WEDNESDAY, 3 SEPTEMBER, 1884.

Wresent:—

MR. CHAPMAN, MR. FLETCHER,

MR. GARRARD, MR. POOLE,

MR. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

Charles Augustus Goodchap, Esquire, Commissioner for Railways, called in and examined:—

Çhas. A Goodchap, Esq.

3 Sept., 1884.

578. Chairman.] Do you remember writing a minute of the 2nd April, 1883, with regard to dump-cars? \mathbf{Y} es.

579. You say in that minute: "I have received from America some papers on the newly patented dumpcars in use there." Can you inform the Committee from whom you received those papers? I rather fancy this (paper produced) is the paper I received.

580. Who is it from? Well, I really could not tell you who it is from.

581. Can you inform the Committee who brought the matter under your notice first? I rather think it was Mr. Carson Woods.

582. Do you know Mr. Carson Woods' agent there? I do not.
583. Will you kindly look at number two of the printed papers—a letter from Mr. J. C. Dibbs in regard to these dump-cars? Yes, he writes as agent for the patentee, I see.
584. Who is the patentee? I do not know who the patentee is. There is a paper signed by Albert F. Sayers, general agent for the United States Car Company, and he says he is the agent—I presume the agent for the patentee.

agent for the patentee.
585. I find that Mr. J. C. Dibbs has written several letters in regard to this dump-car;—did you consider him the agent? I did; he signed himself as agent.
586. But you cannot say whether he first directed your attention to the dump-cars? No, I do not think he did. Either the papers came to me without any letter, or else Carson Woods brought the matter under my attention. I know he was bringing a lot of things under my attention at that time. He said he had travelled in America with the object of bringing under the attention of railway managers in Australia several inventions which he thought would be useful to the traffic on our lines; but I cannot be positive that he brought these cars under my notice.

be positive that he brought these cars under my notice.

587. The reason I ask you is that Mr. Dibbs' letter is dated the 2nd of April, and your minute is dated the 2nd of April? I see this is a letter of the 2nd April, 1883, forwarding "plans, photographs, and particulars of the latest improvement in America for the economical working of Railways in the United States Company's Screw Lever Dump and Coal Car." I should think I received these papers in that way

from Mr. Dibbs.

From Mr. Didds.

588. You think it must have been Mr. Didds, as agent for the patentee, who first brought this car under your attention? I really cannot say positively. It is evident he did by his letter of the 2nd April, bring this car under my attention, and that on the 2nd April I sent off some papers "on the newly patented dump-cars" to the Traffic Manager; whether they are the same I could not tell you, but I think very likely they are. It would be in accordance with my custom, if I got such a letter, to write across it, "Refer to traffic manager." In this case I should have probably written across the letter in that way; so that I force I might have get them from some other source. that I fancy I might have got them from some other source.

589. Did you refer these papers to the Traffic Manager for report? Yes.
590. What did you wish the Traffic Manager to report particularly on, with regard to these dump-cars?

Whether he could make effective use of them. 591. In working the traffic? In working the In working the traffic. I should do that pro forma, forming my own

judgment as to the value of these cars. 592. It is usual, of course, to forward all such papers to the Traffic Manager? Yes, to get his views

and opinions about them.
593. Do you look upon him as the officer responsible for letting you know what rolling stock is required?

594. Did you consider his report satisfactory? The report seemed to me to indicate that a profitable use

594. Did you consider his report satisfactory? The report seemed to me to indicate that a profitable use could be made of such cars; and so far it confirmed my own opinion upon the matter. If I may be permitted to make this suggestion, I should like my examination not to be restricted altogether to replies to interrogatories; but that I may be permitted to offer explanations in addition.
595. We are only too glad to receive any information on the subject? I should like to say, in connection with this matter, that the question of the tare and carrying capacity of our rolling stock had for several years prior to this received the greatest attention at my hands. I had from time to time brought the matter under the attention of the Minister, and pointed out how necessary it was that, when lines were constructed as our lines were, the greatest attention should be paid to the necessity of obtaining rolling stock which, while it would be strong and durable, would embrace the great desideratum of light tare

tare with full carrying power. Mr. Sutherland, when Minister for Works, devoted considerable attention to the matter, and impressed upon me from time to time the necessity of seeing that it was effectively carried out. I called several times upon the officers, whose duty it was to design rolling stock, with that view, and in my instructions to Mr. Scott, when visiting England and America—instructions issued on the 3 Sept., 1884. 15th June, 1882, fully six months before this particular truck was brought under my attention—I made use of these words:—"The importance in the economical working of railways, of the reduction of the tare of vehicles, and the increase of their carrying capacity, cannot be over estimated, and I wish Mr. Scott to direct his inquiries into this matter, especially in America, where the subject has received and is receiving so much attention. There has been recently patented there a design for carrying grain in cylinders, which are made to run on the rails without any framing; the heads of the cylinders are flanged and used as wheels. In view of the prospective increase of grain cultivation in this Colony for home consumption, and even for exportation, it is essential that every means should be sought to give cheap carriage to the seaport; and one of the greatest aids to this object will be to obtain rolling stock which embraces large carrying capacity with comparatively light tare." Well, that being my aim and my constant care, I was well pleased to find that in this car, which had been brought under my attention, there was a vehicle which, while it possessed the qualifications I had insisted upon, seemed in every way durable and strong. engineer officers who reported upon it took no exception to it on the latter score; and I found that, while it weighed only some 9 tons 17 cwt., it carried 20 tons. Alongside of that car, when I went to visit it at Darling Harbour, was another car, designed by the engineer officers of the Railway Department. Notwithstanding the repeated applications I had made to these gentlemen to give attention to this matter, in designing cars, I found that this G car, which seemed to be, mutatis mutandis, the counterpart of the dump-car, weighed 12 tons, and was designed to carry only 10 tons. I had to write then a rather severe minute to these officers, pointing out the utter disregard they seemed to have paid to my directions in

596. Have you a copy of that minute? I will furnish a copy to the Committee, if desired. Well, it seemed to me that a car of that description, without reference to its dumping appliances, although that seemed to me a very useful arrangement, and one that could be brought into operation when the necessary provision had been made for using it, would be of great service. At that time there was considerable public outcry respecting the inconvenience which producers and others in the country—people sending gravel from Penrith, coal from Lithgow, firewood consignors—suffered from the great want of trucks; gravel from Penrith, coal from Lithgow, nrewood consignors—sunered from the great wall of and in reply to my inquiries as to how it was so many trucks were required for locomotive purposes—for there were some two or three hundred devoted to this purpose—I found they were really being used as goal stages, because there was so much delay in getting them unloaded on to the stages. I then thought coal stages, because there was so much delay in getting them unloaded on to the stages. I then thought that apart from their merit as large carrying vehicles these dump-cars would be specially suitable for carrying the locomotive coal; and in pursuance of that idea I determined—subject, of course, to the higher approval which I always seek, the approval of the Minister,—to have the coal stages of the new works at Eveleigh, and the coal stages at Lithgow, so constructed as to be available for this special purpose of unloading coal by means of the dump-car. I asked, in view of my coming before this Committee, to have a plan drawn of the proposed coal stage at Eveleigh, showing in what way the coal truck would come up on the high level, discharge its coal on to the lower level, for the supply of the engines by means of smaller trucks. (Sketch handed in. See separate Appendix 1.). I would like to point out to the Committee how important it is to the effective management of railways that attention should be given to this subject of light tare and large capacity. A train of I would like to point out to the Committee how important it is to the effective management of railways that attention should be given to this subject of light tare and large capacity. A train of fourteen D waggons is considered sufficient for an engine to haul on our mountain grades and curves. The weight of a D waggon is 4 tons 13 cwt., and it will carry 6 tons of coal, which gives a gross weight in a train load of 149 tons 2 cwt., and allowing the tare 65 tons 2 cwt., gives an actual weight of 84 tons of coal. It will thus take (say) eleven trains of D waggons to haul 1,000 tons of coal, at a cost of £24 16s. per train, for the journey between Penrith and Lithgow. 70,000 tons of coal are annually required, and to bring this down 770 trains are necessary, and this represents a total cost of £19,096. With a train of dump-cars seven vehicles can be hauled, and these seven vehicles will carry 140 tons, or say seven trains for each 1 000 tons of coal. say seven trains for each 1,000 tons of coal. 490 trains will therefore be required to haul 70,000 tons, say seven trains for each 1,000 tons of coal. 490 trains will therefore be required to haul 70,000 tons, and, at £24 16s. per train, will cost £12,152, as against £19,096 in D waggons, thus showing a saving of £6,944. The weight of a D truck is 4 tons 13 cwt. = 4 65, and this divided by 6 tons, the weight of coal in a waggon, gives 0.775 the weight of waggon for every ton of coal hauled. For 1 ton of coal the gross load is therefore 1.775. The weight of a dump-car is 9 tons 17 cwt. = 9 85, and this divided by 20 tons, the weight of coal in it, gives 0.492 as the weight of waggon for every ton of coal hauled. For 1 ton of coal the gross load is therefore 1.492. With 70,000 tons of coal to be hauled in the year, we have with D waggons a gross haulage of 124,250 tons. With the use of dump-cars the gross haulage would only amount to 104,440, or an absolute saving of 19,810 tons, and this 19,810 tons represents a saving of no fewer than 132 trains of D waggons in the year. The wear and tear on the permanent way is no inconsiderable. than 132 trains of D waggons in the year. The wear and tear on the permanent way is no inconsiderable item in this matter. A train load of 84 tons of coal in D waggons represents the rolling of twenty-eight pairs of wheels, whereas the number of wheels over which 84 tons will roll in dump-cars is only sixteen pairs. There must consequently be very much less friction on the rails, and the saving in wear and tear must be a large item. It has also to be taken into account that there is less frictional resistance presented by the bogic form of carriage in the dump-cars, which reduces the power to be exerted by the engines in working on our sharp curves as compared with the same load in D trucks, which are without bogics. There will be a considerable saving in the numbers of waggon stock on the lines, because to haul the 70,000 tons of coal 11,666 D waggons would be occupied, while the same weight could be carried in 2,500 rehicles of the damp pattern. 70,000 tons of coal II,666 D waggons would be occupied, while the same weight could be carried in 3,500 vehicles of the dump pattern. A very material point is the difference in the expenditure of capital in rolling stock. The cost of seven D waggons, which will convey no more than two dump-cars, is £819, as against £380, the cost of two dump-cars. Then I should like to draw the attention of the Committee to the economy in the working of such trucks, besides the benefit they give in bringing a larger quantity of coal in fewer trains. The rails are not run over to the same extent, there are not so many wheels, there is not so much friction on the line, the whole rolling-stock is eased considerably, and the permanent way is not used to the same extent. Economy, by the adoption of such a system as that comes in on every side. A railway manager looking to the railway the adoption of such a system as that, comes in on every side. A railway manager, looking to the railway as a public benefit, does not alone think of the saving which will be effected to the Department; he has to look wider than that—to the saving which can be effected to the public who use the railways; for if the coal and the grain of the country, as I have said in my instructions to Mr. Scott-if all these things can

Chas. A. Goodchap, Esq. 3 Sept., 1884.

be brought to market at a cheaper rate, the country will get the benefit—(if the interests of the country can be separated from those of the Department)—the producers themselves will get the benefit of it. could see, at the time that these light cars with large carrying capacity were brought under our attention, that we had at last secured, apparently, a vehicle which was specially suitable to the requirements of our heavily-graded lines—that the principle contained in their design was a principle which I had long sought for, and which I knew a Minister of the Crown, who had taken an interest in these matters, had long looked for as a solution of the difficulty the Department had experienced in giving low rates of traffic to the public. I see in the report of a Committee on the carrying capacity of freight-cars, which is addressed to the members of the Master Carbuilders' Association in America, they say:—"The following are considered a few of the most important advantages that may be derived in transporting any given amount of tonnage:—Less cost of cars; less cost of repairs; less number of way-bills to make; shorter trains; shorter side-tracks; less coupling and uncoupling of cars; less damage to draw-bars and fixtures; less number of brakes to operate; less number of journal-boxes to oil; less number of springs, couplings &c.; less number of wheels to inspect; less train-men; and many other smaller advantages." It was considerations of this character which induced me to recommend the Government to order 200 of these dump-cars for use on our lines. I wished in every way to conserve the interests of the Colony, and I stipulated that the ironwork at least, as to which there could be no difference in weight, should be made in the Colony; it mattered very little, as regards weight, whether the ironwork was made in the Colony or made elsewhere; it would not weigh more in one place than in the other; but with the timber it was different. The specific gravity of the timber of this Colony is very much greater than that of the timber used in America. I did not stipulate that the timber of these trucks should be Colonial timber; for I feared that we might, by the increase of the scantling, owing to the comparative want of toughness of the Colonial timber, effect what I was desirous of avoiding, the increase of the tare of the vehicle. I should like to say that this question of a dumping-car was not brought] under my attention for the first time by the production of this model car. Years before, when there was such an outcry about the impossibility of quickly discharging the trucks at Newtown, owing to the want of siding accommodation there I made a suggestion that the lang hards which was by the side of the Newtown Station should be there, I made a suggestion that the long bank which runs by the side of the Newtown Station should be utilized for coal cellars. There was some difficulty in getting the Corporation of Newtown to close the road that ran alongside the bank, but I considered that if they would not close that road I could utilize it as an approach to these cellars; I asked Mr. Mason to design me a dump-car—I did not call it a dump-car myself, but at any rate the design was the same—to get rid, by some mechanism, of the load at once, and shoot it into these cellars, providing of course trimming plates, so that it should not suddenly descend to too great a depth, but that the coal should go at proper angles into the cellars. If dump-cars of this design had been brought under my attention, when I was endeavouring to find the means of providing greater accommodation at Newtown, I should have jumped at the proposal to take them, because, in addition to the large saving they would effect in the carrying of loads, they would have aided the Department considerably in meeting the demand for additional trucks by the speedy manner in which they would have been unloaded and returned again for use. In addressing you, sir, on this subject I am aware that I am addressing one within whoes personal knowledge these things occurred, and who is no doubt acquainted with all the circumstances. You will doubtless recollect that there was at that time a great demand for shale from the country, and a utilized for coal cellars. There was some difficulty in getting the Corporation of Newtown to close the You will doubtless recollect that there was at that time a great demand for shale from the country, and a large transaction was entered into for the export of this shale, but it came to a sudden termination owing to the difficulty of getting the shale from the trucks over the wharf at Darling Harbour into the punt and the difficulty the exporter of this shale had in getting ships of adequate size to come through the bridge at Pyrmont. At that very time, prior to these dump-cars being brought under our attention, a scheme was entered into for taking the land at Darling Harbour and for extending the wharf right away round to Goodlet and Smith's place, and the design then made for shipping shale and shipping coal, which was also spoken of as an immediately probable prospect, was so arranged that the cars could run upon a line of this character. I had always stipulated that the hopper waggon used on the Great Northern Railway by the coal companies should not be used over our mountains, as the mechanism was not of a character to be used with safety; but I had in view, as I explained to Mr. Mason, a truck which, while it did away with that disadvantage, would carry a design for emptying the trucks into the ships' holds, either coal or shale or anything of that sort. The design now made for wharves, if they should be carried out by the Government, on the opposite side of the Pyrmont Bridge, will be found to meet that purpose. It seems, though controlled in some degree by the rise and fall of the tides, that coal and shale and such material could be with greater advantage dumped into the holds of vessels than it would be either by hydraulic lifts or ordinary steam cranes.

597. On the 6th April you asked Mr. Midelton to report regarding these dump-cars? Yes. 598. What position did Mr. Midelton then occupy? I presume from my asking Mr. Midelton the was then in charge of the Department. If Mr. Scott had been here I should be the state of the department. I presume from my asking Mr. Midelton to report If Mr. Scott had been here I should have asked him.

599. Mr. Midelton was acting Locomotive Engineer? Yes.
600. As such do you hold him responsible for ordering new cars of that description—that is, as
to whether they are suitable for our lines? No; I hold Mr. Midelton responsible for seeing that the
rolling stock we have is strong and perfectly safe, and I also hold him responsible for designing cars to

carry into effect the wishes or the instructions of the Department.
601. Who do you refer to with regard to any design as to whether it is safe to run over the mountains? That is a point which I refer to the mechanical engineer—the Locomotive Engineer. The Engineer for Rolling Stock has to report whether they would be safe. That is the reason I referred this to The Engineer for Rolling Stock has to report whether they would be safe. That is the reason I referred this to Mr. Midelton. I see that in his report on the subject he says nothing whatever about the want of

602. Did you consider his report satisfactory, as regards the use to which the dump-car could be applied? Mr. Midelton stated that it looked satisfactory and promised well, but that it wanted some other appliance to make it complete. Well, I was quite aware of that; and, as I have explained to the Committee, it was the intention of the Department to provide these other appliances. They had already been applied in some instances, because at several places the bank at Darling Harbour had been made available for shooting coal down the side, as well as metal and other stuff; but the trucks were unloaded up to this time by the laborious method of shovelling the coal out of the trucks down the bank. I should like to refer the Committee to what is said in America on this subject:—"We submit an extract from a letter ON THE PURCHASE OF RAILWAY ROLLING STOCK.

written by the master car-builder of one of the oldest and best managed roads in the country, and who is considered a standard authority in the matter of cars:-

Chas. A. Goodchap, Esq.

'In answer to your question as to what is my opinion, as a practical car-builder, of the merits of the dump and coal car of the United States Car Company, I would reply as follows:—I have given the matter the fullest examination, and have proved its practicability for such purposes as it is designed, and in my opinion, it is certain to come into use rapidly, on account of its simplicity and positive merit. There is no complication about it which prevents its being easily worked by an ordinary person (brakenian), and requires only one man to operate it. At a recent trial of the car, one man dumped 25 tons of gravel from one car in less than 2 minutes, and in another instance two car-loads of coal in 3 minutes, and had the cars ready to return. Second: The construction of the car is so near like any ordinary car that those already built may be changed, and the patents applied at a small cost. In my opinion the car cannot be surpassed for the easy handling of coke, gravel, sand, ashes, logs, railroad ties, stone, and railroad iron, or anything of like nature, and in construction or repairs, ballasting, filling of tressel-work and the like. In my opinion, in the very near future, we shall rarely see the kind of cars now in use, for these cars will be substituted on account of the immense saving in the cost of labour. The principle is that of the common horse coal and dump cart applied to railroad uses; and it would seem as reasonable to expect coal-dealers to ask their men to return to the day of the control of the interest and it would seem as reasonable to expect coal-dealers to ask their men to return to the old method of shovelling out their load as it will in the future to expect coal and railroad companies to unload their cars in the present expensive way. It will give me pleasure to show and explain the working of the car at any time we may have one here, or give any information I may be able at any time you may call upon me.'"

603. Was any test made with this car? Yes, on one occasion I was down there when some sand* was put into this car and tested. It seemed to me to operate exceedingly well. It did not all tip out at once; but that was explained at the time to be owing to the sand being very wet when put in, and it hung together a bit; but there was no difficulty, I understood, in getting it out as soon as the parts could be separated.

604. From whom did you understand that there would be no difficulty? I think all those who were present at the time-Mr. Midelton, Mr. Read, and other gentlemen-said that seemed to be the reason

why it did not fall so rapidly as was expected.

605. Were they asked for reports regarding the test? No, I am not aware that they were; my object in

going down was to see it myself.
606. Did you consider the test satisfactory? Yes, I considered it very satisfactory. I could see for myself it would be a most advantageous way of working these trucks.

607. Is it not a fact that a great deal of the sand had to be moved away before the truck could be shifted? The place where it was unloaded was not at all adapted for such a purpose; the fall was not nearly enough. Of course in practical use there should be a slight elevation in order to make room for the gravel or the load to fall, and I have explained in that plan which I have submitted the method in which it is to be done.

608. Is it true a screw-jack had to be used to lift this car? I never heard so.

609. There was another test made with this car, I believe? Yes. 610. Were you there? I was only at one.

No. 611. You were not at the other two tests?

612. Were they considered official tests? No, I think not; I think they were for the convenience or satisfaction of some persons from other railways, if my memory serves me. I think I directed that the method of operating the car should be shown to these gentlemen. I believe that on one occasion some long firewood was put in, and it was reported to me that, owing to the flaps of the car getting wedged in with one or two of the pieces of wood, it did not run quite so freely as it should; and I pointed out to the Traffic Manager that it was not adapted in any way for wood of that kind. The dump-car for wood is a dump-car without sides like this (exhibiting sketch.)

613. Do you remember any test being made with ashes? No, I do not think I do.
614. Was any report asked for after the test from any of the officers? No, I had received all the reports that I required. I had Mr. Midelton's report, which showed me that these cars would be specially suitable for the purpose for which I intended them, with the exception that he said he could not agree with Mr. Read that they were available for locomotive coal traffic. I was aware that Mr. Midelton had some scheme of his own for the coal traffic, depositing the coal on the ground and picking it up by means of a crane and putting it on the tender—a scheme which met with the approval of neither Mr. Cowdery nor Mr. Scott (Mr. Midelton's superior officer); and from inquiry I made it seemed clear to me that the time that would be occupied in such a method of loading the tenders would be altogether too great.

615. Mr. Carson Woods, in his letter of the 6th August, 1883, says he understands the Department wants

rolling stock, and no better or finer car for any freight purpose can be had than the patent screw-lever dump-car. Do you think it could be adapted for general purposes? I should think not; I should think it would be most absurd to attempt to dump ordinary merchandise from a car of that character; I should

think a case of glass, for instance, might come to grief if it were dumped.

616. Before this order for 200 cars was given to Mr. Carson Woods were any officers referred to as to whether this car was safe? That was the object of referring in the first instance to Mr. Midelton. The minute is: "Mr. Midelton for early report." I wished to know from Mr. Midelton whether it was a car that would be suitable as regards its stability and working parts for our traffic and for our lines; and I was particularly careful, in making this contract, to stipulate that the cars supplied should be to the satisfaction of the Locomotive Engineer—that all its details as regards its draw-gear and its buffer arrangement should be in strict accordance with the requirements of our Locomotive Engineer. If it should turn out that this stock has not been supplied to the satisfaction of the engineers—if they have any doubt as to the stability of the draw-gear—it will be their duty to bring it under my attention, and I shall call upon them to show cause why they did not provide for the due stability of all these working

parts.
617. Were the officers concerned made aware of your desire to have 200 of these cars manufactured? am not aware that I specially referred the matter to them. I referred the matter in the first place to the Traffic Manager to know whether he could make use of such trucks; and I then referred the matter to the engineers to let me know whether there was any objection to any of the working parts of such a truck. I formed my own conclusion as to the advisability of getting the trucks, having satisfied myself

from these reports that they could be made of great use to the Department.
618. Mr. Midelton in his report says:—"But when I fully consider the matter in its various manners of application I really cannot see much in it to recommend." Can you tell the Committee in what way he

^{*} Note (on revision):—I have ascertained since giving my evidence that it was other than the "sand" test at which I was present. My recollection of the test must have been derived from the reports made to me at the time.—Ch. A.G., 14/9/84.

Chas. A. Goodchap, Esq.

22

could not-see much in it to recommend? No, I could not. It seems to me that there are several matters in his report which might be criticised adversely. This gentleman says, "If coal could be dumped direct in carts so that it could be hauled away to the coal yards and then dumped again," then he would recom-3 Sept., 1884. mend it. I am rather amazed to find that an engineer should propose to dump 20 tons of coal into a cart on the common road; I do not see how he could consider that an advantage, or indeed how it could be done.

be done.
619. Was he asked to explain? No, I did not ask him to explain it; it did not seem to me to be necessary. As I explained to the Committee I saw where the advantage of these dump-cars would come in. Mr. Midleton says:—"If we could dump kerosene shale from these waggons direct into a ship's hold at Darling Harbour there would be an advantage." That was my proposal, not only kerosene shale but coal; but they commended themselves to me as specially valuable for locomotive purposes.
620. You mentioned that you thought they would be adapted for Eveleigh and Eskbank? Yes.
621. Do you know what quantity of coal is required for loco purposes, both at Eskbank and Eveleigh? I know we use about 70,000 tons of coal from the mines up there, brought down, some of it to Sydney some as far as Granville to go up the Southern line. We use a good deal on the Southern line, and a good deal on the Western line beyond Eskbank. I think the consumption of coal from the district is about 70,000 tons a year altogether: and in estimating the saving from the use of these trucks at

about 70,000 tons a year altogether; and in estimating the saving from the use of these trucks at £6,994, say £7,000, a year, I have adopted that as the quantity of coal to be handled. Of course that is merely a calculation showing the advantage of large carrying capacity in conjunction with light

622. I think you stated that you did not think they would be suitable for the wood traffic? I should not

look upon that particular car as suitable for the wood traffic.
623. Was it not understood that these cars were to be made in the Colony? Yes, unquestionably; that is with some variation as regards the timber to be used in the trucks. The wheels, axles, and those things of course would have to be imported; but I expressly stipulated that the ironwork for the underframing was to be made in the Colony; and that was stated in the instructions to the Crown Solicitor for the

preparation of the bond.
624. Is there any minute with regard to the wood and certain parts of the ironwork not being made in

the Colony? No.

625. Was not Carson Woods' offer accepted on the understanding that the cars were to be manufactured in the Colony? The cars were to be built in the Colony. What was really in my mind at the time was that the cars should be made in the Colony—that the ironwork should be made here—that these people who accepted the contract would have workshops here, and build the cars here—that they might import and they might import the wood of course.

the Colony. I was particular about that, because I wanted them constructed here.

627. Chairman.] Are they carrying out that part of the contract? Well, I have received a report a day or two ago, from the Locomotive Engineer, from which tappears they are not carrying it out.

628. What do you propose to do under such circumstances? I have no objection to tell the Committee that I shall being the matter under the attention of the Minister. It will centainly be my duty to point.

that I shall bring the matter under the attention of the Minister. It will certainly be my duty to point

out to the Minister that there has been a departure from the terms of the contract.

629. Where are these cars being landed? I am not sure, but I think at Darling Harbour.

630. Do you know at what place they are being put together? I believe that Carson Woods has leased from the Public Works Department a portion of the land that was recently taken for wharfage purposes at Darling Harbour—I think the old Atlas Company's Works—where the Atlas Company used to make their locomotives. I know Mr. Carson Woods came to me and asked me if I would lease him that piece of land, and I pointed out that it was not railway land—that the land was taken under a different Act; and that he would have to go to the Under Secretary for Works to assert in whether he could lease it or and that he would have to go to the Under Secretary for Works to ascertain whether he could lease it or

631. You stated in your explanation that you thought it desirable to have a lighter car constructed in order that it might take a larger load. Was it not possible to have such cars constructed in your ordinary class of rolling stock? In giving the orders for the construction of the G waggons I had anticipated that the engineers would have carried out that instruction in the design; but to my amazement they produced a truck that was absolutely worse than the ordinary D waggon; for while the D waggon weighed 4 tons 13 cwt. and carried 6 tons, this car was presented to me on the first occasion, weighing 12 tons and only

carrying 10 tons.

632. Is it true that a greater quantity than 10 tons has been loaded in these G trucks? Since I wrote my minute they have altered the truck; they had put springs under it not at all adapted for goods stock, though admirable for railway carriages, which, though they weigh a good deal, are only called upon to carry some 4 or 5 tons of passengers. They had unwisely put these springs under this G waggon. I pointed out to them at the time the admirable method by which the weight of the dump-car was taken; and Mr. Scott subsequently reported to me that he had made an alteration in the G waggons, by which the weight was decreased some few hundredweight—I think they weigh now 11 tons 18 cwt.—and the carrying capacity increased to 15 tons.

633. Could not a truck be constructed here as light as the dump-car and to carry the same weight? We have not succeeded yet, notwithstanding my repeated expression of my views to the engineers, in constructing a car of that character; and I was glad indeed to get a car which presented such admirable prostrices of light toward reset as a light as the dump-car and to carry the same weight? We

portions of light tare and great carrying capacity as does this dump-car.
634. Would not a car constructed similar to the G waggon carry the same quantity as the dump-car, provided it was made of light material as you suggest? I cannot say exactly. I should think the underframing might be made considerably lighter than the under-frame of the G car. The bogie is heavily constructed in the G waggon.

635. Who designed the G truck? I was so disappointed with it that I did not inquire; because I did

not wish to aim at anybody in particular, but I wrote a very severe minute on the subject. 636. Do we understand that previous to the receipt of this dump-car you had in view the desirability of constructing larger cars to carry more weight than the ordinary D trucks? Yes; the records contain many directions of mine on that subject.

637. Independent of the dumping operations, you had already provided for constructing a car to carry as great a weight as the dump-car, although in your opinion the material was not of so light a description?

The design did not carry out the direction in any way and did not effect the object in view; we have a vehicle in the G truck which weighs considerably more in proportion to its carrying capacity than the D

Chas. A. Goodchap, Esq.

638. The difference in the dump-car and the G-car is in the proportion of weight to carrying capacity? 3 Sept., 1882. Yes; the G-truck, as I said before, weighs 12 tons, and carried 10 tons, now 15 tons, and the dump-car

weighs 9 tons 17 cwt., and carries 20 tons. 639. Could not a car of the G class have been made to carry the same quantity as the dump-car? Up to

this time the engineers have failed in giving us such a car. 640. Mr. Garrard.] Has the carrying capacity of the G-car been increased since the arrival of the dump-car? Yes.

641. Chairman.] Can you give the Committee any opinion with regard to the workmanship of these dump-cars—the material, the ironwork, or the woodwork? No; I understood from the report of Mr. Midelton that there was no exception to be taken to it at the time I called for his report, and I stipulated, when the contract was entered into, that in every respect the working parts should be to the satisfaction of the Locomotive Engineer, who was to see that the draw gear and everything connected with it was made in accordance with our own rolling stock. I also drew the attention of Mr. Carson Woods himself to what seemed to me to be a blemish in the truck in regard to the machinery for dumping, it being liable to act automatically, and I thought it better that, instead of the kind of fastening that was used to attach the under frame to the upper frame, a king-bolt would have been more serviceable; and I told him at the time that the Locomotive Engineer would certainly reject these cars if they did not attain safety of this—that there is a king-bolt attachment.

642. What position does Mr. Bourn occupy? He is under Mr. Midelton, as overseer or foreman of rolling stock. working in that respect. I believe that in the cars that have been sent out provision has been made for

643. Does he give general satisfaction? I believe he is a very good man indeed.
644. Is he competent to form an opinion with regard to the workmanship or safety of these cars? I should not look upon him as a man who has a large designing capacity

645. I mean as regards the quality of the work, and whether it would be safe? Yes, I should say he

could offer a valuable opinion as to the working appliances of any vehicle.

646. Is Mr. Midelton able to do likewise? Mr. Midelton is a gentleman who I think allows his prejudices sometimes to warp his judgment. In my experience he has never thought well of any contrivance, any scheme, any design, which did not emanate from himself. If any other engineer in the Departments suggests anything he will pull it to pieces, to show that it has defects; and therefore I should always receive cum grano salis Mr. Midelton's opinion of designs that did not emanate from himself.

With that exception I think Mr. Midelton is a your competent opinion and always receive cum grano salis Mr. Midelton is a your competent opinion and always received the competent of the competent

With that exception I think Mr. Midelton is a very competent engineer and a very valuable officer.
647. He thoroughly understands his business? Yes, I think he understands it theoretically and

practically.
648. Could be give valuable information as to the safety of this car? I am quite certain be could, if he

649. Has he any prejudice in this matter? I never heard him express any views on this subject, but I know generally that is his character; and not only in this Department,—I have heard of it when he was in England and in Tasmania,—that wherever he has been, his great defect has been fault finding with the designs of others. It may be beneficial—good criticism is always beneficial—and may be the means of remedying defects and detecting errors, but

650. Mr. Scott;—is he an officer to be relied on in a matter of this kind? Yes, unquestionably.
651. Mr. Bingham;—what position does he hold? Mr. Bingham is foreman of carriage rolling stock.
652. Is he a reliable man? Yes, I should say very reliable.

653. Quite competent to give this Committee an opinion regarding these cars with reference to their suitability for our lines? As regards the mechanism, yes. I rely upon these officers to see that we do not get cars, whether from local or foreign manufacturers, of a character that will not be suitable for our lines; I specially refer these questions to them for their opinion as to these matters alone, not as to whether in other respects a car will be suitable—I form my own judgment upon that.

654. Were any reports asked for or given regarding the sample dump-car, other than those in the printed papers? I asked Mr. Midelton for that report. Of course I should not obtain the report of any officer subordinate to Mr. Midelton, but I should think he would fortify his opinion by consulting his officers. 655. Did you consider it necessary to ask Mr. Midelton, or any other officer, for any further report con-

cerning these dump-cars after the trial? No.

656. Mr. Bourn, in his minute of 29/12/83, says:—"I beg to report that previous to the dump-car being allowed to be used by the Traffic Department it is necessary that it should be taken to pieces and reconstructed, as at present it is too wide and will not pass the platforms. It also requires to be fitted with buffers and draw-gear, to suit the present rolling stock now in use"? That is quite right; it was quite understood that would be so. It came here with a central buffer, and none of the draw-gear was capable.

Of course everybody knew that would require to be

buffers and draw-gear, to suit the present rolling stock now in use"? That is quite right; it was quite understood that would be so. It came here with a central buffer, and none of the draw-gear was capable of being used with the rest of the rolling stock. Of course everybody knew that would require to be altered. It could be altered at an expense of some £25 or £30, I believe.

657. In a minute of 25/1/84 you said:—"It had better be made to suit the requirements, in order that those to be supplied may be made suitable." Do you know if any action was taken? It was pointed out that it had better not be altered, inasmuch as it was a sample car, and it had better remain there in order to be en évidence of the conformity or otherwise of the cars that were to be made to it. There was no great advantage in using a single car in this way. If there had been sufficient to form a train load, and I could have sent them up to Penrith for the gravel there, I should have been properly dumped use of them. and should have constructed a siding by which the gravel could have been properly dumped use of them, and should have constructed a siding by which the gravel could have been properly dumped

658. Mr. Poole.] You have objected to the use of the hopper coal cars on our mountain line? Yes. 659. Will you state why? Because I do not think the mode of fastening is a safe one; I dare say it is safe in itself if properly fastened, but subjected as we are to carelessness on the part of men in doing these things, I would not have an appliance which might lead to an accident.

660. Will not that very objection hold with greater weight in respect to the dump-car, seeing that the bogic frames are only connected with the body of the car by these two dowels or knuckle joints upon which the dumping is made to hinge? I certainly should think it would be a defect, and pointed it out at

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

Chas. A. Goodchap, Esq. 3 Sept., 1884.

the time as likely to be a defect; and I stipulated that the mode of fastening the upper frame to the lower frame of the truck should be of a more effective design, but that again I left to the engineers to The objection should have come from them in the first instance, and I am certain they would not receive cars which were made in an unsafe manner.

661. If it should turn out then, when the cars come to be put together, that there is no possibility of providing for the safe connection between the upper and lower frame, except by doing away with the power of dumping, then that, in your opinion, would be a fatal objection to the use of the cars? a fatal objection, because, as I have pointed out to the Committee, the car is a most valuable car even without the dumping arrangement, because of its light tare and great carrying capacity. It is the best car we have on our lines even as a fixed car; but if it should turn out that the mode of attaching the upper to the lower frame is not perfect, I should think our officers would be to blame, for the necessity was impressed upon them, and it was stipulated in the contract, that everything should be done to their

662. But for general purposes the fact of the doors of the car being hung at the top instead of at the bottom would militate against the profitable use of the car in loading and unloading? That could be easily overcome. If it were determined to use these cars as fixed bodies only, a difficulty of that kind could be easily removed.

663. The dump-car is supposed to dump a load of from 18 to 20 tons? Yes.

664. And these smaller waggons shown in that sketch would take the whole of those 20 tons? There

would be sufficient in one of these trucks (referring to sketch) to load one tender.

would be sufficient in one of these trucks (referring to sketch) to load one tender.

665. I gather from your remarks that the prime advantage to the Department is, that you have a far less number of tons of tare or dead weight in relation to the freight or paying weight? Yes, that is one of the great advantages we expect from these cars. I do not say it could not be effected by making the G cars as light, but we had not effected it up to that time; and I should like to draw attention to the fact that while these cars possess this advantage over the G waggon, the G waggon costs £289 7s., and the dump-car £190. There is a saving of (say) £100 per truck, and yet we have a more effective truck, even supposing we do not make use of the dump apparatus.

supposing we do not make use of the dumping apparatus.

666. Independently of the mere quality of workmanship, I think I understood you to say practically that you accept the responsibility of ordering these cars, in relation to their design, and, as you conceive, to their general usefulness in the Department? Yes, as far as recommending I take the responsibility of that, as the officer who is charged with and responsible for the proper administration of the Railway Department; it being, in my opinion, one of his most important duties to see that the traffic is economically worked, not only for the advantage of the Department but for the advantage of the public, who look

for good service at a cheap cost.

667. The officers who have reported to you on the matter were simply asked to give their opinion as to the mechanism and the quality of the workmanship? Mr. Midelton certainly. As to the Traffic Manager, of course I fortify my opinion by his view. If Mr. Read had reported to me that he could not make effective use of these trucks, that they would be of no service to him, I should have considered it necessary to have an interview with Mr. Read upon the subject, and to have pointed out to him that he was in error—that this was the very vehicle we had been looking for for years, and that in our requirements for the future it would be a most admirable vehicle. I do not think that an officer who is charged with the administration of the Department should be influenced altogether by the views of his subordinates.

668. Do I understand that the £7,000 annual saving that you expect to derive from the use of the dump-cars is a saving upon these 200 cars if they are brought into use? No, I have not spoken of it in relation to any particular number of cars. I want 70,000 tons of coal from the Lithgow mines, and I estimate what it will cost us to bring it down in D trucks and to bring it down in these cars, and the

saving is shown in the number of cars required to do the work.

669. The saving would be in dead-weight hauling? Yes. For instance, we should require 11,666 D waggons to carry that amount of coal, and we should only require 3,500 of the dump-cars to carry the same amount of coal. It is easily to be seen where the saving comes in in every respect—a less amount for lubrication, less amount for friction, less amount for keeping in repair the permanent way, fewer wheels running over the line. It is not alone here that this matter is considered important. Associations in America of the best car-builders are always consulting one with the other to get the best supply of vehicles—to reduce the tare and increase the carrying capacity.

670. I suppose it will be necessary to make special provision at at least one of our stations, where you desire to use the dump-cars, to enable them to tip their loads with reasonable facility? Yes. But you will understand that the dumping appliance could not be used generally; there will be only a few terminal stations and ports of shipment where it could be used. It will not be necessary to erect such stations where only a light load is required occasionally.

671. I think the Committee may fairly gather from your answers and general remarks that unless you yourself and your engineer officers are thoroughly satisfied that the connection between the body and the bogie-frame is safe from a running and shunting point of view you will not feel justified in accepting the cars? Our engineer officers ought to have made provision for that. They are to be made to the satisfaction of the engineer; but I should certainly think that the engineer ought to have seen to that prior to the cars being made; and he would have seen to it if my intention had been given effect to, that the rolling stock should be made in the Colony, because he would have had an officer on the spot to watch the

work as it proceeded. 672. I think I understood you to say that prior to the order being given you had pointed out the weakness in this respect and the necessity for having a king-bolt right through the frames? It was a suggestion

amicus curiæ I might say. I did not set myself up as an engineer advising how it should be done, but in conversation with Mr. Woods I said that point would have to be specially considered.

673. Is that embodied in any formal document between the Government and the contractors? No, because it was covered by the general stipulation that in all respects the cars should be supplied to the satisfaction of the engineer.

674. Suppose the contractor considers that he is in no way bound to make this extra work, and declines to do it, what position will you be in then? The engineer will not certify for the proper construction of the car.

675. And outside all this, there is the breach of the general or main condition that the cars were to be made in the Colony? Undoubtedly. I certainly think there is a breach there. If, as I am informed, the ironwork

ironwork is constructed out of the Colony—that nothing has been done within the Colony, and nothing is proposed to be done but simply putting the pieces together—I should certainly consider that a breach

Goodchap, Esq.

676. The wheels under the pattern bogie car are chilled cast-iron wheels, block wheels in fact? 677. Do you consider them as safe for our mountain traffic as the type of wheel you have in general use, solid cylinders with a steel rim? Yes, I think they are as safe; but I do not think sufficient attention is

3 Sept., 1884.

paid in America to making the wheels perfectly cylindrical.

678. They are not screwed up properly from the centre of the axle? No; and that is a fault found with these chilled wheels, even in America itself. The attention of manufacturers has been called to the necessity of paying more attention to this point; but the chilled iron is considered to be a good material, a lasting and durable material, and as many miles have been run with chilled iron wheels as have been run with ordinary wheels with steel tires, with this advantage that when the chilled wheel is worn down below the chilling they will admit of a steel tire being put on.

679. Is it not a matter of common observation that once the skin of a chilled wheel is worn through the remainder of the spread of the wheel is thrown away? Yes; but the chill penetrates to the extent of §

of an inch, and it takes a long time to wear that down.

680. Taking a connected view of the whole matter—our mountain roads, the trucks themselves, the grades, the curves, and all these matters combined—do you think the chilled wheels will be perfectly safe wheels to use upon these lines, with heavy weights such as you propose to use on the double bogies? I should certainly prefer the ordinary wheels, but I do not anticipate any danger from the use of the chilled iron wheels. Their durability probably is not so great, because the friction of the iron break upon them will be so great that they will wear rapidly.

681. I think I may take your answer on that point to be that you would rather pay the difference between the cost of the two kinds of wheels for the sake of the greater safety of the wheels ordinarily in use?

Not the greater safety, the greater durability.

682. You anticipate no danger whatever from the use of these trucks, looking at them altogether as we now have them, with a new connection between the truck and the bogie frame, in running round our mountain curves? If our engineers have done their duty there can be no danger whatever.

683. Mr. Fletcher.] I notice that in one of your minutes, number 31, you have made a special stipulation that the whole of the metal work should be manufactured in the Colony;—do you know if that is being done? I have not received any report upon that subject; I know nothing of it officially; but I have been given to understand that all this work has been imported.

684. If it has not been done it will be a clear breach of contract, will it not? Yes; I shall certainly

bring it under the attention of the Minister.

685. In the use of these dump-cars it will be necessary for you to have an elevated road for the cars to

run on? Yes, either an elevated road or a sunk track.
686. Chairman.] You mentioned the difference in price between the G truck and the dump-car;—can you inform the Committee whether the description of work is equal in all respects, as regards safety and quality of workmanship? No, I do not know that I could compare the two. As regards the quality, in the sense I point out, I prefer the quality of the dump-car.
687. Has the bond been signed? I believe not. I was making inquiry about that, and it seems Mr. Woods left for America before the bond was ready.
688. Have you got him bound sufficiently? He will have to sign the bond before he receives any money; he gets nothing on account before he signs the bond.

689. Do you expect to receive a report in regard to whether the dump-cars are made in the Colony?
690. Will you furnish us with that report? I will. (See Appendix.)

FRIDAY, 5 SEPTEMBER, 1884.

Present:-

Mr. CHAPMAN, Mr. GARRARD,

Mr. SUTHERLAND, Mr. SUTTOR,

Mr. POOLE.

SYDNEY SMITH, Esq., IN THE CHAIR.

Henry Hudson, Esq., called in, sworn, and examined :-

691. Chairman.] What is your business? Contractors and general timber merchants. Contractors for H. Hudson. the supply of rolling stock to the Government; that is one branch of our business. 692. Are you contractors at the present time? We are.

693. Do you remember being requested to tender for a supply of 200 dump-cars? I do. 694. Will you inform the Committee of the particulars regarding that request? Well, Mr. Midelton, who was acting Locomotive Engineer at the time, sent for me to his office, and I went there and he said that he wanted me to give him a tender for 200 dump-cars similar to one that was standing on the siding at the time. I went into the matter and gave him a tender, and I pointed out that there would be some alterations required to suit our stock, because they could not couple up. I submitted a price to him for

the supply of 200 cars.
695. What price did you submit? I think it was £190 each.
696. Do you know the result of your tender? I know that we did not get the order; that is all.

Were you spoken to again on the subject by Mr. Midelton or any officer in the Department? but I made some inquiries myself as to whether it was probable that we should get an order, and they said they did not think so.

698. Did you examine the dump-car prior to your giving a tender? I had seen dump-cars in Boston when I was in America three years ago, long before they came here.

699. Will you give the Committee the opinion you formed regarding those cars? I was invited by the inventor to witness a trial of a dump-car a little way out of Boston, on the Boston and Albany railroad. I was asked what I thought of it, and I said that I did not think very much of it. They pointed out that

1043—D

Esq.

5 Sept., 1884.

26

H. Hudson, it was going to be of immense value there because portions of Boston lay below the water level; and the consequence was that a portion of the siding was raised 2 feet 6 inches, and these cars were formed ostensibly for removing sand from an adjoining hill and filling up this low portion of Boston. They pointed out that it would save a great deal in cartage, and I said "no doubt"; and they wanted to know if I would use my influence to get them introduced here on what they called the Australian railways. I said that I did not see anything in it, and that I did not see that I could take them up at all. They offered me a share in the profits; but I pointed out that our tracks were boxed up level and that there was no possibility of using them, and that I would not entertain their proposal. was no possibility of using them, and that I would not entertain their proposal.

700. Did they name any sum for a patent? No; I threw cold water on the matter, and I would not entertain their proposal at all. I was invited to witness a further trial, but it did not suit my convenience

to attend as I was just about leaving Boston and I did not see any more about the car.
701. What was your opinion about the car? I thought it was suitable for the purpose there designed, which was for having a track raised above the level and making up the ground to the level of the sleepers, but I do not think it would be useful on a railway where the track and the platforms are all laid out for rolling stock which you have to discharge on a level with the platforms? Of course I could not see that they could be used here at all, because in dumping a load one portion would run on to the middle of the road, not clear of it.

702. Is this car used on the American lines generally? I cannot say; it was not then. The trial I

witnessed was the first or second that was made.

703. At the trial you witnessed did the car throw out all the load? It was loaded with sand and it threw out pretty well all, because the track was raised above the level of the ground.
704. Have you seen the cars now being imported? I have not.
705. Were you present at the test of a dump-car here? Yes, I saw one trial of the sample car about a

year ago.
706. What did you consider the result to be? I thought that it was quite a huge failure. They did not dump all the load—not half the load—the way I saw it.
707. What is your opinion about the patent? I do not think much of it. I would not give anything for it myself. I might have had it if I had liked two or three years ago, but I would not give anything for it.
708. For what sum could you have obtained the patent? I would have required something for taking it up rather than pay anything for it. I was urged to take it up and to try and introduce it here and I would not have anything to do with it.
709. What do you think of the workmanship in the sample car? I do not think very much of it. I

709. What do you think of the workmanship in the sample car? I do not think very much of it. I know we have to do our work a good deal better than that which is shown in that car.
710. Would the Government pass work of that description if you did it? I do not believe the Government would ask us to build anything like that. It is quite different from anything they have built—a different style of work altogether.

711. Mr. Chapman.] Who was it asked you to give a price for building the cars? Mr. Midelton wrote to me asking me to give him a price. He was Acting Locomotive Engineer during Mr. Scott's absence.
712. Did he tell you 200 were required? Yes; I think the tender was for 200. My own impression was that when I tendered they would not have them done.

713. Did you receive a communication verbally or in writing from Mr. Midelton? To the best of my recollection I think it was a memo., asking me to call at his office, as he wanted to see me. The memo. was left at my office some time in the morning; and I did not go home until 1 o'clock, and I went to Mr. Midelton soon after 2 o'clock.

714. Your tender was in writing? Oh yes.
715. Mr. Garrard.] You are of opinion that if an elevated track were provided these cars would have been a success? Yes.

716. With a track elevated to the extent of only 2 feet 6 inches? It would be a success in this respect: that it would not discharge a portion of its load in the centre of the track as it does on a level road; the load would be likely to fall clear of the track. What I thought a failure in the trial was, that a portion of the load that was dumped had to be shovelled away before they could shift the car. That was on the

Botany road siding.
717. The first trial which you witnessed in Boston was on an elevated track of 2 feet 6 inches, and was a

success in your opinion, but the trial you witnessed here was a failure? Yes.

718. Are these cars used in America for any other traffic? I never heard that they were; they certainly were not when I was there. I saw, I think, the second trial of them, and that was done with the first

719. What was the car at Darling Harbour loaded with? Gravel. 720. You did not see a trial with firewood? No, I did not.

721. Do you think that the car would be suitable for carrying and dumping firewood? I should not think so. If you attempted to dump a truckload of firewood you would have the billets running out at all angles; and you can understand how that would lead to blocking.

722. Do you suppose that the centre posts would interfere with the discharge of any long material? Yes.

723. You have not seen the cars that are being imported? No, I have not.

724. As a practical car-builder, what is your opinion of the specimen car, as to its safety in travelling over our lines? My opinion is that it is not safe. It simply rests on a ball and socket joint. Going round the curves a carriage will often oscillate that is supported at each end on elliptic springs. This car is simply retained in position by check chains, and if it is to carry 12 tons, and gets a sway on it, like some of our carriages, I don't think it will be very safe.

725. The price that you gave in for building 200 dump-cars of this pattern was independent of any money that would have to be paid as a royalty to the patentees? I did not consider the subject of royalty.

726. It was merely for the production of the cars? Yes; I did not think the thing was patented here.

727. Was your price for work similar to that in the specimen car? Yes; except that I should have to do them better

728. Would you copy the defects—you would only do that which you were bound to do by the terms of your contract? I said to Mr. Midelton that I did not suppose they would call for tenders, and that they simply wanted to ascertain the value of the car.
729. Was there only one centre buffer? Yes; it was just the American freight-car pattern, in which the

draw-bar acts as a sort of buffer.

730. What is your opinion as to the durability and safety of the bogies under these cars? The general H. Hudson, construction of the bogie is similar to that in the case of all the freight stock used in America; but I never heard of their putting 20 tons on axles of the same size as those under these dump-cars.

731. You think the axles too weak? Yes I do, to carry 20 tons. I do not think the Government Sept., 1884.

would put that weight on them.

732. Have you heard that although the pattern car you saw here was meant only for coal or gravel there are others for wood? I never heard.

733. If your tender had been accepted, would all the work have been done in the Colony? Yes; I would not send outside for what I could get done here.

734. You are aware that tenders have been accepted for 200 dump-cars? Yes.

735. Is the work done in the Colony? I am aware that it is not. I have seen the ships' manifest reported in the papers, and I know that certain portions are being discharged at Darling Harbour.
736. Do you know the difference in the weight of these cars and the weight of the ordinary D car? The

D truck is to carry 6 tons, but we have seen 8 tons in them.

737. What is the weight? They average from 4 tons 6 cwt. to 4 tons 12 cwt.

738. What is the weight of the dump-cars? I think there is painted on them "6,000 lbs."

739. In your opinion has weight been sacrificed to safety? Yes, I think so. If they were to put 20 tons on the car and run it as far as Mount Victoria I believe it would be pretty well strained to pieces.
740. What is your opinion as to the comparison between the timber in the dump-car and our own Colonial

timbers that you use? I should say that our timber is twice as durable; it is much heavier, and pro-

portionately stronger.
741. Did you give your attention to what was done at the trial of the car here? I looked at it at the time of the trial; I was invited to witness the trial, but forgot about it; I happened to be driving past, how-

ever, and seeing a crowd of people I jumped out, and was in time to see the car canted.

742. Have any improvements been made in our rolling stock—the D trucks for instance—so as to secure less weight in a truck and a larger carrying capacity? There have been several attempts to lighten the D truck, but experience has proved to the Department that it was not economical, and they have gone back to the type that was in use twelve years ago.

743. Are there on our lines at present any waggons running on bogies? Yes; there is a type of waggon called the G waggon. The sides are made to fall down so that they can place long logs or long machinery or iron-work on them, and as soon as such loads are discharged they can bring back hay, coal, or any

description of merchandise on the truck.

744. What do they carry? They are marked to carry 15 tons, but as a test they will carry 18 tons.

745. What is the weight of them? I think the weight is about 12 tons.

746. Were there 20 tons on the car which you saw tried at Boston? I do not think so. It was loaded with sand, and it was not quite half full.

747. What was the distance it ran? It was not attached to an engine. It was loaded and was waiting for a party of gentlemen to see it dumped. It had been brought about half a mile.

748. Can you tell us whether, since your visit to Boston, these cars have come into general use on the American lines? No; I have not heard. We take three or four railway papers, and I see from them that the cars are advertised as being used on such lines. They are advertised as being useful for carrying iron ore

749. That is the manufacturer's advertisement? Yes.

750. Not an independent report? No.

751. Mr. Suttor.] Is it usual, when the Government wish to invite tenders, for them to ask to have them submitted privately? It is done in cases of emergency. Two or three persons are asked to submit tenders, with a view to private competition.

752. That was the case here with regard to these dump-cars? I took it to be such. I took it that the Department wanted to obtain information as to the value of the cars.

753. Your impression was that the Department did not require the cars? That was my impression. 754. You heard nothing more? No.

755. Your tender was not accepted, and you have not built the cars? I have not built them.
756. When you sent in your tender, you said you were prepared to build 200 cars, similar in every respect to the sample car, for £180 each. Would they be duplicates of the sample car? Yes; but I did not think I was going to slavely follow the sample car. It was the type of vehicle I considered, and I thought they were worth £180 each.

757. The material and the weight of iron would be the same? We would have used our own hardwood;

We would not have used imported timber for them.

758. You have never constructed cars so badly made? No; and the Government would not take such work from us.

759. You say that if one of these dump-cars went to Mount Victoria, it would not come back again? Not with 20 tons on it—it might take 10 tons; but I do not believe the Government would allow the vehicle to go; the officers of the Department would draw attention to it. With 20 tons on the sized axles, and wheels under it, I do not that it would be safe. The wheels are only cast-iron. We have wrought-iron

wheels and steel tires to our trucks.

760. What amount of weight could you put on these dump-cars? I do not think more than 15 tons.

761. That is the same as you could put on the G trucks? Yes. If I were an officer of the Department I should object to put more than 15 tons on the car. I should have some hesitation in running them

over our lines, even with 15 tons on.

762. It comes to this, that the workmanship is inferior to any car you have ever made? Yes.
763. And that the construction is so unsuitable that they could not safely travel over our lines? That is my impression.

my impression.

764. And from the sort of material used they are not an improvement on what we have? They are not.

765. They are not so suitable generally as the trucks in use? No. With the wear and tear you would get out of them I believe one of our trucks would be good when that would be worn out.

766. Can they be used on our lines? They would certainly have to be altered before they could be used—that is self-evident. To alter them would increase the expense very much. The sides being high, you would have to lift loads very high. With our ordinary D and G waggons, when the sides fall down they are level with the platform but with the dump cars in their present style you have to lift high over the are level with the platform, but with the dump-cars in their present style you have to lift high over the side to load and handle it.

H. Hudson, 767. Do you think that any advantage would be derived if the sidings were altered? The expense of altering the sidings would be considerably more than the value of cars. I would admit this, that in running them to collieries where new sidings have to be made they might construct an elevated road so that they could use them; but for all our station accommodation there is no merit in them at all.

768. If they ran to a colliery they would have to be loaded? Just so.

769. There would be no advantage in unloading? No advantage; certainly not.
770. I understand the weight of these dump-cars to be 6 tons? No; I was wrong; it is 9 tons 16 cwt.; very nearly 10 tons.

771. And our G trucks are 12 tons? Yes.
772. For general purposes the G truck is far superior to the dump-car? I think it is just worth two of

them. You can utilize it for everything.

773. What is the contract price for G trucks? Our contract price was £300.

774. Do you think that the difference in cost would be saved by the difference in the length of the lives

775. Mr. Garrard.] Supposing that you had taken the contract for these dump-cars, would you have placed under them our present G bogies? I would have put a bogie similar to the specimen.

776. What would be the difference in cost? The bogie which we put under the G waggon is worth double;

it costs double.

777. Mr. Suttor.] To make the cars suitable it would cost the same as the G waggon? It would cost that by the time they were made to do the same work as the G wagon.

778. What is the cost of the G bogie? £80 or £90.

John Rae, Esq., called in, sworn, and examined :--

J. Rae, Esq. 779. What is your position? Under Secretary for Works.
780. You have been requested to produce certain documents in reference to the leasing of the old Atlas

5 Sept., 1884. Company's works;—can you do so? I am sorry that I have not any such documents to produce.
781. Can you inform the Committee if the Atlas Works have been leased to the Carson Company? that I can ascertain in connection with the land and premises that we took over from the Atlas Company, which is the place you refer to I suppose, is, that the Atlas Company offered to purchase the old material for £100. The offer was referred by the Railway Department to its officers, who reported that they thought it was a fair one; but before he came to any decision on the matter Mr. Goodchap sent it to our Department to ascertain if we knew whether there was anybody in possession or not. I sent for Mr. Woolcott, who is appointed to collect the rents, and he reported that the place was let at £2 a week on a modely tenerate.

782. By whose authority was it let? I cannot say.
783. Does this land belong to the Government? It does. It was taken under our Department, but Mr. Woolcott has been appointed under the Treasury to collect all the rents and to make all the money

he can for the Government, giving short leases—so that occupants might be turned out at any moment.

784. Has your Department been referred to as to whether it should be leased to Carson Woods & Co.?

No; the matter was reported to Mr. Wright, and that gentleman said, "Let the lease remain as it is."

785. Is it customary to let premises in such a manner? In regard to anything of this kind (a weekly tenancy) it is customary. Mr. Woolcott has been appointed to collect the rents, and to pay them into

the Treasury without coming to us.

786. Is Mr. Woolcott possessed of power to lease any premises without reference to the Department? I am not in a position to explain whether he is or not. He is not appointed by us but by the Treasury. What authority he got from the Treasury I do not know.

787. Over what land or buildings has he control? He was appointed to collect the rents of lands taken under the Land Resumption Act, and having to pay them into the Treasury we thought it was more convenient for him to be under the Treasury altogether.

788. What are Mr. Woolcott's duties? I have always understood that he was appointed merely to collect the rents and get a commission on what he collected. He may have had power from the Treasury

collect the rents and get a commission on what he collected. He may have had power from the Treasury to go further, but as far as I know he has been appointed merely as a collector of rents for the Government.

789. Over what lands or buildings has he control? I do not consider that he has any control except as to collecting rents for lands acquired under the Lands Resumption Act. He would attend to anything

required at a building and would inform us accordingly and get authority to act.

790. You are not in a position to inform the Committee how this land came to be leased to Carson Woods & Co.? No, it was not leased from us, and all that I understand is that it is a weekly tenancy and that they can be turned out at any moment. I do not think Mr. Woolcott would have power to lease without sanction from our Department or from the Treasury. As far as I know we have not granted a

lease. I do not know what the Treasury has done.

791. Mr. Suttor.] Are you aware when this land was leased to Carson Woods & Co.? I cannot tell, but on the 22nd of May Mr. Woolcott replied that it was let and Mr. Wright decided that they should remain as they were for the present.

792. Mr. Chapman.] It is let at £2 a week? That is all—a weekly tenancy.

793. Chairman.] I understand that Mr. Williams, who was leased to Carson Woods & Co.? I cannot tell, but on the 22nd of May Mr. Woolcott replied that it was let and Mr. Wright decided that they should remain as they were for the present.

documents in your hands in regard to dump-cars;—have you them with you? I do not know what they are. (Looks at them.) I now find that they are returns with respect to Carson Woods' contract for the manufacture of 200 dump-cars, and I hand them in on behalf of Mr. Williams.

Mr. William Scott called in and further examined:-

Mr. W. Scott. 794. Chairman.] Since you gave your evidence last week have you examined the dump-cars lately imported?

I have examined them, but whether I did so prior or subsequently to my giving evidence before is a matter 5 Sept., 1884. I am not clear upon. I cannot say the day, but I have seen them.

795. You have received your evidence for correction?

796. Have you corrected it? Yes.

797. Do you wish to make any further statements with regard to the dump-cars? No.

Mr. W. Scott.

798. There is one question which you were unable to reply to at the last meeting of the Committee. I want to know the quantity of coal you use daily, or we will say daily, at Eveleigh for locomotive purposes? 5 Sept., 1884. We use at present 100 tons a day.

799. What would be the quantity at Eskbank for coaling purposes? I could not say the quantity there. 800. Can you give a rough estimate? I should say from 40 to 50 tons.

801. How many dump-cars would you require to do the coaling? It would require about 50 continually running with coal for Sydney alone.

802. What weight are these cars supposed to carry? I think that they will not hold more than about 15 tons of coal.

803. Coal, sand, or firewood? Of sand, 18 or 20 tons.

804. Do you consider it would be perfectly safe to let 18 tons into these cars on a train coming (say) from Bathurst to Sydney, over our sharp curves and steep gradients? I think that 15 tons would be a very

good load. 805. Would it be wise to load any greater quantity? No; I would not like to see more than 15 tons

placed in them.

806. Do you know the weight of the cars imported? 9 tons 16 cwt. 807. What is the weight of a G truck? About 12 tons.

808. What quantity would such a truck carry with safety? They do not put more than 15 tons on them. We have them marked for 15 tons. We consider they are safe for 15 tons.

809. Do you think it would be safe to load a greater quantity on them? No; I would prefer not to do

810. Which do you think would be the safest: To load 18 tons in the G truck, or 18 tons in the dumpcar? I should say it would be safest in the G truck. It is a stronger truck.

811. What class of wheels is under the G truck? Iron centres and steel tires.

812. How many miles will they run without requiring to be re-turned? I can get 100,000 miles out of

813. How many times can you re-turn them? Five or six times.
814. What is the cost of re-turning the wheels under the G truck? About 15s. per pair.
815. What class of wheels is under the dump-car? Cast-iron chilled wheels.
816. How many miles will they run? About 50,000 miles. We have had 50,000 and upwards out of

817. How many miles do you think the wheels under the dump-car will run? From 50,000 to 100,000

miles; they vary.

818. And what is done with them then; can you do anything with them? No; you have to take them off the axle and put fresh ones on.

819. What is your experience in regard to the life and quality of the English wheels as compared with the American? The English wheels will last a life-time by re-tiring them.

820. What about the American? You must replace them by new ones.

821. After how long? After travelling from 50,000 to 100,000 miles.

822. Have you discovered any breakage or defects in the American wheels? We have had no waggon wheels break to my knowledge.

823. I mean American wheels generally? No waggon wheels. 824. Or engine wheels? Yes, we have had several of the bosses split.

825. You said you had none on the trucks;—do you import many trucks from America? No. This is the first I think with the exception of the meat car and the sleeping cars.

826. No cattle waggon? I believe there is a cattle waggon. Yes—the one cattle waggon. 827. Were they sample waggons? Yes.

827. Were they sample waggons? Yes.
828. Then am I right in assuming that the reason why you have never had any breakage in the American rolling stock is because you have not imported any? Yes.
829. This is the first dump-car, and it is not running, and the others were merely sample cars? Yes.

830. What has been done with the meat van? It is in the siding at Eveleigh.

831. How long has it been there? Some months.
832. Has it been in use? Not much.
833. Why? I do not know; but I believe it is unsuitable for the traffic.

834. You said that you received a sample cattle waggon? Yes.
835. How long ago? I cannot say the exact date, but it may have been twelve months, more or less.
836. What was the cost of it? That I could not say.
837. Has it been paid for by your Department? I believe so.
838. To what use has it been applied? It has not been used at all. I believe the Traffic Manager says that it is not switchly for cettle. that it is not suitable for cattle.

839. Is it to be reconstructed? Yes; we have instructions to re-construct it and to make a sheep van of it.

840. Is there any more rolling stock that you have imported from America? No, with the exception of the sleeping cars.

841. Have you tested their wheels? We have made provision to supply them with our own wheels and axles. There were none ordered for them.

axles. There were none ordered for them.

842. Why was not that provision made in regard to the dump-cars? I do not know.

843. I presume that the reason why you arranged for your own class of wheels to be placed under the sleeping cars was that you considered they were more serviceable and better adapted to our traffic than the others;—is that so? Yes.

844. You cannot inform the Committee why the same wise provision was not made in regard to the dump-With regard to the dump-cars the arrangement was made to supply them according to cars, can you?

pattern.

845. Did you consider it necessary to alter the pattern in any way? We had instructions to alter it for

846. Did you suppose you were to report on the design, the class of material, and the workmanship, and whether the class of wheels would be suitable or not? I think not.

:847.

Mr. W. Scott. 847. What did you consider you were supposed to report upon? A vehicle that would be suitable to interchange with our ordinary rolling stock as regards buffers and drawbars, and the arrangement was 5 Sept., 1884. made that it was to be according to a pattern-waggon.

848. Were you asked to give any opinion regarding the workmanship, material, design, &c.? No, I think not. 849. If you had been asked to do so before this order for 200 dump-cars had been sent would you have done so? Yes; if I had been requested to do.

850. Were you in charge of the Locomotive Branch at the time the order was given—that is about the 28th August? Yes; I must have been in charge then.

851. And you were never asked to give any report regarding the suitability or otherwise of this car. Were you present at the test? I saw them tipped on two occasions with Carson Woods.

Were you present at the test? I saw them tip 852. Were you present at the first test? No.

853. You mentioned just now that you never found any of the wheels on the trucks imported from America break; and from evidence given since then it transpires that the only classes of railway stock imported have been the cattle wagons and the meat vans;—is that so? Previous to them there were two

sleeping cars—three carriages in all with these wheels.

854. That is the extent of your experience? Yes, with regard to cast-iron chilled wheels from America.

855. Have you noticed any defects in any of the engine wheels imported from America? The only defect has been that we have had three or four split in the bosses.

856. Is that not a serious matter? Yes; but still when it is detected the wheel has been taken off and replaced by enother.

replaced by another.

857. Have you had any accidents from breakage in the wheels? No. 858. None of the trains broken down? No; not from the breakage of any of the wheels.

859. What has been your experience with regard to English-made wheels of engines? As a rule they

are very durably made of wrought iron throughout.

860. Is there the same liability to breakage as there is with the American importations? No.

861. Were you ever asked to report with regard to the advisability of providing a lighter class of truck which would be capable of carrying greater weight than the ordinary D trucks? Yes, I believe I have.
862. What report did you give? I do not recollect any report; but we have been asked to reduce the weight of our rolling stock

863. How long is that ago? It may have been since I returned, but for a number of years previous, in

Mr. Russell's contract, we had a number of light trucks made.

864. What is your experience of them? They were of light kauri timber, and we have had to renew nearly the whole of them since.

865. Since then have you made any other arrangements? We are always going into the matter. We are having plans made so that by the introduction of wrought iron frames we may reduce the weight.

866. Who recommended the G class of truck? I cannot recollect whether it was myself or not, or

whether it was the Traffic Manager. It was recommended previous to my leaving for England three

years ago. 867. Was any objection taken to that truck when it was made? It was considered to be too heavy, I

believe.

868. By whom? I think it was the Traffic Department.

869. Do you yourself consider it as too heavy? Not for carrying 18 tons. I think however that the bogie frame might be lightened a little, and this we are now doing.

870. I mean as regards the woodwork? I do not think it is too strong for the weight it has to carry.

871. Could you reduce it in weight and yet permit it to carry the same quantity over our steep inclines?

If we reduced its weight it would not be so durable. 872. Would it be safe to reduce the weight? It would be safe for a certain time; but it would not be

873. Mr. Poole.] I understand you to say, in answer to the Chairman, that if you reduced the total weight of the trucks they would not be so durable;—is that so? Yes.

of the trucks they would not be so durable;—is that so? Ies.
874. But to your mind as a practical locomotive engineer can these trucks be reduced in weight with perfect safety to their travelling for a limited number of years? That is possible.
875. Is it practicable? Yes, I believe it is, by using lighter timber and lighter ironwork.
876. Well then, following that view, would it, in your opinion, be a saving to the Department to use a lighter truck, carrying the same weight as the present one, but which would wear out in a shorter period than our present truck;—would that be a saving to the Department over a series of years for haulage alone?

That would be a metter of calculation That would be a matter of calculation.

877. Speaking generally, could the trucks be lightened without lessening the factor of safety? To a certain degree.

certain degree.

878. 25 per cent.? No. They might be reduced from 5 to 10 per cent.

879. Not more? No. I do not think it.

880. That would be at the cost of how many years' work or durability—what, in short, would it lessen the life of the trucks? A few years; it would depend upon the usage they get, of course.

881. I think the Committee may gather from your answers that, taking the thing altogether, you do not see that much improvement could be made by lessening the weight of our rolling stock? No.

882. Mr. Garrand 1 During your visit to A merica did you have an opportunity of witnessing the working

882. Mr. Garrard.] During your visit to America did you have an opportunity of witnessing the working of these dump-cars? No, I never saw them at all in America.

883. You are not aware whether they are in actual use there or not? No, I am not.

884. You are certainly of opinion that the cast iron chilled wheels are not near so safe or so economical as the wrought iron wheels with steel tires? No, they are not.

885. What is the difference between the cost of the English bogie and one of these American dump-car

885. What is the difference between the cost of the English bogie and one of these American dump-car bogies? Approximately the American bogie frame would be 10 or 15 per cent. cheaper.

886. You said you had no accidents to waggons with these wheels, but that there had been certain breakages in the engine wheels? Four, to my knowledge.

887. What did you replace them with? American wheels again.

888. Although you had experience of the fact that the previous one had burst? Yes.

889. Who was the designer of the G truck? I think that it was designed in Mr. Burnett's time.

890. You think it is not safe to carry more than 15 tons in this dump-car? That is a good load for it.

891. Are the axles of these cars the same as the axles in the G truck? I have not measured them, but they appear to me to be about the same size. they appear to me to be about the same size.

Mr. W. Scott.

892. The axles in the G truck will carry 15 tons? Yes; they are steel axles.

893. Are the axles in the dump-cars steel? I believe not.

894. Do you think that it would be perfectly safe to work these dump-cars over our mountain lines with 5 Sept.; 1884. a load (say) of 18 tons? I would not recommend it.

895. Are you or is any officer of your Department watching the putting together of these cars? Yes, Mr. Bourn, the Inspector of Rolling Stock.

896. Is he always on the premises? No. 897. Is there an officer of the Department always on the premises? No.

898. Is it not a rule, in the case of any Colonial firm tendering, for an officer of the Government to be

very frequently if not always on their works? Frequently, but not always.

899. In the case of a contract let to Mr. Thomas Wearne, was there not an officer always on his works? I could not say, as the work was not done under the supervision of my branch.

900. Going back to your own Department, how often did your inspecting officers visit Mr. Vale's place? Daily.

901. And he remained there for the greater part of the day? Yes, at the present time. 902. How often does Mr. Bourn visit the works at Darling Harbour? I cannot sa I cannot sav. only just beginning to be put together.

903. Who has charge of the Darling Harbour line? The Traffic Manager.

904. You do not know whether permission has been given to any one to use any of the lines or railway premises there? No, I do not.

905. Mr. Suttor.] You said the dump-cars were in general use? No, I did not say that.

906. Suppose you have a steel axle and an iron axle of the same dimensions, what is the difference in the carrying capacity of the two? A good steel axle is about 10 per cent. more than an iron one; but if you get an inferior steel one it will not carry so much as an iron one will.

907. I understand you to say that the axles of the dump-cars are similar to those in the D trucks, except that the axles in the D trucks are of steel? Yes.

908. Then it would carry 10 per cent. more than the dump-car? It has a greater factor of safety.
909. On the G car you do not carry more that 15 tons? Of coal you would not be able to get more on. 910. Considering that one axle is steel and the other iron, yet both are the same diameter, you would carry 10 per cent less on the dump-car than you would on the truck? Yes; but there is a large margin of safety on these steel axles.

911. Do you consider there is a great difference in the lives of the cars and the trucks? The G-truck is

a longer lived truck than the dump-car.

912. To what extent? I cannot say, for I have not yet had any practical experience of the dump-cars.

913. Then with regard to dump-cars you are working to some extent in the dark? Yes.

914. You do not know what the experience in America has been? No.

915. Do you think the workmanship in the dump-cars is equal to that in the Colonial trucks? I think it is about the same, with the exception of the bogic frames, which are lighter.

916. Do I understand you to say that it would not be safe to run the dump-cars as originally designed over the mountains?

1 would not like to risk them.

917. Do you consider them as safe now? I cannot say I do. I would like to see them over the mountains

on our 8-chain curves

918. You would not like to say they were safe until you saw them tried? No.

919. From your present knowledge of the dump-cars would you certify as to their safety? No, not until I have tested them.

920. Can you tell me the difference in the weights of the G truck and the dump-car? About 2 tons; the G truck is the heaviest.

921. Would that difference in weight be very much against the use of the G truck as against the dump-

cars in regard to haulage? No; I do not see it; 2 tons additional dead weight.

922. Mr. Poole.] What is your standard difference as regards strength and durability between steel and iron axles of the same diameter? I should say about 10 per cent. 923. Not more? No; I do not think so.

924. Is not the theoretical difference nearer 25 per cent. in favour of steel? Of course there is a great difference in steel. A good steel axle is 10 per cent. at all events more than an iron one, but in theory it may be worked out more.

925. If you consider it necessary to have a specific margin for safety in your G trucks with steel axles is it not also necessary to have the same margin of safety in connection with the dump-car axles? It would be better, no doubt; but I do not know what diameter the axles in the dump-cars are; I have not

926. Whatever margin of safety you give in the case of trucks designed and made here in view of the exigencies of our traffic and the peculiarity of our railroads, should you not insist upon the same margin of safety in connection with cars which are imported from abroad? It would, no doubt, be better to have the same margin of safety.

927. You do not consider that the dump-car axles and bogie frames give the same margin of safety as

your own G trucks? No; I do not.

928. Chairman.] In reply to Mr. Suttor you said that the workmanship in the dump-car was equal to that in the Colonial made truck. When you were before the Committee on the last occasion you were asked what you thought of the workmanship, and you said it was fair but not so good as your Colonial work. Have you any reason for altering the statement which you made on that occasion? The American class of work is lighter than the Colonial or English.

929. Is the workmanship as good as in your own articles? No; it is a rougher class of work.
930. Is it not usual to have tests made before using new rolling stock? No, I think not.
931. In the case of engines? We specify the material they are to be made of, the size of the cylinder, the length of stroke, &c.

932. If it is a new type of engine what do you have to guide you in regard to the workmanship, and to inform you whether it will do the work required in this Colony? We make out a specification.
933. Is it not necessary to have some test made as to whether the engine will bear out the specification?

There is an inspector to see everything carried out according to the drawings and specifications.

934.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE 32 Mr. W. Scott. 934. In South Australia it is customary to have a test made when importing engines: have you had similar tests here? No; I do not see what you would gain by them. We run 2,000 miles before we 5 Sept., 1884. sign the final certificate for an engine; 10 per cent. of the cost is kept back until the engine has run that distance to my satisfaction. 935. Who designed the American cattle waggon? I cannot say. 936. Were you in charge at the time it was imported? I was in charge at the time it was delivered. I knew nothing of it until it did arrive. 937. When was it imported? Shortly after I came back,—I think some twelve months ago; I have not got the exact date.

938. Since you returned from England? Yes. 939. Do you know when the order was sent for it? No.
940. Have you tried it? No; it has not been out.
941. Do you know why? I think the Manager thought it was unsuitable for cattle.
942. Have you examined it at all? Yes. 943. Have you reported on it? I really forget whether I have reported on it or not. There is a plan made out for altering it into a sheep van.

944. What will that alteration cost? That I could not say. 945. Was that car patented? I could not say.
946. Do you know by whom it was ordered? No.
947. Do you know the agents? I think that it was imported through Towns & Co.
948. Do you know the cost of it? No; I have not got the cost just now.
949. Has it been paid for by the Department? I think that it has. 950. Is it true that more than one cattle waggon was ordered? I am not aware.
951. Have you seen the papers? Yes; they must have gone through my office with the account before it was certified to 952. Did you certify to the account? I believe I did, but I am not quite clear; if it was paid I must have done so. 953. Do you know under what conditions it was accepted? No, I cannot say, unless I had the papers before me. 954. It was imported with the view of carrying cattle, was it not? Yes, I believe so—for carrying them with greater safety; there was a separate stall for each bullock.
955. Do you think it could be utilized on our lines? Not for cattle, unless you got stalled cattle; it would not do for wild cattle. 956. You referred also to the meat van? Yes. 957. When was that imported? About the same time as the sleeping cars. 958. What was the cost of it? That I could not say. 959. What was the cost of it? I not I could not say.
959. What year was it imported? I could not be sure of that, but it was about four or five years ago.
960. Who imported it? I could not say.
961. Has it been paid for? I could not say; it did not come before me.
962. Does it belong to your department? Yes.
963. Would you have charge of it unless the Government had paid for it? We could not consider it our property unless it was paid for.

964. Do you know whether it has been used? I do not.

965. Is it suitable? Not for what it was intended for.

966. Can other use be made of it? Yes, I think so. 967. Can you tell me why it has not been used? I do not know why the Traffic Manager does not use it. 968. Is there any objection to the design or the workmanship or the class of material? No, it is a light No, it is a light -very light. 969. Could it be safely used on our mountain lines? I have not examined it for two years or more.

970. Who imported it? I could not say.

971. Who is the agent? That I could not say.

972. In reply to a question I put to you some time ago, you stated the difference in the lives of a chilled cast-iron wheel and an English-made wheel? Yes. van-973. What time does it take for American or English wheels in the ordinary way to run 50,000 miles? It may take from nine to twelve months.

974. Do I understand from that that these dump-cars would run only twelve months when new wheels would have to be supplied to them? No; I should say about two years.

975. At the end of two years what would you do with them? If they were worn flat in any places we should take the wheels off and put others on.

976. Of the same type? We have put our own English type on.

977. In your opinion, after these cars have been running for two years they would have to have new wheels of the English type put on? The sleeping cars had a brake on all wheels, and these have not. We have had no experience of the life of the wheels on these dump-cars.

978. Do you believe that it would take two years for them to run 50,000 miles? Yes, if the car was not in continual daily use.

979. At the end of that time you think the wheels would be of no use? No; except as old material for melting up again.
980. How long would the English wheel last? It is everlasting by having the tire renewed; and the

tire will last five or six years.

1981 Would the tire cost as much as an American chilled wheel? Yes I think it would.

981. Would the tire cost as much as an American chilled wheel? Yes, I think it would. 982. What would it cost to re-turn? About 15s. a pair.

983. Would they be as good as ever afterwards? Yes.

Mr. Thomas Midelton sworn and further examined:—

Mr. T. 984. Chairman.] What is your occupation, Mr. Midelton? Locomotive Overseer.

Midelton. 985. When you were before this Committee last week, you were asked to examine the new cars which have been imported and to let us know what your opinion was with regard to the workmanship in them. If you

you have done so will you kindly favour the Committee with full particulars regarding the same? sir. I examined three new cars yesterday and also the pattern car. I found the head-stock in the pattern car fractured almost in two—very badly. It has been loaded with about 20 tons of rails and apparently something has gone against it very smartly, and the buffer which caught the head-stock has fractured it sept., 1884 right through. I also noticed that what is called the bolster beam of one of the bogies has deflected about $\frac{2}{3}$ of an inch with the weight of this iron. The beam is not strong enough or it is not trussed sufficiently. I looked at the work and I still hold the same opinion about the general build of the car, that it is very passable work as regards putting the car together, but it is not what is called finished work. There is no polish about it; but there are good joints, as there are also in the cars which are being put together to order. The ironwork is decidedly rough, and I could not pass a great deal of it—the hooks, chains, and axles especially. The axles are very bad indeed. I would not pass any I saw yesterday. I inspected the axles very closely, and I should not like to take the responsibility of allowing them to go on traffic before they are tested. Taken as a whole the woodwork, the bogies, and the body of the car seem fairly put together. The surfaces are not nicely smoothed down, but it is a good passable waggon job as regards the manufacture. It wants a coat of paint et-cetera, but I dare say that will be done. The timber is very good. The new cars have the same defect as the pattern car in regard to the buffer plank or head-stock. It will break in two the same as the others. It wants a strut to resist the thrust. I or head-stock. It will break in two the same as the others. It wants a strut to resist the thrust. I have called Mr. Scott's attention to the axles this morning so that he might go and look at them himself. I did not go to see these cars until I got a summons to be here to-day, and then I went after dinner yesterday to inspect them as I thought I had authority to. I wrote a memo to Mr. Scott, and I asked him if he would like to go with me before coming here. I drew his attention to the axles especially in the new cars as being defective. I thought also that if there had been time we would have gone this morning and had a look at them. I dare say we will go round this afternoon and have a look.

986 Are the cars as good as the pattern car? The work is as good as in the pattern car but I would. 986. Are the cars as good as the pattern car.? The work is as good as in the pattern car, but I would not like to be responsible for them in any shape or form.

987. Why? I do not approve of the wheels, and I do not approve of the axles.
988. In what way do you not approve of the wheels? It is a question of cost. Some people think first cost is everything. You may buy a cast-iron wheel at half the cost of another, and it may break in two and cost you more than 100 wrought-iron wheels; and therefore I would not support the introduction of cast-iron wheels—the American cast-iron chilled wheels I mean. They are used to a large extent in America, but with bad results, and they are going to use wrought iron wheels and steel tires there now. 989. Are you aware of any accidents there? Yes. I could refer you to the Railroad Gazette, where you can learn the general nature of the accidents. There is a summary there giving all the accidents. Something like the Board of Trade returns—a slight summary of the accidents every month. It is published in the Railroad Gazette and is open to every one. lished in the Railroad Gazette and is open to every one.

990. Do they attribute the accidents to this class of wheel? They are getting to the opinion that castiron wheels are the dearest in the end, and therefore they are going to steel tires as fast as possiblevery fast in my opinion, considering they have been such strong advocates for chilled cast-iron wheels.

991. Do you think it would be unsafe to run these cars with the present appliances over the mountains? I think it would be unsafe as regards the axles. We might get 200,000 miles out of the wheels without a mishap, but not a quarter of that distance out of the axles. They are the worst axles I have ever

992. Do you think there would be danger from them? Yes sir; they are the worst part of the car.

993. What is the difference between the car now being put together and the G truck. The axles look to me to be slighter in the middle. There may be about a for an inch difference in diameter. Our axle is 34-inch in the centre and tapers to 5 inches near the wheels; but these axles are made a different shape and not a better shape by any means. I consider our present steel axle a very good one; that is the English imported axle. They are a nice shape, but I do not consider these American axles a nice shape; the change from the centre to the inside of the bosses is too sudden. It wants a nice gentle change from the small to the big diameter.

994. After careful consideration you are of opinion that it would be unsafe to use them on our lines? Certainly; I would not pass one out of the whole lot I have seen. Even after a test I should be very doubtful of them.

995. Why would you be doubtful then? Because there might be a hidden fracture which we could not find out, unless we tested all, and we could not do that; we can only take a view generally.

996. Have you considered the manner of attaching the frame to the bogie? Yes; I think now I have

996. Have you considered the manner of attaching the frame to the bogie? Yes; I think now I have seen the whole that it is worse than in the original car.

997. In what respect? The bogie will twist on a curve and a link will tend to release itself from the bracket on the bogie, and the other will get further into gear, but I think it is possible for both to get out of gear, and the car dump itself. They are not far enough apart; they should be the width of the gauge, but they are inside considerably.

998. Is there any king bolt? Yes; there is a pin with a joint which goes through a dowel, but it is rather weak. I daresay it might answer the purpose of preventing the car jumping out of the bogie seat, but I would not call it a firm and secure thing now.

but I would not call it a firm and secure thing now. 999. With your large experience would you consider it safe to travel on our mountains with a king bolt of that description? I should not consider it safe.

1000. Are you still of opinion that with a sharp shunt there would be a liability of this king bolt breaking, and the body of the car detaching itself from the bogic frame? I should think it a very likely thing to occur. 1001. Do we understand clearly that after careful examination of this car as regards the wheels, the axles, the dumping apparatus, and the manner in which the body is attached to the frame, you have no reason to alter the opinion you have previously expressed that it would be unsafe to run the car'on our lines? You might run it all right but it is a risk.

1002. Do you think it wise to run such a risk? No, certainly not; I would not do it. I would not take

the responsibility.

1003. You told the Committee that you were connected with the Railway works since you were a boy?

1004. Have you had many opportunities of judging as to the safety of rolling stock, et-cetera? think I have had as good experience as any man you could name.

1043—E

1005.

34

Mr. T. Midelton. 5 Sept., 1884.

1005. Where did you gain it? I served my time on the Great Western Railway, and I have worked at Beyers and Peacock's as a mechanic and as a draughtsman; also as draughtsman at the Vulcan Foundry, Newtonly Willows, Lancashire. I also worked as a mechanic on the Great Eastern Railway and rose to the position of a foreman, and there I sent out 132 engines a day. I had the sole responsibility of the 132 engines and their tenders, and I never had a mishap of any note that I am aware of. From that place I was offered a very good position as engineer to the Smith Vacuum Brake Company. The inventor offered his invention to my superintendent, Mr. Adams, and asked permission to put it on a train, and Mr. Adams sent Mr. Smith to me, and I had carte-blanche to put it on as I thought proper. Mr. Smith explained his idea to me, and he said, "I will leave it in your hands," and I believe it is running now. Mr. Smith offered me £500 a year to go with him to fit it on other lines in England. I was with him eighteen months, and I fitted it on the Great Northern Railway, the North-Eastern Railway, the Manchester, Sheffield, and Lincolnshire on the Great Northern Railway, the North-Eastern Railway, the Manchester, Sheffield, and Lincolnshire Line, and the Monmouthshire Railway, and there were one or two other lines which I almost forget. The Brake Company got into financial difficulties, and I did not receive my salary, and I thought it prudent to look out for something else. I was offered a position on a railway in the Isle of Man. I went to look at it, and it happened that one of the directors was chairman of the Tasmanian Railway, and he said, "We want you to go there." I said that I did not want to go there, and he said that if I did not take that he did not think I would have the other; so I thought a few years in Australia would not hurt me, and I came to Tasmania in 1876 as Engineer and Loco. Superintendent of the main line railway. My strict orders from the chairman were to put things to rights there, because everything was upside down. I was to have full authority and power to put things right in Tasmania. Everything was upside down there, and the rolling stock was anything but what it ought to have been. In fact he told me that it was all wrong. I came here and I effected all that I was sent to do. I was in Tasmania from July, 1876, to about May, 1878, when I left the Company's service. The general manager of that line was very friendly indeed for the first twelve months, until I commenced to make improvements, when he got a little cross. I said that I could not alter my tactics and submit to your control. I will submit to your control if the Board directs me to, but the responsibility of the mechanical department lies with me. I held that posi-Board directs me to, but the responsibility of the mechanical department lies with me. I held that position for two years and effected what I was sent out to do.

1006. How long is it since you entered the service of the Government of New South Wales? I started in August, 1880.

1007. By whom were you appointed? Mr. Burnett gave me a position as draughtsman in his office.

1008. Since then you have worked up to your present position, of course? Yes, sir.

1009. Have you examined the buffers of these dump-cars? Yes, sir.

1010. What do you think of the workmanship in them? I am afraid that the outer edges will break off.

They are cast-iron. It is not what is shown on the drawing; it is wrought-iron there.

1011. But were there any cast-iron buffers previously? Yes; on American stock, on passenger cars; cast-iron heads and wrought-iron spindles; but they are not subject to same sort of strain.

1012. On our waggons? Not in my time. I do not remember seeing any.

1013. Have you ever been asked to report with regard to the advisability of providing rolling stock of a

lighter description, yet capable of carrying extra weight? Yes, repeatedly, and I have done it.

1014. How long is it since you were asked to do so? From the commencement; and my own bent has been that way. I want to reduce the dead weight as low as I can. That is my forte. I have made I have made drawings, but I have not carried them into effect, except in the case of carriages. I have nineteen running out of twenty-four of these designed and built to my design. The Traffic Manager recommended twentyfour, and I designed them. I have also proposed additions to the waggon stock which have not been

four, and I designed them. I have also properly finished, but the drawings have been made.

1015. Have the drawings been approved? They have not been submitted yet. When I started I was Locomotive Engineer, and I could then do what I cannot do now; but the drawings are made and the Locomotive Engineer, and I could then do what I cannot do now; but the drawings are made and the Locomotive Engineer it was done when Mr. Scott was away. The design I referred to in the paper ideas approved of because it was done when Mr. Scott was away. The design I referred to in the paper has been approved of.

The additions to the waggon stock which I proposed were:4-wheeled waggons and double-bogie waggons.

The waggon I refer to specially is what is called a platform waggon, with a flange

round the edges, which I call a coal waggon, or a wool waggon.

round the edges, which I call a coal waggon, or a wool waggon.

1016. What is the weight of it? 8 tons 10 cwt.

1017. What weight will it carry? 25 tons. It will carry 20 tons with perfect safety. I would not hesitate to put 27 tons on as a test load.

1018. What class is it? It is a double bogic wagon, like this dump-car. It is longer and quite as wide.

1019. Has the design been approved of? Yes, the rough outline, with my papers making the recommendation, has been approved of; but the finished drawings have not been submitted; but I apprehend that they will be approved of.

1020. By whom was the design approved of? The Commissioner. I wrote a paper and submitted a tracing to him.
1021. Was your recommendation made previous to the dump-car being imported? Yes; I think before

I heard of the dump-car. 1022. Regarding the class of truck to carry a greater quantity with less weight provision has long since been made to carry that into effect? Yes, certainly. The drawings can be produced if you wish to see

them. 1023. You also mentioned about the four-wheeled waggons you designed? Yes. 1024. What is the weight of the four-wheeled waggon? 4 tons 5 cwt.

1025. What weight will it carry? Seven and a half tons of coal, or anything else like that, or ballast.

1025. What weight will it carry? Seven and a half tons of coal, or anything else like that, or ballast. 1026. You also mentioned to the Committee that you constructed a number of carriages? Yes. 1027. What was the weight of those carriages? The first class was 12 tons 16 cwt. empty. There were six compartments, and a capacity for holding seventy-two passengers. That would be a crowded car; but taking an average of four aside that would be forty-eight passengers. The weight is 12 tons 16 cwt. without the gas apparatus, but with that and the brake it would be 13 tons 6 cwt. I do not know exactly any class of car that would compete with that except the Cleminson car. The Cleminson car, however, is considerable heavier in every respect. The American car is 16 tons 10 cwt., and my carriage will carry as many as that. It is the lightest, simplest, and strongest car we have in my opinion. I do not know of any car there to equal it. It is a very useful car. There are plenty of its type running in the suburban trains, and

35

ON THE PURCHASE OF RAILWAY ROLLING STOCK.

and in express trains, and there are some in the yard. I have the same type of car in the second-class with seven compartments that would carry eighty-four passengers for the same weight. I have also a Mr. T. Midelton. composite carriage of the same size, length, and width, so that you can have any class of accommodation, first-class smoking and non-smoking, and second-class smoking and non-smoking. Those are the cars I sept., 1884. have built; and the waggons which I have referred to may with them be fairly and justly considered to answer the question of reducing dead weight and increasing the carrying capacity, considering that I

have been in office only a little over two years. 1028. How long were you acting as Locomotive Engineer? Mr. Scott went away in June, 1882, and he came back in July, 1883. In round numbers he was away thirteen months. He did not resume duty for three weeks after his return, as he was ill.

1029. Were you in communication with the Commissioner? I saw him several times a week and we agreed upon the desirableness of reducing the dead weight and increasing the dividends.

1030. You think this new waggon of yours will answer that purpose? Oh, yes sir.

1031. You see here a sketch showing the way in which it is proposed to coal engines with the dump-cars, will you furnish the Committee with your opinion on the system? It is not the best system by a long

1032. Why do you think that it is not suitable? Because the coal is handled twice more than it need be, and you require an exceptional spot to utilize this mode. You cannot in all cases have the two elevations with one so much above the other. This is proposed for Eveleigh. Well, I am totally opposed to it. It is expensive and not the best and most expeditions way of doing it. The portions of the stage It is expensive and not the best and most expeditious way of doing it. The portions of the stage occupied by the coal would be about one-third of its width. To remove that coal from where it is dumped to the tender it necessarily must be shovelled into the small four-wheeled waggon shown on the sketch, and wheeled across the stage the other two-thirds, and then tipped by hand into the tender. That moves the coal twice unnecessarily, and deteriorates it unnecessarily. I could accomplish the process of coaling without handling the coal at all.

1033. In what way do you propose to do that? Well, there would be the platform waggon I have referred to—the 8-ton 10-cwt. waggon, or the four-wheeled waggon, made perfectly flush, with only iron round the edges. In that waggon I would have thirty boxes, each of which would hold 10 cwt. of coal. The boxes would fit close together, and they would be very cheap. What would pay for that stage would pay for my boxes. These boxes are made to fit as close together as bricks, and the plates come close together also; and these waggons go to the mines and are filled like an ordinary waggon. They are never touched until they come to the locomotive depôt, and then they stand on a road by themselves. Next to that road would be an old locomotive with a small crane fixed to it, and near that, within 10 feet, would be the engine to be coaled. The operation then is for the crane man to swing the chain round to one of these boxes; he takes this up and swings it round to the engine, and he hauls in a chain and tips the contents of the box down. That, however, is only half of my system. You must get rid of the ashes in the pit. In my case I drop an empty box into the pit, and the man under the engine rakes the ashes into the box and with the same crane you can dump the ashes into a ballast waggon and they can be taken away and utilized on the road. The coal is weighed and measured on the crane and it is not handled

or deteriorated in any shape or form and every man knows what he takes on.

1034. Has the system been in force? Yes, I tried to use the pattern dump-car for the purpose with Newcastle coal to dump it on to the engine, but the car was too wide and I could not get it in by about 4

inches. Mine is acknowledged to be the best system of coaling engines and I am the inventor of it.

1035. Who acknowledges that it is the best? Everyone who has seen it: the introducer of the dump-car, Mr. Carson Woods; and it has also been approved of by the Commissioner.

1036. Has the Commissioner approved of it? I furnished drawings of it over twelve months ago. The system has been approved of and I have had instructions to construct it throughout the lines, and the Commissioner gave instructions that I was to be assisted in carrying it out, and that I have done as far as I can under the circumstances. I have been removed now from the position of Locomotive Engineer to my own position as Locomotive Overseer.

1037. Has any objection been made to your system by any of the officers? Yes, I had objections to meet

generally throughout.

1038. By whom were the objections made? I think the Traffic Manager, and I think Mr. Cowdery objected, but the Commissioner certainly supported the system. In fact he wrote a very handsome minute on the papers instructing me to carry it out. We argued the thing fairly. It was sent to the officers and it was sent to me, and I replied, and I gained the day.

1039. Are the statements of the officers in writing? Yes; the papers show the whole transaction.

1039. Are the statements of the officers in writing? Yes; the papers show the whole transaction.
1040. Will you produce the papers? I can ask for them in an official way, and I have no doubt they will be produced in the usual way. I may mention that I am well on with the scheme at Goulburn. The yard be produced in the usual way. I may mention that I am well on with the scheme at Goulburn. The yard is laid out to my design and the shed also, and time will tell whether I am right or not; but I know I am

right, and I am quite willing to let time speak for itself as to whether I am right or not. It is partly working now in the Sydney yard. But at Goulburn it will be exactly as I want it.

1041. You say that the system is speaking for itself at Sydney. Do you allude to a saving? Yes, a saving. I am coaling more engines with fewer men.

1042. What do you assume the saving to be? I should say 3d. or 3½d. a ton; and it will be more when

the ashes are considered.

1043. Will the dump-cars be required for your scheme of coaling? No; and I can use the waggons for wool during the wool season.

1044. Have you been asked to report as to whether this system of coaling by the dump-car would be better than yours? No; I have been asked for nothing since the original minute on the first page of the papers was written. Mr. Scott favours this scheme, but I claim that my scheme is the best. Mr. Carson papers was written. Mr. Scott favours this scheme, but I claim that my scheme is the best. Mr. Carson Woods has admitted mine to be the best, and he has been through America. I know the places in England where the coaling is done, and I am getting letters from home asking me for leave to use my

system.

1045. Have you patented it? It has been patented. Some friends of mine have paid the money, for I could not afford it. I am satisfied to see it work satisfactorily.

1046. What is the weight of each of your boxes? About $3\frac{1}{2}$ cwt.

1047. How many are there in the truck? Thirty in the double bogie, and fifteen in the four-wheeled waggon. They are both iron waggons, and the wheels and axles are stronger than any we have, and are also made to my design with a new tire-fastening.

Mr. T. Midelton. 5 Sept., 1884. 1048. I want to find out the weight of your new design of bogie waggon that will carry 20 tons? That is

1049. And with the boxes? Thirty times $3\frac{1}{4}$ cwt. more. The inside dimensions of the dump-car are 27 feet 6 inches. My waggon is 31 feet, and the four-wheeled waggon is 15 feet $5\frac{1}{4}$ inches. The width of the American car is 8 feet 3 inches against my 9 feet 3 inches. The depth of the dump-car is 2 feet against my 2 feet 3 inches. The depth of the dump-car is 2 feet against my 2 feet 6 inches. The weight of the American dump-car empty is 9 tons 16 cwt. 2 qrs.; the weight of mine is 8 tons 7 cwt. 1 qr. 15 lbs. Mine is iron, and that is wood. The American car with boxes would be 12 tons 14 cwt.; mine would be 13 tons 3 cwt. The weight of coal carried would be 20 tons in the dump-car, and 15 tons in mine. The weight of the dump-car loaded with coal would be 29 tons 4 cwt., and the weight of mine 28 tons 3 cwt. We could each carry 20 tons of rails. The weight of the dump-car with 20 tons of rails would be 29 tons, and the weight of mine 28 tons 7 cwt.

weight of the dump-car with 20 tons of rails would be 29 tons, and the weight of mine 28 tons 7 cwt. My car being wider and longer will carry more wool of course than the dump-car. 1050. You say yours is wider? Yes, my waggon is 9 feet $3\frac{3}{4}$ inches wide, and that will clear everything; but the original dump-car is 9 feet 6 inches, and that will not clear everything. 1051. Have you given us particulars of the smaller waggon? The total length of that is 15 feet 5 inches, the width 9 feet 3 inches, the depth 2 feet 6 inches with boxes. The number of coal-boxes would be fifteen, and the weight of them 2 tons 8 cwt. The weight of the waggon loaded with empty boxes would be 6 tons 10 cwt.; the weight of coal carried 7 tons 10 cwt. The weight of the waggon loaded with coal would be 14 tons. That is $7\frac{1}{2}$ tons load, and we do not carry more than 7 tons at the present time. I guarantee the strength of the waggon to be greater and the life of it longer; if they are not I would be glad if somebody would show me where that is not the fact.

1052. I understand you to say that it has been criticised, and that your design has been approved of? The Commissioner has approved of it; but the officers generally disapprove of it. Probably they think the dump-car is the best. Mr. Read advocates the dump-car for coaling engines, and I especially went against that.

1053. Are there any other papers with regard to this dump-car that are not in the papers before the Committee? I can hardly say; but there is my letter to Mr. Hudson in my letter-book, and a copy of that I can get. It was written after a conversation with the Commissioner, who asked me what I valued the dump-car at, and asked Messrs. Hudson Brothers what they would build a number for. I wrote to them the same afternoon, and got a reply. My letter I have in my book, and the reply you have. I will

get you a copy of my letter.

1054. Mr. Chapman.] There is one portion of your evidence which appears to me the most alarming of the whole lot. You state that the axles of the dump-cars are the worst you ever saw? That is a fact, sir.

It may hurt my reputation to say it, but I still insist upon it. It is my honest opinion.

1055. If an accident were to occur from these very bad axles ought not the Commissioner to be held highly culpable for using them? He would if I reported them to him. I apprised Mr. Scott of what I saw, and I presume he would send that report on or send a paper to the Commissioner himself. I think it is a mistake to not the order the redsider. it is a mistake to put the axles under the vehicles.

1056. Was the system of coaling that you speak of and explained to the Committee introduced by you before the ordering of these dump-cars? Yes, and approved of by the Commissioner.

1057. You also said that by the using of your coaling waggons you would save $3\frac{1}{4}$ d. or $3\frac{1}{2}$ d. a ton without depreciating the coal or handling it. How many tons are you supposed to use in a year? We use 105 tons a day at Sydney.

1058. Will you give us the approximate quantity of coal likely to be used on the south and west? Oh,

yes; I can give you that approximately.

1059. Mr. Sutherland.] You have stated that your truck that you have invented for coaling will carry 20 tons of rails, and you say that the dump-car will carry 20 tons of rails? That is stipulated on the car; but judging from the load on it I would like to reduce it to 15 tons to be safe. It is printed on the side of the car that it will carry 40,000 lbs., that is, 20 American tons; but I think 15 tons is sufficient

1060. What do you say yours will carry? I guarantee to carry 20 tons, under all conditions of railway

traffic, of anything that can be put on it that will ride on a platform waggon.

1061. What do you say will be the difference in the life of your car and the life of this dump-car? I would say that mine would last twice as long, as mine is iron and that is wood. Mine is scientifically constructed, and I do not care who examines the design. I do not hesitate to submit the designs to any man, a locomotive engineer, and competent to judge.

Mr. Edward John Bourn called in and further examined:-

Mr. E. J. Bourn. 5 Sept., 1884 1062. Chairman.] The Committee asked you to examine the dump-cars now being put together, and to give us your opinion concerning them;—have you done so? Two or three times.

1063. Have you any reason to alter your opinion concerning them? They are making a little better pro-

vision to keep the dumping arrangements from slipping out.

1064. Do you think the arrangement they have made is a safe one? I can hardly say that it is. I am afraid there is not sufficient precaution to keep the car safe in a sharp curve.

1065. You think there is danger? I have a doubt. 1066. Would they be safe going over the mountains? I would like to see one go over first before I pronounced an opinion on that point.

1067. Have you examined the king-bolt? They have a very good arrangement. The pin allows it to dump

1068. Is there any danger of that jumping out? No; for it is keyed.

1069. Is there any danger of its being broken by a sharp shunt? I think it would take a sharp shunt to break it.

1.070. Do you think it would be broken in a sharp shunt? It might be broken at the knuckle or joint. 1071. If the king-bolt broke in the way you say would the frame be likely to become detached? The would be a liability in that case, but with the king-bolt perfect there would not. 1073.

1072. Supposing the king-bolt broke? They are only cast.

Mr. E. J. Bourn.

5 Sept., 1884.

1073. Would you recommend a car of that description for running over our mountains? I should like to see it tested first with regard to the dumping apparatus.

1074. Have you examined the buffers? Yes.

1075. What is your opinion about them? They are cast-iron.

1076. Do you think they are suitable for our lines? I do not like them as well as our own.

1077. What is your opinion as regards the workmanship, the design, and the materials used in connection with the dump-car? The timber is of good quality and it is well put together; but there is nothing particularly smooth in it. In the framing there is not sufficient strut put to resist a blow or to prevent the buffer being knocked right through the head-stock.

the buffer being knocked right through the near-stock.

1078. Have you examined the wheels? I have not had time to go over the wheels.

1079. Have you examined the axles? No, not yet. The ironwork is very rough.

1080. Is it a car that you would pass? Not in its present state.

1081. Independent of the axles and wheels? Yes, independent of the axles and wheels. The first head-stock would have the whole weight of a train upon it and would be very likely to be pulled out in the case of there being twenty cars or so attached to it. There is no continuous draw gear, and a piece of $4\frac{1}{2}$ wood has to bear the weight of the whole.

TUESDAY, 16 SEPTEMBER, 1884.

Bresent :-

Mr. CHAPMAN,

Mr. GARRARD,

MR. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

The Hon. Geoffrey Eagar, called in and examined:-

1082. Chairman.] You are Under Secretary for Finance and Trade? Yes.

1082. Chairman.] You are Under Secretary for Finance and Trade? Yes.
1083. Have you brought any papers with you with regard to the leasing of the old Atlas Company's works to Messrs. Carson Woods and Company? No.
1084. Do you know anything in regard to the leasing of the premises? All I can say is that the property to which you refer was resumed some time ago by the Works Department for public purposes; and on a particular date Mr. Woolcott was appointed to collect certain rents, subject, I infer, to the approval of the Minister. Then the matter came under the cognizance of the Treasury, as we had to look after the revenue; on a particular date we wrote to Mr. Woolcott, pointing out to him his duties, and asking him to furnish the necessary bond and make the necessary declaration, and instructing him to lodge his collections daily in the Bank, to furnish monthly attested accounts to the Auditor-General, and to furnish us with a list of the tenements on the resumed land at Pyrmont, and the particulars of the rents payable upon them. (The letter was read by witness and handed in. See Appendix marked B.) Beyond that upon them. (The letter was read by witness and handed in. See Appendix marked B.) Beyond that letter I know nothing of the transaction.

1085. Had Mr. Woolcott any authority to lease the premises? We had nothing to do with that. It was notified to the Treasury by the Public Works Department that Mr. Woolcott had been appointed to collect the rents of the property. The relation we had with him was this, that he was under the Audit Act a public accountant, he was under certain liabilities and obligations, and the object of the letter I have just handed in was to bring him in contact with us as a public accountant. I only knew him as a revenue officer, accountable to the Treasury.

officer, accountable to the Treasury.

1086. Have you any papers in your Department showing the amounts of rent to be paid? No, we waived that, but kept a careful check upon his receipts. We did not press for the list of tenements.

1087. How did he ascertain the names of the tenants? He had his own leases, I presume.

1088. Who furnishes him with a list? That I cannot say. Our instruction to him was to give us the list of tenants, and we did not press for it on the understanding that he was to furnish the Auditor-General with particulars; I do not know who are the tenants of the property; all I know is that we look after the revenue and we leave the Auditor-General to look after the accounts.

1089. You cannot say who pays the money? No. we keep no check on the accounts: we have nothing

after the revenue and we leave the Auditor-General to look after the accounts.

1089. You cannot say who pays the money? No, we keep no check on the accounts; we have nothing to do with the management of the property, nor have we power to interfere.

1090. You are able to say who Mr. Woolcott got his instructions from respecting the rent to be collected at Darling Harbour? He received instructions from us to pay it into the Treasury.

1091. But regarding the amount of rent to be collected? I do not quite understand.

1092. We understand that the premises at Darling Harbour have been leased to Carson Woods & Co. at a certain rental, and we want to know by whose instructions this rent was collected? That I cannot tell; I can only say that it was not by any instructions from the Treasury, beyond those contained in the letter a certain rental, and we want to know by whose instructions this rent was collected? That I cannot tell; I can only say that it was not by any instructions from the Treasury, beyond those contained in the letter of general instructions. For up to this moment we do not know who is the lessee, or what he pays. 1093. Mr. Chapman.] You are not aware whose duty it is to arrange the amount of rent to be paid weekly or monthly, as the case may be? I imagine that the property was placed in Mr. Woolcott's hands by the Works Department, and that he was to let subject to the approval of the Minister, and to account for the rents to the Treasury. He manages different properties for us; he manages that property for the Works Department; he manages some property for us distinct from the Works Department; what he does is to let subject to the approval of the Minister; he looks after repairs, pays all the rates and taxes; he has, in fact, the fullest control, subject to the approval of the Minister.

1094. What we want to get at is this: For instance, there is property at the corner of Market and Eliza-

1094. What we want to get at is this: For instance, there is property at the corner of Market and Elizabeth Streets;—who arranges the rent of that? Mr. Woolcott, of course.

1095. It is all left to Mr. Woolcott? I presume so; he is looked to to find tenants; he then submits his proposal, and we accept; he does so in regard to all properties in which the Treasury is concerned, and I properties in the same in regard to all properties approached with the Works Department. presume it is the same in regard to all properties connected with the Works Department.

William Prout Woolcott, Esq., called in and examined:

W.P. Woolcott, . Esq. 16 Sept., 1884.

1096. Chairman.] What position do you occupy under the Government? Collector of rents for resumed

1097. Have you anything to do with arranging the rents, the amount of rent to be paid for any Government property? I have.

1098. Do you remember making any arrangement in regard to the leasing of the old Atlas Company's Works to Carson Woods and Company? I do.

1099. Did you arrange that? I did.

1100. Subject to the approval of the Commissioner of Railways or the Government? Not as to rent.

1101. Have you full power to lease Government property without referring the matter to the Minister? In temporary matters such as this was; simply because I thought it was a matter in which there could be no doubt as to the rent we are getting for it under the circumstances, the tenancy being a short one.

1102. Who made application to you for the lease? Mr. Woods.
1103. For what purpose, did he say? For the purpose, he told me, of putting together trucks.
1104. What kind of trucks? Railway trucks, I believe; in fact I have been over there once or twice

since, and have seen them putting together trucks.

1105. Was the Minister for Works, or any member of the Government, made acquainted with your letting these buildings? I may say, first of all, that I am an officer of the Treasury; these properties are letting these buildings? I may say, first of all, that I am an officer of the Treasury; these properties are sent to me to deal with as soon as they are resumed; and when I get this notice I am supposed to find tenants for them; where the properties are vacant I get them occupied; as a rule the rents are fixed by previous tenants; but where valuations have to be made I have to consult Mr. Byrnes and Mr. Mills. But I may say that I have not had more than half-a-dozen instances of valuations where such a course was necessary, where the rent was not fixed by the previous tenant. Then, I being an officer of the Treasury, these properties are put under the control of the Treasury, so that they can have more control over me and the revenue derived from the properties. I am, as an officer of the Treasury, directly accountable to the Treasury to give any information at any moment for anything I.do. The properties that have been placed in my hands in this way to manage are under several Departments. For instance this Pyrmont property to which you refer is under the Works Department; some of it is under the control of Mr. Goodchap, and some of it under Mr. Moriarty. If I were dealing with the part connected with the water I should have to consult Mr. Moriarty; if dealing with the land I should have to consult Mr. Goodchap, as to how far I was justified in letting the place. I can speak as to this property specially. 1106. I wish you would do so? This special property was occupied by the Atlas Works, and was occupied by them from the first; they have not paid rent, inasmuch as they were exempt under the conditions of arbitration, so that the property has really never been let for a tenancy. When it was taken by the Government it was a question to arrive at the value to be paid to the owners; that value was arrived at by arbitration in Court; by that arbitration the owners were allowed to occupy the land free; so that until Mr. Woods went there no other tenant was ever in possession of it. When Davy and Company until Mr. Woods went there no other tenant was ever in possession of it. When Davy and Company occupied it the Government took possession of some portions of it, and took the property as they wanted it. The only portion left consisted of some sheds now occupied by Carson Woods and Company. It was my duty to inquire from Mr. Goodchap and Mr. Moriarty, when Messrs. Davy & Co. left, how I might deal with the property for the purpose of getting a revenue in the shape of rent. I was informed that it was not desirable to deal with it, because they could not give any length of -nothing that would induce any person to take it.

1107. Did you consult Mr. Goodchap or any other Government officer regarding the amount of rent to be paid? No, I did not; because I had a certain license to let the property for a short tenancy for what I considered to be a reasonable rent for the Government under the circumstances. For instance, Mr. Woods is a weekly tenant, and I should not think it necessary to consult any one; I should not know who to go to; who would know better than myself what would be a reasonable rent under the circumstances. I dealt with it the same as I should deal with my own private property, if I had to deal with it for a weekly tenancy. I had to catch the first I could as a tenant, and to get the best rent I could. But I did not inagine I should get a tenant at a weekly tenancy, who would put goods there subject to be turned out at a week's notice. This gentleman, Mr. Woods, who would put goods there subject to be turned out at a week's notice. This gentleman, Mr. Woods, who was a stranger to me, applied for the premises, and I was only too glad to get a small rent under the circumstances. The place was idle, and I immediately advised the Commissioner that it should be let at a weekly tenancy; when I had let it I advised the Railway Department of what I had done, and my

action was confirmed.

1108. Who did you write to? Mr. Goodchap.
1109. Do you remember the date? At the date of the agreement, a copy of which I now hand in.
(Agreement to let premises handed in and marked Appendix C.)
1110. Did you receive any communication from the Government when you had advised them in regard to the matter? I saw Mr. Goodchap, who said the arrangement could remain until the Government wanted

the property.

1111. Mr. Chapman.] It was a verbal communication? I gave him a memorandum of the letting.

1112. Did he give you one in return? No.

1113. Are you empowered to give short leases? No, not without special application and consent; I can act in regard to a weekly tenancy such as this was, subject to confirmation, rather than let it remain idle. It was only this man's necessities that induced him to take it; he had his stuff here and was prepared to take the risk of being turned off at a week's notice; in fact, since he was there the Government intimated that they intended to make a road through the place. I gave him to understand that I would let him the place, but that if the Government required him to clear out at any time he must go; he said he would clear out at a few hours notice if necessary.

clear out at a few hours notice if necessary.

11.14. You have not in any one instance, on your own account, granted a lease? Never.

11.15. For any of the Government properties? Never; in only one case here that I know of has a lease been granted. Rent is no object to the Government if they require the property for public purposes. The difficulty is to get persons to go in as tenants with the risk of being turned out on short notice. It is only the tenants already occupying the property who are likely to remain. Rent is no object to the Government if they require the property for the purposes for which it was resumed. I am not authorised to give a lease of any sort; but in regard to a weekly tenancy I am, subject to approval, empowered to let. I knew that this property was not likely to be required for a week, and I knew also that the tenant would be prepared to go out at any moment. that the tenant would be prepared to go out at any moment.

Mr. E. J. Bourn recalled and examined:

1116. Chairman.] When you were being examined previously before this Committee, I asked you if you had examined the wheels of the cars which have been recently imported;—have you since had an oppor-

tunity of examining them? I have.

1117. Will you kindly state the result of your examination to the Committee? On Saturday, the 6th instant, I went down to Darling Harbour, in company with Mr. Scott, the Locomotive Engineer. We examined fifty-four of the bogies standing on the Government line, outside of the works. in the axles of sixty-nine of them the iron was very bad; it had not been properly welded; it was fagged; there were holes in some, extending from one boss of the wheels to the other; in some others the iron half way across was very bad. In other cases we found the iron laminated very much, on account of the axles not having been worked well together. In fact, out of the sixty-nine bogies we examined, I did not consider there was one of them that ought to be put under a carriage. On Monday, the 8th instant, I went down and examined ninety-six bogies standing in the works of Messrs. Carson Woods & Co. I found that 101 axles out of the ninety-six bogies I examined were in a similar state to those I had examined on Saturday. I then gauged the diameter of the axles in the centre and found they varied from 33 inches to 37 inches, whereas those in the pattern car were 4 inches.

whereas those in the pattern car were 4 inches.

1118. Have you anything further to add in regard to the bogies and the ironwork? Nothing fresh from what I have already stated. The ironwork on all was very rough.

1119. Do I understand from your evidence that most of the bogies and axles are unsafe? There were 69 under 57 bogies; those 69 out of 114 were, I consider, not fit to be put in. That was on Saturday. Then I got 101 out of 192 in the other. They were all the bogies I was able to examine. There were others; but they were covered with material and I could not get at them.

1120. Is it true that four of these dump-cars are now in the Eveleigh yard? Yes. 1121. Have they been received there on the certificate of any person? Not on m Not on my certificate; and I do not know by whose authority they were taken there.

1122. Is it usual to place cars on the road before they are received under a certificate? No.

1123. Would you conclude, by their being at Eveleigh, that they had been received by the Department?

They have not been received by the Locomotive Department.

1124. But supposing that trucks were put in the Eveleigh yard, would you conclude that they had been received? I do not think it is to be understood that they have been received; because when I saw them there I was told they had only been removed there to enable the fitters to get some more out.

there I was told they had only been removed there to enable the littles to get some more out.

1125. Did they travel all right to Eveleigh? They were shunted in the Sydney yard, and three of the brakes were broken; being too low down they came in contact with the cross rail.

1126. Is it not likely that a similar accident will happen to the other cars on account of the brakes being too low down? They are altering them now, or else they would be liable to accident. The foreman of the works told me they were raising the brakes an inch and a half so as to clear the rail. 1127. Three out of the four you speak of were damaged? Yes.

1128. Mr. Chapman.] In speaking of the axles you made use of the term "fagged together?" What we term fagged—that is iron made out of scrap iron, and not worked properly; the iron had not been properly welded together.
1129. That is to say the welding was bad? Badly forged.

1130. And consequently they are unsafe through being badly forged? They are unsafe.

1131. If by any means they were put into use, without a strict examination, would there not be a danger to life and property in consequence? Yes, there would be great danger of their breaking.

1132. Mr. Sutherland.] Who has the authority to receive these trucks and shunt them about, and run them on the sidings at Eveleigh? I cannot say.

1133. You say you have not given any authority for receiving them? No; as soon as I saw them in the yard, I reported them to the Engineer as being there. I told h m I did not know by whose authority they had been put there, and asked him how I was to act.

1134. Then as a matter of fact the manufacturers are making use not only of the shed but also the approaches to the shed and the Eveleigh yard, for getting rid of their trucks as soon as they are put together? Yes.

1135. And the Government engines move the trucks backwards and forwards for them? Yes, they move them backwards and forwards.

1136. And on the removal of these trucks from Darling Harbour to Eveleigh it was found that the brakes were too low? Too low.

1137. And from that fact they are now altering all the other brakes? Yes.

1138. Chairman.] Are you short of room at Redfern? Yes, very much confined for want of room.

1139. Could you have utilised the old Atlas Company's works to advantage? It would be handy provided a roadway was made into it for repairing waggons.

1140. How long has the place been idle? I cannot say.

1141. Mr. Sutherland. Can you give the Committee the dimensions of the sheds occupied by Carson Woods and Company? I cannot.

1142. Will you take the dimensions of the sheds occupied by those gentlemen sometime, and the portions outside that are occupied by them—because I think there is a large portion of the ground outside the sheds occupied by those gentlemen with material, and by trucks as they are put together, so that it is desirable you should take the dimensions of the premises and attach them to your evidence for the information of the Committee? I will do so. (See addendum to evidence.)

1143. Mr. Chapman.] When you were being examined before the Committee previously, you stated that the ironwork of the sample car was very roughly done? It is rough work.

1144. And now you say that though it is rough work, and very badly done, the work of the new cars is not equal to it? It is not.

1145. That is to say, although the work on the sample car is roughly done, that on the new cars is rougher still? Yes.

1146. On whose certificate will these cars be passed? It is my place to pass them; it is my place to give a certificate in regard to all new stock. When I pass any new work I send a memo. to the Traffic Department to fetch it away, and they report it to the Department as being taken over.

1147.

1147. Chairman.] When you were previously under examination before this Committee I asked you E. J. Bourn. regarding the manner in which the buffers are attached to the head-stock of the dump-cars. I should like you now to explain the difference between the way in which these buffers are secured in these dump-cars and the way in which buffers are secured to the ordinary rolling stock? I have prepared a sketch which I now produce, showing the way in which the buffers are attached to the dump-cars. In the ordinary rolling stock they are attached to the head-stock, but the head-stock is provided with a diagonal These are fixed on the head of the sole-bar, and being fixed with iron plates, the buffer strikes in shunting. The weight not only rests on the head-stock, but is supported by a diagonal brace, whereas in the dump-cars the head-stock is framed on to the sole bar and to the intermediate, leaving a space of 2 feet 4 inches between; the buffer is then bolted in the centre of that space, and there is nothing to resist the blow or to prevent the breaking of the head-stock. 1148. There is no continuous draw gear in any of the trucks? No.

ADDENDUM.

In accordance with the request of the Committee, I herewith give the sizes of sheds and ground occupied for the erection of dump-cars at Darling Harbour:—

One shed measures 113 ft. 5 in. \times 53 ft. 6 in. One ditto 73 ft. 9 in. \times 36 ft. 8 in.

There is also a space between the sheds measuring 121 ft. 9 in. \times 121 ft. 3 in. One part of line occupied by five of the dump-cars, outside of works, takes up 180 ft. of space.

The ground on which a number of bogies is standing is outside the rails; this occupies a space of 176 ft. 10 in., but varying in depth from 16 ft. to 62 ft.

E. J. BOURN, 19/9/84.

Mr. G. Bingham recalled and examined:-

1149. Chairman.] Have you examined the dump-cars recently imported? I have not.

G. Bingham. 1150. Can you tell the Committee anything further about them than you have already stated in your evidence? Not with regard to the new ones.

1151. Do you know whether any of them are at Eveleigh? Four of them have been brought up from Darling Harbour.

1152. Have they been received by the Government? Not that I am aware of.

1152. Have they been received by the Government. Not shall a water of.

1153. Is it usual for the Government to bring rolling stock up to Eveleigh before it is passed? Not until it is passed by the Inspector of Rolling Stock.

1154. Were these trucks taken to Eveleigh by the Government engines? Yes, I believe so; one of our examines told us so; but who gave instructions for it to be done I do not know.

1155. Is it true that whilst the cars were being taken there part of the brake-rods broke? Yes, a report was sent to the office that the brake-gear of three of them broke through catching the rails when going over the crossings.

Mr. Thomas Midelton recalled and examined:

Mr. T. Midelton.

1156. Chairman.] When you were last before the Committee you were asked to produce certain papers in regard to the construction of light rolling stock;—have you brought them with you? No; I have only the table of the weights, the same as I had last week. With regard to the drawings I thought I had the table of the weights, the same as I had last week. With regard to the drawings I choose I had better suggest to the Committee that the Commissioner should be applied to to furnish them; I did not care to take upon myself the responsibility of taking drawings without his permission. I have thought it best to suggest to the Committee that the papers should be sent for through the Commissioner's office.

I do not care to bring documents here which it strikes me should come from my superior officer. At the same time I wish to ask you to allow me to withdraw the opinion I expressed unintentionally on the design lying on the table last week, in answer to a question put to me for an opinion as to a scheme of coaling engines. I now see that it would be wrong for me to give an opinion upon a design produced by an officer at the head of my branch. If you will allow me to withdraw that opinion I should be glad. the time see that I was taking an indiscreet course. I did not at

1157. Do you wish to withdraw the evidence given at the last meeting of the Committee because you have altered your opinion as to the design, or only because you do not wish to be found criticising a superior officer's design? Only because I do not wish to be found criticising the design of a superior officer. 1158. Mr. Sutherland.] When the Chairman put the plan before you, and asked you questions with regard to it, you supposed you were bound to answer the questions? Certainly I did. 1159. Chairman.] You were asked to produce some plans and accounts;—will you kindly furnish them to the Committee? I was asked to supply plans of the waggons which I had referred to in my evidence, and Mr. Charman asked me to supply an estimate of the question of coal we used per annum. I have the

Mr. Chapman asked me to supply an estimate of the quantity of coal we used per annum. I have the

Mr. Chapman asked me to supply an estimate of the quantity of coal we used per annum. I have the weights properly tabulated in two sheets, which I now hand to the Committee. One sheet refers to carriages, the other to waggons. (Two tables produced.)

1160. I do not find any estimate of the cost? No.

1161. Could you give the Committee an estimate of the cost? Yes, I can do so.

1162. Will you be prepared at the next meeting of the Committee to furnish us with the estimated cost of each description of vehicle referred to in the tables you have just handed in? Yes.

1163. Mr. Chapman.] What quantity of coal is used per annum by the Locomotive Department for locomotives? In round figures it amounts to 127,000 tons.

1164. And at a saving of 3½d. per ton? At a saving of 3d. per ton it would amount to £1,537. That is only half the saving, because the removal of ashes forms another portion of my scheme, and will give a further saving of 3d. per ton.

1165. Chairman.] Have you examined any more of the dump-cars since you were last before the

1165. Chairman. Have you examined any more of the dump-cars since you were last before the Committee? No.

1166. Is it true that four of those cars are at Eveleigh? I saw four dump-cars there as I passed by 1167. in the train on Friday evening.

1167. Is it usual for the Government to take over cars and put them on the line without first accepting delivery of them? In delivering cars it is usual to have them passed by Mr. Bourn. I do not know

what has taken place in regard to the cars you speak of. As regards their being at Eveleigh, I imagine they were placed there to be out of the way of the Darling Harbour sidings. Whether they have been

received officially or not by our Inspector I cannot say, but I think not.

1168. Have you ever been requested to furnish a comparative statement of the carrying capacity, weight, size, dimensions, and cost of the different cars? Yes.

1169. Who requested you to furnish such particulars? The
1170. How long ago is that? About three months, I think.

The Commissioner, and I supplied them.

1171. Are the returns which you have just handed in a copy of those which you forwarded to the Commissioner? They are. When I was before the Committee at its last meeting I stated that I wrote to Hudson Brothers, asking them for a price, and that letter was copied. I was under the impression at the time that I wrote an official letter to them, asking the price of a dump waggon, but that is not the case I find. I have letters here which show the transaction. The letter I wrote asking Mr. Hudson to call was not copied, as I thought; it was simply a request to Mr. Hudson to call at my office.

1172. Can you bring any authoritative information from any American paper regarding the accidents which occur on the American railways through working with cast-iron wheels or otherwise? Yes; I can produce the Railroad Gazette, in which are records of the accidents which occur in America. But I must qualify that by saying that they are official papers—they are papers taken into our office for office use; we cannot take them out of the office without the Commissioner's sanction. It is a public news-

paper, and perhaps might be had at the School of Arts.

1173. We had it given in evidence by one of the witnesses that Hudson Brothers' firm take three American papers, on whose authority they rely for almost everything connected with railways and rolling stock;—are there any such papers in your office, or under your control? Yes, the Railroad Gazette is one I think which I have referred to.

1174. Is it in your power to produce that without the authority of anyone else? I do not think it is. 1175. Who is the person who has the custody of those papers? The Record Clerk; they are in his custody, and we get them to read in the same way that we get any other official papers, and we are expected to put them back on the file. I introduced that paper to the office myself, and I read it as often as I can find time to read it.

1176. And you think the paper you mention a fair authority upon the question? Yes; it is an official record, something like the Board of Trade record of accidents which take place in England.

1177. To whom should we have to apply to get that before the Committee? I think the Commissioner is the proper authority to apply to. If you apply to him I daresay he will supply them either through Mr. Scott or myself.

1178. The papers themselves would I suppose be of little use to the Committee unless someone who understood the matter explained them? If the papers were furnished by the Commissioner they could

be referred to by me when they were on the table.

1179. Will-you prepare a tabular statement from the Railroad Gazette or other authority relative to accidents which occur through defective axles or wheels which occur on the American lines? do that.

1180. I suppose the Railroad Gazette would state whether the accidents were from cast-iron or wroughtiron? Yes.

William Scott, Esq., Locomotive Engineer, recalled and examined:—
1181. Chairman.] Since you were last before the Committee, have you examined the dump-cars that have W. Scott, Esq. recently arrived in the Colony? Yes.

1182. Will you kindly favour the Committee with your opinion regarding the workmanship of those cars, 16 Sept., 1884. and in regard to the cars themselves? The workmanship is similar to the class of American work turned

1183. But I want to know whether it is good work or not? Well, it is fair. There is one thing I noticed in the axles, they are very inferior. I have applied for four of them, in order to have them tested. 1184. The axles you say are very inferior? Yes. 1185. Have you examined the wheels? Yes.

1186. What is your opinion in regard to them? They are the ordinary style of American wheel, cast-iron

chilled.

1187. Are they of good quality? To all appearance it is the wheel that is used in America; you cannot tell how they will turn out until they have been running for some time.

1188. Do you consider the bogies safe to be run on our lines? The bogie with the dumping arrangements?

1189. Yes? But I should like to have a trial of them before I could say positively.

1190. How many of the new cars have you examined? I have examined three that have been put together; I have examined some seventy-five bogies with the axles under them.

1191. What was the result of your examination? I found that in fifty-seven bogies sixty-nine of the axles are defective; I marked them defective.

1192. Are we to understand from that that they are not safe? I do not consider the axles safe to run. I have applied for four so that we can test them.

I have applied for four so that we can test them.

1193. Is it true that there are four cars now at Eveleigh? Yes. 1194. When were they sent there? One morning last week; I One morning last week; I cannot say the day; I noticed them there

in the yard.
1195. By whose orders were they sent there? I believe by the orders of the Traffic Manager; they were brought up from Darling Harbour.

1196. Is it true that one of the brake-rods was damaged? Yes, I think there are two, if not three of them; the joint of the brake was down too low, and it caught the cross rail. That is a matter that can be altered, and the remainder are being altered.

1197. Did you examine the way in which the buffers are attached? Yes.

1198. What is your opinion regarding the way they are attached as compared with the usual method? That is a weak part of them. The tracing I produce will show where the defect lies. The weakest part, I consider, is where it takes the bumping from the buffers. It may be necessary to have that strengthened. 1043—Ť

Midelton.

Mr. T.

W. Scott, Esq. Even to strengthen it there would be a difficulty, on account of the framework, when dumping, being brought close to the wheels. They could be stiffened to a certain degree, but not to the extent that our 16 Sept., 1884. own frames are made.

1199. Mr. Sutherland.] It would neither be safe nor lasting? I do not say it would be unsafe, but in shunting there would be the risk of getting the buffer-plank broken.

1200. Chairman.] Even if strengthened as you propose there would be great risk of damage? I think it possible to strengthen it to make it secure.

1201. I understood you to say just now it would be difficult to strengthen it in the way you would wish? With diagonal timbers. The only way it would have to be done would be by wrought-iron knees. 1202. There is no continuous draw-gear with any of the dump-cars? No. 1203. Do you not think there would be a difficulty in dumping if there were a centre draw-gear there?

The centre dump-axle takes up the room of the draw-gear.

1204. Do you think it is wise to run rolling stock of this description without the continuous draw-gear?

It is stiffened there by the long truss-bars; it would be better if they had the continuous draw-bar.

1265. After carefully examining the cars, what is your opinion regarding their adaptability to our lines?

For general traffic I do not think they are a suitable truck.

1206. But with regard to any traffic, having in view the workmanship, material, and want of a continuous draw-gear, the manner in which the buffers are attached to the head-stock, &c., what is your opinion in regard to the dump-cars recently imported? They are not what I would recommend.

1207. Would you recommend them to be used at all? For coal purposes they might be utilised.

1208. Do you think it is safe to use them as they have arrived? Not with the present axles.

1209. I am referring to them with the present axles, wheels, the way in which the buffers are attached to

the head stock, and without the continuous draw-gear;—do you consider them to be safe for working on our lines? I do not think they will be a success; but I do not think I should like to say they were unsafe, with the exception of the axles; I would not let the axles run on any account.

1210. But you say you would not recommend them and you would not say they are unsafe? No. 1211. And yet you point out certain defects in them? Yes.

1212. Do you not consider the defects you point out are of such a character as to warrant you in condemning their use? They will have to be improved upon from what they are at present.

1213. But I am referring to them as they are at present? I should like to see a practical test. 1214. But you have examined the cars? Yes.

1215. And you say there is great objection to the way in which the buffers are attached? That is a weak

place.
1216. You admit it would be better to have the continuous draw-gear? Yes.

1217. You say the axles are defective? Yes.
1218. And that the wheels are not good? I have no hesitation in condemning the axles.

1219. Why is there any necessity for a test, when you condemn the principal points in the construction of these cars?' I should really like to see a practical test before I should say positively that they should not

be used. But as I said before, I would not recommend that class of car for our traffic.

1220. In what better position will you be after the test? We should see how they would work round our 8-chain curves.

1221. Could you tell then? Yes, and by taking a load.

1222. And the buffers? The practical use of them would prove whether they are strong enough or not that is the head-stock.

1223. In regard to other rolling stock, is it not usual to have some responsible officer at the works to inspect the cars or rolling stock when they are being put together? Yes, to inspect the work as it progresses. 1224. I presume that if the inspector finds the work defective he throws it out? Yes, he objects to it,

condemns it if necessary.

1225. Does he ever wait until the whole car is built, and then condemn it afterwards? No.

1226. If an inspector sees any defect in the material or workmanship, does he not condemn it at once? Yes, it is usual to condemn it at once as the work proceeds.

1227. Would they have any other test if they saw the design was not the correct thing? No.

1228. Has any officer of the Government been present when these cars were being put together?

Mr. Bourn inspects them almost daily. 1229. Has he made any report to you?

Yes.

He points out the defects. He speaks of the want of the 1230. What was the nature of such report? continuous draw-gear as a very great objection.

1231. Does he point out any other objections? The axles, he mentions them especially.

1232. Does he say anything with regard to the buffers? Yes, he says the buffer-he

Yes, he says the buffer-heads are made of cast-iron.

cast-iron.
1233. If you received a report from Mr. Bourn in regard to any other rolling stock similar to his report on these dump-cars, would you consider a practical test necessary? We reserve the power to reject any vehicle; and with these dump-cars we have the power to reject them if we do not consider them safe.
1234. Have you any contract signed to give you that power? Yes, I think you will find it in the printed

1234. Have you any contract signed to give you that power? Yes, I think you will find it in the printed papers. On page 10, No. 31, you will see this clause: "The vehicles must be finished in the most substantial and workmanlike manner, and in every respect to the entire satisfaction of the Locomotive Engineer." 1235. Do you know if that contract has been signed? I cannot say; I should think the contractor would not expect to get any money until the contract was signed.

1236. Have you sent in any report in regard to these cars? Yes, several. I have asl have four of the axles to test. That request is before the Commissioner now, I believe. Yes, several. I have asked permission to

1237. Independently of the axles and wheels, what is your opinion respecting the dumping apparatus, and the general design or construction of the car? I have no great opinion of it.

1238. Do you think it would be wise to run this car over our mountain line with a heavy load? I should

prefer running our ordinary trucks.

1239. Would you, as Locomotive Engineer, recommend these cars to be run over our mountain line?

I would not recommend them, but before I condemned them I should like to have a practical test. 1240. You have examined them very carefully? So far as workmanship is concerned, they are not what

I would recommend; but, as I said, before condemning them, I should like to have a practical test, as far W. Scott, Esq. as the waggons are concerned; as regards the axles, they cannot run.

1241. You do not think a test necessary in regard to the axles? I have applied for four of them in order 16 Sept., 1884.

that I may test them.

1242. But you have no hesitation in saying that they are unsafe? I should object to any of them running, from what I can see. The axles appear to have been made of scrap iron, jagotted from the scraps, instead of the ordinary scraps being cut off and repiled and drawn out a second time; that is my impression, and they seem to bear that impression out from what I can see.

1243. Are they similar in that respect to the sample car? The sample car seems to be rather a better

job, the axles especially; they are one-eighth of an inch larger in diameter.

1244. Would you recommend the axles in the sample car? There is nothing that I can see objectionable

1245. Do you think it would be safe to run them? The axles? 1246. The axles and wheels? Yes, so far as I can see.

1247. Are they not made from the same class of material? They do not appear to be; they have a

1248. Has Mr. Bourn reported that they are unsafe to run? He has said as much, but he has not directly said they are unsafe; we could not take them over in their present state.

1249. Mr. Chapman.] Are those three or four dump-cars at the Eveleigh Station supposed to have passed? No.

1250. Is there any likelihood of their being used at the present time? No, they are marked not to be used; the Manager has got notice as well; we are taking precautions against that.

1251. Mr. Sutherland.] Who is taking the precautions? I have taken action to prevent their being taken into use until I have certified as to their safety.

1252. Is there any stock running on our railways without your certificate of safety? I do not think

there is; there is not to my knowledge.

1253. You feel yourself responsible for everything put on the line and for the safety of everything put on the line? Yes; I think I should be looked upon as the responsible party if anything went wrong.

1254. And you have not given any authority to receive these dump-cars which are now in the yard at

Eveleigh? No; as soon as I saw them in the yard I made inquiry and found they had been brought up by the Traffic Department.

1255. Mr. Chapman.] You say there is no rolling stock on the lines without your certificate? No, there

1256. What about the Cowdery couplings;—have you given a certificate for them? No, they are used for

the ballast trains and coal trains, not for general traffic.

1257. Have any of them been sent up the line? There are some up the line, being used for ballasting; , but not to my knowledge have any been sent up for use on the ordinary traffic by the ordinary trains.

1258. Mr. Sutherland.] Are you aware that these couplings have been used on the traffic? Not for the

regular traffic—that is, not that I am aware of.

1259. Are you not aware that I am aware of.

1259. Are you not aware that the officers of the Traffic Department have refused to be answerable for the use of them, and have reported against them? They have refused to send them out on ordinary trains.

1260. There is a large number of trucks lying in Eveleigh yard with these couplings now, and it is stated by some of the officers of the Truffs Department that they cannot be used expent for hallesting the line? by some of the officers of the Traffic Department that they cannot be used except for ballasting the line? I believe that is correct.

1261. They are not allowed to be used on the traffic, or have not been certified to for use on the traffic? The Traffic Manager refuses to send them out on the ordinary trains

1262. And you have always refused to certify that they were safe? Yes, I reported against them, I think.

1263. Can you inform the Committee what number of trucks have been supplied with these couplings? I cannot give the exact number now, but I think that over 200 ordinary trucks have been supplied with

1264. Can you, when your evidence is sent to you for revision, attach to it the number of trucks that have been supplied with this class of coupling? Yes, I will do so. I find that 250 D trucks have had this coupler fitted to them.

1265. You have stated in your evidence that the head-stocks of these dump-cars are not strong enough for the uses to which they are to be put? They are not strong enough to resist the bumping they will be subjected to.

1266. What is the size of the timber in the head-stock? 12 inches by 43 inches; they are of either ash.

1267. American ash? Yes.

1268. What would be the solid contents of the timber left in the head-stocks after the mortices are made and the bolt-holes? I cannot state from memory, but I will ascertain and inform the Committee.

I find that the total cubic contents of the head-stock of the new dump-car is 6,103 cubic inches. The total cubic contents of all perforations in the same, that is, mortice-holes, holes for draw-gear bolts, &c., is..... 293

The cubic contents of timber remaining in head-stock, is.....

1269. Have you been required by any one to inspect these vehicles as they were being put together? No; I consider it is part of my duty, together with Mr. Bourn, to inspect them; I delegate him to inspect them personally, and if there is anything special he draws my attention to it. 1270. And after he reports anything particular you go with him to make an examination? Yes. 1271. But you say you have had a report from Mr. Bourn, and you have sent your report to the head

office? Yes.
1272. Will you supply this Committee with a copy of that report? Yes. 1273. Chairman.] I understood from you just now that notwithstanding you reported that the new couplings were unsafe, there are about 200 of them in use? There are something over 200 of them in use; I do not know that I made any special report that they were unsafe.

1274.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

W.Scott, Esq. 1274. Have they been passed by your authority? No; they have not been passed by me.*

1275. By any person under you? No.

1276. Notwithstanding you have not passed them, and that you are responsible for the rolling stock, you find there are about 200 of these couplings now in use? Yes, on coaling trains and for ballasting.

WEDNESDAY, 17 SEPTEMBER, 1884.

Present:—

Mr. POOLE, Mr. CHAPMAN, MR. TEECE. Mr. GARRÁRD,

MR. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Thomas Midelton recalled and examined:

1277. Chairman.] The Committee asked you to furnish a return of the cost of the different classes of T. Midelton. rolling stock;—can you do so? That is in hand; I have not had time to complete it. I was not aware 17 Sept., 1884. that I would require to be here to-day. I have received no notice to attend. I suppose it has crossed. 1278. Will you attach it to your evidence when this is sent to you for correction? Oh, yes.

1278. Will you attach it to your evidence when this is sent to you for correction? On, yes.

1279. Mr. Poole.] You were present at the trial of the pattern dump-car, when the Minister for Works was there, were you not? Yes, sir, at Darling Harbour.

1280. Did you then express to the Minister a favourable opinion as to the adaptability of the dump-car to our traffic purposes? I do not remember having done so. I do not think I spoke to the Minister at all until after we left the trial and went round the goods-shed. I do not remember expressing myself in favour of the car to him.

1281. Did you advise the Minister to purchase the cars? Certainly not.

1282. You are quite clear on that point? Yes, I am quite clear. If he had asked my opinion as to purchasing the cars, I should have said decidedly not to purchase them. How could I do otherwise in the face of a minute like that in the printed papers.

1283. You are quite sure that you never expressed a favourable opinion of the cars to the Minister, or advised him to purchase them? I am quite sure of that, sir.

1284. This is a sketch here which is to be attached to the evidence; will you look at the framing shown on it and say whether or not that is the kind of framing that is to be used in connection with these 200 dump-cars, which are irrespective of the pattern car? This appears to me to be a drawing of it—an exact drawing from the one that is now being put together. There is, however, little difference between the pattern car and this.

1285. Is there any difference in the buffer arrangement? No. 1286. Has the pattern car any buffer? No; just a head-stock carried across. 1287. What is the size of this cross-head? I have not measured it; but I should say it was 4\frac{3}{4} inches

by 12 inches deep.

1288. Judging from your experience in connection with our rolling stock, do you consider that the strength of this cross-piece is sufficient to withstand the pressure of a train being brought up rapidly and having all its weight brought upon it? No, sir.

1289. In your opinion that is a weakness which, if the cars were brought into general use, would be liable

to cause accidents? Yes.
1290. Mr. Garrard.] Do I understand aright when I take it that the pattern car has a buffer in the centre, right opposite these longitudinal pieces of timber shown in the plan? Yes.

1291. In the other cars there are opposite the buffers no corresponding stretchers? No.
1292. Are the cars being delivered exactly like this? I think they are.
1293. You do not know whether any strengthening pieces are being put behind the buffers? I believe not; I think the cars are substantially the same as shown here.

1294. Mr. Poole.] How is the continuous draw-gear provided for in these cars? There is no continuous draw-gear. Some engineers might call it so, but it is not what was asked for. I supplied a copy of what I wanted.

1295. This is a copy of the car? Yes.

1296. It is not in accordance with your sketch? No; the sketch shows the buffers and draw-gear.
1297. Mr. Garrard.] You supplied a sketch for these new cars to be supplied to, and this sketch on the table is not in accordance with your sketch? No sir, the draw-gear is not in accordance with my sketch.
1298. Is the side buffer? The side buffer is as regards the space between the centres.

1299. Mr. Poole. In your sketch you showed where you wanted them to be placed to suit your own stock?

1300. Chairman.] Will you state the brake power, and how it is applied on the pattern car and on the cars now being supplied, and compare it with the brake power in application on the G trucks? Yes. On the pattern car there is a brake worked by the usual hand-wheel, which operates four blocks, on one bogie only; the other bogie has no brake. There is a similar brake on one bogie only on the car now being put together. The G waggons have eight brake blocks (four on each bogie), worked by hand lever; this is certainly the most powerful brake, but I think four blocks would be sufficient.

THURSDAY,

^{*} ADDED (on revision):—They were certified by me as being in accordance with the order given. The Department wished to make a trial of a self-acting coupler; an order was given for a supply of waggons with the appliance, and in the ordinary course of business the vouchers came on to me for a certificate that the trucks were made in accordance with the orders given. The responsibility of running the couplers was accepted by Mr. Cowdery, the Engineer for Existing Lines.

Aresent . -

Mr. CHAPMAN.

Mr. POOLE,

MR. TEECE.

SYDNEY SMITH, Esq., in the Chair.

Charles Augustus Goodchap, Esq., Commissioner for Railways, called in and further examined:-

1301. Chairman.] I think the Committee asked for some papers respecting coaling arrangements and lighter rolling stock;—have you brought them with you? I have some papers here about the coaling of 1302. What do they refer to? They refer to various schemes for coal stages and to taking up coal for 18 Sep., 1884.

locomotives; also to the delay in obtaining the use of trucks, because they were used as coal stages; and other matters.

1303. Do they refer to the general coal traffic? No, only to coaling engines for the Department. (Papers produced and left with the Committee.)

1304. Have you also got some papers about the rolling stock? I do not exactly know what is required. I have some papers about lighter rolling stock. Of course they are not always kept together. Sometimes minutes come up on papers referring to other subjects, and I do not know that I could trace all the minutes about lighter rolling stock.

1305. We understand there have been some minutes during the last two years in regard to providing lighter rolling stock? I requested the report of the engineer officers on some papers I got from America on the subject of lighter rolling stock. I referred to that in my previous evidence. When Mr. Scott returned from England I again brought the matter up, and I was furnished with a report upon the subject, as to the experience he had gained in England. (Papers produced and left with the Committee.) There are some papers about Allison's car, which we decided not to take at any rate for the present, about which Mr. Scott says in a minute:—"I may state that with the exception of the dumping arrangement these cars very much resemble the American dump-car which has been purchased from Carson Woods and Co., and for the supply of a considerable number of which his tender has been accepted, so that until we have had an exportunity of thoroughly testing their efficiency no further orders should in my until we have had an opportunity of thoroughly testing their efficiency no further orders should in my opinion be given, and even assuming that they would, with further alterations, be suitable for our traffic, I consider that in justice to our local contractors, only one of each sort should be imported as a sample, to which others could be made in the Colony." Mr. Augustus Morris was informed on that that it was not

considered desirable to give an order for any of these cars at present.

1306. We have it in evidence that certain rolling stock of a lighter description has been manufactured here lately-some carriages I think ;-could you favour the Committee with any information regarding the

here lately—some carriages I think;—could you rayour the Committee with any information regarding the lighter rolling stock referred to, and by whose recommendation they were manufactured? I assume you are alluding to a type of passenger carriage called the Redfern carriage.

1307. The name has not been given to the Committee, but we have been told that in consequence of your asking for lighter rolling stock, a certain class of carriage was submitted to you, which was approved of, and that some of these carriages are now running. The Committee would like to know whether they have been a success? I took exception to two or three details connected with these cars; I thought the supplications of them was not so good as it sught to have been that the seats were not quite wide enough upholstering of them was not so good as it ought to have been, that the seats were not quite wide enough, and one or two little things, such as the lettering on the door, and the labels containing certain directions not being properly enamelled. Altogether the finish of the car did not seem to me to be what it should be, and I wrote a minute calling attention to these matters, and I am assured they are being remedied.

1308. Mr. Poole.] Were these carriages manufactured in the Colony? Yes. In all other respects they seem to be admirable carriages.

1309. Chairman.] Who designed these carriages? Mr. Midelton.
1310. Is it true that a design for a lighter class of freight trucks has been approved? No; I do not recollect any being submitted to me.
1311. I think it right to tell you that we have it in evidence that some time since, about twelve months ago, one of the officers submitted a design for a truck that would be lighter, and the carrying capacity would be far greater than our own rolling stock? It did not come under my attention.*

1312. Mr. Poole.] Is there any comparative statement of the weights and capacity of the various kinds of rolling stock used by the Government? It is published in my Railway Report every year, a statement of the weight of each kind of vehicle.

1313. And the cost? No, not the cost. The cost varies from time to time.

1314. Coming back to the matter which the Committee first took in hand;—is there any bond signed between Mr. Carson Woods and yourself as the head of the department?

1315. None whatever? No.

1316. I would like to call your attention to your letter to Mr. Carson Woods of the 28th August, 1883, number twenty-six of the printed papers, relating to dump-cars:—"In reply to your letter of the 27th instant, having further reference to the proposal made by you with regard to the rights of the dump-car patent, and in which you state you are prepared to build 200 cars in the Colony, inclusive of the patent rights, for the sum of £190 each, I have the honor to inform you that I have submitted the above proposal to the Havenshle the Scarcetary for Public Works, and he approves of the scarcetary of the same and approved the Havenshle the Scarcetary for Public Works, and he approves of the scarcetary of the same and approved the same states. to the Honorable the Secretary for Public Works, and he approves of the acceptance of the same on condition that the cars are delivered complete on the railway line, Sydney, at the price named, and that they are in all respects equal to and of the same weight as the one now in possession of the Department. It is, as a further condition of the acceptance of your offer, that after the delivery of the above cars is completed, the Government are to have free and undisturbed use of the patent rights for New South Wales for all cars they may build or have built by private firms." Then there is a P.S. "You will have to enter into a bond for the

Goodchap, Esq.

^{*} Note (on revision):—I have since ascertained that allusion was intended to the truck for coaling purposes schemed by Mr. Midelton. I wish to add as an appendix to my evidence the official correspondence on this subject. (See papers Appendix D.)—Ch. A. G., 26/9/84.

C. A. Goodchap, Esq. 18 Sept., 1884.

due fulfilment of your contract, and to assure the Government in the undisturbed possession of the patent rights as far as the Government Railways of New South Wales are concerned. The cars to be delivered, fifty in nine months, and the remainder in lots of fifty at three, six, and nine months, within the succeeding nine months.—Chas. A. G., 28/8/83." Now I would like to ask you if that is not in reality the contract that you have sanctioned? Yes. If you will look a little further you will see that Mr. Carson Woods acknowledges that letter:—"I have the honor and pleasure to acknowledge receipt of Carson Woods acknowledges that letter:—"I have the honor and pleasure to acknowledge receipt of official acceptance of my tender for the supply to your Department of 200 screw lever dump-cars. I now await your instructions as to where and when the bond and other requirements you ask for in your letter can be signed and fulfilled by me." That is a constructive acceptance of the terms.

1317. But in point of fact there is no bond? There is no bond. If you read further you will see that Mr. Carson Woods went to America before the bond was prepared for signature.

1318. Is it not an unusual course for the Government to allow a large order of this kind to be entered into or any action to be taken before the contract bond is signed? No, very often contracts are commenced without the bond being signed, but the Department protects itself by declining to pay any money; therefore the work is commenced at the contractor's own risk.

1319. Is Mr. Carson Woods in the Colony now? He is.

1320. And even now there is no bond signed? There is no bond signed. The Crown Solicitor has requested Mr. Carson Woods to supply a power of attorney under which he can grant to the Government.

requested Mr. Carson Woods to supply a power of attorney under which he can grant to the Government the patent right. Prior to the preparation of the bond that would be necessary.

1321. If it should turn out that Mr. Carson Woods is unable to conform to the Crown Solicitor's wish in this respect what will then be the position of the matter? We shall not accept the cars.

1322. The Government will decline to accept the cars? The cars would not be accepted under any

circumstances unless all the conditions were complied with. In the first place the question will have to be seen into whether it is not a breach of contract the omission to make the cars in the Colony.

1323. There is nothing in your letter of 28th August about their being made, the term used is "built" in the Colony; there is nothing said about making them? The intention is shown by the instructions to

the Crown Solicitor.

1324. I fully admit that that was the intention of the Government, that the cars should be made in the Colony, that is, that the bulk of the money should be spent in the Colony? Yes, with the exception of

that for the wood work, and that I anticipated would be simply imported lumber, to be made up here. 1325. You consider the patent right an essential part of this contract? No doubt. There was no other reason for giving the contract to Carson Woods. We could have given the contract to Hudson Brothers, but we saved £6,000 by giving the contract to Carson Woods as he secured to us the patent right.

1326. During the putting together of the cars here has any report been made to you as to the nature of the workmanship and the materials supplied? Yes.

1327. Is that report of a favourable description? No. Of course that will have to be tested. As

suggested by the Locomotive Engineer, the quality of the work will have to be tested.

1328. Has any report been made to you that the axles or some of them are less in diameter than the axles in the pattern car? I do not remember that the diameter was referred to ——

1329. In the report to you? Yes, it may have been. I only looked at the general fact that the material was said to be inferior, and to the suggestion that a test should be made. I at once pointed out to the Minister that an attempt to test this material would be accepted as a constructive waiver of our right to refuse the trucks altogether, and before anything was done I said it would be judicious to get the opinion of the Crown Solicitor as to whether the contract could not be vitiated on the first point, that the cars were not made in the Colony.

1330. Suppose the Crown Solicitor is unable to advise in that direction, will you not be entitled to strictly compare the 200 cars delivered in contact with the pattern car? Certainly, we can insist upon their being

in every respect equal to the pattern car.

1331. This is a sketch brought up by the Locomotive Engineer. Have you seen it (referring to the sketch

on the table)? I have not.

1332. Will you kindly look at it. I would like particularly to call your attention to the position of the buffers on the cross-heads of the trucks, and ask you to be good enough to look at that position as being entirely unsupported. Assuming that ten of these trucks were in a train with a load of 20 tons on each, besides their own weight, that would be about 300 tons. Would you be good enough to tell the Committee what would be the effect of a sudden pull up of the train on one or more of these cross-heads? would depend on the strength of the material. If that was Colonial timber I should certainly say it was not strong enough to support the buffers.

1333. Is it not admitted by scientists that our hardwood has as great a tensile strength as American ash?

1334. Take our best blue gum for instance? I believe American ash is superior, as regards toughness. 1335. From your intimate knowledge of the construction of our rolling stock, do you consider that that is at all a safe arrangement in relation to the great carrying weight of these trucks? It depends upon the size of the timber and its tensile strength.

1336. Would you consider, from your knowledge of the usage of our rolling stock and the strain thrown upon it, that any timber of that size, no matter how elastic and strong it may be, would be sufficient to resist that strain? I might form an opinion of my own, but I should leave a matter of that kind to the

engineers.

1337. You would prefer their opinion to your own? Yes. That was my stipulation, that all matters of this kind should be to the satisfaction of the engineers.

1338. If the Committee have received an opinion from one of your engineers that he does not consider this a safe arrangement, you would attach considerable weight to that opinion? I should. At the same time I made provision that our engineers should supply details of the draw-gear and buffer arrangements, and I wanted them to supply a specification which you will see they were disinclined to do. I should have very much preferred that our engineers had made the specification; I tried to induce them to do it, but they seemed to think it was better to leave it to be made the specification;

but they seemed to think it was better to leave it to the manufacturers.

1339. To throw the responsibility upon the designer of the truck? Yes.

1340. In other words they naturally shrank from interfering with the general design of the patent? I would not like to interpret their feelings in the matter. I do not know what their delicacy of feeling.

may have been; but I think their sense of duty should have induced them to see that the Department got a perfectly secure arrangement.

1341. With respect to the central draw-gear—this continuous draw-gear—have you examined the details of the proposed arrangement in order to get a continuous draw-gear, so as to clear the central or dumping 18 Sept., 1884.

C.A. Goodchap, Esq.

pivot? No, I have not.

1342. Does it not occur to you that there will be considerable difficulty in getting continuous draw-gear along the line of the centre of the truck, seeing that the central or dumping pivot is also along the centre of the truck? There must be difficulty, but I do not know that it is insuperable.

1343. From your knowledge of rolling stock, is it not likely to considerably increase the cost? think so; but that has to be borne by the manufacturers.

1344. Is there any other evidence or matter that you desire to bring before the Committee with respect to this matter? I think not. Of course I am not aware of what has been said in reference to this matter,

or whether any of the evidence is capable of being challenged or not.

1345. Suppose that the bulk of the evidence is entirely unfavourable to the use of these cars on our railways, then is there any information you desire to give, or any persons you desire to be examined, to substantiate your original views upon this question? I should say that such a statement as that would take me by surprise, if I am to understand that officers of the Department have given that evidence. If any officer of the Department who was charged with reporting to me upon this truck, and did so report upon this truck, now states that the sample truck, for instance, is not an arrangement, is not a design, capable of being worked with safety, then I say I am completely taken by surprise, and am amazed that any such officer should now state that which he omitted to state to me at the period when the question was under consideration. I would like also to say that experience in America seems to contradict the assertion that these trucks cannot be used with safety and advantage. I myself quoted, in my evidence, the opinion of a master car-builder in America, speaking in the highest terms not only of the design of the truck but of its arrangement generally being perfect.

1346. Is there any paper or document printed by authority in America which gives the nature, the extent,

and as far as practicable the cause of the various accidents on railways in America? I think in the State of Massachusetts there is a Commission appointed to watch the railway management, and they publish

every year a number of reports.

1347. Something similar to the report of our English Board of Trade? It is fuller than that—very much fuller than that.

1348. Are there any copies of that publication in your Department? I think I have one or two.
1349. No doubt you consider it a matter of some importance to ascertain for yourself what has been the practice in America with respect to rolling stock, as well as in England and elsewhere? Yes. You will observe among the papers I have produced with respect to coaling arrangements, that I submitted to our engineers several designs which appeared in the Railway Gazette of America, and obtained Mr. Midelton's report thereon.

1350. Are there, as far as your memory will carry you, any considerable number of accidents reported on the American railways as traceable to the use of cast-iron chilled wheels? No, not one that I can recollect. In the list of accidents, I have seen from time to time the cause is sometimes said to be Of course a defective wheel would cause de-railment; but I can recall no accident which was attributed to the use of chilled iron wheels.

1351. Am I correct in assuming that, in your opinion, the use of chilled wheels is as safe within reasonable limits as the ordinary English type of wheel? Just as safe, I think. The only question is as to durability. 1352. Is it a fact that four of these dump-cars have been taken from the old Atlas Works, where they have, I understand, been put together, up to the general depôt for Railway rolling-stock, at Eveleigh? At 4 o'clock yesterday afternoon I received a report from Mr. Scott, stating that two or three—I think he said three—of these trucks had been allowed to run on our rails out to Eveleigh at the contractor's risk and cost, and with no obligation on the part of the Department. I at once, within 5 minutes of receiving the paper, wrote a minute, informing Mr. Scott* that he was entirely wrong in allowing this to be done, and that no more cars were to be received under any condition until they were finally accepted. 1353. Can you inform the Committee if the contractors for the supply of the dump-cars are paying any rent for the use of the old Atlas Works? I should think so, but I know nothing about it; it is not in my Department.

1354. In whose Department will that be? In the Department of the Under Secretary for Works.

1355. I think then the Committee may feel assured that, until you are satisfied by the report of your responsible locomotive officers, that they are up to the quality of the pattern car, you will not accept delivery of any portion of the 200 cars ordered? Certainly not. I would not under any circumstances, whether this inquiry had taken place or not.

1356. That is irrespective altogether of whether the contract has been broken through by any breach of 1356. That is irrespective altogether of whether the contract has been broken through by any breach of the condition as to building the cars here? That question will have to be settled first; and if that be decided against the Department it will be essential that the cars should be in all respects not only equal to the sample but to the satisfaction of the Locomotive Engineer as provided for in the specification. 1357. He could not, I take it, be asked to express his satisfaction as to the design, but simply as to the material and workmanship? And as to the application of the buffers and the draw-gear. 1358. And the modifications in the dumping arrangement? Yes. 1359. And also as to the continuous draw gear? Yes; that is to say, it was stipulated that the buffers and draw-gear should be in all respects similar to ours and applied in the same way.

1360. And also as to the safety of the mode of connecting the two frames together, the running frame and the carrying frame? Yes; although attention was not called by the engineer to any defect in that

1361. You called attention to it? I did.

1362. Chairman.] There is another matter that has come before the Committee with regard to the use of some patent coupling;—could you give the Committee any explanation regarding the ordering of certain rolling stock with this patent coupling—on whose authority was it done? This patent coupler was tried several times and under all conditions at Darling Harbour—up grades, down grades, round curves of 5

^{*} NOTE (on revision):—I have since ascertained it was not Mr. Scott, but the Traffic Manager, who consented to these trucks being taken out to Eveleigh at contractor's risk and cost.—Ch. A. G., 26/9/84.

C. A. Goodchap, Esq. 18 Sept., 1884.

chains radii, detached while running, and under all conditions which could be conceived of as likely to occur in working trucks anywhere. Ministers and a number of scientific people were there, and they all expressed their confidence in the perfection of the coupler. I myself witnessed the trials, and it seemed to me to answer in every respect.

1363. Who is the officer supposed to be responsible for the safety of the rolling stock? The Locomotive

1364. Do you know whether he or any officer under him has been asked for a report upon this patent coupler? Mr. Burnett was Locomotive Engineer at the time. I cannot say whether it is in writing or not, but he expressed a very favourable opinion of the coupler, and in fact made some improvement to it, or some provision in case the coupler should come in conjunction with a truck that was not fitted with the patent coupler—some arrangement by which the ordinary coupler might be used in conjunction with it. This patent coupler I believe obtained a prize in England, when a Committee of shunters (I think) and engineers was appointed to inquire into couplers generally. A large number of automatic couplers of various kinds were brought under attention, and the patentees advanced their schemes with all the ardour of which patentees are capable, and under favourable circumstances; but I am told the Cowdery-Thomas coupler had no friends to recommend it; it was simply lying there while the friends and owners of the other patents had trucks fitted up with them and people to superintend their trials. While all the others were having their merits pointed out and advocated, this neglected one was lying on the ground without any appliances; and yet, when it came to be applied, its merits were found to be so high that it obtained a

prize. I believe I am right in saying a prize.

1365. Have you had any reports from the Locomotive Engineer or Traffic Manager regarding the working of this coupler? Really I have not looked at the matter for some time. I would like to look up the subject to see how it does stand. Any evidence I can give now would be simply the result of recollection

of some old date.

1366. Mr. Poole.] Will you send the Committee copies of all reports made to you as to the adaptability of the coupler prior to the order being given, and any reports of its working since? I shall be very glad to give any information in my power. I may tell you generally that couplers of an automatic character are forced upon the attention of railway managers, and that large sums of money have been spent by Railway Companies in England and America, for the purpose of obtaining a coupler which will reduce the tremendous amount of buffer accidents which take place on all railway lines,—not by any means on economical grounds, but solely on the ground of humanity and a desire to limit fatal accidents as much as possible. It is within my knowledge that a Commission is now sitting in America with a view to insisting that Railway Companies shall adopt automatic couplers for that sole purpose.

1367. In regard to these dump-cars, is there any person other than Mr. Scott, Mr. Midelton, Mr. Bourn, and Mr. Bingham, that you would like to have examined regarding the workmanship and general adaptability of these dump-cars? Well, I cannot recollect anybody just now that I should like to have examined upon that point. The officers you have named are the officers who have given their skill hitherto to designing cars of very heavy construction—tremendous tare with very light carrying capacity and I should expect that they would be rather surprised to find a light durable truck containing

advantages which they had failed to discover.

1368. Do you think they are quite competent to give an opinion regarding the safety, workmanship, and materials used in connection with these dump-cars? I am quite certain they can give a valuable opinion about the strength of the cars and their probable safety in working; but, at the same time, engineers get into grooves; they have been accustomed to build cars with sole bars of large scantling, and heavy head-stocks, and other parts of corresponding dimensions, and they adhere to them; they never think of questioning whether there is not too much weight in these various parts, and whether they cannot be lightened with advantage. Mr. Midelton certainly has given some attention to that matter at my repeated request, and he has designed now a carriage which compares most favourably in that respect with other carriages. He was most demonstrative, when this dump-car was under inspection, in proclaiming its merits in regard to the under-frame; he impressed upon me at the time of the inspection that even as a model it was worth all the money we were called upon to pay for the truck.

1369. Have you any reason to suppose that Mr. Scott, Mr. Midelton, Mr. Bourn, or Mr. Bingham would be influenced by the fact of the other relling stack having hear of a harriage which the relling stack having hear of a harriage which there is no the control of the other relling stack having hear of a harriage with the relling stack having hear of a harriage with the relling stack having hear of a harriage with the relling stack having hear of a harriage with the relling stack having hear of a harriage with the relling stack having hear of a harriage with the relling stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack have a stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of a harriage with the religious stack having hear of the religious stack having hear of a harriage with the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religious stack having hear of the religiou

be influenced by the fact of the other rolling stock having been of a heavier description compared to these dump-cars? I should expect them to receive with some degree of doubt a car which presented itself of lighter dimensions than the cars they had been accustomed to design—that they would receive it with a certain amount of reserve.

1370. Supposing these officers reported against the dump-cars, would you consider it necessary to go outside them for an opinion? If they had reported against the dump-car in the first instance—if they had said they did not consider the working parts were safe, or were in doubt about its durability—my course would have been clear; I should have refused to recommend it for acceptance.

would have been clear; I should have refused to recommend it for acceptance.

1371. I wish to draw your attention to Mr. Midelton's report, when he was Acting Locomotive Engineer in 1883. He says:—"Theoretically this dump-car looks very satisfactory and promises well, but when I fully consider the matter in its various manners of application I really cannot see much in it to recommend; it is like many other things, not complete without some other appliance."* Then, again, he says:—"I could not recommend its adoption for ballasting purposes, and if I were a contractor I should prefer using drop bottom waggons, as with them the ballast is deposited where required, but with the dump-car it would be deposited at the side of the road, and unless there was plenty of room a great quantity would be deposited off the road entirely"? No one proposed to use them for that purpose.

1872. "As for coaling engines with the dump-car, I could not possibly agree to that, as I think it very little if any better than our present system with the D waggons. Should it be decided to order any of these cars, I beg to suggest that dimensions of axles, buffers, &c., be sent by us, to save alterations when they arrive in Sydney—? And that was done; they were requested to do that.†

1373.

^{*}Note (on revision):—I have replied to that by stating that the Department had at that time appliances in view which would make the dump-car valuable, and that fact made Mr. Midelton's report a favourable one.

† Note (on revision):—There is not one word here about the "safety" of the car; there is no representation that the car would be difficult to work; two services are mentioned for which the cars would not, in Mr. Midelton's opinion, be suitable (one is agreed with, and the other differed from), and then he makes the suggestion about axles: "Should it be decided to order any of these cars." This is not or should not be the report of an officer who is of opinion that the working parts of a vehicle offered to the Department are not safe. If Mr. Midelton was of opinion that the arrangement of the car involved a want of safety in working he would have said so, but he did not say so nor did he think so at that time.

1373. From what you know of Mr. Midelton's proclivities in favour of weight, it is not very likely that a specification as to axles would be sent of a less size than that of the axles in the pattern car? Certainly not

C. A. Goodchap, Esq.

1374. Then if it should prove upon examination and report that a considerable number, if not all, of the 18 Sept., 1884. axles being delivered to run under these 200 cars are from $\frac{1}{4}$ to $\frac{1}{8}$ of an inch less in diameter, that would be quite contrary to the intention you had in giving the order? There is a method of testing the strength of the axles.

of the axles.

1375. That would be quite contrary to your intention? Certainly. The axles were to be of the same dimensions. If it be pleaded that they are made of superior material and will stand the same test as the sample, then they would be subjected to the same test that axles are generally put to; their relative strength would be ascertained by the drop and tensile tests.

1376. Is it not a matter of fact that the material to be used in railway rolling stock axles is always required to be of the best description? Yes.*

1377. Then under any circumstances if one is of less diameter than another it must be of inferior strength to that extent? I do not think so.

1378. Both being of equal quality? Of equal quality, yes; but I can quite understand that an axle may be of greater dimensions than another, and yet the one of less dimensions would be the better axle.

TUESDAY, 23 SEPTEMBER, 1884.

Present:-

Mr. GARRARD, Mr. POOLE,

MR. SUTHERLAND, MR. TEECE,

Mr. WRIGHT.

SYDNEY SMITH, Esq., in the Chair.

The Honorable Francis Augustus Wright, M.P., a Member of the Committee, examined in his place:—

1379. Chairman.] You are Minister for Works? Yes. 1379. Chairman.] You are Minister for Works? Yes.
1380. When was your attention first directed to the dump-car? I think in the first instance my attention F. A. Wright, was called to it by Mr. Carson Woods, but I am not certain; that is my impression.
1381. Do you know about what date? I really cannot say the date; it was some time, I think, previous to the date of my first minute in these papers.
23 Sept., 1884

1382. Was it before or after the car was tested? Some time before.

1383. You were present, I believe, at an official test that was made? Yes, I was present at Darling Harbour at a test which I presume was official from the fact of a number of the officers of the Railway. Department being present. Mr. Goodchap accompanied me; and there were present Mr. Midelton, Mr. Read, Mr. Cowdery, and, I believe, also Mr. Paul, the stationmaster at Darling Harbour, and two or three other gentlemen connected with the locomotive and carriage works whose names I did not know.

1384. Was Mr. Scott present at that test? I think not. Mr. G. R. Dibbs was present, and Mr. Carson

Woods.

1385. What was the truck loaded with on that occasion? Billet firewood.
1386. Was it considered a fair load? I should think it was a fair average load; the wood was piled up as high as the sides of the truck.

1387. How many billets were thrown out when the car was dumped? Very few; certainly less than a

1388. What weight do you think was thrown out? The wood that fell off when the car was dumped was 1388. What weight do you think was thrown out? The wood that fell off when the car was dumped was simply some few billets that rolled over the top sides; the doors being hung from the top, and the billets rather long and coming out at different angles, they were at once jammed. I might state without any reserve that, as far as regards its adaptability for dumping wood of that class, I consider the test a most decided failure; the construction of the car rendered it impossible for the wood to get out.

1389. Are the Committee to understand that the official test made was not a success? Not for that special class of loading. I think that had the car been loaded with short, what is called stove, wood, or any material that would have run under the doors the car would have done its work well had it been placed in a suitable position on a bank. Where it was tried the distance from the ground was simply about the height of the rails

height of the rails.

1390. Were you present at any other test? That was the only one I was present at.

1391. Was it owing to that test that the order for 200 cars was given? Not alone to that test, but to the fact that the car had a large carrying capacity and light tare in comparison with our ordinary rolling stock. On that ground (which I consider of great importance), and on the recommendation of the Commissioner, I approved of the purchase of these cars.

1392. For dumping purposes what was your opinion of its value, as far as you were able to judge from the test made? My opinion of the appliance for dumping purposes was that under suitable conditions

the car would be a decided success.

1393. How did you form that opinion? On the facility with which the car was tipped over, and from the fact that it remained at an angle that would have caused anything in the shape of ballast, coal, gravel, or

ract that it remained at an angle that would have caused anything in the snape of ballast, coal, gravel, or sand to run out with rapidity.

1394. Seeing that the test made with firewood was not a success, can you inform the Committee why a test was not made officially with some other class of freight? As far as I was personally concerned I was satisfied that the car would dump with the materials I have mentioned satisfactorily. It then rested with the officers of the Department to inform me whether or not such a car was suitable for our traffic requirements and whether it should be successfully used. ments, and whether it could be successfully used.

^{*} Note (on revision):—But we do not always get the best material, and opinions differ as to what is the best material for axles. 1043—G

ı j

The Hon. 1395. Are you aware that two tests were made with the car loaded with gravel and with sand? Since I F. A. Wright, have seen these papers in print, but I was not aware of it previously.

M.P. 1396. Do you know the result of these tests? Only from the papers before me.

1397. You will find no mention made in the printed papers of the tests with ashes, gravel, or firewood, and 23 Sept., 1884. the Committee are anxious to ascertain on what grounds the 200 cars were ordered, and the result of these tests. You have mentioned that in your opinion the car would be suitable for dumping purposes with gravel, coal, &c.? I cannot tell the Committee why the results of these tests were not included in the Parliamentary papers. Having had no official cognisance of them I naturally came to the conclusion that they were non-official, and that they were conducted for the benefit of Mr. Woods and his friends. 1398. The previous tests? The tests other than the one at which I was present.

1399. Do I understand that the reason why this test was made was to ascertain whether this car would be suitable for dumping purposes? I was requested to inspect the car and to satisfy myself whether it could be easily and readily dumped, and my inspection convinced me that one man could very easily

dump the car.

1400. Do we not understand that the official test made at Darling Harbour with wood was not a success?

1400. The leaded I have already It was a decided non-success with the material with which the car was then loaded. I have already explained that the wood with which the car was loaded, owing to the peculiar construction of the car, rendered it impossible to be dumped. In fact I was amazed to find that Mr. Woods had chosen wood to illustrate the advantages of the dump-car, the very worst material he could possibly have put into it.

1401. Is the Traffic Manager supposed to give an opinion regarding the use to which rolling stock might be applied? Yes, decidedly; it is an important part of his duties to report to the Commissioner what rolling stock he requires for the conduct of the traffic and what quantity of each particular kind of stock. 1402. And whether any particular rolling stock will be suitable for any particular class of traffic? Yes, any new design of rolling stock. I think undoubtedly the Traffic Manager should be called upon for an expression of his opinion as to whether any particular rolling stock is suitable for the traffic.

1403. Are you aware whether any of the responsible officers of the Department were called upon to give an opinion regarding the results of these tests? I believe they were not called upon to give an opinion

1404. So that the Committee understands that this order for 200 cars was given without any reference whatever to the officers responsible to the Government? No, the Traffic Manager was asked to report as to the suitableness or otherwise of these cars and reported favourably upon their use for the traffic. The Locomotive Department was also asked for an opinion on their general design and construction.

1405. Was that previous to the tests? No, afterwards, I believe; I am not sure.

1406. Were any other reports than those which appear in the printed papers asked for before the order for 200 cars was given? None that I am aware of.

1407. I notice in the printed papers that you had an interview with the Commissioner for Railways and Mr. Woods with reference to these dump-cars; —will you kindly tell the Committee the nature of that interview. I refer to No. 11 of the papers, page 5? I do not think I ever saw Mr. Carson Woods at my office in company with the Commissioner; I am not sure, but I think not. If you turn to page 6 you will see that I wrote a minute to this effect:—"I have arranged to send Mr. Woods a note naming a time when I can see him, after I have talked this affair over with the Commissioner for Railways."

when I can see him, after I have talked this after over with the Commissioner for Railways."

1408. Did you talk the matter over with the Commissioner for Railways? Yes, on several occasions.

1409. Will you kindly give the Committee the result of your deliberations? The general tenor of our conversations was as to the suitableness of the dump-cars for our traffic requirements, and the design of the dump-car itself. The Commissioner and myself were both strongly impressed with the idea that this dump-car was a class of vehicle that could be very successfully used on our railways for certain special kinds of traffic, and that from its light tare and great carrying capacity it was a desirable vehicle to use for general traffic. The whole of our conversation was of this nature. We talked the matter over several times, and ultimately, on the recommendation of the Commissioner, which I may say, entirely accorded with my own views, I closed with the offer of Carson Woods & Co., after an alternative tender had been submitted by Hudson Brothers. submitted by Hudson Brothers.

1410. Is it not usual, before giving large orders for rolling stock, to obtain the opinion of the responsible officer of the Department—I mean the Locomotive Engineer? I presume it is. The Locomotive

Engineer's opinion was asked.

1411. Have you read his opinion? Yes.
1412. Do you consider that opinion satisfactory? Most unsatisfactory, coming from a responsible officer of the Government.

1413. Seeing that you considered it unsatisfactory, and that no other report was obtained from the Locomotive Engineer, will you inform the Committee why he was not called upon to explain more particularly? I cannot inform the Committee why he was not called upon by the Commissioner to explain, but I presume the Commissioner took the same view that I did, that this officer, who was acting as Locomotive Superintendent, and whose duty it was to advise, although his report was ambiguous, condemned no one item in the construction or general design of the car. Mr. Midelton having submitted a report of this kind, and knowing from past experience of him that he has a strong tendency to condemn everything proposed or invented by anybody else, I was inclined to think more of the thing than I previously thought, from the fact of this gentleman, who is an expert, failing in his report to point out a single defect.

1414. Do I understand that you considered that the report he furnished was not satisfactory? I considered that in submitting that report he had not done what he should have done? Had he seen defects in the construction or design of the car it was clearly his duty to have pointed them out to the Commissioner, and he having failed to do that I naturally thought there was nothing he could condemn

1415. Mr. Midelton, in his report, states:—" Theoretically this dump-car looks very satisfactory and promises well, but when I fully consider the matter in its various manners of application I really cannot see much in it to recommend"——? I would point out that though he says he cannot see much to recommend, he fails to condemn any one item.

1416. He says further:—"It is like many other things, not complete without some other appliance. I really cannot agree with Mr. Read that it is available for loco. coal traffic, for, as he says, it necessitates

the erection of platforms, staiths, &c. If coal could be dumped direct in carts, so that it could be hauled away to the coal-yards and then dumped again, that would be an advantage, but this could not be done F. A. Wright, M.P. without either raising the dumping waggon or lowering the coal-cart. A good deep-bottom coal waggon, such as used by the Midland and Great Northern Railway Companies at home, cannot well be beaten for 23 Sept.; 1884 coal traffic for domestic and manufactory purposes. I think the coal appliances at the various London depôts of the Midland Company the best I know of. If we could dump kerosene shale into a ship's hold at Darling Harbour there would be an advantage, but at present this could be better done with stopper waggons, as practised at Newcastle. I could not recommend its adoption for ballasting purposes; and if I were a contractor I should prefer using drop-bottom waggons, as with them the ballast is deposited where required, but with the dump-car it would be deposited on the side of the road, and unless there was pleuty of room a great quantity would be deposited off the road entirely. As for coaling organizes was plenty of room a great quantity would be deposited off the road entirely. As for coaling engines with the dump-car, I could not possibly agree to that, as I think it very little if any better than our present system with the D waggons. Should it be decided to order any of these cars, I beg to suggest that dimensions of axles, buffers, &c., be sent by us, to save alterations when they arrive in Sydney." I wish to direct your attention to that, and to ask whether you did not conceive that report was against the dump-car? No; and I will explain to the Committee why not. In the first place, neither more than the form the committee of the dump car with the first place of the latest the dump car with the first place. nor the Commissioner, or, I should think, any sane man, considered the dump-car suitable for ballasting. Mr. Midelton was not asked whether it was suitable for ballasting, and from its peculiar construction it was altogether unsuitable for that purpose. Any man having the slightest experience of railway works must know that Mr. Midelton's opinion about the unsuitableness of this car for carrying coal is merely his opinion against that of the Traffic Manager, who has charge of the whole traffic of the Department, and considers it is suitable. I think no one can deny the fact that, under suitable conditions of a raised line or a sunk roadway, this car could be used very effectually for coal and other material of a similar description.

1417. Are you aware that at the time Mr. Midelton wrote the minute I have just read, the pattern dumpcar was not in the Colony? I am not. I do not see how he could write a minute on a car that he had

1418. Did he not write his minute on some papers from America that had been sent to him by Mr.

Goodchap? I do not know. I have no idea when the dump-car arrived.
1419. From Mr. J. C. Dibbs's letter of the 8th May, number 4, it would appear that the car did not arrive till a month after Mr. Midelton's report? I would call attention to the fact that there is no date on Mr. Midelton's report. The Commissioner sent the papers to Mr. Read for report on the 2nd April. Mr. Read reports on the 5th, and on the 6th it was forwarded to Mr. Midelton, but there is no date to his

1420. Seeing that Mr. Read and Mr. Midelton were only asked to report upon papers submitted about a month previous to the arrival of this sample dump-car, do you not think it would have been well if a further report had been obtained from the Locomotive Engineer after the car had arrived in the Colony? Well, perhaps it would have been an improvement; but I am not sure that the Locomotive Foreman's

report was not written after the arrival of the car.

1421. Supposing that these papers do not show that any report had been made, do you not think it was a departure from the ordinary routine to order 200 cars without first having the report of the officer who was responsible? As far as my experience goes, personally I do not know what has been the practice of the Department in these matters, but I should naturally imagine that the better course would have been to obtain a report. As far as I have been able to discover from the practice of the office, it has never appeared to me that there is any defined rule or any precedent laid down for these things. Each Minister seems to have acted upon his own judgment after receiving the report of the Commissioner.

1422. Do you not think it would be well if some rule were laid down by which a report of a responsible officer could be fully obtained before large orders for rolling stock were given? Well, if the Committee will allow me to explain my views, perhaps it will put it better than by questioning. I went, as I before the committee will be the committee will be the committee of the c explained, to Darling Harbour, to make an official inspection of the dump-car; I was accompanied by the Commissioner, and met a number of the officers of the Department, some of whom I have previously named, having charge of and being responsible for the various Branches of the Service; the car was examined by myself, with the assistance of Mr. Midelton, who pointed out its various excellencies to me, but contribut rooms of its alloged defeats. but certainly none of its alleged defects; general conversation was entered into by all the gentlemen present, and I was then, as I am now, clearly under the impression that it was the duty of these officers to have pointed out to me any defects they saw in the car, but no defects were pointed out. I was almost the only person present who pronounced the experiment of dumping the firewood a failure. Mr. Midelton, in conversation with me, pointed out particularly the bogie, expressing himself in strong terms of admiration of its design and its lightness, as against what he described as the cumbersome bogies we had then in use. Mr. Midelton further urged me, if not in direct words, but I believe he did directly to secure this carriage stating that he appringed the bogies are result, and the did directly, to secure this carriage, stating that he considered the bogie was worth much more than was asked for the whole thing, for the sake of its design. I would like to point out to the Committee that this was an official examination, I being present, and surrounded by all the officers supposed to be capable of giving a judgment, and hearing from them not one single word of condemnation, I felt after that I was perfectly justified in ordering these cars, believing as I did, from my comparatively limited knowledge of such things that it was a good car and of a suitable design, and not because I have knowledge of such things, that it was a good car, and of a suitable design, and not hearing, as I have before said, one word of condemnation of it, or any one part of it, from any of the officers present, all of whom were experts, and entered freely into conversation with me, and who might, and in my opinion undoubtedly should, have pointed out any defects if they had existed.

1423. I may point out that in a previous part of your evidence, in reply to a question put by me, you stated that none of the officers were called upon to report further than is stated in these papers? They were not called upon to report, they were not asked directly to give their opinion, but they were there freely discussing this thing, and all that I heard was commendation. I believe one of the officers—I am not sure who it was—spoke about the weakness of the check chain—I am not sure whether that is the proper term—the chain that broke on one side when the car was dumped over. He spoke of the lightness of this chain—and with that exception I heard no fault found with the graphers the interest of the contraction. of this chain; and with that exception I heard no fault found with the workmanship or design or anything

about the car.

They were not specially 1424. Do you know whether they were aked to examine the car personally? asked

The Hon. asked to make any examination, or to give any report, or to advise in any way, but they were present, and F. A. Wright, were freely conversing with me, and I consider it was unnecessary to ask that question. Had our positions been changed I should have felt it my duty to have pointed out to my chief any defects that I observed.

1425. Were they referred to before the order for the 200 cars was given? I think not, further than that these minutes show that Mr. Midelton and Mr. Scott were asked to make the necessary specification to make the cars suitable to our roads and the rest of our rolling stock.

1426. Was that prior to the order being given or after? - I think it was after the order was given, but there was then time to withdraw order, I believe, if these officers had said the cars were not safe.

1427. Are the Committee to understand that the order for the 200 cars was given without the officers responsible being called upon to give an opinion regarding the workmanship, design, or materials used?\'I really cannot tell you from memory what action was taken by the Commissioner in dealing with the matter after the contract was entered into.

