- Wells. On Coultra a well was sunk to a depth of 320 feet, and it gave a small supply of very indifferent water. Do you know the strata they passed through? No; but it was pretty hard sinking, I believe. You may get the information from Mr. J. S. Armstrong, Burta Station, Silverton. He is the lessee of the run.  
 Are there any tanks in that district? The runs are principally watered by tanks.
- Tanks. What is the average capacity of the tanks? They vary from 2,000 or 3,000 yards up to 22,000 yards. As a rule, embankments are put round them, and the water is pumped up to the level of the top of the embankment. I should say the tanks average 10,000 yards, with a depth of from 12 to 16 feet.  
 What is the character of the ground;—is it retentive soil? They are generally placed in clay-pans and cane-grass flats. It is very retentive soil and quick catchment.
- Silt. Does it silt much? There is a good deal of stuff precipitated from the water by the action of copai (sulphate of lime) after the water gets into the tanks. The silt is not actually washed in, because they have silt-tanks to guard against that. But they cannot guard against the precipitation of the water which goes in in a muddy form. The water is, as a rule, very good. On most of the runs they have wells, and they reserve their well paddocks and wells for the excessively dry times, so that when they are pinched in their tank paddocks they fall back on the well paddocks.  
 What is the average depth of the wells? From 90 to 240 feet.  
 Does the water rise in them? Sometimes 20 or 30 feet.  
 What is the average supply? It is from say 12,000 gallons per day to practically an unlimited supply. It is a strange thing that in almost every case in this district where there is a very large supply the water is seldom so good as where there is a moderate supply. A supply of fresh water is rarely over 15,000 gallons.
- Salt and fresh wells. Is there any apparent difference in the natural features of the country where you find the salt water and where you find the fresh water in sinking wells? To a certain extent there is. As a rule, as far as my experience goes, you can always trace the fresh-water wells to soakage, either soakage from the immediate neighbourhood or from some creek that has run into the soil at a moderate distance. Where it becomes like an artesian supply it appears to be more saline.  
 To what extent on the left-hand bank of the Darling can you give us any information? I know the whole of the left bank moderately well from Bourke to south of Tolarno.
- Sandy Creek. Where does Sandy Creek rise? The highest part I have been on is between Condobolin and Cobar, near Moothumbel.  
 What is the character of that country? It is box-forest country, and scrub, and yarran forest. The creek there has a sandy bed, and it runs from there a distance of 200 or 300 miles to Baden Park.  
 Has it a distinct watershed of its own the whole distance? Wherever I have seen it it has. I think it is a distinct valley.  
 Have you seen any exposed rocks along its bed? Yes.  
 What is the character of the rocks? A kind of light sandstone, coarse-grained. It seems to be a kind of aqueous rock, and in many instances is water-worn as if by the action of a sea beating against its cliffs, undermining it, and making caves.  
 Is it of any thickness? I have never seen it tested. It is flag sandstone. On Mount Manarah, Fulham, and Tiltagara there are immense masses of sandstone and conglomerate fully 100 feet thick. There are immense crags of rock of two distinct kinds. There is the conglomerate and the sandstone. You get a mass of conglomerate, and then a mass of sandstone abutting on to it.  
 Are there any dams on Sandy Creek? I believe not. It is too sandy.  
 Is it a permanent creek? It hardly ever runs. It has not been known to run through for many years until it ran at the end of last year.  
 Is there any under-current in it? I do not think there is an under-current exactly, but you can get a supply for domestic purposes by sinking.  
 Are there any wells along it? On the upper portion they have small wells.  
 Are there any large depressions in the basins at all? It is one large depression, but there is nothing of the nature of a lake.  
 No swamps? None of any size. There is a lake filled by a small creek from the channel. I have heard it holds a supply for years. It is on Neckarbo.  
 In about what position on that run? I am not certain on which bank of the creek. It is not very far from the creek.  
 What is the area of that lake? About  $\frac{3}{4}$  of a mile across, and it holds water from two to three years.  
 Where does Sandy Creek discharge? It never ran at the southern end until it filled the lake a short time ago. Then it ran into some box flats. It runs into Baden Park, near Moira Plains; into box flats, a sandhill running right across the bed of the creek.  
 Can it be traced beyond that? I believe there are signs of depressions running south from that towards Mount Manarah.  
 There is no distinct evidence of any channel beyond Mount Manarah? Not that I know of.
- Talywalka Creek. Do you know the Talywalka Creek? Very well.  
 What is the character of the banks of the Talywalka on the east? In some places it has hardly any banks, but in other places there are high abrupt sandbanks that come to the edge of the creek. Where there is a high bank on one side there is a low flat on the other.
- Range. Is there not a range continuing from Mount Manarah which skirts this series of lakes on the Talywalka? There is high ground and belar ridges, which run from Mount Manarah, on the eastern side of Teryaweynya block, and come round by the boundary of Teryaweynya and Billilla, to M'Culloch's Range.

And

And that forms the divide between the Lachlan and the Darling? Yes. The fall from the top of that ridge is all to the Darling on this side, and on the other side it seems to spread to the Lachlan.

Mr.  
G. W. Moore.  
4 Oct., 1886.

How does that divide continue past the M'Culloch Range? It continues easterly on the boundary of Fulham and Cultowa runs, forming the divide between Sandy Creek and the Darling River, as far as the Cobar Range.

How far does the range continue south of Mount Manarah? I only followed it down for about 5 or 6 miles. I could not speak for anything further south than that. It is the largest range in this part of the country. It is fully 200 or 300 feet above the surrounding country.

Are there any large depressions besides the series of lakes? There is a number of box-flat depressions running in a north and south line though Teryaweynya and a portion of the eastern part of Albemarle which appear to have been the waterholes of an old watercourse. They have the characteristics of waterholes of an old river.

Box-flat  
depressions.

Are any of them large? From half a mile to a mile in length, a quarter to half a mile in breadth, and about 20 feet deep.

Could they be filled from the Darling when in flood? It is hard to say. If a channel could be cut through that country they would afford magnificent places for storing water. The question is as to whether the levels would suit.

What distance would they be from Lake Victoria? About 4 or 5 miles.

What is the character of the intervening country? Rather lumpy ground and red-soil plains, but no high ridges. The lake bottom is at one level, and the banks are abrupt into it.

Would the filling of these depressions be of any benefit to the surrounding country? It would be of immense benefit. They would water a great deal of country if water could be taken to them. On the edges of these depressions, as a rule, well water can be obtained at a depth of about 100 feet.

Are there any deep wells in that district? The box well is about 190 feet. The best wells I saw on the wells lakes were about from 80 to 100 feet.

Is it good water in the 190-foot well? Fair stock-water.

Does the water rise in the well? About 10 feet, I think.

Is there an unlimited supply? No; a supply of about 2,000 gallons an hour.

Is it good water in the wells on the other lakes? It varies very much. Even on the same lake you may get one well brackish and another perfectly fresh.

What is the average depth you sink the wells on the Teryaweynya Lakes? On Albemarle the average depth would be about 60 feet.

Does the water rise in the wells? You can hardly say it rises. They keep the wells dry, and sink below the water level.

Can they get an unlimited supply? In some places they get a good supply. In some places it is scanty. On Brummy's Lake they get good stock-water, a little saline, but an almost unlimited supply. On Victoria Lake, from two shafts they get about 30,000 gallons a day of good fresh water. On Eucalyptus they can only get about 7,000 gallons a day. On Sayer's they get about 12,000 gallons a day of fresh water. They had to sink two shafts, and work them simultaneously by the same whim. At Ratecatcher's, at a depth of 58 feet, they get a supply of about 16,000 gallons a day. On Bullabulka the depth is 75 to 100 feet. They get good stock-water in two shafts, about 30,000 gallons a day. In another shaft, supplying about 18,000 gallons a day, and one close to it, the water is very brackish, and they could hardly use it.

What is the general character of the strata these wells are sunk through? Soft alluvial, and a great deal of sand-drift.

Is the drift sand at the bottom? Yes. I think they are soakage wells.

Do you think there were many sheep or stock lost during the late drought from want of water? I would have to explain my answer to that. I think an immense number of stock were lost through want of water, but it was in this way: There were so few watering-places that the sheep were massed round the water instead of being evenly distributed over large areas. They destroyed and ate all the vegetation within easy reach of the water, and were then obliged to go long distances out back to get feed. They became weaker and weaker, and sometimes would get out to such a distance that they were too weak to walk back to the water. Thus they died from want of water. There was a certain amount of vegetation, and if they had had water within easy distance of it there would not have been anything like the loss there was.

Losses of stock.

You think every effort should be made to spread these floods over as large an extent of country as possible? I am convinced that would be the best thing to do. Tolarno, Albemarle, and Teryaweynya runs had the heaviest losses during the late drought. If they had had water they would have had comparatively few losses. On Teryaweynya they were bringing in cotton-bush for their horses, but the sheep could not get it. They had 110 trial shafts put down on Teryaweynya, but in every case they struck salt water, but they did not bore below 160 feet.

Mr. Donkin.] Do you think this country ought to be tested as to the feasibility of discovering an artesian supply? Yes, and I have very little doubt that artesian water could be found here.

Artesian water.

Do you know of any wells put down here 2,000 feet? Not in this neighbourhood. I think 320 feet is the deepest I know of in this vicinity.

What would you recommend in order to lessen the great losses in stock, some provision for water, or the keeping of a part of the run in reserve? I think that people who have well paddocks should, as far as they possibly can, keep them as a stand-by for a time of trouble. They should work on their tank paddocks, and when the tanks dry up they would have some vegetation. But where they have overstocked they have been compelled to continue the use of all their paddocks.

Reserving  
paddocks.

You spoke of three stations where they had losses; what would those amount to in the aggregate? The actual death of sheep on three stations was about a quarter of a million in two years, exclusive of the death of lambs.

Losses.

Which are the best for conserving water, wells or tanks? I think more good can be done by tanks than by wells, if the tanks are made large enough with embankments round them, and the water be promptly pumped into them after rains. One tank on Teryaweynya is the Limekilns Tank. There were about 12,000 yards of excavation. It is 16 feet deep, and there is an embankment around it of 8 feet high. It holds 22 feet of water. That tank never went dry during the drought, although there were

were

Tanks.

- Mr. G. W. Moore. were 10,000 sheep constantly watering on it. Cowie's Flat Tank on Teryaweynya is a very similar one. That never went dry. In times of extremity, when water is scarce, a great deal could be saved by making arrangements to water the sheep from troughs. They take away in their wool nearly as much water as they drink. I have seen old ewes go into the tanks till the water was half way up their sides. That was on Burta Station, in the month of May.
- 4 Oct., 1886.
- Natural state of back country. In the back country here, away from the frontage to the river, would it have been possible to occupy it without improvements? No. You can hardly get on to the country to-day without artificial water.
- Natural irrigation on lakes. What is the effect of the flood-waters on the lakes when they subside? As they subside there is very rich vegetation on the margin of the lakes. There is always a fringe where the water blows up on the edge of the lakes. On Teryaweynya Lake and Long Lake there is the finest grass. In the Western Division you can mow hay from the bed of the lake. It is close, fine, even sward, as fine as any lawn. That is divided into small paddocks for stud sheep.
- Worthlessness of lakes. Would you advise the impounding of the water in these natural depressions, 3 or 4 feet deep, for the purpose of water supply, or would it do more good in being used for irrigation? In my opinion, if the lakes had never existed the lessees would have been better off. The lakes have been a curse instead of a benefit, because the lessees have depended on the lakes instead of making water improvements, and when the lakes dried up they had heavy losses. If they had not depended on the lakes the lessees would have put further improvements on their country. I am speaking particularly of Tolarno. The heaviest losses were on Bullabulka Lake, where the sheep bogged and died in thousands. There are now wells on the lake, but very few tanks.
- Scheme for water conservation. Could the water impounded in these lakes be used more extensively for irrigation of the natural grasses? The water in Brennan's and Denny's Lakes could be used if a sluice-gate were put on the channel. Instead of allowing the water to run to waste you would have magnificent results. You have travelled over this district for some hundreds of miles;—what conclusion have you come to as to any comprehensive scheme that could be carried out for the conservation of water? I have travelled some thousands of miles in this district, and, as far as my experience goes, the only scheme that would be of any use would be to keep the water in the river by weirs or any other means that engineers could devise, and to force the water that goes into the Talywalka out as far as possible on the eastern bank. At present, by the action of private individuals on the Talywalka, the water has been forced out 50 miles? Yes.
- Irrigation. Do you think that plan could be extended? I think if larger works were made into the Talywalka, and a better system adopted, water could be forced into the dry country to the south of Bullabulka. There are marks of old watercourses there. At some time or other there must have been a creek through that country. The water could never back up the Talywalka again. You have a report to hand in? Yes, I have it here. (*Appendix to Report on Darling River, No. 13.*) This information has been obtained from about a dozen people, and I have checked one person's information by that obtained from another, and I find the main figures all agree. You have seen the sample of lucerne produced;—could that be grown by irrigation? I have seen lucerne growing in several places in this district by means of irrigation. I have seen it at Tolarno head station.
- Have you seen irrigation carried out? To a small extent. At Albemarle they have a small pump which they use for the garden. They have a windmill at Netley, and a steam-engine at Tolarno. At Tintinallogy they use a whim.
- When irrigation is better known throughout the district, do you think it will be more used? Yes. Any person who studies the gardens on this river will be convinced of the benefits of irrigation. Almost anything would grow in the gardens and orchards of Tintinallogy, Albemarle, and Tolarno. The oranges and lemons are magnificent, and I never saw finer vines in my life. I am certain that with irrigation almost anything could be grown here.
- You think then it is only a matter of experience and education? Yes, but there is another thing. There could be no system of irrigation unless there were conservation of the water of the river. When I came up here a few months ago the river was dry for stretches. When the river gets very low the water becomes salt and hard, because of the salt springs in the bank.
- Lucerne. What would be the most profitable crop to raise by irrigation? I think lucerne is about as good as anything. It is more permanent than anything else. In Victoria I have seen the roots go down 16 or 18 feet to the level of the water in very similar soil to this, but the climate was much more humid. Are these red sand ridges prevalent all throughout the district? In every direction, and as a rule they run east and west.
- Are they affected by the wind? To a great extent; there is a great deal of shifting sand.
- Talywalka dam. Is there any point on which we have omitted to question you? I may say that I heard Mr. Sadleir's evidence about the dam on the Talywalka. I have seen the lakes when full and when dry. I quite agree with Mr. Sadleir that the fact of these lakes being now full is due principally to the dam across the Talywalka at the intersection of the Teryaweynya Creek, which has been erected by private enterprise. This dam has stood for about ten years in the Talywalka? About nine years, I think. There was another dam before, which was a great cause of war. The Albemarle people put it up, and the other people used to cut it down. Then the four people interested came to the present agreement. The work carried out there shows conclusively that other works of a similar nature could be carried out? Yes.
- Weirs. Do you think it is possible to raise the rocky bars in the river 4 or 5 feet? I should think weirs could be put on them. Without erosion of the banks taking place? Decidedly. If there had been a tendency towards erosion it would have shown itself in the case of the natural weirs in the river. If these bars were removed the river would run right away.

Mr. W. J. Faust called in and examined :—

*Mr. Donkin.*] How long have you been here? About twenty years.  
 What have you been engaged in? As a blacksmith and wheelright.  
 You have noticed the floods in the river? Yes.  
 Which was the largest flood? The 1870 flood in my time.  
 How much higher was that than this? 3 feet 6 inches higher.  
 You know Menindie Lake? Yes.  
 Is there a large body of water stored there? A very large body.  
 Does that act in any way in keeping up the river? When the river falls it does to a certain extent, but not very much.  
 Do you think anything could be done to impound a large body of water in Menindie Lake? I think it would be a pity to do so, because it would destroy many thousands of acres of grass country.  
 Is the pasture very rich when the water recedes? Yes, very good. The lignum bush sustains the cattle for many years when the water goes down. Thousands of cattle have been saved on this run through having the lignum bushes to fall back on.  
 How long will this flood keep sufficient water in the river for navigation? It depends. If there be no more supply the river will fall very rapidly. Steamers would not be able to get here beyond six months.  
 Is there much alteration in the township of Menindie through the shifting of the sand ridges? The sand is a great nuisance in backing up against the fences. It has covered several fences completely.  
 Are the residents compelled to remove the sand? No; there is no Municipal Council. If the sand interferes with the houses we must remove it.  
 What do you do for water in the dry times? We have wells, which are fed from the river.  
 Have you known the water to be unfit for domestic purposes? Yes.  
 You are satisfied the water can be applied more beneficially to the growing of grasses than by storing it. Yes.  
*Mr. Gipps.*] What are the prevailing winds? Usually northerly in the summer and westerly in the winter.  
 Are they continuous enough for windmills? I think so. We have wind almost every day, some time in the twenty-four hours.  
 Have you any dew here at all? Very little. We have a little in spring, about July; it is a sort of frost.  
 How long does it last? Not beyond the end of July and the first week of August.  
 Do you know anything of the bars of rock? There is no rock immediately near here. There are sand bars in the river. The nearest rocks are at Weinteriga.  
 Have they been worn much by the action of the floods? I do not see any difference.

Mr.  
W. J. Faust,  
4 Oct., 1886.

Menindie Lake.

Mr. J. R. Holding called in and examined :—

*Mr. Donkin.*] How long have you been at Menindie? I have been here six years. I am post and telegraph master. I have been on and know the Darling River since 1866, off and on.  
 You know the river from Wentworth to Menindie? Yes, since that time.  
 In what state was the river when you came here? In 1866 it was very low, and had been for some time. It was the end of a very bad drought.  
 Was there water in the river? There was little or no water throughout the river. If I remember rightly steamers were high and dry in it.  
 What is the longest time you have known steamers to be stuck through waiting for a flood? From four to seven months.  
 Of course there is often a river here from the back-water of the Murray? No; the back-water of the Murray does not come up further than 60 miles at the most.  
 Is the river navigable here before it is navigable at Wilcannia? No; the water must come down.  
 Do you know any of the rocky bars in the river? Yes.  
 Where are they? I can hardly give you the exact localities, but I know there are two or three on each side of Menindie.  
 Is there one near Menindie? No; but there is a deposit of sandstone, where there may be a bar, about 4 or 5 miles from here. When it is low water you can see the stone in the banks.  
 What was the next flood after 1880? There was a fair river in 1881.  
 How long was the river nearly dry before the present flood? For six or eight months, with fine grass and wattles 10 feet high growing in the bed.  
 You know Menindie Lake? Yes.  
 You described that to the Commission before as in its dry state? Yes.  
 When dry, after the waters had receded, was there rich feed upon it? I have seen very good feed in it.  
 Will the pasture and herbage grow there, after the water has completely gone, without further rainfall? Yes; as fast as the water recedes the herbage grows. The water does not go off all at once, but remains in pools, the surface being uneven.  
 What height here has the river to rise before it overflows into the lake? The water commences to run up the Menindie Creek when it rises about 8 feet in the river.  
 Above summer level or the bed? Above summer level.  
 How much above the bed? I take summer level from the bars, just about when the river becomes stationary, that is to say, when it can fall no more without leaving the bed dry.  
 What depth is there in the river now? 26 feet 4 inches above summer level.  
 That would give about 18 feet flowing into the lake through the creek? Yes.  
 How long has the water been flowing into the lake from the river? For the last four months. There are two separate creeks. The water has to rise about 15 feet before it begins to run into the lake through the first creek or inlet from the river. These creeks appear to me to be lower at the discharges into the lake, and higher at the mouth, where the river runs into them, and the water has to rise a considerable height at the mouth before it begins to flow over into them from the river.

Mr.  
J. R. Holding,  
4 Oct., 1886.

Steamers stuck.

Rocky bars.

River dry.

Menindie Lake.

- Mr. J. R. Holding. You saw the water running in to-day; about what rate, in miles, per hour has it been running? The water in First Creek is running at the rate of  $3\frac{1}{2}$  to 4 miles an hour, and in the other creek I gauged it, and it went 160 yards in three minutes.
- 4 Oct., 1886. Have you seen it running into the lake any previous year? Not in the volume it is now running.\*  
Have you seen it running out? Yes, after the flood of 1879-80.  
Does it run out as rapidly as it fills? Yes, at a tremendous rate, but dependent on the rate the the river falls and releases it.  
What does the lake go down to? It gradually runs out, not dry, but leaves a good body of water in the far end of it.
- Damming the lake. Would it be possible to dam the creeks to prevent the water from going out? Yes.  
Could it be done in the present state of the creeks? Yes.
- Cost. What do you think the cost would be? If it were done by a sandbag dam my idea is it could be done for about £600 or £800; that is, the two main inlets only.  
What depth of water would be retained in the lake? It would average 6 feet at its present level.
- Depth. What was the deepest sounding made by you to-day? Ten feet some inches. To-day we only sounded about one-eighth of the actual area of the lake.
- Circumference. Do you know the circumference of the lake? It is about 60 miles.  
Has any inspection been made of those creeks as to the possibility of damming the waters? There has lately by the Department of Roads and Bridges.
- Instructions to dam lake. Has any action been taken? Instructions have been issued by the Commissioner for Roads and Bridges to dam Menindie Lake.
- Use of the water. If this body of water were conserved, of what use would it be to the district? It would be of immense use in saving stock from having to come to the river for water; it would give water so much further on the road to Silverton, as it would enable Speculation Lake to be filled and kept full. This lake is beyond it again, and gives permanent water for six years when once filled.  
Could any extent of country be irrigated from it? I believe the country all around it could be irrigated. The banks are not as high all round as they are on this side.
- Advantage to navigation. Have you known navigation to be kept up in the Darling through the water from the lake receding and flowing back into the river? I have known it to keep the river open for three or four months for steamers of a draught of 3 feet 6 inches.  
If the water were conserved in the lake, could it be made use of to augment the river supply for navigation? Yes. Of course the question as to how long a body of water running from the lake into the river would affect the river would depend upon the Murray at Wentworth; but my idea is to utilize the water in enhancing the value of the country adjacent by irrigation.  
What distance from here is the river affected by the Murray water? About 120 to 130 miles from here by road.  
What proportion does the length of the river bear to the road? About 3 to 1.  
Do you think the soil here and around the lake is of such a nature that irrigation could be profitably engaged in? I do.
- River-gauge. What gauge do you read the height of the river from here? From summer level, that is when the water is just trickling over the sand-bars.  
But the sand-bars shift, do they not? Yes; but they always maintain a comparatively equal level throughout.  
What would you recommend as the best zero to read from? Summer level, just when the water is awash over the bars.  
Do you think the level as now taken at Bourke is sufficiently well-known to be adopted? I think it is. Navigation level there has been done away with. I pointed out to Mr. Russell, in Sydney, some time ago, the confusion caused by having differences in the gauges. From my gauge all the captains of steamers know exactly when the river is at summer level, that if it then rises 1 foot they have 1 foot of water on the bars.
- Local rains. Have you ever known any local rain between here and Wentworth to have materially affected the height of the river? Yes. Last December the heavy rain that fell—about 4 inches here and about 6 inches at Tolarno—put a series of waves in the river varying from 2 feet to 3 feet 6 inches high; and in 1885, 8 inches of rain in this district caused the river to rise half a banker in the form of a large wave, a similar rain to that just mentioned.  
As a general thing, is it considered that the local rains throughout the course of the Darling augment the river to any extent? It is not considered they do, and they should not be considered as so doing.  
Then where do you depend on the flood-waters? From Queensland and New England. In fact, as far as rain goes, if we depended on what falls from Bourke downwards we would never have a river.  
You exhibited to-day a fine sample of lucerne grown by yourself, was that grown on the red sandy soil? Yes. Entirely by rain? Yes.
- Irrigation. You are satisfied, then, that irrigation could be applied with good results? I believe so, with very good results, because the climate and soil are evidently suited to grow anything.
- Menindie Lake. Mr. Gipps.] How many channels divert the Darling into Lake Menindie? Two. The two main channels are the two creeks; the others are only shallows.  
What is the character of the first channel at the point of off-take from the river? A wide open mouth, about 50 yards across, with a depth of about 11 feet, and the height of the bed above the river channel is about 14 feet.  
What is the character of that channel at its point of discharge into the lake? It runs off into a lot of fingers and smaller channels, and loses itself altogether. What

\* NOTE (on revision):—I have seen it going in several times, in fact every time the river rises 10 feet above summer level the water goes up the creek for a greater or lesser distance, though it may not actually go into the lake proper. I do not think a lesser rise than 12 feet in the river above summer-level reaches the lake bed in any part—that is to say, it does not by the Menindie Creek, nor by Cawndilla Creek, which is very deep from end to end in its course through Menindie Lake, but every foot rise after that would make a great difference. A great spread follows even a few inches rise over a certain level the depth depending on height of river and time it keeps up. On one occasion, in 1882, I think, the creek was then about 15 feet deep, and going in pretty fast, I followed Menindie Creek, from the junction with Cawndilla, in its course through the lake, till it finally ran out in the bed of the lake, where the water was spreading and running into chasms in the ground in all directions. After passing a certain point the current increased to probably 2 miles per hour, and I had great difficulty in getting back with the boat. I should say I followed this feeder from 6 to 8 miles through all its windings in the lake bed.—J.R.H.

What is the depth of the deepest part of it at the point of discharge? It would not be above 4 feet at the present time, but would deepen as the river rose.

Where do you propose the dam should be located in that creek for impounding the lake? Just a short distance back from the mouth.

What would be the sectional area of the channel where you propose to locate the dam? Between 30 and 40 yards in length, and about 10 feet deep. The width would be a technical matter, depending on the pressure.

What is the character of the dam you would propose? Under the present circumstances, now that the water is there, sandbags.

What width of sandbags would you propose to put down? My idea was that the channel should be filled with layers of sandbags, and, as the water went down, if it were found there were any leakage, to strengthen it. Earth should be run along the top, and thrown down on the waterside, so that the water might wash it through and fill the crevices. The dam could also be strengthened on the lower side as the water fell away. How would you propose to fill the channel with sandbags? I should think it might be done by rigging a cradle on wire ropes, and dropping the bags down from the cradle.

What width of dam would you propose? About 30 or 35 yards of dam would answer all purposes.

What is the character of the second channel at its point of off-take from the river? Similar to the first. It is very wide and very deep; about equal in capacity to one-sixth that of the river.

What is its greatest depth? About 25 feet at the mouth.

What is the character of that channel at its point of discharge into the lake? To answer that question directly would be a difficult matter. That creek, after going up about  $1\frac{1}{2}$  miles, has a large branch, which goes into Menindie Lake. At this branch-off the main creek ceases to be called Menindie Creek, and is called Cawndilla Creek. Then it goes right on to Cawndilla Lake, running through the bed of Menindie Lake all the time. As the water rises it spreads out, still continuing its course to Cawndilla Lake. After filling Cawndilla the water ebbs back again, and distributes itself over Menindie Lake.

In what position do you propose the dam should be located in that creek? About three-quarters of a mile from the mouth. It is at a good point, where the banks are high and hard.

What is the character of the banks? Very steep, and of stiff, hard clay, that does not wear away.

What is the depth of the creek at the point of discharge into the lake? That is similar to the first, because it runs off to nothing at all. You could not give a depth to it. The channels lose themselves in the lake.

What is the character of the dam you would propose? Similar to the first.

How much do you think the two dams would cost? I should think the one in the main creek would cost perhaps £600 or £700, and the other perhaps £150, but it is a difficult matter to say. I have not made any calculation as to the actual cost. I merely base my estimate on the supposition that the quantity of earth required would be about the capacity of a station tank of fair size, and to the cost of taking the earth out there should be added the cost of the filling, fastening, and carrying the bags. Tank work averages about a shilling a square yard.

Do you know anything of Pine Creek? Not personally, only from repute.

Why is called Pine Creek? On account of the pines growing in its bed.

Have you ever heard anything relative to the floods in that creek? Very heavy floods come down it, and there is a peculiar feature in connection with it which seems to show that, although it is a drainage creek from the ranges, and runs into a good-sized lake, which it fills, yet there must have been very great droughts in years gone-by, because there are full-grown pine trees in the very bed of the creek. Since the country has been taken up and turned into station property there have been heavy floods in the creek, the drift being left high up in the branches of the pines.

At what height? Considerably over the head of a man on horseback, I am given to understand.

You think, judging from that, that the rainfall is increasing? I fancy it would point to the conclusion that the rainfalls are better than they used to be, or that stocking the country has induced more drainage.

What are the prevailing winds here in summer? North, north-west, west, and south.

And in winter? Principally west and south.

Are the winds continuous, so as to admit of the use of windmills? I know from experience that wind power in summer is quite unreliable. When you want the water most there is no wind. Frequently we go over a week with little or no wind. As a rule, the hotter the weather the less wind we have.

*Mr. Donkin.*] What instruments does Mr. Russell supply you with? Two barometers, three thermometers, and a rain-gauge.

What are the thermometers? A maximum, a minimum, and a mean. The mean thermometer is attached to the barometer.

You are not supplied with hygrometers? No.

You do not know what the moisture is? No. Some years ago, at Wentworth, I was in the habit of taking the evaporation every morning. The system was to put out 14 pounds of water and weigh it every twenty-four hours until it evaporated to 8 pounds, when it was replenished to 14 again, and on the hottest days the evaporation would be about 9 oz. in the twenty-four hours. I now put in statement of rainfall for the present year. (*Appendix to Report on Darling River, No. 14.*)

Mr. W. J. Hanna, C.E., called in and examined:—

*Mr. Donkin.*] You have been already examined before the Commissioners in Sydney, I think? Yes, in July, 1885.

That was during the drought? Yes; one of the worst seasons that this district has ever experienced.

You are Road Superintendent? Yes.

Is Menindie in your district? Yes; it is now the south boundary.

How far does your district extend around Wilcannia? It extends to the Queensland border on the north, the South Australian border on the west, Menindie on the south, and half way to Cobar and Bourke on the east.

How many years have you been here? Three and a half years.

You have seen the river at a very dry time? Yes, when it was a chain of waterholes.

And now at the present flood? Yes.

Mr.  
J. R. Holding.  
4 Oct., 1886.

Pine Creek.

Winds.

Windmills.

Evaporation.

Mr. W. J.  
Hanna, C.E.  
4 Oct., 1886.

- Mr. W. J. Hanna, C.E.  
4 Oct., 1886.  
Rocky bars.
- Do you know of any bars in the river? The following are some of the principal reefs between Wentworth and Wilcannia, together with the approximate distance from the former town:—Avoca Reef, 35 miles; Burtundy Rocks, 80 miles; Ten-mile Point, 125 miles; Christmas Rocks, 400 miles; Wilcannia, 505 miles. There are several bars between Wilcannia and Bourke, but I am unable to state their position.
- Is there any fall at Wilcannia? There is a fall of about a foot.
- Is the water backed up perceptibly? It is backed up about 5 miles.
- Would it be possible, in your opinion, to build a weir on the bar there? Yes; I think it is quite practicable.
- Weirs.
- To what height could you raise it without erosion of the banks taking place? A weir that would interfere with the natural flow of the water would be expensive, owing to the difficulty of protecting the banks against erosion in time of flood. I think weirs in the Darling should be movable, or constructed in such a way that in time of flood the water would be allowed its free flow.
- Does the one foot of bar affect it now? It is scarcely perceptible in an 8-foot rise. The bar is not more than 9 inches or a foot above water level on the lower side.
- Navigation stopped.
- For what length of time have you known navigation to be stopped? About eighteen months to my knowledge, but I believe it has been stopped for longer periods.
- Have you known produce to be detained waiting for a river? I believe two clips of wool have been stored in Wilcannia awaiting a navigable river.
- What do you think should be done with the river to ensure communication? Either locks or movable weirs should be constructed.
- Would movable weirs answer for navigation? I believe they answer for this purpose in other places, but cannot speak from experience. I have not seen them. The reason I mention them in preference to fixed weirs is because they would interfere to a very small extent with the natural flow of the river when in flood.
- Prices of provisions.
- Have you known grain and other necessaries of life to rise in price through communication being cut off? Yes, almost to famine prices. Chaff has been 25s. a bag, that would be £50 per ton; oats, 15s. per bushel; flour was £4 per bag, or £40 per ton; potatoes, when procurable only by coach, 9d. per pound.
- Do you know the country between Wilcannia and the Lachlan and Cobar? I have not been out to Cobar or the Lachlan from Wilcannia.
- Railway from Cobar.
- Would there be much difficulty in constructing a railway to Cobar? I know sufficient of the country between Wilcannia and Cobar to justify me in stating that a railway could be cheaply constructed.
- Which would be most profitable to the State: to construct locks or movable weirs, or to construct a railway to Wilcannia? Without both I consider the Western Division can never be fully developed.
- Locks.
- You think it would be sufficient to keep the river navigable between the points of the railway? That would certainly be a step in the right direction, but I think the river ought to be locked down to Pooncairie at least, because the further it is locked the greater will be the amount of trade kept within the Colony, and an immense advantage would also be derived from the increased storage and distribution of water in lakes, billabongs, &c.
- Filling lakes.
- Will you name any of the lakes or large depressions within your district where you think a large body of water might be stored? There are the lakes on the east and west sides of the river, in all of which water could be stored, and in some cases drained off for irrigation. Several of these are filled from the Talywalka Creek, and from this source the water could by a small expenditure, I think, be taken further back to fill other lakes and depressions.
- Could any of these lakes be considered as permanent supplies if they were dammed? Some of them could.
- What do you think would be most advantageous to the country: to store the water for stock or for irrigation? Where the lakes and soil are suitable, irrigation would undoubtedly be more beneficial. A sufficient supply of water for stock purposes can always be obtained from wells or by excavating tanks.
- Losses in stock.
- You know there have been large losses in stock;—has that been due to want of grass or want of water? To both. In some places where they had water there was very little feed, and inland where feed was sufficient to keep stock alive there was no water.
- Lake Woytchugga.
- Could a large body of water be stored in Lake Woytchugga at Wilcannia? Yes.
- For what purpose would you recommend its storage? If the water could be conveyed from Lake Woytchugga further back, or even parallel with the river, it would be a great advantage, and by a comparatively small expense this could be done; but in this instance it becomes a question as to whether the water impounded in the lake would be more valuable than the rich feed that springs up after it recedes. The latter, I think, would be more beneficial.
- It would be a matter of no very great expense, as you have an embankment and a bridge across the lake? The impounding of the water could be very easily accomplished.
- At about what cost, approximately? About £400.
- How many square miles of water would be impounded? Between 4 and 5 square miles.
- Is it not a noticeable fact in connection with all these depressions and lakes that when the river goes down the water runs again into the river? The water in these lakes having direct communication with the river rises and falls with it. In some lakes, where the bed is lower than the inlet, water is left behind, but in most cases the depth is shallow.
- Growth of feed on bed of lakes.
- Then if the water is not impounded it is lost? At present the water simply irrigates the bed of the lakes, which for some time afterwards will produce excellent feed.
- There is a large area of country now covered by the talywalkas and these depressions;—is there a growth of herbage when the water recedes? Grass and herbage grow up rapidly, but the latter will not, as a rule, stand dry weather for any length of time.
- That is really the result of natural irrigation? Yes.
- Menindie Lake.
- What do you think Lake Menindie would average when full? Roughly estimated, the lake contains about 50,000 acres.
- About what depth? I think the average would now be about 8 feet. If the river kept up to its present level the lake would rise about a foot higher, as the water is about a foot below the present level of the river at its entrance to the lake.

If the water were stored in Lake Menindie, would it augment the supply in the river? It would keep the river navigable for perhaps two months longer.

Do you think the water could be taken from Lake Menindie further south-west to irrigate country? I do not think it could be taken beyond Cawndilla Lake.

Would it be a matter of great expense to impound that water? I think it could be impounded in a temporary way to surface level at the old bridge for about £700.

How would you propose to impound the water? The only way practicable at present would be by sand-bags, and that course I consider would be somewhat uncertain.

When the river ceases to flow into the lake, and they are both at the same level, would there be any rush of water? No; the water would then be still, but would only remain in that state for a short time. As the river falls the outward current from the lake increases to such an extent that it would be impossible to do work under water. The cause of this rapid flow is due to the comparatively small outlet through which an immense body of water has to pass. Instead of converting Menindie Lake into a basin, merely for the purpose of impounding water, I am strongly of opinion that it would be much better to use the bed of the lake for cultivation, &c., irrigating it from Menindie Creek and Cawndilla Lake, which would act well as reservoirs if the river supply failed, as it probably would occasionally for short intervals. The course of Menindie Creek from the river through Menindie Lake and into Cawndilla Lake is very tortuous, the actual length being over 20 miles, with an average depth of from 15 to 18 feet, and about 120 feet wide from bank to bank. It will therefore be seen that in this creek and Cawndilla Lake, containing an approximate area of 15,000 acres, a great natural storage is already provided. From this source the water could be raised and distributed over the whole surface of what is now the lake bed. Before this, or a similar scheme, could be carried out, it would be necessary to construct a lock or weir in the river at the nearest suitable place. But as it is only a question of time until the river, or the greater portion of it, is made permanently navigable, this expense should not be taken into account.

Is Cawndilla Lake filling now? It is nearly full.

Could the water be impounded there? I have not been to the entrance to Cawndilla Lake, but I believe it could be easily done,

You recommend the storage of water there for the irrigation of the 50,000 acres in Menindie Lake? Yes; to supplement the supply from the river when necessary. Regulating works would be required in Menindie Creek and between Menindie Lake and Cawndilla Lake, so that advantage could be taken of all floods and freshes in the river.

*Mr. Gipps.*] What is the character of Menindie Creek as it leaves Menindie Lake? I have not seen it when dry, but believe it is black soil. The channel is well defined.

Is Cawndilla Lake deeper than Menindie Lake? I have not taken levels, but am informed on good authority that it is deeper.

What would be the average depth? I could not say.

And the extreme depth? When full, about 20 feet in the deepest part.

Do you supervise the laying out and construction of tanks? Yes.

What size of tank do you recommend? 16,000 to 20,000 yards, according to the nature and area of catchments.

And what depth? 18 feet at least.

Do you know the amount of evaporation which occurs here in summer-time? Five feet I consider is ample to allow for evaporation and absorption for the whole year.

As a general rule, is the soil of this part of the country retentive? As a rule, it is. After getting down in some cases to 14 and 16 feet, occasionally a drift is met with, but by altering the site a little one way or another this can, generally speaking, be avoided.

Do you supervise the repairs of the tanks? Yes.

Do they silt up much? Not very much. A good deal depends upon the nature of the country.

A tank at Copago, on the Paroo Road, has only been excavated about seven years, and before the flood of January, 1885, it was silted up to within 2 feet of the surface. But that was chiefly owing to its position and the nature of the surrounding country. The site was selected in an off-take from the Paroo, the excavated material being formed into an embankment across the channel. The wind, especially from the N.E. and S.W., acting on the loose sandy soil of the high ground on each side, always carried a certain amount into the channel, which was washed down by the first rainfall. As an instance of the opposite kind, I may mention Boonoona tank, on the road Wilcannia to Hay, constructed in 1870. The silt accumulated to date does not exceed 9 feet.

Do you know anything of the ana-branch leaving the Darling on its right bank some distance below Menindie? I do not.

*Mr. Donkin.*] You are a civil engineer by profession? Yes.

During your experience here as Superintendent of Roads and Bridges you have paid some attention to the question of water conservation, have you not? I have.

What do you think could be adopted by the Government as a national scheme with regard to the Darling? I am of opinion that without the construction of locks or movable weirs in the Darling this Western Division can never be fully developed. For such works the natural facilities are exceptionally favourable. From Bourke to Wentworth, a distance of 896 miles by river, the fall does not exceed 3 inches per mile. Good foundations, I believe, can be found, and in most cases partly, if not wholly, on rock. Besides making the river almost permanently navigable, large bodies of water would be conserved in lakes, creeks, billabongs, and natural depressions, providing a permanent supply for hundreds of square miles of country that in a dry season is little better than a desert. I am convinced that the result of such work would be highly satisfactory and beneficial alike to the district and Colony.

From your experience of the country and the soil, do you think irrigation could be profitably undertaken? I am satisfied that, with sufficient water and proper management, the soil will grow almost any crop, and perhaps two or three crops in a year. There is ample proof of this in the district, but of necessity, on a small scale.

With regard to the back lands in the interior, was the country of any benefit to the State, or could it have been utilised or made productive unless water had been conserved upon it? No. If water had not been artificially conserved the back country must have remained unoccupied, as the rainfall is too light and uncertain to be relied upon. The largest natural reservoirs I have seen perfectly dry.

Are

Mr. W. J. Hanna, C.E.  
4 Oct., 1886.

Are there any questions we have omitted to ask you? I do not think so. Menindie Lake is about the most important on the river that has come under my notice, and it is the easiest to deal with. Do you think the Commissioners have visited the river at a time when they would obtain the most information? This is undoubtedly the best time for obtaining information, and from personal observation some idea can be formed of the immense advantages to be derived from the construction of a few simple and comparatively inexpensive works.

WEDNESDAY, 6 OCTOBER, 1886.

At Moorara Station.

Mr. C. H. Wreford examined:—

Mr. C.H. Wreford.  
6 Oct., 1886.

Mr. Donkin.] How long have you been here? Sixteen years, within a few days.  
Have you been the whole time on Moorara? Yes.  
What distance is it by the road from Wentworth? 100 miles.  
How often has the river been dry since you have been here? Only once.  
When was that? In 1885.

Dry river. What do you mean by being dry? You could walk across the river in lots of places without wetting the soles of your boots. Of course there was a great deal more of the bed of the river covered with water than there was quite dry, but still the river had stopped running.  
How long was it dry? I could hardly say.  
Have you been unable at any time to send your wool away? No; but I have carted a portion of the clip of four seasons to Wentworth, and the whole of last year's clip.

Rocky bars. Are there any rocky bars that you know of in the river? There are what they call the Christmas Rocks and the Burtundy Rocks.  
Are there any rocks between those two places? Not that I know of. The Burtundy Rocks are about 50 miles above Wentworth.  
Is the river backed up by the rocks there;—is there any fall in the river? I do not think so.  
Do you think it would be possible to erect a weir or locks on the bar at Burtundy;—suppose the river were raised 6 or 8 feet, would that cause the banks to wash away? I should think not, if it were properly done.  
Have you noticed the effect of any impediments put in the river? I do not understand locking rivers, but I should think it would be quite possible to lock this river.

Banks do not erode. You think the banks would stand? I should think you might pick out places that would stand.  
You have seen some places where the river has cut across bends? Oh, yes. There is one place near Polio Station, about 6 miles by land from here.  
Has that been cut away since you have been here? No; it had the name of Polio Island fourteen years ago. But the tendency of this river is not to cut fresh channels? The tendency is certainly not to cut fresh channels, but of course the river cuts away going round bends.  
From your experience, the course of the river has been the same, as far as you know? Yes.  
How does the length of the river compare with the road? In the proportion of about  $2\frac{1}{2}$  to 1.  
What is the area of your country? A little over 1,000,000 acres.  
Is there any natural permanent water at the back of the run? No.  
Are there any depressions or creeks? Depressions, but not creeks.  
How did you occupy that back country in the first instance if there was no permanent water? If we had a wet winter we occupied it for about three or four months, and sent the sheep back there for that time; but if it was a dry winter we could not send them back at all.

Wells. What have you done out back in the way of conserving water? We have wells and tanks now.  
Which do you find answer best for a permanent supply? Wells; we have one good well which has been better to us than all the tanks.  
What depth is it? 100 feet.  
Does the water flow to the surface? We have to raise the water by a whim.  
You do not use windmills? No.  
Would they not answer at these well? They would not be reliable.  
Do you think there is any possibility of obtaining an artesian supply in this part of the country by going deeper? I could not give an opinion.  
You do not know of any wells that have been put down 1,000 feet? No. We have two wells that are worked by steam.  
What depth are they? One is about 80 feet, and the other about 70 feet.  
Do they give you a continuous supply? No.  
What I mean is, have you sufficient for all the purposes of watering stock? No. One of them would water about 8,000 sheep. It is fair stock-water, but a little brackish.  
Is it fit for domestic use? No. As to the other well, we found the water to be too salt even for the use of stock.

Different waters on same level. Whereabouts is that well you speak of now? Somewhere about 60 miles north-east from here. In the first place we put down a trial shaft, and got moderately fresh water, almost good enough for the use of man. Then we went perhaps 70 feet away and sank the main shaft, and got the same water. We applied an engine to the pump, and found there was only a small supply. So we put a bore down, and up came salt water. Then the difficulty was to stop the salt water back and get a supply of the fresh water. So we had a lot of clay rammed down the bore in little bags. We believed we had shut off the salt water and had got back the fresh. We then started a drive from the main shaft to the trial shaft, the drive being 3 feet wide and 5 feet high clear inside the timber. We did this for about 50 feet, and at the end of the drive we made three bores—onestraight east, one south-east, and onenorth-east. From these bores we had three different waters,—one comparatively good for stock, another slightly salt, another very salt.  
Were they on the same level? Yes.  
How do you account for the difference? I cannot account for it at all.  
Was there any difference in the formation—was it all drift? The drives were on a perfect level. The water was got in drift.  
Was it a coarse drift? Yes.

You

You did not have the waters analysed? I think we did send some down, but it was lost on the road.

What are you doing with the well now? We are not doing anything with it.

You had to abandon it? We had to water sheep with it at the time because we could not water them anywhere else, and the consequence was a few hundreds died.

In carrying out the work 60 miles away in the dry country, how do you provide for the men and horses? At that time we had to cart the water in a tank to them.

What is the process in making a tank? If we get a wet winter we take advantage of it, and put down a few small tanks; but we may have to wait two or three years for the rain. The largest tank which we have put down is of about 50,000 yards capacity. Tanks.

And what depth? This tank is what is called a high-level tank. The depth of the excavation is about 13 feet 6 inches, but the water runs in from the top, and we make use of the dirt. So you can put in about 18 or 19 feet of water.

What do these tanks cost, say a tank of 50,000 yards? 1s. a yard at the very least.

Is that tank permanent? No.

Was it dry in any of the droughts? It has been dry.

From your experience, what do you consider is the best means of obtaining water for stock in these long droughts, deep tanks or wells? Wells, if you can get them. But my experience is that we have got only one well really good on the run after at least fifty trial shafts.

Did you lose many stock in the drought? Yes.

Losses in stock.

Can you give an idea of the loss? It would be very difficult for me to tell.

Say in one year, in 1884? I should say we lost about 25,000 sheep, besides not having any lambs.

What would the lambs amount to in ordinary seasons? We should have had 25,000 lambs.

In a good season you might have been 40,000 or 50,000 to the good? Yes.

Were the deaths caused by want of water or want of grass? I think I may say by both. They died from want of grass where we had water, and of course we had some feed where we could not possibly get water.

What feed had you? Natural herbage, salt-bush.

Had you any grass? Certainly not.

Could anything be done in future years to prevent these losses? If you could order us a fair rainfall.

By spelling portions of the run, could these disasters be prevented? I do not think anything could be done to prevent losses like what we have had in the last few years. Increased rainfall is the only remedy.

Have you ever tried spelling portions of the run for bad seasons? I cannot say we have ever overstocked. We have never had more than one sheep to 13 acres on this run.

Had you to buy chaff for the horses in a dry season? Yes, for many seasons.

Where do you obtain it from? We cart it from Wentworth.

What amount for one year have you paid for feed? The worst year we had cost us about £700, but we lost a large number of horses, and had to feed a great many on flour and sugar, and a material we call chaff made from the oak-bush, which we cut. We had not a team fit to carry chaff from Wentworth, so we used flour and sugar, of which we happened to have a good supply, to try to keep them alive. Feeding horses on flour and sugar.

Judging from the look of your garden this soil will apparently grow anything? Yes, with plenty of water it will.

Would it not have paid you to irrigate for a crop? It takes time to start irrigation, and we were not prepared. Irrigation.

Had you sufficient water in the river if you had started irrigation? That would be doubtful, I think.

Suppose all the stations started irrigation, there might have been no water in the river.

I suppose you have kept your garden going entirely by pumping from the river? Yes.

Has the irrigation been a success? Oh, yes, as far as the garden is concerned.

Have you seen irrigation tried on the river? I have seen it at Tapio.

Has it been a success there? I think so, comparatively.

It all depends on the water and the lift? Not entirely. I do not think you could find 10 acres equal to the natural soil of this garden between here and Wentworth.

Is there good soil where the sand ridges abut the bank of the river? Yes; there is a little space between.

Do you find the sand ridges better for production than the black-soil flats? In ordinary seasons.

With water, which would grow the best crop, the sand ridges or the black flats? I have never seen our black flats look so good from rain as this year. But this special spot is on the foot of a sandhill, which is a sort of a mixture of sand and black soil. One runs into the other.

But do you think the black-soil flats all along the river would grow lucerne if you had plenty of water? I have never seen lucerne tried on them.

What is the character of the soil at Tapio? Sandy.

Have you any ana-branches on the run? No. The water goes out about half a mile from the river.

How long will it take this flood in the river to go down without further supplies;—will the river keep up for six months? Oh, no. I should say, without more rain, from ten to twelve weeks.

Is much water taken down the Great Ana-branch;—have you seen it to run? I have just seen it running, but I do not know what water goes down. Of course there is a great deal of water running into the lake.

*Mr. Gipps.*] Are there any large waterholes in the river near here? There is a good waterhole here which I have never seen anything like dry, and 10 miles up there is another large waterhole. Waterholes

What depths are these holes? I have never tried the depths.

What length do they extend? The deep holes are certainly not more than about from 50 to 150 yards.

Do you pump a large quantity of water from them? I suppose this garden is not more than an acre, and we only pump for that.

Does that pumping seem to reduce the level of the water? Not perceptibly.

Do you think there is any under-current in the river? There might be a very little soakage.

What is the character of the water in the waterholes when the river ceases running? It gradually becomes brackish.

Fit for drinking? Some people object to it, but we have to use it; there is nothing else. I have never found it injurious myself.

What is the general character of the country on your side of the river;—is it flat or hilly? It consists of mallee and porcupine sandhills, with small patches of salt-bush.

How far do the river flats extend to these sandhills on your run? Half a mile.

Do these sandhills extend as a regular ridge forming the divide between the Darling and the Murrumbidgee? Sandhills.

Mr. C. H. Wreford.  
6 Oct., 1886.

Murrumbidgee? We have sandhills here within half a mile of the river, and then we may have broken plains between, but we have sandhills out 50 miles from here. There is no doubt there is an irregular ridge. After you get from 50 to 70 miles out from the Darling I do not think you would meet with any more sandhills till you reach the Lachlan.

What is the average height of these sand ridges from the level of the river bank? They are of various heights—I should think about 50 feet.

What is the character of the river bank—is it rocky? It is certainly not rocky. There are a few rocks, but they are the exception.

Is it stiff clay or sand? You can generally get clay on one side, and sand on the other. It is principally clay, I think.

Is it permeable? Not much so.

Wells. With regard to the first well, which was sunk 100 feet, what was the character of the strata? Clay for a certain distance, and then drift sand, so drifts that the man who sank the well could not go below 85 feet. The supply he got for us was not more than 600 or 700 gallons per hour. The consequence was we would have to keep on baling night and day for the sheep. Then we employed another man, who had a patent cylinder, which he put down at great cost through the drift. By using round buckets he got us a good supply, but the drift was so fine that he could not possibly timber the well.

What was the character of the water? It is brackish. Sheep do fairly well on it, but they do not grow good wool. They drink it readily.

Do you draw on it continuously? Not all the year round; only when the dry weather sets in.

To what level did the water rise in the well? In the first place not more than 6 feet until we got the cylinders put down; then we had from 14 to 15 feet of water.

What quantity of water have you pumped from it regularly? We pumped about 16,000 gallons in the twenty-four hours.

Did that reduce the level? Only to a certain point, to about 8 feet.

And you think no amount of pumping would have reduced it lower? I think it might have been reduced lower.

Was the well sunk in a watercourse or clay-pan? It was sunk near a depression on the edge of a cane-grass flat.

What depth have you generally sunk your trial shafts? From 70 to 160 feet.

Never over 160 feet? No; we generally get very salt water from 70 to 100 feet.

What is the general character of the strata you passed through in those wells, drift or sand? Through clay, and then drift and sand.

Coarse drift? Sometimes coarse, but usually very fine when we get the water.

Are there any depressions on the run? Yes.

Are they ever filled with water? They are shallow depressions, and have never been properly filled. Even in 1870 3 feet of water was the greatest depth we had, except in one depression.

Are they filled by local rains? By no other means except local rains.

Are there any long watercourses on these sand-ridges? None.

Winds. What are the prevailing winds in summer-time? I think about south-west.

And in winter? I think north-west.

Do the winds blow strongly and continuously? They blow more in summer than in winter.

More during the night than the day? During the day.

What is your average rainfall for the last fifteen years? About 9 inches, I think.

Does the rain come in heavy storms or continuously? After all my experience I do not know how it comes. We used to get it in storms, but the last few years what we have had has been in drops.

It has not been of much benefit to vegetation? Very little till this year.

Have you any heavy dews? Very few.

At what season? What few dews we get are generally about June and July.

Does not this flooding of the country affect the fall of dews at all? I could not say. We do not derive any advantage from these floods at any distance from the river.

Rainfall. Mr. Donkin.] What is the lowest rainfall you have had? Speaking from memory, about 6 inches.

Do you generally get the rain at one particular time of the year, or is it distributed over the twelve months? At no particular time; we get very little.

Is there any certainty as to when you may expect it? We are never certain of getting any.

Six inches in two falls in the year would be sufficient to keep up herbage, I suppose? It would be better than the way we have been getting it for a few years.

What do you consider would be a sufficient fall in a dry time? We have had so little rain that we are glad to get anything, but I think after a very dry time nothing less than about 2 inches does us much good.

After your experience of these dry times here, do you intend to irrigate for fodder? Well, I intend to clear out the first chance I get. I do not intend to try irrigation.

Mr. Gipps.] What is the area of your largest depression? I think about 3 square miles.

Could it be filled from the river? No; it is not possible, except at an enormous cost.

Is there any creek which feeds it now? No.

---

FRIDAY, 8 OCTOBER, 1886.

At Tapio Station.

Mr. A. T. Brooke examined:—

Mr. A. T. Brooke. Mr. Donkin.] How long have you resided on the river? I have been here constantly for ten years.

What is the area of your run? 800,000 acres.

8 Oct., 1886. About what number of stock do you carry on the run? We have shorn 130,000.

Have you known many floods in the Darling? Several, but I could not enumerate them. The 1879 flood was the highest we have had since 1870.

How much higher was that than the present one? I could not tell that without looking, but I should say about 6 feet.

You have a gauge in the river, have you not? Yes.

Back-water of Murray. The rise in the river here depends a great deal on the back-water from the Murray? Yes.

Do

Do you know how far up the Darling the Murray waters affect it? Up to Seaward's selection, about 10 miles from here. That is a regular thing.

Have you any rocky bars in the river? There is only one that I know of; it is about 5 miles up from here.

What do you call that? Mypumby.

What is the description of rock? Sandstone; but I do not know whether that is the real name.

Do you think it would be possible to build a weir on it? I do not know anything about weirs.

You have known the river to be low? I have seen it absolutely dry. That was last year.

Was it dry for any time? The Murray kept it up here. A little water came down the Murray and backed it up here.

If it had not been for the Murray the Darling would have been absolutely dry? Yes, except the water-holes.

What zero do you adopt in reading the gauge here? Our gauge registers a foot when the "Trafalgar" steamer can get up here. River gauge.

What do you understand as summer-level? It does not mean anything; everybody has his own summer-level.

They telegraph from Bourke so much "above summer-level";—do you understand that? Yes; we know what 40 feet above summer-level at Bourke will do here, but everybody seems to speak of summer-level at random.

What do you recommend should be adopted as zero? The height of the 1870 flood, and to read downwards from that.

Is that flood well known? It is marked everywhere, I think.

Would not the present flood be better known throughout by the present settlers on the river? I am not sure; the 1870 flood was in everybody's house, and is marked on the trees.

Has navigation been stopped for any lengthened period here? It is stopped every year from about Christmas to May or June. We are wholly dependent on Murray water for navigation.

Is there any particular season of the year when you look for a rise in the Murray? Yes; it is generally at its highest at the end of October.

What is the rise caused by? Snow-water.

How do you account for the body of water in the river here being so much less than at Wilcannia? I cannot account for that at all.

What I mean is this, the river is over the banks 2 or 3 miles further up, and as we approach to the junction of the Murray it is so much more confined? It may be deeper here.

What is the depth here now? It is about 20 feet.

It is 42 feet at Bourke;—can you account for the difference? Well, the Ana-branch takes off nearly as much as the Darling, and there are other creeks; and there may be an underground soakage. This seems probable, because the river went dry up above a month before it went dry here.

How do the bends of the river compare here with the straight road? As 3 to 1. It is 33 miles to Wentworth by river, and 12 by road.

Since you have known the Darling, have the floods been confined to the large channel, or have any new channels been cut? The floods have cut off one bend of about half a mile. Action of floods.

Is that action going on now? I think so. I think the next big flood will cut off this bend in front of the house. The river is silting up too.

More at present than formerly? I think all the deep holes are being filled up.

Can you account for it? I think it is by the action of the steamers, which are always washing silt in.

