or less steepness. Figure 8, sheet II, shows a side view of a locomotive fitted with an arrangement for this purpose. The rod I, by which the lever E is moved, so as to put the brake apparatus in action or take it out of action, has several notches at I², any one of which can be engaged on a fixed stud. The other end of the rod is connected to a bent lever, I³, the pin of which works in a slotted hole in the rod I. The bent lever I³ is connected to the lever E, and there are two levers, I⁴ and I⁵, forming a connection from the rod I to the weight E², which is made to slide along the lever E. The levers I⁴ and I⁵ have slotted holes, to allow freedom of motion to their connecting pins.

When the rod I is released from the stud at I², the lever E descends and brings the drum D in contact with the drum B, thereby causing the brakes to be applied. Should the driver desire to increase the brake power, he pushes the rod I farther forward (the slot at its end permitting the movement), and he thus moves the levers I⁴ and I⁵ so as to slide the weight E² towards the outer end of the lever E, and thus to increase the frictional pressure of the drum D on the drum B.

On the drawings are represented the means which I adopt for applying the brakes from any part of a railway train, and which I will now describe, referring to figures 1 and 2, sheet I.

The tumbler I¹ on the locomotive has attached to it a cord, chain, or rod, *i*, which is carried by suitable guide rollers, and coupled from carriage to carriage, serving as a line of communication throughout the train for operating the brakes. The tumbler K¹ of my carriage is connected by a cord or chain, *k*, to a handle, *i*², whereon is mounted a pulley, *i*¹, round which passes the chain coupling the communicating line *i*. According to this arrangement, the engine-driver can lift the rod I off its tumbler I¹, and so put on the brakes of the locomotive and tender only; or he can also, by pulling the line *i*, move the several tumblers K throughout the train, and thus bring the several brakes into operation. By pulling the line *i* less or more, he can regulate the amount of brake power, a moderate pull serving to operate the brake apparatus nearest to him, and a greater pull, communicated round the pulleys *i*¹, bringing into operation the brakes farther from him.

Also, the guard on a brake carriage can release his rod K from its tumbler, and so put on the brakes of his own carriage, or he can also, by pulling down the handle *i*², draw the line *i* both ways, and thereby move the tumbler I¹ on the locomotive, and tumblers, such as K¹, on other carriages throughout the train, so as to bring the several brakes besides his own into operation. Thus, a guard at the rear of the train has it in his power to apply the brakes of the engine and tender as well as others throughout the train, in case of danger which may have escaped the notice of the engine-driver.

A line of communication, *j*, can also be connected from the line *i* to a pull in any compartment of the train, so that a passenger can, by pulling the line *j*, bring the brakes into action.

Should the train accidentally separate, or should a carriage run off the line, or should an axle break so that one end of a carriage drops below its proper level, a strain is immediately put on the line of communication *i*, such as to cause the various tumblers I¹ and K¹ to be moved, and thereby to bring the brakes into operation.

It is often convenient, especially for goods trains or trains of a mixed character, to arrange the line of communication under the carriages instead of leading it along their roofs. For this purpose the rods K and their tumblers K¹ may be constructed and arranged as shown at figure 5, sheet II, and to an enlarged scale in figure 9, sheet II. Here the line of communication *i* passing under the carriages is lead around guide pulleys, and round a pulley, *i*¹, mounted on the arm of the tumbler K¹, a handle, *i*², being also attached to the pulley. The rod K, by which the lever E is held up, catches on a pin, and roller K² being pressed over it by a spring at the back. It can be released from this catch, either by hand applied to the top of the rod pulling up the handle *i*² and thereby turning the tumbler K¹ down, or by the pull of the line *i* turning the tumbler K¹ upwards.

Any one of the brake apparatus can be taken out of action by the driver or guard moving his rod I or K till it becomes held on its tumbler I¹ or K¹. The driver may also be enabled to take off the brakes behind the locomotive by means of a pull, *m*¹, figure 1, drawing a line of communication, *m*. The line *m* is attached to a bent lever, *m*², figure 2, from which a rod, *m*³, is connected to the lever E. When the line *m* is pulled, the lever E is raised and the brakes taken out of action. The line *m* may, like the line *i*, be carried along the train so as to operate on other bent levers, *m*², for taking other of the brake apparatus out of action.

Instead of employing two lines of communication, one for bringing the brakes into action, and the other for taking them out of action, I sometimes use a single line, alternate pulls of which are made to accomplish these objects by means of an apparatus which I will now describe, referring to figure 10, sheet II,

Improvements in Apparatus for working Brakes for Railway and other Carriages.

II, which shows an enlarged view of this apparatus. The line of communication i , which may be carried along the roofs of the carriages or under them, is, at each brake apparatus, led round guide pulleys and round a pulley on a lever V . This lever is mounted loose on a shaft, S , on which is fixed a ratchet wheel, S^1 , of four teeth. A spring pawl, v , on the lever V , engages with the teeth of the ratchet wheel, and another pawl, Z , prevents the wheel from turning backwards. On the shaft S are fixed two cam segments or wipers, $T T^1$, which come directly under a roller mounted on the lever E . When either of these wipers T is standing upwards, as shown in figure 10, the lever E is held up by it, and the brake apparatus is out of action; but when the line i is pulled so as to lift the lever V to the position marked by the dotted line V^1 , the ratchet wheel is thereby turned one-quarter of a revolution around, and the wiper T being thus turned from under the lever E , it descends and brings the friction drums into contact, whereby the brakes are applied. The line i being slackened, the lever V descends, being urged by the spring W , and its pawl engages on another of the ratchet teeth. The next pull of the line i again raising the lever V and turning the ratchet wheel, another tooth brings the second wiper T^1 under the lever E , and thus lifts it and takes the brake drums out of contact. The outermost part of the wipers $T T^1$ is preferably made with a slight hollow, in which rests the roller of the lever E so as to remain steady therein until the wiper be moved a little round by the action of the lever V . Suitable stops, $n n$, are provided to limit the stroke of the lever V .

Having thus described the nature of my invention, and in what manner the same is to be performed, I would have it understood that I make no claim generally to the working of brakes by means of the frictional contact of a drum or wheel on a carriage axle with another drum or wheel, causing the latter to revolve and thereby to move apparatus which applies the brakes; apparatus of that kind being well known, and having been first described in the Specification of Letters Patent of the United Kingdom of Great Britain and Ireland, dated the 17th September, 1856, No. 2,180, granted to George Davies, for an invention communicated from abroad to him by me, but I claim,—

- First.—The wooden periphery for the friction drum B , or D , with the fibres of the wood arranged radially, or nearly so, and secured between metal cheeks, or in mortises, substantially in the manner set forth.
- Second.—The lever E with adjustable weight, operating in combination with the friction drum D , pulleys D^2 , chains F , and lever G , substantially as and for the purposes described.
- Third.—The arrangement of the chains F in connection with the brake drum and brake lever, so that their tension in applying the brakes increase the frictional pressure of the drums substantially as described.
- Fourth.—The lever E operating in combination with the suspending rod K and tumbler K^1 , substantially as and for the purposes described.
- Fifth.—The cords, chains, or rods, i, j , and k , and pulley, i^1 , or their equivalent, operating in combination with the rods K and tumblers K^1 for bringing the brake apparatus into action from any part of the train, substantially as described.
- Sixth.—The chord or chain m , lever m^2 , and rod m^3 , or their equivalents, operating in combination with the levers e , and rods K , and tumblers K^1 , for putting the brake apparatus out of action from any part of the train, substantially as described.
- Seventh.—The combination of the rod I , and levers I^1, I^2 , and I^3 , with the lever E , and weights, E^2 , for adjusting the brake power, substantially as described with reference to figure 8, sheet II.
- Eighth.—The lever h operating in combination with the coupling of the brake rods, substantially as described with reference to figures 2 and 2^a, sheet I.
- Ninth.—Combining with friction brake apparatus with the ordinary screw brake gear, the holes in the connections of the screw brake apparatus being slotted so that the brakes can be worked by friction apparatus or by hand, or by both, substantially as described.
- Tenth.—The use of an adjustable weight on the lever E for adjusting the friction pressure of the drums substantially as described.
- Eleventh.—In friction drums brake apparatus combining the chains F with a lever G , and rods $G^2 G^3$, or $H H^1$, whereby their tension is distributed among the several brakes, substantially as described.
- Twelfth.—The combination of two sets of friction drums on one lever with one axle drum and chains conveying the brake power forwards and backwards, substantially as described with reference to figures 5 and 6, sheet III.
- Thirteenth.—The connection of the brake chains F to the pulleys D^2 in such a manner that the pulleys wind up the chains so as to put on the brakes in whichever direction the friction drums may rotate, substantially as described.
- Fourteenth.—The apparatus substantially as described with reference to figure 10, sheet II, whereby the friction drum apparatus can be brought into action and taken out of action by alternate pulls of the line of communication.
- Fifteenth.—The arrangement of the line of communication i in such a manner that the brake apparatus is brought into action automatically when a train becomes divided, or when a carriage runs off the line, or when an axle breaks, substantially as described.

Sixteenth.—

**PHILLIPS'S STAMPER, GRINDER, AMALGAMATOR, AND WASHER OF
GOLD AND SILVER ORES.**

LETTERS OF REGISTRATION to John Phillips, for Improvements in amalgamation, trituration, and washing of Gold and Silver Ores, &c.

[Registered on the 12th day of August, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JOHN PHILLIPS, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for Improvements in amalgamation, trituration, and washing of Gold and Silver Ores, or the pulverization and washing of any mineral, animal, or vegetable matter, and the separation of the lighter from the heavier, and the soluble from the insoluble matters, which is more particularly described in the specification which is herunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Phillips, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said John Phillips, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said John Phillips shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eleventh day of August, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Phillips's Stamper, Grinder, Amalgamator, and Washer.

REPORT.

Sydney, 22 July, 1873.

SIR,

The application of Mr. John Phillips for Letters of Registration for a Machine for amalgamation, trituration, and washing of Gold and Silver Ores, &c., having been referred to us, we have examined the specification and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

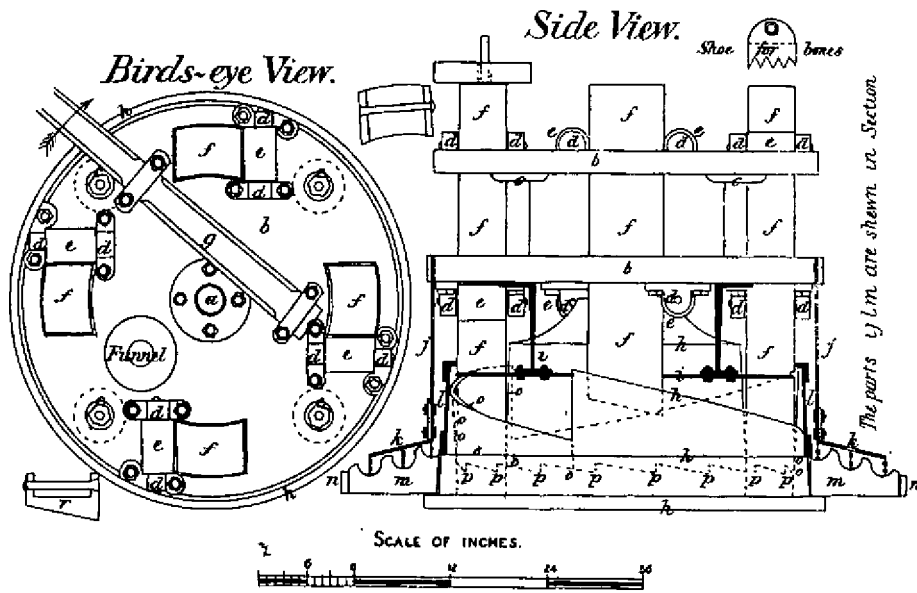

We have, &c.,

J. SMITH.
GOTHER K. MANN.

THE PRINCIPAL UNDER SECRETARY.

[Drawings—one sheet.]

DRAWINGS and Specification of Phillips's Stamper, Grinder, Amalgamator, and Washer of Gold and Silver Ores, for the pulverization and washing of any mineral, animal, or vegetable matter, the separation of the lighter from the heavier, and the soluble from the insoluble matter, for reef-testing, metallurgical, and other purposes.

EXPLANATION.

The letter *a* shows the axis of wrought or cast iron. The letter *b* the parallel plates of wood, wrought or cast iron, held together by four bolts through the distance pillars, *c*, *d*, blocks for carrying the rollers *e*. *f*, the stampers and mullers, which may be made of metal, wood, or stone, to be loaded and shod according to the nature of their work, whether on mineral or organic matter. *g* is the horse-arm in case of no belt or wheel-gear, as in remote mining districts. *h*, the stamper, grinder, and amalgamator trough. *i*, splash-plates within the machine; *j*, the outer splash-plate or apron all around. *k*, bars attached to the outer apron, to carry chains, rakes, or coulters, to keep the contents of grooves *m* loose. *l*, a circular grating all around the stamper trough, shiftable according to its wear. *m*, three annular troughs of iron, wood, or stone, and bound around with iron band, *n*, the contents of troughs *m* being constantly agitated by *k*. *o* shows the rise of the stamper bottom within, for lifting the stamper and grinding the stuff. *p*, the form of the grinder and amalgamator bottom. *q*, a circular lump or cap of iron, or other matter, about half cwt., with a hole in the middle; the stampers or mullers being thus loaded with any number of such cap-pieces. *r* is a vertical section of steel shoe; *s* is the plan of same.

Peculiarities, new — 1st Its arrangement for portability. 2nd. There is nothing to force the mercury out of the trough as the Chilean rollers do. 3rd. The shiftable of the grating according to worn parts. 4th. The troughs and chains close to the grating, making blankets and other things unnecessary. 5th. The ready conversion from a stamper and grinder to a grinder and amalgamator, by merely changing the bottom or bed within. 6th. The stamper-beds in this invention taking the place of lifting-rams. 7th. The rise as well as the fall of the stampers being utilized, and friction being subdued into the work. 8th. The ready removal of the machine from place to place without mechanical skill. 9th. The loading and shoeing of the stampers to suit the work to be done. 10th. A horse-power applied to this machine, giving out three times the quantity of work that it would if applied to the ordinary stamper, because the grinding action on half-crushed stone is double as efficient as the blow which is half defeated by the rush of water from beneath the dropping stamper carrying the fine gravel away. The blow here has its usual efficiency, the molar action in addition being double, hence three times the work for each horse-power.

This is the specification referred to in the annexed Letters of Registration granted to John Phillips, this eleventh day of August, 1878.

HERCULES ROBINSON.

A.D. 1873, 11th August. No. 376.

IMPROVEMENTS IN THE MANUFACTURE OF LEATHER.

**LETTERS OF REGISTRATION to George Rawle and William Nathaniel Evans,
for Improvements in the manufacture of Leather.**

[Registered on the 12th day of August, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS GEORGE RAWLE, of Temple-street, in the city of Bristol, and WILLIAM NATHANIEL EVANS, of Bedminster, in the county of Somerset, England, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the manufacture of Leather," which is more particularly described in the specification which is hereunto annexed ; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said George Rawle and William Nathaniel Evans, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said George Rawle and William Nathaniel Evans, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said George Rawle and William Nathaniel Evans shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eleventh day of August, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in the manufacture of Leather.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN, Be it known that we, GEORGE RAWLE, of Temple-street, in the city of Bristol, and WILLIAM NATHANIEL EVANS, of Bedminster, in the County of Somerset, England, are in possession of an invention for "Improvements in the manufacture of Leather"; and we, the said George Rawle and William Nathaniel Evans, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

THE object of this invention is mainly to diminish the time now required for tanning hides and skins. In tanning hides and skins, it is now usual to commence the tanning operations by subjecting the skins to weak solutions of tannin material, and gradually to increase the strength of the solution as the process proceeds. By proceeding in this manner a considerable length of time is necessarily occupied; and if, in order to save time, the skins are at once subjected to a strong solution of tannin, the grain side of the skin becomes hardened, and the leather produced is comparatively valueless.

According to our invention, we protect the grain side of the skins or hides from the action of the liquor before placing them into the pits, so that the skins may at once be placed into a strong tannin solution; and, consequently, the tanning of the skins will be greatly expedited, whilst the grain side, being protected from the action of the liquor, will remain soft and pliable. The hides or skins may also be first partly tanned in weak tannin solutions, in the ordinary manner, and be afterwards protected on the grain side from the action of the tannin liquor before submitting such partially tanned skins to the action of strong tannin solutions. To protect the grain side from the action of the tannin liquor, we prefer to rub it over with a dubbing of grease and oil; but other modes of protecting the grain side from the liquor may be adopted. When we employ a mixture of grease and oil as the protecting material, we use by preference a mixture composed of cod oil and tallow, in the proportion of about 2 lbs. of tallow to 1 gallon of the oil. In carrying out our invention we prefer to proceed as follows:—The skins, after being unhaired, and after being washed in water, are rubbed down in the usual way; the grain side of the skins is then smeared over with the mixture of tallow and oil, and the skins are placed into a pit containing a strong tannin solution, say of a strength of 80 to 90 degrees, which is the usual strength for the last bath when tanning skins in the ordinary manner. A stronger liquor may, however, be used with advantage. We prefer that the skins should be suspended in the pit, at a short distance apart from one another, so that the tannin liquor may have free access to the flesh side of each skin. By this means the tanning of the skins or hides may be effected without removing them from the pit, tanning material being from time to time added to the liquor in the pit, as usual, to keep it up to the required strength. In place of coating the grain side of the skins or hides with a protecting coating, the grain side of two skins might be placed together, and caused to adhere to one another by rubbing them down before placing such skins into the tan pit, or the grain side might be in other ways protected from the action of the tannin liquor. We, however, prefer to apply a coating of protecting material to the grain side, as above described. By thus tanning hides and skins, not only will the tanning process be greatly expedited, but a superior leather will be produced to that tanned by the present tedious tanning process.

Having thus described the nature of our invention and the manner of performing the same, we would have it understood that we claim—

- 1st. Coating the grain side of skins or hides with a protecting coating of grease and oil, or other coating capable of protecting such grain side from the action of tannin liquor, and subsequently submitting the skins so prepared to the action of tannin liquor in a tan pit, substantially as herein described.
- 2nd. Protecting the grain side of skins and hides from the action of the tannin liquor during the tanning process.

In witness whereof, we, the said George Rawle and William Nathaniel Evans, have hereunto set our hands and seals, this twenty-ninth day of March, in the year of our Lord one thousand eight hundred and seventy-three.

GEORGE RAWLE. (L.S.)
WILLIAM N. EVANS. (L.S.)

This is the specification referred to in the annexed Letters of Registration granted to George Rawle and William Nathaniel Evans, this eleventh day of August, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 22 July, 1873.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report, under your B.C. communication of the 11th instant, No. 73/5499, and which have reference to Mr. George Rawle and William Nathaniel Evans's application for Letters of Registration for their "Improvements in the manufacture of Leather"; and we recommend the issue of Letters of Registration securing to Messieurs Rawle and Evans the exclusive right to their invention, in accordance with their Petition and specification.

We have, &c.,

GOTHER K. MANN.
JAMES BARNET.

THE PRINCIPAL UNDER SECRETARY.

A.D. 1873, 21st August. No. 377.

INVENTION OF CERTAIN CHEMICAL COMPOUNDS FOR PRESERVATION OF WOOD.

LETTERS OF REGISTRATION to William Malpas, for an invention of certain chemical compounds for preservation of Wood without impregnation by pressure.

[Registered on the 23rd day of August, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS WILLIAM MALPAS, of Athelstone, near Adelaide, in the Colony of South Australia, gentleman, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an "invention of certain chemical compounds for preservation of Wood without impregnation by pressure," which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales, the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Malpas, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said William Malpas, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Malpas shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of August, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Invention of certain chemical compounds for preservation of Wood.

AMENDED SPECIFICATION.

The following is a description of the invention:—

The application to wood by immersion therein or otherwise of sulphate of copper dissolved in water, and in combination with arsenious acid dissolved in water only or by means of carbonate of soda or other chemical agent, used for the purpose of rendering arsenious acid more soluble in water, so as to protect the wood from injury by white ants or other insects.

The application of sulphate of copper without arsenious acid will protect wood from white ants or other insects, but the addition of arsenious acid will render the solution more poisonous, its application more efficacious, and its effect more lasting.

The invention your Petitioner claims is the application to wood, as above set forth, of sulphate of copper in combination with arsenious acid in a state of solution, for the purpose of protecting such wood from injury by white ants or other insects.

WILLIAM MALPAS,

By his Attorney,

J. K. BRADLEY.

This is the specification referred to in the annexed Letters of Registration granted to William Malpas, this twenty-first day of August, 1873.

HERCULES ROBINSON.

REPORTS.

Sydney, 10 May, 1873.

SIR,

The application of Mr. Wm. Malpas for Letters of Registration for an "invention of certain chemical compounds for preservation of Wood without impregnation by pressure," having been referred to us, we have examined the specification accompanying the same, and have the honor to report thereon as follows:—

Mr. Malpas claims as his invention—

1st.—The use of sulphate of copper either alone or in conjunction with arsenious acid, or arsenious acid with carbonate of soda.

2nd.—The external application of the solution or mixture to the wood intended to be preserved, instead of the impregnation of the same by pressure.

It is within our own knowledge that both sulphate of copper and arsenious acid have been used many years ago for the preservation of wood without pressure, and therefore we cannot recommend that Letters of Registration be granted to Mr. Malpas.

We have, &c.,

J. SMITH.

CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

Sydney, 30 July, 1873.

SIR,

In the matter of the application of Mr. Wm. Malpas for Letters of Registration for an "invention of certain chemical compounds for preservation of Wood without impregnation by pressure," which has been again referred to us, we have the honor to report further that, with the amended specification now submitted, in which the claim is restricted to a mixture of sulphate of copper with arsenious acid, we consider that Letters of Registration may now be granted.

We have, &c.,

J. SMITH.

CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

[103]

A.D. 1873, 18th September. No. 378.

IMPROVEMENTS IN MOTIVE-POWER ENGINES.

LETTERS OF REGISTRATION to Theodore Frederic Sandback Tinne, for
Improvements in Motive-power Engines.

[Registered on the 19th day of September, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS THEODORE FREDERIC SANDBACK TINNE, of Auckland, in the Colony of New Zealand, engineer, hath by his Petition humbly represented to me that he is the assignee of James Robertson, of the city of Glasgow, engineer, who is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Motive-power Engines," which is more particularly described in the specification, marked A, and the three sheets of drawings, marked B, C, and D, respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Theodore Frederic Sandback Tinne, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Theodore Frederic Sandback Tinne, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Theodore Frederic Sandback Tinne shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this eighteenth day of September, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Motive-power Engines.

A.

SPECIFICATION of James Robertson's Invention for "Improvements in Motive-power Engines."

My invention relates to various novel motions, constructions, combinations, and arrangements of the parts of engines adapted to utilize power obtained from steam, water, or gas under pressure, or from a vacuum.

I cause a piston formed or constructed with passages therein and fitted with a piston-rod to partake of two motions, or a compound motion, within a cylinder, such cylinder being provided with induction and eduction ports, and a cover and stuffing gland.

The said two motions of which the piston partakes are—one a motion of reciprocation, and another a motion of rotation on its own axis.

These motions are imparted to it simultaneously, and they serve to bring the passages in the piston opposite the induction and eduction ports in the cylinder in the proper sequential time; and by making the passages in the piston partly on the surface and partly within its interior, I can obtain any required degree of expansive working of the steam or other fluid employed.

As mechanism for imparting the motion of rotation to the piston, I secure to the piston-rod, under one modification, a hollow cylindrical casing, which encloses a corresponding bush, in which latter is fitted a crank pin, fixed firmly on a revolving shaft, which is the main or crank shaft. Room must be provided so that the crank-pin can play lengthwise in the bush.

The importance of these features will become apparent in the following description of engines which are constructed in accordance with my invention, and illustrated on the drawings. These several modifications have been appended that others may be enabled to carry my improvements into beneficial effect.

The accompanying drawings form a part of this specification, and with the descriptive references hereafter contained, mechanics will be enabled to build and work my said motive-power engines.

DESCRIPTION OF THE DRAWINGS.

Figure 1 is a side elevation; figure 2, a plan view, the cylinder being shown in section; figure 3, a sectional plan view of the cylinder looking from below; and figure 4, a sectional end elevation of the cylinder through the line AA, all of one modification of my improved motive-power engine. Figure 5 is a sectional end elevation of the cylinder through the line BB, but showing the ports so constructed as to work steam expansively. In these views like letters denote the same parts.

The arrangement of ports is such as affords ready facility to form them, to cut off the steam at any desired point of the stroke from about one-tenth of the stroke to any greater fractional part thereof.

The steam in this modification is admitted by the branch pipe A round the passage a^1 to the port A^1 underneath the cylinder, seen in section in figure 4, and exhausts from the top side of the cylinder by the exhaust port A^2 and exhaust branch-pipe A^3 ; the exhaust port in the cylinder and exhaust passages B^1 B^2 in the piston bearing on the top side.

The form of the exhaust passages B^3 and B^1 is seen in the plan (see figure 2) of the cylinder; they are formed the full length of the stroke of the engine, and therefore give for nearly the full stroke a free exhaust for the steam. The inverted sectional plan of the cylinder and external plan of the piston B (figure 3) shows the length and form of the steam ports longitudinally, and the corresponding inverted sectional elevation shows the ports in the cylinder and passages in the piston, in section through the line BB (figure 3).

As will be seen by figure 3, the steam passages in the piston are only left open toward the port or ports about one-half of the length of the stroke; the steam thereafter in its passage to the cylinder is cut off to this extent, and the steam passage continued underneath the surface of the piston, as indicated by the dotted lines and arrow shown in port B^1 . In this way, as will be readily seen by shortening the opening or open part of the steam passages B^1 and B^2 in the piston out to the port in the cylinder, the steam cut off will be proportionately shortened, so that within about the limits stated any degree of cut off in the length of the stroke can be effected. The motion of the steam is as indicated by the arrows. The connection of the arm D to the crank on the revolving shaft as shown in figures 2 and 6 is what I consider the best form of universal joint or crank connection for coupling the arm from the piston-rod to the crank-shaft.

In this bush-joint the oscillating bush D^1 is placed in the arm D fixed on the piston-rod C^1 , and is worked upon the pin E^2 , which is fixed in the crank E, keyed upon the crank-shaft F. When the oscillating bush D^1 is placed in the arm D as in this example, it only requires to oscillate in one plane or direction, as the axis of the crank-pin E^2 on which it works remains parallel to the axis of the crank-shaft F at every point of the circle which it is caused to describe.

Hence the oscillating bush D^1 in this modification is of a cylindrical form, with flat ends, its axis lying parallel to the axis of the piston-rod C^1 . It is formed in halves to receive the crank-pin E^2 , which passes through or into it at a right angle to the axis of the piston-rod C^1 . When the piston C is at mid-stroke, the arm or bush-holder D is oscillated to one side the full radius of the crank E. Figure 6 shows in section the position of the arm D, bush D^1 , crank E, and pin E^2 at mid-forward stroke, and figure 2 shows the position assumed by these parts when the piston-rod is at one end of its stroke. The seat of the bush D^1 is turned out, all the parts are easily made, are adjustable for wear, and work smoothly.

Figure 7, sheet I, is a front external elevation, figure 8 a side external elevation, and figure 9, in part, an external plan, and in part a sectional plan of a pair of oscillating and reciprocating pistons, combined and connected to one crank-shaft, to act as a water-engine or water-meter, whereby when at work the water passing can be measured.

The form of the ports and passages in the pistons used is the same as described in connection with figures 1, 2, 3, and 4. The same letters of reference refer to the same parts in these figures as in this combination, and do not require to be otherwise further described. The water enters by the branch pipe A, and passing through the channels and ports as indicated by the arrows, passes out by the exhaust pipe

A²,

Improvements in Motive-power Engines.

A⁵, the capacity of the cylinders being made to any desired aliquot part or understood quantity, as indicated by an ordinary liquid index through a small wheel, Q, which has formed on its spindle the small worm R gearing with the worm-wheel S, to which an ordinary index can be geared, and forming thereby a complete water-engine and meter. Two cylinders can be coupled in various ways as a coupled engine, and this illustrates one way of doing so.

Figure 10, sheet I, is an external side elevation of a condensing engine, constructed in accordance with my invention. Here *a* is the steam cylinder receiving steam through *b c* exhaust pipe, through which steam exhausts into the condenser *d e*, waste pipe for condensed steam. In this modification the ports in the piston are constructed similarly to those described under figures 1, 2, 3, and 4.

Figure 11, sheet II, is an external side elevation; figure 12 a plan with the cylinder shown in section, the piston being in external plan, and figure 13 is an end elevation showing the cylinder with its steam ports and passages in-section through the line *c c* in figure 12.

The form of the steam ports in this engine are similar to those described above, but there are two sets of passages formed in the piston B in a reverse way, to give reversing action. As these parts are the same, and the same letters of reference are used, they need not be again described, the ports in the cylinder and passages in the piston shown out of action being left without letters of reference. Those shown in action have the same letters on like parts as in figures 1, 2, 3, and 4; and the courses of the currents and motion indicated by the arrows as before. For reversing the currents the cylinder is provided with two slide-valves as represented. The slide-valve seen in action in figure 13 has the steam port A¹ open to the casing, and the slide-valve J has the exhaust port A² open, giving motion to the engine accordingly. On the handle *k* being raised, and the slide-valves I and J moved to the opposite ends of their casings, the other set of ports and passages shown comes into action, and the motion of the engine is thereby reversed. The connection of the arm D to the crank on the revolving shaft here represented is perfectly practicable, and is clearly represented as one of the modifications which will allow the benefit of some parts of my invention, but I prefer the different connection hereinbefore described.

Figure 14, sheet II, is an external side elevation of a combined condensing pump constructed in accordance with my invention; *a*, steam cylinder; *b*, induction port; *c*, eduction port exhausting into the water exit pipe *d*; *e*, air vessel; *f*, pumping cylinder; *g*, suction pipe.

Figures 15 and 16, sheet II, are external side elevations of a blasting engine, constructed in accordance with my invention; *a*, steam cylinder; *b*, blowing cylinder. The ports in the pistons of the engines, illustrated in figures 14, 15, and 16, are similar to those hereinbefore described. All the modifications of my engines are (by making the ports and piston passages without cut off of the actuating current) suitable for being worked or actuated by water or other liquids, as well as by elastic fluids.

Figure 17, sheet III, is a transverse section of an expanding piston for engines of large size or high pressure, and for pumps for high lifts constructed in accordance with my invention. For these purposes, and in all others where a powerful vacuum or pressure of fluid is required, it becomes necessary to have these peculiarly constructed pistons to compensate for the wear of both piston and cylinder. Figure 18 is a longitudinal section through line AB of figure 17, and figure 19 is a longitudinal section through the centre of piston. CC are the portions of the piston which are fixed to its rod and receive the driving pressure; when required, they carry the packing rings. DD are the parts which form the centre of the piston in which are the steam ports or passages. These parts are forced from each other, and against the inner surface of the cylinder or pump, by means of the wedge-shaped pieces EEEE, which are carried on and moved to and fro by the screw FF, and work against similar wedge-shaped pieces on back of parts DD. In order to work said screws, it is necessary to remove the whole or a portion of the cylinder or pump cover, when a wrench can be applied to them.

Having now described the nature of my said invention, and particularized the same by the several modifications herein referred to and delineated on the drawings, I would have it understood that I do not confine myself to the exact details set forth, as many modifications may be made without departing from the leading features of my improvements; many of the parts shown are common to other, and some to all engines, pumps, and analogous machines now in use.

What I do claim is—

- I. The within-described piston, constructed with passages, B¹ and *c*, formed partly on the surface and partly under the surface, and so connected and operated that it partakes simultaneously when at work of a motion of reciprocation and a motion of rotation on its own axis, to receive, direct and cut off the impelling fluid without a necessity for valves, all as herein set forth.
- II. In connection with the above, the bush D¹ free to oscillate in the arm D secured to the piston-rod in combination with the crank or eccentric stud E², and arranged as represented, so as to serve as means both for transmitting motive power to or from the crank-shaft or mechanism, and for ensuring a motion of rotation in the piston, all substantially as described and shown in the drawings.
- III. Expanding that portion of the piston of engines and pumps made according to my invention, which contains the port and passages, so as to compensate for the wear, and so prevent leakage, substantially as herein described and shown in the drawings.

This is the specification referred to in the annexed Letters of Registration, and marked A, granted to Theodore Frederick Sandback Tinne, this eighteenth day of September, 1873.

HERCULES ROBINSON.

Improvements in Motive-power Engines.

REPORT.

Sydney, 1 September, 1873.

Sir,
The application of Mr. Theodore F. S. Tinne, for Letters of Registration for "Improvements in Motive-power Engines" having been referred to us, we have examined the drawings and specification accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,
J. SMITH.

A.D. 1873, 29th September. No. 379.

BASSETT'S CONDENSATIVE AMALGAMATOR.

LETTERS OF REGISTRATION to William Frederick Bassett, for Improvements for the more complete removal of Gold or Silver from the sludge of puddled earth, &c.

[Registered on the 30th day of September, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS WILLIAM FREDERICK BASSETT, of Bathurst, in the Colony of New South Wales, Esquire, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an Invention for the more perfect separation of Gold or Silver from the sludge of puddled earth or tailings of crushing machines, also the self-retorting of Gold obtained and complete saving of the Mercury employed, which said invention is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said William Frederick Bassett, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said William Frederick Bassett, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said William Frederick Bassett shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-ninth day of September, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Bassett's Condensative Amalgamator.

SPECIFICATION of W. F. BASSETT, of Bathurst, in the Colony of New South Wales, of Condensative Amalgamator.

IMPROVEMENTS for the more complete removal of Gold or Silver from the sludge of puddled earths or from tailings of crushing machines, by the use of heated mercury, also the self-retorting of Gold obtained and the complete saving of the Mercury employed.

My invention consists primarily of an Amalgamator, No. 1 on plan A. This will be made an iron or iron-lined receiver of any size suited to the quantity of stuff to be heated in a given time, and will contain the sludge or tailings used. In a cast-iron socket, at the centre of the receiver, an iron revolving shaft will be set, having projecting arms carrying blades capable of being removed, and varied in sizes and shapes, and fitted at convenience with brushes to sweep the bottom of receiver. The necessary rotary motion to the shaft, which will be supported at top by a cross beam on stayed uprights, will be communicated either by hand or cog-wheel, as best suited to connect with the driving power, either steam, horse, water, or hand.

The contour of the bottom of receiver will be conical, as shown on Section C, having also a gradual descent at the outer circumference to a well, where a tap will be fixed to draw off amalgam, and a sluice-trap to complete any cleansing operation; provision is also made to raise the whole of the revolving machinery during the cleansing time, and to facilitate the fixing of blades or brushes.

Whether used for sludge or tailings, the flow into the amalgamator will be immediately in front of the condenser, and at the highest containing level of the receiver, and in the direction of the current formed by the revolving blades.

Under these circumstances the incoming matter will immediately be brought into contact with the vapour of mercury which, condensing, will percolate, in a state of extreme division, through the liquid to be heated, and amalgamating with every particle of floating gold, will fall gradually to the floor of the receiver, to be swept forward into the well as amalgam and drawn off by the tap there, while the surplus sludge will run over at a low edge of the receiver into an over-flow trough.

Section C shows, on a larger scale, a sectional line of the amalgamator, taken through the centre of furnace, retort, receiver, and condenser.

The furnace will be of fire-brick, built to receive the retort, which will be movable, and connected with the condenser by an adapter. A tube, with funnel, top, and tap, will stand out from the top of retort above the movable cap, and pass down to below the ordinary level of quicksilver in retort. A movable cap will be placed over the retort connecting with the space between the outer and inner skins of the condenser by a telescopic tube, the whole protecting the retort, its tube and adapter, from the cooling effects of the atmosphere.

The fire of the furnace after ignition by use of its own flue may be shut off at that vent, and will then pass through the cap and telescopic tubes to the space between the outer and inner skins of the condenser, and escape by the flue at its point.

In cases where the use of a portable furnace might be found desirable, additional heat would be readily obtained by a continuation of the furnace along the neck of the retort.

The condenser will consist of an iron chamber, open at bottom, suspended over, and its edges dipped into the sludge. A double skin, as shown in Section E and plan D, will form part of furnace flue, increasing heating power, and protecting the inner skin in contact with the heated mercury from the cooling effects of the atmosphere.

From the edge of the condenser furthest from the inlet to receiver a hinged iron flap will be suspended, lifted by the revolving blades, but returning to its position in each interim; the object being to retard the active current of sludge as long as possible beneath the condenser, and to direct amalgam to the lowest level. A tube, with tap reaching the interior, will be placed on the top of the condenser, to admit air when needed, or to indicate the rapidity of evaporation.

The iron retort having been supplied with quicksilver and fixed, the movable cap and telescopic tubes secured, and heat generated, the vapour from the retort will pass into the condenser, where it will come into contact with the liquid to be acted on. Afterwards the fire may be supplied with fuel through orifices in the brick furnace, and the supply of quicksilver kept up by passing into the retort the amalgam drawn from the tap in the well of receiver through the funnel-tube; this tube will also be used to pass a test rod down to ascertain the amount of gold retorted, and govern the times of opening retort.

Attached to the amalgamator at its lowest side is the "Mercurial Arrester," F G and H plan and sections. This consists of a wood receiver, into which will descend an iron pipe from the overflow of the Amalgamator receiving the puddle of same. On a level with the bottom of the pipe, and forming a complete false bottom, a finely perforated plate is placed, and over it a depth of quicksilver. In the iron pipe a revolving rod works an Archimedian screw, forcing the puddle descending the pipe up through the perforated plate, and through the over-lying mercury, thence overflowing as waste.

The result will be to recover any mercury escaping by the overflow of Amalgamator.

The principle of the invention here claimed is the discovery that mercury will not pass through a finely perforated plate or wire gauze through which sludge or water can be forced. The motive power to the screw will be the same as for Amalgamator. It is claimed for this portion of the patent that while the invention may be used with effect in the Amalgamator, it can be applied for similar uses in any condition where the escape of mercury requires to be arrested.

Bassett's Condensative Amalgamator.

The puddling machine shown on plan A, as feeder for the Amalgamator, claims to act more effectively than an ordinary puddling machine, on the principle of the iron bottom sloping to the outlet hastening the delivery of gold and reducing the need of cleaning out. A grating and sluice would be placed at the outlet to Amalgamator.

The working of pump in well would only be useful when a short supply of water necessitated re-use, or the supply was deep.

WM. F. BASSETT.

This is the specification referred to in the annexed Letters of Registration granted to William Frederick Bassett, this twenty-ninth day of September, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 8 September, 1873.

SIR,

We do ourselves the honor to return to you the documents transmitted for our report under your B.C. communication of the 30th August, No. 73/6742, and which have reference to Mr. William Frederick Bassett's "Invention for the more perfect separation of Gold or Silver from the sludge of puddled earth or tailings of crushing machines, also the self-retorting of Gold obtained, and complete saving of the Mercury employed"; and we recommend the issue of Letters of Registration securing to Mr. Bassett the exclusive right to his invention, in accordance with his Petition, drawings, specification, and claim.

A.D. 1873, 7th October. No. 380.

AN INVENTION FOR THE IMMEDIATE EXTRACTION OF GOLD AND SILVER.

LETTERS OF REGISTRATION to James Lawson and Thomas Jaffrey, for an Invention for the immediate extraction of Gold and Silver from any mineral substance, either oxidized or unoxidized.

[Registered on the 9th day of October, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JAMES LAWSON, of George-street, in the city of Sydney, in the Colony of New South Wales, and THOMAS JAFFREY, of the Exchange, in the city of Sydney aforesaid, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention for the immediate extraction of Gold and Silver from any mineral substance containing one or both of these metals, either oxidized or unoxidized, such as pyrites, quartz, granite, slate, cement, sand, gravel, or other substances containing Gold and Silver, which said invention is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said James Lawson and Thomas Jaffrey, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said James Lawson and Thomas Jaffrey, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Lawson and Thomas Jaffrey shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this seventh day of October, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

An Invention for the immediate extraction of Gold and Silver.

SPECIFICATION of an Invention for the immediate extraction of Gold and Silver from any mineral substance, either oxidized or unoxidized.

TO ALL TO WHOM THESE PRESENTS SHALL COME, we, JAMES LAWSON, of George-street, and THOMAS JAFFREY, consulting engineer, of the Exchange, in the city of Sydney, in the Colony of New South Wales, do hereby declare the nature of our invention, and the manner in which the same is to be performed, to be particularly described and ascertained in and by the following statement and the accompanying drawings:—

The machine as shown upon the drawings consists of two (2) revolving drums, A and B, driven by a pulley, J, and fitted on hollow axles, C and D. A feeding-hopper, H, to be fixed at the mouth of the axle C, through which the ore is passed into the axle C, which is constructed in the form of an internal female screw, by which the ore from the hopper is discharged into the drum A, where it is submitted to a process of grinding, by means of two or more balls, EE, of the same diameter as the half-circle of the drum. Hot or cold water is introduced into the drum through the hopper and axle, by pipes, AA. On the mouth of axle D a grating, G, is fixed, through which the ground ore passes into and through the axle D into the drum B, where it is further submitted to a similar grinding process as in drum A, from which it passes through a grating, F (which is much finer than grating G), into a series of revolving ripples, RRR, screwed upon the drum and charged with mercury. The ripples discharge upon a perforated plate, P, through which it passes into a trough, T, charged with mercury, and fitted with a regulating plate, K, from which it can be passed on to blanketing-table or through pipe L into a revolving barrel, M, charged with mercury, from which it is discharged through the axle X into the waste spout Y.

Having thus described the nature of our invention and the manner in which the same is to be performed, we wish it to be understood that we do not confine ourselves to the number of drums or the precise details and proportions hereinbefore described, as the same might be varied without departing from the nature of the said invention, but we claim as our invention—

Firstly.—A new and inexpensive method for the immediate extraction of gold and silver.

Secondly.—Superior grinding power and economy of motive power.

Thirdly.—The method of feeding and discharging through hollow or tubular axles.

Fourthly.—Revolving ripples.

Fifthly.—The continuous feeding and discharge of the drums and barrel.

Sydney, N.S.W., 12 September, 1873.

JAMES LAWSON.
THOMAS JAFFREY.

REPORT.

Sydney, 20 September, 1873.

SIR,

The application of Messrs. James Lawson and Thomas Jaffrey for Letters of Registration for an invention for the "immediate extraction of Gold and Silver from any mineral substance," having been referred to us, we have examined the specification and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.

INVENTION FOR THE SEPARATION OF MINERAL SUBSTANCES, &c.

LETTERS OF REGISTRATION to John Phillips, for an Invention for the separation of Mineral Substances, cleaning of Tin and other ores, the amalgamation and separation of Gold and Mercury from lighter substances, and the exposition of Precious Stones.

[Registered on the 16th day of October, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS JOHN PHILLIPS, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for the separation of Mineral Substances, cleaning of Tin and other ores, the amalgamation and separation of Gold and Mercury from lighter substances, and the exposition of Precious Stones, which said invention is more particularly described in the document marked A which is hereunto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expence of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Phillips, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said John Phillips, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said John Phillips shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this fourteenth day of October, in the year of our Lord one thousand eight hundred and seventy-three.

HERCULES ROBINSON.

Invention for the separation of Mineral Substances, &c.

REPORT.

Sydney, 24 September, 1873.

SIR,

The application of Mr. John Phillips for Letters of Registration for an "invention for the separation of Mineral Substances, cleaning of Tin and other ores, the amalgamation and separation of Gold and Mercury from lighter substances, and the exposition of Precious Stones," having been referred to us, we have the honor to report that we have examined the drawings and descriptions accompanying the same, and see no objection to the issue of Letters of Registration in accordance therewith.

We have, &c.,

J. SMITH,
GOTHER K. MANN.

THE PRINCIPAL UNDER SECRETARY.

[Drawings—one sheet.]

No. 382.

[Assignment of No. 365. See page 61 of this Return.]

A.

DRAWINGS of the Six Parts of Machinery for the Separation of Minerals, Cleaning of Tin and other Ores, the Amalgamation and Separation of Gold and Mercury from lighter Substances, and the Exposition of Precious Stones (Scale 1 inch = 1 foot), with Descriptions, for the purpose of Registration under the Letters of Registration Act, 1852. By John Phillips, Mining Surveyor and Engineer, of Sydney.

No. 1.—Rocking berran, with or without a wheel

Instead of bars *a*, a perforated plate may be employed, for passing the fine matter, & retaining the stones. This berran may be made wholly of iron, with riddled sides as well.

This Berran-rest, and Receiver, may be made wholly, or partly of iron.

Length View.

- (A) Teeth made of the common wood screw thus altered
- (B) Steps, for the retention of the heavy substances, tin, lead, gold, or mercury and heavy stones, the use of screw teeth being, to prevent clogging & to precipitate the fine tin by keeping the passing soil loose & floating.
- (C) Ricking arms extending two feet up, broken off

Sections.

No. 2.

Another view of Number 2

No. 3, for catching the fine tin.

Cross View.

This denotes parts, which either rock, or oscillate
" " " " are fixtures

No. 4, for cleaning the ores by the hand.

Central Section, far side shewn.

This is recommended for small quantities

End View.

Side-Elevation of Cleaner.

The Pan is hinged at A, & falls down at B for discharge; the mercury pan, D, is half an inch deeper, & the number of oscillations 180 per minute. C is set out of magnets for the separation of iron, they are placed in inch, or less, apart, across the stream.

In numbers 5 and 6, the comb-frame moves up and down, while the pans move horizontally, so that the heavy metals are pulled against the stream, while the lighter are hastened downwards.

No. 5 is a mechanical appliance for large quantities to be turned slowly by hand

No. 6 is a modification of 5, as shown by the dots, for amalgamation and separation of gold from tin or pyrites, and saving pyrites

John Phillips,
Mining Surveyor & Engineer,
Sydney, Sept. 1th 1873.

X, a tool used with No. 2, A, & Z is used with Nos. 2, 3, & 4 and is extremely for precious stones, gold nuggets, and as a sieve. The anglebars and tool X, are together a part of the subject of Patent.

This is the Document marked A, referred to in the annexed letters of Registration, granted to John Phillips, this fourteenth day of October, 1873.

Sketch of Jigging Machine of the ordinary Cornish type, driven by machinery, motion being imparted by a cam-wheel striking against a lever. Hancock's principle is applied to this jigger, and is represented on the sketch in red, by which compound motion (somewhat similar to that described in No. 1) is obtained. The use of this Jigging Machine, however, is also almost superseded by the improvements shown in the following sketches.

The mechanism of this machine is essential throughout. It is similar to No. 4, except that the forward and backward motion is obtained in a different manner. On both sketches, viz. 3 and 4, the gear for obtaining the motion on a given rod, is not to make the 4 strokes conspicuous. Both arrangements produce nearly the same effect, only that in No. 4 it is superior, as in the working of it there is less wear and tear. The reference shown in No. 4 can be applied to this machine, except G and H, both of which refer to the horizontal motion. The No. 4 machine is the best that are in such use in the operation at the Mounta Mines, South Australia, one of which recently jigs from 100 to 150 tons of crushed stuff per diem.

H. R. HANCOCK,
 Mounta Mines, South Australia,
 20th September, 1873.

Witness to signature -
 Joseph Jolly, Clerk, Mounta Mines.

A. Cam-wheel and driving shaft, giving motion to the whole apparatus.
 B. Levers running lengthwise, connected by logs and pins, keyed to arbor. The cam-wheel which strikes the end of one of the levers conveys uniform motion to the machine.
 C. Horizontal rods conveying motion from the levers to the sieve bars.
 D. Horizontal screw-bars resting on the upright rods and suspending the sieves.
 E. Arches on which the levers are keyed running screws underneath the hatch in order to convey the motion uniformly to both sides of the sieve.
 F. Logs connecting the different levers with parallel pins.
 G. Oil-spout or lever, fixed to the hatch and connected with the sieve, thus giving compound motion to the sieve, viz. up and down, combined with forward and backward movements.
 H. Iron (cast), cranked, fastened to the hatch, and to which rod G is fastened with a screw, which can be moved so that the obliquity of the angle of rod G can be set at pleasure.
 I. Rod for regulating the extent of the motion and by which means the machine can be quickly thrown out of gear by screwing the lever high enough to allow the cam-wheel to pass without striking it.
 K. Cast-iron pillars, which can be made any height that may be most desirable for any particular situation in which the machine may be required.
 L. Fly-wheel, which also serves as belt-driving wheel.

This is the sheet of drawings, referred to in the annexed Letters of Registration, granted to Henry Richard Hancock, the twenty-first day of November, 1873.

**IMPROVEMENTS IN MACHINERY FOR MAKING ICE, COOLING LIQUIDS,
REFRIGERATING ROOMS, &c.**

LETTERS OF REGISTRATION to Samuel Barclay Martin and John M'Gough Beath, for Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, and for other like purposes.

[Registered on the 22nd day of November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS SAMUEL BARCLAY MARTIN and JOHN M'GOUGH BEATH, of San Francisco, State of California, United States of America, engineers, have by their Petition humbly represented to me that they are the authors or designers of a certain invention or improvement in manufactures, that is to say, of an invention intituled "Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, and for other like purposes," which is more particularly described in the specification and sheet of drawings which are hereunto annexed; and that they, the said Petitioners, have deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and have humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to them for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Samuel Barclay Martin and John M'Gough Beath, their executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Samuel Barclay Martin and John M'Gough Beath, their executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Samuel Barclay Martin and John M'Gough Beath shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, &c.

SPECIFICATION of SAMUEL BARCLAY MARTIN and JOHN M'GOUGH BEATH, of San Francisco, California, United States of America, engineers, for an Invention intituled "Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, and for other like purposes."

OUR said invention relates to that part of an ice or refrigerating machine known as the congealer or refrigerator, and to that class of ice machines in which cold is continuously produced by the vaporization and condensation of volatile fluid.

Our object is to produce a wide-spread, simple, and efficient distribution of the fluid, to entirely dispense with the use of an uncongealable liquid, and to make transparent, solid, and homogeneous ice, free from seams, air cells, and all impurities held in suspension by the water from which it is made.

We will first speak of the objectionable features in the present methods of ice manufacture, and next, of the principle on which our invention is based, in order that we may better show wherein it differs from all others before known or used.

It will be apprehended by those skilled in the art to which our invention relates, that the withdrawal of heat from water in quantities sufficient to produce ice in bulk by the vaporization of a volatile liquid contiguous to it, involves either a rapid transmission of heat from the water to the liquid, or the action must be spread over a large surface.

As ice is a slow conductor of heat, and as the heat withdrawn has to pass through the ice already formed, a rapid formation of ice of any considerable thickness is impracticable, and can only be partially urged by vaporizing the liquid at extreme low temperature, and consequently low pressure, which can only be accomplished by an unwarrantable expenditure of power; therefore, a uniform distribution of both liquid and water over a large surface is a condition indispensable to the production of ice with economy, and we have found its consequent slow formation is essential in producing it in solid and transparent form from undistilled water.

Heretofore, the methods of freezing by direct contact have been by means of spraying the liquid within the freezing surface, and by covering the inner surface of the freezing vessels with absorbents of the liquid, or by means of expansion chambers, and more recently by means of hollow slabs, or long and narrow chambers holding a specific charge of liquid sufficient by its vaporization to give a stated result or form a given quantity of ice on the surface of the containing vessel. But the vaporization of any liquid in a vessel offering free space for the escape of the vapour from the surface of the liquid will absorb nearly all its latent heat of vaporization before leaving the surface of the liquid, therefore the constant subsidence of the liquid as it passes off in the gaseous form will inevitably produce an irregular formation of ice.

These different methods of applying the cold-producing agent renders the machines employing them irregular in their action, limited in their capacity, difficult and expensive to construct and operate.

From actual experiment we have found that we are able, with great security, economy, and simplicity of construction, to produce an immensely large surface for the formation of ice by the use of metallic plates traversed by parallel channels in which the volatile liquid flows as it expands into vapour, thereby forming ice on either surface from the water in which it is submerged.

The value of these channelled plates is greatly enhanced by reason of the plates being rendered practically uniformly cold, even when the channels are placed ten or twelve diameters apart.

The value of our invention is still further increased by the discovery of means of regulating the intensity and uniformity of the cold throughout the whole extent of the congealer composed of these channelled plates however large they may be.

We find that when volatile liquids are vaporized in their passage through long channels or pipes of small sectional area the fluid remains a homogeneous mass, that is to say, the liquid particles, completely and uniformly mixed with the vapour, are carried along with it without reference to the grade of the pipe, be it either up or down, and when, by reason of the great expansion caused by the absorption of heat, the velocity becomes as high as desirable, the stream of mixed vapour and liquid may be equally divided by simply forking or branching the pipe, and each one of these branches may, after a further expansion by heat, be again divided, and thus the subdivisions may be carried to any number and length of pipe desired, each pipe always carrying its due proportion of liquid and gas, and producing a uniform degree of cold throughout the whole system of pipes, by simply adjusting the pressure in the pipes so that the vaporization of the liquid is not entirely complete before it reaches the outlet.

Our congealer, constructed so as to embody this principle of action, consists of the before-mentioned channelled plates, each plate being traversed by a branch or division of this system of pipes.

The construction and form of the plates may be varied to suit the size of the machine desired by the maker.

The whole system may be embodied in a single plate, which may be put in the form of a scroll, with the necessary space between the parts of the scroll for the formation of ice on both sides of every part of it. In this form it may be lodged in a tub of cylindrical shape, for holding the water, or each division of the pipe may be enclosed in a single plate of plane surface, as is shown in the drawings.

All the divisions may be of equal length, and the plates equal in size.

In the annexed drawings, which form a part of this specification, figure 1 is a perspective view of our congealer, and also shows a form of liquefying apparatus which may be used in connection with it.

Figure 2 is a side view of one of the channelled plates composing the congealer.

Figure 3 is a vertical section of one of these plates.

As a means of security against leakage, when we use ammonia as a freezing agent, we make our system of pipes in which it is expanded into vapour of lead, making the parts which form the lining of the channels much lighter than that which is exposed outside and has to resist the pressure. Each channel is formed by two pieces of plate rolled longitudinally, with semi-tubular depressions to receive the pipe; these are riveted on each side of the pipe, closing between them the edge of the plate which fills the space between the parallel channels. The whole being thus firmly riveted together, forms one plate with the lead-lined channels before described, and as is shown in figures 2 and 3.

In figure 1, seven of these plates are placed in a tank, A, and are fastened to it by bolts or screws passing through the flanges on each end of the plates. We make the space or distance between the plates sufficient so that, when sheets of ice are formed on them of the thickness required, a few inches
of

Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, &c.

of water will remain. This water space allows the ice to be removed from the plate when loosened, and it is also a receptacle for air and impurities held in suspension and rejected or thrown out by the freezing.

The tank A, containing these plates, is made non-conducting, to keep out the external heat, and the plates are raised from the bottom of the tank, to allow a free circulation of water under them, and prevent the ice from freezing or becoming attached to the bottom of the tank.

The freezing liquid is introduced at *a*, which, after passing back and forth through the plate *b*, as is shown by the arrows, makes its exit at *c*. By the time the fluid has reached *c*, it has become so much expanded by the heat absorbed from the freezing water surrounding the plate that its velocity has become greatly increased, so that it may be equally divided into two streams by the fork *c*, from which it passes, by the pipes *d*, *e*, into the plates *f*, *g*.

By the time it has passed through these plates its velocity has again been brought up to a point which requires it to be again divided at *h*, *i*; the four divisions thus formed pass through the plates *j*, *k*, *l*, *m*.

An important advantage of this method of distribution is that all danger of clogging is avoided, as no divisions are made until the volume of the fluid is brought up to a point which permits it to be made without diminishing the size of the pipe or channel in which it flows.

The gasified liquid is still of low temperature and contains some liquid particles after its freezing power is nearly exhausted, and we further utilize it by continuing the congealer pipes through the coil B, over which the incoming water of the natural temperature is passed in a shower from the perforated pipe *n*, and is cooled down before passing into the tank to fill the place of the ice removed.

The congealer pipes on leaving this coil terminate in the large pipe *o*, which conveys the gasified liquid to the liquefying apparatus. This liquefying apparatus may consist of any of the known methods or apparatus used for liquefying the different gases in ice-making machines.

The apparatus shown in the drawings (figure 1) consists of a compressing pump and condensing coil. From the latter the heat is withdrawn by applying water to the surface by any of the usual methods. Any means by which the gas or vapour is constantly withdrawn by the eduction pipe *o*, and returned through the pipe *p*, in the liquid form, may be used. The quantity of liquid received and gas withdrawn is a measure of the quantity of ice produced.

The ice first commences forming on the plate around the channels, but when the thickness of the ice is equal to the distance between the channels, it presents a smooth external surface, therefore we make the distance between the chambers equal to the thickness of ice required. We find the quantity of ice formed for each lineal foot of channel should not be greater than 5 or 6 inches per hour on each side of the plate.

By observing these rules we construct channelled plates for making transparent and compact ice as much as 12 inches in thickness if desired.

The construction of our congealer is such that the ice will not be detached from the plate, by allowing the gas or vapour from the condenser or liquefying apparatus to flow into it, as practised heretofore.

In our experiments we have found that the accumulation of condensed liquid in the pipes would obstruct the flow of gas so that portions of the plate would not be affected by it; we have therefore devised special means for more effectually accomplishing this object, and also means by which the ice is detached and taken from one or more of the plates without interrupting or checking the formation of ice on the other plates of the congealer.

The pipe *p* is connected with the pipe leading to the condenser as shown, and with each one of the congealer plates, by the two-way cocks *q*, *r*, *s*, *t*, *u*, *v*. These cocks are so constructed that they may be set to open a free passage from one plate to the other as the liquid flows in freezing, and by turning them 90 degrees this passage is closed, and the passage from the pipe *p* is opened.

Then to detach the ice from any plate it is only necessary to turn the two-way cock connected with that plate to open a passage for the gas from the condenser, while the cock on the opposite side of the plate is opened sufficiently to allow the condensed liquid produced by the rapid condensation of the gas rushing into the plate under the high pressure of the condenser to pass out.

As we consider ammonia the best cold-producing agent of any of the many substances which have been used or capable of being used for that purpose, we have proportioned the annexed drawings for the use of that agent.

To determine the proportions for any liquid, we ascertain from standard authority on the subject the latent heat of the liquid in question, the specific heat of its vapour, also the tension and volume of its vapour at different temperature, from which we are enabled to calculate the amount of ice or equivalent refrigeration produced by the vaporization of a given quantity of the liquid, also the size of the pipe, and the rate at which the pipe should be increased in number or divisions as the liquid expands into gas, always observing that the velocity may be greatly increased as the fluid approaches the outlet and is nearly all vaporized, but in no case should it be greater than 30 or 40 feet per second.

Our channelled plates may be used for refrigerating rooms by extending the plates through the rooms. The width of room on each side refrigerated by a single plate may be equal to about twice its height.

A descending current of cold air in the vicinity of the plate is replaced by warmer air from the ceiling, by which means a nearly uniform low temperature may be secured throughout the room.

Liquid baths or air may be cooled by extending this system of pipes through them without their being encased in the plates or the liquid, or air may be passed in a current over the pipe.

The channelled plates which form the principal or most important feature of our invention may be made in a variety of ways. That shown in figures 1, 2, and 3 is considered best for ordinary work. We make the thickness of the plate and diameter of pipe proportionate to the size of the plate. For plates (say) 6 feet in depth we make the plate of No. 10 (Birmingham gauge) rolled iron, and the pipes three-fourths of an inch in inside diameter.

To facilitate the removal of the ice in large machines, we usually make the length of the plates less than the width of the tank by a distance equal to about the depth of the plates, and place one end of the plate against one side of the tank, leaving a water space the whole length of the tank on the opposite side.

Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, &c.

As the ice is detached from the plate it is split vertically into square blocks, which are floated into the open space, where they turn on their sides, and may be easily drawn out on an incline fixed at any point required on the side of the tank. The top edges of the plates, especially the end which does not reach the side of the tank, should be stayed by pieces running across from plate to plate, at a height sufficient to allow the ice to float on its edge under them.

In the place of each one of the two way-cocks described two single cocks may be used, so placed as to force the gas from the condenser into any one of the plates for the purpose of loosening the ice from the plate as described.

Having thus fully described the nature of our said invention, together with the methods of carrying the same into practical effect and operation, we wish it to be distinctly understood that we claim the novel arrangements, combinations, and methods of construction and operation, and arrangement of apparatus for effecting the desired objects, as hereinafter set forth and illustrated in the accompanying drawings.

This is the specification referred to in the annexed Letters of Registration granted to Samuel Barclay Martin and John M'Gough Beath, this twenty-first day of November, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 16 October, 1873.

SIR,

The application of Messrs Samuel Barclay Martin and John M'Gough Beath for Letters of Registration for "Improvements in Machinery for making ice, cooling liquids, refrigerating rooms, and for other like purposes," having been referred to us, we have examined the specification and drawings accompanying the same, and have now the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

IMPROVEMENTS IN COOLING, BY THE EVAPORATION OF VOLATILE LIQUIDS, &c.

LETTERS OF REGISTRATION to James Harrison, for Improvements in Cooling, by the evaporation of volatile liquids, &c.

[Registered on the 22nd day of November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JAMES HARRISON, of Melbourne, in the Colony of Victoria, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Cooling, by the evaporation of volatile liquids and by the solution of salts in the apparatus and processes for the manufacture of ice, and in the application of ice and cold solutions to the regulation of temperature," which is more particularly described in the specification, marked A, and the two sheets of drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said James Harrison, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said James Harrison, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said James Harrison shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Cooling, by the evaporation of volatile liquids, &c.

A.

SPECIFICATION of JAMES HARRISON, of Melbourne, in the Colony of Victoria, for an invention intituled, "Improvements in Cooling, by the evaporation of volatile liquids and by the solution of salts in the apparatus and processes for the manufacture of ice, and in the application of ice and cold solutions to the regulation of temperature."

THIS invention relates to improvements in the apparatus and processes for the reduction of temperature, by the evaporation of volatile liquids and condensed gases and by the solution of salts; to improvements in the apparatus and processes for the manufacture of ice thereby; and in the modes of economically applying ice and cold liquids to the cooling of enclosed spaces, to the cooling of worts and other liquids, and to the preservation of perishable animal and vegetable substances. The processes and apparatus for cooling by evaporation to which my improvements refer are those by which cold is produced by the evaporation of ether, ethyle, chloride of ethyle, methyle, chloride of methyle, sulphurous anhydride, and other homogeneous liquids, the vapours of which, after producing cold, are reduced again to the liquid state by pressure in a separate condenser, and returned in a liquid state to the evaporating vessel. The process for cooling by the solution of salts to which my improvements refer is that wherein the salts are mixed with water to produce refrigeration and the salts recovered by evaporating the brine.

My improvements in the manufacture of ice consist in a radiating process, and relate to the mode of applying cooled brine irrespective of the process by which the cold is primarily produced; and my improvements in the use of ice and cold liquids relate to the maintenance of a low temperature in any enclosed space by regulated streams of cold water or brine over the interior of the boundary walls, irrespective of the modes of producing the ice or cooling the brine.

The apparatus for cooling by the evaporation of homogeneous liquids, such as ether, usually consists of an evaporating chamber, a pump for withdrawing and confining the vapour, a condenser, in which the vapour is reduced to the liquid state, and a trap-valve which prevents any air or non-condensed vapour from returning to the evaporating chamber. My improvements in the evaporating chamber consist in the adoption of an annular boiler, made of two sheets of boiler plate or copper placed within a sixteenth or other small portion of an inch apart at their lower edge, the distance between them gradually increasing to an inch or more at their upper edge. The boiler thus constructed forms a ring of large diameter in proportion to the enclosed space. The ether occupies the narrow space of the bottom half of the boiler, and the vapour collects in the wider space at top. There is one cross partition, on one side of which the liquid ether enters, and from the other side of which the vapour is withdrawn, so that the vapour traverses the whole length of the enclosed space. Another new form of boiler which I also employ consists of perpendicular or horizontal coils of pipe, the liquid ether entering the lower end of the coil and the vapour being withdrawn from the upper end. The diameter of the pipe is small in the bottom coils, and increases upwards; or the diameter may be constant, and the area of the lower tubes diminished by the insertion of a solid core or of a core formed of a closed tube. Large boilers of either of these forms have a separate vapour chest, from which the vapour pump is supplied, but in small boilers the vapour chest is dispensed with. The advantages of these boilers consist in the facility they afford for the detection and repair of any leak, the avoidance of the annoyance caused by the bursting of tubes from freezing or otherwise, the facility they afford for utilizing the cooled surface either by radiation or by conducting streams of brine over the surface, and in the economy of materials and the small quantity of evaporable liquid required.

To the boiler or evaporating chamber I affix a subsidiary vessel for the purification of the volatile liquid, which in the course of its circuit becomes contaminated with oil and other impurities. This separate evaporator is at a lower level than the refrigerating boiler, with which it communicates by two pipes fitted with stop-cocks, by one of which the impure liquid passes downward, and by the other the vapour passes into the vapour space of the refrigerating boiler or into the pipe leading into the vapour pump. When it is deemed requisite to purify the volatile liquid, the cocks are opened and the lower evaporating chamber fills. The stop-cock on the liquid supply pipe is then closed, and the vapour pipe left open. The cold produced in this subsidiary chamber may be utilized either in cooling brine or in subjecting to a preliminary cooling the water to be afterwards converted into ice. This subsidiary chamber is also used as a reservoir for the volatile fluid employed. When the works are stopped the whole of the fluid is run into the reservoir, which is kept at a lower temperature than the rest of the apparatus, whereby the risk of loss by leakage or in starting the apparatus is diminished.

The vapour pump is usually fitted with self-acting drop valves or with slide valves. My improvements in the valves consist in having slide valves actuated by gearing on the suction or vacuum side, and self-acting valves on the exhaust or pressure side. The valves on the suction side are open during the whole stroke, those on the pressure side remain closed until the pressure inside the cylinder exceeds the pressure in the condenser and close at the end of the stroke. For horizontal pumps I employ on the pressure side a valve which runs down an inclined plane to its seat, and is forced up the inclined plane when the vapour is passing from the pump to the condenser.