1428. Do you not think it would have been well, before the contract was entered into, that an opinion should have been asked from the officers, seeing they had not previously been asked to report upon the car after it was landed here? Had the case been my own private business—and I can put it in no stronger way—I should have felt perfectly justified, after the examination I made in presence of these officers, and hearing no objection from them as to material, workmanship, or design, in making the purchase. In any similar case, if I examined a new thing in the presence of a number of experts who were paid by the country for their services to advise as to its suitableness or otherwise, and who themselves, as in this case, attended this inspection knowing that it was official, I should feel justified in doing a similar thing to-morrow.

1429. Did they understand that this test was an official one? They must have so understood it from the fact that I was present, and that the whole of these gentlemen had been summoned to attend.

1430. Was not the Commissioner for Railways present at some other test? I am not aware, except from

1431. Was it not understood that these 200 cars were to be manufactured in the Colony? I clearly understood so, and I made a minute to that effect. My first midute is: "I should much prefer having the dump-cars made in the Colony, and should be disposed to arrange for purchase of Mr. Woods' patent wight at a fair price but I could not think of any such sum as \$6,000 for a petrat of this kind that may right at a fair price, but I could not think of any such sum as £6,000 for a patent of this kind, that may at any moment be improved upon. An offer may be made for the patent right for New South Wales." Then further on I said: "Mr. Woods' offer to build 200 dump-cars in the Colony at a price, delivered complete, of £190 each, may be accepted, subject to the following conditions:—That the cars are equal in all respects to the one now in the possession of the Department; that they do not exceed the weight of the same; and that after delivery is complete the Government are to have the patent for New South Wales for all cars they may build or have built by private firms." My idea was that these cars should be made absolutely in the Colony—made and manufactured—and I am quite clear that either Mr Carson water for all cars they may build or have built by private firms. In y idea was that these cars should be made absolutely in the Colony—made and manufactured—and I am quite clear that either Mr. Carson Woods or somebody representing him told me in conversation that they had secured a site on the Parramatta River for the purpose of erecting works, and that Mr. Woods was going to America to import the necessary machinery and men who understood how to work it.

1432. Is it true that they are being manufactured in the Colony? I believe they have been imported in

frame, and are being put together here:

1433. Do you not consider that a breach of contract? Clearly so. As soon as I heard from the Commissioner that these cars had been imported in frame, I wrote a minute and forwarded the papers to the Crown Solicitor, asking for his opinion as to whether or not Mr. Carson Woods had not broken his contract in three ways: (first) that he had failed to execute the bond; (second) that he had imported the cars in frame in place of manufacturing them in the Colony; and (third) that he had failed to deliver fifty cars within nine months, in pursuance of his agreement. I further asked the Crown Solicitor if I was correct in my view, should I be justified in informing Mr. Carson Woods of his breach of contract, and in declining to accept the cars now in the Colony.

1434. Have you received any report from the officers regarding the cars which have been imported? I have not; I know nothing about them further than what I glean from the evidence given before the

1435. You have not received a report about the axles or workmanship? No, I know nothing about the cars further than I know from hearsay that they are within the Colony. The rest of my information

is from the evidence now before me.*

1436. You are not aware whether the cars are safe as regards workmanship or design? Nothing further than I have already stated. There is one matter I would like to explain-one action I have taken in reference to the cars: The Commissioner reported to me a short time since that Mr. Carson Woods had reference to the cars: The Commissioner reported to me a short time since that Mr. Carson Woods had been allowed by some one, he believed Mr. Scott, to place four completed cars on our railways. As soon as I found this out I naturally concluded that it might be said we had constructively taken delivery of these cars, but I learned from the Commissioner that he understood that Mr. Woods was prepared to give an undertaking to the Government that he would not consider it a delivery and that the cars should be at his risk. At this particular time I had an application before me from Carson Woods & Co., asking for permission to place the cars, as built, on our lines, and considering that the acceptance of the four cars might have committed us to the whole contract, I took the opportunity of this letter of Mr. Woods' to have him informed that we would allow him to place fifty of the cars on our lines as completed by him on condition that he paid us a rent of 1s. 6d. per week per car; that he paid us for the haulage of the cars from Darling Harbour to Eveleigh; and that he gave to the Government a written undertaking that the cars were there at his risk, and that he would in no manner consider it an acceptance of delivery. 1437. Have you received any reply to that communication? I believe he has accepted the terms of that letter.

1498. Can you tell us who is responsible for receiving these first four cars? Only from hearsay. Commissioner informed me that Mr. Scott was responsible.

1439. Are you aware whether any of these cars got damaged in transit from Darling Harbour to Eveleigh? I have not heard anything about the damage, except what I gather from the report of Mr. Scott's

^{*} Note (on revision):—On perusing my evidence it comes to my recollection that a report was received by me from the Locomotive Superintendent about the defective axles imported by Mr. Woods, and in fact it was upon that paper I wrote my minute to the Crown Solicitor respecting the breach of contract.

1440. It was stated in the House the other evening when this matter was being debated that this Committee had treated you with disrespect in some way or other—will you kindly state whether you consider they have done so? I am not aware that the Committee treated me in any way with disrespect. I suppose the rumour has arisen from the fact that when I found my name included in the Committee I asked Mr. Dibbs, who was then acting for me to write to yourself, as Chairman of the Committee, requesting to have his name substituted for mine, as my then state of health prevented me from attending; but as far as discourtesy to myself is concerned I have none to complain of I think the boot is rather on but as far as discourtesy to myself is concerned I have none to complain of. I think the boot is rather on the other leg-that I treated the Committee unintentionally with discourtesy by not replying to their com-

1441. At the time you asked Mr. Dibbs to write you were attending to the duties of your office? No, he was acting for me.

1442. Do you remember the date? I think it was a day or two after the appointment of the Committee, but I am not sure.

1443. After the adjournment to go to Glen Innes? Yes, I think so.

1444. Is it not the fact that you resumed duty on the day previous to the House sitting again after the adjournment? Yes, I believe it was on the Monday following the opening to Glen Innes that I took charge of the Department again.

1445. Who is the agent here for Carson Woods & Co.? I really do not know; I see by these papers that Mr. J. C. Dibbs has been acting as agent; but I saw nobody but Mr. Woods in the matter, and had

no communication with anybody but him.

1446. Was the first payment for the sample car made to Mr. Dibbs—I see an account here headed "Commissioner for Railways Dr. to J. C. Dibbs"? The sample car was approved by Mr. Stuart on the

18th May, and I was sworn in as Minister for Works on the 28th of the same month.

1447. Mr. Stuart says, "This car to be tried and taken if found suitable as an experiment—18/5/83." Is that the minute? Yes. So that the whole thing had been decided and did not crop up again until some

time after I was sworn in as Minister for Works.

1448. Would you consider from the fact of the account for the sample car being made out in Mr. Dibbs' name, that Mr. Dibbs was in some way connected with the car? I should think there would not be much doubt about that.

1449. The Department would not have paid the account unless it was satisfied that Mr. Dibbs was agent for the car?

I should think not.

14:0. Mr. Poole.] At the trial, when yourself and the officers of the Locomotive Department were present, do you know whether these officers had been summoned there in order that they might officially witness this test? I should think so; they had no business to be there otherwise; they would have been neglecting their work if they had not been summoned there. I more particularly presume that they were summoned to attend from the fact that there were so many of them present.

1451. Is it in accordance with the admitted rule and practice of the Department for an officer to volunteer information when his superiors are present, or to make a report unless asked for it? I should certainly think that in such a case as this any officer would be bound to point out any defects he might notice to

his superior officer.

his superior officer.

1452. Is it not in accordance with the practice of all the large departments of the Works Office that an inferior officer generally gets snubbed if he volunteers a report upon any subject? As a matter of fact there were no inferior officer there; all the officers present were the heads of their different branches.

1453. They were inferior to the Commissioner? Yes; we had there the Traffic Manager, the Engineer for Existing Lines, the Locomotive Superintendent, all of whom are heads of their respective branches.

1454. I would call your attention to question 666, page 24, of the evidence before this Committee—a question put by myself to the Commissioner: "Independently of the mere quality of workmanship, I think I understood you to say practically that you accept the responsibility of ordering these cars, in relation I understood you to say practically that you accept the responsibility of ordering these cars, in relation to their design, and, as you conceive, to their general usefulness in the Department." The answer is, "Yes, as far as recommending I take the responsibility of that, as the officer who is charged with and responsible for the proper administration of the Railway Department." So that so far Mr. Goodchap, as chief of the Department, practically takes the whole responsibility upon himself of the ordering of these cars? In a very manly manner he takes the responsibility, but I think it hardly fair that it should all rest upon his shoulders

1455. Your answer to the Chairman a little while ago was to the effect that the sample car had been received prior to your being sworn in as Minister for Works? Yes, the sample car had been bought. 1456. I would call your attention to Mr. Midelton's evidence on the 17th September, 1884, question 1280:—"Did you then express to the Minister a favourable opinion as to the adaptability of the dumpcar to our traffic purposes? I do not remember having done so; I do not think I spoke to the Minister at all until after we left the trial and went round the goods-shed; I do not remember expressing myself in favour of the car to him"——? In reply to that I have already sworn to-day that Mr. Midelton not only expressed himself as favourable to the under carriage, but he particularly pointed out the spiral springs and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the dump care as a very great in part and other things about the spiral and the spiral springs and other things about the dump-car as a very great improvement upon the heavy and cumbersome style—these were almost his own words—adopted in our ordinary rolling stock; and he recommended me strongly to secure this car for the sake of the benefit we should derive from the bogie alone. I am quite

distinct on that point.

I457. I would like to call your attention also to the two following questions, 1281 and 1282: "Did you advise the Minister to purchase the cars?—Certainly not. You are quite clear on that point?—Yes, I am quite clear. If he had asked my opinion as to purchasing the cars, I should have said decidedly not to purchase them. How could I do otherwise in the face of a minute like that on the printed papers?" I may perhaps explain to the Committee that I have not said Mr. Midelton advised me to purchase the cars as a car; but he advised me to secure the bogie, as the bogie was a vast improvement on our present I do not say Mr. Midelton advised me to buy the dump-car as a car, but he advised me to buy

the bogie, and he raised no objection to the car itself."

1458. I would like also to draw your attention to question 1283: "You are quite sure you never expressed a favourable opinion of the cars to the Minister, or advised him to purchase them?—I am quite sure of that"——? That is what I say; I say he did not express a favourable opinion of the car as a car, but he did express a very high opinion of the bogie, and the necessity of securing the bogie for our requirements.

The Hon. 1458. As he expressed a favourable opinion of the under carriage of the car, and no unfavourable R. A. Wright, opinion of the remainder, you took it that his opinion as a whole was favourable? Quite so; when Mr. Midelton expressed a favourable opinion of one part of the car he might if he had chosen to do so have Midelton expressed a favourable opinion of one part of the car, he might, if he had chosen to do so, have condemned any other part of it. 23 Sept., 1884.

1459. Mr. Teece.] I understood you to say that it was never intended to use this car for ballasting purposes? No; no sane man having a knowledge of railway construction would recommend this car for ballasting the road.

1460. Will you look at Mr. Read's minute of 5/4/83. He says, "The principle would appear to be well adapted for ballast waggons," and it is apparently to that that Mr. Midelton refers in his minute, that part of which seems to be in answer to this remark of Mr. Read. So that if there is any insanity in the matter it does not appear to be referable to Mr. Midelton? I did not accuse Mr. Midelton of insanity. I say no man, who understands the necessary conditions of ballasting work on a railway line, could recommend this car for that purpose. In ballasting a railway the material must be dropped on the line, whereas this car would drop it off the line.

1461. Then it was Mr. Read who made this "insane" proposition? Mr. Read is merely a traffic officer

and does not understand railway ballasting.

George Cowdery, Esquire, called in and examined :-

Esq.

G. Cowdery, 1462. Chairman.] What position do you occupy? I am Engineer for Existing Lines.

1463. Mr. Wright.] You were present on the occasion of a trial of a dump-car in Darling Harbour? 23 Sept., 1884.

1464. Will you state to the Committee what is your opinion about that car, and its suitability for general traffic, or for traffic of any special description, and also as to the general design, workmanship, and material of the car?

1465. Mr. Poole.] Were you present at the test? Yes. The car was loaded with billets of wood, put in endways, and not a suitable load to dump at all. I do not think the car was intended for that. It did not properly dump the load; one reason was that it was not a suitable load to dump, and another that they attempted to dump it on level ground—ground nearly or about level with the road. But I think at the same time that it would dump coal, or mineral, or gravel, very well, provided there was a suitable place for it,—that is, a raised road.

1466. Or a sunk pit? Or a sunk pit, which is the same thing; that is, a get-away for the material.

1467. Mr. Wright.] Will you state to the Committee whether you considered the action of the dump-car satisfactory on that occasion—its action as a dump-car? Perfectly.

1468. Did you notice the general design of the car? Believing I would be questioned on the matter to-day I went down and had a good look at it yesterday. I had not paid much attention to it since the test, as it was not in my Department.

1469. Do you think the car sufficiently strong to carry the weight? Yes, I think so. 1470. Do you think the bogic sufficiently strong? Yes.

1471. Did you notice the workmanship of the car itself? Yes; the workmanship appears to me to be It is not, perhaps, the neatest work in the world, but it is strong and sufficiently good for the strong.

1472. You are speaking now of the sample car? No, one of the others.

1473. What about its adaptability to our roads—had it a continuous drawbar? Really I could not I do not remember that.

1474. Did you notice the way the buffers were placed on the cross-heads? Yes.
1475. Did you see anything weak or defective in the way they were placed on the cross-heads? No.
1476. Do you consider the cross-heads strong enough? Yes; I think the strength is sufficient. It is not

so strong as some of ours, but it should be sufficiently strong.

1477. You think there is no risk in using that construction, with the buffers placed upon the cross-heads

unsupported? I do not think there is.

1478. Did you notice what arrangement the new car has got in place of the king-bolt? The car I examined has a king-bolt, made to rise up and down to suit the dumping arrangement.

1479. Is there any more danger of that king-bolt breaking than there is of the king-bolt in our ordinary rolling stock? I do not see that there is any danger, even if there was no king-bolt.

1480. Is there no danger of the car dumping while in transit? Not with that socket; that is quite sufficient when it is in its normal position.

sufficient when it is in its normal position.
1481. Is it locked in any way? It is loc

It is locked with a link over the lever, and in its normal position the lever has a tendency to keep its proper position without the link.

1482. Do you know of what material the king-bolt is made—whether it is iron, steel, or brass? No, I did not notice that.

1483. You think, at all events, the car is perfectly safe to travel on our lines? Yes, I am quite game to travel on the top of one of them anywhere on our lines for any distance; I should be quite as safe on the load as on a train running along the rails.

1484. You have gone over the car generally;—did you see anything specially defective in it? No, I did not. I examined the way the doors are fastened, and that seems to be all that can be desired. It is quite possible to put another safety appliance to prevent dumping—that is, to simply draw a loose chain over the handle of the wheel that dumps the car.

1485. You think that in the traffic over our lines, where there are sharp curves, there is no fear of the body of the car becoming disconnected from the bogie? I do not think there is any chance of it.

1486. Chairman.] Have you examined the axles of these cars? Yes; I examined a good many of them

yesterday, perhaps a dozen.

1487. What kind of axles are they? They are made of hammered scrap-iron.

1488. Did you notice any defects in the axles? I noticed what was pointed out to me. There were some slight holes. I did not probe them or try them in any way, but they appeared to be chiefly small scales, and outside abrasions. That is very common with hammered scrap-iron.

1489. Did you examine the wheels? Yes; if you see one of them you see them all.

1490. What kind of wheels are they? Cast-iron chilled wheels. I think the best proof of the quality of the wheels

wheels is their having run thousands of miles, the same description of wheel being in common use in G. Cowdery, America. I must say I do not favour cast-iron chilled wheels at all, only that I know American cast-iron is very much better than we get usually.

1491. You have said that even without a king-bolt you do not think there is any danger of the body of the 23 Sept., 1884. car becoming detached from the bogie? No, not as it was originally.

1492. Supposing the truck should go off the road, what would be the result? There would be a capsize in any case, I expect.

1493. Do you think there would be any fear of the body of the car becoming detached from the bogie frame in that case? I do not believe it would even then, unless it was a regular smash—a turn-over, or

In cases of that kind any truck comes to grief. something of that sort.

1494. Have you carefully examined the workmanship and materials used in connection with the dump-I was shown some of the iron that had been hammered and tried, and it appeared very good indeed. That is all I can tell you about the quality of the iron. They twisted some of it into all sorts of shapes, and it seemed to stand without any fracture. I saw a couple of hooks that were being bent under the steam hammer; evidently they had had a great many blows, and they did not show any signs of fracture.

1495. You were present at the trial with billet-wood? Yes.

1496. What quantity dumped out? Very little indeed; but it was the rail round the side that prevented it from being done. The car was not made for it.

1497. Were you present at any other test? No, I was not.

1498. Were you officially summoned to be present on that occasion? Yes, I think the Commissioner asked me to go down with him.

1499. Were you asked for an opinion as to the adaptability of this car? I forget really whether I was or not. I know there was a good deal of talk about it on the ground at the time.

1500. Is it usual to ask for your opinion about any rolling-stock? No; it is not in my department at all. 1501. Mr. Wright.] When you were present on that occasion had you seen anything radically wrong in the design or construction of this car would you have felt any difficulty about drawing my attention to Certainly not; I should have considered it my duty to do it.

1502. Would you consider that any officer present who saw anything that was decidedly deficient would fail in his duty unless he called my attention to it? Certainly. I know Mr. Midelton, in speaking of the dump-car—of the under carriage particularly—drew attention to the style of it, and pointed out how simple and good it was, and that it was all that was necessary for a car of that description for carrying goods.

1503. You do not consider that any officer present would have been going out of his way if he called my attention to defects in this car? Certainly not. I think he would be neglecting his duty if he did not

do so, most assuredly

1504. Mr. Poole.] Will you look at this sketch (on the table). I think your answer to Mr. Wright was that you consider this cross-head or head-stock (pointing to sketch) sufficiently strong to withstand the strain of a train of 300 tons weight coming on it suddenly? Yes. I do not say it is as strong as it would be if it were braced; I do not think it is as strong as ours are in that respect.

1505. Supposing there is a train of 300 tons, running 20 miles an hour, with an engine of 40 tons weight, and it is necessary for it to pull up rapidly, do you consider that head-stock sufficiently strong to with-stand the strain on the truck nearest the engine? I think so.

1506. Mr. Garrard.] You think that, if necessary, additional safety appliances might be applied to this dump-car? Only what I have suggested.

1507. Have you had any experience of the running of cast-iron chilled wheels? No, I have not. I have seen cast-iron wheels on contractor's waggons.

1508. I think you said that personally you were not in favour of cast-iron wheels? I am not. 1509. But you have no hesitation in saying that these dump-cars are perfectly safe? I have it I have not.

1510. Did any other officer besides Mr. Midelton express any opinion in favour of this car? I do not know whether there was any other officer there; I fancy the Traffic Manager was there, I think so. 1511. Chairman.] Are you the inventor of a new kind of coupler? I am one of the inventors; Mr. Thomas, of Mr. Whitton's department, and myself.

1512. How long is it since this coupler has been in use? Something over three years.

1513. How many trucks have been fitted up with this coupler? About 250.

1514. Who recommended this coupler to be fitted on to freight trucks? I think Mr. Burnett recommended it; I know he approved of it and suggested a chain to couple it to the other stock, which I thought a good deal of too. It was made and has been used for the purpose since.

thought a good deal of too. It was made and has been used for the purpose since.

1515. Is this coupler in general use or set apart for any particular kind of traffic? I believe it was ordered for coal and ballast trucks in consequence of their being able to keep them as much as possible together. These couplers were ordered chiefly for the locomotive coaling, because then the trucks fitted with them could be kept together; and also for trucks for ballasting the railways. Ballast-trucks fitted with them are being made, and two of them are completed, up at Clyde; and I have made some

improvements on them, which I considered desirable.

1516. Are the 250 trucks fitted with the patent coupler in use? I believe so; they were put on the road. 1517. Is it true that a number of these trucks are at Eveleigh and other stations on the line, and that they have not been used for some time past? I do not know; I have had nothing to do with that part of the affair. I believe a good many of them have been standing on the siding, for what purpose I do not know.

1518. Have you heard any complaints regarding their safety? I have heard nothing officially. I have heard it mooted that there has been something wrong with one or two of them, but not officially. 1519. Are you aware whether any of the officers of the Department have objected to the use of these couplers on the trains? Not directly, I think.

1520. Are you aware whether there have been any accidents from the use of these couplers? They have not come to my ears.

1521. They have never been reported to you? No. 1522. Are they still fitting up some of the trucks with them? They are fitting up some for ballasting purposes. There is a train of them beyond the Blue Mountains and my men are working a lot of them on the permanent way, and I have heard no complaints.

23 Sept., 1884.

G. Cowdery, 1523. If there have been any accidents they have never been reported to you? They have never been reported to me. The first three trucks fitted with these patent couplers that were made were running with coal I suppose some three months before we gave a trial. There were a great many gentlemen there, and I do not think there was one amongst them that could disapprove of them in any shape. They were tried in every way we could think of. Mr. Burnett, the then locomotive engineer, I know was very

pleased with them.
1524. The couplers, I believe, have been patented? Yes, not only here but all over the world.
1525. Have they been used on any other railways? No, they have not. It is a very difficult thing to get introduced on account of the immense rolling stock on all the lines that are fitted with the ordinary couplings. But I see that in America they are talking of making the use of automatic couplers compulsory. In Massachusetts, for instance, there has been a great deal of discussion of late, and there has pulsory. In Massachusetts, for instance, there has been a great deal of discount of the been a Board appointed, who have written to twenty-two managers of railways to ask their opinion on the been a Board appointed, who have written to twenty-two managers of railways to ask their opinion on the advisability of using automatic couplers, on account of the great sacrifice to life and limb; and twenty out of the twenty-two have approved of their being adopted. Now there is a Select Committee to choose out of all that have been patented one out of the lot, if they can, to suit all parties. They feel that if they do not do it themselves the law will compel them before long. I can show you that in some of the American

papers. The American Railway Age, I think, has a good deal about it.

1526. We will be glad if you will have the paragraphs referred to appended to your evidence? supply them. (See Appendix D1.) I think I can show you that the English people think something of it as well. I have here a first-class certificate from England, as the result of a trial to which the Board of Trade were invited and were present. Since it was over the Chairman has made some inquiries about it and made some little suggestions. I do not know whether they are improvements or not; it is very doubtful. This is the certificate. (Produced. Copy handed in. See Appendix D2.) This certificate is from the National Exhibition of Railway Appliances—a special exhibition for such things, not a general exhibition. 1527. Mr. Poole.] In answer to the Chairman you said the ballast trucks fitted with these couplers are being made at Clyde? Yes.

1528. Are they being made specially to suit the couplers? Yes, they are to be made with the coupler attached. It is not necessary that they should be made specially for it, because the old couplers could

be applied if necessary; but they are being morticed for the patent couplers.

1529. These additional trucks are wanted, I suppose, irrespective of what couplers are to be used with

them? They were ordered specially for these couplers.

1530. To throw other trucks out of use? No, not to throw other trucks out of use.

1531. Do you want trucks irrespective of any particular couplers? Yes, certainly; they are not on pur-

pose to use these couplers; certainly not.

1532. Have you heard incidentally that any officer in charge of the rolling stock objected to the patent couplers? I heard Mr. Scott say he did not like them. I have asked him time after time to show why he did not like them, and he has never been able to give any reason.

1533. Was Mr. Scott present at the official trial? Yes.

1534. Did he express any opinion with respect to the efficiency of the coupler, or against it? I do not know that he did. In fact I do not know that I spoke to him about it that day at all. Mr. Thomassen, who is the agent of a large firm at home who buys up a great many of these patents, wrote something in the paper, saying he thought it was cribbed from their patent. He was in Melbourne at the time, and we let him know we were going to have a trial, and after seeing it he withdrew these expressions publicly, and acknowledged it was the best coupling ever invented.

1535. Is Mr. Scott, from his position as Locomotive Engineer, more directly answerable for the kind of couplings that are used on all our rolling stock? I do not know. I should imagine that, if there were any couplers or anything else in the present rolling-stock that he did not approve of, he would soon make

it known.

1536. May I ask you who gave the order for these couplings? I got the order from the Commissioner, as I do all my orders.

1537. And they have been imported, some hundreds of them, from England? Those that are on the

trucks. Those that are being put on now are made here. 1538. How many were imported? Two hundred and fifty.

1539. Have you found you cannot make them here with advantage? I believe we can make them They are all made of a material which was shown at the Exhibition here as something very splendid in the way of toughness—crucible steel.

1540. To ensure tenacity and strength? Yes, or else they could have been made cheaper.

1541. Is it a fact that a train composed of a reasonable number of trucks, united with the patent coupler, became disconnected while in motion? Not that I am aware of.

1542. No report has been made to you that such has been the case? No.

1543. Where are the trucks used more particularly that are fitted with the patent coupler now? We are using some over the other side of the Mountains, and a good many in the Sydney district—on the

permanent way branch. 1544. Ballasting? Yes A good many of them are used for bringing coal from Darling Harbour. I do Yes. not know why they have not been used generally. Probably the best reason why they have not been more generally used is on account of their being a different coupling from the others, and therefore they cannot split them.

1545. They want trains composed of one kind of coupler? Yes, to some extent. Loose couplers can be

coupled to any other stock.

1546. Is there much difference between the cost of a set of patent couplers and the cost of ordinary couplers? I do not know the difference, but in all probability they will be made cheaper than those

already supplied, 1547. Mr. Wright.] Cost for cost as against the ordinary coupling, which is the most expensive? I do not know the cost of the ordinary coupling.

1548. Do you say the patent coupling will eventually be made cheaper than the ordinary one here? No;

cheaper than the patent one has hitherto been made. 1549. Cost for cost, which do you think will be the cheapest? I do not think the patent coupler will be the cheapest; but I do not know that it will be very much dearer.

1550.

1550. You have no doubt of its superiority as regards the saving of life? I am certain of it, and I think G. Cowdery, I ought to know something about it, having been for forty years on railways, and studied the matter thoroughly. I have studied all the patents that have been taken out, and I am certain there is not at the present time a coupler equal to it.

1551. You have not answered my question as to its being in your opinion unmistakably a life-saving apparatus, as compared with the other? Most unquestionably. There ought not to be any sacrifice of life at all; there is no necessity to go in between the trucks.

1552. Do you remember whose orders you got to use this coupling? I can hardly tell you. I know we got the order from the Commissioner to have them put on. The order was sent to the Locomotive Department.

Department.

1553. About how long ago? Something over two years ago. The first trial was over three years ago.

1554. You have had no official communication of any sort condemning these couplers? No.

1555. Mr. Poole.] I would like to call your attention to a portion of Mr. Scott's evidence, given on the 27th August, 1884. In answer to a question put by myself, question 331: "The couplings, irrespective of who makes them, or who is the patentee, are, in your opinion, not suitable for our purposes"—to which Mr. Scott replies: "There is a difficulty in coupling them with the ordinary stock." The next question, 332, is: "Supposing the whole of our stock was fitted with these couplings, would you consider that an advantage"? He replies, "I do not think it would be any advantage"—? Yes, he talks in that way, but he never gives any reason for it. It is very easy to say he does not think so, but when you come to ask him why and wherefore he does not give the slightest reason.

1556. He says there is a difficulty in coupling them with the ordinary stock? That difficulty can be got over.

1557. Mr. Wright.] Who is the owner of the patent now?. I hold one-third, Mr. Thomas one-third, and

Hudson Brothers a third.

1558. Chairman.] I should like to draw your attention to question 539, in reply to which Mr. Midelton says:—"I think it is likely to uncouple with a heavy pull, and it does not seem to me a good mechanical job as regards the design; it is not a coupling I should recommend or support; on the contrary I have from the first opposed it; I do not think it is safe"——? Of course I never heard of this before; but I should like you gentlemen to go and see it for yourselves. There are two sets at Granville now that I have made some slight improvements on; and you can have them loaded and bumped about as you like, and if you can find any fault with them I shall be perfectly satisfied.

Mr. John Goff called in and examined :-

1559. Chairman.] What position do you occupy? I am a draftsman in the Locomotive Engineer's Office. Mr. J. Goff. 1559. Chairman | What position do you occupy: I am a dialisman in the service in New South Wales? 23 Sept., 1884.

1561. Are you aware whether your name was ever mentioned as an officer qualified to take the position of Superintendent of Rolling Stock, with Mr. Bingham and Mr. Bourn as subordinates? No. 1562. You have made application? Yes.

1563. Has the Commissioner stipulated that whoever fills this position shall go through an examination, and design a car? Yes.

1564. And you are prepared to submit to that test? Yes..
1565. Are your plans prepared? Yes; and, I believe, handed to the Commissioner.
1566. Have you seen the sample dump-car? Yes.
1567. Have you seen the cars imported by Mr. Carson Woods? Yes, a portion of them.

1568. Do you know anything about the tare and dimensions of the rolling stock in use here now? Yes, I have a general idea of it.

1569. How do you consider the dump-cars now being imported compare with the other rolling stock now in use as to durability and suitability for general traffic or special traffic? As regards durability I think the dump-cars will be fully as durable as any we have now in use on the lines; they can be used also for many purposes, for which our own cannot, and I suppose we have the means to apply them to special

1570. Do you wish to convey that they are suitable for special traffic, but that special provision must be made? Yes, and for ordinary traffic they are as good as the other rolling stock.

1571. Have you been accustomed to consider the tare of a vehicle or truck as a matter of any importance?

Certainly.

1572. Then if an officer of the Railway Department has stated that 2 tons of additional tare is of no consequence, in your opinion that is incorrect? Yes, it is like a hammer of 2 tons weight hammering on

1573. Have you examined the iron-work of the sample dump-car? Yes.
1574. What sort of workmanship do you call it? Rather rough.
1575. How is it as to strength? I would not be so presumptuous as to say that the iron is not good

1576. Have you examined the axles of the sample car and the axles now being imported? Yes, they are both rough.

1577. Are the axles now being imported to complete Mr. Woods' contract a fair sample, according to the sample car? I do not think there is anything to choose between them.

1578. They are rough, but you cannot say anything about their strength without a test? No.

1579. Have you noticed the king-bolt provided in the cars now being delivered? Yes.

1580. Do you consider that strong enough? I would like to see that a little stronger.

1581. What is that made of? It appears to be a steel casting.

1582. What are ordinary king-bolts made of? Iron.

1583. Do you think the quality of wood used in the dump-cars is equal or superior to Colonial timber?

1583. Do you think the quality of wood used in the dump-cars is equal or superior to Colonial timber?

Taking lightness and strength together it will compare favourably with Colonial timber.

1584. Do you think it is as good or better? I have not had very much experience of Colonial timber, but I should consider the wood used in these dump-cars would compare favourably with other timbers I have 1585.

Mr. J. Goff. 1585. Have you any idea how the hooks and chains are wrought—do they seem to be fairly wrought—the links fairly welded? They look rather rough. 23 Sept., 1884. 1586. Do you think they are properly shut and secured? Yes, I do. My opinion of the iron-work on the car I examined is that it looked like a singed cat, but it might be better than it looked.*

1587. What class of wheels have these cars under them? Cast-iron, chilled.
1588. Have you had any experience of these wheels? Yes, twelve years in America.
1589. What do you consider the actual running life of these wheels, taking a fair average? From 50,000 to 100,000 miles.

1590. If it has been stated by one of two officers that from 50 to 100,000 miles would be a fair life, and by the other 200,000, would the average of the two statements be a fair estimate? It depends a good

deal upon the traffic on the road.

1591. I do not think you quite understand me. If two officers in the Railway Department of New South Wales have stated respectively, one, that these wheels would run 200,000 miles, and the other, from 50 to 100,000 miles—would we, if we put these two statements together, get a fair average of the life of the Ϋ́es.

1592. These two statements having been made, which is the more likely to be correct? I think the smaller number; that would be the safest to reckon upon. Cast-iron is a material that could not be

depended upon to last longer. It would depend upon the depth of the chilling.

1593. You have seen the new cars;—are they a fair sample in work and material of the pattern car?

They are as good at least.

1594. Were you the inspecting officer, would you accept the cars now being landed as fair workmanship, as against the sample car? Certainly.

1595. Should you consider the cars, from what you have seen of them, as safe cars to run on our lines over the mountains and everywhere else? I should not be afraid of them myself.

1596. Have you examined the mechanism of the car? Yes.
1597. Do you think there is any danger of the car itself jumping off the under frame when going round curves or shunting? There is no more danger than with any other car. It would depend upon the King-

bolt; if that gave way it might do it.

1598. Do you think the King-bolt equally as strong as those used in ordinary cars? I do not know the material, but I should rather see it a little stronger. If of the same diameter and strength it would be about equal to the king-bolts used in other cars.

1599. Do you think these dump-cars are cars that are fairly suitable for general traffic—the ordinary merchandise traffic on the railway? Yes; similar cars without the dumping arrangement are in general use throughout America.

1600. Supposing we abolished the use of these things as dump-cars, are they suitable for general use on the railway? Certainly; they might require some alteration for special purposes.

1601. Do you consider the cars are built of sufficient strength to carry the load they are marked to carry? Yes, they are.

1602. 20 tons? 18 tons only, I believe. 1603. 20 American tons of 2,000 lbs.? Yes.

1604. You think the bogie and the body of the car are both of sufficient strength? Yes.

1605. Is this dumping arrangement a new principle? No, a dump-car is a ballast-car; it is an adapta-

tion of an old principle.†

1606. Are you aware of any railway where such cars have been used to any extent, either for special traffic or general traffic? This particular adaptation is new.

traine or general traine? This particular adaptation is new.
1607. If anybody has stated that the king-bolt of these new cars is made of iron, you believe that is incorrect? Yes, I believe it is a steel casting.
1608. Generally what is your opinion of the new dump-car in comparison with the ordinary cars in use; how does it compare for tare, carrying capacity, and general usefulness with the ordinary cars in our rolling stock; do you consider the imported car as good a car for general purposes, and as strong a car, as the G car? I think the G car is stronger and heavier than is necessary.

as the G car? I think the G car is stronger and heavier than is necessary.

1609. Do you consider the dump-car is a good car for general traffic, and as capable of standing the knocking about and strain of the traffic as the G car? In comparison with weight it will stand more.

1610. At all events, I gather from what you have stated that generally speaking you favour the adoption of this car as being a useful car on our lines? Yes, I think it is a move in the right direction.

1611. Do you think the fact of this car being 2 tons less weight than our G car, and carrying 5 tons more, is a very decided advantage? Certainly.

1612. Has your experience taught you that one object of railway managers is to reduce the weight of rolling stock? Yes, certainly.

1613. Chairman.] In reply to Mr. Wright, you stated that you did not think the king-bolt is as strong as you would like? I should like to see it a little bit stronger, but chiefly on account of not knowing what the material is. If I saw it tested I could form a better opinion. the material is. If I saw it tested I could form a better opinion. 1614. What is the material? It appears to be a steel casting.

1615. Would you recommend a steel casting to be used as a king-bolt? I should use steel or iron. Steel has its advantages. You can get steel to carry 30 per cent. more than iron.

1616. Have you examined the dumping apparatus? Yes.

1617. Do you see any danger of the car dumping itself going round a sharp curve? I see none what-

ever; I do not think it would dump itself; but as a security against that I should have the links that hold it down a little further apart.

1618. Have you examined the buffers? Yes.
1619. What do you think about the strength of the buffers? The buffers themselves are good enough. The car would be the better of having some brace behind the buffers. The car has been designed for a centre buffer originally.

1620. Is there any continuous draw-gear with this car? No.

1621. Can continuous draw-gear be fitted to it? An engineer can do anything.

1622.

^{*} NOTE (on revision):-I mean to convey the idea that the iron may be good notwithstanding the rough looking exterior.

† Note (on revision):—I meant to say that dump-cars have previously been used for ballasting purposes, and these are an adaptation of an old principle.

1622. Can it be fitted to this car? It would require a lot of scheming, but no doubt it can be done.

1622. Can it be fitted to this carr It would require a low of scheming, and the land was schemed 1623. What would be the cost? It is difficult to say what would be the cost until the plan was schemed 23 Sept., 1884.

Mr. J. Goff.

1624. Do you think this car would be safer if the continuous draw-gear were there? A continuous draw-bar is always an element of safety.

1625. Mr. Wright.] Do you consider the draw-gear is a necessity? Yes, for a heavy train.

1626. Chairman.] You state that you have had some experience in America. Are the gradients and curves there similar to ours? Some portions of them.

1627. I mean generally? In the middle States of America, along the big valleys, the gradients and curves vary as they do here; on the plains in the west the lines are level, but on the mountains they have just as sharp curves and steep gradients as we have in New South Wales.

1628. Have you seen them? Yes, I worked on the Pacific Railway at one point.

1629. Have you seen any cars fitted up similar to these dump-cars, running on sharp curves? Not the dump-car; not exactly like it. I have seen the old arrangement they have had for ballasting for the last thirty or forty years.

1630. Mr. Poole.] You mean contractors' waggons? Yes.
1631. Chairman.] I understood that in reply to Mr. Wright you stated that the iron seemed to be rough, and that you could not offer an opinion regarding its durability without testing it? Yes.

1632. Do you know whether any of these wheels or axles have been tested—I mean the dump-car wheels. and axles here? Not that I am aware of.

1633. Before giving an opinion as regards their safety I understand you would like to see them tested? Yes, the axles, before giving an opinion as to the quality of the material.

1634. Then again, I understood you to say that you thought they were a perfectly safe car to run? Yes. 1635. Do you consider them a safe car to run without the test necessary to enable you to give an opinion regarding the quality of the material? In any case if I had charge of the rolling stock on the railway I

should certainly expect to have a number of the axles tested before I accepted them.

1636. I am talking of the axles, as far as you are able to see them at the present time? As far as I am

able to see at the present time I consider the axles safe.

1637. Although you consider them a very rough job? Yes.
1638. Do the Committee understand from your evidence that the buffer would be better if it had a stay at

the back to resist the strain? Certainly.

1639. And it would be better to have continuous draw-gear, and that the materials used in connection with the axles and wheels should be tested? I should judge the axles are good enough, but any man is likely to make a mistake until he sees an actual test of the axles? The work may appear rough, but still be very good. These axles would have looked better if they had had a coat of paint.

1640. Mr. Wright.] The body of this car, I take it from your evidence, is of the general design of all freight-cars in America? Yes. The doors are hung specially for dumping.

1641. If the car were provided with no dump it would be a fac-simile of the ordinary freight-car used in

America? Yes.

1642. Mr. Poole.] You have designed a car as a sample of your knowledge of railway rolling stock, for the approval of the Commissioner? Yes.

1643. What kind of car? A first-class carriage on four wheels.

1644. What railways have you been employed upon? The grand Trunk Railway of Canada, the Royal Danish Railway in Denmark, and the Hungarian Eastern Railway. I have also been with a carriagebuilding firm at Copenhagen.

1645. On any of these European railways do you know of cars similar to this dump-car being in use?

Not with the dumping arrangement.

1646. How long have you been in the Service of this Colony? Since the beginning of January last.

1647. What kind of timber is it they are using in the dump-cars? American pine. 1648. From what State? The Eastern States.

1649. When that timber gets dry is it not very brittle? No, we do not judge it so. 1650. Is it more elastic than Oregon? Fully as elastic, and stronger.

1651. Do you consider that any timber of that class is to be at all compared to our blue gum, section for section? Section for section, in comparison to weight, certainly.

1652. Do you consider that section for section any class of American pine is equal in strength and durability to the same section of our best hardwood? Certainly not.

1653. But in dealing with rolling stock you consider there is an advantage in using lighter material in order to obtain a lighter tare generally? Yes.

1654. And you consider it advisable to sacrifice durability and strength for the sake of lightness? Not

to sacrifice.

1655. To ignore it then? Not to ignore it.
1656. Will you explain? The life of rolling stock is about eighteen years as a general average; I think it is useless to build rolling stock of a weight and strength that will last over that time, because before that time all our plans and arrangements will be changed most probably.

1657. In other words you think that possibly improvements which may take place during a period of eighteen years would warrant you in not building trucks for a longer life? That is my opinion. 1658. You have already stated that you consider a life of from fifty to a hundred thousand miles is a full average of the durability of a cast-iron chilled wheel? No, I will not say it is a full; it is a fair average.

1659. From your past experience what is the average life in miles of English wheels of the type used in this colony, steel tires and malleable centres, all things being equal in the two cases in the working? The English wheels with steel tires of course; you can change the tires on them; the body of the wheel will last a long time if made of good material; but it is a question in my mind if one of the cast-iron wheels is not just as cheap as the tire to one of the ordinary wheels.

1660. You think it would be just as cheap to the Department to put on a new cast-iron chilled wheel as to put a new steel tire on the malleable centre now in use? Yes, nearly so. The tire is turned two or three times and costs money each time it is turned.

1661. How many miles would a wheel of the present type run without a new tire, but simply turning the old one? Perhaps 100,000 miles; if of very good material it might run 150,000 miles.

1662.

Mr. J. Goff. 1662. In the one case then we have it on these terms: A chilled wheel in your opinion, will run from 23. Sept., 1884. 50 to 100,000 miles, fair work, and a wheel such as in common use now in the Department, with a steel tire, without renewing the tire, will run from 100,000 to 150,000 miles? Yes, turning the tire down as long as it is fit to be turned. There is one thing I should like to mention in consideration of making that comparison; taking into consideration the material of which cast-iron chilled wheels are made it will come to nearly 50 per cent. of what the wheel itself is worth; when broken up the value of the metal is taken into consideration in the cost.*

1663. In your experience in the use of chilled wheels to what depth has the chilling penetrated? About

three-eighths of an inch.

1664. As much as that? Yes, some of them more.

1665. Irrespective of its dumping properties, do you consider this a suitable car for our railways? Yes,

independent of its dumping properties, with some slight alterations to suit the traffic.

1666. Have you been over our mountain railways? I have been between here and Melbourne several

1667. Have you been to Bathurst or Hartley? No.

1668. Do you think from your experience of our rolling stock here, and of the use of this particular description of cars in America—dump-cars—that all things considered, they are a decided improvement on our present description of rolling stock for all ordinary purposes? In comparison to the weight that they have to carry, and in comparison to the dead weight of the car itself, I think it is a decided improvement—a step in the right direction.

1669. Do you think they are as safe as our own stock, running round 8-chain curves? I cannot see but

what they are fully as safe; I would not be afraid to run them.

1670. Mr. Garrard.] What position did you occupy in the different Railway Companies you have named? The last position I held, from 1870 until I came here, I started as draftsman and was afterwards manager of the works for building railway and tramway rolling stock.

1671. Where was that? In Denmark.

1672. In your experience in Canada did you find many fractures with cast iron chilled wheels? The engineers argued at that time, and do yet I believe, that there were less with cast-iron than with other wheels in the warm climates, but in the cold climates they were greater. In the warm climates there

wheels in the warm chimates, but in the cold chimates they were greater. In the warm chimates there were no more fractures with chilled wheels than with steel tires.

1673. Mr. Wright.] Have you been in America recently? No; I left America in 1868.

1674. Do you know what kind of wheels are universally made there? Chilled wheels.

1675. Where they have 120,000 miles of railway? Yes, they are all using chilled wheels.

1676. Mr. Garrard.] Are the changes of temperature there equal to those from our lowlands to our mountains? Yes; during the year the temperature varies between 95° and 40° below zero in parts of Canada.

1677. Are the changes of temperature sudden there? Yes.
1678. The carriage you designed to put before the Commissioner you say is a first-class carriage on four wheels? Yes.

1679. Not bogies? No.

1680. Do I understand that you do not favour bogie carriages? Certainly I favour them; but I designed

this carriage on four wheels because it was intended to carry a small number of passengers.

1681. Chairman.] Do I understand that you favour four-wheeled carriages? Only in certain cases. I have given my reasons for so doing to the Commissioner. For a long carriage and a large number of passengers most decidedly it should be on bogic frames.

1682. Was your attention ever directed to the Allison Manufacturing Company's car? I do not know

that I know it.

1683. Do we understand that you are unable to give the Committee any opinion regarding what has been done in America since you left in 1868? Certainly I keep myself posted up in American matters. 1684. Have you ever been asked to give an opinion regarding the rolling stock in connection with the Government Railways of New South Wales? Nothing more than in connection with the designs, &c., I gave in to the Commissioner.

Mr. Owen Blacket called in and examined:-

Mr. O. Blacket. 23 Sept., 1884.

1685. Chairman.] What position do you hold? I am a manufacturing engineer.
1686. In whose employment? I belong to the firm of Blacket and Co.
1687. Are you a mechanical engineer or a civil engineer? Mechanical; I served my apprenticeship at Mort's Dock.

1688. Are you a civil engineer also? No; I have been a consulting engineer.
1689. Can you furnish the Committee with any evidence about the dump-cars? I have seen the sample

dump-car and a number of the cars now being erected.

1690. Will you inform the Committee what you think of the dump-car as a piece of mechanism? I first saw the dump-car that was supplied as a sample two years ago, and I saw it one day last week; that dump-car is not equal to the cars now being supplied in several respects; it has not got a king-bolt; the frame for the bogies is not so well framed and put together; the buffer-beams at the end are lighter; the catches for the doors are also lighter; so are the under-framing bolts; the axle-boxes in the new cars are far superior to the axle-boxes in the old car; and the safety catch to keep it from upsetting is also a decided improvement on the safety gear of the original pattern.

1691. Have you had any experience of railway matters? I have travelled a good deal on railways in America and other places, and have taken notice of what I saw.

1692. Have you had any experience in manufacturing railway rolling stock? At Mort's Dock I had to do with the manufacture of socil waggers, but not much in other relling stock.

do with the manufacture of coal waggons, but not much in other rolling stock.

* Note (on revision):—I meant to convey, that when broken up, the metal of which the wheels are made is worth nearly 50 per cent. of original cost of wheel.

† Note (on revision):—I intend to convey the idea that I am able to give an opinion as I keep myself posted on

American matters through the technical journals and otherwise.

- 1693. There is an automatic fastening to this car, is there not? There is a fastening, but it is not
- O. Blacket. 1694. Do you think it likely to get out of gear if the car receives a sudden shock? No, there is a catch to hold it. The original car might get out of gear, because there is only a slight spring to hold the catch; 23 Sept., 1884. in the sample car it would be very likely to shake out of place.

1695. Then it would dump? Yes, it would stand a chance of doing so if the handle revolved.

1696. Suppose the car was going round a curve, with one side lower than the other? on one side it might dump in a case like that.

1697. As a matter of fact you have had no experience of railway works or of railway material? No more than an engineer who takes an interest in travelling through other countries to see how other people do

1698. Are you in a position to give us any information with reference to this dump-car? I consider the dump-car a far superior car to the G car which belongs to the Railway Department at the present time.

1699. In what way? It is lighter, with less dead load for the same amount of live load.

1700. Is that a consideration with engineers? It is a consideration because of wearing your road out

1701. The object in all cases is to reduce the dead weight? Yes, the non-paying load. 1702. You think in this dump-car that object is attained to a great extent? Yes.

1703. Mr. Poole.] Wherein does the superiority of the axle-boxes of the new cars now being delivered consist, as compared with the pattern car? The pattern car has an ordinary axle-box without any means to keep the grease from flying on to the wheels, whereas the new ones have wooden slats to keep the

grease from coming out of the axle-box and going on to the wheels.

1704. The superiority then consists in the better method of lubrication? Yes, saving the grease; instead

of losing gallons of oil it is kept from splashing out by these pieces of wood.

1705. Do you consider the lightness of the truck itself as of the first consideration, as compared with its durability and safety in running? I think strength is the first consideration, but we can get strength and still get lightness of construction by trussing it properly with bolts.

1706. Mr. Wright.] Do you think this car is properly trussed? Yes, and of splendid material too, as far

as I could see.

1707. Mr. Poole.] You have compared this car with the new G truck;—do you consider that there is more material used in the construction of the G truck in relation to the work it has to perform, than is necessary? Decidedly. The G truck weighs from 12 to 13 tons; the dump-car weighs about 10 tons; and the dump-car carries more than the G truck. There must be a waste of material in the G truck if the dump-car can do its work properly.

1708. Do you consider, from what you know of both trucks, that the life of the dump-car will be equal to the life of the G car, the usage and length of running being the same in both cases? I think the life of the dump-car would be the longer; there will be less dead weight bumping and battering about, and less dead

weight charging it every time it is shifted.

1709. Have you examined the iron-work—the axles especially—that have been put under these new cars?

I saw the axles as they lay at the works.

1710. What is your opinion? My opinion is that the man who made them had a very good opinion of the axles, or he would have tried to smother these little cracks in them; they are sent out in the rough; there is a little bit of scab upon them; and if the man that made them had thought they were defective he never would have supplied them black; he would have painted them if he had thought they were of bad material.

1711. In speaking of the cracks in the axles, do the Committee understand you to be referring to mere scales, or to cracks penetrating towards the centre of the axles? All that I saw were what we call scabs; none of them appeared to me to go to any depth.

1712. What in your opinion is the strength of the axle in relation to the work it is expected to do? I

consider them quite able to stand the strain that is to come upon them.

1713. Considering all the various positions they may be in? Yes, they are quite strong enough.

1714. Mr. Garrard. What is your opinion in reference to the use of cast-iron chilled wheels? I consider them far cheaper to work than wrought iron wheels with steel tires. A cast-iron wheel will wear

out a steel tire, and if we had the iron the same as they have in America it would be foolish for us to go on using wrought-iron wheels. I have travelled a great deal on American railways, and all the wheels used were cast-iron wheels.

1715. Was there much variation in the temperature through which the trains passed? Yes, it was very cold at night-time, and very hot in the middle of the day.

1716. Did the same cars run right through all variations of temperature? Yes.

1716. Did the same cars run right through all variations of temperature? Yes.

1717. I suppose you have had no connection with Mr. Carson Woods? None whatever. I had not seen Mr. Carson Woods till last Thursday for two years.

1718. You are fully of opinion that the cars supplied by him are safe for use and better adapted for our purposes than anything we have on our lines? I think they are a great improvement on anything we have for certain classes of work. For instance, when carrying railway rails we have now to use two A trucks, whereas one of these dump-cars would do the same work.

1719. One of these cars was tested? Yes.

1720. What was the result? The trial was not a good trial; the load was dumped all in one place; it should have been dumped, some in one place, and some a little further on.

1721. Did you examine the king-bolt? Yes; it is a cast-steel king-bolt, hinged in the middle.

1722. Supposing the bolt turned round ——? The cutter stops it from turning round.

1723. Do you think the king-bolt is of sufficient strength for the purpose? It looks to me about an inch

1722. Supposing the noit turned round — ? The cutter stops it from turning round.
1723. Do you think the king-bolt is of sufficient strength for the purpose? It looks to me about an inch in diameter; that will take 10 tons; the carriage will lift before the pin will shear.
1724. In America nothing but chilled wheels are used? Nothing but chilled wheels.

1724. In America nothing out chined wheels are used: Nothing out chined wheels.

1725. You heard no complaints there of their liability to fracture on change of temperature? No; they only laughed at me when I proposed wrought-iron wheels. American iron is specially adapted for chilled wheels. At the Altoona Railway works they cast as many as three or four hundred wheels a day; they have special appliances for turning them out. These wheels are put under the severest tests; they are examined with a heavy wrought-iron hammer to try and break them.

.1726.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

O. Blacket. 23 Sept 1884. 1726. Do you know where the wheels for these dump-cars were manufactured? I think it was at Louis-There are car-wheel makers who do nothing all the year round but make car-wheels.

1727. Prior to your visit to America I suppose you were strongly in favour of English wheels? I had never seen anything else. When I went to America and saw things they looked clumsy to me, but when

I thoroughly examined them I was greatly impressed with them.

1728. Mr. Poole.] Were you summoned by the Chairman of the Committee to give evidence to-day? I had a summons signed by Mr. S. W. Jones, the Clerk of the Assembly.

1729. Were you requested by Mr. Carson Woods to go and examine these cars? Yes, I was last Thursday; and until I received a note from Mr. Carson Woods I had not seen him since he went away to

America eighteen months or two years ago.

1730. In your travels through America did you make these matters a matter of special inquiry? After my apprenticeship was up I travelled for three years, studying engineering, and wherever I saw anything mechanical of course I took it up; and having, as draftsman at Mort's Dock, designed several locomotives now running here, I naturally took an interest in railway rolling-stock.

1731. To sum the whole matter up, and taking a connected view of the whole subject, in relation to the weight, the life, and the general adaptability of this car to our railways, in comparison with any other cars the Government have for freight purposes, you are clearly of opinion that the balance of advantages lies

with the dump-car? Decidedly.

1732. Mr. Wright.] I think you have stated that you have no interest in this matter with Mr. Carson Woods? None whatever. I do not know him at all; he is a perfect stranger to me; I do not know him at all; he is a perfect stranger to me; I do not know here to day: I have Mr. Woods any more than any person here. In fact I would sooner not have been here to-day; I have left my work the whole day to come here,

WEDNESDAY, 24 SEPTEMBER, 1884.

Fresent:—

Mr. CHAPMAN, MR. GARRARD, Mr. POOLE,

MR. SUTHERLAND, MR. SUTTOR MR. WRIGHT.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Bird, instructed by Mr. Bird, from the firm of Messrs. Stephen, Lawrence, and Jaques, appeared as Counsel on behalf of Mr. Carson Woods.

Mr. George Downe called in, sworn, and examined:-

Mr. G. Downe. 1733. Chairman.] What position do you occupy? I am Superintendent of Railway Rolling Stock.
1734. Mr. Wright.] Have you seen the imported American dump-cars in the possession of the railway I have seen several of the dump-cars

24 Sept., 1884. 1735. Will you state to the Committee are the defects or the merits of those dump-cars for the purpose for which they were imported, for special traffic, or for their utilization for general traffic; the quality

of the material used in them, and the workmanship;—you are a mechanical engineer? Yes.

1736. And therefore experienced in railway materials? I have been seven years in the Department here, both railway and tramway. When I went out to look at these dump-cars it was after I had noticed that. I was likely to be called here, and I thought it was likely I should be asked to give some evidence. The short time I looked at them was, perhaps, hardly sufficient to give the details necessary for every question you have put, but I looked at them, and at the principles of them, and they appear to me to have many proful points about them. But at the same time it appeared to me there were some little matters that useful points about them. But at the same time it appeared to me there were some little matters that would have to be improved before they could be said to be working quite successfully. I went into no examination of sizes or strength of material; I just took a cursory glance at the cars, and I am inclined to think that two or three defects will come out in the actual practice. Looking at the car as a whole, I think it will be found of good service when brought into practical working order and working properly. With regard to the little improvements that I think might be made, I take one to be the dumping of the car. As the car is now, before you can empty it you have to pass the angle of rest, and it appears to me that when you get to that angle the man has to stand at right angles to it, and it appears to me a me that when you get to that angle the man has to stand at right angles to it, and it appears to me a dangerous position for that man to be in. But, while looking and thinking that, a very simple remedy appeared to me to be able to overcome that. As far as I can see the car appears to me to be one that As far as I can see the car appears to me to be one that would be useful in practice for many special kinds of traffic.

1737. Did you notice what weight the car was able to carry? I did not notice, but everything appeared to be of sufficient strength.

1738. Did you notice the blocks by which the car is attached to the under-carriage? Yes.
1739. Would there be any danger in running round sharp curves of the body becoming detached from the under-carriage? I do not think so.

1740. Do you think the king-bolt is sufficiently secure? It is.
1741. Did you notice the arrangement for dumping;—is there any danger of the car self-dumping while running? I think not; provision is made to prevent that.
1742. The car is weighted to carry 20 tons;—is the material sufficiently strong? Judging from a casual

glance I should say yes.

1743. Do you think the car is capable of doing the work it is intended to do—carrying a load of 20 tons? Yes. 1744. Did you notice anything defective in the workmanship? I did not examine minutely. The work seemed to me of the usual class; rather better than some I saw in the States, where I saw some inferior work. 1745. Can you form an opinion of the workmanship as against our Colonial stock? I did not examine it

1746. There was nothing in the appearance of the thing that struck you as bad in workmanship or

strength? Not that I saw.

1747. Chairman.] You stated that you noticed certain defects in the car; you only gave the Committee particulars of one? I think the links might be improved—the arrangements for releasing those links from the bolts might be improved. I think they are slightly defective.

1748.

1748. In what way? They are worked by a lever from the end. There is a small bit of \(\frac{3}{6} \) rod to keep the Mr. lever out and the safety links up, and that would soon give way; it is too weak for the work it has to do. G. Downe.

Another matter was the fastening of the flaps. When the car is being dumped the lever has to catch the bogie frame. That appears to me to be too light, and it will have to be made stronger when it goes on the road.

1749. Did you notice the way in which the buffers were attached to the car? Not specially.

1750. Did you notice the difference between the way in which they were attached and the way in which they are attached to our own rolling stock? No, I did not take particular notice of that. I looked more at the car and its working.

1751. You did not notice whether there was anything to resist the strain upon the buffer? No. 1752. Did you notice whether there was a continuous draw-gear? There was a volute spring behind the head stock, but the dumping arrangement prevented the draw-bar from carrying it further.

1753. Do you consider it sufficient to have a car constructed without a continuous draw-gear? say from this drawing that there would be no difficulty in drawing the car in practice from that headstock (pointing to plan of car).

1754. You think there would be no danger with a heavy load coming round a sharp curve or a steep

gradient? No, because they are well trussed, and there are four longitudinal on each side. 1755. Did you examine the king-bolt? I did not examine it very carefully.

1756. Can you tell the Committee what class of material the king-bolt was made of? I did not see it. I only saw that there were stops on it.

1757. Did you examine the axles? Not minutely.
1758. The wheels? Not to give an opinion upon them. They were cast-iron chilled wheels.

1759. Did you examine the workmanship? Not minutely.
1760. What is your opinion about cast-iron wheels? That is a divided question among the railway world, as to whether the chilled wheels are good or bad. From what I have seen I should have no hesitation in using them.

1761. What mileage are they supposed to run? That is a question easier asked than answered. Some say 50,000; others say 200,000 or 300,000. There are to be considered the questions of loading, speed, breaking, and the condition of the road, all of which affect the question.

1762. From your experience as an engineer, would you think these wheels fit for ordinary traffic over the mountains? I should have no hesitation in saying they would run 50,000 miles.

1763. Do you think that would be a fair average? Yes, I think it would over the mountains.

1764. Have you had any experience with the wheel tires of our ordinary rolling stock? No. 1765. Have you any idea what mileage they would travel? That is the average. Depends on conditions before stated—may run 100,000 and upwards. Personally I should have no objection to the chilled iron wheels.

1766. Which would you prefer? I think I should take the chilled wheel in preference for its cost, and, under good conditions of road and average weight of loading, I think it would give quite as much satis-

1767. Do you give that opinion from personal knowledge of the subject? Well I have watched the thing very closely as far as our tramways are concerned. I have watched the action of both the steel and the chilled wheels that we have, and I have given considerable attention to the subject.

1768. Did I understand you to say that you had not examined the woodwork and the workmanship sufficiently to give this Committee an opinion upon them? No; only that it seemed to be of sufficient strength to carry the weight.

1769. Mr., Poole.] You have been seven years in the Tramway and Railway Departments of this Colony?

1770. In what position did you enter the service? As draughtsman for the Engineer-in-Chief for Existing Lines.

1771. How long did you occupy that position? For three and a half years.

1772. And since then? I have been Superintendent of Rolling Stock on the tramways.

1773. Previous to your entering the Railway service of this country had you any experience in any other part of the world? No.

1774. And of your own knowledge as to the relative merits of steel compared with cast-iron chilled wheels you give the opinion that these wheels will run 50,000 miles? I said that it was a divided opinion, some say 50,000, and some say 200,000 or 300,000 miles. 1775. Then you gather from your reading that chilled wheels will run from 50,000 to 300,000 miles?

1776. And you think from your reading and observation of the duty done by them on the tramways, that 50,000 miles is a fair average? I think they will do that.

1777. What opportunities have you had before entering the Government service of forming an opinion as to the relative merits of the wheels of rolling stock? None whatever.

as to the relative merits of the wheels of rolling stock? None whatever.

1778. The whole of your experience has been gained in this Colony? Yes.

1779. You spoke of the angle of rest; what angle is that? About 22 degrees.

1780. Is that from the horizontal or from the vertical? From the horizontal.

1781. Taking the body of the truck in rest, it must be tipped up to the angle of 22 degrees before it will empty itself? Yes, before it will empty itself.

1782. Mr. Garrard. You were recently in America?

1782. Mr. Garrard.] You were recently in America? Yes.
1783. Did you see any of these dump-cars in use there? I saw them, but not in use.
1784. Did you pay any attention to the ordinary chilled wheels that are in use in America? I had very

little opportunity of doing so.

1785. Do you know that chilled wheels are the only sort used in America? They are very much used.

1786. Do you know if the iron in America is of that peculiar nature which makes it specially suitable for chilled wheels? It has the reputation of being so.

1787. While there did you hear of any accident from fracture of these chilled wheels? Yes.
1788. Frequently? You will see sometimes as many as six in a month.
1789. Are they more liable to fracture than wrought-iron wheels with steel tires? I would not say that. 1790. Mr. Wright.] You stated that you had the cast-iron chilled wheels in the Tramway service? Yes. 1791.

Mr. G. Downe, 1791. Have you ever had any case of fracture while running? Not from American but from Colonial. 1792. Do you consider the running on tramways more severe than on the ordinary rails? Much more

24Sept.,1884. severe.
1793. Owing to the bad rails? Not only that, but in running over our tram-lines we have to make on grades and we work by the vacuum brake. an average eight stops to the mile, and some of them on grades, and we work by the vacuum brake. According to the vacuum obtained so is the pressure brought to bear upon the brake. And the wheels are small for the load they have to carry.

1794. Have you had any experience of fracture of an American chilled wheel? I know of none.

1795. You stated just now that the dump-car, when at the angle of rest, would not discharge the load; does that apply to all materials? It applies to all. It must pass the angle of rest before it will empty

1796. Then you are not aware whether this car would dump its load? I have not seen it turned over 1797. Mr. Suttor.] With regard to the chilled wheels on the tramways, have you worn any out? have worn out all the original ones.

1798. And what did you replace them with? Cast-steel. We ordered some cast-steel for a trial, and

they gave better results as to mileage.

1799. And your experience is that chilled wheels are inferior to the other wheels? Yes, on tramways. 1800. Mr. Wright.] What is the difference of cost between the American chilled wheels and the cast-steel steel wheels? The steel are much dearer; I think the chilled wheels are about £2, and the cast-steel are £2 12s. 6d.

1801. Mr. Suttor.] Then the difference is only 12s. 6d. per wheel? Yes.
1802. What is the difference in the life of those wheels;—does it compensate for the extra cost? The life is double that of the chilled wheel on the tramways

1803. What was your object at first in inspecting these cars? Because I had seen that dump-cars were a prominent thing, and I wanted to go and have a look at them.

1804. Did you examine the axles at all? I did not minutely.

1805. You do not know whether they were steel or iron? No, I did not examine them.

1806. You said the work compared favourably with the work done in the United States;—how does it compare with work done in the Colony? I think it would compare very favourably with anything done in the Colony.

1807. Can you give any opinion of the carrying capacity of the axles, say as compared with the ordinary I am not in a position to compare them.

1808. Mr. Poole.] From your experience of wheels on our tramways it appears that while the cost of cast-steel wheels may be taken at 20 per cent. in excess of the cost of chilled iron wheels their durability or life is 100 per cent. better? Yes.

1809. Mr. Wright.] How long have the cast-steel wheels been in use on our tram-lines? About two and a half years.

1810. How long does the ordinary chilled wheel last? They last but a few months; not so long as twelve They will run about 16,000 miles, but that will depend a great deal on the loading. Some do not last that.

1811. Mr. Poole.] Do they not soon get double flanged? Yes.

1812. Mr. Suttor. You have no experience whatever on our railways? No, I have only been connected with them as a draughtsman.

1813. Mr. Bird.] Does the man loading the car stand on the body of the car? He stands at the end of the car, in the centre of the width, on the outside of the frame.

1814. As the floor of the car tips up from the body does he move up with it too? Yes.

1815. Then the alteration you would suggest would be what? I should make him always vertical.

1816. You said there would be no fear of the car self-dumping while in action, going round a curve? I

think it would not.

1817. In what way is that provided for? There are two links, and they are worked by a lever from the end, so that unless this comes off the car cannot cant. Then there are chains carried right down from the frame, so that the chain must also revolve round.

1818. It depends upon the lever being secured? If the lever is secured they cannot dump.
1819. Can the lever be safely secured? Yes.

1820. Did you see that it was? No. They have got merely a pall that you can kick in and out with

your feet.

1821. Did you see that the lever was capable of being made secure? It can be made secure.

1822. By the present means on the car? Unless you kick the pall out nothing can overturn the truck.

1823. Mr. Poole.] There is nothing to hold the pall in the ratchet? Nothing at all. The back frame The back frame would have to cant first before it could go.*

1824. Mr. Bird.] Did you notice any other defects beyond those you have stated? No.

1825. About the wheels—you said you preferred the chilled iron wheels to steel wheels?† I am now

giving my opinion of railway rolling stock. 1826. Do you consider the wear and tear on the tramways more severe for wheels than on the railways?

1827. You said you thought the workmanship of these cars was better than that you had seen in the Yes, they did not pay that attention to good work that we do here on the whole.

1828. Chairman.] In speaking of the life of a steel tire as compared with a chilled iron wheel on the railways, do the Committee understand that you gave your experience, or that you merely spoke from what you had read? It is my opinion only.

1829. But in speaking of the life of those wheels on the tramways you were giving the result of your practical experience? Yes, practical with regard to tramways.

Mr.

^{*} NOTE (on revision):—There is no question bearing on this.
† NOTE (on revision):—As regards safety I should have no hesitation in using chilled wheels.

Henry Gilbert Carson Woods, Esq., called in, sworn, and examined:-

1830. Chairman.] What is your occupation? I am an importer and contractor.

1831. Mr. Bird.] What do you say you are? I am a contractor with the Government for 200 dump-cars. Woods, Esq. I am also a general merchant and importer.

1832. What is this contract with the Government that you mentioned? To supply 200 dump-cars for 24 Sept., 1884. the Government.

1833. When was that entered into? About October last.
1834. That contract is in writing? It is.
1835. Were there any interviews between yourself and the representatives of the Government about that contract? I think I saw the Commissioner for Railways either once or twice, and I saw Mr. Wright twice prior to the contract.

1836. What took place at those interviews? I explained to them the advantages of the dump-cars; that

it was one of the finest freight-cars in America, irrespective of its dumping powers.

1837. What did you mean by its dumping powers? That it was a good freight-car, and one man could empty the load from it in one minute. I said it was equal to any ordinary car, if not better.

1838. Did you refer to its strength or build in any way? As a freight-carrying-car it is strong and light, weighing only 9 tons 17 cwt., and it carries 20 American tons of freight.

1839. Was the agreement you came to contained in the written contract? Yes.

1840. Nothing would be outside of that? Not that I heard of.

1841. In pursuance of that contract what did you do? I made arrangements to purchase materials in America.

1842. Did you go to America? I did. 1843. Did you make arrangements there? I did.

1844. Did you return to this country after that? I did.
1845. What did you do then? I organized a car-building establishment in Pyrmont, and started building the cars with the material I had imported.

1846. Where did you get the material? Partly from the Laconia Car Company, New Hampshire, and

partly from the Ontario Car Company, London, Ontario. 1847. Why did you employ those firms? Because they a Because they are noted in America as keeping the best stock-

the finest and the driest timber. They are generally noted for good ware.

1848. Are you not the possessor of the patent? I own the patent for the South Pacific.

1849. Were any arrangements with regard to the patent made with the Government? I was to hand it up to them.

1850. Is that contained in the contract? Yes, it is one of the conditions.

1851. I suppose that contract is not in your possession? Not here. 1852. Where is it? In town; I could get if you wish it.

1853. Is this car used much, or at all, in America? It is in common use over the American railroads. It is in regular use.

1854. Has it been approved of by any railway companies? It has, to my own knowledge, by several. 1855. And is it not used on their lines? It is in use on many roads.

1856. There was some arrangement about a sample car, was there not? No, I brought a sample car out

1857. Was that prior to the contract being entered into? Prior.
1858. Was that sample car built out here? Yes, built out here.
1859. Was any test applied to it by the Government? It was tested in the presence of the Minister for Works, and several other people.
1860. Who else were present? Mr. Read, Midelton, Mr. Bingham, and another.
1861. Were those all the persons present? I think the representatives of the Press were at that test,

but I am not sure

1862. Where did it take place? At Darling Harbour.

1863. When was this? Some time before I got the contract.

1864. What took place? I was late that day, for I went to the wrong place first, and before I got to Darling Harbour the test was over. I found that either wilfully or ignorantly they had put wood into a box-car, and the test was scarcely a success. The width of the car is some 9 feet odd, and the billets of wood went the full length of the car. When I saw it it was in the dumping position, and there were some few pieces of wood inside.

1865. How was it that it remained in the car? The ends had been caught by the gates of the car. The

1865. How was it that it remained in the car? The ends had been caught by the gates of the car. The top of the wood was held by the top of the gates; I immediately protested.

1866. Was that what was called the sample car? Yes.

1867. And the wood was prevented from coming out by the top bar across the gates? Yes.

1868. Mr. Wright was there? Yes, he was present. I protested that this car was not intended to dump wood. They knew that. It ought to have been gravel, and not wood.

1869. Was there any defect or breakage in the car at the time? Yes: there was the breakage of a link in

1869. Was there any defect or breakage in the car at the time? Yes; there was the breakage of a link in

1870. Did any conversation take place about that link? I spoke to one gentleman of the staff. He told me that that was nothing, and only happened because the chains had not been put equally on; that one had been shorter than the other.

one had been shorter than the other.

1871. Did any further trials take place? Yes; there were some further trials.

1872. Were you present? Yes. The next trial took place before the Press.

1873. Who was present? Mr. Midelton and Mr. Scott.

1874. Were they representing the Government? I am not quite sure.

1875. What took place? We dumped the car with gravel.

1876. Where was this? It was on the Botany Road.

1877. What were the conditions under which the dumping took place? It was a fair dump, but there was no fair chance for the car, because it was on level ground. About two-thirds of the load went out, and a few minutes work of the shovel would clear all the rest. They were satisfied and went away.

1878. Did some of the gravel remain in the car? Yes.

1878. Did some of the gravel remain in the car? Yes. 1879. In consequence of what? Being dumped on level ground.

1880. So that there was not room for the gravel to clear away? No. 1881. When was the next trial? I think the next trial was before Mr. Read, Mr. Scott, Mr. Midelton, H. G. C. Woods, Esq. and Mr. Heaton. 24 Sept., 1884.

and Mr. Heaton.

1882. Who is he? A gentleman in this city in business.

1883. Where did this trial take place? Down on a bank near Darling Harbour.

1884. What took place then? We had the dump satisfactorily done there. It was satisfactory to all, to Mr. Midelton, Mr. Scott, and Mr. Heaton.

1885. Were any of the gentlemen of the Press present? I do not remember that there were any there.

1886. Was it quite successful? Yes, it was.

1887. Under what conditions? It was on the edge of a bank, and it had a fair reasonable chance to throw the load out. The only point I saw was it was much harder to dump than I thought it ought to be—that is, to turn the lever. In America they said one man could turn it, but we had always to call two. I found the reason since. It was built wrongly.

1888. Did you observe the fault? No, but I have a witness here who did.

1889. What is the object of the car? The object is to save labour for any heavy or unbreakable freights.

You can turn a portion on either side. 1890. This special car is intended for what kind of freight? This special car is intended for all freights;

but the improvement is that the dumping apparatus gives it a great advantage over all other cars.

1891. But this dumping arrangement was unsatisfactory on level ground? Partly. I think the chief

reason was because it was badly built.

1892. You say it was satisfactory down a bank; unsatisfactory on level ground? It was satisfactory for the place where it was dumped. If a man wishes to dump 20 tons of gravel on level ground he must expect part of it to be left. If he wished to dump half of it on each side the dump-car would do it. You can dump a portion or the whole, and you can put it at any reasonable angle.

1893. Was it at the first or the second test that there were gentlemen of the Press present? I think it

was at the second, but it was twelve months ago, and I cannot be certain of the order.

1894. Did anything appear in the papers next morning about the test? Yes, a fair and reasonable comment upon it.

1895. Could you remember the date? No, but I could bring up the report that was cut out of the paper

next morning in my office.
1896. Have you read the report in the papers? Yes.

1897. Is it a fair and reasonable report of what took place? Yes, it is fair and reasonable.
1898. What is the cost of these patent cars? £190 to the Government. That is my contract? I have. That is my contract price.

1900. In what way? I have built the cars, and tendered them to the Government.

1900. In what way? I have built the cars, and tendered them to the Government.

1901. I want to ask you a little more about this patent;—how did you acquire it? In the beginning of 1882 I was in Montreal, and there was a meeting of carbuilders. A great many of those gentlemen were my friends. This car was much discussed and approved of, and several of them urged me to go and see it. Mr. Muir was the manager of the Ontario Car Company. I saw him, and he endorsed everything I had heard previously, and urged me to go to Boston and see the owners of the patent—the United States Car Company, of Boston. He said it was a great success, and would revolutionize the carrying of heavy and unbreakable freight. I went down, and on the way called in at Montreal. Mr. Scott, chief of the New Brunswick Railway Company, and Mr. Davis, chief of the Quebec Government Railways, and several other gentlemen whom I saw, all said it was a splendid car, and must come into great use. Then I went to Boston, and heard the same from friends. I went to Boston, and heard the same from friends.

1902. Did you see the car there? No, I had seen it at Ontario.
1903. Beyond that you had no practical knowledge of it? No, I relied upon those engineering people.
1904. Did you see any proofs of the working and making of the car? I did not see that; it was explained to me.

1905. You had the specification of the patent? Yes.

1905. You had the specification of the patent: Ies.

1906. What is the cost in America of cars such as are the subject of this inquiry? About 650 dollars.

This would cost more as it is an improved car. How much more I cannot say. That is the cost of the This would cost more, as it is an improved car. How much more I cannot say. How much more for the improvements I do not know.

1907. Has this car been recognized as being good at any Exhibition? At the Chicago Exhibition this car

received a silver medal.

1908. Were any gold medals given? I do not know.

1909. I wish to ask you about certain alleged defects; for instance, it has been said that there is a defect in the place where the man stood to work the dumping-car; that it should have been fixed and not on the car itself? I cannot see where that could be; it is impossible not to be on the car when the car is running.

running.
1910. Something has been said about the king-bolt? I know it is an improvement put upon the new cars—a cast-steel king-bolt; I put it in under the advice of the engineers in the New England Car Company, and the United States Car Company, both.
1911. Is that in the original car? It is not; it has been added since the contract.
1912. Have any other improvements been added; was any request made to you that further improvements should be placed on the car? Mr. Scott, the Locomotive Engineer, told me he would prefer that the side bearings should be made more automatic; and I understood that if there were any more improvements I should "collar" them.
1913. Did you "collar" any improvements? Yes, I "collared" improvements.
1914. Can you tell me what they were? I cannot remember the technical words; I would rather leave

1914. Can you tell me what they were? I cannot remember the technical words; I would rather leave it to my foreman búilder.

1915. Does he understand the working of it? Thoroughly.

1916. Do you? I understand it generally.

1917. In drawing the car I understand there is a question of a continuous draw-bar; it is considered a defect that it has not a continuous draw-bar; it is said to weaken the bar; can you explain that? there is not a continuous draw-bar, but that it is a defect I do not know.

Strong chains, and the usual coupling; it is 1918. If there is not, what appliances are there? strengthened by truss-rods.

67

1919. As to the buffers;—was any request made to you to have the buffers altered? After the contract was given I got intimation that they wanted the buffers made in the English style, and I have done so.

1920. About the sample car. The contract was to deliver cars according to that sample? The contract 24 Sept., 1884. was to deliver equal to the sample.

1921. Have you built the cars according to the sample? Better in many respects. They are stronger, and improved in other ways. There are many improvements which I could not describe here.

1922. Can your foreman describe them? He can.

1923. Do you know anything about the wheels, as to comparison between chilled cast-iron wheels and steel-tired wheels? I have a paper here which contrasts chilled iron with cast-steel wheels. (Hands in paper. See Appendix E 1.) That is an extract from the National Car Builder of America. It is the best authority in America upon wheels.

1924. How did you get that extract? I cut it out last night.
1925. What is the date? It is from the July number.
1926. Have you got that number? I have got it.
1927. Have you had any test yourself, so that you can speak of your own knowledge as to any part or parts of this car? Not of my own knowledge. All the tests were made under the supervision of my inspectors in America.

1928. Have any tests been made in Sydney? I do not know of any yet.
1929. Do you recollect any tests in Darling Harbour? There was the test I have already spoken of.
1930. I mean of any parts of it as to the strength and durability of any portion of the iron or wood work? I cannot remember any.

1931. If any have been made would any of your witnesses be able to give information? I think they would. They ought to.

1932. Have any tests been made of the parts of the new cars? I am informed that tests of parts of the new cars have been made by my foreman.

1933. The £190 you have mentioned;—is that merely the price of the material and the building of the car, or does it include anything else? It includes the patent right for the Government use only.

1934. Of your own knowledge you do not know beyond what you have been informed of the good qualities or otherwise of the material of which the sample car and the cars included in the contract are

made? Not of my own knowledge.

1935. What is the character and reputation of the firms from whom you have obtained the material? A

very high character.

1936. Was anything said at the first test as to the breakage of the chain being caused by the quality of the chain, or was it caused by the strain of the car? The unequal strain.

1937. Have you received any testimonials respecting this car or similar cars from any firm or persons in America? I have.

1938. And were such testimonials addressed to you yourself? They were enclosed to me from the United States Car Company, from whom I got the patent, including the original letter from the Company, showing that they had sold the patent in Canada and formed it into a Company.

1939. Were those documents shown to any representative of the Government in this country? They were shown to the Minister for Works. (Witness here handed in the testimonials. See Appendix E 2.) 1940. At the time all these tests were made were any complaints made of the car that was tested? None at the time. Mr. Midelton said it was a good car. Mr. Scott was rather reserved, but still pointed out no defects.

1941. Mr. Wright.] Will you tell the Committee how many trials of the dump-car took place at which you and officers of the Railway Department were present? Three.

1942. Were Mr. Scott and Mr. Midelton present on all three occasions? I believe they were.

1943. Did either of those gentlemen take exception, in your presence, to the general design of the car or its construction? None whatever.

its construction? None whatever.

1944. Then so far as you believe the impression on the minds of those gentlemen was favourable? It was favourable. More so with Mr. Midelton than with Mr. Scott.

1945. Did anything they said lead to that impression? Yes, what Mr. Midelton said.

1945. Did anything they said lead to that impression? Yes, what Mr. Midelton said.

1946. So far as you are personally concerned neither of them ever said anything in condemnation of this car, either as to the general design, workmanship, or material? Never.

1947. And your belief was that they were favourably impressed with the car? Yes.

1948. Have you had any personal practical experience of American timbers? Not practical.

1949. Of what wood is the specimen car? White oak and hard pine.

1950. What are the new cars built of? The same woods—hard pine and white oak or ash.

1951. Had you any conversation with other gentlemen besides the gentlemen of the Railway Department with regard to this dump-car? None. I thought it sufficient when they were satisfied. 1952. The only people whose opinion you sought were the practical officers of the Department? That was all.

1953. Did you hear any of those gentlemen receive information which would lead you to understand that the car was a failure, or built of bad material? Never. After the contract was given Mr. Scott said he

would prefer to have a more automatic side bearing.

1954. And you understood that the cars would have to be altered to suit our rolling stock?

1955. And all the alterations pointed out by the Government officers you have had carried out in the cars you are now building? Yes, except as to the continuous draw-bar, which Mr. Scott said he thought could not be put in. When I went to America they said it was impossible to do so. 1956. Was your attention called to the fact that a part of the car was too weak? I do not remember

my attention being called to it.

1957. Chairman.] Have you been supplied with a copy of the evidence taken before this Committee? No.
1958. Were you aware of what evidence had been taken before this Committee? I heard people talk

1959. On what date did you first direct the attention of the Government to these dump-cars? It is in

writing here.
1960. Was that the first time? Yes, as far as I remember.
1961. I find that on the 2nd April Mr. J. C. Dibbs wrote to the Government in regard to the dump-car;—was he then acting as your agent? He was.

1962.

68

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE H. G. C. 1962. Has he be Woods, Esq. he acted for me. 1962. Has he been acting for you in these matters? Yes, in these matters. In my absence in America 1963. Did he act for you in regard to any other imported rolling stock? Yes, some wheels, I believe. 1964. Were you to tender for any sleeping-cars? Yes. 24 Sept., 1884. 1964. Were you to tender for any sleeping-cars? 1965. Who was acting for you in the Colony at that time? I think it was Mr. G. Dibbs. 1966. Who? The present Treasurer. 1967. How long is it since he ceased to act for you? Since he went into Parliament. 1968. You say that Mr. J. C. Dibbs is your agent? He is not now. 1969. How long since he ceased to act? Since I returned to this country. 1970. Can you remember the date of the last test with firewood? No, I cannot remember the date. 1971. Are you quite sure that Mr. Scott and Mr. Midelton were present at that test? I am not quite sure; I think they were. I believe they were there. It is so long ago I cannot exactly remember.

1972. I understand you to say that Mr. Midelton favoured these cars, while Mr. Scott showed a reserve? 1973. Did you speak to him on the subject? We must have been talking about it, and I think Mr. Scott was more reserved than Mr. Midelton. As the car came under Mr. Midelton's notice first, in Mr. Scott's absence, I thought Mr. Midelton ought to know more about it. 1974. When you contracted to supply 200 dump-cars, was it not understood that they were to be manufactured in this Colony? No. 1975. Were you never asked to manufacture them in the Colony? No. I would not have taken the 1976. You are quite certain that neither the Minister for Works nor the Commissioner for Railways said the cars were to be made in the Colony? They said they were to be built here. I know that "built" means put together. 1977. Were you requested to sign any bond? Yes.*
1978. Were you made aware of the particulars of that bond? Never. 1978. Were you made aware of the particulars of that bond? Never.

1979. Have you read the papers laid on the table of the House? I have read the papers.

1980. Were you asked to sign any bond or document containing the conditions such as are in these printed papers? I never heard those conditions before.

1981. Did you inform the Commissioner for Railways or any member of the Government that you did not intend to manufacture these cars in the Colony? I never informed them anything.

1982. Did you lead them to believe that you intended to import these cars? I told them I intended to import the material. I think I told them that. I cannot say I told the Minister for Works.

1983. Had you many interviews with the heads of Departments with regard to these dump-cars? Not 1983. Had you many interviews with the heads of Departments with regard to these dump-cars? Not 1984. And are you quite certain you were never requested to manufacture these cars in the Colony; that there was no stipulation that they should be passed by the Locomotive Engineer? I am perfectly certain; this is the first time I have heard of it; I only understood I was to build them equal to the sample car.

1985. Do you remember receiving letter No. 26 in the printed papers? I received that.

1986. Did you accept those terms and conditions? I did. 1987. Have you ever signed a bond in accordance with that letter? I have not; I was called upon about a week ago to sign a bond, but I was never requested to do so before.†

1988. I think you stated that it was never intended that these cars should be used for timber and fire-Never, with the gates on. 1989. Would you have to alter the truck? No, only take the gates off; I wish to say concerning that wood that I am not an expert in wood; I have given you what I understand the cars are.

1990. The evidence you have given as to the quality of the wood is absolutely worth nothing then? That is it exactly; I depended upon professional people for that.

1991. I think you said you had the authority over the patent for this Colony? I have.

1992. Have the particulars of the bond been furnished to you? Never yet.

1993. When did the first shipment of these cars arrive? The first shipment of the material for these cars arrived while I was in Brisbane. 1994. In letter No. 29 you inform the Commissioner that you intended to leave for America to make the necessary arrangements for the completion of your contract for 200 dump-cars? Yes.

1995. Are you quite satisfied that you informed some persons in authority that you intended to import the materials from America? I feel satisfied that that was generally known, but as I was hurried at the time I will not say that I am quite sure. 1996. Were you requested to make the necessary alterations? I was. 1997. Have you complied with that request? I have, but I consider they are extra.

1998. Are the Committee to understand that your tender was accepted to supply 200 cars, similar in

every respect to the sample car, which was then in the possession of the Government? Equal to it, not similar, as there were changes proposed. Mr. Scott told me he would insist upon the buffers being altered. 1999. Did not the Commissioner point out to you that it was necessary to have side buffers, continuous draw-gear, and other improvements? In talking he said it would be necessary, but I hold to the written

2000. Do you consider that the additions you have made to these cars are extras? From my present view I think they are.

2001. Is it your intention to charge for the extras? I have not yet made up my mind.
2002. Then do the Committee understand that it is likely you will charge the Department for side buffers, draw-gear, &c.? By the action of this Committee I have been nearly ruined as a business man, and I do not feel inclined to give way any more. I look to the contract given me, and if I do anything further I think I have a perfect right to charge for it.

2003. Mr. Chapman.] Have you signed a contract? I signed no contract. I rely upon the letter I received from the Government.

2004. Have you got that letter? I have a copy of it here.
2005. Mr. Bird.] This is a press copy of the letter? It is. It was taken in my presence. (Letter handed to the Chairman and read.)

^{*} Note (on revision):—I find that I have not been called upon to sign any bond.

† Note (on revision):—I find I was not called upon to sign a bond.

ON THE PURCHASE OF RAILWAY ROLLING STOCK. 2006. Chairman.] I understand you to say that you were never asked to sign a contract or enter into a H. G. C. Woods, Esq. Never beyond what is in that letter. 2007. But this distinctly states that you will be required to enter into a bond for the due fulfilment of the 24Sept., 1884 contract? Yes, it does. 2008. Did you not say a short time back that you were never called upon to enter into a contract? I meant since I returned; since I returned I never was asked to enter into a bond. My letter said I was ready to sign, and they never called upon me; I waited for a notification.

2009. But you have had notice in a letter from the Government? Yes.*

2010. Is that in these papers? That letter was received only last week. 2011. Then you have signed no bond yet? No. 2012. Have you received any money? None. 2012. Have you received any money? None.
2013. Have you been paid for the sample car? I have.
2014. When? Some time ago; a long time before I got the contract.
2015. You spoke of being present at a trial of dumping this car? Yes
2016. Who were present when it was dumped? I was.
2017. On one occasion the metavial was forward? 2016. Who were present when it was dumped? I was. 2017. On one occasion the material was firewood? Yes. 2018. When you went there you say it had been dumped, and there was a little in the car which would not come out? I said the dump was just over, but the dumping part was just as it had been dumped. 2019. Were you present at the dumping when they had to get the screwjack to replace the car? I never heard of it until I saw it in evidence. 2020. Where did you see the evidence? I heard of it. 2021. If there was any screwjack used in replacing the car in its position into the dump-socket you did not see it? No. 2022. You were present at the dumping of ashes, of river gravel, and the dumping of wood? Yes, in part as regards the wood. 2023. You say that Mr. Midelton approved of the test? He did. 2023. You say that Mr. Midelton approved of the test? He did.

2024. He told you positively that he approved of the car? He did, all through.

2025. And you say Mr. Scott was a little more cautious? Yes.

2026. Mr. Wright. I find among the printed papers, No. 20, a copy of a letter from the Commissioner for Railways to you, dated the 24th August, 1883. What interpretation do you place upon that; that you should import the cars, or make them here? Make them here.

2027. To that you replied on the 27th of August, No. 24 in the printed papers. I ask you whether, at the time you wrote that particular letter, you were not under the impression that you would have to make these cars in the Colony absolutely: that is, that they were to be of Colonial material? No sir make these cars in the Colony absolutely; that is, that they were to be of Colonial material? No, sir. 2028. In the previous letter you say you will have to make them in the Colony? I understood that they were to be built in the Colony. 2029. Did you at any time in conversation with me mention the fact that you had bought land on the Parramatta River with a view to putting up a factory? Not to my knowledge.

2030. Are you aware that any person in your employ told me so? I am not aware.

2031. Did you mention this fact? I cannot remember. 2032. Was it ever contemplated by you to erect an establishment after the style of Hudson Brothers? It was contemplated if we got such an order. The establishment was here. 2033. Your intention was, if you got the order, to establish a car manufactory, and to manufacture railway rolling stock in the Colony? Yes. 2034. You have no knowledge of having told it to me? I have no knowledge of it, nor any remembrance. 2035. Your interpretation of the word "made" would be manufactured? It would. 2036. Mr. Chapman.] Did you at any time try to purchase a piece of land on the Parramatta River for the purpose of erecting workshops? No, never.
2037. Chairman.] In reply to a question you said you had not seen a copy of the evidence. Subsequently to that you stated you judged so by the evidence? That was a mistake of mine. It was commonly reported that they had used a screw-jack.

2038. Are you sure you did not see the evidence on Saturday? No, I did not.

2039. Were you a passenger by the train that arrived in Sydney about half-past 12 on Sunday last? I was not out of town on Saturday or Sunday. I came in from Brisbane on the Sunday before last.

THURSDAY, 25 SEPTEMBER, 1884.

Present:

Mr. CHAPMAN, MR. SUTHERLAND, MR. SUTTOR. Mr. WRIGHT,

MR. TEECE.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Bird appeared as Counsel for Mr. Carson Woods.

Henry Gilbert Carson Woods, Esq, called in and further examined:—2040. Chairman.] Have you delivered any cars to the Government?; No. 2041. Are any of the cars on the Government lines? Yes. 2042. How many? I cannot say positively, but I think over twenty. H. G. C. 2043. From whom did you get permission to have them placed on the Government lines? I got per-25 Sept., 1884. mission to put fifty on the line from the Commissioner. 2044. On what date? I do not know the date; I can send for the letter.
2045. Under what conditions did you obtain permission to place these trucks on the line? As far as I can remember they are to be there at my risk, and I am to pay 1s. 6d. a week for each car.

^{*} Note (on revision):—I find I have had no notice.

† Note (on revision):—I find that this letter does not ask me to sign any bond.

‡ Note (on revision):—On inquiry I find four cars were delivered to the Government, during my absence from the

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE 2046. Is it true that three or four of these cars were damaged in transit from Darling Harbour to Woods, Esq. Eveleigh? I have no personal knowledge of it. 2047. Have you heard of it? I have. 25 Sept., 1884. 2048. From whom did you hear it? I think I heard it from Mr. Batchelder. 2049. Mr. Bird.] You were asked yesterday as to whether you were required to sign a bond;—have you been required to sign a bond? Since I arrived-2050. I only want to know whether you have been? I have. 2051. When? During the past week. 2052. Have you ever before that time been required to sign any bond? In a letter I received from the Government they stated they would require a bond. 2053. A letter from whom? From the Commissioner for Railways, I think. 2054. Is that the letter you refer to, No. 26 of the printed papers, relating to dump-cars? It is. 2055. Has there been any other mention of the bond referred to in that letter? Yes, in my reply. 2056. No. 27 of the printed papers? Yes.
2057. Will you refer to No. 31—the Commissioner for Railways to the Crown Solicitor, dated 17th November, 1883? This is the first time I have read this. 2058. Have you heard before of the conditions named in that document? I heard of them yesterday. 2059. For the first time? For the first time. 2060. Have you the letter that was sent to you last week? I have it at my office.

2061. By whom was that sent to you? I believe it is signed by the Commissioner for Railways.

2062. You have said that there was a conversation between Mr. Midelton and one of the men in your employ about the cars. What was the name of that man? There was a test made, and you said Mr. Midelton had a conversation respecting the car with one of your men. Who was that? Mr. Batchelder, and I think also I am not sure Mr. Campbell and I think also, I am not sure, Mr. Campbell. 2063. Who is Mr. Campbell? He is my clerk. Mr. George Batchelder called in and examined:-2064. Mr. Bird.] What are you? I am a car-builder. 2065. In whose employment? Carson Woods & Co. Mr. G. Batchelder. 2066. In what capacity? Manager of the building of the cars; I have charge of the works, looking after 25Sept., 1884, the car building. 2067. What is your experience of these dump-cars? With this identical car, with these new attachments here, one week, perhaps nine days. 2068. What do you mean by one week with these new attachments? The firm that furnished the material to build these cars built one themselves, finished it throughout, and they got me to take it on to the different roads in America to show it to the officials, and to work it, and sell cars for them. 2069. Is that what is called the sample car? No. 2070. How long have you been in the employment of Mr. Carson Woods? I landed here on the 6th of June last, I think; I came in the "City of Sydney"; I think that was the date; I left Boston the last day of April. 2071. I want you to describe to me first of all this car or truck, and then the working of it? Do you mean the cars I am building or the sample car? 2072. Have you examined the sample car? I have. 2072. Have you examined the sample car? I have.

2073. I wish you to describe that as shortly as you can. You may refer to the sketch of the car. In the first place what is the woodwork of the car made of? You refer to the sample car now?

2074. Yes? It is made of pitch pine—some may call it Oregon pine—and white oak.

2075. What part of pitch pine, and what part of white oak? The stringers and floors of pitch pine; the boards inside the gates and the boards on the ends of the car are pitch pine; the end sills, cross ties, posts, and frame of the gate are white oak.

2076. What are the sills of the trucks made of? White oak.

2077. What do you mean when you speak of the trucks? I mean the four wheels; they call them bogies here: we call them trucks here; we call them trucks.

2078. I now wish to call your attention to the posts you have mentioned—to the bolts in the posts—
describe the working of that—what that is? Do I understand that you want me to tell the difference between the two cars—the ones we are now building and this car?

2079. I will put the question in this way: What addition has been made to the new cars, as compared with the sample car, in the shape of posts. What improvements? You want me to explain to the Committee if there has been any improvement put on these cars I am now building above what is on the old There are four boxes on the posts where the bolts go through, on the new car 2080. Yes, the posts? that are not on the old one. 2081. What is the advantage? The other bolts go through wood, and these work on iron.

2082. Then I wish you to refer to the latch-levers;—what are they? What hold the sides of the gates in 2082. Then I wish you to refer to the latch-levers;—what are they? when the loads are on. 2083. Describe the latch-levers;—what alteration is there in the latch-levers on the cars now building, as compared with the sample car? They are about as heavy again, as strong again, on the new car, as what

they are on the old one; very near three times—over twice.

2084. How is the latch-lever kept in place? By weights.
2085. How is it attached to the car? By bolts; they are attached the same as the old ones—only they

are made of heavier material—stronger. 2086. What do you call them? Latch-levers.

2087. What is the construction of these latch-levers underneath? They are latched with a bar underneath with a weight of iron on them.

2088. Will you describe the working? When the car dumps the latch-lever strikes on the brace of the bogie, and that opens it and lets the gates open; there is on each end of every one a chunk of heavy iron so as not to throw the levers right back again but so that it will open and shut itself.

2089. When the car is horizontal what is the position of the latch-lever? The latch-lever lies horizontal to hold the latch against the door.

2090. When the car is loaded how does the latch-lever act then? Just the same as I have just described,

Batchelder.

25 Sept., 1884;

Mr: G:

against the door. The more pressure you get against the door the tighter the latch-lever stays.

2091. What do you mean by more pressure? When the car is loaded there is more pressure.

2092. Pressure against what? Against the inside of the gate. The more pressure there is against the gate the more power it takes to unhitch it. The more power there is forced against these gates it takes so much more friction to hoist this latch so that the door will open. 2093. Now I wish you to refer to the trucks. You have already said the truck sill is made of white oak?

2094. What is the difference between the trucks you are now building and the sample truck in respect of the sills? In the trucks we are now building the sills are in two pieces; the top sill in the sample car is in three pieces

2095. The present sill is not in three pieces? No, it is in one solid piece; the top sill in the sample car is in three pieces; in the car we are now building it is in one piece.
2096. What is the advantage of that? We think it is stronger and better to have it in one piece than in three pieces.

2097. Respecting the brake, I want you to describe the brake;—how is that applied? The same as any ordinary brake.

2098. By means of what? Lever power and a chain. The brake power is applied in the same way in both cars, except that the new car has a little more leverage.

2099. Is there any additional strength or safety in the brake on the car you are now building to what there was on the sample car? The sample car has one set of links and hooks that hold the brake, called safety hooks and links; the car we are now building has what we call an extra safety link and hook, in case of one being broken, to go under it to keep it from falling; it makes it safer; if the one that operates while the pressure comes on should break, there is another put on purposely to catch it up, so that it could not fall.

2100. How does the extra link act? The extra link does not act at all until the other breaks; if the

other should break then it catches on it and holds it up; it acts as a safety link and guard.
2101. Can you compare it to anything else in any other part of the truck? There is a spring in the new car that goes with these safety links and chains, that throws the brake block off when they are not using it; that is not on the sample car.

2102. Is there any other difference? The truss-rod on the new car is one-eighth of an inch bigger than

it is on the sample car; that holds up the strength on the bogie; it goes from one side to the other.

2103. Where is this truss-rod—from where does it run? It runs from within about 6 inches of the top sill, down under the bottom of it, and up to another, and goes through a plate of iron about 6 inches on the end of the bolt, that is a support to the trucks to help carry the load.

2104. What is the truck-brace? The brace is on the outside of the truck; it carries the box.

2105. Is there any addition to the truck-brace different in the new car? Yes. 2106. What is that? The end of the inner brace turns up; the iron is a 2106. What is that? The end of the inner brace turns up; the iron is about 3 inches by an inch, turned up an inch so that the top brace stands against it to make a shoulder; it makes it capable of carrying 3,000 lbs. more before it would strain the bolt.

2107. About the brake—where the chain winds—has there been any difference made there? Yes, we have made an improvement on that; instead of a single brace we have a double one.
2108. To hold what? To hold the lower end of the brake rod.

2109. Now, as regards the rocking apparatus or gear—where is the rocking gear placed? You mean the

dump:gear; the dump-gear is placed in the centre of the car.
2110. Not fore-and-aft? I mean the whole length of the car; the dump-gear runs the whole length of the car with the exception of a very few feet; then there are posts that are hung on hinges on the bottom transom; that sets under the transom and keeps the car from dumping.

2111. You are describing what now? The posts under the sample car. This statement I am making is on the sample car, not the other car at all. This post is pulled out by the levers.

2112. By what levers? The levers at the machine end of the car. The posts are pulled out in order to

dump the car. The car cannot dump as long as these posts are under there.

2113. Has there been an alteration in the cars you are now building in that respect? Yes.
2114. What is the alteration? We have links to take the place of these posts.

2115. Now turn your attention to the alteration in the cars you are now building in the dumping gear. You say there there are links in place of the posts;—where are these links—what are the linksaffixed to? The links are an improvement on the sample car; they go up with a bolt through one of the middle sills.

2116. What are they attached to? I have just said they are attached to the middle sill.

2117. How are they worked?

They are worked by a lever at the machine end of the car—by two levers at the machine end of the car.

2118. What is the action of the levers? By pulling the lever back you can take the link off, so as to let the car dump

2119. Take the link off? Take the link off the post that is put on to the side of the bogic truck.
2120. How are the levers kept in place when not pulled back? We have lock links on these levers, that when the lever is thrown into its place and the link fixed properly, and the car ready for running, this link is thrown over the lever, which makes it safe, that the car cannot dump. The sample car has no link or anything of the kind on it but a spring at the bottom. We considered the link best; that was why we put it on; it makes it perfectly safe. We also have a catch to latch it down to the bottom of the gear-rod.
2121. What gear-rod? The gear-rod that dumps the car.
2122. How does that work? The gear-rod works the dumping apparatus; it turns round.

2123. How? By a handle and wheel.

2124. When you turn the handle and wheel what does that do? It will dump the car.
2125. In what way;—how? It tips it up sideways.
2126. What is it attached to? It is attached to the gear that dumps the car.
2127. What is that gear? It is the gear—that is all I can call it.
2128. Is it made of wood or iron? It is made of iron.
2129. What shape is the iron? Four or five shapes. There is a long bar about 23 or 24 feet long; it is about a 2-inch bar and on the machine and it has the gear attached to that and by working the wheels over about a 2-inch bar, and on the machine end it has the gear attached to that, and by working the wheels over-

Mr. G. Batchelder. head you dump the car. There is gear at each end that chains run in, and by turning the machine wheel

25 Sept., 1884. 2130. By means of the gear, by means of a rod, and by means of a chain? Yes; these latch links have, to be hoisted off and the levers pulled back before the car can be dumped.

2131. To lift these latch links what do you do? It will depend on how the car is loaded; if the car is loaded half a ton sideways, you have to take hold of the wheels and roll up the car on to a level, and then you can take out your links to let your car dump; you cannot take them out if your car hangs either one

way or the other; you cannot dump your car.
2132. What is the thickness of these lever links? About three-eighths of an inch. That has not anything

to do with what we are talking about now.
2133. What is the thickness of the chain? The chain that dumps the car is half an inch.

2134. What does the dumping gear rest on-how is it kept in its place? It rests on the sill; it rests on the transom.

2135. How is the car, when being dumped, kept on the truck? There is a king-bolt in each end; there

is not any king-bolt in the sample car.

2136. What is the object of having a king-bolt? To keep the body from jumping off the truck in case When the car runs off the track in case of an accident, those king-bolts keep it up; they of an accident. are inch and three quarters cast steel; that makes it an impossibility for the car to leave the bogie unless there is a general smash.

2137. Is there, in your opinion, any danger of the car, when loaded and travelling, dumping of its own

2137. Is there, in your opinion, any danger of the car, when loaded and travelling, dumping of its own accord? It is impossible for it to dump of its own accord; unless you take truck and all with it you cannot dump the body; it cannot be dumped unless you take these links off the levers and pull the levers back. They are 14 inches long and 6 inches wide, made of inch iron, and weigh about 35 lbs.; the four of them have got to be hoisted or the car cannot be dumped, neither by itself nor by no man.

2138. Is there any danger when the car is travelling, loaded or unloaded, of the latch levers which keep the sides closed falling, so as to let the sides of the car open? No; the more load you have in the car the solider they are; of course when the car is empty there is nothing but themselves to keep them on the car but if the car is loaded there is a pressure against them

car, but if the car is loaded there is a pressure against them.

2139. In addition to the transoms and sills at the bottom of the car, is there anything else to strengthen the body of the car? There are four truss rods that go from one end of the car to the other, with bolts and nuts on the outside of the sill and large washers; they run the whole length of the car and help to carry the load; they also keep the end sill from pulling off.

2140. What do you mean by the end sill? The end sill is the sill that the draw chains, links, and buffers

2141. Do you know the name "cross-heads." Have you ever heard the word "cross-head"? Only on

an engine.
2142. Do you know the word "head-stock"? That is the end sill I have just described; it goes on to the end of the car and to it the drawhook and chains and buffers are attached, and these four truss rods

go right through with nuts and washers at each end.
2143. On each head-stock? Yes, that prevents the head-stock from drawing off.
2144. With reference to the axles, what is the diameter of the axles? They are the standard axles of America; the standard size is $3\frac{3}{4}$ inches; they vary a little; it is according to what heat they are taken out at when they are hammered; if they are very hot when they are taken out they will be a little slack, that is, they will not quite come up to the standard of $3\frac{3}{4}$ inches; sometimes they run over it a little, but as a general thing they are a little under 33 inches.

2145. How are the wheels affixed to the axles? The axles are turned and the wheels bored out, and then

they are put on with hydraulic pressure, not less than 40,000 lbs. to the wheel. 2146. Is that done with heat? No.

2140. Is that the minimum pressure? They do not calculate to let the wheel stay on if it does not take a pressure of 40,000 lbs. to put it there. Sometimes they will let it run large, and if it does not work the machine up to 40,000 lbs. they put on another. It may vary a little; sometimes it takes a great deal

more to get the wheel on.

2148. What are the wheels made of? Cast-iron—what is called a chilled wheel.

2149. Is there any stamp of any sort on them? The maker's name; the axles are all stamped with the maker's name.

2150. What is the depth of the chill on the wheel? It will vary a little; it is generally about \$\frac{3}{6}\$ of an

inch—sometimes a little more.

2151. Is that on each wheel? That is the general run of a first-class wheel.

2152. Have you worked the screws on these cars when dumping the load; have you dumped the load from cars of this pattern? I have; I have dumped 30 tons of gravel out of it, and I have dumped 20 tons of coal, and I have dumped 20 tons of stone and 20 tons of iron.

\[
\begin{align*}
\text{2153. From cars of this pattern? One of the cars that the firm made out of this same material; and I took it over the Boston Road, over the Montreal Road, over the Concord Road, over the Portsmouth Road, and over the Boston and Lowell Road. I was sent out—employed by the firm to take that car and work it

and over the Boston and Lowell Road. I was sent out-employed by the firm to take that car and work it

and over the Boston and Lowell Road. I was sent out—employed by the firm to take that car and work it on the road, to see if I could get orders for the car.

2154. What is your position when you are dumping the car? You can put yourself in whatever position you like. You stand on the front part of the car to dump it.

2155. Do you move with the car when dumping it? The car jumps; you slip up your knee a little.

2156. Has any accident happened to you when dumping the car? No.

2157. Has there been any approach to an accident? No; there is no more danger of an accident in the car than on the ground; you are 3 feet higher, that is all. You can dump the car at any speed you wish. You can turn it round slow or let it go quick. The man that does it is perfectly safe. A child ten years old could dump the car with perfect safety. They could not dump the sample-car when it came here because it was not put together right; consequently they could not dump it without jacks; but I went over it to-day, and put it in shape, so that a child of ten years old could dump it now.

2158. Chairman. I find a letter in the Evening News of Saturday, 20th September, signed "George Batchelder";—are you the person who wrote that letter? I am.

2159. How long is it since the dump-cars arrived—the first shipment? The material came for these cars about six or seven weeks ago.

about six or seven weeks ago.

2160. In what ships? Part of the material came in the "Earl Granville," and the balance in a ship Batchelder. called

2191.

2161. What wharf were they landed on? The ships went to Mr. Dibbs' wharf, I think it was.
2162. How many cars have been removed from that wharf? We did not put any of the material on the 25 Sept., 1884. wharf; I had lighters ready and put it all in the lighters. Once in a while we would send out a piece, but I lightered it all.

2163. Did you arrive with the cars? No, I came round by 'Frisco, about a month ahead.
2164. How long have you been in the Colony? I think I landed here on the 6th of June—somewhere

2165. Have you been over our lines? I have; I went up to see the Zig-Zag; and I have been out on the branches 20 miles, perhaps more.

2166. Have you had any practical experience of railway rolling stock in this Colony? No, I just merely rode over the road; I have examined the stock here—a good many of the cars or trucks as you call them. 2167. Are you aware what prices were to be paid for these cars? I understood they were to be £200, with the buffers and other attachments.

2168. You understood that £200 each was to be paid for the cars with buffers? Yes; I understood there

was a price for the cars and there was a price for things added afterwards, £10.

2169. From whom did you understand that £200 was to be paid? 1 think I must have got it from the office.

2170. What office? Mr. Carson Woods' office.

2171. Are you aware that the first contract was for 200 cars at £190 each? I cannot say how I got it; I heard it a number of times. I understood that the contract was for £190 each car, and that there was buffers or something to be added which would cost £10. Perhaps I might have got it the day I showed the car to Mr. Stanley, an engineer from Queensland. He asked the price and I rather think Mr. Midelton quoted the price to him £190, and buffers and chains connected with them to be £10 extra. 2172. You stated, in reply to another question, that you had it from Mr. Woods' office? I think I heard

it from Mr. Woods' office when the matter was being talked over.

2173. Will you swear that you heard Mr. Midelton say the price of the car was to be £190? No, I will not, but it is my impression he did say so. Mr. Midelton was a stranger to me, but I think Mr. Midelton was one of the men showing Mr. Stanley the car; Mr. Stanley asked the price, and some one of the gentlemen present said it was £190, and the buffers were in addition £10. I think Mr. Scott was one of the gentlemen. I did not know any of the gentlemen present at the time by name, except Mr. Stanley.

2174. Do you know anything with regard to the contract? No.
2175. Have you had tests made with the new car since you arrived? Nothing more than that I took it back and forward from the works; it works all right; I put a lot of men in it and worked it, but I have not loaded it.

2176. Mr. Suttor.] Did you dump the men? Yes. I showed the old car to Mr. Stanley and loaded it

partly with sleepers; I dumped that twice, I think.
2177. Mr. Chapman.] You were not present at any of the dumping trials with the sample car? Not when it was dumped with jack-screws. I know when I first came here the gentlemen on the railroad told me they had to dump it with a jack screw.

2178. I suppose you understood them to mean these dumping trials before the 200 cars were ordered? Yes; they said they put ashes and different things in it, and could not get it over without a jack-screw.

2179. They did not dump it properly till you arrived? No, the dumping machinery was not in right; it would dump, but not in proper shape; it would not work right. I can dump the car now immediately.

2180. All these failures in the dumping took place before the 200 cars were ordered? They said they were satisfied with it even with the jack-screw. I was told by several gentlemen they had used it. told them it was because the car was not put together right. Somebody put it up that did not understand the business.

2181. You spoke of king-bolts—did you—used in America? No, not till we put them in here. It is an improvement. There is no dump-car in America that I know of that has a king-bolt to it. Every man in America building cars is trying to beat his neighbour, and to get an improvement on every class of car. 2182. You spoke of several improvements you have made in the cars you are now putting together that do not exist in the specimen car;—who ordered those improvements? I do not know anything about the ordering of the cars. Mr. Scott told me, if I understood him right, that he wanted Mr. Woods to make some improvement in the dumping arrangement, to put on what improvements he could; I got my information from Mr. Scott himself, I think, for that; and Mr. Woods told me that in a conversation he had with Mr. Scott he told him so.

2183. You are pretty well up in the building of cars, I suppose? Yes; I have been at it ever since I

was sixteen years of age; I ought to be.

2184. What is your opinion about the axles of the cars you are at present putting together? They are just the same class of axles as are used all over America; the same standard axle, capable of carrying 30 tons anywhere safely. The sample car is loaded here now; it has 24 tons of rails on it; it has been loaded ten days; I believe it was loaded by orders; I saw it loaded.

2185. You have seen the axles used on our railways? Yes.

2186. I suppose you know pretty well what they are? Yes, I have examined them thoroughly; the

conversation that is flying round has caused me to examine all these things thoroughly.

2187. Do you think your axles are equal to those already in use on our railways? I think they are ahead of them. I think scrap-iron hammered is safer than steel. When steel breaks it goes right through at once, whereas iron will mostly bend. These axles will bend generally before they break. Steel will stand more pressure than iron, but when it goes it goes at once; it will not bend, but iron will bend before it breaks as a general thing.

1043—K

will stand more pressure than iron, but when it goes it goes at once; it will not bend, but iron will before it breaks, as a general thing.

2188. Then to all intents and purposes in the cars as now being fitted up the dumping gear is perfect, and will carry all that it is intended for? Yes, and more too. The car is suitable to carry more than the 20 tons; it will carry that, and do it right along, and be durable.

2189. And easily dumped? Yes, dumped without any trouble whatever. There is not a wholel ot of fixings about the car that gets out of order; that is one beauty of it. In most of these new things there is so much machinery all the time getting out of order; in this car there is now little.

is so much machinery, all the time getting out of order; in this car there is very little.

2190. Mr. Suttor.] I understood you to say you were taking a sample car about America in the interest of the patentee? In the interest of the Latona Car Company and the patentee of the car in America.

Mr. G. Batchelder.

2191. Who is the patentee? A man named Simpson.
2192. Does the Company buy the patent from him? I cannot say for that; I think that whenever they build the cars he gets a royalty of £1 a car; I think he told me so; he is a man that has been in the dump-car business for thirty years, and has always been endeavouring to make improvements.

2193. You brought this car under the notice of a good many Railway Directors in America? 2194. When was that? About a week or ten days before I left to come here.

2194. When was that? About a week or ten days before I left to come here.
2195. Did you subject this dump-car to ordinary tests? We tested it heavily to see what it could do.
2196. Were the cars you tested similar to the sample car sent cut here? About all the difference was in the different improvements I have spoken of. The car I am now building has these improvements; but

it has the same kind of wheel, the same axle, and is made of the same timber.

2197. Were the cars you submitted in America like the cars you are building here now? Yes. 2198. Did you succeed in dumping 30 tons of gravel in America? Yes, half on one side and half on the

other; you are not obliged to dump it all in one place.
2199. Having dumped half on one side can you lift the car and dump half on the other side? Yes, it will go back itself if you do not look out for it, when half the load is out; you want to keep your hand on the wheel; if you do not it is liable to go back. You can dump a third or a half of it, and then turn the car over and dump the other half.

2200. In these tests did you succeed in thoroughly clearing the car? Yes, we never put a shovel in it.

2201. Can you dump the car on a level piece of ground, and will the car clear itself then? No, it will not do it; there will be 4 or 5 tons that will be just on the edge.

2202. If these cars are used at all, do you think they will be available for our lines as they exist—all the sidings being on a level? You cannot build new cars fit for all classes of traffic. You can carry all kinds of goods in it, but it is not best to do it. For general traffic there is no better car in the world than this car.

2203. Our sidings are on level ground? Yes, that may be, but in this car you can dump your load out of it, even all on one side, and it only adds a little to the expense to get it all cleared off; whereas in the

present cars in use they have to get up on the load and throw all the stuff out. With this car they can do it for 50 per cent. of the cost of what they are now doing.

2204. Supposing the object is to meet the requirements of the coal, gravel, and wood trade, do you think it will be successful in getting rid of its load on our sidings, or will it be necessary to raise the sidings?

To make it dump nicer they ought to be 3 feet high.

2205. So that our sidings, as they at present exist, are not thoroughly suitable for the dump-car? I should say, to make it a perfect success in every respect, you would want raised sidings in some places. For instance, to dump into a ship or lighter, you would want a place to run the car to the side of the ship or lighter.

2206. For ordinary use along our railway lines, can you dump and clear the load at present? Not 20 tons—not the whole of it—but you can soon clear it.
2207. Are the cars that Mr. Carson Woods has undertaken to supply all on the same plan—all similar cars? Yes.

3008. Will these 200 cars be suitable in any way for wood traffic? Yes, but they do not want the gates on for wood. I am putting up some with the gates off, and with a couple of hours work the gates can be

put on if you want them.

3009. Will these cars be suitable for the wood traffic? Yes, nothing in the world better.

3010. Will they clear the load? No, not perfectly clear, but they are a splendid car for wood or anything of that kind.

3011. Have you had any difficulty in altering the cars to meet the requirements of the traffic? Not

3012. Did you get many orders for these cars in America? I got orders for fifty the first day on the Concord Road, only 70 miles long.

3013. Did you get any other orders? They were promised in two places.

3014. Then so far as you are aware these cars are not in general use in America? With the exception of these attachments they are in use all over America.

3015. Are they used for general traffic or for carrying sand and gravel and such things? They are generally used for gravel, wood, coal, stone, and everything of that kind; and they carry back goods as returns; I have seen all classes of goods on them. The cars I am building here have these extraimprovements on them which I have told you about. Many of them like the sample car are at work in America; I can show you half-a-dozen railroads that have them.

2216. Are you to supply cars similar to the sample car, or are they to be an improvement on the sample car? I understood the contract to be for two hundred cars like the sample car or its equal, and these improvements were asked for, as I understood, if we could make any betterment in the dumping arrange-

ment to put it on.

2217. Are you to be paid extra for these improvements? No.
2218. You consider all these improvements are included in the contract price? No, but we have made it our object to put them on, so that if the car proves a success we may get more orders.

2219. You are improving the car with a view to satisfying the Government and getting further orders if

possible? Yes. 2220. Are all these improvements included in the contract price? If I understand it right, we do not get the same those things than without them. I understand that Mr. Scott asked any more for the car by putting on these things than without them. I understand that Mr. Scott asked Mr. Woods to make an improvement if he could, but it was not understood that we were to get anything for it. The expense of some of these things is considerable. For instance, the improved wheel-box costs about £1 a piece more; it shuts out all dust and dirt, and keeps the grease from running out, so that the wheel will run three months without fresh oil; ordinary cars want to be oiled once in two or three days.

2221. What is your position with regard to these cars. You have the putting of them together? I have

the building of them, and the whole charge of them.

2222. Where were they built first of all? We are building them here.

2223. Are you building them here, or merely putting them together? We are building them here. The material has been imported from America.

2224. Had you any directions from Mr. Carson Woods to improve the sample car for submission to the Government? He told me these improvements were to go on the car when I built it. 2225.

ON THE PURCHASE OF RAILWAY ROLLING STOCK.

2225. In other words you got instructions to put these improvements on the car? He bought the material for these improvements with the other stuff that he got in America; some of it I bought here for things that will benefit the car.

Mr. G. Batchelder. 25 Sept., 1884.

2226. You are improving the car yourself? Yes.
2227. Are you doing this on Mr. Woods' authority? I am doing it on my own authority; I tell the master what I do.

2228. Then I am to understand you are improving this car in any way you think fit? I am only cutting off the bolt-heads and putting screws in place of them. 2229. Are the chilled-iron wheels on these cars the ordinary wheels used in America? Yes.

FRIDAY, 26 SEPTEMBER, 1884.

Present:

Mr. WRIGHT,

MR. SUTHERLAND,

Mr. CHAPMAN.

SYDNEY SMITH, Esq., in the Chair.

Mr. George Batchelder further examined:-

2230. Mr. Wright.] Have you had a large experience in America in railway rolling stock and railway Mr. G.

workshops? Yes, I commenced it when I was 16 years of age, and now I am 49.

Batchelder.

2231. At carriage building alone or in that combined with other work? All classes of rolling stock.

2232. Do you consider yourself competent to give an opinion on the suitability and workmanship of 26 Sept., 1884. railway rolling stock? I do.

2233. You stated that you had been employed by a firm in America to build this kind of car—the sample car—and to take orders for the same? Yes. car—and to take orders for the same?

2234. I believe you have already stated that you took some orders? Yes, Mr. Stimpson was with me, and he told me that he took some orders, and I worked the car.

2235. Within your knowledge is there any firm in America using this kind of car or a similar car? Yes. 2236. The sample dumping-car I refer to? Yes, not with these improvements, but like the old one.

2237. Do you consider, with your large experience in railway working and workshops, that these cars are suitable for all kinds of ordinary railway traffic? Yes, they are a general traffic car. There is no car suitable for every class of work.

2238. You introduced bogies or trucks under these cars?

2239. Are they the class of trucks or bogies used in freight-cars in America? Yes. 2240. Are they as strong as the ordinary American trucks? Yes, they are the standard trucks, with the standard axle.

2241. As a matter of fact this particular kind of bogie is used by American Railway Companies? Yes.

2242. It is quite as strong as the bogie in common use in America?

2243. Is the body of the imported dumping-cars constructed of the same class of wood and as well constructed as the bodies of freight-cars in common use in America? Yes, it is.

2244. You are quite sure of that? Yes.

2245. And you give that answer after a very large experience in railway rolling stock construction? Yes. 2246. Did you see the material of these cars shipped from America? I did.

2247. Is it true, as has been stated, that this material is already prepared and imported in frame ready to be put together? Some parts of it are finished, but some are not. Some of it is in the same state as that in which it came from the grooving machine.

2248. Is the woodwork fitted to be bolted and screwed together? Not wholly; it is partially so.

2249. Is the ironwork manufactured before its arrival here? Not all of it.

2250. I understood you to say that the sample dump-car had no king-bolt? No, it has not:

2251. Do you consider that the want of that king-bolt renders the car unsafe for traffic, or dangerous for

No; because it is not commonly used in America.

2252. Do you consider that with the steep gradients and sharp curves on our railway lines—curves of 8 chains radius—the car would be safe travelling over them without a king-bolt? I do not see why it should not be safe; the car is used on railways with strong gradients and curves in America, and I have not heard of any accident arising from its use.

2253. You think the car as originally constructed would not dump itself in transit? No. 2254. There is no danger of its jumping off the undercarriage? It cannot, unless it breaks the chains unless it jumps $14\frac{1}{2}$ inches high.

2255. I understand that the new car now imported to fulfil the contract with the New South Wales Government has a king-bolt? Two—one at each bogie.
2256. That I presume is an additional safeguard? Yes.
2257. What is the king-bolt made of? Cast-steel, 1\(\frac{3}{4}\)-inch through.

2201. What is the king-bolt made of? Cast-steel, 1\frac{3}{4}-inch through.

2258. What is your opinion of the relative strength of a cast-steel king-bolt and a wrought-iron king-bolt? The cast-steel is the stronger.

2259. I believe they do not use him.

2259. I believe they do not use king-bolts on American freight-cars? On some of them they do, but it is a straight bolt.

2260. The ordinary king-bolt? Yes; but this has a joint in it to enable it to dump.

2261. Is a king-bolt made of iron or steel used? A bolt made of iron.

2262. I understand you to say that the cast-steel bolt is stronger than one of the same size made of Yes, a great deal stronger.

2263. Were you at any time present at a conversation between Mr. Midelton—the Locomotive Engineer in Queensland—and Mr. Stanley, the Engineer-in-Chief for Railways in that Colony? Yes.

2264. On that occasion did you hear Mr. Midelton speak in flattering terms of these dump-cars and recommend them? I did.

2265. Will you be kind enough to state what he said? As I was showing the car to Mr. Stanley he said he considered that it was a good one, and when Mr. Stanley asked the price my impression is that he told him, but I could not say for certain. I did not know these gentlemen at the time, but I found out afterwards

Mr. G. Batchelder. 26 Sept., 1884.

that one of them was Mr. Midelton. I think Mr. Midelton said the car cost £190, with the buffer-

work and chains £10 extra, making the car complete cost £200, and he said that was very cheap.

2266. You are quite sure that in your presence and hearing Mr. Midelton, speaking to Mr. Stanley, the Engineer-in-Chief for Queensland Railways. spoke in complimentary terms of this car? Yes.

2267. I understand from what you have said that a gentleman, in your hearing, told Mr. Stanley that these were good cars, and recommended them? Yes.

2268. You did not then know who this gentleman was? No.

2269. Did you afterwards recognize him? Yes; I have been introduced to him since that time as Mr. Midelton, and have spoken to him half-a-dozen times.

2270. Would you undertake, in the presence of this Committee, to dump this car with 20 tons of material

in it? I should have no hesitation in doing so.
2271. You can, in the presence of ourselves, dump 20 tons in this car in a satisfactory manner? Yes; if

you give me dumpable stuff.

2272. There were some figures painted on the side of the car—40,000 lbs.—I think? There was, and when I painted the car to make it look better, I painted out the figures.

2273. Were those figures 40,000 lbs.? Yes, they were on the left-hand corner.

2274. Do I understand that these figures indicated that the car's registered freight was 20 tons? Yes,

at 2,000 lbs. a ton—that is, 20 American tons.

2275. That is about 18 tons of English weight? Yes.

2276. Do you consider that the car itself and the bogies are quite strong enough to carry that weight under the ordinary circumstances of railway traffic? Yes, it has 24 tons on it now.

2277. You have been over the Blue Mountains here I believe? Yes, to Lithgow, over the Zig-Zags.

2278. Would you have any doubt about the stability of this car with 20 tons on it on those roads? No. 2279. Have you noticed the ordinary rolling stock employed on the railways in New South Wales? I have.

2280. Can you give me any idea of the working life of an ordinary truck of any class? That depends

altogether on the load it carries.

2281. Take the average load of 6 tons, which I believe is a fair average, what would you think their life would be with that load? That means a D truck. It depends whether there is a brake on it or not; the wheels will last longer without a brake.* It may be broken off or something of that kind. Then it depends how much they are used. You can use up a wheel in a few years if you use a brake.† Not being familiar with the timber of this country I do not know its strength, so that it is a question on which, perhaps, I should not be a good judge. I could tell better if I knew the quality of the timber in the truck I had seen it used.

2282. Can you give me any information, as far as you are capable of judging with your limited knowledge of Colonial woods, as to the comparative lives of the Carson Woods dumping-car and our railway rolling stock, considering the light power of the one against the heavy power of the other? I should think that the sample dumping-car would outlive the other car with the same weight and work.

2283. That is as far as you are capable of judging from your experience as far as it goes? Yes.

2284. Can you give the Committee any information as to the average life of the chilled wheel as to the number of miles it averages before it is worn out? That depends upon whether there is a brake on the cars. It will make a big difference whether a brake is applied or not a certain number of times a day. It is the brake which uses up the wheels quite as much as the roll on the rails.

2285. Have you any special knowledge of the durability of these wheels? I have known them to be run

eleven years before they were taken out. 2286. They are used exclusively in America? Yes; now and again you see other trucks, but these are mostly used.

2287. Have you heard anything about an agitation in America among railway managers in connection with the use of trucks with steel tires? I have read of it, but I have no personal knowledge of it.

2288. Mr. Bird.] How far up the railway line have you been? About 100 miles.

2289. Have you been up the Zig-Zag? Yes.

2290. Which Zig-Zag? I have been as far as Lithgow.

2291. Mr. Chapman.] Then you have seen both? Yes.

2292. Did you notice the curves and inclines on the mountains? I did.

2293. Have you been over curves and inclines of that description in America? Not zig-zags.

2294. Have you at any time been over curves and grades which are as severe? Yes, over grades very nearly twice as steep—250 feet to the mile.

2295. What description of truck is used? Outside of the mountain traffic the ordinary American truck. 2296. Do you think there would be any danger in the cars in question crossing such grades and curves as you have seen on the mountains in this Colony? I do not think there would be any danger in using the cars on any road. I consider them as safe as any car which is made.

2297. I want you to describe the shape of the king-bolt used in the cars in question? It is an ordinary joint king-bolt. One end is about $4\frac{1}{2}$ inches long and the other end is about 9 inches long. 2298. And the centre what is the thickness of that? About an inch and a quarter. 2299. And the joint? The king-bolt is probably about an inch and a quarter by three. I never measured

it; I am going by my eye.

2300. You said that the links and chains would require to break before the car could self-dump;—what is the strength of these links? You are mistaken. What I said was that it would require the chains and links to break before the body of the car could be thrown from off its truck.

2301. You have carefully examined the links? Yes.
2302. What is your opinion of their effectiveness and strength? They are quite strong enough to carry the load which they are designed to carry.

2303. What is your opinion as to the strength or weakness of the cars with the truss-rod substituted for the continuous draw-gear? The continuous draw-gear does not strengthen the car. It is merely a rod 2304. . connecting the draw-hooks and chains.

^{*} Note (on revision) :- Here was an interruption. Mr. Wright remarked that all our trucks had brakes. I replied, it might have been broken off, or something of that kind.

† NOTE (on revision):—Mr. Wright asked me here if I was familiar with the timber of this Colony.

Mr. G.

ON THE PURCHASE OF BAILWAY ROLLING STOCK.

2304. The truss-rod strengthens the car? It is one of the main things which strengthen it.

2304. The truss-rod strengthens the car: It is one of the main things which strongered the continuous draw-gear with Batchelder.

3305. But for drawing purposes—not for strengthening purposes—compare the continuous draw-gear with the truss-rods? I do not know how to make a comparison. The continuous draw-gear is not worth the truss-rods? I do not know how to make a comparison. The continuous draw-gear is not worth the truss-rods?

anything; it does not make the car better. The truss-rods answer for strength and for drawing-gear.

2306. In what way? They draw from one end of the car to the other. They go through the whole length of the car. It is impossible to pull off the cross-heads without breaking the four truss-rods and other bolts.

2307. Have you examined the woodwork in the sample car? 2308. What is the woodwork? Pitch pine and oak. Yes.

2309. You say that you have examined the trucks in use in New South Wales. What can you tell us about them further than what you have already told us? Are there any other points of comparison between the trucks in use here and the dumping-cars for ordinary freight purposes? The two things are so much unlike that I cannot make a comparison. They are not alike in any particular. 2310. In your evidence you mentioned the fact that you had a conversation with Mr. Scott as to certain improvements to be put into the cars. What is the date of that conversation? I cannot tell you exactly;

but it is within two months.

2311. Suppose you had a full load and wanted to dump it on a level, if you dumped one-half would there be anything to prevent the car from moving on? No.

2312. But suppose you dumped the whole? It would depend upon the material what it was, and whether it was wet or dry.

2313. But you can dump one-half of the load and move on? Yes, the car can be dumped when in motion, but it is proper to stop the train when the car is dumped.

2314. As to the material used in building these cars, did you get all the material in America? I am buying some here.
2315. What men are you employing in building the cars? About forty.

2316. Are they competent? I have got what I call a good lot of men; they are used to the business; some of them have spent their lives at it.

2317. Have you tested any portion of the material of which you are building the cars? I have.
2318. What have you tested? The bolts, draw-chains, and hooks.
2319. Where did you test them? In Sydney.
2320. Where? At a shop in Sussex-street—just this side of the Pyrmont Bridge.
2321. What test did you put them under? A trip-hammer which strikes 250 lbs. to a blow; I did not make

the test myself, but I was present.

2322. What was the result of the test? It was considered good. (Witness produced links and bolts.) The Committee can see for themselves the results of the test. Here is a main link which was struck twenty blows before it was bent to the shape in which you now see it. The links on your trucks are lighter than the links in use on the American trucks. The draw-chain goes into the cross-heads 1 inch*, but on these cars which we are building the chains are $1\frac{1}{4}$ inch. I produce a portion of a link which I saw broken the other morning as I was passing in a train. The engine started off and snapped the link. I picked it up and took it to the same man and he struck it twice and each blow broke it. You will see in You will see in the end of the link that there is a bit of good iron.

the end of the link that there is a bit of good iron.

2323. Mr. Chapman.] That is a Colonial link? Yes. You can always tell good iron because it breaks off stringy; poor iron breaks off clean. If the link had been made of the same class of iron as the good piece which you see at the end of it it would have strung right out. Your railway yards are literally strewn with poor iron like that. I go through there four or six times a day on the way to my house, and once in a while I happen to see a piece of good iron, but as a general rule it is poor stuff. Some one ejaculated here, "We are now getting better iron." I have had a conversation with Mr. Bourn, the inspector. He examined a piece of iron that was broken on the cars, and he said that it was as good iron as he ever saw. He said, "Batchelder, if you were a Chinaman or any other man I would say that there is as good iron in your cars as any I have ever seen." That had reference to the three cars the brakes of which were broken when being run over a turn-table. He took a piece of the iron to his office and he of which were broken when being run over a turn-table. He took a piece of the iron to his office and he told me that it was first-class iron.

2324. Chairman.] Do you receive any royalty on orders received for these cars? No. 2325. No commission of any kind? No; I get £8 a week for my services—yearly engagement.

2326. You have stated that there are certain portions of the car which are not imported; -will you inform

us what they are? Screws, paint, and links to make chains.

2327. What kind of chains? Chains for dumping purposes.

2328. Are there any other parts of the cars made here? Yes, I am getting some ironwork done here. There is an iron plate which covers the top transom; this plate is $8\frac{1}{2}$ feet long and 15 inches wide. I am getting the plates made here at a cost of £2 per 100, and I am having irons made here for all the levers of these dumping arrangements. I have thirty-nine men working here.

2329. What is the value of the materials which are used in the Colony? Do you mean the cost of the labour?

2330. No, the value of the local material used in each truck? About 25s. worth, I think.

2331. Have the thirty-nine men whom you employ a contract to put the cars together? Some of them have a contract.

2332. Did you not enter into a contract with certain persons in the Colony to put the cars together? I entered into a contract with certain men to complete all that there was to do to the cars.

2333. At what cost? £5; but that is only about one-half of the cost of completing the cars after the

material is landed here. 2334. How is the balance of the cost made up? In getting irons ready for the men in painting the cars and in certain class of work which is done by day labour on them. The men get the car material in different shapes; some have the head blocks on and others the draw chains and hooks. I have four gangs of men working under contract, and fifteen or sixteen men who are employed in getting the material

ready for the contractors.

2335. Do I understand that the cost of putting the cars together—the cost of the materials used and other expenses—amount to about £10? The cost from the day that the material is landed here until the cars are put on the track for the Government is between £10 and £11 per car.

^{*} Note (on revision): - The chains used on Government car are 1 inch where they go through the cross-head.

Mr. G. Batchelder. 26 Sept., 1884.

2336. I think that you stated that in America they do not use king-bolts in these cars? The first kingbolts that I have known to be used in connection with the cars are those which have been sent out in the material for these cars that are being built here. Trucks are not made fast in America as they are here;

they hang by the centre so that they swing as these dump-cars do when they go around curves.

2337. Do you know anything about the Allison Company's cars? Where are they made?

2338. In Philadelphia? I have heard of them.

2339. Have you ever seen any of them? I do not know that I have. The makers' names are usually put on the sills of the cars so that you do not notice them unless you look for them specially.

2340. Have you seen the sample car lately? Yes, to-day.

2341. Has it been damaged in any way? No.

2342. Are you sure about that? I am mistaken in that; the cross-head is cracked on one side; it is not

broken.

2343. How did that occur? There is a big mark on the wood which must have been caused by a buffer striking solid against it. The cross-heads on the new cars are 12 inches deep and on the other car $9\frac{1}{2}$

2344. Do you think that the buffers are strong enough to resist the heavy traffic and the rough usage to which trucks are put in this Colony? There used to be buffers on nearly all American freight cars, but so many people were killed by them that the Legislature made a fuss about their use, and they are not put on now to the same extent as they used to be. We use solid buffers. There is a block of wood and a plate of iron over it. This constitutes the buffer. They strike solid, without anything to take

off the jar. We put on centre buffers now, such as the one on the sample car.
2345. On the new cars are the buffers screwed on to the head stocks? They are bolted.
2346. And there is nothing behind to resist the blow? No; there is a board an inch thick, and a plate of iron is put on to that. It does not require anything more to resist the blow. With ordinary usage the buffers never get broken; it is only when there is a general smash that they are damaged.

2347. Have you ever travelled over our mountain line on a goods train? No, but I have travelled over

the line in a passenger train.

2348. You say that it is very difficult to form a comparison between the dump-cars and our trucks? Yes. The frames in your trucks are all cut up. In our cars there are six stringers which run through the whole length. Your trucks are all cut off and angled in. Owing to the way in which they are framed and built they will not stand heavy work. Take your little truck, it is stronger in proportion than your G truck, which is a flimsy affair, because it has no stringer in it. There is material enough in it to make a first-class truck if it were properly built, but it is put up in such a way that I do not consider it much of The truck is heavy enough, and there is iron enough about it to make a truck and a half. Where the strain is, that is through the body of the waggon, there is no sign of a support; the body is cut right in two, with the exception of the outside sills. The truss rod under the body is all that carries it; all the cross timbers are framed into it each way. Let the truss rod go down and the whole load would be carried on one timber stringer. As I have said before, the dump-cars have six stringers through -from one end to the other.

2349. In reply to Mr. Wright you stated that chilled cast wheels run for eleven years? I have known

them to run for eleven years. 2350. Without brakes? Yes Yes.

2351. How many miles? From 150,000 to 200,000.

2352. Would they run that distance with brakes on? It would all depend on how the brakes were I have known some drivers who would speil a wheel in one day, by setting the brakes down hard and causing the wheels to slide for a long distance.
2353. How long would the wheels last if used on steep declines, where it would be necessary to apply all

the brakes? As long as steel wheels.

2354. How many miles would they run? I cannot say; it would all depend on how the brakes were

handled. Some drivers would soon cut through a steel tire or a chilled cast wheel.

2355. What would be the life of the wheels if used in an ordinary way on steep grades where the brakes would have to be applied? With care I should think about ten years.

2356. How many miles would they run? 200,000.

2357. That is where brakes have to be applied? Yes, if your grades are not any heavier than those over which I have travelled since I have been here, the wheels would run that distance.

2358. I understood you to say in the first instance that the wheels would run 200,000 miles without brakes being used: now you say that they would run that distance if brakes were used? Do not mis-

brakes being used; now you say that they would run that distance if brakes were used? Do not mis-understand me. What I say is that as far as I can judge from what I have seen of your lines, if the brakes are properly handled the wheels will run 200,000 miles. Of course if the brakes are applied twice as hard to the whole train as they need be, that seriously affects the wheels. Some drivers will run an engine twice as long without repairs as other drivers would. I have noticed some of your street motors. knocking and bumping; the reason of this is that the brasses are not kept tight. If brasses are kept tight the wheels will last a great deal longer than they will if they are allowed to get loose and to bump. 2359. In reply to a question you stated that Mr. Scott spoke to you about two months ago and suggested certain alterations in the cars? I do not think that I said that Mr. Scott suggested alterations; I was alluding to the alterations made in the cars. The question was asked me, "Who gave the order to have the changes made?" I said that Mr. Scott told Mr. Woods that if he could improve the dumping arrangement, he (Mr. Scott) would like to have it done. Both Mr. Midelton and Mr. Scott told me that they thought that the alterations which were made were improvements.

2360. Mr. Chapman.] I understood you to say that you have had an experience of our Colonial wood? I have had some, but not much. I have worked a few thousand feet of it in our building on the wharf, and

for a track on which to run trollies.

2361. From the tests which you have made of our wood, and from what you have seen of our trucks, doyou hink that you are justified in saying that your dump-cars will last twice as long as our trucks? I do. 2362. Notwithstanding your want of experience of our timbers, and of our trucks generally, you express that opinion? Since this matter has come up I have been in the railway yards, and I have taken particular notice of your wood and I have tested it. I find that it does not stand half the strain that our wood does. The wood in our cars—pitch—was proved to be the strongest wood at the World's Fair in Philadelphia—that is of wood of a good size. that is of wood of a good size.

Mr. G.

2363. Were our woods tested there? I do not know that they were.

I Batchelder. 2364. Even in the face of that you still think that your wood will last twice as long as ours? I do. I have tested your wood in large pieces. It is very brashy. You have a small kind of iron wood which will not break very easily, but the other wood breaks right square off. You might build a car with your wood which would last as long as ours, but you would have to use twice as much wood and make the car twice as heavy. If you were to take the same sized timber and put the same strain or weight on each our car would last twice as long as yours. I am satisfied that our oak will bear three times the strain of your wood; we make the cross-stringers which run through the cars of oak and then there are truss-rods under them.

2365. Have you tested any of the axles which have been brought out here? No.

2366. Did I understand you to say, in reply to Mr. Wright, that you would be prepared to dump one of these cars loaded with anything like reasonable freight—that you would do this by yourself as an exhibition to the Committee? Yes, at any time; but you must bear in mind that as the car is all new it will not work as quickly or as easily as it will when it is worn a little.

2367. In the test which you offer to make I presume that you will not want to choose any portion of a railway to suit you; will you make it on any portion of a line which may be pointed out to you? Yes; if you point out any place I will tell you what the car will do before we dump it. I can dump the car anywhere, provided, of course, that there is proper space for the material. For instance, if there is 20 tons of dirt on you want a space of 20 feet by 6 feet to hold it. The car will not dump itself on a level track with 20 tons unless the load is of iron. You can dump that on a level because it will all go out. Of course if you fill the car up to the top it cannot get out; but give the car room and the load will come out of it.

2368. Mr. Chapman.] It would be all the better if you could give us an exhibition of the dumping process. I have never seen any of the cars dump, but from the evidence I should imagine that they throw their contents out on the track? Those that gave that evidence show that they know nothing about the

2369. Are you willing to give us an exhibition of the process, to prove that they do not throw out on the

track? I don't say the cars will not empty any of the load on the track.
2370. But I understand you to say that they will empty some? They will empty a little portion, but if you give them a fair chance by allowing sufficient space they will clear themselves, track and all. course it cannot be expected that the cars will dump themselves clear on a level track; and no car that man can make will do that. There was a question Mr. Suttor asked me yesterday about the expense of using the dump-car as compared with other cars. I have obtained some information on that point which I am ready to give in evidence if you like.

2371. Mr. Suttor.] What I asked you was whether the cars are suitable for our sidings as they at present exist? I have ascertained that you use 250 D trucks for coaling your engines, and by making a calculation I find that 75 dump-cars will do the work of the 250 D trucks.

2372. Mr. Bird.] Have you ascertained the cost of the D trucks? Yes, I have ascertained it from the

Government Engineers and from tenderers who have built them. I believe it is £100, so that 250 trucks would cost £25,000.

2373. And what do the dump-cars cost? £200; so that 75 cars at £200 would cost £15,000.
2374. What is the weight of the D cars? 5 tons.
2375. How did you ascertain that? I have been told by builders and railway men that they weigh 5 tons

and carry 6.

2376. What do your dump-cars weigh? 9 tons 17 cwt., and they carry 20 tons.

2377. Have you ascertained how many men are required to unload a D truck? You can put as many are not be from one to a dozen.

2378. Have you made any calculation as to the cost of unloading 250 D trucks? Yes; I estimate that it will cost 2s. per truck, so that it will cost £25 to unload the 250 trucks, while the seventy-five dump-cars can be unloaded for £1. I could unload the whole seventy-five in an hour and a-half. I figure it to make this estimation that on ordinary traffic days £1 would unload the seventy-five cars. 2379. Mr. Suttor.] In the calculation you have made have you assumed that the siding accommodation

for the dump-cars must be different from our present sidings—that our sidings must be made suitable for the dump-cars? Yes, but one half the cost of the present sidings of which you build miles for your D trucks would, if put into trestle work, be sufficient for dumping the cars and for working them properly. 2380. But, taking things as they are, do you think there would be any great saving effected by using dump-cars instead of the present D cars? Yes, a saving of 40 per cent.

2381. Even with the present sidings? Yes, taking all classes of goods.

2382. Although all our sidings are on a level? Yes, mostly; I have seen some that are 6 or 8 inches

2383. And that being the case, the dump-cars would not clear the track, possibly? Not in every

2384. So that men would have to be employed to clear the track? Yes, if you dump the load all on

2385. Mr. Bird.] It has been stated already that they can be moved from one place to another while unloading? Yes; you can dump half the load in one place, and then move the car and dump the remainder further along. If the load is gravel you can dump the car as it moves along, and the gravel

will silt out on the level. 2386. Mr. Suttor.] But are you aware that in the case of coal traffic the coal is not thrown from the trucks on to the ground, but is shovelled into carts to be taken away; and that being the case would there be any advantage in using dump-cars in preference to our own trucks? Not if you don't use the dumping part. The advantage of using them is that you do away with 5 or 6 tons of dead rolling stock.

2387. For the purpose of transferring a load into drays the dump-car has no advantage? No, it has no advantage if you have to put a man in to shovel out the load.
2388. Then to make the dump-cars available on our lines we shall have to alter the whole of our present sidings; at any rate, those on the level? No; you can use the cars for gravel or for stone ballast. I have seen your trucks bringing rock ballast from Darling Harbour, every day I see twenty or trucks. have seen your trucks bringing rock ballast from Darling Harbour—every day I see twenty or twenty-five of them—and I understand that that rock is put along the railway track and broken up. For that purpose the dump-cars would be of great advantage. They would empty the load in a minute and a half on both sides of the track. 2389.

Batchelder. 26 Sept., 1884.

2389. But even in the case of stone ballast is it not the practice to distribute the load along the line and not to discharge it all in one place? There you have a great advantage in using the dump-car, because you can sift the ballast out a little at a time on both sides of the road. You are not obliged to tip it out at one time. You may tip the car up so as to get out 1 ton or 5, or any quantity you like.

at one time. You may tip the car up so as to get out 1 ton or 5, or any quantity you like.

2390. You said just now that seventy-five cars would do the work of all the coal trucks employed on our lines? Yes. You have 250, so Mr. Scott tells me, for your own engines, and seventy-five cars would do the work of that 250—would carry all the coal the 250 carry.

2391. And you think the dump-cars would be useful for the carriage of coal? Yes, for every class of goods; but some kind of goods are better suited for them than others. However, they are good general traffic cars. In our country they run trains carrying nothing but coal, and they use none but these cars. You must have sidings for your 250 cars, and one-half the cost of those sidings put into trestle work, as I have said before, would enable you to unload the seventy-five dump cars for £1; whereas the unloading of your 250 D trucks costs you £25, reckoning 2s. a truck, and I think it is worth that to handle 6 tons of coal.

2392. But if you shoot the coal on to the ground you would require men to shovel it into something else? I would not shoot it on the ground if I used trestle work. By spending half the cost of your present sidings on trestle-work you could save £24 a day on coal alone, besides the drawing of 500 tons of rolling

2393. Chairman.] Have you made any calculation with regard to the G truck? No; I would not consider it safe to put 20 tons on a G truck. It might stand it for a while, but I would not consider it

2394. But supposing it to be safe, would there be the same difference? No; the G truck would be as

good as the other, only that you would have to carry an extra weight of 3 or 4 tons. 2395. Mr. Bird.] Which is the heavier, the G truck or the dumping-car? The G truck. I think it

weighs about 14 tons.

2396. Do you know the average? There is one weighing 14 tons 11 cwt., and another about 11 tons.
2397. And the weight of the dump-car is 9 tons and some cwts.? Yes; that is American tons, which are
2,000 lbs., while your tons I understand are 2,240 lbs. That makes a difference of 240 lbs. per each ton,

and will make the G truck weigh 5 tons more than a dump-car.

2398. If you want to turn a load from a dumping-car into a cart—that is, using the car simply as a freight-car, can that be done? Not without a place is made for it.

2399. But if you want to unload a dumping-car into a car without using the dumping apparatus at all, can that be done? Of course it can, just the same as any other; you are not obliged to dump if you do not want to.

2400. But if you wish to dump you can? Yes; and if you do not you are not obliged.
2401. How long does dumping take? The car will dump itself in a minute and a half if it gets a chance, but as a general thing it dumps a little slower than that. It will go over as quickly as you like to let it.

TUESDAY, 30 SEPTEMBER, 1884.

Bresent:

Mr. CHAPMAN, Mr. POOLE,

MR. SUTTOR, MR. TEECE, MR. WRIGHT.

MR. SUTHERLAND,

SYDNEY SMITH, Esq., IN THE CHAIR.

William Cross, Esquire, called in and examined:

W. Cross, Esq. 2402. Chairman.] What occupation do you follow? I am an iron merchant; I belong to a firm of contractors for the manufacture of railway rolling stock in Scotland. We supply railway companies with 30 Sept., 1884. railway material.

railway material.

2403. How long have you been in this Colony? About six months.

2404. Have you examined the dump-car? I have, and I think it a great success. This Colony is to be congratulated upon having initiated this American principle here.

2405. At whose request did you examine these cars? At no request at all. When I came here first I met Mr. Woods along with two Glasgow friends, and we went about the Bay together, and when I came here again I wanted to see Mr. Woods, and found he was at Brisbane, and I then learned that he was building those cars. I know nothing about an inquiry of this kind at that time: but I went down to see building these cars. I knew nothing about an inquiry of this kind at that time; but I went down to see them, and I saw Mr. Bachelder. We got talking about iron matters generally, and I showed him how we tested iron at home. We took a link and a hook and had them tested under a trip-hammer. custom at home to have everything tested.

2406. Have you examined the axles? Yes, I have examined them as they are being delivered to the

Government at the present time.

2407. What is your opinion about the axles? I think there is nothing wrong about the axles at all; it is

a very good axle.

2408. Have you had any experience of the manufacture of rolling stock? Yes, we are regular contractors for the manufacture of rolling stock.

2409. Did you examine the mode in which the buffers are attached to the head stock? No, I do not think I did.

2410. Did you examine the way in which the body of the car is attached to the bogie? Yes 2411. In what way is it done? They are connected by , and in the centre of , and in the centre of the dumping

apparatus there is a bolt to prevent it tipping over. 2412. Of what material is the bolt? Cast steel.

2413. Do you know the size of the bolt—the king-bolt? I cannot give the dimensions definitely. 2414. Have you examined the wheels? I have. 2415. What is the material used? Cast-iron chilled.

2416. Do you use this class of wheels on the rolling stock you make? No.

2417. Why? That is a question I cannot answer. The wheel has never been introduced. When I left W. Cross, Esq. home an effort was being made by some mercantile firms to introduce it.

2418. You are unable, then, to give us any opinion regarding the suitability of cast-iron wheels? 30 Sept., 1884. Nothing more than what I have read and studied about it.

2419. On all the rolling stock manufactured by your firm do you use steel tires? Yes, they are ordered that way

2420. Mr. Poole.] You are an iron merchant? Yes, and permanent-way contractor.
2421. What is the Committee to understand by that,—the construction of lines, or supplying railway lines with material? Supplying railway lines with material.

2422. Have you had extensive experience of this business? Yes; on all the Scotch railways.
2423. What kinds of materials have you supplied? All kinds of materials: rails, wheels, axles, malleable iron, forged iron, steel-not only to railway companies, but also to shipbuilding companies upon the

2424. What experience have you had with respect to making and working of railway rolling stock? We contract with makers to manufacture for us waggons for the different colliery proprietors.

2425. Have you had any experience in the working of railway rolling stock? Yes.

2426. Where? On the Caledonian line between Baillieston and Glasgow.

2427. What kind of rolling stock are you more particularly acquainted with? Coal waggons and other trücks

2428. How are they constructed? That is a very general question.
2429. What was the general system. Was it hopper or plain fixed train waggons? Plain waggons.

2430. Have you seen any of the Government rolling stock here? Yes.

2431. Have you seen any of the Government rolling stock nere? Yes.
2431. Have you seen the trucks known as D trucks, carrying about 6 tons? Yes.
2432. Is that a similar description of rolling stock to what you have been accustomed to? Yes; in its general style. Our trucks hold about 8 or 10 tons.

2433. Upon how many wheels? Four wheels.

2434. What kind of wheels do you use? Latterly we have been using closed wheels. 2435. Block wheels? Yes. Formerly they were open wheels with iron tires.

2436. Lately? They are all closed wheels now. 2437. What are the wheels made of? Iron.

2438. Not steel? Not steel. There are steel tires upon some of the wheels. But each engineer has a different idea. We manufacture for people who have different ideas. Some have iron tires, some steel

2439. Are the block wheels tired? Yes, tired with iron or steel.
2440. Have you had any experience in the use of cast-iron chilled wheels? 'None.

2441. Have you examined the cars known as the American dump-cars, now being put together for the New South Wales Government? I have. I was down at the building works this morning.
2442. Did you examine the bogic frames? Yes, but I am not sufficiently an engineer to talk definitely about any method of construction. I can speak as to the material.
2443. Will you be good enough to give the Committee your opinion as to the quality of the workmanship?

I think the workmanship most strong and serviceable. 2444. Did you examine the axles? I did.

2445. How are they made in your opinion? They are forged axles, made of scrap iron in the ordinary way

2446. Can you by an examination of the axles see where the blooms have been raised on each other? No, you cannot.

2447. Is there any scab or scale? There is a slight scale; but nothing at all material, the same as you will find on all your axles

2448. What material are the wheels composed of? Chilled iron. 2449. Did you notice the construction of the frame that holds the four wheels composing each bogie together? I did.

2450. What, in your opinion, is the nature of the frame-work, so far as its durability is concerned? I think the iron-work in the frame is very strong.

2451. Did you examine the workmanship of the body of the car itself—the timber work? I did, but I do not know anything about timber work.

2452. Did you notice the machinery for the purpose of dumping the car?

2453. And also for the purpose of preventing the car dumping? I did.

2454. Do you consider the machinery is safe to prevent the car dumping while in transit? I do, so far as my knowledge goes.

2455. But you have had no experience of the management of rolling stock generally? No, not the working of it.
2456. You make rolling stock according to somebody else's design? Yes, but we make designs also.
2457. As far as your knowledge goes of the rolling stock in general use in Scotland, is there any example of a car of this pattern? None with dumping gear; there are cars for carrying long rails, but there is no

dumping car.

2458. Is there very heavy mineral traffic along the Caledonian Railway? Yes, coal and iron.

2459. That kind of traffic is carried in trucks with a capacity of about 8 tons? Yes, from 8 to 10 tons.

Then roils are carried in much heavier loads in long trucks. It depends on what material they are carrying. Iron rails are carried in much heavier loads in long trucks. 2460. And these are all four-wheeled trucks? Yes.

2461. No bogies? No bogies.

2462. Do you know of your own knowledge what is the sharpest curve on the Caledonian Railway? I cannot say; but on the South-western Railway, where the curves are very sharp, they are introducing

bogie trucks to assist in getting round.

2463. Do you know the diameter of the axles on the coal trucks on the Caledonian Railway? Three inches and three quarters to four inches. The Caledonian Company make no stipulation as to the size of

2464. Have they to stand a certain test? There is no test at all.

1043-L

2465. Do the makers guarantee a certain number of miles running? No, they make no guarantee. Their own name is sufficient for that.

W. Cross, Esq. 2466. Then your experience is that 8 tons of coal is carried on two $3\frac{3}{4}$ axles? Yes.

2467. What are these axles made of? Hammered iron; forged iron. Steel has been tried, but is not a 30 Sept., 1884

2468. Mr. Chapman. Do I understand you to say that you saw these dump-cars working to-day? I saw them being run to-day down at the other side of the Pyrmont Bridge.

2469. Were they run for your satisfaction? They did run to my satisfaction, but not for me at all. I

happened to go down there to see Mr. Batchelder. 2470. Had they an engine? Yes.

2471. Did the engine belong to Mr. Batchelder or Mr. Woods? I think it belonged to the Government. 2472. Did you ever design rolling stock? No, not individually, but I have gone over it along with my partner, Mr. Wyllie. 2473. Are you the salesman outside? I look after the manufacturing of the stock and buying the

material.

2474. In fact, travelling? No, not travelling. After the orders are got I look after the work. 2475. You have no connection with Carson Woods & Co.? None. 2476. Mr. Wright.] Are you an engineer? No, not a mechanical engineer.

2477. Are you a civil engineer? No. 2478. Simply an iron merchant? Yes, and contractor for rolling stock.

2479. You have had considerable experience in the manufacture of rolling stock? Yes.

2480. Do you consider yourself capable of giving an opinion as to the strength of material, and so forth?

2481. Did you notice the axles under the dump-cars? I did not notice so much those under the dumpcars as those lying ready to be put on.
2482. Do you consider the axles you saw capable of carrying the weight marked on the dump-car—40,000 lbs.? I do.

2483. I think you have already said the workmanship of the axles is good? \mathbf{Y} es.

2484. And you think that under all the circumstances of railway traffic they are sufficiently strong? Perfectly so.

2485. Did you notice the springs under the bogies? Yes.
2486. Do you consider those springs strong enough? I do not think they will come down at all. They are over-strong if that be possible.
2487. Then I understand it to be your opinion that the whole of the iron-work is strong enough for the purpose? Yes, it is quite satisfactory, I think.
2488. Did you notice the size of the axles in the dump-cars? I think they are 3\frac{3}{4} inches.

2489. Is that at the shoulder, or in the centre? In the centre.

2490. Did you notice the mechanism by which the cars are dumped? I did.

2491. Do you think there is any danger of that becoming loose in transit? I do not, but I am not sufficiently an engineer to give an opinion on that point. My opinion is that there is no danger of that

2492. Did you notice that the sample car has no king-bolt? I had that pointed out to me. 2493. Am I to understand that even without the king-bolt there is no danger of the car self-dumping in

transit? I think the king-bolt makes security certain. 12494. Do you think that without the king-bolt there is any danger? I am not sufficient of an engineer to answer that question. Experience only will decide that.

2495. Are the firm you represent manufacturers of railway rolling stock? We contract with manufacturers to make rolling stock for the different colliery proprietors.
2496. Does that include the wood-work of the carriages? Yes. The iron-work is done by one firm, the

wood-work by another.

2497. You sub-let that portion? Yes. 2498. From your general experience of railway rolling stock do you consider the iron-work of these cars We would be delighted to get as good iron at home as they have in these cars. sufficiently strong? 2499. Do you consider the wood-work up to the average for strong workmanship? I think it is very

strong workmanship.

2500. Is the material stout enough? Yes.
2501. Am I to understand from your answers that you have inspected both the workmanship and material of this car, and, as far as both are concerned, it is a good serviceable car? Yes, I think it is a good serviceable car.

2502. Mr. Suttor.] What sort of trucks do you generally supply in your business? Four-wheeled trucks, to carry 6, 8, and 10 tons.

2503. Somewhat similar to those now in use in this Colony? Yes, very similar; I think yours carry

6 tons. Dump-cars have not yet been introduced into England or Scotland.
2504. I suppose the Railway Companies at home are anxious to avail themselves of all labour-saving appliances? Yes.

2505. Are you aware whether the dump-cars have been submitted to any Company in England for approval? I am not.
2506. Do you know the weight of these dump-cars? I did hear the weight of them, but I forget what it is. I know they are very much lighter than ordinary trucks of the same size.

2507. Do you know the weight they are supposed to carry? 20 tons.
2508. Do you know of any recognized proportion between the weight of a truck and the weight it wil carry? I have figures for it, but I cannot give them now.
2509. Can you give us a rough idea? No, I cannot.
2510. You cannot tell whether the weight of the load is heavier than the truck or the truck heavier than

the load? Speaking generally they are about equal. 2511. The truck will carry about its own weight? Yes.

2512. Do you know any truck in England weighing 7 tons that will carry 20 tons? I do not, with the

exception of trucks carrying rails.

2513. Special loading? Yes.

2514. Is there anything to justify you in giving an opinion that this new truck will carry twice its own weight of such material as coal or gravel? Not as far as my experience goes.

2515.

2515. Do you think it is going beyond the bounds of present experience to submit to the coal proprietors W. Cross, Esq. at home that you work for a guarantee that it will carry twice its own weight? I have made up my 30 Sept., 1884. mind to submit it to them when I get home.

2516. But you have never heard of such a thing? I have never heard it and never had it submitted till

I saw it here.

2517. You have not seen these cars tested yet? I have seen them dumped at the Pyrmont Bridge.
2518. With a full load on? No, 6 or 8 tons were on it.
2519. Was it dumped on a level piece of ground? Yes; just upon the railway siding. It threw all the stone out, and everything worked properly.

2520. You say you would be very glad if you could get iron similar to that used in these dump-cars?

Yes, in quality.

2521. And you make that statement after seeing it tested? Yes.

2522. What was the test? They took a hook and link across to the trip hammer at the other side of the bridge, and put them below it, and tested them; it was the usual test.

2523. And you consider it better iron than is used in England? Better iron than our extra best iron.
2524. Have you compared the dump-cars with the other cars used here? I have looked at them, but I have not sufficient experience of either of them to say whether one is better than the other.
2525. As to workmanship—is there any difference? I fancy the dump-cars are as good, if not better.
2526. Have you travelled along our railways at all? Only backwards and forwards up country and to

Melbourne, simply as a traveller.

2527. You did not take special notice of the construction of the lines? No.

2528. You are not in a position to give any opinion as to the suitableness of these cars for our lines? Nothing at all; except that I believe that wherever your cars can go these cars can go.
2529. You have not had much experience of wheels? Yes, we are always supplying material and watching

the making of them. We have to make them from the designs of different engineers who have often

2530. Have you any chilled cast-iron wheels in Scotland? No. I know they are at present being attempted to be pushed, but I do not know whether they have succeeded or not; they had not when $ar{1}$

left Scotland.

2531. Mr. Poole.] What weight do you think these dump-cars are capable of carrying—what weight will the frames carry? I understand they are constructed to carry 20 tons, and I have no doubt they will carry that weight.

2532. Chairman.] How do you arrive at that conclusion? From the fact that nobody would contract to do it unless he was certain of its capabilities.

2533. Have you had any experience with regard to the carrying capacity of freight-trucks built in the same manner as these dump-cars? No, I never saw a dump-car before.

2534. So that from your experience as an iron merchant you are not able to give the Committee a practical opinion with regard to the carrying capacity of these cars? I am not; but I may say, I think

a test would be the simplest way of finding out that.

2535. Mr. Poole.] When you said that no one would contract to supply a car to carry a given weight unless he knew its capabilities, I take you meant persons who make it their business to supply rolling stock and not mere importers? I have had no previous experience of importers; the persons I have been dealing with were always builders.

2536. You were thinking of persons who make it their special business to construct rolling stock, and give the whole value of their name as a guarantee for the proper construction of the truck? Certainly. give the whole value of their name as a guarantee for the proper construction of the truck? Certainly. 2537. It could not apply to a mere importer getting a chance contract? I do not know what you mean by a mere importer.

2538. I mean that he would not have the standing and status of a firm doing this kind of business? He might be making a status for himself, and he would spoil himself if he did not carry out his guarantee.

Mr. Joseph Railt Davis called in and examined:

2539. Chairman.] What is your occupation? Car-builder.
2540. Where are you employed? At the Old Atlas Works at Pyrmont.
2541. By whom are you employed? By Carson Woods and Co.
2542. What work are you doing at the present time? Building cars.
2543. What kind of cars? Dump-cars.
2544. Have you built many of them? Quite a number.
2545. What experience have you had in ear building? My experience.

2545. What experience have you had in car-building? My experience is limited. I have had about twelve years' experience of railroading, and I have been altogether about two years car-building

2546. Have you had any experience in the manufacture of rolling stock in this Colony? No, this is my

first experience here, with Carson Woods and Co.
2547. What class of woodwork is in these cars? I consider it first-class woodwork.
2548. What description of wood? The best pitch pine for the stringers, the best of oak for the head stocks, and the best of oak for the trucks.

2549. How are the buffers attached to the head-stock? With four \(\frac{3}{4}\)-inch bolts passing through the headstock.

2550. Do you think there is any likelihood of the head-stock breaking with a severe shunt? No, not in fair shunting; no iron-work on the cars will break.

2551. Have you had any experience of shunting on our lines? No.

2552. So that you are unable to say with what severity they will be shunted? Engines of about the same diameter of cylinder will give the same power, and a man that will break a buffer as strong as this is should be discharged from any railway employ. He would be in America by any private Company. They are not Government railways there.

2553. Is this buffer attached to the head-stock in the same way as to similar rolling stock in America? No; in America there is just one buffer; the draw-head and buffer are combined; there is only one coupling

2554. Have you had any experience in the use of side buffers? I have not; I never saw them till I came to this country. 2555.

Mr: 30 Sept., 1884.

J. R. Davis. 30 Sept., 1884.

2555. How is the body of the truck attached to the bogie frame? With a king-bolt and strong heavy key above and below.

2556. Is there any likelihood of the body becoming detached from the bogie frame? No, not in ordinary 1186

2557. Have you examined the axles of these cars? Yes.

2557. Have you examined the axies of these cars? I es.
2558. Do you think they are capable of carrying 20 tons? I think so; they have been carrying it for years in America, and we have never had any of them broken unless by accident.
2559. What is the size of the axles? 3\frac{3}{4} inches; perhaps a little larger than that.
2560. What kind of wheels are on these cars? Cast-iron chilled wheels, the same as in use all over

America; they are using them on all their cars there.

2561. How many miles will they travel? I do not know; I never saw one of them worn out. I have seen them go 60 miles with the brake thoroughly tight the whole 60 niles, and I never saw one worn out; I have seen them even red hot with the friction.

2562. Mr. Poole.] Are you a mechanic? I would not consider that I am a mechanic. 2563. In what capacity were you employed in America on railways? The first two The first two years I was brake-

man, the same as you call guard here; from that on I was conductor.

2564. And since you left the railways you have been car-building somewhere in America? No.

2565. I understood you to say you had had two years' experience in car-building? I did not say when;

it was before I ever went to railroad work I was car-building. 2566. Where at? At the Central Pacific car-shop in California.

2567. How long were you there? A year and eight months.
2568. What were you doing during that time? Working at car-building.
2569. In what capacity? In all capacities.

2570. Were you a carpenter? Yes, I am a carpenter. I worked as a carpenter for one year before I left New York, my native State.
2571. Are you a blacksmith? No.
2572. You are now employed by Carson Woods and Co. to put these cars together at Darling Harbour?

No, we are building these cars.

2573. What do you wish the Committee to understand by "building" them? We are building them.

2574. Are you forging the axles? No.

2574. Are you forging the axles? No.
2575. Or making any iron-work? Some of it.
2576. What kind? If we get anything broken we weld it together again.
2577. You are building the cars there, you say. I want to know what you are doing that comes within this general term, "building." Are you forging any iron there? No.
2578. Are you casting any wheels there? No.
2579. Are you preparing any timber there? Some of the timber is prepared there.
2580. What part of it? The flooring is prepared there; some of the stringers are prepared there; some of the head-stocks are prepared there: some of all the wood-work is prepared there.

of the head-stocks are prepared there; some of all the wood-work is prepared there.

2581. The timber itself—the lumber—is all imported? I have nothing to do with the importing of it.

2582. But it is so, is it not—it comes there with the axles? Yes.

2583. Have you any machinery there for shaping wood, at the Atlas Works? Not at present.

2584. Are the alterations you make with the timber just done with ordinary planes, saws, and chisels? There are several alterations to be made in the timber.

2585. What do they consist of? Really I could not tell you; I am only employed on certain cars; I might have alterations to make in mine that others would not have.

2586 You might have to ease the timbers together a little? I do not know what you consider easing

timbers together.

2587. How many years have passed since you were employed in car-building before this? It is all eleven

years—about eleven years.

2588. Were you employed assisting to build this particular kind of cars? No, I was not.

2589. Had you any experience in building this kind of cars till you came here? No, I had not.

2590. Mr. Wright.] Did you ever see these dump-cars used in America? Yes.

2591. On what lines? On the Northern Pacific and Central Pacific.

2592. How long since? About five years was the first car I ever saw in my train, when I was on the Central Pacific line.

2593. Were they used to any extent? They came over quite frequently in our trains. We considered them foreign cars when they got east; cars coming from the Eastern States into California are considered foreign cars; on the Atlantic side they were considered foreign cars, and we particularly noticed them when first they came in our trains; they used to come quite frequently, loaded with iron and all sorts of things

2594. Did you ever hear any complaints about their unsuitableness or insecurity? No, I never heard anything of the kind.

2595. Did you ever hear any complaints that they were unsafe? No, I never heard a complaint about them; we always considered them as safe as any other sort of car.
2596. Are the cars you are now building equal to the sample dump-car? I have examined the sample dump-car, and I consider the cars we are now building excel the sample car in many respects. If I was running a train I would sooner have these cars than the other.

2597. Are what we call bogies, and you call trucks, universally in use in America for this description of car? Yes, we call them trucks. There is no rolling stock in America that has not got cast-iron wheels, and the same axles as are used in these cars.

2598. I am talking of the trucks or bogies? Yes, the diamond trucks are used all over America.
2599. Do you consider, from your experience, that the bogie or truck you are now constructing is equal in strength to the truck in general use in America? Yes.

2600. It is of the same general design? Yes, in fact nearly all the trucks in America are of about the same design.

2601. Is the iron-work about the bogies here the same in size as in common use in America? Yes.

2602. You have said chilled wheels are universal? Yes.
2603. They are used under passenger trains? Yes; in quite a number of passenger trains now they put paper wheels; they run stiller and smoother; but nine-tenths of the passenger coaches in America at present have chilled wheels. **2**304.

2604. The same class of wheels as are used for these dump-cars? Yes. 2605. Have you ever known one of these dump-cars to dump itself while in motion? Never; and I think if it had happened we should have heard of it; we used to hear of all the casualties that happened on any of the roads; we took in the Railroader, a paper that gives all railway information, casualties and their causes, and everything.

2606. As far as your experience goes you consider the chilled wheels imported by Carson Woods & Co. equal to the chilled wheels used ordinarily in America? I do consider them equal in every respect; you could not tell them apart; they are made the same.

2607. Do you know by whom they were manufactured? No, I do not; it is on the wheels, but I never

2608. I understand there are firms in America who do nothing else but manufacture these wheels? Yes, hundreds of them do nothing else.

2609. Have you examined the iron-work, or seen it tested? I have examined it, and seen it tested. 2610. In what way? By bending the bolts in all manner of shapes, and they could not break them; they

put a strain on the rods to see what they would hold, and they never could break one of them.

2611. Has that been done at the Atlas Works? The hooks were taken under a trip-hammer, and pounded out together, and still they would not break. I said I had seen them tested; I beg pardon; I should have said I have seen them after they were tested—the hooks.

2612. Do I understand that all the tests made with the iron to be used in the dump-cars were satisfactory?

Yes, they were satisfactory as far as I know, and I think I know of all the tests that were made.

2613. From what you know of the use of dump-cars, do you think there is any possibility of the car being knocked off the under-carriage while in transit, going round a sharp curve, or owing to unnecessarily severe shunting? No, I do not think it is possible going round a curve.

2614. Do you think it is possible with rough handling? Anything is possible; steam will break anything. I have seen a car doubled right up with shunting. If you take a train of cars and run them into a stationary car something must give; but these cars will stand as much rough usage as any cars will stand.

2615. There is a king-bolt, I believe, in the new car you are now erecting? Yes.

2616. And there was none in the sample car? No, I believe not; as far as I could see I could not see any in the sample car.

any in the sample car.

2617. You are a carpenter, I think you said? Yes; I do not consider myself a first-class carpenter; most of my time I have been railroading.

2618. You said just now that portions of these cars are pitch pine and portions white oak? Yes.

2619. Are those the woods in common use for freight cars in America? Yes.
2620. You have no continuous draw-bars under these cars in America? No, the draw-bars in America are like what is on the sample car; one centre coupling; the draw-bar acts as a buffer at the same time.

2621. Do you think the truss-rods of this car, going through the two head-stocks, are sufficiently strong to make the cars perfectly safe. There is no danger of the head-stocks being pulled of? No, not the least. I have seen the same cars going up steep grades in America without any danger of that; continuous draw-bars are seldom used in America.

2622. You stated, in answer to Mr. Poole, that you considered the buffer's quite strong enough to stand any ordinary usage? Yes.

2623. You are aware that the buffer is fixed to the head-stock? Yes.

2624. Is this head-stock sufficiently strong to withstand the concussion in shunting on our lines? I think

2624. Is this head-stock sumciently strong to withstand the concussion in shunting on our lines? I think it is quite strong enough. Of course in shunting you can break anything, if you do not shunt properly. Occasionally a car of the best manufacture will break.

2625. You think this head-stock is sufficiently strong to stand any fair average shunting? Yes; the head-stock on these new cars is much stronger than on the sample car. There is $2\frac{1}{2}$ inches difference in the size of the stringer; there is $2\frac{1}{2}$ inches of solid oak more than is in the sample car.

2626. In the depth? Yes, in the depth; they are the same thickness, but one is deeper than the other; one is $9\frac{1}{2}$ inches the other is 12

one is $9\frac{1}{2}$ inches, the other is 12.

2627. You draw the car in America from the central draw-bar? Yes, the draw-head and buffer are com-

2628. Did you ever know an instance of a head-stock being pulled off an American car? Yes, quite frequently.

2629. In what way? In collisions.
2630. I mean pulled off in fair work? I have seen draw-heads pulled off, but I never saw a head-stock

2631. As far as your experience goes, will these dump-cars do all the work that is performed by ordinary freight-cars in America? Yes, they are used there as ordinary freight-cars nine-tenths of the time, especially on the North Pacific Railway.

2632. Mr. Suttor.] I understood you to say you were twelve years acting as brake-man and conductor?

2633. And for a year and eight months before that you were engaged as a carpenter, car-building? I never mentioned where or when; where I worked as a carpenter was in New York State, before I left to come to the Pacific Slope.

2634. You worked there as an ordinary carpenter, not in connection with railway work at all? No, not in connection with railway work at all

2635. In what capacity were you employed during the time you were car-building? I was on the Central Pacific Railway which extends from Ogden to San Francisco, over 600 miles. I was working as a general hand in car-building at , in California, repairing cars in a car-shop, as well as car-building.

2636. That is all the practical experience you have had before coming here? Yes.

2637. Chairman.] You said in reply to a question a little while ago that some breakages were renewed in the workshop at the Atlas Works—all the breakages that occurred in constructing the cars? I do not think I said that; I said if anything was broken we repaired it.
2638. Have you had any breakages here? Yes.
2639. What breakages? Well, really now, I will send you a list to-morrow; I cannot exactly call to

mind what they are now. 2640. Were any of the chains broken? I am not aware.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE 2641. Can you tell any parts that were broken? Yes, I can tell quite; a number of things that got J. R. Davis. broken with rough handling in unloading; some castings got knocked about. 30Sept., 1884. What part of the car did they belong to? I cannot tell you just now; I can tell you all that was broken if you wish a statement of it, but I think that is very unimportant.

2643. Mr. Wright.] Is any portion of the wood-work of these cars in frame when it comes here? Some portion of it is. 2644. Are the mortices and tenons cut? Some of the mortices are made, and some of the tenons are .2645. Is any of the wood planed up? Yes, there is some planed, and some that we have to plane. 2646. What you call the side posts;—are they planed up and tenoned ready for use—the posts that support the side of the car? Yes, they are squared and tenoned.

2647. The axles are forged entirely when imported? Yes; I did not see them shipped.

2648. As far as your knowledge goes they are made in America? Yes; I understand they are made there.

2649. The iron-work of the car, the steel springs, and the truss-rods, and all that, are made in America? Yes, I should say so; that is my impression.

2650. What is your definition of the term manufacture? Manufacture is to build and put up, I consider.

2651. If you were manufacturing a wheeled vehicle here for me, what would be your interpretation of that? I should say it was putting it together for you, no matter where I got the material; if I had the material I would make it myself. 2652. If you were to contract to make me a car here, what would you understand by that? I would 2653. Would you prepare all the wood-work here? That would not come under the head of what you say. 2654. Will you describe what you call making it here? I consider it would be building it here. 2655. What process would you go about to make it? I would hire men and put them on to the work and complete it for you. 2656. From the raw material? Yes, if I could not do better. 2657. Mr. Poole.] Did you receive any request from Mr. Carson Woods to attend this Committee? No. 2658. How did you know you were wanted here? I got a summons to come here; I think Mr. Stephen Jones signed it. Mr. William Henry Burgess called in and examined:-Mr. W. H. 2659. Chairman.] What is your occupation? I am a carpenter and truck-builder. Burgess. 2660. By whom are you now employed? By Mr. Batchelder, for Carson Woods & Co. 30 Sept., 1884. 2662. What are you employed upon? Building dump-cars, the Americans call them. 2663. At so much a-piece? Yes. 2664. How much are you getting? £5 each. 2665. Have you been getting that all along? 2666. Are you a mechanic? Yes. Yes, I was the first that started at it: I and three others. 2667. Where were you employed previously? At T. Wearne's; at Moyes & Donald's at Newcastle; and at Glassen's. I have worked on all general rolling stock, going on ten years, except first and second class 2668. As a carpenter? As a carpenter and truck-builder. 2669. Have you anything to do with the iron-work? I am putting the iron-work in.
2670. I mean with regard to manufacturing the iron-work? No, that is not in my line; but still I know a bit of iron when I see it. 2671. What is the size of the timber on this car? The timber of the sole-bars and the head-stocks is what is called 5-inch stuff— $12\frac{1}{2}$ by $4\frac{3}{4}$ inches; the stringers are longitudinal— $8\frac{3}{4}$ by $4\frac{3}{4}$. 2672. Have you examined the way in which the buffers are attached to the head-stock? Yes. 2673. Is there any difference between the way they are attached on this car and on the ordinary rolling stock? Yes. 2674. What is the difference? On these cars it is fixed in a far better style; it goes right through, whereas the others are let in with a mortice; these go right through without any mortice. 2675. Is there anything at the back of the buffer to resist the strain? No. 2676. Is there anything on the other rolling stock? Yes, there is a set of iron braces on the ordinary rolling stock; but they are merely to hold the diagonals; as there are no diagonals in the dump-car the stringers go right fore and aft.
2677. What are these diagonals placed there for in ordinary rolling stock? To try and strengthen it; they have no longitudinals going right through; but these longitudinals are stronger, I think.

2678. Mr. Poole. You are putting these trucks together for Carson Woods & Co.? Yes, I am working for them. 2679. Under contract? Yes. 2680. And you get £5 for each car? Yes.
2681. What do you do for that? We fit and put them together, clean out the mortices, and different other things; in fact I have to use all the tools I would use in any other shop. We fit, mortice, saw, plane, and bore.

2682. You take the imported material, wood and iron, and put it together, cleaning out the mortices and easing the shoulders of the tenons, as the case may be; and you put a truck together, and get £5 for it? Yes.

2683. Are there 200 sets of materials imported, sufficient to make 200 trucks? Yes.

2683. Are there 200 sets of materials imported, suncient to make 200 trucks? I es.
2684. You take a set of material of each kind and you put that together to form one truck? Yes.
2685. And for that Carson Woods & Co. pay you £5? Yes.
2686. That comprises the whole of the building done in this country? Yes.
2687. You, as you say, build the car; that is, you take the various pieces of material—timber and iron, chains, wheels, axles, and all the rest—and you put it together and bolt it up, and put the truck on the road for £5? Yes; but we do more work than what you are stating.
2689. What else? There is a lot of boring to do, a lot of sawing, and a lot of planing.
2689. Whatever you do is comprised and paid for in the sum of £5? Yes, £5 a car.
2690.

2690. And there is no other labour of any kind on that car except what you do? Mr. Woods has other. Mr. W. H labourers there is no other habour of any kind on that car except what you do? But. Woods has other labourers there that carry the heavy timbers and such like.

2691. They are not employed in the building of the car? No, we do that for £5.

2692. Mr. Sutherland. Were you not building these cars at first for £4? No, we contracted for twenty-five of them at £5 each; what other men are getting I know nothing about.

2693. There are other men working there? Yes, between thirty and forty.

2694. You have only four in your party? Yes, we work four in our party; we started with four men and a boy, but the boy has not been with us for the last few days.

2695. Were you the first men that were working there putting these cars together? Yes, we built the first.

2695. Were you the first men that were working there putting these cars together? Yes, we built the first. 2696. What you mean by building is simply putting them together and setting them up ready for the road? If I was working in any other shop I would not have more work to do on any car. 2697. Has not the whole of the tenoning been done before they came here? Yes, by machines. 2698. Has not the whole of the mortising been done by machinery? Yes, but we have to fix them just

the same.

2699. Has the whole of the planing been done that is necessary to be done on all that part that is mortised and tenoned? Yes; the same as the head-stocks and sole-bars.

2700. Everything is planed and squared up, mortised, and tenoned, before it comes here? Not every-

thing; the floor is rough from the machine—we have to cut and fit it.

2701. You say it is rough from the machine—the flooring for the bottom of the trucks—and you have to cut and fit it here? Yes, and bore the different holes that are required.

2702. Mr. Wright.] You have had some considerable experience in the manufacture of railway rolling stock for the Government? Yes.

2703. What is your opinion of these cars—the workmanship, as far as strength is concerned? My opinion is that the dumping is an excellent idea.

2704. I am asking your impression of the strength of the material and workmanship of the dump-car, say as against the ordinary rolling stock we have in use? I think the way in which the dump-car is trussed is stronger than anything we have, and the longitudinals running fore and aft are quite as good as the diagonals in the other trucks. They are bolted securely together with three strong bolts underneath.

2705. Mr. Sutherland.] You say these dump-cars are better trussed than ours? Yes, most undoubtedly. 2706. Mr. Wright.] I gather from your answers that in your opinion the dump-cars you are now employed upon are stronger and more durable than the trucks now in use? I would not say that as far as the timber is concerned, but I believe the dump-car has more strength and will carry more weight on account of these trusses.

2707. What kind of wood is used in these dump-cars? American oak and pitch pine. 2708. From your experience is the wood good? The very best—I never saw better.

2709. Are there any attachments about the dump-car that you think weak or likely to break? No; the iron-work is of very good quality; the bolts are particularly good—we have never been able to break a bolt since I have been there, and we have most powerful spanners.

2710. There is no central draw-bar in these cars like we have in our ordinary rolling stock? Yes.

2711. Not a continuous one? No.
2712. Do you consider that with a train of (say) fifteen trucks there is any danger of the head stock being pulled off by the draw-bar? No, it is morally impossible.
2713. Is it physically impossible? It is physically and merally impossible, even if there were forty

2714. I understood you to say that you consider the longitudinal trussing of this car superior to that adopted in our ordinary trucks? Yes, most decidedly. There are four of these truss-rods in the dump-car; in our G car there are only two truss-rods, and they are not actually under the car: 2715. If you were ordering cars for your own use would you take the dump-car or the ordinary cars? I

would take the dump-car in preference to anything you have got.

2716. That is if you were personally concerned you would take these cars in preference to our own? I would indeed.

2717. And that is your opinion as a mechanic, after considerable experience of our stock? Yes; I have been on all sorts of work except first and second class passenger carriages.

2718. You have some knowledge of iron-work, I presume? Yes.

2719. Do you consider the iron-work on these trucks strong enough to do the work proposed for it to do?

Yes; the whole of it is of the very best quality.

2720. Is the iron-work strong enough to bear the strain it is proposed to put on it—to carry 20 tons? I think so. They are 13th I think, all sound, and of a very fine quality of iron; we have never been able to strip a bolt or to break one since I have been there.

2721. Do you consider the frame of the body of the car strong enough to stand a load of 20 tons in general use? Yes, I should think so. Of course I do not profess to be a judge, but I should think they will carry 20 tons; the trusses will carry it and more; in my opinion they will carry it.

2722. Do you know anything about the axles? No, I could not give an opinion about the axles; the

iron appears to be good.

2723. Have you examined the bogies? Yes.
2724. Is the workmanship good—the wood-work? Yes, very good.
2725. What is the wood? American oak.

2726. What is the wood? American oak. 2726. Is the iron-work good? Yes it app. 2727. What is the control of the Yes it appears to be of first-class quality.

2727. What is the general workmanship about the sample car;—do you consider the work good, bad, or indifferent? I think the work is all of good quality.

2728. Is it rough? It is not like what you see in a first-class carriage; first-class work has to be sand-papered and all that; that is not done in these cars.
2729. As to the question of building, what do you mean by the word "build"? To make them—to put

2730. If I asked you to build me a weatherboard house, what would you understand me to mean? I should understand you to mean that I was to erect it—to put it up.