In the few years since navigation has increased, have you noticed any difference with regard to the caving-in of the banks? Of course navigation was going on when we came here, but not to the same extent. There was a deep hole in front of the house, which is all filled up.

Do you account for that by the wash of the steamers? I think so, to a certain extent, but of course wind and current have an effect too.

How long do you reckon the present flood will take to fall to summer-level? I think it will take fully two months.

Have you ever, in a low time here, dammed the river? Yes; last year we had it dammed.

Did the dam throw the water back to any distance? It was back-water of the Murray that we dammed with sand, and the dam lasted till another flood came down, in a fortnight. Three men made the dam in a morning. The water was only intended for the garden. Dam in river.

Have you known any dams of any size to be put in the river? No.

You have a considerable area of dry country? Yes, almost all of it.

Before water was conserved on it, was it possible to occupy it? No.

You have no natural water on the run except the river? No; and except two dry lakes, in which there is water occasionally in time of flood. One is called Fletcher's Lake, and is about 1½ miles by 1½ miles. Lakes.

It is about 1,000 acres in extent, and is on Tiltao and Outer Tiltao.

That is filled by the overflow of the Murray? Yes; it was last filled in 1875. We got 3 feet of water in it in 1879.

Do you think it would be possible to conserve any depth of water there? It would conserve about 12 feet.

That would be almost permanent? Well, it lasted from the end of 1875 to the beginning of 1878, without any dam being made.

Which would be the most profitable undertaking: to fill it for watering stock, or for irrigating the country? That would depend altogether on whether you had to pump your water. I should irrigate it and sow it with lucerne.

I mean, to bring the water by gravitation? Then it would be best to use the water for irrigation.

Have you found since you have been here any falling off of late years in the flood-waters of the Murray?

There has been no flood in the Murray worth speaking of since 1879.

Do you think that is accounted for by the draining off of the water? I think it is accounted for by general drought.

How do you supply water for the stock on the back of the run? By tanks.

What description of tank do you find the most serviceable and permanent? 20,000 yards is the largest we have. Tanks.

And

- Mr. A. T. Brooke. And the depth? We only go down 12 feet.
- 8 Oct., 1886. Do you consider that permanent? Well, the water will last as long as the feed will.
- Wells. Do you know approximately the amount you have spent on the run for water improvements? I could find that for you.
- Have you any wells? They are all salt, but we have two in the bottom of Gol Gol Lake. The water in one is brackish, and in the other it is of an iron nature, but they are both good stock-water.
- What depth are they? 12 to 16 feet to the water. They are only soakage wells, and are nearly dry now.
- What is Gol Gol Lake filled by? By the Murray.
- Do you not think you could obtain good water by going deeper? We have been down 250 feet and got salt water.
- Have you tried any greater depth? No.
- Do you know of any other deep wells having been put down? That is the deepest on this side of the river about here.
- Do you know of any artesian wells having been discovered in this district? No.
- What is the deepest well you know of in this district? I think that one of ours.
- Have the Government put down any deep wells? They have not put down a well at all here.
- Have you always had water? Yes, except for a short time in the back country.
- Is there any means by which the losses can be averted? By selling the sheep early.
- Reserving the run. Have you tried the plan of spelling any portions of the run? Some of it we have had to spell because there has been no water on it.
- Do you think it would be possible to secure absolute immunity from losses by adopting the plan of spelling the run? No; but I think the country ought to be spelled half the year. But the dogs that have got at large through rabbiting will prevent any immunity from losses in the future. They are swarming this part of the country now.
- Irrigation. You have tried irrigation? On a small scale. We have 22 acres under lucerne, and about 80 acres under a crop of wheat and oats.
- What year did you first try irrigation? Last year. Then we had about 30 acres of wheat in. We sowed it in May, and only watered it once, and that was as soon as it was sown.
- What was the result? We got a little over a ton of hay to the acre with one watering.
- Was that sufficient watering? It ought to have had another, but we were afraid to wet it too much.
- And when we started to water in September there was an inch of rain.
- Success of experiment. What result had you with the lucerne? The first year a poor result, but we think that was because we sowed it too late. The next year we did better. From February 10 to April 28 we averaged 384 sheep on it fattening; that was a little over eighteen sheep to the acre.
- Have you cropped it since? No; it does not grow in winter. But it was overstocked at that time, which was owing to the fact that we were short of water and could not irrigate it, else it would have carried the sheep easily.
- Do you think if you had plenty of water, and not too great a lift, that you could carry eighteen sheep to the acre throughout the summer? There is no doubt of it.
- Is there any difficulty with lucerne in preparing the soil in the first instance? We only scarified our land with the scarifying machine; we did not plough it.
- Is it not usual in some parts to grow a crop of corn before the lucerne? I see they do that at Gunbower.
- What lift had you in the Darling? Part of the time we were lifting up to 38 feet.
- What size of pump and engine? We had a 10-inch centrifugal pump and an 8-horse power engine.
- What would that lift be capable of irrigating? We could easily water 40 acres if we had a strong enough engine.
- What do you consider a sufficient supply for the land in the first watering? The land must be flooded. If there is a little patch only a foot square that the water does not go over the lucerne on it looks quite small beside the rest.
- Had you sufficient water in the river since you erected the plant to carry on irrigation? No; part of the time we had to stop.
- Was there a waterhole where you worked? Yes; but we pumped that out; it is only half a mile long.
- Do you think, from your experience, that if you had a certainty of plenty of water you would be recouped the expense of the machinery and preparing the land to grow lucerne? Yes; the land would carry from eighteen to twenty sheep to the acre.
- Is there any peculiarity about the soil? No; it is the ordinary red loam.
- Is that the character of the bank all along? No; that is about the only place where we have red loam coming up to the bank of the river, although all the country is red loam at the back of the flooded country, which is stiff black soil.
- How far does it extend? It is not level for any distance there.
- Have you tried what is generally called the stiff black-soil plains for irrigation? No; we have never tried them, except a little piece which is not properly black soil; it is more sandy.
- Do you think the clay flats would grow a crop? I think not. Seeing they were nice and level, we made an experiment. We dug up some inside four hurdles, and had it watered with a bucket. The lucerne came up about a quarter of an inch long, and seemed to stop there. The ground appeared to cake round the root.
- Do you find the stiff ground opens into cracks in summer? Yes; it breaks up into little pieces about 2 inches square.
- In growing lucerne by irrigation, would there be any danger of being infested by rabbits? No; it is easy to keep rabbits down, especially on a small area such as would be under irrigation.
- Local rain.] Mr. Gipps.] Do local rains effect a rise in the river at all? I have seen the river rise a few inches from local rain, but it was only a temporary rise. We had about 6 inches of rain in a fortnight at Christmas, and that made the river run a little.
- What is the character of the strata forming the bed and banks of the river? The bed of the river is white sand, but I think it is lying on the mud or a sort of brown clay.
- And the banks? The bank on one side is nearly always a high bank, and the other one is low. The banks run through this same kind of clay ground.
- Is it porous? Not at all. Do

Do you consider there is any underground drainage? I think that when the river is high the water goes into some underground basin, and afterwards drains into the river again, because when the river is low there are salt-water springs in it. Mr.  
A. T. Brooke.

Are these springs of any size? No; they just trickle a little.

8 Oct., 1886.

Do you not think that the narrowing of the channel here at the lower end might be accounted for by the loss of water in the Talywalka and the Big Ana-branch? I daresay it might to a certain extent. Such lakes as Menindie Lake must take a large quantity of water.

Is there any outlet from Lake Fletcher? No; it has run into two or three little lakes in 1870, but not since.

What distance is the lake from the right bank of the Murray? About 3 miles.

And from the left bank of the Darling? About 6 miles.

Could the lake be supplied by Darling water? It would want a deep cutting, but I think the water would run down there.

Are the banks of the lake high? Yes.

What is the character of the banks? Red loam.

Are they 40 feet high? I suppose they are fully that.

How may the water-level of the lake be distinguished? By the box-trees; but we have seen all the box-trees in water.

What is the height of the Murray when it flows into the lake? About 20 feet at Wentworth. It will commence to run in now at about 18 feet at the present cutting.

Is there any other lake that could be supplied by the Murray or Darling floods? There are Gol Gol Lakes, Lake and Gol Gol Swamp.

What is the position of Gol Gol Lake? At the corner of West Paringa A block and Gol Gol.

What distance is that from the right bank of the Murray? About 3 miles.

What must be the height of the river to supply the lake? 19 feet at Euston.

What is the area of the lake? There are two lakes—one is about 1½ mile by 1 mile, and the other is about a mile square. The swamp is about 6 or 7 miles across each way.

What is the average depth of Gol Gol Lake? About 8 feet.

And the depth of the swamp? I do not know. The water is allowed to run out for the sake of the feed.

Do you think a large quantity of water could be conserved in the swamp? I think so. We had it dammed once, but our neighbors wanted the swamp for feed, and they cut the dam. It is all on their country.

What is the character of the inlet to Gol Gol Lake? Just a well-defined creek.

Is there any outlet to it? No.

Is there any other depression on the run? No, except several billabongs.

Could you divert the river Murray in high flood over any area of country between the Murray and the Darling? No, except on the flooded country.

As you get towards the back of the run, is the inclination of the country towards the Darling or towards the Murray? The country has no inclination in any direction. It falls in all sorts of ways.

How many wells have you sunk? I think we have sunk about nine wells besides shafts and bores.

Wells.

What is the character of the strata in these wells? In the deep well we were in damp sand for the last 200 feet. There was just one small stratum of clay which we came across before we got the water.

Did the water rise in the well? No.

And what was the character of the strata in the other wells? In every case we got down into very fine drift sand. It was so fine we could not get through it. It used to boil up under the boxes and make great holes behind the slabs.

Did you ever try boring through the quicksand? Yes; but we bored through 70 feet in salt water, and, in fact, got jammed.

You never bottomed on rock? No; they did at Paika adjoining us. They bottomed on bluestone rock.

Did they get any water? No. They did not go on with the well, because they understood they might have to go 200 feet through bluestone rock.

Have you bored in any sandstone here at all? We have come across sandstone in the borings.

No water in that? No; we went through it, and it was just the same sandstone as there is here on the river and in the lake. The little wells all along the lake got into sandstone.

What is the average rainfall here? About 10½ inches.

Rainfall.

For what number of years would that be? Excluding the good seasons of 1870 and 1872, that average would be for about fifteen years.

Does the rain fall in heavy storms? No; it is nearly all wasted by falling in small showers.

What is the prevailing direction of the wind? There are several. Whenever it comes in the north we expect rain.

Is it sufficient to allow of the use of windmills continuously? No; it is not steady enough. Every station around here has tried a windmill for its garden, and has given it up. They have nearly all engines.

Windmills.

What is the character of the windmills? We had an immense Empire windmill standing on a sandhill, but we were nearly always without water. Then it met with an accident, and we started an engine.

Have you any dews in this part of the country? Very seldom; occasionally with wet weather we have dews. In the winter there is nearly always dew on the lucerne.

What is the general character of the country at the back—is it rolling country? It is scrubby country, and there are no proper undulations. Every little hill loses itself, and there is no creek or waterhole.

Is there any indication of a watercourse? The Willandra is supposed to have run through part of this country from the Lachlan, but it is all supposition. There are creeks on Arumpo, and some on Turlee.

Are there any other creeks on the run besides the Willandra Billabong? No.

What character of timber have you here? Oak, pine, and mallee.

Is the pine becoming troublesome at all? No.

Have you tried lucerne without irrigation? Yes; we did on the clay flats.

What was the result? Hardly any of it came up, but the trial was not a fair one.

Have you tried other crops without irrigation? No.

Have you known of any crops which have been tried? A lot of selectors have tried crops, and they are getting a good result this year; but they have never had a crop except in 1879. No crops without  
irrigation.

Do

- Mr. A. T. Brooke. 8 Oct., 1886. Do you think you would have had any success with your crops without irrigation? No.  
*Mr. Donkin.*] What is the area of the mallee on your run? More than half the country is mallee,—more than 400,000 acres.  
 Is that useless? Well, something grows in it, but very little.  
 Have you the spinifex? Yes; it grows through it.  
 You put down a well 70 feet;—how long did it take to sink? They were all done by contract.  
 What does it generally take to sink 100 feet? Two men would sink 100 feet trial shaft, without timber, easily in a week.  
 Do you think if the Government tested this country, say to 2,000 feet deep, for artesian water, that private individuals would sink deep wells? As far as we are concerned we have more water than feed.  
 We are not troubled for water.  
 You say you have 40,000 sheep on 800,000 acres—is not that a small quantity of sheep? We should have had to cut scrub for them if it had not been for the January rains.  
 Do you lose much water by evaporation? I do not think so.  
 The Willandra. Do you think it would be possible to divert the Willandra from the Lachlan, or the Darling from the Teryaweynya Lakes, in this direction? I dare say; the Willandra is easily traceable on to Gol Gol station.  
 Do you think a greater body of water could be brought down the Willandra than is obtainable now? Oh, yes; the whole stream could be sent down.  
 Have you been across the Lachlan in a dry time where it runs out? I have seen the mouth of it when it was not running.  
 Is it a well-defined channel? It is; but as soon as there is any sort of a flood the water is all over the banks.  
 Flooding for lucerne. What method do you adopt in flooding your lucerne? The land is all in beds, and we cover it all with water.  
 You have no distributory drains? One or two beds we trickle it over.  
 What area are the beds? 4 acres.  
 Did you try flooding the land as a whole? It is not level enough for that; some of the beds are a foot higher than the others.  
 You have a main drain through the centre of the paddock—how do you check that? By sandbags.  
 Do you think private enterprise is checked to any extent by there being no legislation to empower the erection of dams? I do not know that it is checked, but great annoyance is caused. People generally erect the dams and chance the consequences.  
*Mr. Gipps.*] Do fruit trees grow well here with irrigation? Most fruit will grow here. Oranges, lemons, and grapes grow splendidly, but not cherries.  
 How long after they are planted will the orange trees bear? I think they would bear the second year if allowed. The orange and lemon trees bear prolifically.  
 Do almonds grow well? Yes; in fact, I think cherries are the only fruit that will not grow.  
*Mr. Donkin.*] The pepper trees here, which we see 20 feet in height, how long have they been planted? They were put in in 1880.  
 Would they grow without water? Only badly, I think.  
 After the water in the wells has been exposed to the atmosphere, are the salts absorbed to any extent? No. We tried pumping one well to see if we could improve it, but the water did not get any better. We also tried pumping salt water into fresh for our sheep, but we spoiled good water, and they would not drink the mixture.  
*Mr. Gipps.*] Have you ever observed the overflow water from these wells;—does it leave any deposit on the soil? Yes, a thick white deposit.  
 Is it soda or salt? I do not know.  
 Does it seem to affect the vegetation in its vicinity? I do not know.

SATURDAY, 9 OCTOBER, 1886.

At Tapio Station.

Mr. D. H. Cudmore examined:—

- Mr. D. H. Cudmore. 9 Oct., 1886. Murray water backed up Darling. *Mr. Gipps.*] What is your occupation? Squatter.  
 What is the name of your station? Avoca.  
 How long have you resided in this neighbourhood? Since 1871.  
 Have you had any experience of floods in the Darling River? Yes. The largest I have known was in 1870. It was just subsiding when I came here.  
 Was that flood influenced by the Murray being in flood at the same time? Yes, as far as about 10 miles above our station, Avoca. In the 1870 flood the back-water went up to a place called Bull Camp on the Ana-branch. That would be about 20 miles up the Ana-branch, as the crow flies.  
 How far have you known floods in the Murray back up the Darling, without a flood in the Darling? I have known the water to go 60 miles up the Darling, but the 1870 flood must have gone 100 miles up, following the course of the river.  
 What is the character of the bed and banks of the Darling—are the strata composing them permeable or impermeable? They are just clay with sand veins—a sort of clay which is filled in places with gypsum or copai. At the station I sunk a well for an underground water-tank, and we came to this gypsum and sand veins about every 3 or 4 feet.  
 What was the thickness of the sand veins? From 2 to 6 inches.  
 Did they bring in any water? Salt water invariably.  
 What depth from the surface was that? Only about 20 feet.  
 Do you think the banks of the river itself are permeable or impermeable? With the exception of the veins I speak of, they are impermeable.  
 Can you give any information on the Great Ana-branch of the Darling—does it intersect your run at any point? Yes; it goes through a portion of it, and we have frontage over about half the length of the ana-branch.

What

Mr. D. H.  
Cudmore.  
9 Oct., 1886.

What is the greatest distance at which it runs from the right bank of the Darling? About 50 miles.

What is the character of the bed and banks of the Ana-branch? It is a sort of rotten clay which dissolves in the water. In the beds of the lakes it is not good clay, but like black soil. If you put a piece in water it melts away like sugar. It cracks terribly. It is a sort of clay, and becomes very sticky when slightly damped; but when thoroughly wet it does not stick.

Then the beds are permeable? Oh, yes.

What must be the height of the Darling before it flows into the Ana-branch? About 15 feet above summer level—that is to say, when the river is 18 feet on the Wilcannia gauge it will run into the Ana-branch cutting.

What is the average width of the Ana-branch? It would average about 4 chains, I think; then there are cliffs which generally rise about 100 feet.

What depth is the Ana-branch? About 12 feet—the creek proper.

Are there any rocky bars in it? Yes.

Does the rock cross the Ana-branch? No; it shows only on one side—on the left bank.

What is the character of the rock? A sort of burnt conglomerate, composed of a little quartz pebbles and some reddish-looking stones,—a kind of ironstone. It seems as if it had been all molten together.

Are there any lakes or depressions on your run? A great many.

What are the names of them? I have a description of all the lakes, which I will hand in as an appendix. <sup>Lakes.</sup>  
(*Appendix to Report on Darling River, No. 15, with diagram.*)

Does this description include the length, breadth, area, and depth of each lake? It simply says, “shallow depression,” and so on.

Which is the largest lake? Tandou. Tandou Lake is not on our run.

What is the length of it? About 12 miles long, and it is 7 wide.

And the average depth? That I could not tell you, but I should think it is about 12 feet.

What is the character of its banks? I do not know. I have never seen Tandou Lake myself, but I have reports on it from men whom I sent to inspect it.

What is the largest lake you can actually give information on from your own experience? Traveller's Lake, which is situated on Urntah South Run and Illawla Run.

How far is it up the Ana-branch from the Murray? About 80 miles; it is partly on Polio Run.

What size is it? About 10 miles by 7.

And the average depth? It is hard to gauge the depth. I know the water requires to be 3 feet 6 inches in the Ana-branch before it will spread over the lake at all. It is about 6 feet deep.

What distance is it from the left bank of the Ana-branch? About 2 miles.

How is it supplied? By four creeks from the Ana-branch.

Is there any outlet? No.

What is the character of the banks? They are what you would call very permeable sand and rotten cracked clay.

And the character of the bed? The same rotten cracked clay; I should say it is very permeable.

Have you tried sinking in any of these lakes? Yes; but not in Traveller's Lake. Our predecessors sunk in Traveller's Lake, and got salt water. We sunk in Milkengay Lake, and got both salt and fresh water. Do you throw the water into these lakes by dams? Not into Traveller's Lake, but into several of the others.

What is the height of the dam that throws the water into the four lakes? 14 feet, and the length is 150 yards.

What is it constructed of? It is just a clay bank.

No puddle? No.

Has it ever broken away? Yes.

Have you any by-washes to it? It has three by-washes altogether, but two of them are now washed away and useless.

Are they natural by-washes, or have you constructed them? They are natural by-washes.

What is the approximate cost per cubic yard of constructing these dams? I suppose, everything considered, they would cost about 1s. 6d. a cubic yard. We have had some done for 1s. 2d., and a little has been done for 1s., but there is so much pick-and-shovel work, and topping over with barrows, that if all the items were put down the cost would be about 2s. I think.

How far does that dam throw the stream? Over 40 miles by the creek.

Have you any other dams on the main creek? Eight in the Ana-branch.

Have you ever had any difficulty with your neighbours lower down? A good deal.

Have they destroyed dams at any time? Yes; they destroyed three dams in 1879, and the cutting away of those three destroyed three more below.

For what purpose did they destroy them? They would not wait for the water.

Did the water go down when they cut the dams? The water went down, but they did not keep so much as they otherwise would have had; it all went into the Murray.

By breaking the dams they actually wasted the water? Yes.\*

Have you any other deep depressions on your run which are not filled by the floods of the Darling or Murray? Nothing of any consequence, except what are filled by such floods as that of 1864. There is one hollow about 5 miles from here—a sort of a salt-pan. It is full of that ironstone, and the water is as salt as the ocean, but it is not a salt lake. There are numbers of these salt lakes in this back country, some of which are about 3 miles long.

How far are those salt lakes from the right bank of the Ana-branch? About 10 miles.

Is there a chain of them? Yes.

And how are they filled? Simply by local rain. They are dry a great portion of the time.

Are they of any size? From a mile to 3 miles long, and about a quarter of a mile wide.

What depth? About 4 feet.

How long do they last when they are filled? Just a few weeks. Some of them have nearly always water in them. They are boggy, but whether this is due to rain or to the fact that they are down to the salt spring I do not know. Many of them are never dry enough to cross, and a heavy rain fills them.

What

\* NOTE (on revision):—These dams are now, December 6, 1886, all repaired, and being filled through 3-foot sluice-pipe in 183 dam; three are full. I am managing the water below Pop Lake, and have already conserved a large quantity.—D.H.C.

- Mr. D. H. Cudmore.** What is the character of their bed? I never took much notice of that. It looks like a clay-pan, but it is slimy mud underneath. The banks are all red stuff, worn by the weather into fantastic shapes. It looks like crumbling or decomposed red and yellow sandstone.
- 9 Oct., 1886.** Have you any creeks, independent of the river, on your run? None, excepting the Ana-branch.
- Tanks.** Have you any tanks on your run? Yes.  
What is the average size? They range from 2,000 to 10,000 cubic yards.  
What is the average depth? From 12 to 14 feet.  
How long will they last? A few of them last the season through, but only two or three.  
Does the soil seem retentive? Oh, yes.
- Evaporation.** Do you lose much water by evaporation? A great deal.  
You have not measured it? Not accurately. I know when I have dammed the Ana-branch 17 feet of water will only last twenty months—that is, with stock drinking at it and evaporation. I attribute a great deal of the loss to soakage.
- Wells.** Have you any wells? We have not been able to get any good ones, except in the bed of the Ana-branch.  
What depth have you to go to get water there? From 12 to 25 feet.  
Do you get fresh water? Yes, but no supply; it is easily pumped out.  
Are these wells filled in by the floods? Yes.  
Can you get water anywhere by sinking in the Ana-branch? Oh, no; in nine out of ten trial shafts the water proved saltier than the ocean.  
Have you noticed any difference in the character of the strata where you get the fresh and the salt? There is a kind of yellow and red clay wherever you get the salt water. Wherever you get the ordinary brown clay and then the white sand you come to fresh water.  
What depth is the drift sand you get? It varies. In some wells we have 3 feet of it, and in some places there must be 8 or 10 feet of it. In others we have gone through several feet of it, and have not been able to get through.  
Do you get a large supply when you get into a deep lead like that? A very fair supply, but it is difficult to keep the drift sand out.  
How many gallons a day would these wells supply you? I do not think the best of them would give more than 10,000 gallons a day.  
Does the water rise in the wells when you strike it? No. It will rise in the bore a little way.  
Have you any bores on the run? Bores innumerable, but no artesian wells, or anything of that kind.  
What is the deepest bore you have put down in New South Wales? About 90 feet. We come to such quantities of salt drift that we have given up boring. I hand in this description of the bores on Popiltah Run. (*Appendix to Report on Darling River, No. 16, with diagram.*)  
Did you ever bottom on rock in bores or wells? No; excepting in the wells on the Ana-branch.
- Rainfall.** What was the character of the rock there? A sort of hard sandstone.  
What is the average rainfall in this part? From 8 to 10 inches.  
What are the prevailing winds in summer? North-west.  
And in winter? West and south-west.  
Which winds seem to bring up the most rain? The north-west.  
Does the rain come in heavy storms or lightly? In heavy storms.  
Are the winds so continuous that you could use a windmill? I think not; we do not use any.
- Irrigation.** Have you tried irrigation at all? No, except on a very small scale with the garden, about an acre and a half. I irrigated a little lucerne.  
What is the effect? It grows very well.  
How many cuttings in the year can you get from it? I could hardly say, but I dare say about once every three weeks in summer. In winter it will not grow, because of the frost.  
You do not know what quantity of water you put on it? No; we give it an unlimited supply.  
What is the general character of the country in your district as regards its natural features—is it rolling or flat? Undulating.  
And the character of the rocks? There is no rock, except that iron-stone and conglomerate, and a little sandstone.  
Is there much timber? There is no timber I might say, excepting on the river, and that is not very good.  
There is a little pine.  
Does the ironstone occur in beds? Yes.  
What thickness of beds? About 2 feet.  
Are they tilted at any angle? No; they are almost perfectly flat.  
Does the bed strike north or south? It seems to strike east and west.  
What is the greatest thickness of the whole bed you have seen? At one place where it shows on the bank of the Ana-branch it is a mass of rocks. I suppose there are about 6 or 7 feet showing out of the ground.
- Floods.** *Mr. Donkin.*] In speaking of the floods, which was the highest known here? That of 1864 was the highest in the Darling, speaking from hearsay.  
Then that of 1870 was the highest after 1864? Yes.  
The 1870 flood was quite 6 feet higher than the present flood, was it not? It must have been higher.  
And the 1879 flood? That went up to 21 feet at Wentworth, and the present flood is now 15 feet there.
- River-gauges.** You have a gauge in the river? Yes.  
Does that read from the bed or from summer level? It is a good test of summer level, because when my gauge reads 3 feet a steamer can travel past my place. It is navigation level.  
What zero have you been accustomed to read from, navigation level or summer level, or the bed? From the bottom of this gauge. We keep a record of below navigation level or the bottom of our gauge.  
What do you call summer level? When the river is just running.  
Do you understand the height which is intended when it is telegraphed from Bourke and other places so many feet above summer level? I think the gauges are set at different levels, because we got a report from Pooncairie, and the water had to rise 6 feet before it came to the gauge at all; so when they reported 3 feet of water there was really 9 feet of water there.  
What would you recommend to be taken as a standard? I think the most reliable would be to take the 1870 flood, and read downwards from that.\*

\* NOTE (on revision):—Take summer level, or when the river is just running.—D.H.C.

Would not the present flood, which is well known all through, be a good standard to take? They will not record it at a great many places. I think to take the zero as from the river when it is just running over the bars would meet every purpose. The river has washed deeper here owing to the taking out of the snags. When we put up our gauge we intended it to be on a level with the water when just running; now it goes 3 feet below the level of the water.

Mr. D. H. Cudmore.  
9 Oct., 1886.

What is your gauge reading now? 18 feet 6 inches.

We saw it at Bourke a fortnight ago reading 42 feet;—how do you account for the difference? The water rushes away into the Murray.

You think then that the rush of the water into the Murray, which is lower than the Darling; and into the ana-branches and lakes, makes up for the difference? Yes. In 1864, for instance, the water was nothing like a proportionate height here. The Murray was very low, and the water rushed away. The 1864 flood did not injure Wentworth at all, but that of 1870 did, because the Murray was in flood.

Murray flood.

The flood here, then, greatly depends on the height of the Murray? Altogether.

How many miles an hour do you consider the river is running now? I should think about 3 miles an hour; but of course I am only guessing.

Since you have been on the river, have you noticed any alteration in its course—is it silting up in any way? Nothing worth speaking of. There is one place about 3 miles above here where the channel has altered altogether, but that is what we call a break-through.

Is there much erosion of the banks going on? A good deal.

What is that from? It is owing partly to the steamers, but mostly to the soluble nature of the banks. The water eats in, and more particularly in the little sand veins which run horizontally in the banks.

Does it silt up the waterholes? Not to any appreciable extent.

Do you know any rocky bars in the river? There is one about 3 miles above here.

Is there any fall here? At summer level there is.

Do you think it backs the water at all? Not to any practical extent.

Have you lost any stock in the drought through want of water? The stock died for want of feed; not water; but had we had more water in places where we had feed we should not have lost so many.

Losses of stock.

Speaking of the lakes, if they were filled, would the water be permanent? No; the best of them has only lasted five years, and that was with 18 feet of water in it.

Lakes.

Which one was that? Milkengay Lake.

Can stock water at all those lakes? No; at very few.

How is that? They are too boggy and rotten; stock cannot get near the water.

Then they are useless for water purposes? Yes, except when they are quite full; then the banks are a little more sandy, and the stock can get to them.

That is a peculiar feature of these lakes, is it not? Yes.

Could the lakes be used for irrigation of the natural grasses by flooding their surface? Yes.

Is there good grass in them? Yes. Grass only grows in parts of some of them, and after a flood has gone off.

Have you tried damming the Ana-branch and flooding any of these lakes for the purpose of irrigation? Yes, we have. We did not do it for the purpose of irrigation, but more to conserve water.

Have you seen such rotten lakes in other parts of the country that stock could not water at them? No.

Are there any mud springs in the salt lakes? No.

What is about the total length of the Ana-branch? About 300 miles.

Great Ana-branch.

Suppose the Darling were weired and more water thrown down the Ana-branch, is there any possibility that the Ana-branch would become the main channel? Oh, no; if all the water were sent that way it would become the river then; the soil is so rotten it would wash out and deepen the Ana-branch.

What proportion of water passes down there as compared with the river? Very little.

A fourth of the river? Oh, no. The water does not enter the Ana-branch at all until the river is 15 feet high there. We made a cutting there over 10 miles, more or less, 12 feet wide at the bottom. It is not cut all the way; patches here and there did not require cutting.

Where does the Ana-branch come out? Tandou Creek, which is the main arm of the Ana-branch, also Campbell's Creek, come out above Netley, and are dammed and interfered with, but the Ana-branch cutting on which we have to depend is below Netley.

What is the greatest distance you back the water by a dam on the Ana-branch? 40 miles.

What number of cubic yards? I could not say.

What would the dam cost? You could back the water 40 miles by a dam costing £500.

You say you had six dams destroyed, how were they destroyed? They were blown up by dynamite.

Dams destroyed.

Did you do anything to prevent it? No. The matter was referred to arbitration in Melbourne, and I got a verdict for £800; but that did not pay me, as I took a lot of witnesses down to Melbourne.

But that did not establish the legality of the construction of dams? It did not at all.

You know you have no legal right in the matter? Yes; that is what I wanted to see you about. The large dam backs the water up 40 miles, and would throw the water into any of those lakes. A man takes a homestead lease over a part of that lake, which is a perfectly useless lake, and must be kept dammed in order to get the water in the good lakes and in the Lower Ana-branch to give water for the stock below. Well, if that man insists on opening the lake, the people below will stand a poor chance of getting water.

Are any of the lakes reserved? No.

Ought they not to be? I do not see what benefit that would be; portions of the better ones are reserved. But can the bed of the lakes be taken up? Oh, yes; we have some 40-acre blocks right in the bottom of the lakes.

Then you can prevent anyone from flooding them? Oh, no. Take the Yelto Lake. We have never allowed any water in that since 1872. If we opened that lake we would never get any water below it unless the flood were very high and continuous. We want some legislation about that sort of thing in order to preserve the rights of everyone. I think, too, that water for stock should be considered before irrigation.

If the rights to the water were under a Local Trust, would not that remedy the matter? Oh, yes. In a matter of this kind, if the Trust had power to say that the lake shall be kept shut, that would meet the case. Have you ever known the river or Ana-branch to be made run by local rain? I have known the Ana-branch run for 10 or 12 miles in places.

Do you consider the local rain affects the river? Not at all; the heaviest local rains only make the river rise a few inches.

Where

**Mr. D. H. Cudmore.** Where do you look for the floods? Queensland and up above Narrabri.  
Do you know of any deep wells being put down in the district by private enterprise? No.  
Do you think if you went through the salt drift over 1,000 feet that water could be obtained? I do not know.  
9 Oct., 1886. You know they have discovered artesian water in South Australia? Yes.  
Do you see any reason why they should not obtain water here? Well, we kept the whole of the Ana-branch flooded\* and the water soaked away, so somebody must have got it. It would be well worth trying a deep bore between the boundary of the Colony and the Ana-branch, but there is such a quantity of salt drift that we could never undertake it. In South Australia we went down over 300 feet in these deep bores. (*Appendix to Report on Darling River, No. 17.*)  
You know the lakes on the Murray at Gol Gol,—what are they filled by? From the Murray entirely. The Darling would affect them slightly by backing up.  
What do you think could be carried out as a national scheme of water conservation on the rivers, ana-branches or lakes? I am not in a position to say.  
**Difficult to erect weirs.** Do you think anything could be done? I think it would be extremely difficult to get locks or weirs to stand in the river, from my experience on the Ana-branch, although the Darling is not so bad.  
Did you say there are rocky bars? There are some, but they do not appear on both sides.  
**Mr. Gipps.]** You allude to fixed weirs? Yes; I do not think it is possible to put overshot weirs.  
**Mr. Donkin.]** How is it that you have got dams to stand on the Ana-branch? But I have a by-wash. I have great trouble with the by-washes; they cut back for miles. A by-wash will only last about two floods. But you have dammed the whole bed of the creek, have you not? Yes.  
If you made an overshot dam of half the height that would not have taken place? I do not think it would have ever stood; the banks are not sufficiently solid.  
Not if you allow the water to pass over the centre of the dam? No; I tried that on a small scale, and the water took the foundation out. I find that a certain amount of water goes over all right, but when a heavy body of water goes over it tears up the ground.  
What apron do you construct here for the water to fall on? Just rough timber.  
Is there any other information you have to offer? I think something might be done to divert sufficient water from the Darling through the Ana-branch cutting.  
Is that cutting done by private enterprise? Yes; it was carried out by the lessees on the Ana-branch at an expense of about £5,000.  
**Mr. Gipps.]** What is the length of it? 10 miles.  
And the width of the channel? 12 feet at the bottom.  
And the sides? About 2 to 1.  
And the depth? The deepest part of it is about 11 feet.  
**Mr. Donkin.]** What could be done in diverting the water? If the Darling were locked at the outlet to the Ana-branch cutting the water would be forced down the Ana-branch. (*Appendix to Report on Darling River, No. 18.*)  
Do you think the water might be diverted out towards the South Australian border from the Ana-branch? I think possibly it might. The 1864 flood went out over 20 miles from Popiltah Lake.  
How far would that be from the river itself? About 70 or 80 miles. I may mention that it takes as much water to soak the bottom of a rotten lake as it does to fill it. If the lake is 6 feet deep it requires 12 feet of water to fill it. In these lakes, such as Popiltah, Popio, and others, the water pours down the fissures in enormous streams. The action of the wind is so strong in blowing the water across these lakes that I have had to walk very fast to avoid being overtaken by the water. The wave runs in faster than any ordinary tide. A great deal of the water so blown out on to the dry ground soaks in and is wasted. The lakes are very flat, and when they get low the wind soon wastes the water in this way.

At Wentworth.

Mr. J. O. Edwards examined:—

**Mr. J. O. Edwards.** **Mr. Donkin.]** You are the Mayor of Wentworth? Yes.  
How long have you been here? Twenty years.  
9 Oct., 1886. Have you seen many floods in the Darling? Yes; I saw those of 1867 and 1870, and at various times since. That of 1870 was the highest.  
**Floods.** How did the 1870 flood compare with the present one? It was very much higher, at least 14 feet higher.  
Was Wentworth under water? Yes.  
To what depth? The higher portions would be about an inch under water. The water was just about an inch over the crown of Darling-street.  
How do you record the height of the river here? We have a gauge at the wharf.  
How long has that been erected? The present gauge has been there about six or seven years, but we have always had a gauge.  
What does that gauge read from, the bed of the river or summer level? It reads from summer level.  
I suppose you mean by summer level just when the river is running? Yes, and when it is very low.  
When they telegraph from Bourke, and generally up the river, the height of the gauge at those places, can you tell what river to expect here? Yes; it gives us a very good idea.  
There is a good deal of doubt, is there not, as to what summer level is? Yes.  
What do you think would be the best zero to read from: when the river is just running, or navigation level, or some well-known flood-mark? I should imagine from very low water.  
Are there any rocky bars in the river near Wentworth? Yes; there is one near Avoca and one at Burtundy.  
Since you have known the Darling, has the direction of the bed shifted much? Not here; but there is one place 17 miles from here, near Avoca, where it has shifted.  
Have you a gauge in the Murray? No. Our gauge is for the Darling and Murray.  
Does it give a correct reading for both? Yes.  
How far is this from the junction? A little over half a mile. Is

\* NOTE (on revision):—In 1870-80 we kept an enormous quantity of water in the Ana-branch and lakes, and will do the same this flood.—D.H.C.

Is there the same current in the river here as in the Murray? No. I think the current here is slower than that in the Murray. The reason of its being slower is the height of the Murray. A short time ago the current was running over 4 miles an hour.

Mr. J. O. Edwards.  
9 Oct., 1886.  
Dry river.

You have never known the Darling to be dry at Wentworth? In 1867 it was not quite dry, but there was just a little pool you could stop with your two hands. Six months ago it was dry for miles a little above here.

What is the lowest volume of water you have seen passing down the Murray? It has been very small; I should imagine about 2 feet of water.

You have seen the Murray stopped for navigation? Oh, yes. If we had boats drawing 16 or 18 inches the navigation of the Murray would be permanent, but the boats, as a rule, draw from 3 to 4 feet.

Does the navigation of the Murray depend to any great extent on the waters of the Darling? Not below here. Of course this last rise in the Darling has made the Murray navigable, but as a rule the navigation of the Murray does not depend upon a rise in the Darling.

Does the local rainfall affect either the Murray or the Darling? Not the slightest.

Then both these rivers depend on the rain further up? Yes.

What is about the average rainfall since you have been here? From 7 to 9 inches.

Are there any large depressions in the vicinity of Wentworth where a large body of water could be conserved? There is Fletcher's Lake, about 4 miles from here.

What depth is it? About 15 or 20 feet, I should think.

You know the Great Ana-branch? Yes.

Is there any body of water coming down there? I am given to understand it is stopped by Mr. Cudmore's dam. However, the water is through now, I am told.

Could any large body of water be conserved there? I imagine so.

Have you seen any irrigation tried? Yes, on a small scale. There is a man here who has wheat growing which is over 4 feet high.

It has not been tried unsuccessfully? No.

Do you think the soil is adapted for it? I think it must be.

When the river is not navigable here, by what means do you obtain your supplies? As a rule the stores here have to get in large supplies to make sure they will not be short when the river is low. We have never had to resort to carrying from Morgan, with one exception, I think.

The river is rising now? I think so.

Do you think it will rise any higher? I do not think so—not more than a foot higher here, and that will be from the Murray water.

From your knowledge of the Darling, do you think it is possible to construct weirs or locks in the river? I should imagine it would be rather difficult, because the ground here is so treacherous. It is apt to wash away. In 1870 the streets here were level as a table. We opened a little dam one day in 1870, and in the afternoon we had a river running across the street to a depth of 5 or 6 feet. Three outlets went then from the Darling into the billabong about a mile from here.

From what you say of both the Murray and Darling here there is no certainty of irrigation? No.

Is it a usual thing for the river to stop every summer? As a rule it stops between February and June. We can always depend upon having a rise in the Murray from June to January.

Suppose the Darling to be dry, and a flood comes down the Murray, how far does that affect the Darling? About 40 miles by land, or 100 by water.

Mr. Gipps.] What extent of country did the flood of 1870 cover? There were several places on the Murray where the river would be from 10 to 14 miles wide. We could go in a boat from here to the Oak Ranges, 7 miles in a northerly course, up the Darling.

What distance in a southerly direction? Fully 5 miles on the other side of the Murray.

Is that spread of water due to high floods in both rivers at the same time? Yes.

Do you know what was the height of the flood in the Murray at Albury? No. At Swan Hill it was 13 feet 6 or 7 inches, and at Echuca it was 34 feet.

What was the height of the Darling at Wilcannia? I think it was somewhat similar to the present rise. I think it was 40 feet at Bourke in 1870.

Have you any marks of the flood of 1864? There are several here. In Mr. Holding's garden there is a mark on a tree.

Was that flood higher than the flood of 1870? Not nearly so high here.

What is the character of the bed and banks of the Darling here? As a rule they are clay and sand.

Does the sand let the water through? I think it does, for the simple reason that here on the plains if we sink for water we get very brackish water. I bought a small place once, and sunk a well there, and the water was beautiful and fresh. The Darling was 400 yards away, and as the river rose the water in the well rose. So there must be an under-current from the river.

Were any wells sunk in the bed of the river during the late drought? Not here, but I believe there were some up the Darling.

Have you any reason to think there is any strong under-current in the Darling? No, I do not think so. I think if you sink down 18 inches after a high flood the ground would be as hard as if there had been no water on it.

Can you give us any information on Lake Victoria? It is about 30 miles in circumference.

Lake Victoria.

Is it nearly round? Yes.

And what is about the average depth? I should imagine it would be from 8 to 10 feet.

How is it supplied? From the Murray.

Is there any outlet? The inlet and the outlet are the same.

What is the character of the banks—are they high all round? They are high sand banks all round.

Could the water be extended beyond the lake by means of a canal? I hardly think so.

Is there always water in the lake? Always.

What height must the river be to supply the lake? I could not say.

What is the length of the creek supplying the lake? About 5 miles.

Are there any dams on it? I am not aware of any.

Mr. Donkin.] Is it possible to raise a crop here by the ordinary rainfall? We have had several crops here from the ordinary rainfall, but they are very uncertain. If we have good rains we have a splendid crop.

Do

Mr. J. O. Edwards. Do you not think much more could be done with irrigation than has been done so far? Most decidedly I do.

9 Oct., 1886. Do you think any national scheme could be carried out by the Government with regard to the rivers or lakes? Not unless you have weirs in the river. I do not think anything but movable weirs would do.

Have you noticed whether the bed of the river has had a tendency to silt up of late years? No. If there is any impediment in the way at all the river will soon silt up.

Mr. W. B. Christie examined:—

Mr. W.B. Christie. *Mr. Donkin.*] You are a licensed surveyor of this district? Yes.

You know the Willandra Creek? Yes.

It runs out from the Lachlan? Yes, near Hillston; it is an overflow.

9 Oct., 1886. Have you seen the mouth of it? Yes.

The Willandra. What height is the bed of the Willandra above the Lachlan? It is almost on a level with it. I did not notice it much about there. Where it occupied my attention more was this end of it.

Its course. How far down was that? 150 miles from the off-take. I have made a survey all along it from Garnpung, through Garnpung Lake, which is a dry bed, through Gol Gol Lakes, through Outer Back Bullanmong, Arumpo, North Turlee, Turlee A, Buraguay, Marma, North Mundonah, Back Boomiaricool, Laurie Park, and Lower Lette Runs.

How far would that be from the Murray or the Darling? To Lower Lette Run, that would be about 12 miles from the Murray. My survey left off there. I followed it on then into Manie Creek.

What distance would that be from the off-take? About 250 miles.

Is it a defined channel there? You might pass over it without noticing it till it is pointed out to you, but when once it is pointed out you cannot mistake it. It runs to within 35 miles of the Darling at Garnpung, and then it takes a sudden bend. Manie Creek is a sort of billabong running out from the Murrumbidgee into the Murray, and forming a sort of an island at the junction of the two rivers.

The Willandra Creek passes through a large area of dry country? Yes.

Do you think it would be possible by erecting a weir across the Lachlan to divert the water to the back country? I am sure it would. In 1870 the Willandra flowed into Garnpung Lake, but I do not say that of my own knowledge. A good many wells have been sunk about the creek. There are four wells on the Garnpung Lakes, but they have all salt water.

Wells.

What depth are they? They run from 70 to about 150 feet.

Do you know of any deep wells that have been sunk in the Wentworth District? The deepest that has been sunk in this district is a well on one of the back runs of Tapio; it is 340 feet deep.

Do you think if they went deep enough here there is a possibility of finding an underground supply? I do not think so. I think that the bar near Cobar, running just north of Wilcannia, would prevent it.

MONDAY, 11 OCTOBER, 1886.

On board the s.s. "Gem," from Wentworth to Morgan, S. A.

Captain Hugh King examined:—

Captain H. King. *Mr. Donkin.*] How long have you been on this river? I have been thirty years on the Darling, Murrumbidgee, and Murray.

Have you been navigating the rivers the whole of that time? The most of it.

11 Oct., 1886.

Were you here when the first steamboat came up the river? No.

How long afterwards? Four years.

Who was it first navigated the Murray? Francis Cadell. William Randell was the first to navigate the river, but the steamer was not large enough to claim the bonus.

What was the name of his vessel? The "Lady Augusta."

Do you know the Darling River from Wentworth to Brewarrina? Yes.

Have you navigated the river as far as Brewarrina? Yes.

What year were you there first? In 1868.

Floods.

Have you experienced many floods in the Darling? A good few.

Will you name the important ones? That of 1870 is the greatest I have known.

When was the next after that? In 1874, as nearly as I can remember. In 1870 the river ran for eighteen months.

The next to 1874? That of 1879, and then the present one.

How did the 1870 flood compare with the present one? It must have been 14 or 15 feet higher close to Wentworth. The Murray was in flood at the same time, and the Murrumbidgee too.

What is the average width of the Darling? I should say it is not more than 150 feet on an average.

Rocky bars.

Do you know any bars of rock in the river? Yes. The first one is above Avoca; then there is one at the Middle Yards, above Para; the next one is at Leman's public-house at Tarcoola Station; then you skip all the rocks till you get above Menindie and come on to the Christmas Rocks.

Is there any fall at the Christmas Rocks? There is a very little fall now. The rocks were removed from the bar to build a house at Weinteriga.

You do not know what the fall is? No.

From your knowledge of the Darling, do you think foundations could be got at intervals of 50 or 100 miles for the erection of weirs or locks? Yes. With the exception of that stretch between Leman's and the Christmas Rocks you could get them every 20 miles. There are also rocks about half way between Leman's and Christmas Rocks, at a place called Tolarno Cliffs.

Erosion of banks.

Do you think it is possible that such works could be erected without causing the banks to erode? I do not think the banks would wash away at all as long as the gates were allowed to open in flood-time.

What distance would a 10-foot weir make the river navigable up stream? From experience at the lower end of the Darling it would go 50 miles, but I am not sure about the upper end of the river.

*Mr. Gipps.*] Do you mean to say it will make the river actually navigable, or will throw the water back? It will make it actually navigable. If the river rises 7 feet at Wentworth it allows me to go as far as Tapio, a distance of 36 miles, with a boat drawing 3 feet 6 inches.

*Mr. Donkin.*] What is the draught of the ordinary boats on the river? 3 feet.

What

Captain  
H. King.

11 Oct., 1886.

What is the depth of the river banks at Bourke and Brewarrina? About 42 feet.  
Then how do you account for there being only 16 feet at Wentworth at the present time? By the width of the Murray and the great get-away for the water. A lot of water goes into the back country before it reaches Wentworth. There are Menindie Lake and the Talywarka and the Great Ana-branch.

Have you seen a large body of water in the Talywarka? Miles and miles of it.

Have you navigated the Talywarka? Yes.

How far have you been out from the Darling? 60 miles.

What is the average width of the Murray from Wentworth down to the boundary? As near as I can judge it is 150 yards.

Then it is about three times the width of the Darling? Yes.

And you think that the increased width of the Murray, and the depressions, lakes, and ana-branches account for the great difference in the body of water at Bourke and Wentworth? Yes; I am sure of it.

What proportion of the water at Bourke finds its way to the Murray? Not more than one-half.

Have you known the local rain on the Darling or Murray to influence the height of the river at all? Yes, on the Darling. I have known it to raise the river 10 feet at Weinteriga.

*Mr. Gipps.*] In what year was that? I do not remember.

Do you remember the nature of the rainfall? It came in heavy thunderstorms.

*Mr. Donkin.*] But in ordinary seasons the river is not affected? No, not in ordinary seasons.

How long will this present flood keep the Darling navigable? To Menindie, two months; to Wilcannia, about five or six weeks.

Do you know Lake Menindie? I know the creek.

Lake Menindie.

After the river falls, do you think the lake assists to keep up navigation in the river? At the present time it does.

What influence would it have on the river? The return flow of water would be sufficient to keep it up for a month, I should say.

You know the Murrumbidgee? Yes.

Have you navigated it? Yes, as far as Eli Elwah, above Hay.

What does the Murray depend upon? There are several rivers it depends upon—the Murrumbidgee the Goulburn, the Campaspe, and the Murray proper.

Are there any bars in the Murray about Wentworth, or just above it, where works could be constructed? 9 miles above Wentworth there are rocks right across at Williams' old station, Gol Gol. Rocky bars in the Murray.

Are there any bars between Wentworth and the boundary? There is Cadell's Reef right across, close to Ned's Corner.

How far would that be from the boundary? 75 miles this side of the boundary.

Since you have known the Murray River, has it ceased to be navigable for any length of time? For small boats about three months a year; sometimes it is not navigable at all.

Was the Murray navigation stopped last summer? About three months.

And that is nearly always the case? Always, from one to three months. Then even the light boats cannot go, because of sand-bars and Cadell's Reef.

Do the sand-bars shift as a rule? With every flood; then they remain so until the next flood.

Is it generally agreed as to what summer-level is? No.

What do you think should be adopted as zero to give correct information as to the height of floods?

As regards Wentworth, I should take the rocky bottom nearest the town, and put the gauge there.

You think that would be better understood than some flood-level? I think so.

You would adopt this method at such places as the Christmas Rocks and the other bars? Yes. There is only one place where there are no rocks, and that is on each side of Menindie. All through from Wilcannia to Brewarrina there is a rocky bottom.

You have been for many years connected with navigation on the Darling;—how long have you known steamers leaving Morgan to have been delayed in finding their way up the Darling? Three years. Steamer taking three years to navigate Darling.

Could you quote an instance? It is three years last May since the "Jane Eliza" left for Bourke, and she arrived there last June.

Have you been stuck on the Darling on previous occasions? Once I was stuck for nine months in one waterhole.

There is no certainty in the navigation of the Darling in its present state? Not at any time.

Do the steamers which bring produce down the Darling and Murray tranship at the ship's side in Adelaide? In no instance.

Is there no possibility of transshipping? No, because of the bar at the Murray mouth. Produce has to be transhipped on to the rail, and lightered out again. All the mail-boats have to be lightered.

All the produce coming down the river has to be trucked? That is so; it does not pass out of the Murray mouth.

Which is the principal feeder of the Murray? The hills are the principal, next to them is the Murrumbidgee, and the next is the Goulburn.

Has the Goulburn much influence on the Murray? More than the Murrumbidgee. If we get Murrumbidgee water we get Albury water at the same time. In many instances we run for a month or two with Goulburn water.

Is the Edward River an ana-branch of the Murray, or is it fed by local rain? It is entirely fed by the Murray; it is an ana-branch of the Murray. It leaves the Murray above Lake Moira, at a place close to the Gulpa Creek.

Are there several branches there? There is one main entrance only. The Gulpa Creek goes in below Edward River. it, and joins the Edward before reaching Deniliquin.

If the off-take at the Edward, where it leaves the Murray, were closed, would there be any river?

No, except for the water that goes down the Gulpa Creek.

What is the rainfall at the boundary of New South Wales? I should say about 8 inches.

And what is it at Morgan? About 6 inches.

You know the Great Ana-branch of the Darling? Yes.

Does that take off any body of water from the Darling, as compared with the river at Wentworth? I should say there goes down the Ana-branch a body of water quite equal in volume to a quarter of what passes Wentworth.

Do

Captain  
H. King.  
11 Oct., 1886.

Do you think that the utilising of the flood-waters at the head of the Darling and the Murray will make any difference in the navigation of the river here? Not in flood-time, as long as you do not use the water below a certain height.

Has the river kept up to its ordinary level, or has it fallen off? It has fallen off greatly. There is not more than one-half the water coming down there used to be four years ago. I account for this by the shortness of the rainfall and the deficiency of snow in the hills.

Do you think the water used by Victoria for irrigation has made much difference? I do not think so.

Are there any large ana-branches of the Murray on the Victorian side like the Edward? Only very short ones.

What are they? The Gunbower Creek is the longest; it is about 40 or 50 miles long. We receive all the water back again from it. And there is the Little Murray, below Swan Hill, that is quite as large as the Darling.

Can you say roughly what the length of the Edward is? I could not say; I have never gone right through. It must be considerably over 200 miles.

Is the Murray down from Wentworth a difficult stream to navigate? In low water it is.

Fences in Lower  
Murray.

Has anything been done to improve the navigation? The South Australian Government has improved it as far as the boundary by putting in fences to confine the channel to half the width.

Are the fences put from each side? No, from one side only.

You were saying there were no very large off-takes on the Victorian side of the Murray,—are there any large lakes or depressions near Echuca? Above Echuca there is Lake Moira.

What is the effect of that lake on the river? In an ordinary season it has no effect; in a high flood it holds the water back, and throws it over the country for miles.

What is the action of the water in returning to the river? In a high flood like that of 1870 it comes down from the lake and runs up stream. I have gone against the stream in going down the river for 30 miles.

The country from the New South Wales boundary to Morgan is very poor, is it not? Yes, most of it.

Is there much production? Nothing but sheep, and only a few of them.

How many bales of wool are grown on the left bank? About 200 bales.

Is the nature of the soil such that irrigation could not be applied to it? The water is not used because the lift is too high.

Do you know if they have tried irrigation here? They are about to try it at Morgan; the soil on the bank is poor, but out back it is good enough.

APPENDICES TO EVIDENCE TAKEN ON DARLING RIVER BY COMMISSIONERS DONKIN AND GIPPS.

	Year .....	1199	1314	1335	1252	1308	1334	1285	1257	1292	...

From a record of all showers which yielded over ½ an inch in any one 24 hours, it is shown that of the total of about 116 inches, from 1877 to 1885, 37.69 inches fell in showers 1 inch or over, leaving 78.45, or about two-thirds of the total fall, to be accounted for. All that fell in showers lighter than 1 inch, and consequently of little value, unless the ground happened to be previously moistened. 27 inches fell in the period in showers from ½ an inch to 1 inch, so that of the 116 inches about 52, or nearly one-half of the fall, was in absolutely useless quantities.

RAINFALL AT GOORIMPA, PAROO RIVER.

APPENDIX TO REPORT ON DARLING RIVER, No. 13.

REPORT upon the chain of Lakes on Teryawynia, Albemarle and Tolarno Holdings.

THE chain of lakes on the abovenamed holdings are filled by overflow from the Talyawalka Creek an ana-branch of the Darling, through a channel known as the Teryawynia Creek.

The Talyawalka runs when the river is about 28 feet above summer level, and on it immediately below the point where the Teryawynia Creek runs out of it, is situated the Bywash Dam and flood-gates which were erected jointly by the lessees of Tintinalogy, Teryawynia, Albemarle and Tolarno, at a cost of £2,700, in the year 1877. At that time it was arranged between the lessees that the large flood-gates in the centre of the dam-head should be kept open whenever the Talyawalka was flooded until its water ran through into the river. At the same time a foot-board in the lower part of the opening, regulating the water so that an equal quantity should also flow into the Teryawynia Creek. When the water in the Talyawalka completed its circuit to the river, below Menindee, the flood-gates were to be closed and the whole of the water turned into the Teryawynia Creek, through which it filled the lakes. The channel runs direct into Teryawynia Lake, which is the first to fill. Another channel known as Snake-flat Creek runs out of the main one into Dry Lake, and after Teryawynia and the lakes which back up from it are full the whole body of water follows this course. Another small branch runs into cane-grass swamps on Back Talyawalka, and they drain into Mosey's Lake.

When Teryawynia is nearly full another channel backs up and fills Long, Haystack, and Minden (or Washpen) Lakes, and the lake also backs up into Pinchgut, Maggie's and Swan Lakes.

After filling Dry Lake (through Snake-flat Creek) the water runs in a narrow channel out of that lake and fills in succession: On Albemarle, White water, Pelican, Eucalyptus, Waterloo, Victoria, Brommie's, and from it back up Denny's and Brennan's Lakes.

The main channel continues from the south of Brommie's into Sayer's, the eastern part of which is on this run, and on Tolarno are the western parts of Sayer's, Gum Lake, Boolaboolka and the southern part of Ratcatcher's.

On Albemarle is the northern part of Ratcatcher's, and, as a rule, this completes the chain; but it is stated that in 1870 the overflow from Ratcatcher's filled North Lake. There appears to be a broad shallow channel between the two.

It is not very easy to obtain authentic data as to the filling up of these lakes, or the periods for which they retained water; but, from various sources, the following table has been compiled, which I believe to be fairly accurate as far as it goes back.