My improvements in the stuffing-boxes for the piston and valve rods consist in providing an interspace in the middle of the packing, so that when the pump is sucking and there is any leakage in the stuffing-box, the interspace will become filled with air or oil, and when the pressure is reversed the vapour will drive out the air or oil and take its place. Any through leakage will thus be prevented or reduced to a minimum by connecting by a tube the two interspaces of any couple of valves; there will be an interchange of the contents of the interspaces, and any leakages between the interior of the pump and its exterior are rendered still more improbable. By connecting the interspace with an oil chamber, the lubrication is best provided for, and leakage at the same time prevented.

I also employ a condenser, in which the condensation is produced by a jet of the same volatile liquid as that employed for refrigeration. In an ether apparatus the condensation of the ether vapour is accomplished by a jet of liquid ether combined with surface condensation. The condensed ether is cooled in a subsidiary refrigerator before being thrown in a jet into the condenser. The condenser, under this arrangement, consists of a single chamber, into which the jet is thrown. The condensed ether is with-

same

Improvements in Cooling, by the evaporation of volatile liquids, &c.

same pump withdrawing the warm liquid ether and forcing it, when cooled, into the condenser. This form of condenser is of especial advantage when the volatile liquid is evaporated under a pressure less than that of the atmosphere, and when there is a liability to its becoming mixed with air, the presence of air in the vapour acting as a serious hindrance to its contact with the sides of a surface condenser, while it interferes but slightly with the operation of a jet. In addition to the jet, the external surface of the condenser is kept wet, so that it may be kept cool by the evaporation of the moisture. By the subsidiary cooling of the condensed liquid, an economy in the use of the condensing water is effected. When the volatile liquid is evaporated under a pressure equal to or in excess of the atmosphere, the use of a jet is not of so much advantage, and for the sake of simplicity it may be dispensed with, and the vapour be reduced to the liquid state by surface condensation alone.

My improved surface condenser consists of a perpendicular or horizontal coil of pipes covered with network, so as to cause the dispersion of the water over the surface, and at the same time to admit of free radiation from the pipes and free access of air to the moistened surface; a current of air being at the same time maintained by a fan or other external arrangement over the wet surface. This current of air is thrown into the centre of the coil when horizontal and spiral, so that it may flow outward and not merely upward, and is thrown across the tubes when arranged perpendicularly, the object being to supply each round or layer of the pipe with fresh dry cold air, instead of allowing the heated and saturated air from one round to rise to the next.

My improvements in the trap-valve for supplying the boiler or evaporating chamber with returned liquid consist in a lever with a solid plunger of metal at one extremity and a valve at the other, the fulcrum being placed so that the metal plunger shall float in the liquid and fall when the liquid falls. The hollow balls usually employed are superseded, as they are liable to become partly filled with liquid. When jet condensation is employed, the trap arrangement is connected with the boiler so as to regulate the supply thereto.

In order to get rid of the air which is apt to accumulate in the condensers of apparatus wherein the volatile liquid is evaporated under a pressure less than that of the atmosphere, I employ an arrangement on the principle of Wolfe's bottles. A pipe is carried from that part of the condenser most remote from the pump, and when the pressure in the condenser exceeds that of the atmosphere the mixed air and vapour are allowed to escape through a series of cells filled with a liquid in which the volatile liquid is soluble. After passing through these cells the air is allowed to escape into the chimney or waste steam pipe. The oil or other liquid is removed when saturated, and the volatile liquid is recovered from it in the subsidiary vessel already described.

In making a selection of the kind of volatile liquid or condensed gas that it may be most profitable to use, regard must be had to the temperature required to be produced, and to the pressure or tension of the vapour at that temperature. As a rule, it is best to employ that liquid the vapour of which at the temperature required is about equal to the pressure of the atmosphere, not less, but as little over as possible. The object is to prevent leakage either of the vapour outwards or of the air inwards. Mixtures of the materials, provided they are not chemically incompatible, may be made according to the following rule and data. At the temperature of zero, Fahrenheit, the vapour of ammonia has a pressure of 90 inches of mercury; vapour of oxide of methyle, 32 inches; of sulphurous acid, 23 inches; of chloride of ethyle, 10 inches; of sulphuric ether, 3 inches; of pyroxylic spirit, 0.56; and of alcohol, 0.37. Either of these fluids may be mixed, the quantities being in the proportion of the pressure of their vapour, and the mixture will evaporate without leaving a residuum. If there be an excess of the less evaporable liquid it will remain inert in the boiler, but may be removed by distillation.

My improvements in refrigeration by the solution of salts, such as chloride of calcium, in water, consists in arrangements whereby the solid salt descends and meets an upward current of water, whereby the resulting cold solution is often doing the work of refrigeration required of it conveyed still upward, meeting separate descending currents of water and of solid salts, reducing them nearly to the initial temperature of the current of cold brine; and whereby the water of solution is evaporated, the solution passing downward in a long trough, while the heated products of combustion from a furnace pass underneath in an opposite direction, and whereby salt is crystallized from the concentrated solution.

In the use of crystallized chloride of calcium or other salt which produces cold by solution in water for making ice, I make a long and deep but very narrow receptacle, the walls of which are preferably of sheet metal. I feed in the broken or pulverized crystals of the salt at the top, and introduce the water at the bottom. The resulting cold solution flows upward and outward from side perforations near the top, or is conveyed away by a pipe to be applied to any cooling purpose. After having done its work the brine is pumped up in two separate streams, one to meet the descending supply of water, and the other to meet the descending salt. The stream for cooling the salt is carried up between two plates of metal, while the salt falls gradually downward on either side, the broken crystals being fed in from a hopper at the top and raked out at the bottom. The stream for cooling the water is conveyed through a pipe surrounded by another pipe or open channel containing the water to be cooled. The central pipe has a solid core of smaller diameter inserted for the purpose of forcing the brine in a thin stream along the sides of the tube, so that there is no central current carrying off material without doing work. Any of the ordinary refrigerators already known may be used for this purpose. The evaporator consists of a shallow trough divided into narrow channels, along which the brine flows; while the flame and heated gases pass through corresponding channels in the flue underneath. The concentrated brine thence flows into a cooling trough, where it is kept at the desired density by either increasing or diminishing the supply thereto. The concentrated brine is thence run into shallow pans placed in recesses, between and around which a stream of cold water is maintained until the mass in each is crystallized. I also concentrate the brine in an open shallow pan, removing the crystals as they form. The former arrangement is best where economy of space is required. The solid salt is then broken into pieces or pulverized, according to the rapidity with which the refrigerating process is required to be carried on, and is then shovelled into the hopper of the receptacle, when it is cooled by ascending spent brine.

My improvements in the making of ice by streams of cold brine, no matter by what process the cooling has been produced, consist in arrangements for submitting a continuously renewed film of water flowing over a flat surface to the direct radiating surface of the boiler or vessel containing the refrigerating material,

Improvements in Cooling, by the evaporation of volatile liquids, &c.

material, over which surface a stream of saline solution or other liquid non-solidifiable at the required temperature is maintained. Additional radiating surface is obtained by conveying the saline solution over surfaces of cloth or other porous or roughened surface, and when the brine has at last fallen into the bottom trough it is again raised by an endless web of cloth passing over three rollers, one at top and two at bottom, so arranged that the cloth takes up the brine on one side and delivers it on the other. The water to be frozen flows downward on alternate surfaces until the requisite thickness of ice is produced. The surplus water flows into a trough below, whence it is pumped up to be again passed over the moulds. There is a perforated pipe or trough over each set of moulds, with a cloth or canvas covering over the perforations, and with a depending serrated edge: the rapidity of the flow being regulated by the thickness or texture of the envelope. The number of these alternations will of course depend on the height of the apparatus on the degrees of cold produced, and on the rapidity of the downward current and consequent quantity of brine. When the brine in the last compartment has reached 31 or 32 degrees it is available for cooling fresh supplies of water or other materials, and is then returned to the refrigerating surface to do duty once more in the same way, or is pumped to the evaporating pans, as the case may be. The ice moulds are of simple sheets of metal turned out at the edges, but they may be of any material, as there is no conduction of heat required. The ice is thus made partly by radiation and partly by evaporation, the vapour condensing on the opposite colder surface, and the air escapes from the water without forming bubbles. The ice is thus formed more quickly, more economically, of better quality, with equal facility in thick and thin pieces, and more nearly resembles natural ice than that made by any other process.

My improvements in cooling worts consist in an arrangement for passing the worts either directly over the surface of the refrigerating boiler or receptacle for the solution of salts, or over or through any of the refrigerators already known, supplied by a stream of water or brine previously cooled down, by being placed over the refrigerating surface. Where the cold is produced by the solution of salts, the resulting brine is passed directly through the tubes or channels over or along which the worts are conveyed. The worts may thus be cooled from their boiling temperature, or they may be previously cooled by any of the processes now in use, and the final reduction of temperature effected in either of the modes described. I also employ the artificially cooled water or brine in attemperators to regulate the heat during fermentation, so that the Bavarian system is rendered practicable in the hottest of climates. I also cool the beer after fermentation, either in the gyles, the cleansing casks, or store casks. In the latter case the cooling is effected by an attemperator, consisting of a fold of pipes, along which a stream of saline solution is passed, or of a single pipe filled with pieces of solid salt to which water is added, and the whole left in till an equilibrium of temperature is maintained. This pipe may remain as a fixture, so that it may be supplied by a syphon and refilled at pleasure. These arrangements are applicable to the cooling of water or any other liquid in casks or tanks, as well as to the cooling of ice chests, without ice, cupboards, cellars, &c.

My improvements in the cooling of enclosed spaces, such as the hold of a ship, with a view to the preservation of perishable articles by cold, consist in the maintenance and regulation of streams of cooled water or brine carried over the interior lining of the enclosed space, the use of pipes being dispensed with, the cold liquid flowing over the naked surface or between two sheets of metal or waterproof material. The floor walls and roof of the enclosed space are first protected with a thickness of non-conducting material. Where ice alone is employed as the cooling agent I stow the ice at the bottom of the enclosed space and pump up the water as it melts to a reservoir over the deck or roof, whence it flows over the deck or roof and down the sides of the enclosed space, and is again allowed to flow among the ice until its quantity becomes inconvenient. When the temperature is to be reduced below 32° I mix salt with the ice when it is stowed away or with the water which flows over it. It is already known that an intense cold can be produced by a mixture of ice and salt, and refrigeration is produced in vessels brought in contact with such a mixture, but it is not known that after the lowest temperature of the mixture is reached the ice ceases to melt, and the remainder of the ice will remain unmelted for so long a time as the ice alone would remain; the rate of melting in either case being due to the difference in temperature between the enclosed space and the external air, and to the thickness of the imperfectly conducting envelope and its co-efficient of conductivity. This fact being ascertained, it follows that a current of brine flowing over the ice will not melt more than is requisite to keep the brine at the temperature due to its strength. The action ceases so soon as the minimum temperature is attained. The rule which I lay down for ascertaining the quantity of brine required to produce any given effect is this: Take the number of degrees which the brine before mixture is above the temperature required, with this number divide 140, the number of units of heat required to melt the ice; this will give the number of gallons required to melt ten pounds of ice. The percentage of salt (when common salt is used) which the brine shall contain is ascertainable on inspection of the following table of the cold produced by various solutions.

1 per cent. of salt	30 $\frac{3}{4}$ Fahr.
5 " "	25 "
10 " "	18 $\frac{1}{2}$ "
15 " "	12 "
20 " "	6 "
25 " "	0 "
Saturated solution	5 below zero.

To produce these effects the brine must be of the specified strength after its augmentation of bulk by the water from the melted ice. The strength of the brine before use must therefore be in excess by a variable quantity, proportioned to the temperature at which it is used, and consequently to the quantity of ice which it is capable of melting. I have ascertained by experiment that one ton of ice and one hundredweight of salt are sufficient for the maintenance during fifteen days of a temperature below the freezing point in an enclosed chamber having walls of two feet thickness of sawdust, and a superficial internal area of two hundred feet, the external air being of the average temperature of 70 degrees. As the conductivity of materials is proportionate to their thickness, the quantities of ice and salt required to maintain a given temperature in a chamber with walls of a given superficies and thickness for a given time are exactly ascertainable from these data. Of course, where the cooling has to be done at sea, or other place where ice is not freely obtainable, a liberal allowance must be made for unforeseen contingencies.

Improvements in Cooling, by the evaporation of volatile liquids, &c.

I also maintain a cold temperature in enclosed spaces, without ice, by the use of deliquescent salts. In this process I supply the dry salts to the bottom of the hold or other enclosed chamber, and allow water or the returned brine to flow over them, pumping up the solution and conveying it over the sides and deck or roof. When the solution has become saturated, it is pumped out and employed to cool fresh supplies of materials, and is afterwards evaporated and crystallized as already described. The quantity of salt required for this process is about three times the quantity of ice specified above, but as it is continually renewable it will not be requisite to have more than a day's supply, with, of course, a reasonable allowance for emergencies, such as a stopping of the evaporating process. My purpose in placing the ice and salt, or the deliquescent salt, as the case may be, on the floor of the chamber is the preservation of a dry atmosphere in the chamber. If the ice or the deliquescent were placed over or at the side of the chamber, the bottom would be the warmest, and evaporation would proceed therefrom, filling the air of the chamber with moisture, which would condense on its colder contents. By keeping the bottom cold, the contents are not only kept dry but are slightly desiccated. If a moist atmosphere is wanted, it may, of course, be had by placing the ice or salts overhead. In fitting up the hold of the ship for either of these processes, the non-conducting materials are of course fixed on the inside of the floor and sides, but to protect the top they are placed above the deck, leaving an interspace in which the cold brine circulates. The ice may also be stowed between decks, and the upper protecting envelope raised above the upper deck. When the hold or chamber is fitted up so that the brine shall flow between two sheets of metal or waterproof material, the ice may be stowed above or below the cold chamber, as may be most convenient. In order to insure the regular flow of the brine over the interior surface or in the space between the two sheets of waterproof material, I use a lining of blanketing or other porous fabric, through and over which the brine spreads laterally while flowing downwards. To insure a regular feed and a steady current of brine, I use a perforated supply pipe covered with cloth or other porous fabric, through which the brine will ooze with more regularity than if delivered through naked perforations. The supply pipe, if below the level of the ice chamber, will be kept filled by gravitation, but if, when the ship is on a wind, one side is raised so as to be above the brine level in the ice chest, the brine must be supplied to the pipe at its highest part by pumping. Instead of this pipe the brine may be supplied from a trough in the lower angles of the ice chest, into which the brine flows from the melting ice, the trough being divided by partitions, so that when the ship rolls or pitches some of the brine will remain in each compartment. To ascertain the quantity of brine which should be kept in circulation to produce a given effect, the rules I have already given for ascertaining the quantity of ice melted by a given superficies with a given difference of temperature require to be kept in view. Ascertain the quantity of ice melted in a given time at a given temperature with a given thickness of envelope by a square foot of the surface, multiply this by 140, and by the number of square feet of surface over which the brine has to travel, and the quantity found will be that which is required to protect the surface from external heat, so that the brine, after it has performed this service, shall be only one degree higher than it was before. Thus, in the instance I have given of one ton of ice melting in fifteen days with a surface of 200 square feet, the quantity of brine required to be kept in circulation is eighty-eight gallons per hour. As it is impossible to give rules applicable to all circumstances, it is desirable to ascertain the data for each particular case by actual experiment. Different kinds of sawdust, charcoal, coke, straw, or other imperfectly conducting materials, will have different co-efficients of conductivity, and the relation of the external walls to surrounding objects will be so different that the agreement of any two experiments will be a rare occurrence. As the ice melts, the brine will accumulate to an amount in excess of what is required to keep up the circulation. This excess contains a quantity of cold which is rendered useful by being drawn off very slowly through a pipe embedded in the envelope, so that it shall emerge and run off as waste at a temperature but slightly below that of the external source of heat. The quantity run off in a given time should be as nearly as possible equal to the ice melted in the same time. If a deliquescent salt be used instead of ice similar rules will apply, with this difference, that instead of the melting being in proportion to the strength of the resulting brine it is in proportion to its weakness, pure water giving the maximum degree of cold, and the result being diminished by an excess of either salt or liquid.

Where the cold is applied for the preservation of meat or other perishable article, it is desirable to subject the air to a process of drying and purification. This I accomplish by a self-acting process of respiration. A pipe, communicating with an air space at the bottom of the chamber, rises through the protecting envelope, becoming slightly heated as it ascends, thus establishing a current. The pipe passes into a small apparatus consisting of three chambers, the first of which contains broken pieces of chloride of calcium, the second concentrated sulphuric acid, and the third a freezing mixture of ice and salt, or of crystallized chloride of calcium and water. The air thus dried, purified and cooled, descends through another tube into the meat chamber. This process is self-acting, the only attention required being the renewal of the substances in the three chambers, when they have become saturated or ineffective. An enlargement of either tube at entering or leaving this apparatus is loosely plugged with cotton wool, that, according to Dr. Tyndall, being the best arrester of germs and other impurities. The air within the meat chamber is thus kept dry and pure, without any loss of heat.

Having thus described and ascertained the nature of my invention and the manner in which it is to be performed, and having given a concise description of the principles of the various processes, so that the details of their application to special purposes may be worked out by any intelligent expert, I have to state that I claim—

First.—The forms of boiler and condenser.

Second.—The valves.

Third.—The stuffing boxes.

Fourth.—The trap valve.

Fifth.—The arrangement for getting rid of any air that may have leaked into the apparatus, substantially as described.

Sixth.—The employment of a subsidiary boiler, wherein the evaporating fluid is purified without any stoppage of the works, as described.

Seventh.—The cooling of the liquified vapour or gas in a separate vessel, and employing it in a jet for the condensation of vapour within the condensing chamber.

Improvements in Cooling, by the evaporation of volatile liquids, &c.

- Eighth.—The use of mixtures of evaporating liquids in such proportions described, as that they will evaporate without leaving a residuc.
- Ninth.—The use of crystallized chloride of calcium or other deliquescent salt and of a stream of water, passing in opposite directions, as described, for the production of a brine of intense coldness.
- Tenth.—The arrangement described for utilizing the cold remaining in the brine for the purpose of cooling fresh supplies of the salt and water.
- Eleventh.—The use of pipes with central solid core, so as to diminish the quantity of contained liquid and increase relatively the extent of cooling surface.
- Twelfth.—The arrangement for evaporating the brine and recovering the solid salt, substantially as described.
- Thirteenth.—The making of ice by the accretion of thin films of water flowing over surfaces exposed to the radiating surface of a boiler or other surface, over which a stream of cold brine is kept flowing.
- Fourteenth.—The use over again of brine which has not been deprived of the whole of its refrigerating power, by raising it on endless webs passing over rollers, as described.
- Fifteenth.—The perforated pipes or troughs with cloth coverings and serrated depending edging, as described.
- Sixteenth.—The application of the previously described processes to the cooling of worts or other liquids, as described.
- Seventeenth.—The arrangement for the maintenance of an equably cold temperature in enclosed chambers, by streams of cold brine flowing over the interior surface without tubes, as described.
- Eighteenth.—The arrangement of two sheets of metal or other waterproof material with blanketing or other porous substance (sandwich fashion) between, to insure a regular and diffused flow of brine downward.
- Nineteenth.—The application of a mixture of ice and salt, and of ice over which a stream of brine is kept flowing, to the maintenance of a low temperature for any required space of time, the temperature being regulated as described.
- Twentieth.—The mode of perpetually renewing the purity and dryness of the air in any enclosed space by the process of self-acting respiration described, a process applicable to other purposes than that stated.

This is the specification, marked A, referred to in the annexed Letters of Registration granted to James Harrison, this twenty-first day of November, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 27 September, 1873.

SIR,
The application of Mr. James Harrison for Letters of Registration for "Improvements in Cooling, by the evaporation of volatile liquids, and by the solution of salts in the apparatus and processes for the manufacture of ice, and in the application of ice and cold solutions to the regulation of temperature," having been referred to us, we have examined the specifications and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

[Drawings--two sheets.]

Figure 1. Annular boiler referred to in first claim.

AA, section of the annulus; B, outside of annulus at partition; a being the aperture for the return-pipe conveying liquid, and b being the pipe through which the vapour is withdrawn; d is the partition or division between the return and exhaust sides of the boiler; cc is a perforated pipe (as shown in figure 12) for supplying brine; ee, a prolongation *ad lib.* of brine surface.

Figure 3. Section of condenser referred to in first and second claims.

C, condensing chamber; f, being the jet; g, the vapour pipe; h, the pipe for outflow of liquid leading to subsidiary cooler D, with perforated pipe c, for supply of condensing water; h², leading to the pump j, and to reservoir i, the pipe k carrying off the supply of volatile liquid to the boiler.

Figure 5. Section of spherical valve for horizontal vapour-pump referred to in second claim.

F, spherical valve running on grooved inclined plane or curve; mm, end plate of pump-cylinder; n, valve-seat; g, vapour-pipe leading to condenser. The slide and self-acting valves referred to are of the ordinary description, their combination only being claimed.

Figure 6. Section of stuffing-box referred to in third claim.

G, interspace in stuffing-box; o, pipe leading from one box to another or to a lubricator, but this is not essential. The vacancy is provided for by a hollow ring or X-shaped ring.

Figure 9. Section of subsidiary boiler for purifying volatile liquids referred to in sixth claim.

J, subsidiary boiler surrounded with water or brine. A, refrigerating boiler, a¹, the tube through which the impure liquid runs into J; a², the tube by which the pure vapour returns into A; a³, the tube by which the impurities are drawn off; x¹ x², tubes by which the brine or water enters and overflows and is drawn off.

Figure 2. Sections of coil-boilers referred to in first claim.

A¹A¹ section of boiler with tapering tubes or with tubes of small uniform diameter below connected with tubes of large diameter above; A²A² section of tubes of equal diameter with central core, as shown in figure 13. These pipes are either straight or curved, so as to form a wall, a square, or a circle, as required. aa, bb, cc, and ee, as in figure 1.

Figure 4. Section of surface condenser referred to in first claim.

EE, tubes through which the vapour passes, covered with interwoven strings or strips of open textile fabric to diffuse the descending film of cold water, c being the perforated supply pipe. E², tube similarly covered, through which the liquid passes to undergo a further cooling. g, vapour pipe, k, pipe returning liquid to boiler, and l, pipe leading to air-escape, figure 8. The fans or blowers are of ordinary description, no special form being claimed.

Figure 7. Section of trap-valve referred to in fourth claim.

H, valve-chest; p¹, pipe bringing liquid from the condenser; p², pipe leading to the boiler; v, valve; w, weight poised, so that when the valve-chest is full of liquid the valve descends, and when filled with vapour the weight lifts the valve to its place.

Figure 8. Section of air-escape referred to in fifth claim.

I, liquid-trap; r, pipe leading from condenser, bringing air mixed with vapour; ss, alternate partitions dipping into and rising above the liquid or substance in which the volatile liquid is soluble; t, pipe leading to chimney.

Figure 12. Section of pipe and trough used for regulating the flow of liquids referred to in fifteenth claim.

K¹ is the trough, the wavy line representing an absorbent textile fabric such as flannel. K², a pipe with a slit along the top in which a textile fabric is inserted. K³, a perforated pipe covered with canvas to prevent the too rapid dispersion of the contained liquid.

Figure 13. Section of pipe with central solid core, which may be of any solid not acted on by the contents, in order to diminish the area relatively to the surface referred to in eleventh claim.

L, the pipe with its core, upon which there are projections to keep it equidistant from the surface of tube. The core may also be a pipe closed at the ends.

(Sig.1)

This is the sheet of drawings, marked B, referred to in the annexed Letters of Registration granted to James Harrison, this twenty-first day of November, 1873.

HERCULES ROBINSON.

Figure 10. Section of refrigerators referred to in the ninth, tenth, twelfth, and thirteenth claims.

Aa, an oblong receptacle equal in length to its height, for deliquescent salt fed in at the hopper h¹.
 aa, pipes through which cold water is conveyed to the lower part of A.
 bb, apertures through which the brine of the deliquescent salt flows down, cc.
 cc (waved line), network or textile covers, down which the brine flows.
 dd, strips of sheet metal, boarding, or canvas, down which the pure water to be frozen flows. These strips to be removed when covered with the required thickness of ice.
 ee, pans into which the unfrozen water drops, the surplus of which flows into a receptacle (not shown), whence it is pumped up to be again passed over nn. These pans rest on the floor of the chamber, which is flooded with the surplus brine from A, and a portion of the water in the pans is thus frozen simultaneously with the films on dd.
 ff, endless webs of blanketing, or other absorbent fabric, passing over rollers, t¹t¹ and t²t²; the upper rollers, t¹t¹, are kept in revolution by any ordinary gearing.
 gg, pipes through which the surplus brine is pumped to cool the fresh supplies of crystals and water.
 ii, plates (for which a framework of tubes may be substituted) through which a moiety of the surplus brine passes to cool the fresh crystals fed into the hopper h², the cooled crystals being drawn out at l, thence to be shovelled into h¹.
 kk, framework of tubes through which a moiety of the surplus brine passes, cooling a descending film of water, which is afterwards conveyed through the pipe a into A. The arrangement under the thirteenth and fourteenth claims, where other cooling surfaces than the vessel A are employed, is substantially the same.

PLAN OF EVAPORATOR AND CRYSTALLIZER.

B, shallow evaporating-pan, with furnace-flues below corresponding with the divisions mm, between which the spent brine, after doing its work in ii and kk, flows, entering at n, and passing to the cooling and crystallizing pan C, at n², the flow into which is so regulated that the contents, when drawn off, shall be of such specific gravity as to crystallize without residue. Cold water is kept flowing in corresponding divisions below C. The crystals are removed as formed, and conveyed to h².

Figure 14. Section of hold of ship (applicable to other enclosed spaces) fitted up for the regulation of temperature referred to in seventeenth, eighteenth, and nineteenth claims.

A, lower hold to be filled with meat or other cargo requiring to be refrigerated; aa, space filled with ground bark, sawdust, packages of tallow or other material of low conducting power; bb, double iron or other waterproof skin, between which cooled brine flows from the perforated tubes cc. The ice and salt or other refrigerant is supplied to the bottom of the hold through the well e; the store of ice is kept between decks, f, and the upper deck is protected by a covering of low conducting power. The brine is pumped from the lower part of the double skin, thence delivered into the perforated tubes cc, and thus kept in perpetual flow between the plates of the lining. The pumping apparatus is between

decks, either fore or aft of the ice store. The brine may be allowed to flow over the floor of the ice chamber before being passed into the perforated tubes, in which case the well e is dispensed with.

The tubes g¹g², and vessel h, constitute a self-acting respiratory apparatus referred to in claim 20. The tube g¹ passes up through the relatively warm envelope of the cold chamber, and leads to the vessel h, which contains sulphuric acid, chloride of calcium, or other desiccant germ-destroying and refrigerating material, the air descending by the colder pipe g². B, enlarged section of double skin with enclosed absorbent cloth.

Figure 11. Spiral arrangements for the cooling of worts referred to in sixteenth claim.

The refrigerator may be of any of the ordinary forms such as A, but with solid core tubes, the cooling water, brine, or vapour being passed through the interspace between the core and the outer tube.

B is a section of a single tube attemperator, suitable for insertion in the bung-hole of a cask suitable for cooling any contained liquid. The ice or refrigerant salt is filled in at h, and the cold solution after having done its work, flows out at o. The only attention it requires is keeping up the supply of the ice or salt.

This is the sheet of drawings, marked C, referred to in the annexed Letters of Registration granted to James Harrison, this twenty-first day of November, 1873.

A.D. 1873, 21st November. No. 386.

IMPROVEMENTS IN THE MANUFACTURE OF GLASS BOTTLES, AND IN APPARATUS EMPLOYED THEREIN.

LETTERS OF REGISTRATION to Hiram Codd, for Improvements in the manufacture of Glass Bottles, and in Apparatus employed therein.

[Registered on the 22nd day of November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HIRAM CODD, of Grove-lane, Camberwell, in the County of Surrey, England, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in the manufacture of Glass Bottles, and in Apparatus employed therein," which is more particularly described in the specification and sheet of drawings which are hereto annexed ; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four ; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years : And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Hiram Codd, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof ; to have, hold, and exercise unto the said Hiram Codd, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended : Provided always, that if the said Hiram Codd shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in the manufacture of Glass Bottles, and

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN : Be it known that I, HIRAM CODD, of Grove-lane, Camberwell, in the County of Surrey, England, am in possession of an invention for Improvements in the manufacture of Glass Bottles, and in Apparatus employed therein; and I, the said Hiram Codd, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say:—

Heretofore, in the manufacture of glass bottles, when each bottle has been formed by blowing out a bubble of glass into a mould of the shape of the bottle to be produced, such bottle after it has been removed from the mould has required to have the ring or head subsequently formed upon the top of the neck. According to my invention, I form the ring or head upon the top of the neck before removing the bottle from the mould in which it has been blown.

For this purpose I mount the mould in such manner that it is capable of being revolved; and after the mould has been closed upon a bubble of glass, and the bubble has been expanded into it by blowing in the ordinary manner, the bubble outside the neck is burst, or broken off, and a mould suitable for shaping the exterior and interior of the head is then brought over the top of the mould in which the bubble has been expanded. This mould is then revolved, in order to prevent the bottle from collapsing, and to enable glass to be gathered into the mould in which the head is to be shaped. When the head has been properly formed, the revolving of the mould is arrested, and the mould is opened, and the finished bottle quickly removed from it.

Figure 1 shows a side view, and figure 2 a front view of apparatus for constructing bottles in the manner above described. Figures 3 and 4 are plan views of parts of the same. *a* is the mould into which the bottle is blown; it is made in two parts, hinged together at *a'*; one half of the mould is secured to a table, *b*, mounted on a vertical axis, *c*, with which the axis of the mould is made to coincide; the vertical axis *c* is driven by bevel friction gear, *d*, but can be prevented from revolving by a catch, *e*. The mould for shaping the head is in two parts, *f* and *g*, each capable of sliding along an arm, *h*, which stands out from a boss capable of moving up or down, and around a fixed axis, *k*; to this boss is also jointed an arm, *l*, which carries two inclined projections, *mm*, which pass between pins on the two parts *f* and *g*, so that by raising or lowering the arm *l* the parts *f* and *g* can be moved towards or from one another. The operation of forming a bottle is as follows:—A bubble is first blown at the end of a blow-pipe, and roughly moulded to the desired form, and it is then enclosed in the mould *a*, whilst the mould is held from revolving by the catch *e*, as shown at figure 1; the two parts of the mould *a* are then held together at the top by two pieces, *mm*, which embrace the upper parts of the mould *a*, and also form the mould for the upper part of the neck of the bottle; the mould is also kept closed by a spring stop, *o*, being turned upwards to support its movable portion, as shown, the stop itself being held in this position by a spring acting upon a flat surface at its lower end. When the bubble has been blown out so as to expand it into the mould, the end of the blow-pipe is slightly raised away from the mould, by which the small amount of glass between itself and the mould is attenuated, and is blown out into a thin bubble until it bursts, or is broken, as shown at figure 5; the two parts *mm* are then turned aside, as shown at figure 4, and the mould for shaping the head is brought over and down on to the top of the mould *a*, by the handle *l* being pressed down, at the same time the catch *e* is released, and the mould containing the bottle is allowed to revolve; the workman then takes a rod with a small quantity of glass or "metal" upon its end, and touches with it the top of the revolving bottle; the metal is then, by the revolution of the bottle, drawn away from the rod, and gathered into the mould for shaping the head, until the head has been completely formed; the gathering in of the metal is then stopped, and after allowing the bottle to revolve for a short time its movement is arrested, the lever handle *l* is lifted, and the mould by which the head has been shaped is thus opened, and raised up so as to be clear of the bottle; it can then be turned aside, to be out of the way, and is held in its raised position by a cord and counterbalance weight, as shown; one side of the mould is then turned down into a horizontal position, carrying the bottle with it, and the bottle is at once lifted out therefrom by a wire, and is carried away thereon to be annealed; the mould is then ready for another bottle to be blown in it, and the same operation is repeated. In place of the mould being mounted upon a vertical spindle, as in the apparatus just described, it may be mounted upon a horizontal spindle, as shown at figures 6 and 7. In this case the whole of the mould *a* is made capable of being turned upwards, upon a joint, *a'*, so that the mould may be retained in a vertical position when a bottle is being blown in it, the two parts of the mould being at this time held together by two pieces, such as *mm*, but which are not shown in this drawing. When a bottle has been blown into the mould and a bubble blown upon it and burst, as before described, the pieces *mm* are turned aside, and the whole of the mould is turned downwards in a horizontal position, and at once caused to revolve by shifting the band *p* from the loose to the fast pulley on the spindle *c*; the tool for forming the head, which is not shown in the drawing, but which is carried by the slide *x*, is then moved up to the mould *a*, and the head is formed in the manner before described. The mould for shaping the head, which I have shown at figures 1 and 2, is constructed in such manner as to form a groove around the interior of each head, as well as to shape the exterior of the head; but when making ordinary bottles, without any groove around the head, the mould for shaping the head may be formed in a similar manner to the tongs ordinarily used for shaping the head of a bottle. By the apparatus hereinbefore described, not only is the making of bottles greatly facilitated, but all the bottles will be made of one uniform size. The making glass bottles with heads of large dimensions, such as pickle jars, and the like, or the forming of the heads of glass bottles of large size, such as those used for containing acids, is also greatly facilitated.

Having thus described the nature of the invention, and the manner of performing the same, I would have it understood that I claim—

1. The manufacture of glass bottles, substantially as herein described, the head being formed upon the bottle before withdrawing it from the mould in which it has been blown.

in Apparatus employed therein.

2. Mounting upon spindles the moulds in which glass bottles are blown, so that the moulds and bottles may be revolved during the time the head is being formed.
3. The combined arrangements of apparatus, substantially as herein described, for manufacturing of glass bottles.

In witness whereof, I, the said Hiram Codd, have hereunto set my hand and seal, this eleventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

H. CODD. (J.S.)

This is the specification referred to in the annexed Letters of Registration granted to Hiram Codd, this twenty-first day of November, 1873.

IMPROVEMENTS IN BOTTLES FOR CONTAINING AERATED LIQUIDS, &c.

LETTERS OF REGISTRATION to Hiram Codd, for Improvements in Bottles for containing Aerated Liquids, and in Apparatus for making and filling such Bottles.

[Registered on the 22nd day of November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS HIRAM CODD, of Grove-lane, Camberwell, in the county of Surrey, England, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention for "Improvements in Bottles for containing Aerated Liquids, and in Apparatus for making and filling such Bottles," which is more particularly described in the specification, marked A, and the two sheets of drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Hiram Codd, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Hiram Codd, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Hiram Codd shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have herunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-first day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Bottles for containing Aerated Liquids, &c.

A.

SPECIFICATION.

TO ALL TO WHOM IT MAY CONCERN, Be it known that I, HIRAM CODD, of Grove-lane, Camberwell, in the county of Surrey, England, am in possession of an invention for "Improvements in Bottles for containing Aerated Liquids, and in Apparatus for making and filling such Bottles"; and I, the said Hiram Codd, do hereby declare the nature of the said invention, and in what manner the same is to be performed, to be particularly described and ascertained in and by the following statement thereof, that is to say—

THIS invention consists, firstly, in constructing bottles for containing effervescing wines and other aerated or gaseous liquids in such a manner that the bottle when filled is closed by a glass ball, held by the pressure within the bottle against a ring of elastic material placed around the interior of the mouth; secondly, in forming the interior diameter of the mouth of the bottle, above such ring or seat of elastic material, of smaller diameter than the ball, so that however great may be the pressure within the bottle the ball cannot be forced through the ring of elastic material; thirdly, in contracting the lower part of the neck of the bottle to prevent the stopper from dropping into the lower part of the bottle; and fourthly, in forming contractions in the sides of the neck, or otherwise forming the neck in such a manner as to impede the stopper from moving up to the mouth of the bottle during the time that the contents are being poured out. The invention also consists in the construction of tools for shaping the heads of such bottles.

Figure 1 shows a side elevation, partly in section, and figure 2 shows an opposite side elevation of a bottle constructed according to my invention. The bottle in these figures is shown to have been opened and inverted for the purpose of pouring out its contents. Figure 3 shows a side elevation, partly in section, of the bottle when closed. In these figures *a* is the glass-ball stopper; *b*, a ring of elastic material, against which the ball is held by the pressure within the bottle; *c* is a groove formed around the mouth of the bottle to receive the elastic ring *b*. It will be seen that the internal diameter of the mouth of the bottle is smaller than the diameter of the mouth below the groove, and also smaller than the diameter of the ball *a*, so that the ball cannot be forced out through the mouth. In order to construct such a bottle, a tool, shown at figures 4, is employed. This tool is similar to the ordinary tongs heretofore used for moulding the heads of glass bottles, in so far as regards the parts required for shaping the exterior of the head; but in addition to each arm or limb of the tongs, carrying at its ends half-moulds for shaping the exterior of the head, as heretofore, they also carry pieces, *dd*, for shaping its interior. These parts are drawn together when the tongs are opened, so that they can readily enter the neck of a bottle and move apart when the tongs are closed, and they then come into position for shaping the interior of the head, as shown in the drawing. The projections *e* on the pieces *d* form a groove around the interior of the head, whilst, at the same time, the top of the head, above where the groove is formed, is contracted so as to bring it to a less internal diameter than the lower part of the head below the groove. Another way in which the tongs for shaping the head of the bottle may be formed is shown at figure 5. In this case the pieces *dd*, for shaping the interior of the head, in place of being carried by the ends of the tongs, are carried by jointed levers, *d**, carried by the limbs or arms of the tongs, as shown. The bottle is formed in the following manner:—A bubble of glass is first blown, and is roughly reduced to the desired form by rolling and pressing it upon a stone; the roughly shaped bubble is then enclosed in a mould of the form desired, and the bottle is blown therein in the ordinary manner. When the bottle has been removed from the mould, a glass marble, previously heated, is dropped into the bottle through the neck; the ring or head is then formed at the top of the neck in the ordinary manner, by means of the tool above described. After the bottle has been allowed to cool, a ring of cork or other elastic material, as, for example, of vulcanized india-rubber, is inserted into the groove formed around the interior of the head, and the bottle is ready for filling with an effervescing or aerated liquid; the pressure of gas within the bottle will then hold the glass stopper against the elastic ring, and a perfect closing of the bottle will be instantaneously effected. To open a bottle which is closed in this manner, it is only necessary to press back the ball away from its seat; the ball may then either be allowed to drop to the bottom of the bottle, or if the bottle is formed as shown at figures 1 and 2, with the lower part of the neck contracted at *f*, the ball may simply drop to the lower part of the neck. It will be seen from the drawings that the lower part of the neck is contracted from two sides only, so that the passage between the interior of the bottle and the neck can never be closed by the ball-stopper, and therefore no difficulty will be experienced in filling the bottle.

In order also to prevent the ball-stopper from rolling back to its seat as the contents of the bottle are being poured out, contractions, *g g*, are formed down two opposite sides of the neck of the bottle. The forming the contractions *f* and *g* in the neck of the bottle is effected by making the mould in which the bottles are blown of a suitable form to produce the contractions. By forming the contractions *g* down the sides of the neck of the bottle, the ball-stopper, when pressed back from its seat, will fall down in the direction shown by the arrows on one side of these contractions, until it is arrested by the contraction *f*; then, if the bottle be inclined to pour out the contents, the ball will come on the opposite side of the contractions, and will by them be impeded from rolling back to the mouth of the bottle. Another way of forming internal projections in the neck of the bottle to prevent the ball rolling back to its seat when the contents of the bottle are being poured out is shown at figures 6. In this case four short projections are formed at the points *g*. The ball, as it drops from its seat, falls between these projections until it is arrested by the contraction *f*; then, if the bottle be inclined to pour out its contents, the ball will rest in one or other of the semi-circular recesses *h* which are formed at the lower part of the neck, and will be impeded by the projections *g* from rolling back to its seat, or the semi-circular recesses *h* might be used for this purpose, as shown at figures 7, without forming the projections *g*.

Internal projections, *g*, may also be formed in the neck of the bottle in the manner shown at figures 8. In this case the lower part of the internal projections are curved, so that when the ball has fallen from its seat, and has been arrested by the contraction *f*, and when the bottle is inclined to pour out its contents, the ball drops into the position shown by the drawing, and remains there whilst the contents are being poured out. In this case the contents of the bottle, as they are being poured out, pass below the ball-stopper, in place of flowing over it, as in the other arrangements. Similar contractions may also be made

in

Improvements in Bottles for containing Aerated Liquids, &c.

in the necks of bottles which are fitted with internal stoppers, carrying an elastic ring or cap to fit against a seat formed near the mouth of the bottle. Figure 9 shows a bottle fitted with a stopper of this kind, and formed with contractions, *f* and *g*, in the neck, as in the bottle shown at figures 1 and 2. When the stopper is pressed back from its seat, it drops down on one side of the contractions *g* until it is arrested by the contraction *f*; and when the bottle is inclined to pour out its contents, the elastic head or cap, *k*, of the stopper is caught between the contractions *g*, and is prevented from moving back to the mouth of the bottle.

In addition to deriving this advantage from forming the contractions *f* and *g* in the neck of a bottle, when such a stopper is used, a much smaller stopper may be employed than heretofore when the stopper was allowed to drop down into the bottle, as in this case the stopper had to be formed of a length greater than the internal diameter, so that it could not turn over in the bottle; whereas by forming the contraction *f* at the lower part of the neck, the stopper is retained in the neck, and consequently a much shorter stopper can be used.

In order to fill bottles which are closed by stoppers in the manner above described with aerated liquids, as, for example, with soda-water, I employ an arrangement of apparatus such as shown at figures 10, 11, and 12. Figure 10 shows a front view, and figures 11 and 12 show end views of the apparatus. *a* is a nipple, up to which the mouth of the bottle to be filled is held in the ordinary manner; the nipple *a* is carried on a hollow axis, *c*, mounted in bearings, *d*, so that after a bottle has been filled it may be inverted into the position shown at figure 11 before removing it from the nipple. This allows the stopper to fall to the mouth of the bottle, so that immediately the bottle is removed from the nipple the stopper closes the mouth. On one end of the axis is a lever arm with a balance weight, *e*, upon it, and the opposite end is fitted by a stuffing-box to a pipe, *f*, through which aerated liquid is supplied to the hollow axis. *g* is a screw stop-cock on the pipe *f*, to shut off the supply of liquid to the hollow axis after a bottle has been filled. Projecting from the axis *c* are also two arms, *k*, one on either side of the nipple, and upon these slides a plate, *k'*, which carries a cap for the bottom of the bottle to rest in whilst the bottle is being filled. The plate *k* can be pressed up to the nipple by turning the eccentric *b* by its handle *b'*. When a bottle has been filled and inverted into the position shown at figure 10, the eccentric is turned into a position to allow of the bottle being removed; the apparatus is then again brought into the position shown at figures 10 and 12, to be ready for filling another bottle.

Having thus described the nature of my invention, I would state that I claim—

1. The construction of bottles for containing effervescing wines and other aerated or gaseous liquids, in such a manner that the bottle when filled is closed by a glass ball, held by the pressure within against a ring of elastic material placed around the interior of the mouth.
2. Forming the interior diameter of the mouth of such bottles above the ring of elastic material of smaller diameter than the ball, so that the ball cannot escape from the bottle.
3. Contracting the lower part of the neck of bottles fitted with internal stoppers, to prevent the stopper dropping into the lower part of the bottle.
4. Forming contractions in the sides of the neck, or otherwise forming impediments in the neck, to prevent the stopper moving up to the mouth of the bottle during the time that the contents are being poured out.
5. The combined arrangement of apparatus for filling internally stoppered bottles with aerated liquids.
6. The construction of tools for shaping the heads of bottles to be closed by ball-stoppers, substantially as herein described.

In witness whereof, I, the said Hiram Codd, have hereunto set my hand and seal, this eleventh day of July, in the year of our Lord one thousand eight hundred and seventy-three.

H. CODD. (L.S.)

This is the specification, marked A, referred to in the annexed Letters of Registration, granted to Hiram Codd, this twenty-first day of November, 1873.

A.D. 1873, 24th November. No. 388.

MACHINE FOR LAMINATING AND CRUSHING BARK.

LETTERS OF REGISTRATION to John Thomas Stamp, for a Machine for laminating and crushing Bark.

[Registered on the 26th day of November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of St. Michael and St. George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS JOHN THOMAS STAMP, of Melbourne, in the Colony of Victoria, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of a "Machine for laminating and crushing Bark," which said invention is more particularly described in the specification, marked A, and the two sheets of drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said John Thomas Stamp, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said John Thomas Stamp, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said John Thomas Stamp shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-fourth day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Machine for laminating and crushing Bark.

A.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, JOHN THOMAS STAMP, of Melbourne, in the Colony of Victoria, send greeting :

WHEREAS I am desirous of obtaining Letters of Registration for securing unto me Her Majesty's special license that I, my executors, administrators, and assigns, or such others as I or they should at any time agree with, and no others, should and lawfully might, from time to time, and at all times during the term of fourteen years (to be computed from the day on which this instrument is left at the office of the Colonial Secretary, at Sydney), make, use, exercise, and vend within the Colony of New South Wales an invention of a Machine for laminating and crushing Bark; and in order to obtain the said Letters of Registration I must, by an instrument under my hand and seal, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed: Now know ye that I, the said John Thomas Stamp, do hereby declare the nature of the said invention, and the manner in which the same is to be performed, to be particularly described and ascertained in and by the following statement (that is to say): My invention is for a machine for the laminating and crushing of bark by direct percussion, whilst it is being driven freely towards the periphery of the mill by the centrifugal action set up in the interior of the mill. The utility of this invention consists in obtaining a greatly increased result from the same expenditure of power as in an ordinary bark mill. I will now proceed to describe the machine for so doing, reference being had to two sheets of drawings annexed hereto, and numbered 1 and 2. Figure 1 is a side elevation, partly in section, showing the general arrangement. Figures 2 and 3 show sections of pulley boss and bearings. Figure 4 is an end elevation with part of casing removed, to show the cages and bars. A is the casing open at the side, to allow the bark to enter the centre of the mill by the hopper B; C is a wrought-iron disc attached by bolts to the pulley boss D, which revolves on the shaft F. The boss D has adjustable bearings (by preference filled with patent metal); these bearings are acted on by the screws *d d d*, which are kept tight by jam nuts; by this means the disc C can always be kept running true. The interior of the boss D is hollowed out to hold a supply of oil, which is kept in by the plates and washers of leather E E. The shaft F, on which is keyed the pulley G, is carried in two bracket bearings, H H. The disc C is 3 feet outside diameter, and carries on it three sets of wrought-iron or steel bars, placed concentrically to form cages. These bars are fastened to the disc by two nuts, to allow of easy replacement, and are shanked and riveted over on outer rings, C1, C2, C3, or they can be riveted at both ends. Cage C1 is thirty-four and three-quarter inches diameter, and contains sixty bars; cage C2 is twenty-seven and three-quarter inches diameter, and contains forty-three bars; cage C3 is twenty and three-quarter inches diameter, and contains twenty-nine bars; a wrought-iron disc, K, thirty-two and one-half inches diameter, carries the cages K1, K2, K3; cage K1 is thirty-one and one-quarter inches diameter, and contains fifty-four bars; cage K2 is twenty-four and one-quarter inches diameter, and contains thirty-eight bars; cage K3 is seventeen and one-quarter inches diameter, and contains twenty-one bars. The disc K is attached by the bars K3 to the cast-iron disc I, keyed on to the shaft F, and revolving with it. An iron bar, L, carried on bracket M, projects into the interior of the mill, and causes the bark to press against the inner cage, whence the centrifugal action is set up. The shaft F, together with the cages K1, K2, K3, revolve in one direction, at from five to six hundred revolutions per minute, and the pulley boss, together with the cages C1, C2, C3, revolve at the same speed, but in a contrary direction, so that the bark entering the centre and flying towards the periphery receives the blows from each set of bars in a contrary direction, and is laminated and crushed as required. The bark having previously been broken into short lengths by any ordinary process, enters the mill by the hopper B, and is delivered fit for use into the casing A. I do not confine myself to the number of bars or cages indicated in this specification, or to any particular number thereof, but what I claim as the novelty of this invention is the Machine for laminating and crushing Bark by direct percussion, whilst being driven freely toward the periphery of the machine, as herein described.

In witness whereof, I, the said John Thomas Stamp, have hereunto set my hand and seal, this third day of June, one thousand eight hundred and seventy-three.

JNO. T. STAMP. (l.s.)

This is the specification, marked A, referred to in the annexed Letters of Registration granted to John Thomas Stamp, this twenty-fourth day of November, 1873.

HERCULES ROBINSON.

REPORTS.

No. 3, Gresham-street,
Sydney, 11 June, 1873.

SIR,

We have the honor to return the Petition of Mr. John Thomas Stamp, forwarded to us with the accompanying specification and drawings, by your blank cover of the 9th instant, for Letters of Registration of an invention for laminating and crushing Bark, by direct percussion, &c.; and we now desire to state that, having considered the allegations set forth in the said Petition and specification, we are of opinion that the applicant should be required to amend the latter, so as to limit his claim to the machinery or appliances indicated in the drawings appended to the specification.

We have, &c.,

GOTHER K. MANN.
A. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

Sydney,

Machine for laminating and crushing Bark.

Sydney, 19 July, 1873.

SIR,

In returning to you the documents transmitted for our reconsideration, we do ourselves the honor to state that we are still of opinion that the Registration should not be granted unless the specification is amended, as suggested in our former Report. We do not think it necessary that the applicant should confine himself to the number of bars or cages indicated by his drawing, or to any number thereof; but we are of opinion that the Registration should be for the machinery, and not for laminating by direct percussion, which as a principle appears to us incapable of being patented.

We have, &c.,

GOTHER K. MANN.
E. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY.

WE are not aware of any objection to Letters of Registration being granted in accordance with the specification as now amended.

GOTHER K. MANN.
E. O. MORIARTY.

THE PRINCIPAL UNDER SECRETARY,
B.C., 10th October, 1873.

GLEDHILL'S PATENT AERATED WATER-BOTTLE AND STOPPER.

LETTERS OF REGISTRATION to George Gledhill, for an Invention or Improvement styled "Gledhill's Patent Aerated Water-bottle and Stopper."

[Registered on the 26th November, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS HENRY HURTLBURY STAITE, of Melbourne, in the Colony of Victoria, merchant, hath by his Petition humbly represented to me that he is the duly authorized attorney of George Gledhill, of Auckland, in the province of Auckland and Colony of New Zealand, who is the author or designer of a certain invention or improvement styled "Gledhill's Patent Aerated Water-bottle and Stopper," which is more particularly described in the specification, and the three sheets of drawings, marked A, B, and C, respectively, all of which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to the said George Gledhill for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said George Gledhill, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said George Gledhill, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said George Gledhill shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-fourth day of November, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Gledhill's Patent Aerated Water-bottle and Stopper.

This is the Specification referred to in the annexed Petition of Henry Hurtlebury Staite.—Dated the twenty-eighth day of July, 1873.

HENRY H. STAITE.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, GEORGE GLEDHILL, of the city of Auckland, in the Province of Auckland and Colony of New Zealand, Aerated Water Manufacturer, send greeting :

WHEREAS I am desirous of obtaining Royal Letters Patent for securing unto me Her Majesty's special license that I, my executors, administrators, and assigns, and such others as I or they should at any time agree with, and no others, should and lawfully might, from time to time, and at all times during the term of fourteen years, make, use, exercise, and vend within the Colony of New South Wales and its Dependencies, an invention for Improvements in the bottling of Aerated Waters, by dispensing with the corking and wiring thereof, to be called "Gledhill's Patent Aerated Water-bottle and Stopper"; and in order to obtain the said Letters Patent, I must, by an instrument in writing under my hand and seal, particularly describe and ascertain the nature of the said invention, and in what manner the same is to be performed, and must also enter into the covenant hereinafter contained: Now know ye, that the nature of the said invention, and the manner in which the same is to be performed, is particularly described and ascertained in and by the following statement (that is to say), my invention is particularly described and shown by the accompanying drawings and the following explanation of such drawings:—In sheet No. 1, figure No. 1 represents a perpendicular section of a full-sized bottling machine for filling these particular kind of bottles. DD are the handles of the machine, connected together at EE by means of two pins and two small plates, see figure 4. KL is a steel spring, fastened to one of the handles at M, by means of a screw. A is a round hole with a female thread in it, for the reception of one end of a small high-pressure tap, the other end being fastened to a flexible tube connected with a soda-water machine. CC is a passage for the aerated water to flow through into the bottle when filling. RR is a circular india-rubber washer for the neck of the bottle to rest against. JJ is a leather pad fastened to the bottom jaw of the machine, by means of a small screw, H, for the bottom of bottle, G, to rest upon. Figure 2, section line 7, represents a horizontal section of figure 1 along section line 6. Figure 3 represents a perpendicular section of the machine along section lines 2, 3, and horizontal section along section lines 4, 5, figure 1. Figure 4K represents the shape of two small plates which connect the two halves of the machine together at EE. Figure 1, Q, N is an iron pin for the machine to turn on one end, passing through a hole in the top of the machine at N, the other end being flattened out and screwed to a bench. O is a small washer on the end of the iron pin N. V is a small hole for receiving a pin to prevent the machine from slipping off. Sheet No. 2, figure No. 1, represents a perpendicular section of a full-sized bottling machine for filling these particular kind of bottles. DD are the handles of the machine, connected together at EE by means of two pins and two small plates (see figure 4). KL is a steel spring fastened to one of the handles of the machine at N by means of a screw. AA is a tap. B is a handle. OO is a stuffing-box metal. II is a stuffing-box for the tap plug to work through. CC is the passage by which the aerated water is admitted into the bottle when the tap plug AA is open. RR is a circular india-rubber washer with a hole in it for the neck of the bottle to rest against. JJ is a leather pad fastened to the bottom jaw of the machine by means of a small screw for the bottom of the bottle, G, to rest upon. Figure 1 continued—CC is the passage for the aerated water to flow through. XXXX is a continuation of XX, figure 1, with a washer, VV, screwed tight on to one end. WW is a stuffing-box metal. QQ is a stuffing-box. ZZZZ are four small lugs cast on the stuffing-box, for the purpose of fastening down to a bench or stand by means of four holes, VVVV. This is connected with a soda-water machine at T by means of a pipe; this figure is drawn horizontal, to show the position of the plugs. Figure 5 represents a perpendicular section of figure 1 continued along section line 8. Figure 2 represents a horizontal section of figure 1 along section line 6. Figure 3 represents a perpendicular section of the machine along section lines 2 and 3, and horizontal section along section lines 4 and 5, figure 1. Figure 4K represents the shape of two small plates which connect the two halves of the machine together at EE. Figure 6 represents a perpendicular section of a cone and socket for putting the stopper into the bottle. Place the bottle G inside the socket C so that the neck will rest against the leather padding BBB, close to the bottom of the cone A. Stand the bottle on a bench, place the stopper *f* into the wide end of the cone, the cover having been previously lubricated with soap and water, then take the tool, figure 8, which is made of either wood or iron, and drive the stopper through the cone A into the bottle by means of a few blows from a mallet. Figure 8 is a tool for driving the stopper through a cone into the bottle. CC is a leather washer to prevent the punch from injuring the cone. Figure 7 is a round piece of wood with a flat top for pushing down the stopper into the bottle when it requires emptying. Sheet No. 4, figure 1, represents a perpendicular section of an aerated water bottle with an india-rubber stopper, *f*, in its position when the bottle is full. DD forms the curved neck of the bottle made to fit the stopper *f*. BB each form the arc of a circle, for the stopper *f* to lodge in when emptying the bottle of its contents. Figure 2, section line 4, represents a horizontal section of the bottle and stopper along section line 4. Figures 3, 4, 5, represent horizontal sections of the bottle along section lines 1, 2, 3, respectively. My method of filling the bottle is as follows:—Supposing the machine to be connected with a soda-water machine as previously described, press the two handles DD together so as to open the jaw of the machine, then place the bottle G in position, as shown in the drawing; the stopper *f* will then be in the bottom of the bottle, section F. Turn on the tap which is fixed in the machine at A till the bottle is sufficiently full, then stop the tap. Take hold of the handle DD and turn the machine upside down so that the stopper will occupy position in neck of the bottle marked *f* in the drawing; now press the two handles DD together and take out the bottle while in this position, the stopper will then maintain its position, on account of the expansive force contained in the bottle; turn the machine right side up and repeat the operation.

Now what I particularly claim as my invention and as novel is the round india-rubber stopper which supplies the place of the cork as ordinarily used, and the improved shape of the neck of the bottle as shown in the drawings, which facilitates the easy and proper working of the india-rubber stopper; and

Gledhill's Patent Aerated Water-bottle and Stopper.

I do hereby, for myself, my heirs, executors, and administrators, covenant with Her Majesty, Her Heirs and Successors, that I believe the said invention to be a new invention as to the public use and exercise thereof, and that I do not know or believe that any other person than myself is the true and first inventor of the said invention, and that I will not deposit these presents at the office of the Chief Secretary with any such knowledge or belief as last aforesaid.

In witness whereof, I have hereunto set my hand, this twenty-eighth day of July, in the year of our Lord one thousand eight hundred and seventy-three.

GEORGE GLEDHILL.

By his Attorney,—

HENRY H. STAITE.

Witness to the signature of George Gledhill,

By his Attorney,—

HENRY H. STAITE,

ALFRED DE LISSA,

Solr., Sydney.

This is the specification referred to in the annexed Letters of Registration granted to George Gledhill, this twenty-fourth day of November, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 13 October, 1873.

SIR,

We have examined the specification of Mr. George Gledhill for an improved method of stoppering Bottles, and consider that there is sufficient originality in the invention to entitle him to Letters of Registration being granted for a period of fourteen years, and we therefore advise accordingly.

We have, &c.,

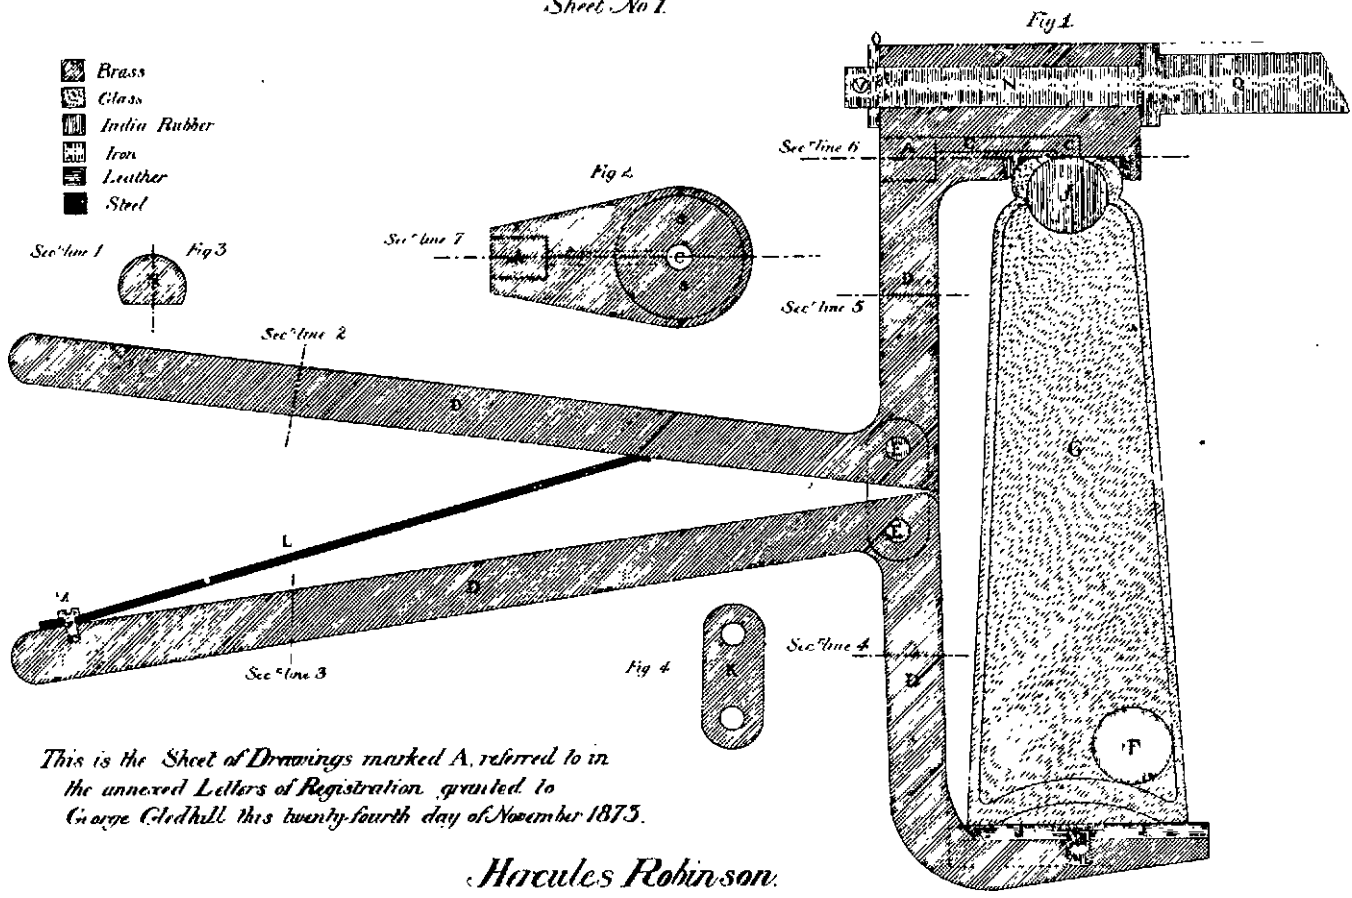

CHAS. WATT.

E. C. CRACKNELL.

**IMPROVEMENTS IN MACHINERY FOR WASHING AURIFEROUS OR
STANNIFEROUS DRIFTS, &c.**

LETTERS OF REGISTRATION to Benjamin R. Brown, for "Improvements in Machinery for washing auriferous or stanniferous drifts, &c.

[Registered on the 12th day of December, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting:

WHEREAS BENJAMIN ROGERS BROWN, of Sydney, in the Colony of New South Wales, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is to say, of an invention of "Improvements in Machinery for washing auriferous or stanniferous drifts, for concentrating sand or slime ores, and for separating pyrites and gold from crushed quartz," which said invention is more particularly described in the specification, marked A, and the two papers of drawings, marked B and C respectively, which are hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Benjamin Rogers Brown, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Benjamin Rogers Brown, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Benjamin Rogers Brown shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have hereunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this ninth day of December, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Improvements in Machinery for washing auriferous or stanniferous drifts, &c.

A.

SPECIFICATION of the Invention of BENJAMIN ROGERS BROWN.

This invention refers to Improvements in Machinery for washing auriferous or stanniferous drifts, for concentrating sand or slime ores, and for separating pyrites and gold from crushed quartz.

For this purpose I use pans of iron, or other suitable material, suspended from above or supported from below by springs, chains, rods, or other appliances, in such manner as to permit of the pans receiving a reciprocating motion in a longitudinal direction, which motion is derived from revolving shafts, by means of cranks or eccentric wheels and connecting rods. Each pan is formed with a bottom sloping downwards from the sides towards the middle, and along the middle of the pan a space is partitioned off, communicating with the other parts of the pan only by means of apertures situated close to the bottom. This central space is provided with another adjustable aperture, by means of which the concentrated material is discharged from the pan, at pleasure, into suitable receivers. The material to be concentrated is fed with water into the pan, near the middle, outside of each central partition, and is kept, by the motion of the pan, in such a state of suspension as to permit the various particles to arrange themselves in the pan according to their specific gravity, those of the greatest specific gravity falling to the bottom, and those having the least specific gravity remaining at the top. The water flowing into the pan is constantly discharged over the sides, carrying the lightest particles with it, whilst the heaviest particles pass through apertures at the bottom of the central partitions, and are discharged by themselves, at pleasure, by the adjustable apertures.

The accompanying drawings exhibit one form of this invention. Fig. 1 is a side elevation; fig. 2 is a plan; fig. 3 is an end elevation; fig. 4 is a cross section; and fig. 5 is a longitudinal section.

In these figures A represents a frame of wood, iron, or other suitable material. P represents the pan, suspended by chains, rods, bladesprings, or other suitable means, from the frame A, and deriving motion from the crank-shaft S, through the connecting rod C. The crank-shaft is furnished with a fly-wheel, W, and is caused to revolve by the belt pulleys B, or by other suitable means. EE represent the side edges of the pans over which the light waste material is discharged into the troughs or launders TT. DD represent the central partitions, with apertures, FF, near the bottom, which form the only communication with the central space G. H represents the adjustable aperture for discharge of concentrated material. The material to be concentrated is supplied to the pan by the troughs or launders II, from which it passes through the longitudinal distributing wells KK (which also serve to collect mercury, if any be present) and passing over the aprons MM falls into the pan at NN.

I do not limit myself to the exact details herein described, which are capable of modification to suit the various localities in which, or the various purposes for which the machine may be used.

I claim as my invention the peculiar arrangement and form of pan herein described, the central partitions with their apertures at bottom, the longitudinal central supply, and the side discharge of refuse material.

Sydney, 23rd October, 73.

BENJAMIN ROGERS BROWN.

This is the specification, marked A, referred to in the annexed Letters of Registration granted to Benjamin Rogers Brown, this ninth day of December, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 17 November, 1873.

SIR,

The application of Mr. Benjamin R. Brown for Letters of Registration for "Improvements in Machinery for washing auriferous or stanniferous drifts, &c.," having been referred to us, we have examined the specification and drawings accompanying the same, and have the honor to report that we see no objection to the issue of Letters of Registration for the machine as described and figured.

**INVENTION FOR IMPREGNATING OR AERATING MALT LIQUORS BY
CARBONIC ACID GAS.**

LETTERS OF REGISTRATION to Robert Henry Prendergast, for an Invention
for impregnating or aerating Malt Liquors by Carbonic Acid Gas.