2731. To work the raw material into its place? No, not the raw material. If I am building a house,

and I get my architraves and other material ready prepared, and put them in their places, I am a builder.

Mr. W. H. Burgess.

2732. If I asked you to build me a carriage or a cart here, what would you understand by that? Simply that I should make you a cart—that I should go and buy the materials; naves for instance, I could not

make them; spokes to make the wheels, and so on.
2733. You would not import the cart in frame, would you. I understood you to answer Mr. Sutherland to this effect, that the materials of these dump-cars were imported roughly in frame? Yes.

2734. In these dump-cars I presume that every part is interchangeable—the head-stock, for instance, will do for any car? Yes.

2735. And so in the frames—the parts are interchangeable? Yes.

WEDNESDAY, 1 OCTOBER, 1884.

Present:-

Mr. CHAPMAN, Mr. POOLE,

MR. SUTHERLAND, Mr. WRIGHT.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. John Hough called in and examined:

Mr. J. Hough. 2736. Chairman.] What is your occupation?

2736. Chairman.] What is your occupation? Carriage-builder. 2737. By whom are you employed? By Mr. Carson Woods. I served my time with the London and

1 Oct., 1884.; North-western Railway Company.
2738. What are you doing now? Building cars.
2739. What kind of cars? Dump-cars.

2740. Have you a contract to build them?

2741. What price are you getting? That is a matter of private interest. 2742. The Committee wish to know? We are getting £5 a car.

2743. How long have you been carriage-building? I have been carriage-building for sixteen years. 2744. Where—in this Colony? No, not all the time. I served my time at home.

2745. Were you employed carriage-building before you came to this Colony? Yes, for eleven years. I have been in the Colony five years.

2746. Do I understand that as a carriage-builder you have been employed in the manufacture of rolling-

stock of all descriptions? Yes.

2747. What class of stock have you been engaged on? I have been engaged in building all kinds, from

coal trucks up to a dining-saloon; that includes them all. 2748. Have you noticed any difference between the construction of the body of the dump-car and the construction of our ordinary rolling-stock; the D trucks, for instance, or G trucks? The dump-cars

have no diagonals, the D trucks have.

2749. Do you consider that an improvement? In the dump-car the diagonals are not required.
2750. Why are they not required? Because the inside stringers go from end to end.
2751. How are the buffers attached to the head-stocks? By bolts right through the head-stock to hold the buffers.

2752. Do you think they are strong enough to resist a sharp strain? Certainly, just as strong as the ordinary D truck buffer.

2753. Have you noticed whether there is continuous draw-gear? No, there is not continuous draw-gear on this dump-car. You mean a draw-bar; no there is not a continuous draw-bar. 2754. You are speaking of the cars now being imported? Yes.

2754. You are speaking of the cars now being imported? Yes.

2755. Do you not consider it would be an improvement if there was a continuous draw-bar? No, I do not see that it would. You have no continuous draw-bar on the D trucks.

2756. What weight do they carry? From 5 to 7 tons.

2757. What weight do they day to the day of the cars of the continuous draw-bar on the D trucks.

2757. What weight do these dump-cars carry? I have never been told exactly what weight they are intended to carry, but I understand it is from 20 to 25 tons.

2758. Do you think the extra weight makes any difference to the safety of the draw-gear? depends upon the brakeman.

2759. What is the size of the timber of the head-stock? $12\frac{1}{2}$ inches deep by $4\frac{3}{4}$ inches. Originally they were 5 inches; when they went into the mill they were 5 inches, but when they came out the planing and dressing reduced them to $4\frac{3}{4}$ inches.

2760. What mill? I think it was in America.

2761. Have you examined minutely the way in which the body of the car is attached to the bogic frame?

There is a king-bolt in the centre keyed at both ends.

2762. Do you consider there is any danger of the body of the truck becoming detached from the bogie in a sharp shunt? No, that is impossible; it cannot be done without the bogie being knocked to pieces.

2763. Supposing the king-bolt were to break? Then the body of the truck would not come off.

2764. Would there be any likelihood of its jumping out of the socket? No.

2765. By building do I understand that you are merely putting the cars together? We are doing more

than putting them together.

2766. Most of the material has been imported from America? As far as I know all the material has been imported from America, but we have a lot of work to do on that material to make it fit into its place before we can build the car. We have a lot of tools to use, just the same as in any other shop in the

country.
2767. The £5 you get is supposed to include all the work you refer to now? Yes.
2768. Do the Committee understand that all the material is imported to the Colony, and you make it up here and fit it in some places? Yes, we fit it in some places.

2769. Is not most of the timber imported in such a shape that you can put it in ready prepared? Most

of it is imported ready prepared.

2770. Have you had any experience in iron-work? No, I have not had much experience in iron-work, only when I have had to put it in carriages or anything like that.

2771.

Mr. J. Fletcher.

1 Oct., 1884.

2771. Have you had practical experience that will enable you to give a definite opinion as regards the Mr. J. Hough. I have had experience of bolts and nuts and the like of that, but as regards castings 1 Oct., 1884. quality of the iron? and heavy iron-work I have had none.

2772. Mr. Poole.] You have been carriage-building at Hudson Brothers? Yes. 2773. Did you make trucks and waggons under contract? Yes.

2774. Did Hudson Brothers find you all the timber, the forgings, the castings, and all ready to be put into

place? Yes.

2775. And having these materials furnished to you you put them together so as to form a truck? Yes.

2776. And that is exactly what you are doing now? Yes, exactly.

2777. With the exception of easing a few pieces of timber together here and there, and sawing a board here and there—easing the timbers where the hinges and other iron-work is fitted—with these exceptions

it is all prepared to your hand? No, it is not prepared to our hand with those exceptions.

2778. Will you explain to the Committee what is not prepared? We have a lot of holes to bore — 2779: To receive the iron-work? To receive the iron-work; and we have all the floor-boards to cut; we have to manufacture our own ends of the trucks and bore out the holes for that.

2780. But taking a connected view of the whole subject, the whole of the labour necessary to, as you say, build the trucks, is comprised and paid for in the sum of £5? Yes, that is what we receive to commence and finish a truck.

2781. You have had considerable experience as a carpenter? No. 2782. What then? A carriage-builder.

2783. You have had considerable experience as a carriage-builder;—have you given any attention to the

qualities of the various kinds of wood? Yes.

2784. What in your opinion is the durability of the timber used in these dump-cars—the American 2784. What in your opinion is the aurability of the similar ascallant and the same with the timber that you used to put together for truck purposes at Hudson Brothers;—will it last longer or shorter, in your opinion, under the same kind of treatment? I should like a sample

truck from Hudson Brothers to compare it by.
2785. You have been building there for years? You must remember these are different-sized trucks

The head-stocks are.

altogether; the timbers put into Hudson Brothers' trucks could not be put into these.

2786. Take the head-stocks and stringers;—are they of American oak? 2787. What are the stringers? Pitch pine.

2788. Have you had any experience of pitch pine? Yes.
2789. How long will it last;—will it last as long as Oregon pine? I am hardly prepared to answer that

question.
2790. When it gets dry does it not get very short in the grain? It just depends upon what part of the tree it is cut from. Pitch pine and Oregon pine are two of the best timbers you can get for cars of this length, and one will last just as long as the other, because they are both of the same nature of wood. 2791. You think, then, that pitch pine, taking it all in all, can be compared favourably with Oregon for durability and elasticity? Yes.

Mr. James Fletcher called in and examined:-

2792. Chairman.] What is your occupation? Carriage builder.
2793. By whom are you employed? By Carson Woods & Co.
2794. What work are you doing for Carson Woods? Making dump-waggons.

2795. How long have you been engaged in the manufacture of rolling stock? Sixteen years. 2796. Where? In England; and four years in this Colony.

2797. Where have you been employed in this Colony? I was eight months in Victoria and four years at Hudson Brothers.

2798. Have you got a contract to make these dump-cars in the Colony? Yes.
2799. What price are you getting for them? £5 each.
2800. Does that include all the work in connection with putting them together? Making them complete.
2801. Are all the materials imported? No, not all the materials.
2802. What materials are not imported? Screws and bolts.

2803. What else? Nails.

2804. What else? Some of the timber.

2805.What timber? Flooring

2806. What do you think would be the value of the screws, bolts, nuts, nails, and timber not imported, per truck? About £3. 2807. Is all the other material imported except these? I cannot tell where it comes from.

2808. Have you reason to believe it is imported, or have you reason to believe it is made in the Colony? There is some made in the Colony, that I know. 2809. What is made in the Colony? Bolts.

2810. Anything in addition to what you have already stated? The floor plates are all made in the Colony, and the hooks for the levers.

2811. How is the buffer attached to the head-stock? It is bolted on.
2812. Is it attached in a different way from the way it is attached to our ordinary rolling stock? Yes, it is different from the D trucks for instance.

2813. What is the difference? The heads are let into the D trucks; these are solid.

2814. Is there anything to resist the blow in the D trucks that is not in the dump-car? I do not think there is.

2815. Are there not diagonals in the D trucks? Yes. 2816. Are there any in the dump-car? No. 2817. What kind of timber is used in the dump-car?

American oak and pitch pine.

2818. Have you had experience regarding the durability of American timber compared with our Colonial timber? I have had experience of American timber at home; American oak is used in England and in France for waggons and rolling stock generally, 2819. Do you think it is as durable as our Colonial wood? Yes, I think so.

2820. Mr. Poole.] Do they use pitch pine in England on the under frames of carriages? Yes. 1043— \dot{M}

J. Fletcher.

2821. In what position? Longitudinal sole-bars.

2822. In the same position as you are using the pitch pine stringers here? Yes, in some of the same positions.

2823. For what kind of rolling stock do they use it? Under carriages and waggons.

2824. What kind of waggons?

2825. Mineral trucks? Yes.

2826. What weight do these trucks carry—the English rolling stock, where they use pitch pine stringers? From 10 to 15 tons.

2827. Are they dumping-cars? No.

2828. Speaking of material that is not imported, you mentioned screws, bolts, and nails;—are these made at the Atlas Works, where you are putting new carriages together? The bolts are made at the Atlas Works, and the screws and nails are bought.

2829. What bolts are being made at the Atlas Works? Bolts 14 inches long for the bogies.

2830. What part of the bogie? To go through where the lap is on to take the link for the dumping.
2831. For the stud? Yes.
2832. That holds the cast-iron plate on to the bogie frame? It is a stud sticking out that is bolted right through the truck.

2833. What is the diameter of the bolt used? Three quarters of an inch.

2834. And with the exception of these trifling matters all the rest of the material is ready to your hand? No.

2835. What is not? We have the ends to make, holes to bore, the sills to cut out for the levers, mortices to clean out and make, and the tenons to make and ease.

2836. All this putting together of the cars, and all the slight alterations you have to make in easing the pieces together are covered by the sum of £5, as the price of each car? Yes.
2837. Mr. Wright.] Did you come here under engagement to work for anybody in the Colony? No, I came out through a letter coming to me.
2838. Who was the letter from? Mr. Chambers.

2838. Who was the letter from? Mr. Chambers. 2839. Who is Mr. Chambers? He used to be foreman at Hudson Brothers.

2840. Did he ask you to come out to work for Hudson Brothers?

2841. Your experience is English previous to coming here? 2842. Have you seen the dump-cars? Yes.

2843. Are you engaged working at them now? Yes.
2344. Will you kindly look at that plan;—do you consider that framing as strong as the framing used in our own rolling stock in this Colony? Yes.
2845. Do you consider it stronger? I consider the head-stock is stronger.

2846. Do you consider it as a whole as strong as our ordinary rolling stock? Yes.
2847. Do you think there is any danger of the head-stock being pulled off—suppose there were a train of twenty of these trucks, the first truck would have to bear the weight of the whole number—do you think there would be any danger of the head-stock being pulled off? No, the four tension rods will be sufficiently strong to prevent any danger of the head-stock being drawn off.

2848. Is that the way the buffers are fixed upon the head-stock, as shown on that drawing? Yes. 2849. Do you think, from your knowledge of railway rolling stock, that there is any danger of that head-stock being broken by rough shunting? No.

2850. In our Colonial rolling stock we have diagonal struts? Yes.

2851. Do you think diagonal struts add very much to the strength of the cars? I do not think so, because there is a lot cut away which makes the timber very weak. 2852. So that there is increase of weight without adding much to the strength? Yes.

2853. And you think these head-stocks are sufficiently strong, without angle pieces, to stand ordinary work? Yes.

2854. Have you had any experience of American timbers? Yes.
2855. What are these dump-cars made of? Pitch pine and oak.
2856. What material is used in England for similar purposes? Oak and pitch-pine.

2857. So that the frame of this car is made of exactly the same material as what they make English rolling stock of? Yes.

2858. Do you think, from your general knowledge of railway rolling-stock, that these cars are sufficiently strong to carry the weight marked upon them—40,000 lbs.? Yes.

2859. Do you think the cars are sufficiently strong to carry that weight under all the circumstances of our traffic, shunting and running and everything else? Yes, I consider they are strong to carry it. 2860. Did you notice the way the bogies are constructed? Yes. 2861. Do you think they are strong enough for the work? Yes, they are very good bogies, I think. 2862. This bogie is much more simple in design than English bogies? Yes. 2863. Do you think there is much difference between the weight of this bogie and the bogies under our ordinary rolling stock? This would be a lighter one.

2864. Then I understand that you, a mechanic of sixteen years standing, express an opinion that this car is strong enough to do all the work it is proposed to do? Yes.

2865. Mr. Chapman.] Do you know anything of our railway traffic? I have travelled from here to Melbourne.

2866. Mr. Poole.] You say you consider the head-stock of the dump-car stronger than the head-stock in use on our ordinary rolling stock? Yes.

2867. What weight do the cars you are contrasting it with carry? I am contrasting it with the D truck. 2868. How much does the D truck carry? 7 tons. 2869. And this car about twenty. Do you think, looking at the weight it is to carry, this is a stronger headstock? Yes, it is stronger built.

2870. I mean compared with the weight the cars have to carry. This has to carry 20 tons, and the D truck, you say, 7 tons—I think generally they are marked at 6? Some 6, some 6½, and some 7 tons. 2871. Is this three times as strong a head-stock as that in use on the D trucks? I consider this head-This has to carry 20 tons, and the D stock will pull three times as much the way it is built.

2872. What is the size of the head-stock on the D trucks? 10 inches by 4.

2873. What is the size of this head-stock? $12\frac{1}{2}$ inches by $4\frac{3}{4}$.

2874. So that the cross sectional area of the head-stock of the D truck is 40 inches, and of this one about 56 inches—that is an increase of 16 inches in the cross section. You think that makes this head-stock stronger in relation to the weight it has to carry than the head-stock on our D truck? Yes; this is not cut away the same as the head-stock of the D truck is; the head-stock of the D truck is cut away by a diagonal, and these bolts are let in; the four tension rods I consider help the draw-gear.

Mr. 1 Oct., 1884.

Mr. C. Paul,

1 Oct., 1884.

2875. You answered Mr. Wright that you considered the head-stock on this car stronger than the head-stock on the D truck—I asked you did you consider the difference in the weight this car has to do with, compared with the weight carried by the D truck? Yes.

2876. What I want to call your attention to is the difference in the weight the two trucks have to carry —that this truck has to carry 20 tons and to stand all the thrust of shunting consequent on that weight. Do you consider this head-stock is stronger proportionately than the head-stock in use on our D truck that only has to carry 7 tons? I consider this head-stock is sufficient to carry the weight.

2877. I ask if you intend the Committee to understand that you give your answer deliberately in relation to the weight this truck has to carry compared with the weight the D truck has to carry? I understood Mr. Wright to ask me the difference between the two head-stocks, and I say I think that is a stronger

head-stock than the head-stock of the D truck.

2878. On the English railways are there any trucks built to carry 20 tons? Yes. 2879. What kind? Long trucks.

2880. Are they double-bogie trucks? 2881. Do you know our G trucks here? Yes.

2882. Are they framed and put together similar to our G trucks? Yes.

2883. The G truck we have here is very similar to the trucks you have alluded to as carrying 20 tons on English railways? Yes, to some of them.

2884. You say the bogie-frame in the dump-car is much simpler than the bogie-frame in use here—In what way is it simpler? The big iron plate that goes all round the G truck is not on this, and where this carries the brake it is a deal simpler than on the G truck.

2885. And you consider that on our G trucks there is unnecessary weight without any benefit to their strength and durability? Yes, it only carries the brake.

2886. Mr. Wright.] Pursuing Mr. Poole's question about this head-stock, do you consider the head-stock

in use on our ordinary rolling stock bigger than it need be? It is the ordinary size.

2887. Do you think a smaller head-stock would answer the same purpose? No, I do not think so.

2888. These long trucks you speak of, are they built of the same material as this truck is built of? Yes.

2889. And about the same size of material? Pretty near; the head-stock and the outside frame are about the same.

2890. Are our Colonial trucks of any sort as strongly built as this—have they got these four truss-rods?

2891. What truss-rods have they? The G truck has a truss-rod on outside but not to end of truck.
2892. Supposing a longitudinal frame were put on to this truck, and a longitudinal frame were put on the

2892. Supposing a longitudinal frame were put on to this truck, and a longitudinal frame were put on the G truck, which would you think would be the first to sever apart longitudinally? The G. 2893. Why do you think that? The longitudinals are in one length in this—in the G truck they are not. 2894. And the G truck would come in two, while this would remain intact? Yes. 2895. Mr. Poole.] The application of the power is very different on the G truck from what it is on this, is it not, owing to the difference in the draw-gear? The G truck has a longitudinal draw-bar. 2896. And that means continuous draw-gear right through the truck? Still this has one too. 2897. The whole strain is thrown on to these stringers by this draw-gear, and on our trucks it is transmitted right through the central draw-bar? Yes.

2898. But in this case the whole pull of the engine is thrown on to these stringers? No, on to the trussrods and the springs at the bars.

Mr. Charles Paul called in and examined:-

2899. Chairman.] What is your position? I am Railway Station-master at Darling Harbour. 2900. Were you present at a trial of a dump-car some time ago? Yes, on one occasion, some Yes, on one occasion, some consider-

able time ago.

2901. Will you favour the Committee with your opinion upon its adaptability for the purpose, after having seen it tried? I had instructions to load it for trial; getting nothing definite we loaded it with long billet-wood, which I consider was not fit for dumping; it might have done well enough for hauling, but downing it with the sides on with long billet wood. I do not consider was a fair test at all. When it but dumping it with the sides on with long billet-wood I do not consider was a fair test at all. was dumped the wood caught in the sides, and only a portion of it went out. Another thing was, that there was no elevated road to dump it on, and therefore I did not consider it a fair trial.

2902. Were you present at any other test? That was the only test that day; there was another test

some time after.

some time after.

2903. Did you see it? I did not see it turned out, but I was on the ground soon after. They could not dump it all out in one place, because the road was not elevated. There is no doubt at all in my mind that if there had been sufficient space it would have come out right enough.

2904. What took place at the first test you were at? That was with the wood.

2905. How many billets came out? I should not like to say how many; a number of them fell out. We put nearly three trucks of wood into it, and all the top wood went right off, but, being long wood, nearly all the rest got jammed in between the doors and the top rail.

2906. What weight fell off? We put about 14 tons on it, and, speaking as near as I can, I should think from 3 to 4 tons fell off; all the top part of the load went off, and some fell through the doors.

from 3 to 4 tons fell off; all the top part of the load went off, and some fell through the doors.

2907. How did you unload the balance? We loaded it up into other trucks again. Through the wood getting jammed between the door and the ground, through the door being fastened, it was difficult to get it out.

2908. In the test you were present at with ashes --? I was not present at the time it was done;

I was there just after; I saw the ashes that had been dumped.

2909. Were you asked for an opinion as to the suitability of this truck for our lines? No. I admit that at the time when it did not dump the wood out, in general conversation I said that with the sides on it would be useless for that kind of work, because the wood could not get out. 2910.

1 Oct., 1884

Mr. C. Paul. 2910. You have had a good deal of experience at Darling Harbour with the wood traffic? Yes.

2911. Do you think it possible to dump wood, billet-wood, &c., on the road as at present laid down at Darling Harbour, without raising them? It could be dumped, but the sides of the car would have to be left off

2912. Supposing the sides to be left off, do you think it could be satisfactorily dumped then? It could be done, but it would have to be done in two places, which would take up the length of two cars; that would take up too much space, but if the roads were elevated we could use them properly. No doubt that would cost the Department a great deal of money.*

2913. Are not the consignees supposed to unload billet-wood? They are allowed twelve hours to do it; but it does not suit the Department to let it remain so long in the trucks—to keep the trucks going we have very often to unload it ourselves.

2914. Do you think it would be a convenience to consignees to have such large consignments of wood—20 tons in one truck? They could not get 20 tons into them.
2915. Supposing they could? As far as my experience goes such large loads would not be suitable for

many of them; for large buyers they would.

2916. Speaking generally of the class of buyers at Darling Harbour every morning, do you not think it would create a monopoly in the hands of a few if the Department insisted on carrying such large loads? It might do; I would not like to express an opinion.

2917. Is all the wood sold by auction at Darling Harbour? Not all of it.
2918. The principal part of it? The principal part of it is.
2919. Mr. Wright.] From what you saw of the dump-car, are you under the impression that it could be used satisfactorily for our traffic? Do you mean for ordinary traffic?
2920. For any special purpose or for ordinary traffic? I certainly think we could use it the same as our

ordinary trucks.

2921. Mr. Chapman.] Without dumping? Yes; there is a great deal of traffic at the present time that it would be suitable for; I wish we had them in use now—we are in want of trucks.

2922. Mr. Wright.] In loading and unloading firewood does it matter whether you have a door on the

truck or not? Not if we were using it as an ordinary truck.
2923. If it were used as an ordinary truck the wood would all have to be pitched out by hand as it is now? Yes.

2924. I understand you that if these sides were fixed it would do very satisfactorily for loading and unloading wood? Yes, the same as our present cars without dumping.
2925. What other classes of traffic would the dump-car be suitable for with the dumping? It would be first rate for the gravel traffic from Emu Plains, which is very heavy, about 4,000 tons a month. We use a good deal of gravel ourselves for making up the Redfern and Eveleigh yards, and it would answer very well to dump that but not many private records who had to cart it away would care to have it dumped well to dump that, but not many private people who had to cart it away would care to have it dumped,

because they would have to shovel it up off the ground.
2926. Nearly all the gravel thrown into the Redfern yard, I think, is thrown on to the ground? Yes, they

could dump it all out there; they could dump half and move the train along and dump the other half.

2927. If you had 200 of these cars in use would they facilitate the traffic? Yes, for that class of traffic, because they carry such a lot. For instance, our D truck will carry 6 tons, and in these we could put 20 tons. Of course that would be a saving of trucks and would give us more yard room, as well as be a great saving in running dead weight over the lines. Then there is the coal traffic; I certainly think these cars would be a great advantage in the coal traffic. We have about 400 tons a trock from Newcostle and in the busy time of the year it is a very serious matter to provide trucks. tons a week from Newcastle, and in the busy time of the year it is a very serious matter to provide trucks for this traffic. If we had these dump-cars in use we could put 24 tons in each of them to go to Redfern, besides the coal we send to all the different branch lines.

2928. Chairman.] Would you use them fixed or dumping? Either way.
2929. Unless you had an elevated road you could not dump them? I stated that we could dump them on the level sidings by dumping half in one place and then moving the cars and dumping the rest.

2930. Mr. Wright.] If you had a raised road you could use these cars to very great advantage? Yes, most decidedly. The want of a raised road is the difficulty. As I said, the place where the car was tested was not a suitable one.

2931. If these dump-cars were used, for instance, in carrying coal from Lithgow, would they, in your opinion, be satisfactory for use to take goods back up the country? Yes, because they are equal to our G trucks for general use. I think they would be very useful for general mercantile traffic—tea, sugar, and so on.

2932. Is it not a fact that, owing to all our present rolling stock having to be unloaded by hand, we require a much larger number of trucks than we would otherwise want; if we could dump out coal, gravel, and other matters of that kind, could we not do with less rolling stock than we have now? at all our suburban stations, if there were suitable places for unloading, one man could do as much as four or five throwing the stuff out by hand; at such stations as Newtown, Ashfield, Petersham, if we had raised roads, one man could do as much as four at the very least, or perhaps half a dozen; and it would be a great saving of rolling stock, and also a saving in time.

2933. Have you noticed the springs in use in the dump-car? Yes.

2934. I suppose you have also noticed the springs in use in our own trucks? Yes.

2935. Has there been any damage done to the springs of our stock in shunting? Yes, there always has been a good deal.

:2936. Do you think the springs under the dump-car are liable to the same damage? I do not think so; I saw one loaded with 24 tons, and it made only half an inch impression.

2937. Do you think the dump-car springs are better for load-carrying springs than those in use on our stock? Yes, they are not so liable to be broken.

2938. And they are much lighter, are they not? Yes; for the weight they carry I never saw any spring like it; it is far lighter than the spring on our G truck.
2939. Do you think the porters and persons employed about the railways would have any difficulty in dumping these cars? No; I have been trying them myself a bit; I have not dumped them with a load, but I should think there would be no difficulty in any one dumping them, as far as my judgment goes.

^{*} NOTE (on revision):—I am not aware of having said anything about the cost. † Revised:—6 tons and 6 tons 10 cwt.

Mr. C. Paul.

1 Oct., 1884.

2940. In sending out coal what trucks do you use now? We use D trucks to go to the mountains.

2941. What weight do they carry? They are not allowed to take more than 6 tons.

2942. What is the weight of the truck itself? They run 4 tons 19 cwt., 4 tons 15 cwt., 4 tons 16 cwt. 2943. And they are loaded with 6 tons? Yes.

2944. Do you know the weight of the dump-car? Yes. I would like to mention that some of the old D trucks are only 4 tons 10 cwt.

2945. Then we may say they run from 4 tons 10 cwt. to 4 tons 16 cwt? There are some only 4 tons 4 cwt., but not many of them. The new ones run 4 tons 15 cwt.
2946. And they are loaded with 6 tons? They are not all limited to that; some carry 6 tons, some 6 tons

10 cwt., and some 7 tons.
2947. What is the weight of the dump-car? About 9 tons 10 cwt.
2948. What does it carry? It is marked for 40,000 lbs. on the side.

2949. Do you think the dump-cars will carry 20 tons of coal?

2950. So that practically one dump-car will carry as much as three average D trucks? Yes.
2951. And will weigh considerably less than three D trucks? Yes.
2952. Of course the same remark will apply to gravel? They will carry more than that. The dump-car will carry the same number of bales of wool as the G truck.

2953. Do you think the adoption of these dump-cars would save much time at Darling Harbour? Certainly, because they will carry so much more than the ordinary trucks.

2954. Two of them do not occupy more space on the line than three D trucks? About three and a

quarter.
2955. And the two dump-cars would carry 40 tons, against 18 or 19 tons in the three D trucks? Yes, $19\frac{1}{2}$ tons.

2956. Two dump-cars will be the length of three D trucks and a quarter, and they will carry 40 tons

against (say) 20? Yes.

2957. You have stated that at the time the dump-car was tested with wood you condemned it? Yes, because there was a good deal of talk about it at the time, and when it did not turn the wood out as we thought it would I thought it was a mistake; but at the same time I knew it was not a fair trial, because it was not likely to send it out with the centre bar at the top; as it was constructed it was not a fair trial, and it was on level ground.

2958. Having condemned it at that time, why do you recommend it now? For general traffic I could not condemn it; in reality it is like one of our G trucks, so that I would have to condemn them too if I condemned this. For general traffic I could not condemn them; and as to the dumping I have since had time to look into and study the matter. I could see at the very commencement that if we had elevated roads it would make a great difference.

2959. Do I understand you to say that you approve of these cars for special traffic for coal, shale, gravel, and so on? Yes, and for ordinary traffic they are equal to our G trucks; I do not see any objections at all. 2960. The dump-car has the advantage of being lighter than the G truck, and carrying a bigger load? Yes, the G trucks run about 12 tons in weight—some a little over.

2961. And the dump-car is also marked to carry a larger load than the G truck? Yes, the G truck only carries 15 tons.

2962. Do you consider, from your knowledge of railway rolling stock and your past experience, that the dump-car is strong enough to carry the weight it is made to carry, 40,000 lbs.? I took very particular care in examining the wood-work and these long bars and the truss rods; the body of that truck I consider is strong enough to carry 24 tons; I have seen one loaded with 24 tons of iron, and it made very little impression on it. The wood is very strong, and the four truss rods go right through, with large washers and bolts. Our G truck has only two truss rods. The joists, I suppose they call them, in the dump-car are very thick and deep, so that the truck is really very strong, while the top work is light, but quite

strong enough in use.

2963. Then you think, as far as your knowledge goes, that these dump-cars are quite strong enough for the purpose for which they were designed? Yes.

the purpose for which they were designed? Yes. 2964. Will you kindly look at this sketch—that shows the framing of this truck; this is where the buffers are fixed;—do you consider that head-stock strong enough to resist the shock of shunting—that being $12\frac{1}{2}$ inches deep by $4\frac{3}{4}$ inches. You have had large experience of shunting at Darling Harbour, where there is more shunting than in any other yard in the Colony;—do you think there is any danger of that piece of wood being broken in any ordinary shunting? Not in any ordinary shunting, because there is such a short space between the supports. The space does not appear to me to be so wide on the car as is shown hore.

2965. At all events, having seen the dump-car, and having had large experience of shunting, you consider that head-stock strong enough to stand any ordinary shunting? Yes, ordinary shunting.

2966. Any shunting it is liable to be subjected to? Yes, I should think so. Of course there may be

rough knocking about, but for any ordinary shunting I should think that is strong enough. 2967. Mr. Poole.] You say you have 4,000 tons of gravel a month from Emu Plains? Yes, sometimes a little over, sometimes under; and we have about 3,000 tons of shale, sometimes about 2,000. 2968. You think the dump-cars are quite equal to the G trucks for ordinary traffic? Yes. 2969. What do you charge usually for loading and unloading? Wheat, and that kind of traffic, 1s. a ton,

and wood is.

2970. Do you conceive that for ordinary traffic purposes these cars are useful, seeing that the gates are top-hung;—are they as useful to load and unload as our ordinary trucks? With that exception, for miscellaneous traffic, and for shale, coal, and that kind of thing, they are.

2971. I am not speaking about unbreakable freight, but breakable freight—unbreakable, we will assume can be dumped out, but breakable freight, that you have to handle to load or unload it from your dock or cart on to the floor of the truck, you would have to hoist it over the gates? The gates are easily undone; there is no fastening in the bottom; you have only to undo the bolts.

2972. To take the gate away altogether? Yes, take it down; there is nothing to prevent that. In our G trucks there are four doors, and when you want to undo them you have to

G trucks there are four doors, and when you want to undo them you have to

2973. You can take the doors of these dump-cars off as quick as you can let down all the doors of the G

2974. And in that way you could utilize them for ordinary traffic? Certainly.

Mr.C. Paul. 2975. What is the weight of our new G truck? The last ones out are 11 tons 19 cwt. 2 qrs., and 12 tons; there are some over that. 1 Oct., 1884. 2976. And they carry how much? 15 tons.

2977. So that there is much greater tare in these trucks in relation to weight carried than in the dump- Υ es. cars?

2978. And so far as the facility for loading and unloading is concerned the dump-car will be in no way at a disadvantage for ordinary service? No, only with that little exception about the doors, and they could be easily taken down.

2979. Your experience of rolling stock is chiefly confined to Darling Harbour? , At Darling Harbour

and Redfern I have had twenty years' experience.

2980. Have you noticed the draw-gear of the dump-cars? Yes.

2981. Do you consider it equal in efficiency and non-liability to accident to that in use on our other rolling stock? I am not an engineer, and would not like to give an opinion about that.

2982. Mr. Chapman.] Do I understand you that it requires considerable alteration to make these dumpcars available for ordinary traffic? No, only just the doors.

2983. For instance, if you want to roll in sheets of lead or large stones? Heavy articles are always lifted by cranes; anything over what men can handle. We need only take the doors down, and the bolts are movable for that purpose.

2984. Will you not have to refit the doors the other way? No; only take it off. 2985. And leave it off? No; when the load is on the truck it can be put on again.

2986. Can you use the dumping at all to advantage unless you have elevated roads? We could use it for ballast for filling up purposes; such work as we are doing a lot of down there now; so much stuff could be thrown down in one place and so much in another; now the navvies have to throw it out of the trucks with shovels; if they had these cars they could dump a portion in one place and a portion in another.
2987. Have you not 200 ballast trucks now that are not being used? Not that I am aware of. We have

only a few ballast trucks.

2988. Mr. Sutherland.] Are there not a lot of them standing idle at Eveleigh? Are you speaking of the

trucks with patent couplings?

2989. Mr. Chapman.] What are these trucks that are fitted with the Cowdery-Thomas couplers? They are D trucks; there is only the difference in the coupling.

2990. What are they used for? We have been using a great number of them for wood. We used to run thirty-five of them, I think it was, for the wood traffic, and then the Ballasting Department got some

2991. Are the dump-cars of any service to you for dumping without elevated roads? Yes; as I said before, you could do it by moving the truck along—throwing out half and then moving along to deposit the other half.

2992. Would you not have occasion to send men with shovels to clear the rails? Not if you dump it in two places; if you dump the whole load in one place, on a level, you would have to do so.
2993. Then unless you have elevated roads the dump-cars would not be a success? Not without moving

the car along, that is for dumping purposes.

2994. Mr. Wright.] Is it not a fact that the bulk of your ballasting for what may be called the home circuit is carried in the ordinary A and D trucks? Yes, principally D trucks.
2995. These trucks are not provided with any drop hatches in the centre? I think there are only about half a dozen on the railway with a hole in the middle.
2996. So that all the ballast has to be shovelled in and shovelled out?

2997. They have to fill it by hand in either case? Yes.

2998. And they have to discharge it by hand by shovelling it out now? Yes.
2999. Whereas the dump-car would discharge it without shovelling? Yes.
3000. Mr. Sutherland.] Have you measured the length of these cars? Yes; it is 28 feet inside for

carrying.
3001. What is the length they stand on the rail? 31 feet to a few inches, from buffer to buffer.
3002. What is the length of the D truck measured in the same way? The D truck is 15 feet long inside; 3003. You have weighed these trucks? No, I have not weighed the dump-car.
3004. You gave us the exact weight? Yes, from what is painted on the side of them.

3005. Are you running the trucks fitted with the patent couplings for the ordinary traffic? Not all of

them; some of them.

3006. You said you were running a great number of them for wood and for other purposes? Yes, there

but not lately: they have been using them on the ballast trains were a good many of them run for wood, but not lately; they have been using them on the ballast trains and for locomotive coal and coal for Newtown, bricks for the bricklayers, and stone brought by water from Newcastle for the sidings. We have not used many of them for wood lately.

3007. Is there any reason why you are not using them for wood. They are lying idle in the yard. Is there any reason why you are not using them for all or any purposes you require trucks for? I do not know the reason why they are not using them all. I think a good many of them are loaded with stuff out there, and some are marked off for repairs

there, and some are marked off for repairs.

3008. They have been standing there for months and getting no repairs? I know we have not got any at our station that are not in use; in fact we load them every week for locomotive coal, and whenever we

our station that are not in use; in fact we load them every week for locomotive coal, and whenever we have any stone to go to the sidings we use them.

3009. We have it in evidence that there is no rolling-stock allowed to go on the railway without the authority of the Locomotive Engineer; has the Traffic Department ever received any authority from the Locomotive Engineer to use the trucks with the patent coupling? I could not say.

3010. Do you use any without that authority? I have used them, but I could not say whether the authority was given. I know they have been used.

3011. Are you sending ballast from Darling Harbour to Blacktown in them? Yes; I saw some of the patent coupler trucks being loaded with ballast this morning.

3012. For Blacktown? Yes, taking metal from Darling Harbour. They have been taking it away for these six months; they are reballasting the suburban line.

these six months; they are reballasting the suburban line.

Mr. A. Clark. 2 Oct., 1884.

THURSDAY, 2 OCTOBER, 1884.

Present:—

Mr. G. CAMPBELL, Mr. CHAPMAN,

Mr. POOLE Mr. WRIGHT,

Mr. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Alexander Clark called in and examined:

3013. Chairman.] What is your occupation? Car-building. 3014. By whom are you employed? By Mr. Carson Woods. 3015. How long have you been in his employ? For about four weeks. 3016. What work are you engaged in? I am building dump-cars. 3017. Are you a mechanic? Yes. 3018. A carpenter? No, a car-builder.

3019. How long have you been engaged in that? I have had fourteen years experience of it. In 1867 I went to the Michigan Car Works.

3020. How long have you been in this Colony? Since the 27th February last.

3021. Then I presume you have had no experience of rolling stock on our Colonial Railways? No, not much. I started to work for Mr. Wearne about two weeks after landing here, to build the combination tram-cars, and I was engaged with him until the six combination tram-cars were finished.

3022. Have you built any D trucks? No; I do not know anything about them at all.
3023. Have you built any freight trucks? I have built a good deal of freight cars. Freight car-work was the work I was mostly engaged in in the United States for the Union, Pacific, Michigan, Central, Erie, and North Shore, and all the different lines in America.

3024. Is this dump-car built in the same way as the ordinary freight-cars in use in America? I never saw a dump-car in America.

3025. How long is it since you left the United States? I left in 1879.
3026. You have never seen any of these cars in use? No.
3027. Therefore you are unable to give the Committee any information about their suitability? I can talk as to the suitability of the cars, of course.

talk as to the suitability of the cars, of course.

3028. I mean their suitability for dumping purposes? Yes.

3029. Have you had experience with regard to their dumping? Yes.

3030. Where? Here. I have built about fifteen of them now.

3031. Have you seen any of them fully loaded and dumped? No. I have seen cars in America that opened in the centre, and some that opened in the bottom, with doors, but I never saw these cars.

3032. What are the cars you speak of used for in America? For coal, for dumping over a stage.

3033. These are drop-bottom waggons you are speaking of? Yes.

3034. Are the buffers of these drop-bottom waggons attached in the same way as on the dump-cars? No,

3034. Are the buffers of these drop-bottom waggons attached in the same way as on the dump-cars? No, that is quite a new thing to me; I never saw a buffer till I came here; they are all central draw-bars in America

3035. Mr. Wright.] What is the difference between the truck or bogic under the dump-car and those in general use in America? I do not see any difference.

3036. Are the trucks, as you call them in America, as strong as these bogies? Yes.

3037. Is the general design of the trucks or bogies in America the same as that of the bogies under the dump-cars? Yes.

3038. Are the bogies imported here as good in design, material, and workmanship as those in use in America? I know of none being imported.

America? I know of none being imported.

3039. Those you are working on, I mean? Yes, they are equal in every respect.

3040. Equal in strength and everything to those in common use in America? Yes, they are.

3041. Do you think these bogies are sufficiently strong to carry the weight of the car and 20 tons of loading besides. The cars are calculated to carry 40,000 fbs.? I expect they are. I do not know anything about that, or about their springs, but they tell me they have loaded 40 tons on a car.

3042. Chairman.] Do you mean this dump-car? Yes, they told me so.

3043. Mr. Wright.] Is the framing and timber of the dump-cars of the general size in ordinary use in America? Yes.

3044. Do you think the wood employed is as large in its different parts as for the common rolling stock in America? Yes, even larger; the dump-cars have 5-inch sills; there we only put 4 inches.

3045. Did you ever know in America cars that would carry 20 tons—any freight-cars—I am not speaking

of dump-cars? The weight of the Erie and North Shore car is from 18 to 20,000 lbs., I think, and it is supposed to carry double its own weight.

3046. Did you know of your own knowledge any cars in use in America which carried anything like the weight that this dump-car carries—twenty American tons, 40,000 lbs.? Yes.

3047. Are they in common use there? Yes.
3048. Are they built any stronger or of any heavier material than these dump-cars? No.

3049. You are a mechanic, I presume? Yes.

3050. Do you consider there is any danger of this car being pulled to pieces by the strain—any danger of the head-stock being pulled off? No, I do not see that it can.

3051. Supposing this car was run up a steep incline attached to an engine and with twenty other similar

loaded cars behind it, do you think there would be any danger then to the head-stock? No. 3052. You know that on English railways what are called continuous draw-bars are used? Yes. 3053. Do you think the attachment of continuous draw-bars to these cars would add much to their strength or safety? No.

3054. Can you tell me how the draw-gear is fastened in this car? You mean the link that comes out from the centre?

3055. What it is drawn by? By this and two other little ones that hold the first link the centre one is connected with a spiral spring with a washer and key. 3056. Mr. Poole.] At the back of the spring, I presume? Yes. 3057.

[Mr. A. Clark. 3057. Mr. Wright.] This is a plan of the framing of the truck. (Shown to witness. See separate Appendix 2.) This is the draw-gear; it is fastened, you say, by a spiral spring? Yes, this is the spiral spring; 2 Oct., 1884. a washer comes in here, and there is a little key.

3058. What I want you particularly to answer me about is this: Is this car next the engine, with twenty other loaded cars behind it, in any danger of the head-stock being pulled off or the draw-gear being pulled

off? No.
3059. You notice the position of the buffer? Yes.
3060. Do you think that with the rough usage in ordinary shunting that this car is likely to get—the

same as all other rolling stock gets—there is any danger of the head-stock breaking? No. 3061. This is not a question of haulage, it is a question of back motion. Suppose the engine is driven back to shunt it, do you think this cross-head sufficiently strong to stand any ordinary shock of that kind? Well, of course the space between the stringer and the outside sill is considerable; the buffer comes almost in the centre; but I do not consider there is any danger of the head-stock breaking.

3062. Is the frame of this car any larger or stronger than that of the cars in general use in America? It

is larger and stronger.

3063. It is in fact, as far as the frame is concerned, a model of all American rolling stock? Yes, of cars, as I said. I did not know anything of dump-cars in America.

3064. This frame is exactly the same as that in use in America? Yes, the frame is, only larger sills.

3065. Have you noticed the mechanism by which this car is dumped? Yes.
3066. Do you consider it secure under all circumstances to which rolling stock is liable—going round Yes. sharp curves or up or down steep grades—against self-dumping?

3067. In shunting, for instance, when it gets a hard knock from the engine running back against it, will there be any danger? No, I think not.

3068. There will be no danger of its self-dumping under any circumstances? No. 3069. Do I understand from you that the body of the dump-car and the trucks under it are identical in design and weight of material and workmanship with the rolling stock in use in America? Yes, they are, with some exceptions.

3070. Mr. Poole. You have already informed the Committee that your business is that of a car-builder, but you have had no experience in the management of rolling stock? Not in the Colony; I have had in the United States.

3071. You do not recollect with any degree of certainty what weight the American cars of this pattern carry? No.

3072. You do not know of your own absolute knowledge what weight this car is designed to carry? No. 3073. But in its general outline it is similar to trucks or cars of that class used in America? Yes.

3074. Mr. Wright asked you if you thought the head-stock was sufficiently strong to stand the thrust or the pull, whichever way the engine might be acting upon the car. Supposing there were twenty cars in a train loaded with what they profess to carry, their combined weight would amount to about 400 American tons;—do you consider that head-stock sufficient to stand the dead pull one way, or the thrust the other, with that enormous weight behind it? Yes.

3075. That is your deliberate opinion? Yes.

3076. Have you had any experience of the working of cars designed to carry these large weights on heavy inclines with sharp curves? 3077. None at all? No.

3078. Are you aware that on many of our principal railways the inclines are very steep and the curves exceedingly sharp? Yes.

3079. And taking a connected view of the whole mechanism of the car, do you think it is perfectly safe I know the cars in transit, under the circumstances I have named, on steep inclines and sharp curves? that are built in the United States, and these are just equally the same as them. The curves I know nothing about; it is not my business; but I know the cars I built have gone round the curves in

America; and as this car is the same it must go round the same curves.

3080. You are employed by Carson Woods & Co. in building these cars at Darling Harbour? Yes.

3081. What does the building consist of? We get the trucks, or bogies as you call them here, with the wheels attached; we have a certain amount of work to do on these before we can put the upper timbers on—the stringers or longitudinals; we have then to run them into our truck, and we start and build on that.

3082. Have you to forge all the iron-work and prepare all the timber? I do not know anything at all about the iron-work.

3083. You simply put it together? We build the car with the materials supplied to us.

3084. You can build it in the same way as you can build a house, if somebody finds you the bricks, and somebody else the floors, and somebody else the doors, the windows, and so on—you can put them together?

Yes, then we can build it.
3085. Does the building in the case of these cars consist in selecting from the stock of materials at Darling Harbour—we will not bother whether they are imported or not—the parts necessary to make up the truck, and putting them together? Yes, doing such work as may be necessary to make them complete.

3086. And for that you either occupy so many days or get a certain lump sum of money? Yes.

3087. As an old car-builder in America you know what the wheels used there are, whether iron or steel?

3088. What are they? They are iron.

3089. The wheels under these dump-cars are precisely the same class, are they not? Yes. 3090. Precisely the same kind of wheels as are used under American cars? Yes.

3090. Precisely the same kind of wheels as are used under American cars?
3091. And the axles are the same class, I presume? Yes.
3092. And the general framing throughout is the same? Yes. 3093. As to the peculiar machinery for dumping purposes, you do not care to give any opinion upon its adaptability or otherwise, do you? Yes; of course I have to see that the car dumps properly before I receive any money for it; and before we lay the flavor when the dumps properly.

3094. As far as your judgment goes, do you consider the dumping apparatus quite sufficient for the purpose for which it was designed? Yes, I do.

Mr. J. Nelson. 2 Oct., 1884.

3095. Mr. Wright.] Are wheels of this kind broken frequently in America or not? No, I never saw Mr. A. Clark. them broken. I have had occasion to repair cars of the North Shore Road in America. I took a contract to repair them all as they came in; we were building Erie and North Shore cars all the time. I had a book in which I made a note of all the cars as I built them, and took down the numbers; and all I saw the matter with the wheels were where they were the hards.

the matter with the wheels was where they were worn by the brake.

3096. Mr. Poole.] Worn into a flat? Yes; and that had to be taken off; but I never saw a broken wheel. We have taken these wheels off and broken them up, but I never saw a wheel broken in use.

3097. Mr. Wright.] I presume from that answer that a broken chilled cast-iron wheel is really a rarity in America? It is a great rarity in America for any of these wheels to come in broken.

Mr. John Nelson called in and examined:-

3098. Chairman.] What is your occupation? Railway carriage builder.
3099. Where are you employed? I am employed by Mr. Carson Woods.
3100. Have you had much experience in the Colonies? About eight years.
3101. What have you been principally doing? Rough work; and fine work in the Colonies.
3102. What class of rolling stock? Goods trucks.
3103. Have you made any of our D trucks? No; cattle and sheep trucks, horse-boxes, and brake-vans.
3104. You have not made any what are ordinarily termed freight trucks—D or G trucks? No.
3105. What is the difference in the size of the head-stock on the dump-car and the head-stock on the ordinary rolling stock you have been engaged in? That is a question I cannot answer. I think there ordinary rolling stock you have been engaged in? That is a question I cannot answer. is about an inch difference in the thickness as far as I can remember.

3106. What is the size of the head-stock in the dump-car? 5 inches thick and a foot deep.

3107. Do you know what it is in the D truck? I think it is 4 inches or $4\frac{1}{2}$ by 8; I forget now; I have

3107. Do you know what it is in the D truck? I think it is 4 inches or $4\frac{1}{2}$ by 8; 1 in not a good memory for figures or recollection of sizes.

3108. Mr. Wright.] How long have you been a car-builder? About seventeen years.

3109. In this Colony? Eight years in this Colony.

3110. Where have you worked? In Italy and England.

3111. Are you an Englishman? I am not.

3112. An Australian? I am not.

3113. From what country then? I am an American.
3114. Have you done any work, car-building, in America? Yes.
3115. What kind of work? Passenger cars.

3116. Have you been engaged in the manufacture of freight-cars? No, not in America.
3117. In any part of the world? No, except out here; I have had most of my experience with Mr. Ritchie, at Parramatta; I was with him for seven years.

3118. Are you a mechanic? I am.

3119. What trade? Railway carriage builder.

3120. What part, wood or iron work? The wood work.

3121. You have noticed American rolling stock, I presume? Yes.
3122. Have you noticed any particular difference between American rolling stock and this dump-car—I do not mean with reference to the dumping, but the general outline of the car? In my candid opinion I think these are a grand lot for strength and durability.

3123. Have you noticed any difference between the design of these cars, the size of the material and the material itself, from those in use in America? They are just the same. There are a good many running on different lines there; but there were very few when I left.

3124. I am not speaking of this as a dump-car but as an ordinary freight-car? Yes, they are just about

the same as this.

3125. As far as your memory serves you, is the material of the same size and strength? Yes. 3126. Do you know what is called the big G truck? Yes.

3127. Can you give me the size of the timber used in that? Not from memory.

3128. The head-stock of the dump-car is $12\frac{1}{2}$ by $4\frac{3}{4}$? I believe that is correct.

3129. Is that larger or smaller than the head-stock used in the big G truck? Larger.

3130. This is a plan showing the framing of the dump-car (sketch shown to witness—separate Appendix 2);—do you consider that that framing is as strong as that used in the G truck? I believe it is just as strong,

3131. Will you say why you think it is as strong? In the G truck there are only four stringers; in this

there are six—four centre ones and two outside ones.
3132. Do you notice these four-truss rods;—do you consider that they add much to the strength of the car? Yes, of-course they do.
3133. Are there similar truss-rods under the G? No.

3134. Are there any truss-rods under the G truck? Yes. 3135. Where? Two; one on either side.

3136. Do you know the dimensions of these truss-rods? No; but I think they are about an inch and a

quarter. 3137. Do you know the measurement of the truss-rods on the outside of the big G truck? I think they

3138. And there are only two in that car as against four in the dump-car? Yes.

3139. Do you think the diagonal braces in the big G truck help the strength of the car very much? Yes, a good deal. 3140. There are none in this dump-car? No.

3141. Still you think this car is as strong as the G without them? Yes. 3142. You notice the head-stock, that is $12\frac{1}{2}$ by $4\frac{3}{4}$; the buffer stands on it midway between the outer and one of the centre springs. Is there danger of the head-stock being broken while the car is being shunted? No, not in ordinary use; a collision, of course, is another thing.

3143. Do you think that if one of these dump-cars fixed to an engine, loaded, and had twenty other loaded cars behind it, there is any danger of the head-stock being drawn off? No.

3144. Why? Because the four truss-rods would hold it, if everything else was away from it. 1043--N

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

3145. You know that the rolling stock in use by the Government of New South Wales has a continuous Mr. J. Nelson. draw-bar? Yes. 3146. Do you consider that these four tie-rods are equal to that draw-gear? Yes. 2 Oct., 1884.

3147. Do you consider that this system of coupling, without continuous draw-gear, is as safe as with it?

No. 3148. Can you tell me what is the size of the continuous draw-bar used in the railway rolling stock in New South Wales—what diameter? I think it is 2 inches; I will not be sure about the size of the iron, because I never measured it.

3149. Is it round or flat? Partly round and partly square. 3150. Have you noticed the mechanism of the dump? Yes Yes.

3151. Do you think there is any danger of that becoming self-acting in transit—of the car dumping itself while in motion? No, I do not see that it is possible.

3152. Or would there be any danger of its becoming self-acting in shunting, in the event of its getting a

sudden and severe blow? No. 3153. From your knowledge of car-building, do you think the framing of that dumping car is sufficiently strong to carry 20 tons in ordinary traffic? I do not think so; it would carry from 10 to 15 tons, but I would not say 20; I would not like to put 20 tons on every one of them; I think it would be putting too much on it, as far as my knowledge goes.

3154. Do you know anything of the freight traffic of America? Not much—I only worked for Pullman

3155. Have you ever seen any freight-cars there as big as these? Yes. 3156. Were they of the same general design as these? Yes, something like our G.

3157. Mr. Poole. They were not dump-cars? No. 3158. Mr. Wright. Have you any knowledge of the weight carried by freight-cars in America as a rule? From 10 tons to 30 or 40 tons.

3159. Did you ever see in America what is called the grain cylinder? Yes. 3160. Have you seen the bogies under that? Yes.

3161. Are the bogies or trucks of the same design as this under these cars? Just the same; there might be a little difference in the rocker.

3162. Are you aware that the usual weight carried by grain trucks in America is 60 tons? 'I do not

know; 40 tons I have seen carried on cars similar to these.

3163. I am speaking now of the bogie portions—I understand you to say that you have seen as much as 40 tons carried on two sets of trucks or bogies? I have.

3164. Mr. Poole.] Would the bogies be the same as these? Yes, all the same, except the rocker.

3165. No stronger? No.

3166. Mr. Wright.] It is not within your knowledge that 60 tons are carried on grain trucks or bogies the same as these? I have read of that.

3167. Do you consider this truck good, fair, workmanship—the car you are building? I do. 3168. Do you consider the material is good? The material is grand.

3169. Is the material used in building these cars of the same class of material as is used in car-building in America.? Yes, just the same

3170. What is the material? White oak and pitch pine.

Yes, carriage-building.

3171. Were you car-building in America? Yes, carriage-building.
3172. Have you any knowledge what rolling stock in England is built of? Yes, I had a year's experience

on the Midland Railway.

3173. What was the material used? The principal part of oak, and part of Baltic timber something like pitch pine.

3174. I understand you that you think this truck safe under all conditions of traffic, with a load up to 15 tons? I do.

3175. Mr. Poole.] You are building these cars at Darling Harbour for Mr. Carson Woods? Yes. 3176. What do you consider building the cars? Putting them together:

3176. What do you consider building the cars? Butting them together:
3177. The bogic frames and all the various parts that form the car are all ready to your hand, are they not? No, not quite, we have a good half day's work in getting the truck ready to put the upper frame on.
3178. Do you build them under contract? Yes.
3179. How long does it take two of you to build a car? It would take two of us about a week, but two could not build a car—they could not lift the timbers; there must be four of us in a party.
3180. The four of you, I suppose, would build two or three cars in a week? Yes.
3181. Chairman. You said you had had some experience in regard to rolling stock on the Midland Railway? Yes.

Railway? Yes.

3182. Do you know the weight the trucks are supposed to carry there? They load about 6 to 8 tons. 3183. Have they trucks to carry any greater quantity? Not that I have seen.

3184. Have you ever examined the freight-trucks running on the Midland line? Yes.
3185. What size of timber is used there—the head-stock, for instance? Something near the same—a foot wide and 4 inches thick—about that.

3186. And yet they do not carry more than from 6 to 8 tons? No. 3187. Do you know the dead weight of the dump-car? No.

3188. Do you know the dead weight of any of the ordinary trucks on the Midland Railway? No. 3189. Mr. Wright.] Were you employed by the Pullman Palace Car Company? Yes, in Italy and in

England. 3190. Had you the firm's interest at your disposal—were you employed to make arrangements for the sale of the cars? No, I was under the orders of the Manager. 3191. You were a workman? Yes, I was foreman.

3192. I presume from that that you were a trusted employé of the firm? Yes.

Mr. S. Cook. 2 Oct., 1884.

Mr. Sydney Cook called in and examined :-

3193. Chairman. What is your occupation? Coach-builder. 3194. By whom are you employed? Mr. Carson Woods. 3195. What doing? Building dump-cars.

3196. Have you had any experience in the manufacture of railway rolling stock? I have had all my time

at it—sixteen years.

3197. What class of rolling stock? The class now running on the New South Wales lines—passenger carriages and goods trucks. I served my time with P. N. Russell & Co.

3198. Where were you engaged before you came into the service of Mr. Carson Woods? With Mr. R. A. Ritchie, at Parramatta and Newcastle.

3199. In what capacity? I was foreman for two and a half years.

3200. You are employed now in building dump-cars for Carson Woods & Co? Yes.

3201. What is your opinion about those cars, as to strength, in comparison with the rolling stock we have in use here? Of course they are not framed the same as we frame them on this line; we have diagonals, and they have longitudinals running straight through, and four truss rods with 3 feet 6 inches from centre to centre of the truss rods, four of them within that; then there is the drawhook in the centre. do not see myself how anything could give way.

3202. Do you consider them as strong as the rolling stock we have? I do. 3203. Is the timber as heavy in size? It is heavier; the stringers are heavier, and the sole-bars and head-stocks are heavier.

3204. Have you worked any of the white oak of which the head-stocks are composed? No, I have not to my knowledge.

3205. Then you cannot form an opinion as to its quality and strength? By the look of the timber, and from what I know by working over there, I think it is very good timber; I never worked any of it to my knowledge before working it over there, but I believe it to be first-class timber.

3206. Mr. Wright. Do you think the dump-cars you are now building are strong enough to carry a load of 20 tons over our lines? Yes, I do, if they are well looked after; if the truss-rods are allowed to get loose of course there may be an accident.

Are they as strong, in your opinion, as the large G truck? I do not think they are any stronger. 3208. The dump-car is marked to carry 20 tons, and the large G truck to carry 15 tons;—do you think the dump-cars are strong enough to carry 20 tons? I think they are.

3209. Then I suppose you consider the large G strong enough to carry more than 15 tons? I do.

3210. There are no diagonal braces in these dump-cars? No.

3211. Do you consider that in running without a continuous draw-bar there is any danger of the head-stock being drawn off: supposing there were fifteen or twenty of these trucks loaded behind an engine, do you think there would be any danger of the head-stock of the first one being pulled off? Not unless these truss-rods gave.

3212. Do you think there is any danger of that? I do not think there is—not with the quality of iron in these truss-rods. The quality of the iron in these truss-rods is so good that with a diameter of 11 inch

I like them better than our own at $1\frac{1}{2}$ inch.

3213. I understand you to say there is no danger of the head-stock being pulled off? No. From what I have seen of coal trucks at Newcastle they are all done the same way, and they get more knocking about than the G trucks.

3214. Is there any danger of the head-stock breaking? No, I do not think it.
3215. Do you think the design of the framing of the dump-car is as good as the design our rolling stock is framed on, or is it better? I do not think it is better; I think the centre part is better, but you could

not put diagonals into these dump-cars.

3216. I am speaking of it as it is. Do you think it is as good, or better, or worse than the design of our rolling stock? I do not think it is worse, and I do not think it is much better.

3217. You have noticed the way the doors are hung in the dump-car; -what would be the cost of altering these doors to hang from the bottom instead of the top-to hang the same as on our own cars? I could

not give you an answer to that.
3218. What do you think it would cost, roughly speaking? I do not think it would exceed £5 for each truck,

Mr. Jonathan A. Murray called in and examined:—

3219. Chairman.] What is your occupation? Car-builder.

3220. By whom are you employed? Mr. Carson Woods. 3221. What doing? On the dump-cars.

3221. What today? On the dump-cars.
3222. How long have you been in the Colony? Five years.
3223. Where have you been employed? A year and a half at Mr. Bray's, at Newtown; a year at Mr. Wearne's, at the Glebe; a year at Newcastle, and a year and a half at Hudson Brothers.
3224. Have you had any experience in building rolling stock, such as D and G trucks? No—almost all

passenger and tram-cars.

3225. Have you had any experience of freight trucks? Hardly any; I have worked on a few; my trade is the building of railway passenger cars.

3226. Do we understand that you are unable to give us any practical information regarding freight trucks? I have a pretty good idea of what they should be; where there are passenger cars building,

Just a small amount on freight cars.

3227. Have you had any personal experience of them? Just a small amount on 3228. Mr. Poole.] Have you had any America experience in building cars? America; I worked six years at it in Boston—that was where I learnt my trade. Yes, it is my home-

3229. The employment you are now in is practically your first experience of freight-car building? No, I built a couple at Newcastle.

3230. What kind of cars were they? Cattle waggons.

3231. Mr. Sutherland. Are you in partnership with any one in building these dump-cars? My partner, Mr. Sydney Cook, was here this morning. He and I are partners over there in building some of these cars.

Mr. A. Murray. 2 Oct., 1884.

Mr. 3232. How many of you are in partnership? Only two—Cook and I. J. A. Murray 3233. How many different parties are there now building dump-cars? A good many; four, I believe. 3234. Four different parties building or putting together the cars? Yes. 2 Oct., 1884. 3235. Putting them together—that is what you mean by building them? Hardly.
3236. What do you mean then by building them? Putting up any article we call building.
3237. Is it not putting them together that you mean? There is a good deal of other work to do—boring bolt-holes and sawing, and all these matters. 3238. Are the bolt-holes not all bored? No. 3239. Mr. Poole.] A great many of them? Yes, a great many of them, but not all. 3240. Mr. Sutherland.] Has not the whole framing of the car been fitted and the holes bored in America? They have been fitted together, but not put up in America. 3241. What do I understand that you mean by building;—put your own meaning on it. What is your own definition of building a car? All car work is always morticed by a machine; the mechanic has to clear out the mortices and put it together. out the mortices and put it together. 3242. I want to know what is your definition of building a car; —you say clearing out the mortices? And putting it up; that is what we call building it; putting it up; it is all in a heap on the ground. 3243. You cut the flooring to suit the framing, after you have it screwed together, do you not? Yes. 3244. I want your definition of what you call building a car? We call it car-building, what we are doing over there.

3245. Then, if I understand you, you mean by the term car-building putting the various pieces together, screwing them up, and fixing the car ready for use? Yes; but all these holes have not been bored in 3246. I am not asking you about the holes, but your definition of the word building? Erecting anything I would call building.
3247. Is not putting together and building the same thing with you? -3248. Mr. Poole.] Mr. Sutherland wants you to tell him what it is you consider to be car-building?—
3249. Mr. Sutherland.] I shall ask you the question again, and I shall have an answer before you leave here in some way or other, or the Chairman must protect me. I am here to ask you a question, and you are not to say whether you will answer it or not. I know you can answer it if you like. The question I will be not not got a definite appropriate in what do you mean by car-building:—do you put to you, and that I have not got a definite answer to is, what do you mean by car-building;—do you mean putting the various pieces of wood together to make a car of? Yes, I call that car-building. Up at Hudson's, where I have been employed, all these articles are morticed by their machinery and are brought out to me, and I just put it up; we call that car-building; everything is morticed by machinery.

3250. That is simply putting the materials together after they are morticed, tenoned, and the bolts all made, and the nuts on them. You have to put all that together, and that makes a car—and that is what you mean by building a car? Yes. It is all flat on the ground, and when I erect that and stand it up, I build it; it is not the old style of doing it by hand; the machine prepares all the work.

3251. Mr. Poole.] I will just call your attention to this plan (sketch of framing of dump-car shown to witness, and the various parts pointed out)—Now is it not a fact that the whole of these pieces are cut, tenoned, morticed, the holes bored in them according to a template, and sent out in numbers for you to select from, in order to build a car? They are. 3252. All these pieces are cut as duplications from the template, both here and in America? Yes. 3253. These bogie frames—you get them in sets; the four wheels and two axles in the frame, that is one set; and the same for the other; that is all ready for you? Yes. 3254. And you simply take these pieces and put them together, run the bolts through, and screw them up; all the main parts of the car, even including the dumping arrangement, you get in sets, and you then simply put it together, and after that you cut the flooring? And the ends; there is boring and sawing about the ends and the floors too.

3255. For that you receive, I suppose, a lump sum? Yes, we have a price per car. 3256. Have you any objection to tell the Committee what the price is? £5 per car. 3257. For the building of each car? Yes.

3258. That includes all the labour that is put upon it in the Colony? That is what I put it up for.

Mr. James Graham called in and examined:-Mr. 3259. Chairman.] What is your occupation? Engine-fitter.
J. Graham. 3260. In whose employ? In the employ of Carson Woods & Co., working on the dump-cars here
2 Oct., 1884. 3262. Where have you been employed? I have been employed a good bit with railway contractors; I was employed by Amos Brothers on the extension between Dubbo and Nyngan. 3263. Have you a contract to put these cars together? No, I am working for the last witness; he gives me so much a week to do the iron-work. 3264. Have you had any experience of what are termed freight-cars or goods-trucks? I have had three months' experience in repairing them for Amos & Co.
3265. Have you had any experience in regard to manufacturing railway rolling stock? No, only 3266. You are therefore unable to give the Committee an opinion as to whether the dump-cars would carry 15 or 20 tons? I can form my own opinion. I can find it out by measurement. 3267. Have you measured the cars? I have not. It is an arithmetical question. My work is entirely on the iron-work; I am doing nothing on the wood-work.

3268. What are you doing on the iron-work? Putting in the tie rods, runnings all the bolts down, screwing the bolts up, setting the washers, and so on, It requires four men to build a car, and half the time is taken up in labouring work, pulling things about and lifting them; no mechanical work about that at all.

Mr. J. W.

2 Oct., 1884.

:101

Mr. John William Brierley called in and examined 12 10y fo years well 2853 3269. Chairman.] What is your occupation? Car-building, enoul one suiting the right year woll 2823. 3270. What description of car? I am engaged at present on a shirt the color of car? I am engaged at present on a shirt the color of car? I am engaged at present on a shirt the color of car? I am engaged at present on a shirt the color of car? I am engaged at present on a shirt the color of car and guitting dimplears together? I not since I came here.

3272. Have you been putting dimplears together? I Not since I came here.

3273. You have not put any of the dumplears together in the Colony? I not ment guitting ton it at 1823. 3274. Mr. Poole. You are employed by Mr. Woods' foreman? Yes sun its ban guitting ton it at 1823. 3275. What kind of a sheep-car is it you are employed upon? A double-decked car. A loos of the color of the 3277. Is it a pattern in use in America? So Yes our to game a recovered and some and some into generally used there for sheep? Not it has been lately introduced there; it had not come into general use when I left America. The not come into general use when I left America. The not come into general use when I left America. The not come into general use when I left America. The not come into general use when I left America. The not come into general use when I left America? I landed here on the 6th June by the City of the come in the state of the same of the come in the state of the come in the same come in the s 3280. Is this a patent car? all believe it is not a guidhood to notified the root it is down and the will stand the car it is about all the difference there is between the cars in use here and the car I am at present engaged on. and the car'l am at present engaged on.

3282. Do you know what is the gauge of the wheels? 4 feet 8½ inches.
3283. Is it a double-bogie truck? (Yes. the true true true to the word of the wheels? 4 feet 8½ inches.
3284. Have you any idea what the weight of it will be when completed? I have not.
3285. How many sheep will it carry? About sixty, I think.
3286. Chairman.] Is this car' being put together for the Government? I believe it was sent here as a sample car. sample car. sample car.

3247. Is not putting togeth T act to the Government of the constant in the constant to the Government of the constant of the Government of the Government of the Coole. The constant of the Government of the Coole. The constant of the Government of the 3288. Chairman. In your evidence before the Committee some questions were asked you with respect to the patent for the dump-car, and I find you state here that you have it in town and you could get it if we wish. Have you got it here? No; I can send it in to the Clerk of the Committee. out to me, and I just put it up; we call that car-building; everything illine in the part of the same stnemusch of the state of the sall flat on the ground, and when I erect that and stati it all flat on the ground, and when I erect that and stati it is all flat on the ground, and when I erect that and stati it is all flat on the ground, and when I erect that and stati it is all flat on the ground, and when I erect that and stati it is all flat on the ground, and when I erect that and stati it is all flat on the ground, and when I erect that and stati it is all flat on the ground. yea wean by building a car? Yes—It is all flat on the ground, and when I erect that and starit about starit about 2. Yes. It is all flat on the ground, and when I erect that and starit she be said in the property of the start of the property of the start of the plan (sketch af t.* gainsom worrom-ot, in the start of 3292. Mr. Sutherland.] How many of the witnesses that you gave a list of to the Minister for Works have tendered, morticed, the holes bored in them according to a template, arwond tonioh laussband been examined that you what to there any of those witnesses not yet examined that you wish to have examined that you wish to that the second with the second beautiful to the sec all possible information given to the Committee, although at the same time Hammost anxious to close it, because the inquiry is a great loss to me—a very heavy loss; or und the not committee and Read 3294. Has this Committee refused to hear or take the evidence of any witness that you have suggested for sent his name in to be summoned? I None that I know of the transparent of the refuse of the result of th sowing about the ends and the floors too. 3297. Will you give their names to the clerk ? Yes. At this present moment there are only two more that I can remember—James Kendall and Thomas Jubbanan) and test of northeside year over all 3228. Are they present now? No. 3299 a.We want to give you every fair play? on Candidly, I do not see that I am don my trial at all; I am here just to give information to the Committee as a volunteer.

Mr. James Graham called in and examined .-

TUESDAY, 7-OCTOBÊR, 11884 po vou of stard who will be send of the control of the

H. G. C. Voods, Esq.

2 Oct., 1884

Mr. T. Jubb.

^{*}Note (on revision):—The Right Honorable Lord Loftus granted to me the patent upon the dump-car on the 29th of June, 1883, I presume by the advice of the responsible Law Officer. I will produce this patent—show it only. For any further information I most respectfully refer the Select Committee to the Crown officers who advised its being granted.

Mr. T. Jubb. 3308. Do you contract to build these dump-cars? Xes.

3309. What price are you getting? £5.

3310. Is that for putting them together? Yes.
3311. That is all the work, as far as you know, that is being done on them in the Colony? Yes, as far as I know-that and the painting.

3312. How are the buffers attached to the head-stock? By four belts.
3313. Is there any difference between the way they are attached to the dump-cars and the way they are attached to the D trucks? Yes, a great deal. In the D truck the buffer is much weaker, because there is so much more boring and morticing in them.

3314. In the D truck is there nothing to stand the pressure against them? Nothing further than the

3315. Nothing behind the head-stock? Yes, there is the diagonal. 3316. Is there any diagonal in the dump-car? No.

3316. Is there any diagonal in the dump-car? No.
3317. How far is the buffer from the sole-plate in the D truck? I cannot say; I do not remember.
3318. Is it closer than in the dump-car? Yes.
3319. Does it add much to the strength, being closer? Yes, I should imagine it would.
3320. Do you not think the diagonal behind the buffer is an element of strength? Yes, as far as it is concerned, but the letting in of the tenons weakens the head-stock.
3321. Do you think that with a heavy shout there is any likelihood of the head stock or huffer break. Yes, as far as itself

3321. Do you think that with a heavy shunt there is any likelihood of the head-stock or buffer breaking?

No, I think not; the buffer may break, but not the head-stock.

3322. Do you know anything about the iron-work? As far as I have seen it is very good.
3323. Have you had any experience of iron-work? Nothing further than putting work together such as I have stated.

Mr. Thomas Midelton called in and further examined:-

Mr. T. Midelton. 7 Oct., 1884.

3324. Chairman.] You were requested by the Committee to furnish a return showing the accidents that have occurred in America from the use of chilled cast-iron wheels;—have you that return? Yes, I have it here. This Return (produced and handed in—See Appendix J1) refers to broken wheels; and this (produced and handed in—See Appendix J2) to broken axles. This (newspaper produced) is one of the journals it is culled from—the Railroad Gazette. It is one of the standard mechanical journals of America. These returns are carefully got out from a six months file of this journal—the first six months of 1884. This is a number for 1883. You see the character of the journal—it is as good as an English paper in every respect; and I take it these are official records supplied by the Railway Companies themselves. 3325. You were also asked to produce a comparative table of the weights, cost, and carrying capacity of the various carriages in use or designed for the Government Railways of New South Wales? Yes, this is it. (Handed in. See Appendix J3.) You will find everything you asked for in that paper; that refers to carriages only. refers to carriages only.

refers to carriages only.

3326. Have all these carriages been manufactured in the Colony? All except the Ashbury carriage. This return (handed in—see Appendix J4) refers to waggon stock.

3327. Have you any other plans? Yes; I have plans of the G waggon, my four-wheeled waggon, and my double bogic waggon. The Commissioner gave me permission to bring any plans or documents that might be asked for. I put the question to him and he said, "Yes, you can take anything you have in your possession to give the Committee information." (Plan of new iron platform bogic waggon, No. 855, handed in Secondard Argandin 2)

in. See separate Appendix 3.)
3328. Will you kindly explain the construction of this car, and how you propose to work it, and for what purpose? It is a locomotive coal waggon. It is customary in England to use waggons specially set apart for the Locomotive Department. The London and North-Western Railway Company have 4,000 waggons, which they use exclusively for coal waggons. They have about 50,000 altogether. I have always contended that we should work our own coal trains with our own engines and our own waggons for locomotive purposes. You see it has iron sole-bars; in fact you may call, it an iron waggon throughout. It is intended to carry thirty iron boxes, each 3 feet square and 2 feet 6 inches deep. Each of these boxes holds 10 cwt. of coal, so that the coal is measured and weighed. When these boxes are on this platform they are filled at the mine, and the waggon then contains 15 tons of coal. The coal is never handled at all from the time it leaves the mine till it is put on the (engine) tender, when the boxes are lifted off the said they are niled at the mine, and the waggon then contains 15 tons of coal. The coal is never handled at all from the time it leaves the mine till it is put on the (engine) tender, when the boxes are lifted off the said waggon by means of a crane and swung round, and the coal is tipped over into the tender 10 cwt. at a time. The waggon is not only available for coal but for wool, copper, hay, timber, straw, potatoes in bags, or any stuff that will ride on a platform waggon. This waggon might also be used for taking the ashes away from the locomotive ash-pits; the boxes, after being emptied of coal, might be put into the ash-pit on which the engine stands, and the fireman might rake or wash his ashes out of the ash-pan into the box and the box might be lifted with the crane referred to and put on the waggon or on to a ballast the box, and the box might be lifted with the crane referred to and put on the waggon or on to a ballast waggon which could be attached to the crane; so that the scheme embraces a locomotive coal-waggon and also provides a means for getting rid of the ashes. In the wool season this waggon, of course without the boxes, could be used for carrying wool, and the boxes could be used at a locomotive station. The cost of our present coal stages would have paid for the boxes and they have the adventure of being portable. boxes, could be used for carrying wool, and the boxes could be used at a recommendate of our present coal-stages would have paid for the boxes, and they have the advantage of being portable. 3329. Mr. Sutherland.] How many bales of wool will this waggon carry? Ninety-nine. It has continuous draw-gear of a very strong description, and the usual standard buffer; but the draw-gear is specially enlarged in dimensions, and the bogie is very simple and strong. The wheels are wrought-iron, with seel and they cannot be used at a recommendate of the strong of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the result of the releasing the r enlarged in dimensions, and the bogie is very simple and strong. The wheels are wrought-iron, with steel tires, fastened on a plan of my own so that they cannot come off the wheel if they break, and they cannot turn round if they get slack. The axles are of steel, of a larger and stouter description than hitherto

3330. Chairman.] What is the size of the axle? The axle is $4\frac{1}{4}$ inches in the middle, 8 x 4 inches in the journal, and 5 inches in the boss of the wheel. That is a very stout axle.

3331. What is the difference between the size of the axle in this car and the dump-car? The dump-car is either $3\frac{3}{4}$ inches or $3\frac{5}{8}$ inches in the centre; I have not measured it, therefore I do not know what size

it is in the journal, because the boxes are on and I could not measure it.

3332. Is there any difference in the size of links? No. I have depended wholly on the middle draw-bar. I have put the usual side-chains for safety, but I depend on the enlarged draw-bar, hook, &c.

3333. Is it much stronger than in the dump-car? Very much stronger. The hook on the dump-car is the one usually adopted; I claim this hook as my hook.

3334. Have any orders been given for trucks of this description? I have received the Commissioner's

authority to build these waggons.

Mr. T. Midelton. 3335. How many? I took it to mean that I was to build 250 for coal purposes. The coaling papers referred to in my previous evidence show that. I am only speaking from memory now. There was a 7 Oct., 1884. skeleton drawing of this waggon supplied with the papers to show what I intended.

3336. How long is it since these trucks were approved of? I think last January twelve months; some

time before the dump-car was brought under my notice.

3337. Were these waggons ordered for coaling purposes? I understood the Commissioner's minute to mean that these waggons were to be substituted for the G waggons, or rather for 250 coal waggons that were ordered at that time. I think, if you refer to the papers, you will find a minute to that effect. This (Plan handed in—See Separate Appendix 4) is a four-wheeled waggon for the same purpose; it carries that half the weight 7 tons 10 cent instead of 15 tons, the weight of it is given in the table I have just half the weight, 7 tons 10 cwt., instead of 15 tons; the weight of it is given in the table I have handed in.

3338. Does it show anywhere the description of material? The drawing shows it. It is all iron, except the floor

3339. With iron wheels and steel tires? Yes.
3340. Mr. Poole.] What is the weight of this four-wheeled waggon? The four-wheeled waggon has a little advantage; one is 8 tons 10 cwt. empty, the other is 4 tons 2 cwt.

3341. Your idea, with respect to those waggons, is that they are practically travelling coal staiths? I would hardly say that; I would say they are loaded at the mine and hauled to the locomotive depôt, and when the coal is taken off with the crane it is both weighed and measured at the same time.

3342. In measuring the coal by boxes you ascertain the weight? I measure it in the boxes, and ascertain the weight, because a small weighing-machine is hooked on to the crane. It is weighed and measured

both.

3343. Your idea is that what you lose in the weight of the coal carried, by the use of the boxes you save in the less handling? Yes, most decidedly.

3344. You consider that the Department gains more than the equivalent for the loss of the coal carried? Yes, considerably more.

3345. In having practically no handling? There is no handling to do, either of coal or ashes. I proposed this scheme to the Berrima Coal Company when they were talking about laying their tramway down, in

3346. Mr. Sutherland.] Before you were in the Government service at all? Yes; and instead of getting

weaker on the scheme I have got stronger on it ever since.

3347. Mr. Poole.] I want to call your attention to evidence given by the Commissioner on the 3rd of September. At question 614 the Commissioner says:—"I was aware that Mr. Midelton had some scheme of his own for the coal traffic, depositing the coal on the ground and picking it up by means of a crane and putting on the tender—a scheme which met with the approval of neither Mr. Cowdery nor Mr. Scott (Mr. Midelton's superior officer), and from inquire I made it seemed clear to me that the time Scott (Mr. Midelton's superior officer); and from inquiry I made, it seemed clear to me that the time that would be occupied in such a method of loading the tenders would be altogether too great." That is the Commissioner's answer to a question put by the Chairman. But if I understand you rightly, you are under the impression that the Commissioner approved of the platform waggons, of which you have just submitted a plan? That was what I understand submitted a plan? That was what I understood.

3348. Have any of these waggons been made? Not yet. This was approved when I was Acting Locomotive Engineer. Mr. Scott came back to office just about the time I was going to commence building them, and I have not had the opportunity of building them now. I am only second officer in the Locomo-

tive Department.

3349. You are quite clear that the Commissioner approved of these plans? There is no doubt I think about that; the coal papers show that, as I said on a previous occasion. I am sorry I cannot agree with what the Commissioner says; he must forget what has taken place I think with regard to these matters; I have discussed it with him over and over again, without any written record. Besides, I never proposed

to put the coal on the ground.

3350. It was never any part of your intention to put the coal on the ground, but your idea was to lift it off the platform waggon on to the tender at once? Yes, direct; but I also acknowledge that I said that in the wool season the coal waggons could come in full to the locomotive depôt, and the crane could pick the coal-boxes off and tip it out in a heap on the ground, when there were no tenders ready to receive it, so that the waggons could be used at once for carrying wool, in which case I should have to pick it up off the ground again. But that would only be when we were pressed for waggons.

3351. You could either tip the boxes or let them stand full? Yes, I should leave them full; that would

be the sensible thing to do, and the waggons could go away.

3352. Chairman.] Have you any other papers to lay before the Committee? I do not think there is anything just now. 3353. $Mr.\ Poole.$] I will recall your attention to some answers given by you, on the 17th September, to

questions put by me:—

"1279. Did you then express to the Minister a favourable opinion as to the adaptability of the dump-car to our traffic purposes? I do not remember having done so. I do not think I spoke to the Minister at all until after we left the trial and went round the goods-shed. I do not remember expressing myself in favour of the car to him.

1280. Did you advise the Minister to purchase the cars? Certainly not.

1281. You are quite clear on that point? Yes, I am quite clear. If he had asked my opinion as

to purchasing the cars, I should have said decidedly not to purchase them. How could I do otherwise in the face of a minute like that on the printed papers.

1282. You are quite sure that you never expressed a favourable opinion of the cars to the Minister, or advised him to purchase them? I am quite sure of that, sir."

That is your evidence. Are you still of the same opinion, or do you desire to give the Committee any further explanation? I do. If you remember, when I was here last, your question to me was as you have just read, and ever since then I have been uneasy, thinking it would imply that I had advised the Minister to purchase these dump-cars.

3354. Pardon me, your evidence is quite the contrary? Your question to me led me to think you thought I had advised the Minister to purchase the cars; that is what I have been thinking of ever since; but the

contrary is the case.

104

T. Midelton.

7.Oct., 1884.

3355. You never advised him to do so? Certainly not. If the question had been put to me, I should There is not a man in the Colony who can say I have ever been in favour have said emphatically, No. of the dump-cars.

of the dump-cars.

3356. Did you speak in terms of commendation as to any particular portion of the car? Yes, I was talking to the Commissioner about the first of the G waggons, which came down according to my instructions; I had the G waggon brought down purposely to compare it with the dump-car; I pointed out to the Commissioner the absurd dead weight of the G waggon compared with the lightness of the dump-cars; I give them credit where credit is due; and I think I said something in favour of the bogic and springs, either to the Minister or the Commissioner, I cannot tell which; in favour of the bogic only, nothing else, and it passed off at that time. If he thought I was in favour of the car as a whole, I am sorry for it, but I cannot help it; most emphatically he did not ask me my opinion about it nor did anybody else. I told the Commissioner the disadvantage of the dead weight of the G waggon compared with the light weight of the dump-car, considering their respective carrying capacity.

3357. Having had time to think over the matter, and having had your memory refreshed by your evidence on the 17th September, you are quite clear that beyond expressing a favourable opinion as to the bogic ——? As to the bogic frame; I did not say a word as to the wheels

3358. Beyond that you expressed no favourable opinion of the cars whatever? No; except as to the

3358. Beyond that you expressed no favourable opinion of the cars whatever? No; except as to the lightness of them; I might have said they were a light car; I say that still; but the designers have not succeeded any better than I succeeded myself; on the contrary, my car is a ton lighter than theirs. You saw a letter in the Evening News cracking up the advantage there would be in these cars on account of their lightness. Well, considering my car is a ton lighter, and of iron instead of wood, I think I have the balance of argument in my favour.

3359. You are quite sure that on the occasion you have just referred to, when the Minister for Works, the Commissioner, and others, were present, you never expressed a favourable opinion as to the wheels, the axles, the head-stock, or the general adaptability and durability of the dump-car? No. In conversation with the Commissioner in his office, I think I have a recollection of speaking of the advantage of these cars being light, but not specially referring to any part of it as being of extraordinary elever design, because we could design a similar thing ourselves, or perhaps better. It is not by any means a

new thing to me in any shape or form.

3360. Mr. Sutherland. You have stated in your evidence that the wheels on both these proposed cars of yours are different from the wheels we are now using—the wheels and axles;—will you please describe the difference? The axles are stronger in proportion to their increase of size, and the wheels are lessened somewhat in weight, and the tire is fastened in a way which is my own, to prevent its coming off the wheel if it breaks, and it also prevents its turning round on the wheel if it gets slack; you can cut the tire into six different pieces, and it cannot come off the wheel. There are forty or fifty different schemes for doing that; but I claim that this is as good as any of them. It is approved, and about a thousand wheels of this pattern are coming out for the use of the Department. Mr. Goodchap has approved of it, That was just after he came back from England, and it is about the only thing he and Mr. Scott also. has approved I think.

3361. Mr. Poole.] The ordinary way of fastening the tire on to the body of the wheel is by counter-sunk bolts or rivers? Yes, right through the middle of the tire—a systém which Captain Tyler twenty years

ago told the Railway Companies in England was a barbarous system.

3362. You do not fasten through the wheel? No, mine hooks on to the outside of the wheel; it is a sort of double dovetail. (The witness explained by making a sketch.) The tire can wear from $2\frac{1}{2}$ inches down to 1 inch thick without coming off; it cannot come off; it is an impossibility in fact; the tire can break, but it cannot come off.

3363. Mr. Sutherland.] You say there are a thousand of these wheels on the way out now?. Yes, there are a thousand ordered and expected here now.

are a thousand ordered and expected here now.

364. Mr. Suttor.] Have you patented any of these inventions? I have patented the coaling scheme for locomotives, and I have also patented a bogie; but the Government have the use of them.

365. Mr. Poole.] They do not pay any royalty? No.

366. Mr. Suttor.] Have you patented the waggon? Yes, the coal scheme; I have patented that. It is patented in New South Wales, and applied for in England and America.

367. Before the Commissioner approved of this plan of yours, did you make any arrangements as to what your remuneration should be? I asked if he had any objection to my getting a patent for it; and he said he had no objection. Of course the Government will have the use of it. If he gives me the credit I am satisfied, and will leave the remuneration to him.

368. You submitted the proposed cars to the Commissioner without at the same time making any claim?

3368. You submitted the proposed cars to the Commissioner without at the same time making any claim? I left that to his generosity. I thought that, as a servant of his, he would treat me as a man should be treated. I want to do the best I can for the Government I am employed by, or the Board of Directors, or whoever it may be; it is immaterial to me so long as I am appreciated. 'I have made no claim, and do not intend to; but if the Government think proper to award me something I shall not refuse it. 3369. These boxes are standing on the floor of the waggon? Yes. 3370. Have you any means of keeping them in their places? Yes, a little piece of iron $2\frac{1}{2}$ inches wide goes round the extreme edge; that keeps them from sliding about. The weight in the boxes keeps them

steady on the floor.

3371. What is the weight of this waggon of yours? 8 tons 10 cwt. the double bogie.
3372. And it carries how much? It is all on the table I have handed in. My waggon is a ton lighter than

the dump-car.

3373. Chairman.] You consider it is your duty as an officer of the Government to do the best you can?

Yes; and the duty of the Government is to give me the best remuneration they can.
3374. Mr. Poole.] Your duty is to do the best you can with regard to economy? Yes.
3375. Mr. Sutherland.] You said something about the springs under this proposed waggon of yours being different from the springs under the ordinary rolling stock? I do not think I said anything about the The springs, of course, are stronger on account of the extra weight they have to carry; and they are a different class of springs from what we use now. There is a stronger spring and a stronger axle on the double bogie waggon.
3376. Is it not a fact that in the whole of the rolling stock we are using now it is the weakness of the

Mr.

T. Midelton.

springs that causes the weight they carry to be limited—the D trucks for instance—to the $6\frac{1}{2}$ or 7 tons marked upon them? The carrying capacity of any wgagon or car is in proportion, of course, to the strength of the springs and axle. I should like to see our D waggons made for 10 tons instead of 7. 3377. If you had power to put stronger springs and axles on them you would carry 10 tons on the D waggons you are now using? Certainly.

3378. What would be the difference in the cost of a spring on a waggon—the four sets? Not more than a pound difference in each to really it carry 10 tons.

a pound difference in each to make it carry 10 tons. But we cannot do it unless we strengthen our axles. We could not do it on our present axles; but in the next five years' contract the axles are being made stronger. The waggon will carry more by increasing the strength of the axles and springs.

3379. Chairman.] Do you remember the date of the trial with the billet-wood? No, I cannot remember the date. Mr. Seatt same back about the latter and of Tune 1892 and it must have been within about

the date. Mr. Scott came back about the latter end of June, 1883, and it must have been within about three weeks of that; I think it was within three weeks of his return, as near as I can remember; but surely somebody in the Traffic Department will have some record of it. It was a sort of show day, and we were all requested to attend.

3380. Were you acting Locomotive Engineer at that time? No, Mr. Scott had resumed duties, and was responsible then. The only thing I am responsible for is that first minute, when the design was sent to

me. I gave my opinion before I ever saw the car.
3381. You know Mr. Stanley? Yes.
3382. Did you express an opinion favourable to the dump-car to Mr. Stanley? I might have said it was light, the same as I did at the time you referred to, to the Minister. If Mr. Stanley thought I was in favour of it he misunderstood me. I avoided saying anything at the time about the car as a whole.

3383. I think the Committee will understand this, that when you admit having told various gentlemen that the dump-car was very light in comparison to our rolling-stock, you in no way intended that to be a measure of praise? No, except in that respect; it was a measure of praise as regards the dead weight. But this is the point: what is there in it to show an advantage to the Government in using it. That is the point I want to get at. I have never expressed myself in favour of that.

3384. I suppose you or any other locomotive engineer could design a car, even very much lighter than the dump-car to carry the same weight, but for a short period? Of course we could. There would be no miracle in that. I hope there are as clever men in Australia as in America.

3385. In designing cars for freight you keep in view first the dead weight of the car in relation to its carrying capacity and the life of the car in work? Yes, certainly that is the foundation.

3386. The mere lightness of the car and its first cost is not the sole consideration?

look upon it as if I were working the line myself, not as if I were making cars to sell. I look at it from an administrative point of view.

3387. Does not the problem resolve itself in your mind into this—first cost compared with after maintenance cost? First cost, consistent with strength, durability, and safety.

3388. And cost of maintenance? Most decidedly.

3389. To put it in another way: you keep in view not only the first cost of the car and the work it will do, but the cost per year it will take to maintain the car in reasonable efficiency for the calculated period of its life? Exactly; that is the very ground.

3390. In designing a car you take into consideration whether that car shall, in your opinion, last (say) for

five years, ten years, or fifteen years, with reasonable repair? Certainly.

3391. And the balance of your opinion is that it is better, all those points considered, to expend a reasonably large amount of money on the building of the car, in order to insure its greater durability and less annual cost for maintenance? Certainly, in every respect I agree with that; and it applies not only to cars but to engines and everything else, stations and all; it does not matter what.

3392. Mr. Suttor.] Have you any car now working that will carry more than twice its own weight? No,* the only car I know of is the dump-car, and that is not working; but provision was made before the dump-car was introduced for doing the same thing: if I had remained in office as acting Locomotive

dump-car was introduced for doing the same thing; if I had remained in office as acting Locomotive Engineer, I daresay it would have been accomplished before now. My Redfern carriage is a lighter vehicle than any passenger carriage we had before made; and the dump-car is the lightest freight waggon we have at the present for its carrying capacity.

3393. Mr. Poole.] Looking back over the whole of your evidence with respect to the workmanship, material, general design, and adaptability of the dump-car for our railways, do you desire or have you modified your opinion upon any essential point, from the evidence you have previously given? No; it is exactly the same now as it was eighteen months ago. I am not a man to change my opinion very often. When I put anything down in writing I mean it.

Augustus Morris, Esquire, called in and examined:-

3394. Chairman.] What is your occupation? I am an agent for some American and some English firms. A. Morris,

3395. Have you seen the dump-car? I saw a model which Mr. Scott showed me.
3396. How long since? Some months ago; I could not remember exactly; it must be seven or eight 7 Oct., 1884.

3397. Do you remember expressing an opinion regarding the suitability of the dump-car for our purposes? I expressed no opinion of my own; but I had a private conversation with Mr. Read, of the Traffic Department, and I must say I am astonished to see that any private conversation should be retailed; and Mr. Read did not report the whole of the conversation.

3398. I presume you saw Mr. Read's report in the papers, laid upon the Table of the House? You told me about it, and I saw it just now; since I came into this room I looked it up.

3399. Mr. Read, in the papers recently laid upon the Table of the House, states, "In a conversation I had with Mr. Augustus Morris recently, he informed me that these waggons were not a success in America." Is that correct? What I told him was that a friend of mine who was an American engineer, and had been employed on the Pennsylvania railroad, had said that the dump-cars which they had at one time in use were not a success for coal—they were inconvenient for delivering coal—but that for ordinary freight they were very good. That is what I told Mr. Read.

A. Morris, Esq. 7 Oct., 1884. 3400. Will you point out in what way they were inconvenient for coal? In regard to the dumping. He said he did not care for the style of dumping. Since my friend made that observation to me I have seen him again, and he said he had not at that time seen this dump-car, and that it is a very great improvement upon those that the Pennsylvania railroad abandoned.

3401. Is that gentleman in the City now? He is.

3402. What is his name? Mr. Rhodes. He is a travelling agent for the Baldwin Locomotive Company. 3403. Have you received any orders from the Government for rolling stock from America? Yes; I act with Mr. Rhodes as agent for the Baldwin Locomotive Company; I received an order about six months ago for twenty locomotives.

3404. Did you receive an order for any other stock? Not lately.

3405. Are you acting in conjunction with any person or firm in the City? No, only with Mr. Rhodes, as

the sole agent for the Baldwin Company.

3406. How long have you been so acting? I have been their agent for four or five years.

3407. Sole agent in Sydney? I am their sole agent. All orders have to pass through me; I made that a

condition with the Baldwin people.

3408. What kind of engines have been ordered? Ten are what are called Mogul engines, heavy goods engines, and ten are mixed passenger and goods engines, but so powerful that a single one will be able to

take the express train to Albury instead of two as now.

3409. Were tenders called for? No, no tenders were invited. I got the order through the agent for an English firm coming to me and saying, "Now is your chance; they want these engines within three months and we cannot supply them within eighteen months." We undertook to supply them within three months after receiving the specifications at the works—that is, they were to be delivered f.o.b. at

3410. Is it usual to invite tenders for rolling stock? No; we never get orders for anything unless other people cannot supply them. They only come to us when nobody else can supply their order, and we do them very cheaply.

3411. In the case of the twenty engines you speak of, no tenders were invited from any other American firm? No, because the Department required them to be made in special ways which it would have taken some months longer to get any other firm to do. This order could not have been supplied from England under two years. A large portion of the order will be here in seven months, being now more than a month at sea.

3412. Have you ever brought under the notice of the Government a car known as the Allison freight-

car? Yes.

3413. With what result? They said they did not require them; they did not require any more cars just now. 3414. What was the price of that car? It is a pity you did not send me notice what information you required. I can scarcely give the price from memory. I will add it to my evidence. 3415. Mr. Teece.] You have travelled a good deal in Allican Company? Not more than twolve months.

3416. How long have you been acting as agent for the Allison Company? Not more than twelve months, certainly within twelve months.

3417. Do you think the Allison dump-car is superior to the other? How can I tell you that?

give you a description of all the Allison cars.

3418. Is it the custom in America for persons to manufacture and take out patents for cars and to get other leading firms to do business for them. Is it the custom for people like Allison & Co. to take out patents and get other leading firms to get orders for them? Allison & Co. is the leading firm in the United States in car-building. They make more cars than any other firm in the world.

3419. Do you know that the firm of Cameron & Co. do any business for Allison & Co.? Yes, it was

through Cameron & Co. that I received the agency.

3420. And you have had that agency for twelve months? Yes.
3421. Do you know who was acting for them before you? No one was ever agent for them here before me. I wrote to Cameron & Co. asking them to send me the prices of American coal and freight car. At that time I had Queensland more in view than New South Wales.

3422. You are quite certain Cameron & Co. had no agent here? Cameron & Co. had no agent here; no agent whatever in this matter but myself. I am quite willing to show you their letters to prove that. I am corresponding direct with Allison & Co.

3423. You said that the Government bought some Mogul engines;—what was the price agreed upon for

those engines? I can scarcely say from memory.

3424. Was it £2,000? We only deliver free on board, so that you would have to add freight, &c. You could get that better from the Commissioner.

3425. What firm supplied the Mogul engines? The Baldwin Company is to supply them.

3426. Have you done any other business with the Government on behalf of the Baldwin Company? Yes,

I have supplied them, a good while ago, with Seller's railway turn-tables. 3427. Have you sold any motors to the Government? Yes. 3428. How many? Fifty or sixty.

3429. Say within the last twelve months? Certainly from fifteen to twenty, including the Downes compound motors, which all passed through me, although ordered while Mr. Downe was in America. 3430. How many Downes motors were ordered? Only six. 3431. You have not received any further orders? No. We have offered to supply thirty at a very

moderate price.

3432. Who are the orders sent through from here, or who is the payment made to? My agents here are Towns & Co.; they do all the money business. They are Messrs. R. W. Cameron & Co.'s agents, and the engines come by their ships generally.

3433. Have you ever acted in conjunction with Towns & Company? No, except as agents between me and the Baldwin Company.

3434. They are your agents? Yes.
3435. Mr. Suttor.] They are the medium between you and Cameron & Co.? Yes; but I deal direct with Baldwin's; Towns & Co. are Cameron & Co.'s shipping agents, and everything is shipped through Cameron

3436. Mr. Teece.] Is the money paid through Cameron & Co.? No. 3437. Is it paid through Towns & Co.? Yes. The Baldwin Company draws for 85 or 90 per cent. on

the Agent-General in London, sending of course the account and the insurance policy and all necessary documents.

3438. But all moneys are paid to Towns & Co.? Yes, that is what is receivable in the Colony. 3439. Irrespective of the Mogul engines and the Baldwin motors, have you sold to the Government any 7 Oct., 1884. springs or brakes or couplers? I have never sold any brakes; no brakes whatever.

Esq.

H. G. C.

Woods, Esq.

A. Morris,

3440. Have you ever offered any brakes? No. Springs I have—of course the order was through us—from the Baldwin people. There was a Beale's brake sent here through Cameron & Co., and the Government tried it, and I believe it was not a good thing. None were ever sold to the Government through me. 3441. Did you ever act in the capacity of agent for Carson Woods & Co.? No; I never saw Mr. Woods

till I was introduced to him just now outside this room.

3442. Have you sold any couplings to the Government? No. 3443. Did you ever offer any? No, never. 3444. Do you know the Parry coupler? No; I am only agent for the Baldwin Locomotive Company, Wm. Sellers & Co., and the Edgmoor Iron Co. made wrought-iron turn-tables, but I never sold the Government any. I offered them, but as the Department drew out a specification for turn-tables which only suited English patterns, we never competed, and the consequence is it cost the Government-£80 or £100 more, being the extra cost in setting them; and it takes three men to move an English table round, while the American one only takes one man, or even a boy, a power of lilb. at the end of the lever being sufficient to turn an unloaded table.

3445. Mr. Poole.] Where is the table you are alluding to put down? I do not know where the English

tables are set.

3446. Mr. Teece.] You are quite certain no order has been accepted for any more of the combined motors and cars? Quite certain.

3447. Is your offer accepted? No, it is simply declined, I understand, till they have made some tests or some inquiry. I have offered them thirty.

3448. And none of these agencies were transferred from Towns & Co. to you? No, I was the original

agent, but I act with and often through them. 3449. But all the moneys are paid to Towns & Co.?

3449. But all the moneys are paid to Towns & Co.? Yes.
3450. Towns & Co. are the agents for Cameron & Co.? Yes, and have been for many years.
3451. You are sure they have not acted for the Baldwin Company? Only through me. Their connection with the Baldwin Company is simply through me. with the Baldwin Company is simply through me, I having first obtained the agency.

3452. Have you had any communication with the Department as to Railway bridges? For years I have

been incessantly at the Government with respect to them.

3453. Did you make any suggestion to the Government as to the bridge over the Hawkesbury? Yes, I suggested to the Government that they should call for tenders, with designs, all over the world, showing no favour to any one; and I will say that I know, absolutely know, that my advice will reduce the cost below the estimate at least £250,000. That I guarantee.

3454. Mr. Poole.] And the bridge will last as long? And the bridge will be a better bridge than ever was in the Colony before. I think I might as well say I have also drawn the attention of the Government to the appropriate and of iron winds to incompany advents on of iron winds to incompany advents on of iron winds to incompany advents on of iron winds to incompany advents on of the graph of the appropriate the same and the pr

the enormous advantage of iron viaducts in going through the mountains, instead of having these sharp curves and steep grades; and I have said, and I say now, that on the Illawarra Railway they would have saved £100,000. If you had an American locating engineer he would have saved hundreds of thousands on the Western Line; and you need never have had a Zig Zag at all if you had adopted iron trestle viaducts.

Henry Gilbert Carson Woods, Esquire, called in and further examined :

3455. Chairman.] You were asked to produce certain papers in regard to the patent? Yes, I have them (Papers produced.)

3456. Will you inform the Committee whether any duty has been paid upon any material used in connection with the dump-cars? I do not know 3457. Have you paid any? Not personally. I do not know. 7 Oct., 1884.

3458. From whom can we obtain that information? My managing man attends to all that. 3459. Who is your managing man? Mr. Campbell. 3460. What was the consignment invoiced as? Do you mean the bills of lading? 3461. Yes? I think it was material for the manufacture of dump-cars.

I think it was material for the manufacture of dump-cars.

3462. Mr. Teece.] Have you ever offered to the Government any Perry car-couplers? I sent in a sample

3463. Who acted as agent? I think I acted myself in that case

3464. Did you ever speak to Mr. Augustus Morris about it? No; the first time I have seen Mr. Morris to my knowledge was this morning, here.

3465. Mr. Suttor.] In submitting your price to the Government for these dump-cars I suppose you calculated all details as to what they would cost you? Yes.

3466. Did you take into consideration the Customs duties? No, I did not.*
3467. Were you under the impression, at the time you sent in your estimate, that you would get your

materials admitted free of duty? Yes, I was.

3468. Was that after inquiry? No, I made no inquiry.

3469. You cannot say whether you have paid any Customs duties or not? No; I do not see why we should; but that is not an answer to the question. I never calculated on paying Customs duties.

3470. You calculated on not paying them? I calculated on not paying them.

3471. Have the Government applied to you for any power-of-attorney in regard to the patent for the dump-car?

dump-car? Yes.

3472. Have you furnished it? No. I have not replied to their letter yet. 3473. Do you intend to reply? Certainly.

3474. How many applications have been made to you? One.
3475. Have you got a power-of-attorney in your possession? I have. The Government are only licensee under that patent; I hold the patent still; they will only get a license from me for their own use. That patent is good for the whole Colony still.

Mr.* Here again Mr. Woods made an appeal to the Committee to be permitted to send, for examination on dump-cars, the two aforementioned engineers.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

Mr. George Downe called in and further examined:

G. Downe. 7 Oct., 1884. 3476. Chairman.] What is your position? I am the Superintendent of Tramway Rolling Stock.

3477. How long have you been so engaged? A little over three and a half years. 3478. What was your previous employment? I was in the Existing Lines Branch.

3479. In what capacity? As draftsman.

3480. You designed a motor called the compound motor? Yes.
3481. How long is it since you designed that motor? I commenced to make drawings of it last December

3482. On what date was the drawing approved of? I think somewhere about the first week in February of last year. I think that was the date of their completion.

3483. What was done to give effect to your recommendation? I was sent to America to get a motor made. 3484. Was any price arranged for? No.

3485. Who was that left to? I think it was left to Cameron & Company.

3486. Who are they? They are the agents of the Government in New York. I think they were to

arrange for the payment, but no price was arranged for making the motor.

3487. Cameron & Company are merchants? Yes.

3488. It was left to them to arrange everything as regards price? I do not think there was any arrange-

3489. Was any alteration made in your design by the American authorities? No. I may as well tell you what I did when I went to America. I was instructed by the Government to place myself in correspondence with them and to talk the matter over with them as regards any defects which we found in the motor. 3490. Mr. Poole.] That is, with the Baldwin Company? Yes. I told them that I had worked out a design

which I thought would overcome some of the difficulties we had experienced, but that I was prepared to talk the matter over with them and if they could give me something better than I had brought I was prepared to take it and to say that they had taught me something. We discussed the matter for parts of three days, and eventually they decided to make a motor according to the design which I had brought. That was done.

3491. Chairman.] Were any trials of the motor made? There were.
3492. What kind of trials? We ran the motor for several hundred miles on the Philadelphia and Reading Railway.

3493. Was the trial considered a success? It was considered satisfactory.

3494. Were any alterations made in the motor after it had been brought to the Colony? I think not.

Yes; we have had to make some little 3495. No alterations in the working parts of the machinery? alterations in the machinery. In this as in all other new designs little sore places were sure to crop up. We have had these little difficulties to contend with, but as they have risen we have grappled with them, and we are now, I think, getting pretty nearly to the end of them. 3496. Have any other motors been ordered? I think not.

3497. How many have the Government received altogether? Six.

3498. What did they pay for them? I cannot speak from memory. The cost is given in the Return which

was recently laid on the Table of the House.

3499. Have these motors proved the success which you anticipated that they would prove? I think I may

safely say yes. 3500. How many times during the last six months have they been repaired? Let me explain to you some of the little sore places which we have found, and you will perhaps then understand the matter better: When we were discussing the details a discussion arose between the Baldwin people and myself as to what description of piston valve I should put in. I had designed for rings and they considered that as we were working vertically, solid piston valves would do as well as rings. We did not agree upon that point, but I said, "In order to make a test we will make one side according to your idea, and the other side according to mine." We did so, and on the last day of the trial the rings broke on the one side. I said, "It is not worth my while to remain on this side for another month; you seem to have rather the best of me in this matter; make the other side solid and pack the motor away so that it can catch this mail." "It is not a very important item," I said, "we will make some further tests on the other side." That was done. In making the other solid piston they made it a very slack fit; consequently, when the motor was tried on the road here I did not get the result which I had obtained in America. After some little examination and trial we found that the valves were leaking steam very badly on account of the bad fit. I immediately brought the matter under the notice of the Commissioner and Minister, and by that time the other five motors which I was authorized to obtain had arrived. On another examination we found that they also were fitted badly. I brought the matter under the notice of the Minister, and told him the probable cost of the alteration. He immediately decided that the Baldwin Company should pay the cost. had another piston made and fitted in and it was tried, but it did not give satisfactory results, and I decided to drop back to my original idea of the rings. The motors have since been fitted with rings and they are giving very good results. Another matter which has given us trouble, another sore place, is the plan adopted for giving motion to the valves; it is what is understood as the Joy-motion. Joy has two kinds of motions—one a sliding link, and the other a pin motion. At the time that I designed the motor I knew only of Joy's link-motion, and consequently the link-motion was fitted on the first engine. The last day of the trial Joy's agent came down to go out with us. He then showed me the pin-motion. It is certainly superior. There are less frictional parts about it. It is simpler, easier to make, and easier to repair. After consulting with the Baldwin people I decided to put this pin-motion into the other five motors; but instead of adhering to Joy's design they altered it and made it lighter. We found in practice that they had so weakened the design that it was necessary to make it stronger in order that it might do its work. The result of this has been that we have broken one spindle and have bent some ten or eleven. I happened to have a print of Joy's own design, and I decided to follow it out. The motors have been so altered as to carry out the design in its entirety. The motors on the road with that alteration are not exhibiting any weakness in the parts in which it was apparent before.

3501. Was it a part of the contract that on condition of the motors here giving satisfaction the Government would order (say) twenty more from the Baldwin Company? If I remember the correspondence rightly it was stated that if the motors gave satisfaction here an order would be given for fifteen more. I think fifteen was the balance.

Mr.

G. Downe.

7 Oct., 1884.

3502. At the same price as the others? The price was a matter to be agreed upon.

3503. Was it not possible to carry out this design in the Colony? I think not.

3504. Why? There was not time to do it.

3505. How did you ascertain that there was not time? The position in which we were placed in regard to rolling stock was this: That we wanted an increase of motive power as quickly as we could get it. It was not obtainable from any firm in the Colony; they had not the power to supply it with the necessary speed. No firm, even in England, would have given me this motor in anything like the time—say double the time in which I got it made in America.

3506. But when you went to America you had no proof that the motor when made would be the success which was anticipated? When I went to America I took with me only a general outline, and after discussing the matter with the Baldwin people, and deciding that they could give me nothing better than I

had brought, I had to work out all the details of the design.

3507. Could they not have been worked out in the Colony? Yes; but not in the same time.
3508. How long is it since the first motor was imported? You are losing sight of one fact, and it is this: that there was delay after I arrived in the Colony. For this of course the Baldwin people are not responsible. No firm in England or in America could have turned out the work in the time in which they did.

3509. But it took a certain amount of time for you to go to America, to come back to have the motors fitted, and to have these trials;—are you taking that into consideration? Taking that into consideration no other firm could have turned out the work in anything approaching the time.

3510. Did you ascertain that? I knew the firm, and I knew their capabilities pretty fairly.

3511. Were any other firms in the Colony asked to do the work? I did not see my way clear to recommend it at the time. I did not think they could give us the work in sufficient time.

3512. Is it not usual in ordering rolling stock of this kind to invite tenders? But you must understand

that this was a new design, a departure from anything we had got, and we wanted to get a motor made and tested as quickly as possible. I suggested that after we had obtained sufficient to meet the demands coming upon us we should call for tenders in the Colony.

3513. I noticed a paragraph in one of the papers in which it was stated that one of the motors had been repaired twenty times? The information furnished to the House upon this point is strictly correct.

3514. Where did you obtain this information? From the reports as they occur.

3515. Mr. Poole.] Were you present at all the trials made on the Philadelphia and Reading Railway?

3516. Have you any note as to the days on which the motor was run? I do not think I have.

3517. Was the Superintendent of the line present? Mr. Steevey, the Inspector of the Philadelphia and Reading Railway, was present on behalf of the Railway Company.

3518. At all the trials? Yes.

3519. Are these motors numbered? Yes, from 70 to 75.

3520. I suppose the motor numbered 70 was the first made? Yes.

3521. And the first imported here? Yes.

3522. Are there any motors of this class running in America? There are not; it is my own design.

3523. Then the templates and every separate piece of machinery would have to be made in America? Scarcely, and for this reason—that in designing we brought in as much as we could of anything which they had got made. The cylinders and valves had to be new, but there were many parts in which we worked in some of the templates and other things which they had.

3524. But for every part of which they did not happen to have a copy a pattern had to be made? Yes. 3525. And these patterns and templates are in possession of the Baldwin Company? Yes. 3526. Will not that give them an enormous advantage over any other firm if tenders are called for any more of these motors? It will give them an advantage decidedly.

3527. And our Government has paid for these templates. That would be necessarily included in the cost of the first five or six motors? Well, I should say that they had. Of course some of the parts are from their own designs. They worked in all that they could.

3528. Previous to your appointment as Superintendent of Tramway Rolling Stock had you any locomotive

experience? No, I had not.

3529. What is the peculiar advantage which you claim for the motor which is now known as the Downe's motor? The advantages I claim are these: That we save in the weight of an independent motor by giving adhesive force on to the wheels of the engine from the car and the live loading. I also adopted the compound principle, as it is universally admitted to be economical. - I work the steam twice over, and thus effect a saving of fuel, and the motor is so arranged that it can be worked by one man instead of by two on each shift.

3530. You use the steam in the small cylinder first? Yes.

3531. Does that exhaust into a separate cylinder or direct into what you term the low pressure cylinder? Direct.

3532. Is there not a back pressure on the high pressure cylinder equal to the pressure per square inch on the low pressure cylinder? Of course there is.

3533. You claim for your motor that it saves one man—that is a fireman? Yes.
3534. Does the driver fire continuously? Very little attention is required to firing. The heating capacity of the boiler is increased to effect this.

3535. That is not an answer to my question, which is: Does the driver fire? Very little; he does not fire on the road.

3536. Does he fire at each terminus? There is no occasion to touch the fire after leaving Redfern for Bridge-street until he returns to Redfern. We have stationed an extra man there on each shift to attend to We have had to keep two fuelmen there to attend to the other motors; these men also attended to the two combined motors. Since four combined motors have been put on an extra man on each shift has been necessary. These men do the firing, occasionally also watering and oiling. 3537. How long have these four motors been running? Since yesterday.

3538. Previous to yesterday there were two? Yes. 3539. Running continuously? Continuously since June.

3540. Previous to that? There was one running from the beginning of May.

Mr. G. Downe. 7 Oct., 1884.

3541. It is necessary to have a "V" or a turn-table to turn these motors, is it not? Yes, or a circle, the same as we have at Coogee.

3542. How many men does it take to turn a motor around at Bridge-street? Two; one has been known to

do it; but two can do it easily.

3543. Independent of the driver? Yes; he does not touch it; when the engine comes in the car-cleaners. turn it around.

3544. If you had the whole of the service worked by these motors you would have more turn-tables at Bridgestreet than you have now? Yes, unless we adopted a triangle or a circle.

3545. Is there room for either? We could adopt a circle if the Act of Parliament would allow it. This

system would make the yard much better than it is, as it would avoid shunting to every train.

3546. Is there room there? I think so; we might put down another turn-table.
3547. Is there room for a circle or a triangle? Not in the present yard.

3548. Supposing that these motors were adopted generally, you would require a turn-table, a circle, or a triangle at each terminus? Yes.

3549. In the summons which you received to attend to-day were you requested to bring any drawings of the motors? No.

3550. Chairman. Was not such a request written on the inside of the sheet? I did not notice it.

3551. Mr. Poole. You have a working model of the valve arrangement? Yes.

3552. Is that the only working model which you have of any part of the motor? 3553. Can you bring it here? Yes.

3554. Have you drawings in detail of the whole of the machinery? Yes.

3555. Can you furnish us with those? Yes.

3556. Do you find from your experience of the working of the motors that there is any saving in the cost of repairs compared with that of the Baldwin motors—take the first four that you had out; I think that they were of the class which you call heavy motors? We call them independent motors. I think that I am safe in saying that we do find that there is a saving.

3557. To what extent? I will give you one instance: We find that the side rod brasses of the ordinary

motors require a new set all around once in about every six weeks. 3558. As often as that? Yes; because the wear on them is so heavy. In that time they do something over 3,000 miles of running. One combined motor has done nearly 5,000 miles, another has done something over 4,000, and the others have done between 1,000 and 2,000. The two which have done the greatest amount of mileage are as good now, as far as the side rod brasses are concerned, as they were when they were put on the road.

3559. Are there no other repairs peculiar to these motors—motors from 70 to 75—beyond those to the valves and spindles? Nothing beyond the bending of the valve spindles. I may mention another thing: I was induced to try a metallic packing which in a great many instances is giving very good results, but it did not give satisfaction on these motors, and I have had to replace it with the ordinary glands and packing. 3560. Are we to understand that with the exception of the weaknesses which have been discovered in the valves and spindles and the packing that the new motors require no other kind of repairs? They are far lighter on repairs than the other motors.

3561. They cast very little strain on your repairing department? A much lighter strain than the other motors

3562. When are they repaired? At night, when they are not on the road. Very few repairs are done to them. 3563. The other motors are repaired at night are they not? Yes. The repairs booked to the new motors at night are much lighter than those booked to the others.

You commenced these motors with No. 70? Yes.

3565. Then I presume that you ran motor 71, and that you have kept these two motors running until quite lately; you have not used the whole of the motors? We have had to keep the traffic requirements supplied. Thus when the spindle of one motor was bent or broken we had to put another motor on. 70, 71, 72, 73, and 75. 74 was not started until yesterday. I kept it in until all the alterations were made to the valve gear throughout.

3566. In relation to the amount of work done by them—the number of passengers which they carry—do you find that they are more economical in the consumption of coke than the other motors are? Much more. 3567. What percentage? With all the drawbacks against which we have had to contend—such as leaky valves—I find that since the motors have been running—taking the whole consumption throughout—we have saved about 30 per cent. in fuel. That is more than I calculated we should gain—my estimate was 20

per cent.
3568. How is the fuel supplied to them—by baskets or by weight? By baskets, two of which take a bag The fuel is served out in the same way to the other motors.

3569. Was there not an inquiry in your Department lately with respect to the difference between the amount of coke received and that tallied out? I have to make a return of that every month.

3570. Was there not a discrepancy over a given period? There is always a discrepancy between the drivers' sheets and the quantity received; there is bound to be.

3571. What did it amount to on the last occasion? I could not tell from memory. 3572. Was it 30, 40, 50, 60, or 70 tons? I cannot say from memory. 3573. The fuel is supplied in the same way to all the motors? Yes.

3574. Do you find when the new motors are in steam that they prime at all? They did at first. 3575. Do they do so now? Very rarely. I get no complaints from the drivers to that effect.

3576. Has the cast-iron saddle spanning the boiler on which the two sets of cylinders are bolted been found

strong enough? No, we have strengthened them.
3577. How many have been broken? Three, I think; but we have strengthened the others to make sureof their not breaking.

3578. Are all the repairs to the new motors done at night? The alterations of the valves and valve spindles. have been made in the day-time.

3579. Is there a distinct record kept of the repairs done to these motors and to the other motors? Yes. 3580. Has any complaint reached you of the new motors sticking up on the hill coming up from Belmore

Yes. Park 3581. With one car attached? Yes. 3582.

111

3582. What do you think is the cause of that? Shortness of steam and defective valves. Owing to the G. Downe. blowing of the valves the engines have used considerably more steam.

3583. Would it not arise from priming? Yes, if they did prime; but I have had no complaint of their 7 Oct., 1884. priming recently.

within

3584. Since when? I have had no complaint of priming within the last two months.

.3585. Are the drivers who are working them satisfied with them ? They have made no complaint to me. 3586. What are the names of the drivers? Harris No. 2 and H. Walker on one; Bastian and Cheval on

3587. These are the men who were driving up till yesterday? Yes.
3588. Are they working now? Cheval has had to be relieved on account of sickness.
3589. Who is working in his place? Bullis.

3590. Have any other of the men had to be relieved? No.

3591. Who are driving the new motors put on recently? Harris No. 1 (I forget the name of his mate), and Black and Osborne.

3592. Who is immediately under you—more directly over repairs—at Randwick? Mr. Howe. 3593. Who is under him on the day-shift? Mr. Garforth. 3594. Who is the night foreman? Mr. Allen. 3595. He is over the fitters at night? Yes. 3596. Who is at the Pitt-street yard? Mr. Davey by day, Mr. Brown by night. 3597. Who is immediately over the drivers? Mr. Hondy was the supplier foremen. 3597. Who is immediately over the drivers? Mr. Hendy was the running foreman. 3598. Who occupies the position now? Mr. Albert Brown.

3599. Is that the Brown you mentioned before? No.

3600. I suppose that you would be able to give the Committee a drawing showing the grate space, the water space, the clear room above high water mark for the steam space, the steam capacity, and the consumption of steam per throw of the piston-rods? Yes.

3601. Taking the thing all in all, is it your opinion, after some four or five months' experience, that if the Government adopted this system of motor it would result in a great annual saving to the Department? Yes. 3602. That is your deliberate opinion? Yes.

3602. That is your deliberate opinion?

3603. Can you tell the Committee what the percentage of saving would be as compared with the present motors? For the number running at present from £15,000 to £20,000.

3604. Per annum?

3605. That is your deliberate opinion as to the financial result in saving? Yes.

3606. Coming back to the design;—that, you inform the Committee, is solely your own? Yes. 3607. Prior to making that design how long had you been in the Colony? About nine years.

3608. And of course you were well acquainted with the capabilities of not only the Government workshops but of the workshops of all the Colonial firms who lay themselves out specially to make locomotive machinery? I think I know them pretty well.

3609. Are you aware that locomotives have been built in this Colony? Oh yes.

3610. Where? At the Atlas Works, Vale & Lacy's, and Mort's Dock.

3611. Anywhere else in this Colony? I do not remember.
3612. In the Government workshops? Yes, they have been built in the Government workshops.

3613. And they are constantly making large repairs at the Government workshops? To engines—yes.

3614. What I want to know is, what special reason you had for going to America,—we have pretty good workmen here, I presume? Yes.
3615. And fair machinery? Yes, for a general shop.
3616. And a reasonably large number of motors have been built in the Colony? Engines—yes.

3617. Then I should like to know what were your special reasons for going to America, you being the designer and having all the plans? You must understand that I had only a general plan; the details had to be worked out afterwards.

3618. But you worked out the details? I worked out the details with the draughtsmen employed there. Sometimes four or five men were employed.

3619. Then you felt the necessity of obtaining assistance from the draughtsmen employed in Baldwin's place? Not a necessity to obtain the assistance of those particular men, though there can be no doubt that having men thoroughly used to that kind of work as they are it could be done more rapidly than by men who would do the work as an occasional job.

3620. But you came before the Committee as the inventor of the combined motor and car, and I presume that you had fully considered all the details? Yes.

3621. Well I wish you to inform the Committee what special reasons there could be for you to go to America to have the details worked out when you were thoroughly master of the position here? What you are speaking of and what I have in my mind are two different things. There was no necessity for me to have the Baldwin people to work out the details; I could have worked them out here as well, but the necessity arose in consequence of the shortness of time. We were in want of rolling stock and we had felt for a long time that the Baldwin motor was a very expensive motor and that something more economical was The Government were constructing new lines and we were forced to order Baldwin motors to keep those lines going. It was necessary therefore that the design should be worked out in the shortest possible time, and it was considered that the Baldwin works, with the appliances at their command, could furnish us with a motor made from that design in as short a time as such work could possibly be done.

3622. When did you go to America? Last February 12 months.

3623. And up to within a week or ten days ago you had only two additional motors on the road? Yes.

3624. That is to say that so far as this idea of yours is concerned, the tramway rolling stock has received

the benefit of two motors only of the new class up to within a few days ago? Yes.

3625. Does it not appear to you that assuming the new motors to have all the merits you claim for them, no great harm, even financially, could have resulted from ordering a couple more of the ordinary Baldwin motors until you had thoroughly worked out your design here? While I was away twelve of them were ordered, and they were landed after my return.

3626. In reality, whatever press there was upon the Department to furnish additional motive power owing to the extension of the tramways, it has only had the benefit of two of those new combined motors up to

Mr. G. Downe. 7 Oct., 1884. within ten days ago? Yes, but there is another thing to consider: When I was in America I wrote, giving the particulars required for a table to turn the new motors so that they might be put on the road directly they arrived. After I returned to the Colony there was a delay of six months before the table was ready, although the motor was ready, so that the whole of the delay must not be saddled on the motor.

3627. How many cars have you that are adapted to run with these motors? Seven.

3628. And when was the last combined motor imported;—the last five were imported in one batch, were they not? No, they came in three batches; two by different steamers,—and then one came by a sailing vessel, if I remember rightly.

3629. When did you get the last? The last one came, I think, in May of this year.
3630. And then as well as now you were pressed for locomotive power; you are pressed for locomotive

power now, are you not? Yes.

3631. When had you the seven carriages? I should think that the last was delivered about two months ago. 3632. Then can you explain to the Committee why the whole of the motors have not been running? I have limited the accommodation at Randwick for performing the work of the motors that are running, so that I have been longer on that account in remedying the little sores or defects in the new motors.

3633. That is why the delay has occurred? Yes.

3634. Then it has taken you since May last to overcome these minor matters? Yes.

3635. Owing as you say to the want of machinery and men to perform the necessary work?

3636. Now, I wish to ask you a few questions with respect to the cars themselves. Some of them-Nos. 100 and 101—were the two first cars running, were they not? I think No. 101 was, but I am not quite sure.
3637. Have any of the cars shown signs of deflecting from the horizontal line? Yes.

3638. Whereabouts? Near the junction, between the engine-cab and the sitting capacity.
3639. What is the extent of the deflection? Well, with a load on I suppose it is fully an inch and a half.
3640. But without a load is there any deflection? Yes, slightly.
3641. How do you propose to remedy that? There is no fear of any danger arising from the deflection that is at present shown. That was felt to be a weak part in the car when it was designed, and in order to overcome it I divided the sole-bar into two parts, carrying an iron flitch-plate the whole width of the sole-bar, between the two parts, and extending it back some 4 feet beyond the weak point. The inside one, which forms the hinge of the door, is also a flitch-plate carried back about 4 feet beyond the cab connection.

3642. By a flitch-plate you mean a covering plate, do you not? It is like a flitch-beam in a house between two pieces of wood. There is one of them between the two parts of the sole-bar and another on the inside of the sole-bar, and they are carried about 4 feet beyond that point of connection between the cab part and the passenger part, and secured by bolts through the sole-bar.

3643. But in spite of that protection the cars have deflected? They have deflected a little.

3644. I take it that there is simply a butt joint and that the flitch-plate makes a connection between the two? No; the sole-bar is in one piece right through, and there is a flitch plate between the two parts of the sole-bar carried back for 4 feet. The inner flitch-plate is carried back in the same manner so that the whole thing is in one piece.

3645. Have you detail drawings showing this? Yes. 3646. And you can produce them to the Committee? Yes.

3647. The motor here numbered 70 was the only one under steam in America? Yes.

3648. The only one that you saw under steam there? Yes; they always tried them under steam before they sent them out.

3649. When you came to put the motor together here did you experience any difficulty in getting rid of the condensed water from the cylinder? None that I am aware of.

3650. Provision was made for that in America? Yes, there are always relief cocks.

3651. If they had not relief-cocks they would knock the cylinder end out?

3652. You are confident that they were in when you saw the motors in America?

You had no difficulty in fixing the boilers to the framework? No.

3654. The stude went into the holes ready for the frame? Yes; we eased the holes to allow for expansion. 3655. What workmen have been particularly engaged in the repair of the combined motor? There is one

named Davidson who has been at work on them.

3656. Anyone else? There have been others; but I cannot just now recollect their names.

The foreman you know? Yes.

3658. Have you made any report to the Government with respect to the superiority of this motor over the ordinary Baldwin motor? I have expressed the same opinion as that which I have expressed to the Committee.

3659. Summing up the whole matter, are you of opinion that if the whole service were supplied with this particular class of motor—the Downe's motor—there would be a saving of from £15,000 to £20,000 a year?

3660. Have you taken into consideration in that estimate the extra accommodation and appliances in the shape of turn-tables, circles, or triangles, which would have to be provided at each of the outlying termini? No, I have not taken into consideration the interest. I have not taken these matters into consideration at all, but my own running simply.

3661. Have you not running now Baldwin motors which have been running four months without the slightest repairs? Not one.

3662. Have you any that have been running two or three months? I think there is one which has been running two months.

3663. I include in that reference to repairs the alterations to the side rod-brasses? There have been none on the ordinary motors which have run for two months without repairs.

3664. Are you quite sure of that? I am.

3665. How long has Mr. Howe been with you? He was transferred to the Tramway Branch when I went to America.

3666. Is he a mechanic? Yes.

3667. And he is well used to locomotive machinery? Yes.

3668. He is competent to give an opinion? 3669. Is Mr. Davey a mechanic? Yes.

3669. Is Mr. Davey a mechanic?

3670. And also competent to give an opinion? I do not know that he has looked into the matter. 3671. If you requested it he would do so? I have no doubt he would.

Мr.

3671. If you requested to he would do so? I have no doubt no notice of the Pitt-street yard? He is the mechanic in charge of the Pitt-street yard? Oct., 1884. at night.

D. W.

Campbell.

7 Oct., 1884.

J. Powell,

Esq.

3710.

3673. Mr. Hendy;—is he a mechanic? Yes.

3674. A good man? A fair young man.

3675. How long has he been employed as running foreman? For the last two years and a half.

3676. But he is not running foreman now? No. 3677. What position does he hold? He is temporarily filling the position of officer in charge of the Pittstreet yard in the day.

3678. You say that Albert Brown is a running foreman? Yes.

3679. Is Brown an engine-fitter? Yes. He came from America with the first motors.

3680. He is a fitter—not a mere driver? He is a fitter; I believed he served his time at the Baldwin works.

3681. Mr. Allen—is he not foreman of fitters? Yes.

3682. How long has he held this position? About two years.

3683. And of course you have found him a trustworthy man? Yes.

3684. The trifling repairs which have been found necessary in the combined motors have been effected under his immediate superintendence? Yes. It might facilitate your inquiry if I were to send up the book in which the repairs are entered, containing everything that is done to every engine every night.

3685. Mr. Teece.] What is the difference in cost between the Baldwin and the combined motors? The

Baldwin and the combined motors cost about the same.

3686. What is the cost of the combined motor and car delivered on board a vessel in America? The cost of the car, if I remember rightly, was from £530 to £540. The last five motors have been built at a cost of £1,150 each—that is delivered.

3687. What is the price of the Baldwin motors? It varies according to their class. to over £1,200. 3688. Very few? All the large ones; and the bulk of those we have are of the large class.

3689. How many Baldwin motors have you altogether? About sixty-five I think; I am not quite sure. 3690. How many out of that number are running—that is to say approximately? About forty-five.

3691. You say that only two of the combined motors have been running;—where have the other four been? I explained that the limited accommodation we have prevented me from getting the valves altered and getting them out sooner.

3692. Then none of the four have been running? We have running Nos. 70, 71, 72, 73, and 75. No. 70 has done 4,882 miles; No. 71, 2,311; No. 72, 1,809; No. 73, 4,008; and No. 75, 1,386 miles.

3693. Mr. Poole.] About what mileage per week do the motors run—say to Waterloo and Marrickville, and taking another point of about equal distance, say Waverley? They average from about 70 to 90 miles a We have two which are running from Moore Park to Randwick and Coogee, 120 miles a day.

3694. About 600 miles a week? Yes, or over 2,000 miles a month.
3695. What is the highest rate? 4,882 miles is the highest a combined motor has made.

Daniel William Campbell called in and examined:

3696. Chairman.] You are in the employ of Carson Woods and Company? I am.

3697. Can you inform the Committee whether duty is paid on the timber imported for the dump-cars? No. 3698. Nor on any of the material? It was imported as car material and we passed it as car material.

3699. No duty was paid? No; there was a small duty on nails.

3700. What amount? Between £2 and £3.

3701. There was no duty on the timber; No.

WEDNESDAY, 8 OCTOBER, 1884.

Mr. CHAPMAN, Mr. POOLE,

Present:-MR. SUTHERLAND,

Mr. TEECE,

Mr. WRIGHT.

SYDNEY SMITH, Esq., IN THE CHAIR.

James Powell, Esquire, called in and examined:—

3702. Chairman.] You are Collector of Customs? I am.

3703. Are you aware whether any dressed or undressed timber has been received at Dibbs' Wharf on which no duty has been paid? I am not aware.

3704. Is it usual to charge duty on any dressed or undressed timber arriving at any of these private 8 Oct., 1884. wharves? It is.

3705. What is the duty chargeable on dressed or undressed timber? 2s. on dressed and 1s. on undressed

timber per 100 feet superficial. 3706. Has your attention been directed to the receipt of any dressed or undressed timber consigned to

Carson Woods & Company? No. 3707. Or to Mr. J. C. Dibbs? No. My attention would not be called to it unless there was something special in reference to the parcel.

3708. Whose duty is it to see to the payment of the duty in such a case? The officers connected with the

Department of Customs.

3709. Can you tell the Committee what officer was in charge of that particular wharf? The landing-waiter on the station would be responsible for any dutiable timber landed there. 1043—P

J. Powell, Esq. 8 Oct., 1884.

3710. I may tell you that we have sent for you as we have been informed that the materials for 200 dumpcars have been landed, some at Dibbs' Wharf and some at Darling Harbour, at the old Atlas Company's works, on which no duty has been paid? If the goods were for the Government and entered by the Government they would be admitted free of duty. They could not possibly be entered free by any private

3711. Mr. Poole.] That could only happen when goods are consigned direct to the Government? Or

imported for the use of the Government and entered by the Railway Department.

3712. Would that affect materials imported into the country under contract to supply the Government with certain articles? My instructions generally are that I am to be satisfied that any goods entered free by the Railway Department are consigned to the Government. That is the general instruction under which I have On one occasion, when I found that railway material had been imported and entered free of duty under a declaration that the goods were for the Government, I demurred, and was informed that the contract allowed the admission of the goods free of duty, but until I was so informed I hesitated to admit them and always have done so. As a rule I only take the entries of a Government office—say the Railway Department or the Works Department—with a declaration that they are imported for the use of the Government. 3713. Your attention having been called to the subject will you make inquiry in your Department and inform the Committee who made the declaration and on whose behalf it was made? Yes, I will undertake to do that in half-an-hour. (Witness withdrew; and, being subsequently readmitted, his examination was continued.)

3714. Chairman.] Do you now produce the papers in the case before referred to? I produce the papers of the ship "Earl Granville," from Boston, the Custom-house free entry for 9,555 packages of frames and buffers for car-trucks; also an entry for two cases of car-couplers, free of duty; also an entry for thirty-two kegs of nails, found contained in the frames of the cars, upon which nails duty was paid; they were landed with the frames and buffers, and according to the practice the landing-waiter called for the invoices and examined them, and charged the duty on the nails. They were entered by Carson Woods & Co., by their agent, Mr. L. F. Ebsworth.

3715. Mr. Poole.] These articles are on the free list. We consider them free; we do not regard them as timber either rough or dressed; they have undergone a process of manufacture. A number of other articles are imported in the same way-settees, chairs, waggons, buggies-these are admitted free, as

having been made up. I should add that these goods are valued at £2,000.

8716. Mr. Wright.] That value is merely for statistical purposes? Yes, and is not very reliable.

3717. Chairman.] Can you inform the Committee at what wharf these goods were landed? I cannot say where they were landed; I believe they were landed at the Government Wharf, at the head of Darling Harbour.

3718. Is it not usual to charge wharfage rates on all goods landed? Yes.

3719. Do you know whether any wharfage has been charged? I do not know. That would be a private matter between the importer and the wharf-owner.

Mr. Henry Bryant Howe called in and examined:-

Mr. H. B. Howe.

3720. Chairman.] What is your occupation? I am general foreman of the Tramway Locomotive Works. 3721. Have you been long in that position? Since February, 1883. 3722. Where were you employed previously? In the Railway Locomotive Department:

8 Oct., 1884. 3723. How long altogether have you been in the service of the Government? Over twenty years.

3724. During your term of office as foreman of tramway locomotives I presume you have had opportunities of judging of the merits or otherwise of the combined motors? I have so far.

3725. Will you kindly inform the Committee what is your opinion of the combined motor—that is, whether it is better or equal to the ordinary motors, and in what way you think it is so? It is better in some

respects as to economical working.

3726. In what way is it better? As to consumption of fuel, &c.

3727. Do you find the maintenance of the combined motor costs more than that of the ordinary motor in regard to repairs? For repairs for general wear and tear there has not been sufficient time to demonstrate it

3728. How long is it since the first combined moter ran? I believe it was about the 1st of May of the present year; I am not sure. 3729. How many have you in stock at present? Six engines and seven cars.

8730. How many are in daily use? Four.

3731. There are four running at the present time? Yes, in traffic.

3732. How long have the four been running? The four have been running from the beginning of the week, starting last Monday.

3733. How many were running previous to that? Two for some considerable time.
3734. Why were not the others running before? They were not completed; some slight alterations were being made to them.

3735. Since the four have been in use, during the present week, have you had any breakdowns? No.

One had a slight mishap the other evening through the diaphragm rubber bursting.

3736. In what way do you consider them superior, besides the economical use of fuel, to the ordinary motor? Well, I can say nothing unless it is as to the ultimate development of wear and tear; there might be a saving in that respect. There is a saving of a fireman on them; there is no fireman used on

3737. Have you heard of any complaints from any of your men driving these combined motors? I have not.

3738. Have any of them asked to be removed from the motors? Not to me. I know that driver W. Cheval asked to be removed because he had not been well, and because his father was ill at the same time; he asked to be allowed off.

3739. Did he attribute that to the driving of the motor? Not to me.

3740. You are aware of the terms of the contract with the Baldwin Company for the supply of these engines? I am not.

3741. I presume you are aware that the combined motor was designed by Mr. Downe, of Sydney? Yes. You are acquainted with the various workshops in the Colony, and have had large experience with

regard to machinery? Yes, thirty-two years experience.

Mr. H. B. Howe.

3743. Do you not think it is possible for this design to be worked out in the Colony? It is possible for 8 Oct., 1884. it to be done, but it would take a long time to do it.
3744. How long do you think it would take? There are no appliances and conveniences for doing

anything of that kind here at present.

3745. Have any motors been manufactured in the Colony? Yes, one motor.

3746. Do you think we have workmen here and machinery capable of manufacturing motors? Yes. 3747. Do you think they could make them equally well or better than they are made by the Baldwin Company—more serviceable or otherwise? Quite equal, if not better; better, I think. 3748. In your time you have made locomotive engines? I have.

3749. What is your experience of the merits of American engines and of engines made out here at the workshop under your charge? Our own are superior in workmanship and durability.
3750. What about the cost? They cost more.

3751. Do you think the extra cost is repaid by the durability? I would like to qualify that answer. Those that were built at the Railway workshop, which you allude to, I presume, were built under difficulties. The repairs of general engines had to be conducted at the same time, and very often the work on the new engines had to be laid aside to allow of general repairs being done, consequently making the work more costly.

3752. Are these objections got rid of now? They will be when there is more machinery there; not at

present they could not possibly do it.

3753. Have you any idea how many times the compound motors have been taken into the shop for repairs since they commenced to run? From twelve to fifteen times altogether I should imagine, as near as my memory serves me now.

3754. Mr. Poole.] Can you inform the Committee what were the special difficulties in the way of working out the details of the invention, and why it was necessary to go to America to get these details worked

out? Because they have better facilities for completing the job.

3755. Working out the details of the design? I do not think there were any details of the design worked out there; there might have been some slight alterations in detail, but not altering the original design of the motor.

3756. As far as you are aware the motor known as the Downe motor is the first of the kind? As far as

I am aware it is.

3757. There is nothing in America similar to it? Not that I am aware of.

3758. Necessarily there was no pattern to work to there? No.

3759. All the templates, all the moulds, and other matters would have to be made just as much at the Baldwin works as in Sydney? Yes.

3760. And yet, in view of that, you think these matters could have been accomplished much more rapidly in America than in Sydney? Yes, in large workshops like the Baldwin, because they are laid out specially for that work; they are locomotive builders and nothing else, and they have men always trained from their-boyhood to template making and all this work.

3761. The first motor-I think it is No. 70—that was imported here of this particular class, known

as the combined motor, was put to work about May, was it not? I believe so. 3762. You have had a long practical experience of locomotives of all kinds in this Colony? I have. 3763. Are you aware that it was a very common occurrence for this first motor to fuse the fire-plug? No. 3764. Was no such case brought under your notice? I was on the engine in every case but one when

the lead plug—or the fusible plug—dropped.

3765. How many times did that happen? Twice; not on that particular engine. I could give a reason

how it happened.

3766. Have you noticed or had any complaints made to you of the continual priming of the boilers of these motors? There was some trouble with the first one.
3767. Continually? Not continually. That has been remedied; I remedied it myself by putting an

internal perforator pipe up from the crown.

3768. Is there as much steam space in these boilers as in the boilers of the ordinary motors? Hardly

3769. The cylinders are so arranged as to use the steam twice,—that is, once in what we may term the high-pressure cylinder, and then again in the low-pressure cylinder; but there is an arrangement by which you can use the steam direct in both cylinders? Yes.

3770. That, I presume is to overcome heavy inclines with a heavy load? I am not thoroughly acquainted

with the designer's idea; but I understood that the valve referred to was to be used in case they had to

stop on a hill, and the smaller cylinders were not capable of starting the train again.

3771. From your practical knowledge as a locomotive engineer, will you answer this question: Suppose the motor is coming up the incline from Coogee, would it be possible for the boiler to produce steam enough to work the four cylinders direct from the boiler? No; that was never intended.

3772. It could not be carried out? No, not to work continuously.

3772. It could not be carried out: No, not to work continuously.
3773. Come to another part of the subject: The steam exhausts from the high pressure cylinder direct into the low pressure cylinder? Yes.
3774. Then is it not an absolute fact that whatever pressure to the square inch there is on the low pressure. cylinder, there must be the same corresponding back pressure on the high pressure cylinder? Yes, it stands to reason there must be.

3775. Then, in theory, all the effect you gain is in the difference in the two diameters of the cylinders?

3776. Is it not a fact that, owing to the small steam space and also the small margin of water space over the crown of the flue, there is very great difficulty in either preventing the engine priming, on the one hand, or losing the fire-plug on the other. In order to get more steam does not the driver, with this peculiar description of boiler, run great risk of losing his fire-plug? It did happen at first. The men ever strange to them. The ordinary description of boiler was so simple that a man could hardly make a mistake. The men at first were not accustomed to these boilers, but now, since they have got used to them, it is a long time since a lead plug was dropped.

Mr. H. B. Howe. 8 Oct., 1884. 3777. Have you not had a considerable amount of difficulty with your valves and valve spindles? Yes. 3778. Did that arise from the severe pressure of the valve upon the face? No, there is no face; it is a

circular valve or a piston valve.

3779. You did experience a considerable amount of difficulty, did you not? They were broken and bent. Those are in fact the principal break-downs that have occurred to these engines; any others have been no more than would have occurred to ordinary motors. Most of the twelve or fifteen break-downs that have occurred I attribute to that.

3780. Can you give the Committee any rough idea in pounds what it cost to repair No. 70 motor in this particular respect—the valves and the valve spindles? No. 70 motor has never broken down in that way. 3781. Which one did? 71 and 73; these are the others that have broken down; there is a slight differ-

ence in their design.

3782. Is it a fact that night after night the men on duty at Randwick have been kept principally repairing these defects in the combined motors? No, it is not a fact; there is a man sent to them; there might be one man working every night or every second night the same as at any other engine; but it is not a fact that there is any staff of men employed upon them.

3783. You know the cast-iron saddle which spans the boiler upon which the two sets of cylinders are

Yes.

3784. Have any of these been broken in action? Yes.

3785. How many? I think they are all but one broken or cracked through the centre.
3786. Was that one strengthened before it left the Randwick shop at all? Yes; the first ran some considerable time before we did anything to it; and it was not till after it was running in Elizabeth-street for some time that it got broken. The road being somewhat bad we attributed the breakage to

that cause, and to its being a sore place.
3787. Is it a fact that the whole of them have cracked or broken across the saddle? Yes, they have

shown cracks or signs of weakness.

3788. Is it reasonable to suppose that vertical machinery like this—the main action of the engine being in a vertical line—can act as easily and with as little injury to itself on a rough knotty road as horizontal machinery? It can hardly be expected to do so. That is a thing that remains to be developed. Time will demonstrate that.

3789. But taking an ordinary practical common sense view of this matter, based upon your long experience of locomotive machinery, would it not be your opinion, looking at the almost utter impossibility of keeping the roads to a nice level, as the railways can be kept, be against vertical machinery?

3790. Take the heavier class of ordinary Baldwin motors, say the first four numbers—1, 2, 3, and 4—looking at the work they have done, and when in good order can do—taking, as I have seen myself, as much as three loaded cars, ninety-passenger cars, up the incline at Liverpool-street,—do you consider that the compound motor is an economical machine, in view of the work that it can do, as compared with the Baldwin motor of the type I have just alluded to? The compound engine was never intended to, the Baldwin motor of the type I have just alluded to? take such loads.

3791. That is to say, it cannot do it? No, it was never designed to do it.
3792. The car attached to the compound motor, when filled with passengers, is about up to the maximum

performance of the motor? It should do it easily.
3793. Has it not come within your own experience that motors of the type I have alluded to have often taken three of the double-decked cars loaded with passengers? Not three ninety-passenger cars; one

ninety and two sixty.

3794. They often take two ninety-passenger cars? Yes, under favourable conditions.

You have informed the Committee, in answer to the shortness of the Chairman's question, that beyond a saving in fuel you are not prepared yet, owing to the shortness of the time these combined motors have been in action, to say whether any other saving will arise through their use or not? I am not.

3796. And until you have had a much greater experience of them than you at present possess, would you consider it a reasonable thing to order twenty or thirty more of them, provided the responsibility rested solely with you? Putting it to myself, under the circumstances I think I would not. I should like to have more time; must have had more experience before I undertook such a thing.

3797. Have you made any estimate yourself from your own observation of the probable saving in fuel?

I know from returns, and I can vouch for their accuracy.

3798. Speaking from the returns in which you have such confidence, about what will be the saving percent. in fuel as compared with the ordinary Baldwin motor? About 30 per cent.

3799. Let us be clear upon this question: Do you wish the Committee to understand that there will be

a saving of 30 per cent. in fuel, as compared with the Baldwin motor, with the same amount of work done, not by the same motors, but with the same amount of work done? How are you to get at it unless.

aone, not by the same motors, but with the same amount of work done? How are you to get at it unless you take the mileage?

3800. I ask you to give your answer in relation to the work done by each class of engines—would there be a saving then; it would be very easy to say there is a saving when one machine employed is only doing half the work of the other. Take the work in foot pounds, never mind about the mileage? It is a question which we cannot get at under present conditions. The only thing you could do is to order a return to be got out from the engines before the combined motors came here. You could take a new present working on the Redfam line running precisely the same twings at the compounds do at the present engine working on the Redfern line running precisely the same trip as the compounds do at the present time, and averaging these trips for a week you would be very little out. Now, within the last few days, these four engines being upon the Railway, and comparing against the Baldwins running exactly the same trips, because I do not suppose there are two passengers different at certain times in the morning, would are the desired comparing. give the desired comparison.

3801. I wish to take another view of the subject: Suppose with a certain number, say twenty, Baldwin motors of the type of the first four, you are able to do a certain amount of work, these engines working up reasonably to their fair power every day, you place a number of compound motors on the same line to do the same amount of work;—would you be able to do it with the same number of motors, and then effect a saving of 30 per cent. in the fuel? Well, I cannot see why it should not be; but I have not yet.

had sufficient experience to warrant giving a decided opinion for all times.

3802. Will any one of the compound motors do the same duty in foot-pounds per day as the Baldwin of the type of the first four imported, trying both engines up to their best? No; I do not think they

Mr. H. B. Howe. 8 Oct., 1884.

3803. What then would be the difference, do you think, in duty in favour of the ordinary Baldwin engine. Would it be 10 or 15 or 20 per cent.? It is a question I am not prepared to answer just at present; I could get it out.

3804. At any rate you are clearly of opinion there would be a margin in favour of the Baldwin motor of the ordinary type first imported? That is the same number, placing one against the other, to do the same work. The comparison is hardly fair; they are not designed to do the same work; these compound motors are designed more for economy

3805. You must, I am sure, observe that if we are asked to give an opinion of the relative merits of the two engines they must be placed under precisely the same circumstances as to duty before we can For instance, the Baldwin motor may be able, and is often called upon to do a duty of a hundred thousand foot-pounds, working up to fair maximum power. If you place a compound motor in the same position and it does duty up to 70,000 foot-pounds, and you claim a saving of 30 per cent, does it not appear clearly to you there is no saving? In that light there is not, but they were never intended for that.

3806. It is not what was intended but what they are capable of doing? It is nothing but fair to the designer of a machine to consider what it was intended to do. The machine is designed to do certain work. If a boy can do the work of a man it is economy to employ him.

3807. Perhaps it is my fault in not making myself properly understood. The question is now, first, that you have not had sufficient experience of these compound motors to enable you to give an opinion that there will be any saving in ordinary wear and tear, as compared with the ordinary Baldwin motor; second, you are of opinion that there is a saving of 30 per cent. in fuel. What I want to get at is, if the Department is satisfied to order a new set of motors on the combined principle to supersede the present motors, would you be able to do the same amount of work as you now do with the ordinary Baldwin motor—would you be able to do that work with the same number of motors of the combined class? It is a question which requires some little consideration. You are putting it to me in a different form. Engine for engine, I do not suppose we can. But, as I said before, it was never intended.

3808. What I presume was intended was that this light kind of engines should be used for light lines? 3808. What I presume was intended was that this light kind of engines should be used for light lines? I could not say what was the intention in designing them. The intention, to me, appears to have been general economy throughout; that is, not to run a large engine where such an engine, as the combined motor, which could be worked more economically, could be used. These are questions I have not gone into. I had nothing to do with the combineds before they were brought here.

3809. If it is plain that there is a direct saving to the Department by the use of four or five of these engines, does it not follow, as a logical sequence, that if the Department used forty or fifty of them there would be a still greater saving? Up to the present time it would appear so.

3810. The whole thing, as yet, resolves itself into a question of economy of fuel, does it not? I might add that, as far as can be seen in general wear and tear, there is no perceptible wear yet on the combined motors, where there would be considerable wear shown on the Baldwin.

motors, where there would be considerable wear shown on the Baldwin. 3811. On the brasses? On the brasses

3812. This is what I want to get at. We can take it this way: If I have two engines, one of which is 60 horse power, and the other 40 horse power, and I have two firemen to attend to them, one of them with the 60-horse power engine shows me he has been using 60 cwt. of coal per day, and the other 40 cwt. of coal per day, would it be a reasonable thing for me to conclude that there was a saving of 30 per cent. with the 40 horse engine as compared with the 60-horse engine? Yes, if it was doing the same work.

3813. If it is not doing the same work? I have already said they are not intended to do the same work. 3814. I want you, if you will, to tell the Committee whether this 30 per cent. saving in fuel, which you estimate will be effected by the use of these engines, is an absolute saving, comparing the work that can be done with the Baldwin motors with the work that can be done with the combined motors? No; not with the work that can be done; I am not prepared to say that. It is only since the combined motor has with the work that can be done; I am not prepared to say that. I been brought upon the board that we have begun to compare them.

3815. Would the combined motor in your opinion do duty to the same amount of foot-pounds as you can get out of the ordinary Baldwin motors of the type first alluded to, and then save 30 per cent. in the fuel? I am hardly prepared to answer that question. I may say this, however, that comparing one of our Baldwin motors with a 9-inch cylinder with a compound motor with a 9-inch cylinder, the compound will. do considerably more work in proportion. As you put the question you are putting the compounds at a disadvantage by comparing an 11-inch cylinder with a 9-inch; but if you put a 9-inch cylinder in the Baldwin the compound has the advantage, and will work more economically; it will do more work and more economically than the 9-inch Baldwin.

3816. Has it the same stroke of piston in both cases? Yes.

3817. How long, upon the average, in weeks, will the Baldwin motors run without repairs? Without ordinary minor repairs they might not be a week; from one day to another there are always jobbing repairs on any locomotive engine, but as to brasses the ordinary Baldwin motor, running on our roads would require main rod brasses or connecting rod brasses within two months; from six weeks to two months is about the average of a set of brasses.

3818. Taking a connected view of the whole matter—both classes of engines, the nature of the road, the work to be done—at present you would not feel justified in asking the Department to increase the number of the compound engines? I would not; so far the matter is not sufficiently developed to my mind to give an opinion; before I pledged myself to a thing of that kind I would like to have a little more experience.

3819. Mr. Wright.] I understand you to say that the lead plug has dropped twice? Yes, the lead plug: dropped out twice while running trial trips to Coogee; never while they have been in service to my knowledge. The men not being accustomed to them let the water drop a little too low, and in coming up the hill the plug dropped, but no damage was done. Since they have been at work and the men have become acquainted with them there has been nothing of that kind.

3820. Do you consider the breaking of the saddle which carries the cylinders in any way affects the 3820. Do you consider the breaking of the sature which consider the combined motor, or the utility of its design? No, it is merely a weak place in carrying 3821.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE Mr. H. B. 3821. How many of these combined motors are there running between Redfern and Bridge-street? Howe. 3822. Do they do the same work on that road as the Baldwin motors? They do. 8 Oct., 1884. 3823. Is there any saving of fuel between them and the Baldwin motors? out, the time is too short. The four only started last Monday morning. That has not been worked 3824. How many were working before that? Two, for some time before that. 3825. Were they doing the same work as the ordinary Baldwin motors on that track? Yes. 3826. Have you made any comparison between the Baldwin motors and the compound? The saving amounts to about 30 per cent. 3827. With this saving the two compound motors have been doing exactly the same work as the Baldwin motors on that road? Yes, to the best of my belief. 3828. What is the relative horse-power of the Baldwin and the compound motor? That I have not worked out. 3829. Have all matters in connection with the compound engines been under your control? Yes. 3830. Is there much difference in the repairs effected in one engine as against the other? Yes, a good deal. 3831. Is there a good deal more in the compound motor? There is less in the compound motors than in the Baldwin motors; that is, from actual work, wear and tear on the road. 3832. You have seen the original design of these engines? Yes. 3833. Did the first engine show any marked difference from the original design? No; it differed in some minor details. 3834. Is there any difference in any of the working parts of the first engine, as it is now, from what it was when it first arrived, as far as the principle is concerned? No. 3835. You have had to put in new valves with rings? Yes. 3836. Does that alter the principle of the design? No. 3837. Have any of the valve motions in the first engine exhibited a weakness? No. 3838. Have you replaced any of the side rod brasses in any of the engines? No. 3839. Have you replaced any of the main rod brasses? No.

3840. How often have you put new side and main rod brasses on the Baldwin engines? About once in

every two months; from six weeks to two months; two months at the outside.

3841. How long is it since the first of these compound motors has run on the roads regularly? Since

about the beginning of May. 3842. About five months? Yes.

3843. During those five months you have put in no new brasses on the main and side rods? No.

3844. Is the valve motion in the new engines different in design from the first engine? Ye 3845. Have you seen Mr. Joy's design, showing the valve motion as intended to be fitted?

3846. Does the valve motion of the five combined motors correspond exactly with Mr. Joy's design? No. 3847. Can you tell me how many valve spindles have been broken and bent? Between twelve and fifteen. There have been three broken.

3848. Have you altered these spindles to Mr. Joy's design? As near as possible. 3849. Since the alteration has been made have any spindles been broken? No.

3850. Do you consider that the builders of these motors have strictly followed the design of Mr. Joy's valve gear? No they have not.

3851. Has any alteration been made in any part of this motor that will affect its design? No. 3852. Then I understand you to say the design still remains in its original form? Yes.

3853. You have considerable knowledge of the Baldwin motors; -do you think, taking the whole thing into consideration, that the compound motor is more or less expensive, with necessary repairs to keep it running on the road, than a Baldwin motor of the same power? With the slight alterations that have been made since they came here they seem to indicate that they will be less in cost of wear and tear than the Baldwin motors, with the improved valve spindles we have put in.

3854. From your experience as an engineer do you consider the design defective in any way? As I said before, I would like to have a little more time to let the thing develop itself.
3855. Do you know of any defects in the principle? No more than what I have stated as to the vertical

3856. Is there any question of labour in the employment of these combined motors as compared with the Baldwin motors; do they save labour in running? They save a man as fireman.

Baldwin motors; do they save labour in running? They save a man as fireman.

3857. Do you know whether it is a fact that the compound principle in motors is coming into use or being sought after by engineers in connection with locomotive purposes? Yes, compound engines are being sought after by engineers all over the world; that is in the principal engineering centres such as England, France, Germany, and America. For many years they have been attempting it in France and in England. Mr. Webb, one of the best locomotive engineers of the day, has been trying for years to apply it. 3858. Mr. Poole.] But he has not succeeded? He has succeeded so far that he is constructing more of them. A good many locomotive engineers do not believe in them. 3859. Mr. Wright.] Is it not a fact, speaking from a mechanical point of view, that every new engine and every new design has to undergo considerable modification when put into practical use? They have; I never saw any new design but what has a considerable amount of alterations made in it. No man can be expected to perfect a thing right off.

be expected to perfect a thing right off.

3860. So that you are not at all surprised at the trifling alterations that have been effected in this new motor and car? Not at all.

3861. Have you ever heard that the labour interest objected to any new mechanism? Such things do occur amongst men. There is very often prejudice amongst them against introducing new machines.

3862. I dare say you have heard that there have been riots in England against the introduction of

Yes; they little know that machines are their best friends.

3863. Would it surprise you if the workmen, thinking there might be a possibility of less labour being employed on these motors, would feel dissatisfaction with them? No, it would not surprise me. 3864. I understood you, in answer to Mr. Poole's question, to say that the combined motors could not do the same work as heavy Baldwin motors of the type of Nos. 1, 2, 3, and 4? No, they were never intended

3865. You have had considerable experience in tramway working now;—do you consider these compound

motors capable of working the ordinary traffic of our suburban lines; you have already stated they are not capable of taking two cars? On such a line as Waverley, where the traffic is very heavy, I do not think that they would come out well with the present time-table, but they are quite capable of doing the work 8 Oct., 1884.

3866. Do you think they are capable of doing the traffic now done on any of our suburban lines with the same number of engines employed; for instance do you think they could do the Botany traffic? Yes, they could do the Botany and Waterloo traffic.

3867. But you think the Waverley traffic too heavy for them? I fancy so, unless we ran more of them.

3868. Supposing there are six motors now running on the Waverley line, do you think the same traffic could be worked with seven compound motors and cars? I think so.

3869. Do you think the running of these seven combined motors would be more expensive to the Department than the running of six Baldwins? I do not think there would be much difference.

3870. Would the cost be less? It is a question that cannot be answered off-hand; I could not answer it

without working it out.

3871. I understand, from the general tenor of your remarks, that you rather look with a favourable eye on these combined motors? I do, for their work.

3872. Do you know the relative cost of the two classes of engines? I think they are about equal, as near

as I heard; personally I do not know.

3873. Mr. Sutherland. Before the alteration was made in the compound engines were they saving in coal then, or did they not use 50 per cent. more coal or coke than the Baldwin motors? Previous to the alterations that have been made at Randwick there was no saving of fuel with them; that is, before putting rings in the piston valves, they burnt as much and probably more than the Baldwin engines until this alteration was made.

3874. Mr. Wright.] Did you ever see a Return, prepared by the Tramway Department, in answer to a question in the Assembly, as to the number and amounts of the respective repairs done? I did not.

3875. If that Return were shown to you could you verify it or not;—if it had been falsified could you say

whether it was so? Yes. 3876. Mr. Poole. You spoke of one of the combined motors having been running since May;—has that motor been continually running since May? motor been continually running since May? There may have been occasions when it has been stopped. 3877. And some other motor put in its place? No, not as a rule; one of the other cars. 3878. No one motor has been running continuously since May? No. No. 70 is not now running, because I am making some alterations in it, it is atomic when the same alterations in it.

I am making some alterations in it; it is standing by as a spare engine.

3879. I suppose, taking a fair average of the time they have been here, no one of the combined motors has run even half the time since May? Yes.

3880. How much? Quite three-quarters of the time, as a hap-hazard answer.

3881. As to the saving in men—have they not to be fired irrespective of the driver? The driver looks to his fire.

3882. Does he fire himself? He does; it is considered his place to fire.
3883. If Mr. Downe has informed the Committee that the fuel-man at Redfern Station fires these motors he is under a mistake? The driver might ask him to fire while he is doing something else.

3884. Is it not an admitted practice that some one besides the driver does the firing for these combined motors;—is it not the regular practice? It is not the practice, because I have repeatedly been there and That is my own personal observation. When there were two engines running, or four as now, there has been an extra man.

3885. Suppose one of these engines were put upon the Leichhardt line, would she carry water enough for the journey? I question it.
3886. You doubt it? Yes.

3887. If you were asked to give an opinion as to the advisability, or otherwise, of ordering a number more of this class of compound motors, would you consider it a part of your duty to take into consideration the necessity for additional watering places, and the difficulty of turning them as compared with the Baldwin motors, and firing them at the terminal points? Yes, if such a question were asked me I should have to consider all these things. have to consider all these things.

3888. Mr. Chapman.] Has your attention been called to the sagging of the floors of these cars? Yes, I have noticed that.

3889. Do you consider that a defect? It is a slight defect, but it can be easily remedied; there is no danger attached to it in any way. To an ordinary person in the street it looks bad, but there is no danger in the way it is constructed. That can be prevented in future. Lots of little defects that are developing themselves now can be remedied.

3890. You say you have got six motors;—is it a fact that out of the six you have generally got two in the dock for repairs? No; they have not been there for repairs; we have been making alterations to them—altering the valves and various other matters. But for actual wear and tear it is not the fact that they are continually under repair.

are continually under repair.

3891. Can you work five out of the six? I can work four, and I hope to work at least five of them.

3892. Mr. Wright.] It has been represented to me on several occasions that the engine in the combined motor and car is hardly ever run for two days without being taken out and changed. It has also been represented to me that changes of the engines have been going on continually, so that I have been deceived by seeing two cars passing along the road between Redfern and Bridge-street, whereas the engine that drew the cars was changed perhaps twice a week. Has this been the case or not? It is not the case.

3893. Then the information conveyed to me is incorrect, that these changes have been very frequently made with the engines? Yes.

made with the engines? Yes.

3894. I have been further told that the breakdowns are so frequent that the engines are often taken out in the night and the car on the road the next morning, so as to encourage myself and the public to believe that one engine is doing the work, whereas three or four have been doing it? It is not correct; there is no foundation for it. I might say that since we have had the new cars built by Mr. Wearne there has been a spare engine, and if anything went wrong we could put on the road at once.
3895. The breakdowns have not been frequent? No.

3896. Do I distinctly understand that the repairs, other than the alterations you speak of, have been slight, on these cars? Yes.

MINUTES OF EVIDENCE TAKEN BEFORE THE SELECT COMMITTEE

THURSDAY, 9 OCTOBER, 1884.

Present:—

Mr. CHAPMAN, Mr. GARRARD,

Mr. POOLE, Mr. TEECE.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Frederick Davy called in and examined:-

Mr. F. Davy. 3897. Chairman.] What is your occupation at the present time? I am foreman in the Tramway 9 Oct., 1884. 3898. How long have you been in your present position? A little over two years as foreman.
3899. Have you much to do with the compound motors? No; nothing more than lifting them on the road when they have been off, or sending men out to make repairs while they were running.

3900. What experience have you had in regard to railway and tramway rolling stock? I have been on the tramways nearly the whole of my time in the service of the Government. In rolling stock I have had about twenty-one years' experience. 3901. Have you lately been selected by the Government to do any particular duty in regards to works, machinery, &c. ? I was appointed as Government valuator for resumptions where machinery is concerned, such as the resumptions at Darling Harbour.

3902. You have had frequent opportunities of judging of the merits of the combined motor? Yes.
3903. Will you kindly give the Committee your opinion, as a practical man, of the combined motor as compared with the ordinary motor that has been running for some time? In the first place the construction of the combined motor is against all mechanical principles, being a vertical engine.

3904. Have you had any experience of that class of engines? Yes, we had an engine on that principle

previous to this combined motor, built by Kitson and Co., of Leeds.

3905. Is this motor on the same principle? It is far more complicated than the Kitson—it is more intricate; it takes a good man to understand it.

3906. How long has the Kitson motor been running? It ran about twelve months, and then it was put on one side when the combined motor commenced

3907. For what reason was it put on one side? I could not answer that question. It was merely ordered to be put on one side; no reason was assigned that I know of.

3908. Was there any objection to it—was the wear and tear great, or did it not do the work it was

expected to do? I consider it did the work better than the combined motors do it; it did run longer at one time than they do.

3909. How long has this Kitson motor been put on one side? Eight or nine months.
3910. Has anything been done with it since? They are going to use it to drive an electric light.

3911. Where? At Randwick.
3912. But for tramway purposes, that is, for running on the road, it has not been used lately? No. It was in fair running order when it was sent to Randwick. I was not at Randwick, and I made no inquiry

about it till I was ordered to go there the other day. 3913. Have you had any experience of this class of motor other than the Kitson—I mean with regard to vertical engines used on tramways? There never were any on the tramway before these, to my knowledge, and on no other way. Only when Stephenson made his "Rocket" he started on the vertical

principle, and found it was wrong:
3914. It is not used, as far as you know, on any other line? It is not mechanical to use it.
3915. Why? Because it works on to a dead road, and the concussion knocks all the machinery to pieces, and the road too.

3916. You think the Kitson motor would do more work than any of these? Yes, it did do more work

for its size.

3917. What running did it do compared with the compound motor? It would run for a month at a stretch, and any one of these have never done a week yet; I do not think one of them has done six days in succession without requiring repairs.

and there are two running now; I met one as I was coming here, going back crippled.

3919. How long is it since the first combined motor commenced to run? About six months, I should think.

3919. How many commenced to run at that time? From the time it first ran till it was put into service it was running about in various trips.

3921. What has been your experience since it has been in service? To go and get the road clear when

she has been broken down. 3922. How often has she been broken down since the first time she was put in service? I am speaking of the whole kit of them, not of one engine.

3923. The whole kit have not been running? Yes, they have all been in service, but they have never long run together. You can take an engine out to-night and have another ready to go in in the morning. 3924. Do you mean that the motor is changed into another car over-night? Yes, they change the motors when necessary; just take one motor out and put another in.

3925. Is that done at night-time? Yes.

3926. How often is that done? It is hard to tell when they are changed; you have to go alongside and

look up into the car to see the number.

3927: You are sure they have been repeatedly changed? I am sure of it; there is no doubt about it.

3928. How many miles do they run in a week—about? I am not running foreman; I cannot tell you how many trips they make; perhaps twenty trips; that would be equivalent to about 60 miles a day.

3929. Would they average that, taking into consideration the repairs—the six in use at the present time?

No; there are not six in use; there are six ready for use at present; four started this morning, and there are now two of them running. One was going back to Randwick crippled as I was coming in, and another was in the Bridge-street yard, waiting for orders.

3930. What was the matter with it? I do not know. I spoke to the driver of one of them, and he said he wished he could be taken out of it or he would be smothered; the steam was escaping by a burst-icity or something.

joint or something.

3931. What was the name of the driver? Thomas Osborne.

Mr. F. Davy.

3932. Is it customary for these combined motors to break down daily? There may sometimes be a day or 9 Oct., 1884. two without a break-down.

3933. Do you think there is any saving of fuel in the motor cars compared with ordinary motors that have been in use some time? I have nothing to do with that; it does not come under me. That is the run-

ning foreman's duty; each driver gives him his return daily.

3934. Do you think these combined motors capable of doing the same work as the other motors? No.

3935. What do you think is the difference? Another motor of the same weight would take two loaded cars any way; she will not take herself and a little car.

3936. The compound motor will not take another car? When they have just come out of the shed, and

are in first-rate trim, they will take one car besides themselves to the Railway Station and back. 3937. Have you the same trouble with the other motors that you have with the compound motors with regard to repairs and break-downs? Not having been connected with the repairs at Randwick I can hardly say that. All motors require frequent repair.

3938 Do you think they require repair so often as the compound motors? The book states that the

compound motors require more repairs than the others.
3939. What book? The night fitters' time-book.
3940. What other difference is there in design between the compound motors and the other motors? This has got what they call piston valves, the others have slide valves.

3941. Which do you think the best? The slide valves. You can keep that tight, but you cannot keep

this—piston valves—tight.

3942. What other difference is there? I may as well say I do not believe there is any compounding about it; it is working four cylinders at high pressure instead of two.

3943. Mr. Poole.] Have you seen this working model that purports to be, and I have no doubt it is, a correct working model of the valve arrangement of the compound motor? It is a model that works well by hand, and the motors do not work so well with steam.

3944. You have just stated to the Committee that you do not consider there is any compounding about it;—do I understand you to mean that you do not consider that there is any advantage derived from using the steam in the second cylinder? Not a bit.

3945. You have not been at the Randwick repairing shops? Not during the time the combineds have been there.

3946. You know nothing then absolutely of your own knowledge as to the state the motors were in when they arrived from America? No, they were all in cases, packed up. 3947. Have you heard at all, in your official capacity, of the difficulty there was in running the first motor under steam at all? Yes.

3948. Do you recollect what causes were assigned;—was there any difficulty in getting rid of the condensed water? Yes.

3949. Will you explain to the Committee what you, thought was the nature of that defect? I only know that such was the case, from having been told of it. 3950. Some person informed you there was a defect? 3951. Who was it? It was Mr. Howe himself.

3952. Has your attention been called at all to the question of economy in the use of fuel, with respect to the combined motors? No, that does not come under my notice.

3953. You know the general mechanical arrangement of the combined motor?

3954. From your knowledge of locomotive machinery in action, would you consider, without any returns being presented to you, that there would be a saving of fuel? I should not.
3955. Have you known any cases where one or more of the combined motors under steam kave lost the

fusible fire-plug? Yes, on one or two occasions. 3956. While under trial? While under trial.

3950. While the trial: While the trial:

3951. Have any complaints been made to you by any of the drivers that they are very liable to prime? They would not complaint to me, but I have heard them say so.

3958. The complaints were not made to you officially? No; that is not part of my duty.

3959. In answer to the Chairman you stated that, in your opinion, the construction of the compound motor is in direct opposition to mechanical principles of locomotives? Yes.

3960. I should be glad if you will amplify your answer on that point, and state more in detail to the Committee why you consider vertical machinery objectionable or less economical in maintenance than horizontal machinery—locomotive in both cases? In the first place you have to have your machinery so rigid that there shall be no spring whatever to maintain your strength, so that driving on the road and going over the joints shakes everything to pieces; and then you have to have your wheels balanced to compensate for the weight of the other machinery, which causes a great strain on other parts, which is

3961. As far as you know, what has yet been the principal defect manifested in the compound motors? The piston-valves wearing and what we call blowing through—letting steam go to waste; valve-spindles bending—that is caused by the piston-valve getting out of place; and the saddles that connect the cylinders being broken

3962. These span the boilers? Yes, and the vertical stanchions that carry the cylinders having given way, and the safety-plugs being blown out.

way, and the salety-plugs being blown out.

3963. I would like to call your attention to the water-carrying capabilities of the compound motors contrasted with the ordinary boilers and motors. Take those engines first imported—1, 2, 3, and 4;—what distance can the ordinary boiler and motor run, under ordinary fair circumstances, without a fresh supply of water; that is to say, what is their water-carrying capacity? About 10 miles; that is the big engines; the little ones will not carry quite so far. Those of the class you name will carry 6 miles comfortably.

3964. And what distance will the compound motor carry water sufficient for its use? I do not know.

3965. Have you examined their tank space? Yes.

3966. Can you not give the Committee some idea whether they would be able to carry water for 10 miles, 8 miles, 6 miles, or any other distance? It depends on their priming and what condition they

3967. Do you consider they are more liable to prime than the ordinary motor? Yes.

1043—Q

Mr. F. Davy. 3968. Far more so? Far more. 3969. Has that been found to be the case in actual practice? Yes, in all of them. 3970. About how long will the ordinary Baldwin motor run without any necessity for repairs? mean if an engine goes out in thorough repair—That depends a good deal on what road she is on. 3971. Say on the line from Bridge-street to the Railway? Without anything being done to her at all, 3971. Say on the line from Bridge-street to the Railway? from three to four weeks. 3972. What would be necessary then? The side rod brasses would want letting together.
3973. If they were of the description known as club ends, how long would they last? Solid ends? 3973. If they were of the description known as club ends, now long would they last? Solid ends?
3974. Yes; I think they are Midelton's design? As much as four months.
3975. And then they would require new bushes? Yes.
3976. Now, taking a connected view of this matter, placing the compound motor to work under the same circumstances and on the same roads as you would place the ordinary Baldwin motors, do you think the combined motors would compare favourably for maintenance cost against the ordinary Baldwin motors, say for eighteen months or two years? I do not think anything of the sort; I do not think it would.
3977. In fact, from your experience, you feel convinced the combined motor would cost more for maintenance then the Baldwin motor? tenance than the Baldwin motor? Yes. 3978. And as to economy of fuel you cannot give us any information from your own knowledge? from the principle of the thing; it consumes more steam and must require more fuel. 3979. If the Committee have been informed that there is a positive saving of 30 per cent. in fuel by the use of the combined motor as compared with the ordinary Baldwin motor, would you be prepared to endorse that statement? No. 3980. Suppose we take an engine of the ordinary Baldwin type, 1, 2, 3, 4 engines of that type, and place them on a road where they would be worked up to their full fair capacity, would a compound motor placed on the same road be able to do the same amount of work? No. 3981. By about how much per cent.—what do you think would be the difference—I do not like to bother you with foot-pounds but that is really the only way of getting at it;—roughly speaking, what do you think would be the difference in per-centage? With their performances I should say they would not come up to within 50 per cent; they would not do more than half of what the big class of engines would.

3982. Then it necessarily follows that you would require from two to three compound motors to do the same duty as one of the Baldwin motors I have named? Yes, of the large type. 3983. So that if it could be proved by returns that there was a saving of 30 per cent. of fuel by the use of one compound motor, compared with the requirements of an ordinary Baldwin motor, there would still be, looking to the duty done, an enormous loss? Certainly. looking to the duty done, an enormous loss? Certainly.

3984. I desire to call your attention to the supposed advantages claimed for the compound motor by the double use of the steam. I suppose in this case as in all others the steam is admitted into the high pressure cylinder first, and then at the termination of the stroke, when the stroke is reversed the steam is allowed to exhaust direct into what is called the low pressure cylinder. Does it not follow as a matter of course that whatever pressure the steam exerts per square inch on the low pressure cylinder there must be, as a matter of course and fact, the same back pressure, the same pressure per square inch, acting as back pressure upon the high pressure cylinder? Yes. back pressure upon the high pressure cylinder? Yes.
3985. Then all the advantage that would be possible to be gained by the action would be the difference due to the two diameters of the piston? Yes. 3986. Then when the stroke is reversed does it not follow that the steam from the boiler would have to force out the steam at the other end of the piston into what may be termed the low pressure cylinder? Yes. 3987. And from that do you think that in practice the theoretical advantages claimed would be reduced to nil? Yes. 3988. Has your attention been called to the cars themselves that are attached to the combined motors? 3989. When they were first delivered over to the Department I suppose their floor line was horizontal? Yes. 3990. Is it so now? 3991. Gan you say roughly about how much they have deflected from the horizontal line? The worst one is No. 103, and that is about $4\frac{1}{2}$ inches when loaded; when not laden it is about $1\frac{3}{4}$ inch. 3992. Do you consider these cars perfectly safe in that state? I do not.
3993. You think they are not safe with a heavy load? They are not.
3994. Does that weakness arise from some defect in construction, or is it, in your opinion, essential from the design? It could not be otherwise from the design; it is part and parcel of the design.
3995. It is weak about midway between the support of the car on the motor and the bogie frame behind? 3996. Mr. Garrard.] With reference to the piston valves, they are just solid blocks, I suppose—there were no rings on them when imported? No. 3997. Do you know whether rings have been placed upon them since? Yes, they have.
3998. Do you know whether they have acted beneficially? The first day or two they are right, but after that they blow through; the steam passes. 3999. Has there been any doubling up of the valve spindles owing to these rings getting into the port? There has been a doubling of the valve spindles, but I do not know from what cause.

4000. Are the ends of these rings fastened in any way? Not that I am aware of. I have only had an opportunity since yesterday morning to see these rings; I was sent to Randwick, and told to make myself acquainted with the motors so that I could give evidence. 4001. Do you not think it is very likely these rings would get into the port? The rings are wider than the port, and could not get in.
4002. There is one ring on each? Yes.
4003. An ordinary cast-iron ring? Yes, I believe they are; they are not brass; they are either iron or steel.

4004. It is only since yesterday you have had anything to do with the compound motors? Yes.
4005. Do they come into the Pitt-street yard at all for repairs? They cannot get in the shed.
4006. You were foreman at the Randwick shed? Yes.
4007. Were you foreman at the time the design was first brought out? Yes.
4008. Were you consulted at that time as to the feasibility of the design? I had it shown to me.
was made before I was consulted. I knew it was being made, but I was never consulted.
400

ON THE PURCHASE OF RAILWAY ROLLING STOCK. 4009. Did you give your assent to the principle when you first saw it? I was never asked.
4010. From the first you have been of opinion, I suppose, that it would not be an economical design? Yes.

9 Oct., 1884. 4011. And so far as your experience goes that has been borne out? Yes. 4012. You said just now that in your opinion the engines were not compounding? Yes.
4013. But that the whole four cylinders got the high-pressure steam? If they do not get it, if the high-pressure cylinders get it, it is of no use when it goes out into the others.
4014. Have you noticed the workmanship of the combined cars supplied from America and of those supplied by local manufacturers;—have you compared them? No. 4015. You spoke of the deflection; -was that on a Colonial or American car? Colonial. My attention was called to it by the Traffic Superintendent at the gate, and he ordered it to be stopped at once.

4016. One of them has a permanent set of an inch and a quarter? Yes, when not loaded.

4017. Can you tell us if there is an indisposition on the part of the drivers to take charge of these combined motors? Yes, there is. 4018. Do you know the reasons they have urged? There are many reasons. For one thing, they take so much reporting; they have to report when they break down, and a great deal of the driver's time is taken up in being called upon to attend inquiries, why this and why the other. There is an indisposition to go on for that reason. 4019. Have there been any improvements made in these motors, other than the piston rings, since they arrived here? Yes, there is a heap of work at Randwick that has been condemned—a heap of condemned valves and valve spindles. 4020. In your opinion is there sufficient steam space in these boilers to work an engine of that calibre? No, there is not sufficient steam space.
4021. Where is the fusible plug placed? In the crown of the fire-box.
4022. Is that frequently bare of water going up a steep incline? Yes, when she is steaming at all that is bare. 4023. Is there internal steam pipe in this engine? There has been something applied—what we call a steam baffler 4024. With better results? I do not see it. They always throw water out when they start. 4025. Was it necessary to take off the crown of the road before these motors could be used? 4026. Mr. Teece.] I understood you to say there was a close resemblance between the Downe combined motor and the Kitson motor? As regards the principle.
4027. Could you describe the difference between them? The principal part that is not similar is the boiler; the boiler is of a different construction.
4028. The other parts are similar? The other and this of Mr. Downers has four. The other parts are similar, but the Kitson motor has two cylinders, 4029. You say two of these compound motors have been continuously running? Yes, for several months. 4030. How many motors altogether have been in use? Five. 4031. And two have been continuously running? Yes.4032. I think you also said it was customary to change these motors at night? Yes. Then virtually five have been in use to keep two cars running? Yes. 4033. Then virtually five have been in use to keep two cars running? Yes.
4034. How many passengers will the combined motor carry, say from Bridge-street to the Railway, a fair load;—would she take one car or two cars? When in good order, just come from the shed, she will take two.
4035. With how many passengers? Altogether about 140 passengers for the two.
4036. How many cars and passengers will the Baldwin motor carry for the same trip? The big car will carry 120 and the little car 80—altogether 200 passengers.
4037. Would not the consumption of coal in the heavy Baldwin engines be considerably more if it carries more passengers? No, I do not think it would. It would be more, but not anything to speak of.
4038. Mr. Garrard.] You were at one time foreman of the machine-shop at the Redfern locomotive works? 4039. How long? About eighteen months. 4040. You were also foreman with P. N. Russell & Co. at one time? Yes.
4041. How long? I was in their service about $12\frac{1}{2}$ years, and I was foreman for $9\frac{1}{2}$ years.
4042. In their busiest time? Yes. 4043. You were also engaged in business as managing partner of the Albion Foundry at Pyrmont? Yes. 4044. For how many years? Four years. 4045. How long were you foreman at Randwick before you went to Pitt-street? You mean when I took Mr. Broad's place; that was two years ago last June. Before that I was temporary foreman. 4046. You had full charge of the fitting up of the Randwick rolling stock? Yes; of the workshops and machinery. I was only a fitter then. 4047. During the last two years you have visited England? Yes; within the last four years.
4048. And are conversant with the latest designs in rolling stock? Yes, railway rolling stock.
4049. Where did you obtain your professional training? At Davey Brothers, Park Iron Works, at Sheffield.

4050. Have you ever had anything to do with the manufacture of locomotive engines? I have had to do with them but only in a small way; I was not brought up in the locomotive shop.

4051. At the Railway works ——? I was foreman of the machine-shop there.

4052. There is nothing but locomotive work done there? No; what I mean is that I never worked much

4053. I suppose you have always taken great interest in anything concerning locomotive work? Yes. 4054. You have observed all modern improvements and designs? Yes, I have always taken a deep interest in that.

Mr. John Moxey Tiley called in and examined:-

4055. Chairman.] What is your position in the Government service? Collecting officer and manager at Darling Harbour Wharf.

4056. Is it your duty to collect wharfage rates at Darling Harbour? Yes.

4057. Do you recollect any material for dump-cars arriving there for Carson Woods & Co.? Mr. J. M. Tiley. Yes, I 9 Oct., 1884. remember their arriving, but they did not come up to the wharf. 4058.

Mr. J. M. Tiley. 9 Oct., 1884.

4058. Do you know whether any duty was charged? None that I know of.
4059. Where was the material landed? At the Atlas Company's old place, on the ground lately resumed by the Government.

4060. Is it usual for goods to be received there without paying duty? No; it is not usual for goods to be landed there at all.

4061. Do you think goods landed there should be exempt from wharfage rates? No, decidedly not; it would be cheating the revenue.

4062. You understand that I am speaking of the Atlas Company's Wharf? Yes; it now belongs to the Government.

4063. You think it would be cheating the revenue? Yes.

4064. You are satisfied no duty has been paid? I am satisfied no duty has been paid.

4065. You have seen the materials to which I refer? Yes, I saw them landing, and I have seen them

being worked up.
4066. You are quite satisfied no wharfage rates have been paid? Yes, I am quite satisfied no wharfage rates have been paid.

4067. Mr. Garrard.] Is it not possible for these rates yet to be paid? Yes, it would be possible by finding

out the amount of material that has been landed. 4068. They are usually paid when the material is landed? Yes, all railway material coming to Darling Harbour wharf pays 1s. 8d. per ton, even on the Government material itself. It is all charged 1s. 8d. per

ton by the Treasury. 4069. That is on Darling Harbour wharf; but where these goods have been landed is virtually a private

wharf? No, I believe it is Government property. 4070. You refer to the old Atlas Works? Yes.

4071. Are you aware that the Government have leased that place to a private individual or firm? No, I am not.

4072. If they have done so would not the private individual or firm have the right to land goods there without paying wharfage? Certainly.

4073. Mr. Teece.] Did you offer any protest or make any inquiry as to the non-payment of these wharfage rates? No, none at all.

Mr. George Hendy called in and examined:—

Mr. G. Hendy. 4074. Chairman.] What is your occupation? At present I am general foreman in the Pitt-street Tramway yard.

4075. How long have you been engaged in that position? Since yesterday. 4076. What were you doing previously? I was running foreman on the Government Tramways. 4077. How long have you been in the Tramway service altogether? Since May, 1880.

4078. Had you any experience previous to that? Yes, nine years on railways.

4079. What railways? The South-eastern Railway in England.

4080. In what position? I started first as a turner and fitter, and I was in the drawing office for seven

years.
4081. Have you had frequent opportunities of observing the work done by what are known as the combined motors? I have had to arrange for the running of them on the lines.
4082. In what way are the combined motors different from the ordinary motors? One is a vertical

engine, the other horizontal.
4083. What do you think about the vertical and horizontal engines, with regard to the work that can be performed by each? The horizontal engine ought to be more powerful. Those we have had on the tramways are larger and more powerful.