	Filled.	Became dry.
Lakes on Teryawynia Holdings—		
Teryawynia Lake* .....	1870-74. Creek stopped running, in 1876, before it was nearly full; did not run into other lakes. Filled in 1879; creek stopped running, 15 July, 1880.	Some time before 1879. Dry, 16 April, 1883. About 3 ft. of rain-water (local) ran into it in 1885, January rain.
Dry Lake .....	1870-74-79, and is now filling .....	Usually holds water about 2 years.
Mosey's Lake .....	" " .....	" " to 2½ years.
Long Lake .....	" " .....	After 1879; in August, 1883. Holds water over 3 years.
Maggie's† .....		
Winden .....	1870-74-79, and now filling .....	Holds water for about 2½ years.
Swan .....	" " .....	" "
Pinchgut .....	" " .....	Not quite so long.
Lakes on Albemarle Holding—		
Mosey's Lake .....	See above.	
Dry Lake .....	See above.	
White Water .....	1870-74-79, and is now filling, or will probably be filled this flood.	Holds water about 2 years.
Pelican .....	" " .....	" 2 "
Eucalyptus .....	" " .....	" 2 "
Waterloo .....	" " .....	" 2½ "
Victoria (filled 5 Oct., 1879; dry, Jan. 1884) .....	" " .....	" 3½ "
Brommie's .....	" " .....	" 3½ "
Denny's .....	" " .....	" 2 "
Brennan's .....	" " .....	" 2 "
Sayer's (E. part) .....	1870-74-79. ....	" 2 "
North part of Ratcatcher's .....	1870-74, and partly filled in 1879. ....	" 2½ "
North part of North Lake .....	1870. ....	No data.
Lakes on Tolarno Holding—		
West part of Sayer's .....	1870-74-79, .....	Holds water about 2 years.
Gum .....	" .....	" 2 "
Boolaboolka .....	" .....	" 4 to 4½ "
Ratcatcher's (southern part) .....	1870-74, and partly filled 1879. ....	" 2½ "
North Lake (southern part) .....	1870. ....	No data.

\* Usually contains water (say) over 3 years, from time Teryawynia Creek runs.

† Water has been dammed out for some years.

The Teryawynia Creek is now running a very strong stream, and there is every reason to believe that the present flood will fill all the lakes.

The lessees state that the "Bywash" has had a very considerable effect upon the lakes, and that since its erection in 1877, the chain would not have filled without its agency, and even with its assistance the flood of 1879 only partly filled Ratcatcher's. They also state that since the Bywash was made polygonum, which used to be found in some of the lakes, has died out in consequence of the greater quantity of water in them.

The Teryawynia Creek has no outlet beyond the lakes (of which, under any circumstances, North Lake is the last) and ran out of the Talyawalka in the years 1870 and 1874—a little only into Teryawynia Lake in 1876, and since the Bywash was made filled in 1879; and in January 1885, from heavy local rain, putting only 3 feet of water into Teryawynia Lake. An immense body of water is now coming down it, and as soon as the Talyawalka water reaches the river, near Menindee, the whole stream will be diverted into the lake channel by closing the flood-gates.

In my opinion Teryawynia, Long Lake, Victoria, Brommie's, and Boolaboolka are the best of the chain, though the latter is extremely boggy for the last year that it contains water, and during the drought thousands of sheep died from being bogged in it.

The depth of the lakes is from 15 feet down to 4 or 5.

On Teryawynia Holding useful wells have been made, varying in depth from 25 to 70 feet. On Teryawynia there are two of fresh water, and one too full of soda to use. Any supply could be obtained in the lakes. A well with small supply of fresh water on Albemarle.

On Long Lake there is a well of very good fresh water, 140 feet deep—will supply 10,000 sheep.

On Albemarle Holding there are wells as follow:—

50 feet deep,	on Mosey's Lake,	fresh,	supply for 24 horses.
60	"	"	Eucalyptus, fresh, supply 4,000 sheep.
65	"	"	Victoria, fresh (two shafts), supply 16,000 sheep.
65	"	"	Brommie's, good stock water, supply unlimited (practically).
58	"	"	Ratcatcher's, good stock water, supply 10,000 sheep.
60	"	"	Sayer's, two shafts, fresh water, supply 7,000 sheep.

On Tolarno Holding, on Boolaboolka Lake, there are two good shafts, very good stock water, supply 20,000 sheep; one, supply 12,000 sheep; one shaft, brackish water, supply 12,000 sheep.

There is great drainage into all the lakes from hard clay-pan ridges, by which most of them are surrounded; and in wet seasons the supply would, to a certain extent, be augmented, or rather kept from falling, by local rain, though not appreciably.

The margins of the lakes, as a rule, are very rich country, and almost all of the bed of Teryawynia Lake grows close fine grass and clover and herbage when the water dries up. Long Lake also grows grass, clover, and herbage in its bed when dry. Victoria grows clover and herbage, as do also most of the other lakes over a large part of their margins.

There are very good catchments for tanks in the clay-pans surrounding the lakes, and if the country was fully improved by tanks and wells, it would, in my opinion, be better to exclude the water from the lakes altogether, as too much of the best of the country is covered by water when they are full, and they are boggy and dangerous when drying up.

It is true that they give splendid lambing paddocks when full, but it is a question whether this compensates for the large area of country rendered useless.

Christmas Well, Teryawynia, 2 Sep., 1886.

G. W. MOORE.

J. R. HOLDING.

#### APPENDIX TO REPORT ON DARLING RIVER, No. 15.

(See accompanying Diagram for position of Lake.)

MEMO. showing relative depth of water which could be backed into various lakes by 183 dam on the Great Ana-branch of the Darling, near 183 marked tree (compiled in 1880).

When 183 gauge reads 12 ft., that is when there is 12 ft. of water against 183 dam,

	ft.	in.
Milkengay Lake would contain	18	2½
Nearie	15	10
Yeltow	13	0
Nialia	3	0

A dam below Popiltah junction would keep Popiltah, Popio, Traveller's, and Dry Lakes all full.

A strong dam at Duckpool could be made to retain a large body of water, and to keep Warrawenia Lake full.

From the above it appears that by one additional dam and the strengthening of two existing dams, nine lakes could be kept full.

For description of these lakes, see folios 45 to 47, Report Select Committee, Pastoral Dams Bill, 8th May, 1884.

## APPENDIX TO REPORT ON DARLING RIVER, No. 18.

SUGGESTION *re* the Great Ana-branch of the Darling River.

If a lock can be constructed below the Ana-branch cutting or below Tandou Creek, it would ensure the permanency of the waters of the Ana-branch.

By a small expenditure flood-gates could be erected below Tandou Lake, and below Popiltah Lake, also at Duckpool dam. By this means the flow of *flood* waters down the Ana-branch could be controlled, and all of the lakes could be filled, and, if required, kept full, thus impounding such an enormous quantity of water that it would beneficially affect our arid climate. With the primitive means now at my command, I filled and kept many of the lakes full after 1879 flood, and this present (1886) flood I hope to do the same.

What is required is some local authority to control the water, for, as the resumed areas are taken up, it will so increase the number of people interested as to cause endless disputes.

I would advise that the Government put down a deep bore near the 66 to 70th mile-posts on the South Australian border, on the road from Pop Lake to Kooringa; water for the work could be obtained from Oakvale well, which is about 6 miles from the 76 mile-post.

I at one time intended to get my neighbours to join and put a pump at the Ana-branch cutting, but a lock would be infinitely better.

Avoca Station, Wentworth, 6th December, 1886.

D. H. CUDMORE.

EVIDENCE TAKEN BY COMMISSIONERS MURRAY, M'MORDIE, AND  
GIPPS ON THE NORTHERN COASTAL RIVERS, &c.

OCTOBER-NOVEMBER, 1886.

THURSDAY, 14 OCTOBER, 1886.

At Glen Innes.

Present:—

Mr. MURRAY,

Mr. M'MORDIE, B.E., M.I.C.E.

Mr. Francis George Finley examined:—

*Mr. F. G. Finley.* *Mr. Murray.* What is your position? I am District Surveyor, stationed at Glen Innes for twelve months past. Previously I was for eight years in the Gwydir and Inverell Districts, particularly on the Western Watershed and the Gwydir District. I have an extensive knowledge of the country, having had considerable experience there. I cannot speak with much authority in this particular district as yet, but during my short stay I have seen a fairly large extent of the country. I know that in this district we are at the head of many waters. What seemed to me to be a wonderful natural reservoir is what is known as the Mother-o'-Ducks, at Guyra, taking into consideration its altitude and other facts. Of course, as the Commission, or many of them, may be aware, water is very general in the Glen Innes District, and there is such a constant and regular rainfall that there is never a necessity for troubling about a water supply. I cannot, however, speak with any certainty as to the existence of any natural reservoirs in the gorges in which suitable sites for water storage might be found. I know the Gwydir country, however, very well.

*Dam site.* Can you inform us of any suitable sites? Well, one particular spot may be found near Gravesend Station; it is a most marvellous place for a dam.

Can you give us any information as to what the size of the requisite dam would be, and what extent of water would be conserved? I hardly can state what size the dam would have to be, but a not very elaborate one would throw back a considerable amount of water. Although there is a pretty rapid stream, I should say the water would be thrown back 15 miles—10 miles at all events. I took particular notice of the river, and it is about 80 yards wide. The dam, perhaps, would have to be 200 or 300 yards wide. The water would be simply confined to the channel of the river. Its banks are at least 50 or 60 feet high there. The stream is tolerably small, although I have never seen the levels. I should reckon that there would be a fall of from 2 to 3 feet in the mile.

Is the position very suitable for a dam? Yes. There are hills with a stony outcrop on both sides.

Would much land be benefited by cutting channels for the utilization of impounded waters in times of drought;—could you carry such waters to advantage on to country which would require it? Certainly. Is there any, or much, agriculture carried on in that district? Yes; there is a good deal between Warialda and Ginneroy. It is only during the past three or four years that agricultural land thereabouts has been taken up in any great quantity. The holders have been chiefly pastoralists and those carrying on small farming occupations.

I suppose that one of the chief drawbacks to them is drought? There is no question about that.

*Irrigation.* Do you think that if water could be supplied from a general reservoir that the settlers and others would avail themselves of it in order to go in more extensively for agriculture? Most decidedly. I know of one place where irrigation is being carried out on the Big River, at Boollooroo. They have irrigated a small portion of country there, and the results have been very extraordinary in the way of crop-growing. I think the best thing I could do would be to refer you to Mr. M'Donald, of Mickubrindi. Personally, I cannot give you the exact statistics, so that I would not care to commit myself. I know, however,

however, that the results were very satisfactory indeed. The locality is just where some great pumping machinery has been erected by Messrs. Robertson and Wagner. About 40 acres are being irrigated. The produce has been used for sheep feed principally, and it kept a very great number alive. Mr. M'Donald was also enabled from the product of those 40 irrigated acres to keep alive a large number of valuable stock during a succession of seasons of drought.

Mr.  
F. G. Finley.  
14 Oct., 1886.

If the system were extended, would any considerable extent of additional country be likely to be utilized similarly? Yes; I certainly believe so.

Do you think that it would induce a larger population, and that agriculture would be increased, with good results? Most decidedly. With irrigation thereabouts they could grow anything.

Have you any information which you can supply us with as to the produce of (say) hay per acre, from that place? I believe the result was something like 4 tons per acre, probably more. I do not know exactly.

Do you think that if the State went to the expense of constructing works of the kind suggested that the people would be satisfied to pay a reasonable interest on the outlay, at a fair rate? That is such a national question that I really do not feel competent to answer it. In dry times they would give anything for water. During the last seven years they have lost immense quantities of stock from drought. They have, in fact, been thrown so much upon their own resources that they have conserved large quantities of water in wells and dams, and they are almost becoming independent of large schemes of conservation.

This is the first wet season for some time? Yes; the first since 1878 or 1879.

You know something about floods, I believe? Yes. I went down from Moree to Walgett immediately after the large flood of 1879, when the rivers were all overflowing, and when an immense quantity of water was running over the flat country in the Gwydir District.

Floods.

Is the soil there a permeable one? No; it is very retentive in its character; it becomes so after having been saturated.

The whole of the water runs into the river then? At early stages of floods the immense chasms in the ground absorb vast quantities of water. The whole of this goes into the Barwon River. I must have driven through between 20 and 30 miles of water, averaging from a foot to 3 feet, from Tyrell Station to Collarindabri. All the surrounding stations were also flooded.

Do you know of any good sites for conserving water in large quantities thereabouts? There is not the slightest difficulty in conserving water on the Mehi anywhere from Pallamelawa to its junction with the Barwon. The fall is very slight, and the banks are very retentive; in point of fact the rivers themselves are simply channels cut through the mud. Dams could be constructed anywhere. Messrs. Robertson and Wagner have erected large pumping machinery at Bullaroo, and they have cut a canal about 4 miles across into the Carore Creek, otherwise known as Midkin Creek. The water is pumped out of the Big River into the canal, and it flows by gravitation down those creeks for about 60 miles. They then have erected large reservoirs in the creeks, which all become filled with water. Subsidiary drains were then cut, to my knowledge in one case 10 miles long, picking up two 7,000 cubic-yard tanks on the way. At the end of 60 miles they started pumping, and next morning the water had been thrown back 5 miles. The next day they had carried it out 10 miles and filled the second tank. Their main pump threw 10,000 gallons per minute, and it was imported from Melbourne at a very great expense. The whole of this outlay is gone to for stock purposes, and as a result of it they were able to occupy country that they could not put a sheep on before for a long time. On Talloona Run, a very valuable conservation was made by Mr. Payne, of Gill and Payne. The creek is a large, black washer, running through the country, and in dry seasons it becomes perfectly dry. In 1881 he erected a dam, at comparatively little cost, across the creek, and it threw the water back 8 miles. There is a great depth of black soil on the banks; and he cut into each bank and carried the dam into the natural surface. It held splendidly, and never leaked at all. Half a mile above it there was a little branch, which acted as a by-wash.

Pumping on  
Bullaroo.

Have you any idea as to its cost? I should think that it did not cost more than £200, and the result was very effectual indeed. It watered several sheep paddocks, and it has never been dry since it was made, that is some five years ago. It is situated on Cropper Creek.

Is there any agriculture in that district? Mr. Payne tried crops without irrigation, but during the drought he could not grow anything. He left the place and sold it to Messrs. Amos Brothers.

Do you know anything of a place called the watercourse country? Yes. It is a very large extent of land known as the reed-bed country. You could conserve any quantity of water there; in fact the district has been taken up of late for sheep and cattle farming. Many valuable dams have been erected, and I know of one case in which a very fine supply of water was obtained by sinking.

Do you think it better for the State to undertake the work, or would you leave it to private enterprise? I think that the interests of the country would be advanced if the Government undertook the work. The proprietors would be able to pay fairly for a good supply of water. It would also lead to an increase in the number of landowners.

You think, then, that an undertaking of that kind by the State would be of great benefit to it, and that it would be largely availed of? I do. In that country there is no difficulty in conserving water anywhere. It is simply a matter of expense. I cannot say whether it could be conserved at a sufficiently high level to provide the whole country. Down the Mehi the water would not be high enough to command the surface. The place I speak of was a dead level, and the water was carried across it by its mere force of current. The canal was a most primitive one, some 3 feet wide and a foot deep. I believe you could conserve it sufficiently high to carry it out, but not sufficiently for irrigation purposes without laying pipes, &c. I think I could show plans of the pumping works, and I will undertake to have the same prepared and forwarded to the Commission.

Do you know of any suitable places on the M'Intyre River? I am afraid that that is a too rapid stream. I know of several places at which a dam could be constructed to conserve large quantities of water if there was any means of securing a by-wash. One place in particular at Arrawatta, about 10 miles north-east of Inverell. Most of the soil is occupied at present by farmers and sheep-breeders, also by a good number of wine-growers. Some of the farmers also grow wheat and cultivate vineyards, and most of them combine pastoral pursuits with farming.

Would the water be thrown back for any great distance? By making a high dam, say 50 feet, it would be thrown back, say, 6 miles. Such water would be confined to the main channel of the river, so that there would be no great expense in reclaiming the land.

The

Mr.  
F. G. Finley.  
14 Oct., 1886.  
Dam sites on  
Barwon.

The water would be conveyed over a great extent of very rich country? Yes.  
*Mr. M' Mordie.*] What is the nature of the bed of the river? Gravelly; but probably beds of rock at no great depth. I believe a rocky bar could be found there on which to construct a dam.  
Have you any suggestions of your own, or any other information which you think would be useful which we have not yet elicited from you? I know of two places on the Barwon River where there are rocky crossings which would make good sites for dams. One is about a mile below Collarendabri, and one just above the township. The former place would make a very fine site for a dam, and it would throw back large quantities of water. In fact, I do not think that there would be any great trouble in locking the Barwon from Goondiwindi down to Collarendabri, even so far as to carry on navigation. That would give over 200 miles, as the river fall is very slight, and the water when in high floods moves very sluggishly. As a matter of fact there is a great scarcity of feed there in dry seasons, and a work of the nature proposed would make it a necessity. At one station, Caidmurra, they have been very badly off for water for years past; not to speak of many other stations. I know the whole of the country through which the Whalan and the Gil Gil pass. It is very subject to droughts. The Whalan is an ana-branch of the Boomi. There are very fine sites for water conservation on all of those creeks. Of course the drainage is very great.  
Do you know to what height the River Barwon rose this year? No; I have not been down there this year.

Mother-o'-  
Ducks.

Have you any idea as to the area and depth of the Mother-o'-Ducks Swamp? I believe the average depth in a season like this is from 5 to 6 feet. The area is 3,360 acres. I believe the depth could be increased at a moderate expense by the construction of dams. I am of opinion that both Glen Innes and Armidale could be supplied with water from it, on account of its elevation, which is considerably above both towns.

Are the physical features of the country between here and Mother-o'-Ducks favourable for conveying the water? Yes. I believe that a scheme could be easily devised for carrying it to both towns. It is not wanted for irrigation in this climate; in fact, draining is rather more requisite, except in dry seasons. We have had 33 inches of rain up to the present time from January 1st this year. The average rainfall here is over 30 inches per annum. I think about 35.

What is the nature of the river-bed at Gravesend? I should think it is a stiff clay, and no doubt you could get rock if you went to a reasonable depth.

What quantity of water would flow in the Gwydir during the recent dry seasons? I am not a sufficient authority to give you that information. I have seen the Big River stop running several times during droughts. The Meei has been dry time after time for miles along its course.

Did it run sometimes during dry years? No. The Meei did not at one time run for about three years.

*Mr. Murray.*] What was the cause of the river stopping running;—was it evaporation or great percolation? Simply a reduced rainfall. The Big River itself did run several times during the drought. By the Big River you will understand, of course, the Gwydir River.

*Mr. M' Mordie.*] When the Big River was dry, was there any under-current going through the sand? My own impression is that there is a very large subterranean flow running through the whole of that district.

Would it be possible to stop that underflow by the erection of dams? I do not know; but I think there must be a very large underflow of water. The Meei River could be made a very valuable water-frontage if the obstruction at its mouth could be removed, and that would not cost very much. The obstruction has been caused by debris accumulating through an eddy at the effluence, and any moderate freshet will not top it, and run into the Meei. If that obstruction was removed any ordinary freshet would flow into the river, and through its whole length. It is simply debris of large logs, &c., and the cost of its removal would be very small in comparison with the great benefits which would result. I believe that there is some idea that a legal difficulty would exist in connection with the matter, as certain riparian rights would probably be affected. It is chiefly a want of funds which prevents its removal. I have read a large amount of correspondence and evidence in connection with it; and it appears to me that from £1,000 to £2,000 would remedy the difficulty; probably less than that would do it.

*Mr. Murray.*] Do you think it would be necessary to construct something to prevent the accumulation repeating? Yes. Steps in that direction could easily be taken. A very large number of people would be benefited, and the town of Moree also; it is a very flourishing town. The Broadwater River used to run before the main Meei.

*Mr. M' Mordie.*] Would the people on the Big River object to the removal of the bar? I believe they would, because the pumping operations I have spoken of would be affected. I believe you could devise a plan by means of which a good supply of water could be got for both rivers. I do not think that the opening of the Meei would interfere with the flow of water down the Big River to any great extent; it would be simply restoring the river to its natural state. There is a large number of residents on the Big River who derive their water supply from it. The major portion of settlement is on the Meei. The population now is about 700 or 800.

Do they avail themselves much of wells in that district? Not so much as of tanks, although there are numerous wells.

Wells.

Where they have gone in for wells, have they been successful? Not always; many of them are brackish, but still give very good stock-water. Some of them are 100 feet deep.

Have you heard of any of them going through the brackish water into fresh? I am not aware of any such cases. I know of one well only 40 feet deep near Moree, which gives a magnificent supply of beautiful water. The owner, Mr. Solling, a surveyor, irrigates slightly from it. I should think that it would supply from 4,000 to 10,000 gallons a day, and I believe that the supply of underground water in that district is almost inexhaustible.

Mr. Edward Gradwell examined:—

Mr.  
E. Gradwell.  
14 Oct., 1886.  
Wells.

*Mr. Murray.*] You are a well-sinker? I am a well-sinker, and I have had four years' experience in this district, and particularly in Glen Innes. During that time I have sunk probably fifty or a hundred wells, inclusive of the deepening of old ones. I have sunk all sorts of wells within a radius of 10 miles of Glen Innes. The deepest depth to which we have gone is 65 feet, but two men sank 110 feet on the Inverell road,

road, some 5 miles from here. We have got water in every instance, and never had any occasion to abandon a hole for want of it. In every case the water which we have struck has been fit for drinking purposes, but in many cases it is very hard. The best quality is got on the north-west side of the town, where it is quite soft and contains no ironstone or minerals; in fact, you could wash yourself in it without soap, as the saying goes. We sometimes get basalt within 3 feet of the surface. There are three bars of basalt or trap-rock running through the town in a north-west to south-east direction, and very often we get water before we come to the basalt. Immediately we get on to the basalt, if no water is struck, we stop sinking. No one has ever sunk through this basalt or trap-rock. The stream is sometimes only slight, but it is never absent. Mr. M'Cormack, of "Tattersall's Hotel," Glen Innes, uses water from his back-yard well to water his garden. I never saw the effects of its water on grass. Mr. M'Crae, of Furracabad, about 2½ or 3 miles away, has had a very deep well sunk at his own private residence, and has had a windmill pump erected, with the object of watering his garden.

Mr. E.  
Gradwell.  
14 Oct., 1886.

*Mr. M'Mordie.*] Did he go to a great depth? You can get water running under every one of the adjacent flats; there is not above 18 feet of a rise, and yet they had to go more than 100 feet. The formation round about is more of a limestone one than anything else. By constantly using pumps I believe you would certainly exhaust the supply, and I only knew of one well to the contrary, namely, one belonging to Mr. Utz. You could take about 1,000 gallons a day from it before exhausting it.

*Mr. Murray.*] Do you think that if you wanted water for stock purposes that the wells would not be sufficient? If you sunk them deep enough they would be. If you don't get the water on the top of the basalt you will not get a drop in a well. Well-sinkers have only gone through the basalt at Vegetable Creek, and there is not the slightest doubt in my mind that there is a drift of tin under the Glen Innes seam of basalt. There is a trial-hole for railway watering purposes near town which is down more than 70 feet. The engineers expected to strike water at 60 feet, and have consequently now given the hole up. I sank the first 20 feet of it. We got on the basalt at 10 feet, and they were still going through basalt when they gave it up. It is a hard blue honeycombed basalt.

What other experience have you had in well-sinking? In no other district. I came from Inverell here. I was digging there.

*Mr. M'Mordie.*] Have you noticed any underground current whilst you were sinking? Only in Mr. Utz's well. It came up to my waist suddenly, and I had to be pulled up and leave the tools below ground. I immediately remarked to my mate, "That is an underground creek; pull me up, for I'm up to my middle in water." The tools are there to the present day, and we could not recover them. This is a grandly-watered country about here, and the whole of the wells are sunk entirely for domestic and stock purposes.

Is there any demand here for water for irrigation purposes, or is the rainfall sufficient for all crop-growing purposes? I have been here five years, and I think that the water is ample for all purposes.

What is the nature of the water-supply for the town? The people all depend on wells and roofs.

Where would be the most convenient place for getting a supply of water for the town? Just at the back of the township, on the flat.

Is that supply high enough to flow into the town and give a service? No; I certainly do not think it would be. You could not get water on any of the neighbouring hills. There is a shaft down 76 feet on the Show Ground, but not a drop of water is to be had in it.

*Mr. Murray.*] If you went back towards Ben Lomond you could get high sites, could you not? Certainly, and at a far less distance. New Zealand is the grandest country for wells that ever I was in. If you sink 10 feet you can get water.

Is the water that you get from the creek everywhere fresh? Yes. Some of the wells in this district are of an artesian character, but I never knew of one being full up to the surface. As a rule we are satisfied with about 4 feet of water in the shafts. The average cost of sinking is about 5s. per 5 feet from the surface to 20 feet for picked ground, but if it comes to honeycomb there is an allowance made. The basalt cutting runs from £2 10s. to £3 per foot. I am sure that you could get a bed-drift under the basalt, and obtain abundance of water; but I cannot say how far down you would have to go.

What are the nearest mining properties from the town of Glen Innes? Vegetable Creek tin-mines, about 30 miles off. I have been working there. In the dry season they are very often stopped for want of water, sometimes for months at a time. There is not the slightest doubt that water could be conserved on some of the adjacent hills, sufficient to accommodate the whole of the miners. I should think that they would be willing to pay a fair share of the cost. I know that if I had a claim there I should be only too happy to do so.

*Mr. M'Mordie.*] The sinking of a well about 60 feet deep here would cost about £60, I gather from your remarks? That is if it was on picked ground. On the other side of the hospital we sunk 56 feet. It is our custom to brick the shafts when in bad ground. The owners found the bricks, and we put them in, and sunk the well at 5s. per foot. That was because we knew that the ground was good sinking. It is beautiful, soft water—the softest in this district. It contains no hard metal or stone of any kind. We had just touched some quartz, but having plenty of water we left off. We put in a curve on getting into bad ground, and bricked up then. That was found necessary in only two cases. I have known three or four wells fall in altogether through not being properly attended to during the sinking, and leaving them neglected for a single night until the following morning.

FRIDAY, 15 OCTOBER, 1886.

Present:—

MR. MURRAY,

MR. M'MORDIE, B.E., M.I.C.E.

Mr. Archibald Wellesley Chapman examined:—

*Mr. Murray.*] What is your occupation? I am a Government staff surveyor, and I have been stationed in this district between seven and eight years, and I have a good knowledge also of the surrounding district, and in fact of the whole of the New England District, and as far west as Canonbar and Bourke. The largest lagoon near Glen Innes is 7 miles from here. It contains 193 acres, and there is a narrow channel leading from it. If this were dammed up a very considerable amount of water could be stored.

Mr. A. W.  
Chapman.  
15 Oct., 1886.  
Lagoon.

It

Mr. A. W.  
Chapman.  
15 Oct., 1886.

It has no particular name that I know of, but it is on the Clairvaulx Run, parish of Wellington, county of Gough, about 8 miles west from Glen Innes. The area I have mentioned is the area over which the water spreads at present. Of course it would spread over a larger area if dammed up. It was dry about two years ago, but then we had not had heavy rain for a month previously. After heavy rain there is usually an average of about 4 feet of water in it.

Could the capacity of the water be increased by diverting water from other streams? It could. The country is pretty level about there, and I suppose about 2 miles to the west there is a good catchment from which the water could be diverted into the lagoon. The spots are on ridges between here and Emmaville.

To what extent might water be conserved by diverting it into that lagoon? By making a dam to the mouth where it leads out you could get, probably, a uniform depth of 10 feet of water all over it.

Where does it run into? Into Clairvaulx Creek. I think that is the name, or Reddiston Creek, which is identical with Clairvaulx, which is close to Beardy Creek, near its confluence with the Severn River.

What size would the dam require to be? About 20 chains long for a not very high dam, and (say) perhaps about 10 feet in height. There are about 4 feet of water in the lagoon at the present time, and the dam in question would store a uniform depth of 10 feet. I have not made any calculation as to the amount of water that would be thereby caught.

Could that water be subsequently distributed to advantage over the surrounding land? The land adjoining it is, as a rule, poor until reaching Ranger's Valley, about 10 miles away. There are farms surrounding it at a radius of 3 miles, which would doubtless be benefited. At Ranger's Valley the land could be watered by the Severn River, which passes through the centre of the run.

*Mr. M'Mordie.*] If a dam were constructed at that lagoon, would it not fill from its present drainage area? Heavy rain fills the lagoon, but a soaking rain has not much effect on it; still, it is very seldom that it is dry. The Llangothlan Lagoon, on Ben Lomond, 25 miles from here, is only 100 acres smaller than the Mother-o'-Ducks, viz., 1,065 acres is at present covered with water. That amount could be extended very considerably. There is another lagoon of 300 acres a mile south-east of it. It contains beautiful water, and no reeds at all.

Llangothlan  
Lagoon.

What size would the dam require to be? Mr. Bagot dug a race down to the head station, carrying the water about 2 miles from the lagoon. You could carry water from it over perhaps half the tableland. By making a dam you could raise the water another 6 or 10 feet. Ten chains across would do the whole thing;—the ridges crop in admirably all round. I could not say where you could still further enclose water by adding to the dam. In all you might put an additional 10 feet into the water.

Could the Clairvaulx dam be still more enclosed? I do not think so. The country is very level thereabouts. Have you any idea of the amount of water which would be held with a 10-foot dam there? It would not take long to work it out, but I have not calculated. It would probably cover about 200 acres more all round with a 10-foot dam, or 1,260 acres with a depth of 15 feet of water.

After conservation, could the water be easily distributed on to the lands that require it? Yes, very readily, because the lagoon is 1,000 feet higher than Glen Innes. There are a great many farms all the way from Ben Lomond to Glen Innes, along Beardy Plain.

Do you think the dam superior to the Mother-o'-Ducks? Certainly, for this district. The Mother-o'-Ducks is filled with weeds, and this is clear water.

The capacity, I find, would be about 5,000,000,000 gallons? Yes.

*Mr. Murray.*] Could that be conveyed at a moderate cost on to the farms which would require it during dry seasons? Yes. The descent is very gradual.

I am aware that there is not so much necessity in this district for water, but do you think it would be advisable and requisite to construct works of this nature? I do, most certainly. The district suffers more for want of water, especially in connection with crops, than people think is the case. We generally get a good supply of rain about September, and in summer-time we always have storms. By irrigation we would anticipate the storms, and could thus save our crops. I think it would make a wonderful difference in our farming industry. The population in the district is rather thin at present, although there is ample room for an extended population, and a work of the kind which is now proposed would have the effect of increasing it. The farming industry is absolutely in its infancy hereabouts just now, and hundreds of thousands of acres are still undeveloped.

*Mr. M'Mordie.*] Would this lagoon command good land immediately below it, or would the water have to be conveyed any considerable distance? It would not have to be conveyed any great distance. There is good land right from the lagoon down. The Mother-o'-Ducks would also water a good deal of land in this direction.

Have you any knowledge of any other lagoons in this district? No. Only smaller ones, of a rather insignificant character, only about 10 chains across. There is one at Glencoe, about 10 chains square, which could be considerably increased by damming. There is another about the same size not more than 2½ miles from here, but there is very little catchment for it, and it could hardly be increased by damming. It is on the main road to Tenterfield. The first-mentioned one is about 1 mile north from Glen Innes. Those are about the most important ones.

*Mr. Murray.*] Outside of the lagoons, can you tell us of any places where, by making dams, good reservoirs could be made on creeks or rivers—say, where the mountains crop up close to the creeks? There is one place in the Clairvaulx Creek which is pretty wide in places down past Furracabad, and it is hemmed in by the mountains. The water could be thrown back a tremendous distance there. If a dam, say 50 feet high, was constructed, it would throw the water back probably 2 miles. Its width would be about a mile.

Would the water in the reservoir have to be gathered upon freehold properties? Yes; I think it would cover parts of the Haymarket Estate, the land of which is worth about £7 to £10 per acre, or more.

Do you think that some of the other places could be utilized without incurring the great cost of purchasing the freehold? On Beardy Plain and towards the Mann River I think that could be done. I have not taken particular notice of it, however.

Do you think it would be advisable to have an instrumental examination of all the places spoken of to ascertain? I think the information could be had at very little expense. For instance, an aneroid would give you all that would be required.

Is there anything else that strikes you that the Commission have not asked by way of irrigating

or conserving water which might to your thinking be useful? I have no doubt there are numbers of places where water could be conserved, where there is a good catchment, and where there are flats which would hold large areas of water. Especially to the west of the town out towards Clairvaux there is a large amount of agricultural land which would be benefited by irrigation.

Mr. A. W. Chapman.  
15 Oct., 1886.

Have you any knowledge of the average production of corn and wheat in the Glen Innes District? Wheat would average about 30 bushels per acre; but of course there are many heavier crops. The corn average would be about 50 bushels. These yields would be materially increased by irrigation, inasmuch as people could put their corn in to suit the climate better.

Mr. M' Mordie.] Could you give any reliable information as to what irrigation would be worth per acre per annum;—would it be worth (say) £1 per acre? I should think it would. Especially would it be valuable for potato growing.

Mr. Murray.] How many tons of potatoes per acre do you average in the district? From 4 to 6 tons. I think that could be largely increased by irrigating, and by a system of under-drains more could be made of the land. For instance, if you turn up your land after very wet weather it is apt to be cakey; but if you water it properly you can turn it up so as to have it mellow.

In what proportion of years do you suffer from insufficient rainfall in this district;—when does it not fall at the proper time? I think for about four years past it has been considered dry weather in New England. Our last season was a wet one, and taking it on the whole I think we have a very fair rainfall here. We are nearly always sure of rain, but if we had it at the proper time we could regulate our crops. Frost is another serious thing which we have to contend with.

Do you know anything about the springs or the wells here? There are numerous springs in the locality. Only the other day a spring at Stonehenge was analysed at Sydney, and was found to be as nearly perfectly pure as could be wished.

What is the value of land hereabouts? The value of land in the immediate vicinity of Glen Innes is £25 per acre, and farm land adjacent is worth £10 per acre, say a few miles from town.

Mr. James Martin examined:—

Mr. Murray.] How long have you been in the district? I have resided in New England since 1850. For many years I was a storekeeper in Glen Innes—for about twenty years or more,—and I have a thorough knowledge of the surrounding district. Probably no one has a better knowledge of it than myself, except, perhaps, Mr. Colin Fletcher. I was here before Glen Innes was inhabited, and long before farmers sat down on it. I have seen a great many floods, but never any droughts. We have had dry seasons, certainly. The driest was probably 1878, when the Beardy River was dry in places for stretches of a quarter of a mile. I have never seen such a thing before, and never since, and even then we had fair crops. I think I know all the natural reservoirs in the district. I have heard Mr. Chapman's evidence, and it is perfectly correct, as far as the water is concerned. I can add nothing further than that at Ben Lomond, where the immense lagoon is, there are numerous springs, and there is no necessity for taking the water to the farms under Ben Lomond. The fact is that we have too much water to contend against. Excess o water.

Mr. J. Martin.  
15 Oct., 1886.

In my own case, I lost hundreds of sheep from fluke and other diseases.

Do you know of places at which, at a reasonable outlay, water could be conserved for distribution? No; I know of no place where there is a necessity for water conservation on the adjacent hills. I am speaking of the district as far as Swanbrook, on the western fall.

Could it be conserved on the New England tableland to serve the other districts? It certainly could; but it would be very expensive. The fact is that we could conserve enough water in New England to serve the whole of Australia. Our great trouble is to get rid of it. Unfortunately it comes at the wrong time occasionally. At harvest time thunderstorms do us an immense amount of damage. The Beardy is a shallow river, but the Mann River is different. I have, however, seldom heard of damage to any extensive degree from that source. I do not think that it would be necessary for us to conserve water more than once during ten years, and I very much question whether the people would guarantee to pay for what was given to them in the shape of water conservation here, because it would be very seldom required. Oats are our standard crop, but in some parts we have wheat. In the Clairvaux District wheat thrives remarkably well. On the black-soil plains it does not do well, unless we have a good season, when it occasionally is a success. On the hilly or red soil we sometimes get 40 bushels to the acre, but our average for wheat is 22 bushels, and for oats 50 bushels per acre. That is a rather low, and certainly not an exaggerated average. Only a certain portion of the district is fitted for corn-growing. As a rule, corn is put into newly-ploughed ground, because the land is too mellow. Our corn crop would not average more than 20 bushels, but I have known instances of perhaps 60 or 70 bushels per acre.

Do you think that on the slopes the corn could be increased considerably in average by irrigation? I certainly think that it could be, on the western slopes.

Nothing could be done, in your opinion, to benefit the potato crop? No, except on the western slopes. The locality of Swanbrook, in the west, is looked upon as the limit of the tableland. That is about 22 miles from Glen Innes. On all other sides we have an unlimited supply of water—north, south, east, and west. We do not pretend to grow grapes, but occasionally we do grow them. The late Captain Williamson grew them profitably at Swanbrook. I have only once known the local creek—i.e., the Rocky Ponds—to be dry. That was in 1852. I was the first Returning Officer for the district, and I take a very deep interest in it. I certainly think that an unlimited supply of water could be provided for the town from the lagoons referred to, but we have really no need for it in Glen Innes. When population demands it, a system of gravitation could be readily carried into effect. There are any number of springs in the immediate vicinity. I am not aware that an officer of the Works Department (Mr. Hickson) is at present making inquiries with respect to a water supply for Glen Innes. Almost every house in the town is supplied from wells. It would not be possible to utilise the creek, inasmuch as it is full of dead dogs, &c. Our municipal roll contains within 120 of 3,000 electors, but I cannot say the amount of ratable property in the borough. It has increased about a third during the last couple of years. In future times I have no doubt it would be a grand thing to have a pure-water supply for the town, for unless the Municipal Council take very extraordinary precautions indeed the future supply will be anything but pure. English fruits grow here to perfection, and frosts are prevalent. We grow almost every fruit here, including some of the finest cherries in the world. I speak from experience, having grown them for years. As I have

Mr. J. Martin. have said, grapes are not worth troubling about on the tableland. The people in the district have a very primitive style of farming, and only during the last few years have they made use of any modern appliances such as double ploughs, reaping machinery, &c. They are now, in some instances, making arrangements to house their cattle. Some new people have imported new ideas, and things are bidding fair to be largely improved in the immediate future. We have the ground, and it only needs enterprise to make the district one of the most important in the Colony.

15 Oct., 1886.

Wheat growing. *Mr. M' Mordie.*] Could water be profitably used to a distance of (say) 40 miles, assuming that it be conveyed for that distance? I do not think so. The land is not there. We are looking for a market for our produce to Queensland. We could get a suitable market at Newcastle and elsewhere if the Government would allow us to take our goods at a reasonable rate to those markets. At the present railway rates we are virtually shut out from everything; and if no reduction is made, or in the event of our failing to get a market in Queensland, we may as well shut up altogether. Oats can be grown very profitably at 1s. 9d. or 2s. per bushel, and other things in proportion. We must either send our produce south or to Queensland. If both of these quarters fail we must stop farming, and live upon each other as well as we can. I have never been engaged in milling, so that I have no direct personal knowledge of it, nor am I personally interested in it. At present we have no special inducements to grow more than we require for our own consumption. I know as a matter of fact that we have been importing Californian wheat here, which is explainable by the reasons I have mentioned. This is the first year that flour has ever been sent away from Glen Innes. Mr. Utz has this year sent locally-grown flour to Newcastle, Narrabri, Tenterfield, and Armidale. It costs about a pound per ton to truck it to Newcastle. Do you think that if sufficient inducement was given to the people in these districts they could supply all the deficiency of Queensland for breadstuffs? Yes. Some of the finest wheat I ever saw in the country was grown at Tenterfield. I have been judging wheat there for some years past, and it is quite equal to the Adelaide. Inverell and Tenterfield wheat seems to produce a little more flour. Our average is, I know, infinitely larger than that of Adelaide—in fact, it is fully four times as much.

Mr. Lewis Schwenke examined:—

Mr. L. Schwenke. *Mr. Murray.*] What is your occupation? I am at the present time a publican, residing at Yarrowford, but I have been for about thirty years in Glen Innes, and I know a good deal about the district. I have heard the evidence of the last two witnesses, and I don't see anything in it from which I can differ, nor have I anything to say in opposition to their remarks. I am the proprietor of a saw-mill on the Beardy River, which is worked by water. About fourteen or fifteen years ago, when I started it, I worked it for three years successfully, but subsequently we had droughts, and for two or three years I was without water. If I had a constant supply from the Government it would be a great advantage to me, and I would be perfectly prepared and willing to pay a fair price for the accommodation, so long as it was not more costly than steam. I know that there are plenty of places on the Beardy River beyond me where such a supply could be conserved at a small cost.

15 Oct., 1886.

Can you tell us of any places? Near my own place is one spot, but I cannot say the extent. I think that if water was conserved it would be availed of for manufacturing and for other purposes. At the present time my water-wheel is 31 feet 6 inches in diameter, but it is not sunk in a pit. I think I had to blast a few rocks out here and there. I do not at all see what is to hinder a water supply being utilized for irrigation in this district, particularly in some parts, at Clairvaux Creek especially. On the whole I think a system of water conservation in the district would be beneficial to the people, and that they would be prepared to pay a fair price for it. In some instances I have seen our creeks perfectly dry, with not sufficient water anywhere to water cattle. Clairvaux Creek and the Furracabad Creek I have seen dry, whereas years ago I had to swim my horses across them.

Mr. John Frederick Utz examined:—

Mr. J. F. Utz. *Mr. Murray.*] What is your occupation? I am a storekeeper and miller, residing in Glen Innes, and I have resided here for twenty-four years, consequently I have a knowledge of the whole district and of its capabilities.

15 Oct., 1886.

Rainfall plentiful.

Can you give us any information that you think would be of service to the Commission in connection with its present inquiry? There is abundance of water running to waste. The Beardy, Severn, and Mann Rivers are each running to waste, any of which would doubtless be useful for storage and irrigation. As far as my knowledge goes, irrigation in New England would not be required in one season out of any ten or fifteen. The fall of rain, as a rule, is plentiful, as far as this part of the district is concerned. I have not the shadow of a doubt that abundance of water could be conserved here which might be utilized in the western slopes. I am well acquainted with green produce in the district. Within a reasonable radius of the town of Glen Innes I should say about five to six thousand acres are under cultivation, the produce of which goes into the town. We have a great tract of good agricultural country which is not under cultivation. The great drawback, up to the present, has been that there is no local market. If we grow more grain than we could consume here it would simply go to waste. They would not be able to send it away for lack of convenience. If markets were opened up by railway communication there would be, undoubtedly a large quantity—probably from five to ten times as much—of land cultivated in the district. The population would increase, and irrigation would undoubtedly assist the population. Bad seasons are not very frequent in this part of New England. As a matter of fact, I have purchased Californian wheat and ground it at my own mill, and I am actually doing so at the present time. I could not get wheat in our own district. I could get it from Inverell, but the carriage for the distance, only 44 miles, is as high, sometimes, as £7 a ton, on account of the bad roads; and, consequently, I am able to buy Californian-grown wheat far cheaper. This year I purchased from Mr. Gindan, of Inverell, 5,000 bushels. I got 2,000 of them delivered here at from 2s. 6d. to 3s. per cwt., by the carriers. The remaining 3,000 bushels I was forced to resell at Inverell, because it was almost impossible to get it to Glen Innes at any price. That undoubtedly accounts for, at the least, ten times as much more wheat not being grown in the district. The actual fact of the matter is that farmers are afraid to sow for fear that they will lose everything.

Obstacles to wheat growing.

*Mr. M' Mordie.*] Would it, under the circumstances, be advisable to spend money in making a good road hence to Inverell, assuming that a necessity exists for a railway? Certainly not. A good road would

would be only temporary, whereas a railway would be everlasting. Apart altogether from that, even if we had no road at all to Inverell, I fail to see how a good road would do us any particular good, because the means of transit are so slow that it would not suit us in any way. The great difficulty is not the badness of the road.

Mr.  
J. F. Utz.  
15 Oct., 1886.

Within what distance west from Glen Innes would there be a demand for water for irrigation? I should say the whole of the western districts would require water more than our district. When once you leave Glen Innes and travel 12 miles you get into the high districts. The change is very great after you cross the Waterloo Range; and water conserved here could be profitably used at a distance of 12 miles, there as I have mentioned.

Can you give any reliable information as to what the value of water would be there per acre per annum? That just entirely depends. If the land was cultivated it would be very valuable, but not so much for grazing land. In some instances it might be worth 6d. or 1s. per acre for grazing, and for agricultural probably from 5s. to half a sovereign. On looking into the matter, I should say that it might improve the land probably 20 per cent. or more. Every common sensible man knows there would be some benefit, but to what extent I really could not say without calculating.

Do you think that it would be possible, under the most favourable conditions, to conserve water and distribute it at the rate of 1s. per acre irrigated? I certainly do, for the whole year.

*Mr. Murray.*] Do you think that the water could be conserved here for the township's purposes with advantage? Yes. I have been an Alderman and also the Mayor of the town. The ratable property returns an annual sum of £1,200 at 5 per cent., or £24,000 in all. The population inside the municipal boundary is about 1,800. The number of houses is probably about £500, with about an average of five rooms in each, making some 2,500 rooms in all. These, at 2s. 6d. per room, would give a revenue of over £300 per annum. I don't think that amount would be sufficient to pay a revenue, or the interest on such an expenditure as would be involved. The selling price of land within a distance of say 2 miles from the town is from £5 to £10 per acre. Land has been sold at £10 per acre within that distance.

If we were enabled to increase the product of the land, where would be the market for the increase? Queensland—as soon as the line is opened.

Is there an ample market there? I should say they will take a very large quantity of produce. I am not very well personally acquainted with Queensland, except from hearing and reading. I know that the Queenslanders import nearly all their breadstuffs, and when once a market is opened I have not the slightest doubt that an increase of production will follow. Without that, irrigation or anything else that would increase the production would be utterly useless.

SATURDAY, 16 OCTOBER, 1886.

Present:—

MR. MURRAY,

MR. M'MORDIE, B.E., M.I.C.E.

Mr. John Henry M'Creery examined:—

*Mr. Murray.*] What is your occupation? I have been a station manager for a long time in this district I was for some seven years on Myall Creek as assistant manager, and four years on Stonehenge I have also travelled all through this part of the country as far as the Barwon River, and I have a good general knowledge of the whole district. I have served my time as a farmer in Tasmania in my younger days, and I understand the growing of grasses. I sowed a hundred acres of English rye grass, cocksfoot, prairie, and red clover at Stonehenge. These did remarkably well, the climate being thoroughly adapted for them. I did not try irrigation at all for them, and I think that in this climate it is hardly required, as it is so moist. It is two years since I sowed the first lot. We mowed some of it and made about 10 tons of English grass hay, which ran about 10 tons to the acre. I think that on the whole the seasons here are sufficiently moist for the general growth of English grasses, and only in exceptional seasons would, in my opinion, irrigation assist in making an increase.

Mr. J. H.  
M'Creery.  
16 Oct., 1886.  
English grasses.

Do you know of anything that you could inform the Commissioners of with respect to irrigation? I really do not think it is necessary in this district; the streams are always running. At Myall Creek it is very much drier, and I believe that irrigation there would be a very great benefit—and in that direction away towards the Barwon.

*Mr. M'Mordie.*] Do you consider 1 ton to the acre a fair yield from English grasses? Hardly; but this was the first crop. It has only been a few months in the ground, and no doubt it will yield better hereafter. The ground was properly prepared, but the grass had hardly taken hold. The second year will probably yield much more. Sheep have been fattened all through the winter on the English grasses, whereas if fed on the natural grasses they would have been poor. I believe that the roots would hold eight or ten years in the ground. I doubt very much whether they would answer at Myall Creek without irrigation, but with it they undoubtedly would. This is a climate adapted for them, and in which they can be produced with advantage.

What would be the cost about per acre of preparing the ground for the grass? It would cost £2 an acre for ploughing, seeding, harrowing, and rolling.

*Mr. Murray.*] What do you value grass hay at per ton grown here? Really it is very hard to put a value on it, because it has never been used. It ought to be worth fully £2 a ton. If you put it into the local market you might not get that much for it, because the people do not know anything about it yet. They have yet to be educated in connection with it. In Tasmania thousands of tons are stacked every year with great advantage. They adopt irrigation there in places privately, the country is so well adapted for it, there being numerous streams running through valleys which they can easily dam up. Some of the very best dairy farms I have seen irrigated there. About Moree and that district, with irrigation they would grow any kind of hay.

Irrigation.

*Mr. M'Mordie.*] Have you found that the class of grass you have mentioned grows equally well here? Yes; every one of them has flourished. Mr. Simpson, who has bought the station I have mentioned, is so pleased with it that he is going in for it extensively. One acre of English grass is worth at the very least 5 acres of bush grass. I believe that with irrigation English grasses would grow anywhere in

Mr. J. H. M'Creery. in the Colony. Some years ago in the Moree District it was extremely dear. I have seen it weighed out by the pound at a shilling a pound, and so careful were they of it that I have seen them pulling a few straws out of the scale. Grass has been so scarce that I have often had occasion to feed our horses on bread. Mr. Murray.] To my recollection, Dr. Seigol had a special bakery for feeding his horses here? Yes.

MONDAY, 18 OCTOBER, 1886.

At Tenterfield.

Present:—

MR. MURRAY,

MR. M'MORDIE, B.E., M.I.C.E.

Mr. Thomas Arden Lewis examined:—

Mr. T. A. Lewis. Mr. M'Mordie.] How long have you been in this district? I have been eight years in the neighbourhood, but I do not know the district. I know the town, and occasionally I have gone through the district, but I cannot give very reliable information with respect to it.

18 Oct., 1886. Could you give us any information as to suitable places for storing water in large quantities? Yes. There is a place called Hawker's Gully, on the top of the hill. We were thinking of storing water there, but on account of the expense the work was not started.

Hawker's Gully. What quantity of water could you store there? We could not store much without making dams—it would need an engineer. We would at all events have a nice fall to the town.

Could you give any information as to the area of a reservoir which might be made there? I could not. The position is what I speak of. It is about 2 miles from the post office. There would be a constant supply of very good water there.

Is it about the head of Tenterfield Creek? It is one of the heads.

Wells. How is the town supplied with water now? By the creek and watercourse. The water is all hard in the wells, except at the court-house and gaol, and Corney's Well, and in one other. We get a water supply in the wells, according to their position. The best quality is at the court-house, where the well is between 28 and 30 feet deep. Then, again, 50 yards further off the water is bad, and very brackish. It is an imperative necessity that we should get a water supply laid on. The Hawker's Gully supply would cost from £6,000 to £8,000. The pipes could, however, be now carried by railway cheaper than before. The carriage of the pipes would need to be reckoned up, and the material has to be brought so far from Sydney.

Sit on for water supply. What is the ratable value of property in the municipality? I will procure the exact information for you. The population of the town is about 2,000. I would like to mention, by the way, that we sank a well here alongside the creek which was about 40 feet deep; but these wells are not reliable. For instance, when the well was first sunk the water was good, but after the first month it turned quite brackish. Another thing, where population exists the nature of the soil in Tenterfield causes the drainage to percolate nearer the surface than it does in most other places. You get down to clay very quickly; from 12 inches to 2 feet in the town, the water will not sink any lower, so that if there is a fall in the ground, the water is even seen oozing out, as can be exemplified in the main street opposite the bank. That interferes with the water, and where there is any bad drainage it must interfere with the wells. With regard to the creek, I have formed one of three committees to inspect various places for a water supply, and at one time we were thinking of damming up the creek above 30 yards south of the bridge (I mean the traffic bridge). We found when viewing the place that there is an accumulation of sand, and if we placed a dam there we should have more sand than water. Another time we went to a log crossing, and thought of making an overshot dam there, but the same objection happened. The Hawker's Gully site would be sufficiently high to feed the town by gravitation, but the creek would not be. The water in the creek above the town would be the best to get for the town, but it would require a pumping apparatus. At one time we asked the Government to put on a large engine here to pump for the use of the town, as the engine would not be continually required for the railway station. We were then told that arrangements had been made already with regard to the engine, and that the plans could not be altered. If water could be stored here there would be a demand for water-power. It might not be of any great extent during wet weather, but in dry times I have seen some 300 loads of water leave the creek in one day for various households. I think that a water-power, if offered, would be accepted, especially for sanitary purposes. There is a large supply of good timber in the district of a good many kinds—cedar and all other hardwoods; and also soft ones, such as sassafras, blackbut, willibut, &c. I should fancy, however, that a water supply would not be very suitable for a flour-mill. They have never proved a success. You can get the exact desired power better by the use of steam. Probably the power derived from a water supply might be regulated, but in all places where machinery can be got the people prefer it. I should fancy it would be much cheaper to have water than steam, but why the system is not adopted I do not know, except for the reason given. The water-power could be regulated by turbines, if properly constructed; but I am speaking simply of my experience with regard to creeks and gullies for a water supply where water is not constant. I could not say exactly what the town could afford to pay for a water supply, but our present rate is 1s. in the £1. The people would be willing to pay a good deal more than that for a water supply. The better plan would be to use meters, as one man might use twenty times as much as another. At the present time we are paying 1s. per cask of about 120 gallons. They are called casks, but they are made of galvanized iron. The water they are filled with comes from the creek. For an average family, of five or six persons, that would be about £5 per annum, and it would be a very small supply. A minimum would be, probably, from £5 to £6 per annum, and we would be decidedly glad to pay something more than half that for the supply the Commission have indicated. In the one case it would be good water, and in the other we are never certain. In dry weather our creek water is green slimy stuff, containing drainage, and several cases of disease have occurred through drinking it. It is our wish to have a water supply laid into the town, and to be supplied by gravitation, and at the present time I cannot advise any other place but Hunter's Gully, although there might be other places that I don't know of. I should fancy there would be a demand for irrigation. There are many gardeners here who would be only too glad to get it. It would, of course, be possible to utilize stored water twice—once for working a mill, and subsequently for irrigation, or for the supply of the town. It is my opinion that creeks should not

not be used for the water supply of towns. Our own creeks are nothing but sewers at the present time. The time has arrived when there are actually more sewers than conveyers of pure water. We have had typhoid fever, which was clearly attributable to the creek last summer. The present time is a very awkward one in which to elicit evidence, as people are busy in connection with the railway demonstration. It is not that they do not take an interest in the matter which keeps them away to-day. There have been a great many agitations in the town for a supply. Some time ago the people used brackish water from wells in preference to the stagnant stuff in the creek, and the Municipal Council pumped it up gratis.

*Mr. Murray.*] Would a water supply pay a maximum interest on the sum referred to? I should think so. It is a very poor family which does not use more than two casks per week. At Brown's Hotel the landlord uses something like twenty casks every week, which would be equivalent to £300 per annum.

That would pay the interest on the cost for the whole town nearly? I should estimate that every family averages £5 per annum for their water—that is a reasonable minimum rate.

Why is it that a move has not yet been made towards effecting that very desirable object? The people here do not like to go into debt. It was thought that if we could borrow the money from the Government it would be far preferable to borrowing it from private individuals.

*Mr. Murray.*] It can be done under the Country Water Supply Act, or by Private Bill, on Debentures.

*Mr. Lewis.*] I do not know of any cases of irrigation in this district. It is a country that very much requires it, however, and it would increase the crops to a great extent. There are any number of places which might store the water, and admit of its being carried on to the land. For instance, near Mr. Walker's station, Vinelands, which is suitable for vines, or for anything else. It will grow anything, provided there is plenty of water. A Mr. Thomas Miller, a farmer, 3 miles out of town, has a windmill, and follows out irrigation on a small scale for his garden, orchard, &c. Since he got his windmill in working order he has grown the greatest crop of potatoes he ever did in his life. He had about 20 tons this season, for which he got a better price, on account of other people not being able to grow them.