[Registered on the 23rd day of December, 1873, in pursuance of the Act 16 Vic., No. 24.]

BY HIS EXCELLENCY SIR HERCULES GEORGE ROBERT ROBINSON, Knight Commander of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies, and Vice-Admiral of the same.

TO ALL TO WHOM THESE PRESENTS SHALL COME, greeting :

WHEREAS ROBERT HENRY PRENDERGAST, of the city of Sydney, in the Colony of New South Wales, brewer, hath by his Petition humbly represented to me that he is the author or designer of a certain invention or improvement in manufactures, that is say, of an invention for impregnating or aerating Malt Liquors by Carbonic Acid Gas, which is more particularly described in the specification which is hereunto annexed; and that he, the said Petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of Twenty Pounds sterling, for defraying the expense of granting these Letters of Registration, as required by the Act of Council, sixteenth Victoria, number twenty-four; and hath humbly prayed that I would be pleased to grant Letters of Registration, whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I, being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to the prayer of the said Petition, from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council, to grant, and do by these Letters of Registration grant unto the said Robert Henry Prendergast, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement, for and during the term of fourteen years from the date hereof; to have, hold, and exercise unto the said Robert Henry Prendergast, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof, for and during and unto the full end and term of fourteen years from the date of these presents next and immediately ensuing, and fully to be complete and ended: Provided always, that if the said Robert Henry Prendergast shall not, within three days after the granting of these Letters of Registration, register the same in the proper office in the Supreme Court, at Sydney, in the said Colony of New South Wales, then these Letters of Registration, and all advantages whatsoever hereby granted, shall cease and become void.

In witness whereof, I have herunto set my sign manual, and have caused the present Letters of Registration to be sealed with the seal of the said Colony of New South Wales, at Government House, Sydney, in New South Wales, this twenty-third day of December, in the year of our Lord one thousand eight hundred and seventy-three.

(L.S.)

HERCULES ROBINSON.

Invention for impregnating or aerating Malt Liquors by Carbonic Acid Gas.

SPECIFICATION.

TO ALL TO WHOM THESE PRESENTS SHALL COME, I, ROBERT HENRY PRENDERGAST, of Sydney, brewer, do hereby declare the nature of my invention, and the manner in which the same is to be performed.

THE machine used is similar to the one in use by aerated water manufacturers, with the addition of having all the internal parts thickly plated with silver.

The gas proposed to be used is the ordinary carbonic acid gas used in the manufacture of soda water, or the natural carbonic acid gas that is generated in brewery vats during the process of fermentation, thus impregnating the beer with its natural gas.

This gas will be collected by pumping it from the fermentating vats into a gasometer, where it will be stored for use.

First.—I claim charging fermenting liquors, as before stated, with carbonic acid gas.

Secondly.—I claim collecting gas during fermentation for the purpose above mentioned.

In witness whereof, I, the said Robert Henry Prendergast, have hereunto set my hand and seal, this thirteenth day of November, one thousand eight hundred and seventy-three.

ROBERT HENRY PRENDERGAST. (t.s.)

Witness to signature of Robert Henry Prendergast—

JNO. SAUNDERS.

—

This is the specification referred to in the annexed Letters of Registration granted to Robert Henry Prendergast, this twenty-third day of December, 1873.

HERCULES ROBINSON.

REPORT.

Sydney, 25 November, 1873.

SIR,

In the matter of the application of Mr. Robert H. Prendergast for Letters of Registration for an "Invention for impregnating or aerating Malt Liquors by Carbonic Acid Gas," which has been referred to us, we have the honor to report that we see no objection to the issue of Letters of Registration as prayed for.

We have, &c.,

J. SMITH.
CHAS. WATT.

THE PRINCIPAL UNDER SECRETARY.

1875.

NEW SOUTH WALES.

IMMIGRATION.

(REPORT FROM AGENT FOR 1874.)

Presented to Parliament by Command.

THE AGENT FOR IMMIGRATION TO THE PRINCIPAL UNDER SECRETARY.

Government Immigration Office,
Sydney, 2 March, 1875.

SIR,

I have the honor to submit, for the information of the Honorable the Colonial Secretary, my Report on Immigration for the year 1874.

2. The "British Commodore" was the last ship which arrived (on 24th April, 1873) under the Instructions given in 1870 by the Honorable the Colonial Secretary, granting free passages to single females, accompanied by a few married people, a portion of whose cost of passage was paid by themselves. A total of 653 single females were thus introduced in 1871, 1872, and 1873, thereby disposing of the unexpended balance from former Immigration votes of about £11,000, referred to in my communication of 18th February, 1870.

3. The existing "Regulations for the promotion of Immigration" on the principle of assisted passages, by the payment either in this Colony or in Great Britain of about one-third of the cost of passage money, came into operation on the 1st June, 1873.

4. Under these Regulations there have arrived during the past year four ships with immigrants, viz., the—

"Samuel Plimsoll," arrived February 1, 1874,
"Jerusalem," " June 22, 1874,
"Tyburnia," " October 5, 1874,
"Samuel Plimsoll," " December 16, 1874,

bringing 1,080 immigrants, 475 of whom were sent for by their relatives or friends resident in this Colony; the remainder, viz., 605 individuals, were selected by the Agent General. During the outward voyage of these several ships there occurred thirteen births and thirteen deaths, viz., one adult and twelve infants.

5. The immigrants by these ships were natives of—

England and Wales	524
Ireland	432
Scotland	108
Foreign Parts	6
Born on the voyage	10
Total	1,080

of whom were—

Male adults	427
Female adults	411
Children under 12 years of age	{ Male, 109 }		242
	{ Female, 133 }		
Total	1,080

6. The religious denominations of these immigrants were—

Protestants	721
Roman Catholics	359
Total	1,080

7. Their educational attainments, as compared with their native countries, were—

<i>From England and Wales.</i>					
Cannot read (9 born on voyage)	129	} 533
Read only	26

8. The disposal of the immigrants has been notified in my separate reports on the arrival of each vessel; by which reports it appears that of the 284 single women who arrived only sixty-three were willing to engage as domestic servants; the larger number, viz. 221, were received by their relatives and friends resident in the Colony. The average wages obtained by those who were hired at the Depôt was at the rate of £22 10s. per annum, with board and lodging. The greater proportion of the married people and of the single men immediately joined their friends, the remaining few readily found remunerative employment, viz.—married couples at from £60 to £70 per annum; single men at from £30 to £40 per annum, in both cases with board and lodging; carpenters and plasterers at from 30s. to 40s. per week, with board; masons and bricklayers at 10s. per day of eight hours.

9. The Collector of Customs has, as usual, furnished me with a return, by which it appears that, during the year 1874, the total number of individuals arrived in the Colony from the United Kingdom, irrespective of the assisted immigrants, has been 576, and the departures to the United Kingdom have numbered 605 individuals.

10. From the Report published by the Marine Department of the Board of Trade on Emigration from the United Kingdom for the year 1873 (that for 1874 is not yet published), the following information is obtained:—The total emigration from the United Kingdom during the past fifty-nine years has amounted to 7,871,897 persons, including 1,042,954 who have emigrated to the Australian Colonies and New Zealand. The average annual emigration from the United Kingdom for the ten years ending 1873 was 233,908 persons; but for the year 1873, the larger number of 310,612 emigrated, of which number 26,428 individuals emigrated to the Australian Colonies and New Zealand, of whom only 941 emigrated to New South Wales.

I have the honor to be,

Sir,

Your most obedient servant,

GEORGE F. WISE,

Agent for Immigration.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMMIGRATION.

(PETITION OF RESIDENTS OF ANVIL CREEK AND GRETA.)

Ordered by the Legislative Assembly to be printed, 4 June, 1875.

To the Honorable the Speaker of the Legislative Assembly of New South Wales.

The Petition of the undersigned residents of Greta, Anvil Creek, and the surrounding districts,—

HUMBLY SHOWETH :—

That as a community of working men, we view with regret and alarm the motion now before your Honorable House having for its object the introduction of a large number of immigrants to this Colony, at a very extensive expenditure of the public funds.

We protest against this expenditure, on the following grounds :—

- 1st. That for every person so introduced into this Colony we, as working men, have to pay in the shape of taxation a certain share of the cost attending their introduction.
- 2nd. That it is an established and acknowledged fact that at the present time there are thousands of men in this and the adjacent Colonies who are unable to find employment; and we most respectfully desire to record our opinion that it would be an act of gross injustice to the present colonists on the one hand, and to those who may be introduced as immigrants on the other, to offer inducements which cannot fail to end in disappointment to them and injury to us.

We beg most humbly, further, to pray and express our strong opinion against Chinese immigration, now being so extensively introduced into the neighbouring Colony of Queensland, and pray that your Honorable House will see fit to enact some law of capitation, or otherwise, in order to prevent the evils that must inevitably arise from this course being extended to the land of our adoption.

We pray that your Honorable House will take these promises into consideration, and grant the prayers of our petition, by refusing to accept the proposed immigration scheme, and by legislating against the introduction of Chinese labour.

And your Petitioners will ever pray, &c., &c., &c.

(Here follow 402 signatures).

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMMIGRATION.

(PETITION OF RESIDENTS OF LAMBTON, NEW LAMBTON, AND WARATAH.)

Ordered by the Legislative Assembly to be printed, 4 June, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned residents of Lambton, New Lambton, and Waratah,—
HUMBLY SHOWETH :—

That your Petitioners view with alarm the motion now before your Honorable House having for its object the introduction of a large number of immigrants to this Colony at a very extensive expenditure of the public funds.

Your Petitioners protest against this expenditure, on the following grounds :—

- 1st. That every person so introduced into this Colony your Petitioners have to pay in the shape of taxation a share of the cost attending their introduction.
- 2nd. That it is an established and acknowledged fact that at the present time there are thousands of men in this and the adjacent Colonies who are unable to find employment; and your Petitioners most respectfully desire to record an opinion that it would be an act of gross injustice to the present colonists on the one hand, and to those who may be induced to immigrate on the other hand, to offer inducements which cannot fail to end in disappointment to them and injury to the community in general.

Your Petitioners beg most humbly further to express their strong opinion against Chinese immigration, now being so extensively introduced into the neighbouring Colony of Queensland, and pray that your Honorable House will see fit to enact some law of capitation or otherwise, in order to prevent the evils that must inevitably arise from this course being extended to the land of our adoption.

Your Petitioners therefore pray that your Honorable House will take these premises into consideration and refuse to accept the proposed immigration scheme, and legislative against the introduction of Chinese labour into this Colony.

And your Petitioners, as in duty bound, will ever pray, &c.,

[Here follow 907 signatures.]

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMMIGRATION.

(PETITION AGAINST—RESIDENTS OF WALLSEND.)

Ordered by the Legislative Assembly to be printed, 14 June, 1875.

To the Honorable the Members of the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The Petition of the undersigned Inhabitants of Wallsend and the surrounding district,—

HUMBLY SHOWETH:—

That your Petitioners, having observed that a measure for promoting immigration to this Colony has been introduced in the Legislative Assembly, are of opinion that any such measure as the one proposed is exceedingly inopportune, and wholly uncalled for by the requirements of the Colony.

That a scheme of immigration such as the one proposed is, in the opinion of your Petitioners, calculated to import into the labour market of this Colony a redundancy of that element of which a surplus already exists, and thus have the effect of lowering the condition of the class who live by their labour, without any corresponding advantages being derived from an extension of colonial industries.

That until such time as the capitalists of this Colony are prepared to extend and sustain the manufacturing and other productive interests of the Colony generally, the introduction here of a large number of the wage-earning class from the Mother Country can only be attended with disastrous consequences to labour in particular and the Colony in general, more especially as the cost of these importations must be borne by the producers out of their contributions to the Revenue of the State, the burdens of which already press heavily upon the only partially employed labour of the Colony.

Your Petitioners, therefore, pray that your Honorable House will take the foregoing Petition into your favourable consideration.

And your Petitioners will ever pray, &c.

[Here follow 860 signatures.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMMIGRATION.

(PETITION AGAINST—INHABITANTS OF MINMI.)

Ordered by the Legislative Assembly to be printed, 19 July, 1875.

To the Honorable the Members of the Legislative Assembly of the Colony of New South Wales, in
Parliament assembled.

The Petition of the undersigned inhabitants of Minmi,—

HUMBLY SHOWETH :—

That your Petitioners having observed that a measure for promoting Immigration to this Colony has been introduced into the Legislative Assembly, are of opinion that any such measure as the one proposed is exceedingly inopportune and wholly uncalled for by the requirements of the Colony.

That a scheme of Immigration such as the one proposed is, in the opinion of your Petitioners, calculated to import into the labour market of this Colony a redundancy of that element of which a surplus already exists, and thus have the effect of lowering the condition of the class who live by their labour, without any corresponding advantage being derived from an extension of colonial industries.

That until such time as the capitalists of this Colony are prepared to extend and sustain the manufacturing and other productive interests of the Colony generally, the introduction here of a large number of the wage-earning class can only be attended with disastrous consequences to labour in particular and the Colony in general, more especially as the cost of these importations must be borne by the producers out of their contributions to the Revenue of the State, the burdens which press heavily upon the only partially employed labour of the Colony.

Your Petitioners therefore humbly pray that your Honorable House will take the foregoing Petition into your favourable consideration.

And your Petitioners will ever pray, &c.

[*Here follow 124 signatures*]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

AMOS DAVIS.

(PETITION FROM INHABITANTS OF WALLABADAH TO SECRETARY FOR PUBLIC WORKS.)

Ordered by the Legislative Assembly to be printed, 4 June, 1875.

To the Honorable John Sutherland, Minister for Works of the Colony of New South Wales.

The Petition of the undersigned Inhabitants of Wallabadah, in the Colony of New South Wales,—
HUMBLY SHOWETH:—

That your Petitioners are freeholders and householders residing in Wallabadah aforesaid, which is a township situated on the Great Northern Road, in the county of Buckland, Liverpool Plains, in the Colony aforesaid.

2. That having known Amos Davis as a contractor for Government for a number of years, and we, the undersigned, knowing him to be a persevering and straightforward man; also, having been at a great expense in purchasing plant to enable him to complete the several contracts previously granted him by the Government.

3. And for some cause unknown to us, he has not obtained any contracts of late from the Government, which has caused him, the aforesaid Amos Davis, a great amount of loss on account of having the said plant laying idle on his hands.

4. That if there is any cause which disqualifies him from obtaining Government contracts, we, the undersigned, do hereby pray that an investigation may be held, and a report made as to the cause thereof.

5. That your Petitioners are desirous, if the aforesaid Amos Davis be not disqualified, he may be permitted to obtain Government contracts as hitherto.

6. Your Petitioners, therefore, humbly prayeth that your Honor will remove the present cause for him not obtaining Government contracts for public works, if cause there be any.

And your Petitioners, as in duty bound, will ever pray, &c.

PETITION OF AMOS DAVIS.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 7th May, 1875,—“with power to send for persons and papers, to inquire into and report on certain allegations contained in a Petition from Amos Davis, which was presented to this House and ordered to be printed on the 11th November last,”—have agreed to the following Report:—

1. That after having examined the witnesses named in the List,* and carefully considered the Evidence, together with the documents appended thereto, your Committee have decided that Mr. Amos Davis has no claim against the Government. See List, page 8.

2. Under the circumstances revealed in the Evidence, your Committee are of opinion that the Commissioner for Roads was justified in refusing to entertain any application from Mr. Amos Davis for any further work until such time as his differences with the Roads Department were adjusted.

JOHN MACINTOSH,
Acting Chairman.

No. 3 Committee Room,
Sydney, 10th August, 1875.

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 11 MAY, 1875.

MEMBERS PRESENT:—

Mr. Bennett,		Mr. W. C. Browne,
Mr. Cunneen,		Mr. T. G. Dangar,

Mr. Scholey,		Mr. Macintosh.

In the absence of the Chairman, Mr. T. G. Dangar called to the Chair, *pro tem*.

William C. Bennett, Esq., called in and further examined.

Witness handed in certain documents which were ordered to be appended. (See Appendices G 1 and 2.)

Witness withdrew.

Mr. Amos Davies called in and further examined.

Room cleared.

Committee deliberated.

William C. Bennett, Esq., called in and further examined.

Witness handed in certain documents which were ordered to be appended. (See Appendices G 3 and 4.)

Witness withdrew.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 1 JULY, 1875.

MEMBERS PRESENT :—

Mr. Scholey,		Mr. T. G. Dangar,
		Mr. Cohen.

In the absence of the Chairman, Mr. T. G. Dangar called to the Chair, *pro tem*.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

FRIDAY, 2 JULY, 1875.

MEMBERS PRESENT :—

Mr. Bennett in the Chair.

Mr. T. G. Dangar,		Mr. Cohen,
		Mr. Jacob.

The Chairman proposing to further examine Mr. Amos Davies,—

Mr. T. G. Dangar moved,—“That the Committee shall forthwith proceed to consider the evidence with a view to reporting to the House.”—

Question put and agreed to.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

TUESDAY,

TUESDAY, 20 JULY, 1875.

In the absence of a quorum the meeting called for this day lapsed.

FRIDAY, 23 JULY, 1875.

MEMBERS PRESENT:—

Mr. T. G. Dangar,		Mr. Gray,
Mr. Macintosh,		Mr. Cameron,
Mr. Lackey,		Mr. W. C. Browne.

In the absence of the Chairman Mr. Macintosh called to the Chair *pro tem*.

Clerk laid before the Committee a letter of Mr. Davies, and a memorandum of Mr. Bennett (Chairman), having reference to the inquiry.

Committee deliberated, and declined to receive the documents.

Draft Report, as proposed by the Chairman (Mr. Bennett), read 1^o, as follows:—

“DRAFT REPORT.

“THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 7th May, 1875,—‘with power to send for persons and papers to inquire into and report on certain allegations contained in a Petition from Amos Davis, which was presented to this House and ordered to be printed on the 11th November last,’—have agreed to the following report:—

“1. Your Committee having examined the witnesses named in the List,* and carefully considered the evidence and documents appended thereto, have come to the conclusion that Mr. Davies’s claim against the Government has not been disproved. * See List, page

“2. That certain departmental documents, known as I Forms (generally used as measurement forms), were asked for by your Committee, but have not been supplied by the Commissioner for Roads, in whose custody the several witnesses stated them to be, and which that officer acknowledged had been forwarded to his department.

“3. Therefore, in the absence of the measurement forms alluded to, it is impossible for your Committee to furnish a complete Report; and in order to expedite the duties of your Committee it devolves on the Chief Commissioner to lay before them these particular measurement forms.

“4. The assumption that your Committee cannot bring up a final Report is fully justified by the answers given to questions 232 and 240 of Commissioner W. C. Bennett’s evidence. See questions 232 and 240.

“5. It further appears to your Committee that the answers to Questions from 277 to 291 are of that ambiguous character that your Committee deem it desirable that further explanation should be afforded before any final Report can be brought up.

“6. It also further appears to your Committee to be inopportune to submit a final report on the present occasion, from the fact that some alterations have been made by the Chief Commissioner, Mr. W. C. Bennett, in two documents put in evidence, marked E 3 and 4, without the concurrence of Contractor Davies or Mr. Nardin, Road Superintendent, under whose supervision the work referred to in these papers was performed.

“7. It still further appears to your Committee undesirable for the present to bring up a Final Report; which objection may be reasonably based upon the answer given by the Chief Commissioner, Mr. W. C. Bennett, to question 958,—having special reference to a letter from Contractor Davies to Road Superintendent Nardin, which he stated to have been received but cannot be found.

“8. Therefore in justice to all parties concerned your Committee are of opinion that this letter, if such letter ever passed from Contractor Davies to Road Superintendent Nardin, should be produced, otherwise the natural presumption is that no such letter did pass from Contractor Davies to Road Superintendent Nardin. Hence, if such should be the case, as is here suggested, and if this particular letter be not produced, your Committee must, under all circumstances, consider Contractor Davies’s claim proven beyond all doubt.

“9. There is also a plan with specifications for the erection of Goonoo Goonoo Bridge which is of material importance to the inquiry, and which has not been laid before your Committee.

“10. Your Committee therefore, for the reasons above-mentioned, are of opinion, that it would be prejudicial to the interest of all parties concerned to submit a final Report until all documents and other papers, which have been ordered by your Committee, and do not appear in the printed evidence, shall have been laid before them.

Draft Report, as proposed by Mr. T. G. Dangar, read 1^o, as follows:—

“DRAFT REPORT.

“THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 7th May, 1875,—‘with power to send for persons and papers, to inquire into and report on certain allegations contained in a Petition from Amos Davis, which was presented to this House and ordered to be printed on the 11th November last,’—have agreed to the following Report:—

“1. That after having examined the witnesses named in the List,* and carefully considered the evidence, together with the documents appended thereto, your Committee have decided that Mr. Amos Davies has no claim against the Government. * See List, page

“2. Under the circumstances revealed in the evidence, your Committee are of opinion that the Commissioner for Roads was justified in refusing to entertain any application from Mr. Amos Davies for any further work until such time as his differences with the Roads Department were adjusted.

Motion made (Mr. Gray) *pro forma* and Question proposed, “That the Draft Report of ‘the Chairman’ be read 2^o paragraph by paragraph.”

Amendment

Amendment proposed (*Mr. Cameron*),—To omit the words “the Chairman” and to insert the words “Mr. T. G. Dangar” instead thereof.

Question,—That the words proposed to be omitted stand part of the question,—put and *negatived*.

Question,—That the words proposed to be inserted be so inserted,—put and *agreed to*.

Question then,—That the Draft Report of Mr. T. G. Dangar be read 2^o, paragraph by paragraph—put and *agreed to*.

Paragraphs 1 and 2 respectively read and *agreed to*.

Motion made (*Mr. Cameron*) and Question,—“That the Report as proposed by Mr. T. G. Dangar be the Report of the Committee,”—put and *agreed to*.

Chairman to report to the House.

MONDAY, 9 AUGUST, 1875.

In the absence of a quorum, the meeting called for this day lapsed.

TUESDAY, 10 AUGUST, 1875.

MEMBERS PRESENT:—

Mr. Macintosh,	Mr. Cameron,
Mr. T. G. Dangar,	Mr. Scholey,
Mr. W. C. Browne.	

In the absence of the Chairman, Mr. Macintosh called to the Chair *pro tem*.

Clerk submitted letter from Mr. Bennett (the Chairman), declining to sign the Report agreed to by the Committee.

Entry from Votes and Proceedings, suspending the 47th Standing Order, to allow the Acting Chairman to sign the Report, *read* by the Clerk.

Committee deliberated.

Resolved,—That the Acting Chairman do sign and bring up the Report.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

PETITION OF AMOS DAVIS.

THURSDAY, 13 MAY, 1875.

Present:—

Mr. BENNETT,
Mr. W. C. BROWNE,
Mr. CAMERON,

Mr. T. G. DANGAR,
Mr. GRAY,
Mr. JACOB,

Mr. SCHOLEY.

H. BENNETT, Esq., IN THE CHAIR.

Mr. Amos Davis examined:—

1. *Chairman.*] You are the person whose petition has been referred to this Committee? I am.
2. Will you state as briefly as possible what is the nature of your grievance, or of your claim against the Government? That I am unpaid for extra work on contracts 10 and 16—£716 Os. 5d.
3. That is the amount the Government owe you? Yes, on these two contracts; also, on the sheathing on Dangar's Creek Bridge, £5 7s. 5d.; and on the sheathing on bridges on Liverpool Range, £10 Os. 8d.; total on sheathing work, £15 Ss. 1d. Prior to these claims there were three debts against the Government respectively,—one for metal ballast, and fine on the construction of bridge and approach at Goonoo Goonoo, North Tamworth—this was in 1864 that the work was finished—amounting to £93 10s. 8d. When the Commissioner came to the consideration of the contracts 10 and 16, he referred to it in an impatient manner, and I replied that I thought it was still an undischarged obligation.
4. Have you applied for the payment of this sum of which you have now given us the detail? The above claims I did place, together with two others, in the hands of a solicitor, Mr. Wallace, of Tamworth, who communicated with the Government—such proceedings subsequently being suspended at the instance and solicitations of Superintendent Bailey, pending their consideration by the Commissioner for Roads. After correspondence, dating from the 11th January, 1870, to 6th September, 1870, the Commissioner writes that the matter had been referred to a Mr. Statham, who considered that no further consideration should be given to such claims; adding, that no farther employment would be given to the contractor until such claim be withdrawn. The contractor never received certificates for the work referred to from the time they were done till the 6th September, 1870, a period of six years.* Indeed, so far as regarded the work at Goonoo Goonoo, during the same month that the Commissioner wrote that he had referred the matter to Mr. Statham, that person had to be removed from our district because of some unfortunate sickness of a character that rendered his performance of the Commissioner's duty in this matter unsatisfactory.
5. Have you any other claim against the Government? Yes, £73—arising from an excess of work over the Government schedule of quantities on contract 8-64; also, £69 Ss. 8d., being a fine and extra culvert on contract 3-67, Great Northern Road. This extra culvert was rendered necessary by the Superintendent diverting the road from the cleared line over two instead of one gully. The Committee are invited to consider if the contractor is not entitled to compensation for the loss of the use of the money detained from him—his compulsory suspension from his usual work—and the loss sustained by him in consequence of his expensive plant lying idle.
6. *Mr. Dangar.*] That is a full statement of your claims against the Government? Yes.
7. When were these contracts entered into? Contracts 10 and 16, in August, 1872.

Mr. A. Davis.
13 May, 1875.

233—A

8.

* *NOTE (on revision)*:—That is to say, from the date of finishing the Goonoo Goonoo work, on the 25th May, 1864, to the date of the Commissioner's writing on the 6th September, 1870, a period of six years did elapse.

- Mr. A. Davies. 8. Were they all entered into at the same time? No.
- 13 May, 1875. 9. Are all these claims under one contract or under two contracts? No; they were entered into at different times, and are under seven contracts.
10. Is the sum that you allege is due to you the full amount of the contracts or balances due? Balances due.
11. On what contract are they due? They are balances due on several contracts.
12. You have received some money from the Government on account of them? Yes.
13. What are the reasons alleged by the Government for refusing to pay these balances? As far as I understand the Commissioner refuses to pay.
14. Have you demanded payment from Government? Yes.
15. And they have refused? Yes.
16. For what reason? He has never assigned a reason to myself, but he told Mr. Bowden, of Messrs. Allen, Bowden, and Allen, that the earthwork claimed for —
17. Who told? Mr. Commissioner Bennett. The earthwork I claimed for was outside the contract.
18. What do you mean by outside the contract? It was not included in the contract. This is what Mr. Bowden told me, and I have been so circumstanced that I have not been able to approach Commissioner Bennett.
19. You say you demanded it from Government;—how did you demand it? I put in a written demand.
20. Have you a copy of that written demand? I have. (*The witness handed in the same. Vide Appendix A 1.*)
21. Had you a reply? Yes. (*The witness handed in the same. Vide Appendix A 2.*)
22. *Chairman.*] Who instructed you to do this work for which you claim now? Overseer Holloway.
23. *Mr. Dangar.*] Then I infer that you have not accepted the tender from the Government direct, but as a sub-contractor? No; I was the original contractor.
24. How came Mr. Holloway to instruct you then? He was the Government overseer of the work.
25. *Chairman.*] What was the additional work that Mr. Holloway instructed you to do? Earthwork—to make up the embankments on the line of formation on contracts 10 and 16. This earthwork, not being provided for in the original tender or specifications, it was supplied in obedience to a pencil line, struck on the longitudinal plans after—perhaps three weeks after—the contracts were entered into. The formation clause of the specification does not provide for any earthwork at all.
26. *Mr. Dangar.*] Do I understand that you took the original contract from Government, and then Mr. Holloway directed you to perform extra work, and that it is for this extra work, ordered by Mr. Holloway, you make the demand, and for nothing that was in the original contract? Yes—this earthwork was substituted for metal work. The formation clause states the formation to be in the solid or made up with metal, and all holes, ruts, or depressions to be filled in with metal ballast or other allowed material—that is obliterated—“extra material for embankment to be obtained from any distance not exceeding yards.” That printed line is also obliterated. I received a written order from Mr. Holloway to reduce the quantity of metal that was in the original specification, and to put this earthwork in the formation; no metal whatever was used in the formation.
27. *Mr. Browne.*] Have you the order to substitute? Yes.
28. Will you put it in and also the original contract? Yes. (*The witness handed in the contract and order. Vide Appendices A 3 and 4.*)
29. *Chairman.*] Have you ever received any order from any other overseer or road superintendent to do any extra work for which you have not been paid? There is the sheathing.
30. Who gave you the order to do that? That for Dangar's Creek Bridge—Mr. Nardin.
31. When? At the time of my ordering the timber from the sawyers.
32. Have you got any written order? No, not for that.
33. Have you never been paid anything for doing that work? Yes, £36 10s. 11d.—and claims £5 7s. 5d. more—and on Liverpool Range sheathing have been paid £80 6s. 3d., leaving £10 0s. 8d. unpaid. I have been paid for 2-inch thickness of timber, and I used 2½-inch with the concurrence, not order, of Mr. Nardin.
34. What is the balance you claim upon that? The difference of thickness between 2 inches and 2½.
35. What does that amount to? £10 0s. 8d.
36. Has Mr. Nardin ever instructed you to do any other work besides the sheathing of this bridge for which you have not been paid? Dangar's Creek Bridge—Mr. Nardin returned the bridge as being sheathed 13 feet wide, whereas it was 15 feet, leaving a strip of 2 feet unreturned. This contained 30 cubic feet 8 inches at 3s. 8d. per foot. That is all the work for which I have received orders from Mr. Nardin.
37. Have you ever received any other orders from any road overseer or road superintendent to do any work which you had not contracted to do? Yes, from Mr. Bailey.
38. What is the nature of the work you have done under his order? I built an extra culvert on contract 3-67.
39. Anything else? No.
40. Did you receive that order from him verbally or by written authority? Verbally.
41. What was the amount due upon that work? £47; and there is a fine inflicted in that work of £21 18s. 8d., making together £69 8s. 8d.
42. Have you done any other work besides that, on the order of Mr. Bailey, at any time, for which you have not been paid? Yes, this is his authority. (*The witness handed in the same. Vide Appendix A 5.*)
43. This is the paper Mr. Bailey gave you? Yes.
44. You received it from him personally? Yes.
45. Have you done any other work under Mr. Bailey for which you have not been paid? That is all.
46. Have you done any other work by order of a road superintendent or overseer for which you have not been paid? Yes—Superintendent Quodling.
47. Have you any written document from him? That was a contract. I have not got the contract here to put in. The contract was for four bridges and a culvert.
48. Were you paid anything at all for that? I was paid the bulk sum of the tender.
49. What is the amount you now claim for extras? £73.
50. What was the nature of the extras you performed? I have not got the papers in connection with this claim—I gave them to Mr. Wallace, the solicitor, and he has been unable to find them. This was in 1865.
51. What was the nature of the work? I substituted a first class for a second class culvert.

52. What was the difference in the amount of the original contract and the work substituted? I cannot give the particulars; Mr. Bennett can supply them from the office, as this amount was carefully estimated by Superintendent Quodling himself. Sills were substituted for piles. The contract was for piles, but we found that the earth was too shallow to hold the piles. Mr. A. Davis.
13 May, 1875.
53. *Mr. Gray.*] The rock was too close to the surface, and you could not drive the piles? Yes, there was not sufficient holding ground.
54. *Mr. Cameron.*] And you substituted wooden sills? Yes; we blasted the rock, and bolted it to the rock. I speak from memory, and I think it was 15s. for blasting the channel and 3s. for removing the earthwork.
55. *Chairman.*] That is all the claim you now have against the Government with respect to works done under the order of Mr. Quodling? Yes; he gave me no written order for this change.
56. It was a verbal agreement? Yes.
57. Have you done any other work for any other officer in the department for which you have not been paid? No, that is all.
58. You have no further claim against the Government than those you have now stated? No.
59. *Mr. Scholey.*] You say that you have had seven contracts with the Government? Yes; seven contracts, on which I claim balances.
60. Is the £716 Os. 5d. the balance of a contract? It is for extra work done outside the contract; that is, the tender or specification does not provide for the work done.
61. You have received the amount for the original contract? No, I have been paid only £1,421 4s. on contract 10, the tender being £1,911 8s. 6d.
62. Then about £500 is due on that amount, and the rest of the amount of £716 Os. 5d. is for extras? No, the difference between what I was paid and the bulk sum of the tender arose from deductions made on the metalling and six culverts.
63. What I want to know is, whether this amount is due for extras or for part of the original contract? This is for extra work.
64. The whole of it? Yes. When I say that there have been other deductions made on the contract—that is, I have not been paid this £1,911 8s. 6d.—there were deductions made and other work substituted. There were 1067.47 cubic yards of metal deducted;—so much less had to be supplied on the work, and this had to be paid for at 5s. 6d. per cube yard. The original contract states that metal shall be filled into the hollows and depressions, but when earth was substituted it enabled us to dispense with the metal that is stated in the original contract to be used in the ruts and hollows to make up the line of the road.
65. Did you allow the Government for using earth instead of stone? The metal that was dispensed with was deducted from my account at the rate of 5s. 6d. per cube yard. I have allowed this deduction.
66. And your claim is what you believe to be right? My claim is just. There was no metal used in making the formation as required in the original tender, and there was a farther deduction from the original contract of six culverts.
67. *Mr. Gray.*] Had you the usual authority for all these alterations? Yes.
68. *Mr. Dangar.*] What was the original amount of the 10 contract? £1,911 8s. 6d.
69. How much have you received off that? £1,421 4s.
70. What extra work have you done under that contract? £532 7s. 9d.
71. Have you received any payment for that extra work? Yes; £84 18s. 6d., leaving £448 1s. still due.
72. You still hold that claim? Yes.
73. Has there been any substitution work done under the original contract No. 10? Yes, this earthwork has been put in.
74. You claim under that? Yes.
75. As an extra claim? Yes.
76. What is the other contract on which you claim? No. 16.
77. What was the original amount of that contract? £1,115 19s.
78. What balance is due on that contract? £267 19s. 5d.
79. That still remains unpaid by Government? Yes.
80. Have you any extra work on 16 contract? That amount was for extra work.
81. Then on each of these contracts you did extra work? Yes.
82. Has No. 16 contract been paid in full? No; I have been paid about £1,114 12s. 6d.
83. What remains? About £267 19s. 5d. There were deductions made from the original contract.
84. Those deductions you agreed to? Yes.
85. What is due to you from the original contract? There is nothing due for work done within the contract.
86. What is due outside the contract No. 16 for extra work? £267 19s. 5d.
87. Do I understand that all your claims are embraced in these two contracts, Nos. 10 and 16, for extra work performed outside of them? No, there is the sheathing, and these that I consider old claims for work done under Mr. Nardin, Mr. Bailey, and Mr. Quodling.
88. That is your claim against the Government? Yes.
89. Reverting to your petition;—what do you mean when you say that “work is now withheld from your petitioner, thereby depriving him of his ordinary means of livelihood, and rendering his costly working plant useless”? They have refused to consider my tenders.
90. By whom was that work withheld—by the Government? By the Government.
91. Upon what grounds? They are stated in the letters I now hand in. (*The witness handed in the same. Vide Appendices A 6, 7, and 8.*)
92. In your second paragraph you say you have been “denied facilities of tendering for works”;—what does that mean? I allude to the letters which I have just handed in.
93. By whom were you denied facilities for tendering? The Government.
94. Then you go on to say: “And that there is now being unjustly detained from your Petitioner large sums of money for work actually performed, for no other apparent reason than to coerce your Petitioner”;—what do you mean by the word “coerce” here? At the time of that petition, Mr. Bennett acknowledged to be due to me something over £600, and he detained that in his hands until the 25th March last.
95. Did you receive any representation from Government that seemed to you to warrant the words used in this petition, that you were coerced;—did the Government ask you to take a less sum than was owing? Yes, Mr. Bennett offered this amount on condition of my signing the final voucher upon the receipt of £384 Os. 7d. He has since paid £637.

Mr. A. Davies. 96. After signing that final receipt? No; I signed nothing at all. The Bank authorities signed in the usual manner. I had given an order on the commencement of the contract 10, 16, 17-72 to pay—as we are entitled by the general condition—"Pay all moneys due on account of contracts to my credit in the Bank of New South Wales, Tamworth." Such order was never withdrawn. When this difficulty arose I pointed out the better way was open for paying me, but I should sign only ordinary receipts.

13 May, 1875.

97. In the third paragraph you say you have been "restrained from legal remedy by the officers of the Road Department"? Yes; I will put in Mr. Abbott's statement of the case, and Mr. Butler's opinion. (*The witness handed in the same. Vide Appendix A 9.*)

98. Will you state what reason was alleged by the Government for not making these payments—Did they say they were not indebted, or that you had performed your work badly? The Commissioner's position, as far as I understood it, was, that the payment of 2s. 6d. per lineal yard of formation was ample remuneration for the work as done.

99. That was the sole reason he assigned for non-payment? Yes.

100. That could not have applied to your contract if you had an amount specified in the contract? That is the only reason he has assigned for it.

101. Mr. Browne.] In connection with contract 16, did you receive the whole amount upon the original contract, as tendered by you? No.

102. Do you say that you did not receive £15 due to you upon the contract No. 16? Yes; but I did receive £14 12s. 6d. for extra quantity of stone in culverts, being the amount of receipts on contract 16 to £1,114 12s. 6d., leaving a balance due of £267 19s. 5d. on that contract.

WEDNESDAY, 19 MAY, 1875.

Present:—

MR. JACOB, | MR. SCHOLEY.
H. BENNETT, ESQ., IN THE CHAIR.

Mr. Amos Davies further examined:—

Mr. A. Davies. 103. Chairman.] Are you prepared to place any further evidence before the Committee in support of the allegations of your petition? At the last meeting of the Committee I fear I did not present my case so clearly as I could have desired, and I would therefore beg permission to make a continuous and detailed statement of the contracts out of which my claim arose. About the year 1863 I was first employed by Government in the erection of a bridge over Goonoo Goonoo Creek, South Tamworth. Immediately after the completion of that bridge the floods of 1864 occurred, taking away the old Goonoo Goonoo Bridge over the North Creek, situated about a hundred yards from the bridge I had recently erected. The Commissioner for Roads telegraphed to Mr. Superintendent Bailey to inquire if I was still in Tamworth, and if so he was to engage me to re-erect the bridge that had been swept away, at the same schedule of prices as that for the work I had just completed. Mr. Bailey telegraphed to me to meet him at Tamworth. I did so, and the agreement I have produced was the result. (*Vide Appendix A 5.*) We at once marked out the site of the bridge, the length of the approaches, and I proceeded to its erection. After the woodwork of the bridge was finished, the metal and ballast was coming on the approaches—Mr. Boyd, the overseer, had measured the stone and ballasting metal,—when Mr. Bailey remarked about the great expense of the bridge, and stated that he was getting metal broken on the Moonboys at 9s. per cube yard, and that I ought to reduce my rate of metal to 9s. My schedule price for previous work had been 20s., and I therefore objected to do this. Some months after I visited Sydney, and found on inquiry that the balance due on the work had not been paid. I asked to know the amount and when it would be paid, and on looking over the items I found that the price for metal had been reduced from 20s. to 9s. per cube yard, the ballast from 15s. to 4s. 6d., and that I had been fined £5 for one week over time,—making a difference in the total amount to be received by me of £93 10s. 8d. I complained bitterly of the injustice I felt I was suffering, to Mr. Commissioner Bennett, but failed to obtain the amount. During this visit to Sydney I tendered for four bridges and a culvert at Wallabadah Gap, the Government schedule of quantities being attached to the specification which was adopted by me in my tender. The culvert in the specification was a second-class culvert. My tender was accepted, and I proceeded to carry out the work under Superintendent Quodling. Mr. Quodling substituted a first-class culvert on the site where one of the second-class was intended to be, furnishing me with a plan from his own office. On completion of the contract, Mr. Quodling carefully went through the measurements of the quantities actually used, the result being that, allowing for the increased price of the culvert, if my memory serves me rightly, £30, excavating rock for sills, and earth excavation, bolting sills to rock, and deducting the schedule for piles which were originally intended—the amount of work performed by me exceeded the original amount of my tender by £73. Mr. Quodling furnished the particulars of these measurements, of which I retained a copy, but having subsequently placed them in the hands of my solicitor, Mr. Wallace, they were mislaid by him, and I am therefore unable to produce them. This amount of £73 the Government have refused to pay. They paid only the bulk sum of my tender, which amounted to £823 16s., notwithstanding that there was the usual condition in the tender for additions or reductions. About the latter part of 1867 I undertook the contract known in the Department as 3-67, for the sum of £1,096 15s. 6d. Extra metal was supplied to the value of £111 3s. 4d., and an extra culvert was erected on this work, ordered by Mr. Bailey, in the presence of Mr. George Crawford. For this extra culvert I have been refused payment and am still. In addition to this I was charged with fines to the amount of £21 18s. 8d.; so that there was a deduction of £69 8s. 8d. from the amount I should have received upon this contract. The fines were, as I believed, improperly deducted, as some delay took place in getting the bonds signed, they having to be sent to bondsmen in Denison Town, where I had recently erected a bridge, and Mr. Bailey refused to recognize me as a contractor until the said bonds were received. I was therefore prevented from proceeding with the work. From the date of his recognition to the completion of the work the contract time was not exceeded although the extra work required was done within that period. About this time a disagreement arose between the Commissioner and myself in connection with the purchase of some timber at Cox's Creek, on which he first suspended me from work. Reference to this circumstance is made

in the Commissioner's letter of 11th February, 1869. The next item, I believe to be a mistaken measurement; it is the sheathing of Dangar's bridge, returned as 13 feet wide, whereas the actual width is 15 feet; making a difference in the amount of £5 7s. 5d. In August, 1872, three contracts were given me, known as contracts 10, 16, and 17-72. On two of these, 10 and 16, there was a dispute. On the first contract, 10, I supplied 4,476 cubic yards of earthwork, not required by the original specification, in raising the road. For this work I charged 1s. 3d. per cube yard, making £279 15s. On the same contract I substituted, at the instance of overseer Holloway, cube ashlar work instead of rubble. For this difference of work I charged 25s. 3d. per cube yard, making £162 17s. 3d., total not included in the original contract, £442 12s. 3d. The supply of the earthwork referred to resulted in a saving of 1,066 cubic yards of metal at 5s. 6d. per yard, equal to £293 3s. Difference in favour of making up earthwork in formation, £13 8s. The construction of these embankments also had the effect of diverting the water to fewer openings and thereby of reducing the number of culverts to four instead of ten, and three pipe drains, which involved a deduction of £280. The deductions therefore from the original contract amounted to £574 11s. 3d., leaving upon the original contract £1,336, to which should be added £83 18s. 6d. for extras allowed by the Government, and the £442 12s. 3d., making the total due to me according to this statement of £1,863 8s. Of this I have received £1,421 4s., leaving a balance due to me of £442 4s., which the Government have refused to pay. On contract 16, the tender for which was £1,115 19s. deductions were made on this by authority of Mr. Holloway (*Vide Appendix 4*): Metal to the value of £59 7s. and admitted additions, £43 8s. 8d., showing a nett deduction of £15 19s. There has also since been admitted as extras £14 12s. 6d., making a total of £1,114 12s. 6d. The whole amount of this I have received. But besides this work I supplied 1,468 cubic yards of earth in raising the roadway, at 1s. 3d. a cubic yard, £91 15s., and substituted in this work also ashlar instead of rubble, for which I claim £126 11s. 5d. There were other items to the amount of £9 13s. I also claim £40, there being a schedule price in my accepted tender of £20 per month, and I maintained the work for two months in accordance with the specification. The total value of work done on this contract is £1,382 11s. 11d., and I have received £1,114 12s. 6d.; balance therefore is left to me of £267 19s. 5d., which the Government have refused to pay me. The extra work to which I have just referred was performed by me in accordance with instructions received by me from Mr. Holloway, and I may add that Mr. Holloway during the last week went before the Secretary for Public Works and acknowledged that he authorized the doing of this earthwork, and the substitution of ashlar for rubble. Another item, for which I remain unpaid, is £10 0s. 8d. for sheathing three bridges on Liverpool Range, Doughboy Hollow. This work was originally specified as 2 inch sheathing. With the concurrence of Mr. Nardin I increased the thickness to 2½ inches, thus adding one-eighth to the original amount. I beg also to hand in a tabulated statement of my claim (*Vide Appendix A 10*); also details of measurement of earthwork and the trade difference between rubble and ashlar work in connection with contract 10-72. (*Vide Appendix A 11*.) I also hand in final certificate for contract 16-72, detailed statement of earthwork and trade difference between rubble and ashlar work. (*Vide Appendix A 12*.) I also hand in final certificates for replacing Goonoo Goonoo Bridge, for contract 8-64, for 3-67, for Dangar's Creek Bridge, and for three bridges, Liverpool Range. (*Vide Appendices A 13, 14, 15, 16, and 17*.) I should wish to add that I have no ill-feeling whatever against any officers of the Department, and my confidence in the Department is shown by my large expenditure of money in the purchase of plant for carrying on the public works of the Colony.

104. Have you any further evidence to offer to-day? I wish, in order to show the efforts I have made to obtain certificates, to put in the following correspondence: The first is a letter addressed by me to Mr. Nardin, dated 27th December, 1873 (*Vide Appendix A 18*), and his reply thereto. (*Vide Appendix A 19*.) Also a letter to Mr. Donnelly. (*Vide Appendix A 20*.) To the last letter I received no reply.

105. You did not receive any certificate in reply to that letter? I have not received any certificate at all. Mr. Nardin said he always forwarded the certificates to the head office. Mr. Donnelly never replied. I also beg to hand in the telegram, to which I have referred in my statement, from Mr. A. C. Bayley. (*Vide Appendix A 21*.) A copy of schedule of prices for bridge over Goonoo Goonoo Creek, Tamworth, as per tender. (*Vide Appendix A 22*.) An order from Mr. Boyd with reference to the level of the bridge. (*Vide Appendix A 23*.) And also an order from Mr. Boyd that no border stones are required on the approaches to the bridge. (*Vide Appendix A 24*.)

106. *Mr. Scholey.*] Am I to understand that the whole of your claims against the Government are contained in the statements you have handed in, and that they amount to £967 7s. 10d.? Yes.

107. You are sure this is correct? Yes.

108. *Mr. Jacob.*] This tabular statement which you have handed in shows various balances due to you from time to time? Yes.

109. As each of these balances became due did you apply for payment? I did.

110. During the ten years over which these items extend was there any attempt made at an adjustment with the Government? Yes; the only reason assigned was, as I have stated, that Mr. Bayley asked me to reduce the amount.

111. For instance there is a balance of £93 10s. 8d. due to you as the first item? Yes.

112. How was it that it was not settled;—did you apply for it? Yes. The only reason I can give is the one I have stated.

113. It was not settled? It was not settled.

114. Still you went on contracting with the Government? Yes.

115. Under various other contracts other sums became due? Yes.

116. As they became due did you not endeavour to get a settlement with the Government? Yes.

117. And you could not get it? No.

118. Still you went on undertaking other contracts. Had you any hope that your claims would ultimately be allowed? Yes, in the case of Bowling Alley Point, work done in 1869 was not paid for until 1874.

119. Did the Government hold out any hope that they would settle these balances, or did they deny that they were due to you? Mr. Commissioner Bennett wrote me that he had received a report from Mr. Bayley that the approaches were not included in the engagement at schedule prices for Goonoo Goonoo Bridge South.

120. And therefore that this balance was not due to you? Yes.

121. Then you still disputed that with them and went on contracting for other work? Yes.

122. Then comes the item of £73. Did the Government dispute owing you that money? I will tell you how that occurred: The tender is for £823 16s. The final payment on that work was in abeyance some months

- Mr. A. Davies. months till the Commissioner visited the place. He inquired about how the difference arose between my claim and the bulk sum, and if I had not tendered for the work at a bulk sum.
- 19 May, 1875. 123. He wanted to know if you had not done so? Yes. I replied that the usual clause of increase and decrease was attached to the tender, and that I expected to be paid for this increase at the schedule of quantities; that the quantities exceeded the schedule in the total.
124. Did he admit that? He admitted that it did.
125. Did he ultimately admit that this £73 was due to you from the Government? No. He said I should only be paid the bulk sum of the tender.
126. Then, in fact, the Government did dispute this sum, and denied owing it to you? Yes.
127. In what way has this denial been made—in correspondence or verbally? Verbally as to this transaction with respect to the bridge, on the occasion when he visited it on its completion.
128. Has he always visited your work after its completion? Usually.
129. Then you have submitted your claims, and they have been refused in every instance? Yes.
130. In the last allegation of your petition you say: "That your Petitioner is restrained from legal remedy by the officers of the Roads Department unjustly withholding your Petitioner's certificates for the several works completed." How come you to make such a serious assertion; what grounds have you for saying that they unjustly withhold from you your certificates? I have handed in Mr. Nardin's refusal.
131. He may refuse feeling justified in doing so; you say they are unjustly withheld? On the previous day I handed in Mr. Butler's opinion.
132. Why do you believe that you are entitled to these certificates? Because the work is done under the usual authority.
133. Has it been customary to furnish you with this certificate? No, I never obtained any.
134. Why then do you think you are entitled to it, so much as to justify your making the severe assertion in the petition? Because in clause 15 of the general conditions, attached to the contract, to which I have subscribed, it states that the obtaining of a certificate shall be a condition precedent to the contractor having any claim or cause of action.
135. Therefore you endeavoured to obtain this necessary certificate? Yes.
136. Was it refused to you? Yes.
137. It is upon that you maintain your complaint—that the certificates are unjustly withheld from you? Yes.
138. You have been advised that you could not take legal proceedings against the Government without these certificates? Yes; Mr. Butler states in his opinion that the certificates being sent in to the department does not meet the case, when it is definitely stated that the contractor and not the department shall obtain the certificate.
139. You have had legal advice that you could not successfully take legal steps against the Government without these certificates? Yes.
140. If you had obtained those certificates you would have resorted to law instead of applying to Parliament by petition? Yes.

TUESDAY, 26 MAY, 1875.

Present:—

MR. W. C. BROWNE, | MR. T. G. DANGAR,
MR. SCHOLEY.

H. BENNETT, ESQ., IN THE CHAIR.

Mr. George Holloway examined:—

- Mr. G. Holloway. 141. *Chairman.* What position have you occupied under the Department of Works? Road overseer and road superintendent.
- 26 May, 1875. 142. On the northern line? Yes; and also on the western.
143. Do you know Mr. Amos Davies, the petitioner? Yes.
144. Had he any contracts on the northern line while you had the supervision of it? Yes.
145. Did you ever order him to do any extra work on any portions of that line of road, to any contracts he had accepted? No, I did not, that I am aware of.*
146. Did he ever do any extra work in addition to any accepted tender? He may have done, but he has not been authorized by me.†
147. Did you ever authorize him to do any work on the line for which he had not contracted? Yes.
148. What was the nature of the work? Small tasks I have let to Mr. Davies.
149. Can you tell us the nature of the works you have let to him—that you have instructed him to perform? The repair of bridges at Doughboy Hollow, and sundry other little jobs—such as repairs to culverts—small jobs.
150. And those works which you called upon him to do were necessary? Yes.
151. Have you any authority or power, in your position as road superintendent, to instruct contractors to do this kind of emergency work? I had the power to order small works that I saw required to be done, such as necessary repairs, without receiving written instructions, but no large contract.
152. Were you aware that Davies had to build a first-class culvert at any point on the northern line, instead of a second-class culvert, according to the contract? No.
153. There was no such change made? Not that I am aware.
154. You are not aware of any change in the class of culvert? I do not know that while I was overseer a first-class was substituted for a second-class culvert.
155. Do you know of any ashlar work being substituted for rubble? Yes; on 10-72 ashlar was used instead of rubble; rubble was specified—ashlar was used.
156. Do you know of any extra earthwork being substituted for other work in the specification? There were some heavy banks made in 10-72 and 16-72. 157.

* NOTE (on revision):—On taxing my memory I find I did—to the amount of about £3—in a contract between 10 and 16-72.

† NOTE (on revision):—I find he did, in a contract between 10 and 16-72—amount about £3.

157. Was that earthwork provided for in Mr. Davies's tender? The banks were not actually specified; the word used was "forming" or "formation."

158. But he did supply these earthworks? Yes, a large amount of earthwork in banks.

159. In addition to what was in the specification and contracts in this contract 10-72? There was a large amount of earthwork there. There was no earthwork specified in the banks; it was merely formation.

160. But he did supply a large number of yards of this earthwork in excess of what was in the specification? I believe he did; there was no bank specified at all.

161. For any of these extra emergency works that Mr. Davies performed did you send vouchers to the Department? Yes, for certain works that were finished—for any small jobs; but they extend over some years.

162. Then I am to understand that you did authorize Mr. Davies to do this additional earthwork? I did not.

163. Who did? I am not aware. The section was provided him. I took a section, and the lines and grades were given him to work by. I was authorized to take the section by my superior officer, Mr. Nardin.

164. Did you authorize Mr. Davies to do any work on any other portion of the road you had the supervision of, besides the length of road between Murrurundi and Tamworth? There was a taskwork between Tamworth and Manila, but I think he had authority from Mr. Nardin to do this.

165. *Mr. Scholey.*] Do you know that? I do not; he did not get any authority from me.

166. *Chairman.*] To return to the other line of road;—with regard to this earthwork, was this returned for by you? No, it was not.

167. Then you have no knowledge whether it was returned for by anyone else of course? No.

168. That portion of road between Murrurundi and Tamworth was the only portion under your supervision on which you ever instructed Mr. Davies to do any work? Yes.

169. For all the works you have instructed him to do you have returned? Yes, for any small job previous to this 10-72 and 16-72.

170. Did you not receive some new plans from the Department, and at the same time instructions that this necessary earthwork should be performed by Mr. Davies? I made the section myself—there were no plans besides what I drew myself.

171. Did you return these plans to the Department when you returned for the work? No I did not return for anything on that job; I left before it was done.

172. Who succeeded you in that work? Mr. Dowling was there afterwards, but I do not know whether he had the supervision of that work or not.

173. Was it under you that Mr. Davies agreed to sheath the bridges and place the culverts between Doughboy Hollow and the Willow-tree? Yes.*

174. What was the substance of the timber agreed upon between you and him? Any bad planks in the bridges were to be taken up and fresh ones put in with 4-inch stuff, and portions of the handrail that were rotten were to be taken out and replaced with new.

175. Was there any specified thickness? Yes, the top rail 4 by 4; the centre rail 3 by 3; and the planking 4 inches thick.

176. Only 4? Yes.

177. Did you not give any further order with regard to the thickness of the planking—that it was to be more than 4 inches? No, I think not; the work had not been started when I left the district.†

178. Have you travelled over these culverts and bridges at any time? When I came from Gunnedah I believe I did, but it was at night.

179. You had not an opportunity of seeing whether he had put thicker planking? No, I had not.

180. You do not know of your own knowledge whether he had or not? No.

181. You are not aware that Mr. Davies has been paid for these extra works that you instructed him to perform? Do you refer to the culverts in Doughboy Hollow?

182. Or to any other work. Was he ever paid for any additional work, such as sheathing the culverts and bridges? I am not aware that the culverts and bridges were paid for, for they were not started when I left the district.

183. Where there any other? There may have been some small jobs. I am not sure whether he was paid for them, but it is so many years ago I cannot say. If they were paid I paid them. That is, Mr. Nardin paid them by cheque through me.

184. How many years have you known Mr. Davies as a contractor at work under the Department? Between six and seven years I think.

185. Has he always done his work in a workmanlike manner—were you satisfied with the manner in which he performed his work? Yes.

186. *Mr. Scholey.*] I suppose you are supported by the Government? Yes, by Mr. Bennett.

187. That is your authority? Yes.

188. You say at the commencement you did not ask Mr. Davies to do any extra work? That referred to contract 10-72 and 16-72. The work was only half completed when I was there.

189. You say you had only a few small jobs? Yes, during that time.

190. What do you think would be the value of them? They varied.

191. Could you give an idea? I really could not. There were little jobs—such as a culvert washed away in time of flood; this had to be repaired and covered with stone.

192. Would it amount to £20—more or less? I dare say it would be likely to be about that—probably rather more than less.

193. Will you try to tax you memory;—would it be anything like £207 11s. 9d.? No.

194. If it has been stated before this Committee that the extra work was performed by Mr. Davies, and ordered by Mr. Holloway, on any contract—is that correct? It is not.

195. Could you give any idea what the extras would amount to? Do you mean the extras connected with the 10-72 and 16-72, and all the small jobs?

196.

* NOTE (on revision):—I must have misunderstood this question. There was no sheathing in the task I let Davies; the task for sheathing was let to him after the other was completed, and was started after I left the district.

† NOTE (on revision):—The task I let to Davies was to repair the bridges in Doughboy Hollow with 4-inch planking; no alteration in thickness was made; after its completion another task was let by Mr. Nardin for sheathing; this was not started when I left.

- Mr. G. Holloway.
26 May, 1875.
196. The whole of the works you ordered? I dare say about £20 would cover all the small jobs I let him, extending over the time I was in charge.
197. Do you include the earthwork? No, that is irrespective of these two contracts.
198. What would be the extras on the line between Tamworth and Murrurundi—supplying the extra earthwork? I could not answer—I never measured it. The work was not completed when I left.
199. Could you have any idea by looking at the plans? I could not say whether the work was carried out according to the plan.
200. Supposing it were, what would be the extra work? I really could not say.
201. I will take you back again to what I asked you: If it has been stated that the extra work ordered by you amounted to £207 11s. 9d., is that true? It is not.
202. *Mr. Dangar.*] How long were you engaged in superintending the Northern Road? About three years.
203. For what period? From about the year 1869 to 1873.
204. How many contracts had Mr. Davies from the Government during the time you had charge of the road? About five, I think.
205. Among which were those two contracts? Yes; 10-72 and 16-72.
206. Were they completed during your superintendence? No; only partially completed.
207. What extra work did you give Mr. Davies during the time outside these contracts while you had charge of these roads? In a contract near the wire fences we put extra sills in a second-class culvert. I think I gave him £3 extra for that, to raise the culvert the proper height. There was also another culvert in the place called Sugarloaf Gap; the sills were giving way, and I had it blocked up at a cost of £1. There were also several little jobs between there and Murrurundi.
208. Were these paid for by you? Yes; except that at Sugarloaf Gap; that was not paid by me; whether it was paid after I cannot say.
209. All the extra work you gave him you paid him for? Yes, I believe I did.
210. Had you authority from the head department to give him extra work? In times of flood, if I saw a culvert dangerous, I had authority.
211. I am alluding to work given by you to Mr. Davies? I had authority, if I saw a culvert dangerous, to give orders for its repair without writing to the head office, to save delay—small jobs amounting to a few pounds.
212. It was not necessary to obtain the sanction of the Commissioner in such cases? No.
213. *Chairman.*] Did you and Mr. Davies agree at the time as to the prices for this extra work, exclusive of the earthwork you have mentioned? Yes; I believe we did. In some cases it was task; for instance, that work at Doughboy Hollow was on the task-book, and signed by Mr. Davies; that was a final agreement.
214. For these other extra jobs did you agree? Yes; for small jobs; sometimes a mere matter of a pound.
215. You state that you paid Davies for these minor works? Yes; excepting for that in Doughboy Hollow; that was not started when I left.*
216. I allude more to items 3 and 1? There was one item at the wire fences that was put as an extra in the I form; it was paid in the final payment at the winding up, by cheques from Mr. Nardin, which were paid through me to Mr. Davies.
217. Where are these plans now? I do not know.
218. Did you forward them to the Department? No; I believe they were left in the hands of Mr. Davies.
219. Did you superintend the work at Dangar's Creek Bridge? No; I never saw that; that was below my district.

WEDNESDAY, 2 JUNE, 1875.

Present:—

Mr. CAMERON,		Mr. LACKY,
Mr. T. G. DANGAR,		Mr. MACINTOSH.

H. BENNETT, Esq., IN THE CHAIR.

William Christopher Bennett, Esq., called in and examined:—

- W.C. Bennett, Esq.
2 June, 1875.
220. *Chairman.*] You are Commissioner and Engineer for Roads? I am.
221. Since the adjournment of the Committee have you directed your attention to the evidence given by Mr. Davies before this Committee, and the Appendices to that evidence? I have.
222. Have you paid any portion of the account stated in Appendix A 1; and, if so, to what amount? There are two statements of account, and the difference between the two schedules A 1 and A 10 will show what has been paid.
223. Can you now concur in the payment of any of these amounts or portions of the amounts stated in Appendix A 10? No, I cannot recommend the payment of any amount where no certificate has been received by me from any local officer for the payment of that amount.
224. Did you, in February, 1864, authorize Mr. Superintendent Bailey to let to Mr. Amos Davies the construction of a bridge and approaches over Goonoo Goonoo Creek, north of Tamworth? No; I authorized Mr. Bailey to let the construction of a bridge only, which was let according to a statement put in by Mr. Davies.
225. Was the same schedule of prices he had been paid for bridges over the south branch of the creek adopted? For the bridge only.
226. Was Mr. Davies paid for all the work under the same schedule of prices—for the second as for the first bridge? Yes, for all the work contained in his agreement.
227. What were the exceptions? The approaches.
228. Why were the ballast and metal not paid for on the same schedule of prices for the second as for the first? Because they were not included in the agreement. The agreement says, "for erecting a bridge over Goonoo

* NOTE (on revision):—This refers to the task for sheathing—not to the task for the supply of 4-inch planking.

Goonoo Creek," and because the road superintendent reported to me that Davies was advised before he commenced the work that he would get only current rates, as the prices for the other bridge at Tamworth were excessive. If I may be allowed to read a statement I have prepared, I think the matter will be more clearly understood by the Committee. I have read all Mr. Davies's assertions and have replied to them in detail. The facts as far as I know are, Mr. Davies signed an agreement to do the second bridge over Goonoo Goonoo Creek in lieu of that carried away, at the same rates as the first bridge. The signed agreement does not include approaches, the prices for which were more than the usual rates. During the progress of the work on 29th March, 1864, Mr. Bayley told Mr. Davies that he would give him the current rates, 9s. per cubic yard for metal, and 4s. 6d. for ballast; he also informed Mr. Boyd, the overseer, of the same. I now hold Mr. Boyd's letter, corroborating the statement which I beg to hand in. (*Vide Appendix B 1.*) Mr. Bayley on a subsequent occasion told Davies that he proceeded with this work on his own responsibility, and it is clear that though there was no agreement in writing Mr. Davies was verbally advised, and still proceeded with the work. I hold that his doing so was a tacit assent to Mr. Bayley's price, which Mr. Statham reported "though the price ruling at the time the work was done" to be excessive at the date of his report. I beg to hand in a letter from Mr. Amos Davies, stating that he was prepared to sign the usual receipt on being paid the amount certified (*Vide Appendix B 2*); also a letter from Mr. Davies, stating his abandonment of all claims on account of the Goonoo Goonoo approaches. (*Vide Appendix B 3.*) I also hand in Mr. Statham's report. He was an entirely disinterested officer, who was sent up there to relieve Mr. Bayley. He became ill from brain fever, but the report was written previous to his illness. (*Vide Appendix B 4.*)

229. Was Mr. Davies paid £5 on this work; if so, why? I have no recollection of that.

230. After the work was completed did Davies claim to be paid at the same schedule of prices as for his first work? Yes.

231. Why was he not paid? Because Mr. Bayley did not certify to it.

232. Have you any documentary evidence to show that Davies concurred in the deductions made on the metal and ballast on this second work; if so will you produce it, and also the tender and specifications for the first work? I cannot produce the tender and specification for the first work; I cannot find them in the office; it is ten years since the thing occurred—possibly Mr. Davies has a copy of them. But with reference to the first part of your question, as to documentary evidence of Davies's concurrence in the price, I have no documentary evidence from him; but I have Mr. Bayley's statement, corroborated by the letter of Mr. Boyd I have put in. I have nothing from Mr. Davies, except that he went on with his work after, as both these men say, he was told the price would be so and so.

233. Was Davies known as the contractor for S-64, being for the construction of four bridges and culverts in Wallabadah Gap? Yes, Davies was the contractor for that.

234. What was the bulk sum of the accepted tender? £823 16s.

235. How much has been paid on that contract? From the admission of Davies there has been paid £823 16s.

236. Was there in this contract the usual condition: "And do hereby agree that any addition, deduction, or alteration shall be valued at the following rates, or at a price to be agreed upon at the time, and added to or deducted from the above amount, as the case may be"? Yes, in the general conditions. May I add that there was a clause also to this effect: "The contractor to satisfy himself of the nature of the material and quantity, as the Commissioner will not hold himself responsible for either." That is a special written clause in the specification. And there is also clause 13 in the printed general conditions: "As this contract is for the entire completion of bridges and road, except ballasting and metalling, it is to be expressly understood that all bolts, screws, rivets, washers, keys, pins, spikes, and all minor parts which may not be shown on the drawings or mentioned in the specification, but which may reasonably and obviously be considered requisite for the proper completion of the work, are to be provided by the contractor and included in his tender."

237. Had Mr. Superintendent Quodling the authority to make any necessary additions, deductions, or alterations, found advisable to carry out this work? Officers in Mr. Quodling's position generally have. I have searched, but cannot find any special authority for Mr. Quodling. I should like to add alterations, not of material importance—not large alterations.

238. Is this power to make alterations usually exercised by road superintendents? Not without consulting me.

239. If alterations were made in the work done, why was not a corresponding alteration made in the amount paid? I cannot tell you why in that particular case; I have not written to or asked Mr. Quodling for any explanation. There is no written statement by Mr. Quodling whether those alterations were made, or, if so, why; but Mr. Quodling is at Murrurundi, and can be examined by the Committee. I have no doubt he will be able to give a good explanation, for he is a very accurate officer.