4084. Have you seen vertical engines in use in any other place but this Colony? Not for tramway

purposes.
4085. Do you think they are as economical as the others in working? That I could not say. I do not know exactly what repairs have been done to them. That is done at Randwick.

4086. Can you tell the Committee how often the combined motors have been in the shops for repairs, and what has been the nature of the repairs effected? There have been a great number of valve spindles bent. what has been the nature of the repairs effected? There have been a great number of valve spindles bent. 4087. How often have they been taken into the shop for repairs? I could not tell you exactly now; but there are reports that would show that. I used to forward reports of any delay to the traffic. 4088. How long do they generally run before being sent to the shop for repairs—how many miles? Only two motors were running for regular traffic until quite recently. Now we have four placed on the line

for traffic purposes.

4089. Is it true that two were broken down to-day? Yes, I sent out fitters to do some work on them just as I was coming away; I do not know what they did.

4090. Mr. Poole.] You have been running foreman at the Pitt-street shop almost since the tramway was opened? I have been high foreman and running foreman. I first started as an ordinary fitter on the resilient form for a few weeks.

railway for a few weeks. 4091. You were running foreman for a considerable time before the compound motors were introduced?

4092. You have had considerable experience with the Baldwin motors, and also as much experience as anyone else with respect to compound motors? I never made a study of the compounds until they came out here.

4093. In your position as running foreman, whatever defects are noticed by the drivers in the course of the day are reported to you? Yes.

4094. And therefore it is a part of your official duty to take notice of all these matters? Yes. 4095. There are, I think, six or seven compound motors in all? Yes.

4096. And the whole of them have been at various times running on the line? Yes, now they are. 4097. There was one put upon the line at first—one car running? Yes, No. 70.

4098. Did No. 70 motor run that car regularly every day, or was it necessary to change the motor and put another one in? I have changed it at times when there were repairs they could not execute during the night. 4099. 4099. When the repairs were too heavy to be effected in one night another motor was put in its place Mr.G. Hendy. and the car sent out the following day? Yes.

4100. It was about May, I think, when the first compound motor was put on the line? Yes, it was in 9 Oct., 1884.

4101. And for the principal part of the time between then and now there have been two cars running? \mathbf{Y} es. 4102. And to keep the two cars running it has been necessary to use the whole of the motors up to within the last three days? Four of them have been used.

4103. Four motors have been in use to keep two cars going?

4104. Up to within the commencement of this week? Yes.

4105. And then four cars were set running? Yes, just recently there have been four cars put on.
4106. To-day two of those motors have temporarily broken down from some cause or other? I know of one; I could not answer for two; I have sent out fitters to attend to them. It may be a little job they can do while going along.

4107. Is it a part of your duty for all the returns of fuel to come through you? Yes, all running sheets have to come through me; they amount to about 120 daily. All reports of every kind came through me

while I was holding the position of running foreman.

4108. Do you know of your own knowledge that the men as a rule desire to be placed upon these compound motors to work them;—do they like to get charge of a compound motor? Some do not; some are speaking rather bitterly against them.

4109. Have they complained to you officially about them? Yes.

4110. What is the nature of their complaints? They did not state the cause; they have said they would rather not drive them.

4111. Do they not allege any particular cause? No, I have not heard of any particular cause.
4112. Did they ever complain to you that they were very liable to prime? The first one that was on the road was liable to prime; I have not heard it since.

4113. Do the returns furnished to you show any large saving in the consumption of fuel on these motors? No; the consumption is a little under that of the Baldwin motors.

4114. With what Baldwin motors have you compared them? The class that has been running on the Redfern line principally.

4115. The 10-inch cylinder class? Yes.

4116. Will the 10-inch cylinder ordinary Baldwin motor do as much work per day as the compound motor? Yes.

4117. Will it do more? It will draw a larger load—more passengers.
4118. And compared with that class of engine you think there is little, if any, saving in the consumption of fuel? There is a slight saving in fuel.

4119. Since when? Since they have altered the valves.

4120. Can you give the Committee any reliable information as to the per centage of saving of fuel? I could not; I do not take the figures out; the returns are sent to Randwick, and at the office there they

get out the returns from the sheet.
4121. Do the compound motors give you much more trouble to maintain the traffic arrangements than the ordinary motors—in other words are they breaking down oftener? We have had a good deal of trouble with the breaking down of the valve spindles.

4122. You are a mechanic brought up as an engine fitter? Yes, since I was fourteen years old. 4123. And you have had considerable experience in locomotive machinery? Yes, in machiner Yes, in machinery, and in the drawing office.

4124. From your experience do you think the compound motor, owing to its having vertical machinery, is likely to be as economical in cost of maintenance as the ordinary Baldwin motor, running over our tramway roads? I should say no.

4125. You think it is almost impossible for it to work as economically as the Baldwin motor with horizontal machinery, owing to the great difference in the arrangement of the machinery? Owing to its being vertical.

4126. Arranged vertically instead of horizontally? Yes.

4127. Do you think it likely vertical machinery will last as long on our tramways as horizontal machinery? I do not.

4128. Have the men made any complaints about the great difficulty of keeping up the supply of steam? No, not since the new valves have been placed in them.
4129. How long will the ordinary Baldwin motor of the type of the heavy motors run without repairs?

That greatly depends on the roads they are placed on.
4130. Take the line from Bridge-street to the railway? We have had Baldwin motors on that line for nine or ten months without coming in for a general overhaul; of course they may have had slight repairs, such

as we have to do at night. 4131. About what is the mileage made per day by the motors running to the railway station from Bridge-street? It varies; the average is from 60 to 80 miles. They alter the time service pretty often, accord-

ing to the railway time-tables.

4132. Take the line to Newtown or to Leichhardt;—what would be the average mileage run with the motors there? I suppose 90 miles would be the average; it might be over 100 in some cases.

4133. Are not the Newtown road and the Leichhardt road considered very dirty roads compared with the road to the station? Yes, and very heavy roads to work; there is the greatest wear and tear on them

4134. Is it a fact that you have a Baldwin engine running on the Leichhardt road that has not had the slightest repair for the last three or four months? Yes.
4135. And that is a very heavy road? Yes.
4136. Would one of the combined motors be able to work either of those roads and bring in the same amount of passengers—do the same amount of duty? Not to bring in the same amount of passengers.
4137. If the whole of your service was supplied with the compound motors, and you had the same amount of work to do as you now have on the lines could you do it with the same number of engines if they were of work to do as you now have on the lines, could you do it with the same number of engines if they were compound motors instead of the motors you have—could you do the day's work you do now with the same

Mr. G. Hendy number of engines? There is one thing to be considered. The largest size of motor has to draw two heavy cars, which will seat about 90 or 100 passengers each, but the combined car could not take two large cars; therefore it could not do the same work.

4138. Could one of the combined motors take its own car and a small car carrying sixty passengers to Newtown or to Leichhardt? Υ es.

4139. Would it be able to carry water enough for the journey in either case? Yes, it might be able to carry water.

4140. But it would be running very close? Yes.
4141. Mr. Garrard.] Do the drivers of these compound motors get a larger wage than those running the ordinary motors? Yes, they get a shilling a day extra.

4142. And yet there is a disinclination on the part of the drivers to take them; I think you said they sometimes requested not to be put on the combined motors? Yes, they have made several requests of that kind, but they have given no reason why.

4143. In reference to the fuel-sheets, you have no means of checking their accuracy? Yes, I have means of checking them with the fuel-men at the fuel stations. What the fuel-man issues to the driver daily is checked with the sheet that he sends in.

4144. So that it is left to the fuel-man really to say what fuel is used? The driver signs the fuel-man's

ticket to acknowledge he has had the amount.

4145. You have said that since the alteration to the valves there have not been complaints of want of steam like there used to be? No.
4146. What is the alteration? They have placed small rings on the piston valves.
4147 They are solid piston-valves? Yes.

4147. They are solid piston-valves? Yes.
4148. Do you know what the rings are made of? Steel. 4149. There are no springs at the back of them? No.

4150. Have you had frequent complaints as to the priming of the compound motors? There were complaints at first starting, but I have not heard of many complaints of late.

4151. Has any improvement been made to prevent the priming? I could not say.
4152. Has anything been done to prevent the doubling up of the valves? Yes, recently they have put in stays.

4153. Had any of these motors, previous to any alteration, run a distance of 500 miles without repair of

4154. Mr. Poole.] Do you think it is likely? Yes, they might, but I could not say; I do not know what repairs were actually done to the motors.
4155. Mr. Garrard.] Do you know if any of the saddles of these combined motors have broken or cracked? Yes.

4156. And have been renewed? They have been strengthened.
4157. Do you know if the supporting rods or stanchions of the cylinders have given way? I could not

4158. Do you know that the fusible lead-plug has frequently been burnt out, owing to the shortness of water? I know it was on one occasion; I do not know of any others.

4159. Do you think there is sufficient steam space in the boiler of the combined motor;—do you think more steam space would be better? I do.

4160. Have you examined these motors minutely? No.

4061. You have not been sent out specially to examine them, with the view of giving evidence here? No.

FRIDAY, 10 OCTOBER, 1884.

Aresent:-

MR. POOLE,

MR. TEECE,

MR. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. William Allen called in and examined:-

Mr. W. Allen. 4062. Chairman.] What is your occupation? I am night foreman of the tramway repairing-shops at Randwick.

10 Oct., 1884. 4163. How long have you occupied that position? I have been there about two years and eight months.

I was removed from Pitt-street to Randwick. 4164. You have been two years and eight months in the same position? Yes, constantly on night duty. 4165. What experince had you in connection with tramways or railways prior to your appointment in the Tramway Department here? I have worked in the railway-sheds at home to some extent as a millwright and engineer.

4166. You are a fitter and turner? Yes.

4167. Have you had much experience in connection with machinery? Yes, a good deal as a journeyman

4168. Have you had anything to do with the combined motor? I have.
4169. How long have the combined motors been running here? About six months; that is running on

and off. I could not tell exactly how long they have been running though I have been here all the time.
4170. How many of these motors have you at Randwick? I think there are six.
4171. What is your experience with regard to repairs that have to be effected to these motors. Are you called upon more frequently to effect repairs to them than to the other motors? Lately the repairs

have been rather heavy.
4172. And the motors are frequently taken into the sheds for repairs? Yes.
4173. How long do they run without being taken into the sheds for repairs? Repairs have been necessary.

almost daily. 4174. What is the nature of the mishaps that render the repairs necessary? The principal breakages have been in connection with the valve gear.

4175. Are there any other causes? The breakage of the valve gear is the principal, but there are other Mr. W. Allen.

parts of the machinery that require attention.
4176. How many miles do these combined motors run without requiring repairs to be effected? Some- 10 Oct., 1884.

times they will run half a day, sometimes a day, sometimes two days.
4177. Are we to understand that it is necessary to have these motors brought in every day for repairs? No, up to the present time we have had only two of them running. 4178. Although you have six in the shed? Yes.

4179. Can you say why the others have not been utilized? I do not think they have been ready.
4180. Why? I believe they have been waiting for alterations,
4181. What alterations were required? They have altered the stuff boxes and the cylinder ends and also the valve gear. I believe that up to the last week we had only two of these motors running.

4182. What have you had since then? Four.

4183 How often have these been running without being taken into the sheds for repairs? They have been taken into the sheds two or three times. The valves and spindles have been altered, and the motors have not gone so badly since then.

4184. Is it true that the motors are changed in different cars at the Kandwick works? Yes.
4185. How often? That is when the two were running at night—two to-morrow night, and frequently each night.

4186. That was on account of the break-down? Yes, and to enable the work to be done in the night.
4187. Did you find a similar difficulty with regard to the other motors? No, there is little or no change.

4187. Did you find a similar difficulty with regard to the other motors: No, there is notice or no change. 4188. How long do they run? We can generally effect all the repairs they require in a night. 4189. How long will it generally take to effect the repairs to the combined motors? Sometimes I can perform them during the night the work is necessary; but there is a large portion of the work to be taken down, and sometimes you have not time to take it down and couple it again in time for the morning's

4190. Is there any saving effected by using the combined motor over the ordinary motor which has been in use for some time? The repairs to the combined motor up to a week ago have been very heavy, but I do not know how it will be now that we have four running.

4191. We have been up to the present changing portions of the machinery, but now we have the other

four motors running we have nothing to change.

4192. Since the four other motors have been running during the last week you find yourself compelled

to make more repairs? Something in the way of repairs has to be done every night. 4193. How long does it take to effect the repairs? I have managed to get ou morning—that is the next morning. I have managed to get out the motors every

4194. How many men are required to effect the repairs? Two have been employed on motor No. 73 all night; two on the night previous, and one or two on the others, and sometimes we can manage with one.

4195. Speaking generally of the other motors, how long does it take to effect the necessary repairs on them? I can generally manage them before the next morning. There are cases in which there is a lot

of lifting to do, and in coupling them up, but generally I manage it by losing only one trip.

4196. How long will that take? It is done in the morning before I leave, unless boxes are required in them which would detain them another hour after I have gone. In cases like that the work is left to be

done in the day.

4197. Then it takes a longer time to repair these combined motors? Yes, they are complicated, and there is a good deal of taking down and coupling up, whereas the others are taken down directly.

4198. Have you any record of the number of times each motor has been taken into the shed for repairs? As they come in at night the number, say 75 and so on, is taken, and the repairs required, such as a broken spindle or valve out of order is taken down. broken spindle or valve out of order, is taken down.

4199. Will that record show the time occupied in effecting repairs? No.

4200. Is there any way of the Committee learning the time occupied in effecting the repairs to these motors? Only from the time-book in the office. After the fitters have done their night's work they have small boards, and before going home they put down the number of the motor and the nature of the repairs or alterations, whether it be to the spindle or dealing with any other cause of a break-down. They say whether it has occupied a day or a day and a half or a quarter or half-day. This board is thrown into the office and is taken away in the morning.
4201. From whom can we ascertain the time taken in effecting repairs? The fitter puts it down.

What is the name of the officer who takes it away? Mr. Godden.

4203. Do you think there is any saving of fuel effected in running the combined motors? I do not think

so; sometimes they are running a little later than the others.

4204. Taking day for day, late for late, do you think there is any saving? It is seldom that they run two cars, while the others are running all day with heavier loads, and some of those engines run with the same amount of fuel with two heavy cars on a rough road; for instance, to Leichhardt or Botany, with doubledecked cars.

4205. Have you any way of ascertaining the quantity of fuel used by each class of engine? No; the driver takes the quantity. We take sufficient for the night only, and they get up to the shed in the morning. The combined motors have lately had the regular supply, and they generally have some left. They take two bags as they go out in the morning, and this can be absorbed in the furnace at once. 4206. You do not think there is any saving of fuel? I think not; but I have seen no account of what

they use

4207. Mr. Poole.] Did you have anything to do with putting together the first combined motor that came here? Not the erection. Not the erection.

4208. You cannot speak then of the state of the machinery? Not until the motor was ready for running. 4209. I want you to recollect as far as you can all the circumstances of the first trial of the first combined motor which came here—No. 70, I think? Yes.

4210. Was it necessary to make any provision to get rid of the condensed water from the cylinder after it had been running here, or did it come under your notice that it was so necessary? No. 4211. Did you have to put any relief cocks in? They were in when the motor came, but they have never

worked properly.

```
Mr. W. Allen. 4212. Was the connection made with the inside of the cylinder? I cannot say; that would be done in
                         the day shift.
10 Oct., 1884. 4213. Up till quite lately the repairs have been very heavy and continuous? Yes.
                         4214. Until lately you have had only two of these engines running on the road? Yes.
4215. And to keep them on the road you have continually had to exchange one day parts of the machi-
                                                                                                                                                                                                Yes.
                          nery of one with that of another of the motors to do duty another day? It has been so.
                          4216. You have had to do what is ordinarily called robbing Peter to pay Paul, to strip one engine to keep
                          another going? Yes.
                          4217. You have had to-day to take a spindle or valve of one to serve another motor in order to keep it on the road to-morrow? Yes, that has been the case.
                          4218. Is it not a fact that in order to try and keep two motors on the road you have had to keep a great
                          many of your men on at night to effect the repairs necessary to enable the motors to go out next day?
                          Yes, that is in changing the motors from one part to another.
                          4219. And you have had to keep your lathe men at work too? Yes, they have had to be constantly on.
4220. How many in addition to the men who happened to be employed on the engine itself—Would you
                          not have to employ a number of lathe men and turners, almost every night to keep them going?
                          occasionally.
                          4221. How many men have you at Randwick? I think about seventy the last time I counted them.

4222. That is under your charge? Yes, the last time I counted them. There may be more now.

4223. Up to the beginning of last week, I believe, you have had only two combined motors running? Yes.
                         4223. Up to the beginning of last week, I believe, you have had only two combined motors running? Yes. 4224. We will speak of the period up to the present week. In order to keep those two motors on the road has it not been necessary for you to employ fully one-third of your men at Randwick? I could not say. 4225. Well, about what proportion of your men have you found it necessary to employ, in order to keep two of the motors running; that is, with the facilities that you had for changing when you could not effect the repairs necessary to day to get the motor out to-morrow; about what percentage of your men have been employed in attending to the motors? The greatest number of men on them is generally in the changing. It has generally been a rushed job to get them out of the cars and in again, otherwise I should be detained with my other work. I generally got them out as quickly as possible.

4226. How long does it occupy? Sometimes we commence at half-past 9, and I have been there till 12 o'clock at night, and as late as 2 in the morning, before I have got them shunted.

4227. It takes about two and half hours to effect the shunting? Yes, if there are two to shunt. And engines to change into the different cars, in a night.
                          engines to change into the different cars, in a night.
                          4228. But when you did not change one motor for another, then you always had a lot of repairs to effect; that would keep how many of your men? We could not get more than four men on them. That would be four men on the job itself—say two fitters and one labourer—sometimes boilermaker and his mate.
                          4229. Then I suppose you had to employ labourers to wait on them?
                                                                                                                                                                         Yes, I might want some lathe men
                          in addition. You cannot give any reliable idea as to the number of men, or the percentage of the total number of men who have been continuously employed on the combined motors keeping them going? It
                          would be almost impossible. It is simply a matter of rushing to get them in and out again.

4230. There has been a great deal of rushing them to keep two motors out of the six running? It has
                                                                                                                                                                          Out they must go. Oh, yes.
                          been all my trouble to have them right by half-past 5 in the morning. 4231. Do you know whether there was any break-down last Sunday?
                          4231. Do you know whether there was any break-town has beinday? One had a good smash.
4232. How many? One had a good smash.
4233. What happened to it? The left hand engine of No. 73 broke down.
4234. The gearing? The double links, bolts and everything—the brass that steadied it to the frame-
                                           All doubled up.*
                          4235. Did anything happen to any of them yesterday? I believe there was one in yesterday.
4236. Do you know whether a second combined engine broke down on Sunday? I do not think there was a break-down but there was a struggle to keep her out on account of the joints.
4237. Owing to the breakage of the joints? Yes.
                           4238. Do you find that there is very much more difficulty in keeping the combined engines out in comparison with the work they do than there is in keeping the ordinary motors out? Yes.
4239. Much more difficulty? It is a difficult matter to keep them out their time:
                           4240. Does that arise in your opinion from the machinery being in a vertical position instead of being horizontal? Yes, and from the complication of the thing. If you get one little job to do you have to
                           take half of the machine down to get at it.
                           4241. A small repair which would be simple and easy in an ordinary motor becomes a costly job in a combined motor, owing to the complicated nature of the machinery? Yes.
                           4242. Owing to the time necessary to take down the intervening machinery and put it up again? Yes.
                           4243. Is there not some considerable danger to the driver if he should happen when the motor is swinging
                           round a curve to get his foot between the cab and the footplate? Rather. It would be a matter of cutting his leg off.

4244. And if that should unfortunately happen to a driver when one of these combined motors is under steam with a loaded car attached to it, what would be the result? There would be nothing for it but to let her rip along until she ran off the road or something else. If there was one coming along the
                           street and I was at the corner, I could not get on to it.
4245. You could not give the driver any relief? No, I should have to jump in through the window, so
                           that in the event of any accident to the driver, to prevent him shutting off steam, it would be a source of extreme danger to some of the passengers? To them all I should think.

4246. As to any saving in the fuel compared with the ordinary motors, you are not prepared to give an opinion on that? It is out of my hands.
                            4247. But you are quite clear on this point, that looking at them as new engines coming out, they ought
                           to be fit to go to work without giving your repairing department any trouble; but that they have given you an enormous amount of trouble to keep them in running order? Yes, some trouble. 4248. Has there not been a large amount of trouble? Yes, sometimes, some difficulty to get them out,
                            and to keep them on the road.
```

Added (on revision):—It is supposed that one of the bolts came out of the valve gear and caught the main rod, and so caused the links to double up and the bolts to break.

4249. Mr. Sutherland.] How many hours do you work at night? I go in at half-past 9, and I am there Mr. W. Allen.

4250. Is the shed a healthy place at night? No, far from it. I do not feel the same man at all.
4251. Is it a fact then that the men are unable to do anything like a fair night's work there, being choked with steam and smoke? You cannot do it. The men have to come outside to get air, and that is worse still because there is always a thick for there. still, because there is always a thick fog there. All the engines are blown down in that shed, and the

men are working amongst steam, smoke, and sulphur.

4252. If I have been informed that it is impossible for them to do anything like half the work that they could do in the daytime, is that correct?* They cannot get through it. There are times when they have to knock off and go outside, especially when they are lighting up the engines in a morning.

4253. Mr. Poole.] Have the men under your charge ever requested to be allowed to work in the day instead of at night, and to be replaced by others? Yes. 4254. Have you ever requested to be allowed to work on the day-shift? I have applied frequently. I have doctors' certificates at home now.

4255. You have not been allowed to change? No.

4256. If the Committee have been informed by one of your superior officers that any time a man applies for a change he can have it, is that in accordance with your experience? No, it is just the opposite. 4257. Do you know an engine called the "Kitson?" Yes.

4259. That is a vertical engine, is it not? No, it is an horizontal engine.

4260. It is a combined car, with two cylinders instead of four. How long has that been running? I could not tell you how long.

4261. Was that like this, subject to a constant necessity of repair? Oh yes, it was always in the shed. Perhaps it would run two trips and then have to go into the shed.

4262. The main outlines of this engine, with the exception of the compounding principle, are similar to

those of the engine known as Downe's patent? Yes.

4263. Can you tell us what they are going to do with it? Yes, they have taken it out of the car—off the car, and stripped it partly, and they have it erected outside the end of the turning shop. I believe it is going to be used for driving an electric-light machine.

Mr. Evans Davies called in and examined:—

4264. Chairman.] What is your occupation? Carriage-builder.
4265. Where are you employed? At Randwick.
4266. In what capacity? Foreman carriage builder in the Tramway Department.

10 Oct., 1884.

Mr. E. Davies.

4267. How long have you been in that position? Two years on the 3rd April last.
4268. Have you had much to do with the repair of the compound motors? I have nothing to do with the

4269. I mean with the cars? Yes.
4270. Do you find that they frequently require repairing, or do they run long without? Small repairs are frequently required. We have not had anything very big yet. The brake-gears that apply the shoes to the wheels, and the connecting levers.

4271. What is the difference in the construction of these cars and the ordinary cars? The ordinary cars have two bogies—two sets of wheels of four each. The combined motor has only one, and the motor part takes the other end.

4272. Mr. Poole.] When the cars were handed over to the Department I suppose the floor line was horizontal? Yes.

4273. Have you noticed any serious deflection in the floor line of the carriage attached to the motor? There is a deflection when the car is empty of about $1\frac{1}{4}$ inch, and it increases in proportion to the weight put on it. I measured two of the cars, No. 100 and No. 103. I took an examiner who was working under me, and we measured the deflection of car No. 100. It was then empty, and the deflection was $1\frac{1}{4}$ inch. 4274. That was the pattern car built in America? Yes; she went away, and I had not an opportunity to measure her when loaded. No. 103 came up and I measured her, the deflection being about the same as in the other car. I measured her again before she went away, and when she was about half loaded there

was a deflection of 15 inches.

4275. Does that arise from defective workmanship, or is it owing to the design? It arises from the designing of the car. I can only illustrate it in this way: A horse being in the shafts of a dray and the wheels being at the back end of the dray, a deflection would be caused by any weight between the shafts

and the wheels. That exactly represents it.

4276. You cannot balance the weight then with these cars or with the others where you have a double set of bogies? There is no means to truss them; there is a truss on the car, but the action of the truss is the reverse of what it ought to be; instead of holding the car up it pulls it down in that particular place. There are iron plates put to strengthen it, but they are evidently not sufficient.

4277. Have you noticed the facial board running underneath the projection of the deck?

4278. Instead of the joint being jointed fair, does it not appear to be hung at a considerable angle? That arises from the deflection.

4279. You have noticed that? Yes.

4280. There is a permanent set in car No. 100 of 1 inch? There is $1\frac{1}{4}$ inch.
4281. And when loaded I suppose the set is likely to increase to 3 or 4 inches? I have never measured of fully loaded, but from what I have seen I should say that it will be as much as 3 inches.
4282. Do you consider that safe for the travelling public? Well, they will go for a time, but I have given instructions to the examiner that should be see any likelihood of them getting worse he is to stant by met. instructions to the examiner that should he see any likelihood of them getting worse he is to stop them at once, and inform me.

4283. Therefore you consider them a source of danger, and that they require special watching? They require special watching, and I have given special instructions that they are never to be allowed to go out without being examined to see if anything has started afresh.

^{*} Note (on revision):—It cannot be expected of them to perform as much work as if they had the daylight to work with; although, considering the difficulties they have to contend with, they do a fair night's work.

Mr.E. Davies. 4284. There were a number of four-wheeled single bogie cars in use at one time; —all these have been converted into double bogies, have they not? $ar{\mathbf{Y}}\mathbf{e}\mathbf{s}.$

40 Oct., 1884. 4285. Was the conversion carried on under your supervision or in the Engineering Department? Under

my supervision.
4286. Can you give the Committee any idea of the cost of converting one of those cars from a four-wheeled car into an eight-wheeled car? Yes. Hudson Bros. took a contract to convert them and took what part of ironwork there was on the four-wheeled cars which could be used in the conversion. This they did. Hudson Bros. supplied the bogies at £70 each car, and took all the parts that were of any use

to help them out in the work of construction.

4287. In other words, they were allowed to use any material in the car, wheels, axles, and framework, and to supply two four-wheeled bogies instead of two-wheeled bogies, for a sum of £70 each car, to the Department? Yes, but the Department found wheels in addition; Hudson Bros. only found the bogies. They were to use, according to the first agreement, the India-runber springs that were in the four-wheel cars, but on further consideration the India-rubber springs were done away with; they were considered to be unserviceable, and they were, in fact, not the thing at all. Mr. Midelton mentioned to me that there was some arrangement to have steel springs put in. Hudson Bros. had £5 extra for supplying steel springs. I had new wheels and axles put under the cars, and we used what portions were under the cars We were very short of wheels at the time. serviceable to run on the old cars then running.

4288. Then it comes to this, from your statement, that Hudson Bros. received a total of £75 for each car, and the Department in addition furnished them with wheels and axles in order that they might convert the four-wheeled cars into eight-wheeled cars? Yes.

4289. Can you give the Committee any idea as to what would be the value of the wheels and axles? Some of the wheels and axles in the four-wheelers were useless to run under cars again. thin that they would have split the points. We have some in the yard now. The flanges were so

4290. Before going further can you explain why in your opinion the flanges were worn so thin? There was nothing to keep the wheel in its place on the road. The four-wheel bogie is 4 feet $3\frac{1}{2}$ inch wheel base,

centre to centre.

4291. On these four-wheeled cars each pair of wheels made such a sharp angle with the rails that the flange acted as a scissors edge upon the rails? Yes, in many instances cutting either the rails or the wheel, 4292. I suppose that accounted for the unearthly screech which they continually made? That was the cause of it.

4293. What is the value of the wheels and axles supplied to Hudson Brothers, to enable them to convert the four-wheeled into eight-wheeled cars? About £30 a set—that is a set of four pairs of wheels and

4294. £15 for each bogie set? Yes. They are steel wheels and steel axles; I am not sure of the price to a few shillings; but the figure I have given is about the price.

4295. You say that some of the old axles were useless;—what was done with them? Some of the old

wheels were useless—they are at Randwick yet.

4296. Did the Government supply others in their place to Hudson Brothers? Yes.

4297. New ones? Yes; all the wheels which were put on the four-wheeled bogies were new. Hudson Brothers were supplied with no old wheels. I considered it wrong to put old wheels on the new bogies, and we used them on the old bogies. I considered that they were worth about half the price of the new

4298. It comes to this: That, less whatever might be the value of the old wheels and axles, the total cost 4298. It comes to this: That, less whatever might be the value of the old wheels and axies, the total cost to the Department of converting each of these cars from a four-wheeled to an eight-wheeled car was about £105? There was something more, because after Hudson Brothers had finished, there was a certain amount of work to be done by the Department, in going over and adjusting the brakes, and seeing that everything was right. Then there were the tie-rods and other things which did not come in Hudson Brothers' contract. The work that we did at Randwick would be worth about £3 a car.

4299. Making the total cost £108? Yes, per car, less the value of the two pairs of old wheels, whatever

they might be worth.

4300. What would you value them at as a deduction? About half the price of new wheels, and a new wheel is worth about £2 8s.

4301. That will be £4 16s. for the wheels; what are the two axles worth? Of course you could not take them into consideration; they would come in again. They would be worth about £2 each.

4302. Then there would be a deduction due to the Department for unused material of about £8 16s.?

Quite so.

4303. These cars, I believe, were designed to carry sixty passengers? Yes. 4304. And that is all that they carry since their conversion? Yes.

4304. And that is all that they carry since their conversion?

4305. I suppose the bogies that are under the old four-wheeled cars are capable of carrying much more weight? Yes.

4306. As far as you are aware, was not the idea of constructing the four-wheeled bogies to lessen the tare weight in relation to the live load? Yes.

4306. As far as you are aware, was not the idea of constructing the four-wheeled bogies to lessen the tare weight in relation to the live load? Yes.
4307. And it has egregiously failed? Yes.
4308. Now that they have had to put eight wheels under the original four-wheeled cars, there is more dead weight per passenger when the cars are loaded, in the case of these converted cars, than there was with the original long double bogie cars? Yes; there is more dead haulage.
4309. Instead of reducing the dead weight they have had to increase it? Yes, per passenger.
4310. I suppose the bogies under the original four-wheeled cars are the same as under the larger 90-passenger cars? They are a shade lighter in the frame. The wheels and axles are exactly the same. The springs are made of half-inch round steel instead of with half-inch square steel. The difference would not be more than 1 cwt. on each bogie. would not be more than 1 cwt. on each bogie.

4311. The Department has actually had to increase the cost of these cars by £99, and at the same time to increase the dead weight, in order to render them safe for public purposes? In order to render them

serviceable.

4312. Mr. Teece.] Where are the old two-wheeled bogies? The remnants which Hudson Bros. did not take away are now out at Randwick lying in the sand. They are worth something for old iron.
4313. Mr. Poole.] You have had a good deal of experience with railway carriages in various countries?

About forty years.

4314. In the Mother Country as well as in this Colony? Yes, and in America also.
4315. Would you, from your long experience, think of recommending to your superior officer a kind of Mr. E. Davies. car such as that which is attached to the compound motor? Oh dear no—no practical carriage-builder 10 Oct., 1884; would dream of it—no man who knew his business would think of such a thing.* 4316. Nor would you have recommended the chief of your Department to use the four-wheeled cars?

4317. If unfortunately one of these cars should get off the road with a heavy load in the top, would it not almost as a matter of necessity roll over? One of them did roll over at the corner of Liverpool-

4318. Was it loaded? It happened to be nearly empty; but it rolled over under peculiar circumstances, one bogic took one road and the other took another.

4319. But, under any circumstances and irrespective of the economy of working them, if there were any economy, they are decidedly unsafe on the ground of their unstability? Yes; there is no economy in it, because while the double bogie car was wearing out two pairs of wheels the single-wheeled bogie would wear out three pairs of wheels.

4320. It would follow as a matter of course that the destruction of the rails would correspond almost with the destruction of the wheels? I should be inclined to say so, but I have no experience of the permanent way; from what I have observed I should be inclined to say that one would cut the other.

4321. You said that you had had forty years' experience as a carriage-builder;—will you tell the Committee where? In the first instance I was apprenticed at Westminster to a private carriage-builder; when I had been there two years my master failed; I then went as an improver to Adams & Co's.

Fairfield works at Bow.

4322. Are they large works? At that time they were one of the largest in England-locomotive and carriage works. I stopped there and became a piece-master; that is I took up piece-work by contract. I stopped there until the firm closed—between three and four years. From there I went to Joseph Wright's, the railway carriage builder. He made a lot of carriages for this Colony. Some of my carriages are here now. I was with the firm until they shifted their works from London to Birmingham. there I went to the Great Western Railway.

4323. At Paddington? At Paddington Station, and from there to the Royal Arsenal at Woolwich.
4324. Were you a foreman? I was at piece-work—that is the system generally adopted at home. They pick out a competent man and give him half-a-dozen carriages to make throughout at a certain price. He employs his own labour. I have had as many as twenty or thirty men working under me. From Woolwich I went to Canada.

4325. In what capacity? As a carriage-builder. I worked on the Great Western Railway.
4326. As a carriage-builder the whole time? Yes. I was there for four years. I then went back to England, the climate not agreeing with me, and I returned to the Great Western Railway at home. I then

had a better opportunity, and I went on to the London and North-western Line.

4327. Where at? At Euston Square. There was afterwards an opening for a foreman at Hazeldine and Co.'s, the rolling stock manufacturers. I went there as a foreman; in fact I was chief man there. I was foreman, inspector, and general valuator. I used to value all damages caused by accident on the Court Western Bailway and on the London and North-western Bailway. South-eastern Railway, on the Great Western Railway, and on the London and North-western Railway. Other Companies also employed me as a valuator. I held that position for from nine to ten years. Certain changes took place in the firm, and I afterwards came out here. My first situation in the Colony was in the employ of Mr. Whateley, private carriage-builder, of Newtown. There I built some omnibuses. I then went to Mr. James Bennett, carriage-builder, of Camperdown. I was offered inducements to return to Mr. Whateley's employ, and I did so. From there I went to the Waverley and Woollahra Omnibus. Company as foreman. I stopped with them for about two years. I then had an opportunity to return to railway work, and I went with Mr. Thomas Braid, who had some brake-vans and carriages to make. I assisted him in carrying out that job, and at the completion of it I took the place of foreman for Mr. Thomas Wearne, of the Glebe. I built ten carriages there for the Government. On the completion of that job I took the place of foreman at Messrs. Moyes and Donald's. The firm failed. I complete the work in hand for the Government, and was afterwards employed in the Government Railway Works at Newcastle. I was there until I came into the Tramway Department.

4328. You have had a large and varied experience in all kinds of carriage-building? In every kind.

4328. You have had a large and varied experience in all kinds of carriage-building? In every kind.
4329. And the result of your forty years' experience is that you would not recommend cars of the description attached to the compound motors? No.
4330. Nor the four-wheeled cars? No experienced carriage-builder would think of such a thing.†
4331. Chairman.] Do you advocate double decked cars? No, certainly not.
4332. Do you find them more expensive by reason of repairs? They are very expensive in that way, and still more for haulage, and the life of a double-decked car is not one half of the life of a single-decked car. I have seen a double-decked car on the line at Randwick with the brake on, and I have seen the wind catch the top and slide it down the line. That could not occur with single-decked cars; there is not the same wind resistance. When the brake has been suddenly put on, I have seen the whole of the top of one of these cars vibrate as much as 3 or 4 inches. That pulls the frame of the cars all to pieces. It shakes all the framing from the sole-bar upwards, and the iron posts which are stuck up make it still worse. They are only screwed into a cast-iron shoe, and we are continually repairing them. This does not occur with the cars which have wooden instead of iron posts; we have had no trouble with them. not occur with the cars which have wooden instead of iron posts; we have had no trouble with them. The roof rails have not cost a single shilling for breakages. We have single-decked cars which will seat seventy passengers, and some of them will seat eighty. They run much more lightly and smoothly; and with greater safety.

4333. What is the difference in the dead weight of the double-decked and of the single-decked cars? The single-decked cars, properly constructed, could be made to seat seventy passengers, or to carry 100 with a weight of 3½ tons. I do not know what the weight of a double-decked car would be. They are reported

to be 7 tons in weight, but I should say that they were nearer 8 tons.

4334. How many will they carry? They will seat ninety; but I have seen as many as 200 upon them.

4335. You are of opinion that the Government would save considerably by using the single-decked cars

^{*} NOTE (on revision):—My answer "No" is all that I wished to convey; the remainder was merely conversational. † NOTE (on revision):—My answer "No" is all that I wish to convey.

```
Mr. E. Davies in place of the double decked-cars? That is my opinion; there is not one half the wear and tear, and
there is not one half the cost in repairs; they would also last much longer from the content ment the state of the cost in repairs; they would also last much longer from the content ment the state of the cost in repair of the cost in the cost in repair of the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in the cost in th
                                                    4337: And it is your deliberate opinion that double decked cars cost more to keep in repair than do single decked cars? Yes:
                                                    4338. Mr. Poole.] And some of the single-decked cars will carry within ten of the number carried by the double-decked cars? Yes. Which was a substant of the number carried by the
                                                    double-decked cars? Yes. White part are a such are you'l reacte to tuo seg usife your ed 1784 4339. Chairman. Can you tell the Committee the difference in the cost of the two cars? I The contract
                                                    price of the double-decked cars is from £595 to £620, and the single-decked cars would cost £400. The £340. Or a difference of almost £200 to represent a carriage of about ten more passengers ? JoYes . The
                                                   4341. On holidays or race-days what would be the difference between the carrying capacity of the two cars? I have seen 200 on double-decked cars. I have seen them loaded till they have what I consider quite unsafe of un your your end chan upon and successful ours. I stinger unitures to now be guites.
                                                  4342. Do you think they could safely carry 100? They could carry 100 comfortably if a few people were to stand between the seats and on the platforms. I should not recommend them to carry more than 100. The extra number of passengers does not compensate the Government for the repairs which are afterwards necessary.
                                                     4343. Do you think it would be better to run the single cars more frequently than to use the others?

                                                John Campbell Dibbs, Esquire, called in and examined as a valve and there are start there was an interest as a valve spinion of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract o
     J. C. Dibbs,
Esq.
4346. Are you a manufacturer of rolling stock or railway material? No. 4347. Are you agent for any importers of such materials for the Government? Way was agent for Mr. Carson Woods.

4348. For the importation of some dump-cars? I was agent for one dump-car, a now remember writing a letter to the Commissioner, for Railways, as agent for the patentee of the dump-car, on the 2nd of April 1883? I believe I did to the second of the form of the patentee of 4350. How, long have you been agent for Mr. Carson Woods? Somewhere about two years: I cannot say exactly.
                                                  messioner in regard to the dump-cars: I will passed the second of the order that time of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second 
                                                    arranged; this is less expensive to work than the raive arrangements on the other five motors imported.
                                                                                                                                          4397. Has your attention been called to the boilers of this compound engine? Yes.
                                                    4398. Have you had any miberimexe but his believe the boilers have needed
  Mr. 4360. Chairman.] What is your occupation? Engineer.

J.H.Garforth. 4361. Where are you employed? In the Tramway Department at Raindwick of the bestou evad no Y. 68:14

4362. How long have you been in the Tramway Department? Three years and two months eval T. 00:14

4363. What experience had you prior to entering the Government service as an engineer? Some thirty

Three years and two months.
                                                    years experience.

4364. In what capacity? As an apprentice to the trade, and as a draftsman, and as manager of works.

4365. What works? W. and J. Garforth, Duckenfield, near Manchester.

4366. What class of engines and rolling stock used you to turn out? All kinds of land engines for factory and colliery purposes, and locomotives also.
                                                                               experience.
                                                      factory, and colliery purposes, and locomotives also.

4367. Have you had much to do with the compound motors now running? They have all been erected.
                                                    under my supervision. It was the first motor and car arrived? Paragraphs and the supervision when the first motor and car arrived? Paragraphs and the supervision of the compound motor. That a shift to do with the car.

4869. I understand you supervised the erection of it? Yes, the motor; I had nothing to do with the car.

4870. Will you favour the Committee, with your opinion of the compound motor—that is, whether you consider it as useful, as economical, and as well adapted for our tramways as the ordinary Baldwin motors? I do not think it is equal to the Baldwin motor in any of these respects.

1. The supervision of the compound motor—that is, whether you consider it as useful, as economical, and as well adapted for our tramways as the ordinary Baldwin motors? I do not think it is equal to the Baldwin motor in any of these respects.
```

4371. Why? I think its economy of fuel is questionable. I cannot speak from my own personal know-ledge, but from inquiries I have made at different times I think that if the Baldwin motors were in good J.H.Garforth. order they would burn as little, if not less, fuel than the combined.

4372. In what other way is it inferior to the Baldwin motor? I think the very fact of its having vertical 14 Oct., 1884. cylinders and working on a dead axle is prejudicial to any machinery; I cannot see how such machinery

4373. There is no spring ——? There is no spring under the machinery.
4374. Do they often get out of order? They have done so very frequently.
4375. What has been the principal part that requires repairs? The valve-spindles and the saddlecastings connecting the two cylinders.

4376. Any other parts? The bolts require tightening; up; they are constantly shaking loose with the hammering on the road.

4377. How long will they run without requiring to be overhauled;—how long will they run without breaking down or requiring repairs? Since the alterations have been made they may run for some time; I do not think they will break down in that particular spot. Through the strain on the valves not being equal they were liable to give way at any time.

4378. Do you think they are heavier on the permanent way than the other motors? They must be. In

itself without the car the motor is heavier than our ordinary motors.

4379. What is the difference in weight? I reckon the weight of the combined motor alone at 11 tons when loaded, the other, the largest size, No. 1 class when loaded is 13 tons; but if you take the compound motor at 11 tons and the car at 6 tons, and then a third of the 6 for the weight on the motor, that makes 13 tons—equal to the weight of the largest Baldwin motor, which will pull considerably more weight than the combined motor. The 10-inch cylinder Baldwin motor will draw more cars loaded. The combined motor, I have been told repeatedly, sticks up with two cars.

4380. You say you have been told ——? Yes, I cannot say from my own knowledge; I am not on the

road myself.

4381. Have you had much to do with the repairs of these motors? Yes.

4382. And the other motors as well? Yes.

4383. How often are the combined motors brought into the shed for repairs? Two or three times a week sometimes.

4384. Do the repairs take long? It is this way: Having three or four engines standing there doing nothing, when a valve spindle broke a spindle was taken off one of the standing engines and put on this one, so that there was not much lost time.

4385. You rob one engine to repair another? Yes.

4386. What do you do with the one you take a part from? While it is standing there we get a new . 14 5. piece made.

4387. How long would it take you to make one, supposing you could not rob another engine?

spindle, coupling the engine together again, a couple of days.

4388. How often do you find it necessary to repair the Baldwin motors? If you take a new engine, or one that has had a thorough overhaul, and put her on the Redfern line, I should say that, with the exception of renewing the brake-shoes and closing the braces of the main and side rods about every ten days or a fortnight—something like that—according to the quality of the brass, one of these engines would last from six to nine months with very little repairs.

4389. Do the Committee gather from you that the compound motor is more expensive for repairs, and more destructive on the permanent way, than the Baldwin motor, and will not carry the same load as the smallest Baldwin engine? As the middle-sized one with the 10-inch cylinder.

4390. Have you had anything to do with the double-decked cars? No, I have not. 4391. You have had no experience with regard to the cars? No.

4392. Mr. Poole.] You see this working model here? Yes.

4393. Is that a correct miniature of the pistons and valves and valve spindles on the combined motor as they originally came out? 'Yes.

they originally came out? I.es.
4394. You spoke just now of the unequal pressure on the valves as being a source of weakness in your

4395. And therefore increasing the expense of maintenance. Will you point out to the Committee from the model itself what you mean by that? (Witness explained by reference to the model) and the same parent expense of keeping. What you have now explained to us accounts for the difficulty and consequent expense of keeping. them in repair? Yes. Allow me to say that that valve motion is similar to that in the first combined motor that came here; the other five are differently it is the same patentee's motion, but differently expensed, this is less expensive to work then the valve expense on the other five motor imported. arranged; this is less expensive to work than the valve arrangements on the other five motors imported.

4397. Has your attention been called to the boilers of this compound engine? Yes.

4398. Have you had any experience with them at all in examining them? No, the boilers have needed no repairs. 50 A 11

4399. You have noticed their peculiar construction? I have.
4400. There are practically two boilers, a horizontal and a vertical boiler;—is not the horizontal boiler full of water up to the top of the skin? Yes. 4401. Then as the water expands in boiling it has to force itself along the top, underneath the top skin,

and into the vertical boiler? Yes.

4402. Has your attention been called by the drivers or have you heard any complaints of their continual priming? That I have noticed myself.

4403. You have seen them prime? Yes.

4404. What, in your opinion, was the cause of the priming? Too small steam space in proportion to the size of the boiler.

4405. Would not the steam be, as engineers express it, wet steam? Yes, very wet indeed.

4406. Would not that be extremely injurious to a complicated mechanism such as this? One of the first principles required by a compound engine is dry steam.

4407. And that is impossible with the present boilers? Impossible.

4408. And therefore what advantage might otherwise perhaps be attained by the compound motor using steam twice over is lost now altogether, owing to the inefficiency of the boiler in giving wet steam instead of dry? The engine would have stood a better chance of doing its work had it had dry steam.

```
4409. Coming back to the Baldwin motors, the springs are in connection with the engine itself over the
J.H. Garforth.
                      wheel, and assist in cushioning the machinery against the irregularity of the road?
14 Oct., 1884. 4410. Is that possible with the vertical machinery? No.
4411. Then the shock thrown upon the wheels by the inequalities of the road must be transmitted direct to the machinery? Certainly.
                      4412. Will not that tend then, not as a matter of opinion, but of absolute certainty, to very much knock the machinery to pieces in a very short time? It shows itself from the fact that the bolts in every part
                      are continually slacking back and wearing slack in the holes.

4413. That is to say they are riming the holes out? Yes, from the constant concussion.

4414. If you were asked by your superior officer, from the experience you have already had of the com-
                      bined motor, as compared with the ordinary Baldwin motor, to recommend the Government to purchase a considerable number of combined motors, would you feel justified in doing so? Certainly not.
                      4415. Without inquiring very much more into detail, taking a general view of this matter, and the load
                      the ordinary Baldwin motors and the combined motors will take, you consider there is no ground of economy
                      sufficiently established in favour of the combined motor? I do not.
                      4416. And you could not recommend the Government to proceed further with that experiment? I could
                      not conscientiously.
                                                                      Mr. Albert Blair Brown called in and examined:—
A. B. Brown. 4417. Chairman.] What is your occupation? Running foreman in the Tramway Department. 4418. How long have you been in the Tramway Department? Since the commencement of the tramways,
about five years ago.

4419. Did you come out with any of the Baldwin motors? Yes, the first four.

4420. You had to put them together, had you not? Yes.

4421. Have you had much to do with the combined motors? I have driven the company of the Baldwin motors? I have driven the company of the Baldwin motors? I have driven the company of the Baldwin motors?
                                                                                                                                  I have driven the compound motors.
                      4423. Do you consider the compound motors equal to the Baldwin motors? I do.
                      4424. Do you consider them better? Yes; that is, engine for engine.
4425. In what way are they superior to the Baldwin engine? They burn less fuel for one thing.
4426. How much less fuel? I only go by my experience; I know what fuel we use on the Baldwin
                      motors
                     4427. What quantity of coke does the Baldwin engine use to run, say 100 miles, on the line to the railway? From 1,500 lbs. to 1,600 lbs.*
                     4428. Every 100 miles? No, not every 100 miles; they are kept on the line from half-past 5 o'clock in the morning till 12 at night, and they burn about 1,600 lbs. in that time at continual work.

4429. What quantity will the combined engines burn? From 1,000 to 1,100 lbs.; probably less. I am
                     just giving this approximately.
                      4430. You say you have been driving one of these combined motors? Yes.

4431. Have you been driving one in continual work from half-past 5 till 12 at night on the railway line? On different shifts I have; I have driven them from 6 o'clock in the morning till 7 in the evening con-
                     4432. What quantity of fuel will a combined motor use in continual running, the same way as the Baldwin motor, from half-past 5 till 12 at night? I should judge between 1,000 and 1,100 lbs. 4433. How do you judge? I have been on both of the shifts, and I know exactly how much is used on
                     each shift; I have not run the engine continuously from half-past 5 till 12, but I have run from half-past 5 in the morning till 2 o'clock in the afternoon one week, and the next from 2 o'clock till 12.

4434. In what other way is the compound motor superior to the Baldwin? It uses less oil, and some
                      parts of the construction I consider superior to the Baldwin.
4435. What parts? The side rods are closed in, and the construction of them is such that they do not
                      require to be taken down; they do not wear out as quick as in the Baldwin.

4436. Any other way? I think the general construction of the engine will prove that the repair required
                      will not be as much as in the Baldwin engines.
4437. What has been the experience of the past as regards repairs? The actual running repairs have
                     been very light, as far as my experience goes with them.

4438. Do they run as long as the Baldwin motors? Yes, they make the same hours.

4439. Mr. Poole.] You are running foreman? Yes.

4440. How long have you been so? Since the 7th of September.

4441. And previous to that you were a driver? Yes.

4442. You say the ordinary Baldwin motor on the railway section uses about 1,600 lbs. of coal a day? Yes.
                      4443. How do you know that? From my practical experience in driving them.
4444. Have you seen it measured or weighed, or delivered to you? Yes; each bag weighed 100 lbs., and
                      4444. Have you seen it measured or weighted, or the number of bags put on board the engine were charged to us.
                      4445. And you say sixteen of these bags were used in a day? 4446. 1,600 lbs., not hundredweight? Yes.
                      4447. That is the consumption of the Baldwin motor? Yes, about the consumption.
                      4448. With respect to the coke used on the combined motor, you say it amounts to 1,100 lbs. or 1,200 lbs.?
                      No, 1,000 or 1,100 lbs.
                     4449. Have you seen that put on board? Yes. 4450. Did you fire yourself? Yes.
                     4450. Did you fire yourself? Yes.
4451. At both ends of the trip? No, at the Railway Station.
4452. The fuel-man never did that for you? No, he did not when I was there.
                     4453. When did you go there? I think it was some time in July. 4454. You went with the first combined motor that was running?
                                                                                                                                           I ran the first one, but not when they
```

4458.

first came out; but I ran the original engine that first started, No. 70.

4455. And you always fired that engine yourself? 4456. The fuel-man never fired it for you? No. 4457. You are quite sure of that? Certain of it.

^{*}Note (on revision):—I misunderstood Mr. Poole's question; they will burn about 3,200 lbs. per 100 miles run.

135 ON THE PURCHASE OF RAILWAY ROLLING STOCK. 4458. In answer to the Chairman you said the combined motor cost very little for running expenses? Yes. A.B. Brown. What do you call running expenses? The consumption of fuel, oil, waste, and repairs. 4460. What repairs? General running repairs. .14 Oct., 1884 4461. Does that include putting new valve spindles in? No, that is not running expenses. 4462. Nor braces, and so on? No. 4463. What kind of repairs do you call renewal of valve spindles, if it is necessary to renew the valve spindles when they have been at work a week or two? I consider that when any part of a machine continually breaks that is a fault in construction. 4464. Either a fault of workmanship or design? Yes.
4465. In this case was it a fault of design or of workmanship that the valve spindles continually broke or bent? I consider it a fault of workmanship.
4466. Was the material bad? It was in one case. 4467. There have been many cases; -what about the other cases? I consider the fault of workmanship was in the valves not being turned up true.

4468. The valves themselves? Yes.

4469. That is, they did not fit the port properly? Yes.
4470. They are solid valves—piston valves? They were solid valves originally.

4471. In what way did the defective turning up of the valve itself assist in bending or breaking the valve spindles? In one or two cases I think the valve got in one of the ports, not being a true fit. That was the opinion at the time among the workmen. 4472. Has that been remedied now? Yes.

4473. How many of the motors went through your hands in the short time you were driving them? have driven nearly all those that have run. Nos. 70, 71, 72, 73, and 74.

4474. Six of them? No, five.

4475. How many weeks were you driving them? I cannot say exactly; I was on special work part of the time, but I should judge I was driving them about five or six weeks altogether.

4476. And in that time you had five or six motors to drive? Yes.

4477. As a rule did you ever drive one of them for two days running without going to the shop for repairs? Yes, longer.

4478. How much longer? I ran one engine as near as I can tell about three weeks. 4479. Which one was that? No. 71.

4480. You ran six of them six weeks altogether, and one of them for half that time; now the other five must have gone through your hands in three weeks? There were two or three running at the time.

4481. You have been running these engines since they first came out? Yes.

4482. Do you not know of your own absolute knowledge that up to the commencement of last week there were only two combined motors kept on the line? No, I did not know that; I understood there were three running for some time.

4483. In answer to the Chairman you told us this machinery would call for less repairs than the machinery of the ordinary Baldwin motor, owing to the difference in its construction, that is being vertical machinery?

4484. Do you wish the Committee to understand that according to your experience machinery working on a dead axle without anything to ease the concussion will last longer than machinery that has a spring to it? I take my opinion from what I have seen between these compound motors and the Baldwin motors. 4485. That is your opinion, that it will last longer having no spring, than one that has a spring? So far I am convinced it will be a fact.

4486. That it will last longer? Yes.

4487. Although working on to a dead axle? Yes.
4488. And subject to all the inequalities of the road? Yes.

That is your opinion? Yes.

4490. You have had the whole six engines through your hands;—did any of them ever prime? They did when they first came out—when they first came from the shop.

4491. They pumped water out through the steam ports? Yes.

4492. What has been done to obviate that? They obviated that themselves when first they came out; all boilers prime when they are first run from the grease and oil that is used inside them in constructing them. We generally expect boilers to prime the first day or two after coming from the shop.

4493. After the first day or two was there no priming with any of them? There was priming, but if the water is carried rightly there will be no priming. All boilers will prime if the water is carried above a

4494. Have you plenty of room in this boiler for steam space—no need to press the steam space with water in order to save fire space? There is no necessity for that. 4495. There is plenty of room? Yes.

4496. You are quite sure of that? Yes, from the experience I have had. 4497. Mr. Garrard.] You are a mechanic by trade? Yes.

Where did you serve your time? At the Baldwin Locomotive Works at Philadelphia,

4499. You have been running these motors until within the last few weeks? Yes.

4500. You told Mr. Poole just now that in your opinion it was the fault of the material in one case that the valves were bent up; you were under the impression that the piston-valve got into the port? That was my opinion at the time; I did not investigate it any further.

4501. As a driver it is no part of your duty to take any of these engines to pieces? No. 4502. When did you gain your knowledge of the construction of the machines themselves—since you have

been running foreman? No. 4503. When? I have been out to Randwick when they were putting them together; I examined the parts before they were put together.
4504. You believe one of the causes of the bending of the valve-spindle was the bad shape of the piston-

valve, owing to its not being turned round; -will you explain? It was bad construction in one case.

4505. That is to say, the piston was too slack, giving it the option of canting over into the port?

4506. Is it not a fact that since these motors arrived here guides have been put on? Yes.
4507. Would not that prove that it was in the design the fault was? No the construction.

Mr.

4508. Have any of these valve-spindles bent or broken since this outside guide was placed there? No. A. B. Brown. 4509. You said just now you were quite sure as to the quantity of the fuel burnt by these motors, and that none of the fuel-men ever fired for you at the terminus? Yes.

4510. Are you aware that the fuel-men do fire for the drivers of these motors? Yes.

4511. Do you know whether the fuel with which the boiler is charged by the fuel-man is debited against the engine? Yes.

4512. Or only the bags placed in the bunker? The fuel is all charged to the engines.
4513. I will put it in another way. When the fuel-men charge the fire do they use fuel from the bags they place on the motor, or do they take it from the heap? There is a box put on the platform specially for these motors, and none of the other motors are allowed to take fuel from this box. The cost of all fuel that goes into these boxes is put down to the combined motors. The other motors get their coke direct from the coke-house.

4514. You have recently been appointed running foreman;—who was running foreman previous to your being placed in that position? Mr. Hendy.

4515. What position does he occupy now? He is in charge of the running repairs at Pitt-street.

4516. Who did Mr. Hendy supersede? Mr. Davis.
4517. Where is Mr. Davis? At Randwick, I believe.
4518. In whose place? Mr. Garforth's place.
4519. What has become of Mr. Garforth? I do not know; I saw him there yesterday.
4520. Mr. Garforth was foreman, was he not? Yes.

4521. I think you said that your experience of the running of these combined motors embraced a period of six weeks, and that during three weeks of that time you were running No. 71, and never had a breakdown? Yes.

4522. The other three weeks was split up among the other five motors? Yes.
4523. Were there any break-downs on the other five motors? No, not while run by me

4524. You are quite sure that for three weeks you ran No. 71 without a break-down? Yes.
4525. When you speak of the number are you taking the number of the engine or the number of the car?

The number of the engine.

4526. Is it not a fact that the same car is used continuously, but with a different engine? Not in my case. 4527. You never after the first day or so found the boiler priming with you, you said just now, I think? I have had the boiler priming, but I attribute that more to my own fault than the fault of the boiler, letting the water get too high.

4528. Does the level of the water require more watching in the combined motors than in ordinary Baldwin's? I do not think so. I never experienced any trouble that way.

4529. Do you know of any alteration being made in any of the boilers to prevent priming? No, not that I am aware of.

4530. You never knew anything to be done to the internal pipes or anything of the sort? No. 4531. Do you know if one of the saddles of these engines have broken? Yes.

4532. Which number was that? I could not exactly say which.
4533. It was not 71? I do not think so—not while run by me.
4534. Do you know if any of the stanchions or supporting-rods of the cylinders were ever broken or bent?
Not while under my charge; I never heard of any having been broken.
4535. Did you ever have any difficulty in bringing another car, besides the car attached to the motor, up

from the railway? No, I cannot say I have. Of course there might be a difficulty if the cars were overcrowded, the same as the other motors have.

4536. No more difficulty with the combined motor than with the ordinary Baldwin? Not with the same

4537. How many men are there employed at each end called fuel-men? There are only two extra men put on for the four motors running now. There are two shifts of men in the day.

4538. How were the Baldwin motors supplied with fuel—by the fireman on the engine? No, there are

always coke-men.

4539. Are there not more men now to supply the combined motors than to supply the Baldwins? There are two more men at the fuel stations, but there is actually a gain of six men—six men less on the motors. 4540. Because there is no fireman on a combined motor? Yes. 4541. But more fuel-men? We do not call them fuel-men. There are actually two men more for the

day at the fuel places.

4542. Does the driver of a combined motor assist to coal? No.

4543. Mr. Suttor.] You said the Baldwin motor consumes 1,600 lbs. of coke and the compound engine from 1,000 lbs. to 1,100 lbs.? Yes.

4544. But the combined motor only takes one carriage? One carriage attached to the motor, but we

can attach another car if the traffic requires it.

4545. Do you do it? Yes, when necessary.

4546. What is the rule;—do you run one or two? We run one as a rule.

4547. What is the rule with the Baldwin motors? We run two.

4548. Always? Not always. We have been running two with the Baldwin's from the Railway; that has been the rule whether there were passengers or not.

4549. As a rule the combined motor hauls one carriage and the Baldwin two? Yes; should the traffic require it the combined takes two.

4550. Do these carriages carry the same number of passengers? The combined will carry about the same number of passengers—more, I believe, than the average car that is running.

4551. So that the compound motor burning from 1,000lbs. to 1,100lbs. of coke a day carries one carriage, and the Baldwin motor, burning from 1,500 to 1,600 lbs., carries two? Yes.

4652. And thus, compared with the loads they carry, the consumption of fuel is less on the Baldwin than on the compound? No, I do not understand it in that way.

4553. From your evidence I understand that as a rule these compound motors only draw one carriage?

4554. And consume from 1,000 to 1,100 lbs. of coke a day, while the Baldwin motor as a rule, taking two carriages, consumes from 1,500 to 1,600 lbs.; and therefore, taking both these circumstances into consideration,

```
consideration, the Baldwin motor drawing two carriages burns only 400 fbs. of coke more than the compound
  motor drawing only one? But we can put two carriages on with the combined motor on the same con. A. B. Brown.
 sumption, or with a very slight increase.
  4555. Mr. Wright.] Do I understand that the Railway traffic is done with two classes of engines—the 14 Oct., 1884.
  Baldwin motor and the combined motor?
                                                                    \mathbf{Y}es.
 4556. Are they both capable of doing the work required of them? Yes.
4557. You said just now that the combined motor usually carries its own car? Yes.
  4558. But when the traffic requires it, it can take another car behind it? Yes, that can be seen every day.
  4559: And it performs its work like the rest? Yes.
 4560. Then in fact the combined motor does exactly the same work on the Railway line as the Baldwin
 motor? Yes:
 4561. And carries the same number of passengers when necessary? Yes.
 4562. Mr. Poole.] Do you wish the Committee to understand that it is a usual thing for the combined motor to take an extra carriage? No; we do not pull rolling stock over the road without necessity.
 4563. Is it a usual thing for you to take an extra carriage behind the combined motors? When the traffic
 requires it it can be done.
 4564. Is it a usual thing?
                                             I cannot say whether it is a usual thing. It can be done, and is done, when
                   The Baldwin motors that have been running on the Railway section have been using what is
 called the middle class carriage.
                                                     When one of these carriages will not do the traffic we have been obliged
 to run two of these middle class cars.
 4565. While running foreman did you never know the compound motors to stick up on the road from
 Belmore Park without any carriage behind them except their own? I cannot say I have.
 4566. Mr. Wright.] Have you ever known the Baldwin motors to stick up? Yes.
4567. Mr. Poole.] Last Sunday week, the 5th October, you were running foreman then? Yes. *
4569. Did any one of these compound motors break down on that day? Yes.
4569. Which of them? I think it was No. 71; I will not say for certain.
 4570. What happened to it? One of the pins came out of the valve gear. 4571. And disabled her? Yes.
 4572. And she had to go into the shed? Yes. I would like to explain that a little further: The pin came out of the valve gear owing to one of the nuts having worked loose; the driver did not see it, and the consequence was that the gear dropped down. That was the only defect. I attribute that to care-
 lessness on the part of the driver.
 4573. As you are running foreman there is a considerable amount of responsibility on your back now? Yes.
 4574. Have you never asked yourself what was likely to be the result to a car-load of passengers on a combined motor and car if anything should happen to the driver—if he should be paralysed, or take a fit,
 or meet with any serious accident, so that he could not cut off the steam? Yes. 4575. What is your answer? My answer is that the thing is hardly possible.
                                                                                                                            I have been driving loco-
 motive engines for seven years now and I never knew a driver yet to go off as suddenly as that.
 4576. Do you think it a reasonable thing to allow a steam engine to run through a crowded city with only
 one man on it, setting aside economy altogether. Is it not a fact that should anything happen to the
 driver while the motor is in motion the conductor cannot get at him the same as he can get on to an ordinary Baldwin motor, nor no passenger, nor no person from the street, owing to his being boxed in? A person could not get to the driver as quickly as he could on a Baldwin motor, but a person could step into that cab from the outside.
 4577. When it is travelling 9 or 10 miles an hour, or even at 8 miles an hour—would not that be a very risky thing to do? I think the risk would be just the same with the Baldwin motor.
 4578. Mr. Garrard.] There is no brake attached to the car of the compound motor, is there—to the car itself? Yes, there is a hand-brake which can be worked at the rear end.
 4579. Has that been placed on since the cars came here? No.
 4580. It was in the original design?
                                           Mr. James W. Cayzer called in and examined:-
 4581. Chairman.] What position do you occupy? At present I am Chief Draftsman in the Tramway Mr. J. W. Cayzen
 4582. How long have you been in your present position? During the last couple of months; I have there altogether as draftsman.
 4583. Whose place did you supply? I took Mr. Thorpe's place when he was transferred to the Railway Department.
 4584. Where were you employed previous to entering the Tramway Department? In London, by Alexander Wilson & Co.
4585. Had you anything to do with railway rolling stock there? Not directly.
4586. Mr. Wright.] Did you make the drawings of the motors running in the combined cars? Yes, according to Mr. Downe's directions.
 4587. Does the motor differ from other motors in its design? Yes. 4588. It is a compound engine, I believe? Yes.
4589. Do you know anything about the advantages claimed for the compound engine? Yes. 4590. Have you had any experience in compound engines? Yes, a great deal.
4591. Can you explain to the Committee in what way the application of this principle to steam-motors is likely to prove advantageous? Yes; apart from the great saving of steam, and consequently of the producer of steam, that is, fuel, the advantages of this compound engine are those that are common to all
producer of steam, that is, fuel, the advantages of this compound engine are those that are common to all compound engines and demonstrate the superiority of the compound system in this case the same, as in any other case in which the compound principle has been applied. If you will allow me to to go into figures a little in comparison with an 11-inch Baldwin, I can demonstrate it more clearly still. We have a boiler pressure of 130 lbs. per square inch in both boilers, compound and Baldwin, and the mean pressure in the cylinders of each is 125 lbs. Now the mean pressure on the high pressure cylinder in this compound motor is the area multiplied by 125 lbs., which gives 7,875 lbs. of steam pressure on the top or high.
```

Mr. high-pressure piston. The mean total pressure on the low-pressure cylinder is a total of 7,458 lbs. Well, J. W. Cayzer. these are the two positive quantities, as you may term them. But against the sum of these two pressures you have a back pressure, as you must have in a compound engine, of 4,158 lbs. The total effective pressure per stroke in this compound engine will therefore be 11,175 lbs., while the total pressure in the large pressure per stroke in this compound engine will therefore be 11,175 lbs., while the total pressure in the low-pressure cylinder is a total of 7,458 lbs. Well, but against the sum of these two pressures you have a back pressure, as you must have in a compound engine, of 4,158 lbs. The total effective pressure per stroke in this compound engine will therefore be 11,175 lbs., while the total pressure in the low-pressure cylinder is a total of 7,458 lbs. 11-inch ordinary Baldwin motor is 11,875 lbs. Now in reference to the cubic inches of steam used: cubic inches of steam used per stroke in the compound engine is 567, and the cubic inches per stroke used in the 11-inch Baldwin engine is 1,140. Of course that is on one single stroke in any direction of the piston in one cylinder. So that this compound engine, using 567 cubic inches of steam, gives a pressure per stroke of 11,175 lbs., while the 11-inch Baldwin engine, using 1,140 cubic inches of steam, gives a pressure of 11,875 lbs., that is, 46 per cent. less steam is used by the compound engine to do the same work per stroke as the Baldwin engine does; but there is a difference in the diameter of the wheels. The ordinary Baldwin motor wheel is 35 inches in diameter, and this compound motor wheel is only 30 inches; consequently, there is a difference of 16 per cent., that is to say, there is 16 per cent. less diameter in this compound motor; therefore you must deduct this 16 per cent. from the 46, and you get a net saving of 30 per cent. in the steam used to cover the same distance on the road.

4592. What is the advantage of that, attached to the compound engine as against the ordinary Baldwin engine. Is it the much less consumption of steam? The less consumption of steam and easy manipulation.

It is worked by one man.

4593. You say you made the original drawings for this design? Yes.

4594. Was there any difference between the cars as imported here and the original drawings? Practically

4595. Was there any difference between the motors that were landed here at a more recent date over the first ones that were landed? \mathbf{Y} es.

4596. In what does that difference consist? In the difference of the application of Joy's valve gear to

the engine.
4597. Was the valve gear in the first engine in accordance with the original design or a departure from it? There are two classes of Joy's gear.

No, it was on the same

4598. Was the first motor different in respect of Joy's gear from your drawing? No, it was on the same 4599. Is the valve motion in the five motors subsequently imported in accordance with the inventor's

design? No, there is one part in which it differs.

4600. Have any of the valve spindles of these motors broken? There have been a great many bent; I do not know about their breaking.

4601. How do you account for this? By one small feature in Joy's own idea not being carried out in accordance with his design. That is in the second batch of five engines.

4602. Do I understand that the American makers failed to carry out the inventor's idea according to his

Yes, in the five engines.

4603. You have had large experience with compound engines? Yes, twelve years on and off.

4604. Do you know of any successful application of this principle in the old country for locomotive purposes? Mr. Webb, on the North-western line, has achieved considerable success with his compound motor, locomotive he calls it; and there was a very good one exhibited at the Dusseldorf Exhibition lately that gave good results. It seems to be the aim of locomotive superintendents in all countries to produce a compound locomotive.

4605. Are you a mechanical engineer as well as a draftsman? I served five years in the workshop.

4606. Do you consider, as far as your experience goes, this compound motor is a success? I honestly do; but it is a new design, and it wants to be thoroughly ventilated.
4607. Is it not unusual for new machinery to require various alterations in its parts before it runs

smoothly? It is the exception for it to run smoothly at first.
4608. Have you ever seen a compound locomotive in any part of the world? No, this is the first I have

seen. There are but two or three in existence.
4609. Have you seen the drawings of any compound engines for traction purposes? Yes.

4610. Is Mr. Downe's motor a copy of any of these, or is it original, as far as your knowledge goes? As a whole this is purely an original design.

4611. Have you attended any trials or been connected with this combined motor in running through the I was out with it for about a week before it was put into service, finding out any streets in any way?

weak points in it requiring any small shop alterations—shop work not affecting the design.

4612. What was its running, as far as your own personal knowledge is concerned—what performances were done? For a new invention, a new design, a total departure from established practice, they have done their work exceedingly well, and they are now what engineers call well down to their bearings. 4613. Have you seen this model of the engine? Yes, it was made under my superintendence.

4614. Can you explain from that model the working of the valves and pistons? I could do it, but I would have to requote the figures I have just given.

4615. What do you consider is the saving of weight between the combined motor and car and the ordinary Baldwin motor with a car behind it? About 4 tons, standing on the rail.

4616. That is the difference in weight? Yes, the difference between the combined motor and car as it

stands, and the 11-inch Baldwin motor and car behind it.
4617. What is the carrying capacity of the respective cars—the combined car and the ordinary double-decker? The heaviest double-decker we have will carry ninety passengers, while the combined car has

sitting capacity for eighty. 4618. From your experience as an engineer, would you have any hesitation, if in Mr. Downe's or any similar responsible position, in recommending the general adoption of this car in substitution for the Baldwin motors? Considering their efficacy in every respect, the saving which a system conducted on the principle of this combined car must result in, taking into account the cost of turn-tables and everything else, the saving in wages and in stores of every description, I should say the sooner the whole system of tramways is carried out with combined cars the better it will be for the public in every respect.

4619. Would you take the responsibility of recommending it upon your back, if you were in the position of chief engineer of the Department? I should accept it without hesitation as to the result.

4620. Mr. Poole.] The result of your figures given to the Committee a short time ago gives a net saving of 30 per cent. of steam, in your opinion? Yes. 4621.

4621, If the Committee have been informed that there will be a net saving of 30 per cent. of fuel, I suppose that is about how it has been got at. There is a net saving, theoretically, of 30 per cent. in J. W. Cayzer. steam, and therefore a net saving of 30 per cent. in fuel? I believe the actual running sheet shows a 14 Oct., 1884.

larger percentage than I have given.
4622. Have you taken into consideration, in advocating the compound motors in place of the ordinary

Baldwin motor, all the terminal charges—all the necessity of putting in turn-tables, or circles, or triangles, as the case may be, at all the various outlying terminal points? Yes.

4623. Have you considered at all what it would be likely to cost the Government for ground to turn them on? At the majority of the termini the transvay lines are situated in such a manner that not much resumption will be required, and the cost of that resumption would be nothing in comparison to the item saved in wages.

4624. Have you made any estimate whatever of the cost of resumption at any of these points? I do not

profess to be a land valuer.

4625. This is a mere general opinion you have given to the Committee—not based on any estimate you have made? I am more competent to go into figures with regard to the engine than I am with regard to land.

4626. Taking the whole of these contingencies into serious consideration, you would advise that there should be a total change in the description of motor used? I am still of that opinion.

4627. I want to get at the cost to the Government of putting down turn-tables and resuming land? I can form a pretty fair idea.

4628. Will you give the Committee an idea what it will cost at some of these points? £600 at Randwick, for instance.

4629. Whereabouts? On the reserve opposite the Asylum.
4630. Take a case where you would have to resume land? I scarcely think you ought to ask me that question. I cannot form an estimate of the cost of land, but the saving would be considerable in stores and wages and in repairs and in compensation for accidents.
4631. You are a mechanical draftsman, and served your time in a locomotive shop? Not locomotive

general engineer's.

4632. Is it not a fact that, with these compounding engines with vertical machinery, the whole work is on to the dead axle, on the tramsom end—that there is no spring between them and the road? It is a fact that there is no spring on the driving axle, but when the engine was lifted I must honestly say I never saw bearings that had worn better.

4633. What would be the effect of continual concussion, owing to the inequality of the joints of the road, on that vertical machinery, in the course of five or six months? Little or no difference.

4634. It would throw no additional strain upon it? Not on the vertical engine, where the motion is vertical and at right angles to the road.

4635. You think that is a far better arrangement than horizontal machinery such as we have in ordinary locomotives? I do not say it is better, but it is no worse.

4636. You know that springs do act in easing off the concussion due to the road? Yes.

4637. And that is not the case in these compound motors? No.

4638. Mr. Wright.] There is a large amount of wear, is there not, under the journals and brasses of the ordinary Baldwin motors? Yes, on the side rods.

4639. I understand you that there is much less wear on the compound motors—the brasses last much longer? I confess I was agreeably surprised to find the way the non-adjustable ends of the side rods of this compound engine wore, but I attributed it to two things—one is that there is good bush metal used, good gun metal—Ajax metal I think it is termed—in the rods, and on each side-pin of the side cranks there is a circular steel bush or collar put on; these two work together and give a surface like gloss. But then, again, in this compound motor the whole is cased in, and if that system were carried out there would be a great saving in all the motors, because no dust could work in at all; there is not a score on the side cranks of these compound motors, whereas on the ordinary motors they are cut away and riddled as though they had been cut with a tool in a lathe.

4640. Could the ordinary motors be boxed in to prevent the working parts being exposed? Not without total reconstruction of the design, because the wheels would have to be inside the frames of the ordinary

Baldwin engines instead of outside, as they are at present.

4641. Do you consider the framing of the compound machinery, being vertical, is much more liable to go

to pieces than the horizontal framing? No. 4642. You are quite clear in your implicit belief in these compound motors? I am; and I say that if fair play is given to this principle there is a great future before it, and the Government of the country will never regret adopting it.

4643. Mr. Suttor.] Do I understand you to say that this is the first compound locomotive you have seen?

4644. And there are only two or three others in the world? Yes.
4645. One of Mr. Webb's that you spoke of? Yes, and the one at Dusseldorf.
4646. They have not adopted these compound engines in England yet? No, but such favourable results have been obtained with Mr. Webb's engine on the North-western line—it takes the mail-train—that I am sure it is only a matter of time to introduce them generally.

4647. For a new engine you think this compound motor of Mr. Downe's works well? You have been watching the running of this combined motor and car on the line? Yes, with great interest, but I am only interested in its success as being a new thing, and as an engineer I think it is a good thing.

4649. What does it usually run with—one or two cars attached? It generally has one light car, besides its own car, when the traffic is heavy; but when the traffic is in its normal state it runs by itself.

4650. By what test do you compare it with the Baldwin motor—the fuel consumed? The fuel consumed I have not entered into, but the saving in the capacity and the cut off of steam at various degrees of expansion.

4651. Yours is a theoretical comparison? It has been borne out practically. You can scarcely say it is

theoretical, because these figures could not err to a great extent.

4652. Has there been any practical test made with regard to the consumption of fuel? There has, but I would not care to state it. That I would leave to any witness in whose department it may be.

4653.

4653. You said there would be a saving in compensation for damages—in what way? There have been a J. W. Cayzer. number of persons knocked down in consequence of the drivers not having a good look-out ahead, but in this compound engine he is right in front and can see everything.

14 Oc., 1884. 4654. Is it not a fact that in this combined motor there is only one man on the engine? Yes.

4655. And he has to attend to the engine as well as to look out? An ordinary driver should be always looking out.

4656. On the other motors the drivers have a man to assist them, have they not? Yes.

4657. In one case the driver has to look out and drive his engine, in the other a man is told off to look out? There is no extra duty, because the construction of the front of the car admits of his doing the

duty with ease.
4658. Is there any communication between the motor and the carriage? The carriage rests on a tubular

plate on the motor, and in addition it is provided with a safety link attaching it to the motor.

4659. That is not what I mean. Could the conductor or any passenger get from the car to the motor while in motion. Is there any communication at all between the motor and the carriage? No; except No; except by the driver getting out on to the track and then going to the carriage.

4660. In the event of anything happening to the driver—if he were taken suddenly ill or dropped dead—what would be the result? The car could be stopped by an outsider; I have done the same thing myself. The engine was moving slowly down a decline at a coke-house and I stepped up and put the vacuum brake on through the window.

He could work his way along the 4661. How could an outsider get on if there is no communication? The same objection applies to the Baldwin motor, because an outsider would scarcely know To save a man's wages we must put up with a trifling inconvenience in view of a casualty what to do. which might not happen once in twenty years.

4662. If anything happened is there any way in which the engine can be stopped? Only by the conductor working his way on to it; he could do it just as well as in the ordinary motor.

4663. But there is a second man on the Baldwin motor? Yes.

4664. Mr. Poole.] You spoke of Webb's compound engine;—is that a vertical engine? No, horizontal.

4665. Do you know of any case, from your own observation or reading, of a vertical locomotive engine now in use—of course 'I know Stephenson's original engine "Rapid" was a vertical engine;—but do you know of any vertical locomotive engine in later days? Yes, Chaplin's contractor's engine.

4666. I am speaking of a locomotive used to draw passenger carriages? Yes; Perkins' high-pressure motor, that is working on one of the Continental lines; it has a pressure of 600 lbs. to the square inch, and its three cylinders are vertical; Mr. Charles Brown's tramway locomotive, on the Barcelona Tramways, an engine of Merryweather, and Kitson's combined engine and car that we have here...

4667. Is it a fact that the Department has put Kitson's combined engine and car on one side? Yes, as

being too small.
4668. That has a 9-inch cylinder? No, 7-inch.

Mr. George Downe called in and further examined:-

4669. Mr. Poole.] There were a number of four-wheeled passenger cars at one time were there not? Mr. G. Downe.

4670. How many? I do not exactly know how many. I should think about forty.

All of them.

14 Oct., 1884. 4671. Some of them were afterwards converted into four-wheeled or double bogic cars? Al 4672. Can you tell us why the conversion was necessary? There was no absolute necessity.

4673. Do you know what was about the cost of converting them;—were you asked to furnish a return as to the cost? The tenders were called for and the alterations made while I was away in America. If I remember rightly the cost was about £70 a car, but I am not sure.

4674. Were you asked to furnish any report to the Commissioner as to the cost of converting the cars after you returned to Sydney from America? Yes, I think so. after you returned to Sydney from America? 4675. Did you furnish it? Yes, I think so.

4676. And that report would show the actual cost? Yes.

4677. Did you find that while the cars had only four wheels under them the flanges of the wheels were worn very thin? No.

4678. Do you know what were the reasons that led to their being altered? There was a public cry got up that the cars were unsafe on four wheels, because if one wheel broke the car might topple over, and yielding to that cry the Commissioner ordered that they should be altered into bogies.

4679. But in your opinion that was unnecessary? I was of opinion that the car was perfectly safe as it.

4680. Was that car your design? It was.

4681. Referring to the combined motor, is it not the fact that when the driver is inside and the door shut he is completely boxed in? He is boxed in.

4682. And it would be very difficult for anyone to get at him while the car was in motion? Yes.

4683. And there is no means by which the conductor can get from the car portion into the cab occupied by the driver? He can get in by getting on the side that is boxed up from the passengers. There is a step-plate outside.

4684. But the conductor would have first to get upon the road? Yes.
4685. And if the car were in motion he would have to get down, run along, and get up again? Yes, if he wanted to get into the front at all.

4686. If he wanted to call the driver's attention to anything? He could whistle:

4687. But supposing that unfortunately anything should happen to the driver—that he should be seized with a fit or paralysis, or in any other way prevented from cutting off the steam;—have you ever considered

what would happen to the passengers in such an event? Yes, the conductor could put his brake on 4688. Would that be sufficient? It would check the speed sufficiently to enable any one to get into the front. But if we look at all the railway experience of the world such an accident is very rare, and the risk is worth running if any saving can be effected by it. Such a thing is scarcely known to have occurred. 4690. And there have never been any disastrous results? I never heard of any.

Mr.

G. Downe.

14 Oct., 1884.

Mr

H. B. Howe.

14 Oct., 1884.

4691. What is the name of you foreman carriage-builder at Randwick? Mr. Davis.

4692. I suppose he would be able to form a pretty good opinion as to the cost of converting the four-wheeled into eight-wheeled cars? He should be.

4693. He is a man of pretty considerable experience, is he not? Yes.
4694. A very reliable man? Yes, that is, as far as his work is concerned.
4695. Chairman.] Are you in favour of the double-deck cars? That is a question I would answer straight off in this way: I am not, if you ask my opinion candidly.
4696. Why? Because I think a tramway system should be assimilated to an omnibus system, and that the

passengers should not be centralized; but they are an absolute necessity where people are centralized.

4697. Have you found from experience that it costs more to keep the cars in repair—that the wear and tear is greater in the case of double-decked than in the case of single-decked cars? I do not think so from our experience.

4698. Who would be the best one among your officers to inform the Committee with regard to the relative cost of maintenance? We can furnish you with a return showing the relative cost for the past

4699. How long will it take to prepare? You can have it by Thursday, or Friday at any rate.

4700. Will you furnish the Committee then with a tabulated return showing the class of carriage, whether single or doubled decked, the weight, the cost, the carrying capacity, and the number of wheels?

4701. Mr. Poole.] In consequence of the interruption to the traffic arising from vehicles and persons crossing the tramway, it is often necessary for the drivers to put on their brakes very suddenly, is it not? Yes.

4702. Then in the case of the double-decked cars that as a matter of course would cause a tremendous strain upon the car frame owing to the great leverage? There will be a strain decidedly.

4703. Which would not be felt by a single-decked car? Of course when you have the weight in the air

you must have the leverage of that weight.
4704. Have you noticed lately that some of the double-decked cars that have been some time in use are beginning to oscillate considerably when the brake is put on? I have not, neither have I had my attention called to the fact.

4705. Will you be good enough to look at them occasionally and see for yourself whether such is the case? I generally do look at them and often ride on the top, where I could perceive the motion if there was any.

Mr. Henry Bryant Howe called in and further examined:—

4706. Mr. Poole.] You remember that there were a number of four-wheel cars in use? Yes.

4707. Are there any in use now? No.

4708. They were converted into double four-wheel bogies? Yes.
4709. How many were converted? About fifty or fifty-one.
4710. What was the cost of converting them? I think that the contract price was £70.
4711. What did that include? That included the shifting of the fixed bolster and making the bogie frame—less the wheels and boxes. The wheels which were in use before were utilized and the other whoels which were required had to be supported. wheels which were required had to be supplied.

4712. Then two axles, four wheels, and two bogie-frames had to be found? One bogie complete.
4713. Two sets of bogie-frames had to be made? Yes, that was included in the £70; we had to find the wheels and axle-boxes.

4714. Were all the old wheels, axles, and boxes used? I believe that they were.
4715. If any of them had been thrown out the Department would have had to supply new ones to a corresponding extent? Yes.
4716. Was the work let by contract? Hudson Brothers had the job; it was all arranged before I went

into the Department I think.

4717. Then the conversion of each car cost £70—the Department finding wheels, axles, and boxes? Yes,

4718. Do you know whether any of the flanges of the wheels were worn very thin while they were running under the four-wheeled cars? Nothing particular was brought under my notice at the time. I know that they wear very thin now, and they have to be taken out, although they are thick on the tread. The flanges at times wear faster than the tread.

4719. How do you account for that? I attribute it to running around sharp curves and to the cars always being run one way—without being turned from end to end.

4720. Do you know what were the causes which led to the conversion of the cars from four-wheeled to eight-wheeled cars? I am not in possession of the particulars. I believe that the alteration was ordered by Mr. Copeland. The work was started just after I went into the Department.

4721. I believe that you were at the Railway previous to going to Randwick? Yes.
4722. And you are well accustomed to locomotives and all that appertains to them? Yes.
4723. Have you noticed the manner in which the driver is boxed in, so to speak, in the cab of the combined motor? I have.

4724. If anything were to happen to him while the motor was under steam which would prevent him cutting off steam, would it not be a difficult thing for any other person to get into the cab to cut off steam? It would.

4725. A very difficult thing? It would be.
4726. From that point of view does it not appear to you to be a somewhat dangerous experiment to be running steam motors through the crowded streets of the city with only one man in contact with the engine? There are certain risks about it.

4727. Is it not probable, owing to the frame of the motor itself having to swing underneath the frame of the car around curves, that if the driver should unfortunately happen to step down at such a time, he might step between the two and get his legs broken? I do not think that he could get his legs down very well. The casing of the motor comes out beyond the sides of the car or quite level with them, and the motor would have to swing back quickly, or make an "S" curve within its own length to do what you describe describe.

4728. If anything happened to paralyse the driver it would be very difficult for the conductor to get into the cab to cut off steam? Yes, it would be.

Mr. 4729. Far more difficult that B. Howe. of a Baldwin motor? Yes. 4729. Far more difficult than it is to get from the foot-plate of an ordinary carriage on to the foot-plate

14 Oct., 1884. 4730. Do you recollect last Sunday week—the 5th instant? Yes.
4731. Did not one of the combined motors break down on that day? Yes; one of them broke down

coming from Coogee.
4732. What happened to her? The valve-gear was carried away. It appears that a nut came off which allowed a bolt to drop out, and this caused the lever to drop and double it up.

4733. The bolt dropped out and the valve-gear became disarranged? Yes; it might have been caused through the nut not being tightly screwed up. There was a rush to get the engine finished for the

Saturday afternoon; this might account for it.

4734. Are not the bolts and nuts and ordinary gearing of the combined motors—the machinery being vertical—more likely to get disarranged than they would be if the machinery were horizontal, owing to the continual heavy concussion on the road? They are apt to shake loose in any engine. On locomotive engines sometimes the bolts and nuts shake loose all over.

Mr. John Halliday called in and examined:-

4735. Chairman.] What is your position in the Tramway Department? I am traffic foreman at the J. Halliday. Bridge-street vard.

4736. How long have you held the position? I have been a traffic foreman for about three years, but I have not been at Bridge-street all the time; I used to be at Redfern; I have been at Bridge-street about nine months.

4737. Where were you employed before you became connected with the Tramway Department? I was in the employ of the Omnibus Company.

4738. Have you had much to do with the combined motors? Nothing more than seeing them come in

and go out of the yard.
4739. What do you find with regard to their power as compared with the ordinary motors;—are they more powerful? No; generally speaking the combined motor only draws the car which is attached to it; occasionally on the Redfern line the motor has to draw an extra car.

4740. Have you ever drawn more than one car with a combined motor on the Coogee line? Yes. 4741. What was the result? When the Sunday traffic has been more than one car could meet, another

car has been put on; but generally they have to be shoved up by another motor. For the last six or eight weeks no extra car has been attached to the combined motor on the Coogee line.

4742. Has there been any difficulty on the Coogee line with the Baldwin motor with two cars attached? Sometimes, when the cars have been overloaded. For instance, last Sunday the cars had to be shoved up by a smaller motor than the one in front; whether the motor was short of steam or not I cannot say.

4743. Generally speaking, what is the result? The middle-class engine draws up two cars heavily laden. The small engine came up on Sunday with what we call the black car* and pushed up the other laden cars without sticking.

4744. Is it a usual thing for the Baldwin motors to stick? No, unless the motor is out of repair.
4745. You find that the combined motor cannot draw two cars up the Coogee line? She does not draw

two now. She was tried with two a few weeks ago, but it was always a case of sticking-up when two cars were on.

4746. What has been your experience of the combined motor on the Redfern line? I have had nothing

to do with it on that line beyond seeing it come in and go out of the yard.

4747. Have you seen any of them refuse to take up the load? I have heard of them breaking down.

They always start away from Bridge-street all right.

4748. Is it usual to run an extra car with the combined motor? That depends on the Railway end. If a heavy train comes in, and there is not room for the passengers in one car, another is hooked on; this car is sent back to Redfern, in case it should be required again.

4749. Have you found in the case of the combined motors that they have ever refused to take two cars from the railway? I have not seen it; I am at this end, not at the Elizabeth-street end. 4750. Are you always at Bridge-street? Yes.

4751. Then you know nothing, except from hearsay, of what takes place at any of the outside stations? With the exception of Sunday, when we go to regulate the tráffic at Coogee.

4752. As far as the traffic is concerned then you speak from your own experience? Yes.
4753. How long is it since these combined motors and cars have been in use on the Redfern line? I can scarcely trust my memory to answer that question. In the first instance there were two motors running, but recently two more have been put on.

4754. If any engine broke down on the road would it be reported to the Traffic Department? Yes.
4755. And you have to make arrangements for another engine to take its place? Yes.
4756. Have any such occurrences been reported to you in connection with the combined motors running between Redfern and Bridge-street? They have broken down, and they have telegraphed down for another engine. A couple of engines are kept there for the purpose; that is to say, if an engine breaks down, one of them goes out and takes up the running.

4757. Has this happened often with the combined motors? It appears to happen often in connection with them for this reason, that when anything happens it is to the car as well as to the motor; if there is a breakage to the car for instance, both the car and motor have to be taken off in order that the repair may be made.

4758. But I am speaking solely with reference to the motors? They have sometimes broken down.

4759. How often? I could not well say. A few weeks ago there was something breaking in one of them; it broke several times during the week.

4760. And you had to get another engine to replace it? Yes.
4761. If anything goes wrong with the car both engine and car have to be put aside? Yes. I have just explained that.

4762. Is it part of your duty to keep an eye on the carriages as well as on the motors? No; there is a

^{*} Note (on revision):—I cut the motor off and pushed the Baldwin motor up the hill, then came back and drew the load, the black car and another small one, up the hill.

MrJ. Halliday.

14 Oct., 1884.

car fitter who does that work; it is no part of my duty. If a man examines the carriages and says that

such and such a car is not fit to run, we cut her off.

4763. It is a fact, is it not, that up to within the last week or two when there were only two combined motors kept on the road, it was necessary, in order to keep these two running, to use the whole of the five or six motors? I cannot say. Two were kept running up to last Monday week; four were then put on the road, and they have been running ever since.

4764. With the two motors running was the obstruction to traffic greater than with the other motors? There were only two of them, and there were about fifty of the others. More notice would be taken of them if they were to break down. A man comes in for instance and says "Jumbo's broken down again." If the least thing happens to one of them the men sing out about it.

4765. What officer is there in connection with the Traffic Department who looks after the traffic generally outside of Bridge-street? There is nobody.

4766. No travelling inspector? No.

4767. Is there any other officer at Bridge-street? Mr. Gangey relieves me.
4768. Your experience at Coogee is that whereas the ordinary motors will bring up two cars loaded, the combined motors will bring up only their own cars? That is my experience; but the combined motor always has a heavy load.

4769. And it would take two combined motors to bring up the number of passengers which an ordinary motor would bring up? No. The combined cars carry more than one of the small 60-passenger cars. 4770. How many will they carry? Ninety, I suppose; of course, they have more roof room than the shorter cars.

4771. What does the combined car carry when the passengers are all seated? I should think about seventy; I am not certain.

4772. There is not so much standing room on one of them as compared with one of the other cars, when filled with passengers? I never rode on the top of one of them; I could not say. Of course the combined car would carry a lot more than ninety if it were overloaded.

4773. How many? I cannot tell; it depends upon the rush.

4774. Would it carry twenty more people if it were crowded? More than that. 4775. Would it carry thirty more? About that number I daresay it would.

4776. That is to say that when very crowded it would carry about 120? About that number.
4777. How many will each of the 60-passenger cars carry when they are very crowded? About eighty apiece

4778. When the two cars are crowded then it is a question between 160 and 120 passengers? There would be more than a difference of forty passengers between them when they are crowded.

4779. What do you think the difference would be? There would be standing room on the steps of the

smaller cars, and it would be very difficult to count the number of passengers.

4780. But the difference in the sitting accommodation is seventy as compared with 120? Yes.

4781. Mr. Sutherland.] Is there not a great loss of time in using the turn-tables for these combined motors and cars? It takes 4 minutes from the time they come into the yard to get them back to the platform again.

4782. Only 4 minutes? It takes about that; it takes 4 minutes without a car; if it has a car it takes 6 minutes. The one car and motor going out of the yard have four pairs of points to go over. Then again, with the cars attached they have to come over two more. They have to run out into the street, and to come back on to the No. 5 road; they pick up the car and draw it out into the street, and then they back down again alongside the platform. This takes nearly 6 minutes.

4783. Is it not a fact that the street is often blocked as far as Hunter-street, owing to the time occupied in turning the tables? At 9 o'clock in the morning, when there is a great rush, it will not take 5 minutes to block the street as far as Hunter street, sometimes we get blocked when the combined motors

minutes to block the street as far as Hunter-street; sometimes we get blocked when the combined motors

are not there.

4784. Is it possible to make the block in the manner to which I refer when only the ordinary motors are running? It depends upon how the time-tables run.

4785. But is it possible to take up the same time with the ordinary motors as with the motors which have to be placed upon the turn-tables? No; it takes 6 or 7 minutes to shunt one of the combined motors; a Baldwin motor can be shunted in about 2 minutes.

4786. Mr. Poole.] Suppose the motors you had in use were all combined motors, could you shunt them and run the same number of trains as you run at the present time? No.
4787. Nor anything like the number? No; No. 6 road is taken up altogether by the combined motors.
4788. How many men does it take to turn them? It takes two to turn them and do the car-cleaning.
4789. If you had four more running it would take two men at Bridge-street to do nothing but turn the cars? Yes.

4790. Does it occasionally happen that the motors get over the end of the turn-tables? No. 4791. Has it not happened on several occasions? No, it happened once. The men who looked after the turn-table did not put a chock under the front wheels; you could scarcely say that the motor came off the end of the table.

4792. I suppose you have never asked yourself how many turn-tables you would want in Bridge-street if the engines were all combined motors? No, we never asked ourselves that. We could not manage them

in that yard; it is not big enough.

4793. You would want a much larger yard? We should.

4794. Under the most favourable circumstances it takes 4 minutes to turn round one combined car, and you can shunt an ordinary motor in from 1 to 2 minutes? If we are in a hurry we can do that.

4795. Mr. Wright.] You are speaking of shunting the Baldwin motors—and what do you call shunting the Baldwin motors? If a car comes in it has to be cut off, and the man breaks it down another road. If a combined car goes down No. 6 road he breaks it down No. 5 road; it catches up the car and goes on

to the platform.

4796. Do you say that it takes 6 or 7 minutes—supposing the yard is empty—to turn a car? To hook on the car, get on again, and get down to the platform, may only take 4 minutes if she goes on to

4797. I am speaking of the combined motor without any car? About 4 minutes, because generally the driver has something to do to his fire

4798. How long as a matter of fact do they take to come out of the yard after they have gone in? Some-J. Halliday. times they are quicker than at other times.

4799. How long is the ordinary Baldwin with its one or two cars before it goes out? It all depends

14 Oct., 1884. upon the time-table. 4800. What is the average time? It depends upon the line. If he comes in late and he wants to make

up time, we shunt him on the top road.

4801. Is it not on the average 15 minutes? No. 4802. Do they average 10 minutes in the yard? Some 10—some less; it all depends upon when they

4803. Do they average 10 minutes all round? No, I do not think they will.
4804. You have four combined motors running between the yard and Redfern Railway Station? Yes.
4805. Do they do the work as satisfactorily as the Baldwin cars? They have done. I have heard no complaint since the four have been running.

4806. They carry an additional car when the traffic demands it? Yes.

4807. Are there any complaints of their breaking down? I have not heard of any this last week or so. 4808. As far as you know they perform their work satisfactorily between Bridge-street and Redfern? Yes, they do.

4809. You said that you had seen the combined cars stuck up near Coogee with a full load? Yes, coming up the hill from Coogee.

4810. Do you know the gradient there? No.
4811. Have you seen the Baldwin motor require a push up there? No, not there.

4812. Is it not a common thing for them to want a push up when going out of Bridge-street yard? Yes.
4813. You say that the Baldwin motor occasionally breaks down? Yes.
4814. I will ask you to think over this question: Do the breaks down of the Baldwin cars equal in number

the average of those of the combined cars? There is more notice taken of the combined cars.

4815. If you had an equal number of each kind of cars running would the average number of the breaksdown of the Baldwin cars equal that of the combined cars? I cannot answer that question at all.

4816. Is there any feeling of dislike amongst the men towards the combined cars? I do not know. They are all singing out about the "Jumbo's;" they do not like them.
4817. Do you think that the employment of fewer hands in consequence of their use may have anything to do with it? They say that as there is no look-out man on the engine if it runs over anybody it will

cost the Government a lot of money.

4818. Have you heard it said that if the combined motors were used much labour would be done away with? No.

Mr. George Smith called in and examined :-

Mr. G. Smith 4819. Chairman.] What is your occupation? Traffic foreman at the railway station.

4820. How long have you been there? Two years.

14 Oct., 1884. 4821. Where were you employed before you entered the service? I was with my father.

4822. You had nothing to do with tramways? No.

4823. Have you noticed the compound motor running between the Railway and Bridge-street? Yes. 4824. Have you paid particular attention to the number of cars that they will take? Yes, they take

4825. Is it usual to take two? No, the drivers do not like to take two.
4826. Why? I think they are afraid they will get stuck up if they get a heavy load on. They do jump sometimes in Elizabeth-street.

4827. That is a car in addition to the combined car? Yes. They stop, but they can start again if they put on the compound pressure. The drivers do not like to take two cars.

4828. Do they make the same objection with regard to the Baldwin motors? Not if they are in proper

4829. They do not object to two cars being drawn by the Baldwin motors if they are in proper condition? If they are in proper repair.

4830. Mr. Poole.] What position were you in before you were made traffic foreman? Conductor.

4831. For how long? From the year 1880.

4832. I suppose that if you order a driver to take another car he has to take it? Yes.

4833. You regulate the traffic there? Yes.

4834. I suppose you do not know anything at all about firing engines? No, there is a spare fireman there. 4835. He is kept at the Redfern Station to fire the engines as they come in I suppose? Yes. 4836. The drivers do not do that? No.

4837. What coal they use you do not know? No, there is a cokeman there.
4838. He looks after that? Yes.
4839. You have heard drivers complain of the combined motors? Yes.
4840. They do not like them? They do not like to take an extra car.
4841. They do not object to the motor? I never heard them.

4842. They do not like an extra car because they might get stuck up? Yes.
4843. Mr. Sutherland.] What is the name of the man who is in charge of the coal at Redfern Station? Daniel Manning on the shift that I am on.

4844. How many coal-men or coke-men are there? There are two. 4845. Only two? Yes.

4846. What is the name of the other? I do not know the other one.

Mr. Thomas Midelton examined:-

Mr. T. Midelton.

4847. Mr. Wright.] When you were before the Committee you gave the following evidence:—
"1279. Mr. Poole.] You were present at the trial of the pattern dump-car, when the Minister for Works was there, were you not? Yes, sir, at Darling Harbour.

1280. Did you then express to the Minister a favourable opinion as to the adaptability of the dump-car to our traffic purposes? I do not remember having done so. I do not think I spoke to the Minister at all until often we left the trial and mont remember. Minister at all until after we left the trial and went round the goods-shed. I do not remember expressing myself in favour of the car to him.

1281. Did you advise the Minister to purchase the cars? Certainly not.

1282. You are quite clear on that point? Yes, I am quite clear. If he had asked my opinion as T. Midelton. to purchasing the cars, I should have said decidedly not to purchase them. How could I do other
14 Oct., 1884. wise in the face of a minute like that in the printed papers?

1283. You are quite sure that you never expressed a favourable opinion of the cars to the Minister, or advised him to purchase them? I am quite sure of that, sir."

4848. You gave that evidence? Yes. 4849. Since you gave that evidence did you write me a note requesting to be allowed to see me? I wrote to you referring to two men who wanted employment, and in the same note I asked permission to have a

private interview with you.
4850. You got a reply to that note from me? Yes, appointing an interview to take place at the Públic

Works Office.

4851. Will you tell the Committee what took place there? You appointed Monday, and I went into the Commissioner's room to see if he was in but he was not. Our appointment was for any time before 11 o'clock, and as it was getting towards a quarter or 20 minutes to 11 I thought I would show you that I had kept my promise. I therefore asked the messenger to announce me to the Minister, and to state the fact that I wanted the Commissioner to be present while I had the interview. I was shown into his noon, and the Minister asked what I wanted to see him for I resid it was in reference to a my ten into his room, and the Minister asked what I wanted to see him for. I said it was in reference to a matter connected with the dump-cars, and that I did not care to say anything unless the Commissioner was present. The Minister fell in with that view, and I left the room. I then went into the Commissioner's room and waited some time, and the messenger again called me to the Minister's room. I forget what was said but there was nothing said about any business that was going to take place, except that I thought it best for the Commissioner to be present. I went again and waited till the Commissioner came in. I told the Commissioner that I had written a letter in reply to one from the Minister about two men who were applying for promotion, and that I at the same time asked for an interview with the Minister because I had a weight on my mind which was caused by a question asked by Mr. Poole. I have felt uneasy ever since. I asked the Commissioner to come into the Minister's room to hear what I had to say, and the Minister rang the bell for the Commissioner to attend. Shortly after that I was summoned again, and I said as follows. I said that I felt very uneasy in my mind from the time that Mr. Poole on the said as considering the said as follows. said as follows: I said that I felt very uneasy in my mind from the time that Mr. Poole put a question to me in this room with respect to advising the Minister about the purchase of the dump-cars, and that I had worried myself considerably over it; that I was under the impression that the Minister thought that I had advised him to purchase the cars, and that I wanted to clear the matter up. I think that the Minister's reply to that was: "Mr. Midelton, if you told the truth and acted in a straightforward way, you have nothing to fear."

4852. Did you say at that time that something had occurred to you which had slipped your memory at the time when you were giving your evidence? Yes, I did.

4853. And that that something was in relation to the underframing of the dump-cars? To the bogies. And I said: "Mr. Midelton, I suppose you have acted like me, you have given truthful evidence; therefore you have nothing to fear?" Yes, that is what took place.

4854. You said in your evidence in chief that no conversation took place between us; but you do remember now that a conversation took place? Yes; I have stated that in my evidence since, after I was reminded. From the time that Mr. Poole asked his question I have reflected on the matter. I remember saying something about the bogies.

4855. Do you remember what you said about the bogies? I said something in favour of the frames and

springs—nothing else.
4856. Do you remember on that occasion speaking to me in the strongest terms of admiration of the lightness and utility of it as against the bogie that stood under the G truck? I do not remember expressing myself to you to that effect, but I brought the G bogie for the purpose of showing the difference between the dump-car and the G waggon manufactured in the Colony. I had it loaded expressly so as to give the Commissioner an opportunity of seeing and comparing the two cars together.
4857. You do not remember recommending me to purchase the dump-cars? I am certain that I never

did that.

4858. Do you remember recommending me to secure the bogie? No, I could not recommend the bogie

being taken without the cars.

4859. Then, if any one in this Committee has sworn that you made the recommendation, I presume that they have sworn what is false? How could that be; I do not think I spoke to you directly but to the Commissioner, and you probably heard what I said to him.* I was not engineer at that time, I was

4860. Mr. Scott had not then resumed his duties? Yes, he had resumed his duties. I was requested to attend, but Mr. Scott remained in his office. I do not want to be put in a position to show that any man has

perjured himself.

4861. You were sent there by Mr. Scott? No, I had instructions from the Commissioner by writing or telephone, to be present at the trial at Darling Harbour, and I went there with the intention of seeing as much as I could.

WEDNESDAY, 15 OCTOBER, 1884.

Present:-

Mr. CHAPMAN, Mr. POOLE,

MR. SUTHERLAND, Mr. SUTTOR,

MR. TEECE.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Thomas Midelton called in and further examined:-

4862. Mr. Poole.] You stated in your evidence yesterday that you called the Commissioner's attention to the design of the bogic under the dump-car, and pointed out to him how much lighter and how much more T. Midelton. suitable it was than the bogic under our G truck? I directed Mr. Bourn to bring a G waggon down to Darling Darling

*Note (on revision):—I should be sorry to be put in the position of having to show that any one had stated anything false.

146

Darling Harbour when the dump-car was shown, when the Minister and the Commissioner were present. My object in doing that was to show the advantages of the lightness of the dump-car bogie, and other portions of the car, compared with the G waggon designed in our own Department. I am sure I spoke to the Commissioner about it, but I cannot remember whether I spoke to the Minister direct, but he might have heard what I said to the Commissioner. I remember saying something in favour of the bogie. I admire the bogie, and I admire other structural parts of the dump-car, and give it credit where I can, but as a whole, as far as the utility of the thing to the Department, I condemn it most emphatically, the same as I did at first. It is a light car I know, and there is credit due to the man who designed it, but as to the dumping arrangement, and its utility in traffic as a car to supersede all others, I do not see anything in it. 4863. Were you asked to give any opinion on the matters you have just alluded to at the time? No. I looked upon it as a show day. I was invited to attend, and I was holding the position of Locomotive Overseer at the time. I had no business to be there; it was Mr. Scott's business to be there, not mine. I looked upon it as an experimental thing, and in the same light as if I had been invited to dinner, and I was not going to find fault with the cooking or what was put before me. I said as much as I could to favour it, but where there was anything to say against it I left that out.
4864. I think in your evidence in chief you say you saw certain things about the dump-car which in your opinion were defective? Yes, I think I said that; I do see defects in it. 4865. As you thought it well to point out what you believed to be good about the dump-car, without being asked, at the time of the official inspection, will you explain why you did not at the same time call the attention of the Commissioner or the Minister to what you considered defects in it? I have just given the reason—because the people had invited me there; but I had already done it officially in this minute in the printed papers, written in April, 1883. In that minute I had done my duty as Locomotive Engineer.

The date is not shown here, but it is in reply to minutes of the Commissioner and the Traffic Manager. 4866. I find the original of your minute among the manuscript papers;—is the date that appears upon it (which is omitted in the papers as printed) the correct date for that minute? Yes, that is the correct

date; it is the same minute as printed here.

4867. In that minute you considered you had dealt generally with the question? I had discharged my duty as Locomotive Engineer, and I should have considered it pressing the matter if I had gone any further.

4868. Are you certain that you have been told nothing about the evidence given by the Minister before

this Committee? Yes, of course I am. 4869. By the plans which accompanied Mr. Huntley's letter of the 3rd October, offering to treat with the Commissioner for Railways for the right to use the system of coaling therein referred to, it is stated to be Midelton and Huntley's combined scheme;—are you the Mr. Midelton referred to? I am. 4870. Is Mr. Huntley your partner in this matter? No. I will explain the matter. In passing in the

train to and from his house at Petersham, Mr. Huntley saw the scheme I had partly introduced at Redfern on the coal-stage, and he called upon me several times and asked me to allow him to patent the scheme and allow my name to be used. I said yes, he could do as he liked; but I have had no profit out of it. Mr. Huntley has paid for the patenting of it, but there is no partnership whatever. Mr. Cowdery has done the same thing with his couplers, and I have followed his example. The Government has the benefit.

I have derived no benefit from it whatever, nor do I intend to claim any 4871. Is it your intention to make a claim against the Department for the right to use this scheme? No; I have already stated that I do not intend to do anything of the kind.

4872. Can you control Mr. Huntley's right to make a claim? No; Mr. Huntley, I am sure, would not do anything of the kind unless it was justifiable, or unless the Government feel disposed to compensate

4873. Are you associated with him in any other matter? No; I am not associated with him even in that. 4874. Chairman.] In the evidence, as printed, at page 55, question 1502, Mr. Cowdery is asked by the Minister for Works, "Would you consider that any officer present who saw anything that was decidedly deficient would fail in his duty unless he called my attention to it?" and his answer is, "Certainly. I know Mr. Midelton, in speaking of the dump-car—of the under-carriage particularly—drew attention to the style of it and pointed out how simple and good it was and that it was all that was necessary for a the style of it, and pointed out how simple and good it was, and that it was all that was necessary for a car of that description for carrying goods." Do you desire to make any explanation with regard to that? Any officer of the Department would naturally call attention to anything defective or dangerous, but I had already done that in my first minute of 17 April, 1883, as I have said before; and if I had done it again on that particular occasion I should have been offensive; I consider I should have been forcing my views on the Minister.

views on the Minister.

4875. Mr. Poole.] You consider you would have been doing something extra-official? Yes, and I would have run the risk of being checked; in fact I have been checked for doing my duty in that particular respect. I will tell you an instance: I had considered it my duty, when acting Locomotive Engineer, to give the Government the best of my experience. In the usual professional and gentlemanly way I called attention to the Eveleigh works particularly. The design of the Eveleigh works made by Mr. Cowdery himself in 1881 was entirely put on one side, and mine has been adopted. A second design, which was made by Mr. Cowdery from my design, has been put on one side also, and mine has been partly adopted; and I then so far got myself into such bad odour and unfriendly terms with the other officers that I have thought it prudent to leave off expressing my views. In fact the willing horse has been worked to death.

4876. In point of fact you have found it expedient not to volunteer advice? Yes, especially since I have gone back to the position of Locomotive Overseer. I had my own duties as Locomotive Overseer, the duties of Locomotive Engineer, and extra duties as Locomotive Superintendent for the tramways, all at the same time; I can show a good two and a half years work to anybody who cares to go into it; and I the same time; I can show a good two and a half years work to anybody who cares to go into it; and I think I ought to have an opportunity of defending my actions during my tenure of office.

4877. Can you tell the Committee the date on which you went back to your former position as Locomotive These printed papers show that Mr. Scott resumed office about the latter end of June.

believe the records will show that it was the 19th of June, 1883.

4878. Do you know the date of the test of the dump-car with billet-wood? I do not, but it was subsequent to Mr. Scott's resumption of office.

4879. Whatever may be the date to a day or two, you are quite clear that Mr. Scott had resumed his position as Locomotive Engineer prior to the test being made with the dump-car, when you were present, at Darling Harbour? Most certainly; I have no doubt of it whatever; and I well remember the unpleasant position I was placed in being there without Mr. Scott; I had no business there, and I did not want

147

want to go. Will you allow me to make an explanation. In these printed papers about the dump-cars, it is stated over Mr. Scott's signature of the 10/3/84, "I may also mention that the dump-cars would be specially suitable for dumping the coal on to the platform." Previous to that, on the 29/9/83, Mr. Scott made a similar recommendation; and that must have taken place with the full knowledge of my scheme being approved. Mr. Scott must have known being approved. Mr. Scott must have known being approved. being approved. Mr. Scott must have known, having seen the papers, that my scheme of coaling engines was approved, and that the Commissioner directed it to be carried out; and it seems to me rather queer that the recommendation should go for the dump-cars on the 29/9/83. There was a sketch with the papers showing the Eskbank arrangement. These are two occasions where the dump-cars have been recommended by Mr. Scott, and judging from the Minister's questions yesterday, it appears to me he thinks that I am the one that recommended them. I most emphatically deny that—I never recommended the car to any one.

4880. Chairman.] Is it true that you are now busy preparing roads, &c., for coaling arrangements at Goulburn? I am not preparing the roads, but roads have been laid in to my design by Mr. Cowdery, and the running shed for thirty engines has been designed by me, and is being erected under my superintendence, with the Commissioner's sanction and the Minister's sanction also. As I pointed out a minute ago, I advanced my views in my official position for the benefit of the Department, and I have a minute ago, I satisfy the stiels to those views if I consider I am nor position in the benefit of the Department, and I have a right to stick to those views if I consider I am perfectly right; and if anybody has anything better to advance I am willing to give way; but if they have not anything better to advance I will not give way. I have recommended certain arrangements at Goulburn, and I am quite willing to wait for successful results of what I have proposed. The Commissioner has approved of my scheme throughout, and wrote

very handsomely and complimentarily in support of my views.

4881 Mr. Poole.] In your opinion the Commissioner has thoroughly endorsed your views? He has most decidedly, from the beginning to the present time, but Mr. Cowdery is opposing me; he may think

with all reason, but I believe I have proved my case to be correct.

4882. The fact is that Mr. Cowdery does not approve of your system of coaling? There is no doubt about that, but he fails to show anything better. I might add that the contract price is considerably below Mr. Cowdery's estimate for my work.

4883. That is to say, the contract price for carrying out your views at Goulburn is considerably less than

what Mr. Cowdery estimated the work would be done for? Yes. 4884. Chairman.] How much less? I do not remember the figures exactly, but I think it was £13,000 against £23,000; but my contract price is £9,000. The shed is being built for £9,000 odd.

4885. Do you know of any cars that have been imported other than those included in the return furnished to this Committee; -are there any imported cars, now in the possession of the Railway Department, not included in the return of rolling stock already placed before the Committee by you: if there are, we desire you to place them before the Committee as an appendix to your evidence, in a similar return to that you have already given, with the cost and all other necessary explanation? I included in the return all the stock in our possession at present, except two Pullman cars recently imported, known as the Lady Parkes and Lady Robertson. I thought they were too recently in the service to be included, but if you wish to have them. I will give the same data for them if I can obtain it. They are two sleeping cars, Nos. 8 and 9. There are also two refrigerator cars lying at Eveleigh, one English and one American, and there was a car in use when I came to the country in 1880, an American box car, the body of which is now used as a workshop.

4886. In the return you will furnish the Committee with, will you be able to include any costs for alterations in these two special Pullman cars, Nos. 8 and 9? I would prefer your asking Mr. Scott for

4887. Mr. Poole.] I want you now to leave the subject of dump-cars and go to the combined and compound motors and cars. You have had considerable experience as a locomotive engineer? I have—I have done nothing else all my life.

4888. Have you examined the compound and combined motor and car now running on our tramways?

Yes, I have examined it casually since I got intimation yesterday.
4889. You have seen the general design? Yes.
4890. You know whether the machinery is vertical or horizontal, or at an angle of 45°? Yes.

4891. You have noticed the construction of the boiler?

And the general arrangement of the machinery throughout?

4893. Looking at the general arrangement of the boiler, do you think it is such that it would be economial the generation of steam? No.

4894. Will you explain why you think it is not economical for the generation of steam? I should say that a boiler like that would take water up with the steam. The steam generated from those tubes must necessarily escape somewhere. I should say the steam generated from these tubes would have a tendency to bring water up with it into the dome steam-pipe. I should not design a boiler like that myself. 4895. In general use do you think there would be a great danger of priming? I should think a boiler like that would prime.

4896. And it would not at all surprise you if you heard that in practice this boiler did prime? It would not.

4897. There ought to be a constant circulation of water all through the boiler? It is better if you can

4898. Will not the particular construction of this boiler cause considerable strain and wear upon the angle at the junction of the vertical and horizontal parts of the boiler? I should say there would be a great motion of water there. I should prefer making the boiler barrel a little bigger—more like a locomotive.

4899. Do you consider that, owing to the peculiar construction of the machinery and the piston valves it would be highly necessary, in order to obtain anything like the theoretical advantage claimed for the compound engine, that it should have dry steam? That is the essence of it—dry, hot steam, as hot as ever it can be kept.

4900. Dry steam at high pressure? Yes, and it must be kept hot, otherwise it is nowhere.
4901. Setting aside the theoretical advantages that may be claimed by using steam twice over, do you think that with this arrangement of the boiler and peculiar arrangement of the machinery any real advantage can be obtained by compounding? No, I do not see it.

4902. If that is so, could there possibly be any economy in the use of fuel? I should very much doubt that that would show economy in fuel.

Mr. T. Midelton.

15 Oct., 1884. Have you ever known in all your experience any successful experiment with vertical recommendation of the first.

4903. Have you ever known in all your experience any successful experiment with vertical regimes? No; in all cases they have been abandoned. It was the first idea—about the first.

4904. Was not Stephenson's original engine vertical—the "Rocket," now laid up in Kensington Museum? Not the "Rocket," but the original engine, which stands on a pedestal at Darlington station at this moment, has vertical cylinders, but they are I think placed inside the boilers and kept hot.

4905. Will you explain to the Committee the main reasons, in your opinion, why locomotive engineers

place their machinery in a horizontal position, or in a position nearly approaching the horizontal, in preference to a vertical one? To the true mechanic there is every reason for putting it horizontal, and every reason for not putting it vertical. You do not want me to go into details.

4906. I presume your answer may be taken to mean this: that horizontal machinery, other things being equal, works much more economically in locomotives than vertical machinery? Yes, with vertical

machinery it is almost impossible to get springs—elasticity—between the machinery and the road.

4907. The main connecting rod, working on to the crank-pin, gives a rigidness throughout the whole of the machinery in this case, which is obviated by horizontal machinery? Yes, by means of bearing

4908. And that has been found necessary, I presume, in order to relieve the engine from the effect of the constant concussion on the road, owing to the slight irregularities of the road? Yes.
4909. With vertical machinery it is impossible to avoid this constant concussion? Yes, I think it is.

4910. At any rate, with the machinery now in use on the combined motors it is not obviated? No, the machinery is solid right on to the road.

4911. Is it not a principle in locomotive mechanics that the action of the wheel on the road is precisely the same as that of a ram falling from a given height? Yes, a rail joint; it is just the same as striking it with a hammer.

4912. Then, from your experience, both as Locomotive Tramway Superintendent and also as Superintendent of locomotive rolling stock on the railways, do you not think that it is far more difficult to use vertical machinery upon a tram road with anything like reasonable success, owing to the difficulty of keeping what railway men term a good tip on the road, than it would be to use vertical machinery on the ordinary roadway? Yes, it is more difficult too keep the engine in repair, and more difficult to keep the road in repair.

4913. Taking a general view of the whole of this matter—the road, the cost of maintenance, combined with first cost—do you consider that it is possible for this kind of machinery, illustrated on this plan and also in the working model, to compete successfully with the description of motors known as the ordinary Baldwin motors? I should back the Baldwin motors for economy in every way against that, for both wear of the road and itself.

4914. Previous to the Government of this country authorizing the construction of these combined motors, were you asked to give an opinion upon the matter, by the Commissioner or any other of your superior officers? I was.

4915. Did you give an opinion? I did. 4916. Verbally or in writing? I think I gave it verbally—I cannot say whether I gave it verbally or in

writing.
4917. Will your memory enable you to state to the Committee the substance of that opinion? The substance of my opinion on that matter was the same as my opinion on the dump-cars. I wanted to know what advantages were to be gained by its introduction; and after examination of the design my opinion was that I failed to see the advantages claimed for it. Substantially I take that to mean that my opinion was opposed to it. I might add, too, that I reluctantly gave my opinion. I was asked by the Commissioner to give it, and I said that as a matter of etiquette I did not care to do it; I did not want to give an opinion on a brother officer's design, but I could not get out of it. 4918. The Commissioner pressed you for an opinion? Yes.

4918. The Commissioner pressed you for an opinion?

4919. And you gave that opinion? Yes.

4920. And that opinion, in short, was unfavourable to the compound motor and car? It was unfavourable. 4921. Then it is hardly worth while for me to put the next question; but under no circumstances could you feel justified in recommending the expenditure of large sums of money in the purchase of this particular description of locomotive stock? No. If he asks me again I shall say the same as I did on the first occasion. I do not yet see any advantage in it. If he asks me that again I shall say precisely the same as I am doing to you now. I am quite willing to discuss the question with any engineer who supports that view, but unless he can show me that two and two make four I cannot give way.

4922. It amounts to this: That your lengthened experience of locomotive machinery generally compels you reluctantly to give an opinion adverse to the use of this particular description of locomotive? Exactly so. 4923. Do you know, from your English experience, of any instances where locomotives are driven through the streets of a large city with only one person in charge? No, I do not.

4924. Independently of the merely economic aspect of the question, do you not think the Government are running an unnecessary risk in permitting steam locomotive machinery of any kind to be run through our streets with only one person in charge, on the ground of safety to the general public? There can be no question of the extra safety with two men. That is the only answer I can give. I place myself in a very curious position by answering such a question as that. For my own part I should certainly prefer two men to one: If two men are necessary on a locomotive running on a fenced railway, they are certainly preserved to a street realway without a fence.

certainly necessary on a street railway without a fence.

4925. But independently of that view of the question, is there not a considerable amount of danger and unnecessary risk run by the Government to the travelling public through having only one person in charge; suppose that person should become even temporarily disabled or unable to cut off the steam? Yes, no doubt there is that danger with only one man.

4926. Take an extreme case: If anything should temporarily paralyse both driver and fireman on one of the ordinary Baidwin motors, is it not a comparatively easy thing for the guard or any person from the street to get on to the foot-plate and shut off the steam, as compared with the difficulty of getting into the cab of this combined motor? Yes, the entrance is easier on the Baldwin motor than on this combined motor. What you speak of I think took place on one occasion with an engine that was allowed to run out of Pitt-street yard without any one on it; one of the firemen ran after it and stopped it. I think this combined car is slightly more complicated, and it would not be so easy to find the handle as with the

4927. Is not the engine boxed in all round in the combined motor? Yes, I think it is.

4928. Suppose, to take another view of this matter,—because it appears to me it is one that concerns the general public very much—suppose the conductor was aware that something was wrong owing to the engine not pulling up at the usual stopping place, would he have sufficient power by putting on the handbrake on the passenger-car to pull up the engine? Yes, on a fair bit of road he might hold the car but on an incline it is questionable if he could do so. It would depend, of course, upon circumstances.

4929. Did you notice the car attached to the motor? Yes, I did this morning and yesterday afternoon.

T. Mideltons

4930. Did you notice whether there was any deflection in the floor-line of the car? Yes, there is a deflection just where the truss rods end between the motor and the car.

4931. Is the deflection caused by bad workmanship or is it in your opinion inseparable from the design? You cannot blame the work.

4932. Then it is inseparable from the design? Yes.
4933. Is the deflection permanent? It is slightly but not so much as when leaded.
4934. Is that deflection likely to increase with the wear of the car? Yes, if it is not attended to. To my surprise I found that the sole-bar in one of the cars is going; it was fractured in the car I looked at this morning

4935. Has it gone right through? No, but it shewed a crack on the bottom edge where the tension is. 4936. The tension having been too great for it? Yes. 4937. Did you notice the number of that car? I think it was 103, but I am not certain.

4937. Did you notice the number of that car? I think it was 103, but 1 am not certain.
4938. I suppose, beyond taking this general look at the car and engine this morning, you have not paid any particular attention to the working of the motor and car? No, I have never paid the slightest attention to it.
4939. I have here a volume of Engineering, No. 29, of date 16 January, 1880. Here is a cut of a locomotive. Will you be good enough to look at that; you see the arrangement of the boiler? Yes.
4940. And the general arrangements throughout? Yes.
4941. Will you be good enough to look upon this section here—"Compound Motor or Steam Tramcar, Original Design," with the dates 12th February, 1883, and 3rd March, 1883. Having looked at the cut I have now drawn your attention to and at this sketch, will you tell the Committee if, in your opinion, there is any general resemblance between the cut in this volume and the design now before you? They are

is any general resemblance between the cut in this volume and the design now before you? They are

uncommonly alike—as near as can be.

4942. You think they are alike? No doubt about it, they are alike.

4943. Well, then, that being so; it is very hard for us, knowing that all these scientific works are generally read by engineers of every class-is it not a very hard thing for this Committee to come to the conclusion that this is a new and original design? Has that been stated, that it is a new and original design?

4944. Never mind whether it has been stated or not. Would it not be very hard to conclude that this is

a new and original design? I should not accept it as a new design or original, because I saw that when it was published in 1880.

4945. If anyone claims that this is a new and original design, under date March, 1883, in view of the cut there published in a scientific work in January, 1880, that statement would have to be received with a very great deal of caution? Yes.

4946. A statement made by anyone claiming this to be an original design? Yes, quite so. 4947. Mr. Suttor.] I understood you to say just now that you were asked by the Commissioner, when this design was submitted, to give an opinion upon it? Yes, 4948. Were you then told the design was original?

No. The design was lying on the Commissioner's table, and he asked me to give an opinion on it. He told me it was Mr. Downe's design, and I then said I did not want to give an opinion on it; but, as I have said before, I ultimately gave an opinion reluc-

4949. Do you recognize the sketch Mr. Poole has shown you as the same that was before the Commissioner? Yes.

4950. Did it then strike you that the design in *Engineering* was similar to it? Yes, of course. I remembered this, and another similar to it, being published in that paper or the *Engineer* previous to seeing this.

4951. You recognized what was said to be Mr. Downe's design as being similar to one of these? Yes. The valve-gear is Joy's patent gear; that is a separate matter altogether.

4952. In giving your opinion to the Commissioner did you give your objections in detail? No, I do not

think I did; I did not think it was necessary. 4953. You simply said generally that you did not think it was a good design? I said I did not see what the advantages were. If Mr. Downe can show me its advantages I will give it my support. I said so

the advantages were. to Mr. Downe himself.

4954. With regard to the car you inspected this morning;—is the sole-bar, which you say was cracked, a very material part of the car? It is the principal part. Here is the drawing of it. (Witness explained) by reference to sketch.)

4955. You say that is an important and material place? Yes. It will want looking to soon, if not to-

4956. Did you see how far the fracture had extended? I could not get my head low enough down to see

4957. Are we to conclude that the running of this car is not safe, in your opinion? It will certainly go if it is not strengthened. I would not like to say it is unsafe, because that is a word which is startling. I do not want to say that.

4958. I think you ought to say it, if you think yourself justified in doing so, out of consideration for the travelling public? I have stated the fact.

4959. Mr. Poole.] In your opinion, the car at the position you have indicated shows such signs of weakness that it is necessary for it to be constantly inspected? It wants constant inspection, or extra support.

4960. Mr. Suttor.] In making your calculation of the amount of fuel consumed by the motor or engine, would you have to take into consideration the amount of load carried by the engine? Certainly the test would you have to take into consideration the amount of load carried by the engine? Certainly, the test of consumption of coal is value received;—what is done with it. If you burn a pound of coal you want as much theoretical and practical duty out of that pound of coal as you can get; and the question resolves itself into work done in any engine, whether compound motor, or locomotive, or any other engine. For every pound of coal burnt you should develop so much power. Now the question is whether that engine is developing the power that ought to be got from the coal consumed by it. I cannot answer that question because I have no data. You want to know the actual conditions of each test, or otherwise you can prove nothing.

T. Midelton.

4961. Mr. Poole. You want to reduce the whole thing to foot-pounds? Yes.

4962. I think you mentioned Mr. Webb's compound engine. You are aware that Mr. Webb is running his compound engine on the London and North-western line? Yes.

15 Oct., 1884.

4963. How long has that been running? It has been in hand about two years. The London and Northwestern is a very level line, and therefore suitable for such an engine, which would run upon it under very favourable conditions.

4964. You have watched the history of that particular locomotive? Yes, very closely.
4965. Has it given satisfaction? It has not, in my opinion. Mr. Webb thinks he is getting great results, but every other engineer proves that he is not; for instance, Mr. Stroudley, on the Brighton line, and Mr.

Stirling, on the Great Northern Railway.

4966. How have they proved that it is not working well in England? For economy.

4967. Have they run it on their lines? Yes, Mr. Webb has put his engine on other Companies' lines, with his own man and his own coal, and has failed. I do not see how it could be otherwise.

4968. Mr. Suttor.] Can you give the Committee any expression of opinion by any authority in England, upon the working of Mr. Webb's compound locomotive? Yes, The Engineer, of 26th October, 1883, speaking of Mr. Stroudley's new express engine on the Brighton line, says, "If the performance of this engine be compared with that of the compound locomotive of Mr. Webb, it will be found that the advantage claimed for the latter does not come out very prominently."

4969. Although this engine of Mr. Webb's has been running for two years, and has been thoroughly tested, so far as you are aware no other engine of the same pattern has been made? No; and I do not think he will make any more himself.

think he will make any more himself.

4970. In your opinion this compound principle is not a success? That is a fact; it is not a success. The essence of compounding is keeping the steam and cylinders hot, using very high pressure steam, and condensing the steam after you have done with it.

Mr. William Scott called in and further examined:

Mr. W. Scott. 4971. Mr. Poole.] I believe you received a summons from the Committee to appear here this morning; in that summons was the nature of the subject you would be questioned upon stated?

15 Oct., 1884. 4972. What was the subject mentioned? Mr. Downe's motor.

4973. The compound and combined motor and car? Yes.

4974. Did you examine the motor and car? Yes, I looked at it externally.

4974. Did you examine the motor and car? I es, I looked at it externally.
4975. Did you examine it sufficiently to enable you to give the Committee an opinion as to its merits or demerits, compared with any other description of locomotive engine? To a certain extent.
4976. Did you examine the construction of the boiler? Yes.
4977. You recognize that sketch (on the table) as an outline of the design of the boiler? Yes, I believe

that is correct.

4978. Do you notice the high-water line shown there? Yes.

4979. That is some considerable distance up the vertical boiler, above the level of the top skin of the horizontal boiler, is it not? Yes.

4980. You have had considerable experience of locomotive boilers and machinery? Yes.

4981. Is the arrangement shown upon this drawing, in your opinion, an economical one for the generation of steam. I want to call your attention to the high-water line, and that the water in the vertical boiler fills the whole space between the top and bottom skin. Do you think that is an economical arrangement for the generation of steam? I should prefer a larger barrel.

4982. Would you not prefer a barrel with a clear steam space between the top of the tube and the top skin of the boiler? I think I would prefer it.

4983. You have noticed the arrangement of the machinery—the pistons and cylinders? Yes.

4984. Is that (referring to model in the room) a working model of them? I have not seen them dissected. 4985. That is something like them? I believe it is, as far as I can judge.

4986. It is part of the principle of this machine that the steam should be used twice over? Yes.

4987. Is it not very essential where steam is used twice over that the steam should be exceedingly dry

4988. Do you consider that (referring to sketch) a good steam space to leave between the high-water mark and the top of the steam chest? Yes, if you have sufficient heating space to generate steam.

4989. Without going into the matter closely, you would not be able to give the Committee any decisive opinion as to whether there is sufficient steam space or not? No, I should like to go into the matter. 4990. At the first glance you could not tell the Committee? No.

4990. At the first glance you could not tell the Committee?

4991. Provided you have sufficient heating space, you think that steam space is sufficient? Yes, the dome space is sufficient.
4992. You see the arrangement of the machinery here is vertical? Yes.

4993. In your experience, do you know of any example where vertical locomotive machinery is in use? In Wilkinson's locomotive the cylinder is vertical.

4994. And the valve and connecting rods vertical? Yes.

4995. Where is that used? In England and on the Continent I think there are some being built; I find since that Messrs. Beyer, Peacock, & Co. have manufactured some for use in Lancashire, North

Staffordshire, and Java, and have erected special shops for manufacturing them.

4996. Can you tell us in what way they are being used? I could not just at present.

4997. Do you think, from your knowledge of machinery generally, especially locomotive machinery, that vertical machinery will work as economically as horizontal machinery? I should prefer it horizontal, but

with the present arrangement for compounding, I do not see that it could be applied.
4998. Irrespective of compounding, you would prefer horizontal to vertical machinery? Yes.
4999. Will you explain to the Committee why? In the first place, being vertical, the blow down is direct into the road.

4500. The concussion? The concussion.

4501. And back from the rail on to the engine? Yes.

4502. I think you wish the Committee to understand that where there are inequalities at the jointing of the rails the whole force of the blow would be thrown back upon the working parts of the engine? Yes.

5003. Would not that necessarily tend to throw the machinery out of adjustment? It would tend to Mr. W. Scott. give it considerable concussion and strain? Yes.

5004. Does it not follow, as almost a matter of course, in fact as an absolute certainty, that the cost of 15 Oct., 1884. maintenance will necessarily be greater with vertical machinery than with horizontal machinery? believe it would.

5005. As to the compounding or using the steam twice over, do you see any practical advantage to be gained by these short-stroke engines without condensers in using the steam twice over? I cannot see where the advantage is.

5006. Then, in the first place, your long experience leads you to the opinion that there is no economical advantage to be obtained by using the steam twice over with these short-stroke locomotive engines? No, I do not think there is.

5007. Secondly, that it follows that the maintenance cost for vertical machinery, whether it compounds or not, other things being equal, must necessarily be greater than for horizontal machinery?

5008. Was your opinion ever asked with respect to the value of this design before it was approved of by

the Commissioner for Railways? No; I was not in the Colony.

5009. Had you been asked to give an opinion, with the whole weight of your responsibility due to your position, could you have advised the Commissioner to order one or more of these machines? It requires some consideration.

5010. I am speaking on economical grounds? On my own responsibility, I do not think I should.
5011. Have you ever seen a similar design to this anywhere? Not quite the same.
5012. But in its general outlines? I have seen a design similar to that, in the boiler especially, in some of the engineering works.

5013. I would ask you to look at this volume of Engineering, the 29th volume, under date 16 January 1880. Here is a cut at page 46, to which I call your attention—a cut showing a vertical locomotive. Will you be good enough to tell the Committee if you see any general resemblance between that cut and the design here on the table, now before the Committee? The boiler is similar, but I see no outline of the engine.

5014. The boiler is similar? Something similar.
5015. The outline of the boiler is similar to that shown on this sketch? Yes.

5016. Was there not a vertical engine out here, called the Kitson engine, running on the tramways? Yes, I believe that was a vertical engine.

5017. Do you know whether that was considered a success or not? I really could not say.

5018. It was not brought under your notice? No.

5019. Have you noticed the cars attached to this motor? Yes.

5020. Did you notice any weakness anywhere—whether the floor-line was deflected beyond the horizontal line or not? I did not.

5021. You did not examine the general construction of the car? No, not minutely. 5022. Did you examine the heating space at all, the fire-box and tube? No.

5023. Beyond the opinion you have already given the Committee, you are not prepared to go into any further details upon the subject? No, not at present.
5024. Will you kindly inform the Committee on what date you resumed duty as Locomotive Engineer after your return from England? When examining the records of the office I found that the first minute I signed after my return was dated 11th June, 1883.

5025. You could not say whether you resumed duty before that date? No, I could not, positively. 5026. Will you endeavour to supply the date more definitely? Yes, if I can. I cannot positively say upon what date I resumed, but from the records of the office I have every reason to believe it was on

Monday, 11th June, 1883.

5027. I should be glad also if you can ascertain the date of the trial of the dump-car, when it was loaded with billet-wood, at which trial I believe you were present? I will, if possible. I was not present on the occasion when the dump-car was loaded with billet-wood, and from the inquiries I have made of the officers of this branch who were present, the date was I believe either the 7th or 8th June, 1883.

Mr. Henry Walker called in and examined:-

5028. Chairman.] What is your position in the Tramway Department? I am a driver on the Redfern

H. Walker. 15 Oct., 1884.

5029. What motors do you drive? I have been on several—Nos. 70, 71, 72, 73, and 75. 5030. They are compound motors? Yes.

You are still driving a compound motor? Yes. 5031.

5032. How long have you been driving the compound motors? Since they were first put on. 5033. Prior to that you were driving Baldwin motors? Yes.

5034. Will the compound motors do the same amount of work as the Baldwin motors? No, I do not

think that they will, judging by my experience of them so far.

5035. What number of cars do you generally take from Redfern to Bridge-street? Generally one; but sometimes we take two. If we have two cars we cannot keep time; we generally get behind. We oftener take one than two.

5036. Has the compound motor ever refused to act with two cars on? Several times. 5037. That is going up Elizabeth-street? Yes; I have engine No. 73 now, and there is

Yes; I have engine No. 73 now, and there is scarcely a day but what I get stuck up at Goulburn-street if there are two cars on and they are well loaded.

5038. Mr. Poole.] That is about half-way up the incline? The pinch is on the lower side of Goulburn-

street just before crossing.

5039. Chairman.] What quantity of fuel do you generally use? When the new valves were put in we used to use from $4\frac{1}{2}$ to 5 bags of coke, but after the motors have been out a few days the quantity gets higher, from 5 to 6 and $6\frac{1}{2}$ bags.

5040. What is the weight? Each bag is supposed to weigh 1 cwt. At present I am burning $7\frac{1}{2}$ bags.

5041. Mr. Poole. Is that in one shift? Yes.

H. Walker.

5042. How many hours do you work in a shift? I leave Randwick in the morning about 5.35 so as to H. Walker. leave Bridge-street at 6.5, and I am relieved at 2 o'clock. I run about nine trips to and from the station.

5043. How many hours are you engaged altogether? We are supposed to work 9 hours, but it all depends on the shift; one week we have a long shift and the next week a short shift. The morning shift is the shorter of the two.

5044. Then every 9 hours you use $7\frac{1}{2}$ bags of coke? Yes; as much as 9, 10, and 13 bags have been used in 9 hours.

5045. Have you used that quantity? Yes, before the new valves were put in. 5046. Since then you have been using $7\frac{1}{2}$ bags? Yes, but it is rising higher now. 5047. What has been the largest quantity which you have used in 9 hours? I that is in addition to about 2 cwt. of coal which I use at starting in the morning. I am using $7\frac{1}{2}$ bags now;

5048. What quantity do you use on the ordinary Baldwin motor in the same number of hours? The average is about six bags; that is the quantity I used; some only use five, but it all depends on the condition of the engine.

5049. They have an allowance of coal the same as the other motors? Yes, some of them carry 4 or 5 cwt.

of coal on the footplate.

5050. What do you think is the difference in the quantity of fuel used by a compound motor and a Baldwin motor in nine hours? I never use coal on the compound motors throughout the shift because they will not burn coal very well. When I get to Redfern in the morning I take out the coal and start a coke fire. We have all tried coal fires but they do not answer; there does not seem to be sufficient draught. There are some of the Baldwin motors which do not burn coal very well. I think that it -must be on account of the construction of the fire-boxes.

5051. I understand that from your experience as a driver of both classes of engines you say that the compound motors use more coke than the Baldwin motors? After a few days running they do. When they first came out with new valves they did not use as much coke as the Baldwin motors, but after running two or three days—two days—they have used more. What I mean to say is, that they get out of order sooner than the Baldwin motors, and then they use more fuel.

5052. How many cars do you generally take with the Baldwin motor from Redfern to Bridge-street?

5053. Always? Not always, but it is seldom that we run with one.

5054. Do you find that there is any difficulty with the Baldwin motor in taking two cars from Redfern to Bridge-street? There is with the small motors unless the two cars which are attached are single-decked. 5055. Is there any difficulty with the large and middle-sized motors? No; they will pull two cars; they do it every day

5056. Do you find that the compound motors get, out of order very often? Yes, very often.
5057. How long will they run without being taken into the shop for repairs? I have run them two or three days, and then they have been fit to go into the shop again. It is very hard work to get along with them then.

5058. Where do they generally break down? They generally blow through.
5059. What do you consider is the cause of that? I could not exactly say. Nearly all the engines now on the road are blowing through.

5060. Cannot that difficulty be overcome? They keep trying to do so.
5061. How long will the ordinary Baldwin motors run without being taken to the shop? It is seldom that they blow through unless they have been running for some months. I do not know, during the whole time I have been driving, that I have had one of them blow through.

5062. How long do they generally run without requiring repairs? They run from eight and nine to ten

months before they get overhauled.
5063. Mr. Poole.] That is with the exception of the side-rod brasses? Yes; they require to be attended

to frequently on account of the sand.

5064. Chairman.] How often are they taken into the shop for small repairs? Generally there is something to do every second or third night; it depends on the road. Some roads are very bad—the Newtown road especially—and in the case of engines running on these roads the brasses require to be reduced oftener than those of engines on other lines.

5065. How long does it take to do that? The side-rods on both sides are done in one night, besides other

little jobs.

5066. But in the combined motors there is very great difficulty, I understand? Yes, I cannot see how we are going to get along with them at all. I was on the first that was used; I was on it all the time it was being tried at Randwick.
5067. Mr. Poole.] You went out with the first motor? Yes, I was out at night mostly, running up the

Coogee Hill with it.

5068. Did the engine prime? Yes, she primed badly.
5069. Does she do so now? Yes, you can constantly see the water dropping from the cylinders down the

piston-rods.

5070. More or less she is always liable to prime? Yes, you cannot come up the hill without you see the water coming out of all parts.

5071. The pressure of the piston forces the water out of her? Yes.

5072. Is that the case with the other motors? No, unless you have a full boiler. 5073. With ordinary care you do not run any risk of priming with them? No.

5074. But you have to be exceedingly careful with the combined motors to prevent excessive priming? If you have two loaded cars on you have to carry a great deal of water, because often enough you have to stop, and then you have to open the cylinders, and thus before you get to Liverpool-street all the water and steam are taken away.

5075. Have you ever lost the fire-plug? No.

5076. Have you heard of the fire-plug being lost? I have.

5077. I suppose that was through priming? Yes.

5077. I suppose that was through priming? Yes.
5078. The engine threw all the water out of the boiler, and the fire melted the fusible plug? Yes.
5079. In answer to the Chairman you said that after the combined motors had been out a day or two you used about $7\frac{1}{3}$ bags of coke per shift, and that in your opinion the Baldwin motors do not use as much as that;—what kind of Baldwin motor had you in your mind when you made that statement—the large one or the small one? The ordinary medium-sized one, which we have on the Redfern line.
5080.

5080. I suppose that your mate would use about 7½ cwt. of coke in his shift? Yes, perhaps a little more. 5081. Then in the two shifts you would use from 14 to 16 cwt. of coke per day, in addition to the coal which is supplied for lighting up with? Yes.

Mr. H. Walker. 15 Oct., 1884.

5082. Have you had any difficulty with the valves and valve spindles? Yes, a few have bent. 5083. How often has that happened while you have been driving? I have had two bent, and a third slightly bent.

5084. Have you had any broken? No. 5085. Do you know the cause of the bending? I think it was owing to the heavy pressure of steam.

I did not consider the spindles strong enough, but we have had them strengthened since.

5086. The stuffing-boxes have been opened, and larger spindles put in? Different spindles have been put in, and a strengthening bracket put in the centre.

5087. But even now, with all the improvements which have been effected, you find that after the motors have been running a couple of days there is great difficulty in getting along the read with them and have been running a couple of days there is great difficulty in getting along the road with them, and keeping anything like a fair head of steam? It is very difficult; we cannot give satisfaction to our superior officers or to the traffic.

5088. When you have to take a second car you have great difficulty in running to time? We have. 5089. I suppose you would far sooner drive a Baldwin motor than a combined motor? There is not half as much trouble on the Baldwin motor.

5090. Is there a man to do the firing at Redfern station? There has been a man to do it since the four motors have been out, but when only two were out we had to do our own firing. Of course we are held responsible. We have generally to attend to the fire after the man puts the coke on. 5091. When you reach Bridge-street you have to turn the motor round? Yes.

5092. How long does that take? About 3 or 4 minutes, sometimes it is longer; sometimes the men are away cleaning cars, and we have to wait.

5093. How many men do you have to turn it around? Two, but I have known it to take as many as seven and eight, and even twelve; but it has been easier since the table was altered.

5094. The number you speak of would be when the table was stiff and a little out of adjustment? Yes, it would be out of order.

5095. Have you ever asked to be relieved from driving the compound motor? No; I have not asked. 5096. Is there any saving in the oil used? Yes, I dare say there is a little. 5097. But you think that there is not the slightest saving in the fuel? I do not think so. 5098. On the other hand, after the first day or two of use, the combined motor in your opinion uses more fuel than the ordinary Baldwin motor? I think so.

Mr. Thomas Rawlings Osborne called in and examined:

5099. Chairman.] What is your position? I am an engineer, but at the present moment I am a motor-

Mr. T. R. Osborne. 15 Oct., 1884.

5123.

5100. You have served your time as an engineer? Yes.

5101. How long have you been driving motors? A little over three years. 5102. What motor are you driving at the present time? No. 71. 5103. One of the compound motors? Yes.

5104. Do you experience any difficulty in taking more than the car itself from the railway station to Bridge-street? I have had no difficulty so far, but the loading has not yet been very big for a test. 5105. What loading has there been? Each of the cars have so far been about half-full. 5106. Have you had more than one car? One car as a rule.

5107. Have you tried two? Yes.
5108. With what result? The cars have not been fully loaded. There has been, perhaps, half a load in each car. There has only been about half the complement of passengers, so that I have not been able to get a thorough test.

5109. Have you found any difficulty in getting to Elizabeth-street? Not so far.
5110. What quantity of fuel do you use? I think the first day I was out I used about $4\frac{1}{2}$ bags, that is, $4\frac{1}{2}$ cwt. That would be from half-past 7 o'clock in the morning until 4 o'clock in the afternoon. Of course there would be a fire brought out from the sheds, but that would not be counted. We only count the coke which we actually take after we leave the shed.

5111. Supposing you have any coke in the motor at the time you start? None of that is counted. 5112. What quantity do you usually have when you commence? I dare say there is sufficient to bring us down from the racecourse to Bridge-street, and from Bridge-street to the railway. We burn 4½ cwt. after we leave the shed.

5113. How much do you burn from half-past 4 until the last trip at night? I have burnt five and six

bags; last night I burnt six.

5114. That would be about 10 cwt. in the day? Yes. The first day I was out I burnt $4\frac{1}{3}$ cwt.; the second day I burned 5. For two days in succession I think I burned 5. Now it has gone up to 6.

5115. You found it necessary then to increase the quantity of fuel? It appears so.

5116. What is the greatest quantity you have used from half-past 4 o'clock until the last trip at night?

Six bags.
5117. What quantity would be used for the Baldwin motors on this trip to the railway? I could not say.

The railway I have been driving a compound motor. I could not speak with certainty therefore as to the quantity which is burnt on the railway trip by the Baldwin motors.

5118. Mr. Poole.] When you come out from Randwick you have a certain amount of coke on the foot plate which is not counted against your running? No, that is not counted on the sheet.
5119. Only the coke you receive from Redfern? Yes.
5120. So that if you happen to have a bag of coke on the foot-plate when you go to the station at Redfern that would not count against the day's delivery? No.
5121. Who fires the motors up ready for your use at Randwick? They are ready when we go to the sheds in the morning. The cleaner is supposed to see that all is ready.
5122. If you had a full fire when you started you would not require to fire again going down to Relfour 2.

1043--- U

sheds in the morning. The cleaner is supposed to see that all is ready.

5122. If you had a full fire when you started you would not require to fire again going down to Redfern? No; but it would not be safe to come away without a little coke to spare.

Mř. Ť. R: Ösborne.

5123. I suppose you usually have from half a bag to a bag of coke on the foot-plate? Yes, lately we have been starting with coal

15 Oct., 1884. What run were you on before you were appointed to run the compound motor to Redfern? Moore Park to Raindwick and Coogee Bay.

5125. Is that a lighter or a heavier run than the Redfern line? It is much heavier if you go to Coogee. 5126. What kind of motors do you use on that line? One of the Baldwins. 5127. One of the heaviest ones? No, one of the medium class.

5128. And would your mileage be greater on the Randwick and Moore Park line per shift than on the Station run? Yes.

5129. Much greater? Yes.

5130. And the passengers per trip would be greater in number? I should say they would be, judging from the experience I have had in eight days on the Redfern line.

5131. Is not the Redfern line looked upon by the drivers as being one of the lightest lines to run? Yes.

5132. One of the very lightest? Yes; of course there is only the bank in Elizabeth-street.
5133. But that is only a short bank? Yes, and there is also the little piece going across from Bridgestreet; but we have to encounter that.

5134. About how much coke per shift would you use on the Moore Park shift? It would depend entirely on the state of the motor.

5135. But taking the average? On the average we might burn from eight to nine bags a shift.
5136. But your mileage would be considerably more? Yes; of course if you went to Coogee Bay the mileage would be still greater than running to Moore Park; if you stop running at Moore Park, and another motor takes it up there, the mileage would be less, and you would burn less fuel than if you went through to the bay. If you took one or two trips through to Randwick you would burn one or two bags of coke more. The grade from Coogee Bay to Randwick is very much heavier, and with a light motor

you are bound to keep up a good fire.
5137. Although you do not drive the ordinary motor on the Redfern length, from your experience of them do you think they would burn more fuel to do the same amount of work than is burned by the compound

motors? As far as the average goes I do not suppose they would burn more.

5138. According to your opinion then, there cannot be a very great saving of fuel by the use of the compound motor? Not under the present system.

5139. You have told the Committee that when the motors go out from the repairing-sheds, or when they have had an overhauling, you can do a shift with about four and a half bags of coke. I suppose when you referred just now to your burning four bags in the first day, you meant that the motor had just come out? Yes.

5140. But you increase your fuel up to six or six and a half bags in a shift? Yes.
5141. And you have been driving only nine or ten days? Only eight days; this should be my ninth day.
5142. You have had the same motor? Yes.

5143. And you find the consumption increases slightly every day? Yes. I could not say what we burnt last night, not being at work this afternoon. I have not my coke docket. On Monday we burnt six

5144. Had you any difficulty through the engine priming? No great difficulty as to her priming. That

is not a very great drawback.

5145. What in your opinion is the cause of this gradually increased quantity of which is necessary to keep up the supply of steam day by day? Am I to understand you this way, that the construction of the

motor is bad, or that there is extra wear and tear?

5146. The question is this: You informed the Committee that when you first began to drive, the motor did its duty with four and a balf bags to the shift; you have said that that has increased by two bags per shift;—what is your own idea as to the cause of that? Of course it would be waste of steam over and above what is necessary to drive the motor.

5147. And what is that waste caused by, in your opinion: of course if you do not know or if you are not sure you need not say? Of course we are outside and we cannot very well look inside to see. We may

have an idea as to what is wrong, but then we may be wrong ourselves.
5148. Would your ears not guide you as to the cause? In a manner of speaking they would. The construction of the piston-valves in these motors is such that it would be sometimes almost impossible to say with certainty whether the valves were blowing through or whether it was the packing between the valves. It would be necessary to take them out to see.

5149. The steam escapes through from the boilers without doing full duty on the piston-head? That

would be waste of steam.

would be waste of steam.

5150. In ordinary phraseology the engine would be blowing through more or less? Quite so.

5151. Have you any difficulty with the valve-rods? Not yet.

5152. Are the valve-rods of the engine you are driving of the same strength as they were originally designed to be, or have they been strengthened here? I could not say.

5153. You know the cast-iron that spans the boiler upon which the two sets of cylinders are bolted;—
has it shown any signs of weakness yet? Not yet.

nas it snown any signs of weakless yet? Not yet.

5154. Has it been strengthened by wrought iron plates being bolted on to it? I could not say whether the plates were put on here, but there are plates on it.

5155. You have been on the run out to Newtown and Marrickville I presume? The engines run from Newtown and to Newtown again without a fresh supply of water. I am speaking of the ordinary Baldwins. That is to say they do not get their water at the Bridge-street sheds? Not as a rule.

5156. The water you obtain at Newtown brings them into town and takes them back again?

5157. I am speaking of the medium-sized motors; —would the compound motors be able to do that run without a fresh supply of water? I do not think so.
5153. Would they be able to run from Bridge-street to Newtown without a fresh supply? I dare say

they would.

5159. But they would not come back? Not with safety I should imagine. You must understand I do not say that it cannot be done, but I should not consider that it would be safe to run the risk.
5160. You think that there would be great danger of a stick up for want of water? Yes.
5161. If these engines were brought generally into use, would it not be necessary to supply them with water more often than the Baldwin engines are supplied? Yes, unless the tanks were made larger. 5162.

5162. Is it not much more easy to shunt the ordinary Baldwin motors and to get round to the other end of the carriages again than it is to turn the compound motor on the turn-table and take up the running? Under existing circumstances it is.

Mr. T. R. Osborne.

D. Manning.

5163. If the Government decides to use all these new kind of engines you would require a complete circle

at Bridge-street? That would be necessary 5164. That is, it would be necessary to enable you to get to your work again with reasonable speed?

Yes.

5165. Do you fire the engine yourself? A fireman is kept at the Railway Station. Sometimes when we have another car on we generally put a little coke on so as to make sure of taking us down to the Railway again; but as a rule the man at Redfern does the firing.

Daniel Manning called in and examined:---

5166. What is your occupation? I am in charge of the fuel at Redfern. 5167. How long have you been there? Ten months. 5168. You supply fuel to all the motors? Yes.

15 Oct., 1884. 5169. Can you tell the Committee the quantity you supply to each class of motors per shift? The combined motors when they are in good repair take about 4 or 5 bags. As they are worked the supply

5170. Mr. Poole.] Up to what quantity? From 11 to 13 bags. 5171. Chairman.] On one shift? Yes, of course, when they first Yes, of course, when they first come out they do not require that quan-During the last week some of them have used 6½ or 7 bags, and some of them as much as 8 bags on the shift.

5172. What does the medium Baldwin motor use per shift? They use about 4 or 5 bags on the shift when in good repair.

5173. What weight is in a bag? They are supposed to contain 1 cwt.

5174. As you have charge of the fuel, can you inform the Committee whether taking everything into consideration, the combined motor uses more fuel per shift than the medium-sized Baldwin engine? They do, unless in the case of a common motor which is very much out of repair. 5175. You have no doubt about that at all? No doubt about it.

5176. Mr. Poole.] Do you keep a sheet or book, showing the amount of coke delivered to each kind of engine every day? I keep a book, and according as the coke is taken I enter it to each man, and as he goes out he gets a docket from another book, showing the amount he has taken. Then I put all those into a sheet and put the sheet in the office.

5177. And does the driver sign? Sometimes, if I require him to he does, but I always keep the butt, and

give him another part.

5178. But there is a book in which you register every day the number of bags of coke you supply to each engine? Yes.
5179. What is that book called? The docket-book.
5180. The fuel docket-book? Yes, and there is another which I call the coke-book.

5181. Mr. Suttor.] Are the bags sent full? They are sent full, but they are generally emptied into the shed, and the coke is afterwards taken out in baskets.

5182. Mr. Poole.] The coke is given out in baskets to both kinds of engines? Yes.

TUESDAY, 21 OCTOBER, 1884.

Bresent:-

Mr. GARRARD, Mr. POOLE,

MR. SUTHERLAND, MR. SUTTOR,

Mr. TEECE.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. George Downe called in and further examined:-

5183. Chairman.] You were requested to produce certain books and a return? Yes, the books are here (produced), and the return will be here in half an hour. I took up the wrong paper in my hurry this morning, but I have telephoned to have the right one sent on. (Return referred to subsequently

G. Downe. 21 Oct., 1884,

5184. Will you inform the Committee whether any order has been given for thirty additional compound motors, or any less number? I think not.

motors, or any less number? I think not.

5185. Do you know if the Minister has approved of any such order? The Minister did approve.

5186. Of how many? Thirty.

5187. How long is that ago? I should think it would be six weeks or two months since.

5188. Has any action been taken to carry out that approval? Not that I am aware of.

5189. Do you know the price that was to be paid for these motors? £1,075.

5190. To whom was the order to be given? I anticipated the order would be given to the Baldwin Works. The papers, I think, are before you, with my minute and recommendation.

5191. Would the order be given direct to the Baldwin Company, or to an agent in Sydney? I could not say how the Minister would give it.

say how the Minister would give it.

5192. We omitted, when you were before the Committee on the last occasion, to obtain your history prior to your entering the Government Service in New South Wales;—will you kindly tell us how you were previously employed? It is stated in the papers—all my testimonials and everything—my experience for thirty-five years.

5193. In what papers? In answer to a question replied to in the House by Mr. Copeland, I think, at the time he was Minister for Works.

5194. Where were you engaged prior to entering the service of this Government? I was with Mr. T. S. Mort.

5195. How long? About three years.

5196. What were you doing? Designing and erecting machinery for him. Mr. G. Downe. 5196. What kind of machinery? Refrigerating machinery.
5197. What kind of machinery? Refrigerating machinery.
5198. What did you leave Mr. Mort's service for? The job was completed.
5199. Where were you engaged prior to that? In Victoria.
5200. How? As Manager of the Langlands Foundry Company.
5201. Were you there long? Twelve months.
5202. Why did you leave? Because I considered this Colony opened up more advantages.
5202. You left all these places of your own second? Ver 21 Oct., 1884.

5203. You left all these places of your own accord? Yes.

5204. Have you designed any other class of stock for the tramways other than the compound motors?

Yes; some cars, as I told you before. 5205. What sort of cars? Six-wheel Six-wheeled cars. In fact the drawings were made by me for the large ninety-

passenger car, and a six-wheeled car.
5206. Was the six-wheeled car subsequently altered? It was subsequently altered to four wheels, and

afterwards to bogies. 5207. Did you design any other car? The ninety-passenger car was drawn by me under Mr. Mason's

directions—those with the glass sliding doors.
5208. You have nothing to do with the Camden tramway? Nothing whatever.

5209. Are you aware whether there are any cars on the Camden tramway that have not been used for some time? Three cars that were put upon the Camden tramway when it first started were afterwards

abandoned by the Railway Department when they took charge.

5210. What has been done with them? Nothing as yet.

5211. Where are they? 'I think they are at Campbelltown.

5212. They are not being used? No, I do not think so.

5213. Have you seen those cars lately? I have not.

5214. What was the cost of those cars? I do not know what the original cost was. They were built

before I entered the Department.
5215. I understand the Railway Department declined to use them? I think so.

5215. I understand the Railway Department declined to use them? I think so.
5216. Could they not be used in Sydney? No; we have been obliged to take the same class of car off the streets here, because they are end delivery cars; the delivery is not sufficiently rapid; too much time is taken up in getting the passengers in and out. They are used occasionally at holiday times, but they are not suitable for general traffic, for the reason I have given.
5217. Are the Committee to understand that the cars at Campbelltown are not suitable for the tramway there or in Sydney? They are not suitable here, for the reason I have just given, and the Railway Department do not consider they are suitable for the traffic on that line.
5218. By whose directions were they sent to the Camden line? By order of the Commissioner.
5219. Mr. Poole. You say you designed and fitted up some refrigerating machinery for the late Mr. T. S. Mort? Yes.
5220. Where? The killing machinery was put up at Lithgow and the refrigerating machinery.

5220. Where? The killing machinery was put up at Lithgow, and the refrigerating machinery on board the ship "Northam."

5221. And you designed that? I designed it under Mr. Nicolle.
5222. Was the machinery fitted up on board the "Northam" a success? It was not.
5223. It was a failure? It was a failure.

5224. You were Manager for twelve months at the Langlands Foundry, in Victoria? Yes. 5225. Did you design or modify the design of any locomotives there? I had to do with the rebuilding of a contractor's locomotive there. There were certain portions—the cylinders and some other portions—and we had to make it complete and put it to work. That was done while I was there.

5226. Was that a success? As far as I know it was; it did its work.
5227. Were you a shareholder in that Company? I was not.
5228. And that was the only locomotive the design of which you interfered with there? I did not interfere with the design—I merely carried it out.
5229. You did not design or modify the design of any locomotive? No; I only carried out the original

specification.

5230. Previous to your coming to the Colonies, what mechanical branch of engineering were you most accustomed to? I served my time in the Government yard at Devonport; I was apprenticed there for seven years, and I worked for five years as a mechanic. After that I started in the management of general engineering works in Plymouth, in which we had to do with all descriptions of engineering work—mill work, portable engine work, and marine work.

5231. Not locomotives? Not locomotives.

5232. After that? After that I was Assistant Manager to a gas establishment for some time in England, and then I came to Victoria. At the time I was Manager for the engineering establishment at Plymouth I was also an Engineer Surveyor for the Board of Trade, an Examiner of Engineers, and Engineer Surveyor to the Emigration Board.

Surveyor to the Emigration Board. 5233. Do you know the special reasons why the Railway Department object to run the particular description of car referred to on the Campbelltown and Camden Tramway? I do not know any special

5234. The same reason that holds good in Sydney as to the delay in receiving and delivering passengers through the end would scarcely apply on the Camden line? No, it could not.

through the end would scarcely apply on the Camden line? No, it could not.

5235. There must be some other special reason? I do not know what it is.

5236. You had nothing to do with the design of these cars? Nothing whatever.

5237. Mr. Teece.] You say the order was given for these thirty compound motors? No, I did not say the order was given; I said it was approved.

5238. You recommended that thirty additional compound motors should be obtained? I did.,

5239. And the order was approved by the Minister? It was.

5240. The Minister has signed a minute to that effect? Yes.

5241. Do you know whether the giving of the order has been postponed? I do not think there is anything on the papers to show that it has been postponed, but there was a promise by Mr. Stuart in the House that he would not order them at once.

House that he would not order them at once. 5242. Do you know whether these motors are being manufactered by the Baldwin Company? my knowledge.

5243. To whom would this order be given;—would it be sent direct to Burnham, Parry, Williams, & Co.? I do not know.

Mr. G. Downe.

5244. Mr. Augustus Morris has told us that the orders for previous motors were sent through him;— 21 Oct., 1884. are you aware of any communication with Mr. Morris in reference to these thirty? I am not. I know a cablegram was sent offering to make them for £1,075.

5245. Was there any communication from him as to the time they would deliver them? I think that was in the cablegram; I think it stated they would send ten in November, ten in December, and ten in

January

5246. That was after the Minister approved of the order? Yes.
5247. And Mr. Morris was informed of the approval of the order? That I cannot say.
5248. You know that after the approval of the order Mr. Morris wrote, stating the time they could be delivered? I know that, after the approval of the order, there came a cablegram from the Baldwin works. 5249. You recommended the ordering of these thirty compound motors, the Commissioner endorsed that recommendation, and the Minister approved of it. Yes.

5250. Is there any minute afterwards disapproving or postponing that order? I do not know.

5251. In pencil here I find the words "postponed by Minister";—who wrote that memo.?

know whose writing that is; it is something like the Minister's own; I do not think it is the Commissioner's.

5252. What would be the cost of freight on these compound motors? To have them brought by sailingship it would be about £60 I think.

5253. And by steamer? Perhaps another £100, because they would have to go over 3,000 miles of rail transit; about £160 if brought by steamer.

5254. Mr. Sutherland.] You say you drew the plans of the six-wheeled car? Yes.
5255. Was there not a contract taken for six-wheeled cars? I am not quite clear, but I think there was.
5256. Who got the contract for them;—were they divided amongst three? They were divided amongst

three—Hudson Brothers, Mr. Wearne, and Mr. Ritchie. 5257. How many from each? Thirty-two from Hudson Brothers, fourteen from Wearne, and four from

5258. Of these six-wheeled cars? No, we only got two six-wheeled cars; they were altered to fourwheels after two had been made.

5259. What was done with them? They were afterwards altered to bogies. 5260. Were they not tested on the lines and found to be a total failure?

5261. Were they tested on the lines at all? Yes.

5262. And were they not a failure so far that they could not be run? Why not?
5263. I cannot say why—I am asking you? They were running constantly.
5264. Why were they altered? They were altered because the traffic complained that they had not brake power sufficient on the four wheels when braking down.

5265. Were the contractors paid the same price for the four-wheels as they had contracted for for the the six-wheels? Yes, because it was considered that the underframing was about equal, and that there Yes, because it was considered that the underframing was about equal, and that there would be no difference in cost.

5266. You considered the six-wheeled car as the best design you could get? The six-wheel was adopted with the view of lightening the dead haulage as much as possible; we saved the weight in every car of a pair of wheels and axles at the least. If you save that haulage over our lines upon every car that runs per day, that means something considerable when totalled up.

5267. However, you abandoned that contract, and the contractors got the same price for the four-wheels as they had contracted for for the six-wheels? Yes.

5268. And what became of the four-wheel cars that replaced the six-wheels? They were afterwards

altered to bogies.

5269. Why were they altered to bogies? By reason of the complaints that were made of the jolting said to take place over the joints of the rails being so much felt on a single pair of wheels, which would be distributed in a bogie—there were great complaints of that. And then the traffic complained that they could not brake them down. And the cry again was that there being only four wheels, if one wheel broke there would be danger of the car toppling over, and perhaps great loss of life would accrue therefrom. Acting upon the pressure thus brought to bear, the Commissioner decided to stop these cars and have beginn by under them have bogies put under them.

5270. You were the designer of the car, and you have given us evidence that everything you designed is perfect;—has anybody else given evidence to that effect? I am giving you the facts, as they appear to me; I do not know what the other evidence is.

5271. What was the next thing you designed on the tramway? This combined motor and car. 5272. And do you say the combined motor and car is a success? I do.

5273. Would you have any objection to have a test made completely out of your hands, to test this motor, by disinterested people? I would have no objection whatever.

5274. Did you make the drawings of any other car when you were with Mr. Mason than that you have already given to the Committee? I gave the drawings of different cars on the railway under him.

5275. Can you give us any special one that you have drawn that has never been used—one made and never used—or found unsuitable for the purpose? I drew a combination sheep and cattle truck and a C van.

5276. Do you know whether that was a success or not? The cost was said to be too high, and it was abandoned on that account.

5277. It has been abandoned? It is used, I believe, as a sheep or cattle truck occasionally, as far as I I have never looked after it for some time.

5278. Have not one or two of these combined motors broke down since you were here giving your evidence? The transverse angle-iron of one broke on Friday last. 5279. Only one? That is all.

5280. Can you give us the number? 7. 5281. Mr. Poole.] The last out? Yes.

5282. Mr. Sutherland.] Is 73 running all right? Yes, she is running still. 5283. How long had 74 been on the road? Ten days.

5284. And how long will it be before you get her on the road again? It is a very awkward job to repair the angle-iron.

5285. Will you not have to take the motor almost to pieces? No, we can lift the boiler and take the

angle-iron out. angle-iron out.
5286. Mr. Suttor.] With regard to the compound motor, what parts do you consider original, or what parts have you adapted? I look upon very little of it as original. It is an adaptation of a principle with the two cylinders one on top of the other; and then I adopted the boiler that I thought was most suitable. That was originally designed by Mr. Brown, of Winterthur. Then I put a change-valve in it—that was my own—which enabled all four cylinders to be worked at high pressure when occasion requires. Then I altered the arrangement of the attachment to the car from any we have got, because I

deemed it better than what we have.

5287. Have you patented the motor as a whole? I have not patented anything.
5288. I think some officers of the Department have pointed out to the Committee that there is a very great saving in fuel with these compound motors as compared with the Baldwin motors;—have you inquired into the relative amounts of fuel consumed? Yes.

5289. And you are still of opinion that there is a great saving by using your motor? Yes.
5290. Does the actual test of running show that there is considerably less fuel consumed by the compound motor than by the Baldwin motor? Yes.

motor than by the Baldwin motor? Yes.

5291. What inquiry have you made as to the amount of fuel used? The fuel-men at the station serve out the fuel to the drivers; they put the amount on a docket, which the driver signs, acknowledging that he has received so much; and the driver enters that upon his daily sheet or return of work done. This sheet shows the amount of fuel he consumes on his trips, and the returns I speak from are from these sheets

5292. Up to what time have you made this inquiry;—have you inquired up to the end of last week? No,

up to the end of September.

5293. Have you found that one of your motors generally consumes the same amount of fuel, whether she has been running on the road for some time or whether she has just gone on the road after an over-haul? Sometimes she consumes a little bit more until she gets into proper trim. With a little wear, if haul? Sometimes she consumes a little bit more until she gets into proper trim. With a little wear, if the valves keep in good order, she will want a little less. When she first comes out she consumes a little the valves keep in good order, she will want a little less.

more than when she gets a little free.

5294. Is it your duty to examine these motors occasionally? Yes.

5295. Are they in fairly good order, excepting those in the workshop? Yes, there are four doing traffic now. One of them is blowing a little, and may have to be taken in.

5296. Is No. 103 on the road? Yes; that is the one I refer to as blowing a little. She takes two cars—that is, another car besides herself.

5297. Is she sound? I know nothing of her being unsound.

5298. I suppose when examining the motor you examine the car as well? Yes; No. 73 motor is in 103 car, and they are still running.
5299. As a rule I understand you run the combined motors with their own carriage only? They often

take another car besides their own.

5300. But as a rule a combined motor only runs with one car? It takes two when required. If the traffic does not demand an extra car they run by themselves. They each take two or three trips per day with a double car.

5301. As regards the saving of fuel, whether they take two cars or one, the comparison is in favour of the combined motors? Yes.

5302. And I clearly understand you to say that you arrive at this opinion after having actually tested the amount of fuel consumed by both engines? Yes.

5303. Mr. Poole.] Do you know that one or both of the sole-bars of car 103 is fractured on the lower edge? Yes, they are fractured on the lower edge. 5304. You know that? Yes.

5305. Is that from the fault of the design, or of bad workmanship or material? If you call it a fault at all you may say it is in the design, because you must take the cross-grain of the wood; but if you can get wood that can be bent to form that, you do not get the cross-grain of the wood.

5306. I take it you took into consideration all the practical difficulties—that you were well acquainted with the timber you would get? Yes.

5307. You have told the Committee to-day that there is very little of the compound motor that is new? \mathbf{Y} es. ,

5308. That the various parts are adaptations of machinery that you have seen or read of, or heard of elsewhere? Yes.

5309. Now I will call your attention to question 3606 in your evidence of 7th October:—"3606. Coming back to the design;—that you inform the Committee is solely your own—?" It is my adaptation.
5310. When you designed the six-wheeled cars you considered that was the best kind of car you could design for the purpose? From my standpoint, yes. I considered we should save dead haulage; it was my duty to save dead haulage if I could.

5311. That car was the best kind of car to effect that object? Yes.

5312. There were only two of them used, I think you said? There were three of them used.

5313. And the remainder of that order the contractors were authorized to turn into four-wheeled cars?

Yes; to still further lessen if possible the dead weight.

5314. Now you tell the Committee that complaints were continually made of the excessive jolting of the four-wheeled cars? Yes.

5315. Did you not take that into consideration in designing the four-wheeled cars? I did not take into consideration the bad road I should run on; I considered they would make the road good; I had no right to think I should have to run on a bad road.

5316. You had no right to consider the road the cars had to run on? I had a right to consider the road, but not to suppose it would be in a bad state. If the road was maintained perfect there would be no

jolting, and no complaints. 5317. As designer you took into consideration the nature of the road, its formation, and general character? Yes, supposing it would be efficiently maintained. Yes, supposing it would be efficiently maintained.

5318. And knowing all that, you designed the four-wheeled car? Yes.
5319. Was there not a difficulty in getting the six-wheeled car to go through the points at the crossings?

There was not; there could be no difficulty, because the outside wheels on each end radiated to the curve.

5320. And the pony action adjusted itself in coming off the curve on to the straight road? Yes. 5321. The fact remains, however, divested of all technicalities, that first of all these cars were to be six-wheeled cars; these were changed into four-wheeled cars; and these again have been altered to run on double bogies? You have not got it exactly. When we were pushed for rolling stock, I suggested to the Commissioner that we should make them on six wheels, and save the dead haulage of a pair of wheels and arlors they contains did their work posterior and I then proceeded that we might still wheels and axles; they certainly did their work perfectly; and I then suggested that we might still further reduce the dead weight by taking another pair off. There was no time to make this alteration before we had to proceed with these cars, and therefore drawings could not be got ready till we had two of the six-wheeled cars made. Then we had one made with four wheels, brought it on to the railway lines, and ran it on the lines to make sure the radiction was perfect, and then the others were ordered to lines, and ran it on the lines to make sure the radiation was perfect, and then the others were ordered to be put on four wheels.

5322. And since then they have been converted into double bogies? They have, for the reasons I have given. 5323. Will you give the Committee your idea of the cost of converting these four-wheeled cars into double bogies, or eight wheels? There was a return given on that subject in answer to a question in the

5324. When that question was asked, it would be referred to you for an answer? Yes. 5325. And that answer is yours? Yes.

5326. Now I will call your attention to that answer as given in the Votes and Proceedings of the Assembly, No. 49. The question was: "Who was the designer of the tram-cars intended to run on four wheels; at what cost were they altered, so as to be run on eight wheels"? The answer given by Mr. Wright is this: "The cars were designed by the Superintendent of Rolling Stock, and the cost of altering same was £70 per car, but the actual loss would not exceed £25 per car." Now can you explain to the Committee how that was? I think I can pretty well explain how that was arrived at. The value of the popies was £50: they were taken out for the reasons given and hogies substituted, the contract of the ponies was £50; they were taken out for the reasons given and bogies substituted, the contract price for which was £70; and then there were some little extras attached to altering the cars, say about £2 a car, and an extra set of bearings and brasses, about £3—bringing up the cost to about £75 per car. Now, if the ponies as they were taken out were only old iron, I grant you the answer is wrong; but if, when we get our roads in better order these can be again utilized for ponies under trucks, then the value remains at what they cost, less any depreciation until they are in use.

5327. They are rusting in the meantime? They are resting in the meantime.

5328. Is it not a fact that Hudson Brothers had £70 per car for what they did in the conversion of the

four-wheeled cars into eight-wheeled cars, and the Department found the wheels and axles? The Department always finds wheels and axles in all cases.

5329. Is it not a fact that Hudson Brothers got £70 each for the conversion of these cars? Yes.
5330. And the Department found wheels and axles? Yes.

5331. Does it not follow as a matter of course that the Department must find two extra axles and four wheels? Yes, they must.
5332. Must not that be added to the £70? Yes.

5333. Then how can you reduce the cost to the Department down to £25? When that answer was given the wheels and axles were lost sight of.

5334. But you evidently deducted them? No, we did not deduct them at all.
5335. The contract price was £70 for what Hudson Brothers did; the Department found wheels and axles. Now, assuming that the two axles and four wheels were in good order and fit to be used in the bogies, does it not follow that the Department had to find the other two axles and four wheels? Yes.
5336. What was the value of them? The value of them is £16 3s., for two axles and four wheels. That should be added on to the £25, no doubt.

5337. Should it not be added to the £70? If you say the pony is only old iron you alter the value to

£66 or £71.

5338. £70 was the first cost of Hudson Brothers' work, then the Department found them wheels and axles to the value of £16 3s., that makes £86 3s. And after the cars came back to the yard they were still subject to some alterations with respect to the brakes? That I am not clear about.
5339. What is it you deduct from the £86 3s; the value of the radiating gear only? Yes.
5340. What is that? They cost £50; the ponies and the wheels and axles were omitted.
5341. It seems to me the answer given to Parliament does not square with the facts? The wheels and

axles were omitted in the hurry, no doubt.

5342. Since you were here before the Committee, have you considered it any part of your duty to interview any one of your officers that have given evidence here? I sent for Mr. Davis to ask him some particulars, before answering questions about the cars, to see if he could give me some information to

refresh my memory.

5343. Is it a question of memory, or do you refer to written records of all these matters? I had to depend on memory in this case to some extent, because that answer was given to the Commissioner when I had not an opportunity to refer to the records. I sent for Mr. Davis to ask what there was in connection with it at the time—to ask if he could remember the circumstances; and then he told me he had given evidence. I said, "What evidence did you give"? and he said he could not remember.

5344. In making up an answer for your superior officer, to be given through him to the Minister, and through the Minister to Parliament, do you trust to memory? This is what had to be done. The question is sent to me, and I sent it to the officers each to give what particulars may be in his department. In this case for the answer to the first question I referred to the Accountant. I put on the paper,—"The Accountant can answer last clause," and he can produce the paper and show you that I did so, and the answer that he gave.

5345. You simply throw the responsibility on the Accountant? I said, "the Accountant can answer the last clause." Then the Commissioner sent for me the morning the question had to be answered, and we

discussed the matter then, and wrote the answer you have there.

5346. However the answer was arrived at, the fact is it is not correct? It is correct, omitting the wheels and axles.

5347. Mr. Sutherland.] How do you arrive at the £16 3s.? That is the imported cost, including freight, landing charges, and other matters.
5348. Have you taken into account charges in this Colony? Yes, that is all included. The amount I am

giving you is what the store has rendered me as the cost. 5349. 160

Mr, G. Downe. 21 Oct., 1884.

5349. Is the cost of sending the wheels and axles to the manufacturer's included. The manufacturer fetches them from the store.

5350. The manufacturer pays for fetching them? Yes; that is in the contract—that he has to get the

material from the store.

5351. Chairman.] Who would be the person to rely upon to give evidence regarding the consumption of fuel, say for the motors running between Redfern and Bridge-street? You can have the drivers' sheets and returns. The fuel-men have their dockets, as I explained just now, on which they put the amount issued to each engine. They give each driver when he goes off duty a docket; the driver signs the docket, and puts on his sheet the amount the man gives him a docket for.

5352. Independent of the drivers the fuel-men at Redfern station could inform the Committee of the exact quantity distributed to each class of motor? Yes, the amounts which they issue. But besides

that we give all the Baldwin motors from 4½ to 5 cwt. of natural coke every day, when they leave Rand-

wick, of which the fuel-men take no account. 5353. Is that done in every case? Yes.

5354. Does the compound motor get a like allowance? No, only just enough to take it to its destination. 5355. You are quite certain the Baldwin motors each receive four or five bags prior to leaving Randwick?

Yes; 5 cwt. is the instruction I give. 5356. Is that quantity issued daily?

168; 5 cwt. is the instruction 1 give.
5356. Is that quantity issued daily? Yes, every morning.
5357. If they have any surplus at the end of the day is 5 cwt. additional put on the next morning, or is the amount made up to 5 cwt.? No, they do not do that. What little is left is used for night-work and making up the fire in the morning. They have to take up so much natural coke into the shed for making up fires in addition.

5358. Have you heard of any person making a claim against the Government for infringement of patent in regard to your motor? Mr. Rowan said something about infringing his patent, but he has never

5359. Do you know whether it is his intention to do so? I do not.

5360. Do you think he has any grounds for making a claim? I do not. The attachment of the car is the thing which he sought to claim a royalty for. The attachment of the car which he patented and the attachment of the car as it is are distinct; and that is the only thing he patented in the Colony, so that I do not see how he could sustain his claim.

5361. Who is Mr. Rowan? He is a brother of Mr. W. C. Rowan, who had a great deal to do with

steam-cars in England and on the Continent. It was from them we got the first steam-car.

5362. Is he an agent? For his brother.

5363. Is he agent for the Kitson motors? Yes.
5364. Is it true that while the plans were being drawn for the combined motor the Kitson motor was at Randwick shed? Yes.

5365. Do you know whether any of the parts of that motor were measured? Not for this purpose.

.5366. Not for yours? No.

5367. Are you quite certain the draftsman did not make any measurements from the Kitson motor? There is no similarity—nothing to assist him in any way.

5368. What royalty was paid on Joy's patent? I think it was 50 dollars.

5369. 50 dollars per motor? 50 dollars for the first, and I think the others were to be 45 dollars.

5370. On every motor? Yes.

5371. Mr. Poole.] Has Mr. Rowan any arrangement with the Government to perform any work at all at Randwick—to do anything for the Government Sawing at Randwick.

Randwick—to do anything for the Government Service at Randwick? He is making an experiment with the electric light. He offered to show that the electric light was economical and efficient for working in the running shed at night; and the Government agreed to provide him with motive power, but he has to

do the rest at his own cost.
5372. And if he succeeds? It is a question of cost. If he shows that it is cheaper to use the electric

light, I have no doubt the Government will entertain it.

5373. If it succeeds, will not Mr. Rowan be paid for his outlay at Randwick? I do not think so.
5374. What kind of motive power are you finding for him? I took the motor out of the little Kitson car.

Mr. Frederick Davey called in and further examined:-

Mr. F. Davey. 5375. Chairman.] Since you were before the Committee last week have any accidents occurred with the compound motors? Yes.

21 Oct., 1884 5376. What engines have broken down? The last new one, No. 74.
21 Oct., 1884 5377. What was the cause of its breaking down? It was the construction of the thing was not right; it

was not strong enough to bear the resistance.

5378. What parts have been broken? It is now being taken to pieces; we have hardly got to the extent

of it yet.

5379. How long will it take to effect the repairs? I cannot tell; I do not know the extent of the damage yet. The men have been a day and a half pulling it to pieces.

5380. What do you think it will cost to place it in proper order? It would be difficult to say.

5381. How many men are employed upon it? Two fitters and two labourers will be two days taking it to pieces; then there are the boiler-makers; they might be a week.

5382. Then two fitters and two labourers will be two days putting it together again? More than that.

5383. How long will it be before it is put in traffic again? A fortnight or three weeks perhaps.

5384. Can you give the Committee any idea of the cost, roughly? When the boiler-makers begin you never know when they will stop.

never know when they will stop.

5385. Is there anything wrong with the car? Not with that car. The principal part that is wrong with this motor is that the saddle that carries the boiler has given way. That has sprung the sides out, and it has sunk as far as the axle. It could not get any further.

5386. Was it unsafe to run? It could not run.

5387. The frame is bulged out? Yes; it wants taking to pieces and putting together again.

5388. Is any other compound motor damaged besides 74? No. 70 the first that came is in for an over-

5389. How long is it since she was in the repairing shop? She came in this day week; she has been in a week.

5390. Since you were before this Committee? Yes.

Mr. F. Davey.

5391. What was the nature of the repairs required? General repairs. The valve gear is out of order, and the steam-pipes and pistons. We are going to turn the piston-rods and put in new glands.
5392. Does the Committee understand that motor No. 70 requires a complete overhaul? Yes. The

steam-pipes joints must be remade, the smoke-box door taken down to be examined and cleaned, and new glands put in all the spindles.

5393. What do you think is the cause of all these break-downs? No. 70 is not a break-down.

5394. The breakages? On account of the bad design; the unmechanical design causes them to shake to

5395. You are quite certain that no matter how often they are repaired they will go out of order on

account of the design? Yes, the principle is wrong.
5396. How long will it take from the date No. 70 was taken into the shop to have her ready for traffic

again? At the end of this week she will be ready—say ten days.