Mr. James B. Graham examined:—

*Mr. M'Mordie.*] How long have you been in this district? I shall have been in the district for sixteen years next January, and I have travelled about it very largely in my capacity of Police Magistrate, Mining Warden, and in other ways. Consequently I know the district and the watershed country well. I have just heard the last witness' evidence. I admit the supply of water would be a very advantageous thing to the town, but I fancy that he is mistaken in one point. The whole of the water supply which could be utilised from Hawker's Gully would be very small indeed, and if it could be used even for domestic or drinking purposes it would be as much as could be expected from the place, or from any other of the head waters. Tenterfield is situated very near to the dividing ranges, and consequently the waters running by the town are very small. The mere fact of Tenterfield Creek being sometimes dry is evidence of that fact. The irrigation of any portion of the town would be most difficult, as there is not sufficient water lower down, on the Mole. Large conservations of water could be made in consequence of the ranges coming in close to the river, and extending above that into large flats, where immense lakes could be made, and vast quantities of water could be stored for use lower down on the river. Lower on the Dumaresq River similar conservations could be made, especially below the junction of all the creeks, such as Pye's Creek, Tenterfield Creek, the Mole River, and the watersheds from Stanthorpe, &c., where there is a very large watershed. That river is the boundary of the two Colonies, and of course it would require (if ever used) some arrangement with the Queensland Government. As you get down the river it opens into wide alluvial flats, in some cases extending 5 miles from mountain to mountain. All of that is of a very rich soil, which with irrigation could be made most productive. Without irrigation, from its nature of a shingly sub-soil, it drains quickly, and the rainfall there is much less than on the tableland. At Maidenhead the level would be about a thousand or fifteen hundred feet below Tenterfield, and enormous quantities of water could be conserved on account of the nature of the country. Occasionally bars of rock cross the river, especially where the mountains come close in towards it. The formation is trap rock and slate. Where the Dumaresq River enters the plains it opens widely. The water backed up on the moles could scarcely be used for irrigation on the lower country in consequence of the roughness of the country. Fluming and races would be of enormous expense. The water would have to be taken down by the old channel. Almost anything could be grown. Tobacco, for instance, could be cultivated to immense advantage. The "Texas" tobacco, which is grown thereabouts, is supposed to be the best that is grown in the Colonies. It is fragrant, and perfectly free from saltpetre. I think that with irrigation almost anything would flourish. There are no mining industries on the western slopes, except on the Mole tableland, where tin-mining is carried on. Silver-mining is also carried on. Below Mungoolah, I believe the Dumaresq to be a constantly flowing river—at any rate the waterholes are always full. There is an underground flow at all times. Years of drought have dried some of the springs up, but after the recent supply of rain the river will probably run for years and years. On the west the application of water could be made almost immediately to rich flats, as in contradistinction to the east. There is a river called the Timbarra, which junctions the Clarence just below Tabulam, which is constantly running, and water could be conserved in it. The Timbarra takes in a rather large shed of water, and after going through comparatively open country gets dammed in the high ranges, where it could be utilized for the Clarence River flats. The mining town there is Fairfield or Drake, as it is known, situated on Plumbago or Fairfield Creek. The watershed there is very small—simply head waters from large mountains, but there is quite sufficient at the present time for mining purposes, although it has to be pumped. The mining is chiefly crushing, not alluvial. It is too high for gravitation purposes, and owing to the peculiar nature of the local mining, water is not much required. Irrigation is not nearly as necessary for the Richmond and the Clarence as for the western slopes. There is a heavy rainfall, and it comes there, as a rule, at the proper time. In ordinary seasons there is more than sufficient water. The rainfall on the eastern slope would be almost 35 inches per annum, and on the western side probably not more than 20. To sum up my opinion, I consider this is a very suitable place in which to form subsidiary reservoirs for conserving waters. The question of cost I am scarcely engineer

Mr.  
T. A. Lewis.

Site for water  
conservation.

Tobacco.

enough

Mr. J. B. Graham. enough to go into. I do not know how the dams are constructed. It would take very substantial works in the way of dams to hold heavy flood-waters. In many places, if they were properly chosen, where the rivers narrow in—if the water were put back, you could form very large and extensive lakes. The nearest place to Tenterfield that could be advantageously irrigated I should take to be Mingoolah, about 35 or 40 miles radius distant, near Aitken's Flat. That is a flat between high precipitous mountains, and in places it is as much as 4 or 5 miles across. It is formed of particularly good soil on the river-flats, and grapes and trefoil grow luxuriantly. The only irrigation that I know of thereabouts is on the Condamine, in Queensland, where it is wonderfully successfully applied for growing lucerne. It is near Warwick, and I believe that a 10-horse-power engine and pump is used. Lucerne and grass paddocks are irrigated, and used for the purpose of fattening cattle and sheep for the butchers. I have heard, and I have every reason to believe it has paid remarkably well. From the river to the highest part of the land on which the water is thrown would not be more than 50 or 60 feet, if as much. It is simply used for lucerne and grasses for stock purposes. I think that the wheat crops are too subject to rust to be a very safe crop. A great deal of wheat certainly is grown, but it is not a very safe thing. The Beardy River would be a splendid one from which to water the flats to Maidenhead, and even as far as Bonshaw. It is a really excellent river for that purpose. The mountains rise almost precipitously. The trefoil in anything like a good season grows to such an extent that it is impossible to eat it down, or even to ride through it. All the adjacent river banks are good tobacco-growing ground. There is very little of purchased land—the country consists chiefly of squatrages thereabouts. Farming is not carried on to any great extent, and much of the land is Crown land. Irrigation would, in my opinion, certainly lead to increased farming. The first start towards showing what the country could do has already been made at Texas, where they had a tobacco manufactory on the Dumaresq River. The Beardy River is the last river of any importance until you make to the M'Intyre.

18 Oct., 1886.  
Mingoolah

Successful  
irrigation.

Mr. William Henry Walker examined:—

Mr. M'Ordie.] How long have you been in this district? I shall have resided here about ten years next January, and I am acquainted with the country from here to about 50 miles below Goondiwindi. I also know the M'Intyre River from (say) Coolati down to Yetman and on to Goondiwindi. In usual seasons the supply of water in Tenterfield Creek is wonderfully good. Last year it was drier than ever I knew it before. The soil here is not very rich; it is of granite formation. I have never heard of stock dying from want of water here. The losses from death in winter are more from the rigour of the climate than from anything else. I have not sold a store beast for some years in this district, and we have all our stock in capital fat condition. There is no necessity for constructing dams on the Tenterfield Creek, from a stock point of view. Of course the town requires water very badly. I could not say whether Hawker's Gully or Curry's Creek was the best site, for I really do not know, but I am rather in favour of the latter place. I understand that Hawker's Gully is a very rough place, but Curry's is freer from population. Despite the fact of the railway passing on to the Queensland Border, I expect that the town of Tenterfield will continue to go ahead. It has progressed steadily during the last thirty years, and I don't think it is likely to suffer from depression after the line passes away from it, as has been the case with some other towns. I have sold a great deal of land on the plain for £20 per acre, a mile from the town, and for £13 per acre 3 miles hence. That was some six years ago. Since then land has risen in value to about £13 per acre 3 miles from town, and up to £30 per acre within a mile. I recently sold a quantity for £23 per acre. Some people have made as much as £20 per acre from their land all round. The first year they bought it they made £17 cash, supplied their household with crops, and fed one pig. The second year they got £16 cash, all their produce, and two pigs. They go in generally for growing sweet-potatoes and corn. In another instance, off 1½ acres, a man has raised £30 worth of corn, worth about 6s. a bushel. I do not think that any large quantity of water could be conserved on Tenterfield Creek; it is a very rapid mountain stream. I have myself had dams made for sheep-washing purposes, but eventually they have all been washed away. There is no doubt that the flats do commence on Moongoola Run, but they are very small. The country is of trap formation, and the very rich portion of the flats are very close to the river. As you get lower down the river the good soil is more extensive, and further from the river; but beyond a mile from the river the land gets much poorer. At Texas Station there are a number of flats, and the soil is very suitable for growing tobacco and corn. I do not know of any basaltic country on the Dumaresq River until it junctions with the M'Intyre. There might be a little of it below the junction, but not much. The chief basalt is near Yetman, Tucka Tucka, Merriwa, &c., and there may be a little black soil just about the junction. There are places both at Moongoola and Maidenhead where to run between two very high ridges close together, where it would be possible to store large quantities of water at a considerable expense. The watersheds on Glen Lyon, not 3 miles from the river, are possibly 1,500 or 2,000 feet higher, and consequently the water in the gullies runs down at a tremendous rate. The length of a dam 50 feet high would be on the top, a little more than a quarter of a mile there. I think that I know one spur where it would be possible to erect such a dam. A 50-foot high dam would throw the water back 3 miles, and up two or three streams, viz., up the Mole, Petie's Creek, and Broadwater. The site I refer to is just below the junction of Moongoola and the Maidenhead stations, near the gate. Doubtless there are other places. Another one, for instance, is the top station, about 4 miles distant. There the water would be probably thrown back a greater distance. The low ridges possibly come in close to the river. The rainfall gets tremendously less as the course of the Dumaresq is followed down. I have often ridden out 6 or 7 miles and found that there had not been a drop of rain for ten days, whereas it had been pouring at Tenterfield. I should think that at Glen Lyon the rainfall does not average 20 inches a year, while it is about 30 at Tenterfield. Neither is it nearly so regular as ours. I do not consider there is sufficient good ground at Moongoola to justify irrigation; a greater portion of the flats are poor. Without irrigation the crops would be very risky. The tobacco at Texas is grown without irrigation, but doubtless with it the increase would be very large. With irrigation they could grow all sorts of things. There are large stretches of land, with plenty of limestone in it, which would tend to strengthen the wheat, and to make it more rust-proof. I do not know of any irrigation at present on the Dumaresq River. The lime country I refer to is not of any extreme extent; but 3 miles from Moongoola there are large limestone caves and mountainous masses of nothing but limestone. At Glen Lyon

Agriculture.

Poor soil.

Mr. W. H. Walker.  
18 Oct., 1886.

Lyon there are about 6 miles of extremely limestone country. There is also a small quantity at Clifton; and probably more down the Dumaresq. The outcrop of it at Glen Lyon is the most wonderful thing of the sort that I ever saw in my life. The absence of settlement along the Dumaresq is due to want of water, and nothing else. On most of the ridges there is not 2 inches of soil away from the river; the country is all used for pastoral purposes. Three weeks only of thoroughly dry weather make a drought on the ridges, and much stock are occasionally lost. My partner, who bought me out from Glen Lyon, was subsequently very nearly ruined from drought. Even if the hill country was under cultivation it would be of very small extent. With irrigation they certainly could get sufficient feed to save the stock in dry country. There is no comparison between the McIntyre and the Dumaresq as regards richness. Irrigation on the McIntyre would do vastly more good than on the Dumaresq. The former country is flat black soil for miles away from the river. I have not followed the McIntyre down in the same manner in which I have followed down the Dumaresq, but from (say) Wallangara to 50 miles below Goondiwindi. At Wallangara the soil is very good indeed, and there is limestone about 6 miles distant. There are also falls at Wallangara. You could get a number of sites for storing water below Yetman, owing to the general formation of the country. Between Wallangara and Yetman the country is very rough. I think there are places at, above, and below Yetman, particularly Trigaman, at which water could be conserved which would irrigate a large area of very rich country lower down. The valley below Yetman consists of basaltic plains, averaging about 6 to 10 miles wide. The good country is on the eastern side. At Yetman very beautiful trefoil grows. There is a road from Tucka Tucka to the west, which must be pretty flat, some 20 miles in extent. There is beautiful black soil from Blue Nobley to Yetman, on to Boornor. I certainly think that irrigation is greatly needed along the McIntyre; also that there is good water and that it could be easily conserved. I cannot say what rate farmers would be willing to pay for it. Probably the most money would be made out of the grasses which irrigation would induce. It should be worth certainly 10s. per acre to improve the grass land, and I should think that irrigation would treble the supply, and probably you might make as much as £1 increase per acre on stock. The value per acre of the present crops of lucerne at Yetman to the junction of the Dumaresq is about £3 to £4 net. If you had large quantities of it it would not be worth anything like that sum. A few years ago hay, in the time of drought, at Yetman, was worth probably £10 or £12 a ton. I think the McIntyre is like the Dumaresq, and that there is always an underground supply of water running down—possibly not more than 10 feet from the surface at any place. You would find it above Yetman in the one case, and above Bengoola in the other district. There is, by the way, a windmill at Tucka Tucka; also several sawmills on the McIntyre.

Mr. W. H. Walker.  
18 Oct., 1886.

Irrigation  
needed on  
McIntyre.

Mr. William Drummond examined:—

*Mr. M. Mordie.*] You are a licensed surveyor? Yes.

How long have you been in this district? I have resided in this district fourteen years, and I know more particularly the country between Pareelah Creek down to Mungoolah in the south-west. I also know a good bit of the country at the head of the Rocky River (counties Clive and Buller). The whole of the Buller district drains to the east. Tenterfield Creek is the natural western water, and that is in the county of Clive. The whole county of Buller and one-third of the county of Clive is western water. The whole of that country is very abundantly and permanently supplied with water. I have never known it to fail in any season. In Buller, especially, the country is nothing more than a mass of granite sand saturated with water. The ridges that intervene between the various creeks are so steep and precipitous that you could not carry water except by following the watercourses themselves. I don't think that irrigation would be required for any purpose in that part of the country. Conserved water could not be carried into the county of Drake and utilized there. That county is well enough supplied with water itself. Irrigation would be of service in the neighbourhood of Tabulam, and where the country opens out into flats. In heavy floods the water goes over the banks and spreads over large areas of land. The only sites for damming water back that I know of would be in the neighbourhood of Tabulam. If once raised by a dam it could be spread over a considerable distance. The heights of the banks are never less than 20 to 25 feet, and the water-holes themselves often go down 10 or 15 feet, and contain permanent water. The fall of the river is very great. The valley is from 2 to 3 miles on each side of the river Clarence, when you get into the level country. Very often there is a fall from the banks, so that when the river is in flood it leaves plenty of water behind in the by-channels which have been made in flood-times. There is plenty of first-class agricultural land there, but it is all in the hands of a few persons. That was what blocked agriculture; otherwise there would be heavy crops of corn grown. There are actually no settlers. If water was supplied for irrigation it would raise the value of the land considerably, and doubtless the present owners would sell considerable quantities of it. Railway construction would also lead to the same result. I could not put any exact value as to what the people would be prepared to pay for a system of irrigation; it would depend principally upon the facilities which they got for taking their produce away. The soil at the heads of the creeks is basaltic. With regard to the western side, the Mole river has an abundant and permanent supply of water, and so has Tenterfield Creek. Both of them have a continuous flow throughout the year. They both pass through very barren country after leaving Tenterfield. The upper portion is formed of granite and also trap. The ridges close in at intervals, and other flats begin again. Dams would certainly throw back a large quantity of water, because the river generally runs pretty level in the reaches. The difficulty of using the country is that of getting into it. It is very nearly 1,800 feet below Tenterfield, and only about 10 miles away, so that you have to go down very abruptly. At Tenterfield Creek there is nothing available for irrigation below the town, and there would be no advantage in conserving water there. Even the Mole flats are simply the wash from the higher banks, and I do not think that the area is sufficient to encourage people to irrigate for simply grass purposes. You cannot get any land on a large scale to irrigate before travelling down the river. My opinion is that Hawker's Gully, or Groombridge Swamp, and Carrier's Gap Reef, which joins about half a mile outside the town, would be about the best sources for a water supply for Tenterfield. Hawker's Gully and another creek, which converge, might possibly supply the town in its main parts, but not the outskirts and higher portions. They would, at all events, supply the surveyed portion of the town. The water is all good, and the country is of granite formation.

Mr. W. Drummond.  
18 Oct., 1886.

Dam sites near  
Tabulam.

Hawker's Gully.

FRIDAY,

FRIDAY, 22 OCTOBER, 1886.

At Grafton.

Present:—

MR. MURRAY,

| MR. M' MORDIE, B.E., M.I.C.E.

Mr. Edwin Joseph Statham, Assistant Engineer for Roads, examined:—

Mr. E. J.  
Statham.

22 Oct., 1886.

*Mr. M' Mordie.*] How long have you been here? I have been fourteen years here.

What are the boundaries of your district? I have a certain amount of the district under my immediate charge, and I have to inspect the surrounding districts. I am acquainted with the district from the Macleay River to the Queensland border, and west to Inverell.

Can you give us any information as to the levels of the roads, and the heights of river floods? I can give you some information as to river floods and their levels.

What is the extreme range of the flood-level at Grafton? 23 feet 8 inches above high water, and summer level down to tidal level as tested tidal level. At Ramorney, above Copmanhurst, the level of the highest flood would be about 77 feet.

What extent of country would a flood of that height cover below Copmanhurst? The whole of the level lands of the Clarence. Its width at Copmanhurst would be fully 2 miles. Grafton would be left an island.

What width of the low-lying lands would be covered north and south of the river? About 1½ miles. The valley thereabouts is very narrow. In flood-time it would be 5 miles wide across the bend. The level of the river bank at Grafton is about 22 feet, and at Copmanhurst about 40 feet. The rise of flood is 62 feet at the junction of the Orara River, and 34 feet at Moleville, *i.e.*, during the 1876 flood.

Have you any other information about the Clarence which you think would be of interest to the Commission? I can give you information about the tributaries of the Clarence, namely, the Nimboi and the Orara, and possibly of places for storage reservoirs if required.

Is there any public demand for water for irrigation purposes in the vicinity of the Clarence Valley? No one appears to have thought of it.

Would it be of any service, or does the rainfall come at suitable times? They have a very good rainfall here.

Irrigation.

Would there be any demand for irrigation if water was provided by storage for that purpose? I think people would have to be educated up to it.

Do you think it is required; would it improve the land? It certainly would improve the yield. There is a good deal of irrigation done by the Chinese in the Clarence Valley. They put down wells and raise the water by windlasses, with two buckets, one up and the other down. This water is used for gardening and growing fruit and vegetables. They raise vegetables here when they won't grow otherwise. Is irrigation by the Chinese carried on to any great extent, or is it merely confined to small patches? Some of the gardens are about 3 acres large. You could get water anywhere about Grafton at a depth of about 20 feet, suitable for watering gardens, from an underground supply.

Soil.

What is the nature of the ground passed through in well-sinking? It varies a good deal. For instance, clay and sandy loam, but mostly a thick bed of dark-coloured clay.

What kind of stratum is the water found in? On this side of Alumny Creek, which divides the town, it is chiefly found in sand. That creek is an ana-branch of the river running right through the centre of the town. There is a different character of soil on the eastern side, where it is more of a level. On the west side it is more clayey and very loamy.

What is the water-bearing strata on the side you are now speaking of? On the east clayey, and the west gravelly.

And is there what might be called an inexhaustible supply? There is a very good supply in the gravel on the west side. It has never run short during the dry weather. It is also much better water on the western side. On the eastern side there is very little good drinking water; it is brackish and hard.

Do you know anything of the water, as to its suitability for irrigation? It seems to answer very well in the Chinamen's gardens from either side of the creek.

Will you name the principal tributaries of the river Clarence in the order of their size? There are two main branches, Nimboi and Tabulam. The river divides above Gordon Brook, and goes north and south in opposite directions.

What is the nature of the valleys? The water runs through metamorphic rocks, slates, and granite. From Tabulam down the northern branch there is a good deal of granite, and in the southern branch it is chiefly metamorphic rocks and slate.

Is the land there of any considerable value? It is chiefly grazing land—not much agricultural land—and very broken country.

What is the nature of the contours of the valley—are the river beds precipitous, or what? Extremely broken country, with steep banks.

Do the valleys narrow? Yes, they narrow a good deal. It is very high country on the western side. These rivers mark the base of the tableland.

Sites for water  
conservation.

Are there any places in those valleys where water could be conserved in quantities at a moderate cost? Yes; I certainly think so.

Could you name any place in particular? Above Nimboi, on the south branch.

Any other places on that branch? There are places on the tableland where you could store considerable quantities. On the head of St. Cloud's Creek, for instance, at an elevation of about 1,000 feet over the Nimboi.

Can you name any places on the northern tributary? There is Fort's Creek, a tributary of the Whiteman. There is a good height for a storage reservoir there.

What size of reservoir could be formed there by a dam of moderate height, say 50 feet? A dam of 40 feet would throw back a large quantity of water there.

Can you state the approximate quantity? I have never made any measurements, but I should say about 500 acres, with an average depth of say 20 feet.

You think that large quantities of water could be stored on these tributaries of the main branches?

Yes; at moderate cost, too.

Would

Would there be any demand for water so stored for water-power or for irrigation, or for both? There might be on the Whiteman, which is partially level, with light, sandy, loamy soil, suitable for irrigation. That is the only place where I know that irrigation could be carried out with any chance of success.

Mr. E. J. Statham.  
22 Oct., 1886.

What area of land do you think might be irrigated there with advantage? About 9 or 10 miles down the Whiteman, to its junction with the Clarence.

By what width? It varies. In some places it is narrow, and in others it extends a considerable distance. There are a number of farms there under cultivation at present.

Could you state what the water would be worth there for irrigation per acre per annum? I really have no idea.

Would there be any demand for water-power? I should think so.

On the Little River, could there be large quantities of water stored? I think the fall is too rapid.

Is there any mining in the Little River District? Yes.

Have the miners ample supplies of water? No. Some of their best mines are away in on the back gullies, and they very often run dry for lack of water.

Could water be stored with advantage for any of those mines? The gullies are very steep, and I don't think you could store any large quantities.

You don't think that anything could be done to assist mining in that district by storing water? I do not think so.

Does anything else occur to you which you would like to state with reference to the Clarence River or its tributaries—anything which the Commission have not asked you? I shall be happy to give you information with respect to the various flood discharges from the several rivers. I do not clearly understand what nature of information the Commission would require.

We want to know how much water could be conserved, and to what purpose it can be put, whether for irrigation, mining purposes, water-power, or otherwise? The south branch of the Clarence is at a considerably higher level than this part of the river. The Nimboi, at Buckurumbah, is 387 feet above Grafton summer level.

What is the nature of the Nimboi Valley;—have you any reason to suppose there is any gold in it? Mining. Yes; there is gold in every tributary of the Nimboi River.

Can that gold be obtained at present with advantage;—is it just now being worked? The reefs have been worked, but only one or two are now being worked.

Would water stored for sluicing be of advantage? Yes, undoubtedly it would.

Will you give us any information you can on this subject? At St. Cloud's Creek water could be readily stored, and there is a considerable quantity of ground there suitable for sluicing. Large quantities of water could be stored at the upper portion of that creek, which I know is gold-bearing all the way down.

Do you think that water could be there stored to advantage? Yes, I think so.

Do you think that people would pay a fair rate for the advantages which would be reaped by the storage of water? There are gold deposits which might pay for working there if there only was water.

Yes; but would miners pay a rate which would give a fair interest on the cost of the storage, and also recoup the capital? I am not prepared to say that. Very little has been done in that way for a long time. I think mainly because the natural supplies of water at a high level having been availed of on account of dry seasons. A good deal of sluicing has been done in the district for a great time; but they have had no water for some years past to work with.

Can you mention any places where water could be stored with advantage for water-power? Yes; either in Blick's River or St. Cloud's Creek, where it would be available for timber. There are large forests of timber, and also considerable reserves.

Will you kindly give us some particulars as to the way in which water could be stored there, and how it could be utilised? In St. Cloud's Creek there is a tableland at an elevation of about 1,000 feet over the creek, and there is very little fall for some miles. A considerable quantity of water could be stored there, which could be made available for timber-cutting.

Where could you get the power for using the water-power you speak of? There is a fall of from 800 to 1,000 feet in about 15 miles.

Do you think that sawmills could be erected there with great advantage, and this water used for working them? Yes. It is the centre of a large timber reserve, containing cedar, tallow-wood, blackbutt, &c., and there is actually some of the finest timber in the district there.

How could this timber be got to market if sawn at the place described? It is at present brought down by the Armidale road. Some comes here and a good deal goes to Armidale.

Do you know of any cases where water could be stored in one valley and diverted to another valley at a lower level, so as to obtain great water-power? Yes; at the Nimboi.

Could you give us any particulars about that? The elevation of the Nimboi at Nimboida would be about 500 feet above high water at Grafton, and at Nimboi Gap, dividing the waters of the Clarence and the Nimboi Rivers, it is within half a mile of the river. About 2 miles of a tunnel would bring that water to command the Clarence District for cultivation purposes. There is a rapid fall all the way down, and water coming through the tunnel would be immediately available for use after flowing into Blaxland's Creek. It would serve for the agricultural land round Blaxland's Creek, Skinner's Swamp, Kangaroo Creek, &c., which are all good grazing creeks; also for all down the Orara River, which has splendid light sandy soil which requires water. The best maize is grown on the Orara and Kangaroo Creek.

Could that water be used for other purposes, as well as for irrigation? It might be used for water-power.

For water-power for what purposes? For pine-cutting, for instance. There is a large quantity of pine there in sufficient quantity to induce people to put up saw-mills. That is where they will have to get the supply of pine very soon, as all the nearer supplies are now exhausted. Hence stored water could be used twice over, viz., once for water-power, and afterwards for irrigation.

What are the ranges of the tide-levels at the Clarence and Richmond Heads? About the same—about 2 feet 6 inches. They are about the same in all these coastal rivers, with the exception of the Brunswick. The Richmond, Clarence, and Tweed are each about the same.

What are the levels of the banks of the Richmond at Woodburn, Lismore, and Casino? Woodburn is about 7 feet above high-water level; Lismore about 35 feet; and I think Casino fully 50.

Could you describe the valley of the Richmond as to the necessity for irrigation, the practicability of irrigation, and the extent and fertility of the valley, as compared with the Clarence? The level land of the Richmond.

**Mr. E. J. Statham.** the Richmond is much less than the Clarence; but the back lands are very rich. All the hill country there is rich volcanic soil; but of course irrigation there would be out of the question. Then the extent of land available for irrigation on the Richmond is much less than on the Clarence? I should say so. They have a better rainfall on the Richmond. I should therefore think there was not any great necessity for irrigation. On the Clarence, I think there are places where it could be applied with advantage.

**Delta of Clarence.** With your intimate knowledge of the district, does anything suggest itself to you which might be of interest to the Commission about which I have not asked you? I dare say it would be of interest to you to know what the nature of the delta of the Clarence is. I have information from well-sinkers and others, collected from them at various time. You find timber under the clay nearly all over Grafton, and we found the same in sinking the cylinders down the river. It is a very stiff clay, ranging from 8 to 20 feet thick. When you get through that you are into quicksand, leaves, and also timber.

**Mr. Murray.]** How far is it from the Heads to the city of Grafton? About 48 miles. At full tide, for what sized vessels is the river navigable up towards Grafton? For vessels of about 200 tons.

Is it available for vessels of that tonnage higher up the river? Not very well.

How far is the river navigable for vessels of smaller size? Up to Moleville, for vessels drawing 5 feet; that is about 15 miles further up. It is navigable for droghers up to Copmanhurst, which is 30 miles up beyond Grafton.

What is the point where you first get pure fresh water not affected by the tide? Above Copmanhurst, beyond Tyndall's Falls.

I believe that down the banks the land is very rich and mostly all taken up? Yes.

Is nearly all the soil taken up? Yes, almost all of it.

**Crops.** What are the principal crops grown? Maize, bananas, and sugar-cane.

Do they ever suffer from drought? Yes; they have felt the recent droughts considerably.

For how long—one year or more? Last year the maize especially suffered greatly. I think the rainfall was less then.

As a rule, is there much uncertainty with respect to the crops from want of rain? No; I do not think so, as a rule.

What are the average crops of maize in the district? About 30 bushels to the acre.

What is considered the maximum, or a very heavy crop? I have heard of 90 bushels.

How many tons of sugar-cane? I cannot say for certain; but probably about 40 tons per acre.

Is that very profitable to the growers? It has been until the depression of the present year.

Could that crop be increased if they had a certainty of water every year to put on at the proper time?

It is only on the lower portion of the river where they can make sure of their sugar-canes, chiefly on account of the frosts than from a want of rain. Sugar-cane does not do very well above Ulmarra.

They frequently lose it there by frosts. It is grown successfully on Carr's Island, close to Grafton.

Have you any idea of the acreage of cane or corn under cultivation on the Clarence? No. I have not taken any particular notice. There are said to be 60 mills on the river.

What is the value of sugar-growing land per acre on the Clarence? The best lands are worth £40 an acre. I have known even higher prices than that.

MONDAY, 25 OCTOBER, 1886.

At Grafton.

Present:—

Mr. GIPPS, C.E. | Mr. MURRAY.

Mr. Edwin Joseph Statham further examined:—

**Mr. E. J. Statham.** **Mr. Murray.]** In addition to the information you gave us on Friday last, I should like to obtain further information—Is there an abundance of water running from the Little River and its tributaries in time of rain? Yes; there is a rise of flood of something like 30 feet in the Little River. It comes down very rapidly.

**Mining.** Could any reservoir be established where the ridges crop in close to the watercourse, notwithstanding the flow is so rapid? Reservoirs could be made on some of the tributaries.

Could mining be carried on to a great extent if a permanent water supply were ensured in that locality? There would be a good deal of mining.

Do you think that by surveying places could be found suitable for the storage of water? No doubt places could be found.

Do you know that valuable gold-mines have been abandoned for want of a water supply in that locality? There have been valuable reefs abandoned for want of water.

Could you tell us what was the yield from some of those reefs before they were abandoned? Some were said to have gone an ounce and a half to the ton. They were out of the way, and they could not get water for the machine, and it was too far to haul the stuff to the river.

Do you think that those gold-mines were abandoned simply because there was no supply of water? They were abandoned for the want of facilities in drawing the stone. Water would have been a very essential part of the consideration which determined the working of them.

Do you think that these claims would be payable at one and a half ounce to the ton if a supply of water were afforded? There are many payable reefs there if there were facilities for working.

You have been a long time in the district, and have an intimate knowledge of it;—I would like to ascertain from you what the flood discharges of the tributaries of the Clarence have been, as far as you know? I have not computed the discharges. I have the elements from which they can be found. The Nymboi River at Buccarumbi has, roughly, a flood discharge of 271,212 cubic feet a second.

**Discharge of Nymboi River.**

Have you gauged it at different times, and struck an average of the flood discharges? That is the flood discharge.

**Mr. Gipps.]** What was the section of the river at flood-time? The flood area was 22,601 superficial feet.

What was the velocity? About 8 miles an hour. Is

Is that surface velocity? Velocity due to the fall, computed from the declivity of the river. These calculations were made at the bridge site on the Nymboi River, below the junction of the Little River with the Nymboi. Mr. E. J. Statham.

Have you a section of the river? These are the sectional areas. I have not gone to any great degree of accuracy to get out the discharges, but I have got it approximately. I have the elements from which you can compute it. 25 Oct., 1886.

*Mr. Murray.*] Can you give us the discharges of any other tributaries? Blick's River, one of the main tributaries of the Nymboi, off the tableland, is a rapid mountain torrent. The flood area of that is 1,965 feet; the discharge per second, 37,177 cubic feet. Blick's River.

*Mr. Gipps.*] Where does it join the Clarence? It rises at Tryringham Run, and discharges into the Nymboi a few miles above Nymboidia. The elevation of the section is 2,000 feet above sea-level, and the source is fully 4,000 feet. It rises in the most lofty part of the tableland, up towards Mount Mitchell. It is a permanent running stream. I never saw it dry in the driest season.

Could you give the sectional area at the lowest level? 191 square feet is the minimum summer level.

What is the declivity per mile? It is very rapid; I should think 50 feet in a mile.

Are there any other calculations you could give us? There is the Whiteman, on the north side of the river. It rises in the Coal Range, about 800 feet above sea-level, and it discharges into the Clarence River at Eatonsville. Whiteman River.

Have you a section of that? The sectional flood area of that is 4,766 superficial feet, the velocity about 5 miles an hour, the discharge 35,055 cubic feet per second.

At what point was that section taken? At the bridge site on the Smith's Flat road, before its junction.

What is the length of that river from its source to the entrance? It is a network of rivers. The main branch of it, I suppose, would be 30 miles long.

What is the section of that stream when it is running at its lowest? It runs dry on a sandy bed.

Is there no underground flow in it? No doubt. There is a deep bed of sand in it.

Do you know what depth of sand there is;—did you try the depth when sinking for the bridge? We bottomed it. I could ascertain from the records of pile-driving what the depth is. We bottomed on the rock.

*Mr. Murray.*] Are there any gauges on the river? No.

Do you not think it would be a good thing to fix gauges on all the bridges you build in the district? I think it would. Gauges.

Will you suggest that to the head of your department? Yes, but I think it would be better to come from you.

Have you any other sections of tributaries? These are all that I have.

Will you hand in tracings? Yes.

Do you know if there is any means by which water could be supplied to the farmers on the Clarence River, Kangaroo Creek, and other tributaries of the Clarence? There is a very fine water supply in the Nymboi, at a good elevation—at an elevation of fully 500 feet.

Are there suitable places for reservoirs? There would be no occasion for them. There is a permanent supply if you can get it out. You can bring it down now to Grafton.

Can you point out any particular place at which it could be diverted to Grafton? It could be diverted by a tunnel at the Nymboi Gap. Probably 2 miles of tunnel would be required, but that could be very easily ascertained. That is the only point, I think, at which it could be diverted.

Would that command a large extent of country? You could take it anywhere down the Clarence you liked from there. It would command Grafton. There are several localities where nearly all the land is taken up for cultivation at the present which would be commanded by the water from this source.

*Mr. Gipps.*] What is the character of the rock through which the tunnel would pass? It would have to be made through sandstone rock.

What kind of sandstone would it be—similar to the Hawkesbury, or of finer grain? Mostly coarse grain. Sandstone.

Hard? Some of it is very hard.

Micaceous? No, siliceous mostly.

That diversion would affect all the south side of the Clarence River? Yes.

Have you made any examination of the north side? Yes; there is Fortis Creek, the main tributary of the Whiteman. Fortis Creek.

Do you know of any good position for a reservoir for the supply of the city of Grafton for domestic purposes? The only place I can suggest is Fortis Creek, but I would not suggest that as a source for the city's supply—there is not sufficient elevation.

Do you not think a sufficient examination of the district should be made to ascertain where the proper supply could be found? There has been an examination made. Mr. Darley made an examination, and proposed the Orara.

What elevation is that above the city? I think it is only about 50 feet above here. It was for a pumping system.

Do you think there would be any possibility of getting a gravitation scheme here? I suppose the tunnel would be too costly to be carried out.

*Mr. Murray.*] How far is it from the city of Grafton? Nymboi is 30 miles.

*Mr. Gipps.*] After piercing this range by a tunnel, would you propose to lead the water by an open conduit over the plains? I do not feel called upon to go into that. I simply point out this as a possible site for works of that sort. I would not make any suggestion as to how the work should be carried out.

*Mr. Murray.*] In your opinion, in the absence of instrumental examination, what would be the best course to adopt?—

*Mr. Gipps.*] Could that water be brought on by gravitation to Grafton? It could.

And it would also be available to supply irrigation over a large area of country? Yes.

*Mr. Murray.*] You gave us some information with regard to the Richmond River last Friday. I should like to ask you, further, is it not possible to store water in positions to command the back lands on the Richmond, which you described as rich volcanic soils? The country on the Richmond is very much broken, especially the volcanic portion. Possibly storage reservoirs might be found on the south side, where there is a great deal of flat land with a very gentle declivity, and there might be sites for storage reservoirs at the foot of the Richmond Range, on the north side. Reservoir sites.

Are you acquainted with some of the tributaries of the Richmond? Yes.

Can

Mr. E. J. Statham. Can you name some of them, and state the elevation at which they rise above the Richmond? There is Wilson's Creek. It rises at an elevation of 800 or 900 feet up towards Cape Byron; that is one of the principal tributaries. There is Terrania Creek, which rises in very high land at an elevation of say 3,000 feet.

25 Oct., 1886.

Are there any other tributaries? There is Back Creek. That rises in very high land, at an elevation of fully 1,500 feet. That discharges into the Leicester Creek, and into the Richmond north of Lismore.

Mr. Gipps.] What is the length of Back Creek? Over 20 miles.

What is the character of its bed? Mostly very black soil. The hills are very black soil.

Is it a continuous stream? It runs dry sometimes, but there is mostly water in it.

Does it bring down a large quantity of water in flood-time? Yes; but it would be very difficult to store water in that volcanic country because of the permeable nature of the soil.

Mr. Murray.] That would be a difficulty in regard to the irrigation of these volcanic soils on the Richmond? Yes, it would be a difficulty.

At what depth would you come upon clay, or an impermeable stratum? I do not know; it is not a clay country.

What is the sub-soil? It is all volcanic until, I suppose, you come to the rock.

Mr. Gipps.] What is the character of the rock? We have never got down to it. There are sandstone ranges in the Nightcap Range.

Are you not aware of any position on any of these tributaries, where the hills crop in close to the water, where reservoirs could be made independent of the permeable nature of the soils? I have not seen any place on the north side of the Richmond that struck me as a suitable place for a reservoir.

Is the range that divides the waters of the Richmond from those of the Tweed a high range? Very high, running up to 3,000 feet.

Is there any position in that range in which water might be stored for distribution on the lower lands? I do not know of any from my own knowledge.

Are not all these tributaries of the Richmond permanent streams? They are nearly always running. During the last dry season some of them have been dry, but usually it is a very well-watered district.

Would any of them afford a sufficient quantity of water for irrigation on a very large scale? Wilson's Creek might. There is a place on Wilson's Creek where a small quantity might be stored. You could not make a very large reservoir there.

Is Wilson's Creek at a sufficient elevation to command any very large area of the Richmond flats? No. The banks are very high, and the fall of the creek very gradual.

If you wish to supply water from Wilson's Creek, would you have to pump it? Yes.

What supply could you depend upon from Wilson's Creek? I have never gauged it.

What is the highest source of the Richmond River? The Macpherson Range.

What creek does that supply? The Casino branch of the river.

Is that a large stream? Yes.

Is it a permanent stream? Yes.

What is the character of its bed? Sandstone

Are the banks high? Very high.

What is the character of the banks? Loam.

Could water be diverted from it at any point, do you think? No; the banks are too high.

What is the height of the river at its source? It rises in mountains between 3,000 and 4,000 feet high.

Has it a rocky bottom? It has a rocky bottom at Casino. There is a succession of rocky falls.

From its source, how far does the rock in its bed extend? I have not examined it. It is very sandy above Casino.

Are there any positions whatever for conservation reservoirs? I do not know of any on the north side.

What is about the sectional area of the stream near Casino? I have never taken it. It can be ascertained from the bridge section.

Generally, you think it would be advisable to have an examination of the sources of the Richmond to see if water could be conserved? Yes.

Mr. Murray.] To come back to the Clarence District—are the seasons pretty regular in the Clarence District? We have had a continuance of dry seasons for some years.

As a rule, do the rains come at any particular season? You get thunderstorms mostly in November.

Is that a favourable time for agricultural purposes? I do not know.

Is the rain generally well distributed over the district when it does come? It is very patchy. During the last season they had an abundance of rain about the Little River country, and very little over the Richmond. Ordinarily it is the other way about. They get most rain on the Richmond. They have had a succession of dry seasons on the Little River until the last year, and this has been an exceptionally good season.

Are these rain-storms frequent when they come? Yes; we usually get them all through November.

Has the district not suffered from want of rain for some years past? Yes; we have had dry seasons now for ten years until this season.

Do you think that a system of conservation of water which would give a certain supply to farmers at the proper season would be of great benefit to the district? Yes.

Have you seen many floods in this district? Yes; I have seen several floods.

In what years? I could not tell you the years, except the big flood of 1876.

At what height above high-water level was the water in 1876? 23 feet 8 inches at Grafton.

At high-water? Yes.

Have these floods, as a rule, been beneficial to the district or otherwise? They have deposited silt on the flat land, or they have deposited sand, or have washed away soil; but on the whole they are decidedly beneficial.

In any cases where they have washed away soil or deposited silt, have they been injurious? Yes; they have washed away the banks in places along the river.

As a rule, do the banks scour much? They are beginning to scour very badly.

Do you think it is necessary that precautions should be taken to prevent the scouring of the banks and the washing away of rich alluvial soil? It would be very desirable.

Mr.

*Mr. Gipps.*] Do you not think the growth of osiers would prevent it? I do not think they would grow. Have they ever been tried? They would grow on the Richmond, but here the water is too brackish.

Mr.  
E. J. Statham.  
25 Oct., 1886.

*Mr. Murray.*] The sub-soil in this district is, as a rule, clayey, and is therefore impermeable, and suitable for reservoirs away from the river? Yes; all through the Clarence series the soil is clayey; you find clay a foot or 9 inches below sand or sandy loam.

On the whole, do you think that this is a district in which the conservation of water might be carried out with advantage to the State, and with profit to landholders;—what I mean by advantage to the State is by increasing the productiveness of the soil, and inducing a larger settlement of population? With an abundant water supply this district would grow enough to supply the whole Colony.

At what elevation would the site of the proposed Nymboi tunnel be above the river at Grafton? 500 feet. Does the range continue towards Grafton? It divides. The junction of the South River cuts the South River off from the Clarence.

If there is anything that suggests itself to you we should be glad if you would put it in writing and supply it as an appendix? Very good. (*Appendix 1.*)

Mr. Thomas Page examined:—

*Mr. Murray.*] How many years have you resided in this district? Since 1855.

Mr. T. Page.  
25 Oct., 1886.

Then you are well acquainted with it? With Grafton and down the river. You have had ample opportunity of obtaining information respecting Grafton and the surrounding districts during that time? Yes.

Have you noticed if the agricultural produce of the district has been diminished in quantity in consequence of the dry seasons? I can hardly say that it has diminished. It has increased largely every year, and it is still increasing.

That, I presume, is in consequence of the larger population? Yes; and more land being brought under tillage.

Taking the produce in connection with the area of land under tillage, has the production been diminished by dry seasons? In dry seasons the crops are lighter.

Do you think that during average seasons the rainfall is sufficient for agricultural purposes? During the wet seasons it is. We have periodical changes—so many years of dry weather, and so many years of wet.

How many of each have you observed? I should say that the dry seasons have been the most numerous during the years from 1855. Dry seasons.

Could you say how many dry seasons there have been, and how many wet ones? I should say that there have been three dry periods previous to this since the year 1855, namely, from 1857, 1861, and 1874.

Have the dry seasons been injurious to the pastoral as well as to the agricultural interest? More so, I believe.

*Mr. Gipps.*] Have you ever lost your crops altogether? Not as a whole throughout the district; only in particular localities have they failed.

What crops do you generally cultivate? Maize is the staple product.

In the worst season you have known, what has been the return of maize per acre? In some cases they have had to cut it up altogether. The lower river portion of the district gets much more rain than the upper portion.

*Mr. Murray.*] Taking one year with another, what is your average crop of maize? On good land it would be from 60 to 70 bushels per acre. It has been more than 120 bushels to the acre on new lands on the river-bank farms.

Do you know of any place where irrigation has been carried out on the Clarence? I do not know of any case where it has been tried.

Do the Chinamen irrigate? Yes, by water from wells.

With what result, do you know? They appear to be able to grow a crop when other people are not successful.

*Mr. Gipps.*] What is the average depth of the wells? From 16 to 20 feet.

Wells.

Do they give you an unfailing supply of water? No.

What is the average supply that they give? I do not know of one which has ever been tested sufficiently long to see how the supply would hold out.

How do you draw the supply, by steam? No, by hand-pumps. In some places what are called unlimited supplies have been proved to be insufficient when more than ordinary pressure has been brought to bear upon them.

Is the water fresh or salt? Fresh; but not of the best quality.

Have they sunk to a deeper than the ordinary depth to ascertain if there is a better supply lower down? There was a trial made in Grafton. They went down much lower than usual, but they only succeeded in getting salt water. The water-auger was used.

*Mr. Murray.*] Have the Chinese, as a rule, been successful in irrigating their small patches? In some seasons they have lost their crops the same as Europeans have. Chinese irrigation.

Then you do not think that any supply dependent upon wells would be of great benefit to the district? I do not think it would be of the slightest use where Grafton is situated.

Do the Chinese irrigate exclusively from wells? They do, unless they are alongside a creek.

Can you give us any information as to the other crops grown in the district and their average produce? The only other crops which are grown to any extent are sugar-cane and potatoes.

What are the average crops? The potato crop is really very unreliable in this district. It is generally injured by the frost or suffers from want of rain at the proper time. The rains often come too late.

Would water laid on at the proper time prevent a failure of the crop? I should say it would.

Do you think that a system of irrigation could be adopted with benefit to your district? I think that it would be beneficial.

Do you think that the farmers and residents of the district would be willing to pay a fair rate of interest on the outlay for irrigation works? No. I think that they would require to see that they were successful before they would avail themselves of the advantages of such works. They would require to be educated up to it.

What is the population of Grafton? Five thousand, including South Grafton.

The

**Mr. T. Page.** The town on both sides of the river is all in one municipality? Yes. The number of houses in North and South Grafton at the end of this year was 840, exclusive of churches, public buildings, schools, and parsonages. Possibly it would be 900 in round numbers at the present time. The ratable value of the property liable to assessment, exclusive of all Government lands, is about £34,700.

**25 Oct., 1886.** How do you get your supply of water at present? By the catchment of rain water in tanks above ground and from wells, the water from the latter being used for purposes other than drinking.

**Water rate.** What do you think the residents would be inclined to pay per room if they got a good supply laid on to the town? I think the bulk of the people would be inclined to contribute a rate equal to that contributed by the people of any other town; but there is a very strong feeling amongst a section of the community against paying any rate at all. The difficulty about a water-rate here would arise from the extensive area of the town. There are 48½ miles of streets, and the buildings—with the exception of the central part of the town—are very much scattered. The cost of reticulation would be very great, and the rate would have to be a heavy one.

Those not supplied would not be rated? They would not be rated for the water, but they would be for the cost of the works.

Mr. Thomas Bawden examined:—

**Mr. T. Bawden.** *Mr. Murray.*] To what extent have you had an opportunity of becoming acquainted with the Clarence District? I have resided in the district for upwards of forty-six years, and I have travelled over a great portion of it during that time.

**25 Oct., 1886.** You represented the district in Parliament at one time, I believe? Yes.

Can you tell us up to what point on the Clarence River the tidal water flows in ordinary seasons? To Copmanhurst.

Up to that point the river is salt? In dry seasons.

And in wet seasons? It is fresh below Grafton for some months in very wet seasons.

Then if any supply for the city of Grafton or the lower Clarence were to be taken from the river it would have to be from some point above Copmanhurst? Quite so.

**Rainfall.** Are the rains partial, or do they fall generally over the district? During the late series of dry years which we have had there has been a belt of some 14 miles below Grafton that has been more favoured with rain than any other part of the district. At Woodward Island and the Coldstream, towards Sportsman's Creek, they have been more favoured with rain. The crops have been better there than in any other part of the district.

**Dry seasons.** How often during your experience has the rainfall been insufficient for agricultural purposes in this district? We have had remarkably dry seasons during the past seven years—it may be said almost since the great flood of 1876. The seasons were very dry from 1848 to 1857, and from 1841 to 1848 they were moderately dry, but there was very little agriculture in the district during those years—none properly speaking until after 1857. I think the district has suffered more from dry seasons during the past ten years than at any previous time.

The pastoralists have suffered equally with the agriculturists? I think they have suffered more during the past three or four years than previously. As the country has become stocked it has been better drained. In primitive times there was more water retained in the soil.

During dry years, when the rainfall proved insufficient, do you know what was the depth and width of the Ourara, the Clarence, and the other rivers? The water did not run on the surface of the bed of the Ourara at many points during the past year. Just about where it was intended to take the water supply for Grafton from, there was no water running on the surface; and I think that during last year the water in the Clarence was quite as low as I have ever known it to be. I have no measurements I could give you, but I do not think that I ever saw it lower than last year.

If the whole of the water had been available for irrigation purposes, would it have been sufficient? Ample, because the water might have been saved previous to the dry seasons.

For the extent of land under cultivation? I think so. To my mind, not being a professional man, there appears to be a difficulty in providing a scheme that would meet the wants of the whole district. A number of smaller schemes suitable to certain localities would, as it appears to me, be more desirable than one large scheme.

*Mr. Gipps.*] I suppose you would suggest diversion of the waters of the northern and southern tributaries for the supply of those districts respectively? Quite so.

*Mr. Murray.*] If water could be stored in large quantities, and at a moderate expense, on the Upper Clarence, and allowed to flow down through the lower ground, would it be an advantage to the district, do you think? Certainly.

**Storage sites.** Do you know of any place on the Upper Clarence where water could be stored for that purpose? I think that might be done at the heads of most of our watercourses and creeks. It would be very difficult to do it in the main river, and exceedingly expensive. There are points upon the Nymboi and upon the main Clarence River above Tabulam where water could be stored, but that would be a great distance from Grafton.

*Mr. Gipps.*] What value do you think irrigation would place upon the land per acre? It is very difficult to say. I have never gone into a calculation of that kind, but I should think that land which is now worth £1 an acre rent would be worth double that if there were a regular supply of water for irrigation purposes.

Do you think the farmers would be willing to pay 10s. an acre for it? I do not know that our present farmers would. I do not think that they are sufficiently educated up to appreciate the importance of that system of agriculture.

Do you not think that if they saw there was a certainty of losing their crops in some seasons under the present system, and that by irrigation they would certainly save them, they would avail themselves of the water? They would no doubt follow the example of their neighbours; but I do not think that it could be expected that, as a general rule, they would take hold of it at once. Eventually they no doubt would.

*Mr. Murray.*] You do not think there is any great supply of water to be found underground? No, excepting what is to be found in the Clarence basin.

**Swamps.** Are swamps of common occurrence in the valley of the Clarence? They are; and they are a source of

of considerable trouble to our farmers. They are anxious to get rid of the water when there is too much of it, and to get a supply when the rainfall is short.

*Mr. Gipps.*] Could not the swamps be made basins for conserving reservoirs? Some of them might, perhaps.

Mr.  
T. Bawden.  
25 Oct., 1886.

Could you name any? I cannot say that I could.

Would they be of large extent? Mr. Donaldson, the district surveyor, would give you better information than I can. He has a better knowledge of them.

*Mr. Murray.*] Do you think it would be an advantage to drain these swamps? They make very good feeding paddocks when they are drained.

Have you any suggestions you could make to the Commission? No; I do not know that I have. It might be of service to you to have some information as to the floods which have occurred in the district. There is a sort of legend that the whole of Grafton was at one time under water, with the exception of the hill above South Grafton; but I think it is only a legend, except in so far as it was approached in 1876. In 1841 we had the first flood known here by white people, and that just came level with the banks of South Grafton. In 1848 we had a flood which overflowed the banks there. In 1857 we had a much higher flood than in 1848. In 1863 we had a higher flood still. On that occasion all the branches of the Clarence were flooded; but the southern branches were not flooded so high as they were in the following years. In 1864 we had a flood in the river; but it was not so high at Grafton as the flood of 1863 by 18 inches, and the northern branches were not so much in flood as they were the previous year. In 1876 we had the highest flood ever known here, and on that occasion I believe the branches on both sides were in flood much higher than was ever known before. On that occasion some damage was done from the scouring away of the alluvial soil of the banks, and the deposit of sand in its place; but most of the floods have had a beneficial effect in enriching the land by the deposit of alluvial matter. Our farmers prefer two floods to one drought. The yield of maize immediately after a flood is very much greater than at other times.

What is the average yield? The present season's average is somewhat below 60 bushels to the acre. Last year it was very low. I knew a man who only got seven bags off 5 acres of land. I suppose that the average may now be put at 60 bushels to the acre. That is in a great measure owing to the fact that the farmers do not manure the land. They go on ploughing and sowing the same ground year after year with the same crop.

Could you give us the acreage under cultivation in the district? No; but you can get it from the Statistical Register. The information is collected by the police. People do not give all the particulars they are expected to give, and therefore it may not be quite correct.

*Mr. Gipps.*] Do you know of any springs in the district? Of some small ones; but not of any which are permanent.

None have been opened? Not that I am aware of.

Are any of the springs strong? I do not think so. About the Richmond River there is a good place for the storage of water, between Roseberry and Unumbgar. That is on the main Richmond River, heading at Mount Lindsay.

Can you name any particular point? The ranges close in there to the river, forming a sort of gorge.

What is the character of the bed? Rocky there. A spur of the Macpherson Range closes in on one side.

What is the character of the main basin? A number of small tributaries flow in at the head of the Richmond. If the water was conserved there there would be ample for irrigation purposes down the main river. I could not give you the exact area. It would take in the whole of the Unumbgar Run and portion of the Roseberry.

Is there much silt there? Not much.

Not enough to silt up the stream? I do not think so.

How far do you think an 80-foot dam would throw the water back? That I could hardly say; but it would conserve an immense quantity of water.

What would be about the width of the river at that point? Not more, I think, than 300 yards between the two spurs.

What is the character of the rock? I hardly know what kind of rock it is.

How many miles above Casino might it be? About 40 miles, I think.

Would it command any of the new gold-field at Fairfield? No; it is in the Clarence waters.

Could that water be used for the supply of Casino? Yes.

Do you think it would irrigate a very large area of country? I think it would.

Is the stream there permanent? I have never known the Richmond cease running from its source.

The land between Casino and the head of the Richmond up that valley is very good land. Most of it is used at present for pastoral purposes; but the time will come, and that very speedily, when it will be given up for agricultural purposes.

Mr. Patrick Riddle Donaldson examined:—

*Mr. Murray.*] You are the district surveyor stationed at Grafton? Yes.

You have an intimate acquaintance with the district? I have.

You have heard Mr. Bawden refer in his evidence to some swamps in the district? Yes.

Do you think that those swamps could be converted into reservoirs, or would it be more beneficial to the district to drain them? To drain them. One of them, the Great Marlowe Swamp, was placed under a drainage union some years ago, but nothing ever came of it. It can be drained. It has a fall of about 5 feet to low-water.

Mr. P. R.  
Donaldson.  
25 Oct., 1886.  
Great Marlowe  
Swamp.

What area does it cover? 1,500 acres.

*Mr. Gipps.*] Would that be from the bottom of the swamp to low-water? Yes; except, perhaps, in one or two small deep undulations which may occur. When I say it can be drained, I speak of the general surface of the swamp.

Is it fed by any creeks? No; it is between the ana-branch and Alumny Creek.

How is it filled? Generally by floods, and the water lies there until it evaporates.

From which creek? Over the banks of the river or from Alumny Creek. There are some large swamps on the other side of the river called the Coldstream Swamps, and they are filled in the same way, by the overflowing of flood-waters from the river, and also from Glenugie Creek.

What

Mr. P. R.  
Donaldson.  
25 Oct., 1886.

What is the character of the bed of those swamps? There is a deposit of decayed vegetable matter of from 1 to 2 feet, and then a bluish clay. It is only some parts of the Coldstream Swamps which have been penetrated during the last two or three years. A large waterhole has been discovered in the centre, which was not known until two years ago. It is very deep, and the tall reeds prevented people from getting to it; but owing to the dry seasons and the bush fires, the cattle gradually encroached upon it.

Do you not think that a large body of water might be conserved in those swamps by embanking the sides, and draining the water into the centre of the swamp? There is a large quantity conserved in them after every flood.

In the reed beds of the Lachlan they manage to half irrigate a very large area of ground by cutting drains into the centre. Could not the same thing be done here by having embankments constructed with the material taken out of the drains? It is quite possible that something of that kind could be done; but I think that the cost would be far greater than the benefit in areas of that extent. The cost of drainage would be comparatively small, and when drained they become immensely valuable, as in the late dry seasons, when the water has been drawn off by evaporation.

Would the drains have to be cut through any one else's property? Yes, through various properties. Then compensation would have to be paid? There seems to be a doubt whether the Act is workable. It provides for cutting drains through other people's property, and also for each person paying a share for the advantage which he derives. Any one who derives an advantage is supposed to be rated according to the interest he has in the land benefited by the work carried out.

Are portions of these swamps owned by different people? Yes; in the case of the Great Marlowe Swamp there are more than twenty people interested in it.

What is the area of it? 1,500 acres. In some cases it extends very close to the river, within 5 chains. Farms measured 30 chains deep, many of them have 25 chains of it in the swamp. In other cases the whole of the block is in the swamp, and some people have not seen their land for four or five years at a time.

What drain would you advise? An open drain covered near the bank, and well protected with rubble work. Where the drain cuts a property in two, what would you do? Protect it by a fence.

And pay for any damage by severance? That would be very slight. As a matter of fact, where I proposed to drain this swamp it was only 5 or 6 chains from the edge of the swamp to the river. The drain would be all in one man's farm.

Coldstream  
Swamps.

Are there any other swamps? There are the Coldstream Swamps.

What area do they cover? Between two and three thousand acres.

Have they a similar bed? Very similar. An attempt has been made to drain one property. The man has cut into the river bank and made almost a canal.

The water has opened a considerable gutter drain? Yes. The same thing has occurred on the Richmond, where they have attempted to drain without protecting the soil.

When the river is high, would it not flood these drains up again, if they are open drains? I think not.

Would not the water run up the drains in flood-time, and deposit silt in them? It might a little; flood-gates could be put in at the outlet.

Are there any more swamps in the district? Not of any consequence. Those are the principal ones.

Storage basins.

Do you know of any storage basins in the valley of the Clarence? At the gorge above Gordon Brook it is quite possible that storage might be effected.

What distance is that above Grafton? About 57 miles, just below the junction of the Clarence with the south branch of the Mitchell, as it is called on the map.

What would be the width of the river at that point? From 5 to 7 chains.

What is the character of the bottom? Slaty rock.

And of the banks? Slaty rocks come right in.

Are they tilted? Very much.

Hard? Very hard.

Would a weir there impound water over a large area? There are 150 miles of creeks beyond that, besides two or three other arms of nearly the same extent.

Is the declivity of the river above that point very steep? It has a fall of, I think, about 4 feet to the mile.

Then an 80-foot dam would throw the water back for nearly 20 miles? For a considerable distance.

Would it throw it back in a large valley? The valley is narrow there. The hills come in and form the gorge.

Does it open out behind? Yes; as you get near Yulgilbar the country opens.

To any great width? In places where tributaries come in.

Do you think that water stored there would be available for irrigation on any large scale? If the cost were not too great to bring it to Grafton, it would be a great boon to all this low country in dry seasons. I believe the plan suggested by Mr. Statham would be the best for the south side.

This would be for the north side? The difficulty of crossing the river is why I suggest the possibility of this.

What would be the character of the country the conduit would have to cross to irrigate the north side of the Clarence? Gordon Brook Creek would first have to be crossed.

Would it be undulating country? Generally.

What is the character of the soil? Rather impermeable, if anything. The formation is generally granite and sandstone on this side.

There would be no difficulty in constructing a conduit? It is more a matter of cost.