240. Will you be good enough to furnish to the Committee Mr. Davies's tender and Mr. Quodling's full report of the measurement made and the work done? (*Vide Appendix B 5.*) I cannot trace Mr. Quodling's final I form, but I have the payments on account of the work referred to. (*Vide Appendix B 6.*)

241. Did Mr. Davies claim additional payment after finishing this work? Not to my knowledge. I have no application of Davies's at all near this period for this; cannot trace any reference to it in the correspondence or reports of the officers of that date. It is evident the question was never raised until the claims under contracts 10 and 16 were made, or the department could not have allowed Davies to resume work unless this claim were withdrawn with the others mentioned in letter of 11 September, 1870. Mr. Quodling certified for a certain amount, which was paid without question by this officer. I do not recollect the circumstance of any change. Mr. Quodling is now in the Railway Department at Murrurundi, and could be examined if necessary. There was in this contract a written clause: "The contractor to satisfy himself of the nature of the material and the quantity, as the Commissioner will not hold himself responsible for either." Mr. Davies's schedule rates have no quantities worked out; he tendered a bulk sum and there does not appear to have been any Government schedule with which to compare Mr. Quodling's quantities, but no doubt the question was gone into at the time and settled. We have Davies's own signature to the vouchers as in full of all demands. I fail to see why Mr. Quodling would not have returned for any money due to Davies. There is a question arises in this case to which I would like to draw the attention of the Committee. I refer to A. 14, where an error occurs in the name of the overseer, which is printed "Bevols;" it should be Boyd; Mr. Boyd never did sign either of those documents A. 14 or A. 11, certifying to their correctness.

W. C. Bennett,
Esq.
2 June, 1875.

- W.C. Bennett, Esq.
2 June, 1875.
242. *Mr. Lackey.*] Did Mr. Boyd not sign these? Never. A 11, which is perhaps the more important, and A 12, the forms are printed as if signed by Mr. Nardin, the road superintendent, but Mr. Nardin has not signed them, for if he had there would be no occasion for this Committee, for here he is made to certify to the disputed items. Might I ask for the production of the original documents. (*The original papers were referred to.*) I find that the disputed items are here written in red ink, but no such distinction is shown in the document as printed, and it is therefore calculated to mislead the Committee.
243. *Chairman.*] Have you any more papers to hand in with regard to the matter of the Wallabadah and Goonoo Goonoo bridges under the superintendence of Mr. Quodling? No, except the papers you have asked me for.
244. In the year 1867 was Mr. Davies's tender for £1,096 15s. 6d. accepted for contract 3-67, Sugarloaf Gap? Yes, it was accepted.
245. Are you aware that only two first-class culverts were specified, but that three were supplied? No, I could not trace anything with reference to that on the papers, and I have telegraphed to Mr. Bayley for an explanation, but have not received his reply.
246. Was the length of road embraced by this contract pegged out and cleared some years before this contract was accepted? Yes, I believe it was.
247. Are you aware that Mr. Superintendent Bayley diverted the new road from the cleared line, thereby rendering this extra culvert necessary? I am not particularly aware; he may have found the ground more uneven, and have found it necessary in order to improve it to make a slight diversion.
248. At the time of its completion did Mr. Davies claim payment for this extra culvert? I have no knowledge of it, and can trace no application. He made no claim to me. At the same time I beg the Committee to consider that it is eight years ago, and I am dealing with hundreds, perhaps thousands, of such cases every year.
249. Was Davies paid for this extra culvert? I have no idea that it existed; he may or may not have been paid for it under some other name.*
250. In the memo. on Appendix A 15 Mr. Davies states: "From date of payment to date of final voucher is only four months and five days; the contract time was five months, which time would be extended by the extra work being done. A fine of £21 18s. was hereon imposed; its remission is now sought." Is this memorandum true? No. The specification distinctly states that the time is to be five months from the date of the acceptance of the tender. The date of the acceptance of the tender was the 9th May, 1867; the date of the final measurement was 17th January, 1868,—which was eight months and seven days, which was more than 50 per cent. over the specified time; the amount of extra work was only 10 per cent.
251. What do you say was the time over and above the contract time? Three months and seven days.
252. Do you not consider that the delay in making first and subsequent payments materially retards the contractors in carrying out their work, and affords to them a reasonable ground for extension of time, if required by them? I have no knowledge if that delay existed or not. I know no possible delay is allowed to exist; every nerve is strained to pay the men promptly; in fact we advise the road superintendents by telegram when the payments are ready. Those officers have a large extent of country to attend to; but they do everything in their power to comply with the terms of the contract.
253. Do you know of any just ground why this fine of £21 18s. 8d. should not be remitted, and the amount paid to Davies? I do not see why this matter, disposed of eight years ago, should be ripped up again. The law itself does not allow of such claims—it is beyond the Statute of Limitations. We were constantly harassed by these applications, and feeling that Mr. Davies's complaints were becoming chronic, we were obliged to disregard them altogether. If fines were to be remitted it would become impossible to depend upon contractors to carry out their works; in fact, of late we have given up putting fines in the contracts.
254. Did you, after the completion of this contract, receive on behalf of Mr. Davies any communication from Solicitor Wallace, of Tamworth, respecting the balance claimed on this? We received a communication from Mr. Wallace, the solicitor, of Tamworth.
255. As also for Goonoo Goonoo Bridge, and the metal and ballast for work done on four bridges and culverts on the Wallabadah Gap? I do not know that the work was specially set forth in the communication, but we did receive such a communication.
256. Will you produce the same? Yes. (*Vide Appendix B 7.*)
257. Did Davies ever obtain the certificates of the three preceding mentioned works? The certificates were all sent in, in the usual course, for all the work done, to the office, and those sent to the office were paid.
258. I want to know whether you can say, from your knowledge, Davies received any of these certificates? He never asked for them.
259. You do not know whether he ever did receive them? I think in all probability before the certificates were sent in the whole thing was gone into by the road superintendent with the contractor on the spot, and the certificate sent in was the result of that. We do not usually give certificates to contractors.
260. You do not know of your own knowledge that he did obtain these certificates? No; in fact I might say absolutely I know he did not.
261. You have refused to pay Davies the amount he has claimed? I never refused to pay Davies anything that was certified by any of our officers; of course I refused to pay what he claimed, unless authenticated by the certificate of an officer.
262. Did Mr. Davies in 1870 send to you a letter agreeing to suspend legal proceedings pending your consideration of his claim? No. I think the letter must be that which is withdrawing all claim, which is about that time. There may be such a letter. I will search for it. I know our reply to Mr. Wallace was that we had receipts from Mr. Davies for all the amounts due to him.
263. Did you afterwards devote to Mr. Statham the duty of considering such claim? Yes. I told Mr. Statham to inquire into his claims, and I have put in his report with reference to one of them. There were several claims of Davies's inquired into by Mr. Statham, some three or four, and on his recommendation some two or three were conceded. I did not trouble the Committee with those but only with the
extract

* *NOTE (on revision):*—What I wish to convey is that Davies may have been paid for this under some other contract or work, or on a separate voucher, though it does not appear on the final voucher for the contract.

extract relating to the particular one before the Committee. If they wish, the whole letter can be put in. W.C. Bennett, Esq.

264. Did Mr. Statham become so unwell about this time—in September, 1870—as to render his consideration of the matter in dispute unsatisfactory? No; he was quite competent to make the report at that time. After that time he went to Armidale; it was very hot and wet weather; he wore a white puggaree on his head, had inflammation of the brain, and became delirious. This was after he had sent in his report, and the report itself will show that the man was perfectly competent, as he was before and has been since. He is one of our best officers.

265. Some time prior to this, and after the completion of contract 3-67, did you dispute Davies's right to remove some timber and iron that he (Davies) had purchased at Cox's Creek by public auction? I did not dispute his right to remove the iron.

266. Nor the timber? Yes, the timber, because the timber had been cut on Crown Land for the use of the Crown alone for the building of these bridges, and it was my business to protect the interests of the Crown. A contractor broke down, Mr. Davies bought his timber, and he wanted to exact from another contractor and from the Government what I considered a disproportionate price, the timber being really Government, and the workmanship only the property of Davies. The matter was arranged at law between Davies and the contractor.

267. Did you threaten Davies with a criminal prosecution if he did remove it? Yes; at least I wrote to him to say that he rendered himself liable to a criminal prosecution. That is simply what I did.

268. Are you aware that Davies subsequently got a verdict at law for the full value of the timber and iron that you claimed, and all expenses against the person who did remove this property? There was an arrangement made with Davies and the contractor for the bridge, and they went to law about it, but I have no knowledge of the merits of the case. My point was simple enough; the timber was cut upon Crown land for Crown purposes and was the property of the Crown.

269. *Mr. Dangar.*] How was the Crown protected in this matter by you if Davies ultimately became possessed of this timber? I know the Crown did not lose anything by it; the contractor had to pay this. I cannot tell how the Crown was protected, but I will look up the papers.

270. I understood from you that the reason you took this step was to protect the interests of the Crown? Yes. This verdict was given perhaps not for the value of the timber but for the value of the workmanship upon it.

271. *Chairman.*] With reference to some sheathing at Dangar's Creek Bridge. This was under the supervision of Superintendent Nardin, and in Davies's evidence of 19th May he says: "The next item I believe to be a mistaken measurement—it is the sheathing of Dangar's Creek Bridge, returned as 13 feet wide, whereas the actual width is 15 feet, making a difference in the amount of £5 7s. 5d." Is this true? The mistaken measurement is on Davies's part. Mr. Nardin contracted to have this bridge sheathed 13 feet wide—the sheathing to be laid diagonally; but Davies, in sheathing, put it at an angle less than 45°, and that made it wider. Mr. Nardin did not consider that he would be justified in returning for what he had not ordered, so that though the sheathing was 15 feet wide it was returned as only 13 feet, as ordered.

272. Did the quantity of sawn timber delivered by the sawyers just about suit the sheathing of this bridge 15 feet wide? I have no knowledge of that; Mr. Nardin can answer that.

273. In August, 1872, was Mr. Davies the accepted tenderer for the contracts 10, 16, and 17-72? Yes, I believe he was.

274. Will you produce those contracts? Yes. (*Vide Appendix B 8.*)

275. Are those contracts now completed to your satisfaction? Mr. Nardin has certified that they are completed.

276. Were these performed under overseer Holloway? Mr. Holloway was never in charge of contracts; he was assisting Mr. Nardin.

277. Who drew the plans and specifications for contracts 10, 16, and 17-72? The specifications were drawn by Mr. Nardin, and perhaps amended in the office, and the plans were lithographed; the only plans belonging to the contracts, and recognized by the office, are those lithographs.

278. Had this length of road, contract 10, been let to any person previous to being let to Mr. Davies, and afterwards cancelled? I cannot answer that question.

279. Between the cancellation of the other tender, and the acceptance of Davies's tender, was there any change made in the specification; if so, how, and when was the change made? I do not recollect of my own knowledge that any change was made, but Mr. Nardin says there was, that I made it myself, but I do not recollect it.

280. Was the metal increased, and the 1,500 cubic yards of ballast, specified for in the previous specification, dispensed with? I have no knowledge of that; I do not recollect it.

281. Did you use printed forms of specification, with blank spaces to be filled in, to show the special character of the work you required on this contract? Yes, I think so; they are in the bond at all events.

282. Do you use more than one kind of printed forms? They are amended from time to time.

283. In the formation clause, as filled in for contract 10-72, as let to Davies, what is the meaning of the words, "formation to be in the solid, or made up with metal"; and further on, "all holes, ruts, hollows, or depressions to be filled in with metal"? "In the solid" means to be cut out of the earth entirely, or made up with metal—that is alternative, "or made up with metal."

284. *Mr. Macintosh.*] What do you mean by the term "alternative," in interpretation of that clause? I consider that the context bears on that, that the contract evidently contemplated something besides metal. I have dealt with the specification as a whole, not with any special clause in it.

285. *Chairman.*] I was desirous of knowing in answer to my question what is the meaning of the words "formation to be in the solid";—is it to be understood that it is to be in the solid, or that it is to be made up with metal, and that all holes, ruts, hollows and depressions are to be filled in with metal? I have read the whole together, and Mr. Davies tenders for the formation at 2s. 6d. a yard; the specification says farther down that so much metal is to be provided, and no metal is to be spread until the formation is completed.

286. Then you will not give any direct answer with regard to the meaning of the word "formation"? I would give this direct answer, that it is slightly contradictory, because the formation is contracted for at a certain price. It was never contemplated to make an embankment of metal, and the formation has been done in this way by Davies himself and by every other contractor we have ever had; and if that interpretation

W.C. Bennett, tation is to be taken, that the formation is to be made up with metal, you must read the next clause. If all this were required, Mr. Davies's interpretation of the clause might be turned on himself, and we might have insisted upon his supplying all the metal for this embankment, in addition to the quantity specified.

Req. 2 June, 1875. 287. *Mr. Macintosh.*] It is a schedule of prices is it not? No, it is a bulk sum. It is very specific in the metal clauses afterwards. When the whole or any well defined length of formation is ready to receive metal, it is after measurement, and on receipt of a written order from the road superintendent or overseer, to be evenly spread to a width of 20 feet, and a depth of about $7\frac{1}{2}$ inches, or at the rate of one and a third cubic yard to the lineal yard of road. That is *after* the formation is completed, and then it says afterwards: "The road is to be kept raken in, and maintained with the remaining five-twelfths of a yard of metal to the yard run."

288. We have the words "approved hard material" in the third line obliterated, and in the seventh and eighth lines "ballast or approved gravel"; further on the words "extra material for embankment to be obtained as will be directed from any distance not exceeding"—? They have evidently been obliterated to insert the word "metal"; but if this interpretation is insisted on, the interpretation on the opposite side would be that Davies would be obliged to make all these embankments with metal, and was afterwards obliged to supply the specified quantity of metal.

289. The first clause, giving the general interpretation, is printed, but the other is obliterated, and the special terms are put in, so that the general terms must be interpreted by the special or written agreement? I am prepared to stand by the literal interpretation; and if so, Mr. Davies is obliged to make all these embankments of metal, and afterwards to supply the specified quantity of metal.

290. Special written instructions must override all general printed instructions? I am not prepared to enter upon the legal question, but I am prepared to abide by the literal interpretation of the contract. I wish to put this point strongly to the Committee: If Mr. Davies wishes the literal interpretation of this clause to be taken, it is clear to me he was bound to make the formation first with metal, and then to supply the specified quantity of metal, for it is said, "When the whole or any well defined length of the formation is ready to receive metal it is after measurement, and on receipt of a written order from the road superintendent or overseer, to be evenly spread to a width of 20 feet, and a depth of about $7\frac{1}{2}$ inches, or at the rate of one and a third cubic yard to the lineal yard of road." After the formation is done, which it is specified is to be done with metal.

291. *Chairman.*] Would not these obliterations of these printed words and the insertion of the written word "metal" reasonably lead the contractor to conclude that metal only was to be used in making up the formation? Not if he read the context; he would see it was doubtful.

292. Did Davies's tender include a schedule rate of 5s. 6d. per cubic yard for all the metal supplied on this contract? Yes, for a certain quantity of 3,729 cubic yards; not for all metal for a specific quantity.

293. I would like the answer to be a little more definite. Did Davies's tender include a schedule rate of 5s. 6d. per cubic yard for all the metal supplied on this contract? It included a schedule price of 5s. 6d. per cubic yard for 3,729 cubic yards of metal.

294. That 5s. 6d. would apply to deductions or increases? Yes.

295. Has there been 1,067 $\frac{1}{2}$ cubic yards, at 5s. 6d. a cubic yard, dispensed with, and its value £293 11s. 3d. deducted from the contract? Yes.

296. Were these six culverts dispensed with, and their schedule value of £280 deducted from the contract? Yes, but there were substituted in lieu three pipe drains.

297. Did you visit this work during its progress? Yes.

298. Did Davies, during your visit, show you some new plans which he said had been furnished to him by overseer Holloway, the carrying out of which to the pencil line struck thereon rendered necessary the supply of 4,476 cubic yards of earth embankment to fill up the hollows and depressions? When I was on the work Mr. Holloway produced sections that he had made for their guidance in laying down the pipe drain and culverts, showing the lines of the formation. I then pointed out to Mr. Nardin that the cuttings proposed were rather heavier than could be required under a formation clause, and told him not to carry out the pencil lines shown on these sections, which I cannot recognize in any way as documents connected with the contract; they were merely memo. made by the road overseer for his own guidance; they are not signed by me or by the road superintendent, and were not carried out.

299. Did not the supply of this earthwork straighten and shorten the length of the contract 7 lineal yards, besides enabling you to dispense with the metal specified in the contract to be used in the ruts, hollows, and depressions? No; the culverts, it was found, could be dispensed with for various reasons; the shortening of the contract 7 yards is immaterial. It may or may not have done that, and in fact the question of formation had nothing whatever to do with the supply of metal; the metal clause is entirely distinct from the formation. A certain quantity of metal is specified to be supplied and spread a certain width and depth "at the rate of $1\frac{1}{2}$ cubic yard to the lineal yard," and the remaining $\frac{1}{2}$ to be used for maintenance metal afterwards. The formation clause stands alone; whether it was to be done with metal or earth is open to question.

300. What I was wanting to know from you with regard to this question was, would the supply of this earthwork straighten and shorten the length that was contracted for, and by so doing enable you to dispense with the metal specified in the contract? No.

301. Did the construction of this earth embankment have the effect of diverting the water to fewer openings, and so enable you to dispense with six out of ten culverts originally specified? No, I do not think so.

302. If metal to the value of £293 11s. 3d., and six culverts of the value of £280, has been saved, what objection have you to pay Mr. Davies for the supply of 4,476 cubic yards of earthwork substituted for the metal ordered, and for which Davies now claims 1s. 3d. a cubic yard? I cannot see why Davies should be paid for 4,000 yards of earthwork to save 1,000 yards of metal. It would be an anomaly, and if he is to be paid for replacing metal with earthwork it ought only to be to the same extent as the metal saved, but I cannot admit that he is entitled at all.

303. Did you, on your visit at the time referred to in one of the previous questions, amend or in any way alter the pencil line in the new plan, and then leave such plan with Davies to carry out? I objected to the depth of the cuttings, and reduced them considerably to what I thought was fairly comprised in the term formation, for which Davies had tendered half-a-crown a yard.

304. After going over the whole of this work in progress on contracts 10, 16-72 in company with Mr. Nardin, Mr. Holloway, and Mr. Davies, did you not express to Davies your approval of the manner in which such work had been carried out? Yes.

305. Will you produce the new plans referred to? I cannot recognize them as new plans; they are simply memoranda made by the road overseer to assist him in determining the position of the culverts. W.C. Bennett, Esq.
306. During the erection of the first ashlar culvert, did Davies call your attention to the fact that he was obliged to do a better class of work than was required; that instead of rubble he was putting in ashlar work? It is not ashlar work, and Davies did not call my attention to it. 2 June, 1875.
307. Will you produce the printed specifications for the stone culverts in contracts 10, 16, and 17-72? They are already before the Committee. I say that Mr. Davies did not draw my attention to it; but I, of my own motion, drew the attention of the road superintendent—as they were the first works of the sort—to the fact that they were unnecessarily neat on the front; and said that I would rather have what I considered good honest work, rough and strong, than this neat work. It appeared to me that the stones were all edgers, what they technically term soldiers. I left written instructions to the effect that what was required in a stone culvert was good flat-bedded masonry.
308. Do you think that Mr. Davies's estimate in detail of the trade difference between ashlar and rubble, of £1 5s. 3d. per cubic yard, as shown in the Appendix to his evidence, is a fair estimate? I never went into that, for I never considered they were ashlar.
309. Has Davies ever offered to accept the bulk sum of his accepted tender in full payment of his claim? Yes, in this way: I went to Tamworth with the view of going into these things on the ground; I met Davies and asked him for an explanation; but all the explanation I could get from him, was, "I want my bulk sum; I want my bulk sum; I want my bulk sum" reiterated. That was all the explanation I could get out of him.
310. What is the amount of the tender for contract 10-72? £1,911 8s. 6d.
311. And the amount you paid him on that? £1,421 4s.
312. On contract 16-72 Davies claims payment for 1,468 cubic yards of earthwork embankment at 1s. 3d. per yard; and this was supplied in obedience to new plans given to him by overseer Holloway, shown to you, and after your emendation of the pencil line given to Davies as his guide in carrying out the work;—what objections are there to payment for this earthwork? Because it was included in his formation, tendered for at half-a-crown a yard. If not I cannot see what that half-a-crown a yard was put in for.
313. What was the value of the metal dispensed with on this contract? 215 yards of metal appear to have been dispensed with.
314. Davies claims £126 11s. 5d. for ashlar work done in culverts;—was ashlar work done in these culverts instead of rubble work? No; "first-class coursed rubble work, set in mortar" was specified for "quoins to be hammer-dressed."
315. He also claims £40 for two months' maintenance of road, as per tender of £20 a month;—was this £20 a month a stated condition of Davies's accepted tender? It is not in the specification.*
316. There are other items—34 cubic yards of 5-inch ballast at 4s. 6d. per cubic yard, £7 13s., and another item of £2? Really I am not prepared to give an answer upon these small things. I confined myself to the two questions of ashlar and earthwork.
317. Davies also claims £10 0s. 8d. in Appendix A 17, for sheathing done on bridges at Liverpool Range and Doughboy Hollow? This sheathing was specified to be 2 inches thick, and he claims for 2½. Mr. Nardin explains it to me, that from some difference in the railway tariff Mr. Davies could carry 2½ plank as cube timber. I do not know the details, and that he preferred to supply it himself, as he got it cut for the same amount. Mr. Nardin instructed him to put 2-inch planks on, and he was paid for what he was instructed to do. If he put planking a quarter of an inch thicker of his own motion, we do not think the Government should be obliged to pay it. Supposing he had chosen to put 4-inch sheathing he could hardly have come to us and demanded double the amount of his contract. We should have no control over the contractors if we allowed them to act as they liked, and then to come to us for payment of sums in excess of their contracts. We have only a small amount of money at our disposal and we feel bound to economize as far as possible.
318. *Mr. Cameron.*] This extra thickness of timber was used by mutual consent? No, it was Mr. Davies's own act, and he would have had a stronger ground of complaint against the Department if he had offered to use 2½-inch without extra payment and we had insisted upon 2-inch. He might have said that he had offered to do what was better for the Government, and we had objected.
319. It was done with a view of obliging Davies? Yes.
320. *Chairman.*] The second clause of the general conditions of road contract says: "No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner, and countersigned by the Superintendent." Has it been the practice to furnish the contractor with such written order when additions, deductions, and alterations have been found necessary in carrying out contracts? As far as possible it has been the practice; when it is not possible to get my signature, which is not always the case, an order signed by the Superintendent is sufficient.
321. Has Davies at any time been furnished with such an order, signed by the Commissioner and countersigned by the Superintendent, on any contract? I do not know that he was ever furnished with an order signed by me—I am not sure.
322. With respect to the foregoing works, has Davies ever been furnished with the final certificates referred to in the 15th clause of the general conditions, which states, "that the obtaining of such certificate shall be a condition precedent to the contractor having any claim or cause of action"? He has been furnished with copies of them—I do not know whether they have been signed in due form. If he wants them we can furnish them—of course we cannot furnish him with certificates for work to which our officers have declined to certify.
323. I want a direct answer to the question I have just put? He has been furnished with copies of the certificates.
324. Would that be considered by the 15th clause? We have no objection if he asks for a signed copy to give it him.
325. What extent of alterations, additions, and deductions was made in contract 17-72, without a written order signed by the Superintendent and subsequently concurred in by the Commissioner for Roads? I am

NOTE (on revision):—I failed to find this clause when being examined. I now find that it is provided for in both specifications; in No. 10 until thoroughly consolidated by traffic and roller; and in No. 16 for a period of two months after the completion of the work.

W.C. Bennett, Esq. am not prepared to answer that question, for I did not get up the facts of contract 17-72, but I will state this, that any alterations made in that contract were made on my written order to the road superintendent—I remember enough of the case to say that.

2 June, 1875. 326. Will you produce the final certificate for contract 17-72? Yes. (*Vide Appendix B 9.*)

FRIDAY, 4 JUNE, 1875.

Present:—

MR. CAMERON,	MR. T. G. DANGAR,
MR. COHEN,	MR. SCHOLEY.

H. BENNETT, Esq., IN THE CHAIR.

Mr. George Holloway further examined:—

- Mr. G. Holloway. 327. *Chairman.*] Do you remember attending a public auction sale of contractor Atchison's timber and iron at Cox's Creek? Yes.
- 4 June, 1875. 328. As the Government officer, had you received instructions to purchase? Yes.
329. Did you do so; if not why not? I did not, because I had not sufficient money at the time.
330. On your telling Davies, did he offer to send you sufficient money to purchase? He offered to lend me sufficient money.
331. Did you avail yourself of this offer? No.
332. Did Mr. Davies afterwards authorize you to go to the new contractor, Mr. Turner, and to say if he would purchase, Davies would send him the money to do so? Yes, Davies asked me to do so, and I did.
333. Did Davies afterwards become the purchaser at auction? He did.
334. Was this timber and iron afterwards sold by a police officer*? Yes, he was a police officer stationed at Gunnedah.
335. Did Davies afterwards sue the new contractor for the value of the timber and iron? Yes.
336. Did you, and the road overseer, Mr. Donaldson, attend as witnesses at that trial? Yes.
337. From your own knowledge of the property sued for, did Davies get a verdict for the value of the whole of the timber and iron that he purchased? I believe he got my estimated value.
338. Did you, about this time, call on Davies to go with you to meet Superintendent Bayley at Bowling Alley Point, regarding claims Davies had against the Government for work previously performed? Yes, at the instance of Mr. Bayley.
339. Do you know the contract 3-67, carried out by Davies? I know the contract 3-67.
340. That was carried out by Davies? I believe it was.
341. Cannot you say whether it was or was not? I passed over it once, and saw Mr. Bayley, and Mr. Davies with him, and I supposed Davies was the contractor.
342. Can you not say yes or no? I had not charge of the road then.
343. Had you any doubt about it? No.
344. There are two or three first-class culverts on that work†? Three first-class.
345. Did you ever give orders on behalf of Mr. Nardin for Davies to commence that work? No; because Mr. Nardin was not the superintendent.
346. Did you ever give orders on behalf of Mr. Nardin? Not on that contract.
347. Some time after did you make longitudinal plans on the line of road on contract 10 and 16-72? I made sections of 10 and 16-72.
348. Are those the new plans referred to as made by you? (*Witness examined the plans handed in by Mr. Bennett.*) Yes, these are the plans I referred to.
349. Who struck the pencil lines on these new plans? Mr. Nardin.
350. Did the Commissioner see these plans and amend the pencil line? Yes, I believe he saw the plans and amended one portion of them.
351. Were these new plans afterwards left with Davies to bring up the line of formation to the pencil line without embankments‡? Yes, they were.
352. Do you know what it cost Davies for stone delivered on contract 10 and 16 for the metal supplied? I think there was some delivered there for 2s. 3d. a cubic yard.
353. Would any of that stone have been suitable for building rubble work? I believe some of it would.
354. Has Davies got an efficient contractor's working plant? He had when I was in charge of the district.
355. When Mr. Murphy used broken ballast to make up hollows in the formation of the contract opposite to M'Mahon's, between Davies's contract 10 and 16, did you pay at per cubic yard for the quantity of ballast there used? Yes, there was a schedule price for the ballast.
356. Up to the time of Davies taking contract 10, 16-72, can you point out to the Committee any one contract that would have been likely to have come under Davies's knowledge where the metal supplied has not been stacked, measured, and paid for at per cubic yard? No—metal on all contracts has to be stacked and measured before it is spread; that is in the general conditions.
357. Is 5s. 6d. per cube yard for 3-inch metal a low price for contracts 10 and 16? It is reasonable; I could not say very low.
358. Is 1s. 3d. per yard for earthwork a reasonable price? In some of the banks it is a reasonable price, according to the length of cartage.
359. Were the designs of the culverts altered? Partially so in one that I saw; in the parapet-wall it was square instead of round, I think.
360. Are the four culverts and three drain-pipes doing the duty of ten culverts as originally specified? I could not say that positively, because the four culverts were not built when I was there.
361. From your own knowledge had Davies ever received a written order, signed by the Commissioner and countersigned

* NOTE (*on revision*):—I understood my reply was to a question, "Was the timber and iron sold by a police officer?" the word "afterwards" omitted.

† NOTE (*on revision*):—I understood the question to be "Are there" instead of "There are two or three culverts, &c."

‡ NOTE (*on revision*):—I understood this question to be *with* embankments, instead of "without."

countersigned by the superintendent, for all alterations, additions, and deductions done by him? Not to my knowledge.

362. Since the Commissioner visited that contract 10, 16, has it not been regarded as certain that Davies would claim payment for the earthwork in the embankment, and an increased rate for culverts? I heard some rumours in reference to that.

363. *Mr. Scholey.*] You do not know it? No, not positively.

364. *Chairman.*] Did you consider, after yourself and Mr. Davies met Mr. Bayley at Bowling Alley Point, that Government owed Davies for past work done? I came to the conclusion that something was owing to Davies just from the tenor of the remarks of Mr. Bayley and Mr. Davies.

365. For what purpose did you go there? Mr. Bayley sent me a letter to bring Mr. Davies to Bowling Alley Point; I did so, as he required.

366. Has Mr. Davies ever remarked that he would require the payment of the bulk sum of the contract 10 when he was signing advance vouchers for that? I have some recollection at the time* of seeing the work, of his saying that he wanted the bulk sum, or something to that effect.

367. *Mr. Scholey.*] At any time did you give orders from Mr. Nardin for Mr. Davies to do work? Yes, I gave him authority to start the contract after the bonds were signed—a written authority was required.

368. That was in the place of Mr. Nardin? On behalf of Mr. Nardin.

369. You say that Mr. Nardin struck the line on these plans? Yes.

370. Were you there? Yes, I was there at the time.

371. With reference to the culverts, you say there is some alteration;—has that alteration made the work more expensive than the original plan? Yes, I think there was more stone in it; it was square instead of round.

372. What do you think would be about the difference in the expense? A matter of four or five pounds on each culvert.

373. I suppose you are aware that Government has paid Davies since this conversation between you and Mr. Bayley? Yes, since that conversation money has been paid to Davies.

374. Might not the whole of these claims have been paid? They might without my knowing it; some money has been paid that has gone through my hands.

375. You do not know whether it was for this matter or not? No.

376. You are not sure that Government owe any money to Davies? No.

377. *Mr. Dangar.*] During what portion of this contract were you superintendent of roads? Not at any time.

378. What position did you occupy? Road overseer.

379. Were you in that capacity during the execution of the works in dispute? No, I was not.

380. You have stated that the work of the culverts was ashlar? Yes, I believe it was.

381. Did you ever superintend any masonry work before to enable you to judge what was ashlar and what was not? No, I did not.

382. What was the difference between the work specified for and ashlar? Ashlar I understand to be punched and picked, jointed and bedded.

383. Did Mr. Nardin through you order any change in the character of the work? No.

384. *Mr. Cohen.*] Did you of yourself, irrespective of Mr. Nardin or of any superior officer, give instructions to Mr. Davies to alter the character of his work? No.

385. You were asked as to the difference in the value between four culverts and three drain pipes put down in lieu of ten culverts, and you said the difference in the value of the culverts would be about £5 each? Yes.

386. I understand the original specification to have been for ten culverts instead of four culverts and three drain-pipes? I could not say whether that was so, because I left before the whole of the culverts were formed.

387. Assuming that you knew what those culverts were — ? I saw only one culvert built and another commenced.

388. Have you seen the drain pipes? Yes.

389. Can you form an estimate of the difference in value between the four culverts and three drain-pipes as now put down, and the ten culverts originally specified? I could not.

390. You were asked by Mr. Dangar whether you gave orders to Mr. Davies by authority of Mr. Nardin, and I understood you to say that he gave authority to start with the contracts? Yes, it was usual for him to get the bonds signed and then to authorize me to start the contract.

391. Are those the only orders you gave on behalf of Mr. Nardin? Yes, in writing.

392. Did you ever give orders verbally? In some little matters.

393. You referred in your previous evidence to having given orders in some little matters—for some few pounds? Yes, in case of repairs being urgently necessary in time of floods. If a hole were washed under a culvert, and the soil was likely to shift, I repaired it at once without instructions from the head office.

394. Then I take it that the orders to which you have already alluded in your evidence are all the orders you ever gave Mr. Davies to authorize him to depart from the original specification? Yes.

395. *Mr. Cameron.*] You have stated in your evidence that certain portions of these culverts has been done with ashlar work? Yes.

396. Were they specified to be ashlar or rubble? Rubble.

397. Rubble work is work roughly composed of stones without dressing? Yes.

398. Could you give the Committee a rough estimate of what the difference would be for having altered the work from rubble to ashlar work? I could not. I never studied the matter at all.

399. As a matter of fact is ashlar work more expensive than rubble? Yes, I should say so, because it is punched, picked, and jointed. ‡

400. You said in answer to the Chairman's questions that there had been some slight alterations in these culverts; for instance, that they had square instead of round parapets; would not square parapets be more expensive? They would be in that class of work.

* NOTE (on revision):—Of signing advance voucher.

† NOTE (on revision):—My answer to this question refers to work done at Goonoo Goonoo Creek at Tamworth, and contract 3-67. I was overseer on contracts 10 and 16-72.

‡ NOTE (on revision):—Yes, because the stones were cubed, with punched-in picked beds and joints.

- Mr. G. Holloway.
4 June, 1875.
401. Would it not be in any class of work where there was a parapet? With rubble work it would be necessary to have it round.
402. In any dressed stone would it not be less labour to put on a square parapet than a round one? I should think so.
403. Were you present on the works at the time of the visit of Commissioner Bennett? Yes.
404. Do you recollect anything taking place about Davies offering to take a bulk sum of money? I do not remember anything of that sort on the works.
405. Do you remember any other occasion on which Mr. Davies wanted to take the bulk sum of the contract instead of any claim he had? Not at that time.*
406. At any time? I was asked a question, when the advance vouchers were being signed, and Davies signed the vouchers, but that was some time after.
407. *Chairman.*] Was the subject of Davies's claim for any further payment on account of the Goonoo Goonoo Bridge and the approaches to Tamworth discussed at Bowling Alley Point? I believe it was discussed at that time.
408. *Mr. Dangar.*] The answers you have given to Mr. Cameron's questions are merely your private opinion; you are not skilled in masonry? No.
409. *Mr. Cameron.*] Still any man who knew anything of ordinary masonry could with a certain amount of truthfulness give evidence whether work was ashlar or rubble? Yes, if he had given the matter any study.
410. *Chairman.*] Do you know the difference between ashlar and rubble work? There are several kinds of ashlar work, as far as I have read. The work there is not what I should call rubble, and therefore I suppose it to belong to the next class of work, which is ashlar.
411. *Mr. Cameron.*] You consider ashlar to be dressed stone, laid in jointed courses, and rubble to be undressed stone of any size, put into any position in which it will fit.

Ernest Anthony Nardin, Esq., examined:—

- Mr. E. A. Nardin.
4 June, 1875.
412. *Chairman.*] What position in the Government service do you hold? Superintendent of Roads.
413. Do you know Mr. Davies as having been the contractor for sheathing Dangar's Creek Bridge—contracts 10, 16, and 17-72—and for sheathing three bridges at Liverpool Range and Doughboy Hollow? Yes.
414. How many of these works were finished under your supervision? All, except the sheathing of the bridges at Doughboy Hollow—that is to say, 16 was not quite completed; but the principal part was done under me, excepting the sheathing of the bridges.
415. Were those contracts that were finished completed to your satisfaction? Yes, those that I have certified for.
416. Was Dangar's Creek Bridge sheathed 15 feet wide? Yes.
417. Did the specification for contract 10, as let to Mr. Pyrk, of Nundle, contain a provision to supply 1,500 cubic yards of ballast, to be used outside scrap hollows and depressions at per cubic yard? I estimated in the first place for ballast. I am not sure whether it was advertised in that way, but I know the specification was altered afterwards; but I think Mr. Pyrk's tender will show that he tendered in the same way. I am not sure, but there are the tenders to refer to.
418. Will you produce Davies's tender for that work under that specification? They are not in my possession.
419. Did Davies ever offer to do that contract without receiving any money advances till the year following—No. 10? I think he did. I think there was something said about it.
420. In the specification and contract, as let to Davies, was the 1,500 cubic yards of ballast in the preceding specification dispensed with, and the metal increased in quantity? Certainly—a fresh specification with the ballast struck out and metal put in the place of it. We make roads in both ways.
421. Who made the change in the specification, dispensing with the ballast and increasing the metal? The Commissioner for Roads.
422. After Davies commenced on the contract 10 and 16, did Mr. Holloway make longitudinal plans of the line of road on these two contracts, and forward such plans to you? Yes, by my instructions.
423. While these plans were in your possession did you put on this a longitudinal pencil line that runs in places several feet along the then line of road? I did, for Mr. Holloway's guidance, as an experimental line only.
424. Did you afterwards return these plans to Mr. Holloway to give to Davies? I returned them to Mr. Holloway, but not to give them to Mr. Davies.
425. Would it require the supply of 4,476 cubic yards of earth embankment to bring up this line of formation to the pencil line referred to? I cannot say. I never measured it.
426. Did the Commissioner ever see these plans and amend or alter your pencil line on them, and afterwards leave them for Davies to work to? The Commissioner saw these sections. When he was on the ground he thought the cuttings too deep and the banks too high—unnecessarily so—and he instructed me to reduce them. I have his written instructions to that effect. (*Vide Appendix C 1.*)
427. Did the Commissioner after inspection and consultation with you approve of the manner in which the work had been done? Yes, with those exceptions referred to in the letter I have read. Those were the remarks he made on them.
428. Did this earth embankment shorten the lineal length of the road seven yards? I do not know that it did. I do not see how that could be effected, the formed road being on the old cleared line, unless the undulations were followed.
429. Did you dispense with 1067½ cubic yards of metal, and deduct its value from the contract as per cubic yard? I cannot say how much I dispensed with, but I have a letter here which refers to the matter. (*Vide Appendix C 2.*)
430. Will you produce the reply of Mr. Davies? I have not it.
431. Will you furnish it? I left all my papers at Murrurundi with Mr. Donnelly.
432. *Mr. Cameron.*] Can you give the substance of his reply? Certainly, agreeing to these terms.
433. *Chairman.*] Did you dispense with six culverts, and deduct their value from the contract? My final certificate shows how many; I know there were some deducted in consequence of what the Commissioner wrote to me.

* NOTE (on revision):—He did when signing advance vouchers some time after.

Mr. E. A.
Nardin.

4 June, 1875.

434. Do you put in that final certificate? It is in the possession of the Commissioner.
435. Did you ever report to the Commissioner for Roads that Davies's claim should be paid for the earthwork supplied to make the embankments and formation? Yes.*
436. When Mr. Murphy used broken ballast to fill up hollows in the formation of the contract opposite M'Mahon's, between Davies's contract 10 and 16, did you pay him at per cubic yard for the quantity of ballast he used? I do not remember that there was ballast there, it is so long ago; of course if he supplied ballast he was paid for it. Sometimes we make ballasted road—sometimes metalled.
437. When Mr. M'Call broke ballast to make up depressions in the formation on his contract, near the Company's old sheep station, between Davies's contract 16 and 17, did you pay him for the quantity of ballast used in the formation, in addition to so much per lineal yard for forming? I cannot remember if he used ballast; if he used it it was measured and paid for in the usual way.
438. Could you not say whether you did pay him or not? I could not from memory.
439. You have no memorandum of it? I did not know that such a question would be asked; if I had known I could have referred to papers. I could not speak from memory.
440. Was Davies's schedule rate for forming on contract 10 and 16, 2s. 6d.? I believe it was, but the tender will show.
441. In addition to the 3s. per lineal yard, did you pay him for the earth supplied to make up the approach up to the proper level? Certainly not; I paid him by the lineal yard for forming.
442. In addition to the 3s. per lineal yard, did you pay him for the earth supplied to make up the approaches to the proper level? No.
443. Do you know any reasonable cause why Davies should not be paid for the earth embankment on the contract? Because it is included in the stipulated price for forming.
444. Up to the time of Davies taking contract 10, 16-72, can you point out to the Committee any one contract that would be likely to have come within Davies's knowledge where the metal supplied has not been stacked and measured at per cubic yard? Never was such a contract; metal always is stacked and measured before being used.
445. Is 5s. 6d. per cubic yard for 3-inch metal a low price on contract 10 and 16? Yes, it is rather low; about 6s. I think is the usual price.
446. Is 1s. 3d. per cubic yard for earthwork a reasonable price? That is high.
447. Is 4s. 6d. per cubic yard for 5-inch ballast a reasonable price? Yes.
448. Have you any knowledge of the price that Davies paid for stone delivered on contract 10 and 16—for metal supplied? No.
449. Were the designs of the culverts altered? No, not that I know of.
450. Are four culverts and three pipe-drains doing the duty of the ten culverts originally specified? No, there were wooden culverts specified, I think, when there were to be ten; now we have culverts and pipes. The Commissioner himself dispensed with them.
451. Would any of that stone have been suitable for building rubble work? Not such work as was described for these culverts. It would have made random rubble, but that is not what is described.
452. Do you mean to say that none of the stone you saw was suitable? Not for coursed rubble, but for random rubble, and the former had been described.
453. Is the quality of the stone and the workmanship in the culverts better than what was specified;—are they built of ashlar instead of rubble work? No, certainly not ashlar.
454. Did you concur in all the changes that had been made in contracts 10 and 16-72? In all those changes which are shown by the final certificate to have been made.
455. Do you know the usual detailed trade difference between rubble and ashlar work? Yes; I can give my definition of it. Ashlar I look upon as either chiselled, tooled, or picked with through stones and joints crossed,—that is ashlar. Then with a draft round is rock ashlar. Then there is random rubble and coursed rubble in same course; one stone may have full height, and the rest may be in two heights, but they are all good large stones, and are described in the specification as not less than half a cubic foot. That is first-class coursed rubble with quarry faces. Random rubble is any sort of stone laid at random.
456. The specification for stone culverts enjoins that the roadway shall have a level of 5-inch ballast and 3-inch metal;—did you pay for the metal at per cubic yard and leave the ballast unpaid for, both being specified and both done? That is included in the price of the culvert itself. So far as I can remember, I went over the final certificate with Mr. Davies, and everything that was reasonable, proper, and just, in my idea I allowed him, and the only two items we could not agree about were this large quantity of earthwork which he claims, and which I maintain is part of the forming, and the extra quality of work in the culverts. I stated he must deal with the Commissioner if there were ambiguity in the matter, and that if he would write to me I would send his letter on to the Commissioner with my report, and if he did not like that he must appeal to the Commissioner direct.
457. Did you concur with Davies in increasing the size of the sheathing on the three bridges? No, not in increasing the thickness. I concurred in this way: as he acknowledged that he made a saving by it, I let it go.
458. Will you explain how he made a saving by his timber? Mr. Davies informed me that by the sawyer's measurement at Newcastle, 2½ in. could be had for the same price as 2 in., and that the additional ½ in. brought it within some regulation of the railway, by which it could be brought at a cheaper rate than 2 in. could have been.
459. Mr. Dangar.] Then the substitution of 2½ in. for 2 in. was in favour of Davies? Yes.
460. Then you allowed it for the advantage of the contractor? Yes.
461. Chairman.] Does not the increase of a quarter of an inch thickness of sheathing increase the wearing power of the bridges, and enable it to bear a larger amount of traffic? I think 2 in. would see out these old floors; of course 2½ in. is stronger; that is obvious to anybody.
462. Are you aware that the four bridges in Wallabadah Gap, that you ordered Davies to sheathe with 2 in. stuff, have been taken from Davies and given to Connell with 4 in. stuff, the full width of the bridges? I know nothing of the sort.
463. Has Davies ever been furnished with original final certificates for the aforementioned works? Not from me.

* NOTE (on revision):—Reply given in error—corrected before the termination of my evidence.

- Mr. E. A. Nardin.
- 4 June, 1875.
464. Have you ever heard or known that the Commissioner for Roads has refused Davies permission to obtain certificates? The Commissioner instructed me that it was not usual to give them. I never furnished them before, and the Commissioner informed me that it was not usual to do so.
465. From your knowledge, has Davies ever received a written order from the Commissioner, signed by the Commissioner, and countersigned by the superintendent, for alterations, additions, and deductions in the contracts done by him? Never under me.
466. Since the Commissioner visited contracts 10 and 16-72, has it not been regarded as certain that Davies would claim payment for the earthworks in the embankment, and an increased rate for culverts? After the Commissioner left, some time afterwards, Mr. Davies first mentioned this claim to me. I have a letter here from him, which I beg to hand in. (*Vide Appendix C 3.*) I also beg to hand in copy of a letter from myself to Davies. (*Vide Appendix C 4.*)
467. Contracts 10 and 16 being within a short distance from each other, did you, after Davies commenced work, suggest that a steam metal-breaking machine should be procured for the metal supply? A conversation arose about that, and I gave Mr. Davies all the information I could in reference to the working of it in Maitland under me.
468. You did not say that he must provide it then? Decidedly not. I told him to be very careful, in fact to calculate well before he bought it.
469. *Mr. Cameron.*] As a matter of fact it does not matter to you how the metal is broken so long as they are well broken? No; and I explained that the machine did not break it so well as the hand—that it broke the metal into flat instead of cubical, and that the Commissioner required it to be screened.
470. *Chairman.*] Did the Commissioner, by a written communication, concur in such a machine being procured? In my next monthly report I mentioned to the Commissioner that Mr. Davies had done this thing. The Commissioner was pleased, and said he was glad to hear of it, and I told Mr. Davies so. It was a quick way of getting through the work.
471. Will you produce a copy of your letter, dated 8th February, 1873, relating to the Commissioner's ordering that metal should be broken by hand, and Davies's reply thereto, dated 10th of the same month? Yes. (*Vide Appendix C 5.*) The reply I have already handed in—it is marked Appendix C 3.
472. On tenders being called for in your district for road work, have you known higher tenders than Davies's to be accepted? One, I think, from Currabubula to Tamworth.
473. Has Davies ever failed to do his work to your satisfaction, or hesitated to do anything you ordered in regard to work then in hand? No.
474. Have you any reason to conclude that Davies and the Commissioner for Roads have been of contrary opinions for years past? I heard about some bridge work some years ago—long before I saw Mr. Davies. I knew there had been some discussion, and that Mr. Holloway had been mixed up in it. Mr. Holloway told me all about it.
475. Has Mr. Davies an efficient contractor's working plant? Yes; at least he had.
476. *Mr. Cameron.*] You have, I presume, had several years practical knowledge of earth and brick work? Going on seventeen years in this department alone.
477. With reference to these culverts, were they originally specified to be built in rubble or ashlar work? Ashlar was never mentioned—"first-class coursed rubble."
478. You condemned the stone that Davies brought on the ground because you believed it was not fit for rubble? I told Mr. Holloway that it would not do.
479. Was it the quality of the stone you objected to? It was of blue metal and of all shapes; you could not get a bed.
480. Have you any knowledge of the fact, that Mr. Davies has made an offer to Mr. Commissioner Bennett, or anyone else, to take the residue of his contract money without any extras at all to settle this business? I think he asked the bulk sum in discussing this question.
481. When Mr. Bennett was up there? No, I think it was in the office when I was called down about twelve months ago.
482. Did you notice anything particular in his manner, reiterating that he declined to go into the matter at that time? No, at that time it was all settled, when he demurred to what he had previously agreed before the Minister to do. The Commissioner wrote an account of that agreement and I signed it, and Mr. Davies afterwards refused to act up to what he had agreed to do in the presence of the Minister; at least what I understood him to have agreed to do.
483. You are aware that the two largest items are with reference to contracts 10 and 16? Yes.
484. Do you know the different items he claims for each of these contracts? No.
485. You are not aware that for contract 10-72 he claims a sum of £448 ls.? I do not know the particulars of his claim.
486. Provided he has done so, can you give the Committee any opinion whether that is a reasonable or an unreasonable claim? As I consider he is not entitled to anything at all I think it is a most unreasonable one.
487. He has also made a claim for £267 19s. 5d., for contract 16-72;—is your opinion the same with regard to that? Yes, decidedly. I have certified in all cases for what he is justly entitled to, and cannot admit that he has a right to anything beyond that.
488. With reference to the sheathing of the three bridges at Liverpool Range, is it the fact that the sheathing is wider than it was originally specified to be? I never saw them; that work was done after I left.
489. Presuming it were so, is it not usual in contracts of this kind for a discretionary power to be given to the party overseeing the work to make slight deviations from the original contract? There was an agreement for this, but I forget now what it was.† I left before the work was done, and never saw the timber.
490. As a matter of fact, is it not usual to insert such a clause in the specification —? That any change shall not vitiate the contract—Yes.
491. *Mr. Dangar.*] The Chairman asked you did you ever report to the Commissioner, recommending Davies's claim for this earthwork, and you replied Yes? Decidedly not so. (*The Short-hand writer read his note of the preceding evidence.*) If I did make such an answer it is incorrect. I understood the Chairman to say had I reported upon this claim made by Mr. Davies, and I answered Yes.

492.

* NOTE (on revision):—This question is evidently intended to refer to Dangar's Creek Bridge; my reply refers to bridges on the Liverpool Range.

† NOTE (on revision):—This reply likewise refers to the bridges on the Liverpool Range.

492. Will you be good enough to produce that report? Yes. This is my report upon the letter which was sent to me by Davies to be sent to the Commissioner. (*Vide Appendix C 6*)

493. Why did the Commissioner order the metal to be broken by hand? I ordered that.

494. For what reason? The machine broke down.

495. It was making no progress with the work? Yes, the jaws would not work, and Davies had to get fresh jaws, and could not proceed with the work.

496. As this has been stated to be different from other contracts, is there any reason why the metal should be supplied without measurement to make up these banks? If the banks had to be made of metal there would have been no measurement about that; it is only covering metal to be measured.

497. This contract is stated to be different from other contracts. I ask you is this any reason why the metal should be supplied without measurement to make up these banks? If that specification were adhered to —

498. I will come to that presently. This contract is stated to be different from other contracts; there are some words obliterated and others interlined;—is that any reason why the metal should be supplied without measurement to make up these banks? Not to be measured if it were to go into these banks, of course not.

499. The instructions read by you from the Commissioner were general and not applicable to Mr. Davies's work only? I think Mr. Davies's were the only two works of construction going on at the time. Yes, there was 19.

500. Then it applied to others as well as to his? Yes, I think there was one other—Conlan's. I remember now that Conlan had no stone culverts; therefore that applies entirely to Davies, who built the only stone culverts there.

501. Are the usual memoranda given by the Commissioner when he goes through your district? He always leaves me memoranda for my guidance.

502. What proportion of this work was done at the time of the Commissioner's visit? There was not much done to 16; I think 10 was about half done.

503. Can you explain why Davies did not make his claim before the Commissioner's visit? I do not suppose he ever thought of it.

504. Were the Commissioner's instructions not intended to apply to future works under you? Yes, for my future guidance.

505. We now come to the contracts 10 and 16-72. If the strict interpretation of the first paragraph of formation clause was insisted on would not the contractor have been obliged to make all the embankments of metal? Certainly he would.

506. That is your interpretation of that clause? That would be an absurdity. It is ambiguous, but must be read with the other portion. I interpret it that the formation was to be done in the usual manner, and that after traffic over it, all holes, ruts, and depressions made by such traffic were to be filled up with metal.

507. Did you ever explain your interpretation of it to Davies? Yes, I explained it to Mr. Davies, and told him that I must refer him to the Commissioner for Roads.

508. When did Davies first make a claim for payment for this earthwork? In November, 1872.

509. After Davies had completed formation was he bound by the second clause of metal specification to metal such formation 20 feet wide, 7½ inches deep, or at the rate of 1½ cube yard to the yard run? Yes, that was the measured metal for the construction specified for in that clause.

510. Has he done so? He supplied sufficient—as much as we wanted. The quantity measured will show what he has put on—I could not say the exact quantity; I think it was a little under.

511. You are sure it was not more? Yes.

512. Have you any idea of the quantity of such metal he did supply? I can furnish it. (*Vide Appendix C 7*.)

513. In blinding clause of contract 10—the last paragraph—is not the contractor bound to supply five-twelfths of a cubic yard of metal on side of road after completion for maintenance? Yes, five-twelfths.

514. He is bound to do so? Yes, if required.*

515. Did he supply that quantity? No, we had not the money to pay for it, and we had to reduce the quantity.

516. Was he agreeable to this reduction? There was a letter from him which cannot be found, in which he expressed his agreement.

517. Is that about the amount deducted from him on this contract? I think so.

518. Did he not in the following year supply this quantity, and at contract price, and was he not allowed to do so without competition? I think so, according to the terms of that letter.

519. In contract 17 was not the formation taken by Davies at 3s. per yard run much heavier than the formation on these two contracts? On Tamworth side is a heavy piece of cutting, as heavy as anything in 10, and heavier than 16, which is ordinary forming—17 is heavier than 16.

520. He took that at 3s. per yard run? Yes.

521. Did Davies make any claim for payment for cubic quantities on that contract? No, not to me.

522. Did you ever know formation to be paid for at per cubic yard? No, not for years back.

523. Is it not always paid for by the lineal yard, and why? Yes, because it is the simplest way, and to prevent any fraud.

524. Was not much heavier formation done at per lineal yard on the Northern and Mudgee Roads? Atcheson's contract (No. 19) is heavier, and on the Mudgee Road there are far heavier works done.

525. What was the average price of the formation on those roads, and generally is not 2s. 6d. a high price? It is a very fair price.

526. Do you consider it high or reasonable? Reasonable.

527. Was the metal on contract 16 reduced by your order? No; there was not the specified quantity when it came to be measured up.

528. How did the deficiency deducted in voucher arise? It was not supplied by Mr. Davies.

529. Was the contractor bound to maintain both contracts? Yes.

530. Will you point out the maintenance clause in both those specifications? (*The witness referred to the specifications.*)

NOTE (*on revision*):—The qualification of my answer referred to the power of the Commissioner to reduce and deduct amount—which is practically what was done.

- Mr. E. A. Nardin.
4 June, 1875.
- specifications.*) One is in manuscript, and the other is in print. No. 10 is to be maintained until consolidated, and No. 16 is to be maintained for two months only.
531. Will you point out those clauses? (*The witness pointed them out.*)
532. Was not the price for this included in the bulk sum? Yes.
533. Is the stonework in the culverts ashlar? No.
534. Did you order Davies yourself, or through your assistant, to put in better work than was specified for? No.
535. Did the contractor apply to you for extra payment for the improved character of this work before it was commenced, or object to do it in the way pointed out by you? No, not until after the Commissioner had visited the work.
536. Did the Commissioner give you written instructions, when he visited this work in progress, both with reference to culverts and banks, and for your general guidance? Yes, those I have handed in.
537. Were there not some culverts omitted, and why and when? The Commissioner did not think them necessary, and they were omitted.
538. Was it owing to the greater amount of excavation? No, the excavation would have been the same in any case.
539. Did you not receive a letter from Davies, through the Minister for Works, with a postscript asking you if you wished all future communications sent that way? Yes, I have it here.
540. There is a postscript to that letter;—is there not? Yes.
541. Did you not regard that postscript as an insinuated threat that he would expose some secrets between you? Not the postscript merely. I object to the whole letter, as my reply shows. (*Vide Appendices C 8 and 9.*)
542. Davies in giving evidence before this Committee, in answer to a question from myself, said, "The formation clause states the formation to be in the solid or made up with metal; and all holes, ruts, or depressions to be filled in with metal, ballast, or other allowed material" that is obliterated—"extra material for embankment to be obtained from any distance not exceeding — yards." That printed line is also obliterated;—can you explain that? It is an ambiguity—a bad description. I have already given my interpretation of the clause "extra material to be obtained"—shows that it was the same as any other.
543. Who was the overseer at the time this contract was completed; Mr. Holloway says he was there part of the time; who succeeded him? No one. I had Mr. Dowling, a cadet, there some months afterwards, but I had no one to deal with this matter after Mr. Holloway.
544. Will you look at this paper (*Appendix A 10*), which contains a statement of Mr. Davies's claims against the Government, and state whether the items for which he claims are correct or not? (*The witness referred to the Appendix.*) There are only three items I know of. The first is with reference to the sheathing of Dangar's Creek Bridge, £5 7s. 5d., and I say he is not entitled to that amount.
545. For what reason? Because against my instructions he made the sheathing 15 feet wide when I ordered 13. I have here the correspondence with reference to it. (*Vide Appendices C 10 and 11.*)
546. On the next item for 16-72, there is a claim of £448 1s.;—do you think this claim unjust or correct? Not correct.
547. In what respect? He is not entitled to what he claims for earthwork, and for stonework for culverts. I have certified to something extra for stonework.
548. What are your reasons for saying he is not entitled? Because the earthwork is included in the price for formation by lineal yard, and the stonework in the culverts is not beyond what we could demand by the specification.
549. We now come to contract 16-72;—will the same answer apply to that? Yes.
550. We now come to "sheathing three bridges, Liverpool Range"? That was ordered by me, and completed under my successor. That claim is for 2½ in. sheathing instead of 2 in., and I have already explained that it was done for his own accommodation, and that he is not therefore entitled to payment.
551. Who were the road overseers under you during the time of Mr. Davies's contract? Only Mr. Holloway; Mr. Dowling, a cadet in the department, was there afterwards.
552. Did you ever give instructions to Mr. Holloway to instruct Davies to do other work than in this contract? No other than I have certified for.
553. You say you had a letter from Mr. Davies, agreeing to your proposal? Yes, I am sure he agreed to my instructions.
554. Were the usual certificates given to Davies for these contracts on their completion? I never gave him any.
555. For what reason? I never gave them to any one.
556. Were they forwarded to the head of the department? Yes.
557. Was it not usual to furnish them to contractors? Not that I know. I was never asked for one before.
558. *Mr. Cohen.*] Under the rules of the department, would Mr. Holloway, as road overseer, have authority to order deviations from accepted specifications? No.
559. Mr. Dangar asked you whether you had given any order to reduce the metal, and you said you think not? Only with regard to No. 16.
560. Could you speak positively? It is my strong impression—I have no paper or document with reference to it—I did so in the case of 10, but not of 16.
561. Is it likely you would have given any verbal authority for any such reduction? I might have said it did not matter if there was not the full quantity. I was leaving the district, and was finishing up the work for my successor.
562. I will just call your attention to these figures in contract 10/72. The amount of the original contract was £1,911 8s. 6d.; the amount paid seems to be £1,421 4s.,—leaving a balance of £448 1s. You consider that charge ought not to be made? He has not done the work.
563. Then we can take the sum of £1,421 4s. as the value of the work done under that contract? Yes, the full value at schedule rates.
564. Then I see in contract No. 16 that the amount of the original contract was £1,115 19s., and that he has been paid £1,114 12s. 6d., leaving a balance of £1 13s.? Yes.
565. As to the extras, Davies claims £267 19s. 5d.? They are not extras—I could not certify to them as extras.

566. Keeping in your mind what has been done under contract 16-72, do you say that £1,114 12s. 6d. is a fair and reasonable compensation under that contract and for the work done? Certainly, according to my certificate.

Mr. E. A.
Nardin.

4 June, 1875.

567. Supposing we regard the work done irrespectively of the contract, would that be a fair and reasonable compensation? I have known men to get good prices and very bad prices.

568. Supposing there had been no contract, do you think £1,114 12s. 6d. would have been a fair remuneration for the work done? It is the remuneration he asked for under the contract. I cannot say whether it paid him or not.

569. What do you say to the three first items, under the head of additions, in Appendix A 11? What I certified for is right, and no other.

570. *Chairman.*] Will you explain to the Committee how the contractor can be asked to supply 4,476 cubic yards of earthwork on contract 10? From the way I interpret this as ordinary forming, and I look upon that alteration of top metal as a mistake which will creep into these things, and for which a clause provides in the general conditions, namely, that the Commissioner's decision upon such matters shall be final. It mentions that it shall be boned through, and that the banks shall be made up, allowance being made for shrinkage. That first mention of metal I look upon as a discrepancy which has crept in, and which the Commissioner should decide.

571. Did you pay for the maintenance of contract 10 what Davies claimed? I never heard of that claim, I think, before lately. It is not in my final certificate.

572. You have no recollection of its having been paid for? It has not been paid for under my certificate.

573. *Mr. Dangar.*] I understand that the signature to the document marked A 11 is not yours? Certainly not, and I should wish it to be struck out.

FRIDAY, 11 JUNE, 1875.

Present:—

MR. W. C. BROWNE, | MR. T. G. DANGAR,
MR. SCHOLEY.

H. BENNETT, Esq., IN THE CHAIR.

Henry Quodling, Esq., examined:—

574. *Chairman.*] Did you hold the position of road superintendent in the year 1864? I did.

575. Did you know Mr. Amos Davies as contractor for 1864, being for four bridges and a culvert in Wallabadah Gap? Yes.

H. Quodling,
Esq.

576. Did Mr. Davies complete those works to your satisfaction? Yes.

11 June, 1875.

577. Will your memory serve you to say if a first-class culvert was erected on the site of a second-class culvert, specified for in the contract? No, there was no class specified in the specification.

578. Is there a first-class culvert erected on that contract? Yes.

579. By whose authority was that done? The specification provided for it.

580. Were there sills used in three of the bridges? I am not quite certain, but there were sills used in place of piles in certain cases.

581. Mr. Davies's tender not having included a schedule rate of earth and rock excavations, did you arrange to pay Davies the schedule price of 15s. a cubic yard for rock excavation, and 3s. for earth excavation? That is where sills were used in place of piles. The specification provided first for piles, and, in the event of the ground not admitting of piles being driven, sills were to be placed, as far as my memory serves me.

582. Then how am I to understand your answer to the question to be that you did agree to give Mr. Davies the schedule price of 15s. a cubic yard for rock excavation, and 3s. for earth excavation? If I agreed to give it him he was paid certainly.

583. What will your answer be? That is my answer simply, and that I would not agree to the thing without having the authority of my superior officer, and if I agreed to it he was paid it.

584. Did you or overseer Brookes make the measurement of all the work done on this contract? I do not think overseer Brookes did anything in the way of measurement.

585. Did you do the measurement yourself then? Any measurements that were done on that work were done by myself altogether. I do not think any one else did any measurement. I used to make it a point to do my own work in that respect.

586. Did the value of the work done, estimated at schedule prices, exceed the bulk sum of the tender? That is a matter I never went into.

587. Did you report this excess of value to the Commissioner for Roads? No, I do not think I ever did, or made any comment upon it. The tender was for a bulk sum.

588. Was this excess of value paid to Mr. Davies, or only the bulk sum of the tender? I do not know anything of his doing any excess. He carried out his contract for a lump sum. I know nothing beyond that.

589. Did Davies claim to be paid more than the bulk sum of this tender? Not that I am aware of.

590. Was there anything special about this bridge and culvert contract that would prevent any alterations made in carrying out the work from being valued at schedule rates of tender or the prices agreed on at this time—anything special about this bridge and culvert contract? That is a very long question. It is simply this, as far as my memory serves me—but bear in mind it is quite ten years ago: Mr. Davies contracted to do the work for a lump sum, and beyond that I think the specification—as far as I can recollect—was carried out in its entirety, and I returned for that lump sum.

591. Is there anything special about the receipt signed by Mr. Davies for money received for this contract? Not that I am aware of. I am under the impression that at the conclusion of the work Mr. Davies signed a receipt in full for all demands. That was my practice, and I presume I did not deviate from it in this case.

592. Is there anything special about the receipts—what is it and why were they made special? I do not know anything special about this. Everything with reference to Mr. Davies was carried on in the ordinary way. I know of nothing special with reference to his affairs.

- H. Quodling, Esq. 593. On completion or since, did you ever furnish Davies with certificates for this work? Certainly not.
594. Were you aware of any difference between the Commissioner for Roads and Mr. Davies, that existed prior to Davies doing this No. 8-64 contract? No.
- 11 June, 1875. 595. Did you ever know of any metal or broken ballast to be brought on to a road contract and to be used without first being measured and paid for as per cubic yard? There may have been instances. I do not think in Mr. Bennett's time as Commissioner, but perhaps in Mr. Collett's time the practice may have been to measure it on the road a certain width and a certain thickness, but I do not think that has been the case in Mr. Bennett's time.
596. It is either yes or no that is wanted in reply to this question (*The Chairman repeated the question*)? Really it is a difficult matter to say yes or no to that question, inasmuch as I believe that some of the specifications during Mr. Collett's time as Commissioner provided not for the measurement of the metal in heaps as Mr. Bennett is in the habit of having done, but for being measured on the road.
597. If you have seen metal used without being measured, where was it? Ah, there is the question. Really I cannot tax my memory to say where. There may have been solitary instances of it.
598. Did you supply plans of the culverts that were built from your office? Yes, I believe I did.
599. When was it first intimated to you that you would be called upon to give evidence in this case? I got a communication I think on Sunday last by letter. Yes, it was on Sunday.
600. Have you previously stated anything that you believed you would be called upon to give in evidence before this Committee? It is just possible. Coming down by the train I was asked what was taking me down to Sydney by Dr. Creed, the late Member of the Assembly—a gentleman I do not know much about—but I do not know that I afforded him much information. I may have said that I was coming down for this purpose, but as to affording him any information I do not think I did. I do not suppose I would, he being a stranger.
601. We are to understand you have spoken to Dr. Creed of what evidence you were going to give here? I may have made remarks about it to Dr. Creed, but nothing that would in any way injure Mr. Davies, or compromise myself in any way. I am certain of that.
602. *Mr. Dangar.*] Will you look at that document marked A No. 10 (*handing the Appendix to witness*)? Yes.
603. That is a statement of Davies's claim against the Government;—will you kindly state what portion of that was under your supervision? The only item is this for which he claims £73 1s.
604. That is for contract 8-64 "for bridges and culvert, Wallabadah Gap"? Yes.
605. He obtained this work under tender? Yes.
606. Are you aware whether he did any work outside the contract? I am not aware that he did. If he did it is returned for. My memory will not serve me sufficiently to enable me to say whether he did or not.
607. Was there any dispute with Davies when you conferred with him as to the final voucher? I think not. I have no recollection of any dispute with Mr. Davies.
608. Did he make any claims for extras when signing the receipt? Not that I am aware of, or that I recollect.
609. Did he sign the specification for the culvert when he was signing for the other works? Yes.
610. Why did he not sign the plan? The plan is not forthcoming, and I cannot say positively whether he did or not, but I am satisfied that he did.
611. You cannot say his reason for not signing it? I say the plan is not forthcoming; I have made inquiry for it in the office but it cannot be found, but I have seen the specification which is signed, and that is for a first-class culvert, and I should have insisted upon his signing the plan.
612. Was a second-class culvert mentioned at all in the specification? Never. I beg to hand in the specification. (*Vide Appendix D.*)
613. Did not Davies sign a receipt in full of all demands? I believe so.
614. How many years ago was this? Some ten years.
615. Was there any Government schedule of quantities for this? No.
616. Did the Commissioner ever refuse to pay anything certified for by you? No.
617. Did you not alter the printed heading of the receipt column when Davies signed, making it a receipt in full of all demands? Very possibly I might have done so; if not so printed I should have altered it unquestionably; that is the practice.
618. *Mr. Scholey.*] Is it common to give certificates of work when a question is disputed. Mr. Davies has applied for a certificate for work done, and states that he cannot take legal proceedings for the recovery of his claim without it. Is it common to give certificates to contractors? No, it is not our practice. I do not know of any document being given to the contractor; he simply signs the receipt.