5397. What do you estimate the cost of repairs? £25 or £30, for labour and material.

5398. How long do you think she will run without requiring another overhaul? She might run perhaps another month or six weeks. She might shake herself all to pieces in that time. If there was nothing done to her she would run about a week.

5399. In any case in about a month she would require another overhaul at a cost of £25 or £30? she will have to get a temporary overhaul every month—fastening up everything, screwing up bolts, and

5400. Do the Committee understand that it will cost about £25 every month to keep this motor in repair? Yes, I dare say it will. Perhaps the next overhaul will cost more, because many parts will want renewing 5401. You have already stated that you do not have similar difficulty with the other motors—the We have not. Baldwins?

5402. How much do they cost to keep them in order? Some of them run for four months, and do not cost £10 the whole time.

5403. Can you inform the Committee whether, when the combined motors leave Randwick, they are supplied with any coke? Yes.

5404. What quantity? I do not know what the bunkers will hold; at the very least $2\frac{1}{2}$ or 3 cwt.

5405. These are the motors that run between Bridge-street and Redfern? Yes. They have always got a good fire in; that is another $1\frac{1}{2}$ cwt. in the fire-box.

5406. Is there a similar quantity allotted to the ordinary Baldwin motors? Yes. 5407. You are quite certain that both the combined motors and the Baldwin motors receive a like proportion of fuel when they leave Randwick? Yes, about the same; they always have a quantity of coal in the bunker when they start.

5408. If the Committee have been informed that the compound motors receive no allowance when they leave Randwick, that would be a mistake? Yes, certainly; I see it put in one of them every morning.

5409. A similar quantity for each motor? I do not know exactly how much each receives, but they

partly fill the bunkers I believe.

5410. Mr. Sutherland.] I think you said you were altering the principle by the repairs you are now doing. We are putting in new glands for the stuffing-boxes; what were in before were of no use; they were some one's patent, but they were no use.

5411. You are substituting what were in before with new ones? Yes, new glands.
5412. Of a different construction? The same as all engine glands are.
5413. Is that by Mr. Downe's order? Mr. Howe's order; I presume it is Mr. Downe's through him.
5414. Mr. Suttor.] You consider that the principle of these compound motors is altogether wrong, and that they will never work? Yes, I am more convinced than ever that it is wrong. If I had known what

I know now I would have spoken even more strongly than I did before.

5415. Chairman.] I presume that you refer to the break-down of Nos. 70 and 74? I do not call No. 70 a break-down; it is an overhaul. No. 74 has run about ten or twelve days.

5416. How long was No. 70 running? I could not say.

5417. When was she taken into the shop? About a fortnight ago. No. 72 was ready to go out when I went there, and when 72 went out I took 70 in for repairs. Since that 74 has come in with the framing

sprung and the boilers out of place.

5418. What is the name of the fuel-man at Randwick? I could not tell you his name. There is a coal-stage there, and they put in their fuel, and then a cleaner goes with them to put them on the triangle and turn them round, and before he goes he puts the fuel on, about $2\frac{1}{2}$ cwt.

5419. Is it considered any person's duty to allot the coal to them at Randwick? Of course; they are

not supposed to have a fireman, but they have a man to take them out, and this man's duty is to fill the bunkers with coal or to put coal in. There are four men to the four combineds.

5420. You are quite certain that an equal-proportion of fuel is given out to both the combined and Baldwin motors? Yes.

Baldwin motors? Yes.
5421. You have seen it being put on? Yes.
5422. Mr. Sutherland.] I think you said there is a man for each combined motor;—who goes out with it?
Yes, every time it leaves Randwick down to Sydney.

That man goes to Moore Park with them? Yes.

1 see, every time it leaves Randwick down to Sydney.

5423. That man goes to Moore Park with them? Yes.

5424. What time does that man get for that;—what time does he charge for? A quarter of a day, I suppose. That does not come under me; it is in the running department. I do not see how they can charge it less than a quarter of a day, if charged at all.

5425. Then if there were fifty combined motors there would be fifty men that would have to go out with

them in the same way? Yes.

WEDNESDAY, 22 OCTOBER, 1884.

Present:—

Mr. CHAPMAN, Mr. POOLE,

MR. TEECE. MR. SUTHERLAND.

SYDNEY SMITH, Esq., IN THE CHAIR.

Mr. Frederick Davey called in and further examined:—

Mr. F. Davey. 5426. Chairman:] When you were before the Committee yesterday, I asked you a question regarding the quantity of coal supplied to the different motors at Randwick. Have you since had an opportunity of 22 Oct., 1884. ascertaining the system pursued in regard to the coaling of each class of motor? Yes.

5427. What quantity is each style of motor supplied with before leaving Randwick every morning—the combined and the Baldwin? When there were two combined motors running each had three bags of coke tetched by a special engine from Moore Park, and the man that fetched it had to sign for it; his name is Joseph Dana; he is now a shunter at Randwick. Now coke has been stopped and coal taken name is Joseph Dana; he is now a shunter at Randwick. Now coke has been stopped and coal taken—what we call natural coke or Bulli coal. It is taken from the coal-stages. Steam is got up by that through the night, which takes about $2\frac{1}{2}$ cwt., and there is about $2\frac{1}{2}$ cwt. put in each bunker every morning for them to leave Randwick with. That is done to comply with the regulation that no driver shall leave the shed without his engine being fully equipped with coal, water, and stores generally. That is sufficient to carry him to Bridge-street and to the Railway. The Baldwin engines are treated in the same way, only that the big engines will take perhaps $3\frac{1}{2}$ cwt., the medium class about 3 cwt., and the small class about $2\frac{1}{2}$ cwt.; and of course steam is up in them, the same as in the others. 5428. Then both classes of motors are supplied with similar quantities of coal? The 9-inch class of engine, the same size as the combined, takes about the same quantity of coal to start with—about $2\frac{1}{2}$ cwt. 5429. Have any combined motors broken down since you were here yesterday? Yes, one broke down last night; she got off the road anyhow.

last night; she got off the road anyhow. 5430. What number? 71 I believe.

5430. What number? 71 I believe. 5431. What was the nature of the damage? In crossing the points at Bridge-street yard, by some means or other one part of the motor took one line and the other the other. That was while backing down the yard.

5432. What was the cause? After the rain the points might be choked.
5433. That would occur with other motors as well? It did not because they had been over the points

5434. Was any person hurt? There was no person hurt.

5435. Was there any approach to an accident? If the driver had been in his ordinary position—if he had had his feet where they generally are—he would have been hurt and dangerously crushed. The frame and the boiler came round and burst the side of the cab and bent the stay-plates.

5436. Had the driver been in his proper position he might have been seriously hurt? Yes, ha stood where he generally stands, but, looking back, he happened to have his feet the other way. 5437. An accident like that could not occur with the Baldwin motor? No. 5438. Do you consider the liability to this accident as a defect in the design? Yes, most decidedly.

5439. Mr. Poole.] Did you notice particularly the state of the road? No, I have not been there since. 5440. You do not know whether the road just at that part formed a double curve, so that the bogic frame

of the motor would be on one curve and the bogie frame of the car on another? The car bogie went on the right road and the engine wheels of the bogie of the motor went on the wrong road..

15441. Was it a double curve? No, I do not think so. It was on one of the roads going into the yard. 5442. Mr. Sutherland.] Did I understand you aright to say that when the two combined motors were working there was a special engine that brought coke from Moore Park to Randwick to supply these two motors? Yes, there was no coke delivered at Randwick; it came from Moore Park; an engine was sent specially for it.

5443. The engine was sent specially every day for coke for these two combined motors? Yes. 5444. And if I understand you properly that is charged to the Randwick shed? The Randwick man signs for it, not the driver of the motor.

5445. It is then put down to the Randwick shed, not to the motor that gets it? I could not say what it is charged to, but I know the man that fetches it signs for it, not the driver that uses it.

5446. You say that now, since there have been four combined motors working, they are supplied with coal, not with coke? Yes.

coal, not with coker res.
5447. Or, in other words, since this inquiry has been going on, they have been supplied with coal; the special engine has not been sent to Moore Park for coke for them, but they are supplied with coal from the coal-stages at Randwick, and that coal is taken in for the use of the works at Randwick? No, for the motors that come to Randwick in firing up in the morning. That is charged at so much per motor, but does not appear in the driver's sheet. It is entered in the night foreman's book, so many bags of coal for such a motor; the driver does not sign for that. The driver's sheet does not show the amount of fuel that is on the motor when he takes charge in the morning. that is on the motor when he takes charge in the morning.

5448. Mr. Poole.] He simply signs for what he gets during the day? Yes, when he is in service, when

he first gets hold of the car.

PURCHASE OF RAILWAY ROLLING STOCK.

APPENDIX.

[To the evidence of Charles A. Goodchap, Esq., 3 September, 1884.]

[To the evidence of the Honorable Geoffrey Eagar, 16 September, 1884.] В.

The Under Secretary for Finance and Trade to W. P. Woolcott, Esq.

The Under Secretary for Finance and Trade to W. P. Woolcott, Esq.

Sir,

The Treasury, New South Wales, Sydney, 5 June, 1882.

Referring to your appointment by the Minister for Public Works as Collector of the rents on the property at Pyrmont, resumed for public purposes, I have the honor, by direction of the Colonial Treasurer, to inform you that, as a Collector of Public Revenue, you are required to furnish the guarantee of either the Victoria Life and General Insurance Company or the London Guarantee and Accident Company (Limited) for the sum of £500, personal bonds not now being accepted by the Government.

In the cash book which has already been supplied to you it is requested that you should enter every sum received on behalf of the Government, for which you must give a printed receipt out of a book of receipts with which the Government Printer will furnish you. The particulars of such receipts must be fully and carefully entered on the butts of same.

Your collections must be lodged daily in the Bank of New South Wales to the credit of a Public Account opened in your name as a Government officer. Payments therefrom, by crossed cheque, in favour of the Colonial Treasurer, must be made to the Treasury on the 8th, 15th, 22nd, and last day of each month, unless any of these dates fall on a Sunday, when the payments must be made on the day following.

I enclose form of receipt-voucher which you are to use in making these payments. A supply of the forms can be obtained at the Government Printing Office.

I also enclose for your guidance a copy of the Audit Act of 1870, and circular issued from this Department relating thereto, together with a copy of Instructions to Collectors of Public Revenue, published in the Government Gazette of 27th August, 1869, which you should carefully peruse. From these documents you will see that you require to furnish monthly attested accounts to the Auditor General, with whom you had better place yourself in communication on the subject.

You will be good enough to furnish me, at

I have, &c., G. EAGAR.

P.S.—The guarantee referred to herein will be effected by the Treasury on your behalf, and application made to you for payment of premium in due course.-G.E.

[To the evidence of W. P. Woolcott, Esq., 16 September, 1884.]

MEMORANDUM of Agreement made this day of May, 1884.

To let and take.—Premises, unoccupied, portion of Atlas Works; situate, Pyrmont; rent, £2 per week, payable monthly, for the term of a weekly tenancy, to be computed from 12th May instant. Not to assign or sublet the whole or any part without leave. To leave premises in as good repair as at present. Proviso for re-entry by lessor on non-payment of rent, or non-payment of insolvency. performance of covenants, or in case of insolvency.

CARSON WOODS. HON. COL. TREASURER, Landlord.

[To the evidence of George Cowdery, Esq., 23 September, 1884.] D 1.

REPORT OF COMMITTEE ON AUTOMATIC FREIGHT-CAR COUPLERS. From the "Railway Review," Chicago, 21 June, 1884.

Your Committee appointed to make a report on automatic freight-car couplers would respectfully submit the following: We have sent our circulars to all representatives of the different car departments, embodying the following questions :

1. In your judgment would there be a large saving to the railroads of the country by the adoption of a standard automatic coupler?

Would the adoption of such a coupler be safer for trainmen?

Is it practical or desirable to adopt such a coupler for all new construction or renewals?

If so, will you please make any suggestions which may occur to you as to the best methods to secure these results? Which in your judgment is the simplest and most economical freight-car coupler in service, all things considered?

5. Which in your judgment is the simplest and most economical freight-car coupler in service, all things considered?
6. Are there any practical difficulties in the way of adopting a standard automatic coupler?
7. If so, please say what, in your judgment, they are?
8. If you were asked to adopt a standard freight-car coupler for your road, what one would you select?
We have received twenty-four replies, twenty-two of which have answered in the affirmative and two in the negative to the first three questions. Twenty-two have answered "No," and two "Yes" to the sixth question. There are a variety of opinions in answer to questions 4, 5, 7, and 8.

Your Committee have given this subject careful thought, and have experimented with a large number of draw-bars during the past year, and we have also witnessed tests of the various draw-bars made at Saratoga. We have carefully examined all of the models which have been presented at this meeting, and we find such a similarity of principle involved in various ones examined that we would suggest before their adoption they would be referred to the Eastern and Western Railroad Associations for their decision as to the validity of the patents.

Our classification of the various draw-bars are as follows:—

Our classification of the various draw-bars are as follows:—
Worthy of special mention:—Archer, Cowell, United States, Janney, Ames, Mitchell, Wilson and Walker, Conway-

As meritorious: -Gifford, Granger, Bechard, Pease and Sankey, Hilliard, Hitchcock, Prescott, Marks, Howe, Union, Perry, Burrell.

We have also examined the Quakenbush, Life and Limb Protecting, Lancaster, Smillie, James Horseley, Barnes, M'Keen, Stebbens, Williams, Skinner, New Era, Blanden.

In conclusion we would say that we realize the importance and magnitude of the work which has been given us, and we would therefore urge upon the members of this association the importance of thoroughly discussing the merits of car

We think the subject is one which should not be passed over slightly, and think that the different roads we represent we think the subject is one which should not be passed over slightly, and think that the different roads we represent and the public at large demand of us a thorough investigation as to the best coupler and prompt action in recommending its adoption. We would earnestly request that the association appoint a committee of experts to be present at the trial or hearing of the different railroad commissions, or any trial ordered by the executive committee of the association.

Respectfully submitted.

J. W. MARDEN,
F. D. ADAMS,
R. C. BLACKALL,
Committee.

(From "The Railway Review," June 21, 1884.)

Another meeting of car-builders has come and gone, and still the freight-car coupling question is unsolved. This would furnish strong ground for censure were it not that the members of the Convention gave evidence at this session of appreciating the folly of continued procrastination, and that they even went further than this and took a long step forward in an agreement upon a definite plan which will doubtless result in decisive action. As will be seen by our report of the proceedings elsewhere, the association agreed upon the appointment of a committee of experts who shall take up the whole question of car-couplers. This agreement will not be acted upon until it is assented to by the railroad companies represented in the association, who will be expected to pay the expenses of the committee, but we are confident that this assent will be obtained, and that the plan will be carried out. that the plan will be carried out

that the plan will be expected to pay the expenses of the committee, but we are confident that this assent will be obtained, and that the plan will be carried out.

'Under this plan some leading difficulties will at once disappear. For instance, there will be an energy at work in one direction untrammeled by other requirements; a perfect inquiry into the merits of all couplers is impossible with the carbuilders, who have their daily duties to attend to. Again, the car-builders will be relieved of the annoying and entangling questions of conflicting patent-rights, and of imputations of favoritism, venal or otherwise. The determination of the best coupler or couplers will rest with an agency entirely independent of the Car-Builders' Association, because paid for by the railway companies direct. Of course the value of such determination rests upon the personnel of the committee appointed to investigate, and in this regard the association has made an excellent selection. The name of Mr. Forney, who was named for the place, was suggested by The Review some weeks ago, and the well-known theoretical and practical acquirements of that gentleman constitute assurance that the duties which it is proposed the railways shall assign to him will be well performed.

Accordingly, we see that at last the car-coupling problem is to be properly attacked. And it is getting time. The public are becoming more and more clamorous for reform in this regard. Massachusetts, as we have seen lately, provoked at delay, this year takes the matter into its own hands, and on all sides evidence accumulates that further procrastination will not be tolerated. Humanity, economy, and policy demand that change be made in present methods of freight car-coupling, and for this reason we urge railways to support the car-builders' plan of placing the question in hands of independent experts. Reform will be somewhat hard, but we refer to the standard-time reform, even though it is hardly a parallel case, to show how much may easily be accomplished if the e

THE NATIONAL EXHIBITION OF RAILWAY APPLIANCES—COUPLINGS, SIGNAL ARRANGMENTS, ETC. DARLINGTON, OCTOBER, 1882.

This is to certify that Messrs. Thomas and Cowdery, of Sydney, New South Wales, exhibited in Class 1 a Double Automatic Coupling, and in consideration of the merit thereof this First Class Certificate is hereby awarded.

306, City Road, London, E.C.

FRED. W. EVANS, Joint Secretaries.

[To the evidence of Carson Woods, Esq, 24 September, 1884.]

(From "National Car Builder," New York, July, 1884.)

CHILLED CAST-IRON WHEELS.

In respect to breakages it does not appear, so far as evidence goes, that chilled wheels made of the best irons are any more liable to break than steel-tired wheels.

, (From " New York Railway Gazette," July 4, 1884.)

BREAKING OF STEEL TIRE WHEELS.

THE Imperial Railroad Bureau of the German Empire has collected statistics of the breakages of tires, which, in view of the growing use of steel-tired car wheels in this country, will be of interest here? It seems that on the German system the number of tires broken in 1883 was:—

Miles worked. 21,883 22,149 Six winter months, January to April, November and December Six months, May to October 1,937

Per 100 miles of road this gives 12.2 breakages in the colder half of the year and 8.8 in the warmer half.

APPENDIX. 165

By these breakages there was some interruption to the operation of the roads caused in 281 cases, including eighteen derailments. From those cases where the locality on the road was known where the breakage occurred, it appears that per 100 miles of road with different kinds of substructure the tire breakages were as follows:—

Per 100 miles of track on-No. tires broken. Wooden cross ties 7‡ Iron longitudinal sleepers..... 23

The inference from this is that tires break chiefly at bad joints, and that the joints are supported best on longitudinal

The report shows that 76 per cent. of the breakages were on spoke wheels, and only 21 per cent. on disk wheels; but in the absence of information as to the proportion of disk wheels running, this is not significant. No less than 40 per cent. of the tires broken were of puddled steel, and 84 per cent. of these breakages were due to defects in the material and to its imperfect welding.

E 2.

The United States Car-Co., 48, Congress-street, Boston, Mass., 13 Feb., 1883.

Messrs. Carson Woods, Rich, and Co., Carson Woods, Esq., Sydney, N.S.W.,-

Gentlemen,

We shipped the screw-lever dump and coal car to you early in January, via barque "Julia," L. Jordan, master. We also sent several pieces of castings without charge, which were duplicates of what were with car, to replace any that may get broken in transit via vessel. We sent bill to Messrs. Richard Irvin and Co., New York City, as requested by you, and received a prompt remittance for balance due for car. We are meeting with grand success here with our cars; the one we shipped to you was loaded and dumped, and found to work perfectly. We trust you will see personally to it—that the car is put together in a good workmanlike manner—then satisfactory results will follow, and one man be able to dump car loaded with 20 tons in 30 seconds with ease. The past week a Pennsylvania coal road placed an order with a reliable car-builder for eighty our patent screw lever cars. Since your Mr. Woods left here we have sold our patent covering the entire Dominion of Canada to some Montreal men, and they are forming a rolling-stock company, with \$650,000 capital, to build our style dump-cars, and lease them to Canada Railroad Companies. Let us hear from you, and of your success with the car after its arrival. Yours, &c.,

Yours, &c., . FRANK BROWNELL, Treas.

No. 2.

J. E. Rose, Esq., M. of T. M. & C. Railway Company, Cincinnati, Ohio,—

Gill Car Manufacturing Company, Columbus, Ohio, 3/1/82.

My dear Sir,

It affords me pleasure to answer your recent inquiry. We have in many particulars improved the United States Car Company's dump, and the C. H. V. & T. Railway Company have adopted it, and are getting a considerable number of them. We are building fifty for the Cleveland Rolling Mills Company. They give entire satisfaction where used, and we would be happy to send you one on trial if you will probably be in the market for some of them. Early next week we expect to send your neighbour, Mr. John Carlisle, one of them, up on the Chatteroi Railway, and should be pleased to have you make inquiries of him when he has tried it. The other day one man dumped six of them in 11 minutes. One of its good points is the ability and ease with which it can be dumped on either side, and all at once or slowly, and along a considerable distance, or part on one side and part on the other.

We have so changed the construction as to admit of the master car builders' standard axle and box, and it is the opinion of the writer, any road, old or new, would find very great economy in its use, either for building or distributing cinders and ballast, or anything that can be dumped.

H. R. GILL, Treas.

A. F. Thayer, Esq.,-

Boston and Albany R.R. Co., Car Department,

Dear Sir,

In answer to your question as to what is my opinion as a practical car-builder of the merits of the dump and coal car of the United States Car Co., I would reply as follows:—

First. I have given the matter the fullest examination, and have proved its practicability for such purposes as it is designed, and in my opinion it is certain to come into use rapidly on account of its simplicity and positive merit. There is no complication about it, which permits it to be easily worked by an ordinary person (brakeman), and requires only one man to operate it. At a recent trial of the car upon the Boston and Albany R. R. one man dumped twenty-five tons of gravel from one car in less than 2 minutes, and in another instance two car-loads of coal in 3 minutes, and had the car ready to return. The Boston and Albany R. R., Co., as I understand, have purchased the right to build these cars; and I think will do so as soon as practicable for their own use.

Second. The construction of the car body is so near alike any ordinary car that cars already built may be changed and this patent applied at a small cost.

In my opinion the car cannot be surpassed for the easy bandling of coal in 3 minutes.

this patent applied at a small cost.

In my opinion the car cannot be surpassed for the easy handling of coal of any kind, also iron and every kind of ore; and it is especially adapted to handling coke, gravel, sand, ashes, logs, railroad ties, stone, and railroad iron, or anything of like nature used in construction or repairs, and ballasting, filling, of trestle-work, and the like. In my opinion in the very near future this car will be so generally adopted that we shall rarely see the kind of car now in use, for these cars will substitute on account of the immense saving in cost of labour. The principle is that of the common horse coal and dump cart applied to railroad uses, and it would seem as reasonable to expect coal dealers to ask their men to return to the old method of shovelling out their coal as it will in the future to expect coal and railroad companies to unload their cars in the present expensive way. It will give me pleasure to show and explain the working of this car at any time we may have one here, or give any information I may be able to at any time you may call on me.

Yours respectfully,

Yours respectfully, F. D. ADAMS, M.C.B. Boston and Albany R.R.

No. 4.

Simeon Brownell, President.

Joliett Steel Company, General Superintendent's Office, Joliett, Ill., 8 July, 1882. U.S. Car Co., Boston, Mass.,-

Dear Sir,
In regard to your inquiry as to the workings of the train "Screw Lever Dump-cars," I would say they are now

working quite satisfactory.

I think your device is quite practicable, and in time this style of car will come into general use for handling ore and coal or such material as can be dumped in this manner. I think it is an improvement over a former style of dump-car.

We have twenty-five cars of your patent, carrying 20 tons of ore per car. We find there is no trouble in one man handling or dumping them to advantage.

Your struly,

We find there is no trouble in one man Yours truly, H. S. SMITH, General Superintendent.

APPENDIX.

No. 5.

Simeon Brownell, President; The U.S. Car Co., Boston, Mass.,—

Rock Island and Mercer County Railroad Company, Rock Island, 19 July, 1882.

Dear Sir,

In answer to yours of even date, the thirty-five screw-lever dump-cars you had built for us at Wells, French, & Co.'s shops, Chicago, Ill., M. Van Wormer patents, are here and in active service, making daily trips to our mines and return, a distance of 26 miles. I have examined them carefully. The dumping device is simply perfect, one man with ease dumping 100 tons of coal, five cars (20 tons each), in the remarkable short time of 9 minutes. As to durability I think it is the best and strongest 20-ton car I ever saw. Your dumping device is strong, simple, and durable, and I think far ahead of any dump-car in use. I had been thinking of and experimenting for four years on a side dump-car, and you can imagine my feelings when confronted with the very thing I had tried to obtain.

Have had sixteen years experience as M.M., and have done my best to find a defect, but I give it up, and acknowledge its the best car I ever saw—perfect. One car of your patent stood fifty-two hours loaded with full 20 tons, and it could not be noticed that the car had gone down in the centre \$\frac{1}{4}\$ of an inch; that I consider remarkable. We want not less that 100 more of your cars, and I have recommended our President (Mr. P. L. Cable) to order them immediately. You have without a doubt made a ten strike.

a doubt made a ten strike.

As you have a dump-car which its merits alone are bound to bring it into general use on all roads where dirt, coal, ore, Very truly yours, J. H. PARK, M.M., or gravel are used, will take pleasure in answering all inquiries.

R.I. and M.C. and R.I. and Peoria R.R's.

No. 6.

Simeon Brownell, Esq.,

President of the U. S. Car Co., Boston, Mass.;

Rock Island, July 21, 1882.

The cars that were built for this Company under your patent have arrived, and have been placed in service, and to all appearance are a thoroughly well built car, and so far as its dumping qualities have been tested we are inclined to pronounce them a success, and I think is a car that will come into general use for the purpose for which it is designed.

Very respectfully yours,

H. B. LUDLOW,

Superintendent Cool Valley Mining Co.

No. 7.

Columbus, Hocking Valley, and Toledo Railway Company.

Simeon Brownell, Esq., President U. S. Car-Co., Boston, Mass.,—

Nelsonville, Ohio, 4 August, 1882.

The eight cars are working all O.K. I have examined them over carefully, and pronounce them the strongest car ve in our yards. The repairing is much less than on our own. I saw to-day one man dump full 20 tons of slack with They are a car that we ought to have more of. I hope the balance will be put in as good shape as these, for we need Yours truly,
J. STONEBURNES them badly.

General Car Repairer, C., H.V., & T. Ry. Co.

Pennsylvania, Slatington, and New England R.R. Co., Office of the Chief Engineer, New York, 4 August, 1882.

To the President and Directors of Pa. S. and N.E.R.R.,-

Dear Sirs,

We have examined the side dump-car of the U.S. Car Co., and beg leave to report as follows:—The car was partly filled with coal (about 8 tons), and was upon the treatle of the N.Y. Lake Erie and W.R. at their coal pockets at the west end of the Bergen tunnel. The Agent of the U.S. Car Co. readily dumped the contents of the car in about forty seconds, and could have as easily dumped the car, if it had contained its full load of 18 tons. The car worked perfectly, and we have no hesitation in recommending its adoption on your road. We consider it a great saving in time and labour in discharging contents, and thus a less number of cars will be required to do the same amount of business, and saving a large sum in first cost. The car can be used for any kind of freight, which is not the case with the present kind of hopper bottom cars, so that the return freight now lost to hopper bottom cars will be earned by cars having these attachments, and the entire cost of the car will be saved in a short time in the return freights alone. This car is a much stronger car than the hopper bottom coal car, for it has four centre stringers that go the entire length of the car, through the centre where the strength is needed, and have also four truss rods which add greatly to the strength of the car.

The attachments by which the car is inclined, and the contents unloaded are very simple, and can be easily operated by any common workman, as there is no complicated machinery about it to get out of order:

We have no hesitation in saying that it will be a great saving in dumping any kind of materials that can be dumped, and a great saving in time and money.

We have no restrain in a sorting and a great saving in time and money.

We are satisfied the car will do all the Agent of, the Company, Mr. A. F. Phayer, says it will do, and we have no hesitation in recommending its adoption on your road.

Very respectfully,

A. B. PAINE,

Chief Engineer

Chief Engineer. F. M. WARD, Supt. of Bridges.

No. 9.

Columbus, Hocking Valley, and Toledo Railway Company, . Nelsonville, Ohio, August 24, 1882.

Simeon Brownell. President, The U. S. Car Co., Boston, Mass.,

'Sir. The "Dump Cars" Mr. Van Wormer fixed over for us at Gill Car Co.'s Works are here in active service; they were loaded full of slack, all we could get on, and they stand up under a load nicely, and the dumping device is all we can desire one man dumping them with ease. I liope all will be put in the same good condition, as we need just such a car daily. Vare using these in making new track with fine slack.

Yours, &c., CHAS. E. SCHAFF,

General Yard Master, C., H.V. & T.R.C.

No. 10:

Mr. S. Brownelk,

President, United States Car Co.,-

Melrose, Mass., October 21, 1882.

Dear Sir,

We have used your side dump-cars at our coal-yards, and they have given us the greatest satisfaction; and any one can readily see the immense saving made by them in handling coal. I will say for myself that I am ready at once to put up trestles at my yards, and will do all that I can, as I know every other coal dealer will do, to have your car come into general use by all the railroads that handle coal, it being for our interest as well as for the railroads to have it done, and as specifly as possible. I liave paid a great deal of money for demurrage on vessels that have been kept here by delays in unloading cars, which your cars entirely do away with, as we easily unload 18 to 20 tons in a minute or two each.

Yours truly,
SETH E., BENSON.

The Commissioner for Railways to C. Woods, Esq.

Department of Public Works, Railway Branch. Sydney, 28 August, 1883. Sir,

In reply to your letter of the 27th instant, having further reference to the proposal made by you with regard to the rights of the dump-car patent, and in which you state that you are prepared to build two hundred cars in the Colony, inclusive of the patent rights, for the sum of £190 each, I have the honor to inform you that I have submitted the above proposal to the Honorable the Secretary for Public Works, and he approves of the acceptance of the same, on condition that the cars are delivered complete on the Railway line, Sydney, at the price named, and that they are in all respects equal to and of the same weight as the one now in possession of the Department. It is a further condition of the acceptance of your offer, that after the delivery of the above cars is completed the Government are to have free and undisturbed use of the patent rights for New South Wales for all cars they may build or have built by private firms.

I have, &c.,

CH. A. GOODCHAP;

Commissioner for Railways.

P.S.—You will have to enter into a bond for the due fulfilment of your contract, and to assure the Government in the undistructed possession of the patent right so far as the Government Railways of New South Wales are concerned; the cars to be delivered-50 in nine months, and the remainder in lots of 50 at three, six, and nine months within the succeeding nine months.—CH. A. G., 28/8/83.

E. 4.

From the "Evening News," Sydney, 30: June,, 1883. DUMPING CARS.

MR. CARSON WOODS, of the firm of Carson Woods, Rich, and Co., of this city, has recently imported into the Colony a screw lever dump-car from America, and it has lately been subjected to several trials at Darling Harbour and Redfern. Yesterday an official trial was made of it at the latter place, in the presence of Mr. Read, Traffic Manager; Mr. Scott, Tocomotive Engineer: Mr. Middley Tocomotive Operating Operati Yesterday an official twil was made of it at the latter place, in the presence of Mr. Read, Traffic Manager; Mr. Scott, Locomotive Engineer; Mr. Midelton, Locomotive Overseer; and several other gentlemen interested in such matters. The car may be briefly described as a "tip"-car, and one man can work it so effectually as in a couple of minutes, by the turning of a handle, to eject the whole of its contents on either side of it. The screw-lever works in a cog-wheel upon the end of a shaft. running the whole length of the car, and upon this shaft are two chain-wheels, one over each truck. These wheels have sockets, in which the chains fit. Side-bearings, levers, and latches also form an important element in working the dumping, or "tipping." Attached to the side-gates of the car is an arm that extends under the car, and strikes upon the truck as the car is dumped, thus opening the latches, which are thrown back by means, of weights in the centre of the car. The rockers are of the same width as the trucks, and the chains are kept in position by the wheels, which have flanges upon them for that purpose. Speaking of the car generally, a high authority on such subjects in the United States considers it must come into use rapidly on account of its simplicity. There is no complication which prevents its being easily worked by an ordinary person. At a recent trial of the car one man dumped 25 tons of gravel from one car in less than 2 minutes, and in another instance two car-loads of coal in 3 minutes. The construction of the car is so near like any ordinary car that those already built may be changed, and the patent applied at a small cost. The cars run upon two sets (each of four) bogic wheels, and have a capacity of from 20 to 30 tons. That tested yesterday was of the former dimensions. It was placed on one of the lines near the Botany-road. It was full of gravel, and when it was tipped, or dumped, more than half of this shot out on to the ground, until' it was piled up so high that the balance (about a third) did no save, especially in the case of coals, coke, timbers gravel, &c.; or in fact, almost anything that is not of a breakable character. The makers of the car are the Gilbert Carriage Manufacturing Company, of Troy, United States. The trial of sesterday was considered very satisfactory, and no doubt before very long our railways will be well supplied with these patent cars, as they are called, although in appearance they are very much like the ordinary trucks.

[Ordered to be appended to Mr. Goodchap's evidence of 18 September, 1884.]

The Commissioner for Railways to The Locomotive Engineer.

It was stated to me at the Committee on Rolling Stock, in fact I was asked if I had seen a plan of a truck made by one of the officers combining light tare and large carrying capacity, attention; if it exist I should like to know something about it. I am not aware that this plan has been brought; under my

18/9/84.

THE Commissioner informs me that he was asked by the Committee appointed to inquire into the purchase of Rolling Stock,

whether he had seen a plan of a truck made by one of his officers combining light tare and large carrying capacity.

Neither the Commissioner nor myself have seen any such plan, and if it is being prepared by an officer of the Department it is probably under your directions. The Commissioner wishes to have full particulars regarding this matter. I shall be glad, therefore, if you will submit the plan—should there be any such—at once with your report thereon.—W. Scott, 22/9/84. The Locomotive Overseer.

All particulars are given in the papers on coaling engines—L.E., 83/270, Comr., 82/10,292; and other papers, Comr., 82/18,558, L.E. 82/3,699.—J.M.

82/18,558, L.E. 82/3,699.—J.M..

The plans referred to were all prepared in our Drawing Office. The first, No. 754, was made in December, 1882, tracings of which were sent to Commissioner with my report, E.E., 83/270. The finished drawing of double bogic waggon was completed in October, 1883, and the drawing of the 4-wheeled waggon is just now done, all of which I think you have seen in progress in the office. A reference to the papers will make matters clear no doubt.—Thos. Mediators, 22/9/84. L.E.

Comr., 83-6,056.

The report referred to is one that was submitted by Mr. Midelton during my absence in England, respecting the coaling of engines. It was designed to carry coal-boxes, but in the report no reference was made to its being of light tare, combined with large carrying capacity.

168

APPENDIX.

The finished drawing which Mr. Midelton alludes to as just now being completed has never been brought under my attention. It is true, I saw a drawing on one of the draftsmen's boards, but was never consulted in any way with reference to it, and I was therefore quite unaware of what was being aimed at, in the preparation of the drawing. As before stated, the whole matter was done without any reference to me, and this is only one instance of many where I have no control over the work performed in the Drawing Office.—W. Scott, 23/9/84.

I was not aware that the question asked of me had reference to the waggon proposed for coaling engines. I understood that it was a design made as I understood by one of the subordinate officers, neither Mr. Scott's nor, Mr. Midelton's name being mentioned. Had I known that reference was being made to the truck for coaling I should have replied differently. I may say here that when Mr. Midelton brought his scheme for coaling engines under my attention (and this was during the time Mr. Scott was in England), I thought very highly of it, and believe I so expressed myself. Indeed, I gave directions for its adoption—not necessarily including the truck, for that was to be dependent upon whether the 250 trucks already ordered for coaling purposes had been proceeded with—but the box system with the use of crane. I thought highly of the truck also, for although no mention is made in the report about the tare, I questioned Mr. Midelton on the subject and found that the tare was not excessive when the trucks could be used for general traffic; of course, when the boxes were in the truck that tare, when compared with the carrying capacity for coal, would be unfavourable.

After approving of Mf. Midelton's plan, I received a letter from Mr. Scott addressed from England, and he then spoke of a design for coaling similar to that of Mr. Midelton's (without knowing, I understand, that Mr. Midelton had a plan), and also of an elevated platform plan which he considered much superior; this made me hesitate about going on with Mr. Midelton's plan, at any rate for Eveleigh, and I thought it well to postpone final decision till Mr. Scott should return. In the meantime Mr. Midelton—in pursuance of his request that should his plan not be approved of for general application, it might at any rate be allowed to be tested at Goulburn—was allowed to bring it into operation at that station, to be applied more generally should it prove a success. I presume the plan of the truck (there were to have fifty of them for Goulburn) was being proceede

The design of the truck to which Mr. Midelton refers has only to-day been brought under my attention, although, as previously stated, I saw it on one of the draftsmen's boards. The drawing has only been completed and signed to-day upon my asking for it.

The whole work was got out without any reference being made to me, and I was consequently unaware of any effort that was being made to secure light tare. I have now for the first time examined the drawing, and so far as light tare and large carrying capacity are concerned, I do not see that it possesses any very exceptional features or advantages that would not necessarily accrue where iron framing was used instead of wood. Its weight is stated to be 4 tons 2 cwt. without side chains and springs, and its carrying capacity 7½ tons, but it must not be overlooked that the truck is without sides, and if these were provided of wood, the same as on D trucks, the tare would be about 4 tons 13 cwt. to carry 7½ tons, while our ordinary D trucks, with a tare of 4 tons 10 cwt., will carry 7 tons, so that it does not possess in this particular any very great advantage over our ordinary waggons.

The slightly larger carrying capacity is partly brought about by the trucks being 6in. longer and about 1 foot wider than our D trucks. The smaller tare is to be accounted for because the truck is made of iron framing instead of our heavy Colonial hardwood. The subject however of the use of iron in the construction of our goods-stock is one that I have not overlooked, but have had under consideration for some time, with a view to secure a reduction in the tare of vehicles, and I attach hereto copies of correspondence between Messrs. P. and W. M'Lellan and Co., of Glasgow, and myself, from which it will be seen that it is a matter upon which I expect to be able shortly to lay some definite proposals before you for the manufacture

of some stock upon this principle.

W. SCOTT, 25/9/84.

The Commissioner.

Messrs. P. and W. M'Lellan, Trougate, Glasgow,-

Gentlemen

20 June, 1884.

During my recent visit to England I ascertained that you had built some iron goods trucks for the Indian railways. I shall be much obliged if you will be good enough to favour me with particulars of these trucks, such as their price (delivered in Sydney), weight, carrying capacity, and any other particulars you may consider necessary to enable an opinion to be formed as to the desirability of introducing them on the railways of this Colony. I shall be glad if you can also inform me what has been the experience of the Indian railway people with regard to the use of these trucks, after having practically tested them, as compared with trucks with wooden sides.

W SCOTT I have, &c., W. SCOTT,

Locomotive Engineer.

Clutha Iron Works, Glasgow, 7 August, 1884.

W. Scott, Esq., Locomotive Engineer, Department of Public Works,

Railway Branch, Sydney.

We have the pleasure to acknowledge the receipt of your favour, dated 20th June, making inquiry with respect to the iron goods trucks we build for Indian State and other Indian railways.

In reply, we have to state that we are preparing drawings of these waggons, which we hope to have ready in time to send to you by next mail with the other information you desire. We may add that after many years' experience of these waggons upon the Indian railways the authorities now contract for no other description, as they appear to have entirely superseded those with wooden sides.

Thanking you for the inquiry,

We are, &c., P. & W. M'LELLAN.

[Ordered to be appended, 2 October, 1884.]

Mr. W. Scott to The Clerk of the Legislative Assembly.

Mr. W. Scott to The Cierk of the Legislative Assembly.

Department of Public Works, Railway Branch,
Locomotive Engineer's Office, Sydney, 22 September, 1884.

I have the honor to return herewith the evidence given by me at my last examination before the Select Committee on the purchase of Rolling Stock, and should be glad if the corrections can be made.

I enclose herein as promised copies of reports forwarded by me to the Commissioner, and a return of the number of D trucks at Eveleigh with the patent coupler.

W. SCOTT.

APPENDIX. 169

As promised when being examined by the Select Committee of the Legislative Assembly on the 16th instant, I beg to state that the following D trucks are fitted with the patent couplings and are standing at Eveleigh:—

49 loaded with ballast.

14 empty.
5 loaded with old railway material.

68 Total.

W. SCOTT 22/9/84.

Dump-cars.

I inspected the dump-cars on the 1st instant with Messrs. Midelton and Bourn, and again on the 6th instant, and I observed the same defects as pointed out in Mr. Bourn's minute of the 1st instant. I enclose herein a minute from Mr. Midelton, stating that, acting upon instructions received from the Partiamentary Committee now sitting, he examined the cars, and that the majority of the axles were very defective. Upon receipt of this minute I proceeded to Darling Harbour and very minutely examined seventy-five of the bogies, and out of this number I had to mark sixty-nine axles as being defective, and numbers of them are quite unfit for our service. They have been forged out of scrap, the iron has not been properly worked, and bad flaws are visible both longitudinally and horizontally. They appear to be of such inferior workmanship that I consider; it will be necessary to submit (say) four of them to a test. These will, of course, be destroyed; and I have to ask your permission to make the test. If the axles comes up to the proper standard the cost should perhaps be borne by the Department; but in the event of their being found to be inferior the expense should be borne by the Contractor. It is stipulated that the metal work is to be manufactured in the Colony, but this has been imported from America.

The terms of the contract are that the 200 cars are to be built in the Colony; but this portion of the contract I consider is not being carried out, the cars being merely fitted together here, the various parts having been imported from America.

W. SCOTT,

W. SCOTT

The Commissioner.

8/9/84.

DUMP-CAR AXLES.

I was at Darling Harbour to-day, inspecting the new dump-cars, and also the pattern car, in accordance with instructions received from the Parliamentary Committee now sitting.

I am sorry to have to say that the majority of the axles I saw are very defective, and such that I would not allow to run on the road, and I recommend that one or two be tested before any car is allowed to run with a load. I also suggest that the Commissioner's attention be called to the matter after you have made an inspection of them.

The Locomotive Engineer.

I notice also that one of the head-stocks of the pattern car is badly fractured by buffing, and one of the bolster beams in bogie is sagged about \(\frac{2}{3}'' \), due to the weight on it.—T.M.

Memorandum from Mr. E. J. Bourn to Locomotive Overseer.

Memorandum from Mr. E. J. Bourn to Locomotive Overseer.

Sir,

Locomotive Engineer's office, Regent-street, Redfern, Sydney, 1 September, 1884.

In accordance with the Locomotive Engineer's memo., 84/1,669, 26/8/84, re new dump-cars, I beg to report that I paid a visit to the works of Mr. Carson Woods, Darling Harbour, on 28/8/84 for the purpose of inspecting cars now being put together, and I wish to bring under the notice of Locomotive Engineer that I found there is no provision made for the fixing of continuous draw-gear, the gear being fixed consists only of a short draw-bar hook, fixed with a voluble spring, washer and cotter. In this style I do not consider there is sufficient allowance of strength for the haulage of waggon, and they are very liable to break the head-stock when in transit.

The buffers as now fixed are also very weak, sufficient staying power not being provided to prevent even ordinary shunting against them, to stop the buffers from being knocked through or breaking the headstocks.

The draw and side chains are vory roughly forged and the links are not sound in the weldings, the safety-chain hooks are not in accordance with the drawing, and a large number of them are not sound.

The bogies are not to the sample of those previously supplied, more particularly as regards the working of the dumping chains. In the former ones there is a provision, made with an iron casting and a wheel, to enable the chain to work from an eye-bolt fixed on the inside of the sole-bar, whereas in those now being erected this is disponsed with, and the end of the chain is only fixed with a temporary piece of ½" round iron fixed with a washer plate and two nuts on the bottom side-bar of bogie frame. Several of these I examined and found that they were cracked in the corner.

On the 29/8/84 I met Mr. Carson Woods' foreman, as previously asked, and called his attention to the foregoing omissions and defects, more particularly to the continuous draw-gaer. He informed met that this could not be done without interferin

E. J. BOURN.

Dump-cars.

In accordance with your instructions I yesterday had the pattern dump-car loaded with 24 tons of rails and had it run backwards and forwards about 10 chains. I then measured the compression of the springs and found it to be only \(\frac{1}{2}\) an inch. I am however of opinion that it would not be judicious to run these cars with such a load, as I do not consider the bogic frames are sufficiently strong to bear such a strain.

The Commissioner.

DUMP-CARS.

WITH reference to the contract entered into by Mr. Carson Woods for the supply of 200 dump-cars, I have to report that in accordance with the terms of contract fifty of the cars should have been delivered on the 28th May last, but up to the present none have been handed over, and those that are now being put together cannot be accepted unless very material alterations are made in them. I enclose herein copy of Mr. Foreman Bourn's report.

W. SCOTT, 2/9/84.

The Commissioner.

Memorandum from Mr. E. J. Bourn to Locomotive Overseer.

Sir,

I beg to report for your information that, in conjunction with the Locomotive Engineer, I examined on the 6th inst. fifty-seven bogies of dump-cars standing on the Government Line at Darling Harbour, and found that sixty-nine of the axles were in a very unsatisfactory condition, owing to the iron not being properly worked together in a number of them, and in the remainder the iron is laminated through not being properly welded.

On the 8th instant I visited the works of Mr. Carson Woods and examined ninety-six bogies, and found that 101 axles were in a similar condition to those examined on the 6th inst.

There are still a number of bogies to examine, but their being covered with material prevents my so doing at present.

E. J. BOURN.

I have already said before the Parliamentary Committee now sitting that I would not allow one of these axles to run over our lines. I can corroborate what Mr. Bourn says.—J.M., 9/9/84.

REMOVAL

170

APPENDIX.

REMOVAL OF DUMP CARS.

WITH reference to my memo., 84-1,806, of the 17/9/84, intimating that four dump cars had been removed from Darling Harbour to Eveleigh, for the convenience of the contractors, I have to report that five more of these cars were removed by Traffic Branch to the same place early yesterday morning. I may add that they were brought up before the receipt of your paper, directing that no more were to be received.

W. SCOTT,

To Commissioner.

Per D.C.M'L., 18/9/84.

DUMP-CARS REMOVED TO EVELEIGH.

I HAVE to inform the Commissioner that four dump-cars have been taken out of the builders' shops and placed at Eveleigh. They have not, however, been taken charge of by the Department, but have only been put at Eveleigh for the convenience of the contractors. Whilst they were being removed the brake-gear gave way, being fixed too near the ground; but I understand this is being rectified in the other cars.

Per D.C.M'L., 17/9/84.

The cars should not be allowed to travel on our lines without the question being first decided whether they can be accepted. No more can be received.—Chas. A. G., 17/9/84. Loco. Engineer, B.C.

Traffic Manager to see. It appears five more were brought up before receipt of Commissioner's directions above. Please return paper early.—W. Scott, 17/9/84.

' Memorandum from Mr. E. J. Bourn to Loco. Overseer.

Sir,

Loco. Engineer's Office, Regent-street, Redfern, Sydney, 11 September, 1884.

I beg to report for your information that four of the dump-cars recently put together by Mr. Carson Woods, at Darling Harbour, have been brought up to the Sydney goods siding this morning, but by whose authority I cannot say. During the shunting three of them were crippled by the brake-gear (being fixed too near the ground) coming in contact with the cross-rails leading into the paint-shop.

I have instructed examiner John Baker to mark them off, and not to allow them to be taken out.

These waggons have not been brought under my notice for the purpose of being passed as correct.

Will you please inform me how to act in this matter. Examiner Baker's report attached.

E. J. BOURN.

Urgent. Loco. Engineer, pro T.M., W.L.N., 12/9/84.

[Ordered to be appended, 2 October, 1884.]

Railway Age, 17 August, 1882.

Papers re cars to carry 30 tons freight.

"The feasibility of constructing freight-cars to carry the enormous weight of 30 tons of freight was favourably discussed at the master car-builders' convention, and a practical experiment has already been made on the Union Pacific road, a car containing 1,000 bushels of wheat having been run from Solomon City, Kan., to Kansas City. The peculiarity of this car is a central truck, by means of which it is claimed that all freight-cars can carry from 50 to 100 per cent. additional weight."

Traffic Manager to see.—B.C., 5/10/82. Another to Locomotive Engineer.—Ch. A. G.

Seen. It would certainly be a great saving if the carrying capacity of our trucks could be increased, and I have before suggested that the maximum weight of our open trucks should be increased from 6 to 7 tons. It rests entirely with the Locomotive Engineer to say what can be done in this respect.—W.V.R., 14/10/82. Commissioner.

I think the printed matter* refers to the "Cleminson system," or perhaps to a car with three four-wheeled bogies (one at each end and one in centre of car), but either plan would be an unwise one to adopt. I prefer either a four-wheeled vehicle, an eight-wheeled, or a twelve-wheeled vehicle, and the four and eight I prefer most of all. I am fully prepared to do as Mr. Read suggests, that is, increase the carrying capacity of our waggon stock without increasing the dead weight; and as soon as I can possibly put the work into the hands of a competent draftsman, I shall have much pleasure in showing you what I propose, and if we could adopt a central buffer and draw-bar (combined), this question could be most satisfactorily set at rest, I think, and also cover the present danger in coupling and uncoupling cars, &c.—Thos. Midelian, 19/10/82. The Commissioner.

Over a year has now elapsed since this question was mooted, and in the meantime tenders have been invited for the supply of rolling stock for five years. Mr. Scott has also made a visit of inspection to America and England, and in pursuance of my instructions has devoted his consideration to the question of lessening the tare of rolling stock. I should be glad to learn what is to be the outcome of all this in regard to the improvement of our rolling stock.—CH. A. G., B.C., 22/11/83. missioner.

Mr. Scott.

Minute from Mr. W. Scott to Commissioner.

Carrying capacity of Goods Trucks.

It will be seen by reference to my report on observations made by me during my recent visit to America and England that the question of the carrying capacity of goods vehicles engaged my particular attention. When in New York I called upon the Secretary of the Master Car Builders' Association of America, and obtained from him a report prepared by a Committee, appointed by that body, "upon the carrying capacity of freight-cars." Their report undoubtedly shows that there are many advantages to be gained by increasing, where practicable, the size of the cars, amongst which the following are the most important: the most important :--

Reduction in first cost. Saving in cost of repairs. Less dead-weight to load. Shorter trains and sidings.

Shorter trains and sidings.

Fewer couplings required.

Fawer brakes required.

The carrying capacity of the freight-cars in America had been generally increased from 10 to 20 tons with advantage.

Evidence was then obtained, and the question considered as to the advisability of increasing the size of the cars so as to admit of their carrying 30 tons; and the Committee, finding the weight of testimony much in favour of the larger cars, recommended that a few, with a carrying capacity of 30 tons, should be built as an experiment, the result of which I am anxiously looking for. I gather, however, from an article in the Railroad Gazette, of 5th October, 1883, that sufficient consideration has not been given, in the experiments made, to the question of their capacity for resisting wear and tear to which they are subjected from the shocks and strains, and it appears it is still a matter for inquiry as to what extent the carrying capacity of trucks can be advantageously increased to.

I am most decidedly of opinion that large trucks of a maximum and the carrying capacity of trucks can

I am most decidedly of opinion that large trucks, of a maximum carrying capacity of (say) 20 tons, would, if adapted for our traffic, be a great advantage in many respects.

As you are aware our G trucks are much larger than our ordinary goods trucks, and with a dead weight of 11 tons 8 cwt. have a carrying capacity of 18 tons, so that we have already progressed in a degree to the same lines as those advocated in America.

When comparing the dead-weight and carrying capacity of our trucks with those of America, it should be borne in mind that where we use a very heavy hardwood the Americans use a light soft wood, and that while our trucks are in every respect substantial in construction, theirs are comparatively frail.

* See above extract.

I concur.—CH. A. G., 29/1/84.

APPENDIX.

In 1874 100 of our D waggons were built of soft wood (kauri), and the iron was much lighter than usual, so that the dead-weight was reduced from 4 tons 12 cwt. to 3 tons 13 cwt. 1 qr.; but the result has been very unsatisfactory, as in many instances the backs of these trucks have been broken with the ordinary loads, and several of the head-stocks and intermediates have been pulled out. In fact, out of the 100, only about thirty remain, and they are being renewed with hardwood as they

It should also be borne in mind that the gradients and curves on the American lines, where these large trucks are used, are very much easier than ours, and consequently it is not necessary that their draw-gear, couplings, &c., should be as strong

The goods stock on the English lines is all strongly built, and it is at once evident that the tendency is not in the direction of reducing the dead-weight, but rather to strengthen the stock, so that greater loads may be carried and the cost of

repairs consequently reduced.

Their waggons are all carried on four wheels, except a few which are built specially for heavy loads, and they are on

The following table shows that tare and loads vary considerably on the different lines :-

	Covered Goods.		Medium.	
	Tare.	Load.	Tare.	Load.
Freat Western London and North-western North-eastern South-eastern Freat Northern London and Brighton Midland	tons. cwt. 5 6 5 11 5 19 5 11 5 17 5 3	tons. 9 7 8 8 10	tons. cwt. 4 15 4 18 5 9 and 4 15 5 6 and 4 7 5 4 4 2 4 14	tons. 9 7 8 10 9 7

Of course the Board of Trade requirements have a great influence on the English companies building their stock so-strong, but I am decidedly of opinion that the error, if any, is on the right side, and on Government lines such as ours I think we are much safer on many grounds in following their example, within fair bounds, than in adopting that of the American private companies where the risk run is so much greater. W. SCOTT, 19/1/84.

MR. Alison's cars reported upon by Mr. Scott in 84/2,228, carry 40,000 lbs., and weigh 19,300 lbs., and another carries 13,000, and weighs 7,900 lbs. This is far better than our "G" truck.—Ch.A.G., 29/1/84.

The English load is, as compared with the tare, very much better than ours. We are not only outpaced in this respect by America but even by England's practice, which Mr. Scott adopts as his model. Take for instance their "medium," equal probably to our D; trucksour trucks weigh 4 tons 12 cwt., and carry 6 tons, while their mediums average 4 tons 16 cwt., and carry 8½ tons. I should be satisfied to get this, but I see the South-eastern Railway of England can load 10 tons in a truck weighing 4 tons 7 cwt., notwithstanding the exacting margin of safety insisted upon by the Board of Trade. I am glad Mr. Scott has given attention to the matter and that it is likely to bear fruit. But do not conclude that this paper shows that we have done the right thing hitherto; it shows on the contrary, even by English practice, that we are far out. I am in favour of increasing the size of trucks; in this way the tare, as compared with the load, can be reduced.—Ch.A.G., 29/1/84. Locomotive Engineer, to be returned.—Ch.A.G.

Seen—W.S., 2/2/84. The Commissioner. Traffic Manager to see.—Ch.A.G., 8/12 84.

I think a good deal might be done in reducing the tare of our vehicles, but I cordially agree with Mr. Scott that even that can be overdone—and I think it is overdone in America.

In the matter of goods waggons (or what are known there as freight cars) I have not seen one come from America yet that I regard as strong enough—they are certainly in that respect a long way behind those in England or New South Wales.

Wales.

I believe in large waggons too, and have ordered a good many of them, but they are more suitable for thickly populated countries, where the traffic is heavy, than in a large measure to a sparsely populated country like this, where, in very many cases, we would not get loads for them.

As regards the reduction of the tare of the vehicles, I wrote to the Commissioner on the 16th November last.—
W.V.R., 15/2/84. Commissioner.

[To the evidence of Thomas Midelton, 7 October, 1884.]

J 1.

ACCIDENTS THROUGH BROKEN WHEELS.

Extracts from The Railroad Gazette, January 4 to July 25, 1884.

Train accidents in November. "On the morning of the 8th the rear of a passenger train, on the Chicago, Rock Island, and Pacific Road, was thrown from the track near Jamesport, Mo., by a broken wheel, and rolled over down an embankment. The car was badly broken; one passenger killed and 12 others hurt."

"On the evening of the 13th several cars of a freight train, on the Connecticut and Passumpsic Rivers Road, were thrown from the track near St. Johnsbury, Vt., by a broken wheel."

"On the evening of the 14th a freight train, on the New York and New England Road, ran off the track at the New York, New Haven, and Hartford crossing, in Hartford, Conn., and four cars were piled up together. It is thought that the accident was caused by a broken wheel:"

"On the morning of the 17th the engine and one car of a passenger train, on the Ohio Central Road, were thrown from the track near Bucyrus, O., by the breaking of a wheel under the engine truck. The engineer was hurt."

"On the morning of the 21st a car of a passenger train, on the Louisville and Nashville Road, was thrown from the track near Newcastle, Ala., by a broken wheel."

"On the morning of the 29th several cars of a freight train, on Wabash, St. Louis, and Pacific Road, were thrown from the track near Kirksville, Mo., by a broken wheel."

Extracts from The Railroad Gazette, February 29, 1884.

Accidents in January. "On the night of the 16th a car of a passenger train, on the Rome, Watertown, and Ogdensburg Road, was thrown from the track near Ogdensburg, N.Y., by a broken wheel."

"On the morning of the 22nd three cars of a passenger train, on the New York, Lake Erie, and Western Road, were thrown from the track near Stockport, N.Y., by a broken wheel."

"On the afternoon of the 22nd a passenger train, on the Toledo, Cincinnati, and St. Louis Road, was thrown from the track on a trestle near Beavertown, O., by the breaking of a truck wheel under the engine. The whole train went off the trestle, carrying away a part of it, and was wrecked, injuring three trainmen and five passengers."

"On the evening of the 28th a car of a passenger train, on the Manchester and Keene Road, was thrown from the track near Greenfield, N.H., by a broken wheel."

Extracts from The Railroad Gazette, April 25, 1884.

Accidents in March.

"On thenight of the 6th, a car of a freight train on the New York, Lake Erie, and Western Road, was thrown from the track near Callicoon, N.Y., by a broken wheel."

"On the morning of the 7th, the engine of a passenger train on the Chicago, Milwaukce, and St. Paul Road was thrown from the track near Astoria, Ia., by the breaking of a wheel. The engine was thrown over on its side, the engineer and fireman were killed, and a brakeman was very badly hurt."

were killed, and a brakeman was very badly hurt."

"On the evening of the 9th, six cars of a freight train on the St. Joseph and Western Road were thrown from the track near Maryville, Kan., by a broken wheel."

"On the night of the 9th, two cars of a passenger train on the New York, New Haven, and Hartford Road were thrown from the track on a trestle bridge at Mott Haven, N.Y., by the breaking of a wheel. Both cars went on the bridge and upset into the Harlem River. One passenger was badly hurt."

"On the night of the 18th, a car of a freight train on the New York Central and Hudson River Road was thrown from the track near Auburn, N.Y., by a broken wheel, blocking the track two hours."

"Early on the morning of the 19th, five cars of a freight train on the New York, Lake Erie, and Western Road were thrown from the track near Port Jervis, N.Y., by a broken wheel."

"On the morning of the 25th, a car of a coal train on the Central Railroad of New Jersey was thrown from the track at Annandale, N.J., by a broken wheel, and the twenty-five following cars were piled up on top of it in a bad werek."

"On the night of the 27th, several cars of a freight train on the Wabash, St. Louis, and Pacific Road were thrown from the track near Wabash, Ind., by a broken wheel."

Extracts from The Railroad Gazette, May 30, 1884.

Accidents in April.

"On the night of the 1st, the tender and three cars of a freight train on the New York, Lake Erie, and Western Road were thrown from the track near Goshen, N.Y., by the breaking of a wheel under the tender."

"Early on the morning of the 3rd, a car of a passenger train on the New York Central and Hudson River Road was thrown from the track near Utica, N.Y., by the breaking of a wheel."

"On the afternoon of the 9th, several cars of a freight train on the Norfolk and Western Road were thrown from the track near Battersea, Va., by the breaking of a wheel."

Extracts from The Railroad Gazette, July 25, 1884.

Accidents in June.

"On the evening of the 12th, six cars of a freight train on the Chicago, Burlington, and Kansas City Road were thrown from the track near Browning, Mo., by a broken wheel and badly wrecked; a tramp who was stealing a ride was killed and another one hurt."

J 2.

ACCIDENTS THEOUGH BROKEN AXLES.

Extracts from The Railroad Gazette, January 4, 1884, to July 25, 1884.

Accidents in November.

"On the afternoon of the 8th, the engine of a passenger train, which was running backwards on the Boston, Foosac Tunnel, and Western Road, near Mechanicsville, N.Y., was thrown from the track by the breaking of an axle under the tender. The engine was wrecked, the engineer badly and the fireman fatally hurt."

"On the morning of the 13th, three cars of a construction train on the New York, West Shore, and Buffalo Road were thrown from the track near Savannah, N.Y., by a broken axle, and went down a high bank, injuring thirty labourers."

"On the afternoon of the 17th, three cars of a freight train on the Wilmington and Northern Road were thrown from the track near Wilmington, Del., by a broken axle, and went down a high bank.'

"On the afternoon of the 24th, a car of a freight train on the Wilmington and Northern Road was thrown from the track near Mortonville, Pa., by a broken axle and upset."

Extracts from The Railroad Gazette, February 1, 1884.

Accidents in December.

"Very early on the morning of the 1st, four cars of a freight train on the Pennsylvania Railroad were thrown from the track near Princeton Junction, N.J., by a broken axle."

"On the evening of the 12th, the tender of a passenger train on the New York Central and Hudson River Road was thrown from the track, near Rochester, N.Y., by a broken axle."

"On the 20th, an engine and two cars of a freight train on the Chicago, Burlington, and Kansas City Road were thrown from the track near Farmington, Ia., by the breaking of a driving axle under the engine. Three trainmen were badly injured."

"On the morning of the 26th, the engine of a passenger train on the Chicago, Burlington, and Kansas City Road was thrown from the track near Sumner, Ia., by the breaking of a driving axle on the engine. The entire train followed the engine from the track, the baggage car and forward coach being overturned and badly broken. Two passengers were hurt."

Extract from The Railroad Gazette, February 29, 1884.

Accidents in January.

"Early on the morning of the 21st, several cars of a coal train on the Delaware, Lackawanna, and Western Road were thrown from the track on a bridge near Dover, N J., by a broken axle. The axle cut through one of the bridge girders, breaking it down and blocking the road all day."

Extracts from The Railroad Gazette, March 28, 1884.

Accidents in February.

"On the night of the 13th, two cars of a freight train on the Pennsylvania Railroad were thrown from the track near Downington, Pa., by a broken axle."

"On the night of the 28th, two cars of a passenger train on the Indiana, Bloomington, and Western Road were thrown from the track near Columbus, O., by a broken axle."

Extracts from The Railroad Gazette, April 25, 1884.

Accidents in March.

"On the morning of the 20th several cars of a freight train on the Rome, Watertown, and Ogdensburg Road were thrown from the track at Hess Roads, N.Y., by a broken axle."

"On the night of the 30th, nine cars of a freight train on the Chicago and Grand Trunk Road were thrown from the track near Battle Creek, Mich., by a broken axle." Extracts

Extracts from The Railroad Gazette, May 30, 1884.

Accidents in April.

"On the morning of the 12th, sixteen cars of a freight train, on the Pennsylvania Railroad were thrown from the track, near Robertstown, Pa., by a broken axle."

"On the night of the 15th, several cars of a freight train on the Texas and St. Louis Road were thrown from the track, near Pittsburgh, Tex., by a broken axle, and four trainmen were hurt."

"On the evening of the 22nd, twenty-one cars of a coal train on the Central Railroad of New Jersey were thrown from the track, near Bloomsbury, N.J., by a broken axle."

"On the afternoon of the 23rd, eight cars of a freight train on the Texas and Pacific Road were thrown from the track, near Clear Fork, Tex., by the breaking of an axle. Several of the cars went down a high bank and were badly wrecked."

[Extracts from The Railroad Gazette, July 25, 1884.]

Accidents in June.

"On the morning of the 1st, a car of a freight train on the Housatonic Road, having a circus on board, was thrown from the track, near New Milford, Conn., by a broken axle."

"On the morning of the 14th, twenty-four cars of a freight train on the New York, West Shore, and Buffalo Road were thrown from the track, near Fairport, N.Y., by a broken axle. The cars went down a bank and were scattered in all directions, making a very bad wreck."

"On the night of the 18th, several cars of a freight train on the International and Great Northern Road were thrown from the track, near Laredo, Tex., by a broken axle."

THOS. MIDELTON.

[Ordered to be appended, 15th October, 1884.]

Minute Paper from Mr. T. Midelton to Commissioner for Railways.

Coaling Engines here and on other Lines—Commissioner's M.P. 82-18,558 herewith.

In compliance with your minute of 13/11/82 on the above paper, I have much pleasure in making the following

I have carefully considered the five designs for coaling engines, illustrated in the Railroad Gazette of September 15th, 1882, and am sorry to say I could not recommend either of them for adoption here.

I set it down as an axiom that all coaling appliances (and indeed a great many other things on a railway) should be portable; then, if an engine cannot get to the coal the coal could be taken to the engine, but with any system of fixed plant for coaling engines it is obviously necessary for them to go to that fixed plant at all times for coal; hence there is only one-half the advantage there is with plant that is portable. We now have at several places on the railway system fixed coal stages which have swallowed up time, capital, and space for their erection, and have served a purpose while temporarily wanted but are now abandoned; the same capital would have provided special coal-waggons which could be useful now wherever required.

It is an important point to note, that whatever system of coaling engines is adopted, it should be one which could be

It is an important point to note, that whatever system of coaling engines is adopted, it should be one which could be used at any locomotive depôt on the railway without difficulty, otherwise it is probable we may have as many different sorts of coaling stages, &c., as we have locomotive depôts. I think that what does for one place should do equally well for all, and this I have secured.

all, and this I have secured.

The scheme, fig. 1, adopted at Altoona, on the Penna. Railroad, requires a lot of preparation by cutting out, or filling in, before the fixed stage can be erected; consequently it is only at exceptional places, like Eskbank for instance, where this or perhaps either of the five systems proposed could be used. I think such a scheme would be very troublesome and costly to work. It is stated the coal is raised 110 feet high, but this probably is a mistake; however, if it is only raised 1 foot higher than is absolutely necessary (say just the height of a tender) it is the reverse of economical. The plan involves a lot of manual labour, and a great deal of space.

Fig. 2 is certainly the best of the five schemes, and shows how engines could be coaled direct from a mine, but this plan even necessitates the erection of a large stage, or bridge, really, a lot of hand shunting, and a special locality. I will suppose such a plan in operation at Eskbank; it would be necessary for each colliery proprietor to consent to run his skips from his mine direct on to this bridge, and there deposit the coal; this would mean a system of light tramways from all the mines to the said bridge; such a system I consider would be extremely inconvenient, and perhaps be applicable only at this particular station.

this particular station

Schemes 3, 4, and 5, possess nothing to recommend them; indeed all the designs are expensive and undesirable for many reasons. Each would require special drawings and a lot of consideration to make them suitable for the different locomotive depôts, where it would be necessary to erect them, and I should certainly prefer seeing the capital spent in

providing waggons as I am about to propose.

When an engine takes coal at a depôt it is nearly always necessary to rake the ashes out of the ash-pan into a pit; therefore it is not only the question of taking coal-expeditiously which has to be considered but that of taking water and depositing ashes, and the further operation of cleaning them out of the pit again; neither of the schemes illustrated in the

therefore it is not only the question of taking coal-expeditiously which has to be considered but that of taking water and depositing ashes, and the further operation of cleaning them out of the pit again; neither of the schemes illustrated in the Railroad Gazette shows an ash-pit or a water-crane.

The question of getting rid of the large quantities of coal ashes which accumulate in the pits, and about the yards, at all locomotive depts, is nearly as important a question as that of coaling engines, and should, therefore, be taken into consideration when making adequate provision for locomotive requirements. The ashes, whether used as ballast on the permanent way, or sold for building and other purposes, is an important item, and I think the locomotive department should get some credit or return for ashes, as I consider the sum they would realize would almost pay the expenses of coaling the engines. Under the system I shall propose (an outline of which I furnished to you in my report of July 4/82, M.P. 82/10, 292, herewith) all this will be done.

I understand that the 250 coal-waggons ordered for the exclusive use of the locomotive department are to be the same as the ordinary D waggon; but, if not too late, I recommend that they be constructed as shewn on tracing No. 754 herewith* to either design, as may best suit the Traffic Department. The four-wheeled waggon will hold fifteen coal-boxes and carry 7½ tons of coal. It contains 93 cubic feet capacity more than our present D waggons. The double bogies how under order, except that my waggon is I' 4" wider than the G waggon son referred to. I may mention that the tare shewn is too high, and it is an error on the safe side, as I propose to construct the entire waggon of iron.

When the coal-boxes (which are shewn in detail on tracing No. 744* herewith) are removed, the waggons are then available for the Traffic Department for wool, grain in sacks, rails, timber, hay, straw, &c., &c., and the boxes can be used at the locomotive depôt for coaling engines from the

not sold in the future but still used by the Permanent-way Department, 1 think we (the 1000.) Should get all waggon-load for them, as if they could not be obtained other ballast would have to be got for Permanent-way and probably at a greater cost.

This system would also do away with a lot of labour, calculations, shunting, &c., now necessary for weighing each coal-waggon when full and again when empty as a check for the quantity used or paid for.

Sketch B* herewith shows a complete running shed and appliances for all the work to be carried on expeditiously (as I propose for Goulburn). The same thing is shown to scale on tracing 754.* The engine-shed to hold forty engines of the largest class (twenty each side of the central traversing table. The road A is for engines going into and out, of the said shed; road B is a through road, on which water can be taken and a shunt made if required, so as not to interfere with any of the other roads or operations to be carried on on them, and so that it will not be necessary for all engines to run over the traverser unless going into or coming out from the shed when only it is intended the said traverser shall be used. On line C are placed as many water columns as may be required at any time. Road D has a pit on it of the required length, and on this road all engines are intended to come for coal, water, and raking out ash-pans, and twenty or more may stand on it one after another, and each do its work and go away out on the road for traffic, or go direct into the shed (that is if the first in is attended to by the coal-men), and so on as engines come in. And in case an emergency engine came in when twenty were standing on road D for coal, &c., it could be immediately accommodated by the crane only in ordinary operations; that is, when the coal-waggons come in on road F, and the engines are coaled direct from them by crane on road E. To keep the whole system complete I should, where it can beconveniently arranged, do it as shown in sketch B,* but where the locality will

"Tracing 754.
"Stable"

Sketch B *

the mines the engines could be run in on road E, the crane kept on road F, and the coal-boxes filled from the faces of the respective heaps H by the coal-men, and lifted on to the tenders. Indeed I almost wish to propose that the special coalwaggons shall be used by us during the slack season of the year for our own purposes exclusively; then enough coal could be stacked at each depôt to carry us over the busy season; the coal-boxes could be left at the respective depôts for coaling engines, and the low-sided special coal-waggon could be used by the Traffic Department the whole of the wool season, or longer if required. The waggon I propose is useful for a great many purposes, although worked for loco. coal exclusively, and could take the place of the G waggons referred to.

The first coal-boxes would, I estimate, cost £6, made in Sydney, but about half that sum if made in England, in large quantities, packed and shipped with the plates close together in cases, and just riveted together by us here. The waggons would be of iron also, and very light and strong. I should prefer making them of steel if there were time and it could be properly arranged.

The paper herewith marked C shows what takes place now with regard to coaling engines, and is worthy of study.

The paper herewith marked C shows what takes place now with regard to coaling engines, and is worthy of study, Paper C. as it shows the waste of time which the Department is paying for. With the system I propose eight men at Sydney would do all the coaling in half the time it is now done by thirty-five. A shunting-engine and two more men entirely dispensed

with.

Another plan could be adopted; say forty boxes were made and kept at each loco. depôt, and coal-waggons made with four sides, something like a D or ballast waggon, and the size shown in tracing 744* in plan, and in tracing 754* in plan and Tracing 744.* elevation, they could have drop bottoms along and nearly close to each of the sides, and the said boxes placed behind closely in a row between roads D, E, and F, and the coal deposited into the boxes; but this system means handling the coal once more than is necessary, and I should prefer the plan first referred to. I could construct small cranes suitable for this purpose at a very moderate sum, and so arrange that at some stations it could be worked by hand until the work was too much, and then a small steam cylinder and boiler could be attached.

If this system is not adopted throughout the line at once, I would earnestly request that you will consider it advisable to have (say) 50 of the 250 coal-waggons ordered made on my plan, and all the arrangements I propose carried out at Goulburn loco. depôt, as I feel extremely sanguine about the complete success and economy of the system, having considered it for over ten years. With 20 or 30 boxes and a small crane (even now) on the Sydney stage I could effect great economy.

I am sorry to have to go to such length in my report, but the subject is one in which I feel very anxious indeed, and have taken great pains to note the wants and difficulties attending the question for a very long time, and I trust you will not consider me occupying your time unnecessarily.

not consider me occupying your time unnecessarily.

The Locomotive Engineer, Redfern Railway Station, Sydney,-

Sir,

I will feel obliged if you will cause to be forwarded to me, at Ashfield, at your earliest convenience, one truck of cinders, upon which I shall be happy to pay all charges.

I have, &c.,

T. T. JONES, per A.T.D.J.

Mr. Cobb,—

Please have a D truck loaded with coal-ashes and addressed to T. T. Jones, Esq., Ashfield, as soon as it can be done. I see ashes are being loaded to-day. Let this go through the Traffic Department, as Mr. Jones will pay all costs. Let me know the value of ashes, and the freight to Ashfield.

T.M., 3/1/83.

1 truck sent to-day,—
Value of the ashes d. 0 0 6 Freight

J.C., 4/1/83. Charge £1 ls. 6d. Will you send voucher to Mr. Jones for the above and collect amount. I presume this is the usual course.—T.M., 5/1/83. Traffic Manager.

This does not show how much coal each engine took each time she was coaled. coalmen now employed here and at all other stations.—T.M., 8/1/83.

There were 20 men (including ganger) employed on Sydney coal stages, 20/2/80.

There are (including ganger) 35 men employed now (5/1/83).

64 men at all out-stations.

Please let me know the number of

Total.....99

Some of these (say 6) are only temporary hands.—C.A.N., 8/1/83. Loco. Engr.

I have given considerable attention to the scheme for coaling proposed by Mr. Midelton, and, after mature consideration, I have no hesitation in approving of its adoption. It will result in our having an expeditious supply at a cheaper cost, and I am satisfied that in many ways a considerable saving will be effected.

Mr. Midelton should best know how far the 250 trucks ordered for coaling purposes have progressed, and whether those he recommends can be substituted for them. No time is to be lost in giving effect to the scheme, and I leave the matter in Mr. Midelton's hands with a request that the Engineer for Existing Lines and the Heads of other Branches will afford him every facility in carrying it out.

I am afraid the freight on the boxes, if ordered from England, will absorb any saving which may be effected in first cost, and it is probable that they may be constructed as cheaply in the Colony.

CH. A. G., 20/1/83.

The bogic truck—similar to the "G" truck should be ordered—they will be very serviceable for the carriage of wool and grain up, and for rails on the down journey during the busy seasons.—Ch. A.G.

Return at once, through Traffic Manager and Engineer for Existing Lines Branches. Noted, 26/1/83.—J.M. Mr. Cowdery, then to Traffic Manager.

I HAVE the honor to inform the Commissioner that it is impossible for trains running between Mount Victoria and Bathurst to keep time if something is not done to improve the coaling arrangements at Eskbank.

I think it is very desirable that a coal stage should be put up in the yard at that station for local purposes, and another on the main line, so as to avoid the necessity of cutting off engines from the through trains; and an engine could coal in much less time on the train than it could by running into the yard and back.

Will the Commissioner kindly approve of this being done, as engines are sometimes delayed 50 minutes in getting coal out of the trucks at Eskbank under present arrangement, whereas they ought to be able to coal in 10 minutes, and the consequent delays seem very unnecessary.

I

consequent delays seem very unnecessary.

I recently handed to Mr. Cowdery a copy of the American Railroad Gazette, in which was the plan of a coaling arrangement in every way suited for Eskbank.

Mr. Cowdery, for report, B.C., 27/11/82.—Ch. A. G. See my minute on attached paper.—Commissioner, 29/12/82.

Mr. Avern, for early report.—G.C., per G.L., 30/11/82. Will Mr. Tipping be good enough to meet the District Engineer at Eskbank early on Friday morning, with a view to settling the best position and dimensions of these coal stages.—F. M. A., 4/12/82. Mr. Tipping. For the information of the Acting Locomotive Engineer please instruct me as to what I am to do re this matter. If I am to meet Mr. Avern on Friday morning it will be necessary for me to leave here on Thursday night.—John Tipping, 5/12/82. I was at Eskbank myself on Sunday and Monday last respecting this and other matters, therefore there is no necessity for your going to Eskbank on this matter. While Mr. Avern is that far he might as well I think come on here and see me. Please advise him accordingly. I have repeatedly explained to Mr. Cowdery what I want with regard to coaling engines, and also sent him drawings. I do not know that I can do any more. The whole of the coaling was a few months ago, as you know, done at other places. Suddenly we were asked to make immediate provision at Eskbank to coal all engines there. This of course was an unreasonable request. We have, practically, no provision there for water or coal or pit accommodation; indeed we are only allowed by the Traffic Department to occupy a portion of the goods yard. Please come here and see me as soon as possible. See Commissioner's, 82/10,292, 80/4,092, 82/18,558.—T.M., 6/12/82. Mr. Tipping.

Memorandum from Mr. J. Tipping to Mr. F. M. Avern.

Sir,

Re your memo. requesting me to meet you early on Friday morning at Eskbank, I cannot get away from Penrith, as the time-sheets for this district have to be in Sydney on Saturday morning. I have forwarded the M.P. to Mr. Midelton, and will wait his instruction re the matter of coal stages for Eskbank.

J. TIPPING.

Please return the M.P.—F.M.A., 8/12/82. Mr. Tipping. Returned herewith.—J.T., 11/12/82. Mr. Avern. I have examined the Eskbank yard. I think the best we can do in the matter of a coaling stage is to provide one against the bank between main line and coal sidings. The position is very favourable. Coal could be unloaded from the trucks to the stage, where level would be a couple of feet above the top of a tender standing on coal-yard road. From such a stage the labour of coaling would be small.—F.M.A., 27/12/82. Mr. Cowdery. I recommend Mr. Avern's suggestion be approved of.—G.C., per G.L., 29/12/82. Commissioner. Loco. Engineer to see.—D.V., 2/1/83. Seen. Please see my minute of 6/12/82, on Comr. 82/19,214 hereunto attached. I am sorry I cannot fall in with either the Traffic Manager or the District Engineer's recommendations; indeed, considering there is a new running shed, a 50-feet turn-table, a large coal-stage, and a water-tank at Wallerawang nearly ready for use, I think it would be rather undesirable to do much at Eskbank just now, although I firmly think that Eskbank is a far better place for a locomotive depot than Wallerawang. It should be borne in mind that ash-pits are wanted at Eskbank, water-tanks, and a good supply of water, if a coal-stage is erected there. We already have a very good 50-feet turn-table. All that is required at Eskbank now is a small portable hand-crane, to lift 15 cwt., about twenty iron boxes, and one man; then I could coal engines quite as expeditiously as Mr. Read suggests, and the cost of this would not be half that of a large coal stage. Please see my report on "Coaling Engines," dated 5/1/83, herewith.—T.M., 5/1/83. The Commissioner.

Memorandum from Mr. J. Turton to Locomotive Overseer.

Sir, Government Railways, Locomotive Engineer's Branch, Bathurst Station, 10 December, 1882.

I have to report that I am much inconvenienced by the ashes accumulating round the turn-table at Bathurst, and want of additional lengths of rails by which to run them out of the way. It is next to impossible to get the engines coaled, turned, and the coal unloaded. I am also in want of the temporary coal-stage, to keep a supply for Christmas holidays, and enable me to unload coal-trucks as they arrive. I have spoken and written to the District Engineer on these subjects, but nothing has yet been done to relieve the Department of the inconvenience and obstruction to the work being carried out. The new pit, in addition to engine-shed, will not be completed for two weeks at present rate, and it also is urgently required; as at present, for want of it, three or four dead engines have to be placed on the coal road, which still further obstructs the work and causes a large amount of unnecessary shunting of engines and consequent loss of time. Immediate action re above matters is urgently required. Nothing yet done to new turn-table.

J. TURTON.

J. TURTON.

This is a most serious matter. I was lately at Bathurst and saw the extreme inconvenience Mr. Turton was put to from want of room; he is worse off now than he was twelve months ago; the new turn-table not being finished and the old one not being long enough, necessitates the uncoupling of nearly all the goods engines from their tenders to turn them. This occupies the time of five or seven men, and the turn-table road being also the coal stage road, coal cannot be unloaded if an engine is on this road raking out ashes, &c., and vice versa. I cannot too strongly urge the extreme importance of this yard being completed. A day or two ago there were sixty-two waggons of coal in the Bathurst yard which could not be unloaded as there was no room to put the coal. The reserve coal-stage has been pulled down and no adequate provision made for stacking coal elsewhere. I simply want a coal road for my own use exclusively—no coal-stage or anything of the kind—and this could be expeditiously done. Hope you please direct that something shall be done at once. The Commissioner and I shall be glad to point out to Mr. Avern what will help us best and cheapest.—Thos. Midelion, 15/12/82.

Mr. Cowdery,—Please give this immediate attention.—D. V., pro Commissioner, 19/12/82. Mr. Avern to attend to this.—G. C., per G. L., 21/12/82.

Attended to. The tramway is laid in, a temporary coal-stage has been erected, and your permission obtained to resume work on ash pit and approach to new turn-table which has been commenced.—F. M. A., per R. H. A., 22/12/82.

Mr. Cowdery.

Mr. Cowdery.

Commissioner.—G.C., per G.L., 27/12/82. Loco. Engineer.—G.B., B.C., 28/12/82. Mr. Turton, for report.

How are you accommodated now?—T.M., 1/1/83.

The ashes have been removed and temporary rails laid down beyond the old turn-table to run the ashes out on, a temporary coal platform has been laid down near new carriage-shed, on which I have about 300 tons of coal. The new pit in addition to engine-shed has been completed, and a junction made from it to cattle road. I can now get on very much better with the work. The new turn-table is not yet completed.—J. Turton, 8/1/83.

The Loco. Overseer. Seen.—T.M., 9/1/83.

Memo. from Mr. J. Turton to Mr. F. P. Hubbard.

Loco. coal standing in trucks at Dubbo.

Sir,

Messrs. Evans and Hornidge were here this morning, and complained of having coal-trucks loaded standing here. I had about fifteen to commence with this morning, and whilst arranging the matter with the abovenamed gentlemen two trains arrived, within 10 minutes of each other, with fifteen or sixteen more trucks loco. coal. I am not ordering more than I require for this station, but I again submit I cannot keep them unloaded as they come in, without they come more regular. I really do require another fuelman to do the necessary work, which has increased so much. Mr. Evans states that trucks arriving should be unloaded the same day. I have several here that arrived on 16th and 17th instant. Extra shunting is required to always unload the first that arrives, and it seems at first sight as if it was badly arranged, but we take the trucks that are handiest to get, so as to have them unloaded at the coal stage. I think that as the coal arrives so uncertain, I should be allowed to engage a man or two temporarily, so as to release the trucks.

T. P. HUBBARD.

I would recommend that an additional fuelman be appointed. They can then be arranged to work in three shifts, as at Bathurst. I have instructed Mr. Hubbard, by wire, to take on, temporarily, two men to get coal unloaded.—J. Turon, 23/11/82. Loco. Overseer. Appd.—T.M., 7/12/82.

This difficulty of a glut of coal is of long standing, and I am anxious to have it remedied by a more regular delivery. Seeing that this Department is almost compelled to engage extra men to unload the waggons when they come in so irregularly, not only at Dubbo but at other stations, I think it unfair that my expenditure should be so increased, for no fault of this Department. I should be glad if you could suggest and bring about a remedy.—T.M., 27/11/82. Storekeeper.

I have given this coal supply business my very best and most careful attention for many years, and, as far as the arrangements made by this Branch for securing a regular supply are concerned, I do not see that they can be improved upon. Clear weekly orders, based upon the Inspectors' memos., are issued from this office, in duplicate, to the various stations from which coal is supplied, viz. —Esk Bank, Moss Vale, Bundanoon. One copy being sent to the Station-master, the other to the contractor, and this office is furnished by each of these stations with a daily return of the coal issued to each station. This, it may be thought, ought to secure the perfection of supply; and so it would, no doubt, but for two conflicting agencies—scarcity of trucks and private trade of the collieries. Do what I can, I confess I have found myself unable to cope successfully for any great length of time with these two antagonistic forces, more especially when the traffic is exceptionally heavy, as during the wool season. I consider the only remedy to be the one verbally suggested to me by Mr. Midelton, and this I have frequently recommended during past years, viz., increased storing facilities at the various coaling stations. This granted, and the slack season approaching, I have no fears whate

Midelton.—T.M., 7/12/82.

I desire specially to bring under Mr. Midelton's notice the way in which his Department is delaying our trucks at Dubbo. I understand that the daily supply of locomotive coal required there is about eight trucks, and it appears that the locomotive foreman has only labour enough to unload four or five, and consequently trucks are frequently detained for a week under load. I am informed that yesterday there were thirty trucks of coal on hand for the Locomotive Department at that station, which will, I understand, take at least a week to unload with the present staff. Will he kindly give this matter his attention, as it is impossible for us to supply the collieries if this state of affairs continue to exist.—W. V. Read (Per D.K.), 23/11/82. Urgent. Acting Locomotive Engineer.

Mr. Turton, for immediate report.—R.J.S., 23/11/82. Report attached.—J. Turton, 1/12/82. The Locomotive Overseer.

tive Overseer.

Memorandum from Mr. T. Hubbard to Mr. Turton.

Sir, Government Railways, Locomotive Engineer's Branch, Dubbo Station, 30 November, 1882.

In answer to the Traffic Manager's report re unloading coal-trucks at Dubbo, I have already reported fully in writing and verbally on this matter to yourself—First.—The uncertain way in which the trucks are brought to Dubbo.

The want of a new coal-stage where we could coal engines without interfering with other engines coming into and out of the engine-shed. The extension of the present engine-shed siding, as pointed out to yourself by me, and the removal of the danger signal at the end of the coal-stage, would greatly help to falicitate the unloading of coal-trucks.

As it is at present, one engine coaling blocks up the whole entrance to the engine-shed; and lastly, insufficient number of fuelmen. At this date I have twenty loaded trucks of coals here. I would respectfully call your attention to the great increase of traffic at this station, both in the increased number of trains, and the addition of the Nevertire extension of 64 miles, and all engines have to have sufficient coals put on their tenders to take them from Dubbo to Nevertire and back to Dubbo, making a distance of 128 miles. (No coaling at Nevertire.)

T. P. HUBBARD, Loco. Sub-Inspector.

I think it would be an advantage to have a dead end from outside or north engine-shed road, for coal trucks to stand on, also for the junction of engine-shed roads with main line to be moved east about 50 yards, and the signal-post near the junction-above-mentioned to be removed about 100 yards east of its present position. This would enable engines to be coaled at either side of coal-stage or to run round the engine-shed or coal-stage without fouling or going on to main line which they cannot now do. An additional fuelman is also required.—J. Turton, 1/12/82. The Locomotive Overseer.

Memorandum from Mr. J. Turton to Locomotive Overseer.

Sir, Government Railways, Locomotive Engineer's Branch, Bathurst Station, 1 December, 1882.

On account of a number of trucks standing full of locomotive coal at Dubbo, and as the Traffic Department was in urgent request of them, I have taken on a young man named John Parkes, as fuelman, temporary, to assist in getting the coal unloaded. Proposed rate, 7s. 6d. per diem. for nine hours. J. TURTON.

Approved .- T.M., 6/12/82.

Telegram from Mr. Loco. Engineer Midelton to Inspector Turton, Bathurst. PLEASE answer immediately.—Is your coal-stage full of coal? How many waggons full of coal are there in the yard? Have you sufficient men to unload coal? Have you room to unload coal?

Memorandum from Mr. J. Turton to Mr. T. Mideltón.

Memorandum from Mr. J. Turton to Mr. T. Mideltón.

Sir,

Government Railways, Locomotive Engineer's Branch, Bathurst, 7 December, 1882.

I have to report re your telegram attached, that I was down the line when it arrived. There are thirty-nine trucks of coal now standing in the yard loaded; some of them will be unloaded to-night, as I have instructed the fuelmen for some time back to coal engines from trucks as much as possible. The coal-stage is not full nor can I keep it so, as I am much inconvenienced for want of additional coal-stage room and the new turn-table. The want of the latter alone causes a loss of four to five hours daily, through having to uncouple to turn engines and recouple them, before they can take coal. I am also much incommoded for want of means to dispose of the ashes, by which the fuelmen are prevented from unloading coal-trucks as they otherwise would. I have spoken to and written to the District Engineer to get these obstructions removed, but it has not yet been done. I have also seen him about the temporary coal-stage that was to have been erected immediately the late new one was pulled down, and which was commenced and discontinued, as it was thought by him better to erect the permanent one, which has also been discontinued. I would urge the necessity of at once completing the new coaling and turning arrangements, as by doing so the work of the Locomotive Department will be very much facilitated. The number of trucks standing is owing in some measure also to the manner in which they arrive, which has been as follows:—Nov. 24, 6; 25th and 26th, 16; 27th, 7; 28th, 13; 29th, 13; Dec. 1st and morning of 2nd, 26; 3rd, 18; 4th, nil; 5th, 13; 6th, 4. As the coal-trucks can only be unloaded on to the stage during the day, and between trains, it is impossible to get them unloaded with the limited facilities at my command, unless the coal arrives regularly as ordered and not in gluts. I have enough men at present, permanent.

J. TURTON.

Telegram from Mr. J. Turton to Mr. T. Midelton.

TWENTY-TWO trucks of coal arrived last night and this morning; fifty-two now in the yard. I will take some temporary hands to unload them.

APPENDIX.

Minute from Acting Locomotive Engineer to Commissioner.

Subject:—Cost, &c., of coaling Locomotive Engines.

Department of Public Works, Railway Branch,
Loco. Engineer's Office, Sydney, 4 July, 1882.

I have carefully perused your 80/4,092 herewith, and upon inquiry I find that you have not yet been supplied with the report you asked for on the 6/2/82. I therefore have much pleasure in forwarding you my views on this very important matter which I may state has occupied my serious attention for some years.

The supply and distribution of fuel is a very large and important item in locomotive expenses, and it is clear that if coal could be taken direct from a mine and put at once on tenders that this would be the cheapest and most simple way that it could be distributed, and it is quite possible to do this, with the exception of its transit from the mine to the various locomotive denots.

coal could be distributed, and it is quite possible to do this, with the exception of its transit from the mine to the various locomotive depots.

I most thoroughly agree with the views expressed by the Secretary, viz., "that we should have suitable waggons constructed for the conveyance of coal, and also have crane appliances." I am happy to learn that waggons have been actually ordered, and hope they are specially designed to suit the work they are intended for.

There are far too many men employed in coaling engines, but I do not wish to dispense with their services; on the contrary when suitable provision is made for coaling engines, but I do not wish to dispense with their services; on the contrary when suitable provision is made for coaling of no coaling engines, but I do not wish to dispense with their services; on the contrary when suitable provision is made for coaling I could more profitably employ these men at other work, especially as the traffic is so rapidly increasing.

At the time you wrote your minute of 7/8/81, and even up to now, this question has been almost constantly in my mind, and I have only to repeat the words used in my report to Mr. Scott when describing my design for the Eveleigh Works (No. 4), and forwarded to him on the 30th December last. It runs thus:—

"The coaling of engines I intend to be done as follows:—On the coal road, next the up main line, will stand as many coal waggons as the siding will hold (which said waggons should be specially designed and constructed for the purpose); then engines coming to the sheds would run in on the road next the coal road; between these roads runs a small jib-crane of special design, capable of lifting 2 tons; this would be used to lift 10, 20, 30, or 40 cwt. of coal as required direct from any waggon on the said coal road to any tender at any time; this avoids coal stages altogether, and the coal is only handled once by this means in place of four times as at present. It is intended that the coal waggons should be unloaded regularly at the

would be done; each man and each engine could do what there is to be done without any obstruction or detenuon whatever. The space between the coal road and the shed roads could be used for erecting a very large coalstage on, but it is not advisable to adopt this plan."

I most thoroughly endorse your expression, viz., "not only in Sydney but at all our depôts we are incurring an extravagant and unnecessary expenditure in connection with our coaling arrangements." I am very anxious to do what I can to reduce this extravagance, but I fear unless immediate steps are taken the cost of coaling engines at Bathurst, Penrith, Goulburn, and other places will be materially increased instead of reduced, and it is evident that the nearer we can approach the true theoretical manner of coaling the greater the economy will be in all respects, and many thousand pounds per annum can be saved in this one item alone.

Drivers complain about the long time they have to wait after finishing a journey before they can turn their engines to get coal and water; half-an-hour is ample for this purpose at any depôt if the locomotive yard and appliances are properly arranged, and this is quite a simple matter to accomplish in all new yards or re-arrangements of old ones, but as far as I can learn it has not yet been successfully done on our lines, and unless it is done soon the cost with our rapid extensions must increase very much. A driver's time generally reckons from the hour he comes on duty till he leaves his engine, and it is evident that the more expeditiously all his duties can be accomplished the less the cost to the Department.

About twenty to twenty-four waggons of ashes per fortnight are, I am informed, loaded up in the Sydney yard by the Locomotive Department and handed over to the Permanent-way Department. Under such circumstances I think we should be allowed something for these ashes, or allowed to use or sell them ourselves.

I have, &c.;

THOS. MIDELTON.

I shall be glad if the Engineer for Existing Lines will, in consultation with Mr. Midelton, devise some means by which greater economy, both in time and expense, can be effected in the cost of coaling locomotive engines.—Ch. A.G., 7/7/82.

Will Mr. Midelton please name a day upon which we might meet and consult on this matter.—G.C., per G.L., Mr. Midelton.

Saw Mr. Cowdery to-day, 15/8/82, with reference to Eveleigh, and explained my views as herein shown, and also showed him drawing of coal-waggon specially arranged for this purpose.—T.M., 15/8/82.

I cannot devise any better plan for coaling engines than that which is herein described, and also shown on tracing of proposed new running engine-shed for Goulburn. The same arrangement is shown in my No. 4 design for the Eveleigh works, and in a tracing which I have just prepared for Newcastle running-shed.—Thos. MIDELTON, 18/9/82. The Commissioner Commissioner.

This matter will, I trust, receive immediate attention. I do not know how far Mr. Midelton's plan of coaling proposed at Eveleigh under his plan of shops must be modified to admit of adaptation to accepted design, but as far as possible Mr. Midelton's proposals for coaling engines are to be carried out at once at Eveleigh and other stations.—Ch. A.G., 29/9/82. Mr. Cowdery, B.C.

Minute from Mr. D. Vernon to Mr. R. J. Sheridan.

Discharging Coal from Truck to Stage, Redfern.

Mr. Sheridan will be good enough to furnish me with the number of men employed and amount paid for wages for the above service.—D.V., 19/2/80.

Twenty men. Wages, £6 13s. 6d. per diem. This includes coaling engines and screening coal.—R.J.S., 23/2/80. The Secretary. It appears to me that if we had a number of suitable waggons constructed for the conveyance of coal from the harbour, and crane appliances at the stage, a very large saving might be effected.—D.V., 26/2/80. Will the Locomotive Engineer look into this matter? The expenses must be cut down, and before touching the wages and salaries, I wish to see whether economic working cannot be otherwise obtained.—Ch.A.G., 26/2/80.

I looked into this matter on receipt of the Commissioner's minute, and found that there were nineteen men employed on this service, besides the ganger. During the year about 20,000 tons of coal were placed on the coal-stages at Redfern; the same quantity being again transferred from the coal-stages to the engines, making in all 40,000 as having passed through the hands of these nineteen men in the year.

The

365 days of the year being reduced by $\left\{ \begin{array}{ll} 52 \; \text{Sundays} \\ 6 \; \text{Proclaimed holidays} \\ 4 \; \text{Exhibition} & \text{do} \end{array} \right.$

and 40,000 tons of coal unloaded in 303 days by nineteen men is equal to 132 tons in one day, which equals about 7 tons per man per day of 8 hours.

The limited accommodation will not admit of a more economical mode of working. The alterations taking place from time to time in the arrangement of the yard and sidings prevents the fixing of such mechanical appliances as would enable the coal to be handled with a minimum of men.—R.H.B., 19/10/80. Commissioner.

Seen. I trust that when the workshops are removed some more economical method of receiving and staging the coal and charging the engines with it will be effected. To pay over £2,000 a year for wages for handling 20,000 tons seems to me extravagant—equal to 2s. a ton.—Ch.A.G., 22/10/80. Resubmit end of June, 1881, to see whether better arrangements can be made, owing to alterations, which will be, I hope, by that time effected.—Ch.A.G., 22/10/80. Resubmitted, I/7/81.

I am disappointed that the progress in making the changes has been so slow. Indeed nothing for some time has been done apparently towards the erection of the new workshops which I expected by this time would have been nearly completed.—Ch.A.G., 7/8/81. End of September. Resubmitted, 4/10/81. Will Mr. Scott give attention to this matter in designing the accommodation at Eveleigh.—Ch.A.G., 24/10/81.

This will be attended to.—W. Scott, 26/10/81. Commissioner.
End of year, 8/11/81. Resubmitted, 3/1/82. Not only in Sydney but at our depôts I am strongly impressed with the idea that we are incurring an extravagant and unnecessary expenditure in connection with our coaling arrangements.—

D. V. 13/1/82

the idea that we are incurring an extravagant and unnecessary expenditure in connection with our coaling arrangements.—
D.V., 13/1/82.
End of month, 13/1/82.—Ch.A.G. Resubmitted, 1/2/82. Acting Locomotive Engineer for report on the whole question.—Ch.A.G., 6/2/82. Report forwarded.—J.M., 4/7/82.
Mr. Hyndman as regards Eveleigh. Please return at once.—G.C., per G.L., 5/10/82. Mr. Hyndman. Will Mr. Cowdery please send for men as to this matter.—R.A.H., 6/10/82. All arrangements have been made.—R.A.H., 20/10/82. Engineer for Existing Lines. Mr. Avern, as regards coaling stations in his district. Please return papers at once.—G.C., per G.L., 21/10/82. Mr. Avern. Seen.—F.M.A., 24/10/82. Mr. Cowdery.
Mr. Stephens, as regards coaling stations in his districts.—G.C., per G.L., 26/10/82. I am making inquiries from Locomotive Overseers Webster, Allan, and Close. I shall send in report as soon as I receive their answers.—R.D.S., 14/11/82. To Mr. Cowdery. Commissioner.—G.C., per G.L., 15/11/82. Mr. Midelton to see.—D.V., 16/11/82.
Seen. I should be very glad at any time to give Mr. Stephens any further information that he may require on this subject than that which I have stated herein, and as the system I propose can be adopted at any station without much trouble in the way of preparing a site, I hardly see the necessity for his applying to the Locomotive Inspectors for information when I can give it better and quicker, as I have well considered what is required at all the locomotive coaling depôts. I beg to refer you to your 82/19,214, Engineer for Existing Lines, 82/8,328, to which is attached herewith, also my report dated 5/11/83 herewith; also your 82/18,558 herewith.—Thos. MIDELTON, 5/1/83.

Minute from Mr. W. Scott to Commissioner.

Coaling arrangements for Locomotive Purposes.

As the question of coaling arrangements for locomotive purposes has been specially brought under your notice, I feel it my duty to report for your information upon what I consider the best system to adopt.

I may state that during my recent visit to America and England I paid special attention to this matter, and I have no hesitation in stating that it is the best that came under my notice.

As it will be seen by the tracing herewith, boxes to hold $\frac{1}{2}$ ton each, which are run on four wheels, are substituted for shoots. Through the wheels being round on the tread and close together they are easily turned in any direction. I would point out that this system is particularly well adapted for places like Eveleigh and Eskbank, where coaling platforms can easily be kept at a high level. In many places in England they go to the expense of making an elevated road upon which the waggons were run to the height required, so much do they prefer this system over any other. While I have no objection to the crane system being adopted for places where a high-level stage cannot be obtained readily, I very strongly recommend the box system where we have natural advantages in its favour.

I may also mention that the dump-cars would be specially suitable for dumping the coal on to the platform.

Mr. Cowdery's plan for Eveleigh—The stage and shoot plan will cost some £11,000. Mr. Midelton's crane and box plan will cost £750. What will Mr. Scott's plan cost? Mr. Cowdery, B.C., 15/3/84.—CH.A.G. Urgent.

Mr. Thomson for cost of Mr. Scott's plan.—G.C., per G.L., 18/3/84. feet by 35 feet.—M.T., 25/3/84. Engineer for Existing Railways. Estimated cost, £6,960, for coal-stage 600

Estimated cost of coal-stage, 600 feet by 35 feet, £6,960.—G.C., per G.L., 26/3/84. Commissioner.

What number of boxes, to hold ½ ton each, will Mr. Scott require to carry out his design of coaling at Eveleigh?—G., 29/3/84. Urgent. Question will be finally determined this month if possible.

The stage I recommend does not require to be more than 25 feet wide, so that Mr. Cowdery's estimate would be considerably reduced. It should be borne in mind that both Mr. Cowdery's and my scheme provide a stage to store coal on and a roof to cover it from the weather. The number of boxes required for my scheme will be 50 at £3 each, or a total of £150.—W. Scott, 7/4/84. The Commissioner. on and a roof to cover it from the of £150.—W. Scott, 7/4/84.

What will be reduced cost if stage be made 25 feet wide instead of 35 feet ?—Ch.A.G., 12/4/84. Urgent. Locomotive Engineer, B.C., 15/4/84.

I presume you will supply this information.—W.S., per R.J.S., 16/4/84. Mr. Thomson, for reduced cost of stage, if made 25 feet wide instead of 35 feet.—G.C., per G.L., 16/4/84. Estimated cost of coal stage 25 feet wide,—£5,980. The cost of a roof is not included in this estimate.—M.T., 22/4/84. Engineer for Existing Lines.

Estimated cost of coal-stage 25 feet wide, -£5,980. The cost of a roof is not included in this estimate. -G.C., per G.L., 22/4/84. Commissioner.

After giving this matter careful consideration, I recommend that the stage designed by Mr. Scott be adopted.—CH.A.G., 29/4/84.

Approved. -F.A.W., 30/4/84. Locomotive Engineer, first. Please return.—G.B., B.C., 30/4/84.

Seen.—W. Scott, 7/5/84. The Commissioner. per G.L., 12/5/84. Mr. Cowdery.—R.J.S., 9/5/84. Mr. Thomson tonote.—G.C.,

Noted. Am I to prepare contract plan and specification for this work?—M.T., 14/5/84. Engineer for Existing Railways. Yes.—G.C., per G.L., 15/5/84. Mr. Thomson. Plan and specification herewith.—M.T., 11/7/84. Engineer for Existing Railways.

Draft advertisement inviting tenders for the construction of coal-stage at Eveleigh herewith. Estimated cost, £4,420.—G.C., per G.L., 13/8/84. Commissioner. For approval of Minister.—Ch.A.G., 14/8/84. Approved.—G.R.D., 15/8/84. Advertisement sent to Herald, Telegraph, Evening News, Public Works, and Government Gazette.—T.S.L., 21/8/84. Mr. Cowdery,—R.J.S., B.C., 21/8/84. Noted.—G.C., per G.L., 22/8/84. Commr. Locomotive Engineer, B.C., 22/8/84.—L.P.I. Seen.—W. Scott, 25/8/84. Commr.

Department of Public Works, Railway Branch, Sydney, 13 August, 1884.

Tenders will be received at this Office until 11 o'clock on Tuesday, the 9th September, from persons willing to contract for the construction of a coaling stage at Eveleigh, Great Southern Railway.

Plan may be seen, and copies of specification, form of tender, schedule of quantities, and further particulars obtained, at the office of the Engineer for Existing Railways, 44, Fhillip-street, Sydney.

Tenders to be endorsed "Tender for Constructing Coal Stage at Eveleigh."

The Commissioner does not bind himself to accept the lowest or any Tender.

CHAS. A. GOODCHAP. Commissioner for Railways.

New South Wales Railways-New Workshops at Eveleigh.

Estimated cost of Coaling Stage and Hoppers $360' \times 42'$ 6" (not c	overed)	:	-

I am quite satisfied that to coal the engines with the steam crane, as proposed, will not answer, as it will take too long. Plan herewith.—G.C., 18/2/84. Commr.

Estimate for new Coal Stage and Hoppers, Eveleigh. s. 0 0 11,735 Stage and Hoppers..... 4,096

G.C., 16/1/84.

M.T., 11/2/84.

Minute from W. Scott to Commissioner. Coal Stage, Eveleigh.

The plan of coal-stage herewith is somewhat similar to those I saw in America. In England the coaling is generally done by a small steam crane which lifts boxes holding 10 cwt. each, or by boxes holding a like quantity, which are run on a high-level stage from which they tip the coal into the tenders.

I believe the plan proposed by Mr. Cowdery will, with slight modifications in the sizes of the shoots, answer very well, but I would recommend that the stage be provided with shoots at both sides, and a stage 20 feet wide between and clear of the shoots for stacking coal on, as by this means engines can coal at both sides and afford necessary space required for keeping a quantity of coal in stock. At the present time we have two coal stages capable of holding 1,000 tons each in Sydney yard, whereas the shoot stages shown on plan only provides space for about 500 tons, which would of course be inadequate for our requirements. It is also very necessary that the coal-stage should have a roof over it, both for the protection of the men to be engaged on it and the coal from the weather.

W. SCOTT.

W. SCOTT 5/10/83.

Forward this report from Mr. Scott to Mr. Cowdery, who will carry out plan of the coaling stage referred to, with such modifications as are required by the terms of Mr. Scott's report.—Ch.A.G., 12/10/83.

Will Mr. Cowdery let me know to-day what progress is being made with the additional sidings at Newtown, and when the work will be sufficiently advanced to admit of the new sidings being used.

Mr. Cowdery is informed that the traffic is being blocked, owing in fact to the delay that is taking place in giving more accommodation at Newtown (there being some 70 trucks shut out encumbering Sydney yard, and delaying the return of trucks to the coal-fields at Lithgow), and partly to the undue use of trucks for locomotive purposes, owing to the want of coaling arrangements for Locomotive Branch.

I should like to have the engineer's undertaking that these evils shall be removed, and a time named within which they will be removed.

will be removed.

Please report in each case separately—"Newtown Sidings" and "Better Arrangements for Locomotive Cooling.

Please report in each case separately—"Newtown Sidings" and "Better Arrangements for Locomotive Coaling."

CH. A. G., 28/6/83.

The roads at Newtown are now being put in and the embankment made up, and will be completed in three weeks. Drawings for coaling are now being prepared, and will be ready to submit in a few days. This paper I put in my pocket a few days ago, and quite forgot it.—G. C., 5/7/83. Comr.

Seen. Perhaps the paper about the Newtown sidings is in the other pocket. Will Mr. Cowdery please look.—Ch. A.G., 9/7/83.

My minute has reference to the siding at Newtown, and also to better arrangement for coaling.—G. C., per G. L., 23/7/83. Comr.

23/7/83. Comr.

I assumed of course that the "roads" referred to were the roads at Eveleigh (the words "at Newtown" having been resulted the two matters might be reported upon separately. I will treat this added since), and more especially so as I requested the two matters might be reported upon separately. I will treat this paper as referring to the coaling arrangements. Where are the plans which on the 5th inst. it was said would be ready in a few days?—Ch.A.G., 26/7/83. Mr. Cowdery, B.C. Plan herewith.—G.C., per G.L., 1/8/83. Comr. Let me see it.—Ch.A.G., 26/8/83. The plan is to be carried out. I understand that Mr. Scott considers that it is as good at least as, if not better, than any plan of coaling he had seen on his visit of inspection.—Ch.A.G., 26/9/83. Ask Mr. Scott.

Minute from Mr. T. Midelton to Mr. W. Scott.

Coaling Engines, &c.—Reply to Traffic Manager's Minute of 23/7/83, on Commissioner's 83-6,056.

Coaling Engines, &c.—Reply to Traffic Manager's Minute of 23/7/83, on Commissioner's 83-6,056.

There can be no doubt about the correctness of the view taken by the Traffic Manager, viz., that "The Locomotive Department should certainly be best qualified to deal with the question of stages for the storage of coal." I am therefore surprised to hear that he does not think very highly of my "scheme of transporting coal from the mine to the locomotive engines," but I am still hopeful that he will think highly of it if he will read the accompanying papers as thoroughly, &c., as has been done by the head of the Department, and adhere to the wishes and directions expressed by him in his minute of 20/1/83, on L.E. 83-270.

If the Traffic Manager can suggest a better scheme than the one I propose for coaling engines, obtaining water, and disposing of ashes, I shall feel deeply indebted to him, and be exceedingly glad to hear what he has to say. It is evident from Mr. Read's minute of 23/7/83, that he misunderstands me; I certainly did not propose to make waggons like the G's to carry only fifteen coal-boxes, or 7 tons 10 cwt. of coal per waggon; what I proposed will tare 8 tons 10 cwt. (say 9 tons), and will carry thirty boxes and 15 tons of coal, or eighty-four bales of wool = 17 tons or 20 tons of rails, &c.; the four-wheeled waggon I suggested would carry 7 tons 10 cwt. of coal exclusive of boxes. We have no such waggons at present. This will meet Mr. Read's hypothetical waggon, which should be capable of carrying from 40 to 50 per cent. more than its own weight.

One would suppose from reading Mr. Read's minute that he never ran an empty waggon on any train, and if the charges are as he states, I think the sooner we do as is done in England, viz., run our own coal trains with our own engine the better; indeed, this is just what I would urge to be done as soon as possible; then all our difficulties re unloading

APPENDIX.

waggons, irregular supply of coal, real cost of haulage, &c., &c., would be at an end. I am sure we could haul a truck of coal from Eskbank to Nyngan, unload it (my way), and work the empty waggon back to Eskbank for less than 20s. 1d. per ton. The Great Eastern Railway Company (E) work 400 tons coal, train 180 miles, at 19 miles an hour, for \(\frac{5}{16} \)d. per ton per mile. The total weight of train would be about 700 tons, worked by one engine, and the empty waggons run back to the mine as I propose. These trains earn for the Company about 2s. 4\frac{1}{2}d. per train mile. The L. & N. W. Railway, work similar trains from Wigan to London, nearly 200 miles I think; surely it is not an uncommon thing to run empty waggons. I would ask the Manager to be good enough to read the papers again and see what I propose. I surely have as much interest in the shape of economy as any other officer, and if I have overlooked any point which would be advantageous to the Department, I am sure I shall be exceedingly grateful if he will enlighten me. I have shown that my coal-waggons are for my use when I want them, that is during the slack time (winter season); in the busy time they are available for traffic, and only weigh 8 tons 10 cwt., and will carry 17 tons; the boxes I use while the traffic use my waggon.

THOS. MIDELTON, 14/8/83.

Doubtless Mr. Midelton has well thought out his scheme, but I must say I fear it will not work as well as he anticipates. I believe the coal proprietors will object to load the boxes spread over the floor of a truck, as those on the far side will not be within reach of the shoot, besides which, if the boxes are to be substituted for coal-stages, there will be some difficulty in obtaining standing room for the quantity that would be required, irrespective of the question of cost of the boxes.—W. Scott, 20/8/83. The Commissioner.

Mr. Scott should ask Mr. Midelton if he has missed these contingencies in making his design.—Ch. A.G., 25/8/83.

Mr. Scott should ask Mr. Midelton, 28/8/83.

Mr. Midelton, 28/8/83.

I reply to the Commissioner's question. I have not missed the question of loading my waggons; indeed I see no difference between loading them than a D waggon; the operations are precisely the same. All the points raised by Locomotive Engineer are fully explained in former papers. I still am prepared to show that my plan is the most economical and convenient of any yet proposed.—T.M., 1/9/83. Locomotive Engineer.

Commissioner.—W. Scott, 1/9/83. Seen.—Ch.A.G., 10/9/83.

Seen. The Locomotive Department should certainly be best qualified to deal with the question of stages for the storage of coal; but I cannot say, from what I can gather from these papers, that I think very highly of Mr. Midelton's scheme of transporting the coal from the mines to the locomotive depôts.

I notice from his minute of 5/1/83 that the new waggon he proposes building for the purpose will be practically the same as the new G waggons that are being built for the Traffic Department, except that it will be built of iron. The design of the waggon is not with these papers, so I cannot tell what the tare will be; but I notice that he proposes it shall carry fifteen coal-boxes, each one of which will contain 10 cwt. of coal = 7 tons 10 cwt. per truck.

That is a very small load for a truck of such dimensions. The boxes themselves will doubtless weigh about 4 cwt. each; at least I should think so from the enclosed plan; but that is just like adding about 3 tons to the tare of the truck when carrying coal, and it involves a tremendous waste of engine power. It appears to me that a truck could be designed capable of carrying from 40 to 50 per cent. more than its own tare, and that any advantage which might be derived, either at the loading stations or in unloading at the locomotive depôts, will be far more than counterbalanced by carrying such a weight in iron. weight in iron.

weight in iron.

Take, for example, a truck of coal from Eskbank to Nyngan, the trainage upon which amounts to £1 0s. Id. per ton; if the boxes weighed 3 tons the Department would lose equal to £3 0s. 3d. in trainage. Even to Mount Victoria it would lose 5s. 9d., and I should think the whole truck of coal could be discharged for the latter sum.

I am, on another paper, reporting as to the merits of Eskbank as a coaling station in preference to Wallerawang. The return of the empty boxes does not appear from these papers to have been considered; but perhaps it has been, although it does not appear. It should be borne in mind that when they are on the trucks no other loading can be put in them.

W.V.R., 23/7/83.

Yours &c., W. SCOTŢ.

Locomotive Engineer for report re coal appliances for loading engines.—Cn. A. G., 24/3/83.

Minute

Minute from Mr. T. Midelton to Commissioner.

Report on Mr. Scott's letter re Coaling Engines (your M.P. 83/5,734, herewith).

I AM sorry I cannot agree with Mr. Scott's view that the coaling arrangements he illustrates are best. To run the coal waggons up a grade so that they shall stand 10 feet higher than the tender to be coaled requires power and a lot of space. I really see no reason for doing this at all, as the small boxes on wheels could be filled without raising the coal waggons. The "stage" is costly and requires a lot of space, and when once fixed cannot well be abandoned. The coal is handled once more than is necessary. Indeed the system is pretty much the same as we now have, except that we do not use the boxes (on wheels). I do not see how engines are coaled from the reserve heap, unless it is shovelled on carelessly. The system could only be adopted in certain places—not anywhere, as it ought to be

than is necessary. Indeed the system. The wheels). I do not see how engines are coaled from the reserve heap, unless it is shown as a shown and it is shown as a show

I cannot trace that the Commissioner's M.P. 83/866 ever came here.—W.V.R., per D.K., 9/5/83. Acting Locomotive Engineer. The paper referred to was sent to Traffic Manager on 29/1/83.—R.J.S., 16/5/83. Mr. Berner. Will Traffic Manager please have search made.—G.B., B.C., 19/5/83. Not here.—W.V.R., per D.K., 29/5/83. Commissioner. Locomotive Engineer, B.C., 30/5/83.—G.B. The paper (Commissioner's 83/866) was sent to Traffic Manager 29/1/83, and has not since been in this office.—R.J.S., 2/6/83. Mr. Berner.

Acting Loco. Engineer's report on Mr. Scott's letter dated 9 February, London, re coaling engines. Will Loco. Engineer please have a further search and inquiry made for missing papers.—G.B., B.C., 16/6/83.

Nothing is known here of the papers referred to; they were sent to Traffic Manager on 29/1/83.—W. Scott, 20/6/83. Commissioner. Will Traffic Manager have a strict search made.—G.B., B.C., 22/6/83. A thorough search has been made, but without success.—W. V. Read, per D.K., 26/6/83. Mr. Berner. Will Mr. Landers please have a search made.—G.B., B.C., 28/6/83. Papers referred to herewith.—G.C., per G.L., 7/7/83. Comr. At last these papers have turned up. They were sent to Mr. Cowdery by Loco. Engineer on 26/1/83, to be returned at once through Traffic Manager, I now send them on to Traffic Manager,—G.B., B.C., 10/7/83.

DUMP-CARS.

(Ordered from Carson Woods & Co.)

Ordered by the Legislative Assembly to be printed, 21 May, 1884.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 25th March, 1884, That there be laid upon the Table of this House,-

"Copies of all minutes, letters, reports, and other documents having reference to the ordering of a number of Dump-cars from Carson Woods & Co."

(Mr. Sydney Smith.)

Minute of Commissioner for Railways.

I have received from America some papers on the newly patented dump-cars in use there, and which seem to be a great improvement in regard to the unloading of certain descriptions of goods. I shall be glad if the Traffic Manager will peruse these papers and furnish me with a report. It seems that the patented arrangement for "dumping" the cars can be attached to trucks in use at a cost of about £6 per truck.

Minutes.

By Traffic Manager:—The principal traffic for which the kind of trucks would be available is coal, but at present we have neither platforms nor staiths on to which to shoot the coal; now it is carted direct from the trucks. Should it be approved to build staiths at stations as is done in England (and I would strongly recommend it), then the adoption of the principle would be of great service in the saving of time and labour, and in enabling of greater mileage being run by waggons. There are other smaller kinds of traffic for which the principle could be made use of if there were places on which to "shoot" it. The principle would appear to be well adapted for ballast waggons, and also for "loco." coal trucks; but of these the Engineer for Existing Lines and Loco. Engineer would be able to give an opinion.—W.V.R., 5/4/83. Commissioner.

Mr. Midelton, for early report.—G.B., B.C., 6/4/83.

Theoretically this dump-car looks very satisfactory and promises well, but when I fully consider the matter in its various manners of application I really cannot see much in it to recommend. It is like many other things not complete without some other appliance. I really cannot agree with Mr. Read that it is available for loco. coal traffic, for, as he says, it necessitates the erection of platforms, staiths, &c. If coal could be dumped direct in carts so that it could be hauled away to the coal-yards and then dumped again, that would be an advantage, but this could not be done without either raising the dumping waggon or lowering the coal cart. A good deep bottom coal waggon, such as used by the Midland and Great Northern Railway Companies at home, cannot well be beater for coal traffic, for domestic and manufactory purposes. I think the coal appliances at the various London depôts of the Midland Company the best I know of. If we could dump kerosene shale from these waggons direct into a ship's hold at Darling Harbour there would be an advantage, but at present this could be better done with stopper waggons as practis

Mr. J. C. Dibbs to The Commissioner for Railways.

Mr. J. C. Dibbs to The Commissioner for Railways.

Sir,

George-street, opposite Bridge-street, Sydney, 2 April, 1883.

As agent for the patentees I venture to submit for your information, plans, photographs, and particulars of the latest improvement in America for the economical working of Railways in the "United States Car Company's Screw Lever Dump and Coal car."

Enclosed herewith I beg to hand you,—

1. Printed descriptions and circulars,
2. Letter dated Columbus, Ohio, 17/3/82,
3. do Allston, 6/4/82,
4. do Joilett, 8/7/82,
5. do Rock Island, 19/7/82,
6. do do 21/7/82,
7. do Nelsonville, Ohio, 4/8/82,
8. do New York, 4/8/82,
9. do Nelsonville, Ohio, 24/8/82,
10. do Melrose. Mass., 21/10/82,
for your perusal, and to be returned after you have finished with them.
I am prepared to deal with you for the patent for this Colony.
A dump-car is now on its way from Boston, which I shall be prepared to place under offer to you, practical proof being of greater service in the advantages of the system than any amount of photographs and plans.
I may state that these cars are in large use on the leading lines of America.

I am, &c.,
I ONN C. DIRPO.

I am, &c., JOHN C. DIBBS, Agent of patentee.

Minutes.

The Traffic Manager for report.—D.V., 8/4/83.

I have already reported on these cars. Please see my minute on Commissioner's minute paper, 83-6,244. I could a few of this style of car at once for traffic purposes, and would like to be supplied.—W.V.R., 23/4/83. Commissioner. By acting Secretary for Public Works:—This car to be tried and taken if found suitable as an experiment.—A.S., /83. Inform. Mr. J. C. Dibbs informed, 22/6/84. Traffic Manager, B.C., 23/5/83.—G.B. Seen.—W.V.R., /83. Locomotive Engineer, B.C., 30/5/83.—G.B. Commissioner. 29/5/83.

The Commissioner for Railways to Mr. J. C. Dibbs.

Sir,

Department of Public Works, Railway Branch, Sydney, 22 May, 1883.

Referring to your letter of the 2nd ultimo, bringing under attention the United States Car Company's screw lever dump and coal car, I have the honor to inform you that the Department will be glad to test the car upon its receipt in the Colony, and if found suitable it will be purchased. I return description and circular as requested.

I have, &c.,

CH. A. GOODCHAP,

GOODCHAR, Commissioner for Railways. Mr.

Mr. J. C. Dibbs to The Commissioner for Railways.

Sir,

Referring to my letter dated 2nd April last, I have now to inform you that the dump-car mentioned therein has arrived, per "Julia," from Boston, and will be landed in the course of a few days. Will you please give me instructions where you wish me to deliver it.

University of the date of the day of t

as Agent.

Minute.

By Commissioner :- As Mr. Read is desirous of having one of these cars at work it may be accepted on trial.-

Mr. J. C. Dibbs to The Commissioner for Railways.

George-street, opposite Bridge-street, Sydney, 11 May, 1883.

Referring to my letters to you, dated 2nd April and 8th May, I have now to forward you the working plans of the dumping car which has been patented for this Colony.

I have &c

Minutes.

By Commissioner:—On other papers I have requested that this car may be received. It will be delivered at Darling Harbour; please have it put together and let me know when it is ready to be used.—Chas. A.G., 11/5/83. Loco. Engineer, Traffic Manager, Storekeeper.

Seen. Traffic Manager to see and please send on at once to Locomotive Engineer with plans or drawings.—A.R., 14/5/83. Traffic Manager. Seen.—W. V. Read, 16/5/83. Acting Locomotive Engineer. Seen.—J.M., 17/5/83.

Mr. J. C. Dibbs to The Commissioner for Railways.

Sir,

I have the honor to enclose herewith memo. of my account for dump-car which has been delivered to your Department, and I trust that it will be found so serviceable and effect so great a saving, both in cost and economical working as compared with the trucks now in use on your lines, that you will be induced to purchase the patentees' rights for New South Wales.

I have, &c.,

JOHN C. DIBBS.

[Enclosure.]

The Commissioner for Railways of New South Wales to John C. Dibbs,-

£ s. 200 0 ear framé 25 0 0Weighing 452lbs.

By Commissioner:—Write separate memo. to ask the Traffic Manager and Locomotive Engineer, stating that I wish an early trial to be made of this car. Ask Mr. Scott to say what progress has been made in the work of putting it together.—CH.A.G., 6/6/83.

Memo.—Referring to the dump-car (in pieces), supplied by Mr. J. C. Dibbs, I shall be glad if you will be good enough to report what progress has been made in the work of putting it together, as the Commissioner wishes an early trial of the car?—G.B., B.C., 8/6/83.

Locomotive engineer.

Mr. Midelton, for report.—R.J.S., 11/6/83. Report on separate paper sent to me by Traffic Manager: This car will be ready to-morrow (Tuesday), at 2 p.m.—J.M., 11/6/83. The Commissioner.—R.J.S., 11/6/83.

Memo.—Please note that a dump-car (in pieces) was supplied to the Department by Mr. Dibbs in May, and the Locomotive engineer has this day been asked to expedite the putting of it together in order that an early trial of the car may be made.—G.B., B.C., 8/6/83. Traffic Manager.

The car is now ready for inspection.—W. V. Read, 13/6/83. Commissioner.

By Commissioner:—Mr. Midelton says that the cost is reasonable. I recommend the car be taken.—Ch.A.G., 2/7/83.

By Secretary for Public Works:—Approved.—F.A.W., 5/7/83.

Locomotive Engineer,—Make out voucher at once, please.—G.B. Mr. Midelton to note and forward certificate.—
R.J.S., 7/7/83. Certificate herewith.—J.M., 9/7/83. Locomotive Engineer. The Examiner.—R.J.S., 11/7/83.

Voucher for £225 has been forwarded for payment.—J.P.F., 31/7/83. Secretary.

Mr. C. Woods to The Secretary for Public Works.

Sir,

With reference to the trial of the dump-car imported by me from the United States, which was officially tested upon Saturday last, I am now desirous to submit to you important drawings and printed descriptions relative thereto, and for this purpose desire a personal interview with yourself at such time as will quite suit your convenience, and which I beg you will appoint.

Soliciting the forward of a real of the sum of a real of the sum of t

Soliciting the favour of an early reply to this letter,

Believe me, &c., CARSON WOODS.

Minutes.

By Commissioner:—Will the Minister name a day for seeing Mr. Carson Woods.—Ch.A.G., 25/6/83. By Secretary for Public Works: Any day will suit me, but it had better be in the afternoon.—25/6/83.

Mr. C. Woods to The Traffic Manager.

The impromptu trial we had on Saturday last gave me no time to advise the Press of this City. Could I ask the favor of another show of this "dump-car," in this instance to be filled with stones or gravel, giving me a day or two's notice, so that I could arrange with the reporters to be present?

You will, I need not say, oblige me very much if this can be arranged.

I have, &c., CARSON WOODS.

I think Mr. Woods should have an opportunity of fully testing the car; would Commissioner please approve of Mr. Woods' application.—W.V.R., 26/6/83. Commissioner. Approved.—CH.A.G., 26/6/83.

Mr. C. Woods to The Commissioner for Railways.

Sir,

253, George-street, Sydney, 21 June, 1883.

In deference to the wishes of a number of gentlemen in the City and representatives of the Press who are desirous to see the working capabilities of the "dump-car," recently imported from America by me for the Government, will you do me the favor to order another trial to be publicly made of it, in this instance directing the car to be loaded with stones or gravel.

If you will kindly do this and give me a few days' notice before the trial takes place, so that I may notify these gentlemen to attend it, you will confer a great favor upon all concerned.

I have, &c., CARSON WOODS.

Minute.

By Commissioner:—I have authorized this on Mr. Woods' application, made to Mr. Read.—Ch.A.G., 26/6/83.

Messrs. Woods, Rich, & Co., to The Secretary for Public Works.

Our Mr. Carson Woods will do himself the honor of laying before you this afternoon the annexed list of papers

Our Mr. Carson Woods will do himself the honor of laying before you this afternoon the annexed list of papers relating to the American lever dump-car.

Mr. Muir, of the works of the Ontario Car Company of London, Ontario, in a letter addressed to us explains fully the value of this invention and we can add nothing to his letter.

Mr. Muir's name and the high standing he holds as a railway expert, being chief of the largest car-building establishment in Ontario, are safe guarantees for all the statements he makes.

The Gilbert Car Company of Troy, in the State of New York, endorse every word of Mr. Muir's letter.

We would respectfully call your attention to the fact that these Companies are not interested parties, as they are car-builders only and have no control of any patent. As Mr. Gilbert, junior, said to our Mr. Woods last January: "It does not matter to us what cars we build, but of course we are quick to appreciate a good thing." He referred, in saying so, to the American lever dump-car.

Letter—Thomas Muir to Carson Woods, 31st January, 1883.
 Letter—F. Brownell to Carson Woods, 13th February, 1883.

[Enclosures.]

Mr. T. Muir to Mr. H. G. C. Woods.

Mr. T. Muir to Mr. H. G. C. Woods.

Dear Sir,

I presume by this time you have got far beyond New York, or London, England, and I conclude it is best to address you "at home." We are really not prepared to undertake passenger car work for foreign shipment, but would like to call your attention specially to the "dump-car" which we build. It is attracting very great attention from railway companies both here and in the States, and quickly superseding all other kinds of gondola and dump-cars. It is quickly discharged, not easily put out of order, very strong, serviceable for general traffic and construction purposes, and so saves a great deal of empty mileage. The railway companies here have adopted it for the iron ore business, which has developed to such vast proportions within the last year. At Kingston and Trenton they are erecting elevated roadways with pockets at each side, overhanging the wharves, so that these cars can be run up and dumped on either side into the pockets, and from the pockets into vessels. You will readily notice, however, that the system for dumping cars can be applied to all descriptions of car-bodies, either the ordinary platform without sides, for carrying poles, ties, cordwood, stone, timber, pig iron, &c., or with box sides for coal, sand, ore, &c., and also with high slotted sides for coke, corn-cobs, and such-like freight. From one of our cars, exhibited at Kingston, a labourer from the wharf discharged over 21 tons ore in a few seconds. The cars do not require to be uncoupled, a whole train could be discharged at one time by so many men (one upon each car), but two or three men could dump fifteen or twenty cars within 30 minutes and have train ready to take away. away.

Our price to-day for 20-ton cars without sides, delivered on track at London, is \$600; same car with sides, \$615.

Car and Engine Wheels.

Car and Engine Wheels.

We are now prepared to supply the steel-tired wheels, cast steel tires fused on double plate, cast-iron centres. This wheel here will cost, for 33-inch size, \$20 as against \$35 which we have now to pay for English or German "Bessemer" steel tired wheels with wrought-iron spokes, and we can guarantee them to give better mileage. Our ordinary chilled cast-iron wheels, 33-inch diameter, cost \$11 just now, but we are making a heavy "special passenger car wheel," with a thicker tire and of extra quality charcoal irons (weighing 570 lbs. against 520 ordinary wheel) for \$12.75, which are really A 1. The "Intercolonial" have taken them from us for their passenger cars.

I shall be glad to hear from you upon these matters. Any further particulars or other information desired I shall be happy to supply. A new sleeping car has been patented by a Halifax company, superior to "Pullman's" and very, very much better than another I know of. I have some idea of taking hold of it as a speciality. It is now before me upon favourable terms.

THOS. MUIR.

Mr. F. Brownell to Messrs. Carson Woods, Rich, & Co.

Mr. F. Brownell to Messrs. Carson Woods, Rich, & Co.

Gentlemen,

The United States Car Co., 48, Congress-street, Boston, Mass., 13 February, 1883.

We shipped the screw lever dump and coal car to you early in January, via barque "Julia," L. Jordan, master; we also sent several pieces castings, without charge, which were duplicates of what were with car, to replace any that may get broken in transit via vessel; we sent bill to Messrs. Richard Irwin & Co., New York City, as requested by you, and received a prompt remittance for balance due for car. We are meeting with grand success here with our car; the one we shipped to you was loaded and dumped and found to work perfectly; we trust you will see personally to it that the car is put together in a good workmanlike manner; then satisfactory results will follow, and one man be able to dump car, loaded with 20 tons, in 30 seconds with ease. The past week a Pennsylvania coal road placed an order with a reliable car-builder for 80 our patent screw lever cars. Since your Mr. Wood left here we have sold our patent, covering the entire Dominion of Canada, to some Montreal men, and they are forming a rolling-stock company with \$650,000 capital, to build our style dump-cars and lease them to Canada railroad companies. Let us hear from you and of your success with the car after its arrival.

FRANK BROWNELL,

Treasurer.

Treasurer.

Mr. C. Woods to The Secretary for Public Works.

Sir,

253, George street, Sydney, 19 July, 1883.

Not wishing to call upon you without your appointment, I should esteem it a great favour if you would name a day on which I could have the honor of an interview with you concerning the new American lever dump-car.

I have, &c., CARSON WOODS.

· Minutes.

By Secretary for Public Works:—Inform Mr. Woods that owing to illness of Commissioner for Railways I have not been able to go into his matter about the dump-car, but that if he will call, say on Monday week, I will be prepared.—F.A.W., 20/7/83. Railways, B.C., 21/7/83.—W.F.

The Under Secretary for Public Works to Mr. C. Woods.

Sir,

Referring to your letter of the 19th instant, I am directed to inform you that the Secretary for Public Works will receive you on Monday week, the 31st instant, on the subject of the new American lever dump-car.

I have, &c., W. FORDE, pro Under Secretary.

Mr. C. Woods to The Under Secretary for Public Works.

Sir,

35, North Pitt-street, Sydney, 24 July, 1883.

I am in receipt of your letter of the 21st instant, informing me that the Secretary for Public Works will receive me on Monday week, the 30th instant, on the subject of the new American lever dump-car.

I will be glad if you will inform the Secretary that I will do myself the honor to call upon him at 11 o'clock on that day.

CARSON WOODS.

Minutes.

Railways, B.C., 27/7/83.—W.F., pro Under Secretary.

By Secretary for Public Works:—I have arranged to send Mr. Wood a note naming a time when I can see him, after I have talked his affair over with the Commissioner for Railways.—F.A.W., 30/7/83. Mr. Goodchap, B.C., 2/8/83.—

By Commissioner:—I am of opinion that the principle of the dump-car can be made, with great advantage, to apply to the traffic of our lines, and if the right to use the patent in our shops can be acquired on reasonable terms I would advocate the purchase.—Ch. A.G., 6/8/83.

Mr. C. Woods to The Commissioner for Railways.

35, North Pitt-street, Sydney, 6 August, 1883. I had the honor of an interview with the Honorable the Minister for Public Works a week ago concerning the United States screw-lever dump-car.

The Honorable Mr. Wright said that no final answer could be given to me until he had discussed the matter with

John I have letters from the Victorian and Queensland Railway Departments, and am in correspondence with the New Zealand people concerning this car. These Departments are most anxious that I should go over there and submit to them proposals for the purchase of my dump-car, saying that if they will not purchase the patent I am certain of very heavy orders for it, from the reports which have come from America in its favour.

Their letters have given me a new idea.

Up till now I have been asking the Minister of Works to purchase the patent, but if the Department thinks it would suit them better to give an order for two hundred cars to be delivered in 9, 12, and 18 months, I will, on completion of that order, transfer the patent to the Railway Department, or, if preferable, as I first said, I will take a lump sum for the natent.

patent.

The Department, I understand, wants rolling-stock, and no better or finer car for any freight purpose can be had than the patent screw-lever dump-car.

I ask the favour of your submitting this offer to the Honorable the Minister for Works, and will be glad of an interview with the Honorable Mr. Wright or yourself to discuss this matter, at your earliest convenience.

One reason why I wish this interview soon is that I want to interview the Governments of Queensland and Victoria, who have written to me desiring to see me on the subject, but of course I could make much better terms with them if I should settle with the Government of New South Wales first.

Another reason is that a party of gentlemen here are talking of purchasing the patent, and of course if it is sold to them the Government here could get no such terms from them as I now offer.

Trusting to hear from you at your earliest convenience,

Trusting to hear from you at your earliest convenience,

I have, &c., CARSON WOODS.

Mr. H. Hudson to Mr. T. Midelton.

Sydney, 7 August, 1883.

In answer to your inquiry as to what we would build 200 dump-cars, similar to that now in Darling Harbour,
I beg to say we are prepared to build 200 cars similar in every respect for one hundred and eighty pounds each (£180).

Should you determine to use dump-cars it will be necessary to use side buffers to work in with the other rolling-stock; this will increase the cost to the extent of ten pounds (£10) per waggon.

Yours respectfully, HENRY HUDSON.

Minute.

By Commissioner:—I sent for this on receiving Mr. Woods' letter of 6th August. Mr. Woods names £190 as the price for the dump-car, and Hudson Brothers offer to construct at the same price. Mr. Woods, however, if we accept his offer, will grant us the use of the patent free, not only for the 200 trucks but for all trucks; otherwise he wants £6,000 for the patent for New South Wales.—Ch. A.G.

Mersrs. Woods, Rich, & Co. to The Secretary for Public Works.

Sir,

Sir,

Sir,

Str.

Str.

Str.

Str.

Str.

Enclosed we take the liberty of sending you a copy of a letter with reference to the United States screw lever dump-car, which we sent the week before last to the Honorable the Commissioner for Railways.

This copy will explain our reason for again bringing this most valuable freight-carrying improvement and necessity under your notice. Two Colonial Governments have, by their authorized agents, requested us to lay before them our claims concerning this United States screw lever dump-car.

We are also in correspondence with New Zealand people, and from the tenor of their letters we have no doubt that if we do not part in each colony with our patent rights we shall get large Government orders for cars, which we would much rather receive than part with these patent rights.

We feel assured that if the Government will order cars as suggested in the enclosed letter, or purchase the patent, we will make a much better and higher settlement with the Governments with whom we are now in correspondence.

we rele assured that it the Government will order cars as suggested in the enclosed letter, or purchase the patent, we will make a much better and higher settlement with the Governments with whom we are now in correspondence.

Of the sale of this United States dump-car we speak with confidence. The master car-builders of the United States speak of it as a necessity. It is the most important and best freight car in the world we assert without fear of disproval. Therefore we hope that the enterprise of our Mr. Carson Woods, in going over to the United States and selecting it and purchasing the patent, bringing it out here and placing the car before the Government of this Colony first, at his own risk, will be recognised.

As our principal is most anxious to go to the other Colonies, where he is invited, as soon as possible, we would most respectfully ask for an interview to discuss the matter at your earliest convenience.

We have, &c., CARSON WOODS, RICH, & CO.

By Secretary for Public Works:—Let Mr. Woods be asked at what price he is prepared to sell his patent right:—1st, for New South Wales; 2nd, for Australia.—F.A.W., 15/8/83. The

With reference to your letter of the 6th instant, on the subject of the United States screw lever dump-car, I have the honor to inform you that I have brought your proposals under the attention of the Honorable the Secretary for Public Works, and he desires me to inquire upon what terms you are prepared to sell the patent right of the above car—

1. For the Colony of New South Wales?

2. For the whole of Australasia?

I have, &c., CH. A. GOODCHAP, Commissioner for Railways.

Mr. C. Woods to The Commissioner for Railways.

Pitt-street, Sydney, 17 August, 1883.

In reply to your letter of 16th instant, asking for the information of the Honorable the Secretary for Public

1. The price at which I am prepared to sell the rights of the dump-car patent for New South Wales,-

2. The price for the whole of Australasia,—

I have the honor to say that I am not in a position to dispose of the rights for the Australasian Colonies, as I have entered

I am willing to give the Government of New South Wales the use of the patent for the sum of £6,000 (six thousand pounds), but I am prepared to make a contract to build here 200 (two hundred) cars, at the rate of £190 (one hundred and ninety pounds) each, and include in such price the right to use the patent for the 200 (two hundred) cars, and for any other cars hereafter to be built or altered for the use of the Government of this Colony.

I have, &c., CARSON WOODS.

Minute of Secretary for Public Works.

I should much prefer having dump-cars made in the Colony, and should be disposed to arrange for purchase of Mr. Woods' patent right at a fair price, but I could not think of any such sum as £6,000 for a patent of this kind, that may at any moment be improved upon. An offer may be made for the patent right for New South Wales.

F.A.W., 23/8/83.

The Commissioner for Railways to Mr. C. Woods.

The Commissioner for Kallways to Etr. U. Woods.

Sir,

Department of Public Works, Railway Office, Sydney, 24 August, 1883.

In reference to your letter of the 17th instant, stating that you are willing to sell the rights of the dump-car patent, for the Colony of New South Wales, for the sum of £6,000, I have the honor, by direction of Mr. Secretary Wright, to inform you that he would prefer having the dump-cars made in the Colony, and is disposed to arrange for the purchase of the patent rights at a fair price, but cannot entertain any such sum as you name, viz, £6,000.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Messrs. Woods, Rich, and Co. to The Secretary for Public Works.

Sir,

We most respectfully ask the favour of your decision with reference to "The United States screw lever dumpdas our Mr. Carson Woods is waiting for your reply, previously to starting for Queensland and New Zealand.

We have had from South Australia another communication, and are holding back our reply until we have the honor

of hearing from you.

In this communication we will not again enter into the merits of the car; these are acknowledged now by all rail-

In this communication we will not again enter into the increase road men in every part, down even to the improved bogies.

Our Mr. Carson Woods will have the honor to wait upon you for your reply at 11 30 this morning.

We have, &c.,

CARSON WOODS, RICH, & CO.

Minute. By Secretary for Public Works:—I will see Mr. Woods on Monday.—F.A.W., 25/8/83.

Messrs. Woods, Rich, & Co. to The Commissioner for Railways.

Sir,

We have the honor to enclose you copy of a letter we have this morning forwarded to the Honorable the Minister for Public Works in reference to "The United States screw lever dump-car," as our Mr. Carson Woods, having received invitations from the Governments of adjacent Colonies to submit his speciality for their inspection and approval, is most anxious to take his departure as soon as possible, and therefore desires to have the honor of your decision as speedily as possible.

We have &C.,

CARSON WOODS PICH & COLONIA COLORS AND COLORS A CARSON WOODS, RICH, & CO.

Messrs. Woods, Rich, & Co. to The Secretary for Public Works.

Messrs. Woods, Rich, & Co. to The Secretary for Public Works.

Sir,

We have the honor to inform you that, by our advices, received by this mail from America, it will be imperatively necessary that our Mr. Carson Woods should take his departure for that country so soon as he has attended the appointments he has with the other Colonial Governments.

In order, however, that he may receive the decision of your Government in reference to "The United States screw lever dump-car," he will wait upon you to-morrow, during the hours of 11 and 12, and if not then convenient for him to receive an audience will attend at the same time on Monday next, the 27th instant.

Should neither of the times stated suit your convenience, we should feel it a great honor, under the circumstances, if you would be pleased to name an hour when the proposed interview can take place.

We have, &c.,

CARSON WOODS, RICH, & CO.

By Secretary for Public Works:—I will see Mr. Woods on Monday.—F.A.W., 25/8/83. Mr. Woods asked to call.—G.B., 25/8/83.

Mr. C. Woods to The Commissioner for Railways.

Sir,

I have the honor to acknowledge receipt of your letter of 24th instant, in which you intimate that Mr. Secretary Wright would prefer to have the dump-cars made in the colony and is disposed to arrange for the purchase of the patent rights at what he considers a fair price, but cannot entertain such a sum as I have named.

In reply, I beg to state that I am prepared to build (200) two hundred cars in the Colony, inclusive of the patent rights, for the sum of (£190) one hundred and ninety pounds each, and thus meet the suggestion of Mr. Wright.

In submitting the offer of the patent for the use of the Colony I did so at a price of (£6,000) six thousand pounds, instead of (£10,000) ten thousand pounds, and I am not disposed to renew my offer at the price named. As I am leaving for Melbourne by the end of the week I should be glad to be favoured with an early reply.

I have, &c.,

I have, &c., CARSON WOODS.

APPENDIX.

Minute of Secretary for Public Works.

MR. WOODS' offers to build 200 dump-cars in the colony at a price, delivered complete, of £190 each, may be accepted, subject to the following conditions:—That the cars are equal in all respects to the one now in the possession of the Department; that they do not exceed the weight of the same; and that after delivery is complete the Government are to have the patent right for New South Wales for all cars they may build or have built by private firms.

F.A.W., 28/8/83.

The Commissioner for Railways to Mr. C. Woods.

Sir,

Department of Public Works, Railway Branch, Sydney, 28 August, 1883.

In reply to your letter of the 27th instant, having further reference to the proposal made by you with regard to the rights of the dump-car patent, and in which you state you are prepared to build 200 cars in the colony, inclusive of the patent rights, for the sum of £190 each, I have the honor to inform you that I have submitted the above proposal to the Honorable the Secretary for Public Works, and he approves of the acceptance of the same on condition that the cars are delivered complete on the railway line, Sydney, at the price named, and that they are in all respects equal to and of the same weight as the one now in possession of the Department. It is, as a further condition of the acceptance of your offer, that after delivery of the above cars is completed the Government are to have free and undisturbed use of the patentrights for New South Wales for all cars they may build or have built by private firms.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Commissioner for Railways.

P.S.—You will have to enter into a bond for the due fulfilment of your contract, and to assure the Government in the undisturbed possession of the patent right as far as the Government Railways of New South Wales are concerned. The cars to be delivered, fifty in nine months and the remainder in lots of fifty at three, six, and nine months, within the succeeding nine months.—Chas. A.G., 28/8/83.

Mr. C. Woods to The Commissioner for Railways.

I have the honor and pleasure to acknowledge receipt of official acceptance of my tender for the supply to your Department of 200 screw lever dump-cars. I now await your instructions as to where and when the bond and other requirements you ask for in your letter can be signed and fulfilled by me.

I have, &c.,

Locomotive Engineer for specification. -G.B., 30/8/83. Urgent.

Minute from Locomotive Engineer to Commissioner for Railways. I would point out that the dump-car which, as it appears, is to be the pattern for the 200 to be built by, has a central buffer and coupler, for which the frame has been specially constructed. This will prevent their being used in connection with our present stock. Before preparing specification I shall be glad if you will inform me if the 200 are to be precisely similar to the pattern.

W. SCOTT 5/9/83.

Minutes.

By Commissioner:—No; they are to have buffers and draw-gear similar to our rolling stock, and a sketch should be sent to the Contractors showing what is required. See that the present dimensions are such that they will not interfere with our platforms, &c., and alter as required.—Chas. A. G., 7/9/83. Locomotive Engineer, B.C. Please have a specification prepared accordingly for approval of the Locomotive Engineer.—R.J.S. Mr. Middlton. Please make sketch of principal dimensions of dump-car. See if it will clear if made 9.0 wide; make tracing of continuous draw-gear, and place diagonals in underframe to suit side buffers, &c., and let me see it.—J.M., 12/9/83. Mr. Chambers. Tracing No. 852, showing draw-gear, buffers, side chains, and maximum width of waggon body, herewith.—J.C., 2/10/83. I think if the builders of these dump-cars keep to the tracing 852, the waggons will gear nicely with our present stock; the width of vehicle must not exceed 9 feet in any part. As the cars are to be built to the pattern one (with the exception of what is shown on tracing 852) I hardly think a specification necessary, as it may involve complication.—J.M., 2/10/83. Locomotive Engineer.

By Locomotive Engineer:—Tracing No. 852, showing deviations required from the dump-car, is in the possession of the Department.—W. Scott, 2/10/83. Commissioner.

Mr. C. Woods to The Commissioner for Railways.

Sir,

35, New Pitt-street, Sydney, I October, 1883.

I have the honor to inform you that I purpose leaving for America on the 4th instant, to make the necessary arrangements for the completion of my contract with your Department for 200 dump-cars. Should you still think a bond necessary I am quite willing and ready to sign but upon that date I must sail. I need scarcely say that my services while in other countries are freely at your command, and any information you may require I will gladly ascertain and advise you by mail by mail.

I have, &c., CARSON WOODS.

Locomotive Engineer for specification.—G.B., B.C., 5/10/83.

The Commissioner for Railways to Mr. C. Woods.

Sir, Department of Public Works, Railway Branch, Sydney, 4 October, 1883.

Referring to your contract for the supply of 200 dump-cars to this Department, I have the honor to forward herein a tracing, showing the maximum width of body (over all) and standard dimensions, &c., of buffers and draw gear for

I may add that the usual bond will be prepared in due course.

I have, &c., CH. A. GOODCHAP, Commissioner for Railways.

Minutes.

I saw Mr. Berner to-day re specification, as I thought had slightly misunderstood the matter. As these cars are to be made to the sample vehicle now in our possession (except as regards buffer and draw gear, a drawing of which we have sent to Mr. Carson Woods), we hardly want a specification. I think if we specify anything more than we have, it will amount to making writing drawings of the car, and a specification to suit, and as there will be a difficulty (with our double buffers, &c.) in introducing the dumping gear or mechanism, I think we should leave the matter to the manufacturers.—

J.M., 16/10/83. Loco. Engineer.

I think the tracing sent, and the pattern waggon is all that is required.—W. Scott, 18/10/83. The Commissioner.

Mr. M'Lachlan for bond instructions.—G.B., B.C., 23/10/83. Herewith.—H. M'L., 17/11/84.

The

The Commissioner for Railways to The Crown Solicitor.

I have to inform you that a contract has been entered into with Mr. Carson Woods for the supply of 200 dump-cars, to be manufactured in the Colony, at £190 each. Each vehicle is to be made the same in all respects, with the exception of buffers, draw-bar, and head-stock, as the screw lever dump-car now in the possession of the Department. The buffers, draw-bar, and headstock to be completed according to drawing sent to the Contractor. The whole of the timber work to be of the same quality and description as that in the sample waggon.

The whole of the metal work to be forged or cast as the case may be, and manufactured in the Colony, and to be as far as possible of the same design and dimensions to that of the sample waggon.

The vehicles must be finished in the most substantial and workmanlike manner, and in every respect to the entire satisfaction of the Locomotive Engineer.

satisfaction of the Locomotive Engineer

50 18

The Contractor shall forfeit and pay to the Commissioner by way of liquidated damages, to be deducted from the moneys due to the Contractor, the sum of 1% on the contract price of each article for each week that each vehicle shall remain undelivered after the respective dates named.

Payments to be made on the certificate of the Locomotive Engineer that the vehicles have been supplied to his

satisfaction.

After the contract is completed the Government is to have the patent rights for New South Wales of the American lever dump-car.
Please give directions for the preparation of the necessary bond.

G.B., pro Commissioner, 17/11/83.

Minutes.

Will the Commissioner please forward the specification, general conditions, and tender in the usual way.—J.W., 30/11/83. The Commissioner for Railways, Sydney.

This contract was not made in the usual way, i.e., by calling for public tenders; consequently no specification was prepared, or Gazette notice. The conditions under which the contract was accepted are given in this paper. A copy of Mr. Woods' letter, agreeing to make the cars, is herewith.—G.B., pro Commissioner, 26/11/83. Crown Solicitor.

Minute from Traffic Manager to Commissioner for Railways.

I should be glad to know whether any decision has been arrived at with regard to the United States Car Company's dump-car? It is standing in one of the sidings in Redfern Yard. Will the Commissioner please say. W. V. READ, 2/11/83.

Minutes.

Locomotive Engineer, B.C., 7/11/83.—G.B.

By Locomotive Engineer:—As Mr. Carson Woods has a contract to supply 200 more of the same pattern; I think it would be well not to use it until the others are supplied.—W. Scorr, 14/11/83. Commissioner.

By Secretary for Railways:—Traffic Manager to see. If it belongs to us and can be used I see no reason for its being left out of work.—D.V., 16/11/83.

By Traffic Manager:—It appears from Commissioner's 83-10,412, attached, that this car has been purchased by the Department, and it would be as well to use it if there is no objection by Locomotive Branch. The load it can carry should be marked on it.—W.V.R., 21/11/83. Locomotive Engineer. Mr. Midelton.—R.J.S., 23/11/83.

I have twice tried to use dump-car for coaling locomotive engines, but it will not clear Darling Harbour Wharf Platform, so I am told. It has no side buffers, and the centre draw-bar and buffers do not match our stock; considerable alteration will have to be made if we are to use it regularly in traffic, and enough scheming required to construct a new car. It is marked to carry 20,000 lbs., in two places.—J.M., 29/11/83. Locomotive Engineer. Traffic Manager.—R.J.S., 29/11/83. 29/11/83.

By Traffic Manager:—Seen. I shall be glad if the Locomotive Engineer will let me know when the car is ready for traffic.—W. V. Read, 12/12/83. Locomotive Engineer. Mr. Midelton to say.—R.J.S., 14/12/83. Mr. Bourn to see me hereon.—J.M., 17/12/83. Please see Mr. Bourn's report of 29/12/83 herewith.—J.M., 5/1/84. Locomotive Engineer.

I beg to report that previous to the dump-car being allowed to be used by the Traffic Department, it is necessary that it should be taken to pieces and reconstructed, as at present it is too wide and will not pass the platforms; it also requires to be fitted with buffers and draw-gear to suit the present rolling stock now in use.—E. Bourn, 29/12/83. Locomotive Overseer.

Locomotive Overseer.

By Locomotive Engineer:—Under these circumstances I cannot recommend that it be used, as the contractors who have tendered to build to this pattern might make it a cause of complaint.—W. Scott, 16/1/84. Traffic Manager.

By Traffic Manager:—The Commissioner should be informed.—W.V.R., 19/1/84. Locomotive Engineer. Forwarded for the Commissioner's information.—R.J.S., 23/1/84.

By Commissioner:—It had better be made to suit the requirements, in order that those to be supplied may be made suitable. I do not understand Mr. Scott's report, which seems to imply that the present car is unsuitable, and yet it must not be altered because the contractors are to build others from this pattern; that surely cannot be the case, but Mr. Scott's minute reads like it.—Ch.A.G., 25/1/84.

By Locomotive Engineer:—I can assure the Commissioner that he only does me justice in assuming that I did not intend that meaning to be conveyed by my minute. Looking at the fact that this particular truck is (excepting in the matter of side buffers and reduced width) the pattern to which Mr. Woods has contracted to supply 200 more, I did not consider it prudent to alter in any way the pattern truck until I saw some of the new ones, particularly when I find that the alteration of the under frame to enable side buffers to be used would make it an unsatisfactory pattern to work to. I also assumed that Mr. Woods would have the frames of those to be built specially designed for side buffers.—W. Scott, 31/1/84. The Commissioner.

Seen.—Ch.A.G., 8/2/84.

Minute from Traffic Manager to Commissioner for Railways.

American Dump-car.

I BEG to refer the Commissioner to his minute paper 83-21,488, and to inform him that the lately imported dump-car, referred to therein, cannot be made use of until the draw gear is altered and side-buffers provided.

In a conversation I had with Mr. Augustus Morris recently, he informed me that these waggons were not a success in America.

It is, however, very important that this car should be brought into use at once, in order that any defects may be noted and corrected in those now being imported, and I should be glad if the Commissioner would please give instructions to have the necessary alterations carried out without delay. W. V. READ, 14/1/84.

Minutes.

By Commissioner:—The dump-car should be made available at once.—Ch.A.G., 21/1/84. Report in one month if it be not ready. Traffic Manager, B.C.—G.B. Kindly return the paper in a month. In the meantime the Locomotive Engineer should see it so that he can have the truck made available—W.V.R., 22/1/84. Commissioner. Loco. Engineer, B.C., 23/1/84.—G.B. See Minute of 31/1/84, on other papers.—W.S. (per R.J.S.), 31/1/84.

APPENDIX.

Extract from Locomotive Engineer's minute re coaling arrangements for locomotive purposes.

I may also mention that the dump-cars would be specially suitable for dumping the coal on to the platform.

W. SCOTT, 10/3/84.

APPENDIX.

Specification of Carson Woods, of No. 253, George-street, Sydney, in the Colony of New South Wales, importer, the agent of Matthew Van Wormer, of Dayton, Ohio, one of the United States of America, the author or designer of an invention entitled "Improvements in railway cars or waggons."

My invention relates to improvements in the class of a signer of the colony of New South Wales, importer, the author or designer of an invention relates to improvements in the class of the colony of New South Wales, importer, the

invention entitled "Improvements in railway cars or waggons."

My invention relates to improvements in that class of railway cars or waggons known as "dumping cars," which are capable of being tilted sideways on their trucks to empty their loads in bulk.

The novelty of the invention consists in the construction and combination of the devices employed as will be herewith set forth and specifically claimed.

In the accompanying drawings figure 1 is a side elevation of my improved dumping car; figure 2 is an end view of the same; figure 3 is a plain view of the body, taken off the trucks and inverted; figure 4 is a sectional end view through the line x x of figure 1; figure 5 is a sectional side elevation through the line y y of figure 2.

The trucks A may be of the usual or any suitable construction.

Upon the top of each upper truck-timber at its middle is secured the centre body bearing plate B (shown at figure 6 in perspective). This plate is concave, as represented, and has a central-frusto-conoidal boss or extension a, through which the king-bolt passes down into the truck-timber and serves to lock the plate B thereto. The head of the king-bolt b is shaped to complete the cone of which the bars upon the plate is a frustum, as seen in figure 6. These plates B and their king-bolts form centre bearings for the body of the car. Upon each side of the plate B flat metal plates C are secured to the upper truck-timber, and through each is one or more apertures forming recesses c, whose office will be hereinafter explained. explained.

Bolted to the end of each upper truck-timber in any suitable manner, is a segmental rack D with the concave side

uppermost as shown.

The platform, or bed, of my improved car-body is composed essentially of the side beams, E; end beams, F; longitudinal central beams, G; and transverse central transoms or beams H, supported by the beams G.

Directly over each truck-timber is a rocker piece I flat on top, and convex on its under surface, the whole forming the segment of an ellipse, as represented. These rocker pieces may be of wood, with the beams G mortised through them, and they are further supported by metal straps or plates J and K, of which the former passes over and the latter under the rockers I, and have their outer ends, which are turned down, bolted to the side timbers E. While the under surfaces of the plate K are convex to conform to the rockers I, their outer ends are concave as represented, for a purpose to be hereinafter explained. To strengthen and stiffen this framework, I employ the girder rods f as represented, and to form a further support for the bed-planks I use metal straps L in pairs, which are bolted to the end timbers F as represented, pass over the plates J and K, and over and under supporting-blocks, secured upon the transverse beams H.

Securely bolted, or otherwise fastened to the lower side of the rockers I, at their middle, are centre-bearing plates M, with convex laver surfaces, and having in each a central recess or aperture g, to receive and contain the heads of the kingbolts and the frusto-conoidal stem of the plate B. It is thus clearly seen that the body of the car by the intervention of the plates M rests upon the plates B as central bearings, and at the same time the king-bolts and the stems of the plates B form pivots for each of the trucks while turning curves.

To dump the car to either side I employ a central longitudinal shaft N, which is journaled in hangers h, supported

pivots for each of the trucks while turning curves.

To dump the car to either side I employ a central longitudinal shaft N, which is journaled in hangers h, supported by the beams G, and is further supported by passing through openings in the rockers I and beams H. This shaft carrries two pinions O, keyed to it, which engage respectively with each of the racks D. The teeth of the pinions are tapered at each side, so as to permit of the play between the parts requisite in turning curves. Keyed upon the end of the shaft N, just under the platform at one end of the car, is a worm-wheel P, which engages with a worm R, secured upon a vertical shaft S, passing up through the platform, and provided with a crank or hand-wheel T. By turning said hand-wheel, the shaft N is caused to rotate, and the car is tilted to either side desired. By the employment of this dumping gear with a worm-shaft, a positive lock is always secured, no matter in what position the body of the car may be. It cannot move from that position without a breakage of some of the parts. To assist, however, in retaining the car in an upright position, and lessen the strain upon the dumping gear, I employ rests or side beams U which consist of cylindrical metal pieces, carrying pivoted friction rollers i in their lower ends as seen. These supports, figure 7, are recessed in metal sockets secured in the rockers I on each side of the centre bearings, and are provided with laterally-projecting pins j, which, travelling in slots in the sockets, prevent the supports from falling out of the said sockets, and further prevent them from turning-therein. These supports are sufficiently long, also, that when dropped down to their lowest extent, their rollers I rest upon the plates C. To lock them in this position so as to enable them to support the body of the car on each side, I employ rods k, having their forward ends connected to levers W, which, pivoted below the platform, pass up through openings in the same. Each of these rods k which have supported in the so

are snited by their levers the sndes i will pass over the tops of the supports, and prevent their from ascending into their sockets.

When it is desired to dump the car, it is only necessary to unlock the supports on the dumping side of the car, when by turning the hand-wheel as aforesaid, the car will turn and empty itself. During this tilting of the car the supports, or side bearings which were unlocked, will be pressed up into their sockets out of the way, and will not interfere with the dumping. When the car, after being dumped, is turned back into a horizontal position, the supports will fall of their own gravity back to their former position, when they can be locked as aforesaid.

In order to prevent the car, while in the act of being dumped, from being disengaged from its centre bearings, I employ studs or dowels m, which are secured in any manner desired, to the underside of the rocker-plates K between the supports U and the centre bearings. These dowels, while the car is tilting, enter the apertures c in the plates B, and serve to prevent the car from slipping or being displaced. The apertures c, as seen are sufficiently wide to receive the dowels even though the car, when being dumped, stood on a short curve.

Especial attention is called to the floor-planks X, which are raised, as seen, just over the rockers, for the purpose of enabling the car to be tilted over further without raising the bed higher than other cars of this class, or of ordinary cars. This result is further contributed to by the curved portions p of the rocker plates K, and by the employment of the strap supports L which, lying upon each other, occupy very little space.

The sides of the cars are movable gates A¹, which are held in slotted posts or supports B¹, and these posts form journals for shafts C¹, as seen. The gates A¹, of which I employ two or more on a side, which are free to slide up and down in the slots of the posts, are connected to the shaft C¹ by chains, ropes, or wire cords D¹, as shown.

By employing permanent or re

by their own gravity.

Another valuable feature of my invention consists of a director board for causing the dumped material, as gravel for instance, to fall close to the rails of the track. This I accomplish by hinging a board E¹ to the side beams by means of pivoted bracket-arms F¹ arranged as shown. By means of these swinging arms the board when not wanted for use, can be swung around so as to lie close to the side of the car, in which position the contents of the car would pass over it while being dumped, or it can be swung out as shown in figure 4, when it could act as a director to throw the load of the car close to

the rails.

It will be observed that the dowels upon the other side of the rocker could be transferred to the plates C, and in that case the recesses c would be formed in the plate K of the rocker.

My invention further relates to the construction of the car-bed; to the transoms; to the construction of the rockers and means whereby the car, after dumping, shall right itself up again; to a device for preventing the separation of the car-bed from the trucks; to the mechanism for dumping at either side of the car; to the means for fastening pulleys to the end of the truck-timbers; to the mechanism for fastening and unfastening the doors of the car; to the construction of the doors; to the end posts, and means for fastening the car-bed; to the centre posts, and the means for fastening them to the car-bed; to the side-bearings and their application, so as to keep the car-bed in position, and to prevent undue friction while the car

car is moving around curves of the track; in combining with the draw-bar a rocker whereby the dumping may take place with the ordinary draw-bar without need of uncoupling the car from the other cars of the train; in an improved brake mechanism; in a special construction of clutch-pulley with grooves and sockets adapted to receive and hold the links of the chain, and whereby the revolving of the pulley to gradually tilt the car will operate the chain, and prevent its slipping; in means for dumping, either slowly or suddenly as desired; in a special construction of guide-rollers for the chains; in combining the shatt of the clutch-coupling pulleys, and their chain and its guide-pulleys with a worm, gear, or screw-lever for operating the same, and in other particulars hereinafter set forth.

In the drawings, figure 9 is an elevation of another improved dump-car; figure 10, a bottom view with one truck removed; figure 11, a cross section through line xx of figure 10; figure 12, a top view of one of the trucks; figure 13, aplan of the couplers, and figure 14, a section through yy, figures 16 and 16, details showing the side bearings; figures 19 and 20, brake mechanism; figure 21, partial top view, parts being broken away, showing the coupler pulleys and their connections; figure 22, fragment enlarged of convex stationary bed; figures 23, 24, 25, 26, and 27, details.

Of the timbers of the car-frame, 11 represents cross-sills or headers, extending from the longitudinal sills 2 and 5, and framed or secured into the same; 3 and 4 represent shorter sills framed into the cross sills, or header 1, and not as long as the outside sills 6, 7, or the sills 2, 5, the objects of making them shorter being for the purpose of giving room or space for the worm and gear of the screw-lever or other appropriate mechanism which operates the chain-shaft hereinafter described, and also to allow sufficient space without weakening the car-bed for such bed to dump over the wheels, oilboxes, and truck timbers, without coming in contact with

timbers or irons, or with the oil-boxes when discharging any material from the car. These transoms or braces a also make the construction strong and safe.

The rockers and their arched beds are such, that after dumping, the car-bed will right itself up again, and they are constructed as follows:—9 representing the rockers, their stationary convex bed being shown at 10; each may be all of iron, or of iron and wood. The rockers 9 have each a short central downwardly projecting stud or boss b, which may be of ball shape if desired, and also a series of sockets c², c², adapted to receive the cogs c c, the object of this being that when the car is turned or dumped they will prevent the car-bed from getting out of position and at the same time permit the tilting of the bed far enough over, and to a degree of pitch sufficient to discharge coal or other material, without the risk of coming in contact with either the trucks, truck-irons, oil-boxes, or wheels, and also to permit the car to right itself up after dumping. The car or car-bed will automatically right itself after dumping, because when it is tilted or turned over to dump and is left free to return by disengagement of the V-shaped couplings on the shaft or shafts, 12, hereinafter described, the fulcrum or bearing-point of the rocker is no longer at the boss b and its central socket, but has been shifted to one or more of cogs and to their sockets, thus giving a long leverage for that side of the car or bed which is for the time being raised up, and this causes that side to fall by its own weight till the car is again level. It will be seen that any mechanical equivalent of the sockets, teeth or cogs, and boss, which will allow the same action and result, may be substituted for them. A bar of iron or wood represented at 11, is designed to hold the car-bed from separating from the trucks while the car is in transit or motion. It is bolted or fastened to the truck-timber, or to the lower convex bed 10, and extended upwards to be attached to either the upper rocke

or of wood represented at 1, is designed to not the car-bed from separating from the trucks while the car is in transit or motion. It is botted or fastened to the truck-timber; or to the lower convex bed 10, and extended upwards to be attached to either the upper rocker 9, or to the car-bed, or to a viron or wood fastened thereto.

A shaft (or shafts if desired) marked 12, runs lengthwise of the car under its floor, either its full length or a sufficient distance for receiving at its end or ends coupling pulleys e e' having V-shaped teeth on their adjacent sides for engaging with each other. On this shaft 12 (if but one be used) are affixed permanently one near each end and to revolve with it two clutches e having V-shaped teeth as shown designed, each to be engaged or disengaged at will from its fellow, which is provided with similar V-shaped teeth and placed loosely upon the shaft and adapted to be shifted in or out of engagement with the fixed clutch e (see enlarged views, figures 13 and 20). This coupling apparatus is to be located beneath the transom 8, so that the latter shall in no wise interfere with its free revolution. A chain f (figures 9 and 10) passing over and clinging to the loose pulley e' (the particular construction of which pulley will be hereinater fully described) and winding partly around said pulley passes thence under guide pulleys p & adjustable if desired, secured to the rocker or to the timbers of the car-bed. This car also passes under guide pulleys h & (see figures 9, 11, and 25) attached respectively to the opposite ends of the truck-timbers or frame; thence the ends of the chain respectively pass up to and are fastened upon the car-bed, or upon the outside sills 6, 7, or to the car floor.

For the purpose of applying the pulleys h h to the outer ends of the truck timbers so as not to interfere with the proper action of the car-springs, I fasten to the end of the under-truck timber so have it is said strap or bar i, such slot allowing the springs between the two truck-timbers to wo

The upright end posts, 17, of the car and their connections are as follows: They rest respectively upon the outside sills, 6, 7, and extend down on the side thereof a sufficient distance to admit of being strongly secured thereto by bolts or otherwise and extend far enough above the doors to permit the same to be hinged or attached thereto. Said posts, 17, are grooved or recessed on their inner corner (see figure 23) to receive the end board of the car so as to leave the inner face of said board or plank flush or even with the inside of the post, thereby preventing any obstruction when unloading, and also to make the car more firm and strong. A rod s of metal or wood extends across the end of the car, and through both these posts to hold them and the end plank or board t firmly in their places. There is also an iron or wooden brace u extending from each post to the end sill or floor to aid in bracing and holding said post, 17, to its place. The upright centre posts, 18, also rest and are secured respectively upon the outside and top of a sill, and each is further secured by a metal plate u which extends down and is fastened to the inside of the outside sills of the car, as seen in figure 24. A vetal rod v passes through both these opposite centre posts 18, 18 under the floor and above the sills, and is tightened by appropriate nuts or equivalent means for firmly holding the posts in place.

The side-bearings for holding the posts in place.

The side-bearings for holding the posts in place.

The side-bearings for holding the car and keeping it in position are represented at 19 in figure 11 and in an enlarged view in figures 17 and 18, and are as follows:—They severally consist of a bar of iron or wood adapted to rest on the truck-timber and extending upward and movably secured to the rocker or to the sills or transoms or floor of the car. Through a hole x having a slot or keyway y in the upper end of each side bearing passes a shaft or bolt z with a key or pin a? thereon This shaft is secured to the car as above

The outer end of the shaft or bolt z receives an arm b^3 secured to it by a pin or screw for the purpose of permitting the said shaft and bearing to be moved by appropriate connections extending upward, and connecting with a rod e^3 , which extends and is attached to both side bearings on one side of the car on the front and rear trucks, said rod extending to the end of the car, and being there attached to a lever f^3 for the purpose of operating both side-bearings, which are upon one side of the car, at one act by the same lever to allow the dumping. Similar side-bearings and attachments are on the other

side of the car, at one act by the same lever to allow the dumping. Similar side bearings and attachments are on the other side of the car.

On the under side of each draw-bar, 20, is an arched or curved rocker, 20*, the object of which is to permit the car to be tilted for dumping or otherwise without the need of uncoupling any car from the other cars of the train. (See figures 15 and 16.) This rocker may rest on a curved bed, as shown in figure 16.

I will now describe my improved brake mechanism, consisting of a combination of levers, chains, and pulleys, as follows, referring more particularly to figures 12 and 25; a bar 21 of metal or wood is also attached to the truck timber by an arm 22 and bolts and screws is also attached to the brake rod or bar f² by an arm, 23, and bolts or screws. The two brake bars of each truck coincidently upon the inner perimeter of all the wheels of each truck by means of the following connections: This bar or lever, 21, which is connected to and immediately operates one of the brake bars and which, as above stated, is fulcrumed upon the lower truck-beam, is also connected by means of a rod or bar i² with one end of a lever j² at the opposite side of said truck-beam, the other end of said lever connecting with the other brake bar g² which acts upon the other two wheels of the same truck, thus giving a movement in opposite directions at the same time to the two brake-bars. Provision is made for adjusting the throw of the levers which actuate the brakes. The brakes and their bars are suspended by links k² k² from springing or yielding straps b² secured upon the truck beams. This affords a yielding and play to meet varying exigencies, and a self-adaptation to the curvature of the wheel. To the upper end of bar 21 (see figures 19 and 20) is attached a chain (or a rod), which connects with a lever m², one end of said lever being fastened to the sill or floor of the car, such chain passing round a pulley p² on or near the end of the car, and fastened at its extremity to an upright ha

this purpose, a loose one.

For connecting and disconnecting these couplers e e! there is an annular groove e! around the periphery of the loose pulley e! into which projects a pin upon a shifting lever 24 (see figure 21) pivoted to a rod u², extending lengthwise of the car, for operating both couplings if desired, said rod being actuated by means of a hand-lever at the end of the car or other convenient place. When by means of this lever the couplings are disengaged or uncoupled, the pulley e! may revolve suddenly as a loose pulley, in order to allow the car-bed to discharge its load itself, when it will come back or return of itself to its upright position. When the coupling pulleys are coupled or engaged, then the car may be tilted slowly. This capacity for sudden dumping is important when clay, dump coal, or other damp or adhesive material constitutes the load, so as to discharge it with a jar or "thud;" but with other materials, which might be damaged by such jars or shocks, or when it is desired to deliver gradually, the V couplings when in engagement afford full control to tilt the car as far or as slowly as may be advisable. The guide-pulleys g for the chain f are hexagonal on their peripheries, thus presenting six flat surfaces of a size adapted to the flat-lying links of the chain, and a peripheral groove x² adapts them for receiving the intermediate or edgewise-lying links. (See enlarged view, figure 27.) Thus these pulleys fit all the surface of the chain, and prevent its getting off. They may be flanged also if desired. Instead of being hexagonal, these pulleys may have eight or more peripheral faces. The pulleys h are circular, but with an annular groove to receive the edges of alternate links of the chain. Having thus fully described my invention, what I claim is:—

First—In a dumping car the combination of the following instrumentalities: Segmentrocks attached to the trucks, pinions engaging with said rocks attached to the car-body by a common shaft and a common shaft and a common shaft.

t—In a dumping car the combination of the following instrumentalities: Segmentrocks attached to the trucks, pinions engaging with said rocks attached to the car-body by a common shaft, and an actuating worm-shaft connected to the pinion shaft by a worm-wheel, whereby the car can be dumped to either side, and whereby a positive lock is effected between the car-body and trucks, no matter in what position of inclination the car-body pays even stond

connected to the pinion shaft by a worm-wheel, whereby the car can be dumped to either side, and whereby a positive lock is effected between the car-body and trucks, no matter in what position of inclination the carbody may stand.

Second—In a dumping-car the combination with rockers upon which the car-body turns and rests of central bearing pivots, consisting of concave plates B, with frusto-conoidal stems and king-bolts, whose heads complete the cones of which the plate-stems are frustums as specified.

Third—In a dumping-car the combination with the trucks whose upper timbers are provided with central bearings and pivots and flat metal bearing plates of convex rockers attached to the body of the car, and mounted upon said central pivots and bearing plates as specified.

Fouth—In a dumping car the rockers.I carrying upon their under surfaces the reversed curved metal plates K and the central recessed convex bearing plates M, in combination with the subjacent concave plates B and their conical pivots, substantially as specified.

Fifth—In a dumping car the combination with rockers on which the body turns and rests, and by which it is pivoted to the trucks of telescopic gravitating side bearings, whereby when said side bearings are extended and locked the car-body is prevented from turning to either side as specified.

Sixth—In a dumping-car the combination with the telescopic gravitating side bearings or supports U recessed in sockets in the said rockers and carrying at their lower ends friction rollers as and for the purpose specified.

Seventh—In a dumping-car the combination with the telescopic gravitating side bearings or supports U of locking-slides connected to shifting rods actuated by levers upon the platform, whereby upon moving said levers in one direction said side bearings are locked to enable them to support the body of the car and prevent it from tilting, and whereby upon moving said levers in an opposite direction said side bearings or supports upon the platform, whereby upon moving said levers

described.

Twelfth—In a dumping car the directing or deflecting board hinged to the side of the car by swinging brackets substantially as shown and described.

Thirteenth—The car bed as made with the cross-sills and headers 11 extended from the longitudinal sills 25, and which reach from end to end of the car, and framed or fastened thereon, and with the shorter longitudinal sills 34 framed into the headers 11, and with the outside sills 67, the construction affording space at the ends of the car and between the sills 25, for the worm and gear or machinery which operates the dumping mechanism and ample clear space at the sides for dumping, and all without weakening the car-bed.

Fourteenth—The rocker 9 constructed with a short central round boss b, and with a series of stout cogs cc on its under side, in combination with the convex-bed 10, constructed with the shallow central socket c¹ and the sockets c²c², on its upper side adapted for the cog teeth cc, all as shown and described and for the purpose of dumping the car and of permitting it to right itself again.

Fifteenth—

Fifteenth—The dumping shafts or shafts 12 extending nearly the length of the car, in combination with the clutch-pulley thereon and with the linked chain and the described series of pulleys or devices for actuating the same and for connection with a hand lever or wheel and a connecting worm and gear, whereby such shaft may be

and for connection with a hand lever or wheel and a connecting worm and gear, whereby such shatt may be operated to dump either slowly or suddenly at option.

Sixteenth—The combination with the ends of the truck timbers of the straps i^1i^1 and their interposed guide-pulley h, these straps being constructed and applied to each other and to the truck timbers substantially as set forth, so as not to interfere with the proper action of the car-springs.

Seventeenth—In combination with the swing-doors the bar or rod 15 one or more dogs or levers k beneath the car, one or more vertical slide-latches l and their guides, the combination and arrangement being such that the inner end of the dogs k may serve automatically to fasten or to unfasten the doors in the manner shown and described.

Eighteenth—The swing-doors constructed as described—that is to say, morticed in timbers or iron supports O at each end, strengthened by truss-rods rr and by metal cross-bars-or straps p having bevelled lower ends for engagement with the fastening latches, and provided with one or more straps or projections q as and for the purposes set forth.

Nineteenth—In combination with the car-bed the end posts 17 resting on the outside sills and extending down and secured to the outside of the same, and extending high enough to permit the swing-doors to be attached thereto, said posts being grooved or recessed at their inner corners to receive the end board t of the car flush with the inside of the posts, the posts and the board being held together by a connecting rod and braced by braces u, all substantially as shown and described.

all substantially as shown and described.

Twentieth—The centre posts 18 made and applied to the car-bed as described, and assisting to support the swingdoors, and strengthened by an inside metal plate u¹ and by a tightening rod v beneath the floor connecting the two opposite ends.

Twenty-first—In combination with the car the movable side bearings 19, provided at their point of suspension with a slot or keyway as described, where, while holding the car in position during transit, and adapted to be swung up for dumping, they also prevent undue friction when the car is in motion around curves.

Twenty-second—In combination with the drawbar the rocker or arched piece 20,* secured upon its under side as and for the purpose described.

Twenty-second—In combination with the drawbar the rocker or arched piece 20,* secured upon its under side as and for the purpose described.
Twenty-third—In combination with a dumping car, brake mechanism, as described, consisting of the combination of bar 21, arm 22 on the truck timber, arm 23 brake bars f² g², rod or bari², lever j², links k², and yielding straps l², and appropriate means for actuating the same from the car platform.
Twenty-fourth—In combination with a dumping car the pulley e¹, made integral with its deep sockets s², and their narrow connecting grooves, and with the V teeth and the annular groove, as and for the purposes set forth.
Twenty-fifth—In combination with a dumping car, the pulley shaft the loose pulley e¹, made integral with its deep sockets, and connecting grooves V teeth, and annular groove as set forth, the pulley e and appropriate mechanism for disengaging these pulleys, and to allow the car bed to dump its load suddenly or slowly, as desired.

desired.

Twenty-sixth—In combination with a dumping car, and with the pulley shaft, its fixed pulley e and the loose pulley e¹, made integral with its sockets, grooves, V teeth, and annular groove, the shifting lever, 24 rod u² and hand lever v², these devices operating as and for the purposes described.

Twenty-seventh—In combination with the linked chain f, attached to both sides of the car bed, the guide pulleys g, made with flat surfaces w², adapted for the links, and with the peripheral groove x, as shown and described. Twenty-eighth—In a dumping car the combination with the pulley shaft and with the described mechanism for operating the same of the pulley e, the pulley e¹, made integral with its sockets, connecting grooves, V teeth, and annular groove, the linked chain, guide, pulleys gg, grooved as described, and the guide pulleys hh, made, as described, the ends of the chain being fastened to the outside car sills or floor, all substantially as shown and described. and described

In witness whereof I, the said Carson Woods, have hereto set my hand and seal this twenty-seventh day of April, one thousand eight hundred and eighty-three

ss—Fred Walsh, Manager, Edward Waters' Patent Office, Sydney.

CARSON WOODS.

This is the specification marked A, referred to in the annexed Letters of Registration, granted to Carson Woods this 29th day of June, AUGUSTUS LOFTUS, Governor.

LETTERS OF REGISTRATION.

By His Excellency the Right Honorable Sir Augustus William Frederick Spencer Loftus (commonly called Lord Augustus Loftus) Knight Grand Cross of the Most Honorable Order of the Bath, a Member of Her Majesty's Most Honorable Privy Council, Governor and Commander-in-Chief of the Colony of New South Wales and its dependencies.

Privy Council, Governor and Commander-in-Chief of the Colony of New South Wales and its dependencies.

To all to whom these presents shall come, greeting:

Whereas Carson Woods, of 253 George-street, Sydney, in the Colony of New South Wales, importer, hath by his petition humbly represented to me that he is the author or designor of a certain invention or improvement in manufactures, that is to say, of an invention entitled "Improvements in Railway Cars or Waggons," which is more particularly described in the specification marked A, and the three sheets of drawings marked B, C, and D respectively, and which are hereunto annexed, and that he, the said petitioner, hath deposited with the Honorable the Treasurer of the said Colony of New South Wales the sum of twenty pounds sterling for defraying the expense of granting these Letters of Registration, as required by the Act of Council 16 Victoria, No. 24, and hath humbly prayed that 1 would be pleased to grant Letters of Registration whereby the exclusive enjoyment and advantage of the said invention or improvement might be secured to him for a period of fourteen years: And I being willing to give encouragement to all inventions and improvements in the arts or manufactures which may be for the public good, and having received a report favourable to, the prayer of the said petition from competent persons appointed by me to examine and consider the matters stated therein, and to report thereon for my information, and am pleased, with the advice of the Executive Council, and in exercise of the power and authority given to me by the said Act of Council to grant and do by these Letters of Registration grant unto the said Carson Woods, his executors, administrators, and assigns, the exclusive enjoyment and advantage of the said invention or improvement for and during the term of fourteen years from the date hereof, to have, hold, and execrcise unto the said Carson Woods, his executors, administrators, and assigns, the exclusive enjoyment and advantage thereof for and dur

AUGUSTUS LOFTUS.

[Ordere l to be appended, 29 October, 1884.]

Mr. W. Scott to The Commissioner for Railways.

Allison Manufacturing Co.'s Cars for Railway Freight.

I have carefully considered the proposal of Mr. Augustus Morris in reference to orders being given for a number of these cars for our lines, and I regret to say that I am unable to see any advantage to be gained that would justify your acceding to his wishes.

The first cost should not be considered apart from the cost of wear and tear, which would in my opinion be very heavy if these trucks were in general use. It is represented that these "cars are as light in relation to the loads they carry as is consistent with a long life," but it is not stated what the long life is where they are used. I am decidedly of opinion that on our lines the life of such a truck would be decidedly short.

Doubtless

APPENDIX.

Doubtless such trucks might answer well for certain traffic, but I am confident they would not do for such a mixed

Doubtless such trucks might answer well for certain traffic, but I am confident they would not do for such a mixed traffic as we have to provide for.

I notice that these waggons could not be run with our present stock, as the distance from the centre of the drawbars to top of rail is only 2 feet 10 inches, whereas our stock is 3 feet 5 inches. Again: the smaller trucks, Nos. 26½ and 28, have no provision for unloading, excepting through a hopper door in the bottom; so that they could only be used over pits or shoots, or as ballast-waggons.

I may state that, with the exception of the dumping arrangement, these cars very much resemble the American dump-car which has been purchased from Carson Woods & Co., and for the supply of a considerable number of which his tender has been accepted; so that until we have had an opportunity of thoroughly testing their efficiency no further orders should in my opinion be given. And even assuming that they would with certain alterations be suitable for our traffic, I consider that, in justice to our local contractors, only one of each sort should be imported as a sample to which others could be made in the Colony.

W. SCOTT, 16/1/84.

Acknowledge receipt of Mr. Morris' letter, and say that for the present it is not considered desirable to give an order for any of these cars.—Ch.A.G., 29/1/84.