Do you know of any other position for a conserving reservoir? Not for a large scheme; but I think that water could be stored in the heads of nearly all the large watercourses in the district, which would very much enhance the value of the land all along below—under the Richmond Range, for instance.

Are there any sites on the tableland where these streams take their rise where you could conserve water? They do not rise very rapidly until close under their sources.

They rise in very steep ranges? Yes.

Mr. Murray.] Have any sites suitable for conserving water on a large scale been reserved from alienation? None; there are none of particular note.

Do

Do you know of any at all? I reserved one the other day in the Richmond, but I doubt if it will ever be required.

Mr. P. R. Donaldson.

Do you think it would be a good thing to reserve every place suitable for reservoirs? I have a number on the Richmond which have been reserved for purposes of public recreation, and they might be valuable possibly for water conservation. I refer to places where there are falls of from 100 to 200 or 300 feet—having a direct perpendicular fall into creeks, and so on.

25 Oct., 1886.

Do you think it would be a good instruction from the head of your department to all the surveyors in the Colony to reserve sites suitable for water conservation? Yes, if they were not made use of in the same way as the reserves for timber have been. In view of our recent instructions to cut down every possible reservation not absolutely necessary, it might be a good thing.

Reserved sites for water conservation.

But you think it might be abused? That is my fear. As a rule such sites are in places not likely to be selected—well, up in parts of the country not suitable for agriculture. I think that our present instructions give us all the authority needed.

Do you think it has been generally carried out? It has not been specifically carried out, from the fact that no specially favourable sites have presented themselves. I am aware that surveyors have the power to recommend for reservation sites which they deem suitable for schools, purposes of recreation, and forest reserves; but I do not remember if conservation of water is specially mentioned. It is not specially mentioned.

Do you not think that it would be a good thing in the interests of the public that reserves should be made for the conservation of water wherever suitable places can be found? It would be beneficial. In the case of the falls on the Richmond River, of which I spoke, some of them would be available for such a purpose. There is one near Lismore would be, if it is not too far away. It is about 20 miles away; but I think that they have some scheme under consideration—that some survey has been made. Is there anything you would like to suggest to the Commission? No.

TUESDAY, 26 OCTOBER, 1886.

At Grafton.

Present:—

Mr. MURRAY,

Mr. GIPPS, C.E.

Mr. William Goodyer examined:—

Mr. Gipps.] Where do you reside? At Ulmarra,

What is your occupation? I am an agent and a grazier.

Mr. W. Goodyer.

What part of the district can you give us special information on? It all depends upon what information you desire. Any question you may ask me I will answer to the best of my information and ability.

26 Oct., 1886.

We wish to know where there are any large depressions on the course of permanent creeks, and to have any information we can obtain in regard to wells, and also a general description of the climate and country? That is at Ulmarra? There is one large creek there called Harrington Creek. Mr. McDougall, the Police Magistrate, knows it well.

Where is the source of the Harrington Creek? It rises in the hills near Glenougie. The stream discharges into the Harrington, and when this overflows it runs into Seven Creek, a tributary of the Clarence. Creeks.

What is the height of that source of that creek? Not above 200 or 300 feet. That is the highest point. The country is in ridges something like South Grafton. I believe they could get enough good water there to supply Grafton without going to the Ourara.

What distance does it run? Somewhere about 10 miles.

Are there any valleys in its course where the water could be conserved in large quantities? At Glenougie Creek, which has a large watershed.

Can you suggest any particular point for a dam? At Glenougie Crossing—that is, where the coach road crosses the creek—the road leading to the coast.

What is the character of the bed of the creek? I believe it is rocky at bottom and sandy on top.

What is the width of the creek? I should judge it is about 200 feet wide.

What is the character of the banks? At this point there are two spurs which nearly meet each other.

Are they rocky spurs? I believe they are.

What is the character of the rock? Sandstone.

Do you think that would be a good point from which to supply Grafton? I do; that and the Harrington.

Would a dam 80 feet high conserve any large quantity of water? Yes; there is not a great fall, and the water would back up a long way.

Is the valley wide? In some parts it is.

What would be the average width? In some parts it would be 500 or 600 feet, or more than that. In some parts along that creek there is land fit for agricultural purposes—alluvial flats; and they are cultivating them in places.

What height would it be above Grafton? I could scarcely give you good information on that point; but it is above Grafton.

What distance from Grafton? 8 miles.

Do you think the water could be brought by gravitation to Grafton? You might require to raise it a little to get the fall, but it would be an easy matter from Harrington.

Is it a permanent creek? Yes.

Is there always a good stream running there? Last season and the season before there was not; but in the Harrington I tell you about there has been water all through. I have never seen it dry during twenty-eight years. It has a depth of 20 feet or more, a shingly bottom, and the water is good.

Do you know of any other creek running into Ulmarra? There is what is called the Coldstream and Pillar Valley. The Coldstream is the boundary of Ulmarra, and the Pillar Valley runs into it near the head. All the tributaries are in the same watershed. Some flow from the east and some from the south.

What is the extent of the watershed? 25 or 30 square miles.

- Mr. W. Goodyer. At what point does the Ulmarra Creek discharge into the river? It comes into Swan Creek. It is swampy country outside the Harrington, and the Council has cut a drain to take the surplus water from the swamps; but still there is always a permanent supply in the Harrington.
- 26 Oct, 1886. Do you know of any other permanent creeks in Ulmarra? Not fresh water.
- Do you know of any position for impounding reservoirs besides the one you have described? No. Ulmarra is all flat country.
- Do you know of any large depressions in which water could be conserved in Ulmarra? No—not to any depth. It is nearly all level country.
- Wells. Are there any wells in the district? We have wells all along the river frontage and at the back from which you can draw good water, but I do not think you would obtain a sufficient supply in a dry time.
- What is the average depth at which the water is struck? About 18 feet.
- Is it good water? Very good.
- What is the character of the strata? On the surface it is alluvial, then clay, then a kind of shingle something like you see on the Upper Clarence. Then you come into pure white sand, in which you find water.
- What thickness is there of these different strata? On the bank there is a greater depth of alluvial, which varies from 5 to 10 feet or 12 feet. In some particular spots you get alluvial nearly all the way down until you come to the sand. The soil varies a good deal. If you notice the banks of the river from the steamer coming up it will give you a better idea of it than any description of mine. When you go back from the river for about a mile you come into stiffer soil.
- Then you get on to the gravel? Yes.
- What thickness? It varies.
- What thickness of sand do you get? In some places it is thicker than in others.
- You invariably get water in the sand? Yes.
- Have you ever had to get through the sand? I do not think it has been tried in Ulmarra; it has been tried in Grafton.
- With what results? I can scarcely tell you. Mr. Hewitt knows all about that. At the market reserve they went down between 200 and 300 feet.
- How do they draw the water from the wells—by steam-pumps? No; hand-pumps.
- Are there any windmills? I had one, but I took it down. I did not require the supply from it.
- Windmills would answer for pumping purposes? Yes.
- The wind is sufficiently constant throughout the year to use them? Yes; nearly every evening we have a north-westerly breeze blowing.
- Could you give us the average rainfall during the twenty-eight years you have been in the district? I do not think you can get that. Some gentlemen on Chatsworth Island have been recording the rainfall there during the last few years.
- Have you suffered very much from the effect of drought during the last few years? Yes.
- Not before? Not before.
- What was the effect of the drought? Loss of crops and loss of stock.
- Irrigation. Do you think that irrigation would be beneficial to the district? I do.
- And you think there is sufficient water in the district to carry it out systematically? Yes; from the Harrington and by storing the water. For eight or ten years there was too much water. There has been a lot of drainage done during the last eight or ten years, and swamps which used to be full for years are now dry. I had a swamp in one of my paddocks which I had not seen dry for twenty-three years, and I have dug 18 feet down in the lowest part of this swamp and have not been able to get water. The soil is impermeable, as a rule? Yes.
- Mr. Murray.] I think you said you were an agent? At present I am.
- What kind of an agent? A commission agent for agricultural produce.
- Then I presume you have an intimate knowledge of the products of the Clarence? I should have. I have been dealing in it for the last nine years.
- Can you give us any information as to the quantity of agricultural land on the Clarence? I could not; I could have done it in my own parish.
- Can you supply us with that information afterwards? I can get you the area of land settled on and the area unsettled on.
- Can you tell us what is the average crop of corn? The yield per acre in fair seasons is from 50 to 60 bushels. There are exceptional cases where you will get 100 bushels to the acre, but taking the seasons all through 50 bushels or 60 bushels would be about the average.
- What is the highest you have ever heard of? 120 bushels.
- Sugar growing. And for sugar-cane? I should say about 40 tons. I have seen over 100 tons taken off an acre; but 40 tons would be the average of mature cane. Mr. Hayley, the manager of the sugar-mill, could give you the information.
- What is sugar-cane worth a ton? If you cut it yourself and deliver it at the mill you get 15s. The company give 10s. and find their own cutters.
- Is sugar-growing a very profitable industry? Yes.
- Do you think that the produce could be increased by irrigation? I feel sure it could.
- Do you know of any instance in which irrigation has been attempted? No; not further than in gardens where things have been regularly watered. I have seen cane grow to great perfection. I had it growing some years before the Sugar Company started, and it was wonderful to see the size to which it grew when watered. I grew just a few plants as an ornament, and they were watered like other plants in the garden.
- If a system of irrigation were adopted, do you not think that great quantities could be produced on a large scale in the same manner as you produced the remarkable growth of your small quantity? I am sure of it.
- Is it possible to get an underground supply of water for that purpose? I do not think it would last. The wells have gone dry merely by watering stock from them.
- If you went deeper you might perhaps get a permanent supply? That I do not know.
- What is the average width of the valley of the Clarence settled for agricultural purposes? I could scarcely

scarcely say. At Ulmarra it is about 7 miles from the river to the Coldstream Ridge on the other side. On the other side, directly opposite Ulmarra, I suppose it would be about 2 or 3 miles.

Are there any watercourses on these ridges bounding the valley in which water could be conserved for distribution down the valley? At different points I think you could do it. As it is now there are waterholes where a large quantity of water is conserved naturally; if it was artificially done you could store a great deal more.

Is the country pretty well taken up all along the course of the Clarence? Yes, and for miles out.

What is the average value of land per acre under cultivation? I should say a fair estimate would be £20 an acre; in fact, I believe it would bring more; that is a low estimate.

What is the highest price you have seen paid for land for agricultural purposes? £50 5s.

That was purchased originally from the Crown? Yes, for £1 an acre. Mr. Munro sold the land, and that is what it fetched at public auction. It was river-bank land.

Do you know the sources of the Coldstream? It ends in the South Arm, and the watershed is out in the Ourara, from which it is divided by the range. There are tributary creeks running into it.

Is there any good timber up near the sources of that stream? Yes; ironbark, a little pine, tallow-wood, blackbutt, and gum—in fact, all the hardwoods which grow in the district. It is being sent to New Zealand as fast as possible for the Harbour Trust works there.

What is the elevation of the Coldstream? The tidal water flows up for 16 miles or 20 miles; then there is a gradual rise up into the hills.

Would it be possible to utilise the water from the head of the Coldstream for water-power or saw-mills? Yes. I have a place there that would do well for that. It has a fall about the depth of this table, but it could be increased by storing the water for a water-wheel. Mr. Campbell, the gentleman who was up here in connection with the proposed model farm, said it could be utilised for the purpose of water-power. Has the rainfall been regular and sufficient for the sugar-cane? It was up to the last three or four years.

It has been insufficient since 1882? Yes. We have a promising season this year; but for the three previous years we had not a sufficient rainfall, and the crops were light in consequence.

What is the average of light crops in dry seasons? About 15 tons to the acre, on land where they used to get from 60 tons to 100 tons to the acre.

Have you seen any irrigation carried out? No; but I have seen where the tidal water has flowed up a drain cut in a low piece of ground, and I noticed that the crop was better there than where there was no water.

Was not that salt water? Yes; but it seemed to keep the land cool, and the cane grew better.

Then you think that the percolation of salt water through the soil was better than none at all? Yes.

Do you think that salt water applied through perforated pipes laid under the soil would be of advantage to the cane? I believe it would in these very dry times.

Not on the surface? No; it would kill any vegetation. At Mr. Rankine's place, in the North Arm, I noticed that where the salt water had run up the drains the cane looked fresher and better than it did where there was no water at all.

Have you any other information which you think would be of advantage to the Commission? No; but I should like you to visit the localities I have referred to, as you would then be able to judge of the matter better.

Mr. Thomas George Hewitt examined:—

*Mr. Gipps.*] How long have you been in the district? Since childhood—about forty years.

What has been your occupation? I have followed various occupations—squatting, purchasing cattle, and latterly I have acted as a newspaper editor.

What particular part of the district can you give us information about with regard to water conservation? The country between Grafton and the tableland and the Newton-Boyd District, and from Grafton to the Richmond, and from Grafton to the Upper Clarence as far as Tabulam.

Then you have had experience not only of the Clarence, but of all its principal tributaries? Almost all of them.

Which do you consider the principal tributary of the Clarence? The main Clarence, or the water-course which passes Tabulam. It is generally called the Clarence, in contradistinction to the other, which is called the south branch.

Where does the main branch takes its rise? In the Macpherson Ranges, on the Queensland Border.

What is the character of the country at its source? Very broken. Near Tabulam there is a little tableland, because one of the tributaries rises near Ben Lomond, and the same again from Aberfoyle on the south, and again from Mount Mitchell there is another important stream flows there. I have no knowledge of the country above the tableland.

It rises in mountainous country, and rushes down gorges until it comes to the bottom land? It passes through the Tabulam Run, Bunalbo Run, and Sandilands Run. I do not know anything of the country beyond those localities.

Where does the river leave the gorges? Above Bunalbo.

Can you suggest any site for storage reservoirs on that branch? I have no experience of reservoirs, but I should think the volume of the water is too great to admit of its being checked in the main river.

There is always a large stream coming down the main river? Yes, always. There is no necessity for any reservoir, as the water supply is so abundant and permanent.

Can you suggest any point at which the stream can be diverted in order to throw water over the northern district of the Clarence? No. The country there would not admit of any dam that would throw the water back for any considerable distance.

Is there any point from which the water from the stream might be conducted by a canal for the purpose of irrigating the country below? I could not suggest any place on the Upper Clarence where that might be done to any extent that would be appreciable. It is all rich country immediately you leave the river, and in my opinion I do not think you could put a dam anywhere that would throw the water back to be available.

Can you suggest any point in the lower part of the stream at which water might be diverted? I think

Mr.  
W. Goodyer.  
26 Oct., 1886.

Mr.  
T. G. Hewitt.

Clarence River.

Mr.  
T. G. Hewitt.  
26 Oct., 1886.

think it might possibly be done on some of the creeks. There is a scarcity of water on the Bunalbo Run in dry seasons, and possibly something might be done there to conserve water. It is only a pastoral country at the present time.

Can you give us any information with reference to the Mitchell or Little River? Before going into that, I may say, that when you get below Tabulam there is a good extent of rich land on Yulgilbar Run, immediately below the confluence with the Rocky or Timbarra River. There is a place where water might be very easily stored from the floods. When the flood is at its highest level, water would run into channels there for irrigation purposes.

By constructing locks in those channels you could keep the water in them in large quantities? It would scarcely need a lock if the channel, which appears to me to have been the old channel of the river, was excavated; it would store a large quantity of water. The place of which I speak is about 10 or 12 miles above the confluence of the Rocky River.

Would the storage of water there benefit any large area of country below? I cannot say that it would be of any great benefit, because the supply of water from the main river is so ample. Streams run from one year's end to another.

What I want to get at is, if water can be diverted from the main stream so as to irrigate the country? In the place of which I speak it could be diverted to a short distance where there is an extent of agricultural land.

Is there a large extent of agricultural land? Perhaps not more than 3,000 or 4,000 acres.

Can you give any more information on that branch? I do not think there is any place in which water might be utilised until you get on the lower branch of the river.

With regard to the southern branch of the Clarence, on what is known as Mitchell's River;—are there any sites on that branch in which water could be conserved in large quantities? I am afraid not. It is such a rapid running stream, and so subject to high and sweeping floods, that work there would have to be of a very extensive character.

Are there any large lateral valleys into which flood-waters could be drained? There are a few, but not of very great extent. A little might be done in that way. In those cases, however, these valleys almost invariably convey enough water from their own watersheds that it would almost be better to erect works at the head of these valleys, and conserve the water which flows from their own watershed.

Can you suggest any particular valley where the water could be conserved in that way? None of the valleys that I am acquainted with have any great extent of country in them suitable for agricultural purposes.

Irrigation.

Would you recommend that these valleys should be examined by an engineer for the purpose of seeing whether water could be conserved in large quantities for irrigation; or, in other words, do you think that irrigation would be a benefit to the district? I think irrigation would be a benefit to the district. I have tried to induce people to try it on an experimental scale, but without success. Perhaps an inspection or report on the valleys of these rivers on the part of the district surveyor would be of use at the present time, with a view to reservations being made for the purpose of water conservation hereafter. Does the country in the upper district suffer much from drought? It does suffer from what we call a drought, but nothing as compared with what is known in the Western country. Such a thing as that is not known here.

What would be the average fall of rain in the upper district? I do not think that any records have been kept from year to year. It would probably average as much as at Grafton, perhaps rather more, because there they get thunderstorms which we do not get here. Our heaviest rains come from the south-east. The clouds, heavily charged with moisture, immediately they meet the high broken land between this and the tableland discharge their contents there.

What is the character of the land;—is it generally fertile? In the river bottoms splendid land. Although small in area, it is quite equal to our rich land.

Is there a large area of bottom land? On the main river the best land is found there. On the south river it is more limited.

Is there much timber there? Good timber is found in all parts of the district. You can scarcely go many miles without finding good timber. In the mountain brushes you find scrub timbers, such as cedar and pine, and at the ranges you find tallow-wood and ironbark, and in the lower country you have a species of gum which is called grey-gum, although I believe it is not the true grey-gum. Stringy-bark also occurs on the ranges.

Wells.

Do you know of any deep wells which have been sunk in the district? No. The deepest attempt was that which was carried on by the Government here close to Princes-street, in the town.

What depth was the bore? I am not very sure of the depth. You will find it in the last report of the Minister for Mines. I think it was about 150 feet.

What results were obtained? The water was brackish. Immediately they touched the coal measures they gave it up.

Have you tried irrigation, or have you known it to be applied at all? Only by the Chinese gardeners. They grow vegetables when no one else can grow them.

Corn crop.

Mr. Murray.] You have had ample opportunities of seeing the district and knowing its products. What is the average corn crop here? I should estimate the average maize crop, with the exception of the late seasons, which have been the poorest yields we have ever had, at about 50 or 60 bushels an acre.

How many bad seasons have you had lately? They would extend back about three years.

Then what would you estimate a full crop to be? I do not think it would be less than about 80 bushels per acre. That would be called a good crop.

Sugar-cane crop.

And as to sugar-cane? Sugar-cane is a crop that is rather misleading to give returns for the land, because up to very recently the cane that had been grown took two years to mature, and now there is a disposition to grow cane which may be cut every year. Of the ribbon cane, which usually takes two years to come to maturity, as high as 100 tons to the acre has been recorded, and I believe accurately so. It was an exceptional case, but I have satisfied myself that the return was correctly stated.

How much per ton is that cane worth delivered in the mill? I believe the price at the present time is 13s.

Effect of irrigation.

Do you think that the yield of corn and sugar-cane could be increased materially by irrigation?

I

I am satisfied of it. I am convinced of it from observation. I would mention a case. Last season, when it was said that the blight prevailed so much in the district, a man within the town showed me the effects of three or four rows of corn growing in a slight depression of the ground, which was filled from the water flowing from the street in Grafton. These three or four rows, he told me, produced as good maize as a man could grow. There was not a trace of disease on these particular rows, while on the adjoining rows the corn was scarcely worth pulling, it was so blighted.

Then you gather from that that one of the causes of blight is insufficiency of moisture? I think so. I think the scientific view of it is correct also, because an impoverished plant becomes an easy prey to the attack of parasites.

Do you think, as a rule, that it would be beneficial to conserve water on the ridges adjoining the Clarence with a view to its being distributed on the sugar and maize-growing land? I certainly do.

Do you think the people would be prepared to pay a fair rate of interest on the outlay for works of that kind? When they were used to it. As in most other things, the people would be slow to avail themselves of it at first, but when it was shown to be valuable they would gladly accept it. They would see that it was profitable for them to do so.

Does anything occur to you that would be of interest to the Commission about which we have not yet asked you? Yes. I would say, in connection with the sugar crop, that it was my duty a few years ago, when the district was suffering from a slight scarcity of rain, to visit the sugar plantations for the purpose of describing the mills, and generally to elicit information from the growers that would be of use to other growers. These were seasons in which the frost had been very severe, and the injury to the crops was then generally attributed to the frost. Amongst the men who were the most observant, and, as I believe, the best farmers, the injurious effects of the frost were attributed more to the want of a proper rainfall—to the want of moisture in the land—than to the frost itself, and they called my attention to such facts that I thought I could clearly see that their view was correct. I noticed that where the plants had a vigorous growth, and the leaves spread well out, overshadowing the stalk, the cane was protected from the frost. The frost on the leaves does not hurt the cane for sugar-growing purposes. It is when the upper part of the stalk becomes frosted that it strikes down, particularly when rain follows.

Where there had been a vigorous growth, and there were plenty of leaves, the frost did not hurt the cane, and if they could ensure the growth of the cane, as they might easily do if they had command of water, to a certain extent before the frost came, very little damage would be done by the frost. I am satisfied that this is the true theory. As to Alumny Creek, which runs through Grafton, water might be conserved in it to the advantage of the people of Great Marlowe. The creek, as it is, is of no use, except as a means of providing water to the stock. In dry seasons it becomes very bad. I think that if some means were taken to conserve the water, which might be obtained from the freshets in the river, it might be useful for stock purposes, and for irrigation as well.

Is not the water salt? It would not be salt if you impounded the water in times of flood. The water then is fresh.

At what height above high-water does water run into Alumny Creek? There is a local work which confines the tidal water as far as the boundary of the town, but it does not go beyond that.

We have had information from other witnesses that the tidal waters affected the water as far as Copmanhurst? But in this ana-branch, Alumny Creek, the bed has been raised in places so that it acts as a natural dam, but when the river attains a certain height it flows over that. The same thing occurs at either end. The water is not conserved, but it remains until it evaporates or is consumed. The creek is almost dry at the present time. When the water in the creek falls very low it becomes alumny, but if a body of water were kept in it it would be perfectly fresh.

*Mr. Gipps.*] What depth of water do you think might be impounded there? An average depth of 10 or 12 feet, without inconveniencing anyone or damaging any private property.

What is the character of the banks, good hard impermeable clay? I should think so.

Is the bed the same? The bottom I do not think is so good, but it is possible it will be found to be generally of clay.

I suppose you do not know the average section of the creek? No.

What would be the average depth? It would probably be about 10 feet. I should think it might average 4 chains, probably 5, in width.

Then you think water could be impounded at a slight cost, and would be of very great benefit to the town? I do.

Mr. Alfred Lardner examined:—

*Mr. Gipps.*] How long have you resided in the district? Forty-six years, continuously.

What is your occupation? For the first ten years I was engaged in grazing pursuits; since then I have lived in Grafton.

What particular part of the district can you give us information upon with regard to water conservation? It is a subject which has not been much considered. I know the district pretty thoroughly except about the mountains, about 40 or 50 miles from Grafton. The question of water conservation has never been spoken about here, only with reference to supplying the wants of Grafton.

Have you ever taken any observation with reference to the sites of reservoirs? I have been in the habit of observing a great many things, but not of putting them to any practical use.

Could you suggest any sites for impounding reservoirs? I am not sufficiently acquainted with the subject to know what is required in the way of elevations and so on. I have read Mr. Statham's evidence as reported in the Press, and I agree pretty well with what he says. But there is one place where I think a considerable quantity of water might be stored cheaply, which he has not mentioned, that is at the mouth of Whiteman's Creek.

Where does Whiteman's Creek rise? It drains the coal ridge, and it discharges into the Clarence River about 10 or 11 miles above Grafton.

What is the length of it? There are a great number of creeks—at least four creeks—that would be 9 or 10 miles long, but the whole of that branch is at least 15 miles.

At what point would you propose to conserve the water? The mouth, for this reason: The banks are very high, and would, I think, retain the water for about a mile in considerable depth; and if it could be impounded only 6 feet, that would throw it back at least 3 miles.

What

Mr.  
T. G. Hewitt.  
26 Oct., 1886.

Frost on cane.

Alumny Creek.

Mr.  
A. Lardner.  
26 Oct., 1886.

Whiteman's  
Creek.

- Mr. A. Lardner. What is the character of the banks at the mouth? Sandstone ridges principally. On one side there is a little alluvial soil.
- 26 Oct., 1886. What would be the width of the river at the point you propose for the dam? It might be 150 feet perhaps. There is a large deep bed there for about a mile.
- Exports. What is the character of the bed of the creek at that particular point? Most likely rocky. I should judge so from the ridges which come out.
- Is there a large waterhole there? It is all a waterhole.
- What is the depth of the valley about the point of the dam? The depth is very little; the ridges come in close on one side and the other.
- The water would be conserved in the bed of the creek? In the bed of the creek, which would contain a great deal of water without excavation.
- What would be the average width of the creek? It is very wide on the top; perhaps 50 or 150 feet at the bottom. It is a place which would hold a very large quantity of water.
- Do you know of any other site for impounding reservoirs? Not in the immediate vicinity. Until lately the only outcry for water has been in the town. The graziers have not suffered, because their stock have had access to water almost everywhere.
- Water would be required to be conserved chiefly for irrigation, as you have quite enough for stock purposes? Stock has not suffered to any very serious extent, except on the alluvial flats, where it is owned by the farmers.
- Has the produce suffered much from drought? Yes; during the last year very considerably, to the extent of nearly one-half. I gave your engineer a table showing the extent of exports, and that will illustrate the effects of the deficient rainfall better than anything else I can give. (*Appendix 2.*) Maize is the principal crop, and during the whole of this period the average quantity of land under cultivation for export has been virtually about the same. This paper which I hand you is an abstract giving information as to the crops from the year 1857 to the year 1886. I have named a few flood years; 1857 was a flood year; there was no cultivation then.
- Will you hand this in as an appendix? Yes. Water for irrigation might be obtained 3 miles above Smith's Flat. There is a large area of agricultural land there, but I very much question whether the farmers would pay for it. For many years after I came to the country the country was lightly stocked. It was after the termination of the drought then in the same state as it is now. Round the large swamps there were flooded gum-trees 50 to 60 feet high, which had been killed with water, and the ground was quite dry. This has happened again since I have been here. It shows that the water was off the land sufficiently to allow the trees to grow, and then the land was flooded again sufficiently to kill them. The great drought of 1837 and 1839 had terminated when this river was first settled. The land four years ago was as dry 20 feet under the surface as it was on the surface, simply because we have not had a flood since 1876, and it is only a very large flood that will fill the depressions. I should think there are 4,000 acres within 5 miles of Grafton that were covered with water for fifteen or twenty years. They are perfectly dry now.
- Do you think it is better to retain water in these waterholes? Certainly. Instead of draining the water off I think it would be better to retain it.
- Wells. Have you had any experience in irrigation? None.
- Do you know of anyone in this district who has tried irrigation? No one, except the Chinamen in their gardens. I have been reading a great deal on the subject of irrigation in Victoria, and it seems to me that one thing is lost sight of. If land is made to bear double and treble crops it will soon exhaust itself unless manure is supplied, but there is little chance of obtaining manure.
- What is the character of the soil in the Clarence Valley? The lower part is all alluvial, and that is settled upon. Many of the farmers have grown over 100 bushels to the acre on scrub lands. I know farms that bore three heavy crops of maize, probably not less than 200 bushels per acre, in three years, without ploughing any portion of it.
- During your experience, has there been any failure of crops? No; this year is the principal exception. The average crop for some years is over 60 bushels to the acre, and of sugar-cane the yield has been as high as 72 tons to the acre, but the average probably is from 35 to 40 tons.
- Have you had any experience in wells in this district? Only on these level flats. In these cases the water always stands at the level of the river. You may come on a patch of clay, and after going through that water always comes up to the level of the river.
- Have you obtained an unlimited supply? No; I have had sufficient for my own use, but I have never had more than 2 feet.
- What average supply would these wells give you per diem? Sufficient for an ordinary family; very little more.
- Is there much fruit cultivation in this district? There is no sale for fruit.
- What kind of fruit can they cultivate? I have thrown away some thousands of dozens of oranges this year. You can grow almost any of the fruits which have been acclimatized. I do not think the plains are so well adapted for fruit-growing as the ridges are. Nearly all our ridges are fully equal to the land cultivated for fruit in the county of Cumberland, and in other parts of the Colony. The same carboniferous formation occurs here.
- Do the dry seasons appear to affect the trade much? Not very much, except this year. There are so many people out of employment consequent upon the opening of the Northern Railway, which has taken away the traffic which used to come here. We paid on our wharf nearly £15,000 for the carriage of tin down. That traffic does not come this way now. The result is that from 70 to 100 horse-teams have been knocked off, and that has affected trade pretty considerably. If each of these workmen receive £30 a year for carriage, trade must be affected by the loss of that sum.
- Is the settlement of the country increasing or decreasing? Slightly increasing, but very slightly. I think at the present time there is no increase.
- What are the principal products of the district? Maize and sugar. On many of these alluvial farms maize has been grown for twenty years.
- Is there any other information you can give that we have not asked you? I do not like to advance opinions of my own, but I am willing to answer any questions.

Mr. Samuel See examined :—

*Mr. Gipps.*] How long have you been in the district? About sixteen years.

What occupation have you followed? The first five years I was a farmer. I came here as a farmer. Since then I have been in business.

Mr. S. See.  
26 Oct., 1886.

At present you are the Mayor of Grafton? Yes.

What particular part of the district are you acquainted with that you can give us information upon? I am acquainted locally with the river parts of the district. From Copmanhurst down I have a fair general knowledge of the river.

Are you acquainted with any of the tributaries higher up? I have been to the Ourara.

Could you suggest any sites for large impounding reservoirs? I think you would get one on the Ourara at a place known as Coutts' Crossing, on the road from Armidale.

Coutts' Crossing

What would be the character of the valley there,—does it open out into a large basin? I believe there are basins to be had above that. The banks are very abrupt there. There are some steep spurs which nearly meet.

Is the character of the spurs rocky? Yes. My mission there was about a water supply to the town of Grafton.

Do you think that would be a good position for impounding water for supplying the town of Grafton? I do, most certainly.

Could water be brought to the town by gravitation? We have reports to that effect.

I suppose you do not know the height of the reservoir site above the town? I could get it for you from the Council Chambers. We were advised that the water could be pumped out of the creek there through to a reservoir 3 miles nearer the town, from which point the whole route would be on an incline.

It would require pumping in the first instance? Yes.

Has it a permanent stream? It would be a permanent supply, I believe. The catchment area is very considerable. It drains all the southern side into the Nymboi, and the northern side into the Ourara.

What is the general character of the rock? I think it is sandstone.

Is that the only position suggested for an impounding reservoir? There is another place, Glenougie Creek, Harrington; that is on the boundary of Ulmarra. From my knowledge of the place I would suggest that, but I would prefer the Ourara. I think the water would flow by gravitation from there, and that it would be less expensive. If it were a matter of catchment area, the locality first mentioned would have the advantage.

Would the Ourara reservoir contain a very large quantity of water? We have had an estimate, but I cannot tell you from my own personal knowledge.

Does your estimate include the works required for the town supply? It is about £20,000, and includes crossing the river and the reticulation of a certain portion of the town.

Could you let us have the general scheme with regard to the height of the dam, so that we may add it as an appendix? If we have the particulars you shall have a copy of them.

Is there any other site you can suggest? There is none other that I know of.

Do you think that irrigation would be beneficial to the district? I do.

Irrigation.

Have you tried it yourself? I have tried it on a small scale in my own garden in growing fruit and vegetables. I have had vegetables all through the three last dry seasons sufficient for my own consumption.

With regard to fruit? It seems to be affected more by blight. I have not been so successful with regard to fruit. I have not experimented much on fruit, but as to vegetables I can speak with great certainty.

What area have you under cultivation? Only sufficient for my own family's consumption.

How do you apply the water? Sometimes over the surface, sometimes by drains.

Have you known many dry seasons in your experience? Yes; the last three seasons have been particularly dry. Dry seasons.

Any previous to that? None so disastrous to the district. None that we felt so badly.

Have the last three seasons affected trade at all? They have.

To a serious degree? Very.

Has the amount of produce been reduced very considerably? It has.

Has it amounted to a total failure of the crops? I cannot say that it has been a total failure, but I estimate that with an ordinary season, having regard to the acreage under maize, the output of produce would be I am certain 300 per cent. more than it was during the last year. Men have told me that from 12 to 20 acres of land they have only pulled from 2½ to 3 bushels per acre. When men come into me with the results of 12 acres of good land—with their whole produce—on a cart, it is obvious that the season has been very bad.

What is the ordinary produce per acre? Upon good land it would be 50 bushels, if not more. You will get exceptional pieces of new land that resist the drought very much more than land which has been used up, but the last two years have been most disastrous.

Has it caused actual ruin to any farmers? To the smaller proprietors it has.

Has it obliged them to leave the district? To leave their farms. It has rendered lots of men absolutely poor, who, if they had had a fair season, would have been in a fair way of doing. It has placed them under a compliment to people who are in business, and I look upon that as something disastrous.

Have there been any large freshes in the river during this season of drought? None.

So that it would have been impossible to have irrigated from the river itself? Yes, quite impossible during these seasons.

Do you think that in ordinary seasons irrigation could be supplied from the river? In the ordinary seasons you may count upon having fresh water (say) 4 to 5 miles above Grafton.

Is it actually so salt below Grafton that it could not be applied? Every year that I have been on the river the water has been more or less salt at Ulmarra, 8 or 9 miles below Grafton.

So salt that cattle could not drink it? Cattle do drink it, because when the streams become empty I have seen them drink salt water, but they would not drink it if they could get fresh.

Do you think, if the water of the river was applied to the ground by what they call the seepage system, that is, by means of perforated pipes at a depth of 3 feet below the surface, it would be very advantageous? I do.

The effect of that would be that the salts would be deposited, and that the moisture would be drawn up

Mr. S. See. up by capillary attraction through the soil, so that the top soil would get all the benefit of fresh-water irrigation? Yes.

26 Oct., 1886. Then you think a great deal of benefit might result from the use of centrifugal pumps and windmills along the river? I do.

Are the winds constant here? They are. There is seldom a day passes without which we get wind. I have had a mill erected two years, and I do not think there has been a day upon which it has not been working. I have never been short of water.

What is the average height to the top of the banks? I should think the average height between high-water level between here and Lawrence would be about 14 feet. I do not think that on an average we have had one-quarter of an ordinary crop of maize during the last dry seasons, and I have had fair opportunities of ascertaining that. It must be remembered that the acreage has been greater every year, but notwithstanding that our exports have been decreasing. My knowledge is gained from the farmers coming in with their produce.

Is the rainfall sufficient in ordinary seasons for the growth of crops? It varies considerably. It would be a great advantage to the district if we had artificial means of supplying water. I certainly believe in irrigation. Sometimes we might not require to use the water, sometimes we might require to drain the soil; but there are other seasons, particularly such as we have had during the last five or eight years, during which we could certainly do with irrigation.

In fact, irrigation would make settlement certain? I think so.

And make settlers prosperous? Yes.

Wells. Could you give any further information? I may say that I do not think the well supply would be of any service. The water in the wells seems to be affected by the ebb and flow of the tide, and there is not more than 18 inches or 2 feet of water in the well, and if you empty it you have to wait the next tidal effect. I get sufficient from my well, but I do not think I could give my neighbour any—in fact, the probability is that I draw from my neighbour.

What is the character of the well water? It is hard.

Do salts accumulate in the ground after irrigation? No; I do not think there is salt in it. You can get salt streams on the hills.

Do you know of any large springs in the district? No.

Do you know of any borings in the district? There was a bore put down at Rocky Mouth for coal, and a bore at Grafton.

What strata did you go through? I think they came on to a gravel bed. They struck salt water, and then left it.

Did the water rise in the bore to the surface? Up to about 20 feet of it, and stopped there. It was a hand bore. The bore at Rocky Mouth was by a diamond drill. I think they struck indications of coal.

Mr. Rush could give you information. He is a shareholder and one of the promoters.

Mr. John H. Munro examined:—

Mr. J. H. Munro. Mr. Gipps.] How long have you been resident in the district? Between twelve and thirteen years.

What has been your occupation? Stock and station agent and auctioneer.

26 Oct., 1886. You have a general knowledge of the district? Yes.

Could you suggest any site for large impounding reservoirs? I do not know that I could. There are valleys perhaps where water could be stored, but I never had occasion to notice particularly.

Is the water sufficient for stock purposes here? As a rule the country is well watered. The owners of stock have been in that position that if they required to construct a few dams they could do so, but none of them have thought it necessary. When the watercourses have been dried up the dams would have been dried also.

Do you know of any large depressions in the district—any swamps? There are swamps on both sides of the river from here towards the Heads.

Would it pay best to drain those swamps or to conserve water in them? As a rule they are shallow. If you conserve the water you spoil a good deal of country. It would be better to drain them if you could supply water to the stock. They would carry a considerable quantity.

Is the river too brackish for stock? From Copmanhurst down the stock drink the water, but they do not thrive on it.

How low down do they drink the water? I have known them to drink it nearly to Brush Grove, 18 to 20 miles down. After a fresh they can drink it below that.

Are the stock increasing in this district? Yes.

Owing to what? To more country being ringbarked. The country has been made capable of carrying a greater quantity of cattle than it was before. I do not think the number of stock in the district has increased during the last two or three years, in consequence of the drought.

What is the character of the pasturage? In some cases very good; in others very bad.

Is it herbage or grass? Mostly grass.

Of what character? Some of it is very good fattening grass, especially in the valleys. When you get near the coast it is sour and rank. Ringbarking improves it very much.

What are the chief stock of the district? Cattle and horses. The district was opened up with sheep; sheep did not succeed, and we now carry no sheep at all.

How many acres are required to feed a bullock? In the back country, in the fattening paddocks, where the country has been improved, 4 to 5 acres to a beast. In the poor country probably 20 acres would not be sufficient to keep one in good condition, according to the season of the year. They do better on the higher ground, but the grass there is scanty.

Is agriculture increasing? Very fast.

What do men mostly plant? Dry seasons affect the crops very much indeed.

Would it be beneficial to irrigate them? There is no question of that.

Are there many small proprietors in the district? A great many, perhaps more than anywhere else in the Colony.

Have the last droughts affected settlement at all? They have stopped it a good deal.

As a general rule, are the small settlers prosperous? I suppose more than in any other part of the Colony. Are

Are most of them independent? Yes. I have known that after each season's crop has been gathered in many have been in a position to lend money out on mortgage, and have done it.

Has dairy-farming been tried here? Not to any great extent as far as the Clarence is concerned. It has not been tried, systematically and properly. I am satisfied that it would answer. A dairy is being started at Ulmarra now. Someone from Illawarra has made an arrangement with Mr. Goodyer for the establishment of a cheese factory, and that will be the first real test. I visit the Richmond every month or six weeks. Nearly all the land we have sold there lately we have sold to farmers from the south coast districts. It has been chiefly in the Big Scrub. They are all going in for dairying, and are making it a great success.

Mr.  
J. H. Munro.  
26 Oct., 1886.

What are the larger proprietors doing with their land? Farming and renting it.

What farms do they rent? The river-bank farms. They get as much in cases as £2 per acre, and from £2 10s. to £3. £2 is a fair rent.

Do they let their farms on a long lease? Three and five years; that is all. I have made a calculation, and I consider that the rentals are equal to about from 5 to 6 per cent. on the value of the farms.

Not more? If anything, less. I have seen land sold at over £90 an acre, and I have sold land at £50 myself. That is river-bank land.

Were there any improvements to speak of? The value was in the land itself, not in anything that was put upon it.

Had the land you speak of been cropped? Yes, probably for twelve or fifteen years—with maize and sugar-cane.

Alternate crops? No. They work the land as long as they can get anything out of it.

Does not the land work out at all? It must do so in time, but we have not seen it yet. We see that in new scrub land the first crop is the richest, but it has been under cultivation for twenty years, and is still profitable.

Do floods bring down much silt? It is ten years since we have had one over the banks.

What was the character of the silt? Very fine deposit, but in places where the current was strong it swept the surface off.

Have you known any lucerne tried here? Yes; it grows very well.

Lucerne.

How many cuttings in the year? I have a little patch in the town, and I am cutting it every three or four weeks.

What height does it grow in three weeks? It comes into flower after about three or four weeks' growth, and it grows very thick.

How long have you been growing it? One patch I have had in since the season before last. They have been bad seasons.

Have you not irrigated it at all? No.

How many tons per acre? I could scarcely tell you; there is very little in on the river.

Do you think it would be a profitable crop? I am certain it would. It has only been put in for feed for draught horses and stock, but latterly there are two or three people who have put in large quantities as an experiment. There is one farm all under lucerne, and doing wonderfully well, I believe. The owner has 80 or 100 acres, most of which is under lucerne. He is growing and selling it.

What is the price of lucerne hay? The price here is ruled by the price of Hunter River hay—£3 6s. to £6, according to Sydney prices.

Have you had to import hay? Yes, when feed is bad.

Have you been feeding stock on hay? Yes, but not in large quantities—working stock, and on stations the pure-bred stock.

Can you give any estimate of the area of valuable land brought under cultivation? No, I could not. There is a large area on the south. I should think that not one-half has been brought under cultivation, more especially on the Richmond and the Tweed. Nine-tenths of the scrub land there has not been brought under cultivation.

Has nearly all the country been taken up? All that is valuable is pretty well taken up, but there are large reserves which are still Government property.

What has been the effect of the recent dry seasons upon stock? It has reduced them very much. This year we have less sale for stock in the district than ever.

Have you lost many? A good many, and the increase has not been anything like what it ought to have been. During the last three years of dry weather the increase has been nominal.

Do you think irrigation would benefit the district generally? For dairy purposes, on the flats, not on the high grounds.

Mr. Murray.] What is the average produce in corn and sugar-cane? The value of maize depends upon the prices in the Sydney market. It has sometimes gone up to 5s., and now it is 3s. 3d.

I mean the number of bushels to the acre? I have known them to get from 70 to 80 bushels. 50 bushels I consider as a good yield. Sometimes it is as low as 35.

What would be a fair yield? 40 bushels; but during the last season, what with the blight and dry weather, some of them did not get 4 bushels to the acre.

If they had had command of water, would they have got more? There is no doubt about that.

Do you think the farmers in the district would be ready to pay a fair interest on the outlay for irrigation? I think the subject would have to be carefully handled to get them to do it. There is not much inclination on their part to pay anything that they can possibly help paying.

Irrigation.

What is the average corn crop? It is a hard thing to give you an average. There are so many different kinds of cane, yearly cane and cane that they cut every alternate year. I have heard that it is 70 tons per acre, but it is very seldom that they get that. Where they are exposed to the frost it tells very much on the cane.

Does anything occur to you that would be of advantage to the Commission that has not been asked? No; I do not think of any other information that I could give you. We have a very plentiful supply of water in the rivers. In the Nymboi and the Little River there is a grand supply of good water. The Ourara runs mostly through rich soil, and there is more vegetable matter in it. Where the rivers run through rocky country the water is purer.

FRIDAY, 29 OCTOBER, 1886.

At Lismore.

Present:—

MR. GIPPS, C.E.

Mr. Frederick Verdon Hunter examined:—

Mr.  
F. V. Hunter.  
29 Oct., 1886.

Mr. Gipps.] What is your profession? I am a licensed surveyor.

Where do you reside? At Lismore.

How long have you been a resident in the district? Nearly nine years.

I suppose you have had a large experience with regard to the whole of the river system of the Richmond? I have.

Taking the river from its mouth to its source, what is the name of the first creek that runs into the Richmond on the northern side? The north creek.

And what distance from the mouth does it discharge into the river? You may say at the mouth.

Where does it rise? From the head of a large swamp—Newrybar Swamp, on the eastern side of the coast range. It runs parallel with the coast. On one side the hills are steep, and on the other the country is swampy. It ends in a sandy beach. It runs parallel with the coast, and not far from it.

Is it fed by the swamp? No; it drains the high land, and is fed by numerous creeks.

At what height above the level of the sea do these creeks rise? They are mountain torrents, not exceeding 500 feet.

Do they rise in springs? No; they come from drainage.

What watershed does this creek drain? 20,000 acres.

Is it a permanent stream? It is tidal.

For what distance? It is navigable for boats 9 miles.

Is it permanent beyond that? It loses itself in an immense swamp.

Has the swamp always water in it? Yes, except in times of drought.

What is the area of the swamp? About 3,500 acres.

Do you think it would be beneficial to drain that swamp or to convert it into a reservoir? To drain it.

Would it afford good pasturage? It is magnificent pastoral soil—alluvial washed from the hills.

What is the length from the source to the outlet? Say 11 miles.

What is the next creek, on the north bank, falling into the Richmond? Emigrant Creek.

Where does that rise? That drains what I may term the central tableland.

What is the character of the watershed? Basalt country, dying off into undulating tableland.

What is the area of the watershed, including its tributaries? I should say from 35,000 to 40,000 acres.

And is its source permanent? Yes.

Where does it enter into the Richmond? About 2 miles above the entrance to the ocean.

How far is it navigable? On one branch there are 14 miles suitable for navigation? It is suitable for steam launches for 7 miles up each of its two arms.

Is it a broad creek up to the head of navigation? It would average 3 chains wide.

And its depth? I believe that at the entrance it would average 12 to 14 feet, in places deeper.

What is the character of its banks? The lower part swampy, tree flooded; good soil if drained.

And the higher part, beyond navigation? Undulating country.

Are the banks steep? Not generally. Undulating in places.

What is the character of the surrounding country with regard to soil? It is all rich alluvial soil.

Do you think it would be possible to divert the tributaries for irrigation from the tableland? Yes, I do.

Do you think it would be advisable? It may be in time to come, but it is not necessary at present.

Is all that country taken up? It is all alienated.

In small holdings? Yes, and well settled.

What is the next creek running in to the Richmond on the northern side? Dungarraba Creek.

What is Broadwater? A great number of large creeks die into an immense swamp at Broadwater. There is no outlet for it, but when the creeks run into this immense swamp they lose themselves, and there is no defined course to the river.

What is Broadwater? It is a sort of bight, an outlet formed by a number of small creeks.

Is it navigable for its whole distance? It is navigable for boats for a distance of about 5 miles.

What is its length? 5 miles. The next creek is Dungarraba Creek, which is suitable for boat navigation.

Where does it rise? At the head of Broadwater Swamp.

What is the area of that swamp? 30,000 acres, I should think.

What is the area of the gathering ground of the watershed? Exclusive of the swamp, I should think about 7,000 acres.

What is the character of it? Basalt.

Hilly? Undulating, generally.

What is the height of the range that the sources of the tributaries are in? About 500 feet.

The same range that extends from close to Lismore down to Ballina? Yes.

That is about the average height of that range? Yes, say 500 feet.

Where does this Dungarraba Creek discharge into the river? At Broadwater.

What distance from the mouth of the Richmond? 18 miles.

What is the next tributary on the northern bank? Wilson's Creek. There are other minor creeks, but they are not of any importance.

Where does Wilson's Creek rise? At the head of the Brunswick or Nightcap ranges.

At what distance from the coast? It rises in many branches. That which rises about 5 miles from the coast is, I think, the principal source.

In what direction does it flow? From its source south, southerly, westing, easting, and northing. Almost in a circle till it joins the main river at Coraki.

What is the character of the country at the source? Steep broken basalt ranges, good soil.

What is the height at the source? I think about 700 feet above the level of the sea.

Does it flow in torrents? At the source.

For what distance? That particular branch is worse than the other. Byron Creek is not in broken country

Creeks flowing  
into the Rich-  
mond River.

country at the source. Wilson's Creek would be about 10 miles from the gorges and precipitous country, then it enters into undulating basalt country for about 10 miles, and opens out into wide level flats and valleys.

Mr. F. V. Hunter  
29 Oct., 1886.

Does it lose its fall quickly as it reaches the lower country? Yes, very quickly.

For what distance is it navigable, that is, from Coraki? 40 miles for boat navigation.

Are there any tributaries running into it? Numerous tributaries.

All permanent creeks? All permanent creeks.

Where does Byron's Creek enter Wilson's Creek? About 15 miles above Lismore.

Is that navigable? No.

Is it permanent water? Yes.

What is the character of the soil of all this country? Rich alluvial soil.

Do you think it would be advantageous to irrigate any portion of it? Not at present.

Is much of it improved? A great deal of it is.

What is the character of that which is unimproved? Dense brush.

What is the cost of clearing this brush? For grass, £5 an acre.

And for other crops? For the purposes of ploughing, £10 an acre.

What crops are generally grown? Sugar-cane and corn, but principally grass at present.

Is most of it alienated? Nearly all, except necessary reserves.

In small holdings? Nothing exceeding 640 acres.

What is the value of improved property ready for sugar-cane? It depends upon the position. Abutting upon deep water an acre of sugar-cane is worth £30.

What is the length of Wilson's Creek from the source you mentioned to its junction at Coraki? Seventy miles—that is, the main line. It is one of the most crooked creeks in the world. In one 150-acre portion there were 7 miles traversing to be done for frontage.

What is the character of the banks above navigation? For a good distance loamy soil.

And of the bed? Rock in places only.

What is the width of it above navigation? One and a half chains from bank to bank.

What is the depth? It is a chain of waterholes in dry weather, and a small running stream in ordinary seasons.

Are there any other streams entering the river on the northern bank? Cooper's Creek enters Wilson's Creek above Lismore.

What gathering ground is there to the main Wilson's Creek above Lismore? I should say about 500,000 acres.

Are there any other large branches? There is Leycester Creek.

Would you name the principal tributaries of the Wilson? The Leycester, the Coolmangar, the Turrannia, the Boore, the Hanging Rock, Cooper's, Gigi, and Back Creek.

Do all these creeks drain rich country? Yes.

It is capable of dense settlement of agricultural occupation? Yes.

Where is Lismore situated? At the junction of Lismore and Leycester Creeks.

Is Leycester Creek navigable for any distance? Six miles above Lismore; Wilson's Creek for about an equal distance.

What is the width of these creeks at Lismore? From bank to bank, say 4 chains.

And the depth? I forget.

Is the water brackish? Never.

Always fresh? Yes.

Of sufficient depth to allow large steamers to come up? To allow ocean navigation, say vessels drawing 16 feet.

Returning to the mouth of the river and taking the southern branches, what is the first southern branch of the Richmond River? German Creek; it is a salt-water creek. Rocky Mouth Creek is the first creek. In speaking of this side of the river I am now out of my district. You would get better information from Mr. Richard Barling. I know it casually, but not professionally.

Where does it join the Richmond? At Woodburn.

Is it navigable? Yes, for about 6 miles.

The next creek is what? Bungawalban Creek.

It discharges into the Richmond River, where? About 5 miles above Woodburn. It is navigable for about 30 miles, passing through rich alluvial plain country.

Is most of it alienated? Nearly all, in small holdings.

Do you think it would be advisable to irrigate any portion of that? Not at present. It is sufficiently well supplied with water.

You come then to the south arm? Yes; it joins the river at Coraki.

At what distance above the mouth? Thirty miles.

What is the width of the main river at Coraki? Eight or 9 chains.

Is that the average width from that point to Woodburn? Yes.

And then it gets gradually wider to the Heads? Yes.

Has it a deep channel all through? Yes, except at Wardell; it is shallow there.

What is the character of the banks? From the mouth of the Richmond to Coraki, level.

And the height? Four feet at the Heads. As you come up the river they pinch in more.

What is the average depth of the main river up to Coraki? 18 feet.

What distance is the south arm navigable? 30 miles.

The navigation is to within 3 miles of Casino? Say a mile and a half.

What is the general stratum of your district? Basalt.

Any other rock? The general run is basalt, and on the coast sandstone.

Does that basalt appear to you to be a flow or a dyke? A flow, I imagine.

Does it cover a sandstone or a conglomerate? On the coast is the only place where I have noticed that.

You have seen no appearance of a basaltic dyke? No.

But you have seen conglomerate and sandstone underneath? Yes.

What is the character of the well supply of this district? The surface water is so plentiful that in most cases in the upper river it is unnecessary to conserve water in any other way or to make any provision for it. In the lower part Abyssinian tubes have been used with great success.

What

Mr. F. V. Hunter.  
29 Oct., 1886.

What depth from the surface do you sink before you reach water? From 10 to 16 feet.  
Do you invariably get water at that depth? In every instance that has been tried.  
What is the character of the strata? Loamy on top, pure sand underneath.  
At what distance does it reach the sand? We have driven 40 feet and found sand all through.  
Do you get an unlimited supply? Yes.  
Have you tried the pump on it? Only in supplying stock and steam engines. I think it is inexhaustible.  
Is it fresh? It is purely fresh, soft, and wholesome, at Lismore.  
Are there any windmills in this district? Yes; there is one on the hill there, and one at Lismore, and one at Ballina.  
Is the wind sufficiently constant to drive them all the year round? To supply stock, yes.  
Irrigation. Have they been tried for irrigation? Yes, for garden irrigation at Ballina.  
Does it answer? Admirably, I have been told.  
Could you give us information upon any other point upon which I have not asked you questions? As to timber.  
What is the character of the timber in your district? Splendid throughout the district. Cedar and hardwoods of all descriptions, rosewood, sycamore, pine, beech, and many other useful timbers.  
Are there many timber mills on the river? A good few.  
Is it an increasing industry? Yes.  
I suppose you do not know the value of the whole industry to the district? No; it must be something enormous. It has been the chief support of the district until sugar-cane commenced. Millions of feet of timber have every year been sent away from here.  
Do you think that, as a general rule, irrigation would be beneficial to the district? I do in time to come, but at present it would be premature, and I further think that all the irrigation that would be necessary could be carried out by private enterprise.  
Water is so plentiful? Yes. At the same time I would submit that it would be very desirable for the Government to make reserves in suitable places for water conservation.  
Are there any reserves at the present time? There are, but we do not know how soon they may be alienated.  
Do you know any of these reserves? I could not exactly mention them without looking over the maps.  
Could you mention any sites for large conservation reservoirs that we could apply to have reserved? I do not think I could at the moment, but I would like to look into it.  
Would you let the Commission have that information at some future time? Yes.

Mr. Ludwig Bornstein, M.D., examined:—

Mr. L. Bernstein, M.D.  
29 Oct., 1886.

Mr. Gipps.] You reside at Lismore? Yes.  
You are Mayor of Lismore? Yes.  
How long have you been residing here? Eight years.  
What was the population when you first came? It was not a municipality then. Within the present municipality, between 500 and 600.  
What is the present population? Over 3,000.  
Is it increasing? Yes; at the rate I should say of more than 20 per cent. a year.  
How many houses are there at the present time? There are 380 ratepayers. There ought to be between 400 and 500 now.  
When was Lismore formed into a municipality? In 1879.  
What provision is there at the present time for water supply? None, except tanks to conserve the rainfall.  
Is there any scheme proposed for supplying the town? Yes.  
What is the character of it? A pumping scheme.  
Where is the pumping station situated? On the left bank of Wilson's Creek. Two alternative schemes have been proposed—one 3 miles from the Post Office, and the other about a mile from the Post Office.  
Which scheme is most recommended? For the sake of having the water pure it would be better to have that which is further away from the town, so as to prevent pollution.  
Where is this conserving reservoir situated? At Gerality's ridge.  
At what distance from the pumping station? About 3,000 feet.  
What is the elevation of the reservoir? About 350 feet.  
The town would be supplied by gravitation? Yes.  
What is the capacity of the pumps? Working half-time, I think they are to supply 30,000 gallons a day. Two pumps with a minimum capacity each of 6,000 gallons per hour.  
What is the estimated cost? The longer scheme, £9,800; the lower one, £6,600.  
Is there much settlement above the site of the pumping station on the creek? Not very much.  
Are there any mills above that site? No; and no sugar-mills on this part of the river.  
Have any precautions been taken to prevent the drainage into the river of fecal matter above that point? There is none possible at the present time.  
What is the estimated working expense per annum of that scheme? I think £600.  
Is there any provision for the drainage of the town? No special provision; the town can be very easily drained.  
Does the drainage flow into the river? Part of it.  
Could it be diverted into any large swamp in the neighbourhood? I do not think so—not drainage from storm-waters. Most of the closets here are earth closets; there are very few cesspits, and none of them drain to the river. We intend gradually to do away with all cesspits within the municipality.  
Where do you remove the earth? To a special place, into pits.  
Have you got any sewage farm? No.  
What are the rates of this town at the present time? The general rate, about £1,100. One-third of it, about £300, is the lighting rate. Together the two would be about £1,400 or £1,500.  
So you propose to construct this water scheme yourselves? No; the Government will do it.  
Do you think the population would submit to a special water-rate? Yes. We made application to the Government for the work, and gave an undertaking to pay whatever it cost—the usual interest and the sinking fund.  
What

What is the price of land per foot at the present time? It ranges as high as about £27 a foot in some places, and in others it is perhaps £1 a foot. It is increasing from 10 to 15 per cent. a year.