Ernest A. Nardin, Esq., further examined:—

- E. A. Nardin, Esq. 619. *Chairman.*] On your previous appearance before this Committee did you read a document purporting to be a report on Mr. Davies's claims to payment for earthwork and embankment, and ashlar work in stone culverts on contracts 10 and 16-72? Yes, and I furnished a copy of that report.
- 11 June, 1875. 620. Is the contract 19-69, referred to by you in that report, the same contract that was let to T. B. Kelly, afterwards carried out by Atcheson? Yes.
621. Was the length of road embraced by that contract pegged out and cleared before the work was let to Kelly? Yes; Mr. Bayley I believe pegged it out, but I did not follow his pegs.
622. In carrying out that contract did you adhere to that pegged and cleared line? To my own pegs.
623. Did you adhere to the pegged and cleared line—one line I suppose was cleared and the other not cleared? We adhered to the cleared line, excepting at the south end, where we made two through cuttings.
624. As a matter of fact did you not leave the cleared line and make two deep cuttings through projecting spurs of hills, whereas the cleared line ran round the end of those spurs? Yes.
625. For a considerable time after the completion of contract 19-69 did not some of the workmen that had been employed thereon complain to you that they had not been paid by Atcheson for work that had been done on that contract? I think not; I do not recollect anything of it.
626. Did J. C. Smith ever complain that he was not paid? The butcher at Wallabadah—Yes, he did; he spoke to me about it.

627. Are you aware that Atcheson is still using Kelly's name on the Mallice Bridge contract? I do not know anything about it. E. A. Nardin, Esq.
628. Is the formation clause of contract 19-69 the same as the formation clause of 10 and 16-72? I produce the specification for 19-69; it is in manuscript. (*Vide Appendix E 1.*) Printed forms were not then issued to us. (*The witness read the clause.*) 11 June, 1876.
629. Have you ever heard of Mr. Davies's workmen complaining of not having been paid for their work? No.
630. If you told Davies to make two deep cuttings not specified for in this contract, is it not likely he would ask you to pay for those cuttings if not included in his contract? Decidedly, if not included in his contract; anything not included in his contract would have to be paid for.
631. Would you have the Committee to infer, because you made Atcheson make deep cuttings and earth embankments on contract 19-69, referred to in your report, it privileged you to make Davies make deep cuttings and large embankments on contract 10 and 16-72, without rendering the Government liable to be paid for such contract? The intentions of the Government in both cases being the same I certainly look upon them in the same way. Mr. Davies tendered for Atcheson's contract at 2/6 per lineal yard. (*Vide Appendix E 2.*) He tendered for the others in the same way, and the printed specification for formation is more stringent than the manuscript specification that I have put in.
632. Are the Committee to understand that this earth embankment for which Davies now claims payment are actually performed in contracts 10 and 16-72? They have been done in terms of the specification, and to such gradients as I approved.
633. If these embankments are actually made in contracts 10 and 16-72, who do you suppose was the cause of their being made? I was the cause; they were made to such gradients as I approved.
634. You refer in your previous evidence to a pencil line having been struck by you on the longitudinal plans? Sections.
635. After you had struck that pencil line did you return the plans to Mr. Holloway with the pencil line remaining on them? I returned them only once with the pencil line on them; they were on the ground always afterwards; there was only one pencil line on them.
636. Does the pencil line show seven lineal yards shorter on the contour line of this road? -I cannot say.
637. Was 2,130 lineal yards of formation specified in Davies's contract 10-72 as being the length of formation? The specification will show—I cannot remember; but on the completion of a road it often varies a few yards one way or the other. It is impossible in the rough to measure so correctly as within seven yards in a length of that kind.
638. Was the length of 2,130 lineal yards of formation arrived at as the result of actual measurement before the contract was let? Whatever was specified was measured by Mr. Holloway, I think, but we never measure so accurately as to a yard or two.
639. After the completion of the formation by Mr. Davies, did you measure the length of the formation as finished and find it to be 2,123 lineal yards, that is, seven yards shorter than specified in the contract? It is seven yards shorter, and I measured it.
640. Did not this shortening clearly result from Mr. Davies working on the pencil line on the plan, making earth embankments and cuttings? Davies has not worked to the pencil line, and had he done so it would not have produced such a result as that.
641. You also referred to your having struck these pencil lines as only experimental lines? For our own guidance and use.
642. Did the Commissioner for Roads also experimentalise with pencil lines on these plans? I think not.
643. When the Commissioner visited contract 10 and 16-72, did he find Davies working to your experimental lines, and the plans with these pencil lines on them in Davies's possession? The sections were in Mr. Holloway's possession, and Mr. Davies never attained to the depths shown by this pencil line.
644. That is not an answer to my question: When the Commissioner visited contract 10 and 16-72, did he find Davies working to your experimental pencil lines, or were the plans with these pencil lines on them in Davies's possession? I think they were in Mr. Holloway's possession, and Mr. Davies was at work at the forming.
645. Did not these plans remain in Mr. Davies's possession till the completion of both contracts? They were left by Mr. Holloway, I believe, with Mr. Davies, but I did not know that till afterwards, when I wanted them.
646. Did you frequently visit the contracts while in progress, and see that Davies was carrying the embankment up to the pencil line? I frequently visited the contracts, but I never made any reference to the pencil lines.
647. If the pencil lines were only experimental lines, why did you not order Mr. Davies to desist from making these earth embankments, unless you had the intention of paying him? When the Commissioner expressed his opinion as to the depth of cutting, I explained to him that it was only an experimental line. There was no further reference made to that pencil line; it might as well have been rubbed out.
648. Is it possible that you were experimentalising on Mr. Davies's credulity, in allowing him to work to those experimental lines? I merely had the work carried out as I think it ought to have been done, and as Mr. Davies was bound to do it I did not wish to put Mr. Davies to any further trouble than was absolutely necessary.
649. As a matter of fact, did you not frequently refer to the subsequent measurement of these earth embankments, and payments at the rate of 10d. per cubic yard? Not that I know of.
650. In a memo. of instructions, as given by the Commissioner for Roads, relating to works in culverts, is it stated that they need not be of coursed masonry, but of flat stones, and the size of the culverts not to exceed the lithographed plans? That paper is in evidence.
651. Is it not the fact that there were hundreds of cubic yards of such thin, flat, stones brought on to contract 10 and 16-72? No, but stone to make metal of—not thin, flat bedded stones—ordinary quarry rubble—bluestone rubble.
652. Did you carry out these instructions as to the using of those flat stones, instead of coursed masonry in culverts? No; the culverts are all of the same character of work; boulders such as these would only cut into chunks. You could not make slices of it, as it was not laminated stone.
653. Did you carry out the instructions as to the size of the culverts not to exceed the lithographed plans? Yes.
654. Is it not the fact that two of the culverts built on contracts 10 and 16 exceed the lithographed plan by 2 feet? Yes; that is what the Commissioner referred to. 655.

- E. A. Nardin, Esq.
11 June, 1875.
655. Is it not the fact that in the two culverts referred to that the cover stones have since given way? There is a crack in the outer covering stone in both.
656. Did you not as a matter of fact instruct Davies that he should continue work in the culverts the same as that done before the Commissioner's visit? I do not think I ever said anything about it. The Commissioner's instructions were not for me to convey to Mr. Davies, they were for my own guidance, and Mr. Holloway was instructed thereupon.
657. Did you not, to the Commissioner, deprecate his interference in the way in which you were having the work carried out, as likely to lead to dispute hereafter? I did say something of the sort: that it was a pity to mention these matters before the contractor; the Commissioner was not aware that Mr. Davies was standing so close by.
658. Is it not the fact that the stones in these culverts are cubical through stones with picked or punched beds? The bodies of the culverts are made of ordinary rubble; the parapet walls are good coursed rubble with quarry faces.
659. Should you think that portions are not of ashlar stone? There is no ashlar in the culverts at all. I have already said that.
660. Have you seen Mr. Davies's estimate of the difference of prices between ashlar and rubble of 25s. 3d. per cubic yard? I saw something of the kind in one of the papers handed in by him.
661. Is that a fair estimate of the difference in value? It is rather high I think for the difference between rubble and ashlar, but there is no ashlar in the culverts.
662. Are you aware that in Davies's accepted tender for contracts 10 and 16-72, there is contained a schedule price per month for maintenance of road after completion? Yes, I am perfectly aware of that.
663. Did you dispense with the maintenance of the road on contract 10-72 under the £24 per month clause, and subsequently employ him for a few days with a small gang of men to put the road in order, for which he has been paid? That was after the expiration of his term.
664. If Davies maintained contract 16-72 for two months under your supervision, would you not consider him entitled to £40, at £20 per month, as per schedule in his accepted tender? Certainly not; had he maintained it for three months I should have considered him entitled to £20 for the extra month; the two months maintenance was part of his contract.
665. Did you ever see Mr. Davies's steam stone-breaking plant after fixing on contract 16-72? I saw it—once I think only.
666. How do you know that machine was broken and unfit for breaking metal? Mr. Davies told me so; he told me he had fresh jaws made of hardened iron.
667. Had Mr. Davies the same person in his employment as was employed in Maitland at steam-machine metal breaking under your supervision;—he had young Paton, I believe, at one time? Yes.
668. Is it not the fact, that when Davies was written to on the 8th February, 1863, to break the metal by hand, that his machine was in perfect order and working, and that it has never wrought since? I do not know.
669. Is it not the fact that there was a considerable outcry made by some of the workmen against the introduction of a steam stone-breaking machine in that district? I do not know; I dare say they did not like it.
670. Supposing the contractor had provided himself with expensive machinery for metal breaking, would you think it fair to lessen the metal supply? Certainly; he procured the machinery without reference to our accommodation; it was not for our accommodation he got it.
671. In a letter you laid before the Committee you referred to the shortness of money as the reason why the metal should be reduced on contract 10 and 16;—if Davies had previously offered to carry out contract 10 without receiving any money for the contract till the following year, why ask him to reduce the metal? Because the Commissioner wrote to me to say there was no more money. Mr. Davies spoke to me some time before about doing work on credit, but it was not thought advisable that he should be allowed to do so. Mr. Davies had the maintenance metal afterwards to supply, or most of it.
672. Is it not the fact that Davies did not during the carrying out of the contract 10 and 16-72 assent to reductions being made? He assented, as I have said before, by letter, as I believe, but the letter cannot be found.
673. Did you not think it a hardship on the contractor to have such machinery thrown altogether out of employ? I cannot say.
674. Could there not have been drawn a specification that would have distinctly described contracts 10, 16, and 17-72, as now completed? The specification does in my opinion describe it, with the exception of the mistake as to the first metal—and that is evidently a mistake.
675. *Mr. Dangar.*] You said in your evidence the other day before the Committee, that the only work that Davies did under your superintendence, and for which he had a claim upon the Government, was for those works contained in the vouchers you gave him? Yes, for works completed until the time I left.
676. Will you look at these two vouchers (*handing the same to witness*), and say if these are the vouchers to which you allude? Yes, copies of them. (*Vide Appendices E 3 and 4.*)
677. Will you look at the Appendix to the printed evidence, marked A 11, and say whether the signature to that form "E. A. Nardin, Road Superintendent" is yours? Certainly it is not.
678. Did you certify to the correctness of this statement? Certainly not.
679. Will you also look at Appendix A 12, and state whether that is your signature? Certainly it is not.
680. You have not certified to the items contained in these schedules? To some of the items, but not as they appear here.
681. You have certified to no original document of which this is a copy? No.
682. These documents to which your name is appended are not original documents? No, I know nothing about them.
683. A 11 refers to contract 10-72, and I find, on comparing it with Schedule E 3, that Mr. Davies's claims for "4,476 cubic yards of earthwork used in rising roads at 1s. 3d.,—£279 15s."? That is included in the bulk price for formation.
684. There is also "129 cubic yards 10 ft. 4 in. ashlar work in culverts, at 25s. 3d.,—£162 17s. 3d."? That cannot be admitted.
685. Is that a just claim? No, it is included in the specification.
686. It is not extra? It is not extra work.
687. You said before that there was no ashlar work? Yes.

688. "26 cubic yards 5 in. ballast, at 4s. 6d.—£5 17s;"—is that extra work, or has he any claim for it? I E. A. Nardin, do not know anything about it. Esq.
689. On referring to these papers I see that the fines have been remitted? I deducted them as directed by the Commissioner; they have since been remitted. 11 June, 1875.
690. Then, adding up this amount, I find it to be £223 19s.;—am I to infer that that is the correct sum due upon that voucher to Mr. Davies? It is £104 more than I certified for; that is to say, the fine has been remitted, and £20 for culverts was paid, which I did not return for.

MONDAY, 14 JUNE, 1875.

Present —

MR. W. C. BROWNE,
MR. T. G. DANGAR,

MR. LACKEY,
MR. SCHOLEY.

H. BENNETT, ESQ., IN THE CHAIR.

Ernest A. Nardin, Esq., further examined:—

691. *Mr. Dangar.*] That is the voucher, marked E 4, which you gave Mr. Davies? Yes. E. A. Nardin, Esq.
692. Do I understand that the whole of the work performed by Davies is included in this voucher? With the exception of £14 12s. 6d. for extra stone work; that is on a supplemental voucher. 14 June, 1875.
693. That supplemental voucher is for an extra quantity of stonework, amounting to £14 12s. 6d. in this Appendix A 12? Yes.
694. In this document, marked A 12, there is "1,468 cubic yards earthwork used to rise the road, at 1/3, £91 15s.";—is that correct, or is it included in that voucher? It is included in the formation.
695. In this final certificate? Yes.
696. "101 cubic yards 7 feet ashlar work in culverts, at 25/3"? Not admitted; there is no ashlar work done at all.
697. Is it included in this? It is included in the price of the culvert.
698. "Two months' maintenance, as per tender, per month £20—£40?" That is included in the bulk sum, according to the tender.
699. The next item is "34 cubic yards 5 inches ballast, at 4/6—£7 13s."? I presume it is the ballast that went on the top of the culvert, and therefore it is included in the bulk sum for the culvert.
700. Then there is the item "misdeducted from 12-inch pipe drain, intended for contract 17-72—£2?" I do not know what that is for—something on contract 17-72.
701. I suppose that is some other contract? Yes.
702. There is an item of £5 7s. 5d. for sheathing Dangar's Creek Bridge, at 3/8 per foot;—perhaps you will explain that? That is for the additional two feet, respecting which I have already given evidence.
703. That is an extra item, not included in this voucher? It is not included in this contract.
704. Also a sum of £10 for sheathing three bridges? That has nothing to do with this contract.
705. Are these two claims correct? No.
706. They have never been done? The two feet extra has been done, but done wrongfully and against instructions. The £10 was for the quarter inch of extra thickness which he did for his own convenience.
707. *Mr. Scholey.*] You do not admit this £10? No.
708. Nor the £5 7s. 5d.? No; in my first examination both these items were explained.
709. *Mr. Lackey.*] You have stated that Mr. Davies had a good plant to carry on the work;—will you state what that consisted of? A steam-engine, stone-breaking machine, a plough for forming, a horse-scoop, sufficient drays, tools, and so forth.
710. Was the stone-cracking machine fit for work? It worked at first but the jaws failed after.
711. Did Davies break the maintenance metal supplied in 10-72 with it? No, not what he supplied for me; it was broken by hand.
712. Was the Commissioner aware that Davies offered to complete the work on credit? No, I think not.
713. Were these so-called embankments more than was contained in the formation clause? No.
714. Did the price contained in the schedule as for formation include everything to be done under that heading in the specification? Yes.
715. Was not Davies paid for such formation at the full price per lineal yard tendered? Yes.
716. Was it not a fair price, and the same that Davies tendered for No. 17, which was heavier work? 17 was 3/, and this work was 2/6.
717. Was not the formation on the Mudgee Road generally heavier than that done by Davies on this contract? A great deal heavier in most parts.
718. What was the average price given for that? I have made out a statement and will put it in evidence. (*Vide Appendix E 5.*)
719. Was not the quantity of metal omitted on No. 10 about equal to that specified to be left stacked outside of the road after the completion of the contract? Yes.
720. Was not the greater portion of this supplied by Davies in the following year and paid for as maintenance metal? Yes.
721. *Mr. Scholey.*] Are there any extras in 10-72 contract? Yes.
722. What is the amount? It is shown in the form which I have handed in. The additions amount to £83 18s. 6d.
723. That he has not been paid? Yes, but the deductions amount to £594 3s., and the one amount has been added and the other subtracted.
724. Then there is nothing due on No. 10 contract? I say nothing is due.
725. What do you say about No. 16? I say there is nothing due.
726. Is it common to give certificates to contractors after work is finished? I never was asked for one, and I never gave one.
727. *Chairman.*] You said something about your name being on the certificates handed in by Davies to the Committee? Yes.
728. In these printed papers? Yes.
729. Have you seen the originals of these certificates in Davies's handwriting? No, I have not.
730. Is the name written on them anything like your own signature? I have never seen them, therefore I cannot say.

Alexander Charles Bayley, Esq., examined:—

- A. C. Bayley, Esq.
14 June, 1876.
731. *Chairman.*] What is your position in the Government service? Road Superintendent.
732. How long have you held that position? About nineteen or twenty years.
733. During that period have you been entrusted with the supervision of the contracts of the bridge and approaches at Goonoo Goonoo south of Tamworth, and of the bridge and approaches north of Tamworth, of contract 3-67 at Sugar-loaf Gap, and others performed by Amos Davies as a contractor? Yes, of Goonoo Goonoo Bridge south and approaches.
734. And of Goonoo Goonoo north? Of a bridge at Goonoo Goonoo north under a schedule of prices, but no approaches.
735. Did Mr. Davies perform those several contracts under your supervision and to your satisfaction? Yes.
736. Do you think that inviting competitive tenders for public works a conclusive mode of ascertaining the current prices for such work? That is a mere matter of opinion.
737. Were tenders invited by the Government for the first or the one known as the south bridge over the Goonoo Goonoo Creek, Tamworth? I believe so.
738. Was Mr. Davies's tender accepted? I believe so. I know I took it from another road superintendent. He did not sign the bonds with me—I have not seen the bonds.
739. Did the specification for the south bridge include the supply of earthwork, ballast, metal, and border stone for the approaches? Yes.
740. Did Davies's tender include a schedule price of 3s. for earthwork at per cubic yard, 15s. [for ballast, and 20s. for metal per cubic yard? Yes, I think that is correct.
741. Were there any alterations, additions, or deductions made in carrying out the south bridge contract? No, I think not.
742. Were there alterations in the shape of additions or deductions on the amount of contract? I think not. I could not recollect, it is so long ago. There may have been some deductions made for less piles driven.
743. Do the tenders mention a bulk sum for this bridge contract, Goonoo Goonoo Bridge south? Yes.
744. And are the Committee to understand that you made no deductions from the bulk sum of this contract? I am not sure whether there were some deductions for piles driven less the quantity specified. There was no other that I remember.
745. You have no recollection that you made any yourself? No.
746. Soon after the completion of this work was the old north bridge that was over Goonoo Goonoo Creek washed away by the flood? Yes.
747. Did the Commissioner for Roads instruct you to let to Mr. Davies the construction of the north bridge with the schedule of prices for Goonoo Goonoo south, and according to the plan and specification for Goonoo Goonoo Bridge south? Yes.
748. Did you make such an engagement with Davies? I made an engagement for the erection of a bridge.
749. I suppose that answer is in effect that you did make an engagement? For a bridge but not for approaches.
750. I did not say anything about approaches in that question. On the completion of the second work were there any alterations made in the schedule of prices for ballast and metal? There was a new agreement for approaches.
751. There is nothing about approaches in the question. On the completion of the second work were there any alterations made in the schedule of prices for ballast and metal? There was another agreement.
752. To what amount were the alterations made? There was a different class of work altogether. There were stone walls built, and there were different prices for that. The price for earthwork and metal were different.
753. Were the alterations that were made deductions on the schedule of prices? They came to as much as if he had the original schedule of prices, but it was a different description of work altogether to the approaches to Goonoo Goonoo Bridge south.
754. Did Davies object to deductions being made as being a breach of engagement? There was no engagement for approaches.
755. Did Davies object to deductions being made as being a breach of engagement? He objected to these prices, but he had commenced the work before any order had been given or any sanction had been given to begin the approaches.
756. Have you any documentary evidence to produce to the Committee to show that Davies in any way concurred in the deduction being made? The vouchers were forwarded to the office.
757. Do you produce any documentary evidence to the Committee to shew that Davies in any way concurred in the deductions being made? As I have been informed, the documents are already before the Committee, with the exception of those of which I now beg to hand in copies. (*Vide Appendix F 1 to 4.*)
758. Supposing the Commissioner to have stated that approaches were not intended in the second work, can you show any other written agreement for the approaches? No, only verbal. Here is the original agreement for the erection of the bridge. (*Vide Appendix F 5.*)
759. Are the Committee to understand that no deductions were made on the metal and ballast from the previous schedule rates, and that you cannot produce any written engagement with Davies embodying such alterations in prices? It had nothing to do with the schedule of prices—the approaches. There is a document signed for the erection of a bridge, and no approaches are included, and they were not included.
760. Is it not the fact that there never was any separate engagement for approaches in existence? A verbal agreement.
761. Have you seen the two letters of Mr. Wm. Boyd to Mr. Amos Davies in the Appendix A 23 and 24, and also the documents marked A 21 and 22? No. (*The witness referred to the papers.*) Of course I have seen the schedule of prices.
762. Was this work at a standstill until Mr. Davies received Mr. Boyd's letter, marked A 23, giving the level of the shoulder of the piles? No, it was not.
763. Was the bridge finished within seven weeks and one day from the date of Mr. Boyd's letter, giving the height of the bridge? It was from the time of entering on his contract that the time was to count according to the agreement in the document I have handed in.
764. How do you justify the infliction of a fine of £5 on this work? Because he was actually over his time.

765. A week? A week.

766. Seeing that the work was completed in May, 1864, why was the sum of £49 ls. detained till December, 1864? I do not know.

767. Did you make the engagement with Davies, marked A 5 in the Appendix to Mr. Davies's evidence? That is the document (F 5) referred to in this A 5.

768. Is the schedule marked A 22 a correct schedule of prices in the first bridge contract as per tender? Yes.

769. Will you look over the schedule list of items;—is the first item, piles over ground per lineal foot of 2s., a very low price? No, not at that time.

770. Look at the items 3 and 4;—are not they also very low prices for the material and workmanship of fixing that bridge? No, not as prices were generally going then.

771. Are the items of earthwork 3s., of ballast 15s., and of metal 20s. per cubic yard, high prices or low? Exceedingly high.

772. Were these high and low rates taken together and paid in the first bridge contract? There were no low rates.

773. My question was, whether taking them altogether? There were no low rates; it was the average rate that was going at the time.

774. Was the making of the approaches included in the specification of the Goonoo Goonoo Bridge south? Yes.

775. Were the approaches included in the tenders that were accepted for the first bridge contract? South?

776. North? No, the approaches were not included in the north.

777. In the south bridge they were included? Yes.

778. Then the Committee are to understand that the tenders for the first bridge being competitive and accepted, containing the schedule rates marked A 22 in the Appendix, brings down the rates when taken together to be correct rates? Yes, they were correct rates.

779. That is, the schedule rates in the tender, when taken together, were current rates and accepted by the Government for the first bridge contract? Yes.

780. On the other hand would it not, if you cut down the highest items without raising in proportion the lower items, bring the cost below the lowest rates in accepted tenders? They were not below the current prices.

781. Is not this what you did on the second bridge contract,—that is, you cut down the prices of metal and ballast by more than a half without proportionately raising the lower price of the timber in the schedule? It is not the lower price of timber in the schedule. It was not a low price at the time.

782. The question rather more bears on this: Is not this what you did on the second bridge contract, that you cut down the price of the metal and ballast? I did not cut down the price. It was a separate agreement altogether.

783. Turn to the account marked A 13 in the Appendix, and say were the items entered under the original contract column in accordance with the first bridge contract? This is not my certificate—I have nothing to do with that. My signature has no business to be attached to that, and I beg to have it withdrawn.

784. *Mr. Dangar.*] You deny the authenticity of that document? I deny that it was ever sent into the office by me.

785. Look at that document and say if the signature appended to that document is yours (*handing the original of the Appendix A 13 to witness*)?

786. *Chairman.*] How do you justify the items headed—"Disputed Deductions?" I dispute the document altogether.

787. Was Mr. Davies the contractor for contract 3-67 under your supervision? Yes.

788. How many first-class culverts were specified? Two.

789. How many were built? Three.

790. Was Mr. Davies paid any additional sum for the extra culvert? No.

791. What is the date of the first payment on this work? 24th August, 1867.

792. As the contract was entered into in May or June, why was the first payment delayed till the 12th of September? It was on the 24th August it was paid.

793. *Mr. Dangar.*] Were the payments made by you or by Mr. Bennett? They were paid by the Commissioner of Roads.

794. I suppose you were merely the superintendent of the work? Yes.

795. *Chairman.*] As a matter of fact, was not this contract, including this extra work, completed within four months of the first payment, the specified time being five months? It is not from the first payment, but from the date that the contract was accepted. It has nothing to do with the first payment.

796. On your giving Davies an order for extra metal did you not promise to allow him one month's extension of time if required? He was over the month—nearly three months over time on the work, and he was fined only one.

797. Since the infliction of this fine of £21 18s., have you not promised Mr. Davies to recommend its remission? No.

798. Are you aware that the recovery of the balance due on contract 3-67 was placed in the hands of Mr. Wallace, the solicitor, of Tamworth? I heard so.

799. Did you instruct Mr. Holloway to bring Mr. Davies to meet you at Bowling Alley Point, for the purpose of discussing these claims? No, never.

800. Are you aware that the consideration of such claims was afterwards deputed to Mr. Statham? Yes, I heard so.

801. *Mr. Scholey.*] You only heard so? No, I never knew it officially.

802. *Chairman.*] Did Mr. Statham have charge of the completion of the iron foot-bridge at Bowling Alley Point? No, he did not finish.

803. Did he have charge of it at all? Yes.

804. Did Mr. Davies send in any tender addressed to you for this work? Yes.

805. Did you ever furnish Davies with certificates that would enable him to go to law to recover the balance before-mentioned? I never gave certificates to any one; they were always forwarded to the head office.

806. Have you ever known Davies to receive a written order, signed by the Commissioner and counter-signed

- A. C. Bayley, Esq.
14 June, 1875.
- signed by the superintendent, for any alterations, additions, or deductions in the contracts? No.
807. Is it customary to make alterations, additions, and deductions on contracts without a written order, when alterations have been necessary? They have always required the sanction of the Commissioner before they have been carried out.
808. Had you sometime ago charge of the road between Wallabadah and Tamworth? Yes.
809. What is the average price of a second-class timber culvert, having a 6 feet waterway, in the neighbourhood of Round Hill, near Goonoo Goonoo? I could not tell; I have not done any work there since 1870.
810. Do you know the road contract that was done by Mr. Davies at the foot of the Round Hill, near Goonoo Goonoo, and known as contract 17-72? No, I do not know.
811. Are there any large earth embankments on that work, excepting the approaches to the culverts, as to what you would call heavy forming? I do not know anything about the work.
812. Have you ever received instructions not to employ Mr. Davies on public work? Yes, not to accept his tenders without referring them to the head office first.
813. How often have you received such instructions? Once or twice.
814. When the damage was done by the floods some months ago to Tamworth Bridge approaches, that made it necessary to lengthen the bridge, did you give Mr. Davies the opportunity to carry out that work? I obeyed the orders given me to carry out that work.
815. Did you let the lengthening of Tamworth Bridge to the contractor for Cockburn Creek Bridge without competition? It was let to him without competition, with the proviso that he took the timber that was ready at Cockburn Bridge into Tamworth, so that there should be no delay in the opening of the bridge.
816. Did you pay him any higher rates for the lengthening of the bridge than the schedule prices for Cockburn Bridge? At the schedule of prices that were sanctioned by the officers.
817. Did you ever know of metal or broken ballast to be brought on to a road contract and used without being first measured and paid for at per cubic yard? No.
818. Did you ever send a report to the Commissioner for Roads, stating that if the south bridge in Tamworth had been valued at the schedule rates of tender that the amount to be paid would have been for the first work exceeding £1,500? No.
819. Are you aware that such a report, if made, would have been untruthful? Of course it would be untruthful.
820. Will you look at the certificate marked A 15 in the Appendix. Is that a true certificate of contract 3-67 as finished? No, it is not. Here is a copy of the certificate I sent in. (*The witness handed in the same. Vide Appendix F 6.*)
821. Will you point out the error, if there is any? There is an error in the number of cubic yards of metal, there is an error in the first-class culvert, and there is omitted nine chains of clearing at 10s. May I give an explanation as to this claim for a first-class culvert in A 15? In the specification and tender put in for this work there was a 26 feet culvert required, and the line of road was altered a little above, for which an allowance of nine chains of clearing was made for shifting the road. It was found then that a 26 feet culvert was not required, and instead of it there were two culverts of 13 feet each put in. There were actually three culverts put in instead of two as in the original specification, but one instead of being 26 feet was converted into two of 13 feet each. This was agreed to by Mr. Davies at the time.
822. *Mr. Dangar.*] Will you show the Committee what portion of this work, for which Mr. Davies claims, was done under you? This contained in A 13.
823. Is that the only portion of this work done under you? Goonoo Goonoo Creek Bridge north, and Goonoo Goonoo Creek Bridge south, and 3-67, Flaggy Gully to Sugar-loaf siding.
824. In paper A 13 Mr. Davies has "disputed deductions," "the ballast reduced by 10s. 6d. per yard—£59 17s."—is that correct? No, he has no claim at all for it.
825. "The metal reduced by 11s. per yard—£28 13s. 8d."? He has no claim for it.
826. "Fine imposed, £5"? That was imposed.
827. That was all you had to do with? Yes.
828. Refer to A 5 in the Appendix. What do you mean by your undertaking "to pay Amos Davies for erecting a bridge over Goonoo Goonoo Creek at schedule of prices for G. G. B. South, for completing to his satisfaction the following works, according to the general printed conditions and within the space of two months";—is that an extra payment to anything included in this? That is for the erection of the woodwork of a bridge.
829. And according to your undertaking included in this certificate A 13? That is not my certificate; and is calculated to place me in a false position.
830. *Mr. Scholey.*] I suppose you protest against that? Yes, against anything that bears my signature, which is not really signed by me, as this is not.
831. *Mr. Lackey.*] Were you present at Tamworth when the Commissioner was trying to arrange with Mr. Davies about No. 10 and 16-72? Yes.
832. Did not Davies refuse all explanation and confine himself to reiterating, "I want my bulk sum"? Yes.
833. Did you not in Mr. Boyd's presence make a verbal agreement with Mr. Davies for this work at Goonoo Goonoo? Yes.
834. Did not Mr. Boyd write to the office confirming this? Yes.
835. Was there a telegram to the same effect? Yes.
836. Do you produce those papers? Yes. (*Vide Appendices F 7 and 8.*)
837. Had Davies any timber ready for the Tamworth Bridge prepared at the time of the flood, when it was lengthened? Not that I am aware of; I never heard of such a thing.
838. Was there not the most pressing necessity for the immediate completion of that work? Yes, it was exceedingly urgent.
839. Did the Commissioner ever refuse the payment of any amount certified to by you? No.
840. Never at any time? No.
841. *Mr. Browne.*] Are you aware whether Mr. Davies has any plant on hand? I am not aware what he has.
842. *Chairman.*] Did not Mr. Davies lend Mr. Murphy piles for Cockburn Bridge at the time of the flood? I am not aware that he did.
843. And his plant too—the piling plant? I never inquire of a contractor where he gets his plant; he has simply to carry out the work.

844. *Mr. Lackey.*] Did you see copies of the printed evidence taken before this Committee exhibited at A. C. Bayley, Esq. Tamworth before you came away? Yes, I did.
845. Did it include copies of all these papers (*referring to the printed evidence, Appendix, &c.*)? Yes, it was like these. 14 June, 1875.

Ernest A. Nardin, Esq., further examined:—

846. *Chairman.*] Are these papers your original final certificate for contract 10 and 16-72 (*handing to Witness originals of Appendices A 11 and A 12*)? No. E. A. Nardin, Esq.
847. Is the Committee to understand that you have certified by final certificate for work shown as completed on contract 10 and 16-72? Yes. 14 June, 1875.
848. After making final certificates what do you do with them? Send them to the Commissioner for Roads for payment.
849. Did you for contracts 10 and 16 send final certificates to the head office for payment? Yes.
850. Were such certificates paid by the head office in due course? They were paid.
851. *Mr. Browne.*] Do you know that of your own knowledge? No, I had left the district.
852. *Chairman.*] You do not know whether they were paid or not? I do not know as a fact that they were paid.
853. Did Davies apply to you by letter to obtain final certificates for 10 and 16? Yes, as in my former evidence I stated.
854. Did you furnish Davies with them? No, I handed in my letter in reply to him.
855. Did Mr. Davies more than twelve months after you had left the office point out to you and the Commissioner that your certificates, then in the Commissioner's office, were incorrect? No, not that I am aware of.
856. Have they since been altered or fresh ones made? No, they have not been altered since. The Commissioner has added to them as to the fines, as I have before pointed out.
857. Then they have been altered since? They have been added to.
858. Then they have been altered since in the Commissioner's handwriting? Yes, added to.
859. Are those papers the altered certificates (*referring to those handed in by the Witness*)? Those are copies of the final certificates referred to.
860. Who made those certificates? I copied them from the originals; that is my handwriting.
861. Is it not usual when you make out final certificates to fill in the printed form on the other side with the detail and measurement of the work done? Certainly—all the details.
862. Was your final certificate filled up with the details of the measurement? Yes.
863. Where did this paper come from? It was copied by me in the office here in Sydney.
864. This detailed measurement form after being filled up has it not to be signed: "We hereby certify that the above return is a fair and correct statement of the contract to which it refers"? Yes.
865. Did you sign the warrants you sent in to the head office? Yes, both sides.
866. *Mr. Dangar.*] I infer from you that the papers marked A 11 and 12 are not true copies of the final certificates? No, they contain items which do not appear in my final certificates.
867. How is it that the documents you have handed in are not true copies of the others—how is it they are not filled in this side? Because this side as being the final certificate is considered to be sufficient.
868. *Mr. Lackey.*] Will you state the nature of the alteration in both documents? There is no alteration.
869. *Mr. Dangar.*] These alterations are in favour of Mr. Davies? The additions are.
870. There is none against him? No.
871. What was the gross sum remitted? There was a fine of £84 in the case of 10 A, and of £132 in the case of 16 A.
872. Both of these have been remitted? Yes.
873. *Mr. Lackey.*] Are not the final certificates handed in by you complete for payment of contractor? Yes.
874. *Chairman.*] Are these papers true copies of the final certificates you have put in to-day? Yes; that is all that is in my handwriting and that is signed by me.

Alexander Charles Bayley, Esq., further examined:—

875. *Chairman.*] Was the bridge only included in the second contract? Only the bridge in Goonoo A. C. Bayley, Esq. Goonoo north. 14 June, 1875.
876. Are the papers you have put in to-day true copies of the final certificates? I believe they are—they are certified copies.
877. Would you read W. Boyd's telegram referring to this work? It is in evidence before the Committee.
878. Was Boyd's telegram three months after the work was completed? I could not recollect the actual date.
879. Was Mr. Boyd discharged from service about this time? I think it was about October he left my district.
880. Is there not much more work in building two 13 feet culverts than in building one 26 feet? There is more work, but there is a great deal less work in the approaches in the two different sites. There would have been more than treble the amount of earthwork in the original culvert than where the two were put.
881. *Mr. Lackey.*] Was it not agreed to by Mr. Davies, this change from two to three culverts? Yes; it is much easier to get timber for 13 feet culverts than for 26 feet.
882. Then you think the change was to his advantage? I think it was about equal, it was a benefit to him not to have to get timber for twenty-six feet span culvert.
883. Then he rather benefited by it? Yes.
884. Did he claim extra payment at the time of completion? No, I never saw anything about it until I saw it in these printed documents in Tamworth.
885. Where did you see these printed documents in Tamworth? In the public street.

- A. C. Bayley, Esq. 886. In this was the first intimation you had of his making such a claim? Yes.
 887. *Chairman.*] What is the length of the sills and caps? My memory would not go that distance. I could not tell from memory what that work was. I have so much going through my hands every year that it would be impossible for me to give the particulars of a special culvert so far back as 1867.
 14 June, 1875. 888. Are the sills and caps not as long as the girders would have been for the large culvert? No, certainly not.

TUESDAY, 15 JUNE, 1875.

Present:—

MR. W. C. BROWNE, | MR. MACINTOSH,
 MR. SCHOLEY.

T. G. DANGAR, ESQ., IN THE CHAIR.

William Christopher Bennett, Esq., further examined:—

- W. C. Bennett, Esq. 889. *Chairman.*] I think when you were examined the other day there were some documents which it was thought necessary to have before the Committee you could not then produce? Yes, I now beg to hand them in. The first is Mr. Bayley's report on Goonoo Goonoo Bridge (*Vide Appendix G 1*); also a report on the transactions with reference to Cox Creek Bridge. (*Vide Appendix G 2*.) I think those are all the documents that were asked for, with the exception of the original specification for Goonoo Goonoo Bridge, which is missing, and Mr. Davies's reply to Mr. Nardin's letter, in which Mr. Davies assented to the changes in the contracts. The letter was lost when Mr. Nardin removed from Murrurundi. We have sent up directions to look through the papers that were left and it has not been found.
 15 June, 1875. 890. Mr. Davies in his petition to the Assembly states that "work is now withheld from your petitioner, thereby depriving him of his ordinary means of livelihood;"—was there any justification for that? Somewhere in 1869 Mr. Davies made so many claims and disputed every arrangement that had been made with reference to his contracts that we found it impossible to get on with him unless these things were arranged, and we refused to give him any further public works unless they were settled up.
 891. I suppose that would allude to the second paragraph? We could not accept his tenders because we could not get the work out of his hands. There were contracts on the Manilla road that have not been referred to in this evidence, that we could not get out of Mr. Davies's hands. There were great complaints made about the state of the road, and we were at length obliged to wind up the contracts and to take them out of Davies's hand unfinished. There were all sorts of disputes arising with reference to them, and the time of the department was constantly wasted with these disputes.
 892. Is it the fact that other tenders have been accepted at higher prices than his? I think they have, but we found that although Mr. Davies's prices might be lower in the first instance they were higher in the end, because all these inquiries into complaints cost money or the time of officers of the department which is even more important.
 893. Mr. Davies in his petition says "there is now being unjustly detained from your petitioner large sums of money for work actually performed, for no other apparent reason than to coerce your petitioner into the acceptance of a much less sum of money than is actually due and owing;"—is that true? No, it is not the fact. Mr. Davies's accounts remained unsettled, and of course we could not make payments unless the accounts were settled some way or other. He was paid up very closely, excepting in these two large contracts on which he was paid within £300 of the amount due, deducting fines.
 894. Then he says he "is restrained from legal remedy by the officers of the Roads Department unjustly withholding your petitioner's certificates for the several works completed;"—has he been refused these certificates, or is it necessary that he should have them? It is not the usual course to give certificates to the contractors. We hold his receipts for the earlier works, and his letter withdrawing all claims, which he has ignored altogether. We gave copies of the certificates of the later works, with the view of enabling him to institute legal proceedings, and we never knew that they were invalid without my signature, or that legal objection had been taken against them, until we heard it in the course of the evidence given before this Committee. If he had applied to me for my signature to the certificates I would have given it, as I should have been glad to have had the matter disposed of in a Court of Justice, but Mr. Davies never applied for it. In fact Mr. Davies made such constant complaints that it was almost impossible to attend to anything else but his business. I used to get two or three letters a day from him.
 895. *Mr. Scholey.*] With reference to Appendix A 10 there is a balance of £93 10s., stated to be due to Mr. Davies;—is that due to him? No, that is a claim by Davies for 10/6 a yard on stone supplied for the approaches to this bridge. There was no contract with Davies to supply this stone at that price. Mr. Bayley made an arrangement with him to supply it at a lower price, which he has paid.
 896. He has paid that as per agreement? Yes, Mr. Bayley has explained that Mr. Davies has signed a receipt in full, and he has written a letter to the department withdrawing all that claim.
 897. Then there is £73? That is the contract in which Mr. Quodling was concerned as superintendent, and it is distinctly stated in the specification. Mr. Davies tendered a bulk sum for that contract, and he was paid at the time, as Mr. Quodling states, all that was due to him, and made no remonstrance, and no remonstrance was made to me.
 898. Did he give you a receipt in full? Yes, for that also, the usual receipt.
 899. Then there is £68 8s. 8d.? A portion of that is for the culvert which Mr. Bayley explains was altered with Mr. Davies's consent. In order to save Mr. Davies expense in timber in embankments he was allowed to put in two 13 feet culverts instead of one 26 feet. That was clearly for his advantage, as it saved embankment and long timber. Davies consented to it, and gave his receipt for it. There was also a fine on that contract, which Mr. Davies claims to have remitted, but he is not quite accurate in his statement, as I will explain:—The time dated not from the first payment but from the acceptance of the tender, and it was eight months and seven days from the latter date to the forwarding of the final voucher, and Mr. Bayley has explained that although Mr. Davies was three months over the time only one month's fine was deducted, and no claim was made for it at the time.

W. C.
Bennett,
Esq.

15 June, 1875.

900. £5 7s. 5d. for sheathing Dangar's Creek Bridge? That has been explained to the Committee where the sheathing was made 2 feet wider than the contract.
901. Has he been paid for that? No.
902. The work is there? The work is there, but he has not been paid, and is not entitled to it.
903. Then there is the balance of £448 1s.? That is made up of a claim for earthwork formation, and ashlar in culverts in contract 10.
904. Is there anything due on that? No.
905. Did he give a receipt in full for that? No, he has given the ordinary receipt; when I say the ordinary receipt I think we got a receipt from the Bank for that.
906. I suppose on his account? On his account.
907. Then there is an amount of £267 19s. 5d. for contract 16-72? I might add, before we leave No. 10, that of this metal which is deducted from that contract half, if not more than half, was supplied by Mr. Davies in the next year, and paid for as maintenance metal at his contract rate. There was 1,067 yards deducted, and 665 supplied in the next year, so that the actual deduction would be only 400 yards.
908. Do you consider that there is anything due on that £267 19s. 5d.? No, nothing.
909. Davies has been settled with for the whole? The amount due to him has been paid.
910. Then there is a sum of £10? That is where Davies employed timber a quarter of an inch thicker than was specified for, for his own advantage. That is not due; in fact every voucher certified by an officer has been paid by me; I never stopped anything from him.
911. There has been a great deal said about certificates;—is it usual to give these certificates to contractors? No, it is not; but we have no objection to give this certificate; we gave what we understood to be enough, but it was not signed by me, but if my signature were required I should have had no objection to do so.
912. *Mr. Browne.*] How long is it since Davies has been engaged as a contractor under the Government? More than eleven years, because it is eleven years since his first claim is dated here.
913. How long ago is it since the first complaints were made to the department of the unsatisfactory manner in which he was carrying on the contracts? The complaints were not so much of the unsatisfactory manner in which he was carrying out his contracts as of his constant wranglings and disputes. The first time I interdicted Mr. Davies having any work was when he was tendering for the Bowling Alley Point Bridge, about 1868, and then he wrote a letter withdrawing all claims, and was allowed to tender again.
914. This continued wrangling was of such an insuperable nature in the opinion of the department as to justify the department in refusing any tender from him? I thought so; I found my time and the time of the office was taken up in considering Mr. Davies's claims, and we had sufficient to attend to and full employment without that.
915. Previous to this wrangling had he given satisfaction? I had not heard any complaints.
916. You are quite of opinion that he has no claim whatever? None. I gave everything I could concede to him, and indeed several things that I was not quite convinced he was entitled to in order to clear the ground for legal investigation. Anything that was doubtful I gave at once.
917. Instead of throwing obstacles in his way you have endeavoured to smooth matters over, and to make them as pleasant as possible? Yes; there have been grave and harsh accusations against me in this matter. It is not for me to say what I have done, but every officer of the department who has been examined has been asked whether I ever refused a payment to Davies, and if their evidence is read over it will be found each one has stated that I have never done so. The only covert act of mine with reference to Davies will be found to be where I said that those cuttings were too deep for formation, and that the masonry of the culverts was better than was required. That certainly was not calculated to prejudice him, but inferentially in his favour. But I have resisted what I considered to be his unjust claims.
918. During the whole of this time you have always given the fullest opportunity for investigating any claims brought forward by Mr. Davies? Yes, when I could. On one or two occasions I have been in the country going north on business, and Davies has protracted these investigations and desired to go into long discussions. My time has been cut out. I have had engagements to meet road superintendents and persons interested in the roads, and when I have found I could not arrive at a satisfactory conclusion with Davies, who has gone back from one thing to another, I have been obliged to cut him short. I could not disappoint all the people who were waiting for me north, and keep them waiting a day or two days while I was investigating some trivial matter that could be settled by any road overseer.
919. *Chairman.*] If you turn to page 4 in the Appendix you will see Mr. Butler's opinion, in which he states that Mr. Davies has not got a good claim in law because he has not got an order in writing, signed by the Commissioner and countersigned by the superintendent, without which according to the second regulation no such work is to be paid for. Did you refuse that certificate? That order was not given, because we do not consider that he did any extra work, or that any extra work was necessary.
920. Was that applied for? I was never applied to for it. We maintained that there was no extra work done, so that we were not justified or called on to give an order, but we were prepared to give a certificate for work done. The order and the certificate are different—the order is for work to be done, the certificate is given after it is finished. Of course this work, not being extra work in our eyes, we did not give an order.
921. Has this been unjustly withheld, as stated in the petition? As I have already stated, Mr. Davies got copies of the certificates, and if my signature had been required to authenticate them, and he had applied to me, he would have had it, but he did not so apply.
922. He applied for the certificate, but did not get your signature? He got the certificate from the officers of the department, and if I had been made aware that my signature was required it would have been attached to them.
923. Are these documents marked A 13 and 14 original documents or copies? They are neither original documents nor copies.
924. They are not recognized in your office? They are not recognized in any place at all.
925. Are the two documents marked A 11 and A 12 original? No. In addition to these additions in red ink (*referring to the original documents handed in*) the totals are wrong, which are in black ink, and I request that these documents may be withdrawn from the evidence altogether, because, independently of any action that may be taken by this Committee, who may understand the matter, these may be produced in after years, when there may be no one to explain the circumstances under which they were laid before the Committee, as authentic. I think these documents should be cancelled.

- W. C. Bennett, Esq.
15 June, 1875.
926. *Mr. Scholey.*] With reference to some fines of £139 13s. and £84? They have been remitted and paid.
927. Why were they remitted and paid if they were not due to Davies? To close the matter, and from a disposition to pay him all that he could possibly be entitled to.
928. Then you remitted these fines of £139 13s. and £84 in order to settle the matter? Yes.
929. Then you consider that there is no claim due to Davies? Not the shadow of a claim.
930. *Chairman.*] Have you ever paid further moneys to Mr. Davies after his signing receipts in full? It is possible we may have done so, if we have found any claim of his at all valid. Unfortunately we did not hold back such payments, but we were anxious to do justice, and when we found anything like a legitimate claim we paid. It was Mr. Davies's own fault that it was not argued out and settled with the road superintendent.
931. Did you send a letter to Davies saying that no farther employment would be given him unless he sent you a letter? Yes, I think we did. We found we could not get on with him unless he wrote withdrawing all his claims.

Mr. Amos Davies further examined:—

- Mr. A. Davies.
15 June, 1875.
932. *Chairman.*] How do you account for the papers marked A 10, 11, 12, 13, and 14, handed in by you to the Committee, not being original documents? They are original documents, made out by myself for the information of the Committee.
933. They are not recognized documents in the Works Department? They are not recognized documents in the Works Department whatever. I sent down copies of the whole seven, similar copies of these documents, for the information of the Department, the day before I presented them before the Committee, in order that Mr. Bennett might bring the originals. I put the names at the bottom in consequence of Mr. Hanley Bennett recommending me to do so for the instruction of the Committee, to show under whose charge the work was done.
934. Then I infer from you that they are not original documents at all? They are my accounts, and the officer's name has no business to be there as a matter of fact.
935. *Mr. Macintosh.*] They are simply claims which you suppose you have against the Government? Yes. The officers' names might have been mentioned somewhere else, under whose charge the work was done.
936. *Chairman.*] All the items in black ink in these schedules are included in the original vouchers, and those in red ink are what you now claim? Yes.*
937. The former are in Mr. Nardin's final certificate? Yes.†
938. And all in red ink are omitted and extra for which you are now claiming? Yes. The certificate for 16 he has put in is in a different form, but the result is the same. That in red ink is the disputed work.
939. *Mr. Macintosh.*] From his view the certificate is final? Yes.
940. You make this as part payment on account of the work? Yes; that in black ink I am paid for—the red I am not. The red items are disputed items.
941. *Mr. Browne.*] Did you offer any explanation to the Committee when you handed in these documents as to the signatures of these officers being attached to them? I think not.
942. None whatever? None whatever. I had no thought that they would be published; but I could see immediately they were printed that they placed me in a false position.
943. Why did you not explain to the Committee at the time you handed in these papers that the names at the foot were not the signatures of the individuals whose names they purported to be? As soon as Mr. Bennett called attention to the matter the original documents were produced, that is, those I had filled up, and the red ink pointed out to him; I think it is in the records that he withdrew the kind of insinuation of my having used their names wrongly, and that the matter was ended there.
944. You tendered no explanation at all when these were handed in to the Committee? No; but I had certainly no intention of leading the Committee astray. The names were put there at the instance of Mr. Hanley Bennett, for the information of the Committee, as he has himself stated before the Committee.
945. *Mr. Macintosh.*] Is there any other matter you wish to explain to the Committee, anything that would throw light upon any matter of which you think they have not a proper view? I should like to go through the disputed items from the commencement, and give some further proof that my claims are in each and every instance to be substantiated. It could be done shortly.‡

William Christopher Bennett, Esq., further examined:—

- W. C. Bennett, Esq.
15 June, 1875.
946. *Chairman.*] These two documents E 3 and 4 are handed in as copies of final certificates, forwarded by Mr. Nardin, of the work done and balances due to Amos Davies, on contracts 10 and 16-72, are they not? Yes, with some additions by me.
947. Will you state the actual balance due to Davies on each of these contracts? There is nothing due.
948. The balances represented on these sheets, have they been paid to Davies? Yes.
949. On E 3 the balance £223 19s., including fines and everything, has been paid? Yes.
950. Do you hold his receipt for that? We hold the Bank receipt, and his order to pay the money into the Bank.
951. On E 4 there is a balance of £297 12s. 6d., including additions and other matters;—has that balance been paid to Davies? Yes, and we hold the Bank receipt for that also.
952. What is the present amount due by the Government to Mr. Davies, on account of any work he has performed, and for which he claims on A 10? Nothing whatever.
953. Do I clearly understand that at the present time the Government do not owe Mr. Davies anything whatever on account of any work he has performed? Nothing whatever on any work he has performed.

954.

* Added on revision:—The black ink items have been paid; the red ink not paid.

† Added on revision:—Excepting the sums of £19 11s. 9d. and £84, on contract 10; and £132, £50, and £14 12s. 6d. on contract 16-72. Mr. Nardin's true original final certificates have not yet been produced before the Committee—not even true copies of those sent to my solicitor.

‡ Added on revision:—By the aid of the documents now before the Committee, and some that I yet hold and desire to put in.

W. C.
Bennett,
Esq.

15 June, 1876.

954. In a note to A 10, Mr. Davies says:—"To avoid delay and dispute I, on the 2nd December, 1873, offered to accept as final payment the bulk sums of tenders in contracts 10 and 16-72";—is that correct? It is very possible he did. Several times he made an offer of that sort, but then the bulk sum was more than he was entitled to.

955. Am I to understand that all balances due to him have been paid since that? When Mr. Davies said the bulk sum he meant the original sum for the contract, without reference to the deductions. In one case there was an absolute deduction of £15 19s., and he is now paid that bulk sum, all but £15 19s.

956. The inference from this note is, that on 2nd December, 1873, there was some money owing to Davies;—has any been paid to him since that? Yes, payment has been made to him since that.

957. All that Government considered to be due to him? Yes.

958. In your previous evidence reference was made to a letter from Mr. Davies? Yes, it was a reply to a letter of Mr. Nardin, assenting to these alterations. That letter cannot be found, but Mr. Nardin states positively that he did receive such a letter. I append letter from him to this effect. (*See Appendix G 3.*)

959. Is it usual for you sometimes to alter your officer's returns? Yes; if I think there is something that ought not to be paid I alter it. If the contractor thinks he has been unjustly treated by the officers under me I inquire into the matter, and if I find the charge well founded remedy it.

960. Have you laid before the Committee the Bank receipts for these payments? No; but I will hand them in. (*Vide Appendix G 4.*)

961. *Mr. Macintosh.*] Did you pay these balances into the Bank? All the money noted here has been paid.

962. You paid these amounts by Davies's order into the Bank of New South Wales? Yes.

963. *Mr. Scholey.*] Something has been said with reference to an ill-feeling between yourself and Mr. Davies;—has that had any effect upon you to lead you to annoy him in any way? Decidedly not; the only ill-feeling has arisen from his constant complaints and disputes. I never had anything to do with Mr. Davies, except as a road contractor, and I never heard his name until he was so employed, and I think the evidence of the various officers who have been examined will bear me out that I have never thrown any difficulty in his way or refused payment for any amount certified for.

964. If this matter is settled by the Committee would you afterwards be willing to give Mr. Davies work? Judging from Mr. Davies's antecedents I would rather have nothing to say to him. If he were employed he should have a special officer to take charge of his work; for the present, officers of the department have quite sufficient to do without having their time constantly occupied with his complaints.

965. *Mr. Macintosh.*] You want give and take contractors? Yes, rough and ready men, who will undertake work and go through with it. I have been twenty years in the service of the Colony, and fifteen in the Imperial and other service, in all thirty-five years—in fact ever since I was a boy have had dealings with contractors—and have never had such accusations brought against me by them before.

966. *Chairman.*] In calling for tenders, is it the rule of the Government that you need not accept the lowest or any tender? It is in the printed notice in the Government Gazette.

967. Have not the certificates now laid before the Committee been altered since they were sent to your office? This is the only portion that was the final certificate; all that has been omitted were memoranda of Mr. Nardin, which was superfluous. This is all that is necessary to enable Mr. Davies to go into Court if he desires to do so, and if he requires signed copies he can have them.

PETITION OF AMOS DAVIS.

APPENDIX.

[To the Evidence of Mr. Amos Davies, 13 May, 1875.]

A 1.

Department of Roads, Dr. to Amos Davies,—		£	s.	d.
25th May, 1864.	To construction of bridge and approaches, Goonoo Goonoo, North Tamworth, on metal, £28 13s. 8d.; ballast, £59 17s.; and fine, £5	93	10	8

A 2.

The Commissioner for Railways to Mr. Amos Davies.

Department of Public Works,
Sydney, 12th February, 1874.

Sir,

I am directed to inform you that the Honorable the Secretary for Public Works having personally gone over the items of your disputed account with the Roads Department, in the presence of Hanley Bennett, Esq., M.P., who attended on your behalf, I am now to offer you without prejudice the sum of £384 0s. 7d., in full satisfaction of all claims upon the Department, for the receipt of which you will be required to sign the usual final voucher.

I am to add that, upon your adopting this course, the fines for non-fulfilment of your contracts, amounting to £242 10s. in all, will be remitted.

I have, &c.,
JOHN RAE.

P.S.—The foregoing is not intended to include items for day-work in dispute, which could not be settled at the time, but which will be arranged between yourself and the Commissioner for Roads; nor any amounts of certificates for other works received since the dispute in this Department, which will be paid in due course.

A 3.

Memo.—These specifications for contract 10-72 are to be substituted for those sent some time ago; they had better be attached to those just forwarded for new contracts.—E. A. NABBIN, 18/7/72.

DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.

Great Northern Road, First District.—Contract 10 of 1872, 18th July, 1872; also Contracts 16 and 17-72.

General Conditions of Road Contracts and Taskwork.

1. The works to which these conditions refer, include the supply of all tools, materials, and labor, and everything else requisite to complete the works specified, to the entire satisfaction of the Commissioner and Road Superintendent.

2. The contractor is on no account to commence any contract without an order in writing, signed by the Road Superintendent; and no claim for any work executed without an order will be admitted. No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner and countersigned by the Superintendent,—the price for any work not in schedule to be determined on previous to its execution, and set forth in the said order.

3. In every case the Commissioner reserves the right of executing any greater or less quantity of the work than that mentioned in the specifications, such increase or decrease to be valued at the schedule rates, and added to or deducted from amount of contract, as the case may be. Schedule rates must be in accordance with bulk sum; if not, the Commissioner shall have power to fix rates in accordance therewith and use them for such valuation.

4. During continuance of this contract the contractor is to maintain in fair order the portion of road comprised therein (except where contract is for supply of metal only), and also to afford every facility for the passing of the traffic during the execution of the work, and, if necessary, to provide new or keep the existing out-turns in repair, and also to provide proper guards for the drains and water-tables, and to stop all adjacent tracks by which the traffic can avoid the new metal, by felling trees, drawing logs, or such other means as the superintendent may direct. The contractor to take all due precaution to prevent accident to the public from leaving culverts open or placing heaps of stone in dangerous positions, and will be responsible for all damage arising from his neglect of these precautions.

5. The road superintendent will have the power of immediately dismissing any agent or workman employed by the contractor, and the contractor is not to sublet or assign any contract, or portion of contract, without the approval of the road superintendent.

6. All gravel, stone, ballast, metal, timber, iron, or other materials, placed on the road, or within one chain of centre thereof, for purposes of this contract, to become the property of the Commissioner when so placed.

7. To secure the proper quantity of metal or gravel it will be measured in a continuous heap of the requisite cross section before being spread, but it shall be competent for the road superintendent to re-measure such metal on the road, when spread, should he consider it necessary.

8. When a certain gauge is specified, it is intended that every stone shall pass in every way through a ring of the diameter of specified gauge, the metal to be clean cuboidal and of sharp fracture; no laminated or jointy stone will be admitted.

9. All water-tables and side drains to have a proper fall to outlets and culverts, and new outlet drains made where directed by the superintendent.

10. The sides of all cuttings, side drains, water-tables, &c., to have a slope of 1 to 1, except when in rock or otherwise specified; the sides of embankments to have a slope of $1\frac{1}{2}$ to 1.

11. The contractor to be liable to all risk from floods or other accidents during the execution of the works.

12. The road superintendent will have power to employ men, horses, and carts, and purchase materials to do all necessary or urgent work, or to remove rejected materials on this contract, and deduct cost of same from contract price, provided the contractor shall have neglected to do such work after due notice. Should there be no funds belonging to contractor in the hands of the Commissioner, for removal of rejected materials, all such materials if not removed by contractor within one month from date of rejection, to become the property of the Commissioner, and be used in any manner he may direct.

13. Should the road superintendent be dissatisfied with the rate of progress, or mode of carrying on the work, or with the character of the work done by the contractor, the Commissioner will have power to annul the contract, and the contractor shall forfeit all claim to payment for work done or material delivered; and the Commissioner shall be at liberty to deduct amount of penalty from any sum or sums due to contractor on this or any other contract under him.

14. If the contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner, without previous notice to the contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, to take the works out of the hands of the contractor, and of the assignees or trustees of his estate, and to re-contract with any other person or persons to proceed with and complete the same, upon such terms, stipulations, and conditions as shall be deemed expedient, and all the then remaining materials, implements, and plant that may be required to complete the work.

15. Payments to be made at the rate of 90 per cent., the remainder to be paid after the road superintendent and overseer shall have certified that the whole of the works have been completed to their entire satisfaction; and the obtaining such a certificate shall be a condition precedent to the contractor having any claim or cause of action in respect of any work done or materials provided, to the payments from time to time to be made hereunder, or to the final payment upon completion of the contract.

16. All moneys due on account of contract, will be paid to the credit of contractor in Bank of New South Wales, or such other Bank as contractor may request, and in no other way; and the Contractor shall not assign over any of the moneys payable under this contract, to any other persons by deed of assignment, letter, or order, to the Commissioner or superintendent. The contractor for each and every breach of this condition, shall pay to the Commissioner for Roads the sum of five pounds, to be deducted on face of pay-sheet from amount due to contractor.

17. The contractor to attend constantly on the work, or employ a properly authorized agent to represent him; any order to whom will be considered as given to the contractor himself.

18. In case of any defective description or ambiguity in the specification, or in memoranda of contracts, the explanation given by the Commissioner shall be final and binding on the contractor; the measurements to be made according to the actual dimensions, notwithstanding any general or local custom to the contrary.

19. The contract to be completed in the time specified under a penalty of 2 per cent. per month on the total amount, for every month that such work shall remain incomplete after the expiration of the said five months, amount of penalty to be deducted on face of pay-sheet from moneys due to contractor by department under this or any other contract.

CONSTRUCTION—SPECIFICATION.

Great Northern Road.—First district, 10-72 contract. Sugarloaf Gap to metalling at M' Mahon's.

Contract.	THIS contract commences at end of metalling over Sugarloaf Gap, and extends northward to metalling at "M' Mahon's Inn," comprising the draining, ballasting, culverting, forming, metalling, blinding, and consolidating, on the following sections:— Section 1.—Sugarloaf to 1st culvert, 1,602 lineal yards. " 2.—1st culvert to 2nd culvert, 528 lineal yards. Making a total of 2,130 lineal yards road construction, 2,130 lineal yards drain, and eight 2nd class and two 3rd class stone culverts.
Drains.	Drains to be cut where directed by the road superintendent; to be 1 foot wide at bottom, with an average depth of 2 feet, and side slopes of one to one drains to discharge freely to culverts, and proper inlets or outlets shall be cut from them wherever the superintendent shall direct. The material excavated from drain to be evenly banked up on lower side $\frac{1}{2}$ feet clear from the edge, or to be distributed as may be directed by road superintendent.
Formation.	Roadway to be formed 30 feet wide, on lines pegged out by road superintendent, and to be cut to the inclination directed by him, the gradients being properly boned through and due allowance made for shrinkage of banks. The formation to be in the solid, or made up with metal, as the nature of the ground may require, to be uniform in cross section, having a convexity of 9 inches to the margin or water-table, and were embanked on a sidling the scarp side to be left slightly high to allow for settlement in consolidation. All stumps, rocks, or other obstructions to be removed, and all holes, ruts, hollows, or depressions to be filled in with metal.* Wherever the formation is not altogether in the solid, it must be consolidated by the traffic before any metal is spread, fresh material being supplied to make up convexity where required. The material excavated in forming the road, unless the contractor receives written instructions to the contrary from the road superintendent, shall be thrown back (6) six feet clear of the water-tables. Wherever it is practicable, mitre drains 18" wide shall be cut to relieve the water-tables, at such intervals as shall be directed, a solid block being left and the tabling recommenced 2 feet below each mitre drain. The length of formation required is 2,130 lineal yards.
Metal.	The metal to be of the hardest and best description of bluestone procurable within 3 miles of the work; to be approved by the superintendent, to whom a sample is to be submitted before any quarrying is done. To be broken to a strict 3 inch gauge, with clean, sharp, and cuboidal fracture, and stacked on even ground by the side of the road for measurement. The metal to be quite free from spawls, quarry face, dirt, chips, &c., and shall be turned over by a fork having tines $1\frac{1}{2}$ " apart. The heap shall be opened out for inspection as directed. The metal to be provided at the rate of $1\frac{1}{2}$ cubic yard to each yard of road.
Blinding.	When the whole or any well defined length of formation is ready to receive metal, it is after measurement, and on receipt of a written order from the road superintendent or overseer, to be evenly spread to a width of 20 feet and a depth of about 7 $\frac{1}{2}$ inches, or at the rate of $1\frac{1}{2}$ cubic yard to the lineal yard of road. Until so spread, examined, and blinded, no more metal shall be stacked within such distance of the measured metal as shall be directed by the road superintendent.
Progress.	When this quantity of metal is properly spread, and after inspection by the superintendent, the central 12 feet of road shall receive an even coat of blinding 3 inches thick, or at the rate of $\frac{1}{2}$ cubic yard to the lineal yard of road. Blinding to consist of decomposed granite, clean ridge gravel, or other approved gritty material. No clay, loam, or black soil on any account to be used as blinding. Quantity of blinding required—532 cubic yards. The road is then to be kept raked in, and maintained with the remaining $\frac{1}{2}$ of a yard of metal to the yard run, until thoroughly consolidated by traffic and roller; any metal not so required to be stacked alongside for further maintenance.
Culverts.	The contractor shall be bound to proceed with the works in such order and at such times as he may be instructed. If required he shall supply all the metal, and construct all the culverts before commencing the formation, or <i>vice versa</i> . The culverts are to be of the dimensions shown on drawings, and in all other respects in accordance with the plans hereto attached; to be of rough hammer-dressed stone, laid in mortar composed of one part approved stone-lime to two parts of clean sand; stones to be well bedded, and joints to be flushed throughout. Parapets to be dressed inside, and all quoins to be drafted. The height of parapets, &c., to be according to position.