A. Morris informed, 4/2/84.

A. Morris, Esq., to The Commissioner for Railways.

A. Morris, Esq., to The Commissioner for Railways.

Sir,

24, Bridge-street, Sydney, 15 December, 1883.

Permit me to enclose descriptions of three freight cars made by the Allison Manufacturing Co. of Philadelphia, which is by far the largest maker in the world of such cars. Its prices, though low, are a little higher than those of some other manufacturers, because of the extra strength and durability of the work.

The cars are made as light, as to weight, in relation to the loads they carry, as is consistent with a long life.

The accompanying photographs* will give an idea of the forms of the cars, which are the same as those used by the Pennsylvania R.R. and the principal railroads in the United States and Canada.

Of course the cars will be supplied with double buffers to adapt them to the railway traffic of this Colony.

If reasonable numbers of any of these cars are ordered I shall be glad to contract on behalf of the Allison Manufacturing Co. to deliver f.o.b. in New York at the following rates for net cash, to be paid in London on presentation of the account, together with the policy of insurance and the shipping receipts. The price for either of the two large cars, exclusive of insurance, is £105 in New-York, and for the small one £60.

The cost for freight cannot exceed 40s. a ton measurement, so that the price of the cars delivered free on board in Sydney Harbour will not be more than £145 and £80 according to the class.

If the railway system in this Colony requires any alterations in the cars they will be made as specified by your engineer, but it should be remembered that under the forms offered the classes of cars referred to have superseded every other for similar purposes in America.

Forward to Loco. Engineer. Cr. A.C. School.

I have, &c., AUGUSTUS MORRIS.

Forward to Loco. Engineer.—CH.A.G., 23/12/83.

THE ALLISON MANUFACTURING Co., PHILADELPHIA, PA.

General Description of Hopper Gondola-car body.

201 Station and Gauge Hall Tours	
Reference to photographs	No. 78.
Capacity of car	40,000 lbs.
Weight of car	19,300 ,,

		$\mathcal{L}u$	nensions.		
	ft.	in.		ft.	in.
Length of car outside of draw-bar			Width of car body inside	7	6
,, ,, ,, body outside of frame	26	0	Height of car from top of track to top of sides (wheels	_	_
,, ,, platform	1	0	33in.)	7	2
Width of car body outside	8	0	Height from top of track to centre of draw-bar	2	10
Length of inside	23	6			

Framing Dimensions.

Sills, 4×10 ; stringers, 4×8 ; bolsters, 5×14 ; end sills, 8×9 .

Floor—13in. tongued and grooved yellow pine.

Trussing—None required.

Sills, 4 x 10; stringers, 4 x 5; bolsters, 5 x 14; end sins, 5 x 5.

Floor—1\frac{1}{2}\text{in.} tongued and grooved yellow pine.

Trussing—None required.

Sides and ends—3in. yellow pine, 36in. high, banded and riveted at corners, and strapped and bolted to sills with iron bolts.

Standards—Six on each side, secured to sills with cast-iron pockets, and riveted to sides.

Drop bottom—Arranged in hopper form, with doors hinged to heavy irons, and secured with chains and shafts.

Drop bottom—Arranged in hopper form, with doors hinged to heavy irons, and secured with chains and shafts.

Loose and hinge sides—Not used.

Construction materials—Ash or oak and yellow pine lumber, with best quality of cast and wrought iron.

Painting—Three coats of mineral paint of any colour required.

Trucks—Two four-wheeled bogies (8 wheels).

Remarks.—This car has been adopted by the leading trunk lines of this country that have any coal tonnage. Having about one-half the floor-flat as in an ordinary car it can be utilized for lumber, or any purposes for which ordinary flat cars are used. By the arrangement of the drop bottom or hopper about two-thirds of the load can be discharged without shovelling.

 Approximate measurements, 400 cubic feet per car. Augustus Morris, Esq., 24, Bridge-street, Sydney.
                                                               R. W. Cameron & Co. to A. Morris, Esq., Sydney.
Dear Sir,

Your favours of the 8th August and 5th September reached us together on the 8th inst.

Coal Trucks.—We beg to enclose sundry photographs, specifications, and prices of cars, furnished by Messrs, W. C.

Allison & Co., of Philadelphia. You will find all the information you desire in these enclosures. The prices are for the cars boxed and delivered in New York. We cannot give the freight to Sydney, as the Messrs. Allison can only furnish approximate measurements, too vague to figure on; but if any business results, we will gladly do the freighting on as
reasonable terms as possible.

**Rockarock.**—We have nothing new to communicate at this time, as the Mr. Rand who attends to the matter is absent from the city, sick.

**We are, &c.,

R. W. CAMERON & Co.
                                              The Allison Manufacturing Co. to Messrs. R. W. Cameron & Co.
         Gentlemen
                                                                                                                                                                               Philadelphia, Oct. 12, 1883.
                      Confirming the conversation had with you yesterday by writer we now enclose you photographs,

No. 26, 8-wheel dump coal-car, price $475 each.

,, 26, 4
,, 5250
,, $250
,, $250
,, $250
,, $250
,, $250
and also specifications of same, giving dimensions, capacity, &c.

These cars are built of iron and wood and have chilled cast-iron wheels.

We could not undertake to make an iron car and compete with European manufacturers, and besides some Railroad companies in this country who a few years ago had some iron cars constructed have abandoned them and are using the
wooden cars.

We could not undertake to use the steel-tired wheel in competition with foreign manufacturers, nor do we think they would be advantageous on such low-priced work as coal cars, especially when cast-iron wheels will run from 60,000 to 150,000 miles.
             Trusting the photographs and specifications will answer Mr. Morris's purposes and awaiting your further favours,
                                                                                                                                  We are, &c.,

Carsón Woods, Esq., to The Hon. F. A. Wright.

Church-hill, Sydney, 6 October, 1884.

I would in the most respectful manner call the Committee's attention to the following facts connected with Railway Rolling Stock:

1st. I have given a first-class freight car, having besides the ordinary car a most expensive set of dumping gear underneath each, carrying 20 tons, for £200 sterling.

2nd.

the present contract.

200

APPENDIX.

2nd. Other contractors give a common freight car, no expensive dumping gear underneath, and carrying only 15

tons of freight, and charge £300 sterling.

3rd. The dump-car is the outcome of the most scientific car-builders on the American Continent, and its strength to carry its load is not questioned. Silver medal at Chicago Exposition for Railway Appliances.

4th. The "G" cars construction is questioned by your own officers as being bad in construction and as having at least 2 tons useless timber and iron work.

least 2 tons useless timber and iron work.

5th. For every 1,000 dump-cars hauled with full freight there is a saving of 7,000 tons haulage to the Department as the dump-cars carry 5 tons more and weigh 2 tons less than the "G" car.

6th. I am ready to contract to build 1,000 "G" cars, with steel axles and wrought iron steel tired wheels, master car-builders diamond trucks for the sum of £240,000, a saving of £60,000 on present contract price.

7th. I am ready to contract to supply 1,000 "D" trucks for the sum of £56,000, a saving of 20% upon the present contract price.

Sth. I am ready to give a cash deposit as security for the due fulfilment of the above offer.

Finally I ask most earnestly the favour of your bringing this letter and offer before the Select Committee upon Rolling Stock now sitting, of which you are a member.

I have, &c., I have, &c., CARSON WOODS.

Weight of car	19.300 lbs
	20,000 100.
Dimensions.	

Length of car outside of draw-bar Length of body outside of frame Length of platform Width of car body outside Length of car body inside	26 1 8	3 0 0	Width of car body inside Height of car from top of track to top of sides (Wheel 33in.) Height from top of track to centre of draw-bar	7 ls, 7	. 2	6
Length of car body inside	23	6		4	1,	٠

Framing Dimensions.

Sills, 4×10 ; stringers, 4×8 ; bolsters, 5×14 ; end sills, 8×9 . Floor— 1_4^3 in. tongued and grooved yellow pine.

Floor—13in. tongued and grooved yellow pine.

Trussing—None required.

Sides and ends—3in. yellow pine, 36in. high, banded and riveted at corners, and strapped and bolted to sills with iron bolts.

Standards—Six on each side, secured to sills with cast iron pockets, and riveted to sides.

Drop bottom—Arranged in hopper form, with doors hinged to heavy irons, and secured with chains and shafts.

Loose and hinge sides—Not used.

Construction materials—Ash or oak and yellow pine lumber, with best quality of cast and wrought iron.

Painting—Three coats of mineral paint of any colour required.

Trucks—2 four wheeled bogies (8 wheels).

Remarks—This car has been adopted by the leading trunk lines of this country that have any coal tonnage. Having about one-half the floor-flat as in an ordinary car, it can be utilized for lumber, or any purposes for which ordinary flat cars are used. By the arrangement of the drop bottom or hopper, about two-thirds of the load can be discharged without shovelling.

THE ALLISON MANUFACTURING CO., By D. L. SYLVESTER.

Approximate measurement, 800 cubic feet per car. Augustus Morris, Esq., 24, Bridge-street, Sydney.

Note.—The foregoing is merely a general description of our standard car. We will furnish a full description with detail specifications and drawings when requested.

The price of this car f.o.b. in New York is £110.

Framing Dimensions.

Sills, 5 x 10; stringers, 4 x 8 and 6 x 8; bolsters, 5 x 14; end sills, 8 x 9.

Floor—1½in. yellow pine, covered with sheet iron, and supported by main timbers and heavy irons.

Trussing—None required.

Sides and ends—Framed with posts and braces, and lined with tongued and grooved yellow pine.

Standards—None required, posts and braces referred to above acting instead.

Drop bottom—Doors of plate iron.

Loose and hinge sides—Not used.

Construction materials—Of ash or oak and yellow pine timber, with best quality cast and wrought irons.

Painting—Three coats of mineral paint of any colour desired.

Painting—Three coats of mineral paint of any colour desired.

Trucks—Two four-wheeled bogies (8 wheels).

Remarks-

—These cars are used by R. R. Companies, where the tonnage is principally coal and ores, the arrangement of the floors being such that when doors are opened the entire load is discharged without shovelling. The floor is made sloping from each end toward centre, and is covered with sheet iron.

[Ordered to be appended; 29 October, 1884.]

The Commissioner for Railways to The Chairman of the Select Committee upon Railway Rolling Stock.

Railway Department, Sydney, October, 1884. In my recent examination before the Select Committee on the 18th ultimo, I was asked whether there were an considerable number of accidents reported on the American railways as traceable to the use of cast iron chilled wheels and I replied, "No, not one that I could recollect; with the list of accidents which I had seen from time to time the cause was sometimes said to be 'derailment'—of course a defective wheel would cause derailment—but I could recall no accident which was attributable to the use of chilled iron wheels."

was attributable to the use of chilled iron wheels."

Since my examination I have been looking up the subject more closely, and as there seems to be a strong impression that the use of chilled iron wheels is accompanied with danger, I should be glad to furnish the Committee with some statistics, obtained from reliable sources, which may serve to reassure them on this point. Chilled iron wheels are almost universally in use in America; they possess 723,984 vehicles, other than locomotives, running over their 110,000 miles of railway. These vehicles have eight wheels, and the total accidents arising from the running of these 5,791,872 wheels numbered 19 in the six months ending 30th June last. It is not stated that these accidents arose because the wheels were made of chilled iron; they simply represent the whole number of accidents arising from defective wheels.

In the United Kingdom they have 444,958 vehicles (mostly with four wheels) running over their 18,000 miles of railway; the wheels for the most part have steel or iron tires; the number of wheel-tire accidents recorded within a similar period is no less than 643.

way; the wheels for the most part have steel or iron tires; the number of wheel-tire accidents recorded within a similar period is no less than 643.

With a mileage of railway six times greater than that possessed by the United Kingdom, and with fully three times as many wheels running, the number of recorded wheel accidents in America, where also the load on each wheel is often greater, was nineteen as against 643 in the Mother Country.

These figures demonstrate clearly that, on the score of safety, the chilled iron wheel used in America is infinitely superior to the tired wheel used in the United Kingdom.

It may seem incredible that the published figures should be so disproportionate, but I have very carefully examined all the authoritative documents procurable upon the subject, and the above is what they reveal. I leave them to speak for themselves. I do not, however, say that the nineteen accidents recorded represent the only failures with chilled wheels; the extracts herewith show that they were not, but one very significant fact is indicated, and that is, that with chilled wheels their defects are detected in time to avert accidents in running, which is not the case with the tired wheel. This fact is also horne testimony to by Captain Galton.

wheels their defects are detected in time to avert accidents in running, which is not the case with the tired wheel. This fact is also borne testimony to by Captain Galton.

To elucidate the matter as much as possible, I append copy of an opinion expressed by Captain Douglas Galton, C.B., D.C.L., F.R.S., and C.E., before the Institute of Civil Engineers in England, on the use of chilled wheels in America; also the following articles from the "Railroad Gazette":—

"Rate of breakage of wheels on the Pennsylvania Railroad."

"Steel versus Cast-iron Wheels."

"The car wheel of the future."

I have, &c.,

CH. A. GOODCHAP,

In favour of the use of chilled wheels.

Adverse to the use of chilled wheels.

See paper here-with.

I have, &c., CH. A. GOODCHAP, Commissioner for Railways.

The

[Enclosures.]

Extract from "Notes on Railway Appliances at the Philadelphia Exhibition," by Douglas Galton, C.B., D.C.L., F.R.S., and C.E.

"The use of wheels of chilled cast-iron is all but universal on American railroads. Other forms of wheel no doubt have been introduced at intervals, but they have not hitherto made way against cast-iron chilled wheels. These wheels are entirely different from any made in this country, and much more is to be said for their advantages than English engineers have been hitherto disposed to allow. The peculiarity of the cast-iron wheel is that each forms a single casting with the tire, and is cast in a chill, consisting of a rim of iron turned perfectly true, so that labour in turning is avoided.

"The duration of car-wheels in the United States was given at from 50,000 to 60,000 miles. The wheels can then be turned up and run a further mileage. If turned before being used a duration of 90,000 miles is guaranteed. It was further stated that a period of rest insured greater durability of car-wheels; that, for instance, the truck wheels under engines and tenders, running an equal number of miles with passenger cars, are usually in a better condition, as the engine has more frequent and longer periods of rest; and also, that in the case of wheels under passenger cars running short trips at a similar rate of speed to express cars running long and continuous trips, the duration in mileage of the former is greater, not-withstanding the more frequent action of the brakes upon them. Numerous inquiries made by the author led to the conclusion that chilled cast-iron wheels do not break in a way to occasion accidents to trains, provided they are examined at proper intervals when running. These cast-iron wheels are, moreover, economical; but whilst I am convinced that these wheels might be advantageously used here, it is certain that the failure of cast-iron wheels made in Great Britain has raised strong prejudices against them, which would prove a serious bar to their introduction."

EXTRACTS from the "Railroad Gazette," 18th April, 1884.

RATE OF BREAKAGE OF CHILLED CAST-IRON CAR WHEELS ON THE PENNSYLVANIA RAILROAD.

To the Editor of the Railroad Gazette.

Several articles in the Railroad Gazette during last year, referring to certain returns for a single month from one or two railroads, and hence suggesting or assuming the possibility that from 4 to 5 per cent. of all the cast wheels in this country were broken annually, have led me to an examination of the subject in order to obtain fuller information. The percentage mentioned has recently been assumed by an English railway paper as conceded, and an article based on this state-

is now en route through the press.

In July last some results obtained from the Pennsylvania Railroad Company's shop reports were published in the Gazette, since when I have revised the figures then given (having been led into error through the way in which the car record is printed in Poor's Manual), and have added those for 1883. The following table shows these results, covering all wheels removed for fracture of their lines east of Pittsburg and Erie during the years stated:

tatement showing number of wheels cracked or broken under cars on Pennsylvania Railroad of all makes and in all branches of service.

		Year 1882.	Year 1883.	
Total number of wheels on road January 1	. 356,326	460,480	453,610	
Number cracked		2,197	2,872	
Number broken	. 454	380	507	
Total	. 2,488	2,577	3,379	
Per cent. cracked	0.57	0:48	0.63	
Per cent. broken	. 0.13	0.08	0.11	
Total	0.70	0.56	0.74	

The percentage is calculated on the same basis as in the articles in the Kailroad Gazette already mentioned. Whether

The percentage is calculated on the same basis as in the articles in the *Railroad Gazette* already mentioned. Whether this is strictly correct or not, it is so for the purpose of comparison, and it is plain that to obtain a rate of even 4 per cent. the number of wheels on the road must be reduced to about one-sixth of those given, which would be absurd.

It is almost equally evident that, assuming the wheels in question to be of average quality, representing, as they do, the product of fifteen to twenty of the largest manufactories, this rate of breakage is not probably exceeded elsewhere. On roads subject to greater extremes of temperature the grades are less severe. For the southern seaboard, the valley of the Mississippi and the western plains, it is reasonable to assume a lower rate.

It is difficult to see, therefore, how a 4 or 5 per cent. rate can be maintained.

As the figures given are for all branches of the service, of course the great preponderance of freight cars brings down the average rate practically to that of this branch of the freight car wheels alone. I find in 1883: 2,774 cracked, being 0.6 of 1 per cent. of 434,104; 386 broken, being 0.9 of 1 per cent. of 434,104; and of the passenger cars and engines 98 cracked, being 0.5 of 1 per cent. of 19,506; 121 broken, being 0.6 of 1 per cent. of 19,506.

In estimating the capability of an article, not the average but the maximum, if accessible, should be considered. It has therefore seemed desirable to obtain complete statistics of the wear and strength of cast wheels of a single reputable make, in each of the different branches of service of a single road, where the number used and the character of the service should be such as to make the results valuable. In the case which I have selected (perhaps the only one which can offer so extensive results with a single wheel), the railroad company is itself the wheel-maker; and however this may be thought to bias its judgment as to the character of its work, it is certain that it takes a great deal of

summary only of statements much more detailed.

I present, therefore, the following table made up from Pennsylvania Railroad Company's shop reports, giving reports as to all the wheels of their own make taken out from engines and passenger cars in 1883.

These wheels are all made at Altoona, where the company has cast, for the last twelve years, from 100 to 400 daily. During 1883 I believe their product was about 70,000 wheels. They are made of certain charcoal irons, certain anthracite irons, old wheels of their own make, and steel; and are certainly not high-priced, since the company claim that they are cheaper at first cost, as well as better, than those of other makers. They are not presented here as the best cast wheels, but simply as those meeting the conditions already stated. Some makers and users of wheels contend that the best are made of charcoal iron alone, or in combination with a small amount of old wheels. If so, the capability of the cast wheel must be still greater than shown in this table.

^{* 8} hub cracked, 1 broken.

It will be noticed

1. That the chief exception to the regular decrease of mileage with the size of the wheel is in the 30-inch passenger engine wheels. These suffer both in truck and tender service and at passenger train speed, while the others are used under one only or at lower speed. The high mileage of the first line may be connected with the infrequent stops of the Pullman engine wheels.

2. The breakage rate of the wheels less than 30 inches in diameter is higher than that of any others. These wheels

are used under engine trucks only.

3. The proportion of broken wheels (which are the dangerous ones) is 0.6 of 1 per cent. (see other table), and the broken and cracked together are 1.1 per cent. These average rates are chiefly due to the higher rate among the small engine wheels, the larger car wheels showing much less than 1 per cent. broken and cracked, and no doubt less than 0.6 of 1 per cent.

wheels, the targer car wheels showing means there is shown I per cons. It is shown also broken only.

4. The wheels removed as defective, after giving the mileage stated, form but about 39 per cent. of all removed. Of the balance 21 per cent. were good for refitting and 40 per cent. ("flat sliding") have been spoiled by the brake. It is well known, also, that many wheels are fractured and many injured on the tread from this cause, so that it would appear that the chief cause of low mileage in chilled wheels is one that would act with still greater force upon any softer metal. In other words, in an economical point of view the question is not so much one of breakage as of braking, or the art of applying brakes in such way as not to prematurely shorten the life of the wheel.

EXTRACT

EXTRACT from the Railroad Gazette, 12th January, 1883.

STEEL versus Cast-Iron Wheels.

To the Editor of the Railroad Gazette.

Reference to the appendix to the report of the Master Car-Builders' Association of the comparative merits of steel and iron car wheels, published in your issue of November, 1882, there are several facts presented as to the cost of cast-iron wheels that are hardly correct.

As this is a most important matter, both for the railway companies and the manufacturers of cast-iron wheels, we submit the cost of a sufficient number of cast-iron wheels to equal the mileage claimed for a steel-tired wheel.

The figures here presented are based on the prices and mileage guarantees that are in ordinary use among railway

The following extract is from the report of the committee appointed by the Master Car-Builders' Association to investigate the subject, and shows the cost of 44 pairs cast-iron wheels as against one pair steel-tired wheels:—

Copy of report to Master Car-Builders' Association.

"The actual average mileage of the steel-tired wheels has been 220,021 miles. Now we will assume the average mileage of the cast-iron wheels to be 50,000 miles. To make 220,021 miles (the life of a steel wheel) it will require 4.4 cast-iron wheels, and the time in service to make 50,000 miles would be 571 days.

Value	One pair steel wheels.	4.4 pairs iron wheels.
Cost of fitting, etc.	. 4.50	\$123·20 8·80
Interest		26.87
. Total	. \$154.66 . 18.75	\$158·8 7 58·92
	\$135.91	\$99:95

"The actual average, however, of cast-iron wheels on Boston & Albany road has been 34,290 miles, the comparative results being as follows :-

Value	4.50	•	6.416 pairs iron wheels. \$179.65 12.83 35.03
Value of old wheels			\$227·51 85·91
•	\$136.75		\$141.60"

The first and most important error is the mileage assumed for cast-iron wheels, viz., 50,000 miles. Some makers may guarantee their 33-inch wheels for only 50,000 miles, but any maker of first-class wheels is ready to and does in all cases guarantee 60,000 miles. Railroad companies have never had any difficulty in purchasing wheels guaranteed for that mileage when they buy in the open market. Taking then 60,000 miles as the basis, we find that 3 66 pairs of cast-iron wheels will equal the 220,021 miles claimed for the steel-tired wheel.

2nd. The prices at which new cast wheels are estimated on report of committee, viz., \$14 each, would suit the manufacturers of them very well if they could get it; but as \$12 each is considerably nearer, and in many cases above the actual cost of such wheels, we will use the latter figures.

3rd. In buying one pair of steel wheels the interest and investment of \$100 is fairly computed from the date of the purchase. In the case of 4 4 cast-iron wheels, but one pair of wheels is purchased, and when, at the expiration of 571 days (or when worn out per Master Car-Builders' report), a second pair is purchased, all of the railways that we know of use their worn-out wheels in part payment for new ones, so that the actual cash expense for the second pair is their full value less the scrap value of the preceding pair; rating 4 4 pair scrap wheels at \$58 92, their scrap value would be \$6.70 per wheel, or \$13.40 per pair. (Per report of Committee.)

By the above figures, and rating 571 days as the life of a cast-iron wheel, making 50,000 miles, we find that a steel-tired wheel must take seven years to make its 220,021 miles, and on the 60,000 miles basis the 3 66 pairs must take 685 days per pair in making 60,000 miles.

In computing the interest on the investment in cast-iron wheels, it must be done from the date at which each individual purchase is made, to the completion of the term of seven years required to wear out a sufficient number to compare with a steel-tired wheel.

Having exp

men nineers will and price of between nineers we to, all as above t		
Cost of first pair wheels Interest on \$24, 7 per cent. for seven years		\$24.00
Interest on \$24, 7 per cent, for seven years	11.75	_

off-set one pair steel-tired ones		64.02
Same per Master Car-Builders' report	•	99.05
Same per Master Car-Builders' report Same per Boston and Albany Railroad report.		141.60

As to the mileage of steel-tired wheels, 220,021 is claimed, and we have heard of claims far exceeding that; but will practice give any such result? As shown above, a wheel will take seven years to make that mileage, and as steel wheels have come into extended use only in the last four or five years, there should accordingly be none worn out yet; we understand that they are not guaranteed, the sellers and purchasers seeming to have such implicit faith in them as to consider a guarantee unnecessary

Has anyone bought steel wheels guaranteed for 220,021 miles, and have there been no failures? Have all the steel wheels used run seven years without having the tires re-turned? There appears to have been no calculation made for such expenses, and we think that the users of them will find they exist and form a pretty large item too.

There are many things developed in the use of steel wheels of which mention should be made to arrive at a comparison with the cast wheel; for instance, they can be flatted by brake sliding and have to be re-turned every time; they also seem to be as open as the cast wheels to the greatest source of loss in car wheels, viz., sharp flanges, and the only way to save them is to re-turn them. To do this the users of them must purchase expensive machinery; if the actual expenses of using them are all computed, they will be fully double those of the cast wheels, while the permanent investment will at all times be nearly four times as great. It makes considerable difference whether a railroad company has one dollar or four dollars invested in doing a certain portion of their business.

We grant that the safest wheels should be used in all cases where life depends, without regard to cost; but is it fully established that the average steel wheel is any safer than a first-class iron one? Have the cast wheels had the opportunity to give their best results? We think not. Let us suppose that a railroad company were willing to spend some of the surplus cash now given for steel wheels on first-class cast ones. In that case a wheel could be made of extra strength; it would probably weigh one hundred pounds more than the ordinary wheel; it could be balanced and trued up as perfect as any steel wheel. It could be tested and examined both by the seller and by the buyer. Such wheels could be furnished for \$30 per pair, and would be just as safe as steel wheels at \$100 per pair.

Many people seem to think that there is no way to test cast wheels except in service, and that their merits and demerits cannot be ascertained until long after the purchase. This is not so; let the user of them test them before he puts them in service; strong wheels will break strong and poor ones will not.

A well-chilled wheel will give a good mileage (due allowance being made for the causes that interfere with the wear of any wheel, whether steel or iron), and a poor chilled wheel will not. The great trouble cast-iron wheels have to contend with is that they are all judged alike, when there is as much difference between good cast wheels and poor ones as there is between steel and iron wheels. We do not hear much of failures in steel wheels, but if the users of them will look into the number purchased and the number they have in use at present, we think they will have quite a number to account for.

Let them investigate the cost of the labour spent in re-turning and the machinery that is required and get at the facts generally. It is quite important for railroad people to know whether an investment of \$400 per car for steel wheels is necessary instead of \$96 per car for the cast wheels.

It may be said that in reducing the estim

Extracts from the Railroad Gazette, 1st February, 1884.

THE CAR-WHEEL OF THE FUTURE.

THE following is an abstract of a paper read by Mr. John M. Ford at a meeting of the Master Car-Builders' Club, held at

THE following is an abstract of a paper read by Mr. John M. Ford at a meeting of the Master Car-Builders' Club, held at Boston, January 30th:

A systematic record of facts as regards the relative service of steel-tired and cast-iron wheels under passenger equipment on the Boston and Albany Railroad, throws some light upon an important subject, which is now much discussed.

During the year 1883, 180 Hartford steel-tired wheels have been removed as worn out. Their average mileage has been 245,980 miles, the minimum being 63,500 and the maximum 470,000 miles; the average time in service, seven years, eight months, three days.

Analysis shows that

	-		Mi	les.				,	Miles.
-	6 wheels:	ran over	60	,000	and	under			100,000
1	4,,	,,		,000	,,	••			150,000
2			150				***************************************		
5		**	200	,000					
3		,,	250	,000			• • • • • • • • • • • • • • • • • • • •		
2		,,	300	,000	,,	,, `			350,000
1		1)	350	,000	,,	,,			400,000
	4,,	,,	400	,000	,,	,,			450,000
	l wheel	,,	450	,000		•••	*	. 	500,000

Thus, out of 180 wheels worn out, the great majority, 131, ran over 200,000 miles, and only about 3 per cent. of the total number ran under 100,000 miles.

The average mileage of worn-out cast-iron wheels removed during 1882 was 29,074 miles, and it would therefore appear that a steel-tired wheel will outlast eight chilled wheels, which latter only ran on an average 332 days.

The total cost of one pair of steel tired wheels, with interest and cost of changing and turning; to run 245,980 miles, has been, less scrap wheels	\$148	35
	100.	٠,
interest and cost of changing, has been, less scrap wheels	190 :

Difference in favour of the 180 steel-tired wheels removed during the year,	•	
without interest added	4,704	30

We have used this style of wheel for the past fourteen years, and had 1,615 in service on January I, 1883, and there has never been reported a defective wheel causing the slightest damage. The average length of all cars in service, passenger, mail, and baggage, is 47.90 ft.; average weight of all cars in service, passenger, mail, and baggage, 40,522 lbs.; size of wheels under consideration, 33 in.; style of truck, four-wheeled, except seven six-wheeled cars; sharp curves and heavy grades, much heavy suburban traffic, making frequent quick stops, the great power of the automatic brake tending to damage the wheel.

damage the wheel.

Car wheels are now being subjected to greater strains and rougher usage, and therefore require not only greater hardness of the tread but also greater strength, toughness, or tenacity of the metal of which they are made. During the past few years the average mileage of cast-iron wheels has fallen from 56,540 in 1880 to 29,074 in 1882 on this road. This fact indicates greater severity of service, and that the proper quality of material is wanting in the cast-iron wheel. This is confirmed by the fact that wheels in passenger service do not generally wear out, but become defective from some other cause. During the last nine months, 108 cast-iron wheels have been removed from a certain line of cars; only ten were worn out; of the remaining ninety-eight, sixteen had bad tread, eighteen were cracked, fifty-six flat, four seams, and four spotted. A few years ago, when cars were lighter, chilled wheels were probably the most economical in use, although many disadvantages resulted from imperfections in the service of the tread. Chilled wheels have, however, since proved unequal to the heavier loads, higher speeds, and the use of continuous brakes.

Crucible steel of good quality, containing about 1 per cent. of carbon, is four times as strong as cast wheel iron and machinery steel, containing about 0.30 per cent. of carbon, gives nearly the same breaking strain with a fibrous fracture. This metal is too soft for wheel tires, but steel made in crucibles from Swedish iron, with 0.70 to 0.80 per cent. of carbon added, hammered and rolled, will produce a perfectly safe and durable tire. A test made of the metal (annealed) of which Mr. Nathan Washburn is making steel tires showed great strength. Exact records as to the service of wheels are the only methods by which we can learn the practical value of different classes of steel for tires.

There is a popular theory that certain wheels are elastic—that is they will yield and recover their form. I admit that wheels contain elastic properties, just as a brick

that wheels contain elastic properties, just as a drick wan does, chough to would require to the fact.

The same is true of the wheel, or it is not fit for the service demanded of it; for the moment it yields or works a hair, that moment the forces required to produce this result was designed. A waggon wheel should never be run when any part yields or works a hair, but should be made perfectly solid at once. Will a continual yielding and recovering produce either durability or safety? A wheel should not be elastic under its load, any more than the principal bones in the body should be elastic in ordinary use, and yield to the blows giving in the act of walking; for in both cases elasticity is provided for in another way. The springs, equalizers and track neutralize the shock to the car bodies, and if the power of the springs to carry the load is determined accurately, so that an exact adjustment between the two is maintained, any additional elasticity would be as much a disadvantage as in the structure of the human body, for the provisions for elasticity are quite similar in each.

The

The destructive element of vibration as communicated from wheel to axle is another popular theory of the present day. This vibration does not tend to destroy axles, as the wheel is always in contact with the axle. The severer vibrations, which are destructive, are due to other causes. Can the wheel from contact with the axle transmit more vibrations to the axle than it receives? This is hardly reasonable, and still we hear nothing about wheels being destroyed by vibration, notwithstanding it is usually supposed that steel-tires and cast-iron possess greater vibratory properties than the wroughtiron axle. Yielding and recovering is not vibration, for no one contends that a cast-iron wheel is elastic or yields under its load; but they do contend that it vibrates, and in so doing destroys the axle without being itself affected. Why is this? The heavier destructive vibrations and strains conveyed to the axle come from the application of the brakes, the resistance to be overcome in the load carried, the tremendous momentum of the train, and the blow and twist communicated by change of direction in rounding curves, etc., and these forces can be neither diminished nor increased by any quality or communicated in the wheel, and accomplish that perfect safety and steady motion for which the vehicle is designed. Cushioning the wheel seat would give direct elasticity, producing a vibratory motion in the body of the car similar to the results produced in freight cars when the journal springs were placed over the oil-boxes. We endeavour to avoid this motion in passenger cars by equalizer bars and springs, which produce a long and soft motion, absorbing the jar and cushioning the blows more effectually and surely than in any other way, and, in conjunction with the body springs, give all the elasticity necessary or safe to have in your construction with the present element of elasticity in your truck. As vibration cannot be prevented we should endeavour to absorb the heavy shocks before they reach the body.

The present mode o The destructive element of vibration as communicated from wheel to axle is another popular theory of the present

In order to gain practical results by careful, systematic records, the wheel-makers and the wheel-users must combine efforts. The future wheel, no less than the present, must give the best results for the least money, and we must look to science to demonstrate the fact.

► [Ordered to be appended, 29 October, 1884.]

Randwick, 4 November, 1882.

In reference to the offer made by F. C. Rowan, Esq., to supply forty car engines, I have to report the engines of the class mentioned have not sufficient power as reserves for the excess of traffic at certain periods of the day over our roads, considering the grades of the city and suburbs; and I am also of opinion, from the design submitted, they will be very costly in wear and tear.

I quite agree with Mr. Rowan that, working over our roads with the present class of engines, any attempts at condensation with cylinders with more than $7\frac{1}{2}$ diameter will not be attended with results that can be considered satisfactory, and those already supplied and fixed will be found of small practical value during the summer months, and certainly not

worth the extra first cost.

While admitting the principle of the car engine as most desirable and economical for tramway work, I certainly do not feel justified in recommending the acceptance of the offer made, even supposing they were capable of performing the work required, and the price quoted was reasonable, so far as the first part is concerned. I have stated they are not equal to it; and as regards the latter, I am confident any one fully cognizant of the requirements of our system could obtain engines such as here specified either in America, England, or of first-class continental makers, at a reduction of some thousands below the lowest tendered price for forty; beside, there is nothing to show in the offer made what class of work or material was reasonable.

thousands below the lowest tendered price for forty; beside, there is nothing to show in the oner made what class of work or material we are to have.

But apart from the consideration, it is imperative (in making a radical change in our system of motive-power and rolling stock, involving the outlay of from eighty to one hundred thousand pounds) we should be in a position to say that that now being adopted combines all the most modern improvements as regards safety, efficiency, and economy. This certainly cannot be contended for in those now offered.

I attach particulars of a trial made with another steam-car (possibly the Commissioner has already seen it), although data, essential to forming a just estimate, is omitted; yet sufficient is said to show there are portions that can be adopted with advantage.

Besides this, there are other makers of car-engines, and it is quite possible there may be points in their construction desirable to follow.

desirable to follow.

I have carefully watched and considered the system of motive-power on our Tramways ever since it was placed under my charge, and I do not hesitate to affirm, from the experience thus gained, that engines can be made either in England, America, or the Continent, by which the traffic on our lines can be worked at from 30 to 50 per cent. below the

There is little doubt after a couple of years we could manufacture them in the Colony, but to meet the demand already created the facilities of one or more of the large locomotive works in the places named must be taken advantage of

to keep us supplied.

Seeing a large outlay must be made for additional plant, I would submit for the consideration of the Commissioner
the adoption of either of the following plans:—

1st. The sending of an order to the Baldwin Company for the necessary number to meet traffic requirements under No.—CH.A.G.

the present system, if continued.

2nd The ordering of a number of car-engines of standard types from present makers.

2—CH.A.G.

the present system, it continued.

2nd. The ordering of a number of car-engines of standard types from present makers.

3rd. Or taking advantage of our experience gained, to have sufficient car-engines manufactured at one or more I think well of locomotive works elsewhere, to meet present demands, and all subsequent requirements, by manufacturing this proposal.—CH.A.G.

locomotive works elsewhere, to meet present demands, and all subsequent requirements, by manufacturing in the Colony.

If the latter course is entertained it involves a personal visit. I have not made the suggestion on that account, for the Commissioner can readily understand there are makers who would be only too glad to avail themselves of the experience thus gained, but I do so solely in the interests of the Service, or, in other words, from a desire to see our Tramway system conducted with the greatest possible efficiency and economy.

Had there been any firms in the Colony capable of manufacturing, so as to meet our present requirements, I should have been only too glad to recommend it, but there is not; subsequent wants could however be met here, for they would be much simpler, and far easier to manufacture than locomotives for the Railway service.

GEO. DOWNE.

GEO. DOWNE.

Comr.—G.C., per J.L., 8/11/32.

The wear and tear of the present motors are unnecessarily great, and I am quite sure that a great saving will be effected by lighter rolling stock. The principle of the combined engine and car commends itself to those who have had experience of the present one on trial, although that design can be greatly improved upon. Our experience is now probably as great as that of any Tramway service, and our knowledge of the requirements of our traffic must necessarily give us superior advantage in designing a machine to meet those requirements. I am very favourably impressed with the proposal that we should adopt none of the advertised specialities; our experience of them so far has been that while they each meet some special kind of service, not one of them combines the requirements to meet our service. I am convinced that our Engineer can now make a design of motor which will meet our requirements in a far greater degree than any of those offered, and at a cheaper cost. I would submit, for the consideration of the Minister, that as we must at once expend some £80,000 in new rolling stock, it would be in the interests of the Department that the Engineer for such rolling stock (Mr. Downe) should take his design to a firm of manufacturers who know our system of lines and have manufactured motors for us—I mean the Baldwin Company, of Philadelphia. That firm has always treated us well in all orders we have entrusted to them, and Dr. Williams, of the firm, who was the first to interest himself in advising us as to our rolling stock for Tramways, will, I am sure, aid Mr. Downe in obtaining the best workmanship and quick supply at the lowest cost. I should have every confidence in entrusting to Mr. Downe the designing of the motor—to leave to Messrs. Cameron & Co., of New York, the arrangement of the price to be paid, and to the Baldwin Company—that, directly two can be constructed, they be sent to the Colony for trial; that tenders then be invited in the Colony for the construction of the twen constructed

constructed here. Mr. Midelton, the Acting Locomotive Engineer, will give a general superintendence to the rolling stock for Tramways during Mr. Downe's absence. I would suggest that the sea passage of Mr. Downe be paid by the Department, and that he be allowed 30s. a day expenses while on land, his absence not to exceed six months, and his services while in America to be devoted to superintending the construction of the motors.—Ch. A.G.

Mr. Scott will be back in Sydney in months. Mr. Midelton is now acting for him, without extra remuneration. I would recommend that he be paid £100 for the six months he will be superintending in Mr. Downe's place during his absence.—Ch. A.G., 13/11/82. Seeing the short time Mr. Midelton has been in the service, I think he should undertake this additional work without extra remuneration. Recommendation otherwise approved.—H.C., 22/2/83.

Mr. Cowdery informed. Mr. Downe informed. Mr. Midelton to see, B.C., 22/2/83.—Ch. A.G.

Seen, 24/2/83.—T.M.

Without is any months.

Mr. Cowdery informed. Mr. Downe informed. Mr. Midelton to see, B.C., 22/2/83.—Ch. A.G. Seen, 24/2/83.—T.M.

Without in any way impugning the decision of the Minister, I would respectfully desire to place upon record, that though I have not been long in the service of the Railway Department of this Colony, and entered it at a salary below that though I have not been long in the service of the Railway Department of this Colony, and entered it at a salary below that twhich my antecedents and qualifications entitled me to look for, I have in addition to the duties of my own office of general Locomotive Overseer, been for the past eight months performing (without extra remuneration) the duties of the Locomotive Engineer during Mr. Scott's official visit to America and England.

I have been glad to perform these duties upon such terms, although they have necessarily imposed upon me much extra labour and responsibility, and have scarcely left me a spare hour, because I was anxious to show, that though a little time only in the service, the Government in selecting me for the office of Loco. Overseer had appointed a person who was not only qualified for that office but for the higher position the duties of which I have been performing. I am now (24/2/83) asked to extend my sphere of usefulness by taking charge of the supervision of the Tramway Workshops and Motors during Mr. Downe's official visit to America for a period of six months, and the Minister has been pleased to approve of this, but has declined to concur in the Commissioner's recommendation that I be paid extra remuneration for the labour and responsibility which this addition to my work will involve.

I bow to the decision without further comment, requesting the Minister and the Commissioner to believe that the first consideration with me is the interests of the Department, and not my own private interests of individual benefit, but at the same time I most respectfully beg to state I do not consider that my case has received the consideration it deserves und

Minute from Commissioner for Railways.

Instructions to Mr. Downe, Superintendent of Tramway Rolling Stock, New South Wales.

Instructions to Mr. Downe, Superintendent of Tramway Rolling Stock, New South Wales.

Mr. Downe is proceeding to America to get made at the Baldwin Locomotive Works, Philadelphia, a tramway motor designed by him. One motor to this design, or any modification of it which, after consultation with the Baldwin Locomotive Company, it may be considered desirable to adopt, will be put in steam and tried on a piece of road in America, which may serve as a test of its general quality, and then be despatched to the Colony in the most expeditious way, to be again tried here. If it answers well on being tried in America, Mr. Downe may anticipate the order of the Government for five of these motors; and upon its being ascertained, by trial in the Colony, that they will answer the purpose, an order for fifteen additional ones will be forwarded by cablegram.

Mr. Downe will place himself in communication with Messrs. Cameron & Co. of New York, who, as the commercial agents of the Government, will advise him on all matters respecting payment for the motors, arrangements for freight, &c., &c. They will be written to to-day on this subject.

Mr. Downe should communicate with the Department, by cablegram, on any matter of sufficient importance to justify such an outlay; and he will be required to make a report monthly of the progress made with the supply of the motors and other matters affecting the interest of the Tramway service.

Mr. Downe of course understands that, with the exception of the first or trial motor, the cars for the motors will be made in the Colony. Mr. Downe will return to Sydney with the first trial motor.

CH.A.G., 22/2/83.

Make copy of this for Mr. Downe.—Ch. A.G., 22/2/83.

Re-submit end of March.—22/2/83. Copy made and handed to Mr. Downe. - D.C. M'L.,

LEGISLATIVE ASSEMBLY.

Tuesday, 27th February, 1883.

12. Mr. Downe, Engineer for Tramways:—Mr. Garrard asked the Secretary for Public Works,—
(1.) Is it true that Mr. Downe, the Engineer for Tramways, has recently left the Colony for America and Europe?
(2.) If so, is his journey being taken with the consent and at the expense of the Government, and will the Minister state

(2.) If so, is its journey being taken with the consent and at the expense of the Government, and will the Minister state the nature of the instructions given to Mr. Downe?

Mr. Copeland answered,—

(1.) Mr. Downe left for America on the 22nd instant.

(2.) The journey is being taken with the consent and at the expense of the Government. Mr. Downe has gone to Philadelphia to superintend the construction of a street motor and car, which he has designed for the Sydney Tramways. I will lay a copy of the instructions given to Mr. Downe upon the Table of the House.

Copy herewith. Submitted for Commissioner to see before being laid upon Table of the House.—D.C.M.L., 6/3/83. The whole of the papers leading up to the design of motor, together with all minutes thereon, the Minister's inquiry re Mr. Downe's history, &c., &c., should be included. Urgent.—Ch. A.G., 12/3/83.

I have now included all the preliminary papers which seem necessary in this matter. I have not had copied the numerous letters received from Captain Rowan, but only two of them which are referred to in one of Mr. Downe's reports. Mr. Midelton's minute in reply to the Minister's decision to allow him no extra remuneration for performing the joint duties might be eliminated. See where slip is put in.—D.C.M.L., 29/3/83. Commissioner.—G.B.

I do not think it necessary to put any of Mr. Rowan's letters in this return. The decision of the Minister must follow the papers re Mr. Downe's qualifications. His first minute should follow my recommendation, and his last minute, approving of the recommendation, should follow statement of Mr. Downe's services, or the description Mr. Downe gives of the motor.—Ch.A.G., 29/3/83.

Commissioner's instructions carried out. Is the return now to be forwarded to P. Works?—D.C.M.L., 31/3/83. Yes.—Ch.A.G., 3/4/83.

Yes.—Сн. А. G., 3/4/83.

LEGISLATIVE ASSEMBLY.

Wednesday, 4th April, 1883.

3. Papers:—Mr. Stuart laid upon the Table,—
Copy of Instructions given to Mr. George Downe, Superintendent of Tramway Rolling Stock.
Ordered to be printed.
Put copy with this when printed.—G. B. Mr. McLachlan, 20/4/83. Copy herewith.—D.C Copy herewith.—D.C. McL., 26/4/83.

TRAMWAYS.

(INSTRUCTIONS GIVEN TO MR. DOWNE, SUPERINTENDENT OF ROLLING STOCK.)

Ordered by the Legislative Assembly to be printed, 4th April, 1883.

Minute of Commissioner.

Rolling Stock for Tramways.

I wish to have a report upon the present adequacy of supply, and whether, with the orders given, it will be sufficient for the next twelve months. If not, what orders are necessary to bring the supply of rolling stock up to standard requirements. C.A.G., 18/9/82.

Please state number of each description on hand under repair, ordered, and not supplied.—B.C., 18/9/82. Mr. Cowdery. Mr. Downe.—G.C., per G.L., 19/9/82.

Urgent. Attached is a list of rolling stock on hand and ordered and not received to 30 September, 1882. To comply with probable requirements of traffic for next year it will be necessary if the present system be continued, to order forty engines and sixty cars. If the principle of the combined car and engine be adopted about sixty engines and cars should be ordered; the latter could be built in the Colony ready to receive engines as they arrive.—Geo. Downe, 30/10/82. To Engineer. Commissioner.—G.C., per G.L., 1/11/82.

GEO. DOWNE

31/10/82.

Minute of Commissioner.

I shall be glad to have design and plans prepared for an engine to work on the combined engine and car principle of such power that it will take its own car with eighty passengers, and on occasions an additional car with about eighty passengers. I propose having these engines made, or say some of them, at the Baldwin Works, Philadelphia. They are acquainted with our system, as they have already made motors for us. When the plans are ready and an estimate of the probable cost made, the question whether an officer of the Department should go to Philadelphia to superintend their construction will be considered.—B.C., C.A.G., 11/11/82. Urgent.

Mr. Cowdery. Mr. Downe to prepare design and plan, as per Commissioner's minute, 11/11/82.—G.C., per G.L., 14/11/82. Mr. Downe.—Urgent. I shall be glad to know if any decision has been arrived at in regard to accomdation asked for on 14/11/82, in order to carry out Commissioner's minute of 11/11/82.—Geo. Downe, 28/11/82. To Engineer. Mr. Downe has informed me that Commissioner gave him verbal instructions to erect a temporary office.—G.C., per G.L., 2/12/82. Commissioner.

Yes; I found that nearly three weeks had been lost, and no attempt made to get out the design which I said was urgently required. Want of room was the reason afforded. Mr. Downe said he could run up a drawing-office attached to his office at Randwick in a week. I told him to go and do it. A wooden building (say) 25 feet by 20, and 20 feet in height, would represent 10,000 feet, which at 6d. a foot run would cost £250.

I hope the drawings are being made by this time; if not, we shall be in a mess for want of engine-power, and I think Mr. Cowdery will be chiefly to blame for the delay.—C.A.G., B.C., 6/12/82.

What progress has been made?—G.C., per G.L., 8/12/82. Mr. Downe.

Building completed and occupied by the draftsmen on the 13/12/82 (drawings are being prepared), size, 35 feet by 16 feet.—Geo. Downe, 15/12/82.

To Engineer. Commissioner.—G.C., per G.L., 16/12/82.

Minute of Superintendent of Rolling Stock—Recommendation of Commissioner for Railways—Minute of Secretary for Public Works—Statement of Mr. George Downe.

Randwick, 4 November, 1882. In reference to the offer made by F. C. Rowan, Esq., to supply forty car-engines, I have to report the engines of the class mentioned have not sufficient power as reserve for the excess of traffic at certain periods of the day over our roads considering the grades of the city and suburbs, and I am also of opinion from the design submitted they will be very costly in wear and tear.

Wear and tear.

I quite agree with Mr. Rowan that working over our roads with the present class of engines any attempt at condensation with cylinders more than 7½ inches diameter will not be attended with results that can be considered satisfactory, and those already supplied and fixed will be found of small practical value during the summer months, and certainly not worth the extra first cost.

While admitting the principle of the car-engine as most desirable and economical for tramway work, I certainly do not feel justified in recommending the acceptance of the offer made, even supposing they were capable of performing the work required, and the price quoted was reasonable. As far as the first part is concerned, I have stated they are not equal to it; and as regards the latter, I am confident anyone fully cognisant of the requirements of our system could obtain engines such as here specified either in America, England, or of first-class Continental makers, at a reduction of some thousands below the lowest tendered price for forty; besides there is nothing to show, in the offer made, what class of work or material we are to have.

But apart from the consideration, it is imperative (in making a radical change in our system of material was a reduction).

But apart from the consideration, it is imperative (in making a radical change in our system of motive-power, and rolling stock involving the outlay of from £80,000 to £100,000) we should be in a position to say that that now being adopted combines all the most modern improvements as regards safety, efficiency, and economy, and this certainly cannot

adopted combines all the most modern improvements as regards safety, efficiency, and economy, and this certainly cannot be contended for in those now offered.

I attach particulars of a trial made with another steam-car [see Enclosure] (possibly the Commissioner has already seen it), although data essential to forming a just estimate is omitted, yet sufficient is said to show there are portions that can be adopted with advantage. Beside this, there are other makers of car-engines, and it is quite possible there may be points in their construction desirable to follow.

I have carefully watched and considered the system of motive-power on our tramways ever since it was placed under my charge, and I do not hesitate to affirm, from the experience thus gained, that engines can be made either in England, America, or on the Continent by which the traffic on our lines can be worked at from 30 to 50 per cent. below the present cost.

There is little doubt, after a couple of years, we could manufacture them in the Colony, but to meet the demand already created the facilities of one or more of the large locomotive works in the places named must be taken advantage of to keep us supplied. Seeing a large outlay must be made for additional plant, I would submit for the consideration of the Commissioner the adoption of either of the following plans:—

1st. The sending of an order to the Baldwin Company for the necessary number to meet traffic requirements No.—Ch.A.G. under the present system, if continued.

2nd. The ordering of a number of car-engines of standard types from present makers.

3rd. Or, taking advantage of our experience gained, to have sufficient car-engines manufactured at one or I think well of more locomotive works elsewhere to meet present demands, and all subsequent requirements by manufacturing in the Colony.

more locomotive works elsewhere to meet present demands, and all subsequent requirements by manufacturing in the Colony.

If the last-named course be entertained it involves a personal visit. I have not made the suggestion on that account, for the Commissioner can readily understand that there are makers who would be only too glad to avail themselves of the experience thus gained, but I do so solely in the interest of the service, or, in other words, from a desire to see our Tramway system conducted with the greatest possible efficiency and economy.

Had there been any firm in the Colony capable of manufacturing, so as to meet our present requirements, I should have been only too glad to recommend it, but there is not; subsequent wants could, however, be met here, for they would be much simpler and far easier to manufacture than locomotives for the Railway service.

GEO. DOWNE.

GEO. DOWNE.

 ${\bf Commissioner. --G.C.,\ 8/11/82.}$

Minute of Commissioner.

Minute of Commissioner.

The wear and tear of the present motors are unnecessarily great, and I am quite sure that a great saving will be effected by lighter rolling stock. The principle of the combined engine and car commends itself to those who have had experience of the present one on trial, although that design can be greatly improved upon. Our experience is now probably as great as that of any Tramway service, and our knowledge of the requirements of our traffic must necessarily give us superior advantage in designing a machine to meet those requirements. I am very favourably impressed with the proposal that we should adopt none of the advertised specialities. Our experience of them so far has been that while they each meet some special kind of service, not one of them combines the requirements to meet our service. I am convinced that our engineer can now make a design of motor which will meet our requirements in a far greater degree than any of those offered, and at a cheaper cost. I would submit for the consideration of the Minister that as we must at once expend some £80,000 in new rolling stock, it would be in the interests of the Department that the engineer for such rolling stock (Mr. Downe) should take his design to a firm of manufacturers who know our system of lines and have manufactured motors for us. I mean the Baldwin Company of Philadelphia. That firm has always treated us well in all orders we have entrusted to them; and Dr. Williams, of the firm, who was the first to interest himself in advising us as to our rolling stock for Tramways will I am sure aid Mr. Downe in obtaining the best workmanship and quick supply at the lowest cost. I should have every confidence in entrusting to Mr. Downe the designing of the motor, to leave to Messrs. Cameron & Co., of New York, the arrangement of the price to be paid, and to the Baldwin Company the faithful carrying out of Mr. Downe's plans. I think that in this way we may depend upon getting the best motor for our Tramways.

I would recommend that (out o

expenses while in land—his absence not to exceed six months, and his services while in America to be devoted to superintending the construction of the motors.

Mr. Scott will be back in Sydney in about six months. Mr. Midelton is now acting for him, without extra remuneration. I would recommend that he be paid £100 for the six months he will be superintending in Mr. Downe's place during his absence.—Ch. A.G., 13/11/82.

Minute of Secretary for Public Works.

I desire some information as to Mr. Downe's capacity as an engineer, and an account of his past experiences, to warrant sending him on an expedition of such importance. Ask Mr. Downe to forward me any testimonials he has in his possession as to previous employment before entering the Government service.—H.C., 19/2/83. Copies of testimonials attached.—Geo. Downe, 19/2/83.

Engineering experiences (condensed) of Mr. Downe, with copies of testimonials attached. APPRENTICESHIP of seven years as engine-fitter and millwright in H.M. Dockyard, Plymouth; workman six years in same service as fitter and engineer.

service as fitter and engineer.

Manager of Plymouth Foundry and Engine-works Company for four years.
In business for myself two years.
During the time I was employed as Manager of the above works, and in business for myself, I also held the following appointments under the Board of Trade, London, viz., Engineer-Surveyor for all Steam Merchant Vessels, Engineer-Surveyor for the Emigration Board, and Engineer Examiner for applicants' certificates of competency as engineers.

Two years as Assistant-Manager of large Gas-engineering Works, Exeter, manufacturing plant, &c.
One year Manager of Langlands Foundry Co., Melbourne.

Three years with the late T. S. Mort as Draftsman and Engineer.
Six years (nearly) in the Railway Department of New South Wales.
Four years as Mechanical Draftsman of Railway Rolling Stock and Bridge Construction, &c.
Two years as Loco.-Superintendent, Government Tramways. My entrance into and subsequent promotions (three) in the service were the result of my own exertions.

H.M. Dockyard, Devonport, January, 1861.

This is to certify that Mr. George Downe served an apprenticeship of seven years in this dockyard as an engine-fitter and millwright, which he completed in February, 1855, and afterwards worked as a journeyman in this establishment for nearly six years, during which time he conducted himself entirely to my satisfaction. He is a good workman, and a steady, diligent, attentive, and intelligent young man, highly deserving the favourable consideration of any person who may have occasion to employ him.

Plymouth Foundry and Engine-works (Lim.), 25 May, 1864.

Mr. George Downe has been engineer to the above Company for nearly four years, and during this period his ability, sobriety, and untiring industry have acquired for him the unqualified approval of the Directors.

He has a thorough knowledge of marine and other engines, and is well qualified to superintend their repairs or construction; combined with this qualification is his unremitting attention to his duties, which makes him a valuable acquisition in any situation where engineering skill and confidence are required.

Mr. Downe leaves this Company at his own request.

JAMES TOLL,

The Wharf, Millbay, Plymouth, 28 September, 1868.

This is to certify that I have known Mr. Downe for several years, including the whole time he was Manager of the Plymouth Engine-works Company, and holding the office of Surveyor for the Board of Trade, and have always found him to be an engineer of first-rate ability, of clear perception, and good judgment, and can strongly recommend him for the situation he is now seeking.

Agent for the Waterford Steamship Co. and Union Steamship Co.,

(Cape Mail Service).

14 March, 1867.

WE, the undersigned members of the Local Marine Board of Plymouth, beg to certify that Mr. George Downe, for nearly six years held the appointment of Engineer-Surveyor for the port of Plymouth and district, and since April 15th, 1864, has held the appointment of Examiner for Engineers' Certificates of Competency, and that he has discharged the duties of both appointments efficiently and to our entire satisfaction.

W. Luscombe, Richard Hill, James King, Richard Hosking. James B. Wilcocks, W. B. Cunning, Thomas H. Bottell,

At the Council Chambers, Whitehall.

Present:-The Right Honorable Thos. Milner Gibson, M.P.

17 & 18 Vic., c. 104, sec. 805.

Whereas it is provided by the "Merchant Shipping Act, 1854," that the Lords of the Committee of Privy Council for Trade may from time to time appoint such number of fit and proper persons to be Shipwright-Surveyors and Engineer-Surveyors, for the purpose of that Act, at such ports or places as they may think fit, and may from time to time fix and alter the rates of remuneration to be received by such surveyors:

Now, therefore, in exercise of the powers thereby vested in them, the Lords of the said Committee of Privy Council for Trade are pleased to appoint Mr. George Downe, Engineer-Surveyor for the port and district of Plymouth, with a fee of £1 for each complete survey, such appointment to continue during their Lordships' pleasure.

Signed by order of the Lords of the said Committee of Privy Council for Trade, the ninth day of February,

1861.

Assistant Secretary of the said Committee.

Sir,

I am directed by the Lords of the Committee of Privy Council to inform you that in pursuance of the provisions of section 6 of the "Merchant Shipping Act, 1862," their Lordships have appointed you to examine applicants for engineers' certificates of competency at the port of Plymouth. The examinations will be held at such times and such places as the Local Marine Board appoint. They will commence in May next.

A set of the forms to be used in connection with the examination of engineers is enclosed for your information and guidance. The examination papers, ex. 10, and ex. 11, are to be given to applicants themselves when they attend in the examiner's room to be examined, and are not to be issued to any other person.

As regards remuneration, my Lords direct me to inform you that they are unable to form any opinion as to the number of applicants likely to present themselves for examination, and that it is therefore at present impossible for their Lordships to fix the amount to be awarded as remuneration for your services as examiner.

The question of remuneration will, however, be taken into consideration at the expiration of the present year.

I have, &c.,

George Downe, Esq., Engineer-Surveyor, Plymouth.

George Downe, Esq., Engineer-Surveyor, Plymouth.

September, 1868.

This is to certify that Mr. George Downe has been the Engineer-Surveyor to H.M. Emigration Commissioners at this port for some years, during which time I have had frequent occasions for calling in his services, and I have much pleasure in bearing testimony to the great care and pains with which he always discharged the duties entrusted to him, and I believe him to be thoroughly efficient in his profession and thoroughly conscientious.

Given at the Government Emigration Office, Plymouth.

JOHN STOLL, Captain, R.N., Government Emigration Officer. 11 March, 1867.

I HAVE been associated with Mr. George Downe under the Board of Trade during the past six years, and can bear testimony to his efficiency in the knowledge of the steam-engine, and also in the construction of iron vessels. I consider him every way equal to the requirements of an engineering manager, and feel assured he would discharge his duties faithfully.

W. B. CUMING,

Retired Lloyd's Surveyor and to the Board of Trade.

Gas-engineering Establishment, Iron and Brass Founder, Contractor, &c.,
February, 1871.

This is to certify that Mr. George Downe has been with me in my employ as assistant manager in the manufactory for two years; during that time he proved himself fully competent for the duties he had to perform.

[Signature omitted.]

To Mr. George Downe, Jamieson-street,-

Dear Sir

46, Elizabeth-street, Melbourne, 30 June, 1873.

Dear Sir,

In reply to your inquiry, I have pleasure in certifying that from a large number of applicants in England you were selected as engineering manager of the Langlands Foundry in Melbourne; that you arrived there on January 1st, 1872, and while there in that position discharged the duties of manager to the satisfaction of the Board of Directors. You resigned the position entirely of your own accord in October, 1872, and with the view of trying your fortunes in Queensland and New South Wales in connection with the erection and planning of mining machinery, for which there is a large demand.

Your experience has been so practical and extensive that I can safely recommend your services in connection with almost any kind of machinery, and I will be glad to hear of your success from time to time.

Yours faithfully,

ANDREW LYELL,

Chairman of Board of Directors, Langland's Foundry Company, Melbourne.

MR. George Downe has been superintending engineer in my service for the last three years. He is possessed of first-class engineering ability, great energy, and is strictly to be relied on for sobriety and attention to his duties. He leaves my service in consequence of the duties in which he was employed having terminated.

T. S. MORT.

Sydney Ice Works, 16 July, 1877. Mr. George Downe has been in our employ during the last three years as engineer, draftsman, and superintendent of works. From the faithful manner he has discharged his various duties during this period I have much pleasure in recommending him, knowing that his skill, energy, and business habits cannot fail from being appreciated by any firm who may require his services.

E. D. NICOLLE.

Minute of Secretary for Public Works.

Seeing the short time Mr. Midelton has been in the service, I think he should undertake this additional work without extra remuneration. Recommendations otherwise approved.—H.C., 22/2/83. Mr. Cowdery informed. Mr. Downe informed. Mr. Midelton to see.—B.C., 22/2/83, Chas. A. G. Seen, 24/2/83.—T.M.

Without in any way impugning the decision of the Minister, I would respectfully desire to place upon record that although I have not been long in the service of the Railway Department of the Colony, and entered it at a salary below that which my antecedents and qualifications entitled me to look for, I have, in addition to the duties of my own office of General Locomotive Overseer, been for the past eight months performing (without extra remuneration) the duties of the Locomotive Engineer during Mr. Scott's official visit to America and England.

I have been glad to perform these duties upon such terms, although they have necessarily imposed upon me much extra labour and responsibility, and have scarcely left me a spare hour; because I was anxious to show that, though only a little time in the service, the Government in selecting me for the office of Locomotive Overseer had appointed a person who was not only qualified for that office but for the higher position the duties of which I have been performing. I am now (24/2/83) asked to extend my sphere of usefulness by taking charge of the supervision of tramway werkshops and motors during Mr. Downe's official visit to America for a period of six months, and the Minister has been pleased to approve of this, but has declined to concur in the Commissioner's recommendation that I be paid extra remuneration for the labour and responsibility which this addition to my work will involve.

I bow to the decision without further comment, requesting the Minister and the Commissioner to believe that the same time I most respectfully beg to state that I do not consider that my case has received the consideration it deserves under the circumstances.—Thos. Midelton, 26/2/83.

The Commi

[Enclasure.]

Trial of a new Steam Tramway Car.

On Saturday last the first trial in public of the new steam-car made by Messrs. Allen and Dickinson (Limited), Sheffield and Birkenhead, took place on the Wirral tramway line, between Woodside and New Ferry, in the presence of a deputation from Dundee and other Scotch towns, and the result in every way gave the highest satisfaction; and on Tuesday last, at the request of some of the directors of the Nottingham, Wallasey, Wirral, Blackburn, Wigan, and Leeds Tramway Companies, the new car made a second trip. Starting from New Ferry at 6:15 a.m. the car steamed down to Green Lane, Trammere, arriving at 6:25. A halt was made here to take up Mr. Busby, of Liverpool, and Mr. Gideon Herbert, of Nottingham. The car was then started up Chester Hill, where the gradient is excessively steep, being 1 in 13 feet; this was overcome without the slighest difficulty, and with a pressure of steam less than one-half the working pressure of the boiler. The car then proceeded to Woodside Ferry by way of Chester-street, and on the hill a halt was made while running at a high speed in order to test the brake power of the engine. It then proceeded to the Woodside Terminus, arriving at 6:25. At 6:40 a start was made for New Ferry, the car assending the Ferry. Hill gradient, which is 1 in 17, aggravated by a sharp curve, at a speed of 10 miles per hour, with the greatest ease, the engines working compound steam, 90 lbs., thus leaving a reserve of over four times power exerted in case of emergency, such as bad roads or greasy rails would be likely to produce. At the corner of Church-street and Ivy-street the power of the engine to take extreme curves was thoroughly tested, a radius of 29 feet being rounded in fine style. The ear then made its way to Chester-street Hill, in the middle of which, and on a gradient of 1 in 13, it was brought to a stand. The engines were reversed and the car steamed back again up the hill, thoroughly showing that the steam—car can be stopped on any hill and stread again at p

Description of proposed Steam-car.

The proposed car may be described as a combination of an ordinary tram-car with a motor of a somewhat novel design, in consequence of which, and the principle of engine adopted, an increased number of passengers are conveyed at a minimum expenditure of steam-power.

The car is divided into conveying the carrier of

The car is divided into compartments in the usual manner, with the exception of a space being reserved at one end sive the motor. The upper deck runs the whole length of the car, and is accessible by means of two staircases, as at to receive the motor.

present.

With a view to lessen the chances of accident, passengers can only enter and leave the car on the side nearest the footpath, doors being provided only on that side. This applies to the staircases as well as to the lower compartments.

No inconvenience can be experienced by outside passengers from the heat or smoke, as the chimney is surrounded by an efficient casing, and being carried much higher than usual the smoke is thrown off above the level of the upper roof.

The motor is to all intents and purposes completely self-contained; all that is required after steam is raised being to move it into the car, connect the chimney and whistle-pipe, and couple the vacuum brake tube.

The

The

212

The doors in front are then closed, all the machinery hidden, and the car is ready for work.

The motor consists of a substantial framing, on which is mounted a steel boiler with copper fire-box of special design and ample capacity for supplying steam to a pair of compound engines working directly on the driving-axle. The cylinders of these engines are connected in a novel manner, there being no space lost between each high and low pressure cylinder. The valves are also a departure from ordinary motor practice, they being of the "piston" type, and actuated by "Joy's" gear, consisting of a series of levers, which, whilst dispensing with the ordinary eccentric (links and rods), is capable of a much finer adjustment than is obtained by them, and the friction of the working parts is much reduced by substituting simple pins for large surfaces.

much nner adjustment than is obtained by them, and the interior of the working parts in making surfaces.

The cylinders are supported on wrought-iron standards fixed on to the axle-boxes, and they are also further supported on the smoke-box end of the boiler; stays running from standard to standard, and carrying the motion-bars, also assist in making the whole of the frame-work as rigid and substantial as is required.

With the exception of a small safety-link, to act in cases of extreme emergency, it has been demonstrated in practice that no connection is necessary between the motor and the car beyond the resting of the latter on a suitable base in the former.

Ample brake-power with hand and vacum is provided, and that on the motor is so arranged that the brakes cannot be applied without shutting off steam at the same time.

This car has been designed to convey eighty passengers at a speed of 10 miles an hour on a gradient of 1 in 19, the steam pressure being 130 lbs. per square inch, and carries a supply of water sufficient for a journey of this length.

Apart from the advantages which ensue in departing from the ordinary practice, as detailed above, the greatest of all is, perhaps, that whilst with an excessive load the ordinary motor has only its own weight to rely upon for the tractive-power, this car, if so loaded, throws half the weight of the extra load upon the driving-wheels, thereby giving additional adhesion, by which the difficulty of starting an overloaded train, as at present, is entirely overcome.

This car has been designed with a view to comfort, safety, efficiency, and economy, both as regards prime cost, working expenses, and repairs to permanent way, &c.

expenses, and repairs to permanent way, &c.

GEO. DOWNE, 16/2/83.

Instructions to Superintendent of Tramway Rolling Stock.

Mr. Downe is proceeding to America to get made at the Baldwin Locomotive Works, Philadelphia, a tramway motor designed by him. One motor to this design, or any modification of it which after consultation with the Baldwin Locomotive Company it may be considered desirable to adopt, will be put in steam and tried on a piece of road in America, which may serve as a test of its general quality, and then be despatched to the Colony in the most expeditious way, to be again tried there. If it answers well on being tried in America Mr. Downe may anticipate the order of the Government for five of these motors; and upon its being ascertained by trial in the Colony that they will answer the purpose an order for fifteen additional ones will be forwarded by cablegram.

Mr. Downe will place himself in communication with Messrs. Cameron & Co., of New York, who, as the commercial agents of the Government, will advise him on all matters respecting payment for the motors, arrangement for freight, &c. They will be written to to-day on this subject.

Mr. Downe should communicate with the Department by cablegram on any matter of sufficient importance to justify

Mr. Downe should communicate with the Department by cablegram on any matter of sufficient importance to justify such an outlay, but he will be required to make a report monthly of the progress made with the supply of the motors and other matters affecting the interests of the tramway service.

Mr. Downe of course understands that, with the exception of the first or trial motor, the cars for the motors will be made in the Colony.

Mr. Downe will return to Sydney with the first trial motor.

CHAS. A. G., 22/2/83.

Messrs. Burnham, Parry, Williams, & Co., to The Commissioner for Railways.

Dear Sir,

We have the honor to acknowledge receipt of your valued favour of February 21st, advising us of the visit shortly to be made us by Mr. George Downe, Superintendent of Tramway Rolling Stock of your Department. It is hardly time, so shortly after the arrival of the mail, for us to expect Mr. Downe, but we anticipate the pleasure of meeting him in due season, and discussing at length the details of the tramway cars which it is proposed to use. We are fully confident that, with the aid of his experience and suggestions, we can so perfect the rough plans which we have heretofore submitted to you as to fully meet the requirements of your service.

that, with the aid of his experience and suggestions, we can so periect one rought to you, as to fully meet the requirements of your service.

We take this opportunity to advise you of the departure, per "City of Sydney," of our Mr. William Rhodes, who is going out to Victoria to attend to the erection and trial of the ten passenger locomotives which we have recently shipped to that Colony. He will be happy to render your Department any services which you may desire from him while in Sydney.

Trusting that the motors which we have recently shipped are doing good service, and awaiting your further valued commands,

We remain, &c.,

BURNHAM, PARRY, WILLIAMS, & CO.,

Per A. B. Johnson.

I note that the Baldwin Co. misapprehend the object of Mr. Downe's visit. It is not by his experience and suggestion to perfect the rough plans which they have heretofore submitted to me, but to get them to make motors to Mr. Downe's own design, which I will venture to say is in its conception and arrangement altogether different to any designs submitted by the Baldwin Company. But, as I said in my letter, I shall be glad if the Baldwin Co. will give to Mr. Downe the benefit of their experience and suggestions in perfecting the design, which he will show them when he reaches Philadelphia. It is true that after Mr. Downe's design was matured, and before he had seen the arrangement of boiler and fire-box proposed by the Baldwin Co., the plans showing what the Baldwin Co. proposed to do in this respect were received, but, as I informed Mr. Stuart at the time, Mr. Downe had independently adopted the same arrangement, and the knowledge, I admit, that the Baldwin Co. had designed an arrangement of the boiler similar to that of Mr. Downes gave me more confidence in Mr. Downe's design of motor.—Ch.A.G., 8/5/83.

Extract from M.P. 83-2,889, being a letter received from Mr. George Downe, Philadelphia, dated 26/4/83. * * *

The Baldwin Company intimated to me if Messrs. Brill & Co. built the car it would be more convenient for them. I placed the drawings before them and they informed me the car would not exceed £500, and as this is only the price of our sixty-passenger car, and as it is to include putting together for trial, and after the trial finishing, packing for shipment, and delivery at the station, I placed the order with them for it.

It was intended, I believe (the papers will show), that the first car should be made in America—I think this is the right course—please submit papers.—Ch.A.G., 16/6/83.

Papers herewith, 18/6/63.

Instructions to Superintendent of Tramway Rolling Stock.

Mr. Downe is proceeding to America to get made at the Baldwin Locomotive Works, Philadelphia, a tramway motor designed my him. One motor to this design, or any modification of it which after consultation with the Baldwin Locomotive Company it may be considered desirable to adopt, will be put in steam and tried on a piece of road in America, which may serve as a test of its general quality, and then be despatched to the Colony in the most expeditious way, to be again tried here. If it answers well on being tried in America Mr. Downe may anticipate the order of the Government for five of these motors; and upon its being ascertained by trial in the Colony that they will answer the purpose an order for fifteen additional ones will be forwarded by cablegram.

Mr.

Mr. Downe will place himself in communication with Messrs. Cameron & Co., of New York, who, as the commercial agents of the Government, will advise him on all matters respecting payment for the motors, arrangement for freight, &c. They will be written to to-day on this subject.

They will be written to to-day on this subject.

Mr. Downe should communicate with the Department by cablegram on any matter of sufficient importance to justify such an outlay, but he will be required to make a report monthly of the progress made with the supply of the motors and other matters affecting the interests of the transway service.

Mr. Downe of course understands that, with the exception of the first or trial motor, the cars for the motors will be made in the Colony.

Mr. Downe will return to Sydney with the first trial motor.

CHAS. A. G.,

22/2/83.

Seen.-CH.A.G., 23/6/83.

Extract from 83-2,889T, letter from Mr. G. Downe, dated 26/4/83.

I at once attended at the Baldwin Works and opened up the object of my visit. I should have first said I went to New York and saw Messrs. Cameron & Co., who informed me they had received communication from you and would do all in their power to assist me, and requested me to inform the Baldwin Company they would pay all charges incurred.

The Baldwin Company at once entered into the subject, the practical members of the firm going over each part carefully; after doing so the general manager of the works said it was the most complete new design they had had presented to them, and that they were prepared to undertake its construction; the general manager also expressed some doubts as to the efficacy of the compound principle and should like it looked into closely. This I was quite desirous of doing, because if there was an error I would unhesitatingly admit it. They also requested me to wait a week, so that their best draftsman could be put on the work, going over the calculations and getting out the details with me. I waited, and we first started on the calculation in regard to the compound. After testing it in different ways, in which the senior engineering partner took an active part, we found the position was a good one, and decided to carry it out, modifying the sizes of the cylinders only. There are a few of the minor details slightly altered, mostly those I mentioned to you before I left, and the drawings are now being pushed on as fast as possible; part of the work is on order, and the Company have promised to complete it in time to have a full trial of its efficiency, and shipped by steamer leaving 'Frisco August 25th. I don't think they will be after date with it, as their workmen work 10 hours per day with only one break; they get 25 per cent. more out of their men than we do. Next month's report will enable me to speak more definitely than I can now.

Seen.—T.M., 27/6/83. The Commr. Seen. Mr. Midelton to see. - CH. A.G., 23/6/83.

Mr. G. Downe to The Commissioner for Railways.

Philadelphia, 26/5/83.

Since writing my last I am pleased to say the Baldwin Company have continued to push on with the compound engine; part of wrought iron work is made; the whole of the castings will be finished next week; the boiler is in hand, and they have fixed the early part of July for the trial. If they keep to this, and I see nothing to prevent the date of shipment as given in my last being kept. It takes fully three week to carry it across the Continent, so that to insure shipment it must leave here by 1st of August.

GEO. DOWNE.

A subsequent letter to this has been received from Mr. Downe, I think.—CH.A.G., 6/8/83.

Mr. G. Downe to The Commissioner for Railways.

Philadelphia, 26/5/83.

I OMITTED to state that Messrs. Brill & Co. are proceeding satisfactorily with the manufacture of the car, and it will be quite ready for trial by the time the engine is completed.

I think these papers should be carried on to papers about new design of motor; they bear materally upon it; in fact some of the enclosures belong exclusively to that subject.—Ch. A.G., 6/8/83.

Mr. G. Downe to The Commissioner for Railways.

Mr. G. Downe to The Commissioner for Railways.

Philadelphia, 21/7/83.

I am pleased to report the combined engine and car, although not so far advanced as I expected when I wrote last, is in a sufficiently forward state to run in steam on jacks to-day, and I hope in three days to have it running on the road. The car is ready for the trial, being the first engine of its kind built here. The men have had to exercise more than the ordinary care in every department and have not been able to work with their usual energy, especially in the erecting shops, both here and at Brill & Co.'s; they would be able to erect any others at fully 33 per cent. less cost for labour.

I will keep this open as long as I can, so as to give you the result of the first trial in steam if possible.

I am afraid it will not be tested in time to ship by the August steamer; but I expect it will be completed in time for me to catch it, and unless I receive any instructions from you to perform other work, shall return by that one and have the engine and car follow in September. Preparation should be made to run it on arrival; if by turn-table it must be 30 feet 6 inches at least in diameter.

inches at least in diameter.

I have been making inquiries for one suitable for the streets and to work easily. So far I have been unsuccessful in finding one answering the requirements we need. I presume, under the circumstances, you will put in a triangle; I would suggest its being prepared in time to prevent delay in putting it to the further test after its arrival and erection.

I have just come from the erecting shop; we cannot get the engine completed for shop trial until Monday morning, and the mail leaves to-night (Saturday). I cannot, therefore, speak definitely; all appears favourable, so far, to realise our expectations of it. You will, however, have received a cablegram of the result almost before this leaves 'Frisco., as arranged the last mail. GEO. DOWNE.

Again when cablegram is to hand.

Mr. G. Downe to The Commissioner for Railways.

Dear Sir,

Thiladelphia, 18 August, 1883.

Instead of writing you I had fully expected to have returned by this mail, but we have had several drawbacks, just what is realized with every new engine, but at the same time very provoking when it is desired to complete by a definite time. By the copy of the American Machinist which I send you by this mail you will see I did not get a first public trial before the 3rd instant, and although things worked fairly well yet on that day we did not go far as the business men who accompanied us could not spare the time. On the following Monday, when making a further trial, one of the side rods fired (not from running neglect) and was bent. New rods had then to be made, which caused a delay. Since then two further trials have been made, but we have suffered from the usual complaint of warm bearings and primings, &c. But I am nearly through with these mechanical misfits, and expect next week to cable you the result. So far as the trials have been made it will be gratifying to you to know they are successful, and there is reasonable prospect of its accomplishing all that is claimed for it. The compound principle will, I feel assured, make a reduction in our fuel bill, and the saving in other respects will, I think, come out very near what I put before you. The Baldwin Company speak well of the design, but as they say an extended test is necessary to prove its economy in working. I myself have no fear that in twelve months you will be able to show them a balance that will be as satisfactory regarding wear and tear as the design is to them now. Mr. Longstreth, one of the partners, and who is the active manager of the works, has taken especial interest in this engine and car. He told me to-day that he had devoted more time than any one else to the question of street motors here; our present motors are almost exclusively his own design; the combined cars they have made are also his, and so interested is he in perfecting it that during

the trials. Such an expression of opinion from one so competent is, I feel, very gratifying, and will, I doubt not, assure you that the design is fully appreciated here, and show at the same time that I have not been sent by you 10,000 miles with something doubtful, or faulty in construction and unable to perform the work required of it. I am aware of adverse expressions of opinion in the colony both as to design and ability to perform its work; but such is not endorsed here by any who have seen it. I have courted criticism that I may discover any defects existing, as I am anxious we shall have the best of its kind, but all who have seen it do little else than praise it; still I do not flatter myself it is perfect, and during its working I daresay I shall be able to introduce some improvements.

The part I designed to escape Mr. Rowan's royalty works admirably, and I have while here designed a change-valve for working all cylinders high pressure or compound that I purpose patenting. It is simple, effective, prevents back pressure, and can be instantly changed by the driver either when stationary or running. Of course New South Wales will be exempt from any charges on patent account. I might add that I tried its haulage power on a grade of 1 in 17 yesterday, with a truck and loading about the weight of one of our sixty passenger cars with 120 persons on it, and it mounted the grade easily compounding, and under unfavourable conditions, for the car built for it was empty, consequently was minus the adhesive power for the engine that its own passengers would give. Without further enlarging on its merits as so far tested I think I may say I feel assured when it reaches Sydney and is put on the road it will give complete satisfaction to you, and show that the object of my visit has been fully attained.

I remain, &c.,

I remain, &c., GEO. DOWNE.

P.S.—I omitted to say on one trial the engine with car did 5 miles in 12 minutes.

Copy of cablegram received from Baldwin, Philadelphia, referring to Mr. Downe's combined motor and car. August 23, 1883.

"Steadfast regenerate, and Downe, September; inform wife."
The cablegram means:—"Steam car is working satisfactorily. Steam car will leave in time for 'Frisco steamer, August 25th, and Mr. Downe September. Inform wife."

EXTRACT from The Sydney Morning Herald, Tuesday, 25 September, 1883.

A COMPOUND TRAMWAY MOTOR FOR AUSTRALIA.

THE following appeared in the American Machinist of the 25th ultimo, published in New York :-

The following appeared in the American Mackinist of the 25th ultimo, published in New York:—

"A tramway motor has just been finished by the Baldwin Locomotive Works for the New South Wales Government, which possesses several novel and interesting features. The motor is intended for service on the tramways in and around Sydney, which are operated by the Government of the Colony, and it was designed by George Downe, superintendent of machinery, who was sent from Australia to look after the building of the machine. Friday menning, August 37d, the motor was steamed up ready for the road. A party of gentlemen who had been invited to witness the trial trip were in attend, ance, and among them was a representative of the American Mackinist. A run was made over part of a division of the Philadelphia and Reading Railroad, and the inotor performed its work in a satisfactory manner. The engine and boiler of the motor are enclosed in the end of a car which is 38 feet long, and weighs complete 14½ tons. The boiler is vertical, and is adapted to burn any kind of coal or coke, the latter being the material used on the trial trip. The engine is of the compound type, with two cylinders at each side standing vertically inverted above the driving shaft. They are connected in the tandem fashion, the high-pressure cylinder being on the top. It exhausts round the casing into the low-pressure cylinder being on the top. It exhausts round the casing into the low-pressure cylinders, which enables the engineer at will to increase the power to a remarkable extent. This arrangement is specially made for the work the motor is intended to perform. The street grades in some parts of Sydney are intensely heavy, as high as 270 feet to the mile being ascended. When the motor is running along on ordinary grade the expansion of the compound cylinders will be utilised, but when a steep grade is reached the increased power of steam acting directly in the four cylinders will be utilised, but when a steep grade is reached the increased power of steam

Since the publication of the above a communication has been received by the Commissioner for Railways from Mr. Downe, in which he states that the new design of motor has exceeded, upon test trial, the most sanguine expectation, and the managing director of the Baldwin Locomotive Company, who is the designer of the motors now in use on the Sydney lines, has pronounced Mr. Downe's street motor to be far in advance of any that have yet been invented.

Forward with Mr. Downe's letter to Mr. Midelton, B.C., 26/9/83.—Ch.A.G. Commissioner. The Seen.-T.M., 29/9/83.

Extract from The Sydney Morning Herald, 27 September, 1883.

Extract from The Sydney Morning Herald, 27 September, 1883.

If Mr. Downe's visit to America results in an improvement in our tramway system the Government will be able to take credit to itself for having permitted him to go so far afield. —In-the Civil Service we have too many "poor unfledg'd," who "have never wing'd from view o' the nest." There are, no doubt, many whose faculties would be freshened and sharpened by travel, and the outcome might be the birth of many mechanical inventions that would prove serviceable to this young Colony. Mr. Downe has shown that it is not alone the prophet that lacks honour in his own country. He, an engineer, has lived amongst us long years, and to the multitude his name has been unknown. He is now on a visit to America, looking after the Colony's interests in regard to its tramway system. His inventive faculties have been set in notion by keen observation and opportunities for comparison which his visit has afforded, and all this has led to the manufacture of an improved steam tramway motor, possessing not only "interesting and novel features," but which has been pronounced by competent authority to be far in advance of any motor yet invented. The reasonable conclusion from that is that but for Mr. Downe's visit to America the world might never have heard of his triumph of engineering skill. He has improved even upon American ingenuity in the shape of mechanical invention, and both countries may therefore expect to profit by his originativeness. Most of the motors in use in this metropolis were made at the Baldwin Locomotive Company's works, New, York. It was at those works that the improved motor was made, and it was the managing director of those works who pronounced so favourable an opinion respecting its merits. The success which Mr. Downe has achieved suggests the possibility of our improving in other directions by sending other of our Civil servants to gather information from abroad. In connection with our railways, are instance, we require not only good motors but go EXTRACT

EXTRACT from letter of Messrs. Burnham, Parry, Williams, & Co. to Commissioner for Railways. " Dear Sir, Philadelphia, 15 September, 1883.

"We are pleased to advise you of the shipment of the compound motor and car, on the 30th ultimo, with a view to its shipment from San Francisco, by the Pacific Mail Steamship 'City of New York,' which carries this letter. On August 22ud we sent you a telegram, as per enclosed copy, announcing the satisfactory performance of the car, and its shipment by this vesse

shipment by this vessel.

"During its trial the motor worked efficiently and satisfactorily, and we believed, fulfilled all our expectations concerning it. It is the best plan of eight-wheeled steam-car which has ever come within our notice, and contains many important features of construction which have never before been used in such a machine. As it is, however, the working out of an entirely new design, there must necessarily be found many points susceptible of improvement, and these points will be demonstrated by its service on your lines. Its comparative economy of fuel will also be shown. While during its trial here it indicated that its consumption of fuel would be small, the conditions are so removed from those under which it will work on your lines that we must consider this one of the points which must be left for time and further experience to decide. Much credit is due to Mr. Downe for the diligence and attention which he has shown to every detail during its construction. He has devoted his time to it exclusively, and much praise is due to his skill and intelligence as a designer. No new idea in the construction of locomotive and kindred machinery has remained uninvestigated, and any credit which may be due for the merits of the design we take pleasure in rendering to him. We hope soon to hear good accounts of the performance of the car on your lines."

Telegram from Messrs. Burnham, Parry, Williams, & Co., Philadelphia, U.S.A., to Commissioner for Railways,
Philadelphia, 22 August, 1883.

Steam-car is working satisfactorily. Steam-car will leave in time for 'Frisco steamer of —; and Downe, September. Inform wife.

Telegram from Auckland Station, to Commissioner for Railways,

Auckland, 16 October, 1883.

ARRIVED Auckland; engine and car on board.

R. Towns & Co. to The Commissioner for Railways.

Dear Sir,

We beg to wait upon you with enclosed receipt of Mr. Geo. Downe, for £151 16s. 10d., as payment to him by your agents, Messrs. Cameron & Co., in New York.

We also enclose draft by the Messrs. Baldwin Co., for £352 17s. 11d., against the balance due on the consolidated motor imported by the last "City of New York."

We shall feel obliged if you will forward on to the Treasury the necessary instructions for payment of these amounts.

We remain, &c.,

R. TOWNS & CO.,

(Per Win. Ed. Wilson).

Supt. of Stores, B.C., 29/10/83.—G.B. Herewith.—A.R. The Examiner, 31/10/83. Voucher forwarded for payment.—J.P.F., 17/11/83. Secretary.

NEW COMBINED MOTOR AND CAR.

Extract from Sydney Morning Herald, November 27, 1883.

New Combined Motor and Car.

Yesterday aftermoon the Minister for Public Works, accompanied by the Commissioner for Railways, two or three Members of the Legislature, and a number of the trainway officials, tested the copabilities of a new combination car and motor recently constructed to the order of the Government. The experiment took place on the Randwick and Googee tram line. The car is of novel design, and presents a very neat appearance, and has been constructed with a view of overcoming many of the technical difficulties of the present system, and at the same time providing more efficiently for the comfort, convenience, and the result was considered very satisfied to the present system of the motor. The car is of the present system of the motor. The car is of the present system of the motor. After a short based of the wind which would afford the best opportunity of really testing the powers of the motor. After a short day at Coogee the return trip was commenced, and it was satisfactory to find that the new car, drawing about 24 tons (exclusive of the motor), rounded the sandhills without a stoppage. The speed, however, was very slow, and it was quite evident that the motor had almost as much as it could manage. On arriving at Randwick another stoppage was made, and the party partook of a little light refreshment, after which a return was made to Sydney, all being apparently thoughly satisfied with the trial. The following description of the car has been supplied to as:—It was designed at the tramway works, Randwick, by Mr. George Downe, the Superintendent of rolling stock, and was built in Philadelphia, under his personal supervision. The vehicle is a combination of an ordinary tramear with a motor of somewhat unique pattern, and it is claimed that by the principle of engine adopted an increased number of passengers may be conveyed at a minimum expensal supervision. The vehicle is a combination of an ordinary tramear with a motor of somewhat unique

vibration, even when the speed is above the maximum at which it will work ordinarily. The difficulty of starting when overloaded is in this class of car entirely overcome, as half the weight of the load is always thrown on the engine wheels, thereby giving additional adhesive power and enabling the motor to accomplish the extra work. Before the car was shipped to Sydney a number of trials were made: first with the engine only, and afterwards with the car attached. Its performance with the latter was witnessed by many scientific gentlemen and others interested in the subject, to whom the performance of the engine was a matter of special interest on account of the adaptation of the compound principle and the general design being such a departure from ordinary locomotive practice. It is the first compound locomotive built in the United States. The economy from the combination of engine and car on our lines was anticipated by the Commissioner for Railways, who many years ago, we understand, advocated the principle in connection with our tramway service. A trial car was ordered by him from England about two years since, and has run on the line from Redfern station for some time. Although this car has not been a favourite with the travelling public, its non-success in this respect did not affect the principle of combining engine and car, and when Mr. Downe introduced his design, which embraced this principle, the Commissioner's confidence in it caused the them Minister for Works to order a trial car, Mr. Downe being sent to America, not only to superintend the manufacture but also to test its capabilities on one of the American lines. During its trial in America the combined engine and car ran several hundred miles, and the testimony of the Baldwin Company, after having witnessed its performance, must be highly gratifying to all concerned.

EXTRACTS from The Daily Telegraph, Tuesday, November 27, 1883. Official Trial of the New Steam Motor.

OFFICIAL TRIAL OF THE New Steam Moror.

It has been no secret that for some time past the tramway authorities have been on the look-out for an improvement in the present style of steam-motor and cars, the great desiderata being lightness and safety. Mr. Downe, the superintendent of rolling stock, has been busy for a considerable time in designing a motor and car combined, to meet the requirements of Sydney traffic. The manufacturers of the present motors, Messrs. Baldwin, of Philadelaphia, have recently completed a model motor according to the designs furnished by Mr. Downe, which has only just arrived in Sydney. Yesterday afternoon an official inspection of it was made by the Hon. F. A. Wright, Mr. Commissioner Goodchap, Mr. Rhodes, of the Locomotive Department, and Mr. Roberts, Superintendent of Tramways. The party included Messrs. Garrard and Vaughn, Ms. L. A.; Mr. Williams, Crown Solicitor; Mr. Richards, Government Printer; together with the representatives of the Telegraph and Herald. A start was made in the new car from Bridge-street, about half-past 4, for Coogee, Randwick being reached after a rather slow journey of 20 minutes or so. Here a "double-decker," heavily laden with iron, was attached to the combined motor and car, so as to make the entire load as near as possible equal to two fully laden cars, or about 22 tons. Of course Coogee was reached without any difficulty, and while there the motor was subjected to a pretty close scrutiny, which resolved so far in a very favourable manner. But the real test was in returning on the steep up-grades to Randwick, and more than once it appeared that the engine had almost too much to draw, more especially as the iron on the hindmost car was really harder to pull than its equivalent in weight of passengers. It was, in fact, the most trying test that the new invention could have had. But Mr. Downe's ability was demonstrated beyond a doubt, for there was no actual stoppage all the way up to Randwick, although, as might be supposed, the progress was exceedingly

EXTRACT from The Sydney Daily Telegraph, Tuesday, November 27th, 1883.

YESTERDAY afternoon the new combined car and motor invented by Mr. Downe, Superintendent of Rolling Stock, was subjected to an official trial. A trip was made to Coogee, the party including the Hon. F. A. Wright, Mr. Goodchap, and Messrs. Vaughn and Garrard, Ms. L.A. The result was decidedly satisfactory. A full report appears elsewhere.

EXTRACT from The Echo, Tuesday, November 27th, 1883.

Extract from The Echo, Tuesday, November 27th, 1883.

If the new compound tramcar is not a success everybody who travels by tram will be sorry for it. The remarkable little compound car that is sometimes pressed into the service between Bridge-street and the railway is answerable for a good deal of profanity. Even the department has not had the hardihood to produce another like it. The principle of it is right enough, but there could hardly have been a more abortive application of that principle. Detached motors and cars are clumsy, dirty, and noisy. Nobody says they are not an advance upon older methods, even in these respects; but they are not things for the last decade of this century. It will count one to us if the new venture is a success; because it is a local invention. Everybody said it was needed, and as many persons said it could be done, it still remained to show how it could be done. If the first example is not perfect, never mind; having caught the idea, the first application of it can be improved upon. The best trial for it was not the one made yesterday. It may have tried the strength of the engine, but since the car is made to carry living freight, put it on one of the lines for a few days, and an intelligent public will soon tell the Commissioner a bit of their mind. If the car runs smoothly and is roomy and clean, "they" will soon say so. The smoothness of the new car may be the crucial test. To start easily, and to stop in the same way, are indispensable desiderata. There is enough shaking about on railways to kill sheep; citizens must be more tenderly used. Of course the department will not repeat this experiment until a thorough good passenger trial has been made of it. Let it be placed on all the lines in turn. The reputed economy of the new car is a great point in its favour, but that is not everything; it is not the first thing in public vehicles. The first consideration is that they be thoroughly suited for the work; the favour which such cars will command ought without fail to recoup a

Minute Paper.

Commr's. complaint of delay in utilizing Mr. Downe's combined engine and car imported from America.

Is the motor at work?—D.V., 13/2/84. Mr. Downe. No.—Geo. Downe, 15/2/84. Secretary. Commr. will require some explanation.—D.V., 19/2/84. Mr. Downe, B.C. It is only waiting for the completion of the turn-table. I saw it this morning, and there is a possibility of its being finished to-morrow, Friday night. If ready, the car can be run over the road on Saturday, and if the road is right throughout can be sent for traffic on Sunday or Monday next.—Geo. Downe, 12/2/84. Secretary. Commr.—D.V. Mr. Cowdery to let me know by the 27th inst. whether the motor is running, and if not, why not?—Ch.A.G., B.C., 23/2/84. The turn-table has been fixed, but unfortunately I was not present at the trial with the combined motor and car on it. I have tried it since with an ordinary car on it, and two men turned it easily. However I have given instructions for some small improvements, which I hope to have completed this week. It must be understood that this is only a make-shift turn-table.—G.C., 27/2/84. Commr. This is an important—exceptionally so—matter. This motor is not yet working, and no satisfactory reason for this failure has been afforded. Mr. Cowdery had better give this matter serious attention, and I will submit to Commr. in a few days.—D.V., 3/3/84. The present turn-table will not answer the purpose Minute Paper.

217

for which it was intended, and as I have no draftsman at present available to prepare drawings for a new one, I have seen Mr. Downe, and if Commr. approves, he will make the new table.—G.C., 13/3/84. Commr. Pending Commr's. return, Mr. Downe had better push forward these plans.—D.V., B.C., 18/3/84. As per verbal instructions from the Secretary on 14/3/84, I have pushed on with the plans, and being sufficiently advanced, a portion of the work has already been put in hand. I have also to facilitate it, asked Mr. Cowdery by memorandums to remove present table, so that the ground may be prepared for new table.—Geo. Downe, 19/3/84. Secretary. Commr. for his information and approval.—D.V., 21/3/84. While approving of the steps taken to bring the new motor speedily into operation, I must express not only my own opinion but that of the Minister that the failures hitherto made in regard to the turn-table reflect discredit upon those who have been engaged in making this provision. I trust that the new turn-table will, both as regards its design, and the expedition of its construction, somewhat redeem the past abortive efforts.—Ch.A.G.,23/3/84. Mr. Cowdery, B.C. Seen. This work is now being pushed forward by Mr. Downe.—G.C., 24/3/84. Commissioner. Mr. Downe, B.C., 25/3/84.—G.B. Noted. The table will be completed next week.—Geo. Downe, 24/4/84. Commissioner.

Minute from Mr. G. Downe to Commissioner for Railways.

[Mr. Downe's Engine from America.]

In replying to the Commissioner's minute of 9/1/84 on the above subject, I have to report as follows:—

Nothing has yet been done with the combined engine and car beyond making several departmental trials in addition to the one to Coogee and back, by the Minister, Commissioner, and others. It is proposed to put it on the road for traffic so soon as the necessary provision to admit of its running has been made. From the design the combined engine and car must be turned round at each terminus; already at Redfern Station and Coogee Bay a triangle and a semicircle are put in which will answer for its working at those places; but it is necessary for a triangle or a turntable to be put in at Bridge-street before it can be utilised for traffic purposes.

With reference to the rumours that a large quantity of repairs have been made, fire-bars burnt, &c., I need only say there is not the slightest ground for truth in them; such can only be circulated with a malicious intention, and the author ought, if possible, to be traced and punished.

there is not the slightest ground for truth in them; such can only be circulated with a mancious interior, and the accordingly to be traced and punished.

I am fully alive to the fact that there will be opposition experienced in introducing the combined system, and it is possible some will be found in the department itself; still, seeing the advantages likely to be gained, and knowing the continuance of steam tramways demands a reduction in the wear and tear and running expenses, the effort made to accomplish these results in this car should claim for it an extended and impartial trial.

Any departure from ordinary practice is rarely if ever found to be perfect at first, and I certainly do not for one moment entertain the thought that this car is perfect and will perform all our requirements without some modification of its parts.

its parts.

its parts.

I enclose a copy of all time expended on motor and car at the works since its arrival, which includes labourers' time going to Railway Station, loading cases as they arrived, unloading and unpacking at Randwick, the erection of both motor and car—the car was built and put together with screws for shipment, consequently it had to be screwed together here, a much longer process than ordinarily adopted—also, the attendance during trials.

The total time expended or charged to alterations has not reached £21; a portion of this is really for additions and improvements; another portion was altering bogies to suit the road, also the new safety-guard to the bogies to prevent persons getting under the wheels, and this it must be remembered is the bogie of car, not the engine. A new gate was also made and fixed on back platform to prevent passengers getting in or out on the wrong side.

The only points really calling for notice in the engine are what I drew Commissioner's attention to verbally, viz., the difficulty we had experienced from unequal expansion of the steam-pipe and boiler, causing such a strain upon the joints of the steam-pipe that they frequently leaked, and the tendency to prime while ascending our grades. The former is a matter easily rectified in many ways; one is by an expansive joint which I am having made (the labour of making pattern for this is included in the cost of alterations). The priming, should it continue, can also be easily overcome, but I do not propose to do anything to prevent it at present, preferring to wait until it has had a proper test on the road working the traffic, as it is possible after the boiler has been blown down a few times and the men accustomed to working it the priming may cease. I may here mention, with regard to the straining of steam pipe joints, that I watched this particularly on the American trials possible after the bolier has been blown down a few times and the men accustomed to working it the priming may cease. In may here mention, with regard to the straining of steam pipe joints, that I watched this particularly on the American trials and although we ran several hundred miles, repeatedly going 25 miles per hour, there was not a joint required attention, neither was there any trouble experienced with priming after the first two trips. The priming is no new feature, but is a common experience in trials of new boilers, and the boilers of all the motors we have running troubled us more or less on this point when first put on the road.

The fire-bars are those first fitted and used on all the American trials, as well as on all trials here, and are just as good now as when first put in

good now as when first put in.

There have been two or three trivial matters attended to on the engine which, if it had not been for the rumours, would not be worth noticing. A hole in one of the cylinders was not drilled through, and the links had to be eased on one side for the motion bars to clear; the arrangement of lubricator pipes on trailing axle was found to feed not quite so fast as

would not be worth noticing. A hole in one of the cylinders was not drilled through, and the links had to be eased on one side for the motion bars to clear; the arrangement of lubricator pipes on trailing axle was found to feed not quite so fast as needed.

With these exceptions everything is as first made, and so far as design of engine and boiler is concerned no alteration whatever has been needed, and there has been nothing during the trials in America and here to indicate that any alteration is necessary, but everything so far points to a considerable reduction in mileage expenses, and these must be reduced if steam tramways are to be a commercial success.

When in America I found many were covering the boilers with a new conductor to prevent radiation of heat. Knowing if effective such would be a great saving in fuel I ordered sufficient to cover the boiler. This has been done, but it adds considerably to the cost of erection, it being necessary to heat the boiler with steam while it is being put on, and it can then only be put on in layers, but the few trials made lead me to anticipate an advantage from it. I have been able to come from Coogee to Randwick with a second car laden, generating steam sufficient to increase the pressure against both injectors at work. This cannot be done with any other boiler in use on our tramways, and although I have adopted a form of boiler combining the vertical and horizontal, I do not consider this the sole cause of the advantage, but am inclined to think the prevention of radiation by the covering of cement has a great deal to do with it.

The Commissioner will see from the foregoing that nothing has occurred that he was not aware of. There has been no attempt to conceal anything; in fact, there has been nothing to conceal, and the principle will bear the closest examination of its detractors. Whatever the result, I, as designer, need not be ashamed of it. It was well scrutinized before it came to the Colony, especially by those who designed the best independent motor i

The delay which has occurred in making the necessary provision for putting this car out for traffic has, I feel sure, been prejudicial to it. From the statements published regarding it before arrival the public have expected something in advance of what we had already. It has had an official trial here which was reported more than two months ago in the newspapers, and yet the car is not placed on the road by the Department; it is only natural therefore to suppose that the public will think there is a defect in its construction and the Department afraid to subject it to further examination; whereas the fact is it has only been waiting for the means to turn it at Bridge-street.

I require to order additional motive power at once, and had hoped long ere this to have shown the Commissioner, from work performed by this one, that we should increase an order for the compound combined class, but whatever my own idea may be of the desirableness of doing so, I have and shall hesitate to do so until the Commissioner has had experience of this one from the road.

GEO. DOWNE,

I do not understand why provision has not been made at Bridge-street for bringing this car into use. I recommend that no further delay be allowed to take place.—Ch.A.G., 30/1/84. Appr.—F.A.W., 31/1/84. Mr. Downe and Mr. Cowdery to be informed, and that I shall expect the motor to be at work within ten days from this date.—Ch.A.G., B.C., 31/1/84. Noted.—G.C. (per J.L.), 31/1/84. Commissioner. Mr. Downe, B.C. Noted.—Geo. Downe.

Minute of Commissioner for Railways.

Mr. Downe's Engine from America.

What is being done with this engine? What is proposed to be done? There are rumours that a large quantity of repairs have been made—that the fire-bars have been nearly burnt away, &c., &c.

I should be made aware of anything that occurs. Will Mr. Downe furnish me with a full report of the facts.

Please see 84-444 herewith.—GEo. Downe, 24/1/84.

Telegram from Agent-General to Colonial Secretary.

London, 15 February, 1884.

Móroks credit exhausted. Fresh invoices in from America. Authorize Bank. Inform me number motors ordered.

Urgent. The Minister for Works.—A.S., 18/2/84. The Under Secretary for Public Works, B.C., 18/2/84.—C.W. Railways, B.C., 19/2/84.—J.R. Mr. M. L.,—Please say what money has been provided? Urgent.—G.B., 21/2/84. The cablegram refers to the combined motors and cars of Mr. Downe's pattern. On looking through the papers I find that no money has been provided for payment of these motors. This was doubtless owing to the uncertainty, at the time Mr. Downe left, as to the number that would be required and the price they would cost. The Baldwin Co. were informed that the price would be arranged with Messrs. Cameron & Co., of New York, but no mention was made that payment would be made in London. The motor and car already here has evidently been paid for out of an advance made to the Agent-General on account of twelve motors ordered of the ordinary type.—D.C.M.L., 22/2/84. What amount will be required?—Ch. A. G., 22/2/84. £9,532 will be required in London.—D.C.M.L., 25/2/84.

Minute from Mr. G. Downe to Commissioner for Railways.

Minute from Mr. G. Downe to Commissioner for Rahways.

Re combined cars being used for traffic.

On Saturday last I took the combined car to Bridge-street, thence to Redfern Station and back, and returned to Randwick. It was tried over the turntable twice; as fixed it took sixteen men to turn the table with the car on.

Until it is made to turn easily by two men it would be undesirable to put it on the road, as the traffic would pronounce it unworkable, and the principle of the car would be likely to suffer for want of a suitable table.

Mr. Cowdery being absent elsewhere on duty I could not bring it personally under his notice on Saturday, but yesterday (Monday) I waited upon Mr. Cowdery. We visited the table, which then had one of our lightest cars on. This was tried several times with fair results, but the weight of the car on the end being only 4 tons at most, this was nothing more than could be expected; but the engine and car being 11½ tons on the one end requires provision to overcome the increased friction. Mr. Cowdery said he would make the necessary alterations so that two men could turn it with car.

When ready he will inform me, and I will make another trial; if right, the car will at once be put out for traffic use.

GEO. DOWNE, 26/2/84.

Mr. Cowdery, B.C., 27/2/84.—G.B. The turntable has been fixed, but requires a little alteration and which will be completed this week.—G.C. (per J.L.), 27/2/84. Commr.

Minute of Commissioner for Railways.

Provision to be made in England for Motors ordered from America.

See cablegram from Agent-General and report thereon. Herewith I recommend that £10,000 be placed to credit of Agent-Ch. A.G., 27/2/84.

Appd. —F.A.W., 29/2/84.

Since above was written Mr. Downe has seen the invoice cost of the two motors that have arrived. Their cost is about £1,150 each, and a less sum than £10,000 will now be sufficient. The sum of £7,750 will cover the total cost. The amount is made up as follows:

One motor, at.....

Memo. to Public Works to provide £7,750.

D.C.M'L., 3/3/84.

Minute from Commissioner for Railways to Under Secretary for Public Works.

An order having been given to the Baldwin Locomotive Company of Philadelphia, for six motors, of the pattern designed by Mr. Downe, I have to request that the Treasury may be asked to have the sum of £7,750 placed to the credit of the Agent-General in London, to meet the cost of the same, to be paid from the vote, for purchase of stores.

The matter is very urgent, and as the motors are coming forward I would suggest that the money be provided by cablegram.

Ch.A.G., B.C., 3/3/84.

Railways.—J.R., 4/3/84.

Railways.—J.R., B.C.,

omitted. Write Treasury.—J.R., 4/3/84. Accountant, with papers.—G.B., B.C., 7/3/84. Approved.—F.A.W., 6/3/84. Seen.—F.W., B.C., 1/3/84. Sec.

The Secretary for Public Works to The Commissioner for Railways.

I should like to be informed what expense has been incurred up to date upon the combined motor and car designed by Mr. Downe, and also if a report that I have heard is correct, that the engine is being taken out of the first car with a view of putting another in; if this is so, why is it being done?

Mr. Downe.

The April, 1884.

Begin in the engine is being taken out of the first car with a view of putting another in; if this is so, why is it being done?

F.A.W., 16/4/84.

Mr. Downe.

The report as to the engine first fitted to the car being taken out, and another put in its place, is quite correct. The reason of its being done was to test the second engine that arrived and was erected; a third engine is nearly ready for trial, and when completed the one now in will be taken out and it put in for test. Two more engines have also arrived; when erected they will be tried in a similar manner, unless the cars being built for these engines by Mr. Wearne are completed in time to make the tests in them. Commissioner's 84/106 and my 84/444, forwarded to Secretary on 20/3/84; have a list of cost attached, to which should be added about £23 for the additions pointed out in my 84/444, and revarnishing car prior to being put on the road.—Geo. Downe, 17/4/84. Commissioner.

When papers are duoted they should be obtained. Please see to this.—G.B., B.C., 22/4/84. Mr. Downe.—Urgent. Papers herewith.—Geo. Downe, 24/4/84. Commissioner. Stated istinctly on this paper what the cost has been.—C.A.G., 25/4/84. Mr. Downe, B.C.

On Commissioner's 84/525, with these papers attached, the entire cost to date of February 1/84, is shown as £2,925 15s. 7d. for engine and car, of which amount £103 6s. 1d. is to be refunded.

Since February 1/84, wages £23, and stores £5. 18s., have been expended; this was in doing what I pointed in my 84/444 to engine and revarnishing the car ready for the road, making a total cost to date of £2,954 13s. 7d., and includes a total of £160 13s. 8d., being all charges since its arrival in the Colony for unpacking, erecting, additions, and making the various tests of both engine and car.—Geo. Downe, 26/4/84. Commissioner.

For Minister's information.—Ch.A.G., Commissioner, 28/4/84. Seen.—F.A.W., 30/4/84.

LEGISLATIVE ASSEMBLY, Thursday, 1 May, 1884.

5. Mr. Downe's Patent Combined Motor and Car (Formal Motion):—Mr. Poole moved, pursuant to Notice, That there be laid upon the table of this House a copy of the Baldwin Company's Certificate of the performance under steam of Mr. Downe's new Patent Combined Motor and Car.

Question put and passed,

Get

220.

Get this copied.—G.B., 6/5/84. Mr. H.M'L. Do you think the copy made (herewith) is what Mr. Poole refers 3.B., B.C., 8/5/84. Mr. Downe. Yes.—Geo. Downe, 9/5/84. Mr. Berner. Mr. H. M'L. Herewith. Is it to 1 on table?—H.M'L., 2/5/84. Yes.—Ch.A.G., 13/5/84. U. Secty., 14/5/84. to?—G.B., B.C., 8/5/84. Mr. Down be laid on table?—H.M.L., 2/5/84.

APPENDIX.

Minute from Mr. G. Downe to Commissioner for Railways.

New Compound Engines.

New Compound Engines.

I have to bring under your notice that the compound motors received from the Baldwin Locomotive Works are in several respects very badly finished, so much so that had I put them on the road for traffic in the condition they were received there is no doubt they would have failed in performing the work required of them, and of which they are capable.

The joints of valve casings connecting same to cylinders as well as those on the cylinders, and the change valves of all the engines had to be refaced. The connections between high and low pressure cylinders containing the stuffing-boxes of one engine had also to be refaced; several of the guides required resetting; the coupling rods of one engine were of unequal length; about one-half of the pipe connections had to be reset to all the engines, and the piston valves of each engine are so small that the effects of compounding may be said to be completely lost, and new valves must be fitted to each engine.

The estimated value of work to be done to these engines to make them such as they should have been when received from the makers is £180.

1.1 (422) 1.3 25 3 2 3 1

The defects above noted are of far greater importance than at first appears, it being the introduction of a new principle, and one which is looked upon as a source of economy in our working, the design was endangered from imperfect work. Had this not been closely watched the principle would in all probability have been condemned. GEO. DOWNE

15/5/84. -Сн. А.G.,

I think the manufacturers should be made to pay for these defects caused by defective workmanship. 19/5/84. I concur—F.A.W., 19/5/84. Write to Baldwin Company accordingly.—Ch.A.G., 19/5/84. B.C., 28/5/84. Noted.—Geo. Downe, 28/5/84. Commissioner. Mr. Downe,

Burnham, Parry, Williams, & Co., Philadelaphia, to The Commissioner for Railways, Sydney.

Dear Sir;

Baldwin Locomotive Works, Philadelphia, 23 July, 1884.

We have the honor to acknowledge receipt of your valued favor, No. 84-2,203 T, of May 27th, ulto., advising us that in consequence of certain defects which have been discovered in the last five compound motors built by us for your Government, it is proper that we should bear the cost of placing them in the proper condition which they should have been in when received. We note that this cost has been placed at £180.

In reply we beg to say that we have requested our Mr. William Rhodes, who is now en route to Sydney, to go over this matter with Mr. Downe, and to adjust it in such a manner as will be alike satisfactory to you and ourselves. To this end we have authorized him to make payment to your Government of such amount as it may be decided upon should properly be charged to us. We trust this course will meet your approbation.

We take this occasion to say that the first ten of the Mogul Locomotives which we are building upon your valued order are now being completed, and will be forwarded to New York within the next week, for shipment by the ship "Kelverdale," of Messrs. R. W. Cameron & Co's line. We hope shortly to advise you of this shipment by cable. The remaining ten locomotives of the order will be completed by September 1st.

Awaiting your further commands, we remain, &c.,

Awaiting your further commands, we remain, &c.,
BURNHAM, PARRY, WILLIAMS, & CO.,
(Per A. B. JOHNSON.)

Mr. Downe, B.C., 2/9/84.—G.B.

Noted. -GEO. DOWNE, 3/9/84. Commissioner.

[Ordered to be appended, 29 October, 1884.]

υ.

Minute from Mr. G. Downe to Commissioner for Railways.

Additional Motive Power.

ADDITIONAL motive power is required for working the various lines, and I suggest the same be ordered with the least possible delay. Additional motive power is required for working the various lines, and I suggest the same be ordered with the least possible delay.

The number of engines at present in stock are seventy-six, including seven combined. One of the latter—that made by Messrs. Kitson & Co.—may be written off so far as traffic is concerned, thus leaving seventy-five for all purposes. Of this number four can only be used for shunting and service work (hauling stores, water-tank, &c.); seven are laid by requiring new boilers; and an average of four-teen are in the shops for overhaul; a total of twenty-five,—leaving fifty available for traffic. Of this number forty-six are regularly running; leaving a reserve of four. Additional specials often absorb these; so that practically every engine it is possible to keep in running condition is on the road. This is doubtless caused by the excessive wear from the roads over which they run, together with the mileage demanded by the time-tables.

From the above it will be seen with the present stock of motors and the limited means at my command for effecting the necessary repairs it is almost impossible to keep the traffic properly supplied.

I would suggest that thirty additional engines be ordered at once. At first sight this number may appear as excessive, but if these are obtained I could make such alterations in my night-staff as would save the Department £17 8s. per night, or £6,351 per year, besides reducing the repairs demanded of the day-staff.

The performance of the compound engine during the past three months has been such that I have no hesitation in recommending that the order be for this class of engine, and if approved the cars for these engines will also supply the traffic with additional passenger accommodation required.

Attached are lists giving performance of the compound during the past three months, with a comparison of one of the Baldwin engines working a run on the same line, for Commissioner's information and guidance.

In addition to the economy as shown on the lists, it

EXTRACT from The Sydney Morning Herald, Wednesday, 27 August, 1884.

Legislative Assembly, Tuesday, 26 August.

Mr. Poole rose to call the attention of the Chief Secretary to a matter affecting the tramways. He said that it had been stated over and over again in the House that when supplies were required for the tramways and other public services, all things being equal, the Government of the day would endeavour to obtain these supplies in the colony. Now it was freely rumoured in the city some ten or twelve days ago that the Government intended to send, or had sent, an order to America for a considerable number of those new-fangled tramway motors. He would like to ask the Chief Secretary if this were the Government in sending an order for an additional supply of them. Could not motors be made in the colony? There seemed to be much conflict of opinion amongst men able to judge as to the suitableness of the motors obtained from America for our tramways, and he had heard that the whole staff of men at the Randwick workshops had been kept busily employed in repairing these motors ever since they arrived in Australia.

Mr. Stuart soid that a half-dozen motors were obtained from the Baldwin Company for the tramways here merely

Mr. STUART said that a half-dozen motors were obtained from the Baldwin Company for the tramways here merely as an experiment, and the understanding was made that if they succeeded others would be ordered. As the motors were of a new description there was considerable expense in making the necessary patterns, and an understanding was come to that the number should be increased to twenty on the condition mentioned. No order, as far as he knew, had yet been given for these extra motors. Two of those which had already been obtained had for some time been in the workshops. The motors at first, as was generally the case with new articles, required some alterations. Yet he understood that they were giving every satisfaction now. The Baldwin Company were not altogether favourable to the manufacture of the motors, but after they went into calculations they altered their opinion in regard to them. He understood that his hon. colleague had called for a specific report from competent men on the general efficiency of the motors.

Mr. Poole asked whether the Government would delay sending for the remainder of the motors until the report alluded to was furnished.

Mr. STUART said that the reports from the officers in charge had been thoroughly satisfactory, and they justified his hon. colleague in fulfilling the understanding with the Company. Still, he would like for his own satisfaction, as well as for that of the general public, that the report would be a full and critical one.

Mr. A. G. TAYLOR replied. He thought there had been no waste of time in discussing this peculiar case.

Minute of the Colonial Secretary.

Tramway Combined Car.

Colonial Secretary's Office, Sydney. in the Lorightius Assemble Label and the Minister of Public Works to questions asked me, without notice, in the Legislative Assembly last night and to my replies thereto.

I will be glad to know whether any independent examination into the working of these cars has been made and by whom, and what is the nature of their report?

I will also be glad to know how the arrangement with the Baldwin Company stands, and whether it has been decided or recommended to send any and what further orders to that Company; also, whether any steps have been taken to call for tenders in the Colony as was, if I mistake not, contemplated in the original minute of the Commissioner for Railways when dealing with Mr. Downe's suggestions.

A.S., 27/8/84.

The Under Secretary for Public Works, B.C., 27/8/84.—C.W. Railways, B.C., 28/8/84.—J.R. Mr. Downe will please see me with papers. After the order for additional motors had been authorized I sent the papers to Mr. Downe and drew his attention to the obligation we were under of inviting tenders in the Colony.—CH.A.G., 5/9/84. Will be the colony.—CH.A.G., 5/9/84. Mr. Downe see Mr. Downe on Tuesday, at 2.30 p.m.

Minute of Commissioner for Railways.

Let me have, for the Committee on Rolling Stock, all recent papers about Mr. Downe's motors and the proposal to order thirty of them CH. A. G., 16/10/84.

Herewith.—L.P.I., 17/10/84.

I have no doubt about the superiority of the combined motor and car over the separate motor; and if steam is to be continued I should recommend that this order be given; but in view of the possibility of other motive power being used (notably compressed air, for machinery in connection with which we have entered into negotiations) I cannot advise that we order more motors than are absolutely necessary for the traffic even at same risk of stopping it. Instead, therefore, of thirty motors I would suggest that we give an order for five only. I will endeavour to see in the meantime whether some of the trams cannot be stopped running in the middle of the day. We must order five motors for Newcastle to Plattsburg Line—in all ten.—Ch.A.G., 9/8/84.

After perusing the report of the Board which I appointed to inquire into the expenditure incurred in motor running I am compelled, from a conviction that owing to the paucity of motive power we are running at extravagant cost, to recommend that the whole order named by Mr. Downe be given at once, viz., thirty motors. I do this, the more willingly because if any other power than steam power be substituted for tramway traffic in our streets the steam motors are sufficiently powerful to work the proposed light lines of railway on the plains of the interior.—Ch.A.G., 25/8/84.

Approved.—F.A.W., 25/8/84.

Extract from M. P. 84/4,010, being a report from Board, consisting of Messrs. G. Downe, R. J. Sheridan, and A. Richardson, appointed to inquire into the staff arrangements at Randwick—Date of report, 15 August, 1884.

It will be seen from the evidence of these officers, many of whom have had considerable experience, there is a general concord of opinion that under existing circumstances the work could not be done better, or more economically, while at the same time the opinion is unanimous, that with additional shop accommodation and machinery and a considerably increased number of motors, a large saving would be effected.

The advantages to be gained by additional shop accommodation and machinery are so apparent as to need little

The work will be done more promptly than is possible at present, and far more actual work per man will be done when the men have room to move about, which they certainly have not under existing circumstances. By increasing the number of motors the necessity for night-work and overtime, which is without doubt, even under the most favorable circumstances expensive and unsatisfactory in the extreme, would be removed.

Thirty motors additional ordered this day, 25/8/84. Postponed by Minister.

Minute of Commissioner for Railways.

Thirty Motors, combined type, for Tramways.

THE Minister has approved of the order being given. I do not know that the whole order should be given to the Baldwin Company. I should like to try some English firms with a few of them. Are they so urgently required that none can be built in Sydney owing to want of time? Mr. Downe for report; he will please see me on the subject also.

Reply herewith.—Geo. Downe, 29/8/84.

Сн. А. G., 25/8/84.

Minute of Commissioner for Railways.

THE Minister for Works, accompanied by the Commissioner for Railways, will visit the Randwick workshops on Monday, with special reference to the new combined motors and cars.

Will Mr. Downe be good enough to be present to afford information respecting running, cost of repairs, and all particulars respecting these motors.

CH.A.G., 27/8/84.

Mr. G. Downe to Commissioner for Railways.

Reply to Commissioner's Minute, 26/8/84, re thirty Motors.

In replying to Commissioner's minute of above date, I am of opinion it would be undesirable to delay in any way the delivery of the whole of the motors, the order for which has been approved.

The experience of the past shows that each engine requires a general overhaul about every six months; this with the present number running means that 100 engines should pass through the repairing shops annually. The utmost that can be done (with present facilities, including extra time by the day-hands, and running the machinery at night, with a second set of men for several of the machines) is to overhaul about seventy engines; besides the night running repairs to those on

The motors run in a great number of cases excessive mileage, which is only done at increased cost, both to daily running and repairing expenses. It will be seen from this that it is not only difficult to keep the traffic supplied at present, but the difficulty is increasing every month, and it is only a question of time when the running must be thrown into a state of confusion,

Then as I pointed out in my minute to Commissioner on 7/8/84, by securing the number asked for speedily, such a change could be made in the night-staff as would save fully £6,000 per year. To do this ten of those asked for will be absorbed; besides there is now on the road at least ten engines that cannot be reckoned on to last beyond the end of the year for running purposes, and will then require either the boilers to be extensively repaired or replaced. This work cannot be touched for nearly twelve months; consequently ten will be wanted to supply their place, because the repairing facilities of the departments, which have always been limited, will not be enlarged for fully nine months, that is, if the contractors for the shops authorized complete them to specified time, a result not generally attained.

At present we have practically no reserve to meet the demands of the traffic, and I do not think a less number than ten should be always in readiness for emergencies; thus it will be seen the number required to replace those to be taken off the road, together with those necessary to effect a saving, and form the reserve before referred to, fully absorb all approved of being ordered.

From the foregoing it is, I think, apparent the thirty motors should be secured with the least possible delay. There is little doubt if the order is placed with the Baldwin Company, after three weeks they would be able in the present state of trade in America, to deliver at least four every week; this means 10½ weeks to execute the whole. Now, assuming ten of the number were sent to us via 'Frisco, they could not possibly arrive and be put together before the end of the year, and if the balance were shipped and sent monthly per sailing vessels, the last would not arrive, and be available for traffic before April next year.

To divide a portion of the order among some English firms, means that the whole would not be ready for use before June, and perhaps July, and further loss of three to four months; with the facts showing the condition in which we are placed, I must leave it to the Commissioner to decide what course shall be pursued in regard to the order.

I would here mention that no one more than myself would like to see the motors manufactured in the Colony, but to call for tenders here for any of these would cause such a delay and inconvenience that I cannot see my way to recommend it; besides I do not think it would place the Colonial manufacturer in a fair position to compete.

I would, however, suggest, with a view of endeavouring to establish such a manufacturing industry in the Colony, that specifications be prepared and tenders invited for the manufacture of thirty more to be delivered on or before June, 1886, allowing three months for preparation of plans, specification, and tenders to be received. A fair time would then be given for any person or company to obtain the required material, labour, and machinery necessary to execute with the greatest economy, and I certainly think there would be a far better chance of establishing the industry by such a course.

I would further add the loss of a few engines of the present order would be more than compensated by the advantages to the manufacturers themselves as well as the convenience that would necessarily be accorded the travelling public.

GEO. DOWNE 29/8/84.

[Ordered to be appended, 29 October, 1884.]

Memo. for Commissioner for Railways.

Sydney, 17 September, 1884.

The Baldwin Locomotive Works cable as follows:—" Will contract to deliver, boxed at works, thirty Downe's combined AUGUSTUS MORRIS.

motors; ten each delivered in November, December, and January; price, £1,075 each.

Mr. Downe to see is the price reasonable. Did not Fowler offer to deliver in steam, in Sydney, for £1,000?—Ch. A.G., 19/9/84. Fowler & Co.'s papers attached, 22/9/84.

1st. The price is a full one. 2nd. There are no papers attached containing the offer of Messrs. Fowler & Co., but I understood from Mr. Greig he had verbally informed the Commissioner that he would deliver them on wharf at Sydney for £1,050 each engine. I would point out to Commissioner that another month has elapsed since my minute recommending the purchase of motors, and, as far as I am aware, an order has not yet been given. As I then stated, it is becoming a question of very little time when the present traffic will be seriously interfered with. To prevent this, and give me the requisite number to effect the saving referred to in my minute of 29/8/84, I would urge that no further delay occur in placing the order.—Geo. Downe, 26/9/84. Commr.

I again bring this matter under the attention of the Minister. At the same time, even if a break-down did occur in the traffic it would only mean the withdrawal of a number of trams now running; they couldn't all go suddenly.—Ch.A.G., 26/9/84.

Mr. D. Greig to The Commissioner for Railways.

[Extract from T 84/3,033.]

Dear Sir,

43, York-street, Wynyard-square, Sydney, 4 July, 1884.

I was sorry that you were so busy to-day, as I wished to have had some talk with you, but I saw it was no use bothering you.

bothering you.

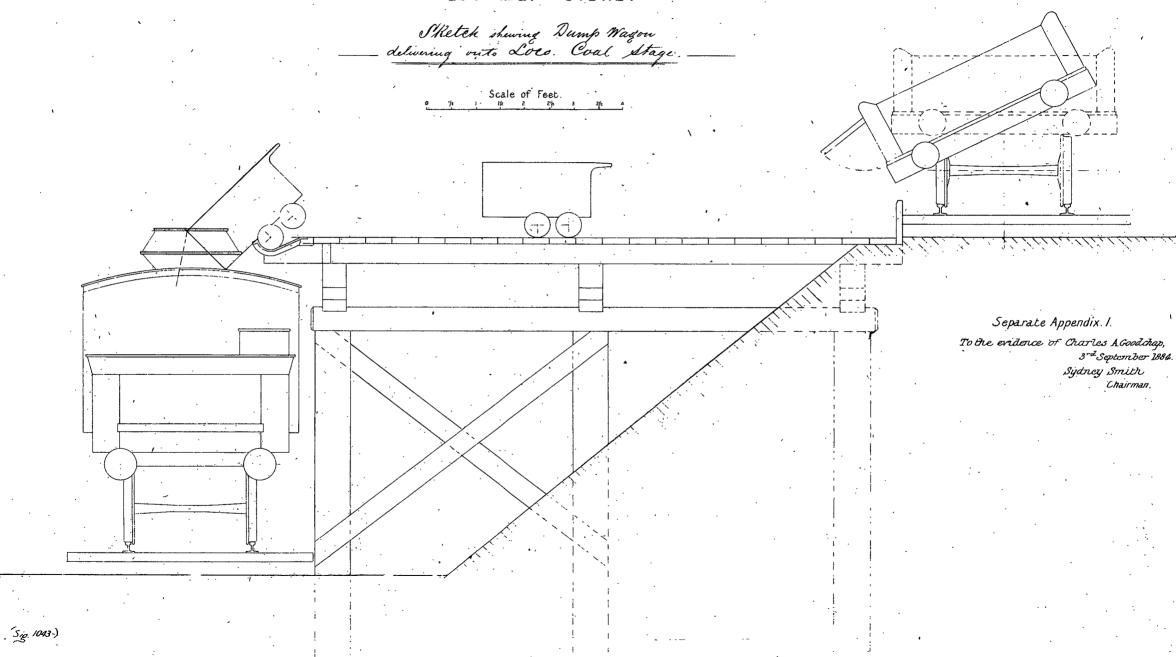

Regarding the compounding of the tram-car engines, I am quite certain it is in the right direction, not only from the great saving it will effect in fuel, but from the much less nuisance from noise and exhaust steam. I can see clearly that your Engineer understands what he is about, and I learnt a great deal in the shops from the excessive wear and tear which evidently take place. I do not like the vertical engine, nor do I consider that it is at all necessary to have the four cylinders. When you are in the market for this kind of engine I should be obliged by being allowed to tender with our design.

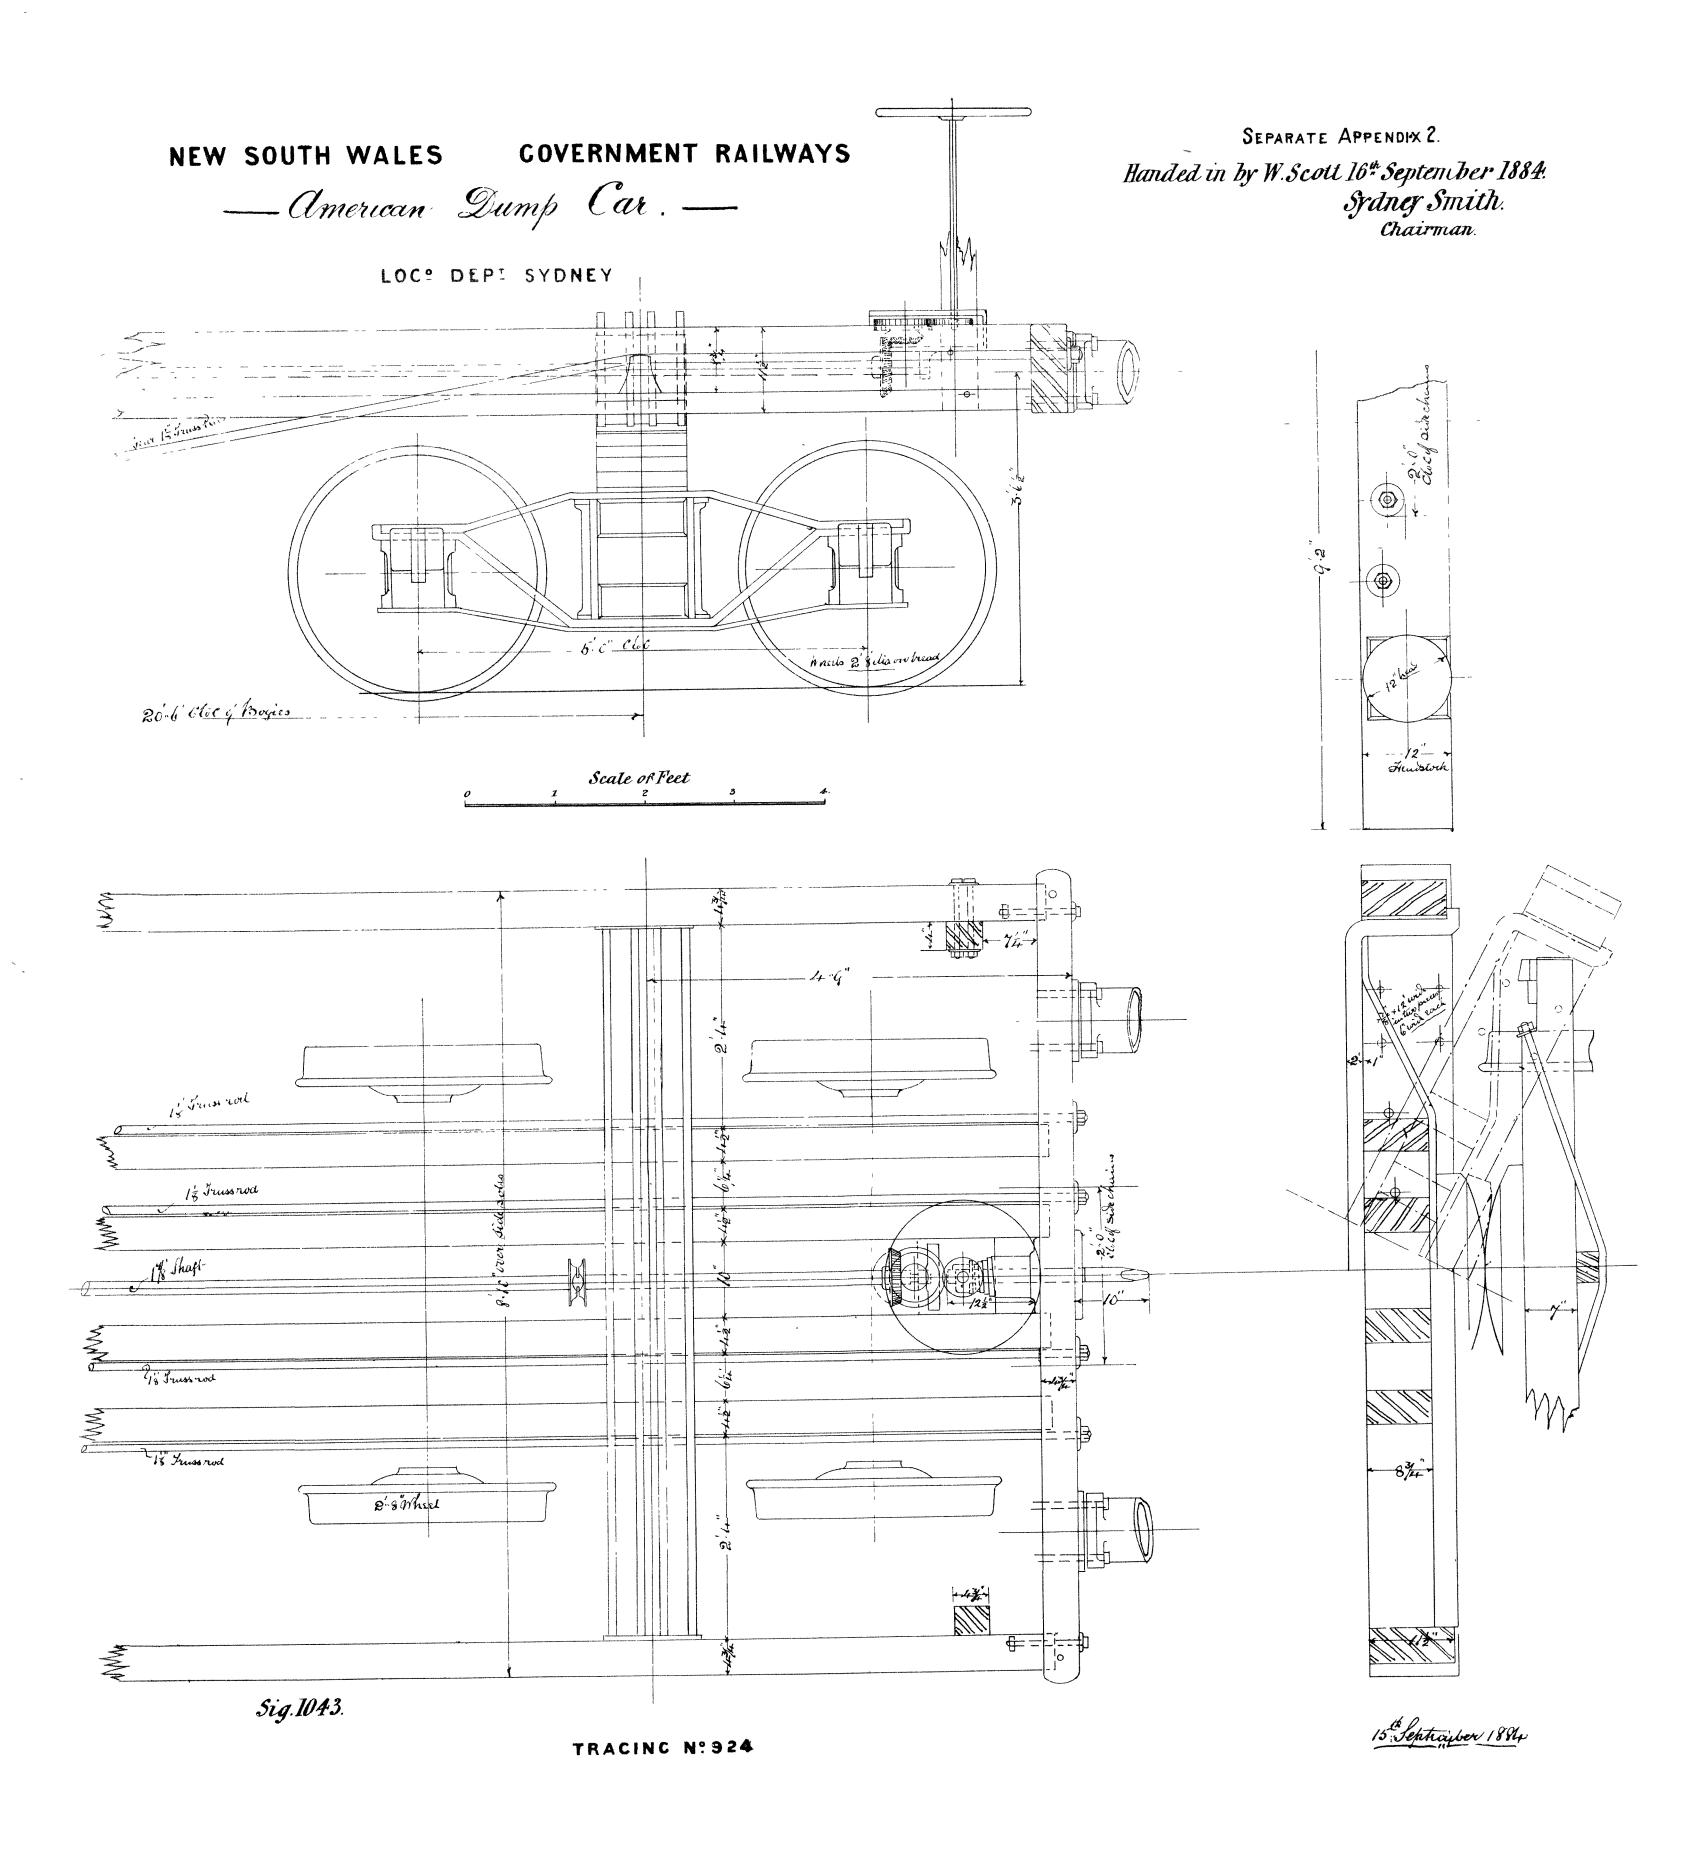

DAVID GREIG.

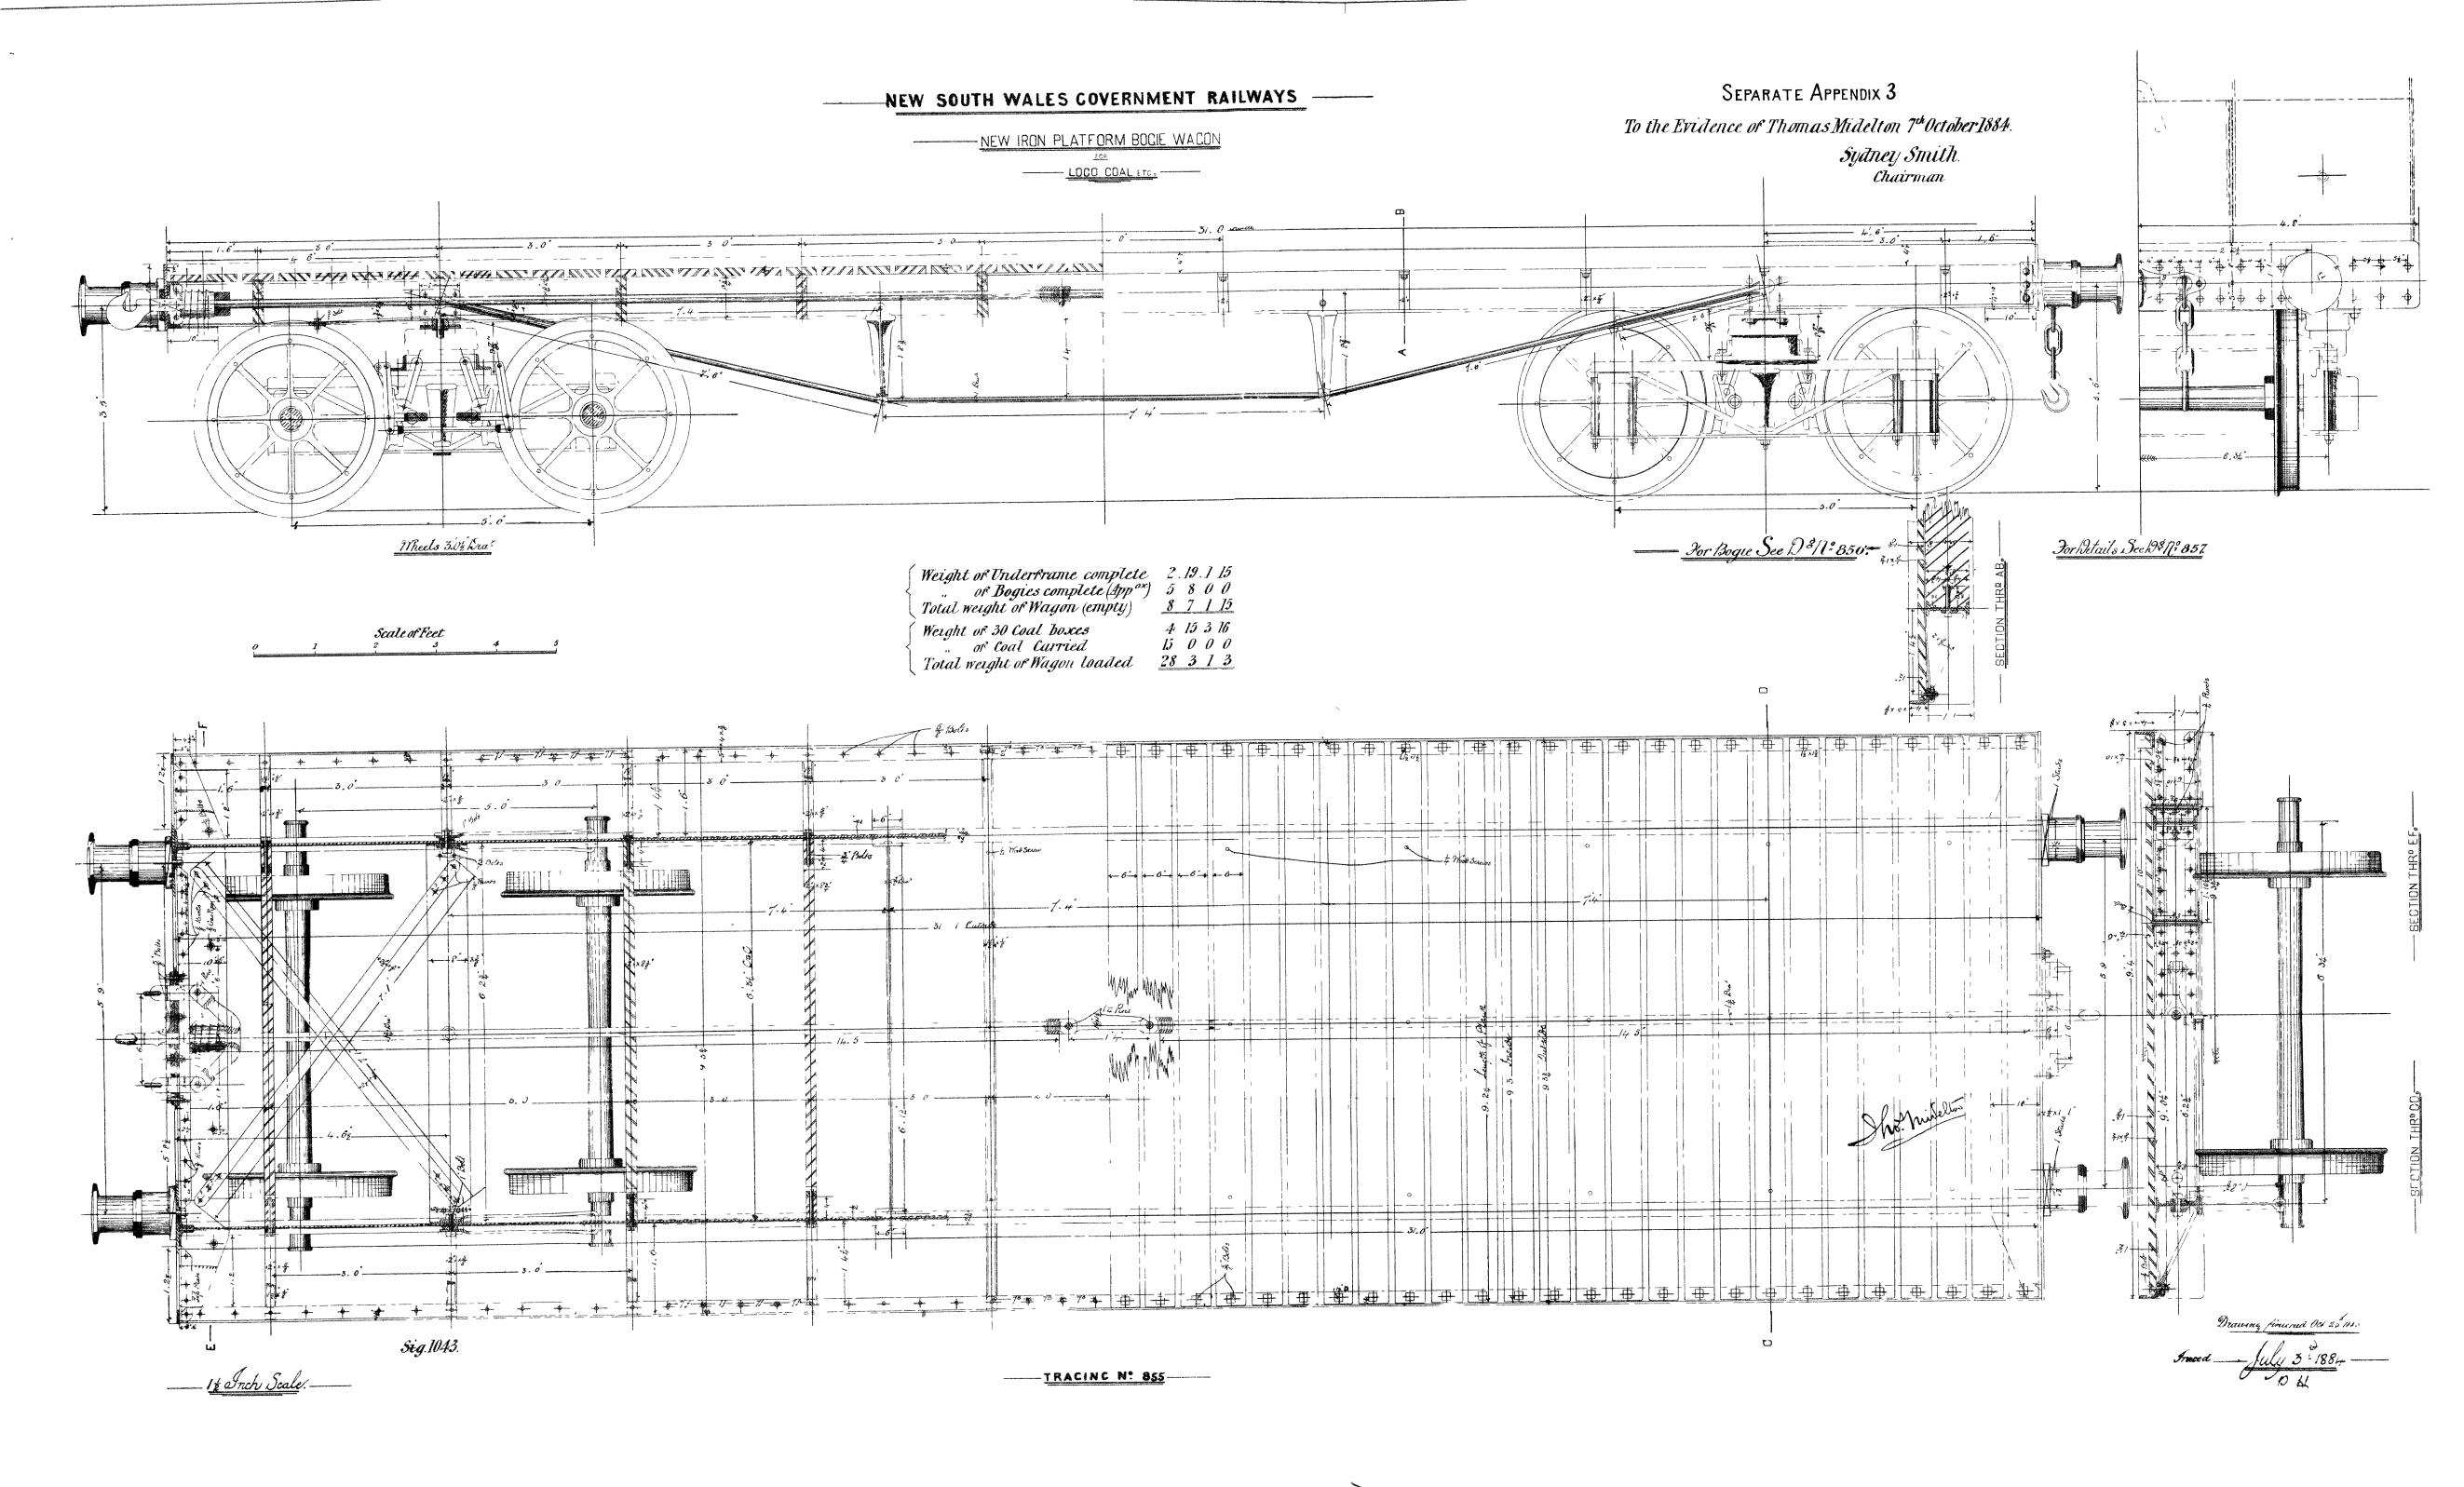

(John Fowler & Co., 43, York-street).

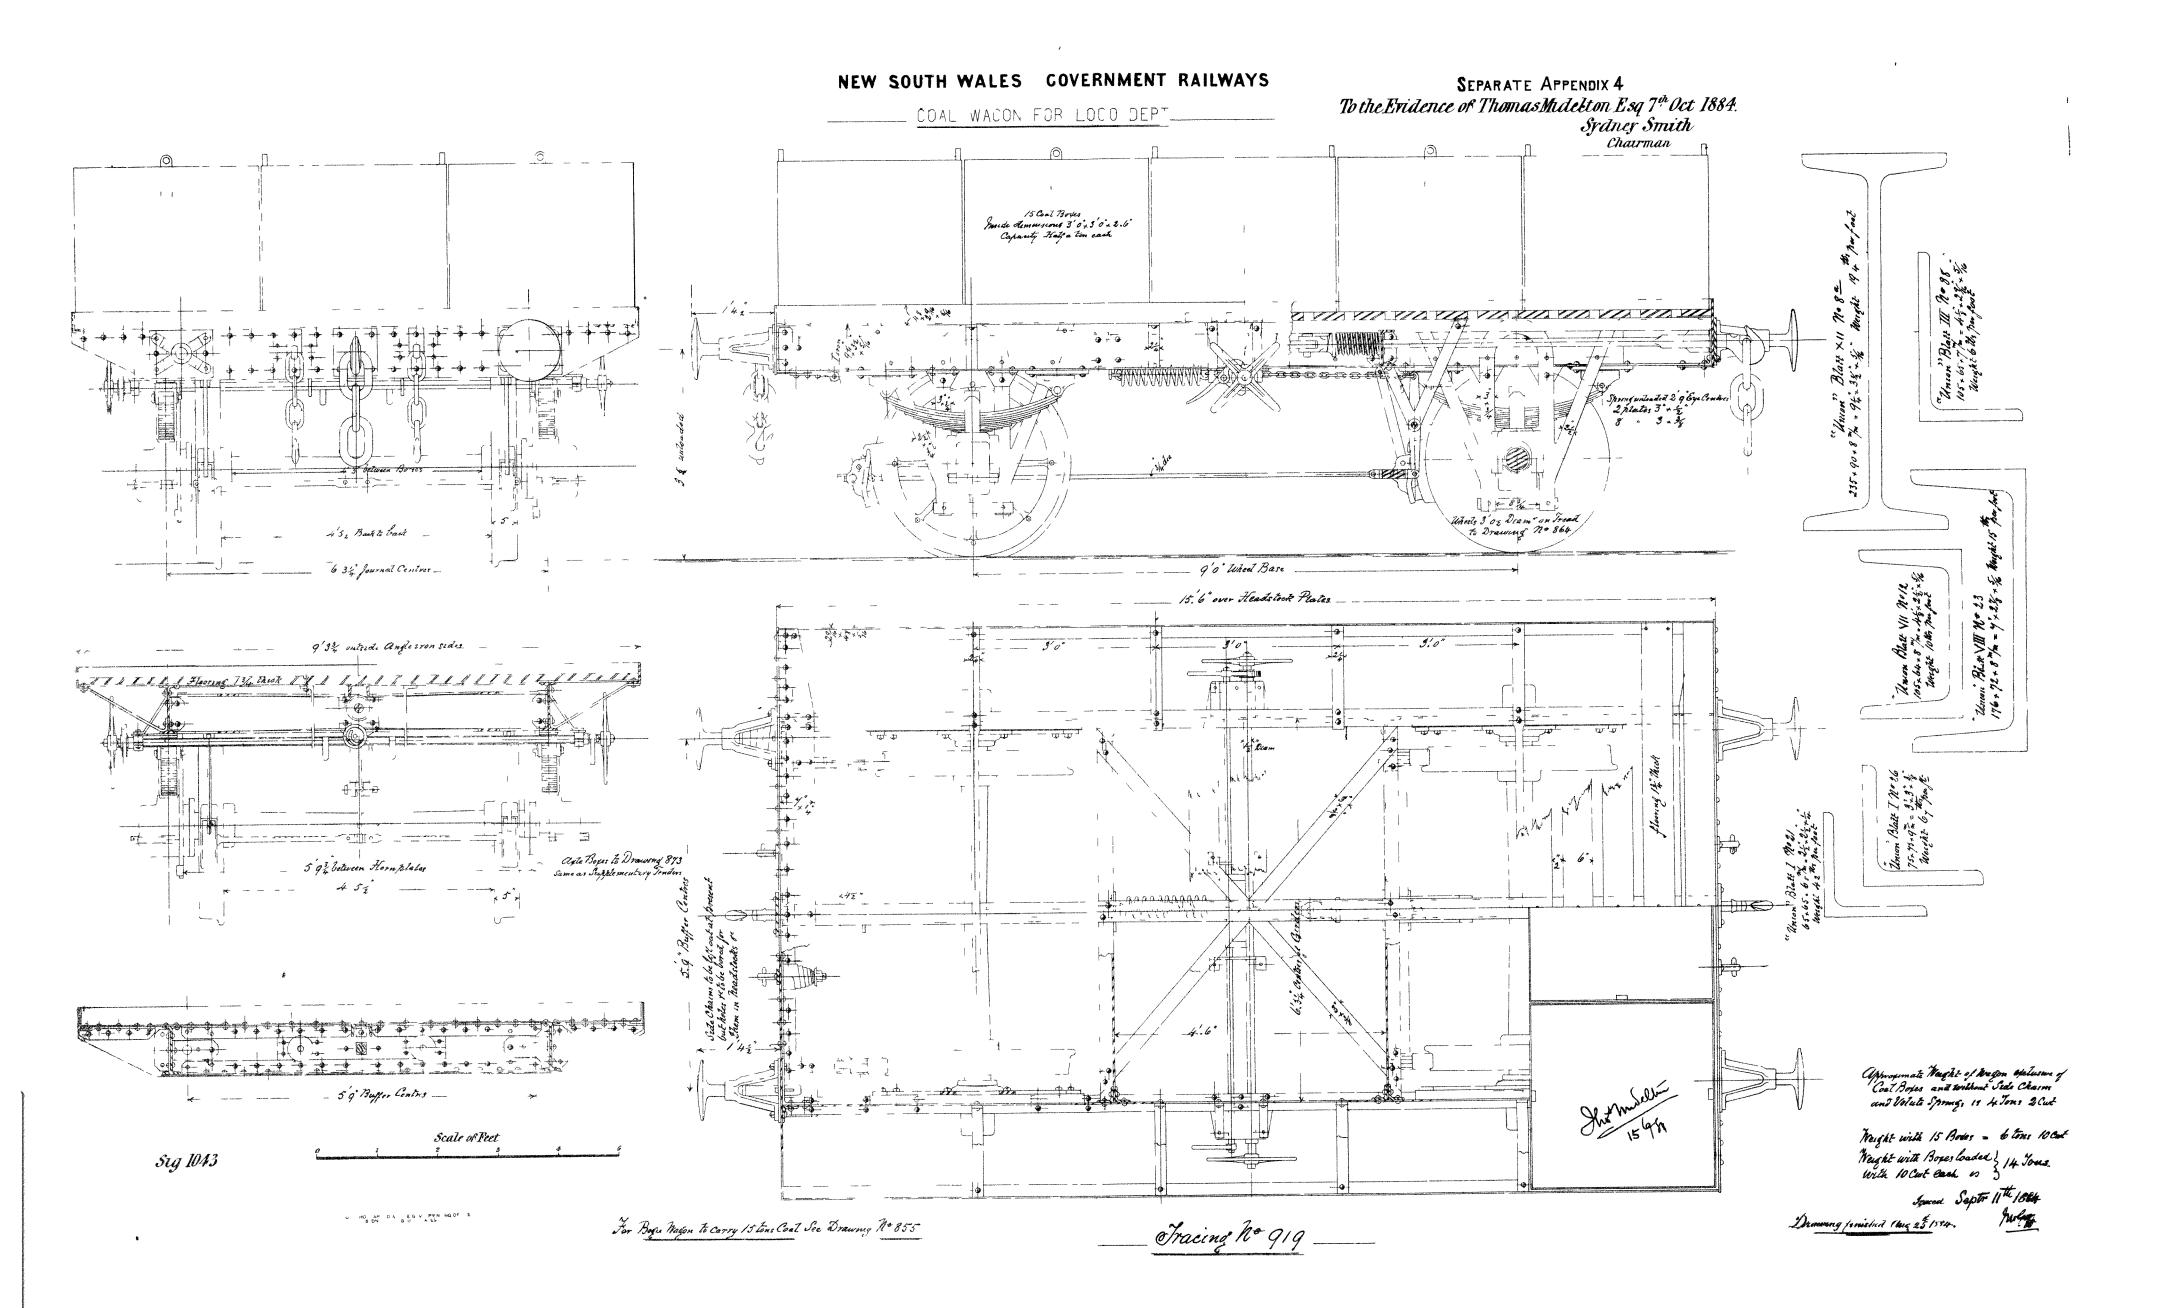

Mr. Downe to see, B.C., 11/7/84.—CH.A.G. Seen. If Mr. Greig has left a copy of the design referred to with Commissioner I shall be glad to have a sight of it.—Geo. Downe, 15/7/84. Mr. Downe, B.C., 17/7/84.—G.B. Commissioner's 84-16,794, just received by me, is, I think, what Mr. Greig refers to, but his particular design is not shown that he would recommend.—Geo. Downe, 19/7/84. Commissioner. Paper herewith, 84-4,255.

NEW SOUTH WALES GOVERNMENT RAILWAYS

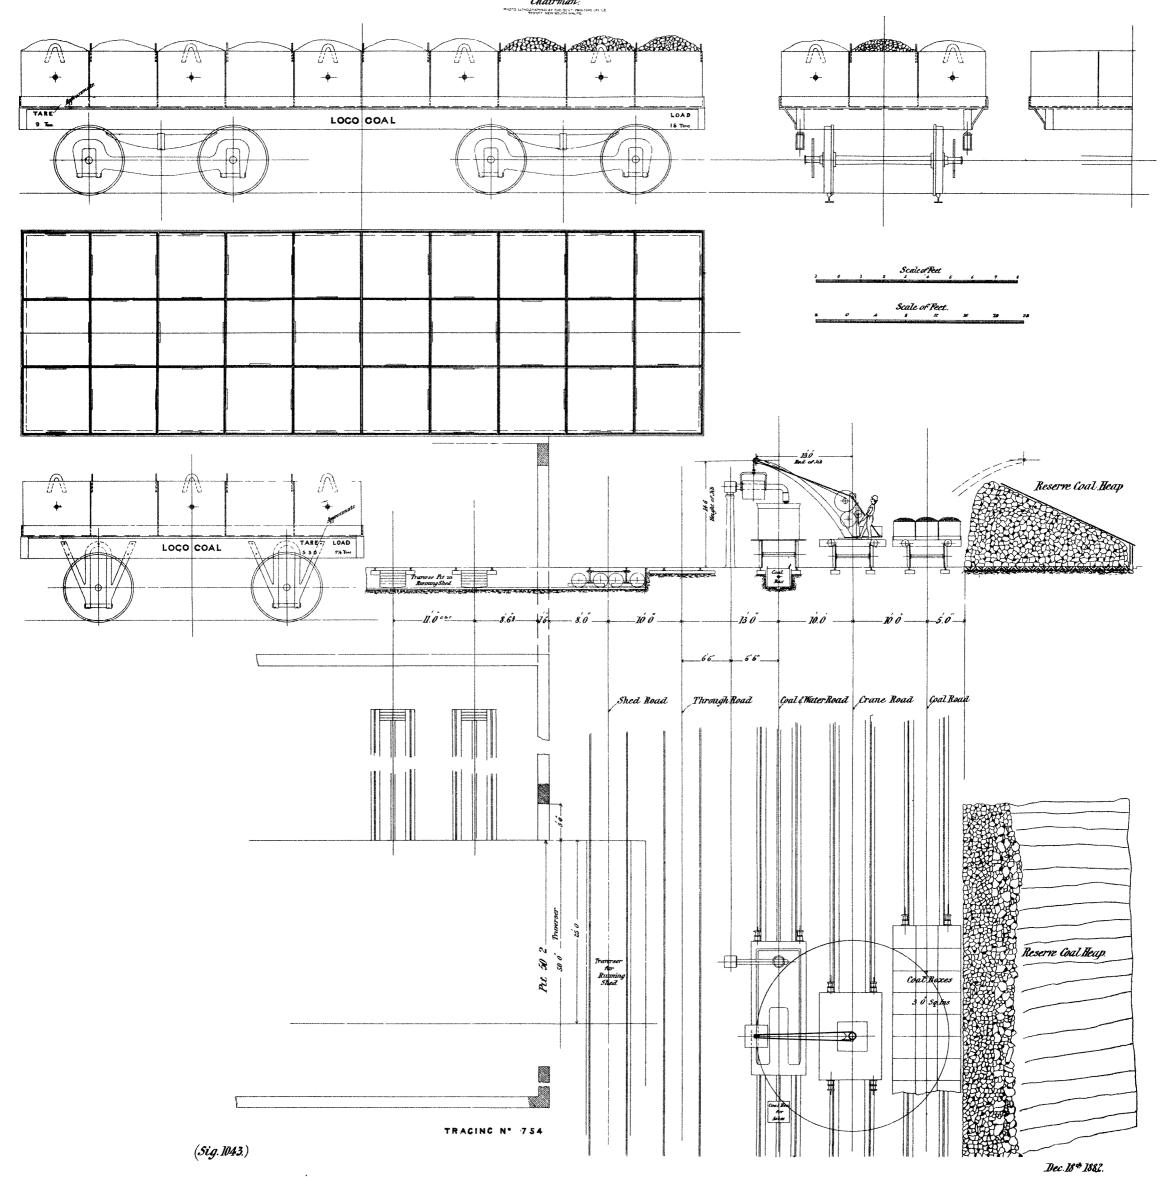

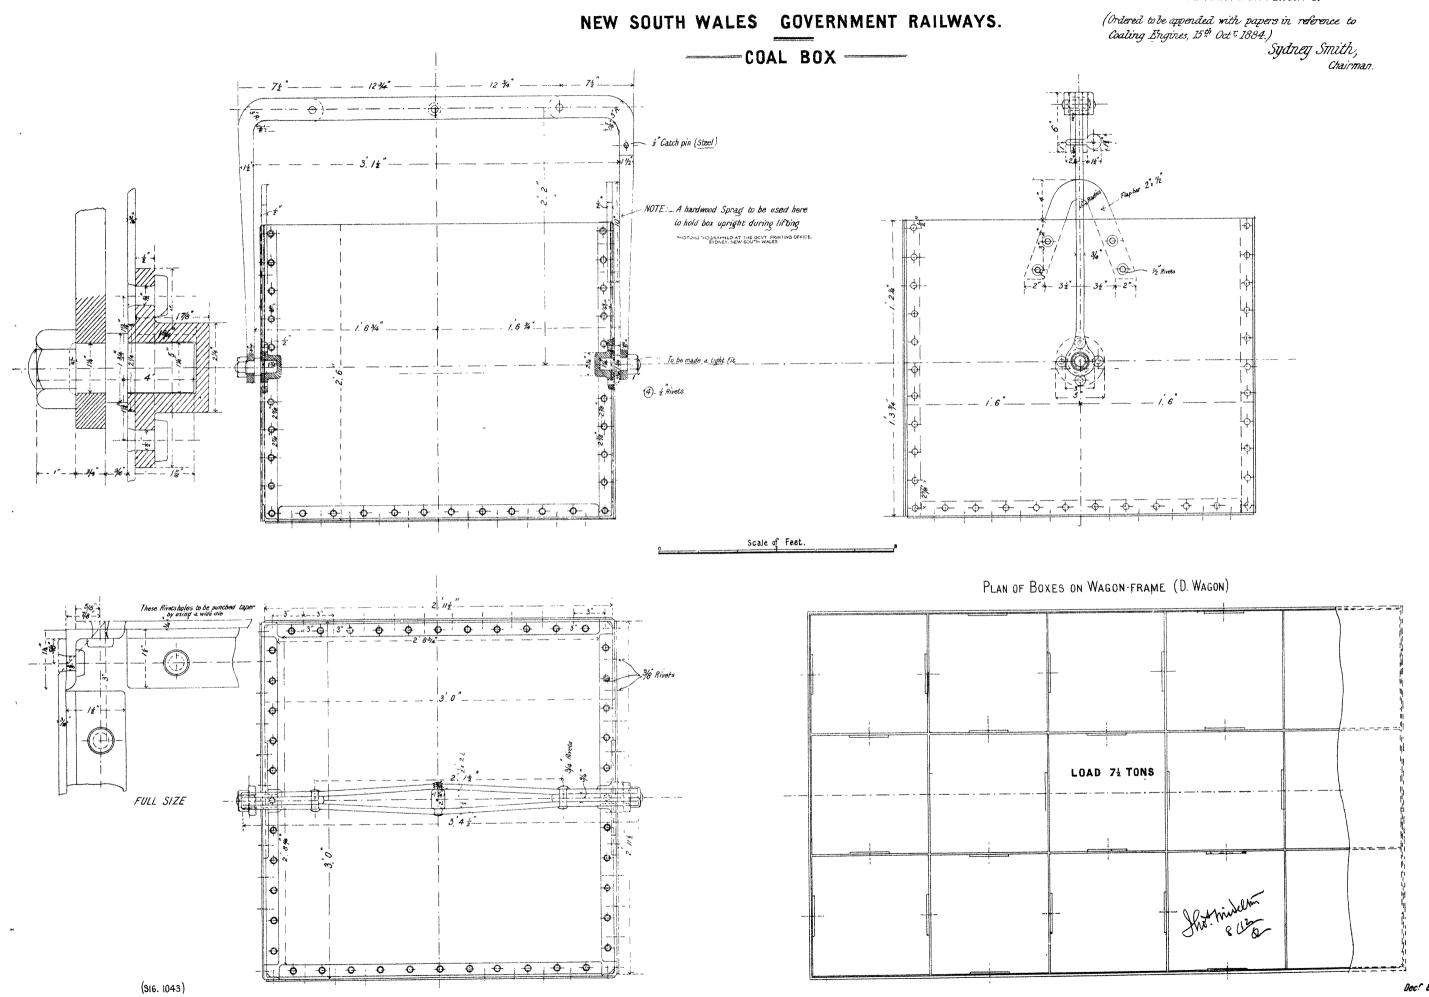

SEPARATE APPENDIX 5. Ordered to be appended with papers in reference to Coaling Engines 15th Oct 1884. Sydney Smith. Chairman:

SEPARATE APPENDIX 6.

TRACING Nº 744

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES,

PURCHASE OF RAILWAY ROLLING STOCK.

MINUTE OF SECRETARY FOR PUBLIC WORKS RESPECTING SELECT COMMITTEE THEREON.)

Ordered by the Legislative Assembly to be printed, 29 October, 1884.

MINUTE of the Honorable F. A. Wright, Secretary for Public Works, a Member of the Committee appointed to inquire into the purchase of Railway Rolling Stock.

From the best attention that I have been able to give to this tedious inquiry, I am compelled to protest both against the manner in which it has been conducted and the conclusions of the Committee.

In the first place, there seems to have been a strong prepossession in the minds of a majority of the Committee on the subject to be investigated, and consequently a strong bias displayed both in the questions asked and the evidence relied upon. Thus, while every stress is laid upon statements against the dump-cars and combined motor and car by witnesses admittedly without experience, the evidence of skilled impartial witnesses is comparatively disregarded. The balance of evidence of this kind as against mere opinion is unquestionably in favour of the cars, as not only suitable for the express purpose for which they were intended, but as combining the advantages of light tare with large carrying capacity—a valuable addition to the rolling stock of the Department.

Against this evidence, supported as it is by practical experience in other countries, there is really little or nothing but a purely theoretical opinion of subordinate officers of the Department, without special knowledge or any practical acquaintance with the new system, and naturally prejudiced in favour of the method with which they

This is pointedly the case in connection with the witness Mr. Downe, when the evidence of that officer, based upon actual experience and supported by official records, received less credence than the mere vague recollection or supposition of his own subordinates.

The fact that this witness's request to be re-examined in reply to his critics was refused by the Committee is itself a proof at least of undue haste in arriving at a conclusion. His request was perfectly just, not only because his evidence as an engineer had been directly traversed, but because some of the witnesses against him were subordinates of the Department with whose conduct in the discharge of his duties he had been called upon to deal.

On the whole, I do not believe that the full evidence available in this matter has been brought to light, or that the evidence that has been produced justifies the conclusions of the Committee. It seems to have been directed entirely to one end; I do not say the foregone conclusion, but at any rate the desired one,—the condemnation of the dump-cars and the combined motor and car.

F. A. WRIGHT. 29/10/84.

1883-4.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY ROLLING STOCK.

(PETITION OF CARSON WOODS, TO BE HEARD BY COUNSEL BEFORE SELECT COMMITTEE.)

Received by the Legislative Assembly, 23 September, 1884.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Carson Woods, of Sydney, in the Colony of New South Wales, Esquire,—

Showeth:--

- 1. That it hath been referred to a Select Committee of your Honorable House, with power to send for persons and papers, to inquire into and report upon the Purchase of Rolling Stock, Material, &c, for the Government Railways and Tramway Works of the Colony.
- 2. That your Petitioner is desirous to appear before such Select Committee, either in person or by Counsel or Attorney, and to produce and give evidence before such Committee in reference to the premises.

Your Petitioner therefore humbly prays your Honorable House will be pleased to grant leave to your Petitioner to appear before such Select Committee, either in person or by Counsel or Attorney, and that he may be at liberty to produce and give evidence before such Committee with reference to the matters aforesaid.

And your Petitioner will ever pray.

CARSON WOODS.

Dated at Sydney, the twenty-third day of September, 1884.

1883-4.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY ROLLING STOCK.

(TENDERS FOR NEXT FIVE YEARS.)

Ordered by the Legislative Assembly to be printed, 4 April, 1884.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 5th February, 1884, That there be laid upon the Table of this House, a Return showing,—

- "(1.) The names of all the tenderers for the supply of rolling stock on the
- "Government Railways for the next five years.
- "(2.) The amount of each tender.
- "(3.) Copies of Specifications and Conditions, in full, under which tenders
- " have been accepted for these works."

(Mr. Abigail.)

† Informal.

The lowest tender in each case was accepted in the first instance. Lowest tenders marked thus.*

Contract No. 7.—Mr. Ritchie's tender was accepted for this, but, having secured the whole of the contracts for the Northern line, he asked to be relieved of those he had tendered for on the Southern and Western lines; this was done, and the contract was then given to the next lowest tenderers, Messrs. Hudson Brothers.

Contract No. 8.—The tender of Mr. Ritchie was accepted for this, but he subsequently asked to be relieved of it. The next lowest tenderers, Messrs. D. Brodie & Co., however, made a mistake in filling in the prices in their offer, and fresh tenders were called for. Messrs. Hudson Brothers were then the successful tenderers, at the following prices:—

15 light brake-vans, at £335 each; 10 heavy brake-vans, at £850 each; 50 goods brake-vans, at £340 each; total amount of contract, £30,525.

Great Southern and Western Lines.

Department of Public Works, Railway Branch, Sydney,

Supply of Railway Rolling Stock for five years, ending 31st December, 1888.

TENDERS will be received at this office until 11 o'clock on Tuesday, the , from persons willing to contract for the supply of Rolling Stock (other than locomotives) required for the Government Railways of New South Wales, for the five years ending 31st December, 1888.

Estimates of requirements for each year, and specifications and forms of tender may be seen, and further particulars obtained at the office of the Locomotive Engineer, Redfern Station, on and after

Tenders to be indorsed "Tenders for Railway Rolling Stock," and each tender must be accompanied by a Treasury deposit receipt for the sum of £200, which will be forfeited in the event of the acceptance of the tender, should the Contractors fail to provide the cash deposit and execute the agreement at the time named in the specification.

The Commissioner does not bind himself to accept the lowest or any tender.

Note.—Tenders will be received for the supplies for the South and West lines, and for the Northern line separately, and the contract will be subdivided as follows, tenders being received for each

Contract No. 6.—First-class carriages, including composite and sleeping cars.

No. 7.—Second-class carriages, mail-vans, prison-vans, hearses, powder-vans, meatvans, and covered vans.

No. 8. -Brake-vans.

-Cattle-wagons, sheep-trucks, and horse-boxes.

No. 10.—Wagons A, B, D, E, and ballast and carriage trucks

CHAS. A. GOODCHAP, Commissioner for Railways.

Specification No. 207, for a Sleeping Carriage (with Double Bogies, American type).

- 1.—Each vehicle is to be made precisely the same in all respects as the double bogic sleeping carriage No. 2, now on the Railways of the Government, and to be seen at the Redfern Station, except where herein specified to the contrary. Drawings of what is intended will be supplied as required.
- 2.—Each vehicle is to be built of thoroughly seasoned timber, free from wanes, shakes, and all other defects, and the whole of the fittings are to be supplied of the best description and quality of their respective kinds, and made, finished, and fixed in the most substantial and workmanlike manner, equal in all respects to the best class of their respective kinds of English manufacture.
 - -The following materials are to be used:

Under-frame-Pitch pine, except headstocks, which are to be of blue gum, tallow-wood, or black butt.

Window pillars—Black-wood or ash.

Corner and door pillars—Cedar (best quality).
Longitudinal rails (top and middle)—Pitch pine or Oregon.
Roof-sticks—Colonial beech.

Roof-boards (T. & G.)—Oregon pine, in narrow strips. Floor-boards (T. & G.)—Oregon pine, $1\frac{1}{4}$ in. thick.

Panels—Cedar.

Window-frames—Cedar.
Venetian blind frames—Cedar (with white cedar laths).

Mouldings-Cedar.

- 4.—The draw-gear, chains, and screw-couplings shall be made of Lowmoor or Bowling iron; and these, as well as the buffers and axle-boxes, are to be of the most recent standard type used by the Railway Department, and are to be made to the drawings or samples that shall be supplied by the Locomotive Engineer for the guidance of the Contractor.
- 5.—The following standard dimensions must be worked to, and, if necessary, modifications from the sample vehicle must be made in the under-frames to suit these dimensions, viz.

				īt.	ın.
Buffers, C. to C		 	• • •	 5	9
Do from rail to C. (empty)) .	 		 3	5
Axles, bearing, C. to C.		 		 6	$3\frac{1}{4}$
Do do diameter		 			
Do do length		 			•
Wheels (diameter on tread)		 		 3	$0\frac{1}{2}$

- 6.—The painting, varnishing, and polishing, inside and out, shall be carried out as directed by the Engineer, in the most approved and complete manner.
 - -The following alterations from the sample vehicle are to be made, viz.:-

The bogies to be made to drawing No. 827.

The buffer-heads to measure 22 inches from face of headstock to front face of buffer.

Lamp-irons are to be fitted on sides and ends (six in all).

Door-locks to be to pattern lock No. 150 (American pattern).
Width of body to be the same as pattern vehicle.
All axle-brasses to be nicely fitted to the journals, and the axle-boxes are to be trimmed with castor oil, to the satisfaction of the Inspector, before the vehicle will be passed. Each vehicle to be fitted with one (standard) screw-coupling to pattern or drawing.

8.—The panels are to be secured by planted mouldings, and to have canvas glued on to them previous to fixing, and when fixed they are to receive a second lining of canvas and glue, and to be then painted nside with two coats of colour in oil.

- 9.—The glass frames and Venetian blinds are to be completed in accordance with the most approved arrangement in use at the present time on the Railways,
- 10.—The upholstering, trimming, and internal fittings generally to be of similar quality, description, and method of fixing to the most recent practice of the Department for this class of vehicle.
- 11.—During the ordinary hours of labour, and at all other reasonable times, access is to be allowed to the servants of the Railway Department (or to any Contractor who may have for the time being the contract to supply gas-fittings to the vehicles) to enter the premises of the Contractor for the vehicles, for the purpose of fitting the gas apparatus, or the Westinghouse brake apparatus, to the said vehicles.
 - 12.—The threads of all bolts, studs, and nuts are to be cut to Whitworth's standard.
- 13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:-

No.	Where delivered.					Date	of delivery.	
One One Two Two	On the rails, Do Do Do Do	Redfern Yar do do do do	d, Sydney do do do do	 	1884, in 1885, 1886, 1887, 1888,	a twelve months do do do · do	s from the date do do do do	of the order. do. do. do. do.

14.—The Department provides the following articles:—Wheels, axles, and tyres; bearing springs;

buffer, draw, and safety springs; lamps.

15.—These articles will be supplied to the Contractor at the Railway Stores, Eveleigh, and he will

have to remove them to his works at his own expense, and free of all cost to the Commissioner.

16.—The Department also provides and fixes the "Westinghouse" patent air-break apparatus, pipes and couplings, and reserves to itself the right to supply (should the Locomotive Engineer deem it advisable), all axle-boxes and buffers complete, to the Contractor at cost price, delivered at the Railway Stores, Eveleigh; the Contractor to remove them to his own works, on the same terms as for other articles

The vehicles must be finished in the most substantial and workmanlike manner, and in every respect to the entire satisfaction of the Locomotive Engineer of the Government, who shall have full power to inspect the manufacture, either personally or by deputy, at any time, in such manner as he may think fit, and to reject at any stage any work or material of which he may disapprove, as not being in accordance with the spirit and intention of this specification.

18.—Any portion of work that may be so rejected or condemned must be replaced immediately by

the Contractor, at his own expense, to the satisfaction of the said Engineer.

19.—In all cases where considered necessary by the said Engineer, full size or other detail drawings

of the vehicles must be prepared by the Contractor at his own expense.

20.—A copy on tracing cloth of each of these drawings must be forwarded by the Contractor to the Locomotive Engineer, and must be approved by him in writing before the work is commenced.

21.—These copies shall be retained, and shall be supplied by the Contractor free of charge.

22.—The Contractor will be wholly responsible for any delay that may arise in commencing or

completing the work caused by the preparation of these drawings, or for any delay that may arise in the delivery of the vehicles in consequence of the rejection of material or work by the Locomotive Engineer or his deputy, as not being in accordance with the spirit and intention of this specification; and any such delay or delays shall not relieve the Contractor from the operation of the fine clause, in the event of nondelivery of the vehicles at the time specified.

23.—It is to be understood that the approval of the drawings by the Engineer shall in no way whatsoever relieve the Contractor of the whole or any part of the responsibility, in the event of the drawings furnished by him for approval being found at any stage of the work to show an error in design or dimensions incompatible with construction or at variance with this specification (unless approval of such variation shall have been previously given in writing by the Engineer), and any loss arising therefrom shall be borne by the Contractor.

24.—Not only the general arrangement but every detail of the vehicles is to be carried out exactly as in the sample vehicle, except wherein provided for to the contrary by this specification, or shown by such detail drawings or written instructions as may be supplied by the Engineer at any time for the guidance of the Contractor. In any case when the specification, drawings, or written instructions are at variance with the sample vehicle, the specification, drawings, or written instructions are to be followed by

preference, and all figured dimensions are to be followed in preference to those obtained by scale.

25.—Should there be anything omitted to be shown in the drawings or mentioned in this specification that is obviously necessary for the proper completion of the contract, the same shall be provided by the Contractor at his own expense, and without any extra charge.

26.—Any suggestions that the Contractor to make with the object of improving the construction or working of the vehicles, or of modifying the mode of manufacture or the material specified to be used in their construction, are to be forwarded in writing to the Locemetive Engineer.

If approved to be used in their construction, are to be forwarded in writing to the Locomotive Engineer. If approved of, the authority to carry them out will be given in writing by the said Engineer, otherwise they will not be allowed.

27.—The Contractor must give notice in writing to the Locomotive Engineer before proceeding with the execution of the contract, so that the said Engineer may have the opportunity of supplying any

information or instructions that he may think necessary to fulfil the conditions of the contract.

28.—The Contractor shall not sublet the contract or any part thereof, nor allow any portion of the work to be done other than at his own establishment (except where permitted by any of the foregoing clauses of this specification), unless the express consent in writing of the Locomotive Engineer be first

-The Contractor will be responsible for a period of twelve months from the date of delivery of each vehicle for any defective work or material supplied by him, and he will be required to make good or replace the same at his own expense to the satisfaction of the Locomotive Engineer.

30.—All the movable and working parts of the vehicle made of iron or steel by the Contractor

must be distinctly marked with the Contractor's name, brand, or number.

31.—Any alterations which may be ordered by the Locomotive Engineer from time to time, as being necessary for the proper execution of the work in accordance with the spirit of this specification, shall be executed by the Contractor without extra charge.

32.—The said Engineer shall have power to supplement this specification by a more complete and detailed one, which shall be binding on the Contractor equally with this one, provided the more complete and detailed one shall not be contradictory to or at variance with the spirit and intention of this specification. Furthermore, the said Engineer shall have power to alter from time to time the disposition and number of the wheels, the length of the wheel base, and the length, breadth, depth, and details of the under-frame, as well as the general arrangement and details of the mode or system in use on the sample vehicle for giving side-play or radial motion to the wheels, and to alter the mode of framing or finishing the sides, ends, or roof, or of fitting the panels, the disposition and proportions of the compartments and of the seats, doors, and windows, as well as the disposition and form of the lamps, without in any way invalidating the contract, and without any extra payment to the Contractor, provided always that the length, breadth, or height of the body (inside), or the carrying capacity of the vehicle specified, is not increased or decreased more than 5 per cent. Any extra charge that may, in the opinion of the Locomotive Engineer, be fairly chargeable by the Contractor, in respect of these variations from the sample vehicle, or any deductions from the contract price that ought in the opinion of the said Engineer to be allowed for by the Contractor from the contract price, shall be determined by the said Engineer.