What is the value of ratable property? I have not got the information with me.

What is the value of property per acre beyond the municipal boundary? I should say from £15 to £25 an acre.

Is that increasing? Yes.

At what rate? At the rate of 10 per cent. at the very least.

What has been the increase since you first came? Land was very nearly unsaleable then.

Can you tell me what acreage there is under crop in the district at the present time? No.

What is the principal industry in the district at the present time? Dairying and corn-growing.

Has dairying been commenced for any length of time? A large scheme has been commenced within the last twelve months for the manufacture of cheese and butter.

Do you think many farmers will go in for it? As far as I have information, which is derived from the produce taken away by the steamers, I may say that during the last fortnight I happened to see the manifest of the steamer going to Sydney, and there were seventy-eight different names of farmers on it who were sending butter in that week.

You think dairying will be the main industry of the district? I have no doubt of it.

Do you think it will take the place of sugar? Yes, I think it will.

What is the average rainfall? Speaking from my personal knowledge during the last three years, the average rainfall would be between 33 and 35 inches.

The last three years have been very dry? Last year was. The rainfall was 29 or 30 inches, but this year up to the present time the rainfall has been 39.42 inches.

What is the maximum rainfall in the Richmond River District? At the Tweed Heads and on the Byron or Brunswick it is over 60 inches a year—sometimes as much as 18 inches a month.

What is the character of the rainfall,—does it come in heavy showers or moderately? In heavy showers. Does it come at a seasonable time for crops? Last year it was not so much so. The year before it was; this year it has been.

What are the prevailing winds of the district? South and south-west mostly.

What winds bring up most rain? Southerly and south-south-west.

Is the wind sufficiently constant for windmills? Yes, except on some stations. As a rule, with very few exceptions, the winds are very light here.

Do you think irrigation would be beneficial to the district? I think that in the Big Scrub it would be of the greatest importance.

What I understand by the Big Scrub is the tableland between Lismore, Ballina, Brunswick, and the Tweed? Yes.

Do you know of any site for conserving water on a large scale there? No, except about Meerum Creek. There may be a great number of other places, but I do not know them.

What are the advantages of Meerum Creek;—is there an extensive fall? There is a large area, and a large area of catchment.

Is there a good site for a dam? Yes; there is a very nice reserve there that would answer—320 acres.

Is it a water reserve? I do not know what the land is specially reserved for.

Would you recommend it to be applied to that purpose in case it is not? It would make a nice reserve.

What is the character of the banks of the creek there;—are they rocky? Partly.

What would be the length of the dam required at that point? Not more than 250 or 300 feet, including wings.

To about what height would the dam have to be to impound a large quantity of water—30 or 40 feet? I think 20 or 25. There is not much fall; but there is a large area.

Is it good water? Splendid water.

A permanent stream? Yes.

Are there any wells sunk in Lismore? There are a few.

What depth? In some cases the formation is peculiar; it takes about 30 or 40 feet to get water; in other places, under the bottoms of the ridge, you can get permanent springs at 6 or 8 feet.

Have any borings been made? No; all by sinking.

Do you know the character of the strata? It consists mostly of decomposed granite and clay.

Fresh water? Yes.

In unlimited quantity? Sufficient has never been used to test it. The well opposite the Court-house is 66 feet—splendid water.

Is there any other information you can give upon subjects that I have not touched on? I think not.

Mr. George Larkin examined:—

Mr. Gipps.] What is your occupation? I am a storekeeper.

How long have you been residing here? Fourteen years.

What particular part of the district can you give information about? I have been through the whole of this district up to the Tweed and Byron Bay, across the Big Scrub.

Have you tried farming? Yes; I am doing a bit of amateur farming.

What is the character of the crops? Fruit. Pineapple is my biggest crop.

Do pineapples pay to grow? The return has been very good. I am right on the top of the hill opposite here, about a mile and a half north-west of the town, at an elevation of 300 feet.

What has been the average yield of pineapples? I have scarcely an acre in. They are constantly coming in at the different ages. Some portion has not borne, and some has. I suppose I shall have 500 dozen off the portion in bearing this year.

What is the value per dozen? I sell them at 4s.

Off less than an acre? Far less than an acre; not more than half is in bearing.

Do you think it would pay to grow pineapples? I do not, as a general crop for the district. You would grow too much for the market.

Do you grow these without any irrigation? Yes.

What is the character of the soil? The little piece where they are growing is rich soil, similar to the Big Scrub; it is all volcanic soil.

What

Mr.  
L. Bernstein,  
M.D.

29 Oct., 1886.

Wells.

Mr.  
G. Larkin.

29 Oct., 1886.

Mr.  
G. Larkin.  
29 Oct., 1886  
Maize.

What different kinds of fruit have you grown here? The mango, Chinese date, plums (two varieties), paw paw, oranges, lemons, strawberries, peaches, loquats, and Brazilian cherries. All do well on the hills, and I do not see why that could not be made an industry of.

What is the principal crop grown at the present time in the district? Maize.

What is the average yield of that? From 40 to 50 bushels. You hear of 80 or 100 bushels being grown occasionally, but I do not think the average is much more than from 40 to 50 bushels.

Would that be the general return from the flat country as well as the hilly? I think so.

What is that worth a bushel here? From 2s. 6d. to 2s. 9d. It may be sold at 3s., but, as a rule, that is as much as it is worth here.

Do the seasons affect the crop much? Last year the crop was affected by some species of blight, but otherwise the seasons have been tolerably favourable for growth. We have had a year or two of what we call dry seasons, but it has not caused a failure of the crop.

You do not know a single instance of complete failure of crops? No.

Is there much sugar-cane grown here? Not around here.

Is it increasing? No.

What do you think will be the principal industry of this district in the future? From present appearances it will be dairying. It is a rich country for grass. Settlement is so new that you can scarcely say what will be the principal product. In time much of the country will probably be occupied as paddocks for fattening stock.

What is the character of the grasses here? The natural grass is kangaroo grass. Clover and couch are the predominant grasses.

How many acres do you require to feed a beast on the natural grasses? I scarcely know what the natural grasses are. They are mostly run out, and the couch is taking their place. Where the couch grows on the flats you might allow from 1 to 2 acres. The racecourse is a 100-acre paddock, and they had 100 head of stock on it last year.

Have English grasses been introduced? Yes, rye and white clover; it is getting all over the country here. Does rye grass flourish here? In many places it does very well, but suffers in the great heat of summer. Last summer killed it in many places.

Has prairie been tried? Yes, and with much the same result.

How many beasts to the acre would English rye grass feed? Where they have a growth I think they would feed a beast to the acre.

What is the cost of clearing this Big Scrub land to get it into grass? From £8 to £10 an acre.

Is that clearing it off and burning it? Yes; say £8 to £10.

Irrigation.

Do you think irrigation would be beneficial to any part of the district? Wherever there is rich soil irrigation would be beneficial. They cannot have too much water, the soil is so porous.

Do you know of any large conserving reservoir sites? No, I do not.

Do you think the streams are permanent enough in this district? I am a little doubtful about that, if the scrub were cleared. There is a large catchment area.

If the scrub were cleared, the probabilities are that that would increase the stream? The soil is very porous, but wherever they sink for water they often get it at 5 or 6 feet, but in some places they have to go down 40 feet.

Is the water fresh? Yes; and a good supply. The wells have not been emptied.

Have you kept any record of the rainfall? No.

Are there fogs at any time of the year here? Very heavy in the bottoms; never on the hills.

Do the fogs come in winter and summer? Yes, all the year round. They reach about half-way up the hill.

As a general rule, the rainfall is seasonable for the crops? Yes.

The only place where you think irrigation would be required would be on the high lands? Yes.

If irrigation was applied, do you think the farmers would pay a rate for it? I scarcely know how to answer that question.

Mr. Henry Alfred Garrard examined: —

Mr.  
H.A. Garrard.  
29 Oct., 1886.

Mr. Gipps.] What is your occupation? I am a farmer.

How long have you been resident here? Thirty-nine years. I am about the oldest resident in Lismore.

What crops have you tried? Oats mostly. Oats seem to get rusty; you can only use the crop for garden stuff. Occasionally we get a small crop of oaten hay. Barley does well if put in in time. It requires to be put in fully a month earlier than oats. We are only now getting in a large quantity of winter food here. Our original grasses are gone out, except kangaroo grass. I have a 200-acre paddock with nothing but kangaroo grass and clover just beginning to come where it has never been before. In this 200-acre paddock I winter 150 head of cows. It is generally closed all the summer, and well sheltered from the frost. It is shut up for five months out of the twelve. It is a tableland, and is sheltered by heavy timber from the west.

English grasses.

Have you introduced English grasses at all? I have tried rye and prairie. It does not do on the black soil; it does on the sides of ridges, and in undulating country, and country sheltered from the heat of the sun. It does not stand the heat well.

Do you have to prepare the ground for it? No. In scrub ground we chip it in; in forest land we have to plough.

Have you ever tried taking hay off it? Never.

Do the seasons seem to affect it at all? Last season seemed to affect it more than any other. There were several good patches of grass, I know, which were not worth anything at all until this spring; it came on then.

Then you have not really lost the grass? No.

Have you ever allowed it to go to seed? Yes.

How many bushels an acre do you get? I could not say.

Is it good seed? Yes. I have got better seed from my own growing than that which I bought.

Have you sold any seed? No; I have not had sufficient for my own use. The average price we pay for local grown seed is 10s. a bushel.

Do

Do you not think it would pay to grow for seed? I have a paddock in now for seed. We feed it off the first season. I shall shut it off in a fortnight or three weeks to come in for seed.

Mr.  
H. A. Garrard.  
29 Oct., 1886.  
Lucerne.

Have you tried lucerne at all? Yes. Lucerne will grow, but you only get one crop. The soil seems to be too heavy for it; it does not take root. It requires loose sandy soil, such as on the Hunter and on the Clarence.

Have you tried Indian corn, and if so what is the yield per acre? That I have only tried in small quantities. I should fancy 60 or 70 bushels to the acre.

Have you tried sugar-cane? Yes. I went into that some years ago. My brother and I were the first that went in for cane. We grew a good deal, but we were not in a position to get machinery, so we ploughed it all out. We grew some very fine cane. We had 18 or 20 acres some twenty years ago, but we had to plough it all out.

Which do you consider the most profitable crop in the district? Maize.

Have you tried dairying at all? I have commenced it this season. I have always tried it for my own use and a little over, but I am going in for it rather largely now. I think that will be the principal industry in the district.

Have you lost many stock during the last dry season? Not many stock has been lost in the district except on large stations which have been overstocked.

But none of the small settlers have lost heavily? The stock lost has been principally from being bogged, and not being attended to.

Is stock-raising a profitable industry? Yes.

Sheep or cattle? Cattle. Sheep do not do well here.

Have the heavy sheep been tried? Not in any quantity. We have not had many sheep in the district for thirty years, only a few pet flocks. There were a good many sheep when I came first, but they were all done away with five years after I had arrived.

What do you get for your beef here? I sell to the butcher at £5 5s. on the average, and I sell to my smaller neighbours at the rate of 3d. per lb. all the year round.

What do you do for mutton? They bring it from Sydney principally. Some comes from New Zealand, and some from Queensland. The squatters get a bigger price for their cattle than I do for mine, because I am obliged to sell off.

What would be the average weight of your cattle? 650 to 700 lb. The squatters' cattle are very little heavier, although they have greater age.

Do you think irrigation would be largely used? I do not think it is required generally. There are a great many places that would benefit by irrigation, but, generally speaking, it is not at all required. I may say that last year was the year of greatest drought I have known since 1847.

SATURDAY, 30 OCTOBER, 1886.

At Casino.

Present:—

MR. GIPPS, C.E., | MR. MURRAY.

Mr. Thomas Hyndes Green examined:—

Mr. Murray.] What are you, Mr. Green? I am the forest ranger for this district.

Have you long resided in the district? Since 1875.

Mr.  
T. H. Green.  
30 Oct., 1886.

I presume you are well acquainted with it? Yes. My district extended some three or four years ago up to the Tweed River; but my head-quarters are Casino. I do not go beyond Lismore at the present time.

Is the rainfall of this district copious? It has not been so copious the last five or six years as previously. Rainfall.

The last two or three years there has been a drought.

Does the rain come in suitable seasons for the crops? About December, January, and March we generally look for rain, but it has failed us the last two or three years.

Are those the best seasons for rain—do they suit the crops best? We have the heaviest thunderstorms and rains generally throughout the year, but heavy rains prevail in the early months of the year.

Would other months be more suitable for the growing of crops? Winter time. If the farmers do not get rain they cannot plough very well.

What is the nature of the soil in this district? In parts it is sandy; the rocks are sandstone, but most parts of it are heavy soil.

Is it suitable for cultivation? Very much so; the scrub lands especially are considered as fine as any in the Colony.

Is there much land under cultivation? Yes; on the north and south arm, but of no extent as compared with the area.

Pastoral pursuits are the prevailing pursuits of the district, I presume? No, farming; but still there are a number of stations and a great deal of capital invested in pastoral pursuits. There is also an industry that is new to this district, namely, dairying.

What is the average size of the holdings of settlers in this district? They vary from 40 to 640 acres.

As a rule, are they large? The stations are very large areas.

Could you say how many settlers there are within a radius of about 20 miles of Casino? From 150 to 200.

Is the quality of land in this district good? Very good in most parts of the district. The most inferior, I suppose, is that near the road from Lawrence to Casino, but there is very good land on the northern slopes of the Richmond Range, notwithstanding that I have read in the prints that it is worthless. It is light sandy soil. I have seen at Comina Station excellent crops produced.

What crops? Oaten hay, maize, and vegetable products. On any of the creeks the land is very good; the same may be said of Bungawalban Creek.

Could you say about what quantity of land is under cultivation in this district? I could not tell you with any degree of accuracy.

Could

- Mr. T. H. Green. Could you give the average maize production per acre? It might be estimated at from 60 to 70 bushels per acre. In good seasons it is very much higher than that.
- 30 Oct., 1886. Have they lost much stock in this district during the recent year on account of the insufficiency of the rainfall? Last year, owing to the waterholes shrinking, a great many cattle were lost by bogging. That occurred throughout the district. Probably more cattle were lost last year than ever was known before, at least so I am informed.
- Can you give us any estimate of the number? I cannot. I have heard various statements. I suppose the owners themselves could hardly tell until they came to muster.
- Is the river fresh at Casino? Yes; there are falls here.
- Has any water been pumped from the river to run into lagoons to supply stock? A little lower down I think Mr. Irving, of Tomki, put up an engine about a year ago to pump up water, and has found it a very great advantage.
- Has he conveyed it far inland? Not very far. I do not think more than perhaps a mile.
- Have you heard of any water being conveyed inland for a very great distance by means of canals? Nothing of that kind has been attempted.
- Has what Mr. Irving has done for his stock been profitable? I have not heard from him, but from others I have heard that he is very well satisfied with the result. Some of the Chinese gardeners about Lismore use pumps to water their gardens, but only to a limited extent; but at Leycester Creek there are a few who use pumps.
- Water power. You say that there are falls here—is there a very large water-power from those falls? The river rises (say) at times from 30 to 40 feet, and it has been over the banks, but I have never seen it since 1875. I suppose there is a good deal of flow always? There is an immense quantity of water always flowing. Last year the water was shallower than before.
- Has any use ever been made of this water-power, say in the way of saw-mills? No. I think the engineer of a saw-mill property said that a mill might be put up here and worked with water-power without any great expense, but I do not know of my own knowledge whether it was ever thought of carrying out the idea into practice. Some of the creeks have a very large flow of water only at times. Back Creek rises in the Macpherson Range, down to Leycester Creek, and it brings a great body of water. Bungawalban Creek also contains a large amount of water.
- Timber. I presume you have an extensive knowledge of the timbers of the district;—is there a large quantity of timber in the district? In hardwood and scrub timbers there is a large quantity, but the timber principally sought after now is becoming very limited; I refer to cedar.
- Will you name some of the timbers which occur in great abundance here? Ironbark, red-gum, blue-gum, tallow-wood, stringy-bark, and spotted-gum. Ironbark ridges prevail very much from here to the Clarence.
- Do you think water could be used for the purpose of sawing timber? It could, but the question is, is the demand sufficient to justify the undertaking; that I doubt.
- Do you know anything about the question of the water supply for the town of Casino? There was a Commission some time ago. The gentleman who came up told me that this town could be supplied with water at a very moderate expense. I refer to Mr. Coghlan, of the Harbours and Rivers Department.
- Mr. Gipps.] Is there a large timber trade in the district? It is not so large as it was a few years ago, but I think that about 11 to 12 million feet are sent from the river during the year.
- How many timber mills are there? There are two mills at Coraki, and they principally cut up hardwood; one at Wyrallah, which chiefly works upon pine; one at Wardell, which chiefly cuts up pine; and there are two or three smaller mills at other parts—two at Lismore, one at Codrington, and one at Deep Creek.
- To what cause do you attribute the decline in the supply? The labour is too high to enable us to compete with southern parts.
- Do you think the import of timber from America has something to do with it? That timber is of a different quality altogether. It may be used owing to the difference in price, but it is by no means equal to Colonial timber.
- But that has an influence? Undoubtedly, a very great influence.
- How many men are engaged in the timber trade at the present time? It would be difficult to say. I am hardly in a position to say how many there are; within 2,000 I should say.
- Do you know anything relative to the rainfall of the district? I have never paid sufficient attention to the subject to tell you what it is.
- Creek. Can you give us any information with regard to the south arm of the Richmond River? It takes its rise from creeks about Mount Lindsay. The creek beyond that, Acacia Creek, runs into the Clarence.
- Do you know Myall Creek? It is south of that part. Findon, Congal, and Tuross Creeks, on the Roseberry Run, bring down a large supply of water.
- Where do they discharge? Into the south arm of the river.
- What distance from its junction with the main river is the south arm navigable? No further than Irvington—that is, 2½ miles below Casino.
- When you have been speaking of the south arm, have you been speaking of that branch of the river on which Casino is situated? Exactly.
- Do you know anything of that branch of the river known as Bungawalban Creek? Yes.
- How far is that navigable? From its junction with the river, about 25 or 30 miles, for small steamers.
- What is the character of the country which that runs through? Light sandy soil, very swampy, and extends from that creek to the coast.
- Above the point of navigation, is it a large creek? No.
- It may probably be from 50 to 100 yards wide? Yes.
- What is its depth? Vessels drawing 5 or 6 feet of water will come up 20 or 30 miles.
- Is it a permanent running stream? Yes.
- Can you give us any information with regard to Myall Creek? It takes its rise in the Richmond Range, at Mount March, on the northern slopes of the Richmond River.
- What is the character of its valley from that point downwards? It is rather a narrow creek; it is not always running, still there is always water in it.
- Are there any positions on it for conserving reservoirs? Not that I know of. No doubt there would be one at Camira Station. What

What distance is that from its source? About 17 or 18 miles.  
 Could the water be impounded in that swamp, do you think? I am not competent to say.  
 At the lower end of the swamp, is that country hilly? No; it is a little ridgy beyond that. Pumpkin Swamp is a large open sheet, partly plain and partly swamp.  
 With regard to the swamp, would there be any facility for constructing a dam at the lower end of it? I have not a good knowledge of it.  
 What is the character of the bed of the creek at that point? Rocky.  
 Are the banks rocky? In parts, but as you get down the country opens out and is sandy.  
 Do you know of any sites below that? No.  
 Do you know Myrtle Creek? Yes.  
 Where does that rise? It comes from the Camira Creek, and runs down to the Bungawalban.  
 What ranges does Myrtle Creek rise in? It is in the watershed of the Richmond.  
 Do you know of any sites for impounding reservoirs on that creek? I never had my attention drawn to them.  
 What is the character of the valley in its upper sources? It is ridgy country.  
 Are there any large flats or swamps on it? Yes; in the parish of Gibberagee it is very swampy.  
 Could water be conserved in those swamps? I think it is possible it might. If ever water should be brought to that part of the country, which is now thought to be so barren, it will be found to be as valuable for agricultural purposes as most of the land in the district. The Italians who have taken up their selections in that part of the country have been very much sympathised with and laughed at for preferring to go there to anywhere else. They are farming in a rough and primitive way, but they are looking to grow fruit, and they prefer that locality to grow it on to the richer land.  
 Do they irrigate their land? Not to my knowledge.  
 Where is this Italian settlement? It lies a little way back from the town of Woodburn.  
*Mr. Murray.*] Do you think irrigation would be very beneficial to the district? In part of the district it would be very much so indeed; but whether the people who would be benefited by it would contribute to the cost is a question upon which I think there would be some doubt.  
 To what extent do you think it would increase the productiveness of the soil? I never gave that consideration.  
 You say the average crop is from 70 to 80 bushels;—if you had a certainty of water laid on to the land how much do you think it would produce? From 80 to 90, perhaps.  
 What is the average price of corn in the district? From 2s. 6d. to 4s. The price depends greatly upon the supply.  
 The increase, reckoning corn at 3s. per bushel, would give an increase equal to £3 per acre;—would the farmers under such circumstances be willing to pay £1 an acre to get the water laid on to their land? The farming is done here in such a primitive style that they would not be likely to listen to any projects that would cost them anything. Some men farm well, and others farm very indifferently.  
 Do you know of any case of irrigation except by Chinamen? No. It is impossible to say what the district would not produce if there was a proper supply of water.

Mr.  
T. H. Green.  
30 Oct., 1886.

Mr. Frederick Burgess Gully examined:—

*Mr. Murray.*] You are the Mayor of Casino? I am.  
 You carry on business as a storekeeper, I believe? Yes.  
 Have you been long residing in the district? On and off for the last sixteen years.  
 You have an intimate acquaintance with the neighbourhood? I have.  
 Have you any land in the district? Yes.  
 What do you use it for? Grazing purposes.  
 Have you gone in for agriculture? No.  
 You have heard a good deal of what Mr. Green has stated;—are there any points in which you differ from him? There are one or two points in which I should be inclined to disagree with him. My own opinion is that if the farmers could be induced to irrigate it would have a very beneficial effect, and, instead of their crops being very often a failure in consequence of there being a want of sufficient moisture, it would pay them handsomely to give a yearly contribution for the purpose of conservation.  
 Is the district, as a rule, pastoral or agricultural? It is both.  
 Is the land that you hold suitable for agriculture? A great portion of it is.  
 Can you give us a reason for not bringing any of it under agriculture? One reason is that I only purchased it eighteen months ago, I have it in contemplation to put some portion of it under agriculture.  
 Another reason why I could not attempt agriculture is that the first season I was there, that is last year, was one of the worst that has been known on the Richmond for the last forty years.  
 In that bad season was agriculture a failure? It was to a great extent.  
 What was the average crop of maize last season? There is very little hay grown in the district. There is more hay imported than grown. The principal quantity consumed in the district is imported from Sydney.  
 Why? On account of the drought. The immediate neighbourhood is not suitable for growing hay; it grows too rank. It is more suitable for corn and potatoes.  
 Have you any sugar grown on the Richmond? Not much on the south arm.  
 In your opinion, is the south arm in reality the main river? The portion of the river upon which Lismore is situated is known as the north arm, but the south arm of the Richmond properly is known as Bungawalban Creek.  
 Do you know anything about the rainfall? I have not kept any records.  
 Do you know that for some years past it has been very insufficient? The last two seasons have been two of the worst known for forty years.  
 In your residence of sixteen years, how many bad years have you known? About six.  
 What was the average corn crop in this very bad season last year? About half the usual average crop.  
 Do you know of any system of irrigation having been carried out in the district? None whatever, with the exception of that referred to by the forest ranger, and minor plans such as windmills for irrigating gardens.

Mr.  
F. B. Gully.  
30 Oct., 1886.

- Mr. F. B. Gully. Has water been carried to any distance? Not to any distance.
- 30 Oct., 1886. In any of these cases that you have seen on a small scale, has irrigation been profitable? It has been very profitable; in fact, I may say that it is the one great drawback to the district, as far as agriculture is concerned, that we cannot depend upon a permanent supply of water.
- Irrigation. You think that a system of irrigation would be a great benefit to this district? I do. The soil is of that nature that if properly irrigated the crops would be abundant, and it is suited for growing many other things besides maize. Most of the farmers have no idea of rotation of crops, and their excuse is that they cannot depend on the rainfall.
- Is most of the land of the district alienated from the Crown? As far as my knowledge goes, there is still a large quantity of land available. The greater portion of the land on the river banks has been alienated. Are there large tracts of country that might be settled on yet if there was a system of irrigation or water supply between this and Ballina and the Tweed? Yes; on the Upper Richmond there is a large quantity of land yet available.
- Water power. Is there any suitable place for water-power to be erected on the river or its tributaries? On the river itself.
- Could you name suitable sites? It has been suggested to you more than once that a water-wheel could be erected just above Casino, near the bridge, and made available for a saw-mill or other purposes.
- Where there is a rocky bar? Yes.
- But no machinery for water-power has been erected there? No.
- Do you think there is a good opening for works of that kind, for timber-cutting especially? I do.
- We have heard already that there has been an investigation into the water supply for the town? Yes.
- Do you know if the recommendation made has been such as you agree with? Yes, as far as my knowledge goes.
- Where is the position that has been recommended as a suitable site for a reservoir for the supply of the town? Just above the hospital, on the river bank.
- What is the supply to be from? From the main river.
- By what means, by pumping? Yes.
- Do you know of any system of gravitation which could be adopted by taking some of the tributaries higher up? I do not.
- Would the works be expensive? We had an estimate of the cost, but I am not prepared to say exactly what the figures were; I think about £3,000.
- Is the pumping plant recommended for steam or water power? Steam.
- And yet you have a permanent river with falls in it? The engineer, in his estimate, recommended steam.
- Do you think that a mistake? I do. I think where water-power could be made available, as in that case, it should be adopted.
- What mileage of streets have you? I really forget. We only propose to lay water on to the main street. It is a comparatively new municipality.
- What is the ratable property within the municipal boundary? It is valued at about £2,500. The population of the town is about 1,200.
- Can you give us an estimate of the number of houses within the municipal boundary? I have not that information with me.
- How long has the town existed as a municipality? About seven years.
- What was the population of the town when you first came here? About 300.
- Has the population increased from year to year? It has been increasing for several years past.
- At what rate? 15 or 20 per cent.
- What is the value of land within the municipal boundary, per foot? It ranges from 10s. to £10.
- Is it increasing or decreasing? I cannot say that it is increasing at present.
- What area is included in the municipal boundary? About 10 square miles.
- Is the stream upon which Casino is situated permanent? Yes.
- Have you estimated the capacity of the stream in gallons? I have not.
- What was the lowest flow you have known here? The river was at its lowest some time during the last summer.
- What quantity of water did it give then? It had almost ceased running in one or two places. I could not speak as to its volume.
- Has any provision been made for drainage or disposal of sewage? Some provision has been made for drainage. We have what is known as the main drain, in Barker-street.
- Does that take sewage matter away? No; we have no system of sewerage at present.
- What are the prevailing winds here? South-west and south-east.
- Are they sufficiently constant and strong for the use of windmills? I should think they would be.
- What is the principal industry of the district? Pastoral and agricultural; timber-getting has been a very important industry.
- What is the principal crop grown here? Maize.
- What is the price of land within a radius of 30 miles from town? Farming land has been sold during the last five years at from £10 to £26 per acre; land for pastoral purposes, that is improved land, has been sold at from 30s. to £4 10s. and £5 an acre.
- Is all the land alienated within that radius? Not all.
- Is the land held in small or large holdings? We have both large and small holdings.
- Who has the largest holding? Griffiths, Fanning, & Co. have the largest number of acres in Woorooloolgen.
- What is the largest area? They have the largest area.
- What area is it? I could not positively say; they have a great many miles of frontage, and a great portion of it is freehold.
- Does that firm use the property for agricultural or pastoral purposes? Pastoral purposes.
- How many acres are required for each head of cattle? About three. It depends upon the nature of the country; if the country was good, about 3 acres.
- Do you know if they have tried English grasses at all? I think they have.
- Losses in stock. Did they lose much stock last year? A great number; they were heavy losers.
- Was that from want of grass? Yes; but principally from want of water. The cattle went into the water-holes

holes and got bogged. My own opinion is that the owners of the cattle should be compelled by law to destroy the dead cattle in consequence of their polluting the water.

It materially affects the water supply? Yes.

Does the water from these swamps drain into the river? It does from a great number of them.

And it pollutes the river, I suppose? It does.

Are there any wells in the district? Some. I have one of the few in the town, perhaps the deepest.

What is the depth? 55 feet to the bed rock.

What is the bed rock? Sandstone.

What is the character of the strata you went through? That well was constructed more than twenty years ago by my predecessor; a great deal of blasting had to be done.

You get an unlimited supply from it? No. In very dry seasons the supply has given out. It appears to rise and fall with the river. In flood-time it has been within 10 feet of the top of the well, and in the very dry time it has been nearly empty.

What is the highest flood you have known in the district? I think it has risen something like 22 feet above its ordinary level.

Are there records of any flood levels higher than that? There are.

How much higher? On one occasion, I am told by my predecessor, who lived in the premises where we now carry on business, that the river broke over its banks and came up into the garden. The place of which I speak is situated in one of the highest parts of the town.

What is the height of the banks at the point to which you allude? As well as I can guess, over 30 feet.

Are not most of the buildings in Casino constructed of wood? The majority of them are. My own store is the only stone building in the town.

Have you made any provision in case of fire for water supply? No. We have attempted at different times to start a fire brigade, but we really have no ample provision for that sort of thing.

Do you know the river above Casino towards its source? I know very little about it.

You do not know any position for a conserving reservoir in the district? No. Referring to the question asked of the preceding witness as to the failure to a certain extent of timber-getting in the district, my own opinion is that it is principally caused by the importation of foreign timber.

Mr. Frederick George Crouch examined:—

*Mr. Murray.*] You are an extensive storekeeper, I believe? Yes, the largest, I think.

And you are also largely interested in shipping pursuits? I have two or three small steamers.

You have acted as alderman and mayor of Casino? I have been Mayor for four years, and I have been an alderman of the municipality ever since it was formed.

You have an extensive knowledge of the town and district? I have. I have been through it all, I suppose. Do you consider the district agricultural or pastoral? The upper portion is essentially pastoral. The holdings are large, and in the hands of squatters, who do not turn their attention, except on a very small scale, to other than pastoral pursuits, although there is land above the town of Casino equally as good as that below the town. If you ride through Kyogle or Wyangracie it is like an English park.

Have they secured the freehold to the land? Yes, by purchase, to a large extent; and now that the runs have been divided there is practically a very small portion available for settlement.

What is the value of freehold land for pastoral purposes? I know of a recent purchase where Mr. Donald Campbell gave £8 an acre for land for pastoral purposes. I have known a good deal of land sold for £5 an acre. £8 is an excessive price.

Do you not think that land of that value is more adapted to agriculture than grazing? Undoubtedly, but agriculture does not pay them.

Is it not a great disadvantage to the district that it should be shut up for pastoral purposes? Undoubtedly.

Where free selection has taken place, are the proprietors, as a rule, small or large holders? Lately there have been some fairly large selections taken up with a view to combining grazing with agriculture.

What would you say is the average size of selections in the district? Selectors take up as much as they can get, whether they mean to work it or not. To that I attribute one cause why agricultural pursuits are not carried on as they ought to be. There is too great a desire to get land, both on the part of the free-selector and of the pastoral holder.

Could you say what quantity of land is under cultivation within 20 miles of Casino? I could not give you the number of acres. The land on the south arm—although, properly speaking, it is the main river extending to Coraki, about 40 miles,—the land on the banks of the river cannot be surpassed in any part of the world. It will grow anything in the way of semi-tropical productions, such as sugar-cane, maize, coffee-plant, arrowroot, and tobacco. All would be grown successfully if some provision were made for a system of irrigation. I have known tobacco grown successfully and profitably here. I have known arrowroot grown also. The sugar-cane grown on the lower portion of the river exhibits a higher quality as regards saccharine matter than cane grown on any other portion of the river. I have heard those who are conversant with the operations of the Colonial Sugar Company say that the cane cut on the south arm of the river is of the highest density.

How many tons to the acre does it yield? The cane growing there now, which is principally "Grey Fig," an annual cane, produces a much less quantity. Some varieties have produced as much as 80 or 100 tons per acre, but the average of the ordinary cane would not be more than 30 or 40 tons an acre.

What is that worth a ton? 13s. 6d.

Delivered to the company's punts? Yes.

Do you know about what the average rainfall of the district is? I could not state that with any degree of exactness; for some years we have had 40 inches.

Is it seasonable, that is to say, does it come at a good time for the crops? With the exception of the last two seasons, we have had a very fair rainfall at the proper season for the production of maize, which is the staple product here.

During your experience, what is the average number of years of bad seasons as compared with good seasons? We have had what may be termed very fair seasons for seven or eight years out of the eleven I have been here.

Do you know of any cases in which irrigation has been attempted in the district? Only on a very small Irrigation.

Mr.  
F. B. Gully.  
30 Oct., 1886.

Wells.

Floods.

Mr.  
F. G. Crouch.  
30 Oct., 1886.

Irrigation.

Rainfall.

Mr. F. G. Crouch. small scale. Mr. Irving, of Tomki, placed a small portable engine on the bank, and irrigated the whole of his back paddocks by means of pipes, and he assured me that he was convinced that it paid him splendidly. In such a season as this he would not require to use it.

30 Oct., 1886.

Do you know to what extent he carried his pipes back from the river? The river bank is high, and the pipe had to be a considerable length to surmount it. About a couple of hundred yards there was a fall, and the water ran through drains into the paddocks.

Is it possible by raising the water over the bank to convey it to a great distance by gravitation? In many places for miles.

As a rule the banks are higher than the surrounding country? Yes. Casino is situated not only above navigation, but above the tidal way. We have a number of small falls in the river. It has been suggested that the water supply could be obtained better by gravitation than by pumping. I was Mayor at the time. The officer from the Department of the Engineer for Harbours and Rivers took the levels where it was proposed to make the reservoir, and he told me that although there was a fall sufficient to get water into it by gravitation, it was insufficient to raise it to the height of any reasonably high building. He recommended one of Tangye's engines.

Are you aware that any of the tributaries higher up have been examined and surveyed to ascertain their levels and quantities? I do not think they have.

Is it not possible that some of these may be used for water supply? The distance from the town would more than counterbalance saving of expense. The Council applied to the Government for a vote under the Act to supply water to the town. The necessary steps were taken, the design approved, but when the Government were pressed to go on with the scheme, and the Municipal Council were ready to guarantee the interest on the cost, the reply was received that there were other towns, not nearly so favourably situated, whose requirements must be provided for first, and so the matter dropped. Until the wants of other towns were attended to we were told that Casino could afford to wait; but an excellent site has been selected and reserved.

From what source do you get your supply for domestic purposes? From the rainfall, and the river in dry seasons. I have a 15,000-gallon tank and a windmill to supply my own house, and I have never run short of water in a dry season.

In case of an extensive fire in Casino, how would you be situated? We are lamentably situated. For my own protection I have put down a 15,000-gallon tank at the rear of my store, and imported a manual engine. The tank is now full.

Sites for water conservation.

Do you think there are suitable places on the tributaries of the Richmond for conserving water for irrigation purposes—that is, places where rocky bars are to be found, and the spurs come in close to the banks? Yes, on the Upper Richmond especially.

Can you give us particulars of any of these places which are in your opinion suitable for conserving reservoirs? I could not name the exact spots, although I believe there are a number of them.

If such places were found, do you think the water would command a great extent of country at the back? I think so, but I am not competent to give a pronounced opinion. Most of our stations have numerous running creeks which have never been known to fail, and our pastoralists have not suffered to any appreciable extent. Woorooloolgen did suffer to a serious extent last season. I believe they lost 3,000 head of cattle, but I attribute that to the want of the necessary precautions for making watering-places in the waterholes, that is, by stone flagging. The cattle get bogged, and are too weak to extricate themselves, and then they have to be pulled out, as they were by hundreds, by means of horse-teams. They were too weak to survive, and have died on the bank. There is a small lagoon close to the town, and I counted 120 head there. Taking them at £6 a head, that in itself is a serious loss.

Are there not numerous reed beds and swamps in the district? Yes, which, if drained, the quality of the land is simply inexhaustible. The richest soil is found in the bed of the swamps. Some were drained by evaporation last season, and the crops taken off them gave extraordinary results.

Do you think the outlet of these reed beds could be dammed so as to be made reservoirs for holding water? I think many of them could.

Mr. Gipps.] What is the value of the present export trade from Casino? I could not tell you. The Richmond is fast surpassing the Clarence as to the total value of its exports. We have four steamers trading here regularly, besides a fleet of sailing vessels.

What is the character of the bed of the river between Casino and Navigation Point? Rocky and sandy. What is the width of the river at the head of navigation? It is navigable at Casino for a small drogher at present. Goods are transhipped at Coraki, 40 miles distant by water. Ocean steamers drawing 6 to 7 feet could come up to Tatham and Tomki.

What is the width of the river at the head of navigation? Somewhat less than 100 feet.

What is the character of the bed of the river at that point? At Irvington, the terminal point of the river, it is sand and mud; but about  $1\frac{1}{2}$  or 2 miles below there is a bar of rocks extending across the river, which the department have been engaged in removing, and cutting a channel. The river is admirably adapted for locking.

What is the fall of the river between Casino and the head of navigation? I do not think more than 12 or 15 feet.

Do you think it might be made navigable? I am certain that two locks would bring the steamers right up to the town of Casino. The reason why the water-power in the river has not been used for saw-mills is the liability to floods, and the consequent danger of washing away any works which might be erected.

What is the average depth between Coraki and the head of navigation? At the wharf at Irvington we have about 15 feet, but it would not give that as an average depth.

Does the tide rise beyond Irvington? About  $\frac{1}{2}$  mile above Irvington.

Do you not think that a movable weir from 10 to 12 feet at Irvington would provide for the continuation of navigation to Casino—that is to say, a weir which you could raise or lower as you pleased? I have not seen one. I should think so.

Do you think it would be desirable to have one constructed? Undoubtedly.

Flood of 1867.

Are there any bridges to prevent navigation? No. Casino bridge is a very high one. The highest flood has not been within 12 or 15 feet of the floor of it. The flood of 1867 has been spoken of by old residents as the highest. The highest flood was 12 or 15 feet below the top of the bank at the site for the railway bridge.

What

What is the lowest flow? I have never seen the river cease to flow. At the time of Mr. Coghlan's visit he assured me that there was more water running to waste than would supply the city of Sydney.

Have you known it lower? Yes; but not much lower.

Do you think from your knowledge of the people of the district that they would be content to contribute a fair interest on the outlay for works for irrigation—that is to say, the farming community? It is very difficult to get the farmers out of one groove, and unless they can be satisfied that the result would be extraordinary they would not be inclined to do anything.

Would it be a benefit to the district to try something on a small scale? I think so. Once you show a man that a thing is profitable, hundreds will follow on the same lines.

You think there are places where, on a small scale, experimental irrigation could be carried out? I do, especially on this arm of the river, where farming is carried on at its best—that is, between Casino and Coraki.

You mentioned a rocky bar 2 miles below Irvington? Yes; they are making a channel there by blowing the rocks out. There was no special vote for removing the rocks.

How deep are they going to blow that bar out? About 6 feet.

And for what width? Not more than 20 feet.

Can you give us any information as to the timber of the district? Timber-getting has been the most important industry. At the present time, owing principally to the importation of foreign timber, it is, however, scarcely remunerative, and many of our timber-getters engaged in cutting it at a distance, and having to take it by waggon for 30 or 40 miles from the borders of Queensland, owing to the low rate at which it is sold in Sydney, have had to abandon the occupation; and until some additional duty is placed upon American redwood, which is not nearly as good as the Colonial timber, although brought into Sydney ready-made in the form of architraves, we cannot expect our own timber trade to revive. The industry must languish. Our hardwoods are vastly superior to the soft timbers imported from America; still the difference in the cost of working hardwood and of working pine is so great that carpenters and joiners and builders invariably place oregon and kauri in their specifications. It is supplied in long lengths, and that also has something to do with it. It is impossible to supply hardwood 50 or 60 feet long. You could not handle it then, even if you could get trees to supply it. The price of hardwood has come down to be almost unremunerative. If sent to Sydney in the log it is sold as low as 7s. in the 100, and seeing that the freight is worth 4s. or 4s. 6d., it cannot be remunerative to those engaged in the industry. I suppose I buy as much cedar in this district as anyone else. A large line was sold the other day at 14s. the 100, girth measurement; that is not equal to more than 7s. superficial measurement. The cedar that I refer to had to be brought 50 or 60 miles, and it is impossible that it could be produced at a profit.

Mr.  
F. G. Crouch.  
30 Oct., 1886.

Mr. Malcolm MacIntyre Campbell examined:—

Mr. Murray.] You are the Clerk of Petty Sessions here? Yes, and Crown Lands Agent.

Have you a long acquaintance with the district? Only eleven years. I have had business relations previously—since 1864,—but I came to reside permanently in 1875.

Have you an intimate acquaintance with the stock in the district? Only a partial knowledge; I am a small stockowner myself.

Has the rainfall been sufficient for you, as a rule, for stock purposes? The summer and winter of 1875 were very dry, and the rainfall was short.

About what is the average number of bad seasons as compared with good seasons during your experience for stock purposes? Only about one in ten or one in nine.

Was last year one of those very bad seasons? It was one of them. I have not seen any other season so bad previously.

Did you lose great quantities of stock in the district last year? I should say the total loss, without counting the loss down at Lismore and the Lower Richmond, among the squatters and selectors would be 15,000 to 16,000 head of cattle, which died from want of grass and water.

Could that loss be averted by conservation of water during seasons when you have an abundance? It could be partially, and altogether if the scheme were extensive enough. Perhaps the grass might not be so good, but if the flat lands were irrigated, and the waters conserved near those large flats, the stock could be saved if they could be kept from the bean trees. When they get poor and water gets scarce they go to the waterholes in the creeks and eat the beans, and they very soon die. There is a great loss from bogging. After the top water runs off the lagoons by evaporation, and as the water gets continuously lower, the banks are muddy, and the cattle get bogged there. They are taken out, but they are no use afterwards; they always die.

Has settlement increased very much in this district? Yes, especially on the banks of the creeks and rivers.

As Crown Lands Agent, I suppose you know about the quantity of land alienated last year? There has not been much alienated. Very little has been alienated since the new Land Act came into force.

How is that? There are two or three reasons. In the first place the best of the rivers and creeks was taken up before the new Land Act came into force. Another reason is that we had a very bad season at the beginning of the year, and money was very scarce. The next reason is that most of the land which is accessible was placed in the leasehold area of the runs; only the back country was left available for the selector. Land for agricultural purposes has therefore not been taken up, but the selections have been for land for grazing.

Is there a large quantity of land in your district still available for selection? I think there must be a million of acres, after taking off the leasehold areas. This is a very large district.

Do you think that if a system of irrigation were adopted here it would cause settlement on the land? It is rather difficult to say that, because people have not been educated to the point of understanding irrigation or draining. Draining is necessary in the driest of land for agricultural purposes—that was my experience in Scotland. It improved the land.

Do you know of any case in which irrigation has been adopted on a small scale? I know of none.

Do you think the experiment would be worth trying on a small scale? I am certain it would pay any farmer who would try it.

Mr. M. M.  
Campbell.  
30 Oct., 1886.

Loss of stock.

Irrigation.

Do

Mr. M. M. Campbell. Do you not think that if it was tried, and shown to be a success, others would follow in the same course? Undoubtedly.

30 Oct., 1886. Do you think there are suitable places on the rivers and tributaries for conserving water? I think the lagoons would be the most suitable places for conserving water.

How would you propose to deal with them? Dam the ends of them, and then if the water were required get it taken by drains. On the land where I graze bullocks I have to pump water for them out of a well 40 feet deep, but I am only on a very small scale. I believe in having wells for cattle on hard land, where they can get to the troughs without bogging.

What quantity can you reckon on per diem? Only about 1,200 gallons.

Does that exhaust its supply? I should have to pump twice a day to get that. During the very dry weather I found that my bullocks, although the grass was very bad, did better on the pump water than any other bullocks did, with the exception of those belonging to a namesake of mine, who was getting water from wells also. The well water appeared to be a great deal better for stock that were fattening than water from the lagoons and creeks, and there was no chance of their being bogged. Where I had cattle getting water from the creek, out of 300 I lost 150 through bogging during the drought, and from want of grass.

Is the water at all brackish? Mine has a peculiar taste. I think there is some mineral in it.

Pollution of water by dead cattle.

Do you attribute to that the fact of the cattle liking it? I think it was cooler, and perhaps the mineral quality of the water purifies the blood of the cattle. On swampy ground fluke is more or less common. In connection with water supply, I may say the water in these lagoons is allowed to be very much polluted in times of drought by reason of the fact that the owners of cattle leave them to putrify on the banks of the lagoons. Some measure ought to be brought into operation by which the owners of cattle would be compelled to burn those which die. You may see 100 dead cattle at the side of one lagoon. The population area of Casino extends 2 miles outside the town in each direction. There are close upon 3,000 head of cattle and horses grazing upon that area. As no person in particular seems to be interested in the question, they allow the cattle to die in the waterholes and to pollute the water as well as the air. Within a mile of the Casino town boundary I counted sixty-three head of dead cattle at one lagoon.

TUESDAY, 2 NOVEMBER, 1886.

At Ballina.

Present:—

MR. GIPPS, C.E.,

MR. MURRAY.

Mr. Charles Jarrett examined:—

Mr. C. Jarrett. Mr. Murray.] You are a Magistrate of the Colony? Yes.

2 Nov., 1886. Your former occupation was that of a timber-getter? Farming and timber-getting combined.

You are well acquainted with this district? With this portion of it.

How many years have you been resident here? Thirty-seven.

You remember, I suppose, the years of flood and drought in this district? I could not remember the particular year when the floods occurred, but I remember several of them.

Is there a copious rainfall in this district? I have not paid particular attention to measuring the rainfall. As a rule, is it sufficient for pastoral and agricultural purposes? Yes; it has been with the exception of the last two seasons previous to this year.

These seasons have been the chief years of drought that you recollect during your residence in the district? Yes.

What is the nature of the soil of the surrounding country? It is all very rich, with the exception of the border along the coast, and some swamps.

Is it suitable for agricultural purposes? It is very suitable.

Has much of it been placed under agriculture? Not a large quantity. The chief portion that has been brought under cultivation has been for pastoral purposes and cane-growing.

Do you know if there is more rain on the coast than inland in this district? There is more along the coast than further inland.

In what proportion? I think, according to my experience, the proportion of rain in the district of Ballina is as two-thirds compared with one-third in the district of Casino.

Do the rains as a rule fall at seasonable times here for the crops? Yes; the rainy season commences generally in March, then again in June and July.

Are those rains sufficient for agricultural purposes? Yes; they have been up to the last two or three seasons.

Dry seasons.

Do you remember any droughts like these to have occurred in the district before? Never so continuous. I remember that we have had one dry season, but it has not been followed by other dry seasons.

In those dry seasons I suppose you had not much agriculture in the district, and perhaps you did not feel the effects of it so much? No; but we felt the benefits in this way, because we were certain that if we put our cedar into the creeks it would be floated down during the rainy periods.

If you have sufficient rainfall in this district you do not think there is any necessity for any scheme of irrigation? I do not think that there is at present.

Have you ever seen irrigation carried out? No.

Do you know what the average crop in the district is? Except in cane.

What is the average cane production? About 30 tons to the acre.

Do you think that that could be increased by irrigation? I think it could. A fair crop of cane is about 40 tons to the acre.

What is the highest you have heard of? I have heard of crops being cut over 100 tons to the acre.

To what do you attribute that? To favourable seasons and favourable localities. We have too much rain in the low land for the cane, while in the high land it requires a great quantity of moisture.

Well, then, do you not think that water laid on at the proper season would increase the yield materially? I have no doubt that in a dry season it would be very beneficial.

Have

Mr. C. Jarrett.  
2 Nov., 1886.

Have you seen irrigation carried on even on a small scale? Only in vegetable gardens.

You are well acquainted with the timber trade in the district? Yes.

Has water-power ever been utilised for the sawing of timber here? Not that I am aware of.

Could it be done? I think not beneficially; the water supply is too uncertain.

But if you had large reservoirs and a certain supply of water? I have heard parties remark that the water was not under such command as steam, that there would be a greater or less volume according to the rains.

Do you know of any tributaries to the Richmond which rise in pretty high ground? Yes.

Could not the fall be utilised for water-power, if stored in reservoirs at the head of those creeks, and a certain supply regulated as required? Yes, it could be, very well. They are very well adapted for anything of that kind.

What are the principal kinds of timber you get in the district now? Beech is the principal at the present time. Pine and some other woods, such as rosewood and numerous others, are found in the scrub. The cedar is pretty well all cleared out.

Within what distance of Ballina can you get a supply of these timbers? The supply within a reasonable distance of Ballina is very limited. There is no large supply within less than 10 miles.

In what years have you had heavy floods in the district? We had a very heavy flood on the 7th of May, 1849, and in 1862 we had a very heavy flood, and again in 1870. Somewhere about 1870 was the last of the very high floods. I remember seeing very high floods in particular that did a great deal of damage at the time, considering the population of the river; but since then I have not taken notice of moderate floods, and it is only the higher ones which have impressed themselves on my memory.

Floods, I suppose, would be very beneficial to you for getting timber down? Yes.

As a rule, are they beneficial to the district? They are beneficial as long as they do not come excessively. Floods.

When they leave deposit, is it of sand or of silt? There is very little sand except in certain tributaries coming down from the sandstone country.

Has that done much damage in the country? I never heard of any damage done by the sand. If there has been it has been on the south arm that goes to the westward, and leads into the sandstone ranges.

Have these floods had any perceptible influence on the surrounding district close to the town of Ballina? Very little. The only difference they make is in the bar at times by washing away the spits, and forming spits elsewhere.

Do these floods overflow much land? They do overflow a deal of country for a time, but the water soon falls.

As a rule, are the banks higher than the surrounding country? On the lower parts they are, but there is a fall back towards the foot of the mountains, generally forming swamps.

Do you know any of these swamps which are suitable places for conserving large quantities of water in times of flood, to be used in times of drought? Yes.

Do you think that could be done with benefit to the district? I believe it could.

How—by throwing dams across the outlet? By merely embanking them.

And if such water were conserved, is there suitable land adjacent to them over which the water could be distributed for irrigation purposes? Yes.

Do you think that that would be of great advantage to the district? I believe it would. These places would chiefly be found on the main river.

Has there been a great falling off in your trade in consequence of the late droughts? Yes; I myself have suffered severely from the great drought in not getting timber down to market.

Do you know anything as to what supply of water may be requisite for the town of Ballina? I could not form any estimate of the supply that would be required, but whatever might be the demand it could be satisfied.

There are suitable places for conserving water for the supply of the town? Yes.

And at a reasonable cost? I think so.

Could you name some of the places where reservoirs might be made? Do you mean in the town or at the water sources?

The nearest place to the town to conserve the best water available, on some of the tributaries or inland, that would command the town by gravitation, if possible? The town and the surrounding district is very flat, and there is not much fall by gravitation within several miles.

How many? The nearest high land to the town is, I think, about  $2\frac{1}{2}$  miles.

At what distance could you get some suitable site for a reservoir? It would have to be done by excavation; there are no ponds or lagoons.

Are there any places, where the hills crop in close to the watercourse, that might be dammed across, and so impound a large body of water? Yes, but it is all pastoral land.

What is the value of that land? It is very hard to get at the value of land just now; I suppose about £8 an acre.

Are all the suitable sites on private lands? Yes.

Have you any suggestions to make that you think would be of benefit to the Commission? No, unless with regard to the supply of water to the town. In my opinion the best and most plentiful supply will be got from Emigrant Creek, just above the village of Tintonbar. Emigrant Creek.

At what distance from the town could a reservoir be made sufficiently high to command the town by gravitation? About  $8\frac{1}{4}$  miles.

How would you propose to secure that? I do not think it would require damming.

How would you secure your supply? It is a constant running stream.

In all seasons? Yes.

And of sufficient volume to supply the town at all seasons? Yes.

You think that at a small cost a very large quantity may be conserved there? Yes, at a very small cost.

Have you any idea of the volume of water that passes down that creek? No, I have not.

Could you tell us what the depth and the breadth of the water is, and about what velocity it is running in the lowest seasons? I have seen it stop running above ground in very dry seasons, but there is always an underground soakage going on through the shingle and gravel, but generally it is about 6 inches deep and 8 or 10 feet wide in ordinary seasons.

At

Mr. C. Jarrett. At what velocity do you think it is running? I suppose it would run from 6 to 8 miles an hour. Then you think that at a small cost a dam might be placed to conserve sufficient water for obtaining a permanent supply for the town of Ballina of good pure water? Yes.

2 Nov., 1886.

Mr. Gipps.] What particular swamp would you recommend as a conserving reservoir for irrigation purposes? The swamp is on both sides of the main river, and at the foot of the mountains, and it rises gradually, coming up towards the river bank to the height of the bank.

Is it known by any name? It is a chain of swamps that traverse each side of the river, between the river and the foot of the mountains.

Pimlico Swamp—how would you propose to embank it? I have had no experience; it is for those who would be entrusted with the work to say what embankments would be sufficient.

What length of embankment would be required? There are miles of swamp.

What depth of water would you conserve? According to the height you throw up the bank.

What is the present depth of water in the swamp? There would be an average perhaps of a foot.

Do you not think it would be far better to drain that foot and to convert it into agricultural country than to form it into a shallow evaporating pan? You could take it in sections and embank a portion of it.

What height of embankment would it require to make a conserving reservoir? I suppose that would be determined by the necessity of the case.

What is the area of the swamp? I could not go nearer to that than by telling you that there are miles of it.

Is there very much timber trade in this district? Yes.

What is the value of it per annum? I have no idea.

How many timber mills are there? I think about eight.

How many hands do each of these timber mills employ? They are slack at present on account of the dull condition of the timber trade and the competition of the foreign market. The mills have been working only half-time. I do not suppose there are more than a dozen hands in each mill.

When in full work, how many hands will each mill employ? Twenty in the mill alone.

And how many in cutting the timber? I should say 400 men.

If you had protection, you would be able to employ 400 men in the getting the timber, besides nearly double the men now employed in the mills? Just so.

Mr. George Topfer examined:—

Mr. G. Topfer.

2 Nov., 1886.

Mr. Gipps.] What is your occupation? I am a farmer and mail contractor at present.

How long have you been resident here? About twenty-one years.

What was the principal industry in the district when you first came? When I first came I was engaged in cedar getting, and have been up to the last eight or ten years. When the Colonial Sugar Company commenced operations I started growing sugar-cane.

Where was the principal growth of cedar in those days? All the scrubs were worked at the same time from here up to the Brunswick and Lismore, and up and down the banks of the rivers where any cedar grew. All the district was worked at one and the same time.

Was there cedar all through the scrub? Yes.

What has become of the cedar now? It has all gone.

Do you know anything with regard to the cedar-tree itself—its growth? No, I do not. I have not studied the growth.

Do you think that plantations of cedar could be advantageously grown here? I believe they could.

But you do not know as to the growth? The growth is more rapid than I thought it would be at first. I have seen young cedar-trees start growing after the original trees were felled, and they seemed to me to grow very rapidly.

How many feet a year? About 18 inches a year; but I rather think they grow to a certain height in the first place, and that they then gain in thickness.

At what age do you think they would be fit for cutting? I think it would take thirty years before they were fit for use.

What would be the timber then in the tree? From 18 inches to 2 feet.

Cedar trade.

Where do they bring the timber from now? The principal cedar is got past Casino, over towards Queensland way. I believe there is a lot lying in the creeks cut ten or fifteen years ago, which cannot be got out owing to the selections having been taken up, and the navigable creeks having been blocked by the falling of the timber. We used to depend on freshes to get the timber out; but the timber which has been felled will not allow the cedar to run out, and so it has been lying in the creeks from one fresh to another.

Is there a large supply of cedar in the district you have mentioned? I think there are a good many thousand feet of timber yet.

What quantity of cedar now is used during the year on the river? I could not form any idea. Since the sugar industry started I have not had anything to do with it.

Rainfall.

Do you know anything of the rainfall of the district? During the last two years I have had a Government rain-gauge, and I have sent in a report to the Government Observatory each month. I drew out a copy last night of the rain-gauge returns sent to Sydney during the last two years.

Does the rain seem to be pretty evenly distributed throughout the year? I think so.

For how many years? I have only kept a record of the gauge since November, 1884.

But you have had eighteen years' experience before that? As far as I remember, there are two seasons of the year more wet than at any other time. It would be in June when we have the most rain.

Do the rains generally come at a time which is seasonable for the crops? Very.

Have you known any great droughts? The heaviest drought was two years ago—the year before last.

Did that do much injury to the crops? A great deal.

Were any actually lost? I believe some sugar-cane was actually lost.

Do you think irrigation would be beneficial to the district? I do so.

Irrigation in Germany.