All

*Notice that no other kind of material was to be used other than metal.—A.D.

All the works specified to be completed within five months from date of signing the bond under a penalty provided for in the "General Conditions for Road Contracts," hereto attached, which penalty will in all cases be strictly enforced, irrespective of bad weather, or any other cause of delay, except a written order be given by the road superintendent not to proceed with the work, or to increase the same when a proportionate extension of time must be allowed.

Tenders to state a bulk sum for the execution of all the works specified; also, a schedule of prices at which any deductions or additions shall be valued. Such additions or deductions, no matter to what extent ordered, shall not vitiate or set aside the contract.

In all matters relating to this contract, not herein specified, the contractor to be bound by the printed general conditions hereto attached.

Six of the 2nd class culverts are to have waterways of 8 feet, and two of them waterways of 5 feet each.
The 3rd class culverts are to have waterways of 5 feet each.

CONSTRUCTION—SPECIFICATION.

Great Northern Road.—First District. 16-72 Contract. Wire fence to south end of Apple-tree Flat.

THIS contract commences at end of metalling at the wire fence, and extends northwards to 1,508 lineal yards, comprising Contract. draining, culverting, forming, metalling, blinding, and consolidating of road, being a total of 1,508 lineal yards road construction, 1,508 lineal yards drain, and four 3rd class culverts of stone, and the laying of five 15-inch pipe drains.

Drains to be cut where directed by the road superintendent; to be 2 feet wide at bottom, with an average depth of 2 feet, and side slopes of 1 to 1. Drains to discharge freely to culverts, and proper inlets or outlets shall be cut from them wherever the superintendent shall direct. The material excavated from drain to be evenly banked up on lower side 4 feet clear from the edge, or to be distributed as may be directed by road superintendent. Length of drain required, 1,508 lineal yards.

Roadway to be formed 30 feet wide, on lines pegged out by road superintendent, and to be cut to the inclination directed by him, the gradients being properly boned through and due allowance made for shrinkage of banks. The formation to be in the solid, or made up with metal as the nature of the ground may require, to be uniform in cross section, having a convexity of 9 inches to the margin or water-table; and where embanked on a siding the scarp side to be left slightly high to allow for settlement in consolidation. All stumps, rocks, or other obstructions to be removed, and all holes, ruts, hollows, or depressions to be filled in with metal. Wherever the formation is not altogether in the solid, it must be consolidated by the traffic before any metal is spread, fresh material being supplied to make up convexity where required. The material excavated in forming the road, unless the contractor receives instructions to the contrary from the road superintendent, shall be thrown back (6) six feet clear of the water-tables. Extra material for embankment to be obtained as will be directed from any distance not exceeding 50 yards. Wherever it is practicable, mitre drains 18 in. wide shall be cut to relieve the water-tables, at such intervals as shall be directed, a solid block being left, and the tabling recommenced two feet below each mitre drain. The length of formation required is 1,508 lineal yards.

Metal to be of the hardest and best description of blue stone procurable within three miles of the work; to be approved by the superintendent, to whom a sample is to be submitted before any quarrying is done. To be broken to a strict 3-in. gauge, with clean, sharp, and cuboidal fracture, and stacked on even ground by the side of the road for measurement. The metal to be quite free from spawls, quarry face, dirt, chips, &c. The heaps shall be opened out for inspection as directed. The total quantity required will be 2,262 cubic yards.

When the whole or any well defined length of formation is ready to receive metal, it is after measurement, and on receipt of an order from the road superintendent or overseer, to be evenly spread to a width of 20 feet, and a depth of 8 inches, or at the rate of 1½ cubic yard to the lineal yard of road. Until so spread, examined, and blinded, no more metal shall be stacked within such distance of the measured metal as shall be directed by the road superintendent.

When the metal is properly spread, and after inspection by the superintendent, the central eleven feet of road shall receive an even coat of blinding two inches thick, or at the rate of one-fifth cubic yard to the lineal yard of road. Blinding to consist of decomposed granite, clean ridge-granite, or other approved gritty material. No clay, loam, or black soil on any account to be used as blinding. Quantity of blinding required, 300 cubic yards.

The contractor shall maintain the road in good order and condition, keeping the ruts well raked in, to the satisfaction of the road superintendent, for a period of two months after the completion of the work, and shall force the traffic off or on the road, as may be directed.

The contractor shall be bound to proceed with the works in such order and at such times as he may be instructed. If required he shall supply all the metal and construct all the culverts before commencing the formation, or *vice versa*.

The culverts are to be of the dimensions shown on drawing, and in all other respects in accordance with the plans hereto attached. The stone is to be approved of, to be quarry dressed, but to have faced joints; to be laid in mortar composed of one part best stone-lime to two parts of approved sand; joints to be flushed throughout.

All the works specified to be completed within five months from date of signing the bond under a penalty provided for in the "General Conditions for Road Contracts," hereto attached, which penalty will in all cases be strictly enforced, irrespective of bad weather, or any other cause of delay, except a written order be given by the road superintendent not to proceed with the work, or to increase the same, when a proportionate extension of time must be allowed.

Tenders to state a bulk sum for the execution of all the works specified, also a schedule of prices at which any deductions or additions shall be valued; such additions or deductions, no matter to what extent ordered, shall not vitiate or set aside the contract.

In all matter relating to this contract, not herein specified, the contractor to be bound by the printed general conditions hereto attached.

The pipes will be provided by the Government and delivered to the contractor, at the railway goods-shed, Murrurundi; the contractor will have to cart them to the work, and be responsible for breakage. They are to be laid in Portland cement, in such positions and with such fall as will be directed. At each end of each pipe-drain two stones, cut to receive pipes, shall be provided and set in cement; each stone to be 3' 6" x 1' 6" x 1' 0". The trench to be filled over pipes with approved ballast up to the level of tops of stones at ends of pipe-drains, rummed above.

A 4.

MEMO. for Mr. Davies, in reference to Contracts 10 and 17-72.

Contract 10-72. The quantity of metal to be reduced to 1½ cub. yd.
Contract 17-72. To be postponed until after the others are finished.

GEO. HOLLOWAY,
2/10/72.

No. 10.

NORTHERN ROAD.—3 DISTRICT, — DIVISION.

24 February, 1864.

MR. A. C. BAYLEY, road superintendent, hereby undertakes to pay AMOS DAVIES, for erecting a bridge over Goonoo Goonoo Creek, at schedule of prices for G. G. B. South, for completing to his satisfaction the following works, according to the general printed conditions, and within the space of two months:—

Erecting a bridge over Goonoo Goonoo Creek, according to the plan and specification of Goonoo Goonoo Bridge South.

A 6.

The Under Secretary for Public Works to Mr. Amos Davies.

Department of Public Works,
Sydney, 31 December, 1873.

Sir,

I am directed by the Secretary for Public Works to inform you that no tender of yours can be taken into consideration by the Government until the matters now in dispute have been arranged by you with the Roads Department.

I have, &c.,

GERALD HALLIGAN,
(For U.S.)

A 7.

The Under Secretary for Public Works to Mr. Amos Davies.

Department of Public Works,
Sydney, 10 February, 1874.

Sir,

Referring to your letter of 28th ultimo, stating that your horses, plant, &c., are disengaged, and offering their services in case of flood, to effect any road repairs, &c., that may become necessary, I am directed by the Secretary for Public Works to inform you that no further work can be given to you to perform for the Government until your differences with the Roads Department are satisfactorily adjusted.

I have, &c.,

JOHN RAE.

A 8.

The Commissioner and Engineer for Roads to Mr. Amos Davies.

Department of Public Works,
Roads Branch, Sydney, 11 February, 1869.

Sir,

In reply to your letter of 8th instant, respecting information to enable you to tender for creation of proposed bridge at Wellington, I have to inform you that, in consequence of your conduct in reference to the timber for Cox's Creek Bridge, I have recommended that your name be noted as ineligible for any further works under the Government.

I am, &c.,

WILLIAM C. BENNETT,
Commissioner and Engineer.

A 9.

Ex parte Amos Davies. Case for opinion of Mr. Butler.

MR. AMOS DAVIES has, for many years, been a contractor performing road works for the Government. In 1872 he entered into three different contracts for the performance of works on the Great North Road, known in Department as contracts 10 A, 16 A, and 17 A.

In each case there was a tender by Davies to do certain specified works, deductions or additions to be charged for, allowed according to rates in tender. The work was also to be done according to general conditions, and to satisfaction of Commissioner for Roads. The obtaining a certificate that work has been completed to satisfaction of road superintendent and overseer was, by clause 15 of general conditions, to be "a condition precedent to the contractor having any claim or cause of action in respect of any work done, or materials provided, to the payments from time to time to be made hereunder, or to the final payment on completion of the contract."

Clause 2 of general regulations stipulates that "No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner, and countersigned by the superintendent. The price for any work not in schedule to be determined on previous to its execution, and set forth in the said order."

After work commenced under contract 10 A, it was carried on by Davies under superintendence of Mr. Holloway, road superintendent assistant, and with concurrence of principal, Holloway, instructed Davies to alter the plan, in fact the culverts were to be stonework of a much more expensive kind than that specified for, and the plan of the road was so altered as to necessitate the doing of a large amount of earthwork not provided for in contract, but the doing of which made less the quantity of metal required, and in fact in that way made the amount payable for the whole work, as claimed by Davies, less than the amount of the original contract.

The change of road formation was carried out in obedience to a plan furnished to Davies by Mr. Holloway after work had been commenced; it was prepared in office of road superintendent, and was carried out under his superintendence. It shows the necessity for the work charged for, and for which the Government refuse payment; it was not required by plan or specification originally furnished, and tender accepted did not provide for it.

The Commissioner visited the work whilst in progress, and his attention was called by Davies to increased value of stonework in culverts, and the supply of the material for embankments, and in both cases he, in presence of road superintendent and Mr. Holloway, admitted that the work was in excess of contract. The change in formation of road saved a large quantity of metal, and three openings or culverts.

Contracts 16 A and 17 A were carried out in the same way, and altered under similar circumstances, and in a similar manner. Davies has not been paid in full; he claims £1,190 as due to him. The Government agree to pay £626 on his releasing all claim. This he refuses to do, and advice is now sought as to whether, under the circumstances, he would recover at law for the extra work referred to. It may here be remarked that no certificate has ever been given to him as rendered necessary by general conditions—the Roads Department refusing to give them, when requested to do so by Davies's solicitor, although they were in possession of the Commissioner, who stated that, it was "not the practice of the Department to give them to contractors." He however did furnish copies of two of the certificates, but would not give up the originals. The following papers are sent herewith:—

Tenders for three contracts.

Specifications for three contracts, with general conditions.

Written statement of Mr. Davies.

And Counsel is requested to advise whether Davies has a good cause of action for amount he claims over and above sum offered him by the Government, and to state his opinion as to the course which should, under the circumstances, be pursued by Mr. Davies.

Ex parte DAVIES.

As I understand the facts of Mr. Davies's case, he is claiming mainly for work not done under his tender and the plans and specifications to which the tender had reference, and I suppose part of his claim is for work done under such tender and in accordance with such plans and specifications. The work not done under his tender must be considered extra, and for this, as I understand his case, he did not get and has not got an order in writing signed by the Commissioner and countersigned by the superintendent, without which according to the 2nd regulation no such work is to be paid for. It is quite clear therefore that he cannot recover for such work in an action against the Government. Again, I understand he has not got the certificate required by the 15th regulation, and on this ground also he cannot recover in an action. He is upon this state of facts simply at the mercy of the Government.

June 30th, /74.

E. BUTLER.

Having

Having further under my consideration the form of certificate given to the department in this case, it may be argued and it admits of being fairly argued that such a certificate is sufficient to satisfy the 15th section of the general conditions. If the Judge were to hold so, of course this difficulty would be removed. But in my opinion it is not sufficient, for I read that condition to mean the "obtaining of a certificate" by the contractor and not its being obtained by the department, to be delivered or not delivered by them to the contractor, as they may think fit. With regard also to the great quantity of work which I am informed was done not under the original plans but under new plans, the question would be whether the first contract was entirely abandoned and rescinded. If it were not but still subsisted and was being partly carried out, then in my opinion the work done upon the new plans would be work extra the contract; in other words would be "extra works" within the meaning of the second condition, and the contractor was bound to have obtained an order in writing for such work.—E.B.

A 23.

Mr. W. Boyd to Mr. A. Davies.

THE level of shoulders of piles (Goonoo Goonoo Creek Bridge) is to be 2 ft. 6 in. above the floor of Goonoo Goonoo Bridge South.

4 ft. 10 in. higher than first ordered.—A.D., 16./

W. BOYD, 14/3/64.

A 24.

Mr. W. Boyd to Mr. A. Davies.

Tamworth, 16 April, 1864.

Sir,

I beg to inform you that no border stones are required on approaches to Bridge.

I am, &c.,
W. BOYD.

[To the Evidence of W. C. Bennett, Esq., 2 June, 1875.]

B 1.

Mr. W. Boyd to The Commissioner and Engineer for Roads.

Uralla, 22 August, 1864.

Sir,

With reference to your telegram of the 20th instant, I have the honor to inform you, that Mr. Bayley told me on or about the 29th March that Mr. Davies was to have nine (9) shillings per cub. yd. for the metal; this was to the best of my knowledge before any metal was got.

Mr. Davies mentioned *several* times that Mr. Bayley was going to allow him 9s. per cub. yd.; the last time I heard him was about the end of April, or beginning of May, as stated in telegram, when none of the metal was drawn.

I have, &c.,
W. BOYD.

Seen. Put with Goonoo Goonoo Bridge papers.—W.C.B., 27/8/64.

B 2.

Mr. A. Davies to The Commissioner and Engineer for Roads.

Wallabadah, 26 November, 1864.

Sir,

In reply to your letter of the 1st, I have to inform you that I am prepared to sign the usual receipt on being paid the amount certified for by Mr. Superintendent Bayley, on account of Goonoo Goonoo Bridge contract.

I have, &c.,
AMOS DAVIES,
Contractor.

P.S.—I shall be in Sydney on the 2nd December, and will call at the office for payment.—A. DAVIES.

Take care the receipt is in full of all demands.—W.C.B., 29/11/64. Mr. Chisholm,—Mr. Quodling requested to obtain receipt in full.—A.J.C., 3/12/64.

B 3.

The prices in the preceding schedule include all labour, materials, tools, and workmanship of every kind necessary for the full and perfect completion of the work, to the entire satisfaction of the Commissioner for Roads, or other authorized officer.

AMOS DAVIES,
Tamworth.

To the Under Secretary for Public Works.

Should the foregoing tender be accepted we, the undersigned, do hereby agree to be responsible for the due performance of the contract, and we hereby undertake, within _____ days from the date of the notification of the acceptance of the said tender, jointly and severally to execute and deliver a bond to Her Majesty in the penal sum of _____ for securing such performance.

B 7.

Mr. G. Wallace to The Commissioner and Engineer for Roads.

Tamworth, 16 August, 1869.

Davies v. Government.

MR. AMOS DAVIES has instructed me to apply for payment of £110 11s. 4d., being the balance due to him for certain road-works performed by him on or about May, 1864, and January, 1868.

Will you kindly inform me if the Government are prepared to make any settlement of Mr. Davies's claim? I have your letter to Mr. Davies of 9th June last, No. 891, but Mr. Davies informs me that he has not been paid in full.

An early answer will oblige

Yours truly,
GEO. WALLACE.

Inform that we hold Mr. Davies's receipt in full for these works.—W.C.B., 14/9/69. Mr. Wallace, 15/9/69.

The Commissioner and Engineer for Roads to Mr. Geo. Wallace.

Department of Public Works,
Office of Commissioner and Engineer for Roads,
Sydney, 15 September, 1869.

Sir,

In reply to your letter of the 16th ultimo, relative to a claim of £110 11s. 4d., alleged to be due to Mr. Amos Davies in respect of works performed by him under this Department, I have to inform you that receipts showing payment in full for the works in question are duly filed in this office.

I am, &c.,
WILLIAM C. BENNETT,
Commissioner and Engineer.

B 8.

KNOW all men by these presents, that we, Amos Davies, of Wallabadah, in the Colony of New South Wales, contractor, Charles John Smith, of Wallabadah, in the Colony aforesaid, butcher, and Jonathan Cock, of Wallabadah, in the Colony aforesaid, freeholder, are hold and firmly bound unto our Sovereign Lady Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, in the sum of thirty-seven pounds sixteen shillings, of good and lawful money of Great Britain, to be paid to our said Lady the Queen, her heirs or successors, to which payment, well and truly to be made, we bind ourselves, and each and every of us, jointly and severally, for and in the whole, our and each of our heirs, executors, and administrators, and every of them, firmly by these presents. £37 16s.

Sealed with our seals. Dated the twenty-eighth day of August, in the year of our Lord one thousand eight hundred and seventy-two.

WHEREAS the above-bounden Amos Davies made the tender hereunto annexed, under the terms and conditions of a notice dated the tenth day of July now last past, and published in the New South Wales *Government Gazette* of the nineteenth day of July, 1872 (of which notice a copy, signed by the said Amos Davies, Charles John Smith, and Jonathan Cock, is also hereunto annexed), and at the prices and under the stipulations in the said tender mentioned or referred to, to complete the whole of the works required in Contract 17-72, Great Northern Road, 1st District, "Thom's Gulleys," according to specification and general conditions hereto attached: And whereas the above-bounden Amos Davies, Charles John Smith, and Jonathan Cock, have severally agreed to become and be bound to Her Majesty, her heirs and successors, for the due performance and fulfilment of the said tender within the time mentioned in that behalf, according to the terms and conditions of the said notice: And whereas the said tender has been duly accepted by His Excellency the Governor of the said Colony, on condition that this bond should be entered into by them the said Amos Davies, Charles John Smith, and Jonathan Cock: Now, the condition of the above-written bond and obligation is such, that if the said Amos Davies shall and do well and truly perform and fulfil the said tender, and the contract arising out of such tender, and the acceptance thereof as aforesaid, and all and every the terms, conditions, and stipulations thereof, within the time hereinbefore in that behalf mentioned, then this obligation to be void and of none effect, otherwise to remain in full force and virtue.

Signed, sealed, and delivered by the abovenamed Amos Davies, in the presence of,—
GEORGE HOLLOWAY.

AMOS DAVIES.

GEORGE HOLLOWAY.

CHARLES JOHN SMITH.

Signed, sealed, and delivered by the abovenamed Jonathan Cock, in the presence of,—
GEORGE HOLLOWAY.

JONATHAN COCK.

GREAT NORTHERN ROAD—1ST DISTRICT—CONTRACT 17-72.

Department of Public Works—Road Branch.

General conditions of Road contracts and taskwork.

1. The work to which these conditions refer, include the supply of all tools, materials, and labour, and everything else requisite to complete the works specified, to the entire satisfaction of the Commissioner and road superintendent.

2. The contractor is on no account to commence any contract without an order in writing, signed by the road superintendent; and no claim for any work executed without an order will be admitted. No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner and countersigned by the superintendent; the price for any work not in schedule to be determined on previous to its execution, and set forth in the said order.

3. In every case the Commissioner reserves the right of executing any greater or less quantity of the work than that mentioned in the specifications, such increase or decrease to be valued at the schedule rates, and added to or deducted from amount of contract, as the case may be. Schedule rates must be in accordance with bulk sum; if not the Commissioners shall have power to fix rates in accordance therewith and use them for such valuation.

4. During continuance of this contract the contractor is to maintain in fair order the portion of road comprised therein (except where contract is for supply of metal only), and also to afford every facility for the passing of the traffic during the execution of the work, and, if necessary, to provide new or keep the existing out-turns in repair, and also to provide proper guards for the drains and water tables, and to stop all adjacent tracks by which the traffic can avoid the new metal, by felling the trees, drawing logs, or such other means as the superintendent may direct. The contractor to take all due precaution to prevent accident to the public from leaving culverts open or placing heaps of stone in dangerous positions, and will be responsible for all damage arising from his neglect of these precautions.

5. The road superintendent will have the power of immediately dismissing any agent or workman employed by the contractor, and the contractor is not to subcontract or assign any contract, or portion of contract, without the approval of the road superintendent.

6. All gravel, stone, ballast, metal, timber, iron, or other materials, placed on the road, or within one chain of centre thereof, for purposes of this contract, to become the property of the Commissioner when so placed.

7.

7. To secure the proper quantity of metal or gravel it will be measured in a continuous heap of the requisite cross section before being spread, but it shall be competent for the road superintendent to remeasure such metal on the road, when spread, should he consider it necessary.

8. When a certain gauge is specified, it is intended that every stone shall pass in every way through a ring of the diameter of specified gauge, the metal to be clean cuboidal and of sharp fracture; no laminated or jointy stone will be admitted.

9. All water tables and side drains to have a proper fall to outlets and culverts, and new outlet drains made where directed by the superintendent.

10. The sides of all cuttings, side drains, water tables, &c., to have a slope of 1 to 1, except when in rock or otherwise specified; the sides of embankments to have a slope of $1\frac{1}{2}$ to 1.

11. The contractor to be liable to all risk from floods or other accidents during the execution of the works.

12. The road superintendent will have power to employ men, horses, and carts, and purchase materials, to do all necessary or urgent work, or to remove rejected materials on this contract, and deduct cost of same from contract price, provided the contractor shall have neglected to do such work after due notice. Should there be no funds belonging to contractor in the hands of the Commissioner for removal of rejected materials, all such materials, if not removed by contractor within one month from date of rejection, to become the property of the Commissioner, and be used in any manner he may direct.

13. Should the road superintendent be dissatisfied with the rate of progress, or mode of carrying on the work, or with the character of the work done by the contractor, the Commissioner will have power to annul the contract, and the contractor shall forfeit all claim to payment for work done or material delivered; and the Commissioner shall be at liberty to deduct amount of penalty from any sum or sums due to contractor on this or any other contract under him.

14. If the contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner, without previous notice to the contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, to take the works out of the hands of the contractor, and of the assignees or trustees of his estate, and to recontract with any other person or persons to proceed with and complete the same, upon such terms, stipulations, and conditions as shall be deemed expedient, using all the then remaining materials, implements, and plant that may be required to complete the work.

15. Payments to be made at least once a month, at the rate of 90 per cent., the remainder to be paid after the road superintendent and overseer shall have certified that the whole of the works have been completed to their entire satisfaction; and the obtaining such a certificate shall be a condition precedent to the contractor having any claim or cause of action in respect of any work done or materials provided, to the payments from time to time to be made hereunder, or to the final payment upon completion of the contract.

16. All moneys due on account of contract will be paid to the credit of contractor in Bank of New South Wales, or such other Bank as contractor may request, and in no other way; and the contractor shall not assign over any of the moneys payable under this contract, to any other persons by deed of assignment, letter, or order, to the Commissioner or superintendent. The contractor for each and every breach of this condition shall pay to the Commissioner for Roads the sum of five pounds, to be deducted on face of pay-sheet from amount due to contractor.

17. The contractor to attend constantly on the work, or employ a properly authorized agent to represent him, any order to whom will be considered as given to the contractor himself.

18. In case of any defective description or ambiguity in the specification, or in memoranda of contracts, the explanation given by the Commissioner shall be final and binding on the contractor; the measurements to be made according to the actual dimensions, notwithstanding any general or local custom to the contrary.

19. The contracts to be completed in the time specified for each under a penalty of 2 per cent. per month on the total amount of each contract, for every month that such work shall remain incomplete after the expiration of the specified time;— amount of penalty to be deducted on face of pay-sheet from moneys due to contractor by department under this or any other contract.

THESE are the general conditions, with specification attached, referred to in our bond to Her Majesty, dated 28th August, A.D. 1872.

Witness—GEORGE HOLLOWAY.

AMOS DAVIES.
CHARLES JOHN SMITH.
JONATHAN COCK.

CONSTRUCTION.—SPECIFICATION.

Great Northern Road.—First District, 17-72 Contract.—Thom's Gulleys.

- Contract.** This contract commences at south side of Thom's Gully, No. 1, and extends northwards to north side of Thom's Gully, No. 2, comprising the draining, culverting, forming, and metalling of 350 lineal yards road, cutting 350 lineal yards drain, and one 1st class, one 2nd class culverts, and the laying of one 12" pipe drain.
- Drains.** Drains to be cut where directed by the road superintendent; to be 2 feet wide at bottom, with an average depth of 2 feet, and side slopes of one to one. Drains to discharge freely to culverts, and proper inlets or outlets shall be cut from them wherever the superintendent shall direct. The material excavated from drain to be evenly banked up on lower side 4 feet clear from the edge, or to be distributed as may be directed by road superintendent.
- Formation.** Length of drain required, 350 lineal yards.
Roadway to be formed 30 feet wide, on lines pegged out by road superintendent, and to be cut to the inclination directed by him, the gradients being properly boned through and due allowance made for shrinkage of banks. The formation to be in the solid, or made up with approved hard material as the nature of the ground may require, to be uniform in cross section, having a convexity of 9 inches to the margin or water-table, and where embanked on a sideling the scarp side to be left slightly high to allow for settlement in consolidation. All stumps, rocks, or other obstructions to be removed, and all holes, ruts, hollows, or depressions, to be filled in with ballast or approved gravel. Wherever the formation is not altogether in the solid, it must be consolidated by the traffic before any metal is spread, fresh material being supplied to make up convexity where required. The material excavated in forming the road, unless the contractor receives written instructions to the contrary from the road superintendent, shall be thrown back (6) six feet clear of the water-tables. Extra material for embankment to be obtained as will be directed from any distance not exceeding 50 yards. Wherever it is practicable, mitre drains 18" wide shall be cut to relieve the water-tables, at such intervals as shall be directed, a solid block being left, and the tabling recommended 2 feet below each mitre drain.
- Metal.** The length of formation required, 350 lineal yards.
Metal to be of the hardest and best description of blue stone procurable within three miles of the work; to be approved by the superintendent, to whom a sample is to be submitted before any quarrying is done. To be broken to a strict 3-inch gauge, with clean, sharp, and cuboidal fracture, and stacked on even ground by the side of the road for measurement. The metal to be quite free from spawls, quarry faces, dirt, chips, &c. The heaps shall be opened out for inspection as directed.
Quantity of metal required, 200 cubic yards.
When the whole length of formation is ready to receive metal, it is after measurement, and on receipt of order from the road superintendent or overseer, to be evenly spread, as will be directed.
- Progress.** The contractor shall be bound to proceed with the works in such order and at such times as he may be instructed. If required, he shall supply all the metal, and construct all the culverts before commencing the formation, or *vice versa*.
- Culverts.** The culverts are to be of the dimensions shown on drawings, and in all other respects in accordance with the plans hereto attached. The stone is to be approved of; to be quarry dressed, but to have faced joints; to be laid in mortar, composed of one part best stone-lime to two parts of approved sand; joints to be flushed throughout.
- Time.** All the works specified to be completed within four months from date of signing the bond under a penalty provided for in the "General Conditions for Road Contracts," hereto attached, which penalty will in all cases be strictly enforced, irrespective of bad weather, or any other cause of delay, except a written order be given by the road superintendent not to proceed with the work, or to increase the same, when a proportionate extension of time must be allowed.

Tenders

Tenders to state a bulk sum for the execution of all the works specified, also a schedule of prices at which any Tenders. deductions or additions shall be valued; such additions or deductions, no matter to what extent ordered, shall not vitiate or set aside the contract.

In all matters relating to this contract, not herein specified, the contractor to be bound by the printed general conditions hereto attached. General conditions.

12" Pipe drain.—The pipes will be provided by the Government, and delivered to the contractor at the Railway goods-shed at Murrurundi; the contractor will have to cart them to the work and be responsible for breakage. They are to be laid in Portland cement, in such position and with such fall as will be directed. At each end of each pipe drain two stones, cut to receive pipes, are to be provided and set in cement, each stone to be 3' x 1' x 10". The trench to be filled over pipes with approved ballast up to the level of tops of stones at ends of pipe drains, and to be well rammed after.

ROADS DEPARTMENT.

Contract 17-72.

2nd-class Stone Culvert—Flagged top, 6ft. span.

THE culvert to be built in general accordance with drawing (as figured),* the water-way being 6 feet x 2½ feet in the clear between abutment walls. The roadway 20 ft. wide in the clear between parapets. * Design. (See separate Appendix No. 1.)
Foundation.

The trenches for foundations shall be dug on lines pegged out by the superintendent, and shall be excavated to such a depth as will ensure sound, permanent, and level foundations for footings on rock or other approved hard stratum. Benching will be allowed or not at the discretion of the superintendent, who will examine and pass the foundation before any masonry is laid. The contractor to keep the foundation trenches free from water either by drains or pumping until such time as the road superintendent may direct.

On receipt of a written order from the superintendent, the main and face walls may be carried up as nearly level in height all round as the nature of the work will allow, so that settlement may be as uniform as possible. Walls to be built in first-class coursed rubble-work set in mortar composed of two parts best stone lime, mixed with three parts of clean sharp sand. No stone to be less than half a cubic foot in dimension. Walls to be of the thickness shown on drawing. Quoins to be hammer-dressed. No stone to be less on bed than height of course. Headers to be at least double the height of course on bed. Masonry.

The trench for the culvert shall be dug across the full width of the road at such inclination as may be directed, and if to be paved shall be shaped with a concavity of 4 inches; the inlet being if necessary either double or bell-mouthed at its junction with side drain. Inlet and outlet.

When the walls are carried up to the required height, and shall have passed inspection and approval by the superintendent, the foundation trenches shall be filled in with the material excavated if of approved quality, rammed in layers. If quality be not approved, fresh material must be obtained. The whole back of the culvert to be covered in with a layer of puddle of approved clay, as shown in drawing.

The bed of waterway shall be either flagged or paved as shown in drawing, with rough spawled pavours 12 inches deep on edge, close laid in the dry, rammed and grouted with lime and fine clean sharp sand. The downstream course to be of the largest stones obtainable, well bedded into remainder of work and to side walls. Paving.

Corbel flags 3 feet 6 inches long, not less than 2 feet wide, and 12 inches thick, shall be bedded on the top of main walls, which shall be built up smooth without spawls to receive them, the tops to be dressed off flat to receive covering flag. The top of culvert shall be covered in by flags 6½ feet long, not less than 2 feet wide or 12 inches thick in any place. All flags to be roughly edged, to lay close and bed truly, jointed and pointed with mortar, and to be thoroughly hard, sound, and free from fractures. Flagging.

The face walls being carried up 18 inches thick to level shown on drawings, shall finish in a parapet of 12 inch rubble masonry, having a coping of rough hammered stone rounded at top and set on edge in mortar, as shown in drawing. Parapets.

When the masonry and flagging has been inspected and passed, and not before, the whole of the culvert between parapets shall be filled into the formation level of roadway with approved material, shale, clay, or earth, rammed in layers, the formation having a convexity of 9 inches in the centre. A perfect junction to be effected with existing road formation. Filling.

The roadway between parapets shall be covered with a layer of approved ballast 6 inches thick, broken to a strict 5 inch gauge, which shall be blinded and consolidated by traffic. Then a layer of the hardest blue metal, 6 inches thick, shall be evenly spread over the whole, and a perfect junction made with existing roadway wherever disturbed. Metal to be broken to a strict 3-inch gauge, clean, cuboidal, and with sharp fractures. To facilitate passage of traffic, if required, the contractor shall build only half of the length of the culvert at one time,—great care being taken to bind the work properly at the joining; and also, if required, shall keep a light burning all night—contractor being responsible for all accidents to vehicles arising from his neglect. Ballast and metal.

Contractor to find all plant, tools, and materials required, and to remove same on completion of work, and clear away all rubbish.

In all matters relating to this contract not set forth herein, the contractor to be bound by the general conditions of contract attached.

ROADS DEPARTMENT.

Contract 17-72.

Stone Culvert—Arch.

THE culvert to be built in general accordance with drawings (as figured), the span being 14 feet clear at springing of arch. Roadway to be 20 feet clear in width between parapet walls. Design. (See separate Appendix No. 2.)
Foundations.

The trenches for foundations shall be dug on lines pegged out by the superintendent, and shall be excavated to such a depth as will ensure sound, permanent, and level foundation for footings on rock or other approved hard stratum. Benching will be allowed or not, at the discretion of the superintendent, who will examine and pass the foundation before any masonry is laid. The contractor to keep the foundation trenches free from water either by drains or pumping until such time as the road superintendent may direct.

On receipt of a written order from the superintendent, the abutment and face walls of the culvert may be carried up as nearly level in height all round as the nature of the work will allow, so that settlement may be as uniform as possible before springing the arch. Masonry.

Footings to be through stones 3 feet long bedded truly on the foundations, no spawling or packing under being allowed. Footings.

Abutments and face walls to be built in first-class coursed rubble-work set flush in mortar composed of two parts best stone lime, with three parts clean sharp sand, well mixed and beaten, no stone to be less on bed than height of course, headers to be at least double the height of course on bed. No stone to be less than half a cubic foot in dimension. Walls to be of the thicknesses shown on drawing, according to their height from footing courses. Abutment walls to have a batter of 1 in 10 on face. The quoins of abutment and outer ring of arch to be neatly hammer-dressed, beds of ring stones being truly radial, and soffits neatly dressed to curve of arch. Skewbacks to be through stones 2 feet on bed. The sheeting of arch to be of the flattest stones obtainable, and if not flat to be roughly hammered and bedded skin to skin flush in fine mortar; the backs carefully spawled up and well grouted with mortar, half lime and half sand. Arch to be built over a centre of planks of sufficient thickness laid on dry stone walls. The joints of soffit to be neatly pointed and struck on removal of centering. Face walls to be carried up 18 inches thick to level shown on drawing, with a parapet of 12 inch rubble masonry, coped with rough hammered and rounded stones set on edge in mortar, as shown in drawing. Walls, and arch.

The bed of waterway or creek shall be shaped out to a regular incline of 1 in 60, with a concavity of 8 inches; then paved with rough spawled pavours 12 inches deep on edge, close laid without mortar, rammed and grouted with lime and fine clean sharp sand, the downstream course to be of the largest stones obtainable, well bonded into remainder of work, and to side walls.

When

Filling and puddle.

When the masonry is carried as high as the springing, and has been examined and approved by the superintendent, the foundation trenches shall be filled in with the material excavated, if of approved quality, rammed in layers. If quality be not approved, fresh material must be obtained. When the whole of the masonry has been inspected and passed, and not before, the whole of the culvert between wing walls shall be covered and backed in with a layer of puddle of approved clay, as shown in drawing, and subsequently raised to formation level by rammed earth as shown; the formation having a convexity of 9 inches in centre.

Ballast and metal.

The roadway between parapet walls shall be covered with a layer of approved ballast 6 inches thick, broken to a strict 5 inch gauge, which shall be blinded and consolidated by traffic. Then a layer of the hardest blue metal 6 inches thick shall be evenly spread over the whole, and a perfect junction made with existing roadway wherever disturbed. Metal to be broken to a strict 3 inch gauge, clean, cuboidal, and with sharp fractures.

To facilitate passage of traffic, if required, the contractor shall build only half the length of this culvert at one time—great care being taken to bond the work properly at the joining; and also, if required, shall keep a light burning all night—contractor being responsible for all accidents to vehicles arising from his neglect.

In places where suitable stone for sheeting of arch cannot be obtained, brick-work of the same thickness may be substituted, with the same conditions as to centering, grouting, and quality of mortar.

The bricks to be laid on edge in concentric rings, bond carefully attended to, and the soffit neatly pointed on removal of centering.

Contractor to find all plant, tools, material, centering, &c., required, and to remove same on completion of work, and clean away all rubbish, &c.

In all matters relating to this contract, not set forth herein, the contractor to be bound by the general conditions of contract attached.

Form of Tender for Road.
DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.

I HEREBY propose to execute the whole of the works required on Contract No. 17-72, Great Northern Road, First District, Thom's Gullies, in strict accordance with specification, general conditions, and to the satisfaction of the Commissioner for Main Roads or other authorized officer, and to complete the same within _____ months after signing the contract for the sum of £ _____; and do hereby agree that any addition, deduction, or alteration, shall be valued at the following rates, or at a price to be agreed upon at the time, and added to or deducted from the above amounts, as the case may be:—

	£	s.	d.
Clearing road wide			
Excavation in earth			
Do. rock			
Forming 350 lin. yards, at 3s.			
Side drains, 350 „ at 1s.			
Ballast gauge, 200 cubic yards, at 6s.			
Metal, 3-in. gauge			
Gravel gauge			
One 1st class culvert, stone, 14 ft. span			
One 2nd class culvert, stone			
Laying 12-in. drain pipe			
	£	378	0 0

The prices in the preceding schedule include all labor, materials, tools, and workmanship of every kind necessary for the full and perfect completion of the works to the entire satisfaction of the Commissioner for Roads or other authorized officer.

To the Under Secretary for Public Works, AMOS DAVIES,
Wallabadah, 4/8/72.

Should the foregoing tender be accepted, we, the undersigned, do hereby agree to be responsible for the due performance of the contract, and we hereby undertake within _____ days from the date of the notification of the acceptance of the said tender, jointly and severally to execute and deliver a bond to Her Majesty in the penal sum of _____ for securing such performance.

CHARLES JOHN SMITH,
Wallabadah.
G. H. WHEATLEY,
Wallabadah.

Department of Public Works,
Sydney, 10th July, 1872.

GREAT NORTHERN ROAD.—FIRST DISTRICT.

TENDERS will be received at this Office, until 11 o'clock of Tuesday, the 6th day of August next, from persons willing to contract for the following Works on the Great Northern Road, 1st District:—

- Contract 16-72.—Wire fence to south end of Apple-tree Flat.
- „ 17-72.—Thom's Gullies.
- „ 18-72.—South of Red Hill.
- „ 19-72.—Martindale's Culvert to The Furrows.

Plan, specification, and form of tender may be seen at the Office of the Commissioner for Roads, Sydney, and at the Court Houses, Murrurundi and Wallabadah. Tenders to be addressed to the Under Secretary for Public Works, Sydney, and to be marked outside "Tender for Contract, Great Northern Road, 1st District."

AMOS DAVIES.

JOHN SUTHERLAND.

Witness—GEORGE HOLLOWAY.

KNOW all men by these presents, that we, Amos Davies, of Wallabadah, in the Colony of New South Wales, contractor; Jonathan Cock, of Wallabadah, in the Colony aforesaid, freeholder; and Charles John Smith, of Wallabadah, in the Colony aforesaid, butcher, are held and firmly bound unto our Sovereign Lady Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, in the sum of one hundred and ninety-one £191 2s pounds and two shillings, of good and lawful money of Great Britain, to be paid to our said Lady the Queen, her heirs or successors, to which payment, well and truly to be made, we bind ourselves, and each and every of us, jointly and severally, for and in the whole, our and each of our heirs, executors, and administrators, and every of them, firmly by these presents.

Sealed with our seals. Dated the twenty-eighth day of August, in the year of our Lord one thousand eight hundred and seventy-two.

WHEREAS the above-bounden Amos Davies made the tender hereunto annexed, under the terms and conditions of a notice dated the tenth day of July now last past, and published in the New South Wales *Government Gazette* of the nineteenth day of July, 1872 (of which notice a copy, signed by the said Amos Davies, Jonathan Cock, and Charles John Smith, is also hereunto annexed), and at the prices and under the stipulations in the said tender mentioned or referred to, to complete the whole of the works required in Contract 10-72, Great Northern Road, 1st District, Sugarloaf, to metalling at M'Mahon's, according to specification and general conditions hereto attached:

And whereas the above-bounden Amos Davies, Jonathan Cock, and Charles John Smith, have severally agreed to become and be bound to Her Majesty, her heirs and successors, for the due performance and fulfilment of the said tender within the time mentioned in that behalf, according to the terms and conditions of the said notice: And whereas the said tender has been duly accepted by His Excellency the Governor of the said Colony, on condition that this bond should be entered into by them the said Amos Davies, Jonathan Cock, and Charles John Smith:

Now the condition of the above-written bond and obligation is such, that if the said Amos Davies shall and do well and truly perform and fulfil the said tender, and the contract arising out of such tender, and the acceptance thereof as aforesaid, and all and every the terms, conditions, and stipulations thereof, within the time hereinbefore in that behalf mentioned, then this obligation to be void and of none effect, otherwise to remain in full force and virtue.

AMOS DAVIES.

DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.

I HEREBY propose to execute the whole of the works required on Contract No. 10-72, Great Northern Road, First District, Sugar-loaf Gap, to metalling at M'Mahon's, in strict accordance with specification, general conditions, and to the satisfaction of the Commissioner for Main Roads, or other authorized officer, and to complete the same within six months after signing the contract, for the sum of £1,911 8s. 6d.; and do hereby agree that any addition, deduction, or alteration, shall be valued at the following rates, or at a price to be agreed upon at the time, and added to or deducted from the above amounts, as the case may be:—

	£	s.	d.
Clearing road wide per lineal chain			
Excavation in earth, per cubic yard.....			
Do. rock, per cubic yard			
Forming 2,130 lineal yards, at 2s. 6d. per lineal yard	266	5	0
Side drains, 2,130 lineal yards, at 1s. per lineal chain	106	10	0
Ballast gauge, per cubic yard.....			
Metal, 3 in. gauge, 3,729 cubic yards, at 5s. 6d. per cubic yard	1,025	9	6
Blinding gauge, 532 cubic yards, at 2s. per cubic yard	53	4	0
Four 3rd class culverts, 5 feet waterway, at £40 each	160	0	0
Six 2nd class do., stone, 8 feet waterway, at £50 each.....	300	0	0
Maintenance of road after completion of construction, £24 per month.			
	£1,911	8	6

The prices in the preceding schedule include all labour, materials, tools, and workmanship of every kind necessary for the full and perfect completion of the works to the entire satisfaction of the Commissioner for Roads, or other authorized officer.

To the Under Secretary for Public Works.

AMOS DAVIES,

Wallabadah, 3 August, 1872.

Should the foregoing tender be accepted, we, the undersigned, do hereby agree to be responsible for the due performance of the contract, and we hereby undertake within _____ days from the date of the notification of the acceptance of the said tender, jointly and severally, to execute and deliver a bond to Her Majesty in the penal sum of _____ for securing such performance.

JONATHAN COCK,
CHARLES JOHN SMITH,
both of Wallabadah.

DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.

Great Northern Road, First District.—Contract 10 of 1872.

General Conditions of Road Contracts and Taskwork.

1. The works to which these conditions refer, include the supply of all tools, materials, and labor, and everything else requisite to complete the works specified, to the entire satisfaction of the Commissioner and road superintendent.

2. The contractor is on no account to commence any contract without an order in writing, signed by the road superintendent; and no claim for any work executed without an order will be admitted. No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner and countersigned by the superintendent,—the price for any work not in schedule to be determined on previous to its execution, and set forth in the said order.

3. In every case the Commissioner reserves the right of executing any greater or less quantity of the work than that mentioned in the specifications, such increase or decrease to be valued at the schedule rates, and added to or deducted from amount of contract, as the case may be. Schedule rates must be in accordance with bulk sum; if not, the Commissioner shall have power to fix rates in accordance therewith and use them for such valuation.

4. During continuance of this contract the contractor is to maintain in fair order the portion of road comprised therein (except where contract is for supply of metal only), and also to afford every facility for the passing of the traffic during the execution of the work, and, if necessary, to provide new or keep the existing out-turns in repair, and also to provide proper guards for the drains and water-tables, and to stop all adjacent tracks by which the traffic can avoid the new metal, by felling trees, drawing logs, or such other means as the superintendent may direct. The contractor to take all due precaution to prevent accident to the public from leaving culverts open or placing heaps of stone in dangerous positions, and will be responsible for all damage arising from his neglect of these precautions.

5. The road superintendent will have the power of immediately dismissing any agent or workman employed by the contractor, and the contractor is not to sublet or assign any contract, or portion of contract, without the approval of the road superintendent.

6. All gravel, stone, ballast, metal, timber, iron, or other materials, placed on the road, or within one chain of centre thereof, for purposes of this contract, to become the property of the Commissioner when so placed.

7. To secure the proper quantity of metal or gravel it will be measured in a continuous heap of the requisite cross section before being spread, but it shall be competent for the road superintendent to re-measure such metal on the road, when spread, should he consider it necessary.

8. When a certain gauge is specified, it is intended that every stone shall pass in every way through a ring of the diameter of specified gauge, the metal to be clean cuboidal and of sharp fracture; no laminated or jointy stone will be admitted.

9. All water-tables and side drains to have a proper fall to outlets and culverts, and new outlet drains made where directed by the superintendent.

10. The sides of all cuttings, side drains, water-tables, &c., to have a slope of 1 to 1, except when in rock or otherwise specified; the sides of embankments to have a slope of $1\frac{1}{2}$ to 1.

11. The contractor to be liable to all risk from floods or other accidents during the execution of the works.

12. The road superintendent will have power to employ men, horses, and carts, and purchase materials to do all necessary or urgent work, or to remove rejected materials on this contract, and deduct cost of same from contract price, provided the contractor shall have neglected to do such work after due notice. Should there be no funds belonging to contractor in the hands of the Commissioner, for removal of rejected materials, all such materials if not removed by contractor within one month from date of rejection, to become the property of the Commissioner, and be used in any manner he may direct.

13. Should the road superintendent be dissatisfied with the rate of progress, or mode of carrying on the work, or with the character of the work done by the contractor, the Commissioner will have power to annul the contract, and the contractor shall forfeit all claim to payment for work done or material delivered; and the Commissioner shall be at liberty to deduct amount of penalty from any sum or sums due to contractor on this or any other contract under him.

14. If the contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner, without previous notice to the contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, to take the works out of the hands of the contractor, and of the assignees or trustees of his estate, and to re-contract with any other person or persons to proceed with and complete the same, upon such terms, stipulations, and conditions as shall be deemed expedient, using all the then remaining materials, implements, and plant that may be required to complete the work.

15. Payments to be made at the rate of 90 per cent., the remainder to be paid after the road superintendent and overseer shall have certified that the whole of the works have been completed to their entire satisfaction; and the obtaining such a certificate shall be a condition precedent to the contractor having any claim or cause of action in respect of any work done or materials provided, to the payments from time to time to be made hereunder, or to the final payment upon completion of the contract.

16. All moneys due on account of contract, will be paid to the credit of contractor in Bank of New South Wales, or such other Bank as contractor may request, and in no other way; and the contractor shall not assign over any of the moneys payable under this contract, to any other persons by deed of assignment, letter, or order, to the Commissioner or superintendent. The contractor for each and every breach of this condition, shall pay to the Commissioner for Roads the sum of five pounds, to be deducted on face of pay-sheet from amount due to contractor.

17. The contractor to attend constantly on the work, or employ a properly authorized agent to represent him; any order to whom will be considered as given to the contractor himself.

18. In case of any defective description or ambiguity in the specification, or in memoranda of contracts, the explanation given by the Commissioner shall be final and binding on the contractor; the measurements to be made according to the actual dimensions, notwithstanding any general or local custom to the contrary.

19. The contract to be completed in the time specified under a penalty of 2 per cent. per month on the total amount, for every month that such work shall remain incomplete after the expiration of the said five months, amount of penalty to be deducted on face of pay-sheet from moneys due to contractor by department under this or any other contract.

These are the general conditions with specification attached, referred to in our bond to Her Majesty, dated 28th August, A.D. 1872.

Witness,—GEORGE HOLLOWAY.

AMOS DAVIES.
JONATHAN COCK.
CHARLES JOHN SMITH.

CONSTRUCTION—SPECIFICATION.

Great Northern Road.—First District, 10-72 contract. Sugarloaf Gap to metalling at M'Mahon's.

Contract. THIS contract commences at end of metalling over Sugarloaf Gap, and extends northwards to metalling at "M'Mahon's Inn," comprising the draining, culverting, forming, metalling, blinding, and consolidating, on the following sections:—

Section 1.—Sugarloaf to 1st culvert, 1,602 lineal yards.

" 2.—1st culvert to 2nd culvert, 528 lineal yards.

Making a total of 2,130 lineal yards road construction, 2,130 lineal yards drain, and eight 2nd class and two 3rd class stone culverts.

Drains. Drains to be cut where directed by the road superintendent; to be 1 foot wide at bottom, with an average depth of 2 feet, and side slopes of one to one; drains to discharge freely to culverts, and proper inlets or outlets shall be cut from them wherever the superintendent shall direct. The material excavated from drain to be evenly banked up on lower side 4 feet clear from the edge, or to be distributed as may be directed by road superintendent.

Formation. Roadway to be formed 30 feet wide, on lines pegged out by road superintendent, and to be cut to the inclination directed by him, the gradients being properly boned through and due allowance made for shrinkage of banks. The formation to be in the solid, or made up with metal, as the nature of the ground may require, to be uniform in cross section, having a convexity of 9 inches to the margin or water-table, and were embanked on a sidling the scarp side to be left slightly high to allow for settlement in consolidation. All stumps, rocks, or other obstructions to be removed, and all holes, ruts, hollows, or depressions to be filled in with metal. Wherever the formation is not altogether in the solid, it must be consolidated by the traffic before any metal is spread, fresh material being supplied to make up convexity where required. The material excavated in forming the road, unless the contractor receives written instructions to the contrary from the road superintendent, shall be thrown back (6) six feet clear of the water-tables. Wherever it is practicable, mitre drains 18" wide shall be cut to relieve the water-tables, at such intervals as shall be directed, a solid block being left and the tabling recommenced 2 feet below each mitre drain. The length of formation required is 2,130 lineal yards.

Metal. The metal to be of the hardest and best description of bluestone procurable within 3 miles of the work; to be approved by the superintendent, to whom a sample is to be submitted before any quarrying is done. To be broken to a strict 3 inch gauge, with clean, sharp, and cuboidal fracture, and stacked on even ground by the side of the road for measurement. The metal

metal to be quite free from spawls, quarry face, dirt, chips, &c., and shall be turned over by a fork having tines $1\frac{1}{2}$ " apart. The heap shall be opened out for inspection as directed. The metal to be provided at the rate of $1\frac{3}{4}$ cubic yard to each yard of road.

When the whole or any well defined length of formation is ready to receive metal, it is after measurement, and on receipt of a written order from the road superintendent or overseer, to be evenly spread to a width of 20 feet and a depth of about $7\frac{1}{2}$ inches, or at the rate of $1\frac{1}{2}$ cubic yard to the lineal yard of road. Until so spread, examined, and blinded, no more metal shall be stacked within such distance of the measured metal as shall be directed by the road superintendent.

When this quantity of metal is properly spread, and after inspection by the superintendent, the central 12 feet of road shall receive an even coat of blinding 3 inches thick, or at the rate of $\frac{1}{2}$ cubic yard to the lineal yard of road. Blinding to consist of decomposed granite, clean ridge gravel, or other approved gritty material. No clay, loam, or black soil on any account to be used as blinding. Quantity of blinding required—532 cubic yards. The road is then to be kept rolled in, and maintained with the remaining $\frac{1}{2}$ of a yard of metal to the yard run, until thoroughly consolidated by traffic and raker; any metal not so required to be stacked alongside for further maintenance.

The contractor shall be bound to proceed with the works in such order and at such times as he may be instructed. If required he shall supply all the metal, and construct all the culverts before commencing the formation, or *vice versa*.

The culverts are to be of the dimensions shown on drawings, and in all other respects in accordance with the plans hereto attached; to be of rough hammer-dressed stone, laid in mortar composed of one part approved stone-lime to two parts of clean sand; stones to be well bedded, and joints to be flushed through. Parapets to be dressed inside, and all quoins to be drafted. The height of parapets, &c., to be according to position.

All the works specified to be completed within five months from date of signing the bond under a penalty provided for in the "General Conditions for Road Contracts," hereto attached, which penalty will in all cases be strictly enforced, irrespective of bad weather, or any other cause of delay, except a written order be given by the road superintendent not to proceed with the work, or to increase the same when a proportionate extension of time must be allowed.

Tenders to state a bulk sum for the execution of all the works specified; also, a schedule of prices at which any deductions or additions shall be valued. Such additions or deductions, no matter to what extent ordered, shall not vitiate or set aside the contract.

In all matters relating to this contract, not herein specified, the contractor to be bound by the printed general conditions hereto attached.

Six of the 2nd class culverts are to have waterways of 8 feet, and two of them waterways of 5 feet each.

The 3rd class culverts are to have waterways of 5 feet each.

ROADS DEPARTMENT.

Contract 10-72—2nd Class Stone Culvert—Flagged Top.

THE culvert to be built in general accordance with drawing (as figured), the waterway being 8 feet x $2\frac{1}{2}$ feet in the clear between abutment walls. The roadway 22 feet wide in the clear between parapets. Design. (See Separate Appendix No. 3) Foundation.

The trenches for foundation shall be dug on lines pegged out by the superintendent, and shall be excavated to such a depth as will ensure sound, permanent, and level foundations for footings on rock or other approved hard stratum. Benching will be allowed or not, at the discretion of the superintendent, who will examine and pass the foundation before any masonry is laid. The contractor to keep the foundation trenches free from water either by drains or pumping until such time as the road superintendent may direct.

On receipt of a written order from the superintendent, the main and face walls may be carried up as nearly level in height all round as the nature of the work will allow, so that settlement may be as uniform as possible. Walls to be built in first-class coursed rubble-work set in mortar composed of two parts best stone lime, mixed with three parts of clean sharp sand. No stone to be less than half a cubic foot in dimension. Walls to be of the thicknesses shown on drawing. Quoins to be hammer-dressed. No stone to be less on bed than height of course. Headers to be at least double the height of course on bed.

The trench for the culvert shall be dug across the full width of the road at such inclination as may be directed, and to be paved shall be shaped with a concavity of 5 inches; the inlet being if necessary either double or bell-mouthed at its junction with side drain. Masonry. Inlet and outlet.

When the walls are carried up to the required height, and shall have passed inspection and approved by the superintendent, the foundation trenches shall be filled in with the material excavated, if of approved quality, rammed in layers. If quality be not approved, fresh material must be obtained. The whole back of the culvert to be covered in with a layer of puddle of approved clay, as shown in drawing.

The bed of waterway shall be either flagged or paved as shown in drawing with rough spawled paviments 12 inches deep on edge, close laid in the dry, rammed and grouted with lime and fine clean sharp sand. The downstream course to be of the largest stones obtainable, well bonded into remainder of work and to side walls. Paving.

Corbel flags, 6 feet long, not less than 2 feet wide and 12 inches thick, shall be bedded on the top of main walls, which shall be built up smooth without spawls to receive them, the tops to be dressed off flat to receive covering flag. The top of culvert shall be covered in by flags 7 feet long, not less than 2 feet wide or 12 inches thick in any place. All flags to be roughly edged, to lay close and bed truly, jointed and pointed with mortar, and to be thoroughly hard, sound, and free from fractures. Flagging.

The face walls being carried up 18 inches thick to level shown on drawings, shall finish in a parapet of 12-inch rubble masonry, having a coping of rough hammered stone rounded at top and set on edge in mortar, as shown in drawing. Parapets.

When the masonry and flagging has been inspected and passed, and not before, the whole of the culvert between parapets shall be filled in to the formation level of roadway with approved material, shale, clay, or earth rammed in layers; the formation having a convexity of 9 inches in the centre. A perfect junction to be effected with existing road formation. Filling.

The roadway between parapets shall be covered with a layer of approved ballast 6 inches thick, broken to a strict 5-inch gauge, which shall be blinded and consolidated by traffic. Then a layer of the hardest blue metal, 6 inches thick, shall be evenly spread over the whole, and a perfect junction made with existing roadway wherever disturbed. Metal to be broken to a strict 3-inch gauge, clean, cuboidal, and with sharp fractures. To facilitate passage of traffic, if required, the contractor shall build only half of the length of the culvert at one time,—great care being taken to bind the work properly at the joining; and also, if required, shall keep a light burning all night—contractor being responsible for all accidents to vehicles arising from his neglect. Ballast and metal.

Contractor to find all plant, tools, and materials required, and to remove same on completion of work, and clear away all rubbish.

In all matters relating to this contract, not set forth herein, the contractor to be bound by the general conditions of contract attached.

ROADS DEPARTMENT.

Contract 10-72—3rd Class Stone Culvert—Flagged Top.

THE culvert to be built in general accordance with drawing (as figured), the waterway being 5 feet x $2\frac{1}{2}$ feet in the clear between abutment walls. The roadway 20 feet wide in the clear between parapets. Design. (See Separate Appendix No. 4.) Foundation.

The trenches for foundation shall be dug on lines pegged out by the superintendent, and shall be excavated to such a depth as will ensure sound, permanent, and level foundations for footings on rock or other approved hard stratum. Benching will be allowed or not, at the discretion of the superintendent, who will examine and pass the foundation before any masonry is laid. The contractor to keep the foundation trenches free from water either by drains or pumping until such time as the road superintendent may direct.

On receipt of a written order from the superintendent, the main and face walls may be carried up as nearly level in height all round as the nature of the work will allow, so that settlement may be as uniform as possible. Walls to be built in first-class coursed rubble-work, set in mortar composed of two parts best stone lime, mixed with three parts of clean sharp sand. Masonry.

No

No stone to be less than half a cubic foot in dimension. Walls to be of the thicknesses shown on drawing. Quoins to be hammer-dressed. No stone to be less on bed than height of course. Headers to be at least double the height of course on bed.

Inlet and outlet. The trench for the culvert shall be dug across the full width of the road at such inclination as may be directed, and if to be paved, shall be shaped with a concavity of 4 inches; the inlet being if necessary either double or bell-mouthed at its junction with side drain.

When the walls are carried up to the required height, and shall have passed inspection and approval by the superintendent, the foundation trenches shall be filled in with the material excavated, if of approved quality, rammed in layers. If quality be not approved, fresh material must be obtained. The whole back of the culvert to be covered in with a layer of puddle of approved clay, as shown in drawing.

Paving. The bed of waterway shall be either flagged or paved as shown in drawing, with rough spawled pavours 12 inches deep on edge, close laid in the dry, rammed and grouted with lime and fine clean sharp sand. The down stream course to be of the largest stones obtainable, well bonded into remainder of work and to side walls.

Flagging. The top of main walls shall be built up smooth without spawls, dressed off flat to receive covering flag. The top of culvert shall be covered in by flags 7 feet long, not less than 2 feet wide or 12 inches thick in any place. All flags to be roughly edged, to lay close and bed truly, jointed and pointed with mortar, and to be thoroughly hard, sound, and free from fractures.

Parapets. The face walls being carried up 18 inches thick to level shown on drawings, shall finish in a parapet of 12 inch rubble masonry, having a coping of rough hammered stone rounded at top and set on edge in mortar, as shown in drawing.

Filling. When the masonry and flagging has been inspected and passed, and not before, the whole of the culvert between parapets shall be filled in to the formation level of roadway with approved material, shale, clay, or earth rammed in layers; the formation having a convexity of 9 inches in the centre. A perfect junction to be effected with existing road formation.

Ballast and metal. The roadway between parapets shall be covered with a layer of approved ballast 6 inches thick, broken to a strict 5-inch gauge, which shall be blinded and consolidated by traffic. Then a layer of the hardest blue metal 6 inches thick, shall be evenly spread over the whole, and a perfect junction made with existing roadway wherever disturbed. Metal to be broken to a strict 3-inch gauge, clean, cuboidal, and with sharp fractures. To facilitate passage of traffic, if required, the contractor shall build only half of the length of the culvert at one time,—great care being taken to bind the work properly at the joining; and also, if required, shall keep a light burning all night—contractor being responsible for all accidents to vehicles arising from his neglect.

Contractor to find all plant, tools, and materials required, and to remove same on completion of work, and clear away all rubbish.

In all matters relating to this contract not set forth herein, the contractor to be bound by the general conditions of contract attached.

Department of Public Works,
Sydney, 10 July, 1872.

GREAT NORTHERN ROAD.—FIRST DISTRICT.

TENDERS will be received at this office, until 11 o'clock of Tuesday, the 6th day of August next, from persons willing to contract for the undermentioned works on the Great Northern Road, 1st District:—

- Contract 10-72.—Sugarloaf to metalling at M'Mahon's.
 " 13-72.—Singleton to Camberwell.
 " 14-72.—South of Grass-tree Hill to Muswellbrook.
 " 15-72.—Skinner's Lun to top of Warland's Range.

Plan, specification, and form of tender may be seen at the office of the Commissioner for Roads, Sydney, and at the Court Houses, Muswellbrook and Murrurundi.

Tenders to be addressed to the Under Secretary for Public Works, Sydney, and to be marked outside "*Tender for Contract, Great Northern Road, 1st District.*"

 CHARLES JOHN SMITH.

Witness,—

KNOW all men by these presents, that we, Amos Davies, of Wallabadah, in the Colony of New South Wales, contractor, Jonathan Cock, of Wallabadah, in the Colony aforesaid, freholder, and Charles John Smith, of Wallabadah, in the Colony aforesaid, butcher, are held and firmly bound unto our Sovereign Lady Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, in the sum of one hundred and eleven pounds and twelve shillings of good and lawful money of Great Britain, to be paid to our said Lady the Queen, her heirs or successors, to which payment, well and truly to be made, we bind ourselves, and each and every of us, jointly and severally, for and in the whole, our and each of our heirs, executors, and administrators, and every of them, firmly by these presents.

Sealed with our seals. Dated the twenty-eighth day of August, in the year of our Lord one thousand eight hundred and seventy-two.

WHEREAS the above-bounden Amos Davies made the tender hereunto annexed, under the terms and conditions of a notice dated the tenth day of July now last past, and published in the New South Wales *Government Gazette* of the nineteenth day of July, 1872 (of which notice a copy, signed by the said Amos Davies, Jonathan Cock, and Charles John Smith, is also hereunto annexed), and at the prices and under the stipulations in the said tender mentioned or referred to, to complete the whole of the works required in Contract 16-72, Great Northern Road, 1st District, "wire fence to south end of Apple-tree Flat," according to specification and general conditions attached hereto:

And whereas the above-bounden Amos Davies, Jonathan Cock, and Charles John Smith have severally agreed to become and be bound to Her Majesty, her heirs and successors, for the due performance and fulfilment of the said tender within the time mentioned in that behalf, according to the terms and conditions of the said notice: And whereas the said tender has been duly accepted by His Excellency the Governor of the said Colony, on condition that this bond should be entered into by them the said Amos Davies, Jonathan Cock, and Charles John Smith: Now the condition of the above-written bond and obligation is such that if the said Amos Davies shall and do well and truly perform and fulfil the said tender, and the contract arising out of such tender, and the acceptance thereof as aforesaid, and all and every the terms, conditions, and stipulations thereof, within the time hereinbefore in that behalf mentioned, then this obligation to be void and of none effect, otherwise to remain in full force and virtue.

DEPARTMENT

DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.

Great Northern Road, First District.—Contract 16-72.

General Conditions of Road Contracts and Taskwork.

1. The works to which these conditions refer include the supply of all tools, materials, and labor, and everything else requisite to complete the works specified, to the entire satisfaction of the Commissioner and road superintendent.
2. The contractor is on no account to commence any contract without an order in writing, signed by the road superintendent; and no claim for any work executed without an order will be admitted. No extra work will be paid for without the production of an order in writing for the same, signed by the Commissioner and countersigned by the superintendent; the price for any work not in schedule to be determined on previous to its execution, and set forth in the said order.
3. In every case the Commissioner reserves the right of executing any greater or less quantity of the work than that mentioned in the specifications, such increase or decrease to be valued at the schedule rates, and added to or deducted from amount of contract, as the case may be. Schedule rates must be in accordance with bulk sum; if not, the Commissioner shall have power to fix rates in accordance therewith and use them for such valuation.
4. During continuance of this contract the contractor is to maintain in fair order the portion of road comprised therein (except where contract is for supply of metal only), and also to afford every facility for the passing of the traffic during the execution of the work, and, if necessary, to provide new or keep the existing out-turns in repair, and also to provide proper guards for the drains and water-tables, and to stop all adjacent tracks by which the traffic can avoid the new metal, by felling the trees, drawing logs, or such other means as the superintendent may direct. The contractor to take all due precaution to prevent accident to the public from leaving culverts open or placing heaps of stone in dangerous positions, and will be responsible for all damage arising from his neglect of these precautions.
5. The road superintendent will have the power of immediately dismissing any agent or workman employed by the contractor, and the contractor is not to sublet or assign any contract, or portion of contract, without the approval of the road superintendent.
6. All gravel, stone, ballast, metal, timber, iron, or other materials, placed on the road, or within one chain of centre thereof, for purposes of this contract, to become the property of the Commissioner when so placed.
7. To secure the proper quantity of metal or gravel it will be measured in a continuous heap of the requisite cross section before being spread, but it shall be competent for the road superintendent to re-measure such metal on the road, when spread, should he consider it necessary.
8. When a certain gauge is specified it is intended that every stone shall pass in every way through a ring of the diameter of specified gauge, the metal to be clean, cuboidal, and of sharp fracture; no laminated or jointy stone will be admitted.
9. All water-tables and side drains to have a proper fall to outlets and culverts, and new outlet drains made where directed by the superintendent.
10. The sides of all cuttings, side drains, water-tables, &c., to have a slope of 1 to 1, except when in rock or otherwise specified; the sides of embankments to have a slope of $1\frac{1}{2}$ to 1.
11. The contractor to be liable to all risk from floods or other accidents during the execution of the works.
12. The road superintendent will have power to employ men, horses, and carts, and purchase materials, to do all necessary or urgent work, or to remove rejected materials on this contract, and deduct cost of same from contract price, provided the contractor shall have neglected to do such work after due notice. Should there be no funds belonging to contractor in the hands of the Commissioner for removal of rejected materials, all such materials, if not removed by contractor within one month from date of rejection to become the property of the Commissioner, and be used in any manner he may direct.
13. Should the road superintendent be dissatisfied with the rate of progress, or mode of carrying on the work, or with the character of the work done by the contractor, the Commissioner will have power to annul the contract, and the contractor shall forfeit all claim to payment for work done or material delivered; and the Commissioner shall be at liberty to deduct amount of penalty from any sum or sums due to contractor on this or any other contract under him.
14. If the contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner, without previous notice to the contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, to take the works out of the hands of the contractor, and of the assignees or trustees of his estate, and to re-contract with any other person or persons to proceed with and complete the same, upon such terms, stipulations, and conditions as shall be deemed expedient, using all the then remaining materials, implements, and plant that may be required to complete the work.
15. Payments to be made at least once a month, at the rate of ninety per cent., the remainder to be paid after the road superintendent and overseer shall have certified that the whole of the works have been completed to their entire satisfaction; and the obtaining such a certificate shall be a condition precedent to the contractor having any claim or cause of action in respect of any work done or materials provided, to the payments from time to time to be made hereunder, or to the final payment upon completion of the contract.
16. All moneys due on account of contract will be paid to the credit of contractor in Bank of New South Wales, or such other Bank as contractor may request, and in no other way; and the contractor shall not assign over any of the moneys payable under this contract, to any other persons by deed of assignment, letter, or order, to the Commissioner or superintendent. The contractor for each and every breach of this condition shall pay to the Commissioner for Roads the sum of five pounds, to be deducted on face of pay sheet from amount due to contractor.
17. The contractor to attend constantly on the work, or employ a properly authorized agent to represent him, any order to whom will be considered as given to the contractor himself.
18. In case of any defective description or ambiguity in the specification, or in memoranda of contracts, the explanation given by the Commissioner shall be final and binding on the contractor; the measurements to be made according to the actual dimensions, notwithstanding any general or local custom to the contrary.
19. The contracts to be completed in the time specified for each, under a penalty of 2 per cent. per month on the total amount of each contract, for every month that such work shall remain incomplete after the expiration of the specified time; amount of penalty to be deducted on face of pay sheet from moneys due to contractor by department under this or any other contract.