33.—Should the Commissioner consider it desirable, at any time during the currency of this contract, to substitute "teak" timber for those descriptions of native or other timber hereinbefore specified, the Contractor shall, upon due notification to that effect, proceed to employ and use "teak," as required. It shall furthermore be optional for the Commissioner—on behalf of the Government—either to supply the requisite "teak" timber for said purpose to the Contractor, or to require the Contractor to provide the same for himself; in any case the Locomotive Engineer shall finally decide and determine the necessary

alteration in price, to be either given or allowed, as circumstances may require.

34.—The decision of the Locomotive Engineer, on any point of dispute or doubt that may arise in reference to any of the foregoing clauses of this specification, shall be final and binding on the Contractor.

WILLIAM SCOTT,

Locomotive Engineer.

Department of Public Works, Railway Branch, Office of Locomotive Engineer, Sydney.

GENERAL CONDITIONS.

If at any time during the progress of the contract it shall be considered expedient by the Commissioner for Railways to increase or diminish either the length, breadth, or height of the body (inside) or the carrying capacity of any of the vehicles specified, by more than 5 (five) per cent., the Contractor, at the request of the Locomotive Engineer for the time being, shall execute such increase, diminution, or alteration, and no such increase, diminution, or alteration, shall in any way annul or set aside the contract. Such increase or alteration shall be allowed and paid for to the Contractor, or such diminution credited to the Commissioner for Railways, as the case may require, according to a price to be agreed upon between the Contractor and the said Engineer. But if the Contractor and the Engineer cannot agree as to the price to be given or allowed for in the altered vehicles, the questions in dispute shall be referred to arbitration, and shall be settled by the award, order, or determination of a disinterested civil engineer or disinterested civil engineers to be appointed to arbitrate thereon as hereinafter. That is to say, if the Commissioner for Railways and the Contractor concur in the appointment of a single arbitrator, then the matters and questions aforesaid shall be referred to and decided by such single arbitrator, but if the Commissioner for Railways and the Contractor cannot concur in the appointment of a single arbitrator, each party, on the request in writing of the other party, shall by writing under his hand nominate and appoint an arbitrator, to whom such questions and matters mentioned in this proviso shall be referred. Every such appointment shall be delivered to the arbitrator, and be deemed a submission to arbitration on the part of the party by whom the same shall have been made; and neither party shall have power to on the part of the party by whom the same shall have been made; and neither party shall have power to revoke the same without the consent in writing of the other, nor shall the death of either party operate as a revocation. And if for twenty-one days after the notice in writing by the Contractor, or by the Locomotive Engineer, that the Contractor and the Locomotive Engineer cannot agree shall have been served, and for seven days after a request in writing to appoint an arbitrator shall have been served by the one party on the other party, such last-mentioned party fail to appoint such arbitrator, then upon such failure the party making the request, and having himself appointed an arbitrator, may appoint such arbitrator to act on behalf of both parties; and the arbitrator may proceed to hear and determine the matter or question covered by this proviso between the Contractor and the Engineer aforesaid, and in

matter or question covered by this proviso between the Contractor and the Engineer aforesaid, and in such case the award or determination of such single arbitrator shall be final.

If, before the matter so referred shall be determined, any arbitrator appointed by either party shall die, or become incapable, the party by whom such arbitrator was appointed may nominate and appoint in writing some other civil engineer to act in his place; and if for the space of seven days after notice in writing from the other party for that purpose he fail to do so, the remaining or other arbitrator may proceed ex parte; and every arbitrator so to be substituted as aforesaid shall have the same powers and authorities as were vested in the former arbitrator at the time of his death or disability as aforesaid.

If more then one orbitrator shall be appointed, such arbitrators shall before they enter into the

If more than one arbitrator shall be appointed, such arbitrators shall, before they enter into the matter or question referred to them, nominate and appoint by writing under their hands an umpire to decide on any such points on which they shall differ; and if such umpire shall die or become incapable of acting, they shall forthwith after such death or incapacity appoint another umpire in his place, and the decision of every such umpire on the matters referred to him shall be final.

If in either of the cases aforesaid the said arbitrators shall refuse, or shall for seven days after request of either party neglect to appoint an umpire, the Governor for the time being of the Colony of New South Wales shall appoint an umpire, and the decision of such umpire on the matters on which the arbitrators shall differ shall be final.

If a single arbitrator shall be appointed, and he shall die or become incapable to act before he shall have made his award, the matters referred to him shall be determined by arbitration under this

clause, as if such arbitrator had not been appointed.

If more than one arbitrator shall be appointed and either of them shall refuse, or for seven days

neglect to act, the other arbitrator may proceed ex parte; and the decision of such arbitrator shall be as effectual as if he had been the single arbitrator appointed by both parties.

If more than one arbitrator shall be appointed, and neither of them shall refuse or neglect to act as aforesaid, then if such arbitrators shall fail to make their award within fourteen days after the day on which the last of make arbitrators shall have been award within fourteen days after the day on which the last of such arbitrators shall have been appointed, the matters so referred to them shall be

determined by the umpire appointed as aforesaid.

The arbitrator, or arbitrators, or their umpire, may call for the production of any documents in the possession or power of either party which he or they may think necessary for determining the questions or matters in dispute and so referred, and may examine the parties and their witnesses, and may inspect the works and view the place out of, from, or in respect of which, any of the matters referred to shall have arisen.

The award of the arbitrator or arbitrators, or umpire, shall be in writing, ready to be delivered to either party within three weeks from the appointment of such arbitrator, or the last of such arbitrators. This submission may be made a rule of the Supreme Court. The amount of cost and by whom payable shall be decided by the arbitrators, arbitrator, or umpire.

It is to be distinctly understood and arread by the arbitrators of the control of the contro

It is to be distinctly understood and agreed by and between the Commissioner for Railways and the Contractor, that the appeal or arbitration from the certificate or decision of the Locomotive Engineer shall be limited only to such of the matters in the above proviso mentioned as subjects for the arbitration of civil engineers as shall be set forth in the notice in writing given as hereinbefore provided by the party requiring such arbitration; and that nothing in this clause contained shall extend to or affect or be construed to extend to or affect any decision, determination, or certificate of the Locomotive Engineer, or any other matters or questions than those in respect of which an appeal shall lie under the proviso above contained.

The Contractor shall forfeit and pay to the Commissioner (by way of liquidated damages to be deducted from the moneys due to the Contractor) the sum of one per cent on the contract price of each vehicle for each week that each vehicle shall remain undelivered after the respective dates named in this

The Contractor shall deposit in some Bank in Sydney, to the credit of the Commissioner for Railways, the sum of £1,000 (one thousand pounds) as security for the due performance of his contract.

Should the Contractor fail to deposit as aforesaid the required amount as security within seven days of the date of the notification of his tender being accepted, the Commissioner will have the option

and full power and authority to declare such acceptance to be annulled.

Should the rate of progress made with the work be such as to prevent, in the opinion of the Engineer, the vehicles being delivered by the time specified, the Commissioner shall have full power and authority, after due notice given to the Contractor, to cancel the contract forthwith, upon which the amount deposited by the Contractor as security for the due performance of same, as well as all moneys due to the Contractor under the Contract for such vehicles as shall remain to be delivered shall be forfeited to the Commissioner.

If the Contractor become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioner for Railways, without previous notice to the Contractor, or to the Official or other Assignees or Assignees of his insolvent estate, or to the Trustee or Trustees under the assignment, to take such of and all portions of the rolling stock, whether completed or not, from the Contractor or the Assignees or Trustees of his estate, and re-contract with any other person or persons to proceed with and complete the said rolling stock, upon such terms, stipulations, and conditions as shall be deemed expedient.

Payments will be made in full for each vehicle in one month after the date of delivery of the same, on certificate of the Locomotive Engineer that the vehicle is complete in every respect and finished in

accordance with the specification.

And it is hereby expressly declared that the giving of a certificate by the Locomotive Engineer for the time being, that the work done by the Contractor has been satisfactorily executed and completed in accordance with the specification, shall be a condition precedent to the Contractor having any right of action or claim to the payment to be made under this specification.

Department of Public Works Railway Branch, Sydney.

CHAS. A. GOODCHAP, Commissioner for Railways.

Painting, Polishing, Varnishing, Upholstering, and Trimming for Passenger and Goods Vehicles, under the five years Contracts, ending 31 December, 1888.

Passenger Carriages.

Sleeping Cars-First-class, Composite, Second-class Carriages, Composite Break-vans, Hearses, and Passenger-carrying Vehicles generally, to be treated as follows:-

Body, Outside.

THE outside of each body is to be primed with three coats of lead colour in oil, and then to be stopped up with hard stopper (composed of dry white lead and gold-size); then to have four coats of filling up (composed of patent filling white lead, gold-size, and turpentine); then a fifth coat of filling up, with a little red for staining; then to be well rubbed down with hard pumice stone; then one coat of glaze colour, two coats of pattern colour (the colour to be decided by the Department); then one coat of glaze (composed

(composed of varnish and pattern colour); and finally to be flattened down where picked out, and initialled according to instructions; the rest then to be flattened down, and to receive one coat of varnish; then again to be flattened down, and to receive the final coat of varnish.

Body, Inside.

The inside of each first-class compartment, and of sleeping cars generally, is to have all mouldings and panels (where visible) French-polished, and protected with one coat of varnish.

Second-class Compartments and Interior of Luggage Compartments and Goods Break-vans, Prison-vans, and Hearses are to be treated inside as follows:—

To be primed with two coats of drab colour in oil; then one coat of ground do., and to be grained (where visible) in imitation of oak, and finished with two coats of varnish. Any cedar mouldings not painted, are to be French-polished and varnished.

Floors.

The floors of all Passenger-carrying Vehicles, including Hearses, Compo., and Luggage Break-vans are to be treated as follows:

Floor-boards to be all well painted with lead colour in oil, before being put together, and on the upper face to receive a second coat of lead colour, and a finishing coat of black.

Note.—The number of each carriage to be painted on the inside of each compartment, as may be directed.

Roofs.

The roofs of all Passenger-carrying Vehicles, including Hearses, Compo., and Luggage Break-vans, are to be treated as follows:-

The roof-boards to receive two coats of colour in oil, and when dry to receive another thick coat (the canvas being applied while the paint is wet); then two coats of white lead in oil, and one finishing coat of white mixed with varnish.

Note.—Both outer and inner roofs to have canvas covering if required.

Under-frames.

The under-frames to be treated as follows:

To be primed with two coats of oil colour all over (inside and outside), the outer faces to be then stopped up, face down, and painted with two coats of pattern colour in oil, and finally picked out, and finished with two coats of varnish.

Ironwork.

The ironwork of all the before-mentioned vehicles is to be treated as follows:-To be scraped clean and free from rust, and then to receive one coat of lead colour in oil, and one finishing coat of black mixed with varnish.

Upholstering and Trimming.

The quality and description of upholstering—be the same in cloth, leather, or stool-carpet—and the trimming (including carpets, mats, &c, &c.) in passenger-carrying vehicles is to be in accordance with samples to be seen at the Locomotive Engineer's Office, Redfern; and the method of fixing and finishing the same is to be according to the most recent practice of the Department, unless otherwise ordered by the Locomotive Engineer.

Goods Break-vans, Horse-boxes, Carriage Trucks, and Prison-vans, to be treated as follows:—

Bodies, Outside.

The outside is to be primed with two coats of lead colour in oil, then to be stopped up and faced down, and to have two coats of pattern colour, and then to be picked out and initialled, and finished with two coats of varnish.

Bodies, Inside.

The inside is to be primed with two coats of stone colour in oil, then to have one coat of ground . colour, and to be grained in imitation of oak, and finished with one coat of varnish.

Floors

The floor-boards are to be all well painted with lead colour in oil, before being put together, and on the upper face to receive a second coat of lead colour, and a finishing coat of black.

Roofs.

The roof-boards are to be primed with two coats of colour in oil, and when dry to receive another thick coat, the canvas being applied while the paint is wet, then two coats of white lead in oil, and one finishing coat of white mixed with varnish.

Under-frames.

The under-frame is to be primed with two coats of lead colour all over (inside and outside); the outer faces to be then stopped up, faced down, and painted with two coats of pattern colour, and finally picked out and finished with two coats of varnish.

Ironwork.

The ironwork is to be scraped clean and free from rust, and then to receive one coat of lead colour in oil, and one finishing coat of black mixed with varnish.

ORDINARY GOODS STOCK.

Ordinary Goods Stock—including Meat, Cattle, Sheep, and Powder Vans, and also A, B, C, D, E, F, G, Wagons and Trucks—are to be treated as follows:—

Bodies, Outside.

To be primed with one coat of lead colour in oil, and to be finished with two coats of pattern colour in oil.

Bodies, Inside.

To be primed with one coat of lead colour in oil, and finished with one coat of pattern colour in oil. Ironwork.

To be scraped clean, and then to receive one coat of black colour in oil.

E.—In every case there must be one clear day between each coat of paint. One coat of filling up may be applied daily; but the work must then stand three clear days before being incled down, and two days must be allowed between each coat of varnish.

GENERAL

GENERAL CONDITION.

This Painting Specification shall be considered as an integral portion of each and every one of the specifications for the various classes of passenger and goods rolling stock under the five years' contracts, ending December 31, 1888, in so far as it may reasonably apply to the same individually, and the whole of the general conditions embodied in said specifications shall apply with equal force to the present specification.

W. SCOTT, specification.

Locomotive Engineer.

The Terms and Conditions of each of the Contracts for the five years supply of Rolling Stock are the same as those mentioned in Specification No. 207, with the following exceptions:-

Southern and Western Railway.

Specification No. 213, for a Mail-van (4 wheels).

-Each vehicle is to be made precisely the same in all respects as mail-van No. 6.

3.—The following materials are to be used:—
Underframe—blue gum, tallow-wood, or black butt.

Body bottom, side and end frames—pitch pine or Baltic.

Intermediate frame bars—blue gum, tallow-wood, or black butt. Side frames, pillars, &c.—cedar, best quality.

Eud frames—b Panels—cedar. -blue gum, tallow-wood, or black butt.

Top side rails—pitch pine or Oregon. Roof sticks—colonial beech.

Window frames—cedar.

Venetian blind frames—cedar, with laths of white cedar. Roof lining and flooring boards—Oregon pine.

Sides and ends of body to be made flat without any turn under. Flooring boards to be $1\frac{1}{4}''$ thick, and run transversely or longitudinally as required.

-The following standard dimensions must be worked to, and if necessary, modifications from the sample vehicle must be made in the underframes to suit these dimensions, viz. :-

			IU.	m.	
Buffers, C. to C	 	•••	 5	9	
Do, from rail to C. (empty)	 		 3	5	
Axles, bearing C. to C			6	$4\frac{3}{4}$	
Do do diameter	 				
f Do do length		• • •	 •		
Wheels (diameter on tread)			3	$6\frac{1}{2}$	

The following alterations from the sample vehicle are to be made, viz.:

Width of body to be same as pattern vehicle. The brake gear to be as shown in drawing to be supplied

Cast iron brake blocks to be used, and so hung as to gear with the Westinghouse continuous brake apparatus.

The Contractor must fix the axle brasses and trim the boxes in accordance with the Inspector's

views: they are to be passed by him before the vehicle is sent out on the rails.

Wheatley's patent locks to be fixed to doors. Each vehicle to be fitted with one standard screw coupling to pattern or drawing.

Main draw-bar to be continuous, as per drawing to be supplied or pattern gear to be supplied. Buffers to stand out 22" from face of headstock.

Lamp irons (six in all) to be fixed as directed by the Inspector. Side pillars to be made to patterns which will be supplied.

Panels to run vertically from fence rail as required.

1/4-in. plate glass to be used for windows.

(Condition No. 10 excised.)

The number of vehicles required under this specification, and the place and time of delivery ofthe same, to be as follows:-

No.	 Where delivered.				Date	of delivery.	,	:
One One	 On rails, Ro Do Do	edfern Yard, Syd do do	lney 		1884, in 12 months 1 1885, in 6 months 1886, in 6 months	From date do do	of orde do do	er.

Southern and Western Railway.

Specification No. 214, for a Prison-van.

-Each vehicle is to be made precisely the same in all respects as prison van No. 3.

The following materials are to be used:— Underframe—blue gum, tallow-wood, or black butt. Body, bottom frame

side and end frames

Body

Body side and end boards-Oregon pine (tongued and grooved).

roof sticks-colonial beech.

window frames—cedar (best quality). doors-

Southern and Western Railway.

Specification No. 232, for a G. Wagon (on Bogies).

1.—Each vehicle is to be made precisely the same in all respects as G. wagon No. 7. 3.—The following materials are to be used:—

Under-frame—blue gum, tallow-wood, or black butt.

Sides and ends (boarding)—Kauri pine.

Stanchions and pillars—blue gum, or tallow-wood.

Flooring boards—do.

The scantlings or sizes of the various parts of the timber and iron work are to be altered and modified as directed by the Loco. Engineer.

6.- The painting, inside and out, shall be carried out as directed by the Engineer, in the most approved and complete manner.

—The following alterations from the sample vehicle are to be made, viz. :—
The brake-gear and main continuous draw-bar to be in accordance with that on the sample vehicle; main draw-bar to be 13 inch diameter.

The bogies are to be made according to plans to be supplied by the Locomotive Engineer. (Conditions

(Conditions Nos. 8, 9, 10, and 11 excised.) 13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:

No.		When del	ivered.		Date of	f delivery.	
Forty Fifty Fifty Fifty Sixty	On the rails, Do Do Do Do	Redfern do do do do do	Yard, Sydney do do do do	 1884—in tw 1885— 1886— 1887— 1888—	velve months do do do do	s from date do do do do	of the order. do. do. do. do.

Southern and Western Railway.

Specification No. 242, for a First-class Double-bogie American Carriage, with end entrances, &c.

1.—Each vehicle is to be made precisely the same in all respects as first-class double bogic carriage No. 68.

-The following materials are to be used:-

Under-frame-pitch pine, except headstocks, which are to be of blue gum, tallow-wood, or black butt.

Window pillars—blackwood or ash.

Corner and door pillars—cedar, best quality.

Longitudinal rails (top and middle)—pitch pine or Oregon.

Roof sticks—colonial beech.

Roof boards (T. & G.)—Oregon pine, in narrow strips. Floor-boards (T. & G.)—Oregon pine, 1\frac{1}{4} inch thick.

Panels—cedar.

Window frames -cedar.

Venetian blind frames—cedar (with white cedar laths).

Mouldings-cedar.

The following alterations from the sample vehicle are to be made, viz.:-

The compensating beam in buffer-rods of sample vehicle will be dispensed with, rubbers or volutes to be substituted, and the same to be supplied by the Department.

The bogies to be made to drawing No. 827.

The buffer-heads to measure 22 inches from face of headstock to front face of buffer.

Lamp-irons are to be fitted on sides and ends (six in all).

Door-locks to be to pattern lock No. 150 (American pattern).

Width of body to be same as pattern vehicle.

All axle-brasses to be nicely fitted to the journals, and the axle-boxes are to be trimmed with castor oil, to the satisfaction of the Inspector, before the vehicle will be passed.

Each vehicle to be fitted with one (standard) screw coupling to pattern or drawing.

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows :-

Two Three Three Three Four	On the rails, Do Do Do Do	Redfern Yard, do do do do	Sydney do do do . do	 1884—in tv 1885— 1886— 1887— 1888—	velve month do do do do	ns from the do do do do	date of order. do. do. do. do.

Southern and Western Railway.

Specification No. 243, for a Second-class Double-bogie American Carriage, with end entrances.

- 1.—Each vehicle is to be made precisely the same in all respects as double-bogie carriage No. 123.
- 3.—The following materials are to used :-

Under-frame-pitch pine, except headstocks, which are to be of blue gum, tallow-wood, or black butt.

Window pillars—black-wood or ash.

Corner and door pillars—cedar (best quality).
Longitudinal rails (top and middle)—pitch pine or Oregon.

Roof-sticks—colonial beech.
Roof-boards (T. & G.)—Oregon, in narrow strips.
Floor-boards (T. & G.)—Oregon, 1\frac{1}{4} in. thick.

Panels—cedar.

Window-frames—cedar.

Venetian blind frames—cedar (with white cedar laths).

Mouldings--cedar. 7.—The following alterations from the sample vehicle are to be made, viz.:-

The compensating beam on buffer-rods of sample vehicle will be dispensed with; rubbers or volutes will be substituted, and the same to be supplied by the Department.

The bogies are to be made to drawing No. 827.

The buffer-heads to measure 22 inches from face of headstock to front face of buffer.

Lamp-irons are to be fitted on sides and ends (six in all).

Door locks to be to pattern No. 150 (American pattern).

Width of body to be the same as pattern vehicle

All axle-brasses to be nicely fitted to the journals, and the axle-boxes are to be trimmed with castor oil, to the satisfaction of the Inspector, before the vehicle will be passed. Each vehicle to be fitted with one (standard) screw coupling, to pattern or drawing.

The seats and upholstering to be of design and quality, similar to most recent practice on the N.S.W. Government Railways, for this class of vehicle.

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:-

No.		Where deli	vered.		Date	of delivery.

Southern and Western Railway.

Specification No. 244, for a Composite Double-bogie American Carriage, with end entrances, &c.

1.—Each vehicle is to be made precisely the same in all respects as composite double-bogie carriage No. 68.

—The following materials are to be used:—

Under-frame—pitch pine, except headstocks, which are to be blue gum, tallow-wood, or black

Window pillars—black-wood or ash.

Corner door pillars—cedar (best quality).

Longitudinal rails (top and middle)—pitch pine or Oregon.

Roof-sticks—colonial beech.

Roof-boards (T. & G.)—Oregon pine, in narrow strips. Floor-boards—Oregon pine, $1\frac{1}{4}$ in. thick.

Panels—cedar.

Window-frames—cedar. Venetian blinds—cedar (with white cedar laths).

Mouldings-

7.—The following alterations from the sample vehicle are to be made, viz. :-

The compensating beams on buffer-rods of sample vehicle will be dispensed with; rubbers or volutes to be substituted, and the same to be supplied by the Department.

The bogies to be made to drawing No. 827.

The buffer-heads to measure 22 inches from face of headstock to the front face of buffers.

Lamp-irons to be fitted on sides and ends (six in all). Door lock to be to pattern lock No. 150 (American pattern).

Width of body to be same as pattern vehicle.

All axle-brasses to be nicely fitted to the journals, and the axle-boxes to be trimmed with castor oil, to the satisfaction of the Inspector, before the vehicle will be passed.

Each vehicle to be fitted with one (standard) screw coupling, to pattern or drawing.

3.—The number of vehicles required under this specification, and the place and time of delivery

of the same, to be as follows:

No.		Where de	livered.		Date	of deliver y .	
One One One Two	On the rails, Do Do Do Do	Redfern do do do do	Yard, Sydney do do do do do	 1884—in 1885— 1886— 1887— 1888—,	twelve mont do do do do	ns from the dat do do do do	e of the order. do. do. do. do.

Southern and Western Railway.

Specification No. 267, for a First-class Bogie Carriage (Redfern type).

1.—Each vehicle is to be made precisely in accordance with drawings Nos. 827, 828, 830, Locomotive Engineer's Office, Redfern.

-The following materials are to be used:-

Under-frame—principal members as marked on plan—blue gum, tallow-wood, or black butt.

Do subordinate members—pitch pine or Oregon.

-side and end framing, pillars and rails—Tasmanian black-wood, ash, or other approved timber.

Do top side-rails and end sweeps—pitch pine or Oregon.

Do roof-sticks—ash or colonial beech.

Do floor-boards—Baltic pine, $1\frac{1}{4}$ in. thick (tongued and grooved).

Do floor-frame—pitch pine, $3\frac{1}{4}$ in. thick.

Do division and lining boards—Oregon pine (tongued and grooved).

Do seat-rails—Kauri pine (lined with cedar).

Do seat-boards—Oregon pine (tongued and grooved).

Do roof-boardsdo

Do window-frames—cedar.

Venetian blinds—cedar, with Huon pine louvres.

Outside panels—cedar. Inside panels—Huon pine.

Inside mouldings—cedar.

-Arrangement of body:

The body is to be divided into six first-class compartments, as indicated on plan or drawing No. 830.

All corner, door, and division pillars to have wrought-iron knees (top and bottom), secured by coach screws or bolts; and all principal floor-frame corners to be similarly secured.

The floor-frame to be secured to under-frame by strap bolts, vide drawing No. 837.

Under-frame to be constructed as indicated on plan or drawing No. 828.

The vehicle is to be carried on two bogies, which are to be constructed as indicated on plan or drawing No. 827.

Lamp-irons (six in number) to be fixed as directed by the Inspector.

One standard screw-coupling to be supplied with each vehicle. \(\frac{1}{4}\)-in. plate-glass to be used for windows.

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:

No.		Where del	livered.		Da	te of d	leliver y.

Southern and Western Railway.

Specification No. 270, for a Second-class Bogie Carriage (Redfern type).

1.—Each vehicle is to be made precisely in accordance with plans or drawings Nos. 846, 828, 827. Locomotive Engineer's Office, Redfern.

3.—The following materials are to be used:

Under-frame—principal members—blue gum, black butt, or tallow-wood (as marked on plan).

Do subordinate members—pitch pine or Oregon.

Body-side and end framing, pillars and rails-Tasmanian black-wood, ash, or other approved timber

Do top side-rails and arch-rails—pitch or Oregon pine.

Do roof-sticks—ash or colonial beech.

Do floor-boards—Baltic pine, $1\frac{1}{4}$ in. thick (tongued and grooved).

Do floor-frame—pitch pine or Oregon, $3\frac{1}{4}$ in. thick.

Do division and lining boards—Oregon pine (tongued and grooved).

Do seat-rails-Kauri pine.

Do seat-boards—Oregon pine (tongued and grooved).

Do roof-boards-D٥

window-frames—cedar.

Venetian blinds—cedar (with Huon pine louvres).

Do outside panels—cedar.

Do mouldings, internal—cedar.

-Arrangemement of body:-

The body is to be divided into seven second-class compartments, as indicated on plan or drawing No. 846.

All corner, door, and division pillars are to have wrought-iron knees top and bottom, secured by coach screws or bolts; and all principal floor-frame corners are to be similarly secured.

The floor-frame is to be attached to under-frame by means of suitable strap bolts, vide drawing No. 837.

The under-frame is to be constructed as shown on plan or drawing No. 828.

The vehicle is to be carried on two four-wheeled bogies, which are to be constructed as shown on plan or drawing No. 827.

Lamp-irons (six in all) to be fixed as directed by the Inspector,

One standard screw-coupling to be supplied with each vehicle.

1/4-in. plate-glass to be used for windows.

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:-

No:		Where deliver	ed.			Date o	of delivery.

Southern and Western Railway.

Specification No. 272, for a Composite Break-van (Bogie-Redfern type).

1.—Each vehicle is to be made precisely in accordance with the drawings Nos. 841, 842, 843, 827, to be seen at the Locomotive Engineer's Office, Redfern, except where herein specified to the contrary.

3.—The following materials are to be used:—

Underframe—principal members as marked on plan—blue gum, black-butt, or tallow-wood.

subordinate do. do do -pitch pine or Oregon.

-side and end framing pillars and rails-Tasmanian blackwood, ash, or other approved

top-side rails and end sweeps-pitch pine or Oregon.

roof sticks—ash or colonial beech.
floor frame—pitch pine, $3\frac{1}{4}''$ thick.
do. boards—Baltic pine, $1\frac{1}{4}''$ thick (tongued and grooved).

division and lining boards—Oregon pine (tongued and grooved).

seat rails-Kauri pine.

do. boards—Oregon pine (tongued and grooved). roof do. do. do.

window frames—cedar. Venetian blinds—do. (with Huon pine louvres).

outside panels— do

internal mouldings in passenger compartments—cedar.

Arrangement of body.

The body of the vehicle is to be constructed as shown upon the drawings or plans, and is to be arranged at one end with two passenger coupés; each coupé to have a closet attached—the one to be for accommodation of ladies and the other for gentlemen. This is to be indicated in painting on the outside of the doors. The other end of the body is to be fitted up as a guards' compartment proper, with brake-wheel, sand-boxes, seats, and shelves, &c., as required, and is to be separated from the luggage compartment by a division or bulkhead, with a double swing door in middle.

The main or central portion of the body is to be arranged as a luggage compartment proper, containing two dog-boxes, and having, if so required by the Locomotive Engineer, a portion of the floor at one end set apart for accommodation of fish, and suitably flashed with lead, &c., for such purpose. Luggage compartment to have double folding or sliding doors, as directed by the Inspector, on either side. All corner, door, and division pillars to have wrought-iron knees, top and bottom, secured by coach screws or bolts, and all principal floor frame to be secured to under-frame by strap bolts, vide drawing No. 837.

Lamp irons (six in all) to be fixed as directed by the Inspector.

One standard screw coupling to be supplied with each vehicle.

plate-glass to be used for windows. The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:-

No			Vhere deliver	ed.			Date of deliv	ery.
One Two Two Two Three	•••	On the rails, R Do. Do. Do. Do.	edfern yard do. do. do. do.	l, Sydney do. do. do. do.	•••	1884—in 12 1885— 1886— 1887— 1888—	2 months from t Do. Do. Do, Do,	the date of the order do. do. do. do.

Southern and Western Railway.

Specification No. 273, for a 6-wheeled Luggage Brake-van (passenger).

1.—Each vehicle is to be made precisely in all respects as the plans or drawings Nos. 847, 848, to be seen at the Locomotive Engineer's Office, Redfern, except where herein specified to the contrary.

-The following materials are to be used:

Under-frame—blue gum, tallow-wood, or black butt. Body bottom frame—blue gum, tallow-wood, or black butt.

side and end frame—do. do. do. inside lining boards—Oregon pine (tongued and grooved). roof and partition boards—do. do.

- roof sticks—colonial beech.
- window frames and doors—cedar. floor—Oregon or Kauri pine.

The main draw-bar to be $1\frac{3}{4}$ diameter continuous.

Cast-iron brake blocks to be provided similar to the most recent standard type in use by the Department.

Lamp-irons (six in all) to be fixed as directed by the Inspector. One standard screw coupling to be supplied with each vehicle.

(Conditions Nos. 8 and 10 excised.)

9.—The glass frames are to be completed in accordance with the most approved arrangement in

use at the present time on the Railways, and plate-glass 1 thick to be used.

11.—During the ordinary hours of labour, and at all other reasonable times, access is to be allowed to the servants of the Railway Department to enter the premises of the Contractor for the vehicles, for the purpose of fitting the Westinghouse brake apparatus to the said vehicles.

13.—The number of vehicles required under this specification, and the place and time of delivery of

the same, to be as follows:

Great Northern Railway.

Specification No. 213 for a Mail-van (4 wheels).

-Each vehicle is to be made precisely the same in all respects as mail-van No. 6.

The following materials are to be used:—
Under-frame—blue gum, tallow-wood, or black butt.

Body bottom, side and end frames—pitch pine or Baltic.

Intermediate frame-bars—blue gum, tallow-wood, or black butt. Side frames, pillars, &c.—cedar (best quality).

blue gum, tallow-wood, or black butt. End frames-

Panels-cedar.

Top side rails—pitch pine or Oregon. Roofs sticks—colonial beech.

Window frames—cedar.

Venetian blind frames—cedar (with laths of white cedar). Roof lining and flooring boards—Oregon pine.

Sides and ends of body to be made flat without any turn under. Flooring boards to be $1\frac{1}{4}$ thick, and run transversely or longitudinally as required.

5. The following standard dimensions must be worked to, and if necessary, modifications from the sample vehicle must be made in the under-frames to suit these dimensions, viz.:

		10.	. ш.
Buffers, C. to C		5	9
Do from rail to C. (empty)	•••	3	5
Axles, bearing, C. to C	•••	6	$4\frac{3}{4}$
Do do diameter			
Do do length	•••	•••	
Wheels (diameter on tread)		3	$6\frac{1}{2}$

-The following alterations from the sample vehicle are to be made, viz.:

Width of body to be same as pattern vehicle.

The brake gear to be as shown in drawing No. Cast-iron brake blocks to be used, and so hung as to gear with the Westinghouse continuous

brake apparatus.

The Contractor must fit the axle brasses and trim the boxes in accordance with the Inspector's views; they are to be passed by him before the vehicle is sent out on the rails. Wheatley's patent locks to be fixed to doors.

Each vehicle to be fitted with one standard screw-coupling to pattern or drawing.

Main draw-bar to be continuous, as per drawing No. — or pattern gear to be supplied.

Buffers to stand out 22 inches from face of headstock.

Lamp irons (six in all) to be fixed as directed by the Inspector.

Side pillars to be made to patterns which will be supplied.

Panels to run vertically from fence-rail as required.

1/4-in. plate-glass to be used for windows.

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:-

Under-frame—blue gum, tallow-wood, or black butt.

Body framingdo

Roof sticks—colonial beech.
Roofing and lining boards—Oregon pine (tongued and grooved).

Flooring boards—Kauri (tongued and grooved).

Floor to be covered with sheet-lead not less than 16" thick.

All inside boards to be fastened with brass screws and copper nails, and heads of iron bolts or nuts to be covered with brass cups.

6.—The painting, inside and out, shall be carried out as directed by the Engineer, in the most approved and complete manner.

—The following alterations from the sample vehicle are to be made, viz.:—Outside boards to be fixed vertically.

The diagonal struts on sides and ends to be fitted as directed by the Inspector.

To have double roof same as "C" vans, and the height of roof to be the same as on sample "C" van.

The main draw-bar to be 13" diameter and continuous, and this, as well as the brake gear, to be in accordance otherwise with that existing on sheep van No. 220.

(Conditions Nos. 8, 9, 10, and 11 excised.)

13.—The number of vehicles required under this specification, and the place and time of delivery of the same, to be as follows:

No.	Where delivered.	. Date of delivery.
One	On the rails at Newcastle Do do	1884—in 8 months from date of the order. 1885— do do do

Great Northern Railway.

Specification No. 223, for a Low-sided Wagon "A."

1.—Each vehicle is to be made precisely the same in all respects as "A" truck Nos. 119 and 120.

3.—The following materials are to be used:

Under-frame—blue gum, tallow-wood, or black butt.

Floor-boards-Body—Sides and ends, Kauri pine.

6.—The painting, inside and out, shall be carried out as directed by the Engineer, in the most approved and complete manner.

LEGISLATIVE ASSEMBLY.

SOUTH WALES.

RAILWAYS.

(PERMANENT-WAY.)

Ordered by the Legislative Assembly to be printed, 20 May, 1884.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 22nd January, 1884, That there be laid upon the Table of this

- "Copies of all correspondence, minutes, papers, &c., between the Secretary for Works and any official of the Works Department, and Hudson
- "Brothers, or any other person, in reference to leasing to the firm known as 'Hudson Brothers,' or any person, the right to keep the Permanent-
- "way of the Railways of this Colony in repair or working order for a "number of years."

(Mr. McElhone.)

NO.	SCHEDULE.	1	. PA	AGE
1. Letter from Messrs. Munford, Neson, and Ban from Mount Victoria to Eskbank Station,	aks, offering to maintain and supervise and minutes thereon. 10 August, 18	e portion of 81	the Western Line	1
2. Reply from Commissioner, declining the offer.	31 August, 1881	t ,		2

No. 1.

Messrs. Munford, Neson, and Banks to The Commissioner for Railways.

Mount Edgcombe, Clarence Siding P.O.,
Sir,
Great Western Railway, 10 August, 1881.
The order of the day being retrenchment in the various Departments of the Government of New South Wales, we have the honor to say, being residents on the Great Western Railway, and platelayers for several years engaged and working on this particular portion, as hereinafter named, to make an offer for the maintenance and supervision of that portion of the line leading from the Mount Victoria Platform and Station to the Eskbank (new station), a distance, including the double line, of 20 miles, for the sum of (£2,100) two thousand one hundred pounds per annum, for five years. We base our calculations upon the men at work, and of the present expense for maintenance and supervision at £2,500 per annum, to say nothing of extras, between Mount Victoria and Lithgow.

We are thoroughly acquainted, from practical experience extending over many years, of what the duties are and we shall have to perform without at present going into details.

[777 copies—Approximate Cost of Printing (labour and material), £1 11s. 8d.]

The men we shall employ will be old and experienced hands on the railways, and their whole time will be devoted to the requirements and improvements as they shall be demanded by the Engineer-in-Chief, or may occur daily through traffic; and divided into three sections or squads of five men each—one section or body of men of five to be stationed at each end, and five men about the centre of the proposed contract—making with the contractors a total of eighteen men. We are perfectly aware of the duties and the works to be performed, and if £400 a year can be saved in 20 miles, where there is so much extra work in running of trains as there is between Lithgow and Mount Victoria, we presume it may lead to future retrenchment along the whole of the lines in New South Wales.

We presume to make this offer for your consideration, and if you thought it advisable you might communicate with the Engineer-in-Chief of the line in question, and obtain that gentleman's views upon the subject.

The supervision and maintenance of this portion of the railway, we flatter ourselves we can give the Government every satisfaction if our project is successful.

We have, &c., MUNFORD, NESON, & BANKS.

P.S.—We presume to say that we are prepared to take the whole line through to Bathurst, for and at the rate of £100 a mile on an average, being a saving to the Department of £1,500 per annum; we should also require that our men should be conveyed free from point to point, that we could be able to concentrate the whole number, if required, at any given place for repairs, &c.—M. N. & Co.

Mr. Cowdery, for report.—G.B., B.C., 20/8/81. I cannot recommend this idea in any way.—G.C., 24/8/81. Commissioner. Cannot be sanctioned.—Ch. A. G., 28/8/81.

No. 2.

The Commissioner for Railways to Messrs. Munford, Neson, and Banks.

Sirs, Department of Public Works, Railway Branch, Sydney, 31 August, 1881.

In reply to your letter of the 10th instant, offering to maintain and supervise that portion of the Great Western Line which extends from Mount Victoria Station to the Eskbank Station, a distance of 20 miles, for the sum of £2,100 per annum, for five years, I have the honor to inform you that your offer is declined.

I have, &c.,

CHAS. A. GOODCHAP, Commissioner for Railways. 1883.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

ELECTRIC LIGHT AT REDFERN RAILWAY STATION.

(COST, AND OTHER PARTICULARS.)

Ordered by the Legislative Assembly to be printed, 29 November, 1883.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 30th April, 1883, That there be laid upon the Table of this House a Return showing,—

- "(1.) The cost to the Department of the plant, *i.e.*, electric and motive power, and the price of each, used in connection with the electric "light at Redfern Station.
- "(2.) The cost of fixing and arranging the same for use.
- "(3.) The expenditure incurred by either the Electric Telegraph Department or the Railway Department, or both, for labour or services in con"nection with the electric light at Redfern Station.
- "(4.) The names of the employes who have been or are now engaged in connection with the electric light at Redfern Station, and what amount has been paid to each for such service.
- "(5.) The cost of maintenance, *i.e.*, fuel, &c., since the electric light has been in use.
- " (6.) The length of time the electric light has been used at Redfern, and "the number of lights used when it is in operation.
- "(7.) The number of times it became inoperative, or failed to produce "light during the month of March last.
- "(8.) The saving the Department effected in the gas account since the electric light has been in use.
- " (9.) The total cost of the experiment."

(Mr. Sydney Smith.)

ELECTRIC LIGHT AT REDFERN RAILWAY STATION.

- (1.) The cost to the Department of the plant, i.e., electric and motive power, and the price of each, used in connection with the electric light at Redfern Station?—The cost of the electric plant was £2,075.
- (2.) The cost of fixing and arranging the same for use \(-\mathcal{L} 50. \)
- (3.) The expenditure incurred by either the Electric Telegraph Department or the Railway Department, or both, for labour or services in connection with the electric light at Redfern Station?—From the time the light was first brought into use—15th June, 1882—till the 14th March, 1883, the expenditure was borne by the Electric Telegraph Department and by Mr. Kingsbury, who introduced the apparatus. No extra expenditure was incurred by the Electric Telegraph Department in attending to the lights, as the work was performed by the staff as a part of their duties. If, however, the work had not been performed in this way, the cost to the Department during the period named would have been about £120, being a man's wages at the rate of 10s. per night. From the 14th March till the 30th April (the date of the question) the machine attendant was paid £24 in wages by this Department.

 This Department paid the engine-driver's wages from the 15th June till the 30th April, amounting to £168 15s. 3d.
- (4.) The names of the employes who have been or are now engaged in connection with the electric light at Redfern Station, and what amount has been paid to each for such service?—Up to the 14th March the lights, as stated in reply to Question No. 3, were attended to by the Electric Telegraph Staff, whose names are Mr. Kopsch, Mr. Metcalfe, Mr. Venn, and by Mr. Kingsbury, who introduced the light, and Mr. Inspector Watson. From the 14th March till the 30th April the machine attendant was Mr. C. F. Krantzcki, whose wages during that period amounted to £24. From the 15th June, 1882, till the 30th April, 1883, the engine-driver was P. George, and his wages, as stated above, amounted to £168 15s. 3d.
- (5.) The cost of maintenance, i.e., fuel, &c., since the electric light has been in use?—£22 14s. 7d. as far as this Department is concerned, up to 30th April. An amount of £28 1s. 6d. was also incurred by Mr. Kingsbury.
- (6.) The length of time the electric light has been used at Redfern, and the number of lights used when it is in operation?—Since the 15th June, 1882, ten lights.
- (7.) The number of times it became inoperative, or failed to produce light during the month of March last?—Four times—twice through belts breaking, when interruption only lasted 5 minutes on one occasion, and 10 on the other; once through wire breaking (interruption lasted one hour); and once through engine-pump being out of repair (interruption lasted the whole night.)
- (8.) The saving the Department effected in the gas account since the electric light has been in use?—
 Nothing, because the contract provides for the contractor being paid by the burner, and as the electric light was being tried experimentally it was not deemed advisable to dispense with the gas lights.

(9.) The total cost of the experiment:—		${\mathfrak L}$	s.	d.
Fixing lights. &c		50		
Wages of machine attendant from 14th March till 30th April		24	0	0
Wages of engine-driver		168	15	3
Fuel and stores paid by Department	٠	22	14	7
•	٠	265		10
•	£	200	9	ΙŪ

It should be mentioned, however, that so far the Department has not reaped the full benefit of the electric plant, because up to the present time only ten lights have been in use, but in a short time twenty-five lights will be used, and then gas will be dispensed with to a very large extent.

1883.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY PASSES GRANTED TO PERSONS OTHER THAN ASSISTED IMMIGRANTS.

(CORRESPONDENCE AND REPORTS.)

Ordered by the Legislative Assembly to be printed, 16 November, 1883.

RETURN to an Order made by the Honorable the Legislative Assembly of New South Wales, dated 7th November, 1883, That there be laid upon the Table of this House,-

"Copies of the Reports and Returns of the Agent for Immigration in

"reference to the Railway Passes granted by him to persons other than

"Assisted Immigrants, from the 1st January to 30th September, 1883,

"omitting therefrom the names of the receivers of such passes."

(Mr. Burns.)

The Commissioner for Railways to The Immigration Agent.

Sir,

Department of Public Works, Railway Branch, Sydney, 26 June, 1883.

The attention of the Secretary for Public Works having been called to the large number of free passes issued to the unemployed, I have the honor to request that you will be good enough to distinguish in the Returns sent in between those who are entitled, under the Immigration Regulations, to free passes, and the ordinary unemployed; and shall be glad if you will endeavour to limit the issue of the latter passes as much as possible. There is reason to believe that sometimes, through misrepresentation made to your Board, passes are issued to persons not in any way entitled to them, viz., to men who are not wholly destitute, and have employment or are promised employment in the country. The passages of these men could and would be deducted by their employers from their after earnings if free passes were not granted by the Board. The difficulty of discriminating in all cases is admitted to be very great; and the present representation is not made in any spirit of fault-finding, but for the purpose very great; and the present representation is not made in any spirit of fault-finding, but for the purpose of putting the Board upon their guard against persons who may be imposing upon them. I have to add that the thanks of the Department are due to the Board for the trouble they have for so many years taken in this matter. I have, &c.

C. A. GOODCHAP, Commissioner for Railways, per D.V.

The Immigration Agent to The Commissioner for Railways.

Sir,

I have the honor to acknowledge receipt of your communication, dated the 26th ultimo, stating that the "attention of the Secretary for Public Works has been called to the large number of free passes issued to the unemployed," and asking for some information thereon. Sir,

The free passes that I issue to immigrants are quite distinct from those issued to the unemployed; thus the nominal list of free passes forwarded by me to your Department each month relates solely to the unemployed.

I have now the honor to transmit the list of free passes issued to the unemployed during the months of May and June, and would specially invite the attention of the Minister to the summary for each month; it is there noted that in May I refused to grant passes to thirty-six individuals, and in June I month; it is there noted that in May I retused to grant passes to thirty-six individuals, and in June I refused twenty-five individuals, no less than sixty-one refused in two months, thus showing that I exercise some discretion. I must add, however, that in so doing I receive the greatest abuse; and it has even been stated in the Assembly that rather than grant free passes I would allow a man to starve. My refusal to grant passes has been most seriously animadverted upon. I am constantly in receipt of letters from clergymen, from Members of Parliament, and from other gentlemen requesting passes for men whom, nevertheless, I have refused. I have noted the reason of each refusal in the record book, a reference to which I think would satisfy the Minister that in all cases I have had good and sufficient grounds for not which I think would satisfy the Minister that in all cases I have had good and sufficient grounds for not

I require each applicant to produce a written certificate, showing the date of his arrival in the Colony, in addition to which I personally examine each one as to his previous occupation; thus when I find, although a man may have only recently arrived from Victoria or elsewhere, that he has previously been at work on the railway in this Colony for months, or has been years in this Colony, I decline to give a pass to such an applicant, notwithstanding that he may produce a letter of recommendation, such as I

have previously alluded to.

I do not give a second pass to a man, although he may be recommended, or may, as he states, have

lost his pass.

I have satisfied myself that in some instances passes have been transferred, probably have been sold. I always give passes to those aged and infirm persons who have lately left either the Liverpool or Parramatta Asylum, or have been discharged from Sydney Hospital. Occasionally, but under exceptional

circumstances, I give a pass to a woman.

There is no doubt that the granting of free passes to proceed to the railway works in various parts

There is no doubt that the granting of free passes to proceed to the railway works in various parts of the country is not only a great boon to the labourers but is also most advantageous to the railway contractors; for instance during the past two months I have forwarded to Dubbo, Nevertire, and Nyngan, no less than 393 labouring men.

I am pleased to note that you consider that I have faithfully fulfilled my duty, and am deserving of the thanks of your Department; at the same time I would respectfully urge that I should be glad to be relieved from the very onerous occupation of granting free passes to the "unemployed," because of the large amount of time consumed, which would be far better spent in the special business of my Immigra-I have, &c., G. F. WISE, tion Department.

Agent for Immigration.

The Commissioner for Railways to The Immigration Agent.

Department of Public Works, Railway Branch, Sydney, 16 July, 1883. With reference to your letter of the 7th instant, enclosing a list of free passes issued by you to the unemployed during the months of May and June, and also detailing the circumstances under which passes are refused by you,

I am directed by Mr. Secretary Wright to inform you that he considers your explanation very

satisfactory.

I have, &c., C. A. GOODCHAP, Commissioner for Railways, per D.V.

RAILWAY DEPARTMENT.

No. 1.

Inspector Turton reporting suspension of Driver Frost, and Minutes thereon.

Memorandum to The Locomotive Overseer.

Government Railways, Locomotive Engineer's Branch,

Bathurst Station, 19 January, 1881. I have to report that this evening, at about 5.35 p.m., fuel-man Antonio Gannoni came to the office and complained that Driver John Frost, with engine No. 88, was impeding the work at coal stage. I went out and spoke to Frost, telling him to go over the turn-table whilst engine No. 49 was turned. He (Frost) got off his engine, came to me, and said he went on the table as the coal-road was clear. I told him he should not have done so, and had no business there until engine No. 49 had turned, as she had "after coaling, &c.," to leave at 6:30 p.m., but should have gone on to the new coal stage road with his

had "after coaling, &c.," to leave at 6:30 p.m., but should have gone on to the new coal stage road with his engine. He told me he would go on to the turn-table road whenever he liked. I said, in reply, I would have none of his impertanence. He then came close up to me with his hand clenched and at his side, and said in a threatening manner, "I will give you something else in a minute." I replied, "If you speak to me in that manner I will suspend you." He repeated the words, and also said, "I will punch your head." I then told him I suspended him for his conduct. He then, still being close up to me, said in a vindictive manner, twice over, "I will stick a knife through your heart." He (Frost) then in defiance of me went on his engine No. 88, and would not come off her when ordered until I sent fuel-men Antonio Gannoni, Andrew Smith, and driver William Green to remove him.

This is the most gross case of insubordination that I have met with, and I would recommend that he be dismissed the service.

he be dismissed the service.

Frost denies the whole of the above statements seriatim, and while claiming that the whole of his statements were to be accepted as absolutely true and without question, did not hesitate, in my presence and in that of Messrs. Scott and Cobb, to assert (pointing to Mr. Turton), "It is all untrue; that man (Turton) has deliberately invented these statements to take away my character."—R.H.B., 9/2/81.

Driver J. Frost to The Locomotive Overseer.

*Should be 19th

Sir,

I was suspended by Mr. Turton after my arrival at Bathurst, on the *18th instant, under the following circumstances, which I most respectfully beg to place before you:—The shunter had just done with me and put me on the turn table and table done with me and put me on the turn-table, and told me to go there, as he wanted another engine out of the shed. The fuel-man ordered me back again, as he said it was Mr. Turton's clerk's orders. In the absence of proper authority I decided to go where the shunter sent me, as I knew he would not have sent me there if he wanted the Rydal engine turned on the table, which engine it is usual for us to make way for, if late, but she was not ready to come on the table, and I could see I could turn and then set back out of the way. I had just got turned half way, when the fuel-man left me and went after Mr. Turton, and he came to me in a most violent manner, and ordered me back off the table, which I did, and the came to me in a most violent manner, and ordered me back off the table, which I did, and the came to me in a most violent manner, and ordered me back off the table, which I did, and the came to me in a most violent manner, and ordered me back off the table, which I did, and the came to me in a most violent manner, and ordered me back off the table, which I did, and the came to me in a most violent manner, and ordered me back off the table, which I did, the came to me in a most violent manner, and ordered me back off the table, which I did, the came to me in a most violent manner, and ordered me back off the table, which I did, the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the table, which I did not the came to me in a most violent manner, and ordered me back off the came to me in a most violent manner, and ordered me back off the came to me in a most violent manner, and ordered me back off the came to me in a most violent manner, and ordered me back off the came to me in a most violent manner, and ordered me back off the came to me in a most vi intended doing without Mr. Turton's orders. He then went away in company with his clerk, and after, I suppose, consulting that officer he came back and told me I was under the influence of drink, and that I was suspended, and in a furious manner ordered me off the engine. I told him I would as soon as I put the engine in the shed, thinking by that time he would be cooled down, and that he would allow me to speak to him; but his temper was so violent that he ordered the fuel-men to pull me off at once, which they proceeded to do, and would have done had I shown any opposition. I think this is very harsh treatment, as I was not under the influence of drink, nor had I tasted any for three days previously; treatment, as I was not under the influence of drink, nor had I tasted any for times ways providing, if Mr. Turton had only listened to what I had to say, instead of allowing himself to be earwigged by his clerk, he would have seen that what I was doing was for the best; but as I cannot explain myself properly in writing, I earnestly request that you will grant me an investigation, and oblige Your obedient servant,

JOHN FROST.

J. Frost asks that Traffic Inspector Hornidge, Station-master Bonamy, and Shunters Thomas Wills and John Emmett be asked to give evidence.-J.C.

Driver Frost says: -Mr. Turton left the coal stage after he (Frost) had come off his engine to speak to him, and disappeared in the direction of the office, and then returned in a few minutes and suspended

him, saying "Come off that engine—you are the worse for liquor—you are drunk."

When he (Frost) got off the engine in the first instance, driver Frost says he pointed out the place from which he had moved his engine when the shunter left him; Mr. Turton would not listen to him; he (Mr. Turton) ordered him on his engine and to go to the other side of the turn-table.

Statements made by driver Frost to me on 19/2/81.—R.H.B., 19/2/81.

Thomas Wilson states:—When you first came out and spoke to Frost last night we were on the turn-table. You said, "John, you must get over the table and let this engine get turned to get away." He (Frost) did not go over the turn-table, but came back towards the coal stage, disobeying your instructions. He then got off the engine and walked up to you. I saw him put his face up to you in an offensive manner, but could not hear the conversation, the distance was too great; he (Frost) afterwards got on the engine and I heard you tell him to get off the engine 88; he replied, "What have I to come off for?—what have I done?

and refused to come down.—I heard you telling two men to get up and put him off; on their getting up for that purpose, he (Frost) told them the first man that put a hand on him he would make it a dear day's work for him, or words to that effect; when you told Frost to come off the engine as it was leaving the turntable for the coal stage pit I saw him look down in a scowling manner at you. Frost would not leave the engine until Green got up and took charge.

> THOMAS WILSON. 20/1/81.

Thomas Wilson, J. Frost's fireman, states that the remarks crossed out above were inserted by you and he refuses to acknowledge them, although he cannot explain to me how it was he signed the above statement.—J.C., 24/1/81. Mr. Turton.

Thomas Wilson's corrected Statement.

Thomas Wilson states: - When you first came out and spoke to Frost last night we were on the turn-table. You said, "John, you must get over the table and let this engine get turned to get away." He did not go over the turn-table but came back towards the coal-stage, disobeying your instructions. He then got off the engine and walked up to you. I saw him put his face up to you in an offensive manner, then got off the engine and walked up to you. I saw nim put his race up to you in an offensive manner, but could not hear the conversation, the distance was too great. He afterwards got on the engine, and I heard you tell him to get off the engine 88. He replied, "What have I to come off for—what have I done?" and refused to come down; I heard you telling two men to get up and put him off; on their getting up for that purpose he (Frost) told them the first man that put a hand on him he would make it a dear day's work for him, or words to that effect; when you tell Frost to come off his engine, as it was leaving the turn-table for the coal-stage pit, I saw him look down in a scowling manner at you. Frost would not leave the engine till Green got up and took charge.

THOMAS WILSON,

20/1/81.

Fireman Wilson to The Locomotive Overseer.

Dear Sir, January 21, 1881. I believe John Frost's statement of 19th instant to be correct, and I may add that I heard Mr. Turton order him (Frost) off his engine, and he said, "What have I done, or what have I said?" Mr. Turton said, "Come off at once, or I will have you put off"; then he sent two fuel-men on the engine for that purpose, but he did not get off until Mr. Turton sent for driver Green to take charge; then he (Frost) got down, and driver Green and I put the engine in the shed. The second time that Mr. Turton came he seemed very violent, and Frost told him that if he waited till he had filled up his boiler he would come down and talk to him, but Mr. Turton ordered him off at once. After we had turned our engine we waited for fully 5 minutes before the Rydal engine came on the pit, as it was shunting on the main line as we saw them go off the main line for water.

THOMAS WILSON, Fireman.

Handed to me by John Frost.—J.C., 21/2/82.

No. 2.

Memo. to Locomotive Overseer.

Sir, Sydney, 25 January, 1881. In accordance with your instructions I proceeded to Bathurst to inquire into Mr. Turton's

report, charging driver John Frost with gross insubordination on the evening of the above date. I have also examined and taken the evidence of all the persons who have any knowledge of the case. It is quite clear that Frost is to blame for not obeying Mr. Turton's orders (given through fuelman Gannoni) not to go on the turn-table until after the Rydal engine had turned; and although it appears that Mr. Turton had not given direct orders about the proper times of the Rydal and Sydney engines turning, &c., it has been the custom for some time (as Frost admits) for the Sydney engine to give place to the Rydal engine, and Frost should have waited, and if the Rydal engine was not ready, could easily have pointed it out to Mr. Turton (whose office is only a few yards off), and got his permission to turn his engine.

turn his engine.

Frost no doubt thought he would have had sufficient time to have turned his engine, and got clear before the Rydal engine was ready; he had just come from Sydney (145 miles). The Rydal engine does not leave until 6:30 p.m., the squabble occurring at 5:35 p.m.; Frost appears to have made another mistake; he states he was sent on to the turn-table by the shunter, he obeyed the shunter, but when told by the fuel-man not to go on the table he refused to obey him.

Mr. Turton denies charging Frost with being drunk, and stated to me that Frost was perfectly

sober.

The evidence does not corroborate the statement made by Mr. Turton that Frost used the very improper language and threats named, as none of the witnesses were near enough to hear what was said by Mr. Turton or Frost to each other, and whether Frost did use the language complained of, or not, must,

I think, remain an open question.

There is no proof that Mr. Turton was violent in his language or behaviour to Frost; no doubt he was excited, and was justified in suspending Frost for insubordination and for making use of some expressions which Frost, who was, I expect, as much excited as Mr. Turton, perhaps now feels sorry for; but it is very questionable whether Mr. Turton acted rightly or judiciously in ordering the fuel-man to pull Frost off his engine.

John Frost has been a first-class driver for upwards of seventeen years; he is rather a shorttempered man, but I have never heard of his making use of any bad or threatening language to any one.

I think that taking all the circumstances of the case, if Frost be reprimanded and allowed to

resume duty it will meet the case.

I would also suggest that Mr. Turton be instructed to give his orders direct, or through his day and night shed inspectors, and that Mr. Clark, his timekeeper, confine himself strictly to his office duties. JOHN COBB.

After reading the evidence carefully through I think John Frost is to blame in disregarding orders, and I think that if he is kept suspended without pay until the 28th instant it will be sufficient punishment. No doubt both Mr. Turton and John Frost were excited at the time, and I think Mr. Turton should have allowed John Frost to have put his engine away in the shed, and then sent for him to come to his office for any instructions he had to give him. It is also necessary for the working of the Department that Mr. Cobb's suggestion with respect to Mr. Clark be carried out.-W. Scott, 26/1/81. Locomotive Engineer.

Minute of Locomotive Engineer.

Having given full consideration to this case, and having carefully compared and weighed the evidence, I am quite satisfied that Driver Frost's version of the affair is wholly and absolutely disproved, and in view of Mr. Turton's report, and of the position taken up by Driver Frost at the interview with him (on the 9th inst.) as recorded in my minute of 9/2/81, I direct that he be dismissed the service.—

B.H.B. 29/2/21 Mr. Scott R.H.B., 22/2/81. Mr. Scott.

Noted and driver J. Frost informed.—J.C., 23/2/81.

As I could not concur in these recommendations, I directed, on the 28/1/81, a meeting of Inspector

Turton and Driver Frost to take place at my office on the earliest opportunity.

The opening of the extensions to Wellington and Albury and the subsequent work involved by them, prevented a day being fixed before the 9th inst. I then fully considered the evidence and the personal explanations of both Driver Frost and Mr. Turton, and was satisfied that Frost's statements could not be accepted as true.

I informed him thereof, and that he would have to remain suspended until I had had time to weigh

the case in the hope of seeing my way to allow him to remain in the service.

Further consideration, and his reiteration to me on Saturday, the 19th inst., of the truthfulness of his version of the case, and of the charge he made against Mr. Turton as recorded in my minute of 9/2/81, and which he has up to the last not thought fit to withdraw, left me no course open, I regret to say, but to direct his dismissal as per my minute of 22/2/81.—R.H.B., 23/2/81.

[Enclosure.]

Enclosure.]

By Mr. Cobb: Thomas Wilson, fireman to John Frost (No. 88) on the 19th instant:—On arrival at Bathurst our engine was turned into the turn-table siding; the fuel-man, Gannoni, told driver John Frost that he would have to get out of the road, and let the Rydal engine turn first, as that engine had the preference. Frost said to Gannoni, "What have you got to do with it, and by whose orders is it?" I think he replied, "By Mr. Clark's orders"; we went on to the turn-table, and Gannoni went to the office, and then Mr. Turton came up to us and said, "John, you will have to set back over the table, and allow the Rydal engine to turn." Frost got off the engine and went to speak to Mr. Turton, but I could not hear what was said, but saw Frost pointing out which road he wanted to go on. I did not hear Frost make use of any threat or improper language to Mr. Turton, neither did I hear Mr. Turton use any improper language to him; after they had spoken together a few minutes, Mr. Turton went away and then came back again and told Frost that he would have to get off the engine at once, or else he would have some men sent to put him off. Frost did not reply immediately, but subsequently asked Mr. Turton "What have I done or said"; Mr. Turton kept repeating—"You will have to come off"; Frost said, "I will come off when I have filled the boiler"; he then ordered the two fuel-men to pull him off, and sent for driver Green to take charge of his engine; when the fuel-men got on our engine Frost said to them, "The first man that lays a hand on me I will make it a dear day's work for him," or words to that effect, and then got off his engine of his own accord. Frost was perfectly sober at the time; the time which elapsed between Mr. Turton's first coming to the engine, and when he went away and returned again would be about 5 minutes; the Rydal engine had turned and there was no delay caused by our engine.

THOMAS WILSON.

Bathurst, 22 January, 1881. Bathurst, 22 January, 1881.

By Mr. Cobb: Mr. Wm. Clark (clerk to Mr. Turton, Locomotive Inspector, Bathurst), examined:—I gave no instructions to the fuel-man respecting John Frost or his engine, neither did I see Frost at all that evening. I know nothing whatever about the altercation between Mr. Turton and Frost; the statement that I went away in company with Mr. Turton is incorrect, and that he consulted with me is also incorrect. I knew nothing about Frost being ordered off his engine by Mr. Turton until after Mr. Turton came to the office at 6·10 p.m.; I had not seen Mr. Turton for half an hour previously to this; this is all I know of the matter.

By John Frost: I was in the bath-room when this occurred.

By Mr. Cobb: Andrew Smith, fuel-man at Bathurst, examined:—I heard Mr. Turton order Frost off his engine. I heard Frost say, "What is your motive for putting me off my engine?" Mr. Turton then told me to get up and put him off; I got on the engine and told Frost he had better get down; he said he would get down as soon as he had done his work; he (Frost) made use of no threat to Mr. Turton in my presence, but he said when I was getting on the step of the engine to put him off, that the first man that put his hands on him he would knock his brains out; he did not get off his engine until driver Green got on, then Frost got off of his own accord; Frost's fireman was standing between me and Frost, and must have heard the threat which Frost made—that he would knock the brains out of the first man who touched him; Frost was not under the influence of drink as far as I could see or judge. Wilson says "A driver Green got on, then Frost got off of his own accord; dearday's work," have heard the threat which Frost made—that he would knock or words to that not under the influence of drink as far as I could see or judge. effect.

A. SMITH.

By Mr. Cobb: Autonio Gamoni, head fuel-man at Bathurst: The passenger engine No. 88, driver J. Frost, was standing on the loop road when I first saw it; he then moved his engine back to get on the turn-table. I told Frost to stop so that the Rydal engine could come in, get turned, and coaled first; Frost told me in reply to mind my own business. The first instructions I had respecting the Rydal engine coaling and having the preference over the passenger engine, were from Mr. Clark about a month ago. I went and complained to Mr. Turton that Frost had taken his engine on to the turn-table, and asked which engine was to have the preference. Mr. Turton informed me that the Rydal engine was to have the preference; I never received any instructions from Mr. Turton before this that the Rydal engine was to have the preference; while I have been employed here (five months) the Rydal engine has invariably had the preference, except on one occasion when the passenger engine was turned first. I did not hear Frost make use of any threat to Mr. Turton. Mr. Turton ordered me and Smith (the fuel-man) to go on the engine and put Frost off; when I got on Frost's engine he said, "The first man that lays hands on me," and this is all I heard; when Mr. Turton ordered Frost to come off the engine I heard Frost say, "I want to put water in the boiler first;" Green then got on by Mr. Turton's orders and Frost got down of his own accord. Frost appeared to be quite sober at the time.

By Mr. Frost: I had my hand on J. Frost's shoulder when I heard him make use of the words, "The first man that lays hands on me;" this is all I heard; I have received a rule book from Mr. Clark, instructed by Mr. Turton, since this occurrence.

ANTONIO GANNONI says the fireman was between him and Frost, and the preference and the preference over the man at Rethard. The contract of the man at Rethard. The contract of the man at Rethard. The contract of the man at Rethard. The contract of the man at Rethard. The contract of the man at Rethard. The

says the fireman was between him and Frost, whereas Gannoni tell Frost not to go on to the turn-table; I heard Frost say, "By whose orders?" Gannoni replied, "By Mr. Turton's and whereas Gannoni then said, "I will go and see Mr. Turton about it;" Frost said, "All right, you can please yourself about had his hands on mine." Gannoni then said, "I will go above the points and go on to the turn-table and clear my smoke-box and Frost's shoulder: that;" Frost said to me and Gannoni, "I will go above the points and go on to the turn-table and clear my smoke-box and turn, by that time the Rydal engine (No. 49) will have taken water, and the work will be forwarded;" he went on to the

table and turned his engine, and while doing this Gannoni brought the Rydal engine on to the pit, and thus blocked Frost's engine in; the Rydal engine stopped in the pit; the men got coal and raked out the ash-pan; Frost moved his engine off the turn-table up towards the Rydal engine; after Frost had turned his engine I heard Mr. Turton order him to move his engine over to the other side of the table, to allow the Rydal engine to get turned; Frost moved his engine as he was ordered about a minute afterwards; I did not hear Frost make use of any threat to Mr. Turton, but he got off his engine and walked towards Mr. Turton, when he charged Frost with being under the influence of drink; Frost replied, "I am not drunk, neither do I drink;" I was then sent by Mr. Turton to tell driver Green to come and take charge of Frost's engine, both Mr. Turton and Frost appeared to me to be out of temper. I heard Mr. Turton order Frost off his engine, and he replied that the time

By Mr. Turton: I heard you tell Frost not to go on No. 88 engine, but he did so in defiance of your orders. I heard you again tell him to come off the engine, which he refused to do, as he said he had charge of that engine.

GEO. WILSON.

By Mr. Cobb: William Green, night driver in charge of Bathurst-shed, examined: I was sent for by Mr. Turton at five minutes to 6 on Wednesday night, the 19th instant, to come to the coal-stage; I then received instructions from Mr. Turton to take charge of engine No. 88, and to put driver J. Frost off; when I got on to the engine driver Frost got off; this is all I know of the matter; when I got on Frost's engine he was there with his fireman and fuel-man, Smith; the other two fuel-men, Gannoni and Wilson, were standing on the coal-stage beside the engine; as far as I could observe I do not think either Mr. Turton or Frost were out of temper. I consider Frost was quite sober.

By Mr. Cobb: Thomas Wills, head night-shunter at Bathurst, examined:—I remember the evening of the 19th instant, when J. Frost arrived with passenger train from Sydney. I cut off the engine from the train and rode on it to the points leading off the main line to the locomotive siding, and turned the engine in for the turn-table road, after this a few minutes elapsed, and then shunter Trives let the Rydal engine on to the turn-table road. I heard Mr. Turton instruct driver Green to take charge of No. 88 engine and put Frost off. I did not hear Frost make use of any threat to Mr. Turton. I consider Mr. Turton was excited. Frost was in his usual temper, as far as I could see, before and after the occurrence. I did not speak to Mr. Turton. I consider Frost was quite sober.

THOS. WILLS.

By Mr. Cobb: John Emmett, night-shunter at Bathurst, examined:—I remember the evening of the 19th instant, when J. Frost arrived from Sydney with the passenger train; I was present at the time, when I heard Mr. Turton order the fuel-men to get on the engine and put driver J. Frost off. I did not hear Frost make use of any threat; I thought Mr. Turton was excited, but I did not think Frost was yehen Frost was on the turn-table he did not block the Rydal engine or cause delay, as that engine was standing taking in water and afterwards coal, and if any delay was caused it was through the altercation between Frost, Mr. Turton, and the fuel-men. Frost, I consider, was perfectly sober. I did not hear Mr. Turton charge Frost with being in liquor. Frost with being in liquor.

JOHN EMMETT.

Mr. Turton, Locomotive Inspector at Bathurst:—I have heard the whole of the foregoing evidence taken, and beg to state that Mr. Clark's evidence is perfecely correct, and that also given by Smith. With reference to Gannoni's evidence, which is all correct except his statements about having his instructions from me respecting the coaling and turning of the Rydal engine; but I believe I have given him instructions, and the custom has been to operate on the Rydal engine first. With reference to the statement made by Wilson, that Frost replied to Mr. Turton' in these words, "I am not drunk, nor do I drink," it is quite correct, but I emphatically deny having accused Frost of being drunk or in liquor. I have read the evidence given by Wilson, and in the main it is quite true, with the above exception. The evidence given by Green is also correct. In reply to the statement made by Thomas Wills that I was excited—I was not excited at all, except that I moved about perhaps a little quicker than usual, but made no expressions to indicate extreme excitement. As driver Frost stood on the turn-table against my orders, and blocked the Rydal engine, he therefore caused delay, and the engine ought to have been out earlier; some of the delay was caused by the altercation. I wish to add that G. Wilson's statement that Frost moved his engine, when ordered, about a minute afterwards is incorrect. The facts are, that after I ordered him to move mention as I ordered him, in the opposite direction. It was then he got off his engine and came to me, and the altercation took place, upon which I suspended him. The paragraphs in statement of fireman Thomas Wilson, taken by me on the 20th instant, and erased by you as having afterwards been insorted by me, were not so, as stated by Wilson, but were his own words in reply to questions put to him by me. His statement was then read over to him in my presence and signed by him as correct. I instructed my clerk, Mr. Clark, to re-write it word for word, and this was done. It was again read over

J. TURTON, 25/1/81.

Bathurst, January 25, 1881. With reference to the statement of Thomas Wilson, fireman to John Frost, in which he says some of the evidence (erased) given by him on the morning of the 20th instant was inserted by you, I beg to state that at the time he (Wilson) signed that statement you were not present, and as he was waiting in the office to sign it before joining his train "No. 8 up," he read over part of his original statement (of which the one referred to is a perfect copy) to me in order to facilitate his getting away, while I wrote out the one sent up. I then read it to him and he signed it; you were present when he gave the Sir

statement at first, and the replies to your questions were put down precisely as given by Wilson to you; this second statement was made out on account of first being interlined.

WILLIAM A. CLARK.

Mr. J. Turton.

By Mr. Cobb: Driver J. Frost: I have heard read the statements made in Mr. Turton's report. I heard the evidence given by all the witnesses and have also had an opportunity of asking each of them questions. In reply I totally deny all the charges brought against me by Mr. Turton, except being ordered off my engine until I had filled my boiler. The statement of fuel-man Smith that I would knock the first man's brains out, &c., &c., is totally incorrect. I deny the statement made by Gannoni that I used the words "the first man that laid hands on me, &c." The evidence given by G. Wilson is correct. The evidence given by W. Green and shunter Thos. Wills is correct. The evidence given by J. Emmett is correct, except that his statement "if any delay was caused it was through the altercation, &c.," but I state that there was no delay caused. I deny that I was told not to go on No. 88 by Mr. Turton, and also that I did not refuse to come off after I had got, on to fill my boiler.

JOHN FROST.

Bathurst, 22 January, 1881. I know nothing of the circumstances which led to the suspension of driver John Frost. He called at my residence as I am informed about 8 p.m. I was out. Shortly after my return, about 9 o'clock, I saw him. He was perfectly sober, and from his appearance and demeanour I had no hesitation in arriving at the conclusion that he had not been drinking; there was not a trace of liquor about him.

M. A. HORNIDGE. Memorandum

Memorandum to Mr. Cobb.

Bathurst Station, 22 January, 1881.
On arrival of down passenger, No. 5, on the 19th instant, the driver (Frost) handed me the staff in the usual way; I am quite positive he was not intoxicated or had the slightest appearance of his having been drinking.

GEO. BONAMY,

Station-master.

February 22, 1881.

Mr. Turton states with reference to driver Frost's statement that he (Mr. Turton) "then went away (in company with his clerk) and after, I suppose, consulting that officer, he came back and told me I was under the influence of drink and that I was suspended." After telling Frost that he was suspended and that he was not to go again on his engine, he doing so in opposition to my orders, I walked to the end and that he was not to go again on his engine, he doing so in opposition to my orders, I walked to the end of the coal stage (a distance of 20 or 30 yards). I then turned round and walked back to him, he having in the meantime moved his engine over the turn-table. I then told him to come off his engine, being determined to have my orders carried out. He then scowled down at me and asked me, two or three times over, why he should come off the engine; I replied, "Come off that engine." While this was going on he was moving his engine over the table towards the coal stage, I accompanying him on foot, and on his stanning. I told him to some off the engine or I would have him not off. As he still refused and on his stopping, I told him to come off the engine, or I would have him put off. As he still refused to come off, it was then I ordered the fuel-men to put him off his engine as reported by me.

No. 3.

Minutes and Reports having reference to further Inquiry made.

WILL the Locomotive Engineer be good enough to let me see the papers in Frost the engine driver's case. I asked to see the papers before anything final was determined, but I hear that Frost has been dismissed. CHAS. A. G., 23/2/81.

Papers herewith. The records do not show any minute from the Commissioner asking to see the papers before anything final was determined.—R.H.B., 23/2/81.—Commissioner.

Driver John Frost to The Commissioner for Railways.

Sir, Sydney, 25 February, 1881 Feeling myself aggrieved, and not being satisfied with the result of the inquiry lately held in my case, I beg therefore, in pursuance of rule 26, to respectfully submit my case for your investigation. Yours, &c.

JÓHN FROST.

Locomotive Engineer.—W. Scott, 25/2/81. The Commissioner.—R.H.B., 25/2/81. I have read the evidence taken in Frost's case, and would like to see Mr. Turton. Will the Locomotive Engineer direct him to call upon me?—Chas. A. G., B.C., 2/3/81. Write, instructing Mr. Turton to report himself here as early as possible.—R.H.B., 3/3/81.

I called at the Commissioner's Office with Mr. Turton at 11.5 to-day. About 11.45* the Commissioner admitted me to his office. I informed him I had brought Mr. Turton in reply to Commissioner's minute of 2/3/81. On my bringing Mr. Turton in, the Commissioner stated that he wanted to ask him some questions in the case of Frost (dismissed the Service), but that there was (about 1145) not sufficient time to do so to-day. After some conversation as to when Inspector Turton could call again, the Commissioner fixed 11 a.m. on Monday, the 7th, for an interview with Mr. Turton.—R.H.B., 5/3/82.

* Mr. Burnett seems to attach importance to small and immaterial circumstances, but he has not quite gathered the facts. I thought Mr. Burnett was aware that I was not at the office at 11 5, when he called. I admitted Mr. Burnett immediately on my arrival. I had been, and was then, engaged on a most important and urgent matter, and as Mr. Burnett had given me no previous intimation of his coming, I informed him "not that there was not time," &c., but that I had not time to go into the matter that day.—Chas. A. G., 15/3/81.

I called at the Commissioner's Office to-day, March 7th, '81, at 11 a.m., as appointed, with Mr. Turton. The Commissioner requested me to see him alone, and the interview lasted about an hour, during which I indicated to the Commissioner the points in the evidence which proved the untruthfulness of which I indicated to the Commissioner the points in the evidence which proved the untruthfulness of Frost's version of the case. The Commissioner having then raised a point in connection with Frost's exclamation "I am not drunk," &c., Mr. Turton was, on my suggestion, called in to give his own explanation to the Commissioner's inquiry, why he (Turton) had not questioned G. Wilson on the 22/1/81 as to the words which, as is *implied* by G. Wilson's evidence, were used by Mr. Turton when he (G. Wilson) states "I did not hear Frost make use of any threat to Mr. Turton, but he got off his engine and walked towards Mr. Turton, when he charged Frost with being under the influence of drink."

Mr. Turton replied in substance that it did not occur to him to ask the question, as he had already stated distinctly that he had never accused Frost of being drunk, or the worse for drink, and that he (Turton) did not anticipate so much importance would be attached to the statement. Mr. Turton then explained that the remark from Frost, "I am not drunk, and don't drink," was an after thought on his (Frost's) part, and was made after the conversation between Frost and himself, on which he (Turton) had suspended him, was completed, and after Frost had walked away several paces, when he (Frost) stopped to Wilson over the distribution of the corridor, and the interview between the Commissioner and myself was brought to a close retired to the corridor, and the interview between the commissioner and myself has brought to about 1.30 by the Commissioner requesting to have additional evidence on the point, as to whether G. Wilson actually heard Mr. Turton accuse Frost of being under the influence of drink, or whether Wilson

heard him.-Сназ. А. G.

Wilson had merely (as I contended was the case) inferred the accusation from the exclamation of Frost "I am not drunk, neither do I drink," for which purpose the Commissioner said he would at once return the papers to me, for me to obtain the additional evidence. I then took occasion to point out to the Commissioner that, as it seemed to me, the evidence was on other points, as well as on this, amply conclusive against Frost without any further evidence, and that to call G. Wilson again, after Frost and others had had time to see the effect of evidence on the point in question, was giving an opportunity, if he were so minded, for G. Wilson to affect the case prejudicially and unfairly to Mr. Turton, by telling a lie on a point on which he could not be refuted (if Mr. Turton's evidence were questioned) except by cross-examination. As the Commissioner still expressed his wish to have further evidence on this point, I stated I would of course, at once, obtain it on the written order of the Commissioner.

R.H.B.

I have given a good deal of consideration to this case, but before arriving finally at a decision on its merits think it desirable that Geo. Wilson, fuel-man, should be asked to say whether he heard Mr. Turton say to Frost, "You are under the influence of drink," and at what time or in what place or position Frost said "I am not drunk, nor do I drink." I shall be glad if the Locomotive Engineer will obtain this information for me.—Chas. A. G., B.C., 7/3/81.

For further evidence and report see my minute of 12/3/81.—R.H.B., 14/3/81.

[Enclosure.]

Further evidence taken before Locomotive Engineer.

Present:

Messrs. Cobb and Turton.

Bathurst, 8 March, 1881.

Messrs. Cobb and Tueton.

Bathurst, 8 March, 1881.

George Wilson called: I have compared the plan marked A with the ground; I saw the engine No. 88 driven by Frost on the evening of the 19th January come in off the main line over the points marked B and C; the shunter (Wills) was with it, and brought the engine from the main line over points C, and placed it on the old coal siding road at D, opposite the ash-pit, between which and the engine I was standing; the driver (Frost) waited there a few minutes until engine No. 93 (pilot engine of Rydal train, No. 1 down goods) moved off the pit towards the engine-shed, clear of point C, when Frost moved his engine over points E, and went on to the turn-table; in the meantime the train engine of the Rydal train (engine No. 49) came from the water-tank and stood over the ash-pit in front of the old coal-stage, and was raked out and coaled gwhile 49 engine was being raked out and coaled Mr. Turton arrived, having been appealed to by Gannoni; I had just completed cleaning out the smoke-box of engine No. 88 when Mr. Turton came close to that engine; I jumped from the end of the tender on to the ground on the coal-stage side; I believe the tender was then partly off the table towards the coal-stage, but I cannot speak positively as to that; after I jumped off the tender of engine S8 I walked to the Rydal engine No. 49, which was still on the pit opposite the coal-stage; I got up and threw some water on the coal on the coal-stage to lay the dust; I then helped to finish coaling that engine; I remained on the coal-stage after that near lamp F, until a few minutes past 6 o'clock, when I went home; I was standing at G when I heard Mr. Turton order Frost "to move his engine over the other side of the table to allow the engine (Rydal, No. 49) to get turned." as stated in my evidence on 22/1/81, If. Turton was standing opposite me on the other side of the rails, at H, and Frost was then on his engine; I was on mine from G (where I jumped off engine 89) to the coal-stage to help to exclamation was made by Frost.

Cross-examined by Mr. Turton:

Are you positive Frost and I were at H when the conversation you have just spoken to took place? Yes.

Are you sure we were not opposite the centre of the ash-pit? .I won't swear you and he were not opposite the ash-pit.

At the time you say you heard myself and Frost making use of the expressions referring to drink were we standing close together? Yes; you were standing close together.

Did you see Frost walk away from me towards his engine at the time his exclamation was made use of? I could not positively swear that he did not walk away.

Re-examined by Locomotive Engineer:

If Mr. Turton and Frost were opposite the ash-pit at the old coal-stage when the conversation took place about the drink how did you hear it when you were at K? I say they did not have the conversation at the pit.

Where had they the conversation about the drink? Between the Rydal engine and engine 88.

What was the charge made by Mr. Turton? When Mr. Turton came to the turn-table and spoke to Frost, his first words were:—"You had better go over the table and let the Rydal engine turn," or words to that effect.

What was the next remark of Mr. Turton? They (that is Mr. Turton and Frost) stopped about a minute. (After a pause) I have nothing more to say on it.

What was the next remark of Mr. Turton? They (that is Mr. Turton and Frost) stopped about a minute. (After a pause.) I have nothing more to say on it.

You did not hear any further conversation? I did not hear any further conversation than what I have stated.

Then I understand you to say that after Mr. Turton had remarked to Frost "You had better go over the table and let the Rydal engine turn," there was a pause in the conversation for about a minute, when Mr. Turton exclaimed :—"I charge you under the influence of drink"? That is right.

Why did you pause in your way from the engine (88) to your work on the coal-stage, while this pause in the conversation between Mr. Turton and Frost took place? I cannot say; there is many a thing stops us there.

What stopped you on this occasion? I cannot say what stopped me.

How long did you stand there? I don't know how long it was.

How long do you think? About half a minute, or perhaps less or more.

What happened then? I have not got any more to say.

What did you see Mr. Turton and Frost do after the exclamation from Frost:—"I am not drunk, neither do I drink"? I did not see any more.

drink ?? I did not see any more.

What did you do then? I walked away towards the Rydal engine No. 49, and began watering the coal as decribed in the beginning of my evidence.

You have stated that you went straight from the place where you stood at K during the conversation between Mr. Turton and Frost, to the coal stage and watered some coal, and then helped to coal the Rydal engine, and that you remained after that near lamp F until you went home soon after 6? That is so.

In your evidence of 22/1/81, you state that after you heard Frost exclaim "I am not drunk, neither do I drink,' I was then sent by Mr. Turton to tell driver Green to come and take charge of Frost's engine."? I was sent off the coal stage

by Mr. Turton. When? After all the conversation was passed. But when-before or after the watering of the coal? But you have stated you remained on the coal stage all the time after you had got upon it, the first time after removing the ashes from engine No. 88? I remember now Mr. Turton telling me to go for driver Green after I had watered and coaled engine No. 49.

Did you see nothing of Frost in the meantime after you had left the spot K? No, not till I came back with Green. got on the stage again, and remained until a few minutes past 6.

GEORGE WILSON.

March 8, 1881.

David King Broderick, fuelman, called by Locomotive Engineer:—I remember engine No. 88, driven by Frost on the evening of January 19th, /81; I remember that engine coming down towards the turn-table; I was waiting to turn her or any engine that came; I believe I had partially turned her when Mr. Turton arrived, and came close up to the turn-table; I had partially completed turning No. 88, when I went to the Rydal engine which was then standing on the pit opposite the coal stage; I got into the pit and raked her out; as I was getting into the pit Mr. Turton, I believe, spoke to me, and told me to make haste and get the engine raked out, so that she could get away; the blower of the engine was on, and made a great noise, so that I could not hear anything that was going on; this engine, No. 49, had moved in on to the pit opposite the coal stage immediately after Frost's engine had gone on to the turn-table.

DAVID K. BRODERICK.

March 8, 1881.

Andrew Smith, fuelman, called by Locomotive Engineer:—I was helping to coal engine No. 49 when she stood on the pit opposite the coal stage; I then heard Mr. Turton's voice in conversation with some one on the other side of the tender, but I could not recognise the voice; it was not the voice of any of the fuelmen—that I am positive of; I could not hear what was said on account of the noise made by the shovelling of the coal, and by the blower which is always on when the ashes are being raked out; the chimney was towards the water-tank; Wilson was assisting me and Gannoni to coal the engine No. 49 when I heard Mr. Turton's voice in conversation with some one; Wilson was at the trailing end of the

ANDREW SMITH.

March 8, 1881.

Antonio Gannoni, fuelman, called by Locomotive Engineer:—I assisted in coaling engine 49 on the pit on the evening of the 19th January; Wilson assisted Smith and me; he (Wilson) worked at the trailing end of the tender, which was towards the turn-table; when I commenced to coal I happened to knock a can (a tea-can) off the side of the tender on to the foot-plate, and I stooped to pick it up, when I saw Mr. Turton on the other side of the tender; it was a mere glance of him between the fire-box and the front of the tender, as I stooped forward to pick up the can; I did not hear any conversation on account of the poise of the shovels and the blower account of the noise of the shovels and the blower.

ANTONIO GANNONI.

Bathurst, 8 March, 1881.

HAVING heard the evidence of fuelman George Wilson, taken by the Locomotive Engineer to-day, I have to state that from his manner of giving his evidence, his hesitation, and the way he contradicted himself on so many points, I consider it was most unsatisfactory; and there is no doubt in my mind that he has made several misstatements, and he appeared to me to be determined to stick to them.

JOHN COBB.

Bathurst, 8 March, 1881.

I HAVE to state that the spot marked + is that on which the conversation between myself and driver, John Frost—when he exclaimed "I am not drunk, nor I don't drink,"—took place, and the engine No. 49 at that time stood with the funnel towards the water-tank, with the ash-pan about its full length over the end of ash-pit, and the trailing end of tender at about the middle of the pit; the exclamation, "I am not drunk, nor I don't drink," was made by driver Frost after I had suspended him for the language he had used to me, and after he had walked 4 or 5 yards away from me in the direction of his engine, No. 88; he then turned round and made use of the exclamation without the slightest grounds for making use of the words, from anything I said to him, as previously stated by me.

J. TURTON.

Thomas Wilson, fireman to Frost, called by Locomotive Engineer, on his arrival from Sydney by the 9 a.m. down passenger train, arriving at Bathurst at 5.27 p.m.:—Mr. Turton was standing close to the turn-table on the side near H when he told driver Frost that he would have to set back over the table; when Frost got off to speak to Mr. Turton he went to Mr. Turton, who was standing, to the best of my belief, opposite the engine pit at the coal stage, at the mark +; I was then standing on the foot-plate of the engine, waiting for Frost to return to the engine, these are the facts to the best of my belief; to the best of my belief the engine was standing on the turn-table, and the tender just off towards the coal stage when Mr. Turton returned (after the conversation between him and Frost) and ordered Frost to come off his engine, but I would not be positive the engine was not at the other side of the table. not be positive the engine was not at the other side of the table.

THOMAS WILSON.

In accordance with the request of the Locomotive Engineer I here state the facts before referred to by me, in the order in which they occurred:—When I first spoke to Frost, and told him to go over the turn-table, I stood at H, and his engine 88, stood on the turn-table as marked in red on sketch. I immediately afterwards walked towards engine 49, which was standing on the ash-pit in front of old coal stage, to expedite the work, and seeing fuelman David Broderick in the act of getting under engine 49 to rake out the ashes, I told him to look sharp and get her done, so that she could get away; I then stepped back from the side of the engine and stood at +, and on looking towards the turn-table saw that driver Frost had disobeyed my order and had brought engine 88 towards the coal-stage, the tender being off and clear of the table; he got off his engine, leaving her in that position, and walked to me at +; it was then and there he made use of the expressions to me for which I suspended him; he then walked a few paces from me in the direction of engine 88, and turning round exclaimed, "I am not drunk, nor I don't drink"; he then turned and went towards his engine; I then, thinking that he intended to disregard my suspension of him, called after him from where I was standing at +, and ordered him not to get on his engine, as he still continued going to her and got on the step, while I still remained at +; being now convinced he intended to disregard my suspension of him, and being for the moment uncertain what further steps to take, I walked round the coal stage to J, and immediately retraced my steps and walked up to Frost's engine, which I found he had moved in the meantime over the table to the dead road at M; in the meantime engine 49, that had been standing on the ash-pit, was moved on to the turn-table, and after being turned was taken right away; being determined to have my orders obeyed, I there and then told him (Frost) to get off the engine; he then, after a slight pause, asked

asked what he should get off for, at the same time moving his engine over the turn-table towards the coal stage; I then followed up alongside the engine; as Frost continued to move along the front of the coal stage to the ash-pit I followed on foot, repeating my order and telling him I would have him put off if he did not come; as he still refused to come off, saying he had charge of the engine, I ordered fuelmen Andrew Smith and Antonio Gannoni to get on the engine and put him off, the engine being then standing on the ash-pit; as he (Frost) still refused to get off the engine after Smith and Gannoni got up to put him off, I sent fuelman Geo. Wilson, who appeared to come from the coal stage, for driver Wm. Green, who came and was told by me to take charge of the engine No. 88, which he did; Frost then got off.

J. TURTON 8/3/81.

Mr. Turton to state why no reference is made in his report of 19/1/81 to the exclamation of Frost, "I am not drunk,

9/3/81.

I made no reference to Frost's exclamation, "I am not drunk, nor I don't drink," as I attached no importance to the words; I did not even condescend to reply to him when he made use of them. It was not until next morning, and after I had sent in my report, that I was informed by inspector Hornidge, on my mentioning having suspended Frost, that Frost had been to him on the previous night, about 9 p.m., or about three hours after I had suspended him, and asked for his (Mr. Hornidge's opinion as to whether he (Frost) was drunk or in liquor; and stated I had charged him with being so. I expressed my surprise that Frost should make such a statement as I had not so charged him, he being, in my opinion, perfectly sober when suspended by me.

J. TURTON, 9/3/81.

Minute of Locomotive Engineer on evidence taken.

With reference to the further evidence asked for in the Commissioner's Minute of 7/3/81, in the matter of Frost's appeal of 25/2/81, against his dismissal from the Service, I have to report that I proceeded the same evening to Bathurst, and took further evidence from G. Wilson, in the presence of Messrs. Cobb and Turton, and now forward the same to the Commissioner, together with that of D. K. Broderick, Andrew Smith, Antonio Gannoni, and Thomas Wilson, as well as that of Inspector Turton, all bearing on the points in question.

I also forward Mr. Cobb's report on the behaviour of G. Wilson under cross-examination, together with a detailed statement by Mr. Turton, giving, at my request, each incident from the moment of his first

speaking to Frost up to the time of Frost's removal from his engine.

In forwarding G. Wilson's evidence, I may remark that although he has stated that he heard Mr. Turton accuse Frost of being under the influence (in these words, as he states, "I charge you under the influence of drink"), I regard his evidence on this point as utterly worthless, as will be at once seen by his contradictions of himself under cross-examination. At the same time his evidence on the main supports that of Mr. Turton on several important points, and notably on that one as to when the reference to drink was made, thus confirming the previous proof of Frost having told a lie which he says (as he does in his report of 20/1/81), "He (Mr. Turton) then," i.e., after ordering him (Frost) to set back off the turntable, "went away in company with sclerk, and after, I suppose, consulting that officer" (a gratuitous of importance on Frost's part as the clerk, and are proceed that he had no know piece of impertinence on Frost's part, as the clerk was not present, and has proved that he had no know-ledge of the events until after they were past) "he (Mr. Turton) came back and told me I was under the

ledge of the events until after they were past) "he (Mr. Turton) came back and told me I was under the influence of drink, and that I was suspended, and in a furious manner ordered me off my engine."

G. Wilson, on the other hand, distinctly affirms that the exclamation of Frost, "I am not drunk, neither do I drink," was made when Mr. Turton had arrived for the first time on the ground, where he remained, as G. Wilson says, in his (Wilson's) sight all the time, and had just told Frost to move his engine over the other side of the table to allow the Rydal Engine (No. 49) to get turned, thus confirming, as I have said before, Mr. Turton's statement that Frost's exclamation was prior to his (Mr. Turton) coming the second time—after his short absence in his walk past the end of the coal stage and back—to insist on his

already given order of suspension of Frost being obeyed.

The justice of my decision in this case, in dismissing Frost, not only for gross insubordination but for lying and making a baseless charge against his superior officer, in his (Frost's) endeavour to screen himself from the consequences of his disgraceful conduct, remaining unshaken, I feel compelled, in justice to myself, and from a sense of the responsibility connected with the carrying on of the work of a department in which the lives of the public are involved, to invite, with all respect, the Commissioner's attention to what appears to me to be a matter of grave importance, viz., the serious diversion of my time and attention from technical and other matters pressing for my consideration, and on which the efficiency and safety of the railway depends, in consequence of Frost's appeal having been entertained, notwithstanding the careful consideration I had already given to the matter, and the abundance and force of the evidence against him when I arrived at my decision in the case, and I do so the more especially as it seems to me that the prompt dismissal of appeals in all such cases is absolutely necessary to ensure that prompt obedience of orders, and that respect for authority, without which the traffic of a railway cannot be safely conducted.—R.H.B., 12/3/81.

I regret that owing to my having to deal with several pressing matters which had accumulated during my absence at Bathurst, I have been prevented returning these papers sooner.—R.H.B., 14/3/81.

Commissioner.

Minute of Commissioner.

I understand that this objection was raised to Thomas Wilson's re-examination, not to Geo. Wilson's. I assented to the representation that Thomas Wilson—being Frost's fireman and also with him—might be disposed to favour Frost, but the Locomotive Engineer agreed with me that Geo. Wilson was an impartial witness. I pointed out that his evidence supported Frost's statement of the case, and also Mr. Turton's. Mr. Burnett seemed to agree with me, that it was to be regretted that the point raised whether G. Wilson really did hear Mr. Turton use the words, or had inferred that he used them, from the answer made by Frost, had not been cleared up at the inquiry. The Locomotive Engineer expressed his conviction that further inquiry would elicit the fact, and show the soundness of his belief that G. Wilson did not hear Mr. Turton make the charge, but had inferred he had made it.

The impression left on my mind was that the Locomotive Engineer was in favour of the point being cleared up. Mr. Vernon, who was present at that particular time (he had entered my room for a moment with papers) stated that in all probability Frost's papers would be published, and Mr. Burnett at once said, "I admit that if the papers are to be published and the evidence considered by those who will not said, "I admit that if the papers are to be published and the evidence considered by those who will not minutely examine into it, and weigh it piece by piece, as he had done, the conclusion might be formed that Frost's evidence was supported by Wilson's, and it was important that the point in doubt should be made clear. I mention this because I am rather taken by surprise that Mr. Burnett now urges that he had resisted the examination of G. Wilson. Mr. Burnett expresses himself as quite satisfied that G. Wilson would substantiate his (Mr. Burnett's) belief, that he had not actually heard Mr. Turton charge Frost with being drunk, but had only inferred he had done so from the character of the words used by Frost, apparently, in reply. It is at all times more agreeable to me if any course of action which I propose is concurred in by the officer who is consulted in the matter, and who has to give effect to it, and I was not aware that Mr. Burnett was so greatly opposed, as he now states he was, to the re-examination of Geo. Wilson, but I take occasion to say that if I had been aware of it I should not have felt myself at liberty to concede the point: The evidence of G. Wilson, as then taken, was the most important of any; it would have been conclusive if he had been examined as to when and where Frost made the answer to it would have been conclusive if he had been examined as to when and where Frost made the answer to Turton, in the words "I am not drunk, nor do I drink," and I may now say that this re-examination (which, however, has not resulted as Mr. Burnett anticipated it would result) has resolved the one doubt that was in my mind on the subject, and has enabled me unhesitatingly to arrive at a decision in the case. Chas. A. G., 15/3/81.

Minute of Commissioner.

Driver Frost's appeal from the decision of the Locomotive Engineer.

I have carefully considered this case, and having had before me the additional evidence, which I deemed necessary, must now dismiss the appeal, and sustain the Locomotive Engineer's action in dismissing Frost.

The evidence supports Mr. Turton's statement that when Frost left his engine to speak to him he suspended him, and ordered him not to return to his engine. Mr. Turton's statement of the reason he suspended Frost must be accepted as true, notwithstanding that Frost denies having used the threats of

personal violence which Mr. Turton charges him with having used.

It is unnecessary that I should reply to the concluding portion of Mr. Burnett's minute of 12/3/81, except to say that I do not concur with his views as to what should constitute my action in cases of appeal, nor do I think it necessary to the maintenance of discipline that appeals made to me should

be promptly dismissed. I will dismiss no appeal without inquiring into the merits of the case, if I think inquiry necessary, as I certainly did in the case of Frost.—Chas. A. G., 17/3/81.

I think it right to state here, with I trust the Minister's concurrence, that should Frost at some subsequent time apply to be re-employed in the Locomorphic Branch, I shall feel disposed to favourably entering his application in consideration of his right to the following the same subsequent time apply to be re-employed. entertain his application, in consideration of his nineteen years of, hitherto, faithful service in the Railway Department, but I do not wish this to be communicated to Frost at the present time, nor would I ask the Minister to concur with my recommendation for Frost's re-employment until after the lapse of a considerable time, say from six to twelve months from the date of his dismissal.—Chas. A. G., 17/3/81.

Minute of Secretary for Public Works.

I regret that it becomes necessary in the interests of the Railway Service that I should have to approve of the dismissal of a railway servant who has for so many years performed his work efficiently and satisfactorily. I quite concur in the recommendation of the Commissioner that Frost after a time may be re-employed in the Department.-J.L., 18/3/81.

Write letter to Frost communicating decision, which will be forwarded to Frost through the Then forward these papers to the Locomotive Engineer.—B.C., 18/3/81. Locomotive Engineer.

CHAS. A. G

Mr. Burnett with letter for J. Frost.—D.V., 19/3/81.

Department of Public Works, Railway Branch, Sydney, 11 March, 1881. I am directed to inform you that the Commissioner has had under his consideration the appeal made by you against your dismissal by the Locomotive Engineer, and after causing additional evidence to be taken and giving the whole of the case his best consideration, he has directed me to state that he must dismiss your appeal, and uphold the decision of the Locomotive Engineer in your case.

I am desired to add that the Commissioner regrets that it has become necessary for him, in the

interest of the Railway Service to adopt this course in the case of an old servant of the Department who has for many years performed his work efficiently and satisfactorily.

I have, &c.,
D. VERNON,

No. 4.

Locomotive Engineer, returning Commissioner's Letter addressed to John Frost, and Minutes thereon.

Memorandum to Commissioner.

Locomotive Engineer's Office, Regent-street, Redfern, Sydney, 21 March, 1881. I VENTURE to return the letter addressed to John Frost, accompanying my 81-1,684 (Commissioner's 81-3,682), with the suggestion that that part of it referring to the additional evidence be omitted, it having been, I think, inadvertently inserted in drafting the letter, because, even supposing the Commissioner to be of onining that additional evidence was respected to the supposing the Commissioner to be of onining that additional evidence was respected to the supposing the Commissioner to be of onining that additional evidence was respected to the supposing the Commissioner to be of onining that additional evidence was respected to the supposing the commissioner to be of onining that additional evidence was respected to the supposing the commissioner to be of onining that additional evidence was respected to the supposing the commissioner to be of onining that the supposing the commissioner to be of onining that the supposing the commissioner to be of onining that the supposing the commissioner to be of onining that the supposing the commissioner to be of onining that the supposing the commissioner to be of onining that the supposing the commissioner to be of onining the commissioner to be of onining that the supposing the commissioner to be of onining the commissioner to be of onining that the supposing the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be only the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be of onining the commissioner to be only the commissioner to be only the commissioner that the commissioner to be only the commissioner to be only the sioner to be of opinion that additional evidence was necessary (which I understood from the Commissioner's

remarks to me on the subject, was not, in his opinion, the case, excepting to satisfy, possibly, the judgment of anyone or other of the public who might take a very superficial glance of the evidence as a whole), I venture to express the opinion, that any official statement which might be construed as evidence of their being (even if it did exist) a want of harmony in the judgment of the various officers responsible for the safety and efficiency of the Department, would not tend to increase the respect of the employes of the Department as a whole, or tend to the maintenance of authority and discipline.

On that ground I respectfully venture to suggest the omission of the words I refer to, viz. :-R.H.B.,

"Causing additional evidence to be taken and."

22/3/81.

I wish the letter, as written, to go to Frost, and will ask the Locomotive Engineer to send it to him

without further delay.

I regret to be constantly at variance with Mr. Burnett, but I cannot agree with him in the views he expresses in his minute of the 22nd March. It was my clear opinion that further inquiry was necessary in regard to the intent and meaning of Geo. Wilson's evidence. I attached great importance to that evidence, as I considered him to be an absolutely impartial witness, and I have seen since no reason to doubt either his veracity or impartiality.

It was mainly on Geo. Wilson's evidence that I decided the case against Frost; the second enquiry was, however, extended to a greater length than my reference warranted. If I had known that it was to have been conducted in the way it was, I should have directed that in fairness to Frost he should have been

allowed an opportunity of being present.—C.A.G., 22/3/81.

I shall be glad if Mr. Burnett will return me the papers at once, as the Minister wishes to see them

_C.A.G., 22/3/81.

I return the papers at once, as requested, but as I have not had time in the pressure of important matters to read many of the Commissioner's comments on my minutes, I shall feel obliged by the Commissioner's kindly returning the papers for my perusal as soon as the Minister has done with them.—R.H.B., 22/3/81.

I shall be glad if Mr. Burnett will make time to read my minutes, and return papers with as little

delay as possible, in order that they may be resubmitted to the Minister.—C.A.G., 23/2/81.

Having now read the minutes on this lengthy and vexatious case, I regret to have to record, with all respect to the Commissioner, my dissent from the Commissioner's impressions in regard not only to the matters of fact referred to by the Commissioner, but as to much that relates to my action in the case. being, however, now settled, I need merely say that I shall be glad, in the event of any similar case occurring, if the Commissioner will do me the justice in his minutes—not only sub judice but when I have finally arrived at a decision—of giving me credit for acting, as I have done in this case, in the best interests of the service in the discharge of the responsible duties entrusted to me. Assuring him that after my sixteen years administrative experience in the management of as large bodies of men as the aggregate of the employés in the two engineering branches of these railways taken together, every matter relating not only

to the conduct, but to the rights of the employés in my branch, can be safely left in my hands.

I will merely add that I am satisfied, on ample evidence, that George Wilson bears false witness in saying he heard Mr. Turton accuse Frost of being under the influence of drink.—R.H.B., 25/3/81.

Commissioner.

No. 5.

Mr. J. Frost to The Commissioner for Railways.

3, Holden-street, Redfern, Sydney, March 25, 1881. Sir, I have the honor to acknowledge the receipt of your letter of the 18th inst., intimating that after consideration you must dismiss my appeal against the decision of the Locomotive Engineer in my case. I am deeply sensible of the high compliment paid me by your expressions of regret at being compelled to adopt the above course, after my many years service, and the performance of my work satisfactorily and efficiently, and beg to tender you my most sincere thanks for the same.

I hope these long and meritorious services may be taken into consideration with my earnest appeal to you for re-employment as an engine-driver, which I now most respectfully and earnestly make.

It must be evident that this long service in this work must have incapacitated me for any other work, and I may add that, if I am taken into the railway service again I will take care that no circumstances I have, &c., JOHN FROST. shall arise to cause you to regret my re-employment.

May be re-submitted in six months from the date of Frost's suspension; he was suspended in January Сназ. А. G., 31/3/81. Re-submitted.

Inform Frost that in consideration of his length of service, and good conduct previous to the commission of the offence, which he has now expiated by being deprived of his employment for six months, I have consented to his being reinstated in his position as a first-class engine-driver. Request him to report himself to Locomotive Overseer.—Chas. A. G., 20/7/81.

The Secretary, Railway Department, to Mr. J. Frost.
Department of Public Works, Railway Branch, Sydney, 21 July, 1881. I am directed by the Commissioner to inform you that, in consideration of your length of service, and general good conduct previous to the commission of the offence for which you were removed from the Service, and which has been expiated by being deprived of your employment for six months, he has been pleased to restore you to the position of first-class engine-driver, and I have therefore to request that you will report yourself to the Locomotive Overseer.

I have, &c.,
D. VERNON, Secretary. Forward Forward papers to Locomotive Engineer, who will be good enough to give directions for Frost's tement.—Chas. A. G., 21/7/81. The Loco. Engineer.—D.V., 21/7/81.

In view of the fact that Frost was dismissed the Service, not merely for insubordination in disobeying orders, but for lying, and for bringing a base and groundless charge against his superior officer, unfitting him (Frost) for employment in the Service, and in view also of the fact that his re-employment, without a distinct retraction on his part of, and apology for, the charge, would be fatal to the authority of every officer in this Department, and prejudicial to the efficiency of the Service, and to the safety of the public, I would respectfully submit to the Commissioner the need of Frost being called upon to withdraw in writing the charge he made and for his being directed by the Commissioner to report himself draw, in writing, the charge he made, and for his being directed by the Commissioner to report himself to me as head of this (the Locomotive) Department, as being a first and necessary step prior to any application from him for re-employment being determined.—R.H.B., 25/7/81. Commissioner.

Frost was referred to Locomotive Overseer as his more immediate superior. It was expected that the Locomotive Engineer would give directions to Mr. Scott to re-employ Frost. I must request that he will do so without further delay. I do not concur with Mr. Burnett's views in the matter.—Chas. A. G.,

Locomotive Engineer.

The main facts of the case, briefly stated, are as follows:—
Frost's insubordination, as regards the disobeyment of orders, consisted in telling Inspector Turton, his superior officer, that "he would," contrary to Mr. Turton's orders, "go on the turn-table road whenever he liked," and in his refusing, after his suspension, to come off his engine when ordered to do so by Mr. Turton.

In his (Frost's) version of the case, as given in his written statement of 20/1/81, Frost grossly mis-stated important facts, misrepresenting, amongst other things, that Mr. Turton had been "ear-wigged," as he expressed it, in the matter by his clerk, a gross piece of impertinence without foundation in fact, which has never been applicated to show orders with restanted threats of personal violence, saving to

which has never been apologised for nor withdrawn by Frost.

He accompanied his refusal to obey orders with reiterated threats of personal violence, saying to Mr. Turton, amongst other things of a like nature, and twice over, "I will stick a knife through your heart," and when asked by me, seriatim, as to each of the threats which he undoubtedly made, he (Frost) did not hesitate to assert, in presence of Messrs. Scott and Cobb, and pointing to Mr. Turton, "It is all untrue; that man (Turton) has deliberately invented these statements to take away my character." This charge, which is tantamount to an accusation against his superior officer (Mr. Turton) of untruthfulness and misconduct of the grossest kind, which, if true, would render him (Inspector Turton) utterly unfit for his situation or indeed for any position of trust, has never been, as yet, retracted in any shape by Frost, and situation, or indeed for any position of trust, has never been, as yet, retracted in any shape by Frost, and was officially re-stated by him to me, in my office, a few days before I dismissed him.

In the absence of a distinct retraction of, and apology for, the foregoing on Frost's part, he remains thereby disqualified, as it seems to me, for employment, and his re-employment, without such retraction and apology, would be, as I have said before, fatal to the authority of every officer in the Department, thereby endangering the public safety, and in view of the responsible duty put upon me, as Locomotive Engineer, by the Minister's minute of 10/5/81, deciding that, "The fullest power of appointing, promoting, suspending, and dismissing, should rest in the hands of the Locomotive Engineer." I beg to inform the Commissioner, with much regret, that in the present position of the matter I feel compelled in the meantime to suspend further action in re-appointing Frost until I have had an opportunity of representing the whole case with all the attending consequences, to the Minister by personal tunity of representing the whole case, with all the attending consequences, to the Minister by personal

interview.—R.H.B., 27/7/81. Commissioner.

Minute of the Commissioner for Railways.

Refusal of the Locomotive Engineer to observe the directions of the Commissioner. See minute of $\frac{27}{7}81$ —Frost's re-instatement.

A somewhat similar minute to this, refusing (constructively at all events) to observe my directions, was addressed to me by Mr. Burnett in driver Main's case. On that occasion I requested that he would either observe my instruction or place Mr. Scott in temporary charge of the Department. Mr. Burnett replied that he had not refused to carry out my decision, but on the contrary had observed it. This minute in Frost's case is a positive refusal to observe my instruction, which I have had already to repeat. If Mr. Burnett fails to observe my direction to reinstate Frost, I shall have no alternative but to direct Mr. Scott to reinstate him. The man must be reinstated in accordance with my decision.—Chas. A. G., 28/7/81

In reply I beg to inform the Commissioner that I have nothing to add or withdraw from my minute of 27/7/81.—R.H.B., 29/7/81. Commissioner.

I brought this matter to the Minister's knowledge yesterday, who concurred in the action I proposed to instruct Mr. South to reinstance Front I have instructed Mr. South accordingly. Charles posed, to instruct Mr. Scott to reinstate Frost. I have instructed Mr. Scott accordingly.—Chas. A. G., 29/7/81. I may add that I feel very reluctant to take this step. I do so with great regret; but there is no alternative course, unless I consent to have my directions disobeyed and my authority as Commissioner for Railways set at naught.—Chas. A. G., 29/7/81. The following will be the directions to Mr. Scott:—"It having been decided that Frost, engine-driver, is to be reinstated, the Locomotive Overseer (Mr. Scott) is instructed to reinstate him accordingly.—Chas. A. G., 29/7/81."

Locomotive Engineer to see, B.C., 1/8/81.—Chas. A. G. Seen.—R.H.B., 2/8/81. Commissioner.

No. 6.

Minute Paper from The Locomotive Engineer to The Commissioner for Railways.

Subject-Papers in the case of Driver Frost, dismissed. Department of Public Works, Railway Branch,

Locomotive Engineer's Office, Sydney, July 23, 1881. I SHALL be glad if the Commissioner will be good enough to let me have the papers in the above case. R.H.B.

I require these papers myself. The Locomotive Engineer has, I believe, copies of them, and the originals in that case cannot be required by him.--C.A.G., 26/7/81.

No. 7.

The Locomotive Engineer to The Commissioner for Railways.

Suspension of Mr. Scott.

HAVING been informed by Mr. Scott that he had, contrary to my written instructions to him on 25/7/81, directed John Frost (lately dismissed the service) to resume work, and had sent him out with the 9.45 a.m. train this day to Goulburn, I have to inform the Commissioner that I have suspended Mr. Scott from his position and duties, and will cease to certify for his pay from this date, and recommend that he be called upon to show cause why he should not be dismissed for disobeying my orders.

ROBT. H. BURNETT

[Urgent.]

1/8/81.

Mr. Burnett has not the power to suspend Mr. Scott, who, in reinstating Frost, acted upon my instructions. My intention to give these instructions was previously intimated to Mr. Burnett in my minute of 28/7/81.—Chas. A. G.

Minute of Secretary for Finance and Trade.

The course taken by Mr. Burnett in this case is most irregular. Mr. Scott is an officer appointed by the Governor and Executive Council, and his suspension can only be authorised by the Minister. the absence of Mr. Lackey, and pending his decision, Mr. Scott's suspension (irregularly made) will be removed, and he will resume his duties.—J.W., for the Minister, 1/8/81.

Mr. Burnett is informed that Mr. Scott has been made acquainted with the decision of the

Minister, and has been directed by me to resume his duties at once.—Chas. A. G., 1/8/81.

I have been informed that Mr. Burnett has telegraphed to Goulburn to the officer in charge there (Mr. Proctor) to suspend Frost on his arrival with the 9.45 train. I am at a loss to understand such extraordinary conduct, and can scarcely credit the accuracy of the statement made. If Mr. Burnett, however, has given such a direction he will be good enough to at once withdraw or countermand it. I shall be glad to know, by bearer, the course Mr. Burnett intends to pursue. I trust Mr. Burnett will pause before he brings any further discredit upon the Department by his unseemly conduct.—Chas.

A. G., 1/8/81.

Mr. Scott having—by his being reinstated, on the action of the Commissioner, while he was under suspension by me for disobeying my orders—been virtually placed, as I understand it, in a position of independent authority between me and the locomotive staff, pending the decision of Mr. Secretary Lackey, I beg to inform the Commissioner, with much regret, that, as I feel compelled—for the reasons already given in my minute of 27/7/81—to withhold in the meantime further action on my part in re-employing Frost until I have had an opportunity of representing the whole case, with all the attending consequences, to the Minister by personal interview, I beg to leave it to the Commissioner to give Mr. Scott, direct, any instructions in the matter which the Commissioner may see fit to give in the meantime.—Robt. H.

BURNETT. Commissioner.

With the Minister's concurrence I gave Mr. Scott directions to reinstate Frost. The Locomotive Engineer has taken upon himself the responsibility of reversing my action, and has again suspended Frost.

It will be seen that he treats the Hon. the Treasurer's action in directing Mr. Scott to resume his duties as tantamount to placing him in a position independent of himself, as Locomotive Engineer, and he adds that he leaves it to the Commissioner to give Mr. Scott, direct, any directions in the matter which he may think fit. I must decline to give instructions to Mr. Scott at the risk of their being reversed by the Locomotive Engineer. I consider that, in the interests of the discipline of the department, and of public life and safety (imperilled by the action which Mr. Burnett has taken in this and other cases, and which demonstrated his incapacity for the proper discharge of the duties of his office), he should cease to have control of the Locomotive Branch, and that Mr. Scott should be temporarily placed in charge pending the decision of the Government.—Chas. A. G., 1/8/81.

Minute of Commissioner re reinstatement of Frost.

It is perfectly useless to enter again into the merits of the case against Frost. There would be no finality to these matters if, upon the occurrence of any incident connected with them, the whole question

was required to be rediscussed.

It is sufficient to say that the case against Frost was not in degree, either in the offence itself or its consequences, of the character which Mr. Burnett strives so earnestly to attach to it. There were besides many mitigating circumstances. The man was punished by being dismissed the Service. I have already stated that, had not the Locomotive Engineer taken this course in the first instance, I would not, in view of the provocation Frost received from Mr. Turton, and in consideration of his previous faithful service in the department for nineteen years, have consented to the extreme sentence of dismissal. The case, however, only came before me on appeal. In dealing with it I was actuated by a desire to uphold, in the interests of the discipline of the Service, the decision of the Locomotive Engineer, and I found myself in a position to uphold it, although I could not acquit Mr. Turton of serious blame in the matter, nor Mr. Burnett bigself of injudicious action in the conduct of the inquiry in connection with it. nor Mr. Burnett himself of injudicious action in the conduct of the inquiry in connection with it.

At the same time I expressed my intention to reinstate Frost at the expiration of some interval of time, and the Minister, upon a careful consideration of the whole case, concurred with me in that

resolution.

ion. The Locomotive Engineer was so apprised at the time.

At the expiration of six months I gave directions for Frost's reinstatement. Mr. Burnett declined state him. With the Minister's concurrence I directed Mr. Scott, the locomotive overseer, to to reinstate him. reinstate him. This step was taken as a temporary measure till the Minister could find time to deal with the action of Mr. Burnett in refusing to obey my instruction. Mr. Burnett was informed that this course would be pursued unless he himself gave directions for Frost's reinstatement.

Upon ascertaining that Frost had been, in pursuance of my directions, reinstated by Mr. Scott, the Locomotive Engineer took upon himself the responsibility of suspending Mr. Scott, and recommended his

dismissal.

In this emergency, in the absence of Mr. Lackey, I laid the matter before the Colonial Treasurer, who, after pointing out the irregularity of Mr. Burnett's proceedings, directed that Mr. Scott (who holds his appointment by the authority of the Governor and Executive Council, and can be suspended only by the Minister) should at once resume duty.

It then came to my knowledge that Mr. Burnett had telegraphed to the Locomotive Foreman, at Goulburn, to suspend Frost upon his arrival there with his train. I at once wrote the accompanying minute, asking Mr. Burnett if the statement were true, and directing him, if it were true, to countermand

his instructions for Frost's suspension.

It will be seen that Mr. Burnett does not reply directly to the question put to him, but leaves me to infer that the statement made is correct (I have since ascertained it is correct). He declines to take action for the re-employment of Frost until he has had an interview with the Minister, and treats the Colonial Treasurer's action in reinstating Mr. Scott as tantamount to placing him in a position independent of himself as Locomotive Engineer. Mr. Burnett adds that he leaves me to give Mr. Scott, direct, any instruction which I may deem fit.

I must decline to give instructions to Mr. Scott at the risk of their being reversed by the Locomotive

Engineer.—Chas. A.G., 3/8/81.

The Locomotive Engineer will be good enough to let me know at once whether engine-driver Frost is at work in accordance with my instructions?—Chas. A. G., B.C., 4/8/81.

He is not at work, so far as I am aware, and for the reasons given in my minute of 27/7/81, to which I beg to refer the Commissioner.

The following is a copy of the minute referred to:-

The main facts of this case, briefly stated, are as follows:—

"Frost's insubordination, as regards the disobeyment of orders, consisted in his telling Inspector Turton, his superior officer, that 'he would,' contrary to Mr. Turton's orders, 'go on the turn-table road whenever he liked,' and in his refusing, after his suspension, to come off his engine when ordered to do so by Mr. Turton.

In his (Frost's) version of the case, as given in his written statement of 20/1/81, Frost grossly misstated important facts, misrepresenting amongst other things that Mr. Turton had been 'ear-wigged,' as he expressed it, in the matter by his clerk—a gross piece of impertinence, without foundation in fact, which has never been apologised for, nor withdrawn by Frost.

He accompanied his refusal to obey orders with reiterated threats of personal violence, saying to Mr. Turton, amongst other things of a like nature, and twice over, 'I will stick a knife through your heart'; and when asked by me, seriatim, as to each of the threats which he undoubtedly made, he (Frost) did not hesitate to assert, in presence of Messrs. Scott and Cobb, and pointing to Mr. Turton, 'It is all untrue; that man (Turton) has deliberately invented these statements to take away my character.'

This charge, which is tantamount to an accusation against his superior officer (Mr. Turton) of untruthfulness and misconduct of the grossest kind, which, if true, would render him (Inspector Turton) utterly unfit for his situation, or indeed any position of trust, has never been, as yet, retracted in any shape by Frost, and was officially restated by him to me in my office a few days before I dismissed him.

In the absence of a distinct retraction of, and apology for, the foregoing on Frost's part, he remains thereby disqualified, as it seems to me, for employment; and his re-employment without such retraction and apology would be, as I have said before, fatal to the authority of every officer in the Department, thereby endangering the public safety; and in view of the responsible duty put upon me as Locomotive Engineer by the Minister's minute of 10/5/81, deciding that 'The fullest power of appointing, promoting, suspending, and dismissing should rest in the hands of the Locomotive Engineer,' I beg to inform the Commissioner, with much regret, that in the present position of the matter I feel compelled in the meantime to suspend further action in re-appointing Frost, until I have had an opportunity of representing the whole case, with all the attending consequences, to the Minister by personal interview.—R.H.B., 27/7/81."

Commissioner.—R.H.B., 1.5 p.m., 5/8/81.

Minute of Commissioner.

Notwithstanding the Minister's direction that, pending the settlement of certain questions affecting Mr. Burnett's position, he was to carry out my instructions, he still refuses to do so. Frost is unemployed. I request respectfully that the Minister will let me know at once what I am to do. I recommend that Mr. Burnett be suspended, pending the settlement of the case by the Government. It is impossible to carry on the duties of the Department in the face of this insubordination; and in the interests of public life and safety I recommend the above course.—Chas. A. G., 5/8/81.

Case of Driver Frost. From Locomotive Engineer to The Commissioner.

I have to report that in accordance with the verbal instructions given to me at my personal interview with the Minister yesterday, I have given directions for driver Frost to resume work.—R.H.B.

No. 8.

Memorandum from Locomotive Overseer to Locomotive Engineer.

Government Railways, Locomotive Engineer's Branch,

Redfern Station, August 12, 1881. With respect to the payment of John Frost would you kindly inform me for what time he should be entered on the pay-sheets. I may state that he reported himself to me on the 23rd July ult., as I informed you at the time, and he also reported himself here on each of the following days, 25th, 26th, 27th, 28th, 29th, and 30th July. On 1st inst. he was employed taking a train to Goulburn, but he returned on 2nd inst. as a passenger. He reported himself at my office on 3rd, 4th, and 5th inst., and resumed work as a driver on 6th instant.

W. SCOTT.

Will the Commissioner please say.—R.H.B., 15/8/81. Frost will be paid from the date he first reported himself to Mr. Scott, viz., on the 23rd.—C.A.G., 16/8/81. Mr. Scott to enter on separate sheet.—R.H.B., 22/8/81. Noted.—J.C. (pro W. Scott.)

No. 9.

·Memo. of Locomotive Engineer.

Case of Driver Frost.

Department of Public Works, Railway Branch, Sydney, 19 August, 1881 As I observe by the notice papers that Mr. Abigail has given notice of motion to lay on the table of the House copies of all minutes, papers, or other documents having reference to the case of driver Frost, I shall feel obliged by the Commissioner returning all these papers to me, so that I may have the opportunity of making such further comments upon the annotation and reports of the Commissioner as may seem to me to be necessary, and which I was prevented completing in consequence of the Commissioner requesting me to return these papers to him at once,* before I had been enabled to complete my remarks, as stated in my minutes of 13/5/81 and 25/6/81.—R.H.B.

* I think there must be some mistake here. Mr. Burnett returned Frost's papers in a minute (which I could not but regard as very disrespectful to me) dated 25/3/81. The papers he refers to are the papers in Geo. Wilson's case I think. As far as I am personally concerned I am indifferent to the amount of latitude which Mr. Burnett may take commenting upon my minutes. The courtesies of official intercourse are, however, outraged by Mr. Burnett's insolent minutes, and the time of the public wasted by his senseless contentions. Be good enough to let me have a list of the papers, or the papers themselves, which Mr. Burnett refers to.—C.A.G.

As Mr. Burnett has since been suspended no further time need be wasted—public business can now go on uninterrupted by these vexatious obstructions.—Chas. A. G.

No. 10.

Mr. R. H. Burnett to The Secretary for Public Works.

Sydney, 18 August, 1881. I respectfully beg to ask your attention to the replies reported in the Votes and Proceedings of Parliament (just to hand) as having been given last night in answer to questions relating to my action in driver Frost's case, which answers I respectfully desire to point out are not in full accordance with the facts of the case, and which, in so far as they are not in accordance with the facts, unfairly represent my conduct in the matter.

I therefore feel compelled, in justice to myself, to respectfully address to you this appeal.

The questions and answers, as reported, are as follows:—
Engine-driver Frost:—Mr. Fitzpatrick, for Mr. William Forster, asked the Secretary for Public

(1.) Was John Frost, engine-driver, lately or at any time dismissed by the Locomotive Engineer

or Superintendent, Mr. Burnett?

(2.) Was the dismissal afterwards approved of by the Minister for Works, or by the Government?

(3.) Was Mr. Burnett afterwards ordered to reinstate the person so dismissed?

(4.) Was the same person aftewards reinstated by the Minister, or the Government, against Mr. Burnett's remonstrance?

(5.) If so, under what circumstances and upon what grounds?
(6.) Has Mr. Burnett been, or will he be, called to account for disobedience in the matter?

Mr. Lackey answered, (1.) Yes, in January last. Frost appealed against the decision; but the action of the Locomotive Engineer was upheld by the Commissioner, who, however, decided that in consideration of Frost's previous good character during a period of nineteen years' service he should be restored to his

position after an interval of six months.

(2.) The Secretary for Public Works approved of the action taken by the Commissioner.

(3.) Yes, at the expiration of six months, in accordance with the decision referred to. (4 and 5.) Mr. Burnett at first refused to carry out the direction given to him by the Commissioner, but was informed by the Minister for Works that unless he did so he would be suspended.

(6.) He has been informed that he must observe the instructions given to him, or the Government would have no alternative but to dispense with his services.

The statements in answers 4, 5, and 6, as follows:—"But he was informed by the Minister for Works that unless he did so he would be suspended," and "he has been informed that he must observe the instructions given to him, or the Government would have no alternative but to dispense with his services "—are, $\check{\mathbf{I}}$ must respectfully state, wholly and absolutely untrue.

I am not conscious of ever having refused to carry out any instructions which have been given me

I am not conscious of ever having refused to carry out any instructions which have been given me by competent authority.

The papers show clearly the grounds upon which I delayed to carry out the instructions of the Commissioner in this (driver Frost's) case; but I may here briefly state that I did not consider the From Commissioner's orders in this instance as being of any binding effect, in view of the fact that (1st) the Minister had in his minute of 10/5/81, in reply to my appeal to him in George Wilson's case, decided that "the fullest power of appointing, promoting, suspending, and dismissing should rest in the hands of the approval of driver Frost being re-employed was, as will be seen by the minutes, clearly to take effect to approval of driver Frost being re-employed was, as will be seen by the minutes, clearly to take effect to approval of a considerable time, from (say) six to twelve months from the date of his dismissal."

Frost was dismissed on February 22nd, 1881, and six months from that date would be the 22nd instant, or four days hence. The Commissioner directed Frost's re-employment on July 21st, 1881, or only five months from the date of his dismissal. In view of the fact of the Commissioner having directed his (Frost's) re-employment at the end of only five months from the date of his dismissal, taken in

his (Frost's) re-employment at the end of only five months from the date of his dismissal, taken in conjunction with the authority given to me, on appeal, by the above quoted minute of the Minister, I considered myself fully warranted, and still respectfully submit that I was fully warranted in postponing

action in the matter until (as I stated in my minute to the Commissioner of 27/7/81) I had "had an opportunity of representing the whole case, with all the attending consequences, to the Minister by personal

Having, however, been informed verbally by the Minister, on the occasion of my personal interview with him on the 5th instant, that it was his desire that Frost should be at once re-employed, and it being the duty of every officer to obey the instructions of his Minister as being the ultimate authority in the

Department, I wrote instructions the same day, carrying out the Minister's directions.

No occasion, therefore, has arisen to require the threats which are represented to have been made to me in this case, and neither on the occasion of my interview with the Minister, nor at any time since then has any verbal or written communication been made to me to justify the statements I have above

quoted from yesterday's Votes and Proceedings.

I do not suppose for a moment that the Minister is personally answerable for the mis-statements which those answers contain, owing to his not having had the time or opportunity for comparing them with the facts as recorded in the papers; but as an injustice has been done me, both personally and as Locomotive Engineer, by the statements as they appear in the Votes and Proceedings, and by their having been circulated in the public Press, I respectfully ask the Minister to cause such steps to be taken as are necessary to remove the injustice under which I am placed.

I have, &c., ROBT. H. BURNETT.

Extract from Votes and Proceedings of Legislative Assembly, No. 22.

WEDNESDAY, 10 AUGUST, 1881.

Suspension of Engine-driver: -Mr. Cameron, for Mr. Abigail, asked the Secretary for Public Works,

(1.) Is it true that instructions were given by the Commissioner for Railways to the Locomotive Engineer to reinstate one of the engine-drivers who had been under suspension, and that the Locomotive Engineer refused to carry out the Commissioner's order?

(2.) Is it true that instructions were then given to the Locomotive Overseer to reinstate the driver

referred to?

(3.) Was the Locomotive Overseer suspended from duty by the Locomotive Engineer for obeying the Commissioner's order; if so, what steps do the Government propose taking in the matter? Mr. Lackey answered,

(1.) Yes.(2.) Yes.

(3.) Yes; but as the power of suspending an officer in Mr. Scott's position is not given to the Locomotive Engineer the action taken by him was of no effect, and Mr. Scott at once resumed duty. Subsequent action has been taken which will, it is thought, prevent a similar occurrence in

I PREPARED the reply to the above questions, except as regards the one in *italics*. I did not at that time know what had transpired at the interview which Mr. Burnett had had with the Minister. Mr. Lackey himself wrote the words commencing "subsequent action had been taken, &c.," and he informed me on the following day that Mr. Burnett had been informed that unless he reinstand Frost he would be suspended, and that he must observe the instructions given to him on the Government would have no alternative and that he must observe the instructions given to him, or the Government would have no alternative but to dispense with his services.

Mr. Burnett asserts, in his letter to the Minister of 18th August, 1881, that nothing of this kind transpired at the interview; that, as Mr. Burnett mildly puts it, the Minister only said it was his desire that Frost should be at once re-employed, and therefore he wrote instructions the same day carrying out

The question submitted to the Minister was, whether Mr. Burnett was to observe my instructions, and it is hardly credible that the Minister lost sight of this question, and merely asked as a personal favour to himself (as Mr. Burnett would almost endeavour to imply) that Frost might be re-employed.

There is the statement of the Minister to the contrary, and, in addition thereto, there is Mr.

Burnett's minute to me, written on the day following his interview with the Minister-stating that he was

now prepared to carry out my instructions.

This last would seem to be proof that the Minister had told him that unless he did so the Government would have no alternative but to dispense with his services, and besides what other intimation could be made to Mr. Burnett; no subordinate refusing to obey the instructions of the head of his Department could be allowed to continue in the service.

No. 11.

Minute of Secretary for Public Works directing Mr. Burnett's suspension.

I HAVE only now had time to examine the paper submitted by Mr. Burnett, Locomotive Engineer, in which I find that he designates the answers given by me to questions asked in the Legislative Assembly as wholly and absolutely untrue. In the interview between Mr. Burnett and myself on the 5th instant, I distinctly informed that gentleman that he would have to carry out at all times such directions and instructions as should be given by the Commissioner for Railways, or of course submit to the consequences. The exact words I used may not have been those contained in the Parliamentary reply, but were certainly intended to convey the same meaning. Under any circumstances the language used by Mr. Burnett is such that, for obvious reasons, ought not to be for one moment tolerated. In addition to this, Mr. Burnett's career during his tenure of office has been marked by such unsatisfactory results that I feel the only course open to me is to direct his suspension from the duties of Locomotive Engineer until I shall be enabled to bring his case before the Cabinet. J.L., 24/8/81.

Mr. Burnett to see, and to hand over to Mr. Scott all documents and papers, &c., belonging to the ment. Mr. Scott has been placed in charge of the Locomotive Branch temporarily. I shall be glad if Mr. Burnett will return this paper to me when read.—C.A.G., 25/8/81.

No. 12.

Minute for Executive Council.

Department of Public Works, Sydney, 30 August, 1881. I have the honor to inform His Excellency the Governor and the Executive Council that on the 25th instant I felt it to be my duty to suspend from office Mr. R. H. Burnett, the Locomotive Engineer, under the following circumstances:

A driver of the name of Frost had been dismissed from his employment by Mr. Burnett, and the

Commissioner for Railways, on appeal, sustained Mr. Burnett's action.

The papers were submitted to me, and I concurred in the decision of the Commissioner that, in consideration of Frost's previous good character and long service in the Department, he should be re-employed after some interval of time. It was afterwards decided that this interval should be six months from date of Frost's suspension for the offence for which he was afterwards dismissed.

At the expiration of the period named the Commissioner directed the Locomotive Engineer to reinstate Frost; Mr. Burnett refused to do so until he had an interview with me, and rediscussed the whole case.

With my consent the Commissioner then directed Mr. Scott, the Locomotive Overseer, to reinstate Frost, till I could find time to determine the course to be pursued in consequence of the refusal of the

Locomotive Engineer to observe the Commissioner's directions.

Mr. Burnett was duly advised that Mr. Scott would be directed to reinstate Frost, if he neglected to do so; but upon learning that Mr. Scott had carried out the directions given him, Mr. Burnett took upon himself the responsibility of suspending that officer, and telegraphed to the Inspector at Goulburn—to which place Frost had taken his train—to order him off his engine, and not to employ him again except by his directions.

I was absent from Sydney at the time, and the Commissioner referred the matter to the Colonial Treasurer, who decided that Mr. Scott, who had been improperly suspended, was at once to resume duty,

pending my action.

On my return to Sydney the papers were laid before me, with the recommendation of the see minute of Commissioner, that Mr. Burnett for his conduct in this and other matters should be suspended from office. 5/8/81 on page 14.

While I was considering the matter the Locomotive Engineer solicited an interview, which I granted him, and after he had fully represented his view of the case to me, I informed him that unless he reinstated Frost he would be suspended, and further, that the Government would have no alternative, if he did not carry out the directions he received, but to dispense with his services.

This was on Friday afternoon, the 5th instant; on the following day Mr. Burnett informed the Commissioner for Railways by minute that he was "now" prepared to carry out his instructions.

In reply to a question asked in the House by Mr. Abigail on the 10th instant, I said "that it was true the Locomotive Overseer had been suspended by Mr. Burnett, but that subsequent action had been taken which would it was thought proposed a similar accommence in future.

taken which would, it was thought, prevent a similar occurrence in future.

I was then alluding to the intimation I had made to Mr. Burnett at the interview he had with me, and which I trusted would have the effect of bringing Mr. Burnett to a sense of his duty.

On the 17th instant Mr. W. Forster asked some questions in the matter, to which I replied, giving the particulars of the intimation which I had made to Mr. Burnett at the interview referred to. On the following day, the 18th August Mr. Burnett addressed to me, the accompanying letters in which he gave following day, the 18th August, Mr. Burnett addressed to me the accompanying letter, in which he says see No. 10. that the statements made by me in answer to Mr. Forster's questions, 4, 5, and 6, "were wholly and abso-

Although Mr. Burnett has added that he does not suppose for a moment that the Minister is personally answerable for these replies, I am unable to accept his view of the case.

No one but the Minister could be personally answerable for the replies made in this case, as they conveyed what transpired at an interview which Mr. Burnett had with me alone.

So far as the matter is a directly personal one, I refrain from making any recommendation; but I may say that I am dissatisfied with Mr. Burnett's conduct in several matters affecting the administration of the business of this Branch, and I do not consider that the public interests will be served by his being retained in the position of Locomotive Engineer.

JOHN LACKEY. After careful consideration of the subject herein set forth, on the subject of Mr. Burnett's insubordinate conduct, the Executive Council advise that he be suspended from official duty, and called upon to show cause why he should not be removed from office.—Alex. C. Budge, Clerk of the Council.

Approved.—A.L. Mr. Burnett informed.—A.C.B., 31/8/81.

No. 13.

Sir,

Ardross, Fitzroy-street, North Shore, 9 September, 1881.

I have the honor to acknowledge the receipt of your letter of the 31st ultimo, informing me that His Excellency the Governor, with the advice of the Executive Council, had approved of my suspension from official duty, and reconstitute that I would of the Executive Council, had approved of my suspension from official duty, and reconstitute that I would of the Executive Council, had approved of my suspension from official duty, and reconstitute that I would not be adviced from the council of the Executive Council, had approved of my suspension from official duty, and reconstitute that I would not be adviced from the council of the Executive Council of the council of the Executive Council of the council of the council of the Executive Council of the council of the Executive Council of the sion from official duty, and requesting that I would show cause in writing, addressed to you, why I should not be removed from the Public Service for the insubordination referred to in the minute paper laid before the Council by the Honorable the Secretary for Public Works, of which a copy was enclosed to me. In reply, I do myself the honor to state the following circumstances for the consideration of the Executive Council:

1. The appointment for which I was engaged in England, and brought out to fill three years ago, and which I held up to the date of my suspension, is, as I regard it, one of great responsibility, requiring, for the effectual performance of its duties, anxious and incessant care, and the free exercise of extensive powers over those in subordinate positions.

The positions and duties attaching to the office are defined in the letter from the then Honorable Secretary for Public Works (dated February 14, 1878) to the Agent-General, on which letter I was

engaged, and which defines the position as follows:—

"The Cabinet having approved of my (the Minister's) recommendation to obtain from England the services of an engineer to take charge of the Locomotive Department, and to design and supervise the construction of the rolling stock required for the conduct of the traffic on our railways, I have the honor

to request that you will have the goodness to secure an engineer fully competent to undertake the duties and to urge upon you the necessity of securing the services of a first-class gentleman, who has had large practical experience of the special duties of the position."

2. During the whole of the time that I have held the appointment I have been actuated by one desire alone, namely, the strict and faithful performance of the duties which I regarded as devolving upon

desire alone, namely, the strict and faithful performance of the duties which I regarded as devolving upon the Locomotive Engineer, and upon which the safety of the travelling public so greatly depends.

3. Influenced by what I conceived to be so grave a responsibility (a responsibility referred to by the Commissioner for Railways in his Minute Paper to me of 14/2/79, entitled "The position of the Locomotive Engineer and his responsibilities," in the following words: "Mr. Burnett can be in no doubt as to the nature and extent of the services he is required to perform in his professional capacity of engineer, and does not need to be reminded of his responsibilities")—I may have at times unwittingly overstepped the authority pertaining to my office, but I unhesitatingly and respectfully assert that my conduct in such instances was dictated solely by an anxious desire for the safe and efficient conduct of the important branch of the Service over which I had charge.

4. With regard to the case of Driver Frost, referred to in the minute of the Honorable the

4. With regard to the case of Driver Frost, referred to in the minute of the Honorable the Minister, I do not desire—in view of the circumstances stated in that minute—to justify my action in Minister, I do not desire—in view of the circumstances stated in that minute—to justify my action in delaying to carry out the instructions of the Commissioner for Railways for Frost's reinstatement, or for my subsequent suspension of him, or for my suspension of Mr. Scott, because I am now conscious that I exceeded the authority of my office, being misled by my interpretation of the minute of the Honorable the Secretary for Public Works of May 5th last, to the effect that he thought it was desirable that "the fullest power of appointing, promoting, suspending, and dismissing should rest in the hands of the Locomotive Engineer," a minute which I regarded as not only confirming but fortifying the control which had been previously placed in my hands by the Commissioner of Railways in his (above queted) minute-naper been previously placed in my hands by the Commissioner of Railways in his (above quoted) minute-paper of 14/2/79, in reply to my minute to him of 4/2/79, in which (in acknowledging receipt of a minute-

paper) I wrote as follows:—

"As the minute-paper states that each engineer shall have control of his own branch, I shall feel

"As the minute-paper states that each engineer shall have control of his own branch, I shall feel obliged if the Commissioner will, in order to prevent any misunderstanding arising, and with a view to facilitate the despatch of business, favour me with a statement indicating the matters that are left to the control of the Locomotive Engineer to act upon, and settle on his discretion, and what are reserved for

the approval of the Commissioner before being put in force.
"Will the Commissioner be so good also as to define what engagements and positions among the employés of the Locomotive Branch are left to the Locomotive Engineer to make and terminate at his

discretion, and what are reserved for the Commissioner or Minister's approval.

"I need hardly say that while I personally should be glad to be relieved entirely of the duty of dealing with the engagement and removal of all employes in my Department, I believe the best results in the conduct of the business of the Department will be obtained by strengthening, as much as possible, the hands of the Locomotive Engineer, by placing in his control to the fullest extent the power of appointing and removing those under him, and that any weakening of his hands in this respect can only result in

delay in bringing the Department into a satisfactory condition."

5. I desire the Council's permission respectfully to state, in further explanation of my action in Frost's case, with reference to one or two points referred to in the minute of the Hon. the Secretary for Public Works, that I was not aware until after Mr. Scott's suspension, that the Minister had approved of Frost's being reinstated after six months from his suspension, or of his having approved of Mr. Scott's being directed to reinstate him; and I respectfully ask the Council's attention to the minutes and papers in connection with the case, as evidencing the motives by which alone I was actuated in my view of the action which I believed my duties and responsibilities forced upon me.

So far as I may have fallen into error on this point I am open to correction, and recognizing that the control in these matters is practically withdrawn by the reversal of my action, or by the rejection of my recommendations, I fully acknowledge that the control rests with the Commissioner in all matters affecting the Branch over which I had charge.

And I here beg to tender an expression of my regret for whatever I may have done, in pursuing a course which I believed my duties and responsibilities required of me, seemingly wanting in due respect for the Commissioner for Railways, or for anything I may have written, however unintentionally, in a style unbefitting the circumstances in my correspondence with the Commissioner.

6. I sincerely regret that I should have written to the Hon. the Secretary for Public Works my letter of the 18th ultimo. I attempt no justification of it, but I earnestly desire the Council and the Minister to accept my assurance that I wrote it under a complete misapprehension of the remarks of the Hon. the Minister to me on the occasion of my interview with him on the 5th ultimo, and under the strong feeling that my influence over my subordinates had been greatly weakened while my responsibilities still remained.

At the same time I can assure the Minister that I did not for a moment intend my letter to bear, in the slightest degree, the construction which, I sincerely regret to learn, the Hon. the Minister has attached to it, but desired solely to direct the Minister's attention to the papers and minutes in connection with the case, in the belief that their contents, and my motives and action in the matter, had not been fully understood by the Minister at the time when the answers in question were given; and I respectfully desire to state that I believed I had fully guarded myself in my letter from being misunderstood on this point.

I respectfully request the Council and the Hon. the Minister to permit of the letter being now and hereby withdrawn; but if the forms of official procedure render this now practically impossible I trust the letter may be regarded as virtually and to all intents and purposes wholly cancelled.

7. It gives me much regret to learn, from the concluding paragraph of the minute of the Hon. the Minister, that he is dissatisfied with my conduct in several matters affecting the administration of the business of my Branch, but I would fain hope that, having regard to the explanations which I have now given, and to the anxious nature of my duties, I may be exonerated from any wilful disregard, either for constituted authority or for the all important interests of the Public Service.

I have, &c., ROBT. H. BURNETT

M.I.C.E., M.I.M.E.

Laid before the Executive Council on the 13th September, 1881, and referred to the Honorable the Secretary for Public Works.—ALEX. C. BUDGE, Clerk of the Council.

No. 14.

Minute of Secretary for Public Works.

THE Commissioner for Railways will furnish particulars of the instances in which Mr. Burnett has failed to conduct satisfactorily the business of that branch of the Railway Department under his control.

Herewith.—Chas. A.G., 19/9/81. Executive Council.—J.L., 27/9/81. To be forwarded to Mr. Burnett through the Clerk of the Minute forwarded to Mr. Burnett by letter.—A. C. Budge, 28/9/81.

No. 15.

Commissioner's Minute re Mr. Burnett's conduct, &c.

I DESIRE to bring under the attention of the Secretary for Public Works the circumstances attending the appointment of Mr. Burnett as Locomotive Engineer, his conduct since his appointment to the present time, and the instances in which he has failed, in my opinion, to carry into effect the object of his engagement.

2. It is but just that I should state that this representation is not made in consequence of the position in which Mr. Burnett is placed at the present time. Some weeks prior to his suspension from office, and on more than one occasion, I had, the Minister is aware, expressed to him my belief that Mr. Burnett had shown himself to be unfitted for the position he held, and I had also informed Mr. Burnett that the property of the Covernment.

that it was my intention to bring his conduct under the attention of the Government.

3. In now stating the case against Mr. Burnett, it will be necessary, I regret to say, that I should do so at some considerable length. I shall, however, be as brief as the circumstances will admit of, referring the Minister, for this purpose, to the official papers on the various matters treated of, and which have

indeed already received some consideration at his hands.

4. I will first refer to the circumstances which led to the appointment of Mr. Burnett as Locomotive Engineer. Previous to 1878 the administration of the Locomotive Branch had been combined with the duties of the maintenance of the permanent way and works, both divisions being under the charge of the Engineer for Existing Lines, who received his instructions from the Commissioner. The increase of work, consequent upon the extension of the railway lines, required that the combined duties should be divided, and it was decided that the Engineer for Existing Lines should retain charge of the permanent way and works, and another engineer, responsible in like manner to the Commissioner, should be appointed to take charge of the rolling stock, &c. It was determined to obtain from England the services of an engineer for the latter office, and upon the recommendation of Mr. Fowler, C.E. (the Inspecting Engineer), the

Agent-General (Mr. Forster) appointed Mr. R. H. Burnett to the office.

5. The statement of Mr. Burnett's qualifications for the office is given in his application. This discloses that he acquired his knowledge of mechanics in the establishment of Messrs. Beyer, Peacock, & Co., locomotive manufacturers, and that his experience of railway management was gained as Locomotive Superintendent of the Metropolitan Railway. This railway, though it carries a large passenger traffic, is of limited extent, and necessarily could not afford such a wide scope for acquiring an extensive experience of railway management as an official connection with more extended lines, having a general traffic, conducted under varying circumstances and conditions, would give. I mention this because Mr. Burnett, in giving expression to views and opinions upon railway management which differed materially from those held by the old officers of the department, has implied—while denying to those opposed to him (viz., the Secretary, the Engineer for Existing Lines, and the Traffic Manager) the possession of any experience to support

their opinions—that his experience entitles his views to unquestioned acceptance. 6. Mr. Burnett commenced the duties of his office in September, 1878, and from that time to the present his conduct of the business has been marked by opposition to the setablished rules of the Department, impatience of proper control, delay and postponement of important works, and by general inefficiency and want of judgment. That he has been discourteous and offensive in his communications, and insubordinate, is evidenced by the fact that he is now under suspension for this misconduct, and by his admission I shall proceed to establish the other charges which, in the interests of that he has no defence to offer.

the Public Service, I have considered it to be my duty to prefer against him.

7. Mr. Burnett's first contention, shortly after his appointment, was that any recommendation which he might feel compelled to make, with the view of meeting the immediate requirements of the Department, should be carried out without question. This had reference to the action of the Secretary for Public Works (Mr. Sutherland), when he decided that he could not give to Messrs. Beyer, Peacock, & Co., without competition (as recommended by Mr. Burnett), an order for certain engines, and he decided that specifications should be prepared, and tenders invited for these supplies in the usual way. To the request that no time should be lost in preparing specifications for the rolling stock, Mr. Burnett contended that the manner in which he should proceed in the conduct of the business of his Branch should be left to himself, and stated that there were other matters of more pressing importance to engage his immediate attention; he pointed out that, in proportion as his opinions and views as to the mode of proceeding with the business were interfered with, so his responsibilities would be limited; in short, he displayed a combative and controversial spirit, refusing to fall in, without unnecessary discussion, with the views of the Minister, and claiming uncontrolled power over the administration of the business of his Branch

8. These peculiar views having been dispelled, Mr. Burnett was given to understand that he must

9. The next occasion upon which Mr. Burnett's action caused discussion was when it was found some such as inspectors, to positions in his Branch, that, contrary to precedent, he was appointing officers, such as inspectors, to positions in his Branch,

10. Upon being informed by me that I had always reserved these appointments for the approval of the Minister, Mr. Burnett, in a combative spirit, at once reviewed the circumstances under which he

was appointed, his duties and responsibilities, and in a paper, appealing to the Minister, insisted that he should have uncontrolled power in this respect, and questioned the right of the Commissioner to direct

11. Having been set right in this respect, Mr. Burnett then requested that his duties, responsibilities, and powers should be defined. This was done accordingly, by my minute of 14/2/79, and I refer the Minister to this document as evidencing my desire to give Mr. Burnett every reasonable facility for conducting effectively the duties of his office. Mr. Burnett, however, in more than one instance has disregarded these directions. In support of this statement I append the papers in the case of Mr. Husk's appointment, and also in the case of Mr. Churchward. In the former case the papers will, I think, establish that Mr. Burnett improperly dispensed with the services of a competent clerk, who was performing the duties on trusted to him satisfactorily for the numbers of giving applearment to Mr. Husk whom ing the duties entrusted to him satisfactorily, for the purpose of giving employment to Mr. Husk, whom he brought or induced to come from South Australia for this purpose.

12. I beg to draw the Minister's attention to the papers with reference to the American engines; they disclose that Mr. Burnett, at a time when the engine power was far from adequate for the proper conduct of the traffic, declined to accept the responsibility of running these engines (some twelve in number) because the weight on the bogies was less than in the engines of English design. The proposal to abandon these engines seemed to me so monstrous, in the face of the difficulties to be contended with in conducting the traffic, and the fact that they were being used in America and elsewhere, constructed precisely on the same principle, that I accepted the responsibility myself of running them, although I was aware that, if any accident happened which could be, distantly even, attributed to a defect in these engines, I should have the engineer in the witness-box against me for venturing to run them in opposition to his advice. The engines, however, were run, and have continued to run, without accident, from the cause stated, for over two years. They are, without doubt, the most powerful engines on our lines, and have done good service to the Department, and will continue to do good service; whereas if Mr. Burnett's recommendation had been accepted, great loss, inconvenience, and perhaps worse results would have followed in the conduct of the traffic.

13. Another instance of what seems to be either incapacity, or wilful disregard of instructions on the part of Mr. Burnett, is disclosed in the case of the tank engines for the suburban lines. I may premise by stating that, prior to Mr. Burnett taking charge, Mr. Mason had prepared a specification for a tank engine weighing about 29 tons, for working the suburban traffic; the engine was designed to this weight on the ground of economy, as it was considered that such an engine would be sufficiently heavy for the suburban traffic, and, while doing the work would cause much less wear and tear on the rails, &c., than the heavier

engines in use.

14. Shortly after Mr. Burnett's arrival he adopted Mr. Mason's specification, and by his advice Messrs. Beyer, Peacock, & Co. were asked to manufacture six of these engines. Very shortly after the despatch of the order, however, Mr. Burnett requested that action might be stayed by cablegram till the question whether these engines should not be of greater power and weight had been further considered. After considerable discussion between the officers of the Department it was, with some hesitation, agreed that the weight of the engine should be increased to 33 tons, in steam. The following cablegram, prepared by Mr. Burnett, was then forwarded to England:

15. "Six tank engines from Beyer. Substitute, leading dimensions of Isle of Wight engines, 3,450 class, for those in Mason's specification, to have 900 gallons of water and Westinghouse automatic acting on engine wheels in place of steam brake, also screw reversing gear, and sliding fire-doors."

16. Shortly after the arrival of the engines it came to my knowledge that their weight exceeded the maximum weight specified, and as Mr. Burnett had not brought the matter under my attention I called upon him for an explanation. In reply, he admitted that the engines weighed over 40 tons (11 tons in excess of Mr. Mason's engine, and over 7 tons in excess of the increased weight agreed upon). I consider that the interests of the Department have been disregarded in this matter, and that the transaction discloses either incapacity on the part of Mr. Burnett to design the dimensions of parts so that the weight of the whole should not exceed 33 tons, or that he has wilfully ignored the decision arrived at. His omission to make report of the increased weight till his attention was drawn to the metter effords evidence of his to make report of the increased weight till his attention was drawn to the matter affords evidence of his

disregard of his official obligations.

conclusions being challenged.

17. The papers in the case of the tender of engine No. 85 leaving the road at Katoomba affords yet another instance of Mr. Burnett's incapacity or culpable carelessness. In reporting the accident to me Mr. Burnett stated that it did not arise from any defect in the vehicle. I thereupon called upon Mr. Mason to say what defect there was in the road, for it must either have been a defect in the vehicle or some fault in the road that caused the accident. Mr. Mason assured me, however, that there was no fault whatever in the road, that it was absolutely perfect, and that any alteration would cause a defect in it. Mr. Mason fully understood the importance of the matter—the risk there was to the life and safety of the public—and did not report till he had made, personally, a careful inspection of the place. referring Mr. Mason's report to Mr. Burnett, that gentleman again confidently stated that the defect was not in the vehicle, and recommended that guard rails should be placed round the curve where the tender left the road. As this curve had been run over for some fifteen or sixteen years without guard rails, and hundreds of thousands of vehicles, at the lowest computation, had passed over it safely (no other vehicle, save this particular one, having left the road) I did not-in view of the fact also that if guard rails were placed round this curve there would be no justification for their not being placed round all other curves on the line—accept Mr. Burnett's recommendation. I stated that I was altogether dissatisfied with the result of the inquiry, and expressed my opinion that those immediately responsible should have left nothing until the discount of the curve of the c nothing untried to discover the cause of the accident.

18. Two or three months afterwards the same vehicle again left the road at the same spot. Directions were then given by me that the Board appointed to inquire into accidents should investigate the matter, and that, pending inquiry, all drivers should be instructed not to exceed 8 miles an hour in rounding the Mr. Mason again assured me that there was no defect in the road, and that he was quite certain that an examination would show that the accidents were caused by a defect in the working parts of the Mr. Burnett seemed to evince considerable indifference in the matter; he wished to be excused from giving his personal attention to the inquiry, and recommended that his place on the Board should be taken by Mr. Scott. This I declined to sanction; for although I had perfect confidence in Mr. Scott's ability, I felt convinced that the accidents were caused by a defect in the vehicle, and as Mr. Burnett had so confidently denied that this was so, I wished him to be present at the inquiry, to avoid thereafter it

19. Before, however, the Board met, Mr. Burnett wrote me a minute, in which he stated that he had at length discovered that the accidents did arise from a defect in the spring gear of the tender. It was a gross piece of carelessness that the discovery was not made before; life and safety were at stake, and might have been sacrificed, and I consider the circumstances afford no excuse whatever for Mr.

Burnett's neglect of his duties.

20. The papers on the subject of the causes which led to one of the carriages catching fire—resulting in a fatal accident to a passenger (Mr. Burgess)—afford another case against Mr. Burnett's administration. That gentleman, on his first taking charge, while objecting to give precedence to certain work, which the Minister wished carried out speedily, urged that his earliest attention should be given to the wheels and axles of the older engines and carriages; and on the 30th November, 1878, stated that after he had disposed of the specification for locomotives, that would be one of the first matters which would have his attention. When it was discovered that the firing of the carriage was caused by the overweight in the springs bringing the floor of the carriage in contact with the wheels, I put certain questions to Mr. Burnett, the replies to which showed that he had neglected his duty, as it was found that no less than nineteen carriages were subject to the same defect. Mr. Burnett sets up in justification of his claim to be held irresponsible, that these carriages were fitted before he took charge; but in view of the fact (apart from his clear obligation in the matter) that he himself pointed out, over $2\frac{1}{2}$ years previously, that one of his first duties would be to see that all old carriages were properly fitted, I fail to see how he can escape from the responsibility of his neglect. His attention, moreover, had been called by Mr. Scott (some little time previous to the accident) to another carriage which had the like defect, and he was asked by that officer, in writing, to come in and inspect it; he neglected to do so, and must be held, I respectfully submit, inexcusably indifferent to the danger involved. If Mr. Burnett had performed this duty the accident referred to would not have occurred. A perusal of the papers will show that Mr. Burnett strives to cast the blame of this accident on Mr. Scott, the overseer, and that in his communications with me on the subject he is discourteous and offensive.

21. If one or two only of the cases quoted had occurred they could not perhaps be accepted as conclusive proof of Mr. Burnett's unfitness for the office he holds; but I think that, taken together,

they cannot but be considered as affording strong evidence of his incapacity.

22. I must, before leaving this portion of my statement, draw attention to the mischievous results which would have followed my acceptance of the advice which Mr. Burnett, as Locomotive Engineer, offered me on the occasion of a coal-waggen axle breaking on the Great Northern Railway recently. offered me on the occasion of a coal-waggen axle breaking on the Great Northern Kailway recently. The waggen belonged to the Minmi Coal Company, and he advised me to prohibit the running of all waggens, the axles of which were made to the same specification as the one which broke. This practically amounted to my stopping the working of this Company's mine—one of the largest in the Newcastle district—and involved the throwing out of employment of scores of miners, the breaking of commercial engagements, and a serious interruption to the shipping trade of the port. The Law Courts would have held, I think, that this course was taken on wholly insufficient grounds, and the damages that would have been obtained by the aggrieved owners would have made a sensible impression upon the Railway revenue. I have no confidence in the advice which this centleman offers me: and notwithstanding his contention that his confidence in the advice which this gentleman offers me; and, notwithstanding his contention that his experience entitles his views and opinions to unquestioned acceptance, I shall venture to disregard them,

as I have felt it to be my duty in several cases to do.

23. The papers in the case of the workshops at Bathurst, Goulburn, and Penrith disclose the result of Mr. Burnett's unwise interference with the plans adopted for these buildings by the Engineer for Existing When these works were well advanced towards completion, Mr. Burnett stated that the accommodation proposed was inadequate, and the expenditure that had been incurred wasteful. In order to give Mr. Burnett an opportunity of explaining his views and providing better plans, I at once directed that the progress of the work in hand should be stayed. Mr. Burnett, however, although admitting the difficulties under which the Locomotive Department laboured, in consequence of the want of workshops and runningshed accommodation, declined to move in the matter of furnishing plans, until the Engineer for Existing Lines had made a survey of each yard, and furnished him with cross sections. It was pointed out to Mr. Burnett that this would delay the works, and was altogether unnecessary, as a personal visit to each place would show him at once the conformation of the ground, and what sites were available; he persisted in his request, however, and nothing could be done till the surveys, &c., had been made. After considerable and vexatious delay, Mr. Burnett at length furnished me with his plans of the running sheds. I at once forwarded them to Mr. Cowdery, and that officer declares that there is not a single improvement to recommend them. Mr. Burnett's proposal, he states, to run three roads in place of two, as now run, would crowd the sheds too much and make them insufferably hot in summer. He further adds that to effect the alterations proposed, an expenditure of £680, already incurred at Goulburn, and £800 at Bathurst, would be wasted. Mr. Cowdery's report reached me on the 20th ultimo, and as Mr. Burnett was suspended before I had time to forward the papers to him. I sent them on to Mr. Scatt where great experience of the before I had time to forward the papers to him, I sent them on to Mr. Scott, whose great experience of the requirements of workshop and running-shed accommodation would, I wrote, enable him to offer a valuable opinion in regard to the proposed alteration. Mr. Scott entirely agrees with Mr. Cowdery. He says, "Having examined the proposed alterations to the original plans for workshops and running-sheds at Bathurst and Goulburn, I beg to state that I fail to see in them any improvement sufficient to justify the pulling up of the brick foundations, and loss of the timber work already prepared. To crowd three roads into the sheds as proposed would not allow sufficient space for cleaning and washing out engines, and the result of the adoption of such a course would be danger to those employed there. I concur with Mr. Cowdery in that the original plans should be carried out without delay."

24. There has been a waste of most valuable time in the postponement of these works, which, but

for Mr. Burnett's unwise interference, might by this time have been completed and ready for use.

25. A great and unnecessary delay has also taken place in deciding upon the plans of the work-

shops at Eveleigh, for which Mr. Burnett is chiefly responsible.

26. Although Mr. Mason's plans for these shops have been in Mr. Burnett's possession for months, for suggested alterations, I fail to learn, from inquiries I have made, that anything whatever has been done in the matter. When the inconvenience and expense which have resulted from the absence of adequate workshop accommodation are considered, the delay in dealing with the matter is most incomprehensible

27. This paper has extended to such a length that I fear to trespass longer on the Minister's time and attention in further demonstrating the shortcomings and unsatisfactory conduct of Mr. Burnett. I must, however, make brief allusion to his actions in encouraging, on the part of the locomotive drivers, a disregard

disregard of the danger signals, and the rules laid down for the safe working of the traffic. These will be found to be clearly set forth in the papers—

1. In the Katoomba accident (Driver Main.)

2. The accident at Parramatta (Driver Bell.)

3. The Murrumburrah Station case (Driver Heiney.)

4. The Orange Station case (Driver Chicken.)

5. The Staff and Ticket Regulations.

28. In the Katoomba case Mr. Burnett exhausts every argument in endeavouring to exonerate the driver of the engine in running past, without heeding, the danger signals against him. An accident to

the passenger train was the result.

29. Even a summary of the case here would extend this paper to too great a length; but a perusal of the papers will show how injudicious and mischievous, in its results, Mr. Burnett's action in the matter might prove to be. One incident connected with the case may be given, as evidencing that gentleman's utter disregard of official propriety and fair conduct. The engine-driver in fault had been suspended at once by the Locomotive Inspector—the inquiry by the Board followed, and the driver (Main) was consequently on his trial before the Board. Without the authority of the Board, and without any communication with me, Mr. Burnett, in the midst of the investigation, took upon himself to reinstate the driver. The effect which such a procedure was calculated to have upon the discipline of the staff may well be understood. The Board subsequently decided—Mr. Burnett alone dissenting—that the driver was to blame for the accident, and it was my duty, rendered painful and complexing by Mr. Burnett's improper conduct in acquitting and reinstating the man, to reverse the action taken, and punish the man in proportion to his offence. Mr. Burnett, however, refused to give effect to the decision.

30. The views and principles which Mr. Burnett has advocated in the other cases quoted, have not been less mischievous in their tendency to bring about the disorganization of the staff, but I must allow the papers on the subject to speak for themselves. In the case of the staff and ticket regulations he has displayed, as the papers disclose, a singular inability to appreciate the essential merits of the system, and his proposed amendments in the regulations would, if accepted, have involved the sacrifice of the very

feature upon which the safety of the working depended.

There are a number of comparatively minor matters connected with Mr. Burnett's administration of his branch, which might be mentioned as affording additional evidence of his inability to properly conduct it—his treatment of the contractors, the involvement of the Department in actions at law to which, the Crown Law Officers have advised, we had no defence whatever, resulting in our having to pay

the claims in full with costs, &c., &c.

32. A reference to the continual changes which Mr. Burnett has made in his staff will show that he has failed to work amicably with his officers. Gentlemen, who have composed his staff have repeatedly complained to me of his discourteous treatment, and several have been driven to resign their positions owing to his hostile bearing towards them. The names of four of these gentlemen occur to me as I write, owing to his hostile bearing towards them. The names of four of these gentlemen occur to me as I write, viz., Mr. Chambers, Mr. Booth, Mr. King, and Mr. Sutcliffe. In his paper of the 9th September, Mr. Burnett pleads very earnestly for his reinstatement, but what consideration has he shown to the gentlemen I have named? Their desire was to earn their living in the positions which they occupied, and their claim to do so, so long as they performed their duties properly, could not be denied. If they were driven from their employment, undeservedly, by Mr. Burnett's hostility towards them, what claim, I respectfully ask, has Mr. Burnett, who has erred so greatly, to a lenient consideration of his case.

33. Mr. Burnett's relations to heads of branches have been marked by all absence of, and even desire for, apparently, harmonious working. To Mr. Mason, to Mr. Read, the Manager, and to Mr. Vernon he has behaved, the records show, with the greatest discourtesy, and he has written minutes reflecting upon these officers in most improper and offensive terms.

reflecting upon these officers in most improper and offensive terms.

34. Although I have received much provocation at the hands of Mr. Burnett, it has been with no feeling of hostility towards him, but solely from a sense of duty that I have endeavoured to demonstrate his unfitness for the office he holds. I have been careful to advance no case against him which cannot be established, and I can unhesitatingly say that I have coloured no representation which I have felt it to be my duty to make. I respectfully ask the Minister to allow this paper, after Mr. Burnett has been afforded an opportunity of replying to it, to accompany the minute which he may write to His Excellency the Governor and the Executive Council, on the subject.

CHAS. A. GOODCHAP, 19/9/81.

No. 16.

Mr. R. H. Burnett asking for Minute Papers.

Sir,

In acknowledging receipt of your letter of the 27th inst., which was not delivered by post until shortly before noon yesterday, the 29th inst., I have the honor to request that I may be furnished with (say) a couple of copies of the printed document it contains.

I ask this to enable me to reply thereto in the most convenient form for perusal by the Executive

Council. The copy enclosed in your letter is, I observe, required to be returned, I presume intact.

I will, in accordance with your suggestion at our interview to-day, send in as soon as possible a list of the papers which, as I explained, are necessary for me to have in enabling me to reply to the

document in question.

That reply I will prepare and submit with the least possible delay, but I beg to point out that the time allowed, viz., seven days from the date of your letter, the 27th, is, I fear, too short a time to enable me to reply to a document dealing with matters—many of which are stated in a very general way—extending over a period of three years, more especially so in the entire absence of the papers referred to in, and as submitted with, the printed document, as well as of the many others required in connection with . I have, &c.

ROBT. H. BURNETT. P.S.—No doubt the few copies required can be readily struck off from the type as set up, and I can fill in the interlineations which appear in the original.—R.H.B.

Mr.

Mr. R. H. Burnett to The Clerk of the Executive Council.

"Ardross," North Shore, September 30, 1881. With reference to my letter to you of to-day's date, saying I would furnish a list of the papers I require, I have now the honor to request to be furnished with the whole of the papers referred to in the printed document, accompanying your letter of the 27th inst., as having been submitted therewith to the Minister, together with all other papers on which the Commissioner for Railways bases the statements contained in the above document.

As regards the list referred to, I have the honor to request that I may be allowed access to the official records of my office, as well as to my late assistants, to enable me to prepare a list of such additional papers as I may require, in replying to the printed document in question.

I have, &c ROBT. H. BURNETT.

The papers asked for by Mr. Burnett were handed to me on the 5th, and duly forwarded to him. Two copies of the Commissioner's minute were also forwarded.—A.C.B., 6/10/81.

No. 17.

Mr. R. H. Burnett to The Clerk of the Executive Council.

"Ardross," Fitzroy-street, North Shore, 10 October, 1881. In accordance with the intimation contained in your letter of the 6th instant, I have now Sir. the honor to ask to be furnished with the following papers:-

Locomotive Engineer's 78/82 and all papers in connection therewith; Locomotive Engineer's report to the Commissioner of 4/9/78 re office staff;

Locomotive Engineer's 79/96 and all papers in connection;

Locomotive Engineer's 79/328 and all papers in connection;
All papers re the ordering of nine consolidation engines from Baldwin & Co.;
Locomotive Engineer's 79/3,642 and 79/3,933, and all papers in connection;
Minute from Commissioner, directing Locomotive Engineer to proceed to Newcastle re Meaden's complaints, and subsequent papers on subject;

All papers re Huby's transfer;

All papers re Huby's transfer;
Remainder of papers in the case of Mr. King (clerk), suspended;
All papers re application for additional office accommodation;
Also the report referred to in the 17th paragraph of the minute paper of the Commissioner of 19/9/81, in the following words:—"On referring Mr. Mason's report to Mr. Burnett that gentleman again confidently stated that the defect was not in the vehicle," &c.;
Also the paper in which (as is stated in the 18th paragraph) "Mr. Burnett had so confidently denied that this was so," viz., that the accidents were caused by a defect in the vehicle.

I beg again, respectfully, to ask to be allowed access to the records of my office, to enable me to name specifically papers, which I believe, if my memory serves me, bear materially on the subjects referred to in the Commissioner's minute. Amongst others, I refer to the report from the Locomotive Overseer (Mr. Scott) of the discovery of the error in the spring gear of tender No. 85, and the other papers between Mr. Scott and myself relative to this tender, the whole of which papers I have now the honor to apply for.

I beg at the same time to point out that from the day of receipt of the papers applied for in mine of the 30th ultimo, to the end of the 2nd, seven days from the date of your letter of the 27th ultimo, only four clear days, including Sunday, intervene and expire to-morrow.

I therefore respectfully ask the indulgence of the Council in granting me a further extension of time for sending in my reply.

I have, &c., ROBT. H. BURNETT.

Be good enough to have the papers collected as early as possible. If the references given by the Locomotive Engineer's record Nos. be not sufficient to identify papers communicate with Record Clerk in Engineer's Office.—C.A.G., 10/10/81.

The extension of time asked for has been granted.—A.C.B. Papers forwarded to Mr. Burnett,—

A.C.B., 13/10/81.

Mr. R. H. Burnett to The Clerk of the Executive Council.

Sir, Fitzroy-street, North Shore, 13 October, 1881 Referring to my letter of the 10th instant I find I therein quoted, in error, paper No. 79/96 and all papers in connection therewith. The papers I intended to refer to are the whole of the papers in connection with the case of Perry's application for a position at Rydal in 1878-79, for which papers I have now the honor to apply in place of the above. I have, &c ROBT. H. BURNETT.

No. 18.

Mr. R. H. Burnett to The Clerk of the Executive Council.

Fitzroy-street, North Shore, 17 October, 1881. I have the honor to apply for a further extension of time in preparing my reply, and beg at the same time to draw your kind attention to the fact that the papers accompanying your letter of the 13th instant do not include several named by me in mine of the 10th instant. The

The papers to which I refer are :-

(a) The report referred to in the 17th paragraph of the minute paper of the Commissioner of 19/9/81, in the following words:—"On referring Mr. Mason's report to Mr. Burnett that gentleman again confidently stated that the defect was not in the vehicle, &c.

(b) The paper in which (as stated in the 18th paragraph) "Mr. Burnett had so confidently

denied that this was so (viz., that the accidents were caused by a defect in the vehicle).

(c) The remainder of the papers in the case of Mr. King (clerk) suspended. (Whether the (Whether these papers are recorded in the Commissioner's office or otherwise.)

(d) The report from the Locomotive Overseer (Mr. Scott) of the discovery of the error in the

spring gear of tender No. 85. I have therefore the honor to make application again for the foregoing.

I shall be glad at the same time to be supplied with the following: (1.) Memorandum to Mr. Scott in July, 1880, re the sending in of his report for the half-year.

(2.) All papers relative to the appointment of the members of the Board of Inquiry for the South and West lines, together with all papers relating thereto, in connection with the inquiry into the Katoomba accident.

(3.) The remainder of the papers in connection with the re-suspension and subsequent employ-

ment of driver Main.

(4.) All papers re workshops at Penrith, Goulburn, and Bathurst, prior to the date of those forwarded with yours of the 6th instant, including my report to the Commissioner on workshops.

The remainder of the papers in G. Wilson's case.

(6.) The whole of the papers in G. Frost's case.

· I-have, &c ROBT. H. BURNETT.

No. 19.

Mr. R. H. Burnett to The Clerk of the Executive Council.

Sir,

I have the honor to inform you that on referring to the bundle of papers forwarded with your letter of the 6th instant, bearing on paragraphs 27, 28, 29, and 30 of the Commissioner's minute of 19/9/81, I find a large number of papers connected with the Katoomba accident case, including the transcript of proceedings, exhibits, &c., have been omitted.

I have the honor to request that the whole of the papers in the case may be furnished to me.

ROBT. H. BURNETT.

I may add that I have not yet received the papers referred to in my letter of the 17th instant.

No. 20.

Mr. R. H. Burnett to The Clerk of the Executive Council.

Sir,

I have the honor to inform you that I find, with much regret, that I am unable to complete my statement in time to hand it to you to-day as arranged, and therefore I beg the kind indulgence of the It shall be in your hands as early as possible to-morrow.

I have, &c.

ROBT. H. BURNETT.

No. 21.

Mr. R. H. Burnett's reply to Minute of Commissioner for Railways.

I HAVE now the honor to submit, for the consideration of His Excellency the Governor and the Executive Council, the following statement in reply to the minute of the Commissioner for Railways of 19/9/81, addressed to the Honorable the Secretary for Public Works.

I would respectfully ask the indulgence of the Executive Council while I trespass—as I fear I shall be compelled to do-at considerable length upon their time and attention, in replying to a document which traverses the whole period of my connection with the Railway Department, and which, as I think I shall be able to show, does not correctly represent my action in the several matters to which it refers.

As regards the opening statement, by the Commissioner, that the representation contained in his minute is not made, as expressed by the Commissioner, "in consequence of the position in which Mr. Burnett is placed at the present time," it is but just that I should state that it was never intimated to me that the Commissioner had expressed to the Minister some weeks prior to my suspension from office his belief that I had shown myself to be unfitted for the position I held, and I never understood the Combelief that I had shown myself to be unfitted for the position I held, and I never understood the Commissioner to inform me that it was his intention to bring my conduct under the attention of the Government. Moreover, the Commissioner himself certified up to the end of August, that being the end of the last pay period, and only some three weeks prior to my suspension—that my "services had been faithfully performed." I mention these circumstances because I cannot but regret that any complaints which it might have been the intention of the Commissioner to bring against me were not made at the time the events occurred, when I should have been enabled to reply to them with the facility arising from free access to the records of my office, and when the circumstances bearing on each case were fresh in the memory. memory

And here I may be permitted to remark, that the interval between the date of my suspension and the date of the Commissioner's minute was close upon a month, while the document was not submitted for my reply until some ten days later.

I will now proceed to deal with the statements contained in the Commissioner's minute. But in the first place I may perhaps be allowed to say, that whatever opinion the Commissioner may now give expression to in regard to the qualifications I possessed for the office, for which I was selected by the Agent-General, on the recommendation of Mr. John Fowler, C.E., it is evident that the statement of my qualifications, as given in my application for the office, and which, in the fullest and frankest manner, "discloses", (to use the Commissioner's language) my prior connection with Messrs. Beyer, Peacock, and Co., was satisfactory to the Minister for Public Works (the Hon. Mr. Sutherland), for on that gentleman's recommendation my appointment was submitted to and confirmed by the Executive Council.

As regards the Metropolitan Railway, to which the Commissioner refers, it is true that in respect of the length of line actually award by the Company it is of limited extent.

the length of line actually owned by the Company it is of limited extent, but during the greater portion of the eight years I was connected with it it leased and worked other lines in conjunction therewith, amounting to a total of 20 miles. It is not, however, by the mere length of a railway that its importance as a field for experience in railway management and working is to be considered. The traffic developed by the Metropolitan Railway, during my connection with it, was so enormous that its train mileage amounted to no less than 1,600,000 miles per annum, which represents the train service of a line of 420 miles, estimated on the basis of the train miles run on the railways of this Colony in the year 1878, the year in which I took charge—the train miles run on the N.S. Wales railways in that year being only 2,600,000 for a total of 690 miles then in operation.

To conduct the train mileage of 1,600,000, as in the case of the Metropolitan Railway, safely over so limited an extent as 20 miles, requires no little vigilance and knowledge of the most approved principles and appliances in railway working. But in addition to its own local and suburban traffic it was run over by the trains of all the principal Trunk lines having termini in London, viz., the Great Western, the Great Northern, the Midland, the London Chatham and Dover, and the Great Easterneach adding to the difficulties and complexity in working, arising out of their several junctions with the Metropolitan, yet at the same time bringing those officially connected with the latter railway into close official and personal contact with the highest authorities in railway management in the United Kingdom.

In combining on the Metropolitan Railway the duties of Locomotive Superintendent and Engineer of Permanent Way, I had charge of the whole of the Engineering Staff, including mechanics, platelayers, and locomotive men, and that the duties were safely and satisfactorily conducted may be gathered from

the following extract from one of the half-yearly Reports of the Directors:

"Since the first opening of the metropolitan line, 316 million passengers have been carried without the loss of a single life from causes within the Company's control, and the few casualties which have arisen can be traced to no want of precaution, discipline, or mechanical or other contrivances, but to the employment of human agency, and in part to over confidence which automatic contrivances unfortunately produce.

Of the 316 million passengers abovenamed, 250 millions were carried during the eight years I was connected with the railway. I refer to the foregoing as bearing testimony to the non-existence during at least eight years of my railway practice of that "neglect of his duties" which the Commissioner attributes to me.

Although the Commissioner, in the concluding paragraph of his minute, states that he has coloured no representation which he has made against me, yet I think I shall be able to show that he has presented a case against me which cannot be sustained.

In support of this I will proceed to take, seriatim, the various matters referred to by the Commis-

sioner, commencing with paragraph 7.

In that paragraph the Commissioner states:—"Mr. Burnett's first contention, shortly after his In that paragraph the Commissioner states:—"Mr. Burnett's first contention, shortly after his appointment, was that any recommendation which he might feel compelled to make with the view of meeting the immediate requirements of the Department should be carried out without question." By the addition of the words "without question," and by the separation from the context of the words actually used by me, a very different meaning is to be gathered as to what I wrote than my language really warrants. I will presently quote, with the indulgence of the Council, from the document itself; but I would in the first place ask the Council's attention to the date of the paper to which the above inaccurate reference by the Commissioner relates. The date of the paper is November 30, 1878. I call attention to this, because the Commissioner next states in the same paragraph (No. 7):—

"This had reference to the action of the Secretary for Public Works (Mr. Sutherland) when he decided that he could not give to Messrs. Beyer, Peacock, & Co., without competition (as recommended by Mr. Burnett), an order for certain engines, and he decided that specifications should be prepared and

Mr. Burnett), an order for certain engines, and he decided that specifications should be prepared and tenders invited for these supplies in the usual way."

This, as will be seen by the papers themselves, is not in accordance with the facts. I made the recommendation regarding the obtaining of the engines in question in a paper dated September 19, 1878, or more than two months previous to the first-named paper (of November 30), in which I ventured, and as I think not improperly, to offer my suggestion for "meeting the immediate requirements of the Department." By the juxta-position by the Commissioner in one paragraph of two inaccurate references to two different papers, which were written at two distinct and separate dates, the inference naturally to be drawn in that I contended that a recommendation which I had made for the propert gundle of an interest be drawn is, that I contended that a recommendation which I had made for the prompt supply of engines from Messrs. Beyer, Peacock, & Co. should be carried out without question.

The terms of the minute in which I made the recommendation as to the engines speak for themselves in disproof of this, and, as I venture to think, will satisfy the Council that the recommendation was not an unreasonable one under the circumstances. To the paper itself I would respectfully ask the attention of the Council. In it, as will be seen, I stated the numerous and important matters which were then—only some three weeks after I had taken charge—awaiting my attention, and having done so

I proceeded as follows:

"The specification and drawings that exist, bearing on these contracts are not, as it seems to me, in a condition in which I could personally take the responsibility of contracts which involve so large an expenditure of money (about £300,000), and which, as in the case of the rolling-stock, would bind the Government for so long a period as five years. I would recommend therefore that the invitation of the five years' contracts for the rolling stock be postponed, until I shall have had sufficient time to prepare the necessary drawings and specifications, and that separate tenders be obtained in the meantime for such vehicles as may be required from time to time to meet the demands of the traffic, as has been done, I believe, for some time back since the last five years contract for vehicles ceased.

"As

"As regards the locomotives, I am having drawings and revised specifications for the passenger and goods engines (referred to in contracts 1 and 2) prepared with all despatch, with the object of catching, if possible, the next home mail (on the 10th proximo), to enable tenders to be invited in England at the earliest possible date.

"As regards the engines named in contract No. 3, I recommend that the ordering of them be postponed, and in lieu thereof that the number of passenger and goods engines, about to be ordered, be

increased to (say) nine each."

My proposal as to the supply of the engines from Messrs. Beyers, Peacock, & Co. then follows:—
"By a report attached from Mr. Scott, the Locomotive Overseer, it would appear that no time should be lost in ordering the four tank engines named in contract No. 4. As this is a new class of engine, for which there are no drawings, and the working out of which would be tedious without the necessary staff, I recommend that a price be obtained from Messrs. Beyer, Peacock, and Co., and, if satisfactory, that the order be given to them. A specification to indicate to them the exact engine required could readily be drawn up, as these makers already know all the special requirements of this The plan I propose would have the result of insuring our having, without delay, pattern

engines of first-class make, and complete with all the most recent details.

"As the number of engines asked for in this lot is small (viz., four), any apparent saving that might be effected by going to competition would be but slight, and would, I submit, be more than balanced by our having thoroughly reliable engines in the shortest possible time."

And then, after making a few suggestions with reference to extra locomotive boilers required for

the Northern Line, I concluded as follows:

"I make these suggestions from a desire to facilitate the carrying on of the work of the Railway during a period of transition of the Locomotive Department from one head to another, at a time when a more than usual number of important matters have accumulated for decision, while at the same time I am placed at no little disadvantage in taking charge of the Department, by being without the assistance of the office staff, including both clerks and draftsmen, which, under usual circumstances, would have been 'available for my assistance.'

In place, however, of my recommendation being entertained, I was met thus early in my connection with and experience of, the Department with the brief intimation that the proposal that tank engines

should be ordered without tender could not be consented to.

should be ordered without tender could not be consented to.

I am unable, I must confess, to see the unreasonableness of my recommendation under the circumstances. The number of engines proposed to be ordered was small, only four being required, while Messrs. Beyer, Peacock, & Co. were already known, and for many years to the Department, as first-class engine-makers, whose faithful carrying out of the work entrusted to them could be relied upon, while as will be seen from my minute, as quoted above, I proposed that a price should be first obtained from them, and that the order should be given only if the price was "satisfactory." Nor was the proposal so entirely at variance with the practice of the department as the Commissioner's remarks—to the effect that the Minister "decided that specifications should be prepared and tenders invited for these supplies in the usual way"—naturally imply. As will be seen by reference to the official papers, an order had been given by the department some six months before (viz., on March 29/78) for several engines without tender or competition, and further, that a month or two after my proposal was rejected engines without tender or competition, and further, that a month or two after my proposal was rejected (viz., on December 20/78), the department ordered nine engines from the same firm without competition

(viz., on December 20/78), the department ordered nine engines from the same nrm without competition of any kind.

The further statement by the Commissioner in paragraph 7 as follows:—"To the request that no time should be lost in preparing specifications for the locomotives" (or rolling stock, as I believe the Commissioner means) "Mr. Burnett contended that the manner in which he should proceed in the conduct of the business of his Branch should be left to himself," is, I beg to say, incorrect. That there were then "other matters of more pressing importance to engage my immediate attention" was doubtless the case, and, in so far as I may have at any time pointed out that "in proportion as my opinions and views as to the mode of proceeding with the business were interfered with, so my responsibilities would be limited," yet I submit that I did not do so either without occasion, or "in a combative and controversial spirit," or indeed in any way unbefitting the circumstances. While in reply to the Commissioner's concluding remarks in paragraph 7, that "I refused to fall in, without unnecessary discussion, with the views of the Minister, and claimed uncontrolled power over the business of my Branch," I beg to be allowed to say that it cannot be substantiated by the papers, and is, as I submit, at variance with the facts.

In support of this I would respectfully refer the Council to the paper itself. I will, however, for the convenience of the Council, extract a few paragraphs which will, I think, satisfy the Council that my

the convenience of the Council, extract a few paragraphs which will, I think, satisfy the Council that my recommendations were reasonable, and that they were not expressed in language, or style unbefitting the occasion. In the paper in question, dated November 30/78, I wrote as follows:—

"In my 78/992 I offered, briefly, my reasons for suggesting a delay in inserting in yesterday's Gazette the proposed advertisement inviting tenders for the five years' contract for rolling stock. The reasons for these suggestions are now given at length, As pointed out in my 78/241 (September 19th), the number of specifications involved in this case is no less than twenty-two. To prepare, even a part of these specifications in full by the time named (the 20th instant) it would be necessary for me to devote these specifications, in full, by the time named (the 20th instant) it would be necessary for me to devote the whole of my attention personally to the matter. But in the present position of the business of the Department, it is not, I regret to say, in my power, unless other important matters are allowed to stand,

to give this one the whole of my personal attention.