Can you suggest any places where water could be conserved in large quantity? The swamps might be reserved. I have seen some irrigation in my own country, Germany, and I have known very low places made into very good land through irrigation. In fact I have seen places where it was impossible for any

any vehicle to go on it, and after irrigation it was quite firm enough for any 4-horse waggon to go over with a load of hay on it.

Are there any swamps above the level of the river upon the coast? I scarcely think so.

How would you propose to impound water in the swamps? By making great dams—great embankments—6 to 8 feet high.

Then how would you propose to distribute the water? By drain-pipes.

By gravitation? Yes.

Is there a great deal of fall in the country from these swamps towards the river? I think a fall could be got.

Do you think that if you had an embankment 8 feet high you could allow the water to be distributed over an immense extent of country? Yes; I believe 10 feet would be sufficient to send the water for a considerable distance.

Is there plenty of good clay from which to form these embankments? Yes; they generally consider it all clay from 18 inches to 2 feet deep below the surface. Sometimes the layer of clay is 3 feet.

Would not the water percolate through the clay into the sand? I do not think so.

Have embankments been tried? I have tried it myself. I do not think I went deep enough. The water stayed there for a long time.

What depth of water did you impound? 2 or 3 feet; I merely did it for my own cattle.

What area was it? 10 feet by 10; just a water-hole.

Did the soil seem to hold the water well? Yes; I think sand will hold water better than the clay.

Could you suggest any site higher up in the ranges where water could be impounded for the district generally? There are running creeks. Numerous creeks might be utilised for water supply.

Do you think they might be impounded at a high level and the water be brought down by a contour canal, and the water be distributed over the land? If small dams, in different places in these creeks, were made, and the water conserved in them, and then laid on to wherever it was required through pipes, they would have a natural fall anywhere almost through the country. That would be beneficial.

Do you think a large supply of water might be depended upon at the worst seasons? I think it could. Since I have been in the district these creeks seem to be dry in the very driest seasons, but by digging below the surface there is always a natural current.

You think that small dams would force these natural currents above ground? Yes.

What experience have you had in irrigation in Germany? The only experience I have had was in irrigating meadows and grass lands.

What quantity of water was used in irrigating these meadows, were they flooded? They were not flooded in ordinary seasons, only in wet; but there was a continual running of water after irrigation was put on for 10 or 12 miles.

How often was the water applied? I do not know; perhaps once in three months, or less.

Were they used for hay? Yes.

Could they not have got hay without irrigation? No. In fact the ground was useless before.

What is the character of the soil? Black loamy sand. It was half water and half sand. We could not get on to it to do anything with it.

*Mr. Murray.*] Those gullies that you mentioned as having cedar logs lying in them, is there any cedar growing on the banks of them now? Not on the banks. It has all been cut many years ago.

Is there a great quantity lying in the gullies? I believe thousands of feet.

Is there sufficient to justify any works, such as locks to impound the water, to get this cedar down? No; it would not pay to do that.

To what extent do you think the crops in this district might be increased by a sufficient supply of water? 20 per cent.

And you think there is a sufficient quantity of water at higher levels to supply all that is necessary in the district? That is my opinion.

Then you think it would be desirable to make a survey of these creeks to ascertain what quantities could be impounded? I believe it would be of great benefit to the district.

Is there much land not settled on in the district? There is a lot of land not settled on.

What is the cause of that? Capital more than anything else.

If you had a system of irrigation settlement would become rapid, and the land soon be used? I think so. There are a good many men who have swampy land which would grow crops that would not grow on high land, which could be irrigated with the water drained off, and the land would be fit to grow anything on. Men have not the means to irrigate the land themselves, and if they had they would not know how to apply the water. I believe it would be a great benefit to the district if the swamp lands were drained and irrigated.

From your knowledge of the people of the district, do you think they would be prepared to pay a reasonable interest on the outlay incurred for such works? Any reasonable man, I think, would see the force on it.

Mr. James Holden examined:—

*Mr. Murray.*] You are Mayor of the town of Ballina? Yes.

You were formerly captain of vessels? Yes.

Trading to many of the coast rivers? Yes, to every one of them.

With regard to the Richmond—do you know much about it? I have been trading off and on for the last twenty years, but as to the land round about I know very little.

With regard to the Richmond River, for what sized vessels is it navigable, vessels drawing 12 feet of water? In ordinary times, from 8 to 10 feet. You will get vessels of 300 tons coming up the river.

To what distance can they go? To Lismore. Some of our steamers are registered at over 500 tons.

Is there anything to prevent large vessels coming into the river or over the bar? The bar is all.

What sized vessel could you send? An 800-ton ship.

What is the rise and fall of the tide? 3 feet 6 inches spring tides. It is greatly influenced by the winds. A strong southerly wind makes it much higher than at any other time.

What are the prevailing winds? We have more southerly than anything else here.

Is that calculated to increase the bar? Yes; it raises the tide.

714—x

Mr.  
J. Holden.  
2 Nov., 1886.

Bar in river.

Does

Mr.  
J. Holden.  
2 Nov., 1886.

Does the bar scour at any time by the action of the wind? No; the wind blows a constant stream of sand over the spit which fills up the channel, and it has to be swept out by the ebb tide.

Are your spits constantly changing? They are.

To what do you attribute that? To the tides and the winds. A strong southerly wind will cause the tide to flow over to the north, and a north-east wind will have an opposite effect.

You have the pilot station here? Yes.

Do you keep constant soundings? When we can get to it.

And the channel is buoyed? Yes.

Could you suggest anything that would remove this great obstacle? From places which I have seen in Europe and America I think that training walls of ballast inside the river would do it.

Is the mouth of this river similar to the mouth of other rivers on this coast? It is very similar to that of the Manning.

Have you remarked that there is a peculiarity in the course of these coastal rivers, that they come down in a south-easterly direction and go out north-easterly? They all drain south until they get to the sea.

To what do you attribute that? To the natural lay of the country. The Clarence is an exception; it has the sand on the north side of its entrance.

Is the Brunswick navigable? For very small craft. There is not more than 6 or 7 feet of water.

What is that due to, to the bar? To the bar. Inside it is only a basin. There is no distance up the river—not above half a mile.

At high-tide? It is a longer river then, but there are flats just inside the bar. As to the southern rivers, the Manning has flats inside. I have not been there for fifteen years or more, but I recollect that it was very similar to this. It had a long sandy spit on the south side. In most of these rivers if the bar were removed vessels of large tonnage could go up a considerable distance. The Manning, the Macleay, the Richmond, and the Tweed River also could be made navigable for large vessels.

Do floods or droughts affect these rivers much? Floods generally sweep the sand out for a time, but it does not last long after the flood. The floods make new channels through the spits, but the sand moves back again. I have seen the channel at the entrance of the Richmond anywhere you like, from the scrub on the south side to the north head, where there is now a sandbank.

You do not know much about the surrounding district? No; only the main roads. They are mostly in rich valleys. It is a rich country at the back. I know that from the produce which comes down.

Do you know something about the Murrumbidgee District? I have been there years ago.

Are these districts richer? Yes; this is far better in its growing capacity than the Murrumbidgee.

Do you think that a system of irrigation could be adopted here? It would make a lot of difference to the district; there is no doubt about it.

Do you know if there are suitable places for preserving water? Marshall's Falls, at Alstonville, are 400 feet above this level. I should say they would do for a town supply, and perhaps for irrigation too.

Will you tell us where you think there is a suitable place to conserve the water? That is high, and there is much low surrounding country.

Is there any place in which the hills crop in where a dam could be constructed at a reasonable cost to impound a large quantity of water? I have never explored the country, but there is a large natural basin there, 400 feet above the town. In a straight line from here, it is 6 or 7 miles from Ballina.

What quantity of water could be impounded? It is a strong stream. I have never known it to be dry. It would run a foot deep, and 8 to 10 feet wide in dry weather.

What is your present water supply in the town? From the roofs. I have one well that has never gone dry.

What is the depth? 22 feet deep. We pump the water over the surface by a windmill.

In case of a fire in the town of Ballina, what supply have you? We have nothing but the river. Some time ago I advocated driving these pipes down the street.

Many of the buildings are wood? Yes, nearly all.

Then there is no provision against fire? None.

Is it considered unnecessary to have such provision made? There is a great necessity for it. This town would be swept out of existence in a few hours if there was a fire.

Irrigation.

Do you think this is a suitable district for irrigation? Yes, I do. I believe there is any amount of room for water conservation in the ranges, but I do not speak from personal knowledge. The country is all hills and valleys.

Do you know of any irrigation in the district? I do not know of any.

You have a garden of your own? Yes; I pump water into an elevated tank, and it flows all over it.

What is the result? I can grow anything I like at all seasons.

What is the rise and fall of the tide at the Heads? 3 feet 6.

And at Woodburn? I do not know, but I expect it is much the same there.

At Coraki? I expect it is about the same all the way up the river.

What is the depth of the deepest part of the channel between the Heads and Woodburn? There is a place above Broadwater where I do not think anybody knows the depth. I have heard it stated that it is about 60 feet.

What is the average depth between the Heads and Woodburn? I suppose it is about 15 feet.

And from Woodburn to Coraki? It is much about the same again. There are spots that are shallow, but they are easily scoured out.

What are they caused by? Mud flats.

What was the population of Ballina when you first came here? Not above 500.

What is the population now? I suppose 1,000.

What is the value of rateable property here? You cannot buy property in this street, even at the present time, under £12 a foot.

I am talking of the whole of it? I think our municipal income is about £600 a year.

What is the capital value of the property? I am not prepared to say.

Mr. Gipps.] What is land worth now per foot in the town? In this street you cannot buy it under £10 a foot.

What area is included within the municipal boundaries? That I cannot say; it is very large.

When was the township first made a municipality? Three or four years ago.

Are the streets all formed? Not yet.

How

How many streets are there? I could not say. I think we have cleared nine or ten streets from timber, but they are not all cleared yet. We must have cleared between 10 or 12 miles of streets since we have been incorporated, and some of the streets have been partially formed.

What is the character of the natural features of the country? Sand flats, with a slight layer of soil. A few yards away it runs into black soil. There is a clay stratum under that, and sand below that again. What is the value of the land in the vicinity of the town, within a radius (say) of 20 miles? From £5 to £15 per acre.

Is that improved or unimproved land? Very slightly improved, if at all.

What does it cost to improve the land? About £10 an acre to clear it right out.

What is the character of that land in its wild state? Chocolate and black soils mostly, covered with scrub chiefly.

Have you had any scheme for water supply surveyed yet? None.

Have you any plan of draining the town at present? We have an engineer taking levels now.

Have you any arrangement for draining off sewage? None whatever.

Mr.  
J. Holden.  
2 Nov., 1886

Mr. Edmund Ross examined:—

Mr. Gipps.] How long have you been resident in the district? I came to Lismore in March, 1856.

What is your occupation? For years past I have followed the occupation of insurance agent and timber merchant.

At present you are a Justice of the Peace? I have been for sixteen or eighteen years.

Have you a general knowledge of the district? I have been travelling about it ever since I came here—that is, from the Tweed to the Clarence.

Of what particular portion can you give us information? More particularly from Casino to Ballina.

What was the principal industry when you first came here? Almost wholly confined to obtaining cedar, breeding cattle, and boiling them down. We had no market then for cattle, except in the shape of tallow, and we used to boil them down. Every year we used to boil down at the Pelican Tree 2,000 head of cattle. Is there much trade in cattle now? We have ceased boiling down now for many years past. The cattle are devoted to food instead of fat.

To what market are they sent? To Sydney.

What is the value of that trade to this river now? I could not tell you. Many of the cattle are driven over to the Clarence and shipped from there. The shipping of cattle here has ceased on account of the detention at the bar. The cattle we have shipped from here have reached £10 per head in the Sydney market.

How do you send your cattle to market now? By the Clarence, thence to Sydney by steam. They would be shipped from here were the bar permanently improved, as we have been promised for many years that it shall be.

What is the greatest flood that you have known on the river? I was in the blacksmith's shop in Flood, the principal street of Lismore when the flood rose high enough to put out the forge fire.

That would be about 4 feet above the street? About that. There were floods from 1860 every year;—1863, 1864, 1865: In April, 1863; June, 1864; February, 1865. We used to look for floods in February and March every year, and I think we had some floods later in the year than that. In 1880, in March, we had a very big flood. The flood of 1870 was the highest flood, when we could get about the streets in boats.

What is the height of the river banks at Lismore from low-water level? The banks vary very much in height—say about 35 feet.

The height of the highest flood would be about 40 feet above low-water mark in the river? Yes.

Did that flood do much damage? Nothing in comparison to what it would do at the present time. The principal damage then was by timber drifting all over the flooded parts of the river. On both sides of the river, as far as the Heads, the timber came on to the plain, some of it on either side, and at what we call the Devil's Elbow there was a raft of timber came right across the plain.

Was there any loss of life? None that I am aware of.

Suppose such a flood were to occur at the present time, would it do much injury? It would throw the district back for years, sacrificing property, and I am afraid life.

Do you think steps should be taken as soon as possible to prevent such floods? Yes, if it is possible for civil engineering to counteract the damages that might occur.

What was the principal cause of that flood—was it due to the heavy rains on the mountains, and high winds backing up the river? We only feel the effect at Ballina when there is an easterly gale meeting the flood-waters.

One of the reasons for those high floods was that there were strong north-easterly gales? Yes, attended with heavy falls of rain. The fall of rain was heavy and general throughout the whole district, over the Clarence as well as the Richmond, but the floods in the Richmond were higher. There were very high floods at the Brunswick. The Richmond was then the principal dépôt for the getting of cedar, which was valuable at that time, and formed the principal occupation of 75 per cent. of the inhabitants.

Is very much land cleared in the higher parts of the river? I know one selection at Newrybar where there is 25 acres under grass.

Has the country been cleared to such an extent as to increase the danger of these floods? If we had the heavy falls of rain at the present time which we used to have twenty years ago the rush of water would be far swifter than it was formerly, and would reach the river much quicker.

What was the year of greatest drought you have known? The drought which continued up to a few months ago. We had three years of successive drought. We have never had anything before to compare with that. It has been the ruin of our exchequer here.

Then it caused much loss? Yes.

Do you think that irrigation would be advantageous to the district? Yes, the salvation of it.

Can you suggest any sites for large conserving reservoirs? Yes; but I have no doubt that Mr. Jarrett's knowledge of the country is much greater than mine. He has been in the habit of going over the district on foot where there are no roads, and he would be likely to tell you of several places. We can go first to the Midgeon Falls, about  $\frac{3}{4}$  mile from Tintenbar, and if you go a mile beyond that you increase the height of the fall.

Mr. E. Ross.  
2 Nov., 1886.

Irrigation

Would

**Mr. E. Ross.** Would you suggest that these tributaries should be examined to see if they are suitable for conserving water? I think it would be a most valuable assistance to civil engineering if that were done.

**2 Nov., 1886.** Do you know of any wells sunk in the district? Yes; I have a well in my own paddock that I supply my cattle from. I drew from 60 to 80 buckets of water all through the drought.

**Wells.**

Where is that? Seven minutes walk from the court-house.

What distance would it be from the shore? From the back of my house to Deepwater would be about one-third of a mile.

What is the depth of that well? Between 8 and 9 feet.

Does it give you a large supply of water? Yes. I have a 200-gallon iron boiling-down tank placed near the pump, and we keep it full for the use of the cattle.

Do you get the same supply in the dry season? Yes, but it is benefited by high spring tides, when we can take the most water from the well.

What is the quality of the water? Beautiful; it is always cold and clear.

Is it not brackish? It has a little tincture of iron in it, but very slight indeed.

Have you tried that in the garden? Yes.

Has it a good effect on the plants—that is to say, does it encourage growth? I never knew any bad effect from it.

What are the prevailing winds in summer? North-east.

Are they continuous? Almost as a trade wind.

**Windmills.**

Are they sufficiently strong to drive windmills? Yes.

Do you know of any windmills in the district? No.

Do you not think that windmill power would be of great advantage if applied here? Yes; there is sufficient force to drive any windmill, especially upon this North Creek.

Do you not think that irrigation might be carried on, on a moderate scale, by the use of these windmills? Yes; it would be of great assistance to the growth of sugar-cane. I may state that the whole of the cane suffered severely—much of it was ruined—through the drought; but had there been an ordinary water supply that could have been saved.

Do you know of any other wells in the district? Several.

What is their average depth? There is one next to me, of Mr. Jarrett's; the pipe is 22 feet.

Does the water rise above the surface? It is pumped up; there is no flow over the surface. There is another one at Captain Bennett's, opposite my house. They have never been able to pump it dry yet.

Is that a tube well? Yes, a perforated tube at the bottom.

Have any of these tube wells got water? Yes, they are all successful. There is another one at Mr. Holden's.

About what is the average depth to which these tubes are driven for water? 16 to 22 feet. There are other waterfalls as fine as those I have mentioned that would be of equal general service to the district. If you go west of Alstonville, Duck Creek, Marshall's Fall, Neild Sharp's Fall; all lie west from here, and there are others which lie north.

Are these streams permanent? All permanent. Of course after a long drought the force of the stream is very much decreased.

Might they not be used for motive-power to great advantage? They have been tried to drive water-wheels to wash arrowroot.

Turbines? No.

**Falls in river.**

About what is the height of these falls? From 40 to 60 feet at Duck Creek. You go a little further to the northward and you come to Marshall's Falls.

What height are they;—are they in Duck Creek? Yes; they are higher up, close to Alstonville. Then you go 3 miles further on, from one to two points further north, and you come to those falls of Neild Sharp's. He applied a water-wheel for an arrowroot mill.

What height are they? I should say 30 feet.

What height are Midgeon Falls? About 16 feet.

Is there a run of water always in the stream? Yes, always.

What distance is that from Ballina? About 8 miles.

Do you know of any other falls? Further up, as you come to the head of the creek, there are falls, but they do not approach the falls I have mentioned. Most tributaries of the river in the higher parts have these rocky falls.

Are they all rocky falls? Yes, and there are ridges of sand. There are flats in Wilson's Creek that that look like pure marble.

**Mr. Murray.]** Do you consider the agricultural produce of the district would be materially increased by a system of irrigation? It would be greatly benefited, but your question opens up a very wide subject. I consider that the agricultural settlement of the district is prevented owing to the absurdity of allowing such large areas as 640 acres to be taken up in these scrubs. This system is keeping out an immense agricultural population, and there is room enough for six families where only occasionally you now find one. The land is too much in the hands of capitalists. There are men who come up here from the southward who are anxious to get land on the Richmond River, but it has been to a great extent monopolised by capitalists.

In cases where agriculture is carried on, to what extent could produce be increased by irrigation? The sugar industry has been the principal industry until lately. When the drought destroyed the sugar-cane, and the sugar market fell as well, that industry was crushed; therefore a number of people devoted themselves to the growing of grass for the production of butter, which is now manufactured to a large extent in this district. The drought from which we have suffered has had a great effect upon the young grass, but that which was matured was not injured much, owing to the heavy dews.

Where you are getting 40 tons of cane now, how much do you think you would get if you had a certain supply of water? I should say that it would improve the yield at least 10 per cent.

Do artificial grasses grow well here? Yes, splendidly.

What kinds of grass do you grow in the district? The principal grass that I see cultivated just about here is what we call buffalo couch; that keeps the sandy soil together; but further up in the scrub they are growing couch and clover, Italian rye-grass, prairie grass, cock's-foot, and all grasses which are considered good for cattle-feeding. All have been tried, and they are all a success. The soil will produce anything

anything that will grow elsewhere. The sugar industry would be greatly enhanced by a general supply of water; and I believe the whole district on the north side of the river has great advantages for that. I could not speak as to the country on the south side.

Mr. E. Ross.  
2 Nov., 1886.

Mr. George W. Dewdney examined:—

*Mr. Murray.*] What is your occupation? I am a surveyor.

Have you been long resident on the Richmond? Nearly four years.

What part of the Richmond are you best acquainted with? Principally with the district lying between Ballina and Lismore. I have been over the whole district, but only in a very few places about the rest of the district.

Mr. G.  
W. Dewdney.  
2 Nov., 1886.

You are aware that the soil is very rich? Yes.

Especially on the north side? Yes.

Are you acquainted with the tributaries of the Richmond? Fairly well on the north side.

Do you know of any suitable place for storing water for irrigation on those tributaries? I think that in nearly all the small creeks that run off the mountains you could store water, if not in the whole of them, and could bring it down to the level ground.

Could works be constructed at a reasonable cost? I think they could in a great many places, especially bordering the Tucki Tucki swamps and Broadwater swamp.

Are they higher or lower than the river bank? They are a little higher, but very little.

You could not conserve the water in the swamp? Not to be of any use—that is, not to draw it off by gravitation.

Have you any particular place in view which you think would be the most suitable place to give an illustration of what could be done. Are you able to state what would be the size of the dam, what quantity of water it would impound, and what quantity of land the water would command when impounded?

The most suitable place, I think, for a water supply for the town of Ballina would be at Marshall's Falls.

My question has reference just now more especially to conserving water for irrigation purposes in a position which would command a large tract of country by gravitation? I should think that on either side of many of these streams contour canals could be made to bring the water into one body on one of the creeks, so as to join them all together.

Do you think that the storage of water would increase the productiveness of the soil very much? Yes.

To what extent? I have not had very much experience, but I think (say) 30 per cent.

A great many crops suffer very much during the dry weather? Yes, especially of late years.

You think that if there was a large water supply that would be averted? Yes.

Do you know of any instance of irrigation in the district? None, except Mr. Holden's. As to the water supply for the town, I think that Marshall's Falls would be the most suitable place. There could be a good conservation of water made there. You would have to make an embankment 60 or 70 feet high and 150 yards across, and you would get 300 feet of fall in 8 miles.

Is the land at that position alienated? Yes, but it is proposed to resume it.

What is the value per acre? As far as the land itself goes it is not very valuable, but up from the falls it is valuable land; it is worth £10 an acre now.

Do you know any sites, not alienated, for water conservation in the district? Not unless you go very far back. If you like to go to the head of Tucki Creek on the Tweed route there are the Boomerang Falls, 250 feet, and the Minim Falls, 450 feet.

Are those sites reserved? Yes.

Do you know any place suitable for water conservation not reserved? No; I think they are all reserved.

Do you make it a practice in your profession to recommend the reservation of the sites on that account? Yes. I made a feature survey upon these creeks, and recommended all these places for reservation.

Is there any information which you could give the Commission that you think would be of special value to them for the purpose of conservation of water? I do not think there is anything more than I have heard other witnesses state.

Is there any of the evidence you have heard from the other witnesses that you differ from? No, unless it is the advisability of obtaining a water supply for the town from Emigrant Creek. I think it would be better to get it from Marshall's Falls. I do not think you can get a supply by gravitation from Emigrant Creek, and the distance would be much longer.

*Mr. Gipps.*] You think that water could be conserved in sufficiently large quantities at the heads of these tributaries to prevent disastrous consequences from floods? Do you mean to conserve the flood-water?

Yes? I do not think so; it is very little you can conserve in comparison with the vast quantity that comes down.

Are there any large swamps connected with those tributaries in which water could be conserved in the back away from the coast. Which is the best swamp you know of in the district? Tucki Tucki and Broadwater combined.

What is the area? I should think there would be 5,000 or 6,000 acres.

When it overflows, where does it discharge its water? Into the Broadwater.

Do you think an embankment would prevent it from overflowing, and would raise the water in the swamp? Yes; it would raise it 3 or 4 feet perhaps.

Then it would overflow the country? No; I do not think it would benefit much land by raising it only 3 or 4 feet, only just the height of the river-bank.

Suppose you embank it at the river 8 or 10 feet, would it supply water over any large area of ground? I daresay you would be able to irrigate then from the swamp down to Ballina. I do not think the banks would be higher than that.

*Mr. Murray.*] Is not Broadwater open with the river now? It runs up into a wide bay, and the swamp joins on to it.

*Mr. Gipps.*] Do you think the embankment of these large swamps in that way and the diversion of flood-water into it would relieve the river of any flood? It might do that, but I do not think it would lessen the damage. There is never much current comes down from those big swamps; they do not back it up very high.

Impounding

Mr. G. Impounding water there would have no beneficial influence with regard to the flood-waters? I do not think so.  
 W. Dewdney.  
 2 Nov., 1886.

THURSDAY, 4 NOVEMBER, 1886.

At Brunswick.

Present:—

MR. GIPPS, C.E.,

MR. MURRAY.

Mr. Delaney Haines examined:—

Mr. D. Haines. *Mr. Murray.*] You are a storekeeper in Brunswick? Yes.  
 Have you lived here long? About three years.  
 Have you a good knowledge of the district round? I am not well acquainted with it.  
 On what points do you think you could give us information that would be of service to the Commission. The object of the Commission is to see if there are any means of conserving water that will be useful for farmers, for water-power sawmills, or for irrigating? I have very little knowledge of the country.  
 Is there much settlement in the district at present? The best part of the district is selected.  
 Is it in the hands of small owners? It is in the hands of large owners.  
 What do they use it for? The majority of them are holding it; a few have laid down grass paddocks.  
 What industry do the settlers live by mostly? A good few of them are timber-getters; some have a few paddocks for grazing; some are just starting dairying. It is about five years since land was first selected here.  
 Do you think the construction of the jetty at Byron Bay will stimulate industry and cause settlement? I think in time this district will be devoted to dairying. The land is very good.  
 Do you know of any place in the district that would be suitable for the conservation of water? I cannot say that I do.

Mr. Robert Marshall examined:—

Mr. R. Marshall. *Mr. Gipps.*] How long have you been residing in the district? Nearly twenty years.  
 How long on the Brunswick? I have only been four years out of it.  
 Have you a general knowledge of the district? Pretty fair. I have been working all through it.  
 What are the sources of the Brunswick River? It is all scrub land principally, but there are a few barren slate and quartz ridges—gold-bearing ridges.  
 Are there any minerals found in the district? It has never been examined for minerals.  
 What are the names of the principal creeks of the Brunswick? There is the north arm, Wilson's Creek, and Marshall's Creek.  
 Is there a Wilson's Creek here as well as at Lismore? Yes; one is named after the son, and the other after the father.  
 Where does the north creek rise? At Tincogar.  
 Where does it join the river? Just at the mouth.  
 What distance does the north arm flow? You could get up with a boat for about 7 miles. If you follow the windings of the creek the length would be over 30 miles.  
 Is it a permanent stream? In the summer-time there is only a ripple in it.  
 What is the character of the bed above Navigation Point? Stony.  
 Are there any gorges at its head? I never was right up at the very head.  
 Where does Wilson's Creek rise? All the creeks head in the same range to the westward.  
 Where does Wilson's Creek join the main river? About 5 miles from here.  
 How far is that navigable? Seven miles.  
 How long is it from Navigation Point to the source? About 30 miles following the bends of the creek.  
 What is the character of the valley? Heavy scrub land in places that spreads out and closes in again.  
 Do you know any place suitable for a conserving reservoir? There are large waterholes, larger in Wilson's Creek than in the north arm. They have 10 or 12 feet of water in them.  
 Do you know of any position where two spurs almost meet, and would enclose any large area? At Wilson's Creek there is such a place.  
 How far is that from here? Between 6 and 7 miles.  
 Would that be a good position for forming a reservoir? That is on Marshall's Creek. The range on one side is about 200 feet or more; it has a quantity of quartz in it.  
 Could water from that point be distributed over a large area? Yes.  
 Have you had any experience in irrigation? I have been mining chiefly—sluicing.  
 Do you think irrigation would be of any advantage? It might; there is plenty of good water underground here.  
 Have you grown any crops? No.  
 What is the principal industry in this district? The district will grow anything.  
 But what is the principal industry now? The settlers have not gone in for anything in particular. Some have gone in for sugar-cane.  
 Who is the principal owner? Many have large farms—640 acres, 300 acres, down to 40 acres. Some grow maize, some are starting dairying, but they have hardly had time to go in for anything.  
*Mr. Murray.*] Have you any idea of the extent of agricultural land in the valley of the Brunswick and its tributaries? There is a large quantity.  
 How far does it extend in one direction? About 9 miles, and may be more. Nearly all the land here is good, even on the ridges. It will grow anything.  
 Is there an ample supply of fresh water in the tributaries of the Brunswick and creeks? Yes; sometimes they are a little bit slack.  
 Would it be an advantage if water were conserved for cultivation purposes? It might be. There are places in the creeks where water could be backed up.  
 Do the dry seasons affect these creeks much? A good deal. When

When was there a dry season? Last season or the summer before.  
 Was the supply of water very limited? Yes; the water runs underneath. The main river ceased to run.  
 At what depth do you get good water underground? Up the creeks, 2 or 3 feet down.  
 Good water? Yes.  
 What sort of strata? Through gravel principally. We get the water in the gravel. I have got water at 16 feet where we are now. I have a tube well down here.  
 Are such wells much used here? I have one; I am the only person that has one.  
 Do you think the place is well adapted for these wells? Yes.  
 Is the water good and fresh so close to the sea? Yes. On the bank of the river—that is, of the main stream—it is pretty brackish; it is drinkable. The wells here are always good.  
 Have you a plentiful rainfall here? Yes.  
 Have you any reed swamps? Yes.  
 Would it be beneficial to drain them? Yes.  
 Or would you think it would be better to use them for conserving water in? Some of them might perhaps be so used, and it would be better to drain others.  
 Do you know that any of them have been drained? Yes.  
 Is the soil good when drained? Yes, the best land we have.  
 When was it drained? It was drained to draw timber through it; before that nothing would grow. Now there is good grass all over what was a swamp.  
 Is there a good supply of timber in the district? Yes.  
 Could any of these watercourses be made available for working saw-mills? I think they could by damming back the water.  
 What do you think will be the principal production in the district? If sugar rises in price a good many will go in for that, others for corn, and others for dairying.  
 Has the population increased greatly during the last few years? Yes.  
 Has it doubled within the last five years? It has trebled.  
 What is that in consequence of? I think the great drawback to this place is the bar. If a little were done to the bar it would do very much to advance settlement in the district, faster than has hitherto taken place.  
 What made the people come into the place during the last few years? Attention having been drawn to the land.  
 Is there deep water inside the bar? Yes, between 6 and 7 feet of a rise. If the bar was removed vessels would not require to come further than the Heads.  
*Mr. Gipps.*] What is the prevailing wind? In summer-time, northerly. Sometimes it lasts for about a week, and then we get westerly or southerly breezes.  
 Is the wind sufficient for driving windmills? Yes, on the coast.

Mr.  
 R. Marshall.  
 4 Nov., 1886.

Mr. Henry Stone examined:—

*Mr. Murray.*] You are an hotel-keeper on the Brunswick? Yes; I am a timber-getter.  
 Have you any vessels? I charter a vessel.  
 Have you a long experience of this district? I have been working here backwards and forwards seventeen or eighteen years.  
 You are acquainted with the tributary waters of the Brunswick? Yes.  
 How far is the highest water of the Brunswick from here? As the crow flies, about 16 miles, west by north from the Brunswick, in what is called the Dividing Range.  
 Not far from Mount Warning? South-east of it, 8 or 10 miles southerly.  
 Are there a number of tributaries flowing into the Brunswick? All flow into it with the exception of one. The water is charged with minerals in the low land, a short distance from the head of navigation.  
 Do the tributaries of the Brunswick rise at a good elevation? Most of them do.  
 Do you know any suitable places for conserving water? I never took very much notice on that point.  
 During the last dry season most of the tributaries ceased to run, but in any moderate season there is a fair supply of water.  
 Do you think there are suitable places on the Brunswick where large storages of water could be made in rainy seasons, to supply the low-lying country in times of drought? There is an ample supply in moderate seasons without retaining any. Where the storms rise in the mountains the places are pretty rugged and the gullies are sharp and steep.  
 Could water be utilised for water-power in connection with saw-mills? It could be taken for that purpose in moderately rainy seasons, but the last three seasons would not give a sufficient supply.  
 Do you think there is a good deal of water underground? I know of one place where it flows underground. It goes through the creek from the dividing range between the Brunswick and the top of the main range. Coming over the cliffs on to the Brunswick it gets under the rocks. It shoots up again at a distance of 300 or 400 yards and runs into the creek again.  
 Is this a district in which tube wells could be used to advantage, do you think? Yes.  
 For pumping and for irrigating on the low land? It is very stony on the higher lands as a rule.  
 What is going to be the great industry of this district? Dairying.  
 Do English grasses grow well here? Very well.  
 Where are the people coming from who are coming into the district now? Principally people from the Clarence, who are attracted by the richness of the land. They came over about five years ago and selected, but the principal portion of the landowners are simply speculating. The first inducement was to select for the purpose of growing sugar-cane, but since the depression in the sugar market they have turned their attention principally to timber.  
 Then a great many are doing nothing with their land? Nothing at present.  
 What are they waiting for;—do you think the jetty at Byron Bay will be an advantage? I think a great number in the southern portion of this district may be waiting for that, but at this northern end of it the people are looking to have the bar removed, and hoping for a railway.  
*Mr. Gipps.*] What are the general features of the country;—is the district flat as a rule? No, rather mountainous. The hills are not very high, but they are pretty numerous.

Mr. H. Stone.  
 4 Nov., 1886.

Dairying.

At

Mr. H. Stone. At what distance from the seaboard do the hills commence? Immediately on the border—a mile off. The hills commence just at the Heads.  
 4 Nov., 1886. Is there much flat land? About half of the district is flat land.  
 Is the hilly land good for cultivation? The principal part of it is quartz ridges.  
 Have you tried irrigation at all? No; I have never seen it tried. There has been no occasion. Water can be got in 5 or 6 feet sinking at any time.  
 Mr. Murray.] Is there anything we have not asked you that you think would be of interest to the Commission? No, unless it is the question of improving the entrance to the Brunswick for navigation. There are three branches of the Brunswick—one running north, the other south for a distance of 7 or 8 miles. The upper part of the north and south creek as far as the navigation goes is through swampy land.  
 Mr. Gipps.] Is it all alienated? The upper part of it is.  
 Has any of it been drained? Not to my knowledge.  
 What are they doing with it? Putting in residence and improvements, and then allowing it to stay at that.  
 Are they keeping any stock? No stock whatever, with the exception of one holder.  
 Do you think the swamps could be easily drained? Not easily; it is almost level with tidal water. The high-tides almost flow up to some of the swamps.

---

Mr. James Mills examined:—

Mr. J. Mills. Mr. Gipps.] How long have you been residing here? Fourteen years.  
 4 Nov., 1886. What is your occupation? A farmer.  
 Have you been farming all that time? No, only for five years.  
 Is your farm in this district? About 2 miles from here.  
 What have you been cultivating? Corn and English grasses.  
 What yield of corn do you get per acre? I got 100 bushels to the acre the year before last.  
 How many acres had you under cultivation? About four that season.  
 How much land have you got under English grass? About 40 acres.  
 For what purpose? For stock-keeping.  
 How many acres do you require for a beast? I think one acre will feed two head on an average—two or three.  
 What grasses have you? Italian rye, prairie, couch, and white clover.  
 English grasses Do the English grasses stand the heat well? They do at my place first-class all the year round.  
 Do you take any seed from it? Yes; I am doing it now.  
 How many bushels per acre? I was away from home when the rye was reaped. I reaped some prairie last Friday that will give 100 bushels of seed to the acre. I got 11 bushels of seed from one-tenth of an acre.  
 Clean seed? Yes.  
 What is it worth? I paid 10s. a bushel for seed when I bought.  
 What is the character of the country, is it low land? I have both flat and ridgy too.  
 Does it grow equally well? I think the ridges grow best.  
 What is the soil? Chocolate. There is the greatest crop of grass on the ridges.  
 What is the soil on the flats? Black sandy loam.  
 Have you tried to grow any fruits? I have peaches, oranges, and apples growing.  
 Do they seem to grow well? The peaches are bearing, but the oranges and apples are not. The trees are healthy.  
 Have you tried irrigation? No.  
 Do you think it would be beneficial? I do not know anything about it.  
 Did you lose any of your crop last year? No.  
 Was last year a dry year? The last year and the year before were the driest.  
 But neither have affected your crop? No.  
 You have a large rainfall here? Yes, about the best in the Colony.  
 Does it come at a seasonable time? Yes.  
 Do you know anything of the creeks or the rivers? I have been on them all.  
 Do you know Marshall's Creek? Yes.  
 Where does that rise? In the ranges. There is no particular name for the range that I am aware of. The waters near that point flow in one way to the Tweed, and the other to the Brunswick.  
 What is the character of that range—is it very rocky? No. The road goes over it from here to the Tweed. On the top it is mostly forest, with belts of scrub running up here and there.  
 Is there much water in the creek? Yes. Sometimes it is low.  
 Did you ever know it to run dry? I was not there in the dry time.  
 What is the principal timber to be found in this district? There are all sorts of scrub timbers. Cedar is to be found in the scrubs, and there are all sorts of forest timbers on the mountains—blackwood, tallow-wood and turpentine.

---

Mr. George Simpson examined:—

Mr. G. Simpson. Mr. Murray.] You are the signalman at the station? Yes.  
 4 Nov., 1886. Have you been long stationed here? I have been here twenty-one years—in the Government Service seven.  
 What is the rise and fall of the tide at the mouth of the Brunswick? In a southerly swell 7 feet; at other times from 5 to 5½. The neap-tides about 2½.  
 What depth of water is there on the bar at low-tide? The bar shifts every week. Sometimes there are 7 feet, sometimes 9 feet. At low-water sometimes only 2, and sometimes not that.  
 What is the highest tide you have known on the bar at low-water? Six feet.  
 How far is the river navigable for small vessels? Six or 7 miles.  
 What draught of vessels can get up? Six feet; nothing more.  
 Do you think that any works could be constructed at the bar to allow vessels to come in? A break-water on the north side would enable vessels to come in. There is plenty of rock at hand to do it with, and the distance would be only 350 feet to connect the shore with the end of the rocks. That would make a channel which would scour out the sand, and make a passage through. If

If vessels could be brought in here, would there be more production? I am certain there would.  
*Mr. Gipps.*] Is the north side of the mouth of the river rocky? Yes.  
 Steep rocks? Yes.  
 What height? 10 or 12 feet above low-water; no higher rock than that.  
 What is the character of the south side? A sandy bar, moved every tide.  
 What is the width of the river at the mouth? 150 yards.  
 What is the average width of the river from the mouth to the head of navigation? Much about the same.  
 There is quite room enough for vessels to go up and down.  
 What is the character of the banks? Some are low, and some are high; some as high as 10 feet. The average height is about 5 feet.  
 What is the average depth of the river? In some places it is very deep, in some very shallow. Some 20 feet deep, but there are three or four bars. The average depth at spring-tides is 6 feet up and down.

Mr.  
 G. Simpson.  
 4 Nov., 1886.

SATURDAY, 6 NOVEMBER, 1886.

At Murwillumbah.

Present:—

MR. GIPPS, C.E., | MR. MURRAY.

Mr. James Black examined:—

*Mr. Murray.*] What is your occupation? I am a farmer.  
 How long have you been resident here? About nineteen years in the Tweed District.  
 Have you general information as to the whole district? I know the district pretty well. I have been over the greater part of it; there may be some spots that I am not personally acquainted with.  
 Have you been living here for the whole time? Yes.  
 What has been the character of the farming? Maize-growing at the commencement, and of late years sugar-cane and a little maize.  
 What returns of maize did you get? I never kept an account of the annual return. The maize crops have not been very heavy on the Tweed. Maize does not grow to the same perfection here that it does on the Richmond and the Clarence. The crop is equally good, but you do not get such heavy produce.  
 What has been the average yield? I think 50 bushels to the acre. It might have been more; it depends upon the season.  
 What has been the yield of the sugar-cane? As far as my own crop is concerned, I have got over 60 tons to the acre. In some seasons I have got 40 tons; in the present season I got 44 tons to the acre. On an average two-year old cane will produce from 40 to 50 tons.  
 What will the one-year cane yield? About 25 tons, as far as my experience goes; I have no statistical information.  
 What is the character of the soil? It is all volcanic formation, and along the river banks it is alluvial. The district is almost wholly volcanic.  
 What is the character of the country on which you have been growing these crops? On the river banks.  
 Have you tried any other crops? I have tried arrowroot, which does very well.  
 What was the yield? I have only grown small quantities for home use. I could not really say what it would yield per acre.  
 Have you tried fruit-growing? I have a few orange trees and a few peach trees.  
 Do the orange trees grow well? Certain trees do; but from my experience of the district I should say that the orange tree is subject to blight. They do very well while the trees are young, but a great deal of dead wood gets into them, and they do not do well after they get old.  
 Have you tried lucerne? I have not tried it myself.  
 Do you know any one who has tried it? Several have tried it.  
 With what success? They do not think it does well. It grows well for the first or second crop. I do not know that it is the fault of the soil. I think it is more owing to the rank vegetation which checks it. Has this district suffered much from drought? During the last two seasons it was very dry.  
 Did you lose any crops from it? My crop was damaged. Indeed the crops in the district did suffer from it very considerably.  
 They were not actually lost? No.  
 Do you think irrigation would be beneficial to the district? It certainly would in dry seasons.  
 How many dry seasons have you had in your experience that have affected the crops prejudicially? I cannot remember. There have been some very dry seasons while I have been on the Tweed, but the last two years have been by far the driest.  
 Have you taken any records of the rainfall? No; I have not had any means of doing it.  
 Do you know of any wells sunk in the district? I think almost every settler has his well. Those that are wells not alongside permanent creeks or rivers mostly depend upon wells.  
 What is the average depth the wells are sunk? Near the river bank they do not require to go to a greater depth than from 12 to 20 feet.  
 What is the character of the strata? A sort of clay after they get below the surface soil, and sometimes they get on to gravel bottom, which I think has been a river bed at one time.  
 Is that any depth? I cannot say.  
 Is there a good supply of water in it? We get water on that bottom. There are large swamps which are wet in wet seasons and dry in dry seasons, and in sinking upon them you get into a clay formation—a formation of decayed vegetation on the surface; a few feet below you come upon firm clay.  
 Is the water pure and fresh which you get? In the wells which I have sunk on the river I have got water brackish. Where the gravel bottom is there appears to be a soakage from the river. Back in the swamp the water is fresh.  
 Does the water in wells near the river bank rise and fall with the river? There are wells in which the water does that.

Mr. J. Black.  
 6 Nov., 1886.

**Mr. J. Black.** Have you any experience of the floods which have occurred in the river? Yes; I have seen the river in flood many times.

**6 Nov., 1886.** What is the highest flood you have seen? That of March, 1870.

**Floods.** What height was that above low-water level? I really cannot say. I have seen it running from the top of the bank where the Commercial Bank and Post Office stand—about 14 feet.

You have not known of any higher flood? Not personally.

Have you heard of any higher flood? I have been told by residents that before I came there was a flood in 1863 which was higher than that.

How much higher? I could not say.

Do these high floods seem to affect the bar at the mouth? They alter the position of the bar.

Does the bar improve with these high floods? I have been told that it scours, that the floods scour the sand out at the entrance, and that in 1870 the entrance was shifted. Before 1870 vessels used to come in over the south spit that now is. The flood of 1870 blocked that entrance, and formed a channel right under the pilot station, where it is now. Before that the bank was to the left, and the pilot station was on a sandbank.

How much land has been alienated in this district? I do not know.

Is there much unalienated land? Yes, a considerable quantity, taking the district as a whole.

How many inhabitants are there in the district? I could not say.

What is the principal industry in the district at the present time? Sugar-growing.

Do you know the number of acres under cultivation? I could not give you an estimate.

Has dairy-farming been tried here? On a small scale; not to any extent to my knowledge.

Do you know the principal parts of the river? Yes; I have been up most of the branches of the river above tidal water.

Do you know the source of the south arm—where does it head? Up at what they call Burvell Mountain, and what they call the Nightcap. The watershed that divides Wilson's Creek and Brunswick Creek waters is the watershed between the south arm and Brunswick.

All these creeks flow into the Tweed River? Yes, on the north side of the ridge, north and north-west.

Are the mountains at the head any great height? What they call the Nightcap Mountain is shown by the aneroid to be 3,300 feet. The mountains are very steep and precipitous. The creeks are gorges, as a rule, until they leave the main range.

Then they flow through what? The south arm is confined by mountains. There are flats, but not of any extent.

Do you know of any situation for a large conserving reservoir on that branch? I have had no experience. I have never seen any of that work done, so that I could not give an opinion.

Where does the north branch of the Tweed head? Up in the Macpherson Range.

Is there any particular mountain near its source? There is a mountain called Cogan, a big rock which sticks out on the range.

Are there many tributaries to this arm of the river? There are a few. It has not a large water-shed.

Do all these creeks rise in high land? Yes; they all come out of the Macpherson Range.

What is the character of the upper part of their valleys? The same as the north arm. The tide flows up for a considerable distance. There are very good flats above navigation. I am not so well acquainted with the north arm as with the south branches.

How far does navigation extend up the north arm? The tide flows up about the same length as the south branch.

How far is that above the junction of the two? They call it 25 miles from the Heads to the head of the flow of tidal water.

How far is it from the Heads or mouth of the river to the junction of the two arms? About 12 miles.

Does the water become brackish? As far as the tide goes in dry seasons.

That is for 25 miles? Yes.

Above that point, is the water clear and good? Yes.

Do both of these arms bring down a permanent supply of water? I have never seen them dry. Last year they were very low; there was not very much flowed down then.

Do you know of any position for a conserving reservoir on the north arm? I could not mention any particular spot.

Where is the principal settlement on this river—is it between the two arms? All along the river on both sides.

Is much of the country cleared? Yes, near to navigation.

What is the character of the rest that has not been cleared—forest? No; there is very little of it. It is mostly scrub country and low plains.

**Swamps.**

Are there any deep swamps? There are no lagoons of water; they have all vegetation growing in them. During wet weather water settles there.

Are they easily drained? So far as my experience goes, there is no difficulty in draining them. They have, except in some few instances, sufficient fall to allow of their being drained.

Do they afford good food for cattle? Beautiful, when they are dry.

Do you grow grass on them? Yes, couch and clover.

How many acres to each head of stock? I could not say. The grass in its natural state is very coarse. Cattle will eat it when they have nothing better, but it is coarse from growing in wet land.

Have you any land laid down in English grasses or clover? My son has a selection where he has clover and couch in.

How many acres? The selection comprises 270 acres; he has about 50 acres in grass.

How many cattle will it carry? At the present time over one beast to the acre, and has been carrying that number for the last six months. The grass has not got a good hold of the soil yet. The greater quantity was planted only during the last two years.

How many would it carry in its natural condition? Not any; it was scrub land before.

Do you know of any case in which irrigation has been tried in the district? No, I do not know of any.

Have you ever seen irrigation carried on? Not in this country.

Are there any Chinamen irrigating gardens in this district? None.

**Irrigation.**

Have you seen irrigation in other countries? In England.

From

From what you have seen in England, do you think it would be beneficial in a district like this? I believe it would be highly beneficial in the summer season. Mr. J. Black.

You have not suffered very much? We consider that we have suffered pretty severely from the want of rain during the last two seasons, when water was very scarce and bad in a great many places. The wells all through were low, and the water in many instances was very bad. 6 Nov., 1886.

Are you speaking of water for domestic purposes? For domestic purposes and stock.

What was the diminution in crops during the dry seasons as compared with former years? I consider the crop was diminished from 15 to 20 tons. The same kind of cane grown in the same land in a good season would yield from 60 to 65 tons to the acre. The estimate I give was for the present season, not for former seasons. The crops were much heavier in former years than in the last year.

What has been the average for the last five years? I could not give you an average; the yield fluctuates. I have known instances of 100 tons being got per acre, while others would not get above 40 tons, and some not that.

To what do you attribute that? To the different kinds of cane grown. Cultivation has also a great deal to do with it.

What percentage of crop do you think you have lost on account of dry weather? I think that I lost at least about 15 tons to the acre last season.

What do you get per ton for that cane? 10s.

That is equal to £7 10s per acre loss? Yes.

Do you think that a system of irrigation that would supply water in the proper season would avert that? I do not know how cane would grow under irrigation; I have had no experience of that, but I have no doubt that it would be beneficial to cane as well as to other crops.

Do you know that there has been a falling off in the yield on account of dry weather? I have no doubt of it.

Then it follows that if you had the water laid on you would have a larger crop? Yes; I should say so. Although cane will stand a large amount of dry weather, very wet seasons deteriorate it in quality, the amount of saccharine matter is reduced. The cane is heavier to the farmer, but the weight of water is not equivalent to what is lost in the amount of saccharine matter in the same bulk.

The tributaries to the Tweed are numerous? Yes.

Fresh-water tributaries? Yes, coming over high mountain ranges.

Would it be easy to conserve water in these creeks? I think it would.

Do you know of any place where the hills crop in close which would make a good reservoir at a small expense? Yes.

Is there much room for an increase of population in the district? There is plenty of room for a large increase in population.

Would irrigation help it? I believe it would. Other things being favourable, the district will become very populous in time.

Sugar-growing will be the chief industry, you think? The district is capable of growing almost any semi-tropical produce, and the soil is good.

What average crop of corn do you get? About 50 bushels to the acre used to be the average when I grew corn. I may mention that in dry seasons this town is very badly supplied with water, so also is Tumbulgun. Last season the wells there were very bad. You could not drink the water. It was very muddy and dirty, and this year I think it has been worse.

Mr. Gipps.] What depth of water had you in the last season? The wells all gave out here.

How was the river? It was salt; yet in places cattle would drink it.

What is the character of the river above the tidal point? A running stream over a shingly bottom. There is a good fall above the tidal water.

What would you consider to be the fall per mile? I was about with a civil engineer at one time, and he had an aneroid with him, and at the Commissioner's Creek, on the south arm, 12 miles above tidal water, the aneroid showed 50 feet. The valley is level, and the mountains rise precipitously. There is not much rise to Talgum.

Do you think a low weir across the river would conserve a sufficient supply of water for the supply of the town? It would have to be brought a considerable distance for the supply of the town from the place where it could be conserved in the river.

If the water were raised, say 20 feet, would not that hold back a sufficient quantity for a permanent and good supply during those dry seasons for the town? I think it would become brackish. There is a filtration through the sub-soil. The creek that is flowing up through this farm becomes brackish when the river is salt.

Have you known the water to be thrown back at all in any of these creeks from the river? No, except in time of flood.

Do you think that the falls in the river may be used for motive-power? They could be above the tidal influence.

Are there any rocky bars in the river above the tidal point? Yes.

What is the first? It is about 5 miles away; that is what we call the falls. The tide flows over it at high-water. It has a shingly bar. Above that, about a mile or 2 miles, there are rocky reefs running across. Rocky bars.

Does the tide come up above them? No.

What is the height of the river on these rocky reefs? The mountains come in very close there. There are small flats on each side, perhaps for a few hundred yards wide in both cases.

Would that be a good position for a dam? I believe there would be no difficulty in making dams.

What do you think would be the length of a dam 50 feet high on the top? The banks there are pretty high, and there are places where the river is very narrow.

A hundred yards? More than that; the river is wide there.

What length would a dam require to be where the banks close in? I could not say. The river has a rocky bottom, off which the banks rise 20 or 25 feet. There are level flats for a short distance before you begin to ascend the steep ridges.

What length would a dam 25 feet on the top require to be? I cannot say what is the width of the river from bank to bank. I should say it would be a hundred yards in the narrowest part.

What

Mr. J. Black. What is the smallest stream you have known to flow over that rocky bar? Whenever I have been there there has always been a good stream flowing, but I was not there during the last dry season.

6 Nov., 1886.

Mr. Joshua Bray examined:—

Mr. J. Bray. *Mr. Murray.*] You are Police Magistrate for the district? Yes.

6 Nov., 1886.

Have you been long residing in the district? I have been living here since 1863.

Are you interested in land in the district? I have got a good deal of land in the district.

To what do you devote it? I principally let it to the farmers who grow cane.

May I ask what is the average rent you get? £1 an acre.

Is there a great quantity of good agricultural land in the district? In proportion to the size of the district, I should think that three parts of the land would be good rich land.

And the fourth, what would it be? Forest hills.

Is there a good rainfall in this district? Very good; I believe as much as any in the Colony.

And does it come at proper seasons for the crops? Yes.

You have had drought recently? The last two years have been the driest years that I have known.

What effect had they on the district? There was a great falling off in the yield of crops.

In what proportion? I could not form an estimate, but the crops did not suffer so much; and we did not suffer from want of grass, but from want of water.

Did the stock die in consequence? In some places, but not many. They used to drink the river water perfectly well. In one case we had cattle in a paddock for four months without water, and they got rolling fat, although we had no rain. The flats and the drained swamps had very green grass, and there were heavy dews at night.

On the whole the drought did not affect you very much? Except for the want of water. Everybody suffered from that.

You cannot say whether there was much falling off in the cane crop? I should think about one-third.

They had one-third less than they might have had if we had had more rain.

Floods.

Are you ever troubled with floods? Yes.

In what years have you had floods? The highest flood I have ever known was in March, 1864. That was 3 feet higher than any flood that has ever been in the river since.

What other floods have you had since? We used to have floods pretty well every year for about seven years, but not remarkably high ones. We had a high flood in 1870. That would be perhaps only about 18 inches higher than the floods we had every year for three or four years before.

Are the floods beneficial or otherwise to the district—do they leave a deposit on the land? They are more beneficial than otherwise.

For what reason? They flood the low lands and leave a deposit, and scour out the channel at the Heads, through the flats. The floods have had a beneficial effect in depositing silt.

Have they deposited sand in any case? No.

Have the dry seasons affected the navigation of the Tweed? Yes. The flats have got very shallow and the bar is very bad, and we think that we want some good floods to clear it out.

The entrance to the river has a sand-bar, I believe? Yes.

And there are sand-flats for 4 miles up the river? Yes, from the bar.

If these were cleared away, would there be good navigation for some distance? Yes.

How many miles? It is 25 miles from here to the Heads, and there would be good navigation up to this point.

What draught of vessels could come up here if the flats at the Heads were cleared? The river might be 15 feet deep up to within 3 miles from here. I believe there is a shallow place in the river 3 miles from here, but there would be 6 or 7 feet of water on that.

Do you think it would be possible at a reasonable expense to construct walls to scour out these flats? I think so. There are several rocky points down near the Heads, and if they were to run stone dykes from one point to the other, and thus confine the water to a narrow channel, I think that would have the effect of deepening the river.

Would that be very beneficial to the district? I should think so; it would make a wonderful difference to the prosperity of the district.

Irrigation.

Do you think that irrigation would be useful in this district? I have never seen irrigation anywhere; but from what I have heard and read of it I should think it would be very beneficial.

Do you know that there are plenty of fresh-water tributaries to the Tweed that could be used for the purpose of conserving water? Plenty.

Places from which the water could be distributed on to the low land? Plenty.

Do you think such works would add greatly to the productiveness of the soil? Yes.

In what proportion? I should say it would double the yield of crops, taking one season with another.

If such works were carried out by the Government, do you think the people in the district would pay a fair interest on the outlay for having water laid on to their farms? I do not think the district is sufficiently advanced for that just now.

If it was made plain to the farmers that it would add greatly to the yield of their land, do you think they would be prepared to pay? I have no doubt that they would then, but there is a very small proportion of land in this district under cultivation as yet. The district is comparatively in its infancy.

Is not fresh land being taken up every year? Yes; settlement is increasing every year.

Is the population increasing largely every year? Yes.

In a short time you hope that all this country will be taken up, and to see a large settlement of people here? Yes.

How long is it since this rapid influx of population and cultivation commenced? Since 1880.

Have great results been produced since then—has a great quantity of land been put under cultivation? There has been a great deal of scrub felled and burnt off.

Do they sow grass on it? Yes. When a man takes a farm in a district like this he cannot cultivate it much; he has to grow grass to feed his horses to enable him to work the land. There has been an immense quantity of scrub felled in the district during the last six years, but there would not be much fit to plough yet.

Within

Within the next few years, do you think a good deal of this will be put under cultivation? Yes.  
Then may I gather from what you have said that you think a system of irrigation would be beneficial to the district, as a rule? Yes.

Mr. J. Bray.  
6 Nov., 1886.

Mr. Gipps.] What is the rise and fall of the tide at the Heads? It varies. The spring tides are 7 feet, and neap tides (say) 4 feet.

What is the rise and fall of these tides at the junction of the north and south arm? About 5 feet.

What is it up at this township? About the same.

What is the average width of the river from the mouth to the junction of the north and south arms? I could not say in yards.

What is it approximately? Say about 10 chains from the Heads down to the junction.

What is the character of the banks? Low banks.

Well wooded or cleared? They were all covered with thick scrub, but they have been cleared.

What is the character of the scrub? It is heavily timbered, full of thick trees, some 5 or 6 feet through.

What is the average width of the river from the junction of the two arms up to this township? It is pretty well the same width all the way up—about 6 chains wide.

And of the north arm up to the terminus of navigation? That would be only about 3 chains.

Are those branches known by any other names than the north and south arm? Those are the only names they have.

When do the banks begin to get high on the south arm? From the sand flats up to the junction the banks would be about 6 feet above high-water on an average; from the junction to this township they would be about 12 feet.

The left banks rise from this all the way into the ranges? Yes; the banks here would be about 12 feet, and when you get up to the head of navigation, 5 miles further, they are about 20 feet high.

Is that on both sides? Yes.

What width is the river at that point? It divides into the middle and south arm; for a mile below navigation it keeps the same width up to that, and each arm is half of that.