These are the general conditions, with specification attached, referred to in our bond to Her Majesty, dated 28th August, A.D. 1872.

Witness,—GEORGE HOLLOWAY.

AMOS DAVIES.
JONATHAN COCK.
CHARLES JOHN SMITH.

CONSTRUCTION—SPECIFICATION.

Great Northern Road.—First District. 16-72 Contract.—Wire fence to south end of Apple-tree Flat.

This contract commences at end of metalling at the wire fence, and extends northwards 1,508 lineal yards, comprising the Contract. draining, culverting, forming, metalling, blinding, and consolidating of road, being a total of 1,508 lineal yards road construction, 1,508 lineal yards drain, four 3rd class culverts of stone, and the laying of five 15-inch pipe drains.

Drains to be cut where directed by the road superintendent; to be 2 feet wide at bottom, with an average depth of Drains. 2 feet, and side slopes of 1 to 1. Drains to discharge freely to culverts, and proper inlets or outlets shall be cut from them wherever the superintendent shall direct. The material excavated from drain to be evenly banked up on lower side 4 feet clear from the edge, or to be distributed as may be directed by road superintendent. Length of drain required, 1,508 lineal yards.

Roadway to be formed 30 feet wide, on lines pegged out by road superintendent, and to be cut to the inclination Formation. directed by him, the gradients being properly boned through and due allowance made for shrinkage of banks. The formation to be in the solid, or made up with metal as the nature of the ground may require, to be uniform in cross section, having a convexity of 9 inches to the margin or water-table; and where embanked on a sideling the scarp side to be left slightly high to allow

allow for settlement in consolidation. All stumps, rocks, or other obstructions to be removed, and all holes, ruts, hollows, or depressions to be filled in with metal. Wherever the formation is not altogether in the solid, it must be consolidated by the traffic before any metal is spread, fresh material being supplied to make up convexity where required. The material excavated in forming the road, unless the contractor receives instructions to the contrary from the road superintendent, shall be thrown back (6) six feet clear of the water-tables. Extra material for embankment to be obtained as will be directed from any distance not exceeding 50 yards. Wherever it is practicable, mitre drains 18 in. wide shall be cut to relieve the water-tables, at such intervals as shall be directed, a solid block being left, and the tabling recommenced two feet below each mitre drain. The length of formation required is 1,508 lineal yards.

Metal.

Metal to be of the hardest and best description of blue stone procurable within three miles of the work; to be approved by the superintendent, to whom a sample is to be submitted before any quarrying is done. To be broken to a strict 3-in. gauge, with clean, sharp, and cuboidal fracture, and stacked on even ground by the side of the road for measurement. The metal to be quite free from spawls, quarry face, dirt, chips, &c. The heaps shall be opened out for inspection as directed. The total quantity required will be 2,262 cubic yards.

When the whole or any well defined length of formation is ready to receive metal, it is after measurement, and on receipt of an order from the road superintendent or overseer, to be evenly spread to a width of 20 feet, and a depth of 8 inches, or at the rate of $1\frac{1}{2}$ cubic yard to the lineal yard of road. Until so spread, examined, and blinded, no more metal shall be stacked within such distance of the measured metal as shall be directed by the road superintendent.

Blinding.

When the metal is properly spread, and after inspection by the superintendent, the central eleven feet of road shall receive an even coat of blinding two inches thick, or at the rate of one-fifth cubic yard to the lineal yard of road. Blinding to consist of decomposed granite, clean ridge gravel, or other approved gritty material. No clay, loam, or black soil on any account to be used as blinding. Quantity of blinding required, 300 cubic yards.

Consolidation.

The contractor shall maintain the road in good order and condition, keeping the ruts well raked in, to the satisfaction of the road superintendent, for a period of two months after the completion of the work, and shall force the traffic off or on the road, as may be directed.

Progress.

The contractor shall be bound to proceed with the works in such order and at such times as he may be instructed. If required he shall supply all the metal and construct all the culverts before commencing the formation, or *vice versa*.

Culverts.

The culverts are to be of the dimensions shown on drawing, and in all other respects in accordance with the plan hereto attached. The stone is to be approved of, to be quarry dressed, but to have faced joints; to be laid in mortar composed of one part best stone-lime to two parts of approved sand; joints to be flushed throughout.

Time.

All the works specified to be completed within five months from date of signing the bond under a penalty provided for in the "General Conditions for Road Contracts," hereto attached, which penalty will in all cases be strictly enforced, irrespective of bad weather, or any other cause of delay, except a written order be given by the road superintendent not to proceed with the work, or to increase the same, when a proportionate extension of time must be allowed.

Tenders.

Tenders to state a bulk sum for the execution of all the works specified, also a schedule of prices at which any deductions or additions shall be valued; such additions or deductions, no matter to what extent ordered, shall not vitiate or set aside the contract.

General conditions.

In all matters relating to this contract, not herein specified, the contractor to be bound by the printed general conditions hereto attached.

Pipe-drains.

The pipes will be provided by the Government and delivered to the contractor, at the railway goods-shed, Murrurundi; the contractor will have to cart them to the work, and be responsible for breakage. They are to be laid in Portland cement, in such positions and with such fall as will be directed. At each end of each pipe-drain two stones, cut to receive pipes, shall be provided and set in cement; each stone to be 3' 6" x 1' 6" x 1' 0". The trench to be filled over pipes with approved ballast up to the level of tops of stones at ends of pipe-drains, rammed above.

ROADS DEPARTMENT.

*Contract 16-72—Four 3rd Class Culverts—Stone culvert—Flagged Top.*Design. (See separate Appendix No. 5.)
Foundation.

THE culvert to be built in general accordance with drawing (as figured), the waterway being 4 feet x 2½ feet in the clear between abutment walls. The roadway 20 feet wide in the clear between parapets.

The trenches for foundation shall be dug on lines pegged out by the superintendent, and shall be excavated to such a depth as will ensure sound, permanent, and level foundations for footings on rock or other approved hard stratum. Benchings will be allowed or not, at the discretion of the superintendent, who will examine and pass the foundation, before any masonry is laid. The contractor to keep the foundation trenches free from water either by drains or pumping until such time as the road superintendent may direct.

Masonry.

On receipt of a written order from the superintendent, the main and face walls may be carried up as nearly level in height all round as the nature of the work will allow, so that settlement may be as uniform as possible. Walls to be built in first-class coursed rubble-work set in mortar, composed of two parts best stone lime, mixed with three parts of clean sharp sand. No stone to be less than half a cubic foot in dimension. Walls to be of the thickness shown on drawing. Quoins to be hammer-dressed. No stone to be less on bed than height of course. Headers to be at least double the height of course on bed.

Inlet and outlet.

The trench for the culvert shall be dug across the full width of the road at such inclination as may be directed, and if to be paved shall be shaped with a concavity of 4 inches; the inlet being if necessary either double or bell-mouthed at its junction with side drain.

When the walls are carried up to the required height, and shall have passed inspection and approval by the superintendent, the foundation trenches shall be filled in with the material excavated, if of approved quality, rammed in layers. If quality be not approved, fresh material must be obtained. The whole back of the culvert to be covered in with a layer of puddle of approved clay, as shown in drawing.

Paving.

The bed of waterway shall be either flagged or paved as shown in drawing, with rough spawled pavours 12 inches deep on edge, close laid in the dry, rammed and grouted with lime and fine clean sharp sand. The downstream course to be of the largest stones obtainable, well bonded into remainder of work and to side walls.

Flagging.

The top of main walls shall be built up smooth, without spawls, dressed off flat to receive covering flag. The top of culverts shall be covered in by flags 6 feet long, not less than 2 feet wide or 12 inches thick in any place. All flags to be roughly edged, to lay close and bed truly, jointed and pointed with mortar, and to be thoroughly hard, sound, and free from fractures.

Parapets.

The face walls being carried up 18 inches thick to level shown on drawings shall finish in a parapet of 12 inch rubble masonry, having a coping of rough hammered stone rounded at top and set on edge in mortar, as shown in drawing.

Filling.

When the masonry and flagging has been inspected and passed, and not before, the whole of the culvert between parapets shall be filled in to the formation level of roadway with approved material, shale, clay, or earth rammed in layers; the formation having a convexity of 9 inches in the centre. A perfect junction to be effected with existing road formation.

Ballast and metal.

The roadway between parapets shall be covered with a layer of approved ballast 6 inches thick, broken to a strict 5 inch gauge, which shall be blinded and consolidated by traffic. Then a layer of the hardest blue metal, 6 inches thick, shall be evenly spread over the whole, and a perfect junction made with existing roadway wherever disturbed. Metal to be broken to a strict 3-inch gauge, clean, cuboidal, and with sharp fractures. To facilitate passage of traffic, if required, the contractor shall build only half of the length of the culvert at one time, great care being taken to bind the work properly at the joining; and also, if required, shall keep a light burning all night—contractor being responsible for all accidents to vehicles arising from his neglect.

Contractor to find all plant, tools, and materials required, and to remove same on completion of work, and clear away all rubbish.

In all matters relating to this contract, not set forth herein, the contractor to be bound by the general conditions of contract attached.

DEPARTMENT OF PUBLIC WORKS.—ROAD BRANCH.

I HEREBY propose to execute the whole of the works required on Contract No. 16-72, Great Northern Road, First District, wire fence to northern end of Apple-tree Flat, in strict accordance with specification, general conditions, and to the satisfaction of the Commissioner for Main Roads or other authorized officer, and to complete the same within six months after signing the contract, for the sum of £1,115 19s.; and do hereby agree that any addition, deduction, or alteration, shall be valued at the following rates, or at a price to be agreed upon at the time, and added to or deducted from the above amounts, as the case may be:—

	£	s.	d.
Clearing road, wide, per lineal chain			
Excavation in earth, per cubic yard			
Do. rock, per cubic yard			
Forming 1,508 lin. yds., at 2/6 per lineal yard	188	10	0
Side-drains, 1,508 lin. yds., at 1/- per lineal chain	75	8	0
Ballast, gauge, per cubic yard			
Metal, 3" gauge, 2,262 cub. yds., at 5/6 per cubic yard	622	1	0
Blinding, gauge, 300 cub. yds., at 2/- per cubic yard	30	0	0
Four 3rd-class stone culverts, at 40/- each	160	0	0
Laying five 15" drain-pipes, at 8/-	40	0	0
Maintenance of road after completion of construction, 20/- per month			
	£1,115	19	0

The prices in the preceding schedule include all labour, materials, tools, and workmanship of every kind necessary for the full and perfect completion of the works to the entire satisfaction of the Commissioner for Roads or other authorized officer.

AMOS DAVIES,

Wallabadah, 3rd August, 1872.

To the Under Secretary for Public Works.

Should the foregoing tender be accepted, we, the undersigned, do hereby agree to be responsible for the due performance of the contract, and we hereby undertake within _____ days from the date of the notification of the acceptance of the said tender, jointly and severally to execute and deliver a bond to Her Majesty in the penal sum of _____ for securing such performance.

JONATHAN COCK,
CHARLES JOHN SMITH,
Both of Wallabadah.

Department of Public Works,
Sydney, 10th July, 1872.

GREAT NORTHERN ROAD.—FIRST DISTRICT.

TENDERS will be received at this Office, until 11 o'clock of Tuesday, the 6th day of August next, from persons willing to contract for the following Works on the Great Northern Road, 1st District:—

- Contract 16-72.—Wire fence to south end of Apple-tree Flat.
 „ 17-72.—Thom's Gullies.
 „ 18-72.—South of Red Hill.
 „ 19-72.—Martindale's Culvert to The Furrows.

Plan, specification, and form of tender may be seen at the Office of the Commissioner for Roads, Sydney, and at the Court Houses, Murrurundi and Wallabadah.

Tenders to be addressed to the Under Secretary for Public Works, Sydney, and to be marked outside "*Tender for Contract, Great Northern Road, 1st District.*"

JOHN SUTHERLAND.

AMOS DAVIES.
JONATHAN COCK.
CHARLES JOHN SMITH.

Witness,—GEORGE HOLLOWAY.

B 9.

Final Certificate for works shown as completed.

I HEREBY certify that the whole of the works on Contract 17 A have been completed in strict accordance with the specification and plans, with the following alterations, additions, or deductions.

WILLIAM C. BENNETT.

[To the Evidence of E. A. Nardin, Esq., 4 June, 1875.]

C 1.

EXTRACTS from Commissioner's instructions.

Memoranda for Mr. Nardin.

* * * * *
With respect to the work being executed, I think that so much high bank is not desirable—the metal will sink in it. Mr. Nardin, while not to follow the surface as in the older works, not to make such heavy cuttings and banks as seems to be the rule now on his work.

Great care should be taken not to have any unnecessary culverts or pipes. I pointed out many to Mr. Nardin which, I think, might be dispensed with, especially the pipes for which oblique cuts into upper drain should be substituted.

* * * * *
The stone culverts need not be of coursed masonry, but of thin flat-bedded stuff; they should have a considerable fall; but all but the bottom course to be level on top bed. The sizes on lithographs not to be exceeded.

* * * * *
WILLIAM C. BENNETT,
6 November, 1872,
Murrurundi.

C 2.

Mr. Road Superintendent Nardin to Mr. A. Davies.

Murrurundi, 7 October, 1872.

Sir,

I have to inform you that in consequence of the votes for 1872 being insufficient to meet all liabilities, it becomes necessary for me to reduce the quantity of work now in hand.

Instead of shortening your Contracts 10 and 16, I propose to reduce the present supply of metal for them to one and a third cubic yards to the yard run, and to obtain the remainder from you as early as possible in 1873, under a taskwork, at present rates; also, I propose to postpone Contract 17-72, and to execute it by task on the completion of the works you have now in hand.

You will please inform me if you agree to these terms.

I am, &c.,
ERNEST A. NARDIN,
Road Superintendent.

C 3.

Mr. A. Davies to Mr. Road Superintendent Nardin.

Sugarloaf Road Works, *via* Murrurundi,
11 February, 1873.

Sir,

In reply to yours of the 8th instant, I beg to inform you that I shall use all available means to finish Contracts 10 and 16-72 by the time stated, viz., end of March, 1873.

We have had great difficulty in introducing steam stone-breaking machine for these contracts, and shall suffer some loss by its being unused on the metal supply. We are getting on fairly in procuring timber for bridge over Old Goonoo Goonoo Creek, and hope to be able to finish within contract time.

It will be necessary at an early date to make a further return on Contracts 10 and 16-72. I may mention that there is a considerable amount due as extra for filling up embankments in construction of formation in these contracts that I think has not as yet been estimated in making out of previous returns.

I have, &c.,
AMOS DAVIES.

Saw Mr. Davies and explained that I could not entertain any claim for extra on formation.—E.A.N., 20/2/73.

C 4.

Mr. Road Superintendent Nardin to Mr. A. Davies.

Murrurundi, 23 June, 1873.

Sir,

Your particulars of claims for extras on Contracts 10A and 16A have been reported upon by me, and submitted for the consideration of the Commissioner for Roads, who now instructs me to inform you that no claims for extra on stone culverts or formation can be allowed. You were furnished with a plan and specification of the former to work to, and were not authorized to deviate from them, and the latter is not heavier than is required by the specification.

I am, &c.,
ERNEST A. NARDIN.

C 5.

Mr. Road Superintendent Nardin to Mr. A. Davies.

Murrurundi, 8 February, 1873.

Sir,

The Commissioner for Roads is dissatisfied with my progress report upon your Contracts 10 and 16 of 1872, in so far as the supply of metal is concerned; it is most desirable that these works should be out of hand by the 31st of next month, and the metal must therefore be broken by hand.

I am further directed to state that the erection of the bridge over Old Goonoo Goonoo Creek must be at once commenced, and to inform you that all fines incurred for delay will be most strictly enforced.

I am, &c.,
ERNEST A. NARDIN,
Road Superintendent.

C 6.

Mr. Road Superintendent Nardin to The Commissioner and Engineer for Roads.

CONTRACTS 10A AND 16A.

Memoranda as to Mr. Amos Davies's claims for extras on stone culverts and formation in the above contracts.

Culverts.—Mr. Davis was furnished with plan and specification to work to, and he had no authority to deviate from them.

Formation.—The Commissioner struck out the ballast and increased the quantity of metal, and alteration which has nothing to do with the question now raised by Mr. Davies, who tendered upon the specification which he signed with his bond. The formation is not, in my opinion, heavier than is warranted by the true intent and meaning of the specification, nor than was

27

was done under the same conditions in Contract 19-69, a work for which Mr. Davies tendered, and which he had before him as a finished example when tendering afterward for Contracts 10A and 16A. It being the first time of using stone culverts and pipe drains, I was more than usually anxious to ensure their being placed in the most advantageous position; therefore the sections sent herewith were made; the pencil lines were merely experimental, and they have not been (nor were they intended to be) worked up to, as sections along the finished work would show.

It was not until after the Commissioner's visit that Mr. Davies introduced these claims to me.

E. A. NARDIN, 18/6/73.

C 7.

Total quantity of metal supplied by Mr. Amos Davies for—

Contract 10A	2661.53 cubic yards.
Contract 16A	2046.18 "

ERNEST A. NARDIN.

C 8.

Mr. A. Davies to Mr. Road Superintendent Nardin.

Mountain View, *via* Murrurundi,
7 January, 1875.

Sir,

I beg to acknowledge the receipt of your letter of the 4th instant, wherein you state that as the "dispute with the Roads Department is a public and not a private matter" you "cannot furnish copies of any correspondence without the permission of the Commissioner for Roads."

In reply, I have no doubt but that this reticent course, so well according with the previous practice of the Commissioners, will meet with his approval and will consequently render futile any further such application.

But as the dispute has originated either by individual or the concerted action of the officers of the Roads Department, and is maintained by much misrepresentation—this is an occurrence at every meeting and other opportunity—it almost becomes on me an imperative duty to ask the removal of all documents and reports from the custody of the several officers concerned, pending the appointment of a competent tribunal.

I think you will freely admit that our present difficulty is not of my seeking, but is the result of circumstances over which I have had no control whatever.

I propose at an early date to write to you of a few matters regarding our relations as contractor and Government superintendent, the explanation of which will appear to me largely rest with yourself. I will explain anything desired from me. Believe me, without prejudice,—

Yours faithfully,
AMOS DAVIES,
Contractor.

P.S.—Say if you prefer this channel for communication?—A.D.

Roads, 13/1/75.—J.R., B.C., 16. Mr. Nardin.—W.B., 16 Jan., /75. Recd., 22/1/75.—E.A.N. For reply, see letter-book this date, 22/1/75.—E.A.N.

Department of Roads and Bridges,
Sydney, 2 March, 1875.

Some time ago I forwarded Mr. Nardin a letter from Mr. Davies, which I think should have been returned to this office. Will he be good enough to return it with any remarks he may have to offer, and state nature of reply.

W. C. BENNETT,
2 Mar., 1875.

Letter and copy of my reply herewith.—E.A.N., 4/3/75.

C 9.

Mr. Road Superintendent Nardin to Mr. A. Davies.

Road Superintendent's Office,
Mudgee, 22 January, 1875.

Sir,

I have to acknowledge the receipt, through the Commissioner for Roads, of your letter of the 7th instant.

It matters nothing through what channel you correspond with me in reference to your disputed contracts; but, while desirous of treating you with perfect courtesy, as heretofore, I shall certainly decline to reply to communications which you may address to me in future if in them you adopt the unwarrantable tone which characterizes your letter of the 7th instant.

Yours obediently,
ERNEST A. NARDIN,
Road Superintendent.

Put with Davies's papers and resubmit.—W.C.B., 6/3/75.

C 10.

Memo. for Mr. Nardin.

Crawford was not to blame in putting the sheathing 15 feet wide on Dangar's Creek Bridge. I find that you and me went down to Dangar's and Walden's Bridges to see to quantity of timber required, and Cox, the sawyer, met us by appointment near the latter bridge, when I gave him a pencilled order for the lengths of plank and quantity suitable for each bridge, which order accords singularly with the work as finished, there having been neither a plank more or less than was required. The fact is, we had made a rough diagram on the bridge with your tape, thereby getting the proper lengths for planks. Allowing in doing so the skew you required the planks laid, error was impossible. You may have arranged with the Commissioner afterwards.

AMOS DAVIES, 28/12/74.

C 11.

Mr. Road Superintendent Nardin to Mr. A. Davies.

Road Superintendent's Office,
Mudgee, 4 January, 1875.

Sir,

I beg to acknowledge the receipt of your letter of the 28th ult.

As your dispute with the Roads Department is a public and not a private matter, it should be obvious to you that I cannot furnish you with copies of any correspondence relating to it without the permission of the Commissioner for Roads.

With regard to the Dangar's Creek Bridge, I am perfectly clear as to the fact that I ordered the sheathing to be 13 feet wide, and laid at an angle of 45°. Moreover, you admitted the error at the time, although urging that the deduction in measurement should not be made. I think Crawford will bear me out in this. Cox, the sawyer, I did not see on this matter.

Yours faithfully,
ERNEST A. NARDIN.

[To

[To the Evidence of Henry Quodling, Esq., 11 June, 1875.]

D.

DEPARTMENT OF PUBLIC WORKS, ROAD BRANCH.

SPECIFICATION for First-class Timber Culvert, Wallabadah Gap Works.

THE timber for culvert is to be ironbark, yellow box, blue or red gum, if procurable within a distance of 3 miles; stringybark, white box, or blackbutt may be used with the sanction of the road superintendent if other timber is not procurable—all to be sound, straight, free from cores, waness, shakes, gum-veins and all other defects, and approved by the superintendent. All timber, except posts and handrails, to be round, barked, and the diameter given is to be taken at the smallest end, exclusive of bark.

The trenails are to be oak, ironbark, or blue gum, cut from sound, old well-seasoned timber, approved by the superintendent, of an hexagonal section, 1 inch across sides, and driven into holes bored with 1 inch auger.

The waterway or span of culvert is to be 10 feet in the clear, and the roadway above kept 18 feet wide between ballast logs.

The trench for culvert is to be cut to the proper depth, and where directed by the road superintendent, with a fall of 1 in 50 towards the outlet; two sills, 12 inches diameter and 28 feet long, will have to be laid apart 10 feet, solidly bedded on a well-rammed foundation, into which will be tenoned four uprights, 12 inches diameter, on each side of culvert, as shown in drawing.

Every upright to be tenoned into sills at least 2 feet below surface.

The whole bottom of culvert will have to be shaped with a concavity of 6 inches in centre, and the earth well rammed in.

Two capsills, 12 inches diameter and 25 feet long, to be mortised and trenailed over uprights, tenons being 5" x 2½" and 6 inches long. The underside of capsill to have a flat seating over each upright to secure a good bearing.

Five joists, 16 inches diameter and 16 feet long, have to be laid as shown in drawing, scribed and notched on to capsills, 1 inch being taken out of each, and trenailed. The upper side of joists is to be adzed off to an even surface about 5½ inches wide, to receive flooring.

At each end of capsills a log 9 inches diameter is to be halved and trenailed; to be sloped with an incline of 1½ to 1, its lower end being sunk in the ground about 2 feet 6 inches deep, and well rammed in.

A lining of slabs, close-jointed, 4 inches thick, is to be trenailed or spiked on the landward side of uprights and sloping logs.

The slabs to break joint over piles, the backing to extend from the bottom of culvert to the underside of joists, the space left open between them filled in with blocks or stones.

Flooring logs, 8 inches in diameter, to be squared on three sides, not less than 6 inches broad, and laid close; the underside of logs over joists to be adzed, to allow a true bearing and leave an even surface on top. Flooring logs to be secured alternately to every joist with a trenaile 4 inches deep.

Ballast logs, 9 inches diameter and 20 feet long, are to be fixed at each end of flooring 18 feet apart, bearing on an adzed face, and secured to outer joists through flooring with ½ inch bolts, as shown in drawing.

Posts 6" x 6" are to be stump-tenoned into each capsill, let 2 inches into ballast logs and outer joists and spiked to them, a strut 4" x 4" is to be stepped and spiked to each post and the projecting end of capsills. The tops of posts to be shaped and kept 4 feet above flooring as shown in drawing.

Round posts, 9 inches diameter, are to be sunk 3 feet at least in the solid ground, 8 feet from the square posts, and set back to form wings as shown, the top left level with the square posts. A rail 6" x 4" is to be halved and spiked on posts 3' 9" above level of floor.

All timber under or in contact with ground to be charred.

The side slopes of the road to be carefully dressed to an incline of 1½ to 1 towards the inlet and outlet of culvert as shown in drawing. The roadway is to be restored to the same condition as when the culvert was commenced, the earth is to be well rammed in by layers not exceeding 1 foot to the sides of culvert, and the junction of the road with flooring to be properly made, all to the entire satisfaction of the road superintendent.

Parties tendering will state the time within which they will complete the works; other things being equal, a preference will be given to those who offer to perform the work in the shortest time.

AMOS DAVIES.
DANIEL REGAN.
JOHN BARNES.

EXTRACT from the Specification for Contract 19-69.

* * * * *

Formation.

To be on line marked out by the road superintendent, to be 30 feet wide with a convexity of 9 inches; where the natural surface is undulating the formation is to be cut down to level, or to such gradients as the road superintendent shall direct. It is to be thoroughly consolidated by the traffic before any metal is spread, and the material from it not required is to be thrown at least 4 feet back from edges of water-tables.

DEPARTMENT OF PUBLIC WORKS—ROAD BRANCH.
Form of Tender for Contract 19-69, Northern Road.

WE hereby propose to execute the whole of the works required on Contract No. 19-69, Great Northern Road, Gaspard's Gully, in strict accordance with specification, general conditions, and to the satisfaction of the Commissioner for Main Roads, or other authorized officer, and to complete the same within four months after signing the contract for the sum of £1,498 15s.; and do hereby agree that any addition, deduction, or alteration shall be valued at the following rates, or at a price to be agreed upon at the time, and added to or deducted from the above amounts, as the case may be:—

		£	s.	d.
Clearing road	wide at 10/-			
Excavation in earth	per lineal chain			
Do	per cubic yard			
Forming 1,950 yards, at 2s. 6d.	per lineal yard	243	15	0
Side drains	per lineal chain			
Ballast gauge	per cubic yard			
Metal, 2½-in. gauge, 2,600 yards, at 7s.	"	910	0	0
Gravel, 2-in. gauge, 650 yards, at 2s.	"	65	0	0
Two 1st class culverts, at £60	each	120	0	0
Eight 3rd class culverts, at £20	each	160	0	0
		£	1,498	15 0

The prices in the preceding schedule include all labor, materials, tools, and workmanship of every kind necessary for the full and perfect completion of the works to the entire satisfaction of the Commissioner for Roads or other authorized officer.

AMOS DAVIES,
THOS. BURKE,
Wallabadah.

To the Under Secretary for Public Works.

Should the foregoing tender be accepted, we, the undersigned, do hereby agree to be responsible for the due performance of the contract, and we hereby undertake within _____ days from the date of the notification of the acceptance of the said tender, jointly and severally to execute and deliver a bond to Her Majesty in the penal sum of _____ for securing such performance.

JONATHAN COCK,
Wallabadah.
C. J. SMITH,
Wallabadah.

Telegram from Mr. W. Boyd to The Commissioner and Engineer for Roads.

Armidale, 22 August, 1864.

I UNDERSTOOD Davies to say that Mr. Bayley told him he would reduce the metal to 9s. about the end of April or beginning of May.

F 8.

Mr. W. Boyd to Mr. Road Superintendent Bayley.

Uralla, 17 September, 1864.

Sir,

With reference to your letter of the 14th instant, I have the honor to inform you that I never heard you offer Mr. Amos Davies 6d. per foot for piles that were too short for bridge.

The only timber I can remember condemning are one outside bearer and one pile, for being too crooked.

I have, &c.,
W. BOYD.

[To the Evidence of W. C. Bennett, Esq., 15th June, 1875.]

G 1.

Bendemeer, 3 October, 1864.

Sir,

I have the honor to forward you report on Mr. Amos Davies's letter, in reference to Goonoo Goonoo Bridge.

I pointed out to Mr. Davies site of the bridge, on the 24th of February, at the same time informed him I could not decide on the length of the bridge until I communicated with you on the subject, and as I was not aware of what length the bridge would be, I could only give Mr. Davies the centre line. I did not peg out any length for approaches, nor did I say the approaches were included in the contract, neither had I any conversation with Mr. Davies, in reference to the approaches, at the Caledonian Hotel.

When I received your telegram of March 3rd, informing me that the stringers of bridge were to be six inches above highest known flood level, I started the following morning to Tamworth and took the levels. On my return to Bendemeer, reduced and plotted levels and wrote to Mr. Boyd, instructing him the height of shoulders of piles above floor Goonoo Goonoo Bridge South. At the time I took the levels there was no timber on the ground.

Pile driving was not commenced till the 22nd March. No piles were delivered on the ground and condemned for being too short.

I never had any conversation with Mr. Davies in reference to offering him 6d. per lineal foot, as stated in his letter. I append a statement of Mr. Boyd's to this effect.

I took no notice of Mr. Davies's offer in respect to the stone wall, as I had received no instructions from you. On visiting the bridge, on the 14th April, I found Mr. Davies had commenced the approaches, and told him, in the presence of Mr. Boyd, that I had given him no instructions to make the approaches, and what he was doing was on his own responsibility.

I did inform Mr. Boyd that no border stones were required in any case.

When I visited the bridge on the 4th May, about 2 p.m., the bridge was completed, except last coat of paint to rails.

I told Mr. Davies, on or about the 29th March, I would give him 9s. per cube yard for metal, and 4s. 6d. for ballast for what would be required for approaches. I also informed Mr. Boyd of the same.

With reference to your memo. on 4th page, I distinctly deny ever having had any such conversation with him. I never held up my hands and called out "Davies, remember!"

After receiving your telegram of the 9th of May, to proceed with approaches, I visited the bridge on the following morning and measured the stone walls. Davies took down the measurements as I called them out.

I have, &c.,
A. C. BAYLEY.

Inform Mr. Davies that Mr. Bayley states he never informed him that approaches were included in contract, and that Davies commenced the work on his own responsibility; that on the 29th March he offered 9s. per cube yard for metal, and 4s. 6d. for ballast, and that Davies going on with the work was an acceptance of this offer, and that I now, by virtue of clause of General Conditions, giving me power to decide finally any dispute, determine that Davies shall get the amount certified for by Mr. Bayley, and no more, and that when he undertakes to sign the usual receipt, this amount—£40 1s.—will be handed to him by Mr. Quodling. Wrote, Mr. Davies, 1/11/64.

G 2.

Cox Creek Bridge.

- Mr. ACHESON, contractor for Cox Creek Bridge, having made application to transfer his contract to Mark Turner, the Superintendent visited the works, March 26, 1863, and found the timber, &c., in charge of a bailiff, under distress warrant against Acheson from the Tamworth Bench. Declaration was immediately made that the timber was the property of the Government. On April 2nd, information was received in this office that the timber had been sold by the bailiff to Amos Davies, another contractor, for £34 4s. 6d. Permission was now given for Turner to complete the work at Acheson's prices. Negotiations were then entered into between Davies and Turner for the purchase of the timber. Davies at first offered it for the amount realized (£34 4s. 6d.) to both Turner and the sub-overseer (Holloway), but subsequently demanded £165 8s. 5d. He was then informed (copy of letter herewith) from this office that the trees were only allowed by the Crown to be cut for this bridge, and were still the property of the Government—the workmanship only being the contractor's (Acheson's) property, and that any attempt to remove the trees would be met with legal proceedings. No reply was received. The Superintendent visiting the work on April 27th, found that Turner was using the disputed timber. On remonstrating with him, he (Turner) expressed his intention of using the timber, and abiding by the consequences. He was then informed that a receipt for payment for the timber must be produced before final payment could be made.

Completion of the bridge was reported on December 4th, 1863, and negotiations again entered into for a satisfactory settlement without avail; Davis still demanded the large sum of £165.

Before payment of the final voucher the question arises as to the liability of the Government.

The timber, at the time of sale by the bailiff, being Government property, the workmanship only could have passed over at the sale against the Government.

I forward the case for the opinion of the Crown Solicitor before payment of final voucher to Turner. Everything possible has been done by Turner and the Department to settle with Davis; he has been offered by Turner the sum he paid, with 25 per cent. interest, but declines to take less than £165 8s. 5d.

I forward this statement in order that we may be instructed by the Crown Solicitor if we are safe in paying Turner.—W.C.B., 18/1/69. Under Secretary B.C. Crown Solicitor to advise accordingly.—J.R., B.C., 19/1/69.

Mr. R. Donaldson to The Commissioner and Engineer for Roads.

Murrurundi, 19 October, 1868.

Sir,

In reply to Mr. Davies's letter of the 2nd instant, relative to the purchase by him of Mr. Contractor Acheson's timber at Cox's Creek Bridge, I have the honor to state:—

1st.—That Mr. Holloway was instructed by me to purchase the timber at a reasonable rate. His report herewith will explain the reason he did not do so.

2nd.—Mr. Turner was never authorized by any officer in the department to use the timber bought by Davies at the sale. In my report on this bridge, dated 2nd May, I notified to you that Turner was using the timber, and after remonstrating with him about it, he said he had offered Davies the amount that he paid for it at the sale; and as Davies would not take it he was quite willing to put up with the consequences, &c. On the 8th May I wrote to Turner and quoted your remarks on my report: "That this would not do, and that he must before final payment is made produce a receipt in full from Davies"—and advising him to try and arrange with Davies at once. Mr. Turner's reply to my letter was verbal, and that he had offered Davies a fair price for the timber, and as they could not agree he would take the consequences.

I also, on the same date, wrote to Mr. Holloway, who was on the spot, to urge upon Turner the necessity of coming to some arrangement with Davies and settling matters.

I have, &c.,

ROBT. DONALDSON.

Seen—W.C.B., 21/10/68.

Mr. G. Holloway to The Commissioner and Engineer for Roads.

Tamworth, 12 October, 1868.

Sir,

With reference to the sale of Contractor Acheson's timber at Cox's Creek, I have to state:—

A few days before the sale I received instructions from Mr. Donaldson to attend and purchase the timber at a reasonable rate, but I was unable to do so, not having sufficient money on hand. The bailiff informed me that he would take nothing but ready money.

Mr. Davies offered to lend me the amount, but I refused to take it, not feeling justified in borrowing from a contractor.

The timber was put up for sale first, in different lots, and was purchased, for the sum of £13 odd, by Mr. Davies; but as that was not sufficient to cover the amount of the distress—£34 odd—the bailiff declared to the people present that the sale was null and void, and handed over the timber into my charge.

A short time after this the bailiff asked me to go down to the bridge with him and Mr. Davies, and be a witness to the sale of the ironwork. I did so. The ironwork was put up and realized £21 odd, which, with the £13 odd, the amount the timber realized, brought it up to the amount of the distress. The timber was not put up a second time for sale.

As soon as work was recommenced at the bridge I discovered that the contractor was using the timber that Mr. Davies had bought. I spoke to Mr. Contractor Turner on the subject, and told him he had no right to use the timber, and that I would be obliged to report the matter. He said that he considered the sale illegal, and did not recognize Mr. Davies as the purchaser of the timber, but would still continue to use it and bear all the responsibility himself.

On my way to Gunnedah the next day I saw Mr. Donaldson, and verbally reported the matter to him.

I have, &c.,

GEORGE HOLLOWAY.

Mr.

Mr. R. Donaldson to The Commissioner and Engineer for Roads.

Murrurundi, 7 January, 1869.

Sir,

I have the honor to inform you that I am detained here awaiting the arrival of Messrs. Turner and Davies, relative to settling the point of the disputed timber at Cox Creek Bridge. I wrote to these parties some time ago to meet me, and Davies's reply to my letter, requesting him to name an early day, was, that he had forwarded my letter to Mr. Wallace, solicitor, Tamworth, asking his advice, and that he would write on receipt thereof. I have been, and am still, waiting here with a view of trying to settle the matter previous to my departure for the Narrabri or Cassilis Roads.

I enclose voucher No. 51, and receipted ditto, for salary and travelling allowance to 31st December, 1868.

Seen.—W.C.B., 9/1/69.

I have, &c.,
ROBT. DONALDSON.

Mr. R. Donaldson to The Commissioner and Engineer for Roads.

Murrurundi, 13 January, 1869.

Sir,

I have the honor to report, relative to the dispute between Turner and Davis about the timber sold at Cox Creek on the 30th of March, 1868.

In accordance with your instructions, I got Davies and Acheson (who is acting as agent for Turner in the matter) to meet me here yesterday, with a view of settling the dispute. I stated the object for which the meeting had been convened, and tried everything to get them to agree and settle the matter, but without success. Davies insists upon asking £165 8s. 5d. (notwithstanding his having offered it to Mr. Holloway and Mr. Turner for £34 4s. 6d., the amount paid by him at sale), and will not abate one shilling of that price. Acheson, on the other hand, offered Davies the amount the timber realized at sale, and, at my suggestion, that Davies should be allowed fair interest in addition, Acheson offered interest at the rate of 25 per cent., or to meet him half way in the transaction; but Davies would do nothing but persist in asking the abovenamed amount. It therefore remains as it did before.

I think your determination to pay the balance to Turner is a just one: Davies may then sue Turner, or adopt any measures he may think advisable for the recovery of this money.

I have, &c.,
ROBT. DONALDSON.

Received vouchers, Nos. 49 and 50; also, return of men and horses up to the 16th instant, and receipt for travelling allowance herewith.—R.D.

Mr. Wickham,—Please make out statement to enable me to consult Crown Solicitor.—W.C.B., 15/1/69. Statement herewith—J.W., 16/1/69.

G 3.

Mr. Road Superintendent Nardin to The Commissioner and Engineer for Roads.

Road Superintendent's Office,
Mudgee, 16 June, 1875.

Sir,

My evidence before the Select Committee on Friday last, in regard to the letter written by Mr. Amos Davies in reply to mine of the 7th October, 1872, and assenting to the alterations in contract 10 A, is represented to me as not being sufficiently conclusive. I beg now to state that I have no doubt whatever that I received such a letter, although it cannot now be produced, having been mislaid on my removal from Murrurundi to this place.

I have, &c.,
ERNEST E. NARDIN,
Superintendent of Roads.

Re-submit.—W.C.B., 18/6/75.

G 4.

DEPARTMENT OF ROADS AND BRIDGES.

[Pay Voucher No. 755]

Main Northern Road.

ABSTRACT of payments to Contractors and others employed as herein described from the of to the 28th February, 1875.

17. Same to D. Buchanan, Esq., M.L.A., to same effect. 7 June, 1875	7
18. Minute of Executive Council, approving of the area in question being withdrawn (with Minute thereon). 7 June, 1875	7
19. Letter from Mr. S. Samper to Minister for Lands, relative to the reduction of the said area. 9 June, 1875	7
20. Government Gazette Notice—Withdrawal of land from temporary Common at Gulgong. 15 June, 1875	8
21. Under Secretary for Lands to Mr. S. Samper, in reply to No. 19. 24 June, 1875	8

COMMON AT GULGONG.

No. 1.

G. D. LANG, Esq., to J. G. O'CONNOR, Esq., M.L.A.

Gulgong Evening Argus,
18 November, 1873.

MY DEAR SIR,

Herewith I beg to hand you a petition, addressed to the Honorable the Minister for Lands, for the reservation of a block of land for Commonage purposes, for the town of Gulgong. This is very much wanted here, and the site indicated would suit admirably, as there is no gold on it; and it is in the immediate neighbourhood of the town, though quite out of the way of it. I shall have another petition to send, either along with this one or by the next post, addressed to the Honorable the Colonial Secretary. I tried to obtain a copy of the paper for which you sent to Zimmer, but was unsuccessful, for neither here nor at the Home Rule is there a copy to be had. I am kept with my hands full; for what with petitions, meetings, leaders, locals, reporting, and proof sheets, my hands are full. I was on the sick list for about a fortnight, and could just manage to get through my work; but I am all right again.

With best wishes, believe me yours faithfully,—

GEORGE D. LANG.

Referred for the consideration of Mr. Surveyor Bolton.—R. D. FITZGERALD, B.C., 9 Dec., /73.

[Enclosure to No. 1.]

Presented by Mr. O'Connor, M.P.

To the Honorable the Minister for Lands, the Petition of the undersigned Freeholders, Householders, and others, resident in the town of Gulgong and its vicinity,—

HUMBLY SHOWN:—

That there is no place set apart in the neighbourhood of the town of Gulgong where the residents or teamsters or strangers arriving from a distance may depasture their cattle and horses without danger of losing them or having them impounded.

That the reservation by the Government of an area of from four to five hundred acres, or of such an area as to the Honorable the Minister for Lands may seem adequate for the purposes of a Town Common, would be a boon of inestimable value to the townspeople.

That there is a conveniently situated block of ground well suited for a Common in the immediate neighbourhood of the town, and yet so far removed that it is never likely to be required for building purposes, between the large hill at the back of the pound yards and Lyons' paddock, which your petitioners would beg most respectfully to suggest might most advantageously be appropriated for the purposes of a Town Common.

That this block of land has been diligently prospected by different parties of miners for gold without the shadow of success, that it is the general belief that no gold in payable quantities if at all exists in this block, and that its reservation for Commonage purposes would in no way interfere with the operations of the miners.

Your Petitioners therefore humbly pray that the Honorable the Minister for Lands may be pleased to take the premises into favourable consideration, and that this or some other suitable block of land may be reserved and dedicated in the manner suggested by your Petitioners.

And your Petitioners, as in duty bound, will ever pray.

WILLIAM EWINGTON, J.P.
CHARLES ZIMMLER,
and 86 others.

No. 2.

J. G. O'CONNOR, Esq., M.L.A., to THE MINISTER FOR LANDS.

York-street, Sydney,
15 December, 1873.

SIR,

Will you please take the prayer of the petitioners (sent herewith) into your consideration. The dedication of a piece of land as a Common would be a great boon to the miners in the district.

Your obedient servant,
J. G. O'CONNOR.

May probably be referred for the consideration of the Gold Commissioner, upon conference with the Acting District Surveyor, Bathurst.

The Gold Commissioner, Western District, accordingly.—B.C., 16th Jan., 1874. T.H.J. for U.S.

[Enclosure

3

[*Enclosure to No. 2.*]

Mr. O. Goodman to J. G. O'Connor, Esq., M.L.A.

Gulgong, December, 1873.

Sir,

I beg to enclose you a petition, which you will greatly oblige me by presenting to the Honorable the Minister for Lands, for the purpose of having the sheep at present grazed on the Gold Fields removed; they are the property of—

Mr. Rouse, around Gulgong,
Mr. Blackman, around Home Rule,
Mr. Lowe, around Canadian,

eating up, as you may easily imagine, the pastures that the gold-miner's cows, goats, and horses ought to benefit by. The petition is faithfully signed, and, should the course we have pursued not be correct to get rid of this nuisance, you will greatly oblige by intimating the correct one. Trusting you will interest yourself in this, to us, important matter,—

I remain, &c.,
OWEN GOODMAN.

[*Sub-enclosure to Enclosure to No. 2.*]

To the Honorable the Minister for Lands.

Gulgong, December, 1873.

The Petition of the undersigned Gold-miners and others, on the Gulgong Gold Field,—
Humbly sheweth:—

That the sheep grazing on the Crown Lands of this Gold Field are detrimental to the welfare of the inhabitants of this important district, totally destroying the grass which is required for the sustenance of the cows, horses, &c., the property of the gold-miner and others connected with the Gold Fields.

We therefore respectfully submit that you will immediately cause them to be removed, and declare a radius of say (5) five miles or so a Commonage for the express use of the aforesaid cattle, horses, &c., and not as at present for the squatter's sheep. And your Petitioners, as in duty bound, will ever pray.

[*Here follow 840 signatures.*]

No. 3.

MEMO. from MR. GOLD COMMISSIONER JOHNSON to MR. GOLD COMMISSIONER BROWNE.

FOR the report of Mr. Gold Commissioner Browne at his earliest convenience, who, if he considers the proclamation of a Commonage necessary, will be kind enough to indicate, as nearly as possible, the situation and extent of the area required for that purpose.

WHITTINGDALE JOHNSON.

B.C., 18th January, 1874.

No. 4.

MR. WARDEN BROWNE to THE UNDER SECRETARY FOR LANDS.

Gulgong, 23 June, 1874.

SIR,

I have the honor to enclose a petition from certain inhabitants of the town and neighbourhood of Gulgong with reference to a Common for the use of stock, and I beg to transmit a plan* and description of proposed reserve, which will, in my opinion, be sufficient for the purpose.

I have the honor to state that I am not aware that the neighbouring squatters have been in the habit of grazing their sheep upon the Gold Field to the injury of the miner's stock, which in the season of unexampled abundance of pasture cannot have suffered in that respect.

I have, &c.,
T. A. BROWNE,
Warden.

The population of Gulgong is somewhere about 8,000 persons. The recommendation for Commonage by Mr. Warden Browne is that 500 acres only, but that recommendation does not appear to have passed through Mr. Warden Johnson. 500 acres for a Common is too little. This may probably go for consideration of Mr. Acting District Surveyor Bolton, who may confer with Mr. Johnson on the matter should he consider it desirable.

16th July, 1874.

R. D. FITZGERALD,
(For Surveyor General).

[*Enclosure B to No. 4.*]*Description of proposed Town Common for the Village of Gulgong, containing about 500 acres.*

Gulgong, 1 July, 1874.

Commencing at a point marked A on plan, being 1 chain north, the north-west corner of Elijah Lyons' 40 acres c. p.; and bounded thence by a line bearing west about 38 chains; and thence by a line bearing north about 62 chains and 50 links; and thence by a line bearing east about 80 chains and 96 links; and thence by a line bearing south about 62 chains and 50 links; and thence by a line bearing west about 42 chains and 96 links, to the point of commencement.

SAMUEL A. McNEALE,
Surveyor.

No. 5.

THE UNDER SECRETARY FOR LANDS TO MR. WARDEN BROWNE.

Department of Lands,
Sydney, 26 June, 1874.

SIR,

See sub-enclo-
sure to No. 2.

I am directed to inform you that a communication has been received from Mr. Warden Johnson, intimating that the Petition for a Common at Gulgong forwarded to you on the 14th January last had not yet been returned, and I am directed to request that you will return the same with your report thereon to this department at your earliest convenience.

I have, &c.,
W. W. STEPHEN.

See enclosures A
and B to No. 4.

Report, with plan and description of Common enclosed. Posted 3rd July, 1874.—T. A. BROWNE,
Warden.
B.C., 4/7/74, Gulgong.

No. 6.

MR. ACTING DISTRICT-SURVEYOR BOLTON TO THE SURVEYOR GENERAL.

District Surveyor's Office,
Orange, 30 September, 1874.

SIR,

See No. 4.

See Enclosures A
and B to No. 4.

* Appendix B.

I do myself the honor to acknowledge the receipt of your B.C., 16th July, 1874, in reference to the proposed Common at Gulgong, county of Phillip, and in reply to inform you that I have visited the locality, and am of opinion that the area indicated by the sketch and description accompanying the application is not large enough; I would therefore recommend the land shown on my sketch* herewith be substituted for it. I would draw attention to the fact that the Gold Field reserve will serve as a temporary Common while there is a large digging population at Gulgong; and in the event of the greater portion of the population leaving, the Common suggested by me should meet the demands of the remaining inhabitants. I have conferred with Mr. Warden Browne, who coincides with my views.

I have, &c.,
C. F. BOLTON,
A. D.S.

No. 7.

MEMO. OF THE SURVEYOR GENERAL.

The area proposed to be substituted for Commonage, in lieu of the 500 acres proposed by Mr. Warden Browne is about 1,920 acres. The total unalienated land within the Gulgong Gold Field, exclusive of the town of Gulgong, is about 52 square miles, of which about 20 square miles is under pre-lease to Rouse, Cox, and Lowe, and others; but in the immediate vicinity of Gulgong, as per tracing,* edges green, the vacant Crown Lands, excluding R. Rouse's pre-leases of 640 acres, 750 acres, 700 acres, and 960 acres, on Wialdra and Coogal Creeks, is about 21 square miles. The population of Gulgong is not given even approximately by the District Surveyor, but I presume is somewhere about five to six thousand persons, excluding children. For the present it would appear by the Acting District-Surveyor's report undesirable to permanently dedicate any land for Commonage. It is therefore submitted that the vacant Crown Land, including about 21 square miles, be devoted for temporary Commonage until required for sale, and placed in trust for householders and freeholders within its boundaries as shown by tracing.

R. D. FITZGERALD,
(For Surveyor General).
B.C., 21 October, 1874.

UNDER SECRETARY FOR LANDS.

For approval, 15 December. Approved.—J.S.F., 29/12/74.

No. 8.

MINUTE PAPER FOR THE EXECUTIVE COUNCIL.

Department of Lands,
Sydney, 22 February, 1875.

Temporary Common at Gulgong.

See No. 9. It is recommended to His Excellency the Governor and the Executive Council that the within described portion of land, containing 21 square miles, and situated at Gulgong, in the county of Phillip, be set apart for Commonage purposes under clause 29 of the "Crown Lands Occupation Act of 1861."

See No. 10. It is also recommended to His Excellency and the Council that the boundaries, of which a description is enclosed, shall be those the freeholders and householders within which shall have the use of the temporary Commonage of Gulgong, subject to the reservations provided by clause 63 of the Regulations under the Alienation Act, and clause 113 of the Regulations under the Occupation Act.

THOS. GARRETT.

Approved.—H.R., 1/3/75.

The Executive Council advise that the portion of land herein described at Gulgong be set apart for Commonage purposes, in terms of the Act herein specified; also that the boundaries herein set forth be those within which freeholders and householders should have the use of the same.—ALEX. C. BUDGE,
Clerk of the Council.

Min. 75/12, 1/3/75. Confirmed, 8/3/75.

Mr. Ellis,—A tracing is enclosed showing the boundaries of the temporary Common at Gulgong, notified the 31st March, 1875, for the information of the Land Agent at Mudgee.—G. LEWIS, for the Surveyor General. Under Secretary for Lands.—B.C., 29th April, 1875.

Mr. Ellis,—Applicants should be informed and invited to nominate trustees, that regulations may be submitted for the management of the Common.—G. LEWIS.

No. 9.

GOVERNMENT GAZETTE NOTICE.—TEMPORARY COMMONAGE. GULGONG.

Department of Lands,
Sydney, 31 March, 1875.

His Excellency the Governor, with the advice of the Executive Council, directs it to be notified, that in pursuance of the provisions contained in the Regulations under the "Crown Lands Occupation Act of 1861," the land described hereunder shall be devoted to temporary Commonage.

THOMAS GARRETT.

County of Phillip, parishes of Guntawang and Gulgong, 21 square miles. The Crown Lands within the following boundaries: Commencing on Wialdra Creek, at the north-west corner of R. Rouse's 1,200 acres; and bounded thence on part of the west and north by that creek upwards to the south-west corner of E. Rouse's portion 9 of 65 acres; thence by the south and part of the east boundaries of that portion easterly and northerly to the south-west corner of E. Rouse's portion 10 of 43 acres; thence by the south and the east boundaries of that portion easterly and northerly to Wialdra Creek, and thence by Wialdra Creek upwards to R. Rouse's 1,081 acres; thence by the west and south boundaries of that land southerly and easterly to its south-east corner; thence by part of the east boundary of that 1,081 acres, bearing north about 80 chains to land under pre-emptive lease to R. Rouse; thence by a line east 277 chains, dividing it from that lessee's land; on the east by a line south, dividing it from land under pre-emptive lease to R. Rouse, to the north-west corner of portion 32; thence by the west and south boundaries of that portion southerly and easterly to its south-east corner, and thence by the road south-easterly to R. Rouse's 851 acres; thence by the part of the west boundary of that land southerly about 66 chains to the south-west corner of that land; thence by the western boundary of R. Rouse's 1,118 acres southerly and the south boundary of that land easterly to the north-west corner of A. J. Liddington's 640 acres; thence by part of the west boundary of that land southerly to G. Stott's 320 acres, portion 4-2; thence on the south by the north and part of the west boundaries of that portion westerly and southerly to the north-east corner of E. Stott's portion 4-3; thence by the north boundaries of that portion and J. Smith's portion 19 westerly to its north-western corner; thence by the west boundaries of that portion and G. Clarke's portion 20 and its southerly prolongation to the north boundary of J. Egan's portion 24; thence by parts of the north and the west boundaries of that portion and the north part of the west boundary of portion 25 westerly and southerly to the boundary dividing the parishes of Wilbertree and Gulgong; thence by that boundary bearing west to the east boundary of R. Lamrock's conditional purchase, portion 50; thence by the eastern and northern boundaries of that portion northerly and north-westerly and part of the north boundary of portion 49 westerly to the south-east corner of portion 27; thence by the east boundary of that portion northerly to its north-east corner; thence by the north boundaries of portions 27, 17, 18, westerly to the north-west corner of portion 18; thence by part of the west boundary of that portion southerly to a point east from the north-east corner of portion 34; thence by a line west to that corner and by the north boundary of that portion westerly to the east boundary of J. Smith's conditional purchase, portion 44; thence by the east and north boundaries of that portion northerly and westerly and the north boundary of portion 47 westerly to its north-west corner; thence again on the west and on the south by the road to Gulgong, passing along the eastern boundary of R. Rouse's 4,000 acres northerly to the north-east corner of that land, and thence by a line crossing that road to that corner, and by part of the north boundary of that land westerly to the south-east corner of R. Rouse's 1,200 acres; thence by the east and north boundaries of that land northerly and westerly to Wialdra Creek, at the point of commencement. But exclusively of the village of Gulgong, as shown on the map of that village at the Surveyor General's Office.

No. 10.

GOVERNMENT GAZETTE NOTICE.—COMMONERS' BOUNDARIES, GULGONG.

Department of Lands,
Sydney, 31 March, 1875.

His Excellency the Governor, with the advice of the Executive Council, directs it to be notified, that all freeholders and householders within the undermentioned boundaries will be entitled to the use of the permanent and temporary Commonage at Gulgong.

THOMAS GARRETT.

County of Phillip, parishes of Guntawang and Gulgong: Commencing on Wialdra Creek, at the north-west corner of R. Rouse's 1,200 acres; and bounded thence on part of the west and north by that creek upwards, to the south-west corner of E. Rouse's portion 9, 765 acres; thence by the south and part of the east boundary of that portion easterly and northerly to the south-west corner of E. Rouse's portion 10, of 43 acres; thence by the south and the east boundaries of that portion easterly and northerly to Wialdra Creek; and thence by Wialdra Creek upwards, to R. Rouse's 1,081 acres; thence by the west and the south boundaries of that land southerly and easterly to its south-east corner; thence by part of the east boundary of that 1,081 acres bearing north about 80 chains to land under pre-emptive lease to R. Rouse; thence by a line east 277 chains, dividing it from that leased land; on the east by a line south, dividing it from land under pre-emptive lease to R. Rouse, to the north-west corner of portion 32; thence by the west and south boundaries of that portion southerly and easterly to its south-east corner; and thence by the road south-easterly to R. Rouse's 851 acres; thence by part of the west boundary of that land southerly, about 66 chains to the south-west corner of that land; thence by the western boundary of R. Rouse's 1,118 acres southerly, and the south boundary of that land easterly to the north-west corner of A. J. Liddington's 640 acres; thence by part of the west boundary of that land southerly to G. Stott's 320 acres, portion 4 over 2; thence on the south by the north and part of the west boundaries of that portion westerly and southerly to the north-east boundary of E. Stott's portion 4 over 3; thence by the north boundaries of that portion and J. Smith's portion 19 westerly to its north-west corner; thence by the west boundaries of that portion and G. Clarke's portion 20 and its southerly prolongation to the north boundary

boundary of J. Egan's portion 24; thence by part of the west boundary of portion 25 westerly and southerly to the boundary dividing the parishes of Wilbertree and Gulgong; thence by that boundary bearing west to the eastern boundary of R. Lamrock's conditional purchase, portion 50; thence by the eastern and northern boundaries of that portion northerly and north-westerly, and part of the north boundary of portion 49, westerly to the south-east corner of portion 27; thence by the east boundary of that portion northerly to its north-east corner; thence by the north boundaries of portions 27, 17, 18, westerly to the north-west corner of portion 18; thence by part of the west boundaries of that portion southerly to a point east from the north-east corner of portion 34; thence by a line west to that corner and by the north boundary of that portion westerly to the east boundary of J. Smith's conditional purchase, portion 44; thence by the east and north boundaries of that portion northerly and westerly, and the north boundary of portion 47 westerly to its north-west corner; thence again on the west and on the south by the road to Gulgong, passing along the east boundary of R. Rouse's 4,000 acres northerly to the north-east corner of that land; and thence by a line crossing that road to that corner, and by part of the north boundary of that land westerly to the south-east corner of R. Rouse's 1,200 acres; thence by the east and north boundaries of that land northerly and westerly to Wialdra Creek, at the point of commencement.

No. 12.

THE UNDER SECRETARY FOR LANDS TO MR. J. G. O'CONNOR.

Department of Lands,

Sydney, 22 May, 1875.

SIR,

Referring to your letter of the 15th December, 1873, relative to a petition from the residents of Gulgong praying for the reservation of a temporary Common at that place, I am directed to invite your attention to a notice which appeared in the Government Gazette of the 31st March last, from which you will perceive that the prayer of the petitioners has been complied with.

Trustees should now be nominated according to the provisions of the Commons Regulation Act of 1873.

I have, &c.,

W. W. STEPHEN.

No. 13.

MR. S. SAMPER TO R. H. M. FORSTER, Esq., M.L.A.

Gulgong Progress Committee Rooms,
26 May, 1875.

SIR,

I have the honor to inform you that a very large meeting of the Progress Committee was held last evening, when it was moved by Mr. Henry Tebbutt, seconded by Mr. J. F. Plunkett, and carried unanimously,—That this meeting protests against the action of the Honorable the Minister of Lands in causing 21 square miles of the richest agricultural lands around Gulgong being proclaimed a Common, thus preventing its use for agricultural purposes.

That Mr. Buchanan, the Member of the Western Gold Fields, be requested to wait on the Minister to ask him to revoke the proclamations and cause the above lands to be thrown open at once for conditional purchase.

That the Secretary be directed to correspond with Mr. Buchanan on the subject, and also forward him a copy of this resolution.

It was further directed that the names of R. H. M. Forster and S. S. Goold, Esqs., M.L.A.'s, be added to the motion.

I am, &c.,

S. SAMPER,

Honorary Secretary.

Urgent. Let the temporary Common be reduced to the area recommended and shown on the plan by Mr. Bolton. Inform Mr. Buchanan and Mr. R. Forster, M.P.'s, at once.—T.G., 2/6/75.

Mr. Ellis. Urgent. Submitted for the consideration of the Honorable the Minister for Lands as directed. That the defined area, containing about 18 square miles, be withdrawn from the temporary Common at Gulgong, in accordance with memo. on 75/3,920 Mis.—R. B. FITZGERALD (for Surveyor General). Under Secretary for Lands.—B.C., 5 June, /75.

No. 14.

MR. S. SAMPER TO D. BUCHANAN, Esq., M.L.A.

Gulgong Progress Committee Rooms,
Gulgong, 26 May, 1875.

SIR,

I have the honor to inform you that a very large meeting of the Progress Committee was held last evening, when it was moved by Mr. Henry Tebbutt, seconded by Mr. J. F. Plunkett, and carried unanimously,—That this meeting protests against the action of the Honorable the Minister of Lands in causing 21 square miles of the richest agricultural land around Gulgong being proclaimed as a Common, thus preventing its use for agricultural purposes.

That

That Mr. Buchanan, the Member of the Western Gold Fields, be requested to wait on the Minister to ask him to revoke the proclamations and cause the above lands to be thrown open at once for conditional purchase. That the Secretary be directed to correspond with Mr. Buchanan on the subject, and also forward him a copy of this resolution. At the suggestion of Mr. Plunkett the following clause was also added:—

“And that Mr. Buchanan be requested to ask in his place in Parliament by what advice or suggestion the Common was proclaimed.”

It was then moved by Mr. Dennis, seconded by Mr. Macdonald,—That the names of Mr. R. M. Forster and Mr. S. S. Goold, M.L.A.'s, be added to Mr. Tebbutt's resolution,—carried. In accordance with the above resolution, I now do myself the honor to address you.

I have, &c.,
S. SAMPER,
Honorary Secretary, G.P. Committee.

No. 15.

TELEGRAM from THE SECRETARY OF THE GULGONG PROGRESS COMMITTEE to D. BUCHANAN, Esq., M.L.A.
1 June, 1875.

THE people applied through J. G. O'Connor three years ago for about 400 acres in one spot for Town Common, but never for such absurd area gazetted.

Handed to me by D. Buchanan, M.P.—T.G., 2/6/75.

Let me see the whole of the papers in this case, together with the letter handed in by Mr. Buchanan yesterday.—T.G., 2/6/75.

No. 16.

THE UNDER SECRETARY FOR LANDS to R. H. M. FORSTER, Esq., M.L.A.
Department of Lands,
Sydney, 7 June, 1875.

SIR,

With reference to your personal representation to the Minister for Lands relative to the temporary Common recently proclaimed at Gulgong, I am directed to inform you that the Minister has determined to reduce the area of it to about 1,920 acres.

I have, &c.,
W. W. STEPHEN.

No. 17.

THE UNDER SECRETARY FOR LANDS to D. BUCHANAN, Esq., M.L.A.
Department of Lands,
Sydney, 7 June, 1875.

SIR,

With reference to your personal representation to the Minister for Lands relative to the temporary Common recently proclaimed at Gulgong, I am directed to inform you that the Minister has determined to reduce the area of it to about 1,920 acres.

I have, &c.,
W. W. STEPHEN.

No. 18.

MINUTE FOR THE EXECUTIVE COUNCIL.
Department of Lands,
Sydney, 7 June, 1875.

Withdrawal from Temporary Common.

It is recommended to His Excellency the Governor and the Executive Council that the within described See No. 20. portion of land situated in the parish of Guntawang, containing about 18 square miles, be withdrawn from the temporary Commonage at Gulgong.

THOS. GARRETT.

Approved.—H.R., 8/6/75.

THE Executive Council advise that the area of land herein described be withdrawn from the temporary Commonage at Gulgong for the purpose herein specified.

ALEX. C. BUDGE,
Clerk of the Council.

Min. 75/28, 8/6/75. Confirmed, 14/6/75.

No. 19.

MR. S. SAMPER to THE MINISTER FOR LANDS.
Gulgong, 9 June, 1875.

SIR,

I have the honor to transmit to you the following resolution as passed by the Gulgong Progress Committee at their last meeting, on the 8th instant, namely:—“That the Hon. Secretary be instructed to write to the Honorable the Minister for Lands, asking him to withdraw from reserve all the land proclaimed as a Common and published in Government Gazette of the 31st March last, excepting 480 acres asked for in a petition presented by Mr. J. G. O'Connor in 1873.

The proclamation of such a large Common has quite surprised the inhabitants of Gulgong, as they never petitioned for such a large area, and it is generally felt that the area of 480 acres, as petitioned for in 1873, is sufficiently large for all purposes.

I have, &c.,
S. SAMPER,
Honorary Secretary, Gulgong Progress Committee.

May be informed of reduction of area.

No. 20.

GOVERNMENT GAZETTE NOTICE—WITHDRAWAL OF LAND FROM TEMPORARY COMMON AT GULGONG.

Department of Lands,
Sydney, 15 June, 1875.

Hrs Excellency the Governor, with the advice of the Executive Council, directs it to be notified that the portion of land hereafter described has been withdrawn from the temporary Commonage at Gulgong.

THOMAS GARRETT.