"Since I assumed the position of head of the Department, my time has been closely occupied with (in addition to the daily work of the Department) the preparation of specifications for the passenger and goods engines ordered to be obtained at once from England. During this time (three months) I have dealt personally with about 800 important documents of various kinds, embracing upwards of 6,000

separate papers.

"This has been done in the absence of the assistance of the office staff, which had hitherto rendered assistance to the gentlemen who have been, at various times, at the head of this Department. During the earlier part of this time I was without office helps of any kind. During the succeeding period, of about a month, the assistance available was of an intermittent and temporary nature, and even now, however able and willing those whom I have to assist me may be, it can hardly be expected that they, new to the Department and the work, can in the meantime relieve me of a large portion of the work which is necessary to meet the daily requirements of the Service, and which, so long as it devolves upon the head of the Department to attend to, must necessarily prevent his giving more than a limited portion of his time to other matters.

Then, after giving a list of a variety of matters awaiting attention, I concluded my minute as

follows:—

"I think I may venture to say (without egotism) that I possess the experience and the will required to raise the working of the department, in respect both of efficiency and economy, to the first rank in railway performance. But before this can be attempted, and before I can personally be held even the safe or efficient working of the Department, it is not only necessary, but just, remotely responsible for the safe or efficient working of the Department, it is not only necessary, but just, that I shall have a fair start, with the opportunity of dealing with the several matters affecting the Department, in the order in which it appears to me they should be dealt with; and further, that any recommendation I may feel compelled to make, with a view of meeting in the promptest way the immediate requirements of the Department, shall be carried out.

"To meet the instructions of the Minister I shall prepare, with all possible despatch, short specifications in accordance with the Commissioner's minute 78/13,380, referring the contractors to sample vehicles now on the railway, if the Commissioner will be good enough to cause to be furnished to me the stock numbers of one of each of the several kinds of carriages, and other vehicles included in the summary estimate of stock required for five years (as per list herewith) which are, in the opinion of the Traffic Department, most suitable for the accommodation of the passenger and goods traffic. On the receipt of this information I will have the best constructed vehicle of each class, corresponding with those indicated by the Traffic Department, collected and placed in a siding, and particulars for the specifications prepared

I respectfully submit that there is nothing either in the matter or tone of the above quoted minute to justify the statements made by the Commissioner in paragraph 7.

Having now dealt with paragraph 7, and, by consequence, of No. 8, I beg to state, in regard to paragraph 9, that it is incorrect that I was, as stated by the Commissioner, "appointing officers, such as inspectors," to positions in my Branch without authority, and "contrary to precedent." The one appointment which I was then about to make was, as I submit, entirely in accordance with the action of my predecessors in such cases. A perusal of the minute which I addressed to the Commissioner on the subject will, I feel sure, satisfy the Council that it was warranted by the circumstances, and does not, as I submit, justify the statement that I acted in the matter in "a combative spirit," or insisted that I should have "uncontrolled power" in this or any respect. The circumstances attending the case seemed to render it necessary for me to request to be furnished with a statement, indicating the matters that were left to the control of the Locomotive Engineer to act upon. and settle on his discretion, and what were left to the control of the Locomotive Engineer to act upon, and settle on his discretion, and what were reserved for the approval of the Commissioner before being put in force. The terms of the Commissioner's minute of 14/2/79, in reply, might have proved sufficient to have enabled the business of my Branch to be carried on with reasonable facility, if the matters indicated in that minute had been left in my hands. This, however, was not the case; and while the control of the staff was nominally given, the action of the Commissioner had the effect of undermining my authority and control.

As regards the case of Mr. Husk and that of Mr. Churchward, referred to in paragraph 11, they

have already been fully dealt with in the papers of each case, and I need therefore merely say that while the appointment of these gentlemen was, in each case, covered, as it seemed to me, by the authority conveyed in the Minister's minute of 10/5/81, to the effect that he was of opinion that "the fullest power of appointing, promoting, suspending, and dismissing should rest in the hands of the Locomotive Engineer," the employment of these two gentlemen was in accordance with the course I had followed in similar cases on previous occasions and which had met with the tacit if not indeed with the formal similar cases on previous occasions, and which had met with the tacit, if not indeed with the formal, approval of the Commissioner; while it is not the case that I dispensed with the services of any one, for the purpose of giving employment to Mr. Husk. I may however add that Mr. Husk offered his services, because (as will be seen by the papers) his then engagement in the office of the Locomotive Engineer for the South Australian Government was about to terminate, and his experience in that office, coupled with his ability to write shorthand—the assistance of which to facilitate the dispatch of my work I had long his ability to write shorthand—the assistance of which to facilitate the dispatch of my work I had long felt the need,—seemed to me to specially fit him to render the assistance I required.

As regards the consolidation engines, referred to in paragraph 12, I beg to state that the statements of the Commissioner in this matter are also at variance with the facts. I did not decline to accept the responsibility of running these engines, "because" (as stated by the Commissioner) "the weight on the bogies was less than in engines of English design," but I nevertheless thought it my duty to point out to the Commissioner that I was of opinion (and rightly too, as later experience showed) that they had too little weight on the bogies for engines of that type and size. If the Commissioner means, by the second sentence in paragraph 12, to imply that I proposed to "abandon" these engines the statement is not correct. The circumstances did not require me to make any such proposal. I was not in any way responsible for their having been obtained, and was not called upon to do more than lay before the Commissioner those points in regard to these engines which it appeared to me he should, under the circumstances, be apprised of; and whatever responsibility the Commissioner may have incurred in respect of these engines was due entirely to the unusual course which was followed in connection with their supply. of these engines was due entirely to the unusual course which was followed in connection with their supply. Fortunately no serious accident has occurred, as the Commissioner says "from the cause stated"; but the Commissioner seems to forget that he himself at a later period thought it necessary to require the speed of these engines to be limited at certain parts of the line considerably below the usual working speed of these parties of the line in consequence of the defeative action of the horizontals in lifting from the speed of these engines to be limited at certain parts of the line considerably below the usual working speed at those portions of the line, in consequence of the defective action of the bogie wheels in lifting from the rails, due to insufficient weight thereon; and further, that the fittings which were brought from America by the gentleman whom the manufacturer sent specially to deal with the matter—in the hope of remedying the defective action of the bogie wheels in lifting from the rails without having recourse to the imposition of the extra weight put upon them—failed in their effect. The matter of the extra weight of the tank engines, referred to in paragraphs 13, 14, 15, and 16, has already been dealt with in the papers on the subject. I should, however, point out that the alteration made in England in respect of the four-wheeled bogie, whereby the weight of the engine was partially increased, was duly covered by the authority contained in the telegram which was transmitted to the Agent-General on my recommendation to the Commissioner, which was as follows:—

to the Commissioner, which was as follows:—

"In carrying out details of six tank engines such modifications and improvements to be made by the makers, with the approval of Mr. Fowler, as their experience of the requirements of the railway may suggest."

As regards the Commissioner's opinion, that the interests of the Department have been disregarded in this matter, I have merely to repeat what I have already stated in my minute of 14/12/80 on the subject, viz. —"That I regard these engines as well suited for the traffic for which they are designed, and am satisfied that the adoption of less powerful engines would have been a great mistake; they are, as I pointed out when I recommended them, ahead of their present work, having that good margin of power for extra traffic, without which no engine is held to be suitable for the service for which it is intended—a quality the advantage of which will be felt and appreciated more and more, year by year, as

the traffic rapidly increases."

I will next proceed to deal with the case of the tender of engine No. 85, leaving the road at Katoomba, referred to in paragraphs 17, 18, and 19. In paragraph 17 the Commissioner commences

"In reporting the accident to me, Mr. Burnett stated that it did not arise from any defect in the vehicle."

The Commissioner then adds as follows:-

"I therefore called upon Mr. Mason to say what defect there was in the road, for it must either have been a defect in the vehicle, or some fault in the road that caused the accident. Mr. Mason assured me, however, that there was no fault whatever in the road, that it was absolutely perfect, and that any alteration would cause a defect in it. Mr. Mason fully understood the importance of the matter, the risk there was to the life and safety of the public, and did not report till he had made personally a careful inspection of the place.'

Whether this "report" was verbal, or in writing, is not so far stated, but it will be seen that the

subsequent context (in paragraph 17) implies that it was in the form of a written report, that it was forwarded to me, and that I replied to it; for the Commissioner goes on to say:—

"On referring Mr. Mason's 'report' to Mr. Burnett, that gentleman again confidently stated that the defect was not in the vehicle, and recommended that guard rails should be placed round the

curve where the tender left the road.'

This, I beg to say, is not the case. No such report was referred to me, nor did I at any time again confidently state that the defect was not in the vehicle. The only report amongst the papers, or that ever reached me concerning the matter from Mr. Mason's office—and I have been unable to trace any otheris one merely marked off to the Commissioner by Mr. Mason, thus:—"Commissioner to see.—W.M., 29/10/80." It is a report from Bowenfels by Mr. John Hollis, the Permanent Way Inspector, addressed to Mr. Mason. It is dated Oct. 28/80. It would reach Sydney on the morning of the 29th, and was marked off by Mr. Mason to the Commissioner on that day, giving Mr. Mason no time to visit the spot; and although it contains a statement by Mr. Hollis that the road was in good order, it bears no statement by Mr. Mason to the effect that he had personally made an inspection of the place. But even this report in place of being forwarded to me by the Commissioner for my information or further report, was retained in the Commissioner's office.

The minutes on the papers in reference to the matter show, that on receiving my report relative to the condition of the engine and tender, the Commissioner, in place of referring to me any report of Mr. Mason's, as stated by the Commissioner, merely inquired by minute, addressed to his Record Clerk: "Is there any report from the Engineer for Existing Lines, 12/11/81.—Cn. A. G." In reply to this question reference is made (in pencil) by the Record Clerk to two papers, one 80-21,122 and the other 80-21,132, the former being, as will be seen, a report of the occurrence by the Traffic Manager, addressed to the Commissioner, and the latter being the report of Inspector Hollis to Mr. Mason, to which I have already

Nothing further appears to have been done in the matter by the Commissioner, beyond recording

on the papers the following minute:—

"Nothing the matter with the road, nothing wrong with the tender or engine, and yet the former leaves the track; this is unsatisfactory.—Chas. A. G., 17/11/80."

Then this further minute follows:

"The engine was probably running at an undue speed, but this is also denied. I am not satisfied, and must consider whether fuller inquiry should not be made.—Chas. A. G., 19/11/80."

Then follows an instruction by the Commissioner to the Record Clerk to resubmit the papers at the "end of the year." The papers appear by the markings to have been resubmitted on January 3/81,

the "end of the year." The papers appear by the markings to have been resubmitted on January 3/81, and on January 15 the Commissioner wrote on them:—

"I am afraid inquiry would result in eliciting nothing further—there has been a fault somewhere, and those immediately responsible should have left nothing untried to discover the cause. This paper may be resubmitted should, unfortunately, any similar case arise.—Chas. A. G., 15/1/81."

It is clear then from the above minute that in place of Mr. Mason's report, or any other of the kind having been referred to me by the Commissioner, the whole of the papers on the subject were retained in his office for resubmission at some future time. But in addition to the erroneous statement by the Commissioner that he had referred to a report from Mr. Mason to me, and that I had "again confidently stated that the defect was not in the vehicle," the Commissioner further adds incorrectly:—

"And (Mr. Burnett) recommended that guard rails should be placed round the curve where the tender left the road," and then concludes the paragraph No. 17 by saying:—"I stated that I was altogether dissatisfied with the result of the inquiry, and expressed my opinion that those immediately responsible should have left nothing untried to discover the cause of the accident."

responsible should have left nothing untried to discover the cause of the accident.

The sequence and wording of these sentences do, I respectfully submit, very incorrectly represent the fac's of the case. It will be seen by a perusal of the papers that, in place of the fac's being as represented by the Commissioner, no communication whatever was made to me by that gentleman, or anything done by him to lead me to reopen the question of the tender's fitness for the road-my report on which had been based on evidence which I was warranted at the time in taking as conclusive-and further, that the Commissioner's expression of dissatisfaction with the result of the inquiry (which was self-evident to anyone who was in possession, as the Commissioner was, of both sets of papers) was confined to his giving expression thereto on a paper which, however, he retained in his office.

As stated by the Commissioner, the same vehicle, two or three months afterwards, viz., on the 13th January, 1881, again left the road at the same spot, and, as afterwards transpired, directions were given by the Commissioner to the Secretary that the Board appointed to inquire into charges brought against the employees should inquire into the cause of this accident. It should, however, be pointed out that employees should inquire into the cause of this accident.

although the accident happened on the 13th January, the first intimation of the calling together of the Board was not made on behalf of the Commissioner until the 25th of that month. Further, the intimation was made on a paper addressed to Mr. Mason alone, which paper was not acted upon or returned to the Commissioner's office by Mr. Mason until the 29th January, and did not reach my office until the 5th

of the following month, or twenty-two days after the occurrence.

In the meantime I had ordered the tender to be lifted, and gave directions to Mr. Scott (the Locomotive Overseer) to supply me with the result of his personal examination, and measurement of the working parts of the tender. This he did on the 18th of January. I examined and checked the measurements he gave me, and directed him to have some modification in the dimensions carried into effect. On his reporting to me, in writing, that the tender was ready for work, it was again brought into use, viz., on the 25th January. Up to this time, however, no intimation had been conveyed to me that Mr. Mason had reported that the road was in perfect order, or that the Commissioner had directed an investigation by the Board, but on the 31st January (the tender having again left the road on that day at the identical spot, to an inch, at which it had left the road on the two previous occasions, indicating some local peculiarity or fault in the road at that spot) I received a minute from the Secretary, on behalf of the Commissioner, stating that it was his wish that a Board Meeting should be held, and that, pending inquiry, all drivers should be instructed to reduce speed at the curve in question, and it was not until then that any of the papers reached me, which the Commissioner states had been referred by him to me on the occasion of the tender first leaving the road, over two months before. I replied on the same day (the 31st January) that I had issued instructions to the drivers as requested, and asked the Secretary to inform me when the time of meeting of the Board was fixed. On the 4th of February I received a reply, proposing "Monday, the 7th, say at 9:30 at Mr. Burnett's office, if this will suit," and adding "that Mr. Cowdery will act as Mr. Mason's substitute." To this I lost no time in replying, "If it will suit the Secretary and Mr. Cowdery I would ask for the meeting to be postponed till 11 on Tuesday (the 8th), and I will come to the Secretary's office if it will better suit the convenience of the other members of the Board." And here I may be permitted to say with reference to the after proposal I made that Mr. Sectit should represent me at the mitted to say, with reference to the after proposal I made, that Mr. Scott should represent me at the inquiry (so pointedly referred to by the Commissioner in paragraph 18), that it did not emanate, as I need hardly say, from any indifference on my part, as stated by the Commissioner, but because it was a matter in regard to which Mr. Scott's personal knowledge of the facts connected with the fittings of the tender rendered him specially qualified to deal with. That the charge of indifference advanced against me by the Commissioner is at variance with the facts, may be at once gathered from a perusal of my minute, which concludes thus:—"Should any point arise at the conclusion of the inquiry requiring my personal action it shall have my earliest attention." Moreover, as showing that to be represented by deputy was not so remarkable a proposal as the Commissioner implies, it will be seen by the papers that the Commissioner had himself approved of the proposal that Mr. Cowdery, Mr. Mason's assistant, should represent the latter on the Board at this very inquiry.

In the meantime, and prior to any communication from the Commissioner on the subject, I had directed the tender to be again lifted under Mr. Scott's personal supervision, and every part again examined, and the result reported by him to me. On its having been again examined in accordance with my directions, I was informed by Mr. Scott, prior to the meeting of the Board, that he had discovered that the recess for one of the spring pillars in the lid of one of the tender axle-boxes was found to be \frac{1}{4} inch deeper than it ought to have been, which caused an unequal loading of the leading axle, and which he had omitted to discover and to report to me before. I therefore at once communicated the result to the Commissioner in

my minute of 7/2/81, as follows:—

"I have to report that since the tender of the above engine (No. 85) left the road on the last

"I have to report that since the tender of the above engine (No. 85) left the road on the last owing to some error having been made in some of the measurements of the spring gear, there is an inequality in the loading of the wheels which I think may be taken, in conjunction with some peculiarity in the formation or condition of the road at the place, as accounting for the tender leaving the road, and the fact being now ascertained it will doubtless be, in the opinion of the Commissioner, unnecessary for the Board to meet.

"At the same time, in view of the fact that the spot at which the tender left the road has been in every case identically the same, viz., 8 feet 10 inches from the end of the same rail, while the tender in question has not left the road at any other place, which may be taken as evidence that this particular part of the line has a less margin of safety than the rest of the railway, I would suggest that a check-rail be fixed there. It is simple and inexpensive, and I know from experience of its results in similar situations

that it could render the place as safe as any other portion of the line.'

Here, for the first time, reference is made by me to the use of a check or guard rail; yet, notwith-standing this, the Commissioner—though claiming that he has coloured no representation which he has made against me—has pointedly stated that I made this recommendation as to the guard rail in reply to a report which the Commissioner states (incorrectly) he had forwarded to me from Mr. Mason recording, on that gentleman's personal examination of the road, that it was in perfect order, and in regard to which report the Commissioner adds (also incorrectly) that I "again confidently stated the defect was not in the vehicle.

The facts being now placed in their true light, I respectfully submit there is no justification whatever for the statement with which the Commissioner concludes paragraph 19, to the effect that "the circumstances afford no excuse whatever for Mr. Burnett's neglect of his duties." In entrusting the duty of ascertaining whether or not the tender was in proper working order for the road to an officer of Mr. Scott's position in the service, and in being guided by the information submitted to me by that officer (with whom indeed, as overseer, the duty of personal supervision rested) I respectfully submit that I in

no way neglected my duty.

In regard to the case of the fire in a carriage, referred to in paragraph 20, I beg to state that in this, as in previous cases, the facts are incorrectly stated by the Commissioner. In the first place I would point out that there is no just of reasonable connection between the reference to the "condition of the wheels and axles of the older engines and carriages" quoted by the Commissioner from my paper of November 30, '78 and the case in question. By the most cursory reference to that paper it will be seen that the reference I made therein to "the condition of the wheels and axles" had no relation whatever to their position in the vehicles. That the vehicles in question had been at work for many years prior to my connection with the Department without the defect, which was brought to light by the accident, having

come to the knowledge of those long connected with the Department, and more immediately engaged in the fitting and maintenance of the carriage stock, is evidence that the contingency was a remote one, and it is not the fact that I pointed out that one of my "first duties would be to see that all old carriages were properly fitted." In reporting to me some days prior to the accident the fact that the wheels of a carriage had been discovered to have come in contact with the underside of the floor of the vehicle, Mr. Scott ascribed the circumstance as principally caused by the special way in which the brake blocks were fixed in the particular vehicle he referred to, and which was different from the other vehicles fitted with brakes prior to my connection with the Department, and he did not in any way indicate in his report that the like defect existed in any other vehicle in use; while it is not correct that I was asked by Mr. Scott to come and inspect the vehicle. Mr. Scott merely mentioned, incidentally, in his report as follows:--"This carriage is now lifted and could be seen by you if convenient," and there was not a single word said by him indicating that he required my personal directions in the matter. Moreover, he reported that he was doing that which was obviously required to meet the case in these words:—"I may state that I am having a set of springs put under this carriage that have been newly set up and supplied with an additional plate." Under the circum-Under the circumstances, I did not consider the occasion required my personal inspection of the vehicle.

A perusal of the papers will show that, as regards Mr. Scott, the object of my minutes to him on the subject was to bring home to him a point which his reports showed that he failed to realize, viz., the need for so arranging the work of those under his direction that any case of neglect in future might be brought home to the person individually in fault. That Mr. Scott recognized that, in his position as overseer, the duty devolved upon him of ascertaining whether there were other vehicles similarly circumstanced to the one he reported upon, may be gathered from his reply to me on the subject. His statement is as

"When the defect in No. 77 carriage was discovered, I thought it possible that some other of the carriages similarly circumstanced might prove liable to a similar defect, and I, in company with Thomas Evans, principal carriage examiner, examined several of them and found no signs of wheels rubbing on the floors of any of them. After this inspection, and No. 77 being the first case of the kind after the running of carriages similarly circumstanced for several years, no imminent danger was anticipated, and pending the trial of the stronger springs that had been placed under No. 77, nothing further was done in the matter. Unless there had been apparent risk in allowing the carriages to run, it would have been very undesirable to have stopped any of them, as during the holidays every available vehicle was most eagerly claimed for use by the Traffic Branch."

That Mr. Scott had received, not only my authority, but my special directions to stop any vehicle whose condition rendered it doubtful or unfit for work, pending the requisite alterations or repairs being

effected, will be seen from the following instructions which I gave to him in July, 1880:—

"Any engine, carriage, or other vehicle in regard to which you may come to have the slightest doubt as to the reliability of its condition for service must be at once reported to me, or, if the case be urgent, it must be at once stopped, and particulars of its condition reported to me forthwith. You will see that the necessary instructions are given on this point."

Before leaving this subject I beg leave to quote one or two paragraphs from my report of May 2,

1881, to the Commissioner on this accident, as follows:—
"Mr. Burnett's expressions of so much consideration for the public life and safety, referred to by the Commissioner, have been, and are, as sincere as those of anyone in the Railway Department, notwith-standing any insinuations to the contrary. The reasons that have led him to put upon paper these expressions at various times will be found by the Commissioner in the Locomotive Engineer's 81–2,012, dated 2/4/81, to which he would now respectfully refer the Commissioner, and to which he has been hoping. for some time past to receive a reply.

"The accident in question is one of the nature of those, which the Locomotive Engineer feared might sooner or later arise from the unfortunate condition of things under which his Department and his work have long been placed, and the anticipation of which led to his putting the consequences likely to ensue so

clearly before the Commissioner in the before quoted and other papers.

As regards the matter of the Minni coal waggons, referred to by the Commissioner in paragraph 22, a perusal of my minute will show that I did not advise the Commissioner "to prohibit the running of all waggons, the axles of which were made to the same specification as the one which broke." The following are my exact words:

"I attach Mr. Boag's report on this matter, my 81-3989. I regard the breakage of this axle in the manner described, as an important matter, indicating, as it does, the probability of axles obtained under the same conditions, and that have been subject to the same usage being liable to similar failure which may lead to serious accident. If the Department is responsible for their condition I recommend that the vehicles be

stopped pending their condition being ascertained."

It is clear from the context that my recommendation did not apply to all waggons, but only to those vehicles with "axles obtained under the same conditions" and that had been "subject to the same usage" as the axle which broke, and even, to this limited extent, my recommendation was to be acted upon only if the Department was responsible for the condition of such axles in the event of their being continued in use on the Government Railways, and the consequences named by the Commissioner as likely to have ensued are, I submit, too remote to have arisen from any recommendation I intended to convey.

As regards the matter of the workshops at Bathurst, Goulburn, and Penrith, referred to in paragraphs 23 and 24, the papers disclose, I respectfully submit, the bad results of the course followed by the late Engineer for Existing Lines, in withholding from the Locomotive Department the control of the buildings and works required for the accommodation and maintenance of the rolling stock; and the waste of funds which it is estimated would result from the adoption of the plans I furnished, only serves to show the evil arising from the unusual step taken by Mr. Mason in proceeding with the work before submitting the plans for the opinion of the Locomotive Engineer. The Commissioner states in paragraph 23:—"When these works were well advanced towards completion, Mr. Burnett stated that the accommodation proposed was inadequate, and the expenditure that had been incurred was wasteful;" but the Commissioner seems to forget that I called attention to the matter long before any expenditure had been incurred. As early as September 22, 1880, I wrote to the Commissioner as follows:—

"As the extent and arrangement of the accommodation provided for the Locomotive Branch very materially affects not only the efficiency but the cost of working thereof, it is usual to come to a common agreement as to the suitability of what is proposed to be done before expending the money." To this the Commissioner replied in his minute of September 28, 1880, addressed to Mr. Mason:—"I concur with Mr. Burnett, that the officer who has to regulate the conduct of the business

should be consulted as to the design of the building in which the work will be done.

Mr. Mason, however, disregarded this opinion and proceeded with the work according to his own views, and it was not until that gentleman resigned his position as Engineer for Existing Lines that the Commissioner's minute, above quoted, was carried into effect. The Commissioner then wrote to Mr. Mason's successor as follows:

"The Engineer for Existing Lines promised me that he would lose no time in having the Locomotive Engineer furnished with tracings of the workshops which he proposed to erect at Eveleigh, and also of the shops which were being erected at Goulburn and Bathurst; I learn to-day from Mr. Burnett that he has not been supplied with these tracings, and that he is dissatisfied with the design of the shops or buildings which are being erected at Bathurst and Goulburn."

Will Mr. Cowdery give directions, and personally see, that Mr. Burnett is supplied, without further delay, with the plans he requires, and I must direct, in view of his representation as to the probable unsuitableness of the buildings in course of erection at Bathurst and Goulburn, that no further work be

done until Mr. Burnett has had an opportunity of seeing the plans, &c."

Whether the survey of a piece of land prior to the design and erection of buildings thereon is Whether the survey of a piece of land prior to the design and erection of buildings thereon is necessary or not may be a matter of opinion, but I certainly regarded it as such, and, as bearing upon the question, I may quote the views of Mr. Mason whom the Commissioner has referred to as an authority in such matters. In reply to the Commissioner's minute of 17/8/80, asking Mr. Mason to submit his proposed plans of workshops for the Eveleigh site, Mr. Mason wrote:—"It will be necessary to have a complete survey made of this estate and sections taken before a design for shops can be laid down. I have given instructions for the survey to be made at once, and no time shall be lost in preparing a design for shops, when I get a plan and sections of the ground." And again, a few months later Mr. Mason wrote to the Commissioner on the subject as follows:—"No time will be lost in preparing designs for new shops as soon as the plans and sections are ready which I expect will be in a few days."

as soon as the plans and sections are ready, which I expect will be in a few days."

It is not perhaps surprising that Mr. Cowdery should declare that there is not a single improvement to recommend the plans I furnished for Bathurst and Goulburn, seeing that they are not in accordance with the arrangement of buildings which emanated from the office over which the gentleman now presides, and in which he held the position of Mr. Mason's chief assistant at the time these buildings were put in hand. My plans are, however, a great improvement in many important points on the original ones. In regard to the reference made by the Commissioner to Mr. Scott's report on the subject, I need merely say that the value to be attached to Mr. Scott's opinion in this matter may be estimated by the exaggerated statement he makes, that the result of the adoption of three roads in the running sheds would be danger to those employed there, seeing that the clear space between the roads would be equal to, or more than, the space adopted in hundreds of running sheds in every day use, not only without "danger to those employed there," but with ample space for "cleaning and washing-out engines," as well as all other purposes of a running shed.

As regards the plans of the workshops at Eveleigh, referred to in paragraphs 25 and 26, a very small portion of the time occupied in connection with this matter rests with me. My report to the Commissioner of 11/8/81 shows clearly the reasons why I could not recommend the adoption of Mr. Mason's plans for these shops. Whatever delay has occurred in connection with this matter since these plans were referred to me has been due to the various events which have in the meantime happened affecting the control and administration of the Locomotive Branch, and which have prevented my giving the processory time and thought to the designing of the meantable.

the necessary time and thought to the designing of the workshops.

In regard to the questions involved in paragraphs 27, 28, 29, and 30, I beg to say, that although I have not found myself in harmony with the views of the Commissioner in the cases referred to, I see no reason to doubt the soundness of the conclusions at which I arrived in each case, and I am confident that the views and principles which I have advocated, in place of being mischievous in their tendency, as described by the Commissioner, are calculated to bring about entirely opposite results. I would respectfully ask the Council to be guided in their judgment, as to the soundness of my opinions and arguments in these cases by what I have said and written as recorded in the papers the measures in which my rich are in these cases, by what I have said and written as recorded in the papers themselves, in which my views as to the culpability of the driver (Main) in the Katoomba accident case are fully stated.

As regards the Board which is referred to by the Commissioner as an authority in these matters, and from whose recorded opinion in the above case I felt compelled to differ, it is but right that I should here state, for the information of the Council, the circumstances connected with its formation, so that its

nature, and the weight to be attached to its conclusions, may be duly estimated.

By the papers on the subject, it will be seen that its origin arose out of a minute written by the Commissioner early in 1878 to the Minister (the Hon. Mr. Sutherland), calling attention to the conflicting testimony which was sometimes found to be given by the men in different branches when a case occurred in which the men in two or many hypothese were implicated and after siving an instance in point the in which the men in two or more branches were implicated, and after giving an instance in point the Commissioner stated:—"I consider it desirable that a Board of three, each representing a branch—Traffic, Locomotive, and Permanent Way—should be appointed to investigate similar charges against the men employed in these Railways."

A temporary Board on the above basis was at first appointed, but subsequently, on June 1, 1878, the Minister (Mr. Sutherland) wrote:—"The Board for the South and West Lines now appointed is only temporary. I think that for the purpose of giving the greatest confidence to all concerned, the Board should be composed of gentleman of higher status in the service than those named. When the Locomotive Engineer is appointed the Board will consist of that gentleman, Mr. Mason, and the Secretary of Railways."

It is clear from the foregoing that for the purposes of the Board each branch was to be represented, as was but just and proper, by one individual—the Permanent Way Branch by its head, the Engineer for Existing Lines, the Traffic Branch by the Secretary for Railways, and the Locomotive Branch by the Locomotive Engineer. For confirmation of this I may refer to answers given in Parliament on January 22/80, in reply to the following questions by Captain Onslow:— 22/80, in reply to the following questions by Captain Onslow:

(1.) "Is there any permanent Board appointed to inquire into accidents; if so, when was it appointed?"

(2.) "Who are the persons comprising it?"

The answers were:

(1.) "The Board appointed is not specially for inquiry into railway accidents, although they may be directed to undertake such inquiry. They were appointed to inquire into charges brought against the employees, in cases where it is doubtful to which branch of the Railway Service the fault is attributable. The Traffic, Locomotive, and Permanent Way Branches are each represented at the Board."

(2.) "For the South and West Lines the Board is composed of the Secretary for Railways, the

Engineer for Existing Lines, and the Locomotive Engineer."

By these answers it is also clear that each of the three executive branches of the Service had its individual representative; and of these three members, as above named, the Board consisted up to the date of the Katoomba accident. The minute of the Commissioner, directing the Board to inquire into the accident, was as follows:-

"The Board will be good enough to meet at once, and inquire into the cause of this accident.— Chas. A. G., 11/3/81. Will Secretary please inform Mr. Mason and Mr. Burnett."

On this authority the Board was summoned; but on its meeting, Mr. Read, the Traffic Manager, also took part, and on the question as to his title to sit on the Board being raised, the Secretary stated that the Commissioner had appointed Mr. Read as a member, and that the papers on the subject would be formally submitted for the information of the Board in due course. It afterwards appeared from the papers, that the appointment was submitted by the Commissioner to the Minister in the following terms:

"I think the name of the Traffic Manager should be added to those forming the Board of Inquiry."

Notwithstanding the addition of the Traffic Manager to the Board, as the representative of the

Traffic Branch, Mr. Vernon (the previously appointed representative of that branch) still remained; and it having been initiated by that gentleman at the first meeting that Mr. Mason was unavoidably absent, but without further intimation as to the cause, the inquiry proceeded for several days in the presence of Mr. Vernon, Mr. Read, and myself. But finding on the fourth day that the continued absence of Mr. Mason was due to his having resigned his appointment as Engineer for Existing Lines, and further (on submission of the papers) that the Secretary sname had not been removed from the Board, notwithstanding the new appointment of the Traffic Manager, whereby the branch I represented was placed in a minority, I deemed it necessary to submit the question as to the constitution of the Board to the Commissioner, as conveyed in the following minute:

"Locomotive Engineer to Chairman of the Board of Inquiry.

"March 18, 1881.

"Constitution of Board of Inquiry into cause of accident at Katoomba on the 11th instant.

"To avoid the misunderstanding arising from verbal communications, I ask that the transcript of the notes of proceedings on the above subject, taken at our two meetings to-day, be submitted with, and embodied in the question as to the constitution of the Board, agreed to be referred to the Commissioner prior to our next meeting (on Monday, the 21st), and in view of the minority in which I find the Department I represent placed by the meant appointment of Mr. Pood to represent the Traffic Department in ment I represent placed by the recent appointment of Mr. Read to represent the Traffic Department, in conjunction with Mr. Vernon, who has hitherto and alone filled the position of representative of the Traffic Branch on the Southern and Western lines, I request that this paper be at once submitted to the Commissioner, respectfully asking that in the absence of a permanently appointed successor to the head of the Permanent Way Branch, Mr. Whitton be nominated to fill the vacancy at the Board, as being one of the very highest authorities on Railway working in this or any other country.'

In place, however, of this, Mr. Cowdery, who was then acting in room of the late Engineer for Existing Lines, was nominated by the Commissioner to a seat on the Board.

Each member of a Board is of course entitled, and indeed called upon to record his opinions on any case submitted for consideration; but in discrediting, as the Commissioner does, my action or opinion in matters affecting the administration of my branch by a reference to the opinions of the other members, as being opposed to mine, the Commissioner compels me, as I respectfully submit, to enter my protest against the opinion of the representatives of other branches being taken as of any weight or authority against that of a member who happens to dissent from them, even supposing each branch to be equally represented which as I have pointed out was not the case on the occasion in question

represented, which, as I have pointed out, was not the case on the occasion in question.

With respect to my removal of the suspension of driver Main, referred to in paragraph 29, I beg to remark that the circumstances connected therewith will be found already fully detailed in the recorded to remark that the circumstances connected therewith will be found already fully detailed in the recorded proceedings of the Board. I may, however, here state that the driver was not suspended by the Board, and in my giving directions in the matter to the effect that I saw "no reason why driver Main should not resume work," I refrained from giving any expression on the merits of the case, and merely removed a suspension which had not been endorsed by my authority, and which had never been either officially or unofficially before the Board in any way whatever; and in removing it, I desired merely that any question affecting the driver should be determined unprejudiced by any prior action which had been taken in suspending him. My subsequent action in regard to the decision in Main's case is fully stated in the papers on the subject. papers on the subject.

My views, in regard to the staff and ticket system are, as I submit, sound, and the representations I have made from time to time on the subject have had the effect of adding to the security of the system.

As regards paragraph 31, I beg to submit that my treatment of the contractors has been in every case proper, and in accordance with my official position and duty; while in regard to the only actions-at-law (two in number) connected with matters in my branch with which I am acquainted, it will be found, by a perusal of the papers, that both actions arose out of the extreme looseness of the terms of the agreement with the contractor, for the drawing up and execution of which I am in no way responsible. The first action was brought by the contractor with the specific object (as the papers show) of having it determined at the hands of a jury what the terms of his contract really were under the above agreement; while in regard to the second action, although it was ultimately decided that the contractor's claim for extra payment for work, which had not (as I think the papers show) been fully performed by him could not be resisted, in consequence of the terms of an offer of extra payment that had been made to the contractor, yet the decision was not arrived at until, on the advice of the Crown Solicitor, the matter had been referred for the opinion of two of the most eminent counsel in Sydney. In

In regard to paragraph 32, I am not aware of the continual changes in my staff which the Commissioner mentions. As regards the gentleman referred to, Mr. Chambers resigned because (as the papers show) he did not receive so high a step in promotion in the Drawing Office as he, excusably enough, though erroneously, considered himself qualified for.

Mr. Booth, on being suspended for a week for insolence, became so abusive in his language as to render it necessary to continue his suspension, and on my reporting the metter to the Commissioner in

render it necessary to continue his suspension; and on my reporting the matter to the Commissioner, in consequence of Mr. Booth failing to offer any apology, the Commissioner, in place of giving his support to my authority, took occasion to transfer Mr. Booth's services to the Tramway Branch, which was then in need of a draftsman. Mr. Booth, however, remained there only three days. Within twenty-four hours of his starting in that branch he addressed a communication to the Commissioner, which Mr. Booth's superior officer, the Tramway Engineer, describes in a minute on the subject as "insolent in the highest degree." Mr. Booth forthwith resigned his post; and the fact of his leaving his employment in the way he did confirms the impression I had formed, that his defiant and insolent conduct in my office was due to his height different to his employment. his being indifferent to his employment.

As regards Mr. King, owing to his being a junior clerk, I came but little into personal contact with him; but I saw quite enough of him to be satisfied that he was idle and careless, and the circumstance which led to his services being dispensed with was gross impertinence to the Chief Clerk, on the

occasion of his finding fault, after several previous warnings, with his (Mr. King's) neglect of his work.

With reference to Mr. Sutcliffe, I should regret exceedingly if I had reason to believe that I had in any way done him an injustice, or said anything, not warranted by the circumstances, to lead to his tendering his resignation. The readiness with which he intimated his intention of leaving led me to the belief that he had other employment in view. Whether this was so or not, I learned that shortly after-

wards he entered upon other employment at a higher rate of pay.

With respect to paragraph 33, I beg to say that my desire throughout has been to maintain cordial relations and harmony in working with heads of branches. Any temporary discord that may have existed between Mr. Read and myself arose out of the special circumstances to which I have already referred, relative to the Board of Inquiry in the Katoomba accident case, and the discussions and papers to which it led. In raising the question as to Mr. Read's being a member of the Board (in the absence of the papers on the subject), I was merely doing that, as I respectfully submit, which the circumstances justified; and nothing was further from my intention than to write or say anything offensive or discourteous to Mr. Read, who, as the head of the Traffic Branch, was unquestionably the proper person to represent that branch on the Board. In inviting attention to the minority in which I found my branch of the Service placed, in consequence of Mr. Vernon's continuing to hold a seat on the Board, notwithstanding Mr. Read's appointment thereto, I was also, as I submit, only doing that which the circumstances warranted, no discourtesy to Mr. Vernon being thereby intended; while, as regards Mr. Mason, I regret that I should have had occasion to differ from him in the matter of locomotive workshops. Although I am under the belief that I have never written anything of, or to, my fellow officers unwarranted by the circumstances, or otherwise than in self defence, yet, if I have done so at any time, regret it and apologize.

I regret to note the Commissioner's remarks that he has received much provocation at my hands,

because in whatever light my actions at any time may have appeared to the Commissioner, I can unhesitatingly say that I have been actuated with but one desire,—to faithfully perform the duties of my office,

with the sole object of securing the best interests of the service.

In conclusion, I would ask the Council to pardon the length to which this paper has extended, and in which I have felt compelled to say much in self defence which I would rather have left unsaid, trusting that if I have herein unwittingly expressed myself on any matter, in any way unbefitting the occasion and the circumstances, I may be pardoned.

ROB. H. BURNETT.

November 17th, 1881.

Laid before the Executive Council, 22nd November, 1881.—A. C. Budge, Clerk of the Council. Referred to the Honorable the Secretary for Public Works.—A.C.B., 23/11/81.

No. 22.

The Clerk of The Executive Council forwarding Papers for His Excellency's perusal.

My dear Bloxsome,

His Excellency wishes to read Mr. Burnett's case at his leisure. Will you kindly forward it, and when read, return to me, as great delay has already taken place in this case.

A. C. BUDGE.

I have perused these voluminous documents. Return them at once to the Clerk of the Council.— A.L., 22/11/81.

No. 23.

The Commissioner's reply to Mr. Burnett's defence.

THE observations which I shall make upon Mr. Burnett's voluminous paper will be brief. defence, for the most part, upon discrepancies which he alleges exist between the facts of the case as disclosed by the papers and my statement of them. I would ask the Minister's attention to the value of Mr. Burnett's representation in this respect, by referring to the first instance advanced by him in support of this assertion. He seeks to throw a doubt upon the accuracy of my statement that I had intimated to the Minister, some weeks prior to his (Mr. Burnett's) suspension, my belief that he had shown himself unfitted for the position he held, by adducing the fact that up to the end of August I had myself certified that his services had been faithfully performed. Mr. Burnett is alluding to the printed form of certificate attached to the pay vouchers, which has to be signed by the Commissioner before the salaries are paid. It seems to me that to seriously reply to such reasoning would be a waste of time. Until Mr. Burnett was
457—E suspended

suspended by higher authority than mine, it was my duty to certify for his salary. The Minister will know whether or not I expressed to him, some weeks prior to Mr. Burnett's suspension, my belief of that officer's unfitness for the office he held. It is more than idle on Mr. Burnett's part to assume ignorance of my expressed intention to bring his conduct under notice. I verbally informed him of this intention on the occasion of his seeing me, at my request, respecting his refusal to comply with my directions to reinstate driver Frost, and to certify for driver Main's wages. If Mr. Burnett is sincere in the expression of his surprise that I should be dissatisfied with his conduct, he must have extraordinary confidence in the endurance and forbearance of the head of a Department; for after indirectly resisting the authority of the head of his Department, in various ways, for three years, he at length puts a climax to his covert insubordination by the commission of flagrant acts of disobedience, and by openly defying instructions. As the whole of Mr. Burnett's questionings of the accuracy of my statements have a basis similar to the one referred to in the matter of the certificate for his salary, the Minister will, perhaps, free me from the necessity of replying to each in turn. I would only add that it seems to be a characteristic of this gentleman to charge others with making inaccurate statements. He deals with a statement with all the minuteness of an analytical dissection, and finding some immaterial discrepancy between it and something else with which it is intended to have relation, founds thereon a charge of utter unreliability. The Minister has had personal experience of this in the case of the statement he made as to what he said at the interview which Mr. Burnett had with him, and which was denounced by Mr. Burnett, on similar grounds, as being wholly and absolutely untrue. The office records afford numerous instances of Mr. Burnett's behaviour in this regard.

Mr. Burnett urges that his railway practice in England "did not show that neglect of duty" which I attribute to him. Mr. Burnett may have been faithful to his duties in England, but there can be no doubt that he has neglected those entrusted to him here; and I am not prepared to admit that he faithfully performed them anywhere; his connection with the Metropolitan Railway was severed—I believe I am right in stating—because of his refusal to carry out instructions. He did not produce a single certificate from the Board of Directors, as then constituted, when he applied to the Agent-General for the appointment of Locomotive Engineer in this Colony. He certainly submitted certificates from the ex-Directors of the Board, the whole of whom, however, had been, by the voice of the shareholders, removed from the management. I have no desire to allude to these matters, but Mr. Burnett's line of

defence requires that I should do so.

I will not lengthen this paper by referring to all the trivial points raised by Mr. Burnett, although, if thought to be necessary, I can show that he is invariably wrong in the version he gives. Ten pages of his reply (pages 6 to 16) are taken up by a verbal disquisition of the meaning and intent of certain papers, which I stated demonstrate Mr. Burnett's efforts to obtain uncontrolled power over the administration of

the business of his branch.

Mr. Burnett urges that there was nothing unreasonable in his recommending, under the circumstances, that an order for tank engines should be given, without competition, to Messrs. Beyer, Peacock, & Co. No one that I am aware of charged him with unreasonableness in making the recommendation, but when the Minister thought proper, for obvious reasons, to decline accepting it, Mr. Burnett, I must repeat, displayed a controversial spirit and an indisposition to fall in, without unnecessary discussion, with the Minister's views. Even in his present paper to the Executive Council he continues the discussion. He says:—"In place, however, of my recommendation being entertained, I was met thus early in my connection with, and experience of, the Department, with the brief intimation that the proposal that tank engines be ordered without tender could not be consented to." And he adds:—"I am unable, I must confess, to see the unreasonableness of my recommendation under the circumstances."

I have only to say that the Minister, to whom the recommendation was submitted, declined to entertain it, and Mr. Burnett should have accepted the decision without question. It is unnecessary to entertain it, and Mr. Burnett should have accepted the decision without question. It is unnecessary to load this paper with the Minister's reasons for declining to give an order, in this way, to Messrs. Beyer, Peacock, & Co., upon Mr. Burnett's recommendation. As I stated before, they were obvious. The statement made by Mr. Burnett that an order had been given by the Department, on March 29th, 1878, for several engines, without tender or competition, and further, that a month or two after his proposal was rejected (viz., in December, 1878) the Department ordered nine engines from the same firm, without competition of any kind, is, I regret to say, very disingenuous and calculated to mislead. The firm alluded to is Messrs. Baldwin & Co., of Philadelphia, the makers of the special type of engine called the "Consolidation." Mr. Burnett might, with equal propriety, point out that we ordered "Vickers' Steel Tyres' from Vickers without competition, or the Westinghouse Brake from the Westinghouse Company without first inviting tenders.

first inviting tenders.

There is no foundation for the statement made by Mr. Burnett, that while the control of the staff was nominally given to him, my action had the effect of undermining his authority and control. In no single instance did I interfere for over two years, notwithstanding it was reported to me that Mr. Burnett was treating his staff with unnecessary severity. The employés had the right of appeal given them by the regulations, approved by the Governor in Council, and until appeal was made, which was not done until the case of driver Frost arose in the early part of this year, I in no way interfered with Mr. Burnett's action in appointing, punishing, or dismissing his men. The power was not given to Mr. Burnett to appoint draftsmen and clerks; indeed it was specifically withheld from him, but he disregarded the directions, and the excuse he now offers in reply to the special instances quoted by me, is that he had previously disregarded the rule laid down in this respect without detection. The papers in the case of Mr. Husk clearly show that Mr. Burnett dispensed with the services of Mr. Wilson, who was quite competent to perform the duties of the position, for the purpose of obtaining the services of the former gentleman. to perform the duties of the position, for the purpose of obtaining the services of the former gentleman.

A perusal of the papers in the matter of the consolidation engines will bear out my previous state-

ment of the case. Mr. Burnett would not accept the responsibility of running them, and unless I had accepted it, the engines would have remained idle in the sidings; the extra dead weight on the bogies which Mr. Burnett, in spite of every remonstrance, insisted upon applying, has resulted most disadvantageously; it has not had the effect which Mr. Burnett asserted it would have, and owing to the injury which the engines are sustaining by the application of this dead weight, the Acting Locomotive Engineer, Mr. Scott, supported by the opinions of the experienced Inspectors, urges that it may be at once removed.

With regard to the tank engines, Mr. Burnett does not deny that without authority the weight was increased from 33 to over 40 tons. The argument he uses in support of his statement, that he regards

these engines as well suited for the traffic, he had previously used in contending that the weight should

be increased from 29 tons, as originally proposed to 33 tons. This latter was the weight ultimately agreed to, and there was no authority, and no justification whatever for again increasing the weight from 33 to 40 tons. An engine of 33 tons possesses that good margin of power for extra traffic which is admitted to be necessary; no increase in the traffic will require the use of heavier engines, more trains admitted to be necessary; no increase in the trame will require the use of neavier engines, more trains may have to be run to meet the growing traffic, but not heavier trains than engines weighing 33 tons could easily control. Indeed it is more than doubtful whether the engine originally designed by Mr. Mason, weighing 29 tons, would not have sufficed. Mr. Mason was clearly of that opinion, as is Mr. Scott now, after experience of the 40-ton engine, but there could be no doubt whatever that engines weighing 33 tons would have been ample, both for present and prospective requirements. It was the weight recommended by Mr. Burnett and approved by the Minister after considerable discussion and inquiry, as the papers show and there exists no authority or instification for the importation of the heavier engines the papers show, and there exists no authority or justification for the importation of the heavier engines.

As regards the case of the tender leaving the road at Katoomba, which, I contended displayed on Mr. Burnett's part a grave neglect of duty, Mr. Burnett endeavours to show that my narration of the circumstances is not chronologically correct. I would desire that Mr. Burnett should have any advantage which can fairly be derived from any inaccuracy in this respect, which may be found in my statement of the case. The fact, however, remains that the vehicle left the road, not twice as stated by me, but three different times before the defect was discovered. The papers do not disclose all that took place; there were several personal conferences between Mr. Mason and myself on the subject, and I learned from that gentleman that Mr. Burnett still adhered to the statement that the defect was not in the vehicle. If I read Mr. Burnett's representation aright, it seems that he is contending that had he known that Mr. Mason had stated there was no defect in the road he would have discovered earlier the defect in the vehicle, and he urges that no intimation was made to him that Mr. Mason had reported that the road was in perfect order. If Mr. Burnett was unaware that such was the report he was the only person interested who was in ignorance of it. Mr. Scott, and the rest of the officers in the Locomotive Branch, interested, were fully aware of it, in fact the question resolved itself into one of contention between the two branchesthe Locomotive and the Permanent-way—one asserting that the fault was in the road, and the other that it was in the vehicle. It seems incredible that Mr. Burnett alone should have been unaware of the dispute.

Carriage catching fire through defective fittings and ensuing loss of life.

The subtle distinctions which Mr. Burnett draws in explanation of his promise, and his neglect of that promise, to see that all carriages were properly fitted, are incomprehensible to me. I must ask the Minister to refer to the papers on the subject. Mr. Burnett says, that by a most cursory reference to them it will be seen that the proposed examination was to extend to the condition of the wheels and axles, and had no relation whatever to their position in the vehicles. I must respectfully decline to waste time in discussing such hair-splitting distinctions. Mr. Burnett undertook to examine these carriages, in fact said it would be one of his first duties to do so, and urged (in accordance with his invariable practice whenever called upon to do any particular duty) that some other duty he was asked to see to urgently must be postponed in consequence. I learn that he made no examination of these carriages whatever, sither as morards the condition of the whole and order on the invariable products to the resoluted to the second time of the whole and order on the invariable in fact he resoluted to the resoluted to the second time of the whole and order on the invariable in fact he resoluted to the second time of the whole and order on the invariable in fact he resoluted to the second time of the whole and order or the invariable products the second time of the second ti must be postponed in consequence. I learn that he made no examination of these carriages whatever, either as regards the condition of the wheels and axles, or their position; in fact he neglected to see one of them, which was shown to have the like defect, though Mr. Scott asked him in writing to do so. I must admit that Mr. Burnett points out, with one of his customary refining distinctions, upon which he bases a charge of inaccurate statement against me, that Mr. Scott did not ask him to come and inspect the vehicle. Mr. Scott's words were: "The carriage is now lifted, and could be seen by you if convenient."

I can see nothing in Mr. Burnett's statement of this case to warrant the slightest modification of the terms of my previous minute on the subject. I must, however, in connection with it draw attention to the accompanying paper as affording another instance of Mr. Burnett's want of skill as a mechanical engineer. To remedy the defect of the floor of these carriages touching the flange of the wheel tyres, a wooden block (B on the plan) was placed by Mr. Scott between the axle-boxes and the springs. Mr. Scott says, the object was effectually attained by those means, which fact was capable of being very easily demonstrated by simply proving by measurement, that the distance between the flange of the tyre and the under side of the floor was greater than that between the nuts of the spring bolts and the under side of the sole bar, which was all that was necessary to ensure that the sole bars of the carriages (however heavily loaded) would bear upon the nuts of the spring bolts, and so entirely prevent the possibility ever heavily loaded) would bear upon the nuts of the spring bolts, and so entirely prevent the possibility of the floor touching the wheel tyre. Mr. Burnett, however, subsequently gave orders that the wooden block A should be fitted to all the carriages in addition to the previous one B. This was quite superfluous, so far as any element of safety was concerned, but it moreover, as can be seen, has the effect of preventing the necessary play of the spring, and ever since their application there have been complaints of the bumping and disagreeable motion of the carriages when carrying an ordinary load of passengers. I have given orders for the removal of the blocks A.

The professional knowledge of an engineer is not essential to judge of the effect of this unwise addition to Mr. Scott's work; its uselessness is apparent to even unprofessional persons, and its mischievous effect has necessitated its removal. On one occasion the passengers seated in one of these carriages were so alarmed that they stopped the train, and upon its being ascertained that their fears were reasonable they were put into other carriages. The loss of life which occurred in consequence of these defective carriages was as preventable as it was deplorable.

As regards the matter of the Minmi coal waggons, I will pass by as immaterial the distinction which, on such slender grounds, Mr. Burnett draws between his recommendation, and my summary of it, and will refer to the endeavour he makes to show that the observance of his recommendation would not have had the effect I stated. In support of this Mr. Burnett implies, that as he alluded only to those axles "obtained under the same conditions, and that have been subjected to the same usage," the waggons axles "obtained under the same conditions, and that have been subjected to the same usage," the waggons to be stopped would be a few only. Mr. Burnett does not seem to be aware that, with immaterial exception, the axles in use by any one company are all of the same make. When an axle of one of the Government trucks broke on the 6th July last, Mr. Burnett called upon Mr. Scott "to furnish a statement of the number of vehicles with axles of the same make and which from the uses they have been put to are liable to break in a similar manner," with a view, it is fair to assume (if the Minmi case was to form a precedent), to recommend that the running of such waggons should be stopped. From Mr. Scott's reply it will be seen that all our rolling stock (with the exception of ninety-three vehicles first imported) is fitted with axles of the same make and brand. Had Mr. Burnett made a similar inquiry in regard to the axles of the Minmi Company it is possible he would not have made the recommendation he did. Had I accepted

accepted

accepted his recommendation the consequence would have been that, as I stated in my previous minute, the Minmi Coal Company would have stopped working, as they would not have had sufficient waggons to

In reply to the representations I made of the delay caused by Mr. Burnett's refusal to report upon the work-shop additions, which were being carried out at Goulburn, Bathurst, and Penrith, until a survey had been made of the yards and cross-sections supplied to him, Mr. Burnett states, that his opinion that such were necessary is supported by the action taken by Mr. Mason, who stated, in reply to my minute of 17/8/80, asking him to submit his proposed plans of work-shops for the Eveleigh site, "It will be necessary to have a complete survey made of this estate, and sections taken before a design for shops can be laid down." I would ask the Minister's attention to the different circumstances of these cases. In the one case they were old-established and comparatively small railway-yards, the conformation of which was well known, and the question to be decided was whether some additions to the buildings, already erected, were being carried out in the most effective way for the purpose required.

In the other case there were 62 acres of a recently purchased estate, upon which new workshops had to be erected; levels were required to be taken, and the conformation of the ground ascertained.

The exact boundaries were not, moreover, known.

A survey, to precede the preparation of a design for workshops, was as necessary in the one case as it was altogether unnecessary and wasteful of time and money in the other, and Mr. Burnett, in seeking to draw a parallel between the two cases, evinces, I think, a want of appreciation of the merits of

It seems to be unnecessary to refer again to the defective designs which Mr. Burnett has submitted for the workshop additions at Goulburn, Bathurst, and Penrith. Mr. Mason designed the additions that are being carried out, and both Mr. Cowdery (the engineer who is now charged with the duty of designing workshops) and Mr. Scott (the engineer whose duty it is to provide for working them to the best advantage) state, in the most emphatic manner, that Mr. Burnett's proposals are on the one hand extravagant and wasteful, and on the other (if carried into effect) would prove dangerous to the employés engaged in these buildings, owing to the limited space between the roads. Mr. Burnett says that the space is equal to, or more than, the space adopted in hundreds of running-sheds in every-day use, but he does not support this statement by reference to any particular running-shed anywhere. He cannot point to one in this or in any of the Colonies having such limited space; and if there be running-sheds in the old Country, in which the spaces are not greater than those which Mr. Burnett would introduce here, it must be in exceptional instances only, caused probably by limitation of room, and rendered workable only by climatic advantages. To require men to work in such confined spaces in a semi-tropical climate would be an unjustifiable proceeding.

In regard to the workshops at Eveleigh, Mr. Burnett states that whatever delay has occurred in connection with the preparation of the plans for them, has been due to the various events which have occurred affecting the control and administration of the Locomotive Branch; but Mr. Burnett is solely responsible for any disturbance to the progress of the business, by his insubordination and refusal to observe the instructions given in the case of driver Frost. I cannot see, however, how Mr. Burnett's plea explains the delay of five months that occurred in getting out these plans, which were so urgently required. The Minister will remember that he repeatedly reminded me of the urgency of the matter, and that I informed him I fully expected every day to get from Mr. Burnett either the improvements or alterations to Mr. Mason's plan, which had been prepared and submitted to him, or some plan which he proposed to substitute for it. I found, however, on his suspension, that nothing whatever had been done in the matter. I may mention further, that since Mr. Burnett's suspension three different designs for these workshops have been prepared, all good, and differing only in degree as to suitability. Tenders will now be invited

have been prepared, all good, and differing only in degree as to suitability. Tenders will now be invited for the works upon the accepted design without any further delay.

It is unnecessary that I should follow Mr. Burnett through the lengthened history he gives of the appointment of the Board of Inquiry. I did not in any way refer to this matter in my paper, and I fail to see the application it has thereto, except, indeed, that it further demonstrates the combative and controversial spirit which Mr. Burnett has imported into the conduct of the business of the Department. Mr. Burnett asks that the papers may be read, in which he explains his reasons for differing from the conclusions arrived at by the rest of the Board. I need only say that if the Board's report and Mr. Burnett's are read in conjunction there will be no question as to the Board having arrived at a right

Mr. Burnett claims that his views in regard to the staff and ticket system are sound, and that the representations he has made from time to time on the subject have had the effect of adding to the security of the system. I am at a loss to account for this latter statement; the staff and ticket regulations, as now existing, were in force before Mr. Burnett came to the Colony, and no alterations whatever have been made in them; there is therefore no foundation for the claim Mr. Burnett sets up of having improved the system. The accompanying reports on this point which, on learning of this claim, I obtained from the Secretary for Railways and the Traffic Manager, will fully dispose of Mr. Burnett's pretensions in this respect.

In regard to Mr. Burnett's statement that he has not involved the Department in unnecessary litigation, I append hereto a letter from the Crown Solicitor on the subject.

I am unable, I regret to say, to modify in any way the opinion which I expressed in my report of the 15th September, "that from the time of Mr. Burnett's appointment to the time of his suspension his conduct has been marked by opposition to the established rules of the Department, by impatience of proper control, by delay in postponing important works, and by general inefficiency and want of judgment."

I will conclude this paper by dealing with Mr. Burnett's assertion that he is not aware of the continual changes in his staff, which I have mentioned as indicating his failure to work amicably with his officers. Mr. Burnett states that Mr. Chambers resigned because, as the papers show, he did not receive so high a step in promotion in the Drawing Office as he, excusably enough, though erroneously, considered himself qualified for. A reference to the papers will show that Mr. Chambers, on tendering his resignation, was informed by Mr. Burnett that his salary had been increased; notwithstanding this, however, Mr. Chambers severed his connection with the Department, because he found it impossible to submit to Mr. Burnett's tyrannical treatment. Mr. Chambers has written to the Chief Clerk of this Department a letter on the subject; but it seems that, even after this lapse of time, his resentment and indignation

indignation are too great to admit of his writing with moderation, and I therefore abstain from attaching Mr. Booth, another gentleman referred to, is in England; his complaints of his treatment at

the hands of Mr. Burnett are notorious, and he preferred returning to England to submitting to it.

Mr. Davies, who was for some time Chief Draftsman in the Locomotive Branch, writes in reference to the reasons for his resigning:—"I have to inform you that Mr. Burnett's conduct was so exceedingly insulting, and his manner of conducting the business of the branch under him so dilatory, that out of respect for myself and to secure my peace of mind I was compelled to resign, although I had no other position to enter upon."

Mr. Burnett says, with reference to Mr. Sutcliffe:—"I should regret exceedingly if I had reason to believe that I had in any own way done him injustice, or stated anything not warranted by the circumstances to lead him to tender his resignation." Mr. Sutcliffe in his letter, which is appended, says:—"Mr. Burnett refrains from admitting, in the slightest degree, that he gave me any cause for resigning. Does Mr. Burnett suppose for a moment that those who were officially brought into contact with him, whilst he had the honor of holding the position of Locomotive Engineer, were dead to all sense of manly feeling? It would appear so when he says, 'the readiness with which Mr. Sutcliffe intimated his intention of leaving led me to the belief that he had other employment in view.' Mr. Sutcliffe adds:—"I can unhesitatingly affirm, without fear of contradiction, that the sole cause of my resignation was on account of Mr. Burnett's arrogant and ungentlemanly conduct towards me.'

The duty imposed upon me of demonstrating, in this way, Mr. Burnett's unfitness for the position of Locomotive Engineer has been far from a congenial one. I may be permitted to say that, personally, it is a matter of indifference to me whether Mr. Burnett is removed from or restored to his office; but regard for the interests of the Service, and the necessity for providing for the effective administration of the business of the Department, require that I should respectfully express my conviction that Mr. Burnett's rejected to hoth

reinstatement would be detrimental to both.

CHAS. A GOODCHAP, 13/12/81.

$\lceil Enclosure. \rceil$

The Commissioner for Railways to The Crown Solicitor.

Minute Paper.

Subject :- Conduct of Mr. Burnett re his action involving the Department in actions-at-law unnecessarily.

Subject:—Conduct of Mr. Burnett re his action involving the Department in actions-at-law unnecessarily.

In formulating certain charges against Mr. Burnett I said:—31. "There are a number of comparatively minor matters connected with Mr. Burnett's administration of his branch which might be mentioned as affording additional evidences of his inability to properly conduct it—his treatment of the contractors; the involvement of the Department in action-at-law, to which the Crown Law Officers have advised, we had no defence whatever, resulting in our having to pay the claims in full with costs, &c., &c." To which Mr. Burnett has replied:—"As regards paragraph 31, I beg to submit that my treatment of the contractors has been in every case proper, and in accordance with my official position and duty; while in regard to the only actions-at-law (two in number connected with matters in my branch with which I am acquainted, it will be found by a perusal of the papers, that both actions arose out of the extreme looseness of the terms of the agreement with the contractors, for the drawing up, and execution of which, I am in no way responsible. The first action was brought by the contractor, with the specific object (as the papers show) of having it determined, at the hands of a jury, what the terms of his contract really were under the above agreement; while in regard to the second action, although it was ultimately decided that the contractor's claim for extra payment for work, which had not (as I think the papers show) been fully performed by him, could not be resisted, in consequence of the terms of an offer of extra payment that had been made to the contractor; yet that decision was not arrived at until, on the advice of the Crown Solicitor, the matter had been referred for the opinion of two of the most eminent counsel in Sydney."

Sydney."

I shall feel obliged if the Crown Solicitor will say if the question of the right of the contractor to be paid the amount he demanded, and for which Mr. Burnett withheld his certificate, was ever really in doubt. It will be seen that the following was the Minister's minute on the subject when the letter of advice from Crown Solicitor was received:—

"The amount had better be settled without any further delay; indeed I fail to see why such delay and expense should have been incurred with such meagre grounds as existed in this case."

I would also ask the Crown Solicitor to say whether in his opinion, after perusing the papers in the case, the Department was not needlessly involved in actions at-law.

ment was not needlessly involved in actions-at-law.

Снаs. A. G., 5/12/81.

The Crown Solicitor to The Commissioner for Railways.

Sir,

I have the honor to return herewith your minute of date, 5th December instant, and the papers forwarded therewith relating to the action, Castner v. The Commissioner for Railways; and in reply to your question as to whether the right of the contractor to be paid the amount demanded, and for which Mr. Burnett withheld his certificate, was ever really in doubt, to state that as I informed you when the papers were submitted to me, I never had any doubt of the plaintiff's right to recover

to recover.

My reasons for taking counsel's opinion in the case were these: The action then pending was the second action brought in respect of claims made by Mr. Castner under his agreement for lighting the railway carriages with gas. I thought, from the papers forwarded, that there was really no defence, but, as the Locomotive Engineer refused to certify for the work in respect of which the claim was made, on the ground that it could or should have been done for a less price than that claimed under the agreement, and that he would probably refuse on the like grounds in respect of any work done in the future, it was desirable that the question, as to your liability under the contract, should be finally settled; and as I had upon receipt of the summons retained counsel on your behalf, I thought it was advisable to take their opinion as to whether the action could be defended. This I did, and forwarded a copy of the opinion to you with my letter of 12th June last.

I do not understand what is meant by the statement in Mr. Burnett's memorandum, that an offer of extra payment had been made to the contractor; according to my recollection the plaintiff was paid only that amount to which he was entitled by the contract under which the work was performed by him—that is, the contract price,—and which he would have recovered in the action, even if the amount is, as appears to be the opinion of the engineer, unreasonable.

I have, &c.,

I have, &c., JOHN WILLIAMS, Crown Solicitor.

Mr. D. Vernon to Mr. G. Berner.

Mr. Vernon's reply re Mr. Burnett's statement, that he had added to the security of the staff and ticket system. 29 November, 1881

In reply to your inquiry as to "in what way Mr. Burnett has added to the security of the staff and ticket system, &c.," I may say at once that I am entirely ignorant of his ever having done, or been in the remotest degree instrumental in doing, anything of the kind. I do know, however, and the papers will speak for themselves, that the suggestions and

representations which Mr. Burnett did make in writing, revealed the fact that he did not understand the subject; and I say most emphatically that had these suggestions been adopted the security of the system would have been completely sacrificed, and the first intimation the country would possibly, and in time, have received of this fact, would have been the wreck of one of

our mail and passenger trains.

I know, furthermore, that Mr. Burnett has, by his verdicts and punishments on the men of his branch concerned in cases of neglect, not only shown that he did not adequately perceive where the gravity of an offence lay, but if he has done anything he has weakened the force which the rules should have on the staff. I think, on referring to the papers, that from a sense of this I called attention to the matter in a minute which led up to the appointment of the Board, &c.

Mr. Burnett's views with regard to the staff and ticket system are utterly unsound, and the representations he has made would have had (if effect had been given to them) the effect of entirely destroying the safety of the system. This I say Yours, &c., Yours, &c., D. VERNON.

Mr. W. V. Read to Mr. G. Berner.

Dear Sir,

I am in receipt of yours of to-day, enclosing statement of Mr. Burnett re train staff and ticket system.

The staff and ticket rules and regulations as approved in 1878 are now in force; no alteration has been made in them at Mr. Burnett's instance. Some suggestions were certainly made by Mr. Burnett some time back, and about eighteen months ago the Commissioner appointed a Board, consisting of Mr. Burnett, Mr. Vernon, Mr. Higgs (Traffic Manager, G.N.R.), and myself, to report upon them, but the suggestions made by Mr. Burnett were found to be impracticable, and in fact would have been dangerous to the system if allowed.

Mr. Burnett, who was Chairman of the Board, never called it together after its first few meetings to complete or close its proceedings.

W. V. READ.

Mr. H. Davies to The Chief Clerk.

Sir,

In reply to your inquiry as to why I resigned the position formerly held by me as Chief Draftsman in the Locomotive Department of the New South Wales Railways, I have to inform you that Mr. Burnett's conduct was so exceedingly insulting, and his manner of conducting the business of the branch under him so dilatory, that out of respect for myself and to secure my peace of mind I was compelled to resign, although I had no other position to enter upon.

I have, &c.,

H DAVIES

H. DAVIES.

Mr. G. Berner to Mr. F. Sutcliffe.

Dear Sir,

Mr. Burnett, in reply to a statement of the Commissioner's as to the continual changes of the staff in Mr. Burnett's Branch, having reported to the Governor and Executive Council that,—

"With reference to Mr. Sutcliffe I should regret 'exceedingly if I had reason to believe that I had in any way done him an injustice, or said anything not warranted by the circumstances to lead to his tendering his resignation. The readiness with which Mr. Sutcliffe intimated his intention of leaving led me to the belief he had other employment in view; whether this was so or not, I learned that shortly afterwards he entered upon other employment at a higher rate of pay",—

The Commissioner will be glad to know if your severance from the Department was for the reasons given by Mr. Burnett, as your letter of 29/7/81, intimating that you had resigned your position, does not bear out Mr. Burnett's statement.

I am desired to request you to consider this matter dispassionately, and not allow any feeling of irritation (if there be any) to influence you. Mr. Burnett is, as it were, upon his defence, and the Commissioner does not wish to prejudice the case, and asks you to say nothing until after full and calm deliberation, and making due allowance for what may be merely mannerism on Mr. Burnett's part. Awaiting your early reply,

GEO. BERNER,

I remain, &c.,
GEO. BERNER,

Chief Clerk.

Mr. F. Sutcliffe to Mr. G. Berner.

Mr. F. Sutcliffe to Mr. G. Berner.

Dear Sir,

Denmark Lodge, Cook's River Road, St. Peter's, 1 December, 1881.

In replying to the Commissioner's inquiry as to the validity of the reasons urged by Mr. Burnett in reference to the severance of my connection with the Locomotive Branch of the Railway Department, I feel bound to say that his statement is calculated to mislead. He refrains from admitting, in the slightest degree, that he gave me any cause for resigning. Does Mr. Burnett suppose for a moment that those who were officially brought into contact with him whilst he had the honor of holding the position of Locomotive Engineer were dead to all sense of manly feeling? It would appear so when he says, "The readiness with which Mr. Sutcliffe intimated his intention of leaving led me to the belief that he had other employment in view"; and then, as if to give colour to this interpretation of my motive in resigning, he adds—"Whether this be so or not, I learned that shortly afterwards he entered upon other employment at a higher rate of pay."

I can unhesitatingly affirm, without fear of contradiction, that the sole cause of my resignation was on account of Mr. Burnett's arrogant and ungentlemanly conduct towards me on the occasion referred to in my letter to the Commissioner of 29/7/81. Certainly I had no other employment in view, but if I had permitted comparative certainty of employment to overcome all other considerations, it is easy to judge of the nature of the position in which I should have been placed by submitting to undeserved insult. I may add that I was extremely sorry to leave the Locomotive Branch, the more so from the fact that upwards of eleven years of my experience has been spent in locomotive and railway engineering. However, having been driven, as it were, to sever my connection with that branch of the profession of my choice, it is quite natural that I should at once seek another appointment. With that object in view I therefore offered my services, on the 30th July, to the Harbours and Ri

I remain, &c., F. SUTCLIFFE.

Mr. W. Scott to The Commissioner.

Removal of additional weights from Consolidation Engines.

Removal of additional weights from Consolidation Engines.

I BEG to forward, herewith, reports from Inspectors Tipping and Turton, recommending the removal of the cast-iron blocks (each weighing 2½ tons), which were fitted to the extreme leading ends of the consolidation engines, in order to keep the bogic-wheel on the inner rail from lifting off same in going round curves. This object, however, has not been attained; but great additional wear and tear are involved in the running of the engines in their weighted condition. The road, as well as the engine, generally are prejudicially affected by this useless dead-weight; but the increased wear and tear are particularly apparent in the extraordinary friction between the boss of leading bogic-wheels and the axle-boxes, so that the latter have frequently to be either renewed or repaired by the addition of a brass "liner" \(\frac{\pi}{2}\)" or \(\frac{\pi}{2}\)" thick, and the wheels have sometimes to be taken off the axle, in order to have a washer-plate fixed to the boss of the wheels to make up for what has been worn off them. I therefore beg to recommend that these weights be removed as early as convenient opportunities offer.

W. SCOTT,

7/11/81.

Memorandum from Mr. J. Tipping to The Locomotive Overseer.

Sir,

Government Railways, Locomotive Engineer's Branch, Penrith Station, 17 October, 1881.

I beg to call your attention to the axle-box taken from the bogie bearing of consolidation engine No. 138, and forwarded to Sydney on Saturday last. Several axle-boxes of consolidation engines have been worn on the side in the same manner. This is mainly due to the additional weight put in the front and over the bogie bearings of these engines. Since this additional weight was put on these engines these bogie bearings have given considerable trouble; the great weight being in the front and at the extreme end causes a considerable amount of extra side-thrust when passing over change curves, much more so with than without the weight, and this together with the fact that the engines do not travel round these curves so smoothly with as without this weight, and the object for which I believe it was put on, viz., to prevent the bogie wheel from lifting off the low rail not being accomplished, causes me to consider that the engines would be benefited by the removal of this weight, and I beg to recommend the same.

I would suggest that the bogie-springs remain with the same number of plates in them, as it is important that these engines should be kept up in front to the standard level, and this was found difficult to do with the original springs with less number of plates, owing to the springs either breaking or loosing their camber.

J. W. TIPPING.

J. W. TIPPING, 17/10/81.

Memorandum from Mr. J. Turton to The Locomotive Overseer.

Sir,

Government Railways, Locomotive Engineer's Branch, Bathurst Station, 4 November, 1881.

I have to report that the extra weight placed on the front of the American consolidation engines for the purpose of keeping the wheels on inside of curves from lifting has not the desired effect, but causes considerable extra wear and tear on the bogic boxes and the bosses of the wheels, through the extra pressure exerted on the outer rails of curves. I also find there is a greater tendency of the nuts of bogic centre-pins to slack back, and considerable extra deflection of the leading springs. I would therefore recommend that the weights be removed.

Minute of Commissioner.

My only reason for opposing the introduction of these dead-weights on the bogies was the conviction that they would have the effect of injuring the engines. These reports clearly show that this has been the result.—Сн. A.G.. 10/11/81.

No. 24.

Minute of Colonial Secretary.

So far as I have been able to consider Mr. Burnett's case, I have arrived at the conclusion that his

So far as I have been able to consider Mr. Burnetts of the Public Service.

Services must be dispensed with in the interest of the Public Service.

Much of the correspondence between Mr. Goodchap and Mr. Burnett relates to matters which are matters as forming part of a long course of official conduct. The question small in themselves, and only important as forming part of a long course of official conduct. The question for the Government to decide is whether Mr. Burnett's retention in his office will be beneficial and not prejudicial to the working of the branch of the Railway Department over which he has been placed. It is clear to me that he has evinced qualities which in a large measure unfit him for the management of the class of men who have been under him, and in dealing with whom tact, consideration, and a conciliatory manner are important.

I am of opinion that this inquiry clearly shows that it is not for the public interest that Mr.

Burnett should be continued in his present office.

December 28, 1881.

I am, &c., HENRY PARKES.

No. 25.

Minute of Secretary for Public Works.

I HAVE made a careful examination of the whole of the circumstances connected with Mr. Burnett in his official capacity as Locomotive Engineer, and regret to have to state that I can arrive at no other conclusion than that it would be most prejudicial in the interests of the Department that that gentleman should continue to fill the office which he has hitherto occupied.

J.L., 4/1/82.

No. 26.

Mr. R. H. Burnett to The Secretary for Public Works.

Sydney, 9 January, 1882. Sir,

I have the honor to tender my resignation as Locomotive Engineer.

In doing so, however, I desire to state that I do not admit that I have deserved the complaints that have been made against my management of the branch under my charge, having all along faithfully performed the duties of the office with the sole desire of furthering the interests of the Department in I have, &c., ROB. H. BURNETT. every way.

Mr. Burnett's resignation of the 9th instant will be accepted.—J.L., 10/1/82. Prepare minute for the Executive Council accordingly.—J.R., 11/1/82.

No. 27.

Minute for Executive Council.

Department of Public Works, Sydney, 12 January, 1882.

Reference to the Executive Council Minute, dated the 30th August, approving of the suspension of Mr. R. H. Burnett, the Locomotive Engineer in the Railway Branch of this Department, the Secretary for Public Works, having perused the paper containing Mr. Burnett's defence, and the Minutes thereon of the Commissioner for Railways, regrets to have to state that he can arrive at no other conclusion than that it would be most prejudicial to the interests of the Department if Mr. Burnett should continue to fill the office of Locomotive Engineer. the office of Locomotive Engineer.

Mr. Burnett having submitted his resignation by letter dated the 9th instant, the Secretary for Public Works recommends its acceptance.

JOHN LACKEY.

The

The Executive Council having fully considered the subject herein set forth, concur in the opinion expressed by the Honorable the Secretary for Works, and advise that the resignation of office tendered by Mr. Burnett be accepted.—Alex. C. Budge, Clerk of the Council.

Min. 82-5, 17/1/82. Confirmed, 24/1/82. Approved.—A.L., 17/1/82.

No. 28.

The Clerk of the Executive Council to Mr. R. H. Burnett.

Sir, Executive Council Office, Sydney, 17 January, 1882.

Referring to former correspondence on the subject of your suspension from official duty, I am now directed to inform you that His Excellency the Governor, under the advice of the Executive Council, has approved of your resignation of office being accepted.

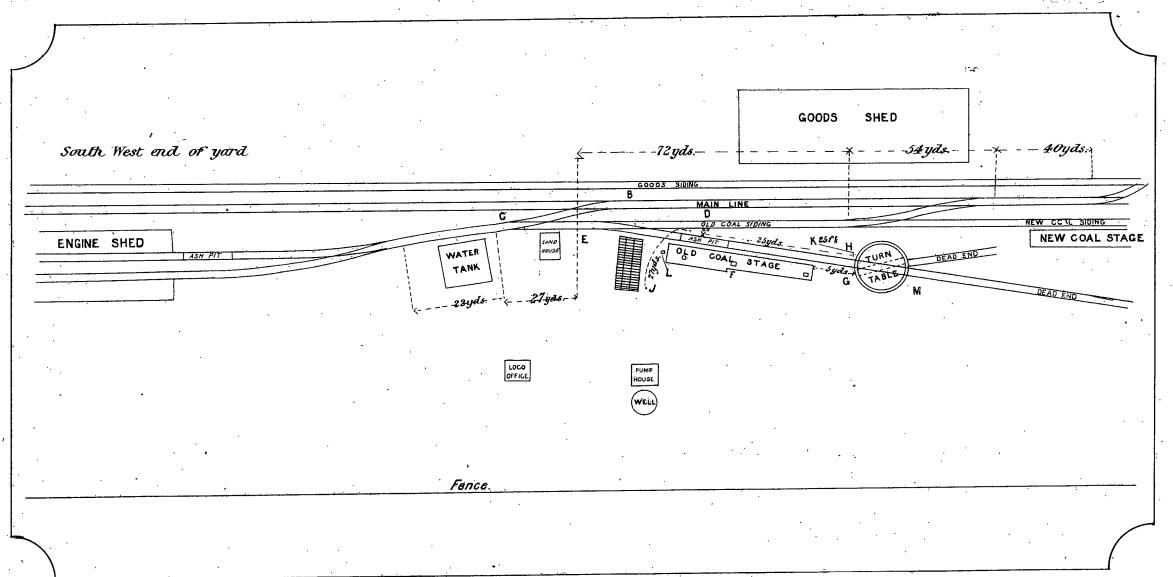

I have, &c.

ALÉX. C. BUDGE, Clerk of the Council.

[Di ıgram.]

Sydney: Thomas Richards, Government Printer.—1884.

[1s. 9d.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY DEPARTMENT.

(APPLICATIONS FOR EMPLOYMENT BY J. R. MILES.)

Ordered by the Legislative Assembly to be printed, 13 March, 1884.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated 19th February, 1884, That there be laid upon the Table of this House,-

"Copies of all correspondence, letters, papers, &c., connected with the

"application of John Roxburgh Miles for employment in the Railway

"Department."

(Mr. A. G. Taylor.)

No. SCHEDULE. 1. J. R. Miles to Commissioner, applying for a clerical appointment in Railway Department, and minutes the 30 July, 1880	PAGE.
 J. R. Miles, renewing application, and Commissioner's minute thereon. 18 October, 1880 Commissioner to J. R. Miles, informing him that he cannot hold out any hope of his receiving employment in Railway Department. 25 October, 1880 	2

No. 1.

Mr. J. R. Miles to The Commissioner for Railways.

Sir, Cowper-street, Stanmore, 30 July, 1880. I have the honor to apply that I may be appointed to a clerical position in the Department of Public Works.

I may state that I was in the Government Service for twenty-four years.

For the last eighteen years I was employed in the Telegraph Department, at a salary of £300 per annum, under the direction of the Superintendent of Telegraphs, and I think I discharged my duties satisfactorily as a public servant.

The Hon. the Postmaster-General has written officially to your Department asking that employment might be given me; and, in conclusion, I trust that you will take into consideration my length of service and the immaculate character that I have hitherto borne, that you will be pleased to re-instate me into the Government Service. I have, &c.

J. R. MILES. I can refer to the following gentlemen:—The Hon. J. Watson, The Hon. S. Samuel, T. G. Dangar, Esq., M.P., H. Clarke, Esq., M.P., J. Hurley, Esq., M.P., E. Lee, Esq., Reform Club, the Hon. J. F. Burns, late Postmaster-General, S. H. Badgery, Esq., M.P., J. McElhone, Esq., M.P., J. M'Intosh, Esq., M.P., D. O'Connor, Esq., M.P., Thos. Garrett, Esq., M.P., E. Barton, Esq., M.P., and many others.

Minute of Commissioner.

I am not aware of there being any vacancy at present, but Mr. Miles' name may be favourably noted for employment if the Postal Department be not aware of any reason why it should not be. Mr. Lambton will perhaps favour me with his views.—Chas. A. G., 3/8/80. There is no record of any such letter as Mr. Miles refers to having been sent by the Postmaster-General to the Railway Department. As Mr. Miles was an officer of the Telegraph Department, these papers are referred to Mr. Cracknell for his remarks.—S.H.L., 6/8/80. It will be remembered that Mr. Miles was dismissed this Department, there being a deficiency in his accounts which he could not account for. I know nothing of the letter referred to.—E.C.C., 9/8/80. The Secretary, General Post Office, B.C. The Commissioner for The Secretary, General Post Office, B.C.

The Commissioner for Inform I can hold out no prospect of employment under this Railways.—S.H.L., B.C., 10/8/80. Letter written, but not sent away.—17/8/80. Department.—Chas. A. G., 13/8/80.

Note.—The letter was not sent away, as it is believed Mr. Miles called and was informed verbally.

No. 2.

Mr. J. R. Miles to The Commissioner for Railways.

Cowper-street, Stanmore, 18 October, 1880. I have been strongly recommended by the Hon. W. Burns to renew my application for Sir, employment in the Railway Department.

I would respectfully point out that I am willing to accept temporary employment for the present,

until some suitable vacancy should occur.

I may mention that up to the time my services were dispensed with there was not a single charge entered against me in the books of the Telegraph Department.

I have, &c., J. R. MILES.

See Mr. Cracknell's minute of 9/8/80. In the face of that minute, made by the Head of the Department to which Mr. Miles referred, I cannot hold out any hope of Miles being employed in the Inform.—G.B., 23/10/80. Railway Department.—Chas. A. G., 22/10/80.

No. 3.

The Commissioner for Railways.to Mr. J. R. Miles.

Department of Public Works, Railway Branch, Sydney, 25 October, 1880. In reply to your letter of the 18th instant, renewing your application for employment in this branch of the Public Service, I have the honor to inform you that I cannot hold out to you any hope of I have, &c., CHAS. A. GOODCHAP, receiving an appointment under this Department. Commissioner for Railways.

Sydney: Thomas Richards, Government Printer.-1884.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MESSRS. T. R. SMITH & CO.

(MONEYS OWING TO THE GOVERNMENT BY.)

Ordered by the Legislative Assembly to be printed, 13 February, 1884.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 23rd October, 1883, That there be laid upon the Table of this House, a Return—

"Of all moneys or amounts of moneys owing by T. R. Smith and Sydney "Smith, trading as T. R. Smith & Co., Auctioneers, which were owing by the said firm to the Government for demurrage, and the amount or amounts allowed as refund to them or any other person so indebted up to "July this year."

(Mr. Melville.)

RETURN showing the amount of demurrage owing by T. R. Smith and Sydney Smith, trading as T. R. Smith & Co., and the amount of refund made to them as well as to any other person so indebted, from 1st February, 1881, to 31st July, 1883.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY STATIONS AND PLATFORMS.

(PARTICULARS OF TRAFFIC, &c.)

Ordered by the Legislative Assembly to be printed, 7 December, 1883.

RETURN to an Order of the Honorable the Legislative Assembly of New South Wales, dated the 18th October, 1883, That there be laid upon the Table of this House,—

- "(1.) The names of all stations on the railway lines of the Colony, on the
- "31st December, 1882, at which the gross earnings did not exceed £1,000
- "for that year, and the lines on which they are situate, specifying in each
- "case the amounts respectively received from inward and outward goods
- "traffic, inward and outward coaching traffic; the gross amount so received,
- "the number of employés engaged, and the amount paid in salaries and "otherwise.
- "(2.) The like information in respect of all platforms having a porter in "charge.
- "(3.) The dates when such stations were established and platforms had porters placed in charge; with the like information as to the receipts, &c.,
- "for the twelve months immediately preceding and following the establish-
- "ment of such stations and the placing of porters in charge."

(Mr. Abigail, for Mr. Gould.)

RAILWAY STATIONS AND PLATFORMS.

RETURN of Stations and Platforms having Porters in charge on Great Southern and Western Railways, on 31st December, 1882, at which the gross earnings did not exceed £1,000 for that year, together with the earnings for twelve months preceding and following the establishment of such Stations and Platforms.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(RAILWAY STATIONS AND PLATFORMS, GREAT SOUTHERN LINE.)

Ordered by the Legislative Assembly to be printed, 26 August, 1884.

[Laid upon the Table of the House in accordance with promise made by the Honorable Mr. Secretary Dibbs, in answer to Question No. 6 on Votes and Proceedings No. 127 of the 8th July, 1884.]

Questions.

- 1. What is the number of Railway Stations on the Great Southern Line, and the name of each?
- Also the number and names of the Platforms on the same Line in charge of Porters?
- 3. What Stations on the same Line produce a less yearly revenue than the Murrumburrah Platform?

Answers.

- 1. (39.) Sydney, Darling Harbour, Macdonaldtown, Newtown, Petersham, Summer Hill, Ashfield Croydon, Burwood, Homebush, Rookwood, Granville, Fairfield, Liverpool, Campbelltown, Menangle, Picton, Mittagong, Bowral, Moss Vale, Bundanoon, Marulan, Goulburn, Breadalbane Gunning, Yass, Bowning, Binalong, Harden, Murrumburrah, Wallendbeen, Cootamundra' Bethungra, South Wagga, Junee Junction, The Rock, Culcairn, Gerogery, Albury.

 2. (25.) Eveleigh, Stanmore, Redmyre, Auburn, Clyde, Merrylands, Guildford, Cabramatta, Minto, Douglas Park, Redbank, Bargo, Hilltop, Colo Vale, Wingello, Towrang, Jerrawa, Rocky Ponds, Nubba, Illabo, Harefield, Bomen, Sandy Creek, Yerong Creek, Yambla.

 3. Macdonaldtown, Summer Hill, Croydon, Rookwood, Fairfield, Campbelltown, Menangle, Picton, Bowral, Moss Vale, Bundanoon, Marulan, Breadalbane, Gunning, Bowning, Binalong, Wallendbeen, Bethungra, Junee Junction, The Rock, Culcairn, Gerogery.

 It need hardly be pointed out that the importance of a Station does not depend upon its earnings.

- It need hardly be pointed out that the importance of a Station does not depend upon its earnings. The revenue for Murrumburrah in 1883 was £9,734 7s. 11d., of which £4,894 18s. 6d was for goods traffic, and the number of passenger tickets was 7,776, while at several Stations where the revenue was lower the actual work and responsibility were very much greater.

 At Macdonaldtown, for instance, where the revenue was only £1,873 2s. 4d., the number of
- passengers booked was 122,320.
 - At Summer Hill the revenue was £4,310 7s. 11d., and 156,645 passengers were booked.
- At Croydon the revenue was £4,040 3s. 7d., and the number of passengers booked, 106,352. At Rookwood the revenue was £2,786 8s. 9d., and the number of passengers booked was 60,551; and of that revenue £828 18s. 3d. was for goods traffic, which represented 9,239 tons against 4,459 tons at Murrumburrah
 - At Fairfield the number of passengers and the tonnage were greatly in excess of Murrumburrah. At Campbelltown the number of passengers and the tonnage were greatly in excess of Murrum-
- At Picton fewer passengers were booked than at Murrumburrah, but the merchandise tonnage was twice as great; besides Picton is an important marshalling station.
- At Bowral about 300 more passengers were booked and the tonnage was about equal to Mur-
- rumburrah At Moss Vale more passengers were booked, and the tonnage was more than twice that of Murrum-
- At Marulan fewer passengers were booked, but the tonnage was about five times greater than at Murrumburrah.
- At Bowning fewer passengers were booked, but the tonnage was greater. The same applies to
- Binalong.

 At Junee Junction the number of passengers and the tonnage were in excess of Murrumburrah.

 The officer in charge of Murrumburrah is paid at the rate of £150 a year and quarters, while porters in charge are only paid 48/ per week (=£124 16s. per annum) and quarters.

 Then again every Station given in answer to Question No. 3 is a Staff Station while Murrum-
- burrah is not.

RAILWAYS.

No. 1.

Messrs. Hunter & Co., to The Secretary for Public Works.

July, 1877.

We have the honor to submit the following proposal to yourself and colleagues. Having made arrangements for working some coal property near the Cataract, a few miles from Berrima, and taking into consideration that, in a minute written by Mr. Goodchap, it is stated that coal for the Great Southern Railway costs the Government twenty-six (26s.) shillings per ton, but if delivered at Berrima at ten shillings (10s.) per ton it would cause a saving to the State of some £6,000 per annum; we beg to make the following offer:—We will deliver coal for the supply of the Great Southern Railway

at Berrima at ten shillings (10s.) per ton, for a term of years to be mutually agreed upon.

This coal shall be equal, if not superior, to that tried for the Berrima Railway League, on the railway between Mittagong and Goulburn, on the 16th December, 1874, for result of which trial we have the honor to refer you to papers and correspondence relating to proposed branch railway to Berrima.

We have, &c. THOMAS HUNTER, E. G. LARKIN GEORGE HENSHAW

Trading as HUNTER & CO., Fitzroy Ironworks, Mittagong.

Mr. J. J. O. Atkinson to The Secretary for Public Works.

Oldbury, Moss Vale, 31 July, 1877. I have the honor of submitting the following proposal to yourself and colleagues.

Having some coal property about 4 miles west of Berrima Bridge, called the "Berrima Coal-mine,"

I beg to make the following offer:

I will deliver coal for the supply of the Great Southern Railway (similar to that tested between Nattai and Goulburn, on 16th December, 1874) at Berrima Bridge (terminus of proposed branch line), at eleven shillings per ton, for a term of years to be mutually agreed upon. I respectfully wish to point out:—

That at the price I offer the coal the Government would save 15s. per ton on their present outlay, it being computed that coal at present costs the State twenty-six shillings (26s.) per ton* (see minute No. 2, page 12 of papers and correspondence relating to proposed Branch Railway to Berrima).

That by getting coal at the reduced price named above, your Government could successfully undercarry the Victorian in the Riverina District, and secure the trade of that important part of the country

for New South Wales.

I may also state that in a short time, when the pit is in thorough working order, and a tramway constructed† to meet the Berrima Railway, the proprietors of the Berrima Coal-mine would be in a position to deliver coal at a considerably lower rate than that named in this offer.

As the offer I have now the honor to make is of considerable importance both to myself and the district generally (and in fact the whole Colony, by the saving it would occasion to the public expenditure), I trust you will take it into your immediate consideration, and favour me with the result of your deliberation at an early date.

I might mention that the late Premier, when at Berrima last year, said that if the Government received an offer of coal showing a saving of 10s per ton on what it at present costs them, they would construct a railway not only to Berrima, but to the pit's mouth.

I have, &c., J. J. O. ATKINSON.

Mr. Mason, for report.—J.R., B.C., 2/8/77. I can offer no opinion upon this subject until I have tested the coal, which I will do if the Commissioner considers it necessary.—W.M., 6/8/77. Com-

Minute of Secretary for Public Works.

I would suggest that the test to be adopted with this coal should be of such a character as to prove beyond any possibility of doubt its value for steaming purposes. It seems to me that the most effectual way to bring about such a result is for a quantity of coal (say not less than 20 tons) to be procured from the seam of coal on Mr. Atkinson's property, that such coal should be obtained or hewn from the seam under the actual supervision of a trustworthy officer of the Railway Department, and that such coal should be afterwards conveyed under such officer's supervision to the Southern Railway, and that afterwards the most careful tests should be made by the Locomotive Department of its value for steaming purposes. I could never give my assent to the construction of a Branch Railway to such an unimportant place as Berrima, unless the fact could be incontrovertibly demonstrated that a great saving would be effected in the use of coal for locomotive purposes on the Southern Railway by obtaining that mineral from near Berrima.—J.H., 10/8/77.

The

^{*}At the time stated it was costing that, but prices have altered and rates have been reduced since then.—Chas. A.G. + A company is now in course of formation for laying down tramway from Berrima to coal-mine.

The Commissioner for Railways to Mr. J. J. O. Atkinson.

Department of Public Works, Railway Branch, Sydney, 15 August, 1877.

In reference to your letter of the 31st ultimo, offering to enter into a contract to supply for the use of the locomotives on the Southern Railway coal from the Berrima mine at 11s. per ton, I have the honor to inform you that the Government have received similar offers from others owning coal-mines in the same locality; and the Secretary for Public Works has written a minute on the subject, of which the

following is a copy:

"I would suggest that the test to be adopted with this coal should be of such a character as to prove beyond any possibility of doubt its value for steaming purposes. It seems to me that the most effectual way to bring about such a result is for a quantity of coal (say not less than 20 tons) to be procured from the seam of coal on Mr. Atkinson's property, that such coal should be obtained or hewn from the seam under the actual supervision of a trustworthy officer of the Railway Department, and that such coal should be afterwards conveyed under such officer's supervision to the Southern Railway, and that afterwards the most careful tests should be made by the Locomotive Department of its value for steaming I could never give my consent to the construction of branch railway to Berrima unless the fact could be uncontrovertibly demonstrated that a great saving would be effected in the use of coal for locomotive purposes on the Southern Railway by obtaining that mineral from near Berrima."

I may add that, upon your intimating your willingness to allow a sample of your coal being taken in the way described for the purpose of being tested, the necessary arrangements will be made accordingly.

I have, &c. JOHN RAE,

Commissioner for Railways.

Messrs. R. J. Matthews and J. Arnfield to The Secretary for Public Works.

Berrima, 31 July, 1877. We, the undersigned, are prepared to deliver at Berrima the best coal, in any quantity, for railway and other purposes, at 11s. per ton.

> R. J. MATTHEWS. JOHN ARNFIELD.

Mr. Mason, for report.—J.R., 9/8/77. I have already stated in a previous paper that I can offer no opinion about this coal for locomotive purposes until I have tested it.—W M., 14/8/77. Commr. Mr. Arnfield might be asked to forward the necessary quantity for testing.—J.R., 20/8/77.

The Commissioner for Railways to Mr. J. Arnfield.

Department of Public Works, Railway Branch, Sydney, 31 August, 1877. In reference to your letter, dated the 31st ultimo, addressed by yourself and Mr. Matthews to the Minister for Works, offering to deliver best coal at Berrima in any quantity at 11s. per ton, I have the honor to inform you that the Engineer for Existing Lines states that he can offer no opinion about this coal for locomotive purposes until he has tested it. If therefore you wish the coal tried, I have to request that you will forward a sufficient quantity for that purpose, say 10 tons.

I have. &c. JOHN RAE,

Commissioner for Railways.

Mr. J. J. O. Atkinson to The Commissioner for Railways.

Oldbury, Moss Vale, 18 October, 1877.

I have the honor to acknowledge receipt of your letter of 15th ultimo, in answer to mine of July 31st, in reference to my offer to deliver coal at Berrima for railway purposes.

I have delayed replying till now, having placed my coal land under offer to a Company now in course

of formation to work the same.

The object of this Company is to lay down a tramway from coal land to Berrima, and to work the

coal for supply of Government or any other available market.

The following are the names of the gentlemen who have been appointed Provisional Directors to form this Company, viz.:—Messrs. P. M. Osborne, J.P.; M. Butler, J.P.; W. J. Cordeaux, J.P.; J. J. O. Atkinson, J.P.; G. C. Makin, R. N. Matthews, and T. P. Galbraith.

From the names of the Provisional Directors you will perceive that the initiatory movements are in bona fide hands, and when carried into effect will be the means of saving the Government some thousands of pounds annually in the outlay for coal, if the necessary provision is made to connect the Company's proposed depôt, Berrima, with the Great Southern Railway.

With regard to the trial of coal, I shall, and do most readily assent to your obtaining it in the

manner you propose, and will render every assistance in my power to facilitate its delivery

I presume, however, you are not aware that although the seam in my property alluded to is exposed to view under a cliff for some 2 miles, it has never been worked thereon, but about a quarter of a mile from my boundary the same seam of coal is now being worked and used at the Fitzroy Iron Works, Nattai, and 5 tons of coal therefrom, at an expense of some £30, were also, in the year 1874, at the special request of your Department, duly tested on the Great Southern and Great Western Railway, and pronounced by the Railway officials (see Berrima Railway papers, letter from Mr. Rae, dated 10/2/75) suitable for locomotive purposes

There would thus be no difficulty in obtaining from that same mine (the coal of which is, as before explained, identical with the seam I have offered to supply the Government from) the 20 tons of coal

required, at an outlay of (say) £20 delivered at the railway.

On the other hand, should the Department deem it absolutely necessary to obtain the 20 tons of test coal from my own property, to open, drive, mine, and deliver same on Great Southern Railway—say at Moss Vale—would require an outlay of about £50.

On receipt of information that the Railway Department is prepared to meet this necessary expenditure (and which will be more than half recouped by the 20 tons coal) I will immediately set miners to work to get out the coal, in the presence and under the superintendence of an officer of the Railway Department,

Considering the enormous saving likely to accrue to the State by being enabled to obtain coal for Southern Railway purposes in this district, I presume the trifling expenditure above alluded to will be assented to without hesitation.

I take this opportunity of drawing your attention to an answer given to our Member, Captain Onslow, on 3rd instant, to the effect that the consumption of coal on Great Southern Railway, when extension to Wagga is completed, will be 14,000 tons a year; and as the difference between the price at which I have offered you the coal and what you now pay is 9s. 6d. per ton, the saving to the State would be about £7,000 per annum.

An early answer to this letter will oblige.

I have, &c., J. J. O. ATKINSON.

Mr. J. J. O. Atkinson to The Commissioner for Railways.

Oldbury, Moss Vale, 24 November, 1877. I have the honor to call your attention to my letter of 18th ultimo, stating that you could obtain the desired quantity of coal for trial in the manner you suggest, namely, to be mined under the

immediate supervision of a person appointed by you.

As the same seam that I propose to obtain the coal from is now being worked by the lessees of the Fitzroy Works on an adjoining block of land, there would be no difficulty now in getting the coal you require for the test, though allow me to remind you that five tons (5) of same coal have already been tried on the railway, and approved of by the Railway Department, and I take this opportunity of repeating my offer to deliver similar coal at Berrima for railway purposes at eleven (11s.) shillings per ton for either one or a term of years.

An early reply will oblige,-

Yours respectfully, &c., J. J. O. ATKINSON.

Mr. Mason, 30/11/77.—J.R. This of proper way?—W.M., 3/12/77. Commissioner. This offer cannot now be entertained; why not tender in the

Show me copy of specifications for the supply of coal for S. and W. Does it not contain provision reserving to the Commissioner the right to obtain coal at any place along the line, should same be found suitable for locomotive purposes?—CH. A. G., 12/12/77.

We are not debarred, I see by clause 9 of the specification, from taking coal other than contract coal, and should Mr. Atkinson's coal be found after trial to be suitable for locomotive purposes, I presume the Commissioner will take it if it be offered at a cheaper rate than equal coal can be obtained elsewhere, but the subject of Mr. Atkinson's letter will not be dealt with by informing him of the terms of Mr. Mason's minute of 3/12/77—which would be "that his offer to supply coal at Berrima at 11s. a ton has been received too late, and that he should have tendered when offers were invited for locomotive coal for 1878." In the first place, tenders to supply coal other than Newcastle and Western coal were not invited, and therefore Mr. Atkinson could not very well tender; on reading however his letter of October 18th and November 24th, it will be seen that he is dealing with the proposal of Mr. Secretary Hoskins, that if he wishes his coal tested on the Government locomotives, with a view to base thereon an application to the Government or Parliament for the construction of a branch line to Berrima, the coal must be taken from the seam (from which he proposes to supply the Government at 11s. a ton) under the inspection of an officer of this Department, &c.

Mr. Atkinson says that it will cost £50 to do this, and he wishes to know whether the Government

will bear the expense. It is to this inquiry that he asks for an answer.—Chas. A. G., 5/12/77.

Minute of Secretary for Public Works.

This must be done at owner's expense.—J.S., 7/2/78.

The Commissioner for Railways to J. J. O. Atkinson, Esq.

Department of Public Works, Railway Branch, Sydney, 21 February, 1878. Sir. In reply to your letters of the 18th October and 24th November last, in reference to your offer to deliver a sufficient quantity of coal at Berrima, from your own seam, for the purpose of being tested in the locomotive engines, and asking whether the Government are prepared to pay the sum of £50, the estimated cost of opening drive, mining, and delivery of coal on the Great Southern Railway, I have the honor to inform you that any expense incurred in obtaining this coal must be borne by the owner or owners thereof.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways. .

Mr. J. J. O. Atkinson to The Minister for Works.

Oldbury, Moss Vale, 26 March, 1878.

I have just heard from the Secretary to the proposed Branch Railway to Berrima League that Captain Onslow informs him that, in course of conversation, you mentioned that you were unaware of any offer to deliver coal at 11s. per ton at Berrima for locomotive purposes.

If you will kindly cause inquiry to be made in the Railway Branch of your Office, you will find that I made an offer to deliver coal for the above purpose at 11s. per ton, for a term of years to be mutually agreed upon, such coal to be delivered at proposed terminus of Branch Railway, at or near Berrima Bridge;

the date of my letter containing such offer being 31st July, 1877. I now beg respectfully to repeat that offer, and also to remind you that coal from the same seam was tested on the railway between Mittagong and Goulburn on 16/12/74, and the result satisfactory. (See Branch Railway to Berrima—papers ordered to be printed by the Legislative Assembly, 29/3/76, page 3, Nos. 3, 4, and 5.)

I have, &c., J. J. O. ATKINSON.

Minute of Secretary for Public Works.

Seen, and refer him to letter sent in reply to his offer in July last.—J.S., 5/4/78.

The Commissioner for Railways to Mr. J. J. O. Atkinson.

Department of Public Works, Railway Branch, Sydney, 16 April, 1878. I have honor to acknowledge the receipt of your letter of the 26th ultimo, with reference to your offer to enter into a contract to supply for the use of the locomotives on the Southern Railway coal from the Berrima Mines at 11s. per ton, and in reply have to invite your attention to my letter of the 15th August, 1877, on this subject. I have, &c.

CHAS. A. GOODCHAP, Commissioner for Railways

No. 2.

Mr. D. Smith to E. Combes, Esq., M.P.

Eisenfels, Nattai, 15 September, 1877. I have the honor to inform you that I have "mined" 10 tons of coal, which I will deliver at Mittagong next week, and I shall esteem it a favour if you will order a trial of this coal on the locomotives working on the Great Southern Railway.

After satisfactory trials are made of this coal, the "Nattai Coal and Coke Company (Limited)," will be willing to contract for all the coals required on the Great Southern Railway for one or more years, at

a price considerably lower than that paid at present.

The Company are getting a very superior quality of coal, suitable for blacksmiths' fires, a sample of which will also be sent to station. Should the sample be approved, this district will be able to supply the Government workshops at Redfern and Liverpool (when the establishment is removed there) cheaper Will you kindly order two trucks to receive the 10 tons on or before Thursday than any other colliery. I have, &c., DAVID SMITH.

Engineer for Existing Lines.—E.C., B.C., 17/9/77. I see no objection to this coal being tried on the locomotives, provided it be delivered to the Commissioner free of all expense.—W.M., 19/9/77. Inform.—E.C., 24/9/77.

The Commissioner for Railways to Mr. D. Smith.

Sir, Department of Public Works, Railway Branch, Sydney, 29 September, 1877.

In reply to your letter of the 15th instant, stating that you have 10 tons of coal ready for delivery at the Mittagong Station, and requesting that an order may be given to have it tested for locomoderate the statement of the statemen tive purposes, I have the honor to inform you that I have no objection to this coal being tested in the locomotives, provided that it be delivered free of all expense.

I have, &c. JOHN RAE,

Commissioner for Railways.

Mr. D. Smith to The Commissioner for Railways.

Eisenfels, Nattai, 2 October, 1877. In reply to your letter of 29th September, I beg to say 10 tons of coals shall be delivered to

the Mittagong Station, free of all expense to the Government.

I shall esteem it a great favour if you will order an immediate trial of this coal, as the matter is of great importance to the Fitzroy Company, and also will effect a very considerable saving in all future coal I have, &c., DAVID SMITH. expenses on the Great Southern Railway.

/77. Mr. Scott to note and return.—R.J.S., 10/10/77. . Commr.—W.M., p. R.J.S., 15/10/77. Mr. Mason.—CH. A. G., B.C., 10/10/77. Noted.—W. Scott, 15/10/77. Mr. Mason.

Mr. David Smith to The Honorable Edward Combes.

Eisenfels, Nattai, 24 September, 1877. I have the honor to inform you that I have, in compliance with my letter of the 15th instant, the delivery of 10 tons of coals to the Mittagong Station. I regret to learn from the Station-Sir, commenced the delivery of 10 tons of coals to the Mittagong Station. master, Mr. Watsford, that he has not yet received from you an order to provide trucks to receive this coal. Will you oblige by giving Mr. Watsford instructions respecting the two trucks.

I have, &c. DAVID SMITH.

Approved, I think, on another paper, 26/9/77.—J.R. Traffic Manager. The coal is to be delivered without expense to Railway Department.—B.C., 26/9/77.—Chas. A.G. The Station-master, Mittagong, to note.—D. Vernon, 28/9/77. Noted, Jas. Watsford, 29/9/77. Traffic Manager,—If these coals are being loaded at Mittagong where are they being sent to?—D. Vernon, 2/10/77. Coals not yet loaded.—J. Watsford, 3/10/77. Traffic Manager. I have not seen any previous paper on this matter; are the coals to be carried free, or are there any special directions to be given concerning them ?-D. Vernon, per David Kirkcaldie, 4/10/77. Secretary. The Engineer for Existing Lines will arrange to try this coal; the coal is to be taken free to any portion of the line where he may require to use it; please arrange with Loco.—B.C., 6/10/77, Chas. A.G. When are these coals to be loaded, and to what station does Mr. Scott wish them sent?—D. Vernon, per David Kirkcaldie, 8/10/77. Mr. Scott, Loco. Supt. I would propose that this coal be loaded up and sent to Picton to be tested.—W. Scorr, 11/10/77. Approved, J.R., 18/10/77. Mr. Mason. Commissioner to see.—W.M., 15/10/77.

Memorandum

Memorandum to Mr. Webster.

Government Railways, Engineer's Branch, Sydney, 15 October, 1877.

10 tons of coal will be sent to Mittagong Station by Mr. David Smith for trial; I wish you to carefully test and report.

Instructions will be sent to Station-master to have this coal loaded up and sent to Picton.

W. SCOTT.

Memo. from Mr. W. Webster to The Locometive Overseer.

19 October, 1877.

I beg to report I have, according to your instructions, tested the sample of coal sent from Mittagong, and find it to be a very inferior coal for making steam, having a deal of small coal in it, and leaving a very large quantity of dirt, not only of ash, but of a slaty clinker, and there is not much smoke. I made three trials between Picton and Mittagong with the same engine, No. 44,—first on Wednesday night, 17th, assisting the through goods train which was light that night, and twice with the 10 30 a.m. train.

When with the through goods there was difficulty in getting steam, but having two engines and the train light it was not so noticeable. On Thursday, 18th, with 10 30 a.m. train we had a full load, eleven loaded trucks and brake way. We had to stop three times between Pictor and Mittagong to clean the fire

loaded trucks and brake-van. We had to stop three times between Picton and Mittagong to clean the fire, and lost one hour on the trip on Friday, 19th, with 10:30 a.m.; there were only eight loaded to take; we lost no time with them, but on arrival at Mittagong the fire-box was nearly full of dirt and clinker. The consumption of this coal has been 80 lbs. per mile, there having been 5 tons 5 cwt. consumed in the three journeys at 48 miles each, without getting up steam, and on the first and second trips, on cleaning the fire at Mittagong, a few lumps of the Bowenfels coal were taken to light the fire, as there were no lumps in the other.

The consumption of Bowenfels coal on the same run is 70 lbs. per mile.

WILLIAM WEBSTER.

Engineer for Existing Lines.—22/10/77. I consider this coal useless for locomotive purposes. W.M., 26/10/77. Commissioner. Inform.—E.C., 8/11/77.

The Commissioner for Railways to Mr. D. Smith.

Department of Public Works, Railway Branch, Sydney, 15 November, 1877. Referring to the coal forwarded by you for the purpose of being tested, I have the honor to enclose herein, copy of a report received from the Locomotive Overseer, from which you will perceive that the coal in question is not adapted for locomotive purposes.

I have, &c. JOHN RAE,

Commissioner for Railways.

W. WEBSTER.

Memorandum to Mr. Scott.

Sir, Picton Station, 19 October, 1877. There were 9 tons 14 cwt. of coal sent from Mittagong for trial, so that there are still 4 tons 9 cwt. on hand. Shall I keep this for further trial, or have it unloaded at once?

Engineer for Existing Lines.—J.C., 22/10/77. This coal is of no use for locomotive purposes, and may be returned if required.—W.M., 26/10/77. Seen.—J.R., 30/10/77.

Mr. D. Smith to The Commissioner for Railways.

Sir, Eisenfels, Nattai, 27 November, 1877. I beg to own receipt of the report upon the trial of the Nattai River coal made by Mr. With the result of this trial I am disappointed, as we have here coal suitable for every purpose Webster. to which coal can be employed.

I have the honor to hand you copy of a report of the same coal tried at the Fitzroy Iron Works on the 14th instant, which shows that by some mischance we must have sent you for trial a very inferior

sample of this coal.

We have two other seams of coal here from which I shall esteem it a favour if you will order a trial. Both these coals we have tried here and found them good, and in my opinion are better coals than the coal now being used from Lithgow on the Great Southern Line. On hearing from you, 5 tons from one or both of the seams shall be delivered at the Mittagong Station, free of any expense to the Government.

I have, &c.,
DAVID SMITH.

[Enclosure.]

1877.

Report upon a trial of Nattai River coal at the Fitzroy Iron Works, by Robert Longmore. To the Committee of the Nattai River Coal and Coke Co., Limited.

Gentlemen,

According to your request, I attended a trial of your coal made at the Fitzroy Iron Works (leased for a short term to Messrs. Hunter & Co.), and I beg to submit my report, which I have no doubt you will deem satisfactory.

In December, 1874, the Government made a trial of coal from the Cataract Mines near Berrima, which trial John Rae, Esq., Commissioner for Railways, reported to be satisfactory. It is with this coal now being used at the Fitzroy Works that I made comparative trials.

Works that I made comparative trials.

Two trials were made, the first in the "mill furnace," and the second in the "puddling furnace," both furnaces being used for the conversion of pig iron into merchant hars.

The mill furnace being in working order, the previous charge having been drawn, and the fire-bars eleansed, the time taken was from the time the doors were closed until the charge of iron was drawn and the doors closed again for Two

Two charges were heated, drawn and worked off under the forge hammer from your coal in four hours and four minutes. I must, however, mention that when the first charge was ready for drawing an accident happened to the machinery, causing a delay of fifteen minutes. The amount of coal consumed for the two charges was 11 cwt. 2 qrs. and the weight of iron rolled from the two trials 1 ton 3 cwt. During the first four hours and four minutes occupied in getting out the two heats the fire-bars were not cleaned, showing that this coal can be used with a minimum of trouble in this respect, and consequently will be a favourite fuel with the employes at the works.

The re-heating furnace was now charged with coal from the Cataract. Only one trial of this coal was made. The coal used for one trial was 7 cwt. 3 qrs. 14 lbs., and the weight of iron rolled was 11 cwt. 2 qrs. With this coal the furnace-bars require cleaning for every charge. Comparing the two trials, there is a saving of coal in using Nattai River coal of 20 per cent., and a saving of time sufficient to enable the same furnace to turn out 11 cwt. of additional iron every twenty-four hours.

four hours.

Trial at the puddling furnce. Two charges were worked with Nattai River coal, and one with Cataract, with about the same result. With this further advantage the iron from your coal required much less labour under the forge hammer and was more homogeneous, and consequently would make a better bar. This I attribute to the better puddling of the iron, and the greater heat of the "balls" when taken out of the furnace. The employes at the works took a lively interest in these trials, and have endorsed at foot all I have said as to the superiority of your coals over the coals they have hitherto used at these works.

ROBERT LONGMORE,

Mining Manager

Mining Manager.

We, the undersigned, workmen at the Fitzroy Works who assisted at the above trials, certify to the truth of the above report.

WILLIAM MILLER, Foreman Roller, WILLIAM LAWSON, Puddler, WILLIAM BOWEN, Mill-Furnaceman. WILLIAM JERVONS, Roller.

Inform-Inconvenient to be trying so many coals.-J.R., 13/12/77.

The Commissioner for Railways to Mr. D. Smith.

Department of Public Works, Railway Branch Sydney, 21 December, 1877. Sir. In reply to your letter of the 27th ultimo, applying to have a further sample of your coal tested for locomotive purposes, I have the honor to inform you that I am unable to accede to your request, as it is found inconvenient to be trying so many samples of coal.

I have, &c.

JÓHN RAE,

Commissioner for Railways.

Mr. D. Smith to Mr. Webster.

Sir, The Parsonage, Berrima, 13 February, 1878. The coal remaining over after the trial can be used, if you will kindly forward it to Mittagong This coal cost me nearly £50, and if you will return the 4 2 tons it will help to recoup some of Station. It was at Mr. Goodchap's request that we sent so much. this loss.

DAVID SMITH.

I presume if Mr. Smith wants the coal to be sent to Mittagong it will be at his expense.—W. WEBSTER, 15/2/78. Mr. Scott. Yes.—W.M., 25/2/78.

No. 3.

J. J. O. Atkinson to The Minister for Works.

Sir,

Oldbury, Moss Vale, 18 November, 1878.

I have the honor to inform you that we have had the Berrima Coal Mine opened for the purpose of obtaining a few tons of coal to hand over to the railway authorities for trial on the Great Southern Railway.

This coal will in all probability be ready for delivery at Moss Vale early next week.

As it is believed to be of superior quality, we trust you will cause such arrangements to be made as will ensure a proper test of its suitability for railway purposes.

Be good enough to inform me what number of tons you will require for this test and what arrangements you will be pleased to make for its reception and trial.

I respectfully beg to request the favour of an early reply.

I have, &c., J. J. O. ATKINSON.

The Locomotive Engineer will please make arrangements for detaching an officer to see that the coal offered is taken out of the mine—the depth taken from, and all particulars. He will then see it brought to Sutton Forest (Moss Vale) Station, and the Locomotive Engineer will give directions for its being tested for locomotive purposes. I have stated that 20 tons will suffice for the purpose.

Write to-day to Mr. Atkinson and forward to Mr. Burnett.—B.C., 27/11/78, Chas.A.G.

The Commissioner for Railways to Mr. J. J. O. Atkinson.

Department of Public Works, Railway Branch, Sydney, 27 November, 1878. Sir. In reply to your letter of the 18th instant, intimating that you are prepared to supply a few tons of coal from the Berrima Coal Mine for the purpose of being tested on the railway locomotives, and asking what number of tons will be required for the trial, I have the honor to inform you that 20 tons. will suffice for the purpose, and an officer has been detailed from the Locomotive Engineer's staff to see that the coal is taken from the mine, the depth taken from, and to attend to all matters connected with the test. I have, &c.

CHAS. A. GOODCHAP, Commissioner for Railways. W. Davies, Esq., M.P., to The Minister for Works.

Goulburn, 16 November, 1878. I have the honor to bring under your notice the fact that coal is being obtained on the land of Mr. Atkinson about 8 miles from the Moss Vale Station, Southern Line. It is believed that this coal is suitable for engine purposes, and my object in writing you is to request that a trial, or trials, of his coal may be made by the Government to ascertain its fitness as steam coal.

I need not point out the great saving to the Government, if an ample supply of coal can be had on

the Southern Line of Railway, and thus avoid the haulage from the Western coal-fields.

Perhaps you would wish that a competent officer should visit the coal seam and superintend the whole trial, in which case Mr. Atkinson, of Oldbury, near Berrima, the owner of the coal seam, will place himself and men at the direction of such officer, and will deliver coal at the Moss Vale Station at any time and in any quantities you may order.

Respectfully requesting an early reply,-

I have, &c., WILLIAM DAVIES.

Minute of Secretary for Public Works.

Inform that an officer will be sent, as requested, when we require a tender for supplying the coal we require, or that the Company can supply weekly for the year 1879, or for five years. be done at once, as contracts are about being entered into for the year 1879.—J.S., 18/11/78.

The Commissioner for Railways to W. Davies, Esq., M.P.

Department of Public Works, Railway Branch, Sydney, 18 November, 1878. Sir, In reference to your letter of the 16th instant, pointing out to the Secretary for Public Works that coal is being obtained on the land of Mr. Atkinson about 8 miles from the Moss Vale Station, and suggesting that as this coal, if serviceable for the locomotive, would effect a great saving in the working expenses of the Southern Railway, an officer of the Department should visit the coal seam, with a view to see that a fair sample is taken out for trial, I have the honor to inform you that Mr. Secretary Sutherland has approved of your suggestion, and an officer will be sent directly it is ascertained that the proprietors of the mine are prepared to tender to supply, weekly, a certain quantity of coal for locomotive purposes for the year 1879, or for four or five years. I may add that no time should be lost in this matter, as contracts for the supply of coal are about being entered into for the year 1879.

I have, &c.

CHAS. A. GOODCHAP,

Commissioner for Railways.

W. Davies, Esq., M.P., to The Commissioner for Railways.

Goulburn, 30 November, 1878. Sir, Replying now to your letter to me, dated 18th instant, and on account of Mr. Atkinson, to your letter addressed to him, and dated the 27th instant, I have to say that the 20 tons of coal required for trial on the railway locomotives will be got out without any delay. Mr. Atkinson thinks it best to get out a few tons before touching that to be supplied as a test, and which may be supposed fairly to represent the quality of the seam. It will be, however, a few days before he will have all in readiness for inspection.

Mr. Atkinson requests the favour of a free pass for himself upon the train when the coal is being tested; or if tested upon more than one train at the same time, then for some one or more appointed by him

to be present during the trial. I think this reasonable, and trust you will consent.

I deem it my duty to inform you that one at least of the engine-drivers on the Southern Railway is interested in a coal mine not far from Jordan's Crossing, and that he was heard to say, upon looking at some of Mr. Atkinson's coal then lying at Moss Vale Station, and consigned to Goulburn, "This will spoil my little spec." This, while paying a tribute to the goodness of Mr. Atkinson's coal, will suggest a caution as to the thorough supervision of the trial or trials which you may give to this coal.

I fear Mr. Atkinson will not be in a position to tender for the supply of coal for 1879, for a tramway must be laid down from Moss Vale to the mine, and this will take a few months to do; but I would respectfully suggest that the saving to the Government will be so great by drawing the supply of coal from Berrima, as compared with Bowenfels or Newcastle, that possibly the Secretary for Public Works will have a clause inserted in the form of tender or in the contract that the supply obtained from the places above named may be diminished at pleasure, and then a quantity could be drawn from Berrima.

Meanwhile I have no doubt Mr. Atkinson will push on his works so as to deliver coal as speedily as possible, and probably by the end of the present year he will be able to name the price per ton at which he will deliver coal at Moss Vale Station so soon as the tramway is finished.

I have, &c., WILLIAM DAVIES.

Inform that a fair test will be given the coal, and that there is no objection to representatives of the mine-owners travelling by the train, the engine of which is testing the coal, and that this can be arranged by the Locomotive Engineer.--Chas. A.G., 2/12/78.

The Commissioner for Railways to W. Davies, Esq., M.P.

Department of Public Works, Railway Branch, Sydney, 2 December, 1878. Sir. I have the honor to acknowledge the receipt of your letter of the 30th ultimo, and in reply thereto, beg to inform you that a fair test will be given to the coal supplied by Mr. Atkinson, and that there is no objection to the representative of the colliery owners travelling by the train, the engine of which is testing the coal. This can be arranged with the Locomotive Engineer, who has been instructed accordingly.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. J. J. O. Atkinson to The Commissioner for Railways.

Sir Oldbury, Moss Vale, 4 December, 1878. I beg to acknowledge receipt of yours of 27th ultimo, informing me that an officer from the Locomotive Engineer's staff has been detached to see the coal is taken from the Berrima Coal-mine for

I have the pleasure to inform you that the mine is ready for said officer's inspection at once.

I have, &c.,

J. J. O. ATKINSON.

Locomotive Engineer to arrange for Inspector to meet Mr. Atkinson at the Moss Vale Station, on Monday next. If not convenient, inform Mr. Atkinson, and arrange for early day.—B.C., 4/12/28, CHAS. A. G.

No. 4.

Mr. J. J. O. Atkinson to The Commissioner for Railways.

Oldbury, Moss Vale, 2 January, 1879. Would you be good enough to cause me to be furnished with copies of reports on the various tests taken of my coal, as I am anxious to see the results.

J. J. O. ATKINSON.

Will Locomotive Engineer enable me to comply with this request.--Cнаs. A. G., В.С., 3/1/79. Copies of reports herewith for Mr. Atkinson's information. Unless the sample tried is an exceptionally bad lot, and can be very materially improved upon, the coal would seem to be quite unfit for locomotive purposes.—R.H.B., 9/1/79. Inform Mr. Atkinson, with copies of reports.—G.B., 13/1/79.

The Commissioner for Railways to Mr. J. J. O. Atkinson.

Department of Public Works, Railway Branch, 14 January, 1879. In compliance with the request contained in your letter of the 2nd instant, I have the honor to forward herewith copies of reports received of the tests made of your coal, and to state that the Locomotive Engineer reports that unless the sample tried is an exceptionally bad lot, and can be very materially improved upon, the coal would seem to be quite unfit for locomotive purposes.

I have, &c.

CHAŚ. A. GOODCHAP, Commissioner for Railways.

Locomotive Drivers' reports respecting coal.

Mr. W. Webster to The Locomotive Overseer. Sir

Picton, 27 December, 1878. I beg to report that according to instructions I visited the Berrima coal-mines, saw a quantity of coal taken therefrom brought to the Moss Vale Station, and have tried it on two occasions on goods trains, once from Picton to Mittagong and back, and once from Picton to Goulburn.

The mine is situated in a deep ravine, about 4 miles from Berrima, through which the Wingecarribee flows; the seam of coal is 5 feet 5 inches in thickness where worked, and nearly 300 feet from the top of the cliff; the coal is obtained by tunnelling at that depth; the tunnel is in to the cliff about 34 feet, where

the coal was got which was tested.

In both trials I found there was a large quantity of dirt in the coal. In the trial between Picton and Mittagong, a distance of 48 miles, with about an hour's shunting, 32 cwt. of coal were consumed, and there were 11½ cwt. of dirt left; the train had to stop once on the road to prick up the fire, and the fire had to be thoroughly cleaned at Mittagong. In the trial between Picton and Goulburn there were 51 cwt. of coal consumed, but I am unable to give the quantity of dirt, as the ash-pan had to be cleaned out three times on the road; besides the fire thoroughly cleaned at Mittagong half-an-hour was lost on the journey through waiting for steam and cleaning the fire, although from Mittagong to Goulburn there was not a full train. The coal makes steam fairly while the fire is clean, but in consequence of the large quantity of dirt, the fire would require cleaning every ton of coal that was burnt; for this reason I have not tried it on the passenger trains, as I do not think it suitable coal for locomotive purposes.

WILLIAM WEBSTER.

Sydney, 23 December, 1878.

Report on the Berrima Coal with the No. 9 Down Western Goods, &c., No. 20 Up Western Goods. Sydney to Penrith and back; 68 miles.

This is a bad steaming coal; will not steam well even at the start when the fire is clean; makes an enormous quantity of ashes and some clinker; had to stop at Parramatta Junction this morning with dead ashes nearly up to fire-hole door and knock it all out and make up a fresh fire. It is, in my opinion, much inferior to the worst kind of Bowenfels coal. Consumed 35 cwt. on the two trips, with light load; fifteen waggons out and thirty-one waggons in.

JOHN JONES.

No. 15 Engine from Sydney to Picton, with a train of five vehicles, the new coal steamed all right to Liverpool, and from Liverpool to Picton middling. On arrival at Picton there were 16 or 17 inches of ash in the fire-box and not much clinker. I would have had to clean the fire before going any further. More of this coal is used, and is not so good as the Bowenfels.

The above coal is a portion of that sent by Mr. Atkinson for trial.—J.C., 24/2/78. Locomotive

294-B

Overseer.

No. 5.

Mr. J. J. O. Atkinson to The Commissioner for Railways.

Oldbury, Moss Vale, 4 March, 1879. Referring to the recent test of my coal on your railways, and your letter of 14th January, accompanying the reports of Messrs. Webster, Jones, and Graham, I notice that out of some 16 tons delivered at the request of your Department for test purposes, and which has cost us in opening mine, &c., some £200, less than half that quantity has been utilized; and I have waited expecting perhaps to hear additional reports as to further trials made. However, as those received are all the Railway Department appear in a position to furnish, I would now beg to state that in the trial alluded to in Mr. Webster's report I was present on the engine; we started from Picton at a pressure of 100 lbs. (some forty minutes behind the time appointed, coal burning all the time), and although the gradient is one in forty from the station, before we had gone many miles on the journey the steam had risen to 120 lbs. to the square inch, showing that although we were ascending rapidly with a full train (fourteen trucks) that the coal was When we arrived in sight of watering place (Bargo Lagoon) the train that had preceded us was still standing there, and moved away as we approached. On reaching the top of the Big Hill the smoke from preceding train was visible ahead, and we arrived at Mittagong to time and immediately after the other train, thus showing that although the coal is reported as "unfit for locomotives," the journey was done in usual time. As to "having to stop on the road to prick up the fire," I am given to understand that it is usual for the goods trains to stop on top of the Big Hill, which is the only place we stopped at. On arrival at Mittagong, Mr. Webster directed the furnace to be cleaned out (the engine being of course suddenly stopped whilst under a fair steam, and fired up to nearly the last), with a view, as he explained, of making up a fresh fire to return to Picton, and having the ash weighed. Now, I wish to point out that the contents of this furnace were found to consist of large quantities of partially burnt, and still blazing coal, and cinders, a considerable quantity of pure coke, and a quantity of ordinary coal ashes (this I presume is the "dirt" spoken of in Mr. Webster's report), the weight of which is said to have been 11½ cwt. It will be seen from the foregoing that the percentage of "dirt" must necessarily be excessive under such a mode of test as this, particularly when it is taken into consideration that the trial was over a portion of the line, where there is always more than double the coal used per mile than on any other part of the Southern line, and up a rise of over 2,000 feet in some 20 miles. I desire further to point out the great discrepance between the reports of Jones and Graham. The former (of the Western line) states he could do nothing with the coal, even at the start; whereas Graham states that from Sydney to Liverpool the coal "steamed all right," and thence to Picton middling. Notwithstanding this fact, the Locomotive Engineer reports the coal "quite unfit for locomotives." The coal I delivered to the Government is known locally to be excellent burning coal, and the analysis will bear favourable comparison with most coal of the Colony, except in regard to ash, which is a trifle degree in excess, accounted for by the fact of the coal not being proved a sufficient distance from outcrop of seam. Moreover, we have the fact that coal taken from within 400 yards of where my coal was obtained, and "out of same seam," was acknowledged by the Railway officials five years ago as "suitable for locomotives"; the same coal is now condemned by them. Taking these points into consideration I must express my dissatisfaction with the recent trial, and also my decided disapproval of the mode of trial. I do think that, considering the immence importance to the Government in being able to get, in the Southern District, a coal suitable for locomotive purposes, that some more interest should be taken in the matter than was apparently the case in the trial of my coal. I do not think so important a matter should be left entirely to the subordinate officials of the Railway Department, and I now beg to apply for a fair trial of my coal, to be made in the presence of some scientific gentleman on behalf of the Government, who may be enabled to thoroughly investigate the matter, and who may see that before a really good and useful coal is condemned in this wholesale manner, that there is good reason for that condemnation, which in the present instance I must decline to admit. Another thing, although my coal is a hard semi-bituminous, it was treated the same as, and put into a furnace adapted for, the mountain splint coal, and therefore totally unfit, from the bars being too close together, to test coal of the description of mine. It is a notorious fact that for years the greatest difficulty was experienced by the owners of the Western coal to get it accepted by the Railway Department, owing to the constant informal reports of engine-drivers, &c. It would seem now that no other than the Western coal will suit, whilst it is well known that the coal here is absolutely superior to it, though, strange to say, "unfit for locomotives."

I have, &c., J. J. O. ATKINSON.

Can the Locomotive Engineer suggest any mode of testing the coal which would, or should remove Mr. Atkinson's suspicion that prejudice has influenced in any way the result of test?—Chas. A.G., 15/3/79.

Mr. W. Davies to The Commissioner for Railways.

Sir, Goulburn, 24 March, 1879.

I understand that Mr. Atkinson complains that his coal did not have a fair trial, and he has ited that another trial of it may be ordered and that appeared are prepared to accomplains the

asked that another trial of it may be ordered, and that special arrangements be made to ascertain the suitability or otherwise of this coal for steam purposes.

Mr. Atkinson says that not more than one half of the coal he supplied to the Government has been used in the trials made; that the journey from Picton southwards was accomplished in usual time; that the furnace-bars were too close for this coal, which is of a different character to that usually consumed by the Government on this line; and that coal from the same seam was tried on the South and West Lines some years ago and pronounced "good," and "equal to Bowenfels."

I am, &c.,

WILLIAM DAVIES.

Send this also to Locomotive Engineer.—Chas. A. G., B.C., 29/3/79.

Memorandum to Mr. Scott.

Government Railways, Locomotive Engineer's Branch, Redfern Station, 20 March, 1879.

Referring to the accompanying papers, re trial of Berrima coal, which please retain, and then return to me with your reply, I shall be glad to learn what quantity of coal was actually tried, detailing the lots in each case in the locomotives, and how much remained untried, and what has become of it. R.H.B., 20/3/79.

Mr. Webster.—J.C., 21/3/79.

Sir,

Report from Mr. W. Webster.

Picton, 22 March, 1879.

In reference to Mr. Atkinson's decided disapproval of the mode of trial of the Berrima coal, contained in his letter M.P.1,003, I regret that he did not express this disapproval at the time of trial, as if he had suggested any other mode which would have done justice equally to the coal and to the Government it would have been adopted at once. In reference to Mr. Atkinson's request to have a fair trial in the presence of a scientific gentleman, I beg to state that it was not a "scientific trial" but a practical trial that I made, and it makes little difference whether the refuse is called "fine coke," "coal ash," or "dirt," or even if it be described as "matter in the wrong place," so long as it is of no more practical use in making steam, which was the east in the instance of the direction of the instance of the direction of making steam, which was the case in the instance referred to.

In regard to Mr. Atkinson's complaint that his coal, being a semi-bituminous coal, was treated as a splint coal, and put into a furnace totally unfitted through the bars being too close for testing coal of this description, I beg to say I had no instructions to alter the fire-bars, nor notice that the coal required that it should be done, neither would it have made any difference had it been done, as no alteration of the fire-bars will effectively dispose of the dirt, and I am not aware that "bituminous" coal

necessarily requires bars further apart than splint.

I would respectfully suggest that Mr. Atkinson be requested to name some "scientific gentleman" in whom he has confidence, in whose presence a trial should be made, either of the coal still remaining at Goulburn or other coal to be supplied on any part of the Southern Lines, and if desirable let the fire bars be arranged and the firing done under his directions.

WILLIAM WEBSTER.

See report from Mr. Webster, which I entirely endorse. The 4 tons 13 cwt. sent to Sydney was all used by John Graham on No. 55 Engine, and John Jones, on No. 64 Engine. I cannot suggest any other method for a further trial than that proposed by Mr. Webster.—W. Scott, 3/4/79. Locomotive Engineer.

Memorandum from the Locomotive Engineer to The Commissioner for Railways.

Subject: -Mr. Atkinson's letter relative to the trial of Berrima coal.

Department of Public Works, Railway Branch,

Locomotive Engineer's Office, Sydney, 7 April, 1879.

1. I feel convinced that Mr. Atkinson is labouring under some misapprehension in thinking that there has been any unfairness in the trial of his coal, or any want of desire on the part of the Department to give

every opportunity for its merits being proved.

2. As Mr. Atkinson was present at the trial of the coal, every facility he asked for to enable him to supervise the trials having been conceded; it is to be regretted that he did not then and there make it known, that he was dissatisfied with the way the trial was being carried out, and that he allowed close upon two months (i.e., from 9th January to 4th March) to elapse between the time at which the reports were sent in, and his letter of complaint before recording his "decided disapproval of the mode of trial."

3. If Mr. Atkinson had expressed any opinion at the time of trial as to the space between the bars requiring to be enlarged, the bars would have been adjusted to suit his views. On this point, I may remark, in passing, that Mr. Atkinson affords no little evidence that the bars were, after all, quite far enough apart, by his statement that the refuse consisted of "large quantities of partially burnt and still blazing coal and With bars wider apart this quantity would necessarily have been greater, and the useful effect even less than it was.

4. The papers bearing on the trial referred to by Mr. Atkinson as having taken place five years ago, with coal "taken from within 400 yards of where his coal was obtained and out of same seam," and which he states the Railway officials reported as "suitable for locomotives," have not reached me.

5. If, however, this were so, and the suitability of the coal for locomotives were thus established (which is, as I understand it, Mr. Atkinson's contention), it is not very clear what was the object of again testing a sample which, having been taken, as Mr. Atkinson states, not "a sufficient distance from the outcrop of seam." could hardly be expected to give any better result, and could not therefore establish any new

6. I have thought it right to go into these several points, not from any desire to discourage a further trial of the coal, but because of the charges of "unfairness" advanced by Mr. Atkinson.

7. I feel sure the desire of the Department is to give every facility for testing the suitability for the Railway of any coal that is readily accessible; and if Mr. Atkinson should wish to make a further test, either with the coal that remains (of which there are still 5 tons unused), or with any better sample he may be able to send, in the presence of any one whom he may name, and under any circumstances he may suggest, I will see that every facility is afforded him.

Send Mr. Atkinson an extract from the Locomotive Engineer's report, paragraphs 1, 2, 3, 6 and 7, and say that, concurring as I do in Mr. Burnett's views as expressed in the concluding paragraph of his report, I shall be glad to give directions for a further trial of the coal in any way which Mr. Atkinson may suggest. Add that I attach great importance to this matter, as the discovery of a suitable locomotive coal on the Southern Railway Line cannot fail to be most beneficial to the Railway Department in reducing its working expenses.—Chas. A. G., 9/4/79.

The Commissioner for Railways to Mr. J. J. Atkinson.

Sir, Department of Public Works, Railway Branch, Sydney, 17 April, 1879.

In reply to your letter of the 4th ultimo, with reference to the alleged unsatisfactory manner in which the coal supplied by you for railway purposes was tested, and in which you request that another trial may be made in the presence of some scientific gentleman on behalf of the Government, I have the honor to inform you that the matter has been referred to the Locomotive Engineer, who reports as follows:—

1. I feel convinced that Mr. Atkinson is labouring under some misapprehension in thinking that there has been any unfairness in the trial of his coal, or any want of desire on the part of the Department to give every opportunity for its merits being proved.

2. As Mr. Atkinson was present at the trial of the coal, every facility he asked for to enable him to supervise the trials having been conceded, it is to be regretted that he did not then and there make it known that he was dissatisfied with the way the trial was being carried out, and that he allowed close upon two months (i.e., from 9th January to 4th March) to elapse between the time at which the reports were sent in and his letter of complaint, before recording his decided disapproval of the "mode of trial."

3. If Mr. Atkinson had expressed any opinion at the time of trial as to the space between the bars requiring to be enlarged, the bars would have been adjusted to suit his views. On this point, I may remark, in passing, that Mr. Atkinson affords no little evidence that the bars were after all quite far enough apart, by his statement that the refuse consisted of large quantities of partially burnt and still blazing coal and cinders. With bars wider apart this quantity would necessarily have been greater, and the useful effect even less than it was.

4. I have thought it right to go into these several points, not from any desire to discourage a further trial of the coal, but because of the charges of "unfairness" advanced by Mr.

5. I feel sure the desire of the Department is to give every facility for testing the suitability for the Railway of any coal that is readily accessible; and if Mr. Atkinson should wish to make a further test, either with the coal that remains (of which there are still five tons unused) or with any better sample he may be able to send, in the presence of any one whom he may name, and under any circumstances he may suggest, I will see that every facility is afforded him.

I may state that, concurring as I do in Mr. Burnett's views, as expressed in the concluding paragraph of his report, I shall be glad to give directions for a further trial of the coal in any way you may suggest.

I may also add that I attach great importance to this matter, as the discovery of a suitable locomotive coal on the Southern Railway Line cannot fail to be most beneficial to the Railway Department in reducing its working expenses.

I have, &c.,

CHÁS. A. GOODCHAP, Commissioner for Railways.

Mr. J. J. Atkinson to The Commissioner for Railways.

Sir,

Moss Vale, 6 May, 1879.

In reply to your letter of 17th ultimo (No. 79-5,720), containing report of Locomotive Engineer on my communication of March 4th, I have the honor to inform you that I have read that report with considerable surprise, and am astonished that its contents (that is contents of my letter) could have been so misunderstood. If you will be good enough to peruse my letter of March 4th before alluded to, you will find that my reason for not communicating with your Department before then, was that I was "waiting for further reports," as those to hand only showed that some $7\frac{1}{2}$ tons out of four truck-loads had been tried, and those trials by subordinate officers. As to every facility being granted me to supervise trial, I may state that I only asked to be present at trial from Picton to Nattai, which request was granted, but I had to pay my fare to go to Picton* to see that trial, although giving the Government some £20 worth of coal, and I was not made aware of when the other trials were to take place.

In third paragraph of Mr. Burnett's report, he states that I afforded no little evidence that the bars were wide enough apart, by my statement that the refuse consisted of large quantities of partially burnt.

In third paragraph of Mr. Burnett's report, he states that I afforded no little evidence that the bars were wide enough apart, by my statement that the refuse consisted of large quantities of partially burnt and still blazing coal and cinders. Mr. Burnett is quite mistaken, as I never called it "refuse," and do not consider it as such. If you will be kind enough to again refer to my letter, you will see that I stated that the "contents of the furnace on being emptied were found to consist of partially burnt and still blazing coal and cinders, and a considerable quantity of pure coke." You will pardon me when I say that I do not consider partially burnt and still blazing coal and coke "refuse," as it was taken from inside the furnace (above the bars) not underneath, and certainly decline to have it called "dirt," as stated in Mr. Webster's report, and weighed as such.

In fourth paragraph of Locomotive Engineer's reports, he repeats the word "unfairness," and puts it as a quotation from me. The word does not occur in my letter of March 4th at all. I certainly pointed out the discrepancy between reports of Jones, of the Western, and Graham, of the Southern Line; and as this is an important matter both to myself and I may say to the country, as mine is the only good coal on Southern Line, I should wish you to refer to those reports to satisfy yourself, that though the same coal was tried by each party, yet the reports are very different. The reports referred to are contained in your letter to me of January 14th. I may add that I do not attach any blame to Mr. Burnett in the matter of last trial, further than leaving it to subordinate officers, if that responsibility rests with him, and I am sorry he should feel aggrieved at my communication to you of March 4th, as from the tenor of his report he evidently is, and I quite understand that in your position as Commissioner for Railways you are anxious, and see the importance of getting good coal on the Southern Line, and am convinced you will see that the coal is thoroughly and properly tested.

I have now the honor to inform you that I shall in all probability have a truck-load of coal ready for trial latter end of this month, and shall feel obliged by your informing me whether you will appoint a Should you wish to appoint a person to see it hoisted out of scientific gentleman to supervise such trial. the mine, I will inform you of the day we shall be ready.

I have, &c.,
J. J. ATKINSON. I do not consider that the report of the Locomotive Engineer is open to the objection taken by Mr. Atkinson; the last paragraph (No. 7) should have been accepted by Mr. Atkinson as indicating a desire on the part of Mr. Burnett to meet in every way his views and wishes.

I shall be obliged to the Locomotive Engineer if he will place me in a position to reply early to the

last paragraph of Mr. Atkinson's letter now forwarded to him.—B.C., 19/5/79, C.A.G.

Mr. J. J. Atkinson to The Commissioner for Railways.

Sir.

I have the honor to inform you that we will be hoisting coal on Tuesday next, 27th instant, from the Berrima Coal-mine, for the purpose of supplying you with some for trial. As this coal, should it meet with the approval of the Department, is intended for supply of Southern Railway, I wish to stipulate that the first trial should take place from Nattai or Moss Vale towards the south, and that I, or somebody whom I may appoint should see the fire lighted and view test, in addition to the gentleman appointed by the Government. I should therefore feel obliged by your making the necessary arrangements for the trial of the coal, which will be at Moss Vale end of next week (weather permitting), and furnishing me or my agent with a free pass to view such trial.

From the report of Inspector of Locomotives I gather that my coal is held to be no better, or rather inferior, to Bowenfels, and as I find that Bowenfels is never used without a certain proportion of Newcastle coal being mixed with it, I wish the trial to take place under the conditions that accompany the use of that coal. I should also feel obliged by your directing that the furnace bars be placed further apart, in fact that the furnace should be arranged the same as for the Bulli or Mount Keira coal. In the event of the trial

being satisfactory, it will be easy to test the coal by itself afterwards.

I have, &c., J. J. ATKINSON. 21/5/79.

Inform to-day that I have forwarded his letter to the Locomotive Engineer, who will make the requisite arrangements for testing the coal. Enclose the pass, available from the 27th instant to 5th June, within which dates the tests will no doubt be made. If further passes are required I shall be glad to furnish them.—C.A.G., 23/5/79.

Then forward to Mr. Burnett, who will kindly place himself in communication with Mr. Atkinson

on the subject of his letter, B.C., 23/5/79.—C.A.G.

The Commissioner for Railways to Mr. J. J. Atkinson.

Department of Public Works, Railway Branch, Sydney, 23 May, 1879. Sir.

In reply to your letter of the 21st instant, with reference to the testing of your coal from the Berrima Coal-mine, I have the honor to inform you that I have forwarded your letter to the Locomotive Engineer, who will make the requisite arrangements for testing the coal.

I enclose herein a free pass available from the 27th instant to the 5th June, within which dates the

tests will no doubt be made, but should further passes be required, I shall be glad to furnish them.

I have, &c., CHAS. A. GOODCHAP, Commissioner for Railways.

The Locomotive Engineer to Mr. J. J. Atkinson.

Department of Public Works, Railway Branch, Locomotive Engineer's Office,

Sir. Sydney, 27 May, 1879.

Your letter of the 21st instant, to the Commissioner, reached me yesterday, and I now write to say that I am making arrangements to give your coal a further trial. I shall in the meantime be glad to learn from you what width apart you would like the bars to be.

These bars, from the way the grate is constructed, cannot be moved closer or put further apart at pleasure, but the bars which support them must be specially drilled and fitted with pegs at the required

distance apart.

Our fire-bars are made of W.I., 3 inches deep and 1 inch wide; the pegs are placed 2 inches apart, c. to c., which gives a clear space between the bars of 1 inch. How much do you require?

I observed that you are under the impression that the Bowenfels coal is used mixed with Newcastle. This is an entire mistake, and under these circumstances it would be, I think, only a loss of time to make trial of your coal under the conditions you propose, but I shall have much pleasure in directing that the

fresh trial shall be made on the easier portions of the line towards the south, as you suggest.

It will take some days, after I have your reply about the bars, to prepare the engine and to make final arrangements for the trial, but I will advise you when we are ready to begin, so that you or your

representative can be present at the lighting up, &c.

If you should happen to be in town in the meantime, and would favour me with a call, it would enable the matter to be talked over, and thus any little matters of detail that might tend to facilitate the carrying out of the trial to your satisfaction could be arranged.

> I have, &c., ROB. H. BURNETT, Locomotive Engineer.

Mr. J. J. Atkinson to The Commissioner for Railways.

Moss Vale, 10 June, 1879. I have the honor to inform you that owing to the excessive wet weather (the road being almost impassable) the carter has been unable as yet to get the coal for trial over to Moss Vale, but promises to do

so before end of week. I shall be in town on Friday, and should feel obliged if you would make it convenient to see me. I will be at your office at 10 a.m.. Herewith I beg to return the pass.

I have, &c., J. J. ATKINSON:

I have issued another pass for Mr. Atkinson. He is very anxious that the next trial of his coal should be made under the most competent authority, and I assured him that he might rely upon the desire of the Department to give the coal a fair trial.—C.A.G., 18/6/79.

Memorandum to the Commissioner.

Sydney, 12 July, 1879.

On the 20th ultimo I instructed Mr. Inspector Cobb to make a trial of Mr. Atkinson's coal. I attach a copy of Mr. Cobb's report, dated 4th July, 1879, for your information.

R. H. B.

Memo from Mr. J. Cobb to The Locomotive Overseer.

Sir,
Sydney, 4 July, 1879.
In accordance with your instructions I proceeded to Mittagong on Tuesday, 1st July, and weighed 42 cwt. of Mr. Atkinson's coal on to engine No. 19, driver John Graham; I saw that the fire-boxes and tubes were clear, and on Wednesday left there at 10 15 a.m. with the ordinary pick-up goods train for Goulburn, having a full load of twenty-four loaded waggons and brake-van, arriving there with thirty-six trucks to time as per sheet attached. Mr. Atkinson and Mr. Westcott (chief engineer at Botany Waterworks) both rode on the engine. On arrival at Jordan's Siding the ashes had to be cleaned on the fire-box and smoke-box, and also at Marulan, no delay being caused, there being plenty of time allowed on the time-table with this train. The consumption of coal was rather more than the average, $37\frac{1}{2}$ ewt. against 30 cwt. of Bowenfels. There were 5 cwt. 0 qrs. 5 lbs. of ash in the fire-box, and 2 qrs. 25 lbs. in the smoke-box on arrival at Goulburn, and I estimate that about half that quantity was taken out at Jordan's Siding and Marulan. This coal steamed very well until too much ash formed, which in my opinion renders it unfit for our use. The trial should have been made, and if any further is asked for I would suggest that it be tried, in one of the goods engines working the ordinary goods trains between Picton and Goulburn, and not between Mittagong and Goulburn.

JOHN COBB.

Loco. Engineer.—W. Scott, 5/7/79.

Send copy to Mr. Atkinson at once.—Chas. A. G., 14/2/79.

The Commissioner for Railways to Mr. J. J. O. Atkinson

Department of Public Works, Railway Branch, Sydney, 15 July, 1879. In compliance with the promise made to you, I have the honor to forward herewith copy of a report received from the Locomotive Engineer on your coal tested for locomotive purposes.

I have, &c.,

CHAS.

Commissioner for Railways.

No. 6.

Mr. H. W. Jackson to The Commissioner for Railways.

320, George-street, Sydney, 17 December, 1878. With reference to the conversation held between you and Mr. E. A. Baker, on Saturday, 14th Sir. instant, in the matter of the Nattai Coal-mining Company (Limited), I have the honor to request that you will cause to be tested, on the Government Railways, coal taken from the seam at Mittagong now being worked by that Company.

I have, &c., H. WILLIAM JACKSON,

Sec. pro tem.

Acknowledge, and inform that request will be complied with if Company will arrange for delivery of some 15 or 20 tons, say at Mittagong Station.—D.V., 20/12/78.

The Commissioner for Railways to Mr. H. W. Jackson.

Department of Public Works, Railway Branch, Sydney, 23 December, 1878. In reply to your letter of the 17th instant, applying to have some of the coal obtained from To be delivered the Nattai Coal-mining Company's seam at Mittagong tested on the railway locomotives, I have the honor Railway Station to inform you that 15 to 20 tons will suffice for the purpose, and an officer has been detailed from the Locomotive Engineer's Staff to see that the coal is taken from the mine, the depth taken from, and to attend to all matters connected with the test.

GEO. BERNER,

Pro Commissioner for Railways.

Mr.

Mr. W. Marshall to The Locomotive Engineer.

Sir, Nattai Coal Company (Limited), 320, George-street, 15 January, 1879. In reply to your letter of the 30th December, I am instructed to inform you that we are now ready to produce the coal for testing, and merely await your convenience.

Please to let me know two days before you send an officer to inspect the getting of the coal.

Yours truly

W. MARSHALL,

Secretary.

Dear Sir

Thursday.

The Nattai Coal-mining Company has applied to you to test some of their coal on the railway, and you have agreed to do so and to send up an officer to see the coal taken from the mine.

I am going up to Mittagong to-morrow, Friday night, to make arrangements, being personally

interested in this Company.

Can you inform me when it will be convenient for the officer to be at Mittagong, so that I may prepare our Manager. We are ready at any time. Could the officer be at Mittagong say on Monday? Yours truly,

The Locomotive Engineer will please arrange that a competent person to test this coal is at Mittagong on Monday the 20th instant.—Chas. A. G., 16/1/79.

Memorandum to Mr. Scott.

Government Railways, Locomotive Engineer's Branch, Redfern Station, 17 January, 1879. Please send a competent officer to Mittagong to be present at the testing of coal belonging to the "Nattai Coal-mining Company, Limited," on Monday next the 20th instant. He will take note of the place from which the coal is taken, &c., and report fully the result of the trial.

R. H. B.,

Locomotive Engineer.

Mr. Webster to carry out.—J.C., 18/1/79.

Dear Sir 28 January, 1879.

You said there would be no objection to Nattai Coal-mining Company being represented at the trial of the coal which is about to take place, I believe, this week. We wish Mr. Self to be at one at least of the trials, and we should like one of our shareholders, a Mr. Ruane, to be present. Will you be kind Yours truly, E. A. BAKER. enough to make an order or send me passes?

Approved.—Chas. A. G., 28/1/79. Inform, and say Locomotive Engineer has been instructed.

The Commissioner for Railways to E. A. Baker, Esq., M.P.

Department of Public Works, Railway Branch, Sydney, 28 January, 1879 Sir. In acknowledging the receipt of your letter of this day's date, requesting that Messrs. J. Self and Ruane may be allowed to be present at the testing of the Nattai Coal Company's coal, I have the honor to inform you that your request is complied with, and the Locomotive Engineer has been instructed to make arrangements accordingly. I have, &c..

CHAS. A. GOODCHAP,

Commissioner for Railways.

Locomotive Engineer.—B.C., 28/1/79, Chas. A. G. The Commissioner.—W.S., 3/9/81.

Memorandum to Locomotive Overseer.

Picton Locomotive Station, 22 January, 1879. I beg to report I went to Mittagong, as directed, on Monday the 20th, and saw the Manager of the mine, but could do nothing on account of the wet weather, but will commence to-morrow. As this will take me more than a week, I will leave driver John Palmer in charge at Picton during my absence.

WILLIAM WEBSTER.

Approved.—W. Scott, 23/1/79. Report herewith.—10/2/79. Locomotive Engineer.

Mr. W. Webster to The Locomotive Overseer.

Picton, 8 February, 1879. I beg to report that according to your instructions I have visited the mine of the Nattai Coalmining Company; have seen some coal taken therefrom and tested. The coal is taken from a drive about 70 yards into the side of a ridge, about 150 feet from the bottom and 200 feet from the top. The seam from which it was taken is about 7 feet thick, but has a large number of small bands running through it, trom which it was taken is about 7 feet thick, but has a large number of small bands running through it, which cannot be taken out; consequently the coal is very dirty. The sample sent for trial was tested in a goods engine, with a full train, between Picton and Mittagong, on the 7th. I find the consumption was very heavy, having burnt 40 cwt. 1 qr. 5 lbs. in the 48 miles, with only a very light train on the up journey. 37 cwt. were burnt on the down journey, which is 7 cwt. more than the average. We had also great difficulty in getting steam after the first 10 miles, as the fire got dirty, and had to be pricked up four times, and once cleaned from the top, as the ash had caked and the draught was stopped. We were 1 hour and 25 minutes longer than usual on the down journey.

There were 5 cwt. 3 qrs. 2 lbs. of ash in the fire-box when the trial was over, but that is only a portion of what was made, as the ash-pan had to be raked out four times on the journeys. This coal makes far too much ash to be of any service for locomotive purposes.

makes far too much ash to be of any service for locomotive purposes.

WILLIAM WEBSTER.

No. 7.

Minute of Secretary for Public Works.

APPLICATION has been made to me, verbally, by some residents of Mittagong, to allow them to have a sample of coal tried. Would the Commissioner give instructions that this be done. Mittagong Station, and Mr. Wallace is the name of the person interested.—J.L., 11/11/79. Commissioner for Railways.

Mr. Scott, in Mr. Burnett's absence, will please direct this to be done at once.—Ch. A.G., 11/11/79. Mr. Scott.—C.A.N., 11/11/79. Mr. Webster to arrange to have this coal tested in the usual way in a goods engine with train, between Picton and Goulburn. Allow Mr. Wallace or his representative to travel on the engine when the coal is being tested.—J.C., 15/11/79. Report attached.

Mr. W. Webster to The Locomotive Overseer.

Sir. Picton, 18 November, 1879. I beg to report I have to-day tested the sample of coal sent for trial by Mr. Wallace, of Mittagong, in goods engine No. 48 with a full train of goods, and find it to be an inferior sample of coal, there being considerable difficulty in getting steam, through there being so much dirt in the coal, and there was considerable dimedity in getting steam, through there being so much dirt in the coal, and there was considerably more of this coal used on the trip than is ordinarily used of the Lithgow Valley coal (about one-third more). There were $44\frac{1}{2}$ cwt. used on the journey from Picton to Mittagong and back, a distance of 48 miles, without shunting.* I am unable to say what ash was made, as it was necessary to rake out the ashes at four different places on the down journey, and there was then a very large quantity in the fire-box on arrival at Mittagong; we were also 55 minutes beyond our time going from Picton to Mittagong although there is ample time allowed on the time-table for this train. I therefore think this coal is not well suited for locomotive purposes.

WILLIAM WEBSTER.

Comr.—W. Scott, 21/11/79. Seen.—J.L., 5/12/79. * About 104 lbs. per mile.

No. 8.

J. de V. Lamb, Esq., to The Commissioner for Railways.

The Australian Kerosene Oil and Mineral Company (Limited).

Sydney, 9-February, 1880. I have requested the Manager of the Australian Kerosene Oil and Mineral Company (Limited), at Joadja, to forward 4 tons of coal to Mittagong for trial on the Government locomotives.

Will you kindly give the necessary instructions to have it tested?

Yours faithfully, J. DE V. LAMB.

I approve of this coal being tested. If suitable coal be discovered at Mittagong, a great saving in fuel for Southern locomotives would be effected. Mr. Burnett, B.C., 10/2/80.—CH. A.G. result of the test of this coal warrants a more extended trial, provided only that the coal be better screened, to lessen if possible the large amount of dirt which the trial test produced.—R.H.B., 1/4/80. Mr. Lamb.—CH. A.G., 3/4/80.

The Commissioner for Railways to J. de V. Lamb, Esq.

Department of Public Works, Railway Branch, Sydney, 7 April, 1880. In reply to your letter of the 9th February last, relative to the Australian Kerosene Oil and Mineral Company's coal which you wished tested, I have the honor to inform you that the Locomotive Engineer reports that the sample supplied warrants a more extended test of the coal, but that it must be

better screened, to lessen, if possible, the large quantity of dirt which the trial test produced.

2. I have therefore to request that you will be good enough to direct the Manager to have a further

and thoroughly screened sample supplied for the purpose of a further test.

I have, &c. CHAS. A. GOODCHAP,

Commissioner for Railways.

I should like to see the detailed report.—Chas. A.G. Locomotive Engineer.—G.B., B.C., 8/4/80. Report now attached.—W. Scott, pro Loco. Engineer, 10/4/80.

Mr. W. Webster to The Locomotive Overseer.

Sir, Picton, 24 March, 1880. I beg to report I have made two trials of the coal sent for that purpose by the Australian

I beg to report I have made two trials of the coal sent for that purpose by the Australian Kerosene Oil and Mineral Company, with goods engine No. 20 with goods train from Picton to Goulburn. The first on the 16th March, when Mr. Fell the Company's Manager was present, with a full load of heavily loaded waggons, the average weight of train for the whole distance being 180 tons; on this occasion the boiler was rather dirty, causing the engine to "prime" and waste the water, and from this cause the water ran short, and the engine had to run from Mittagong to Wingecarribee for water, which put the train out of its running time, causing 12 miles extra running, and a detention of two hours on the road; I thought it best therefore to have another trial, which I did on the 22nd March.

This coal as at present supplied is a very fair steaming coal, but very small, having a slight percentage of small kerosene shale, which improves its steaming qualities, but it has a large proportion of dust which increases the consumption, as a large quantity goes through the tubes partially burnt, filling the smoke-box.

smoke-box.

On the first trip 58 cwt. of the coal were consumed in running 93 miles, including 12 miles for water, which gives a consumption of 70 lbs. per mile, or very nearly 4 lbs. per ton per mile. Than an ordinary quantity of shunting by this train both at Mittagong and Moss Vale. There was also more

On the second trip, after having made a little alteration in the fire-bars to prevent so much of the small falling through, with a clean boiler and no more than an ordinary amount of shunting, there were 42 cwt. used in the 81 miles, with an average weight of train of 155 tons, which gives a consumption of 58 lbs. per mile or a fraction less per ton per mile.

On the first trip it was necessary to empty the ash-pan twice, and the smoke-box once on the journey, and on arrival at Goulburn there were 560 lbs. of ash in the fire-box and smoke-box together. On the second trip neither ash-pan nor smoke-box were touched on the journey, and on arriving at Goulburn 738 lbs. of ash were in ash-pan and smoke-box, which is not more than is made by the coal ordinarily in use.

I think if the dust were taken out of this coal, by screening, it could be used very well in goods

engines, and the consumption would not be excessive.

WILLIAM WEBSTER.

Loco. Engineer.—W. Scott, 25/3/80.

No. 9.

Mr. J. W. Fell to The Commissioner for Railways.

Sir, Australian Kerosene Oil and Mineral Co., Limited, Sydney, 17 April, 1880. I have to acknowledge the receipt of your favour of the 7th instant, respecting the result of trial of our coal.

I submitted your offer of 10s. per ton for 100 tons, for a further practical trial, to my directors, who

. have agreed to accept the same.

I will commence delivering the end of next week.

Yours truly, J. W. FELL, General Manager.

The coal may be accepted and tried.—Ch. A. G., 19/4/80. Storekeeper a Engineer.—B.C., G.B., 19/4/80. W. Scott.—C. A. Neale, p. Loco. Engineer, 22/4/80. ordered.—A.R., 22/4/80. The Loco. Engineer. Storekeeper and Locomotive Noted and

Memorandum to Mr. Webster.

Government Railways, Locomotive Engineer's Branch, Sydney, 22 April, 1880. Please arrange to have the Kerosene Company's coal tested in all trains; 50 tons to be sent to Mr. Proctor for the same purpose.

The Company will of course have to deliver the coal into our trucks.

W. SCOTT.

Note and send to Mr. Proctor. Noted.—W. Webster, 23/4/80. Noted.—J.P., 24/4/80. Has this coal been delivered yet?—J.C. Mr. Webster.—4/5/80. This coal has not yet been delivered. I saw Mr. Fell on the 30th last month; he said it would not be in before next week.—W. Webster, 4/5/80.

Bill for coal.

The Commissioner for Railways

Sydney, 30 April, 1880.

Bought of the Australian Kerosene Oil and Mineral Company. April 22, 1880. To 100 tons coal, at 10s. Delivered at Mittagong.

Storekeeper.—G.B., B.C., 6/5/80. This coal is not included in Mr. Proctor's return for April.— A.R., 10/5/80. Mr. Scott.

Memo. to Locomotive Overseer.

Picton, 8 May, 1880. I beg to report that one truck of coal has arrived from the Kerosene Company's Joadja Creek Mine, but it is too small to be of any use, unless it is screened, when there would not be more than onefourth of the quantity left. I have written to the Manager to send no more until further advised unless of a better quality, as it is impossible to use it. W. WEBSTER. Storekeeper to see.—W. Scott, 10/5/80.

It will be seen that the account has been sent in prior to delivery. I would suggest that the Manager of the Company now be written to in the matter, as the coal does not seem likely to suit unless improved upon.—A. R.

Inform unless better screened coal is supplied it cannot be taken.—Chas. A. G., 17/5/80.

The Commissioner for Railways to Mr. J. W. Fell.

Sir. Department of Public Works, Railway Branch, Sydney, 20 May, 1880. Representations having been made to me that the first truck-load of coal supplied on account of the order recently given your Company for the supply of 100 tons from the Joadja Creek Mine is too small to be of any use for locomotive purposes, I have the honor to inform you that no further supplies can be accepted by the Department unless the coal is better screened.

I have, &c., CHAS. A. GOODCHAP,

Commissioner for Railways

Mr. W. Webster to The Locomotive Overseer.

Picton, 1 June, 1880.

I beg to report I have received five trucks (about 25 tons) of coal from the Kerosene Oil and Mineral Company, Joadja Creek. I find it is much smaller than that sent for trial on a former occasion, and although it is a free burning and very good steaming coal, if it were larger, it is far too small to be serviceable for locomotive purposes, as it is impossible to keep a good fire with it by itself; mixed with Bowenfels coal at a proportion of about one-third it may be used, but even then a large quantity will go through the tubes unburnt. The coal in the last two trucks was thoroughly saturated with water when it arrived, which was not the case with the first two trucks, and from the quantity of water which the dust will absorb the coal is thus made to weigh much heavier, the second two trucks weighing 2 tons more than the first two with apparently no more coal.

I have tried this coal between Picton and Mittagong in four goods engines, Nos. 43, 52, 56, and 59; they have all experienced great difficulty in keeping a fire with it, through its being so small, and have been

compelled to use Bowenfels coal with it.

I have not tried it in passenger engines, as I do not think it suitable and would certainly cause delay. I would recommend that the remainder of the hundred tons ordered be used mixed with Bowenfels coal, and that no more be ordered unless it can be sent with the small taken out by screening. WILLIAM WEBSTER.

Mr. W. Webster to The Locomotive Engineer.

Sir, Picton, 2 June, 1880. In my report on the coal from the Kerosene Oil and Mineral Company's Mine, Joadja Creek, In my report on the coal from the Kerosene On and Filmer Company of Trino, coalgo I omitted to state that this coal could be used to advantage for pumping-engines and for drying sand on the Southern Line, which would take about 50 tons per month, which would be a saving in haulage.

W. WEBSTER.

Locomotive Engineer.—W. Scott, 3/6/80. For the information of the Commissioner.—R.H.B., 23/6/80. Send copy of this to Manager of Company.—CH. A. G., 26/6/80.

The Commissioner for Railways to J. W. Fell, Esq.

Department of Public Works, Railway Branch, Sydney, 28 June, 1880. In adverting to my letter to you of the 20th ultimo, intimating that unless the coal supplied on Sir. account of the order given your Company for a trial 100 tons was not better screened no further supplies could be accepted, I have the honor to inform you that complaint has again been made of the smallness of the coal supplied, and to state that unless an improvement takes place in the size, &c., of that supplied the acceptance of further supplies from your mine must cease.

I have, &c., CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. Fell has been informed that unless larger coal can be supplied no further quantity will be taken. If they have not supplied the 100 tons, and the supplies from this date continue to be unsatisfactory, the receipt of the coal should be stopped.—Ch.A.G., B.C., 28/6/80.

Locomotive Engineer. Noted.—R.H.B., 1/7/80. Storekeeper, B.C., 5/7/80.—G.B.

Is the coal which has been received and made use of, and which is reported to be inferior, to be paid for at 10s. per ton, the price at which the 100 tons were ordered by the Commissioner's directions ?—A.R., Secretary

Yes, I think it should be paid for. It must have cost nearly 10s. to deliver, and I wished this coal tried more in the interests of the Department than in those of the vendors or proprietors.—Ch.A.G. 8/7/80. Storekeeper, B.C., 9/7/80.—G.B. Noted.—A.R., 12/7/80.

J. W. Fell, Esq., to The Commissioner for Railways.

Australian Kerosene Oil and Mineral Co., Limited, Sydney, 9 July, 1880. In reply to your favour of the 28th ultimo, respecting coal supplied by this Company in execution of your order for a trial lot of 100 tons, that the smallness was considered an insuperable objection, I beg to state we are now making such arrangements at the mine as will enable us to obviate to a large extent the breaking up of the coal. Until these are completed, will delay delivering the balance of

I would further point out that, so soon as we are in a position to deliver at the new siding, the breakage arising from loading into waggons will be obviated.

Yours truly, J. W. FELL, General Manager.

Storekeeper, B.C., 14/7/80. Noted.—A.R., 16/7/80. Secretary.

J. W. Fell, Esq., to The Commissioner for Railways.

Joadja Creek, 15 November, 1880. Referring to the trial you had with this Company's coal some three months since, when your Department approved of the quality but found they could not use it for locomotive purposes, owing to the large proportion of slack it contained, I now beg to inform you that we have completed our arrangements whereby we can deliver the coal screened and fairly round. I shall be glad therefore if you will give the necessary instructions for a further trial at your earliest convenience. I have every confidence that the quality of the coal we will now supply you with will meet with your approval. I have, &c.

W. FELL, General Manager, Australian Kerosene Oil and Mineral Co. I think a further trial should be given to this coal.—Ch.A.G., 22/11/80. If Mr. Burnett is unaware of any objection to this, perhaps he will be good enough to give effect to it.—Ch.A.G., 22/11/80. Write to Manager of Company to send coal for trial not exceeding 10 tons.—R.H.B., 24/11/80.

The Locomotive Engineer to James W. Fell, Esq.

Department of Public Works, Railway Branch,

Sir,

Locomotive Engineer's Office, Sydney, 24 November, 1880.

Referring to your letter of the 15th instant, requesting a further trial of your Company's coal, I have the honor to request that you will be good enough to deliver (say) a quantity not exceeding 10 tons at the Mittagong Station, when your request shall be complied with. I shall be glad to hear from you when you have delivered the coal.

I have, &c.,

RÓBT. H. BURNETT, Locomotive Engineer.

Memorandum to Locomotive Overseer.

Sir,

I saw Mr. Fell, the Manager of the Kerosene Oil and MineralCompany, Joadja Creek, who says the Commissioner for Railways has agreed to take some more of their coal. I have also received notice from Mittagong Station that there is a truck of this coal loaded at that station for Locomotive Department. Will you please say if I am to receive it.

WILLIAM WEBSTER.

Locomotive Engineer, 8/12/80. Received, 8/12/80. Please see copy of my 80/5974 herewith, to which no reply has yet been received. I shall be glad to have your report when the trial is completed.

Mr. W. Webster to The Locomotive Overseer.

Sir,

I beg to report I have tested the coal sent by the Kerosene Oil and Mineral Company for trial, in engine No. 50, running between Picton and Mittagong. This coal, although considerably larger than that previously sent by the same Company, is still far too small for use in locomotives; and as there is such a large quantity of it goes through the tubes without being burnt, the consumption is very large, and causes loss of time in emptying the smoke-box frequently. The consumption is about one-fifth greater than that of the coal in general use, 6 tons of it having been used in running three trips between Picton and Mittagong, a distance of 144 miles; the average quantity used by the same engine is 32 cwt. per trip. If this coal can be obtained at a sufficiently reduced price to compensate for the additional consumption, a quantity of it, say 25 tons per week, might be used for drying sand and for pumping engines, but it is not fit for use by itself for locomotive purposes.

WILLIAM WEBSTER.

I expected Mr. Webster in Sydney, and would have explained the necessity of such a quantity of coal being required for drying sand and for pumping engines. If for pumping engines it would only add to expense, as we have to pay a high rate for cartage to such places as Bargo and Yass, and I think would be more economical to have the best coal.—W. Scott, 30/12/80.

Where heavy extra expense is involved in cartage, it is always most economical to use only the best coal.—R.H.B., 10/2/81.

Mr. J. J. Madden to The Commissioner for Railways.

The Australian Kerosene Oil and Mineral Co., Limited, Sydney, 3rd February, 1881.

I shall be obliged if you will be so good as to report on the coal supplied to the Locomotive Department by this Company on the 3rd and 6th December last.

Yours truly,

JAS. J. MADDEN,

pro General Manager.

Locomotive Engineer.—5/2/81, D.V. It has not proved suitable for locomotive purposes.—R.H.B., 10/2/81. Inform.—Ch.A.G., 21/2/81.

The Commissioner for Railways to J. W. Fell, Esq.

Sir, Department of Public Works, Railway Branch, Sydney, 24 February, 1881.

In reply to your letter of the 3rd instant, asking that you may be furnished with a report on the coal supplied by your Company for trial in December last, I have the honor to inform you that the coal has been carefully tested, but the Locomotive Engineer reports that it is not suitable for locomotive purposes.

I have, &c.,

CHAS. A. GOODCHAP, Commissioner for Railways.

No. 10.

Messrs. Barber & Slocombe to The Commissioner for Railways.

Sir,

We are the proprietors of several mineral purchases in the parish of Murrimbah, upon which is now being opened what is believed to be a valuable coal-mine.

The mine is situated about four or five miles from the railway line, and the coal can be delivered at a point on the railway about 28 miles from Goulburn.

The coal is of good quality, and as we are anxious to have it tested for engine purposes, we beg to request that you will be good enough to allow us the opportunity of having a trial in one of the Government locomotives from this station.

We are, &c.,

J. B. BARBER.

J. B. BARBER. JOHN SLOCOMBE. Inform

Inform that I consider it next to useless to test this coal in the locomotives, unless the mine has been in some degree developed. If taken from the outcrop, the coal, if used on the engine, will have the effect of delaying the trains. I think it only right to have a report from the Examiner of Coal Fields, that there is a reasonable prospect of the mine proving a workable one.—CII. A. G., 4/10/80.

The Commissioner for Railways to Messrs. Barber and Slocombe.

Department of Public Works, Railway Branch, Sydney, 6 October, 1880.

In acknowledging the receipt of your letter of the 27th ultimo, stating that you are the proprietors of a coal-mine in the parish of Murrimbah, near Goulburn, and asking that authority may be given to have the coal tested for engine purposes, I have the honor to inform you that before authority can be given for the test to be made, I shall require to know further particulars respecting the mine in question, as I consider it next to useless to test the coal unless the mine has been in some degree developed, as taken from the outcrop, the coal, if used on the engines, will have the effect of delaying the trains.

It is necessary also that I should have a report from the Examiner of Coal Fields, to the effect that there is a reasonable prospect of the mine proving a workable one

I have, &c.

CHAS. A. GOODCHAP.

Commissioner for Railways.

Messrs. Barber and Slocombe to The Commissioner for Railways.

Sir, Goulburn, 19 October, 1880.

We are in receipt of your favour of 6th instant with thanks. In re prospect of our coal-mine, we beg to inform you we are following the seam in a tunnel driving direct into the high table-land. At present we are in 110 feet, coal looking well. We intend carrying the drive in 200 feet, which we consider will be a good test as to quality and quantity. When asking for permission to test the coal for engine purposes, we did not intend taking the sample for trial until we had completed the 200 feet of tunnel. We quite agree with you it would be useless attempting to fire an engine with the outcrop coal.

We are arranging for the Government Mineralogist to inspect and report on the mine. If convenient

for you to receive a bag of coal, we would be pleased to send you one for inspection.

We have proved the seam to extend 6 miles through the high land. Again thanking you for your We remain, &c.

BARBER & SLOCOMBE. Seen. Coal will be tested when the conditions I have named are fulfilled. I trust (in the interest of the Department) that this or some other coal seam in the Southern District may be proved to be workable, and the coal found suitable for locomotive purposes. Put by.—C.A.G., 27/10/80.

No. 11.

Mr. M. J. Moloney to The Commissioner for Railways. Trial of Joadja Creek coal in pumping engines.

Australian Kerosene Oil and Mineral Company (Limited),

Sir.

Joadja Creek, 31 March, 1881.

Mr. Webster, Locomotive Superintendent, Picton, reports that our coal is very satisfactory as regards quality, but cannot use it for locomotive purposes with the furnace bars set to burn Bowenfels coal, as there is too much slack.

I beg to suggest that you use the coal for all the pumping stations from Marulan southwards, for which purpose it is admirably suited. I remain, &c.

M. J. MOLONEY pro General Manager.

What quantity is consumed, and what saving would be effected by the use of this coal at 10s. a ton for the purpose stated? Will the Locomotive Engineer be good enough to ascertain.—CH. A. G., 6/4/81. Please see Mr. Scott's report below.—R.H.B., 26/4/81. Commissioner.

The thirteen pumping-engines on South line, Picton to Albury, consume on an average about 1 ton per week each—about 176 tons a year. By using Joadja Creek coal, freight on the whole of this would be saved (except in the case of that sent to Picton), viz., about 13/3 per ton. As a set-off against this is the higher price of the southern coal, viz., 2/9 per ton—the difference between 10/ and 7/3 per ton. The net saving would therefore be 10/6 per ton, or £355 on the total consumption. The above calculation, however is based on the assumption that each constitute of each kind of each would be required. het saving would therefore be 10/6 per ton, or £355 on the total consumption. The above calculation, however, is based on the assumption that equal quantities of each kind of coal would be required; but as a matter of fact the southern coal being small, its consumption would be greater; and which fact would also involve greater cost of freight, and also cartage, in those cases where the pumping-engine is not near the line, viz., Yass and Bargo, for which 4/ per ton is paid. The saving therefore from the use of this coal will not be great. There would be no objection to giving this coal a fair trial, for say six months in the pump-engines on South lines; after which a report could be furnished.—W. Scott, 25/4/81. Locometica Engineer. motive Engineer.

The trial suggested by Mr. Scott may be made.—Chas. A. G., 27/4/81. Inform and return to Locomotive Engineer.—Chas. A. G.

The Commissioner for Railways to Mr. M. J. Moloney.

Sir,

Department of Public Works, Railway Branch, Sydney, 28 April, 1881.

With reference to your letter of the 31st ultimo, suggesting that the coal supplied by your Company should be used for all the pumping stations from Marulan southwards, I have the honor to inform you that it has been decided to give this coal a trial for six months for use in the pumping-engines named, and the Locomotive Engineer has been instructed to make the necessary arrangements, and to whom I have to refer you for further particulars. I have, &c.,

CHAS. A. GOODCHAP, Commissioner for Railways.

Memorandum

· Memorandum to the Storekeeper.

I have to inform you that it has been decided to use, on trial for six months, the coal supplied by the Australian Kerosene Oil Company for the pumping-engines on the Southern Line between Picton and Albury. G.B.

B.C., 29/4/81.

Locomotive Engineer also informed, with the papers.—G.B. Noted. Has any arrangement nade as to price?—A.R., 3/5/81. Secretary.

The papers are with Locomotive Engineer; please been made as to price !—A.R., 3/5/81. Secretary. inspect them.—G.B., B.C., 5/5/81. inspect them.—G.B., B.C., 5/5/81. Storekeeper,—Will Mr. Burnett kindly lend them to me for this purpose; I will return them without delay.—A.R. The Locomotive Engineer, 7/5/81. Herewith; please return early.—C. A. Neale, pro Locomotive Engineer, 7/5/81. Herewith; please return early.—C. A. Neale, pro Locomotive Engineer, 10/5/81. Storekeeper. I presume orders for this coal, as required, will be sent through this branch in the usual way.—A.R., 11/5/81. Mr. Scott. Yes.—p. W. Scott, J.D.M., 12/5/81. Storekeeper. Papers returned to the Locomotive Engineer.—A.R., 12/5/81.

Memorandum to Mr. Scott.

Government Railways, Locomotive Engineer's Office, Sydney, 5 May, 1881. Referring to your minute of 25/4/81, re using Joadja Creek coal for pump-engines on Southern Line, please note that your suggestion is approved. The owners have been advised.

C. A. NEALE,

pro Locomotive Engineer.

Mr. Webster to note.—J.C., 6/5/81. Not Proctor, and Mr. Park to note.—W. Scott, 9/5/81. Noted,—W. Webster, 6/5/81. Mr. Webster, Mr. Noted.—W. WEBSTER, 10/5/81. Noted.—J. Noted.—H. H. PARK, 19/5/81. PROCTOR, 16/5/81.

Reports as to the quality of the Joadja Creek Coal.

I beg to report that, on comparing the amount of Joadja coal used at the pumping-engines in this district with the amount of Bowenfels coal used to do the same amount of work, I find that there is no appreciable difference in the quantities. H. H. PARK.

Sir,

I beg to report that after six months' trial I find the Joadja Creek coal very nearly, if not quite equal, to the Lithgow Valley coal, although it is very small and requires more careful attention; its steaming properties are very nearly as good, and the consumption is about the same.

W. WEBSTER.

Mr. J. Close to The Locomotive Overseer.

Sir,

In re the use of Joadja coal for pumping-engines, I have to report that I have made a number of experiments with Joadja coal as against Bowenfels. My experience is that with careful firing, Joadja coal is slightly superior to Bowenfels; with careless firing the difference would probably be the other way. The conclusion I have come to is that weight for weight Joadja coal is fully equal to Bowenfels for pumping opening.

pumping-engines.

From the three reports from Inspectors attached, it will be seen that after a six months' trial the Joadja Creek coal has been found to answer well for pumping-engines, and I would recommend that its use be continued for south lines.—John Cobb. Recommended for approval.—W. Scott.

use be continued for south lines.—John Cobb. Recommended for approval.—W. Scott.

Approved for the present; it may be that other coal will compete with it; what do we pay for it?—Ch.A.G., 23/11/81. Loco. Engr.

Seen. 10s. per ton was paid for the coal delivered. I presume we pay the same price now.—W. Scott, Acting Locomot ve Engineer, 5/12/81. Yes; I suppose it cannot be got cheaper.—Chas. A. G., 7/12/81.

No. 12.

Mr. S. R. Baker to The Commissioner for Railways.

Sir. Erith Coal-mine, Jordan's Crossing, 29 August, 1881. I beg to inform you that I have recently opened a coal-mine at a place distant a mile from the new siding, which you caused to be constructed, at my request, a little beyond the Bundanoon platform on the Southern Railway. The coal from my mine has been sent to Goulburn and tried by competent engineers and others, and is pronounced to be of superior quality. One certificate supplied to me states

that 20 cwt. of my coal is equal to 25 cwt. of the best Lithgow.

I am aware that the Government are necessarily at present paying a great price for the coal they use on the Southern Railway, and, should the coal from my mine be suitable for railway purposes, I could, even with my present appliances, supply coal to the Government at a considerably less price than they now

pay for what they use, and thus a considerable money saving would be effected.

Perhaps it would be well before quoting price, to have the coal properly tried by the Government,

and, should it be found suitable, then for me to make a proposal as to quantity, price, &c., &c.

Will you be good enough to inform me if you will have a trial made, and what quantity of coal I should supply, and in what way, &c.

I am, &c., S. R. BAKER.

Inform that if he will send 10 tons free of cost to the nearest station, it will be tested in the locomotives.--C. A. G., 8/9/81.

The

The Commissioner for Railways to Mr. S. R. Baker.

Department of Public Works, Railway Branch, Sydney, 12 September, 1881. Sir, In acknowledging the receipt of your letter of the 29th ultimo, I have the honor to inform you that if you will send 10 tons of your coal free of cost to the nearest station, it will be tested in the locomotives, and the result communicated to you. I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Mr. Scott, B.C., 13/9/81. Mr. Cobb will be good enough to make the necessary arrangements for testing Mr. Baker's coal on an early date, and report to me the result of the test.—W. Scorr, 14/9/81.

Mr. Webster to carry out.—J.C., 15/9/81. Report attached Acting Locomotive Engineer.—Pro. J.C., W.D.M., 12/10/81. Report attached.—W. Webster, 10/10/81.
D.M., 12/10/81. Inspector Webster's report here--W.S. 12/10/81. Commissioner. See subsequent offer to supply 100 tons a week, at 13s. per ton.—C.A.G., 17/10/81.

Mr. W. Webster to The Locomotive Overseer.

Picton, 10 October. I beg to report I have made two trials of the sample of coal sent from the "Erith Mine" for that purpose, in goods engine No. 20 on the 6th instant from Picton to Goulburn, with a special goods train composed, on leaving Picton, of eleven waggons loaded with coal and one goods brake-van, eight waggons loaded with coal were attached at Mittagong, and two waggons loaded with sand were attached at Marulan, making a full load for that class of engines for the whole distance.

The second trial was made in goods engine No. 57 on the 8th, with an ordinary goods train from Picton to Mittagong and head

Picton to Mittagong and back.

This coal is a very fair steaming coal, no difficulty being experienced in getting steam, or in keeping time with the trains with which the coal was tried, but the consumption of the coal is large, and it leaves

a large amount of ash.

On the first trial 54 cwt. of coal were consumed between Picton and Goulburn, a distance of 81 miles, being 746 lbs. per mile, the average consumption being about 65 lbs., but the train was heavier than the average. I cannot say what was the exact amount of ash, as the fire had to be cleaned at Mitta-

gong; there were 460 lbs. on arrival at Goulburn and about the same quantity was taken out at Mittagong.

On the second trial 40 cwt. of coal were used from Picton to Mittagong and back, a distance of 48 miles, being equal to 93 lbs. per mile, the average consumption being about 83 lbs. per mile. 400 lbs. of ash was taken out at Mittagong and the same quantity at Picton, when the fire was dropped, making 800 lbs. of ash to 40 cwt. or 4,480 lbs. of coal.

This coal is not so suitable for railway purposes as the coal at present in use, first on account of the additional consumption, and next on account of the extra amount of ash, rendering it necessary that the fire should be cleaned more frequently.

The following will show the results of the trial as compared with coal at present in use:-

•	Miles traversed.	Total coal consumed in cwts.	lbs. per mile.	Quantity of ash in lbs.
With Engine No. 20, using—Coal from Erith Mine	81	. 54	74.6	900
Coal from Lithgow Valley	81	47	65	700
With Engine No. 57, using—Coal from Erith Mine	448	40	93	800