County of Phillip, parishes of Guntawang and Gulgong, about 18 square miles: Commencing on Wialdra Creek at the north-west corner of R. Rouse's 1,200 acres; and bounded thence on part of the west and north by that creek upwards to the south-west corner of E. Rouse's portion 9 of 65 acres; thence by the south and part of the east boundaries of that portion easterly and northerly to the south-west corner of E. Rouse's portion 10 of 43 acres; thence by the south and east boundaries of that portion easterly and northerly to Wialdra Creek; and thence by Wialdra Creek upwards to R. Rouse's 1,081 acres; thence by the west and south boundaries of that land southerly and easterly to its south-east corner; thence by part of the east boundary of that 1,081 acres bearing north about 80 chains to land under pre-emptive lease to R. Rouse; thence by a line east 277 chains dividing it from that lessee's land; on the east by a line south dividing it from land under pre-emptive lease to R. Rouse to a point due west from the north-west corner of portion 32; thence by a line bearing east to that corner; thence by the west and south boundaries of that portion southerly and easterly to its south-east corner; and thence by the road south-easterly to R. Rouse's 851 acres; thence by part of the west boundary of that land southerly about 66 chains to the south-west corner of that land; thence by the western boundary of R. Rouse's 1,118 acres southerly and the south boundary of that land easterly to the north-west corner of A. J. Liddington's 610 acres; thence by part of the west boundary of that land southerly to G. Stott's 320 acres portion 4 over 2; thence on the south by the north and part of the west boundaries of that portion westerly and southerly to the north-east corner of E. Stott's portion 4 over 3; thence by the north boundaries of that portion and J. Smith's portion 19 westerly to its north-west corner; thence by the west boundaries of that portion and G. Clarke's portion 20 and its southerly prolongation to the north boundary of J. Egan's portion 24; thence by parts of the north and the west boundaries of that portion and the north and part of the west boundary of portion 25 westerly and southerly to the boundary dividing the parishes of Wilbortree and Gulgong; thence by that boundary bearing west to the east boundary of R. Lamroek's conditional purchase portion 50; thence by the eastern and northern boundaries of that portion northerly and north-westerly and part of the northern boundary of portion 49 westerly to the south-east corner of portion 27; thence by the east boundary of that portion northerly to its north-east corner; thence by the north boundaries of portions 27, 17, and 18, westerly to the north-west corner of portion 18; thence by part of the west boundary of that portion southerly to a point east from the north-east corner of portion 34; thence by a line west to that corner and by the north boundary of that portion westerly to the east boundary of J. Smith's conditional purchase portion 44; thence by part of the east and north boundaries of that portion northerly and westerly and the north boundary of portion 47 to its north-west corner; thence again on the west by the road to Gulgong northerly passing along part of the eastern boundary of R. Rouse's 4,000 acres, Guntawang, to the north-west corner of R. Rouse's portion 6 over 31 of 25 acres 1 rood; thence by a line partly forming the north boundary of that portion and R. Rouse's portion 6 over 30 of 40 acres and its easterly continuation about 105 chains to a point due south from the south-east corner of E. Lyons' conditional purchase portion 36 of 40 acres; thence by the south-west boundary of that portion north-westerly to its south-west corner; thence by part of the west boundary of portion 36 bearing north to the south-east corner of portion 31 E. Lyons' 40 acres; thence by the south, the west, the north, and part of the east boundaries of that portion bearing west, north, east, and south, to the north-east corner of portion 36 aforesaid; thence by the north boundary of that portion bearing east to its north-east corner; thence by a line bearing north about 100 chains to a point due east from the south-east corner of portion 37; thence by a line partly forming the south boundary of portion 37 about 90 chains; thence by a line bearing south 43 chains; thence by a line bearing west 22 chains; thence by a line bearing south 60 chains; thence by a line south-easterly to the north-east corner of R. Rouse's 4,000 acres, Guntawang, by part of the north boundary of that land westerly to the south-east corner of R. Rouse's 1,200 acres; thence by the east and the north boundaries of that land northerly and westerly to Wialdra Creek at the point of commencement.

DOGS.

(PETITION RESPECTING DEPREDACTIONS OF—SHEEPOWNERS OF MURRURUNDI.)

Ordered by the Legislative Assembly to be printed, 25 June, 1875.

To the Honorable the Parliament of New South Wales at this time assembled.

The Petition of the undersigned sheepowners and others residing in the district of Murrurundi,—
HUMBLY SHOWETH:—

That your Petitioners beg leave most respectfully to bring under the notice of your Honorable House that we suffer great loss and damage in the destruction of our sheep by reason of the large numbers of domestic dogs roaming about the country, apparently without owners or control. The loss and damage we complain of is daily increasing and becoming more serious, as our estates or runs are being more enclosed, and the sheep running in paddocks without the attendance of shepherds, and it has now become a question with us as to whether we shall not again be compelled to employ shepherds even in paddocks.

We therefore humbly pray that your Honorable House will be pleased to take such steps to remedy the evil complained of as may appear best.

And, as in duty bound, we will ever pray.

NEW SOUTH WALES.

INNKEEPERS' LIABILITY BILL.

(PETITION OF THE LICENSED VICTUALLERS' ASSOCIATION.)

Ordered by the Legislative Assembly to be printed, 2 June, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the Licensed Victuallers' Association of New South Wales,—

HUMBLY SHOWETH :—

That your Petitioners view with alarm the proposal to make an innkeeper liable for the goods of his guest or lodger to the amount of thirty pounds (£30), such goods not being placed in the custody or safe keeping of such innkeeper. Your Petitioners humbly submit that an innkeeper should only be made liable for such goods as are given into his custody. Your Petitioners would also urge that the clause compelling an innkeeper to provide a sealed box for the safe keeping of property would entail in many cases a large and unnecessary expense, inasmuch as all innkeepers would for their own protection provide some place of safety for such property as they were responsible for. Your Petitioners are of opinion that making an innkeeper responsible for property not placed in his charge would lay him open to fraudulent claims as are often even now-a-days made in our Law Courts.

Your Petitioners therefore humbly pray your Honorable House to consider these matters and restrain from imposing still greater restrictions upon a class of tradesmen who contribute so largely to the revenue of the Colony.

And your Petitioners, as in duty bound, will ever pray.

Signed for the Licensed Victuallers' Association of New South Wales,—

J. B. OLLIFFE,
 "Royal Hyde Park Hotel," Sydney,
 President.

E. LEWIS SCOTT,
 30, Botany-street,
 General Secretary.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

INNKEEPERS' LIABILITY BILL.

(PETITION OF LICENSED VICTUALLERS' ASSOCIATION.)

Ordered by the Legislative Assembly to be printed, 21 June, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the Licensed Victuallers' Association of New South Wales,—

HUMBLY SHOWETH :—

That your Petitioners feel that the passing of the Innkeepers' Liability Bill now before your Honorable House in its present state would be unjust to the Licensed Victuallers of the Colony.

Your Petitioners humbly urge that an innkeeper should not be held liable in law for any goods not given into his charge by the owner. Cases of gross fraud have occurred through this matter having been left so indefinite.

Your Petitioners humbly submit that to compel an innkeeper to provide a sealed box for each guest or lodger would entail great expense, as in the case of a large hotel where many lodgers having valuables are staying.

Your Petitioners therefore humbly pray your Honorable House not to allow the Bill to become law in its present form, but to cause its re-committal with the view to insert the provisions as set out in this their Petition.

And your Petitioners, as in duty bound, will ever pray.

Signed on behalf of the Licensed Victuallers' Association of New South Wales,—

J. B. OLIFFE,
President,
Elizabeth-street.

E. LEWIS SCOTT,
General Secretary,
30 Botany-street.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SALE OF COLONIAL WINES REGULATION ACT.

(PETITION—VINEGROWERS OF MAITLAND AND PATERSON.)

Ordered by the Legislative Assembly to be printed, 14 April, 1875.

To the Honorable the House of Assembly, in Parliament assembled.

The humble Petition of the Vinegrowers and others residing in the Districts of Maitland and Paterson and the neighbouring Districts, interested in the production, sale, and consumption of Colonial Wines,—

RESPECTFULLY SHOWETH :—

That your Petitioners have observed with regret that a Bill has been introduced into your Honorable House for the repeal of the Sale of Colonial Wines Regulation Act.

That while your Petitioners are prepared to acknowledge that abuses have occurred in the working of the said Act, they are decidedly of opinion that, instead of its being totally repealed, it ought to be amended, and that an inquiry into the amendments which are called for could be held with advantage to the public interests by your Honorable House.

Your Petitioners, therefore, humbly pray that your Honorable House will take the premises into its consideration, and grant such relief as it may in its wisdom think expedient.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 600 signatures.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

JOHN MELLY.

(PETITION OF.)

Ordered by the Legislative Assembly to be printed, 16 June, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of John Melly, of Waterloo, in the Colony of New South Wales, Soap and Candle Manufacturer,—

SHOWETH :—

That your Petitioner, in the year one thousand eight hundred and forty-eight, commenced business as a Soap and Candle Manufacturer, in Parramatta-street, in the city of Sydney, until the year one thousand eight hundred and sixty, when, in consequence of the passing of the Act 14 Victoria number 30, he was compelled to remove his business outside the boundaries of the said city.

That your Petitioner, in the year one thousand eight hundred and sixty, removed his business, and erected premises on a piece of land between the city of Sydney and the borough of the Glebe, known as "No man's land."

That your Petitioner carried on business at the last-mentioned place until June, one thousand eight hundred and seventy-three, when, in consequence of the passing of an Act of the Legislature, 33 Victoria number 9, known as the "Boundaries of the City of Sydney Extension Act," extending the boundaries of the city of Sydney so as to include the land known as "No man's land," your Petitioner's premises were brought within the city of Sydney, and he became liable to the provisions of the Act 14 Victoria number 30.

That in or about the month of March, one thousand eight hundred and seventy-three, a charge was preferred against your Petitioner at the Central Police Court, Sydney, by the Inspector of Nuisances, for carrying on business as a Soap-boiler within the city of Sydney, under the fifth section of the Act 14 Victoria number 30, when your Petitioner was fined for such offence the sum of forty shillings.

That your Petitioner appealed against the conviction to the Supreme Court, which Court upheld the decision of the Magistrates. That in consequence of this decision your Petitioner was compelled to again remove his business and was put to great loss and expense, and suffered damage to the amount of six hundred pounds, through the passing of the said Act 33 Victoria number 9.

That your Petitioner has been compelled to pull down his premises, to remove his plant, and to erect new buildings in the borough of Alexandria, at considerable expense.

Your Petitioner therefore humbly prays that your Honorable House will take his case into consideration, and that he may be afforded such relief as to your Honorable House shall seem meet.

And your Petitioner, as in duty bound, will ever pray.

JOHN MELLY.

ALL SAINTS PARSONAGE BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, to whom was referred for consideration and report, on 2nd April, 1875,—“*All Saints Parsonage Bill*,”—beg to report to your Honorable House,—

That they have examined the witness named in the margin* (whose *Could A. J., Esq. evidence will be found appended hereto); and that the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the several clauses of the Bill, in which it was deemed necessary to make certain Amendments.

Your Committee now beg to lay before your Honorable House the Bill with certain Amendments.

WILLIAM CHARLES BROWNE,
Chairman.

*No. 3 Committee Room,
Sydney, 9th April, 1875.*

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 8 APRIL, 1875.

MEMBERS PRESENT:—

Mr. W. C. Browne,		Mr. Farnell,
Mr. Jacob,		Mr. Scholey,
Mr. Stuart,		Mr. Montague.

Mr. W. C. Browne called to the Chair.

Entry from Votes and Proceedings appointing the Committee, *read* by the Clerk.Printed copies of the Bill *referred*, and original Petition to introduce the same, before the Committee.

Committee deliberated.

[Adjourned to To-morrow, at half-past *Two* o'clock.]

FRIDAY, 9 APRIL, 1875.

MEMBERS PRESENT:—

Mr. W. C. Browne in the Chair.

Mr. Farnell,		Mr. Scholey,
Mr. Montague,		Mr. Jacob,
Mr. Stuart.		

Present,—Albert John Gould, Esq., (*Solicitor for the Bill*.)

A. J. Gould, Esq., examined.

Witness produced Deed of Conveyance of certain lands from Benjamin Singleton and wife, to the Bishop of Australia.

Room cleared.

Preamble considered.

Question,—“That this Preamble stand part of the Bill,”—put and passed.

Solicitor called in and informed.

Clauses 1 and 2 *read* and *agreed to*.Clause 3 *read*, *amended*,* and *agreed to*.Clauses 4 and 5 *read* and *agreed to*.Schedule *read*, *amended*,† and *agreed to*.

Chairman to report the Bill with Amendments to the House.

*See Schedule of Amendments.

†See Schedule of Amendments.

SCHEDULE OF AMENDMENTS.

Page 2, clause 3, lines 53 and 54. *Omit* “for any period not exceeding three years.”
 Page 3, Schedule. *Omit* “acres or thereabouts.” *Insert* “two acres one rood and twenty-four perches more or less.”

WITNESS.

Gould, A. J., Esq.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

ALL SAINTS PARSONAGE BILL.

FRIDAY, 9 APRIL, 1875.

Present:—

MR. W. C. BROWNE,
MR. FARNELL,
MR. JACOB,

MR. MONTAGUE,
MR. SCHOLEY,
MR. STUART.

W. C. BROWNE, Esq., IN THE CHAIR.

Albert John Gould, Esq., Solicitor for the Bill, examined:—

1. *Chairman.*] You are Solicitor for the Bill now before this Committee? I am.
2. The land referred to in the Bill was originally a grant from Benjamin and Mary Singleton to the Bishop of Australia and his successors, upon trust, for the erection of a church and parsonage for the Church of England, and also for use as a burial-ground and glebe for the clergyman? It is a conveyance by lease and release from Benjamin Singleton and wife to the Bishop of Australia, for the purposes mentioned.
3. A dwelling-house for the clergyman has already been erected upon this site? It has.
4. But it is now considered expedient to erect a more commodious parsonage in a more suitable locality in the town of Singleton? It is.
5. You consider it expedient to sell the site of the present parsonage, and to apply the proceeds arising from the sale in the erection of another parsonage in a more suitable locality? I do.
6. The usual notices of the intention to apply for this Bill have been inserted in the Government Gazette and various newspapers? They have.
7. Do you wish to state anything else? I produce the conveyance by lease and release, dated 15th January, 1842, from Benjamin Singleton and wife to the Bishop of Australia, of the land it is now desired to sell. (*Deed produced.*)
8. *Mr. Farnell.*] Who was the Bishop of Australia at that time? The Right Reverend William Grant Broughton, D.D.
9. Upon whom does that trust devolve at the present time? It would devolve upon the Bishop of Newcastle, as it is within the diocese of Newcastle, but the letters patent do not vest the fee simple in the Bishop of Newcastle, as they should have done, and as we desire to do by the present Act.
10. I presume it would not be vested in the Metropolitan Bishop—Bishop Barker? No.
11. Do you propose by this Bill to transfer the trust vested in the Bishop of Australia at that time to the Bishop of Newcastle? No; we propose to vest the fee simple of the land in the Bishop of Newcastle, and to give him power to sell the land and to hold or apply the money for certain other trusts, stated in the fourth clause of the Bill. At the present moment the Bishop of Newcastle is looked upon as the trustee of the land for the trusts mentioned in the deed I have produced, though the fee simple has not been actually vested in him by law. It may be as well to mention, with regard to these trusts, that the land has been used for a site for a parsonage for the Church of England clergyman at Singleton, but it has never been made use of for the erection of a church or chapel, or for a burial-ground, there being other lands which have been used for those purposes. It has been solely used for a parsonage. We have fifty acres of land a short distance from the town, part of which has been used as a burial-ground, and the church has already been built on another section of land in the town, on which we now propose to build also a new parsonage.
12. Instead of using this land for a church or chapel, you wish to take power under this Bill to use it for some other purpose? To sell the land and apply the proceeds in the erection of a parsonage on part of the land on which the church now stands.

A. J. Gould,
Esq.
April, 1875.

- A. J. Gould, Esq.
9 April, 1875.
13. How far is the church from the present parsonage? About 300 yards.
14. *Chairman.*] The parsonage building has become so dilapidated that it is necessary to build a new one at once? Yes; the building is very dilapidated and very small, and not so conveniently situated as the proposed site.
15. *Mr. Scholey.*] Have all parties concerned had notice of your intention to sell this land? The matter has been brought before the members of the Church at two or three meetings of the parishioners, and they have all concurred in selling this property and appropriating the money to the building of a new parsonage. The Bishop of Newcastle, of course, is the person applying for permission, but it is done with the sanction of the churchwardens and parishioners.
16. There has been no want of publicity? No; it has been duly published, and there is no objection from any one.
17. *Mr. Farnell.*] The preamble refers to the Act of William the Fourth;—has not an Act been passed subsequent to that, vesting the Church property—an Act that arose out of the establishment of the Synod? I am aware that an Act has been passed authorizing the different dioceses to form Synods for the internal management of the affairs of the Church.
18. Did not that Act in some way deal with the property of the Church? I do not think so; I do not think it would affect this matter.
19. Who is the Bishop of the Diocese of Newcastle? The Right Reverend William Tyrrell, D.D.
20. Called Lord Bishop of Newcastle? Yes.
21. Are the trusts contained in the deed produced correctly recited in the preamble of this Bill? They are. I produce also the Government Gazette of 26th January, 1848, containing the letters patent appointing the Bishop of Newcastle, and mentioning the see.
22. What is the area of the land it is proposed to sell? A little under two acres and a half; to speak correctly, two acres and two-fifths. I produce a plan of the town of Singleton, showing the land we desire to sell, marked A in pencil.
23. There are several lots, are there not? There are, as originally subdivided.
24. Are those the lots referred to in the Bill? They are, although on this map they are not shown. This map was prepared after the land was sold. The original map of the town of Singleton, showing the different lots by their numbers, has been unfortunately mislaid to-day; but the land marked A on the plan produced is identically the same as that mentioned in the schedule, and conveyed by the deed produced from Benjamin Singleton and wife to the Bishop of Australia.
25. What is the value of this land? From £400 to £500.

DUBBO PRESBYTERIAN MANSE TRUSTEES BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred, on 27th April, 1875, the *Dubbo Presbyterian Manse Trustees Bill*, beg to report to your Honorable House:—

That they have examined the witnesses named in the margin* (whose evidence will be found appended hereto), and that the Preamble, as *verbally* amended, having been satisfactorily proved to your Committee, they carefully considered the several clauses of the Bill, in which it was not deemed necessary to make any Amendment.

Your Committee now beg to lay before your Honorable House the Bill, with an amended Title and Preamble.

CHAS. E. PILCHER,
Chairman.

No. 3 Committee Room,
Sydney, 29th April, 1875.

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 29 APRIL, 1875.

MEMBERS PRESENT:—

Mr. Pilcher,		Mr. Macintosh,
Mr. F. B. Suttor,		Mr. Stuart.

Mr. Pilcher called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Printed copies of the Bill *referred*, and original Petition to introduce the same, before the Committee.

Present:—Craven Hyde Fitzhardinge, Esq. (*Solicitor for the Bill*).

Craven Hyde Fitzhardinge, Esq., examined.

Witness produced letter from the Promoters of the Bill appointing him their Solicitor; also Deed of Settlement referred to in the Preamble.

Thomas Alexander Thompson, Esq. (*one of the Promoters of the Bill*), called in and examined.

Room cleared.

Preamble considered and *amended*.*

Question,—“That this Preamble stand part of the Bill,”—put and passed.

Solicitor called in and informed.

Clauses 1 and 2 *read* and *agreed to*.

Title *read, amended,†* and *agreed to*.

Chairman to report Bill with amended Title and Preamble to the House.

* See Schedule of Amendments.

† See Schedule of Amendments.

SCHEDULE OF AMENDMENTS.

Page 1, Title. *Omit* “intituled an Act”; also “James Holmes Thomas Baird John Cassels Ryrie and Thomas Alexander Thompson and James Osborne Esquires and other,” and also “a Trustee.”

Page 2, Preamble, line 2, insert “Saint Andrew’s” after “as.”

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

DUBBO PRESBYTERIAN MANSE TRUSTEES BILL.

THURSDAY, 29 APRIL, 1875.

Present:—

MR. MACINTOSH,
MR. PILCHER,

MR. STUART,
MR. F. B. SUTTON.

CHAS. E. PILCHER, Esq., IN THE CHAIR.

Mr. Craven Hyde Fitzhardinge examined:—

1. *Chairman.*] You are Attorney for the Trustees of the land named in this Bill? Yes, I hold an appointment from them.
2. Do you produce it? I do. It is signed by the Trustees. (*Produced.*)
3. Do you produce the deed mentioned in the preamble of the Bill? I do. (*Deed produced.*)
4. The preamble correctly recites that deed? It does.
5. Do you know where the piece of land granted by the deed is situated? I do; in Macquarie-street, Dubbo.
6. Is that the principal street? Yes, the main thoroughfare.
7. How is it situated with reference to other buildings? At the rear of it there is a second-rate hotel—the Commercial Hotel; on the south side there is a smith's forge in constant work; on the north side a second-rate storekeeper's shop; and in front, directly opposite, across the street, a steam saw-mill and a flour-mill in constant work. The allotment is situated in the centre of the town.
8. Where is the Presbyterian church situated? On the top of a hill, perhaps a quarter of a mile from the allotment it is proposed to sell.
9. Is this allotment, in your opinion, suitable for a clergyman's residence? The land is, but the position is not; it is unsuitable, because it is in the main thoroughfare of the town, and in the midst of the principal business places. A solicitor has his office a little further down, and he is removing because he is interrupted by the noise of the saw-mill, which is going almost night and day.
10. What is the extent of this piece of land? Half an acre.
11. Do you know what the land is that the Trustees propose to purchase? I do not. Mr. Thompson, one of the Trustees, will be able to give information as to that. I can give an opinion as to the value of land in Dubbo. Land nearer the church is selling for about £20 or £30 the half-acre.
12. *Mr. Stuart.*] What is the value of the half-acre it is proposed to sell? I should say from £300 to £350. I may mention that it is almost the only piece of vacant land in the main street now.
13. *Mr. Macintosh.*] Do the Trustees intend to expend the value of this allotment in other land? In the purchase of other land and in building a manse. I think in a convenient place they could get 2 acres for about £50 or £70 an acre, and they would spend the remainder in building a manse. It is proposed to buy a larger piece of land. The Presbyterian minister there has several horses, having to visit a large district, and it would be convenient for him to have more room.
14. Has it become locally known that this Bill was to be applied for? Yes; it has been advertised four times in the local paper.
15. Is there any opposition? No.
16. Do you believe it would be advantageous for the district and the church in particular that Parliament should pass this Bill? Decidedly advantageous to the town and district, and also to the church.

Mr. C. H.
Fitzhardinge.
29 April, 1875.

- Mr. C. H. Fitzhardinge.
29 April, 1875.
17. *Mr. F. B. Suttor.*] This half-acre is not sufficient ground for the use of the clergyman? Decidedly not.
18. *Chairman.*] Dubbo is a very thriving town—progressing? Yes.
19. The land you speak of as being now worth £30 an acre would in a few years probably be worth double that? Yes.
20. Is the church in a convenient situation? Yes, very convenient. It is near the centre of the town, but out of the business part, and on a slight rise.
21. Is the church a good building? It is not completed yet, but it is a very good building of white sandstone—one of the best buildings in the town.
22. A permanent building? Yes.
23. *Mr. Macintosh.*] There is no probability of the district requiring the church to be shifted nearer the population? No; they could not get a better site than they have now.
24. *Mr. Stuart.*] I see by the preamble of the Bill that this church is in connection with the General Assembly of the Presbyterian Church of New South Wales. Has this matter been before the General Assembly? I am instructed that it has; but on that point Mr. Thompson can speak more definitely than I can.
25. *Mr. Macintosh.*] Are you aware whether the General Assembly have given their consent to this proceeding? I have been informed so by the clergyman, and I put a clause in the petition to that effect, but it was erased as being unnecessary by counsel who settled the draft.
26. *Mr. Stuart.*] Is it not a necessary part of the discipline of the Presbyterian Church that the sanction of the General Assembly should be obtained before applying to Parliament in a matter of this kind? I believe it is.
27. To whom was the land originally granted? I think to the Trustees.

Mr. Thomas Alexander Thompson examined:—

- Mr. T. A. Thompson.
29 April, 1875.
28. *Chairman.*] You are one of the Trustees named in the Bill and one of the Petitioners? Yes.
29. You live at Dubbo? Yes.
30. And you know the position of the land granted under the deed just produced? Yes.
31. This matter has been set on foot by yourself and your co-Trustees? Yes.
32. Has that been done with the concurrence of the General Assembly of the Presbyterian Church? The Committee of the congregation in the first place applied to the General Assembly for permission, and the answer was that it was not necessary, because the matter was in the hands of the Trustees, and the Committee then applied to the Trustees.
33. As I understand, the consent of the General Assembly was not refused, but you were informed that that was not necessary so long as the Trustees approved of it? Just so—so long as the Trustees approved and the funds were appropriated to the same purpose for which the land was intended.
34. You have not that communication with you? I have not.
35. The situation of the land it is proposed to sell is in the principal street of Dubbo? Yes, in the main thoroughfare.
36. Is it suitable at all for a clergyman's house? No; it is surrounded on one side with stores, on the other side by a public-house and blacksmith's shop, and across the street there are flour and saw mills.
37. It is very unsuitable then for a residence at all? Very unsuitable.
38. Where is the land you propose purchasing? We propose purchasing an allotment more convenient to the church, and suitable for a private residence.
39. How much land do you propose buying? There is about an acre that we have been in treaty for.
40. What would that cost? I think about £30 or £40.
41. *Mr. Macintosh.*] Could you not obtain more land than that? We could obtain more land, but we think that would be sufficient.
42. What is the value of the allotment you wish to dispose of? I think we could realise something like £400 for it.
43. Do you not think it is hardly equitable to sell £400 worth of freehold land and only re-purchase £30 worth—the remainder of the money to be expended in building? I consider that an acre would be quite sufficient to build a manse upon. It is twice as much as we have now.
44. Would you have any objections to allow the Bill to be amended so far that the land to be purchased should not be less than 2 acres? I think it would be rather difficult to get so much as 2 acres convenient enough to the church; we would have to go too far from the church to get 2 acres.
45. Could you not buy sufficient to afford a small paddock for a horse? The ground there would not be suitable for a run for a horse.
46. It might be got away from the township, perhaps a quarter of a mile? That would take the manse too far from the church.
47. Could not the site for the manse be got in a position convenient to the church, and another paddock some little distance away? That could be obtained easily enough; but it is easy to rent or obtain the use of a paddock.
48. *Mr. Stuart.*] What sum of money do you propose to expend in building a manse? We have not decided yet—no plan has been adopted.
49. *Mr. Macintosh.*] The Presbyterian minister of the district visits other charges, and would require horses? Yes.
50. So that it would be desirable to secure land for the run of his horses? There are paddocks near the town, but horses do not run in them, because there is not sufficient water. It would be easy to rent a paddock.
51. *Mr. F. B. Suttor.*] I suppose your intention is to spend far more on the building of the manse than will be realized from the sale of the piece of land you now have? Yes.
52. *Chairman.*] The property you propose to purchase will, when the manse is built upon it, be of more value than the allotment of land you now have in the town? Yes, it must be.
53. Is not the value of land all round Dubbo something like £10 or £12 an acre? It has brought as much as that anywhere close to the town.
54. I do not mean town land, but just round the town? Yes.

ON THE DUBBO PRESBYTERIAN MANSE TRUSTEES BILL.

7

55. *Mr. Macintosh.*] You believe that to give power to the Trustees of this land to sell would be to the advantage of the Presbyterian body in Dubbo? Yes, I do, very much so.
56. *Chairman.*] Who are the Committee you have spoken of? Members of the church.
57. This matter has been initiated by them? Yes, by the Committee of the congregation.
58. They applied, in the first instance, to the General Assembly, and then to the Trustees, to bring it about? Yes.
59. So that it is the wish of the Presbyterian body there to have this arrangement carried out? Yes.
60. There is no opposition at all? No; it is very much approved by all the members of the congregation.
61. *Chairman.*] In the preamble of the Bill there is a blank for the name of the church—is it known by any name? It is known as Saint Andrew's Presbyterian Church.

Mr. T. A.
Thompson.
29 April, 1875.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CHURCH AND SCHOOL ESTATES FUND.

Ordered by the Legislative Assembly to be printed, 5 August, 1875.

RETURN (*in part*) to an Order of the Honorable the Legislative Assembly of New South Wales, dated 2 June, 1874, That there be laid upon the Table of this House,—

A Return showing,—

- “(1.) The total area of Church and School Lands alienated prior to 31st December, 1873.
- “(2.) The total area of such lands still held under trust at that date.
- “(3.) The total proceeds per year derived from sales and leases of said lands since the year 1862.
- “(4.) The distribution of the said proceeds among the several Religious Denominations, specifying in each case whether for Church or School purposes, from the year 1862 to the 31st December, 1873.
- “(5.) The total area of land granted to each Religious Denomination as sites for Churches, Chapels, Parsonages, Glebes, Schools, or other Denominational purposes, since the passing of the ‘Grants for Public Worship Prohibition Act of 1862,’ down to the 31st December, 1873.
- “(6.) The total sums annually paid out of the Consolidated Revenue Fund for the support of Schools of each Religious Denomination during the same period.
- “(7.) The total sums annually paid out of the same Fund to Clergymen of each Religious Denomination as stipend or allowance for services rendered in the capacity of Chaplain to the Gaols, Asylums, or other Public Institutions, for the same period.
- “(8.) The total sums annually paid from the same Fund to Clergymen of each Denomination as stipend under Schedule C, during the same period.”

(*Mr. Stewart.*)

CHURCH AND SCHOOL ESTATES FUND.

No. 3.

RETURN showing the total proceeds each year derived from Sales and Leases of Church and School Lands, from the year 1862 to 31st December, 1873.

NOTE.—The information for the years 1862, 1863, and 1864 was furnished by the Auditor General.

The Treasury, New South Wales,
16th November, 1874.

F. KIRKPATRICK,
Accountant.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CONTAGIOUS DISEASES PREVENTION BILL.

(PETITION AGAINST—COMMITTEE OF PRIVILEGES OF THE WESLEYAN METHODIST CHURCH.)

Ordered by the Legislative Assembly to be printed, 29 June, 1875.

To the Honorable the Legislative Assembly of New South Wales.

The Memorial of the Committee of Privileges of the Wesleyan Methodist Church in New South Wales,—

HUMBLY SHOWETH :—

That your Memorialists entertain strong and conscientious objections on social, moral, and religious grounds to the Bill now before your Honorable House, entitled "*A Bill for the prevention of Contagious Diseases.*" Your Memorialists are aware of the various considerations based upon economical and sanitary grounds on which it is sought to justify such legislation as is now proposed, but they are convinced that the advantages anticipated by the advocates of this measure will not be realised, and that any benefits that might possibly accrue from such legislation would be more than counterbalanced by its essentially immoral character and tendency. Your Memorialists have reason to know that in England, where similar legislation has been in force for several years, there has been no diminution of disease, and that on the Continent of Europe, where such legislation has been in existence on a large scale for a lengthened period, the increase of disease and the moral and physical degeneracy that have ensued fully vindicate their convictions. Your Memorialists would refer your Honorable House to the testimony borne by Mr. Stansfield, M.P., in regard to the working of the English Contagious Diseases Acts: "These Acts have been in operation for eight years and the Royal Commissioners had reported that there was no evidence whatever presented to them that any diminution of disease had arisen from the system." Your Memorialists are of opinion that the cruelties necessarily attendant upon the working of such enactments as the one under consideration should lead your Honorable House to hesitate before introducing them to this colony. Founding their views on the principles of New Testament morality, your Memorialists hold that no argument drawn from supposed expediency can justify measures which offer immunity to offenders against the law of God, and thus smooth the path to ruin.

Your Memorialists therefore pray that your Honorable House will not consent to pass the second reading of the said Bill.

And your Memorialists, as in duty bound, will ever pray.

Signed on behalf of the Committee of Privileges of the Wesleyan Methodist Church.

SAMUEL WILKINSON,

President of the Conference.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CONTAGIOUS DISEASES PREVENTION BILL.

(PETITION AGAINST—ASSOCIATION FOR THE PROMOTION OF MORALITY.)

Ordered by the Legislative Assembly to be printed, 2 July, 1875.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the New South Wales Association for the promotion of Morality,—

RESPECTFULLY SHOWETH:—

1. That your Petitioners are an Association formed for the purpose of promoting Morality in this Colony.

2. That your Petitioners have had under their consideration a Bill now before your Honorable House entitled "A Bill for the Prevention of Contagious Diseases."

3. That your Petitioners regard the proposed Bill as one fraught with serious danger to the morals of the people of this Colony, inasmuch as, should it become law, it will have the effect of affording public sanction to a course of life which has hitherto been regarded as both sinful and criminal, of protecting those who pursue that course of life in their immoral practices, and of creating in the minds of the people at large a conviction that prostitution is both justifiable and expedient.

4. That your Petitioners are informed that a Royal Commission, appointed to inquire into the operation of similar Acts in England, passed in the years 1866-1869, the provisions of which Acts, however, extended on to certain garrison and naval towns, after sitting fifty-four days, examining eighty-five witnesses, and asking twenty thousand questions, amongst other results of this elaborate inquiry reported as follows, viz.:—"That there is no distinct evidence that any diminution of disease among the men of the Army and Navy, which may have taken place, is attributable to a diminution of disease contingent upon the system of periodical examination among the women with whom they have consorted."

5. That your Petitioners would further express their conviction that, whatever may be the supposed sanitary advantages of adopting such regulations as are proposed in the aforesaid Bill, nothing can possibly compensate for the disastrous effects which it must have upon the cause of virtue and good morals, or justify the superseding, upon grounds of human expediency, the principles of Divine Law.

6. That your Petitioners, therefore, pray that your Honorable House will withhold your sanction from the aforesaid Bill.

And your Petitioners will ever pray, &c.

For the Association,

F. SYDNEY,
President.

WILLIAM M. COWPER,
Vice-President.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CONTAGIOUS DISEASES PREVENTION BILL.

(PETITION AGAINST—PRESBYTERY OF SYDNEY.)

Ordered by the Legislative Assembly to be printed, 24 July, 1875, A.M.

To the Honorable the Legislative Assembly, in Parliament assembled.

The Petition of the Presbytery of Sydney,—

HUMBLY SHOWETH :—

That your Petitioners have viewed with alarm the Bill now before your Honorable House for the Prevention of Contagious Diseases.

That your Petitioners, after consideration of said Bill, object to it for the following reasons :—

1. It indirectly encourages prostitution.
2. It is partial and unfair towards fallen woman, and leaves out entirely the other sex, who are equally guilty of immorality, and who, because of vicious indulgence, are liable to contagious disease, and to spread said disease.
3. It is inadequate to prevent the spread of contagious disease, while it promotes indirectly the vice which occasions it.
4. It recognizes a class of persons as voluntarily submitting to examination for the very purpose of prostitution, and thus affords facilities for licentiousness and the corruption of youth.
5. It exposes virtuous women to insult on the part of officers suspecting them.
6. It makes no provision for suppressing the evil of prostitution.

For these reasons, your Petitioners pray your Honorable House not to pass said Bill into law. And your Petitioners will ever pray.

Signed in name and by authority of the Presbytery of Sydney, on this 22nd day of July, 1875,
by me,—

P. F. MACKENZIE, Moderator,
Minister of St. John's Presbyterian Church, Paddington.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PUBLIC VEHICLES REGULATION ACT REPEAL BILL.

(PETITION IN FAVOR OF—MAYOR AND ALDERMEN OF SYDNEY.)

Ordered by the Legislative Assembly to be printed, 6 May, 1875.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The humble Petition of the Mayor, Aldermen, and Citizens of the City of Sydney,—

MOST RESPECTFULLY SHOWETH :—

That a Bill is now under the consideration of Parliament, intituled “ *A Bill to repeal an Act intituled ‘ An Act to regulate Vehicles in the City and Suburbs of the Police District of Sydney.’* ”

That your Petitioners believe the working of the present Act for the regulation of Licensed Vehicles has been not only unsatisfactory to the general public, but that the passing of the said Act has deprived your Petitioners of a large amount of revenue to which they conceive they are fairly and equitably entitled.

Your Petitioners therefore humbly pray that the said Bill, now under the consideration of your Honorable House, may be passed into law.

And your Petitioners, as in duty bound, will ever pray.

(L.S.) B. PALMER,
Mayor.

The Common Seal of the Mayor, Aldermen, and Citizens of the City of Sydney, was affixed hereto by Charles Henry Woolcott, Town Clerk, of the City of Sydney, this fourth day of May, A.D. 1875,—

CHAS. H. WOOLCOTT,
Town Clerk.

1875.

NEW SOUTH WALES.

PUBLIC VEHICLES REGULATION ACT OF 1873.

(BY-LAW.)

Presented to Parliament, pursuant to Act 36 Vict. No. 14, sec. 15.

Colonial Secretary's Office,

Sydney, 21st July, 1875.

The following By-law, made by the Metropolitan Transit Commissioners, having been confirmed by His Excellency the Governor, with the advice of the Executive Council, is published in accordance with the provisions of the "Public Vehicles Regulation Act of 1873."

JOHN ROBERTSON.

THE Board of Metropolitan Transit Commissioners, constituted and empowered by the Public Vehicles Regulation Act of 1873, do, by virtue of the power and authority in them vested by the said Act, declare that the following Public Stands, as fixed and declared by Schedule H, under the By-laws now in force for regulating Licensed Vehicles, shall be and the same are hereby repealed.

Market-street, south side, from George to Pitt Streets, for 8 carriages.

Victoria-street, east side, at Upper William Street, for 10 carriages.

And it is hereby declared that the following places are appointed as Public Stands for carriages:—

Market-street, south side, from George to Pitt Streets, first carriage to stand in George-street, north of entrance to "Royal Hotel," for 8 carriages.

Victoria-street, west side, at Upper William Street, first four carriages to stand on the east side of Victoria-street, at William-street, for 20 carriages.

And it is also hereby declared that so much of the Time-tables as relates to the Omnibuses plying to and from Erskine-street, in the City of Sydney and Crescent-street, Newtown—Wynyard-square and Glebe Point—and Fort-street and Glebe,—shall be and the same are hereby repealed, and that the following Time-tables shall be adopted in lieu thereof.

Time-table for Omnibuses plying to and from Erskine-street and Crescent-street, Enmore.

Omnibuses shall start from the north side of Crescent-street, Enmore, for Erskine-street, Sydney:—

From 7.30 a.m. to 8 a.m., every ten minutes.
 „ 8 a.m. to 11 a.m., every five minutes.
 „ 11 a.m. to 4 p.m., every seven minutes.
 „ 4 p.m. to 8 p.m. every five minutes.
 „ 8 p.m. to 10.30 p.m. every ten minutes.

And each omnibus shall perform the journey to and from Crescent-street, Enmore, to Erskine-street, north side, at York-street, in 30 minutes, and the parts of the journey as follows:—

From Crescent-street to Newtown Toll-bar in 6 minutes.
 „ Newtown Toll-bar to Parramatta-street in 5 minutes.
 „ Newtown Road to Railway in 5 minutes.
 „ Railway to Liverpool-street in 5 minutes.
 „ Liverpool-street to Royal Hotel in 5 minutes.
 „ Royal Hotel to Erskine-street in 4 minutes.
 Erskine-street Stand 5 minutes.

From Erskine-street to Royal Hotel in 4 minutes.
 „ Royal Hotel to Liverpool-street in 5 minutes.
 „ Liverpool-street to Railway in 5 minutes.
 „ Railway to Newtown Road in 5 minutes.
 „ Parramatta-street to Newtown Toll-bar in 5 minutes.
 „ Newtown Toll-bar to Crescent-street, Enmore, in 6 minutes.
 „ Crescent-street to Stanmore Road in 5 minutes.

Time-table for Omnibuses plying to and from Wynyard-square and Glebe Point.

Omnibuses shall start from Glebe Point 100 yards from the Bay, for Wynyard-square, York-street, east side—

From 7.40 a.m. to 5 p.m., every ten minutes.
 „ 5 p.m. to 7 p.m., every five minutes.
 „ 7 p.m. to 10.30 p.m., every ten minutes.

And each omnibus shall perform the journey to and from Glebe Point to Wynyard-square in 30 minutes, and the parts of the journey as follows:—

From Glebe Point to Parramatta Road in 11 minutes.
 „ Parramatta Road to Railway in 5 minutes.
 „ Railway to Liverpool-street in 5 minutes.
 „ Liverpool-street to Royal Hotel in 5 minutes.
 „ Royal Hotel to Erskine-street in 4 minutes.
 Wynyard-square stand 5 minutes.

From Wynyard-square to Royal Hotel in 4 minutes.
 „ Royal Hotel to Liverpool-street in 5 minutes.
 „ Liverpool-street to Railway in 5 minutes.
 „ Railway to Glebe Road in 5 minutes.
 „ Parramatta Road to Glebe Point in 11 minutes.

Time-table for Omnibuses plying to and from Glebe and Fort-street, Miller's Point.

Omnibuses shall start from the centre of the Parramatta Road, at the Glebe Point Road, for Fort-street, Miller's Point—

From 7.40 a.m. to 11 p.m. every five minutes.

And each omnibus shall perform the journey to and from the Glebe to Fort-street, Miller's Point, in 30 minutes, and the parts of the journey as follows:—

From Glebe Point Road to Railway in 5 minutes.
 „ Railway to Liverpool-street in 5 minutes.
 „ Liverpool-street to Royal Hotel in 5 minutes.
 „ Royal Hotel to Essex-street in 5 minutes.

From Essex-street to Fort-street in 5 minutes.
 „ Fort-street to Kent-street in 5 minutes.
 „ Kent-street to Lower George Street in 5 minutes.
 „ Fort-street to Essex-street in 5 minutes.
 „ Essex-street to Royal Hotel in 5 minutes.
 „ Royal Hotel to Liverpool-street in 5 minutes.
 „ Liverpool-street to Railway in 5 minutes.
 „ Railway to Glebe Point Road in 5 minutes.

Passed by the Board of Metropolitan Transit Commissioners this seventeenth day of May, in the year of our Lord one thousand eight hundred and seventy-five.

B. PALMER,
 Chairman.

(L.S.) MICL. CHAPMAN,
 Commissioner.

EDMUND FOSBERY,
 Commissioner.

W. J. MERRIMAN,
 Registrar.

1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SHIPPING BUSINESS OF THE AGENT GENERAL.

(TELEGRAMS, &c.)

Ordered by the Legislative Assembly to be printed, 13 April, 1875.

PAPERS laid on the Table in answer to Mr. Buchanan's Questions.

No. 1.

TELEGRAM from THE COLONIAL SECRETARY, SYDNEY, to THE AGENT GENERAL, LONDON, 1st April, 1875.

How is shipping business of your office paid? What is the average cost per ton for management? What was the cost per ton under former arrangements? Who has charge of it, and how long has he had it? How much has he received in all from you, and is he allowed any perquisites from other parties? Have London ships of equal quality ever been rejected in favour of ships at out-ports, notwithstanding willingness to take lower rates?

No. 2.

TELEGRAM from THE SECRETARY TO THE AGENT GENERAL IN LONDON to THE COLONIAL SECRETARY.
Received, 7 April, 1875.

NOTHING paid now for shipping business, except Liverpool shipments, for which (1) Goffey receives 6d. per ton. These shipments unimportant, and will soon cease. Under former arrangement Shipping Clerk received (2) £200 per annum, but since July, 1873, B. F. Lloyd and Company have conducted shipping business, except Liverpool—they received nothing (3) from Agent General, but doubtless get commission from owners; this, however, is a trade allowance—which Government could not obtain, nor could Agent General, either personally or through Shipping Clerk, make such favourable terms as an experienced Shipping Agent, who knows the state of the market generally for dead weight. Agent General advertises at Jerusalem and Lloyd's Rooms, inviting owners to apply direct to him for freight, and Lloyd quotes survey available. Ship for approval of Agent General. London freights have been kept down to 20s., and no ships at or under this rate have ever been rejected. Ships at ports in north have been charter (4) for whole cargoes at average rate of 27s. 6d., but this increase has been compensated by reduced contractors' rates for delivery in north. Chartering absolutely necessary to meet requirements of rail contracts. (See letters to Public Works, 29 June, 30 October, 17 November last.) Chartering has also assisted to keep down ordinary freight, which has been 25s. to 30s. for merchants' iron, when we have been paying 20s. Consider than (5) Lloyd has assisted to carry out our very heavy shipments—sometimes over 4,000 tons in a month—most satisfactorily and economically. Copper (6) still forbidden word, (7) have therefore been unable to submit your telegram to him. Major Roberts could explain history and working of post (8) and present arrangements.

See copies of these letters appended to this paper.

1. Major Roberts says Goffey & Co. are Shipping Agents at Liverpool, and were responsible for the goods.

2. £200.

3. Major Roberts says B. F. Lloyd & Co. obtain tenders from shipowners or charterers, and submit them to Agent General. The goods are shipped to contractors thereof, who do not obtain payment until bills of lading are produced. Major Roberts believes there is no written agreement.

4. Evidently means "chartered."

5. Evidently "that."

6. Doubtless means "Sir Charles Cowper."

7. Evidently means "work."

8. Evidently means "past."

(Letters referred to in preceding Telegram.)

The Agent General to The Secretary for Public Works.

London, 3, Westminster Chambers, S.W.,
29 June, 1874.

Sir,

With reference to telegram dated 6th June, 1874 ("observe specification strictly packing fish-plates"), I have the honor to explain the circumstances under which the deviation presumed to be referred to was made.

The Darlington Iron Company advised seventy tons of fish-plates as ready for shipment last February. A very favourable engagement was made to send them by the "Tethys," at 12s. 6d., provided that they could be shipped *at once*. There was no time to prepare the boxes and pack the fish-plates, and after due consideration, having ascertained that it was most unusual to furnish packing, I sent them in bundles, in order to secure the ship. A reduction of 11s. was made on the contract rate, in consideration of the boxes not being supplied.

In all other shipments of fish-plates the provisions of the specification have been strictly adhered to.

It may be for your consideration, however, whether it is necessary to continue the system of packing. I understand that, as a rule, fish-plates are sent to all parts of the world, tied in bundles and oiled. If boxes were dispensed with, we should save about £1 per ton on the contract rate, besides a reduction on the amount of freight. The state in which the fish-plates shipped by the "Tethys" were received in Sydney will have enabled you to judge of the necessity of packing; and should you think that it may be dispensed with, I will arrange accordingly on receiving your instructions.

I have, &c.,

CHARLES COWPER.

Captain Jopp to The Secretary for Public Works.

3 Westminster Chambers, S.W.,
30 October, 1874.

Sir,

I have the honor to advise the shipment in the chartered ship "Duchess of Argyle," (referred to in telegram to Chief Secretary, dated 24th July last), of 11,077 rails, weighing 2,400 tons 1 cwt. 1 qr., from the Consett Iron Company, for the Yass to Wagga Wagga extension. Five invoices and corresponding bills of lading, together with copy of charter-party and receipt of owners for proportion of freight payable here, are enclosed herewith.

You will observe that the rate of freight is 30s., but that a deduction of 10s. has been made on the Consett Company's rate, consequent on the shipment having been at Newcastle instead of London. This reduces the actual cost, as compared with the average payment of 20s. for ships in London on the berth, to 20s. *plus* about 3s. per ton for the higher rate of insurance for a full cargo of rails,—a comparison which must be regarded as very favourable, considering the additional expenditure which must be anticipated when it becomes necessary to charter.

One-third of the freight, less 5 per cent. for three months, has been paid here, the remaining two-thirds net (£2,400 1s. 3d.) being payable in Sydney, in terms of the charter-party.

We have also now in course of shipment at Sunderland 1,700 tons of Consett rails in the "Arizona," at same freight and same deduction by the Company as for the "Duchess of Argyle"; and at Newcastle we are shipping in the "Ravenstonedale" for Newcastle, New South Wales, 1,400 tons of rails, fish-plates, and fastenings, under the Murrurundi to Tamworth contracts, at the very favourable rate of 25s., and with deductions by the contractors for the rails and fish-plates.

As indicated in Sir Charles Cowper's despatch, No. 160, of 29 June last, it is only by such arrangements as the above that we can hope to meet the heavy shipments which must be negotiated during the next few months.

In engaging freight to Newcastle, New South Wales, it is sometimes necessary to pay rather higher than to Sydney, but in cases where it would be requisite for you, if the materials were sent to Sydney, to send them on to Newcastle, the apparent increase of cost involved by our shipping direct to Newcastle would disappear; and in order to estimate this it would be convenient if we could be informed by telegram, if thought sufficiently important, what is your average rate from Sydney to Newcastle.

I have, &c.,

A. A. JOPP, Captain, R.E.,
(For Agent General.)

Captain Jopp to The Secretary for Public Works.

London, 3 Westminster Chambers, S.W.,
17 November, 1874.

(No. 191.)

Sir,

With reference to your letter, No. 74/4544, of 3rd September last, covering indent for 25 tons double-headed *iron* rails, to be ordered from the Landore Siemens-Steel Company, to replace rails lent to Messrs. Beilby & Scott, of Sydney, I have the honor to enclose copy of letter, dated 30th October, 1874, from the Managing Director of the Landore Company, stating that they cannot quote for iron rails. I also enclose copy of report, dated 4th November, 1874, from Mr. Shields, in consequence of which (having previously ascertained verbally his opinion) I telegraphed on the 3rd November to the Chief Secretary,—“Landore cannot supply iron rails, propose ordering 25 tons steel.”

I have communicated with Messrs. Scott & Archer, and they concur in the arrangement proposed. I will, therefore, order the 25 tons in steel, and as the Landore Siemens Company have also an order for 1,000 tons of steel rails of the same pattern, we shall obtain the 25 tons at the favourable rate of £11.7s. 6d. if shipped at Swansea, and £12 if shipped in London.

I have, &c.,

A. A. JOPP, Captain, R.E.,
(For Agent General.)

D.

D. M. Gordon, Esq., to Captain Jopp.
 Landore Siemens-Steel Company (Limited),
 Landore, Swansea, 30 October, 1874.

Dear Sir,

In reply to yours of yesterday, regarding 25 tons of iron rails, I regret that, as we work in steel only, I cannot quote for those required.

Yours, &c.,
 D. M. GORDON,
 Managing Director.

F. W. Shields, Esq., to The Agent General.
 6 Delahay-street, Westminster, S.W.,
 4 November, 1874.
 New South Wales Railways.

Dear Sir,

As requested by Captain Jopp's letter of 2nd instant, I beg to report on letter of 30th ultimo, from Landore Siemens-Steel Co., stating that they are unable to quote for the 25 tons of double-headed iron rails named in the indent enclosed in Mr. Rae's letter dated Sydney, 3rd September, 1874.

As it is quite impracticable to make, at any moderate cost in proportion to the amount of the contract, the preliminary arrangements for rolling so very small a quantity of iron rails, and as it appears that these rails are to be of the same section as the 200 and 800 tons of steel rails now also required from the Landore Co., I would recommend that 25 tons of steel rails instead of iron be obtained from the Landore Siemens Co., in conjunction with the two larger orders to be supplied by them as above mentioned.

I am, &c.,
 F. W. SHIELDS.

1875.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

TRIGONOMETRICAL SURVEY.

(COST AND CALCULATIONS, &c.)

Ordered by the Legislative Assembly to be printed, 21 April, 1875.

RETURN containing information asked for in the Assembly on the 20th April, 1875, by Mr. Bawden, M.L.A., laid on the Table of the House in accordance with the reply given by the Minister for Lands to Mr. Bawden's questions.

TUESDAY, 20 APRIL, 1875.

*Question:—*MR. BAWDEN *to ask* THE SECRETARY FOR LANDS,—

- (1.) What has been the total expenditure, to the 1st January, 1875, in connection with the operations in the Trigonometrical Survey of the Colony?
- (2.) What amount of work has been executed in the measurement of Base-line and Triangulation?
- (3.) What number of Trigonometrical Stations have been completed?
- (4.) What is the probable cost for Skeleton Survey of the Colony, at per acre, including field and office expenses?
- (5.) What is the probable maximum error at per mile?
- (6.) Has the Government taken any steps in verifying the Surveyor's computations of the Base-line, mathematical or otherwise?
- (7.) If so, will the report containing the result of such inquiry be laid upon the Table of this House, and when?

*Question.**Answer.*

No. 1.

"What has been the total expenditure, to the 1st January, 1875, in connection with the operations in the Trigonometrical Survey of the Colony?"

Base-line, Lake George—	£	s.	d.
Under Mr. Smalley	2,500	0	0
Under Surveyor General, since September, 1870	2,384	1	4
Base-line, Pymont	100	19	0
Triangulation.			
General Triangulation of the Colony	3,831	3	2
Triangulation of Sydney Harbour and Environs	716	1	9
	£9,532	5	3

The amount includes preliminary expenses in equipment, horses, plant, and instruments; one instrument alone costing £700.

Question.

"What amount of work has been executed in the measurement of Base-line and Triangulation?"

Answer.

No. 2.

Base-line measured, and towers built.

In pursuance of the Triangulation of the Colony, hills have been cleared and stations selected thereon, commencing on the Victorian boundary at Albury, thence north, crossing the Murrumbidgee, then east by Bowning to Lake George, from Bowning north to the Canobolas (near Orange), thence east to Mount York and Binda. This series, when completed, will end on the coast near Sydney.

From Lake George to Jellore (Nattai), this series will, when completed, terminate at the Sydney Observatory.

From Lake George north to Bathurst, excepting a break on the table-land about Crookwell. In consequence of this difficulty, which could not be overcome without great expenditure, it was determined to adopt the series above referred to, extending from Bowning to the Canobolas; the hills cleared in the broken series will however be available for detail hereafter.

Primary Triangulation of Sydney Harbour and environs completed from Ball's Head to head of Darling Harbour, and downwards to Dobroyd Hill and lower Light House.

Detail Triangulation of the whole Harbour frontage is complete as far as Ball's Head, excepting Darling Point to Shark Point, Glebe Island to A. S. N. Company's Works, Pyrmont, and North Shore, from Kiarabilli Point to Heads, affording a basis for twelve sheets of the large scale maps.

No. 3.

"What number of Trigonometrical Stations have been completed?"

Not more than six 1st class and twelve 3rd class stations can be said to be completed, as the beacons will not be put up till the observation of angles commences, which work has been in abeyance for more than twelve months, awaiting the arrival of the large Theodolite ordered from Europe early in 1873.

Ninety-six hills have been cleared, and sites for stations selected, besides a number partially cleared for sights only.

In Sydney Harbour and environs seventy-three stations and one hundred and thirty intersecctions.

No. 4.

"What is the probable cost for Skeleton Survey of the Colony, at per acre, including field and office expenses?"

Estimated at £227,000, to extend over twenty-seven years, and apply to all parts of the Colony suitable to trigonometrical operations.

No. 5.

"What is the probable maximum error per mile?"

With the 18-inch theodolite, $\frac{1}{2}$ an inch—with the 10 inch theodolite, 1 inch. In detail work with smaller instruments the error should not exceed from 4 to 6 inches per mile, but the amount of accuracy obtainable is simply a question of the time devoted to observing at each station, and this will depend very much upon the climate.

No. 6.

"Has the Government taken any steps in verifying the Surveyor's computations of the Base-line, mathematical or otherwise?"

Yes.

No. 7.

"If so, will the report containing the result of such enquiry be laid upon the Table of this House, and when?"

Copy of Mr. Hawkins' report, with the memo. which led to it, herewith.

A report is expected shortly from the Surveyor General, embracing the whole subject from the commencement of Triangulation in the colony up to the present.

INVESTIGATION OF COMPUTATION OF BASE-LINE.

MEMO. :—The measurement of the base-line at Lake George being now complete, and the computations performed as well as the Surveyors who made the measurement could perform them, it is now suggested that the data upon which these computations are based should be placed in the hands of some person totally independent of the work, and perhaps of the Department also, for the recalculation of the work. I may observe that Mr. Clarke, of the London, Liverpool, and Globe Insurance Company, was employed on a previous occasion to re-compute a portion of the line—afterwards abandoned—and I was much pleased at the care and ability displayed by him; but I would prefer leaving the choice of the person to the Honorable the Minister for Lands. The Government Astronomer is perhaps best qualified, but I would point out that he has been already appointed to the computation of the triangulation; and the same objection would now apply to him as to a member of my Department.

Surveyor General's Office,
16th June, 1874.

P. F. ADAMS.

The Under Secretary for Lands,—I would suggest the name of Mr. Hawkins as computer, provided the Surveyor General has no objection.—J.S.F., 20/6/74. I believe Mr. Hawkins to be thoroughly qualified for the duty.—P.F.A. To be appointed.—J.S.F., 24/6/74.

H. S. HAWKINS, Esq., to THE SECRETARY FOR LANDS.

SIR,

I have carefully checked the calculations made in connection with the base-line at Lake George; and having recomputed the whole on a principle which, in some respects, differs from that applied by the Surveyor General, I have the honor to report that the results agree very closely, since for five of the seven sections they may practically be considered identical, whilst the lengths which I obtain for sections III and VI are respectively about one-seventh of an inch less, and greater than those deduced from the Survey Office calculations; so that, in the whole length of a little more than $5\frac{1}{2}$ miles, the difference between the two results is less than a twenty-fifth part of an inch.

This being premised, I proceed to explain the nature of the difference between the principles adopted by the Surveyor General and myself in applying the data on which the computations are based, and to make the explanation intelligible, I must first briefly describe the process of measurement and the implements used.

The whole line, 29,286 feet in length, was divided into seven sections, of which six, varying in length from 2,132 to 8,938 feet, were measured and re-measured in the opposite direction, whilst the seventh, 570 feet long, was calculated from a short base-line, measured for the purpose. Each of the other sections was subdivided into portions of about 700 feet (the average day's work), which were twice measured with a set of rods, the aggregate length of which is about 30 feet, and the two results were compared.

The very small discrepancies between the lengths thus found constitute what, for the sake of brevity, I shall throughout this report term "errors."

The rods are made of well seasoned pine; and their length can at any time be ascertained with very great precision, by comparing them with a standard iron bar, provided that the coefficient of expansion of the latter for a given change of temperature is known. If, therefore, their variation between any two comparisons were uniform, their exact length at any stage of the measurement would be known, and the only difficulty would be one of a purely mechanical nature.

It is, however, found that their irregularities are so great that in the absence of any known law or rate of their variation recourse must be had to some method of interpolation to obtain their mean lengths during the day.

Accordingly the Surveyor General naturally assumed that the arithmetic mean between the results of two comparisons of the rods with the standard bar must be taken as this mean value, and this I have also adopted wherever two comparisons were made on the same day. This was done throughout four sections; and with such care was the measurement performed by Messrs. Betts and Vessey, that the greatest error is $\frac{1}{15}$ of an inch in 750 feet, or $\frac{1}{11250}$ part of that length, whilst the average error in these sections is not more than one-third of this, a result which I believe has rarely, if ever, been surpassed.

For the six measurements of the other three sections, which were first dealt with, as the necessity of making comparisons at the beginning and end of each day's work had not then been recognized, in only one case was this done throughout, there being in the other five cases but one comparison, either in the morning or the evening; whilst for six lengths none were made on the days when the measurement was performed. In these three sections therefore the errors are proportionately larger than in the other four, and are greatest in the last-named six cases; but even here the greatest is but $\frac{1}{32}$ of an inch in 1,500 feet.

In the hope of diminishing these discrepancies I applied two different kinds of arithmetical interpolation, and afterwards, finding that in every instance which had come under my observation there was an increase in the length of the rods during the day, I collected all the double comparisons made during the measurement of the line, and thus found the daily increase of the set for each month. This was very irregular, and was greatest in March, when it was more than double the average of the other months. From these data I deduced formulae for the approximate corrections for single comparisons, depending in the first instance on the monthly variations, and next, on the daily change of temperature of the rods.

With respect to these four methods, it is only necessary to state that each considerably diminished some of the errors, but increased others; whilst the difference between the extreme values thus obtained for the length of the line was less than one-fifth of an inch—a result which supplies an independent proof of the extreme accuracy of the measurement.

Ultimately

Ultimately I came to the conclusion that as the rods do not vary according to any known law, and exhibit no trace of regularity in their daily or monthly changes, the most legitimate correction for single comparisons must depend on the mean daily increase of the set, as deduced from those double comparisons only which were made during the measurement of the three sections in which it was to be applied.

By tabulating these I obtained '0062202 of an inch for the value of this correction, half of which must be added or subtracted according as the comparison was made in the morning or evening, to obtain the mean lengths during the day, whilst for those days on which no comparison was made the mean of the two nearest values thus found is used.

By the application of this principle to sections II, III, and VI, the sum of all the errors, irrespective of sign and the limit of probable error are diminished in each case—the former, on the average, by about 15 per cent., and the latter by 20 per cent.; so that the lengths thus found are probably nearer the truth than those given by any other method.

The difference of the results found by the Surveyor General and myself is accounted for as follows:—In the measurement of section III the majority of the comparisons were made in the evening; so that the average length of the rods during the day being less than the observed values, the length found from the corrected values is also less, the difference being '144 of an inch; whilst in section VI the length thus found is increased by '135 of an inch, since most of the comparisons were made in the morning. These corrections are nearly equal, numerically, but of opposite signs; so that the length which I obtain for the whole line, or 29236 066 feet, differs from that found by the Surveyor General by so small a quantity that, when expressed in feet, it does not amount to a significant digit in the seventh plan of figures.

Finally, I have calculated the probable limit of error in each section, and find that it is an even chance that in the whole length of 5½ miles there is not an error of three-quarters of an inch; also, that is 13'1, that it does not amount to 2 inches.

The tabulated double comparisons from which the average daily increase of the set of rods is deduced are appended, together with the lengths of the several sections, as calculated by the Surveyor General and myself, with the corresponding limits of error.

I have, &c.,

H. S. HAWKINS, M.A., F.I.A.

Balmain, Oct., 17/74.

Submitted, 5 November. I have perused this paper with very great pleasure. The results are highly satisfactory.—J.S.F., 10/11/74. The Surveyor General.—W.W.S., B.C., 11 Nov., 1874.

1875.

NEW SOUTH WALES.

VACCINATION.

(REPORT FOR 1874.)

Presented to Parliament by Command.

THE ACTING MEDICAL ADVISER TO THE GOVERNMENT TO THE COLONIAL SECRETARY.

Medical Adviser's Office.

SIR,

I have the honor to forward the Annual Report of Vaccinations performed by the Public Vaccinators of the Colony during the year 1874.

From the Returns appended it appears that 826 children have been vaccinated successfully in the Country Districts under one year of age, 1,581 from one to five years, and 828 from five to ten years.

In Sydney and the Suburbs 492 children have been successfully vaccinated under one year, 827 from one to five years, and 239 from five to ten years. The total numbers of successful vaccinations being,—

For the Country Districts	3,274
For Sydney and Suburbs	1,558
And for the whole Colony	4,832

I have carefully examined the existing statistics of the Colony with the view of ascertaining if possible the proportion of its inhabitants who have not been vaccinated, but am quite unable to arrive at reliable and satisfactory conclusions.

The subject of re-vaccination is one of the highest importance, and I have thought it desirable to append the published remarks in reference to it, recently issued by the "Medical Department of the Privy Council Office."

Considering the important bearing of these questions upon the health of the community, I have to recommend that, when the next Census is taken, inquiries should be made to ascertain how many of the existing population have been vaccinated, and how many re-vaccinated.

Until this has been done, it will be impossible to arrive at definite conclusions upon which alone it is safe to legislate with the view of rendering "public vaccination effective."

The suggestion made by the Medical Adviser to the Government, in his last Report, has been carried out by the Government, through the Agent General in London, and a small supply of vaccine lymph will in future be forwarded from the National Vaccine Institution in addition to the usual supply sent out by every alternate mail.

In the correspondence between the Agent General, Dr. Seaton, of the National Vaccine Institution, and Dr. Marsdon, of the London Small-pox Hospital, the two latter gentlemen strongly urge that medical men should depend as much as possible upon arm to arm vaccination, and in fact "never use preserved lymph when they can help it."

This is most valuable advice, but it necessitates the establishment of larger vaccination districts than at present exist.

I have, &c.,

ALFRED ROBERTS,
Acting Medical Adviser.

APPENDIX.

Medical Department of the Privy Council Office.

RE-VACCINATION.

By vaccination in infancy, if thoroughly well performed and successful, most people are completely insured for their whole life-time against an attack of small-pox; and in the proportionately few cases where the protection is less complete, small-pox, if it be caught, will, in consequence of the vaccination, generally be so mild a disease as not to threaten death or disfigurement. If, however, the vaccination in early life have been but imperfectly performed, or have, from any other cause, been but imperfectly successful, the protection against small-pox is much less satisfactory; neither lasting so long, nor while it lasts, being nearly so complete, as the protection which first-rate vaccination gives. Hitherto, unfortunately, there has always been a very large amount of imperfect vaccination, and in consequence the population always contains very many persons who, though nominally vaccinated, and believing themselves to be protected against small-pox, are really liable to infection, and may in some cases contract as severe forms of small-pox as if they had never been vaccinated. Partly because of the existence of this large number of imperfectly vaccinated persons, and partly because also even the best infantine vaccination sometimes in process of time loses more or less of its effect, it is advisable that all persons who have been vaccinated in infancy should as they approach adult life undergo re-vaccination.

Generally speaking, the best time of life for re-vaccination is about the time when growth is completing itself, say from fifteen to eighteen years of age, and persons in that period of life ought not to delay their re-vaccination till times when there shall be special alarms of small-pox. In proportion, however, as there is prevalence of small-pox in any neighbourhood, or as individuals are from personal circumstances likely to meet cases of infection, the age of fifteen need not be waited for, especially not by young persons whose marks of previous vaccination are unsatisfactory. In circumstances of special danger, every one past childhood, on whom re-vaccination has not before been successfully performed, ought, without delay, to be re-vaccinated. Re-vaccination, once properly and successfully performed, does not appear ever to require repetition. The nurses and other servants of the Small-pox Hospital when they enter the service (unless it is certain that they have already had small-pox) are invariably submitted to vaccination, which, in their case, is generally re-vaccination, and is never afterwards repeated; and so perfect is the protection, that though the nurses live in the closest and most constant attendance on small-pox patients, and though also the other servants are in various ways exposed to special chances of infection, the resident Surgeon of the Hospital, during his thirty-four years of office there, has never known small-pox affect any one of these nurses or servants.

Legal provisions for re-vaccination are made in the 8th section of the Vaccination Act, 1867, and in section IV of the Regulations which the Lords of the Council, under authority of the Act issued in their order of February 18th, 1868.

Under these provisions re-vaccination is now performed by all Public Vaccinators at their respective stations, and so far as is not inconsistent with the more imperative claims for primary vaccination, any person who ought to be re-vaccinated may, on applying to the public station of the District in which he resides, obtain re-vaccination at the public expense.