What is the character of the bed? A shingly bottom.

Below that, what? Below that, from 5 miles it is sandy, and occasionally shingle.

And from that point to the mouth, sandy? Yes.

Is there a large timber trade in this district? There is a good deal of timber sent away, but I would not call the trade very large. It would be large in comparison perhaps with some other rivers. It keeps about five or six schooners employed.

How many saw-mills are there on the river? Only one small one.

Is the timber trade increasing or decreasing? If anything, it is increasing.

Where is the principal timber brought from, the lower or the higher parts? The lower parts.

What is the character of the timber? Beech and cedar, and a very little pine.

Is there much cedar left in the district now? I do not think there can be a very great deal.

Have you had any experience in the growth of the cedar at all? It is a very fast growing tree. I have seen trees about 18 inches in diameter; ten years afterwards they were 2 ft. 6 in. in diameter.

How many years do you suppose it would take from the time the tree was planted to give it a diameter of 18 inches? Twelve to fifteen years.

Would you advise the Government to encourage cedar plantations? Yes.

It is the most valuable timber there is? Yes.

Is corn-growing increasing in this district? No. People who grow crops nearly all grow cane.

Is cane-growing increasing? Yes, greatly increasing.

Can the growers sell all their crops at all times? Yes.

Has there been much land alienated in the district? Yes, a good deal. Taking the police district of the Tweed or the Richmond, I suppose there may be one-eighth alienated, or one-tenth.

What is the average size of the holdings? A great many people have only 40 acres, and a great many 640. Those that have 640 acres do not make use of it as a whole.

Do those having 40 acres cultivate the whole of it? No; perhaps they only have half of it felled. They perhaps cultivate 10 acres.

Who is the largest land proprietor in the district? Mr. S. W. Gray.

How many acres does he hold? I think he must have 5,000 or 6,000 acres.

How many acres under cultivation? He does not live here.

Is the land unimproved? He has it let.

Has much of it been improved? The river banks would be, where it is let to cane-growers.

How much of it is improved? In some places pretty well the whole of it is improved.

Do you know how many stock this swamp land will carry per 100 acres? A beast to the acre when it is drained, but that would not be all the year round. In the wet season you would have to take them off.

Could not the swamps be drained to carry off the rainfall at all seasons? Yes; but swamp land like that would be covered with water from the rise of the river, and the water would lie there for a week and would kill all the grass. If the cattle depended altogether upon the swamp land you would lose them.

You could have gates to prevent the water flowing back into the swamps? I do not think so.

Are the swamps good for agriculture of any kind? They will grow corn, but not sugar-cane.

In keeping them for pastoral purposes you do not get the best returns you could off them? Perhaps not.

Are there any wells sunk in the district? Yes.

What is the deepest well you know of? They are generally about 12 feet deep.

Wells.

What is the character of the strata? Alluvial for say 5 feet, and then clay for the remainder, and then you come on to the water which is found in a sand-drift.

Does the water rise at all? Perhaps 3 or 4 feet.

Can you get an unlimited supply? No; you can empty the well any time you like, and then you have to wait for it to fill again.

What time would you have to wait for a well 4 by 3 to fill again? If you emptied it at 9 o'clock in the morning, by 1 o'clock it would have 2 or 3 feet of water in it.

Is that the invariable experience? I think so.

What are the prevailing winds in this district? Southerly.

Summer

**Mr. J. Bray.** Summer and winter? Yes; we have more southerly winds than anything else.  
**6 Nov., 1886.** Are they pretty constant? We do not have much wind here. We have north-easterly winds now and again, and sometimes a westerly wind, but we have not more than one or two westerlies in a year. Are they sufficiently constant to apply to windmill power? I think so. I was thinking of putting a windmill up.  
 Do you know of any windmills in the district? No.  
**Dam sites.** Could you suggest any information on the subject of water conservation we have not asked you about? You were asking Mr. Black if he knew of any place in these arms where you could conserve water. I know of several. There would be no difficulty in finding places where the hills come in close, and you could dam it across and keep back an immense body of water.  
 Could you name one such place? Yes.  
 Where is it? Up the north arm.  
 What distance from the junction of the north arm with the main river? It would be above navigation.  
 What distance? 16 miles above the junction.  
 What are the natural features of the valley at this point? Narrow flats with ranges on each side. The ranges come in close.  
 What is the width of the river at that point? About 30 yards.  
 And what would be the length of a dam at a height of 50 feet above the bed of the river? A hundred yards.  
 What is the character of the banks at that point? Rocky.  
 What is the rock—is it sandstone? No, basalt.  
 Do you know if the basalt in this district appears as a flow or in dykes? I do not know.  
 What rocks does it cover chiefly—sandstone, gravel, or what? I could not say.  
 What area do you think a dam 50 feet high would cover with water? I think the water might go back 2 miles.  
 And the average width? Three-quarters of a mile.  
 Do you know if any reserves have been made for water conservation in the district? There are plenty which are called water reserves, but they have not been made for the conservation of water. They have been made to give access to cattle to water? Yes, something of that kind.  
 Would it not be well to secure some of the sites you have mentioned for water conservation purposes? Yes; some of them are already alienated.  
**Mr. Gipps.]** Do you know of any swamps in the higher parts of these creeks? No; they are on the low lands, and perhaps not more than 5 feet above high-water. There is scarcely any swamp higher than that.

THURSDAY, 18 NOVEMBER, 1886.

At Inverell.

Present:—

Mr. GIPPS, C.E,

|

Mr. MURRAY.

Rev. Robert Kirkwood Ewing examined:—

**Rev. R. K. Ewing.** **18 Nov., 1886.** **Mr. Murray.]** You are a clergyman? I am a Church of England minister at Inverell.  
 How long have you been in the district? For nearly nine years.  
 You have an intimate knowledge, I daresay, of a large portion of it? During that time I have travelled a diameter one way of 35, and in another way of 75 miles, at the rate of 4,000 miles a year during the whole time.  
 What is the nature of the country in this district, Mr. Ewing? It is generally hilly; in some places undulating, and in some portions large plains, but not perfectly flat. The soil is chiefly exceedingly rich black soil.  
 Is it suitable for agricultural purposes? Highly so; not to be surpassed for agriculture and for other purposes.  
 Is there much done in the way of fruit-growing and vineyards, &c.? Not so much as there might be if there was a means of outlet.  
 Have you got a heavy rainfall in this district? Up to the present year it has been comparatively dry weather.  
 Has the district suffered much on account of late droughts? Nothing like what other districts have suffered, judging from the descriptions which I have read.  
**Floods.** Have there been any great floods? Yes. In 1879. There were four minor floods, called "bankers," and one heavy flood that came up into the town.  
 Do you know the height of the highest one? It came into the Bank of New South Wales 3 feet, and crossed the street to the steps of the Australian Joint Stock Bank, to my knowledge.  
 Have you ever known the Macintyre River to cease running? In places it was dry—a chain of small waterholes, not running.  
 To what do you impute that? To an insufficient rainfall.  
 Does any of the water not get underground? The percolation in that respect would be considerable, but I do not think that would affect the river to any great extent.  
 Is the soil permeable or retaining? Retaining soil as a whole; it is as a rule black soil.  
 You could not say, I suppose, what is the highest flood above the ordinary summer level of the Macintyre River? The ordinary summer level is simply a rippling, and the depths of the banks at the town of Inverell would be about (say) 25 feet, and therefore the flood must have been 4 or 5 feet higher than that to have got into the bank.  
**Sites for water storage.** Do you know of any suitable sites for water storage in the vicinity, for throwing back the water for a considerable distance behind? Below Newstead station there is one.  
 Do you know of any about Broady's Plains? Yes; there are two or three places there, and also towards Ellesmere, where the country is of such a nature that it would aid in throwing the water back.  
 Do you think that a system of conservation of water for irrigation purposes would be of benefit for this district:

district: I mean conserved water in high positions that would water the lower lands? Undoubtedly, in many places, it would be of the greatest benefit; but it would be a very expensive matter, and the water would have to travel long distances. Rev.  
R. K. Ewing.

Have you seen any cases of irrigation? No. I am inclined to think that irrigation would be better carried out by private enterprise in various quarters, subsidised by the Government, because the Government water-works must necessarily be expensive to be on a scale to make them of any benefit, and the water must be carried from the ridges high up considerable distances; but smaller water-works at different parts could be constructed at greater advantage if the local proprietors were subsidised by the Government. You were a resident in Victoria, I believe, for some time: Did you see any irrigation works carried out there? No. It was since my time. 18 Nov., 1886.

Do you think it would be advisable for the Government to take in hand something which would serve as an example and would be instructive to the people, as to what might be done by irrigation? I do think so, most certainly.

Do you think the people would be willing to pay a fair share of the cost? I have not the slightest doubt. The example would be followed, and the advantages would be incalculable. By a system of water-works between Inverell and Bukkullah, about 20 miles away, there could be had a fall of 400 feet, and the land under hands is of the very richest character, every acre being fit for the plough.

What is the reason it is not now under the plough? The secluded nature of the district, and the absence of roads to market. I have known instance after instance where men would have 50 or 100 acres under the plough where they only have from 5 to 50 at present, for want of roads to get to the market.

*Mr. Gipps.*] Don't you think that the whole of the river valley should be first examined and thoroughly surveyed before allowing any such water schemes to be carried out, or before any such schemes were considered? Most undoubtedly, and I would have expected that the Government in selling the land would have reserved water-rights, with a view to that, especially after the experience of Victorian irrigation. It should be undertaken without delay.

What was the population of the town when you first came here? Between six and seven hundred in the municipality. It is now beginning to decrease, although it recently had increased.

Have you ever heard of any schemes for local water supply? I have never heard of them. The only scheme I could suggest would be to fall back on the River Macintyre a few miles further up, and to bring the water back to the town by gravitation. But in order to get that, and to get power, and, in fact, water which comes from the Tingha direction, the same system that obtains in Launceston, in Tasmania, could be carried out. Here it would require to be pumped up to the first filter-bed from the river, and probably from that to another.

How does the town obtain its present supply? From wells and iron tanks; but the water from the wells is very hard, and slightly brackish. Wells<sup>1</sup>

In what strata are the wells sunk? I really do not know, They are, however, generally 20 to 25 feet deep.

Would the ground allow of percolation of drainage into the wells? Yes, and for that account I think the wells are objectionable, especially in the lower parts of the town.

How do the poorer people get their water? In some instances from the river. They pay sometimes 2s. a barrel of about 40 gallons; and that was from the river somewhat polluted after having been met by the Middle Creek, which comes from the tin mines, and by the crossing of stock and vehicles, &c. My experience is that epidemics are not so severe here as elsewhere, but I could not say if that could be in any way attributable to the water supply.

Has any provision been made for the drainage of the town? I believe that Dr. Segol proposed a plan of a rather comprehensive nature. He took everything of the nature of drainage to the river below the town. I think his scheme is still in the hands of the municipal corporation.

Do you think that the corporation would be willing to pay certain rates for a water-supply? I think think that a rate should be imposed; and I do not think that the inhabitants would object to pay one. It is, most undoubtedly, essentially necessary.

Do you know of any springs in the district? I know of several in various parts, but they would not be sufficient unless opened out. I know of many permanent ones, but of late years they have fallen very much.

Do you know what the character of the rock hereabouts is? Basalt and granite chiefly.

Are the winds pretty constant here in summer and in winter? Yes. The prevailing winds are southerly and northerly. During the dry season they were chiefly westerly. Winds.

Do you think they are sufficiently constant to allow of windmills being used to advantage to the district generally? Yes. There is one at Newstead, and also one at Rob Roy. They pump much more than is wanted, and they must be frequently thrown out of gear. The diameter of one of the wings is about 6 feet, and of another probably not more than 3 feet.

Where is the site of the Newstead proposed dam? It would be about a mile below Newstead, on the river Macintyre, about 16 miles from Inverell.

Do two spurs approach one another at that particular point? Yes, sufficiently near. From one side of the range to another would be about 100 yards.

What distance do you think the river would be thrown back by a dam (say) 50 feet high? If it were thrown back more than 1 mile it would be thrown back on to the Newstead Estate. I do not know anywhere where you could throw it back 15 miles; but a dam of 50 feet would throw back sufficient water to destroy the most valuable portion of Newstead Estate. It would cover a large valley fully 5 miles long by 1 mile in width, but it would take the very heart of the estate out, including the homestead.

Could the water be led away from that point easily to the district for irrigation purposes? Yes; but it would be a very expensive undertaking. I have long been convinced that irrigation for this district must be in disjointed, local pieces, and subsidised. Careful engineering and surveying would be necessary before anything.

Could you suggest anything yourself that we have not touched on? Only the supply for the town, and I don't think that would be a very expensive one. It would, however, be an unspeakable boon to all concerned; and as for the rate upon the people, I don't think there would be a dissentient voice in the place.

Mr. George Nott examined:—

Mr. G. Nott. *Mr. Gipps.*] What is your occupation? I have been well-sinking and mining for the last eight or ten years, and I have had large experience all around this particular neighbourhood of Inverell.  
 18 Nov., 1886. In which direction have you sunk the principal number of your wells? Principally within 2 or 3 miles  
 Wells. of the town, mostly for the use of farms and houses.

What is the average depth you have to sink before obtaining water? The average depth on the town flat was 25 feet.

What is the character of the strata you have generally passed through? The whole of it is nothing but drift.

What did you bottom on? Nothing; only common river drift.

How did you secure your wells? By brickwork.

Have you invariably got an unlimited supply of water in your wells? Invariably. I never could pump any of them dry.

Where do you think the water is derived from? I think it comes from springs in the hills, because it is so hard.

What is the greatest depth of any well in which you have sunk? About 70 feet, on Onus's property, about  $2\frac{1}{2}$  miles southward from Inverell.

What strata did you pass through there? It was nothing but a run of drift and sediment in different places. Some of the basalt was very hard.

What was the character of the drift? Chiefly gravel, with 3 or 4 feet of sandstone. It is softer on the bottom than anywhere.

Did you not get water before coming to the 70 feet depth? Only in cutting through a few inches of soft drift we came across. The water I am getting in that well is from the drift soakage in question.

How is that well secured? It is bricked from about 32 feet from the surface downwards. The water stood pretty well for some time, but since that time it has almost all gone away. I take it to be a run of drift that has at some time or another come from the Middle Creek, and the soakage has by degrees gone away.

What is the shallowest well which you have sunk in this district? About 23 feet, near the town. I did sink one 42 feet deep on the Dog Trap at Byron's, about 4 miles from this town, not very long ago.

What strata did you go through? At 25 feet we went through a kind of floating bar of rock, as near as I could make out, and then we came upon basalt, in which we got any quantity of water. The ground is a kind of honeycomb. Some of the water which was taken out, it was alleged, would kill flowers in flower gardens if it was sprinkled over them. I have, however, tested it often, and I have found it a very pure, clear, nice water.

Has the engine ever reduced the depth of the water there? I do not know.

Did the water rise in the well? No; not from where we first struck it.

In any of your wells, has the water ever risen very quickly? Yes. In some instances it has preciously nearly drowned us out. I have seen it rush up like a cannon going off when I was sinking a shaft to try and get tin.

What was the character of the strata of the rock which you were then cutting through? Chiefly hard basalt or granite—a sort of floating drift; in fact, the water rose fully 15 feet in the well, and remained at that height for at least fifteen months. In another well it rose 75 feet, and all the tools are still buried in it. That place was about 7 miles south-east from Inverell, on the Armidale Road. The depth of one shaft was between 150 and 160 feet. The sinking, I believe, was all very good. Basalt, decomposed, is met with all over the district.

Did you strike water before you came down to that depth? No; the water rushed on them as quickly as it possibly could.

Do you know of any springs, large or small, in the district? Very few permanent springs exist that I know of here. There is one on Campbell's ground, but it has never been opened up. In one well which I sank on the Big Plains, 20 miles below Moree, the water rose at a depth of 90 feet in Williams's fattening paddock, within 2 miles of the Gwydir River. The character of the country between that point and the river was that of simply a large plain. The water rose 30 feet in the shaft. A man selected two thousand (2,000) acres there, and watered sheep with the water.

What was the character of the rock in that particular well? There was no rock in it at all. Every now and then there were 6 or 8 feet of black soil, and now and then gravel drift, sand, &c. It was all made ground from top to bottom.

Did the water rise or fall during rainy seasons? I don't know.

Was the mouth of the shaft much above the bed of the Big River? I don't think it was more than 3 feet.

Did you notice if there was any current? I could not notice, the water drank too quickly.

*Mr. Murray.*] Do you know of the existence of any irrigation works hereabouts? No. I know that one person has erected a windmill; but I don't know with what results. The water I spoke of was tested by some clever man or another in Sydney, some gentleman connected with the Government, I think; but all I know of it is that it did splendidly on the barley paddocks. The Chinamen use it for their vegetables with splendid effect.

Do the cattle thrive well on it? Yes, very well indeed.

Have any of the wells a sufficient supply to admit of the use of a windmill, and to supply a large quantity of water for stock? A great many of the wells in this district could not be pumped dry, even with a windmill. I don't think there is any difficulty in getting sufficient water for all the stock in this district. Have wet or dry seasons any particular effect upon the wells? I don't think so. The supply is chiefly a filter bed itself, in underground drifts.

*Mr. Gipps.*] Are the wells sunk on plains, or are they put down on the hills? Almost all of them are put down on the plains, and many of them at long distances from the rivers and the creeks.

About what height above the river level? Some of them would be 15 or 20 feet, but not more.

Mr.

Mr. Joseph Wessey Moore examined:—

*Mr. Murray.*] You reside at Inverell, I believe? Yes; I have lived here during the last fourteen years, and I am a builder and a contractor. Mr.  
J. W. Moore.  
You have also been an alderman and the Mayor of the town? Yes. 18 Nov., 1886.  
You know a good deal of the surrounding district—its watercourses, &c.? Yes; I have travelled it considerably.

Is Inverell a place that suffers much from want of water? No, I think not. The rainfall is pretty regular, and comes at seasonable times, on the whole.

Have you known the crops to suffer from want of a sufficient downfall of rain at any time? No, never. Then you would not think that there was any necessity for a general system of irrigation? I have not the slightest doubt it would improve the fruit crops very much, but I have known an abundant wheat crop in very dry seasons indeed here.

With respect to a water supply for the town of Inverell, do you think that it is a desirable thing? Yes, most decidedly. Our water supply is at present extremely impure. Our population is at present more than 2,000 in the municipality.

Can you tell us the number of houses? I suppose about 400 or 500.

What is the ratable value of the property? Our rate is £800, at 1s. in the £.

Do you think that a cheap supply of water could be afforded to the population from some of the natural reservoirs which exist? Yes; I think so. To make water serviceable to the town you would require to have a reservoir on one of the hills; but I think the water could be conducted to a hill sufficiently high near the town by its own natural gravitation. A very suitable site would be near Dr. Knowles' residence, on a reserve on the Glen Innes Road.

Could any water be taken from Middle Creek, or from any other creek? Yes. The Middle Creek water is purer than any other, if the sludge that comes from the mines was got rid of. The water would also have to be brought from further up than the wool-washing establishment near Inverell.

Do you think that it would be a boon to the people and to the town generally to get such a supply, and do you think the people would be prepared to pay a reasonable sum for the requisite outlay? I don't think that any of the inhabitants would object to pay a reasonable rate for water.

Do you know of any places suitable for water-power to be used in the district, say for sawmills, for factories, or otherwise? No doubt there are several suitable positions for works of that sort. In fact I am quite sure of it, provided that the water were got from reservoirs.

Do you think that it would be desirable to have surveys made for that particular purpose? I have not the slightest doubt but that it would be a service to the district, if the thing could be kept regularly.

The town has suffered occasionally from floods, I believe? Yes, slightly, at times. Floods.

Do you think that reservoirs on the heads of the Macintyre River would, in times of floods, retain a large quantity of water, and prevent damage? Yes. One of our greatest floods was caused by the breaking away of the tannery dam. There is that danger always remaining to the town.

Have you any embankments to prevent such a danger? No. The Government have never considered the question, although their attention has been drawn to it several times.

*Mr. Gipps.*] Has any application been made to the Government relative to the water supply of the town? I think not.

What is the exact position of the reservoir site which you suggest? There is a water reserve on the Glen Innes Road, about  $\frac{3}{4}$  of a mile south-east from Inverell. It is on the S.E. portion of the town proper.

Is the water in Middle Creek sufficiently permanent for a water supply of the town without storage? I don't think so. It very often goes dry.

Is there any position in which water could be conserved? Yes; above the tannery dam, about 3 miles from the township.

What area would a 40-foot dam at that particular point cover? I suppose it would throw the water back for a mile square.

What would be the length of the dam on its top, do you think? 300 or 400 yards, I should imagine.

What is the character of the banks of the creeks at that spot? Granite, also the bed of the creek.

Is that high above the town? Yes. Probably 500 or 600 feet.

Then water conserved there would be of great advantage for motive-power, as well as for a general water supply? Yes. It undoubtedly would be.

What would be the area of the watershed of Middle Creek down to that point? 8 or 9 miles wide by about 25 miles long.

What are the principal crops cultivated in this district? Wheat and hay.

What is the largest field of wheat per acre that you have known here? Forty-five bushels.

And what is a fair average? About 21 bushels, and in dry seasons about 15.

Consequently, if the ground could be irrigated it would be a great benefit? No doubt it would be.

Has lucerne been tried here? Yes, but it does not grow very well. It requires more moisture than Lucerne.  
we can get in the district; still I think it would grow well with irrigation.

How many tons per acre could be cut, do you think? About 3 tons.

And how many times per annum? That would depend upon the seasons. In the best seasons it would be cut about every five or six weeks. It sells readily at from £2 10s. to £6 per ton anywhere here.

Is there much fruit grown in this district? No, not so much as might be grown, or as could be consumed here. I think that a fruit crop would be a very payable one.

Is there much ground under vineyard cultivation? Yes.

What return do the vignerons get per acre? About 350 gallons of wine. That sells at about 5s. a gallon.

What kind of grape do they chiefly grow here and in the neighbourhood? Hermitage, Malbec, Madeira, Shiraz, Reisling, Tokay, &c., are the chief wines.

Have you ever known any loss from blight? Yes; there is always a slight percentage of loss from *oidium*. It is worst in the wet seasons.

Mr. J. W. Moore. Are the grape crops better during dry than in wet seasons? The crop is heavier in the wet seasons, but the quality of the wine is better in dry weather, so that it is equally balanced.

18 Nov., 1886. What is the greatest flood that you have known in the river? The highest that has occurred within the memory of any living inhabitant went fully 20 feet up the branches of a tree in the bed of the river. The water went all over the town in 1872.

What was the average depth that covered the town then? At the foot of the main street I made a mark, showing 2 feet, on a doorway.

What was the width of the river during the height of that flood? Generally speaking it was confined within its banks, and in other places it broke over and rushed into the town. The danger could be easily overcome, but the municipality was not in a financial position to go on with the work.

What is the average width of the river bed? About 100 yards at the top of the respective banks. At the ordinary water level it would be about 20 yards. The height of the banks would average about 20 feet.

What are the characteristics of the banks? Basalt formation.

Does the basalt show on both sides, and also in the river bed? Yes, it does.

Have you ever known the river dry here? Yes, frequently. Sometimes for three months.

Are there any dams on the river? None that I know of.

Dams. Do you know of any dams in the district? Yes; there is one in Middle Creek called the Tannery or Wool-washing. It is about 6 feet high, and it throws the water back about 300 yards. The length of the embankment would be about 40 yards or so.

What is the embankment constructed of? I believe it is logged, and banked with earth. It does not leak at all, and it is used for wool-washing and tanning purposes, &c.

Do you know of any other dams in the district? Yes. There are several dams made in the back away from the river, from natural watersheds. I have a dam at my own vineyard 700 feet above Inverell, 5 miles from the township, upon a gully.

What is the height of its embankment? 6 feet, as nearly as possible.

How far back does it throw the water? It is only a very small dam.

Do you know of any large dams in the district which could conserve any large quantities of water? There is a good sized one on Myall Creek Run, 12 miles distant from Inverell. It is about 6 feet deep, on the average.

How far back does it throw the water? It would probably cover an area of 200 or 300 square yards.

Can you suggest any information for the Commission which we have not elicited? I think that it would be a very good thing if the Macintyre River were properly surveyed. I am quite certain there are many sites at which water could be thrown back into valleys and conserved at a very moderate cost if the place was well examined. Water could also be applied for irrigation. There are many places between the head of the Macintyre and Goondiwindi. That will be the most important part of the country after this district is left altogether.

---

Mr. Duncan Sinclair Anderson examined:—

Mr. D. S. Anderson. Mr. Murray.] Your profession, Mr. Anderson? I am a grazier, as we are termed.

18 Nov., 1886. And you reside at, and own, Newstead Station? Yes.

How long have you resided there? For about seventeen or eighteen years.

You know the district pretty well, then? Yes, I certainly do.

In the course of your experience of the district, has the rainfall been on the average sufficient? With some exceptions.

Have you ever suffered much from want of rain on your run? No, not much.

You have never lost many sheep or cattle from want of water? No.

Have floods been frequent in the district? Not to do any harm. The creeks and the river have risen, but it has been nothing to speak of. The recent floods have been the severest for the last ten years.

Have you had sufficient water in the creeks for your stock always? Yes, at all seasons.

Is there much agriculture carried on in your district? No; very little, indeed.

Then you do not think that there is any necessity for the conservation of water, either for pastoral or for agricultural purposes? I think it would be almost impossible to make dams, as the creeks are so steep and the falls so great. There is hardly a hole in the creek now; it is cut into one regular deep channel.

Outside of your district, do you think that it would be possible to conserve the water? Doubtless it would be possible. The country is so ridgy that the water runs off it at such a tremendous pace that heavy rain at once causes floods.

Do you think it would be an advantage to have storage reservoirs which would pick up the flood waters and prevent floods? Of course it would be; but there is no real damage done till the storm-waters get down to Goondiwindi and thereabouts.

Do you know that large quantities of stock have been lost of late through want of sufficient rain? Yes, undoubtedly I do. I am only too well aware of that fact; but for my own particular part of the country I don't think the dams necessary.

Is there anything that strikes you yourself, Mr. Anderson, which you think would be of advantage to the Commission? No, Mr. Murray, I don't know of anything. You see that the storm-waters run down so quickly that floods are hardly ever known here. I scarcely know of any direction in which water conservation could be applied in our direction. I fancy it would be very difficult to do anything with flood-waters when they come down, for they travel at such a rate as to carry away culverts, no matter how strongly they may be built. An immense body of water comes down with every flood. In 15 or 16 miles from our town the fall of the river Macintyre must be something enormous.

How many miles is it from your station to the head of the Macintyre? From the junction of King's Creek to the head of the Macintyre is about 15 miles.

---

Mr.

Mr. Peter Colin Campbell examined :—

*Mr. Murray.*] Your occupation, if you please, Mr. Campbell? I am a grazier, residing on the Inverell Station. I was born on the station, and hence I know the whole of the surrounding districts pretty well. As a rule, have you a fair rainfall, sufficient, I mean, for the general requirements of the district? Yes, as a rule we have. Mr. P. C. Campbell.  
18 Nov., 1886.

Have you suffered much from droughts? No. We have had to travel our stock only twice. I think the first occasion was in 1874, or probably before that year; but at all events it was about eight years ago. Did you suffer much then for lack of water? We did not, because we had plenty of it stored. We suffered more from want of grass. Want of grass.

About how often have those dry seasons occurred here? Only twice that I can remember.

Do you think that a supply of water could be conserved to prevent a repetition of occurrences of that kind, and also to irrigate the land? I really do not know; I cannot say.

Have you suffered much from floods in the district? No; we have not suffered much from that cause. Of course the banks of the river have been slightly affected. Floods.

Can you tell us the years in which the heaviest of these floods occurred? The flood a month ago was one of the highest we have had for years. There was a great flood in December, 1873, but I do not remember what height it was above the ordinary summer level.

This is a very large agricultural district, I believe—is it not? Yes, extremely. I think that water could be laid on to it with advantage. I have never seen irrigation carried out. I saw it attempted by Mr. Cruickshank, at Byron Station, but the country thereabouts was not sufficiently level for it.

What are the crops usually grown here? Wheat, maize, oats, but particularly wheat, and a good many vineyards.

Can you tell us what the average crop of wheat is in the district? I think about 20 or 25 bushels to the acre, and on some farms 30 to 40; but probably 25 is a fair average.

What average would you give for hay? About 2 tons per acre.

Do you grow much lucerne in the district? Yes, we grow a good deal. Lucerne.

How many cuttings do you get per year? We simply cut what we require for our stock, and generally one cutting will suffice us. In the showery season we cut it once in about every six weeks. Irrigation would undoubtedly be a grand thing for the lucerne paddocks.

Do you know of any site on the Macintyre River or its tributaries where water could be conserved for irrigation purposes? There are several places, particularly above Ellesmere and at Byron.

*Mr. Gipps.*] How many sheep to the acre can you keep on lucerne all the year round hereabouts? That would entirely depend upon the season. At the present time we could manage about 20 to the acre. We require about an acre of grass land per sheep, as a rule, all round.

What are the principal natural grasses? We have a good deal of blue grass and kangaroo grass, which lasts all the year round.

Any kind of herbs, too? Yes, but I cannot tell you the names or describe them. We have trefoil and carrot, for instance. We also grow a little wheat for our own private use.

What does that generally yield? I have seen, on the average, about 25 bushels to the acre, taking all the seasons round.

What crop would you get in the very dry seasons? Scarcely any.

What wheat crop would you get in a season like the present? About 25 bushels per acre.

Are there many small farm-holdings taken up in the district? Yes, very many—averaging from 40 to 500 acres each. Hard-working men manage to make a living, I think, growing wheat and maize.

Has there been any dairying tried here? Very little that I know of.

Have you any wells on your property? No.

*Mr. Murray.*] Are there any good sites at Swanbrook for reservoirs to be had? No, I think not. The banks are, as a rule, too low. I am aware that there is a great volume of water coming down Swanbrook, but I have seen it cease running for miles last year. It, however, generally runs all through the year. The water is brackish.

Does it injure the vegetation? No; and stock do well on it. There is a good deal of lime-water in it.

Mr. William Wilberforce Fraser examined :—

*Mr. Gipps.*] What are you, Mr. Fraser? I am Police Magistrate and Warden of the district.

How long have you been resident? Since the year 1853.

Do you know anything relative to the tributaries of the Macintyre or Gwydir Rivers—do you know where they rise at all? Yes. I know King's Creek and Waterloo Creek; also the head of Swanbrook, which are each tributaries. They rise in a spur of Ben Lomond. The Waterloo Creek runs into the Beardy Water, which is afterwards called the Severn River, and then it comes into the river Macintyre. What is the general character of the country at the sources of the Waterloo? Broken country, for the most part. Mr. W. W. Fraser  
18 Nov., 1886.

And of the bed of the creek itself? Rocky.

Has it any steep fall in it? I think not. It has a rather steep fall down.

Do you know of any sites on the creek that would be available for use as impounding reservoirs? Yes; but I think that impounded water would spread out and encroach very much on freehold land. There is one site on what is called the Battery or Swanbrook Plain. I do not know so much about Waterloo Creek, but there is one good place near the Sugarloaf. Reservoir sites

What would be the length of a dam, say 50 feet high, at that position, from spur to spur? Probably some 10 or 12 chains.

How far would it throw the water back? It would throw it back a long distance, and, the banks being very low, it would spread over a large area of country.

Then you would recommend that that site should be examined? It might be advantageous. Another place is about 2 miles from the junction of Swanbrook Creek with the Macintyre River, about 3 miles from Inverell.

How far would a dam 50 feet high throw the water back there? Probably more than a mile. It would not spread out very much, but it would be deep all along. On one side it would not keep any water at all, as the hills are very abrupt. Do

Mr. W.W. Fraser. Do you know anything relative to the sources of the Severn River? Not much. There is the Beardy and other creeks. There is one place on the plain, near the Glen Innes racecourse, which would throw water back for a long distance, up to Stonehenge.

18 Nov., 1886. Could water be let away with advantage from that place with the object of irrigating the country? On the left-hand side it could be led down by Furracabad, and it would then irrigate the whole country.

Do you know anything of the sources of the Gwydir or the Bundarra River? There is Booralong Creek, Sandy Creek, George's Creek, Limestone Creek, New Valley Creek, and Cope's Creek.

Do you know of any position for a large impounding reservoir on any of those particular creeks? No; I do not know much about the creeks.

Would not there be sites on the tableland itself? I should certainly think so.

Would a reservoir there be of much importance to the tin-mining industry? Yes. At Tingha an agitation was on foot some time ago for taking a supply of water from Limestone Creek down through the centre of the field. The miners asked the Government to assist them, but nothing was done.

Are there any positions for storage reservoirs on the Limestone Creek? I should think so, but I am not acquainted with the locality.

Would there be a large area of mining land available for sluicing work? Yes.

Would you recommend that the creek be examined with a view to that purpose? A good deal of water could be conserved at the spot spoken of, but I am not prepared to say whether it should be examined officially. There are a large number of tin reefs on the ground there.

Irrigation. During your experience, have you known any droughts which have been actually destructive to the crops? Yes; I have known wheat to go down to (say) 12 bushels to the acre. That was the lowest that I remember. I believe that if irrigation was brought to bear fruit-growing and farming on a larger scale might be carried on, and the crops could be at all times relied upon.

Do you know any position on the Macintyre itself in which water could be conserved in any large quantities? I think a little above Inverell, on Broady's Plains.

How far would a dam of (say) 60 feet throw the water back? Probably 3 or 4 miles—at all events to the foot of Broady's Plains.

Would it cover a large extent of flat country there? Yes.

How far would that be from Inverell? Probably a little more than 3 miles.

What is land worth in this district—say within 5 or 6 miles from Inverell? Unimproved agricultural land is worth about £4 to £5 per acre, and improved from £7 to £8.

Could water be easily diverted from such a dam to cover the plains stretching below? Yes; it could be led away.

Do you know Ottley's Creek at all? No; I only know its name.

What is the principal crop in this district at the present time? Wheat. Maize is also grown very extensively, and the latter averages probably about 30 bushels to the acre. Sometimes on exceptionally good land it has run up to as much as 40 bushels.

What effect had the dry seasons on the maize? The cobs don't fill.

Is much fruit grown in the district? Not so much as the district is adapted for.

Do you think that windmills could be utilized with advantage hereabouts? There are several in the district, but I don't know whether they are being used for irrigation or otherwise. They are supplied with water from wells, the majority of which are permanent ones.

Do you know the style of mill which is used in the district? No.

What are the principal fruits grown here? Principally grapes, but apples are coming into demand. They grow well, and to a large size. A number of people have gone in for them, and have found the venture very successful.

What crops do grapes produce per acre? I cannot give an opinion, but I have been told that a good vineyard is worth from £40 to £50 per acre.

Tin-mining. Mr. Murray.] In dry seasons, have they not had great difficulty in moving the stacks of wash-dirt at the tin mines? Yes. It has sometimes to be carried 2 or 3 miles after having lain for twelve or eighteen months. It had then got extremely hard—almost as hard as before it was first taken from the ground. There are places on Limestone Creek where water could be conserved, but I cannot say what the requisite length of the embankment would be.

Is there usually a good supply of water on Cope's and Nuvally Creeks? I think so. The latter is a tributary of the Barwon River. I should think that the water near Nuvally head station could be diverted to Cope's Creek? If there was a continuous supply of water it would add considerably to tin-mining. As a matter of fact, owing to drought, we have lost the bulk of the European tin-miners.

The farmers could also be supplied? Yes, at one and the same time.

Do you think it would be desirable for the Government to investigate the matter? I most certainly think so. There is a very large revenue to be had from the tin-miners when the mines are in full working order.

Inverell, as a town, has benefited very much by the tin-mines? Yes; and recently tin-mining is being carried on all round the town. If it were not for the tin-miners the farmers would be very badly off, and they certainly would have to export their produce.

Does the granite country contain a great number of springs? Yes; a great deal of water could be conserved also from storms. As Mining Warden of the district, I have a good knowledge of it.

Could you give us any suggestion of interest to the Commission, sir? I think water is the main thing. Of course if that fails the men are able to do nothing at all.

Mr. William Harvey Readett examined:—

Mr. W. H. Readett. Mr. Murray.] You are a grazier? I am a grazier, residing at Bundarra.

18 Nov., 1886. How long have you been acquainted with the Inverell District? I suppose for about eighteen years.

You were formerly a surveyor for the district? Yes, at one time I was.

What is the nature and character of the soil in the surrounding districts? I think it is principally basaltic and black soil.

Is the rainfall sufficient, in your opinion, for the district? I think so, so far as this part of the district is concerned—at all events for pastoral pursuits. Do

Do you know any good sites on the Macintyre or its tributaries where water could be conserved lower down for distribution on the dry country? You could get many good sites on the banks of the Macintyre. There is one place at a spot called Red Cliffs, about 9 miles down the river from Inverell. A dam could be constructed there to advantage. One about 15 or 20 feet high would throw the water back a distance of from 20 to 25 miles.

Mr. W. H. Readett.  
18 Nov., 1886.  
Reservoir sites.

Would that sheet of water be wide in its extent? Of course it would be confined to the river. The outside banks are, as a rule, very good.

If such a reservoir were constructed, could the water be conveyed from it to advantage lower down the Macintyre River? I should think so; in fact, I should most certainly think so. The country falls all the way down, and there would be no ridges or anything of that kind which would have to be got over. Could you name some of the country that might be used to advantage in that way? There are parts of Blue Nobby Run, and Yetman, Tucka Tucka, Bunal, and in fact you could take the water down as far as you liked on the west side of the river. The river's width there would be at the most from 7 to 10 chains. It has very good banks of good sound rock, and the bays could also be formed on rock. These could be put down at a very small expense.

Do you know any other sites like that? The Macintyre then comes down with nothing very remarkable till you get to the falls just near Wallangra Station. A dam similar to the one at Parramatta would dam up enormous floods.

Do you think that would encourage grasses, &c.? Undoubtedly. It would be of immense advantage to the cereal-producing qualities of the whole district.

You have seen all the high floods in the Macintyre—what is the highest that you have seen? I think the one in 1869. There was another shortly afterwards, in 1873, but I was away then. I should say the 1869 flood was from 20 to 30 feet above the high-water level.

Floods.

*Mr. Gipps.*] Does the Macintyre bring down any large quantities of silt? Yes; but it comes down so quickly that the water rolls it away. I have known of several small dams across the river, but these were principally put up for sheep-washing purposes. One was constructed of stone and boulders. It threw the river back only to a perceptible distance; probably not much past the waterhole adjacent to it. I don't know of any dams on any of the creeks running into the Macintyre.

Have you kept any rainfall records? No; but the statistics are very easily got at.

Have you any wells on your property? No; we get our water from the creeks, which are always permanent. Is there any further information that you could adduce? I might point out that the country to the west is a terribly dry one, and irrigation would be of very great advantage, particularly between the towns of Inverell and Warialda.

Can you suggest any scheme for distributing it? The only thing I could suggest would be a very large tank indeed, and then pump the water into a race.

Do you think that the Macintyre could be diverted into Ottley's Creek? It doubtless could be done, but Ottley's Creek, as a rule, is a very bad holding creek. It is in among the limestone country.

Do you know any positions on Ottley's Creek suitable for water conservation? I should not like to say without first making a proper examination.

*Mr. Murray.*] You know that in wet seasons a vast quantity of water runs away from the Macintyre which could be utilized to great advantage? I do. The advantage could not be properly estimated.

#### FRIDAY, 19 NOVEMBER, 1886.

Mr. George Arthur, licensed surveyor, examined:—

*Mr. Gipps.*] How long have you been in this district? For just eight years.

What part of it can you give information upon? In connection with county Arrawatta chiefly.

Then you have a general knowledge of the whole of the watercourses flowing into the Macintyre in that district? Yes; I know almost the whole of them.

What is the general character of the watershed of these tributaries? It is mountainous from Ashford eastward as far as the Dividing Range.

About what distance would that be? About 25 miles or so.

What is the character of the country below? It is level.

Is there no rolling country at all? There is a little undulating country between Wallangra to the west and to the north-west of Ashford, up to Yetman, where it is pretty level.

What are the principal sources of the Severn River? Frazer's Creek is one main tributary.

Where does that creek rise? Up in the King's Plains.

What do those plains consist of? High tablelands, about 2,500 feet above sea-level.

Do you know of any position there at which water might be conserved in large quantities for subsequent use? On a portion of the King's Plains Run there seems to be an almost unlimited supply of water from the surface.

Do you know of any position there where a dam of 50 to 60 feet would throw back a large quantity of stored water? There are a great many such places.

Would you recommend that an examination of King's Plains and of Frazer's Creek should be made? An examination would prove what I say.

Do you know of any position for a reservoir at Frazer's Creek? Not for one of any particular use.

What is the length of Frazer's Creek from its source to its junction with the Severn River? About 60 miles, following the course of the creek.

Is it a permanently watered creek? Yes; it has very rarely stopped running.

What is the width of its bed at the junction of the Severn River? About 100 yards.

What is the height of its banks? About 30 feet on the average.

Where do its banks commence to get hemmed in and confined by the ranges closing on either side? About Bukkullah, or at Nullamana.

Is there any place between Bukkullah and its junction available for the large impounding of water in a reservoir? There is a very suitable place where the main road from Strathbogie to Bukkullah crosses.

Reservoir sites.

Do two spurs approach one another there? Yes, at that particular spot.

†

What

Mr. G. Arthur.  
19 Nov., 1886.

Mr.  
G. Arthur.  
19 Nov., 1886.

What would the length of a 60-foot high dam be at that spot? About 75 yards, I should think.

How far would it throw back the water? Quite a mile, at the least.

About what area do you think that it would cover with water? About 10 acres of land.

What is the character of the Severn River after junctioning with Frazer's Creek? Fairly level on either side for a distance of about 15 miles; then fairly low banks. On the west side it is very precipitous; on the east principally sandy ridges, also on the right, when about opposite Yetman.

Do you know of any position for conserving water between the junction of the Severn River with Frazer's Creek and the junction of the Macintyre with the Severn? No, I don't know of any.

What is the principal source of the Macintyre River of which you could give the Commission special information? Bannockburn.

Is that creek a large one? About a chain across, and water can generally be found in it by sinking a few feet at almost any part.

Where does it take its rise? About 6 miles above Bannockburn Station, in the ranges which run about 6 miles north of Inverell.

What is the character of these ranges? On the east the country is principally level, of granite formation. On the west high basaltic ridges run.

Do you know of any position in Bannockburn Creek for conserving water? It could be conserved at the crossing of the main road from Inverell to Graman, as water is close to the surface.

Could a large reservoir be constructed there? Yes. It is a very good place for one, being the junction of two main roads—one to Reedy Creek, and the other to Queensland. It would be, however, very shallow, because it would not be confined.

Do you know of any position on the Macintyre at which water could be advantageously conserved? I don't know of any place on the river.

Water reserves.

Are there many water reserves in your district? A great many; some, as a matter of fact, where there is no water at all.

Could you describe the position of some of the principal ones of these? There is one at the junction on of Frazer's Creek with the main road running from Inverell to Emmaville.

On what account was that reserved? I can't say. There is always a plentiful supply of permanent water there.

Do you think it would be advisable to construct a reservoir there? No, I don't.

What are the next reserves? There are two in parish Backland, on Frazer's Creek, of 240 acres each. These do not adjoin each other.

Would there be a good position in either of those places for a large conservation of water? I mentioned one of them already. There is permanent water a little below the surface, fed by the high Buckley Mountains of the Dividing Range.

Are there any other large reserves? There is another one, a very large one, at Pindari, consisting of about 1,600 acres, on Frazer's Creek.

Would that be a good position for conserving water? Not to benefit the public, because the creek there is almost inaccessible. If water could be conserved further on it would benefit the public slightly, because there is not far off an almost unlimited supply.

For what purpose was so large a reserve laid out at that place? It was originally made for a water reserve, and was one of the very earliest reserves.

Do you know of any other part? There is a particularly dry part between Wallangra and Yetman Station, where one can hardly get a drink of water.

On what creek is that? There is no creek there; it is open box forest. I would suggest a dam on or near the main road. There are several good positions.

Do you think that water could be diverted from the Macintyre, or from some of its various branches? No. I would propose to supply it from the ordinary watershed on the east.

What would be the area of the watershed that could be availed of? Quite a mile each way.

Do you know of any point on the Macintyre River from which its water could be diverted into Ottley's Creek? No, I don't. Ottley's Creek is a very important creek.

What is the character of the bed and the banks of it? Sandy on either side, with here and there a few basaltic ridges.

Then you do not think it would be advisable to divert the Macintyre River into Ottley's Creek? No, I do not. I have no doubt suitable places could be found in which to store enough water.

Do you know of any position for a dam there? Yes; there is a point near the Highland Plain, about 6 miles from Mr. John Smith's Tucka Tucka main station.

Would a dam at that position throw back a large quantity of water? Not for any great distance, because on the east side it is principally flat, while on the west it is very ridgy; therefore it would be very shallow if thrown back.

What is about the fall of the creek? Very gentle; quite 2 feet to the mile.

Is there a good position for the construction of a 60-foot dam there? A dam certainly could be constructed there, but it would be very shallow, from the reasons which I have stated. The spurs would admit of such a dam, but it would not be a very good position for one.

Do you know of no position at Ottley's Creek where two spurs approach each other suitable for a water-storage reservoir? No; I know of none.

What is the height of the banks of the creek? Only about 4 feet on an average.

And you say they are of a sandy character? Yes; with here and there basaltic ridges.

Do you think it would be possible to divert any portion of the Macintyre along the heads of Ottley's and Cox's Creeks so as to command a large area of country below which might need irrigation? The country would not admit of it, being generally too ridgy and rocky.

Do not the hills gradually give place to rolling country as they go into the plains? From Wallangra they do, but I do not know of any suitable place where their streams could be diverted into Ottley's Creek.

Do you know of any wells in the district? There is one about 3 miles from Highland Plain. It was sunk 100 feet deep without getting water, and on going a few feet further down the water rose over the surface. It was overflowing the surface recently.

Do you think that an artesian supply could be struck there? I do. At the spot I mention it came so fast that the men lost all their tools in the shaft.

You

You do not know whether the level of the water is still permanent? I cannot say. It was far below the actual bed of Ottley's Creek where the water was struck.

You do not think, then, that the surface water can have any connection with it? No; it is not likely. Do you know of any large springs in the district? There is a very important spring close to the main Dumaresq River, in the parish of Gonian and Texas, about 6 miles north-west of Bonshaw.

How far from the left bank of the river Dumaresq? About 4 miles, approximately.

What height above the bed of the river? Not more than 30 feet. They are fed from a lot of sandhills, which are to be found immediately to the west.

Have they been opened up at all? No; just simply scooped out by the squatters; and I think an unlimited quantity of water might be readily conserved from them.

Do you think it might be diverted to play upon the surrounding country? Yes, because there is a gentle slope down from them. It would benefit the country very considerably. I had them reserved some time ago, and they are therefore now on water reserves.

Can you give any information with regard to the upper sources of the Dumaresq River? No.

Have you known irrigation to be tried in any part of the district? No.

Do you think that it would be beneficial? I am sure it would be. It seems to me a pity that right throughout the district selectors, instead of being compelled to erect useless fencing, are not allowed to put improvements on their holdings in the way of water, &c. The internal fences are of no use to themselves or to the country, whereas water conservation would benefit themselves and the Colony at large.

Are the winds pretty general here? Yes; I have seen a few windmills, which are of great utility in pumping water.

*Mr. Murray.*] The tanks and reservoirs you pointed out should be constructed more for the supply of travelling stock than for purposes of irrigation? Yes, with the exception of one.

Do you know the nature of the country that that reservoir would command? Yes; a large tract of country which is at present simply a barren waste. With water it would carry twice as much stock as at present.

Have you seen any irrigation carried out at all? No, not in this country.

Do you carry out any irrigation for garden purposes at King's Plains? No, not up to the present time.

Is there a very distinct dividing range between the Dumaresq and the Macintyre? Principally high sandy ridges.

Would it be possible to divert either of the waters into each other? No; the ridges are too well defined. Is there a well-defined line between the Macintyre and Ottley's Creek? Not particularly so. It seems to be on the whole an undulating country.

From what you know of the district, do you think that a system of irrigation could be carried out in it with great benefit to the population? I do, with the exception of the locality near Texas.

Could water be used for mining purposes with advantage if conserved, say on the neighbouring tin-mines? They are out of my district, and I have not very much to do with them.

Do you think that the Myall Creek country, between Inverell and Warialda, is suitable for water conservation? I really do not know.

Do you know anything about the heads of Myall Creek and Staggy Creek? No; they are out of my district, and I know very little about them.

Have you ever given any attention to the necessity of a water supply for the town of Inverell? No, not in particular.

*Mr. Gipps.*] Could you suggest any further information which would be useful for the purposes of the present investigation? No; I do not think so.

Mr. Thomas Harland, J.P., examined:—

*Mr. Murray.*] What are you, Mr. Harland? I am a wine-grower, and I reside at Inverell. I have lived about twenty years here, but I have not been wine-growing all that time.

Have you a good knowledge of the surrounding district? Not to a great extent.

You have seen all the effects of floods and droughts on the district? Yes, for very many years.

Have you had many floods during your residence here? Only one very heavy one, but we have had very heavy falls of rain. The heaviest flood ever felt here was in the year 1872.

What height was that above the river bed? It would be 8 or 9 feet, I should think, or perhaps more. It was 6 feet above the foundation of Ross's store, and that would be about 20 feet above the river bed.

What other great floods have you had? There was a heavy one about twelve months before I came to the district.

Have you had many droughts? Yes, and very bad ones too.

In what years were they? We have had a whole series of droughts; in fact, we are in a state of chronic drought. My memory would not enable me to particularize the dates, but we have been in a state of chronic drought for the last eight years. The district has suffered chiefly with regard to the stock. The wheat crops have not suffered so much.

Have many head of stock died for the want of enough rain? Yes, a great many; more from that cause than from any other.

Are there any good natural facilities for storing water in the district? Yes; I should think there must be; but I cannot give you any ones in particular. I might mislead the Commission by naming them.

Do you know if irrigation has ever been tried on a small scale in the district? I do not think that it has. Do you think it could be tried beneficially hereabouts? I may have peculiar opinions with regard to irrigation. It might be injurious at the very time that it would be utilized. It might scald the crops, similar to a sudden fall of rain during drought.

What are the principal crops which are grown in the district? Wheat, hay, and wine, principally.

Are pastoral pursuits carried out at all extensively here? Yes, very extensively; also mining. The fact of the matter is the most of the land in this neighbourhood is so valuable that it is a pity to have it simply under natural grasses. It is a national waste. It should be every inch of it under agriculture.

Do

Mr.  
G. Arthur.  
19 Nov., 1886.

Irrigation.

Mr. T.  
Harland, J.P.  
19 Nov., 1886.

Floods.

Droughts.

Mr. T. Harland, J.P.  
19 Nov., 1886.

Do you know of any wells in the district? No; I know of very few good ones.  
How do you derive your own water supply in your elevated position? Just by tanks and the rainfall.  
You think then it would be desirable for the Government to initiate some works to show what could be done in the way of irrigation? I think it would not be desirable for the Government to go to any great expense until the work had been previously tested.

Mr. Frank Langham Burdett, Government Surveyor, examined :—

Mr. Burdett.  
19 Nov., 1886.

*Mr. Gipps.*] How long have you been resident in the district? Only a year permanently.  
What part of the country were you located in before? At Broken Bay, on the Lower Hawkesbury.  
What particular part of the district could you give us any information about? I only received notice this morning, and having been here so short a time I hardly know the district.  
What counties are you acquainted with? I have been a little in the counties of Gough, Hardinge, and Arrawatta.  
Can you give us any information with respect to the sources of the Bundarra River? No; I know the head of the Macintyre.  
Do you know anything of Cope's Creek? Very little, at present.  
Do you know anything of Limestone Creek—I mean of its head? No, nothing.  
Do you know of any position at which it would be available for water conservation? There are some good deep waterholes in it, with hard good crossing-places with waterholes that are never dry; but I cannot mention any places suitable for water conservation; but for all that I know there may be some.  
Do you know Mooredon Creek? I have crossed it; but I repeat I have been only a very short time in the district. I believe that it is a continuous running creek.  
Do you know any good position at which to conserve water there? I cannot say that I do.  
Where does the creek rise? Mooredon, Cope's, and George's Creeks all rise in the spurs of Ben Lomond, and further south-westerly.  
What is the length of Mooredon Creek to its junction with the Bundarra? The best way would be to scale it on the map.  
Can you give any information with regard to the sources of the Macintyre River, such as Paradise Creek, for instance? They rise on the tableland, and there is a kind of swampy plateau some 500 feet above the low lands.  
Do you know Reedy Creek at all? Not much, but I have crossed it. It is generally dry, I think.  
Do you know Paradise Creek? Yes.  
What is the nature of the country which is traversed by that creek? Granite and sandy soil chiefly.  
What are the banks, high or low? Not very high; probably 10 feet.  
What is the average width of the bed of Paradise Creek? I don't know its whole course, but in the part that I do know it is very narrow—probably about 30 feet.  
Do you know of any position on it available for the conservation of water? No, none.  
Do you know Frazer's Creek at all? I have crossed it in one or two places. There is not very much permanent water that I know of there.  
Do you know of any position there available for water conservation? No.  
Can you give any information relative to the sources of the Dumaresq River? No. I cannot say anything about them.  
What is your general opinion with regard to the character of the soil of the district with respect to its cultivation, &c? Speaking roughly, I should think it is more suitable for agriculture.  
Have you had any experience in irrigation? No.  
Do you think from what you have seen of the district that irrigation would be beneficially applied here? I hardly feel qualified to answer that question at present. Near here, on the Bundarra Road, there are two wells with nearly 50 feet of water in each of them. There seems to be a kind of underground river, and you can always get permanent water there. The soil is red, with box timber.  
Are those wells near the Gwydir River? They are only 5 miles from the town of Inverell, west of Gilgai.  
Do you know of any large springs in the district? No.  
Have you any reason to think that there is an underground water supply here? No. I have no special reason. It is, however, very probable that there is.  
What is the character of the banks of the Macintyre River at Inverell? The soil is black, and the banks are high. The bed is stony, sandy, and basaltic. The banks at the town average, probably, 20 to 30 feet.  
Beyond these banks, is there any large extent of flat country? No; not of any great extent. It rises, I think, as a rule, beyond.  
Does the same character of bank extend for a long distance further down below Inverell? No; you get into very poor country, and more sandy soil, about 25 miles from the town.  
Does the river bed get sandy? Not very. I have found it pebbly and stony, and the banks are of loose stone, very porous and permeable.  
Do you think that if water is at any time diverted from the river it ought to be diverted from above west of Ashfield, some 25 miles north of Inverell? I cannot say.  
Do you know anything of Otley's Creek? No; nothing at all.  
Do you know anything of the Warialda District? No; I know little or nothing of it at present.  
Above Inverell, do you think the banks and the bed of the river are permeable or impermeable? It is a black soil for a long distance, as far as Bukkulla.  
Do you think there would be any difficulty in diverting the water from the Macintyre River, or do you think it would be retentive soil from any point above Inverell? I hardly feel called upon to say.

## APPENDIX 1 TO EVIDENCE ON NORTHERN RIVERS.

MEMORANDUM—MR. E. J. STATHAM.

In response to the invitation of the Royal Commission, Conservation of Water, to submit information likely to be of interest to the Commission, I beg to point out that Casino possesses exceptional natural advantages for a water supply.

There is a never failing supply of water in the river at that place. The rocky bed of the river immediately above the bridge forms a natural weir, below which, for a distance of more than a mile, there is a very rapid fall. The stream could be utilized to work a ram, turbine, or water pressure engine, to force water to a reservoir in the high ground at South Casino, which is at sufficient elevation to command the whole town.

## CAMIRA CREEK.

There is a possible site for a large storage reservoir at the head of Camira Creek, county Richmond, parish Marsh; the creek heads in the Richmond Range among spurs from Mount Marsh and Mount Dobie, or Dewy Mount. The creek is some 10 miles long, running out in the Camira Swamp, which discharges into Myall Creek. This extends 10 miles to its junction with Myrtle Creek and along it there are wide flat areas of light loamy soil, which would well repay irrigation.

A reservoir in the position mentioned would command fully 5,000 acres of cultivable land, traversed midway by the proposed Grafton-Tweed line of railway.

## FOUR-MILE CREEK.

Another possible site for a storage reservoir, commanding a large area of irrigable land, exists at Four-mile Creek, county Richmond, parish Wyandah; this is also traversed by the proposed Grafton-Tweed line.

## DEEP CREEK.

The head of Deep Creek will, in all probability, afford storage sites similar to those above mentioned, and are well worth a careful examination, commanding as they do very large areas of flat land which only requires water to make it highly productive. This also is on the Grafton-Tweed line.

## TUCKI SWAMP.

There is an immense swamp known as the Tucki Swamp, near Wyralla in the Richmond River, which might readily be brought under cultivation by a combined system of drainage and irrigation. A conical hill rises out of the centre of the swamp, affording a site for pumping works and sugar mill. The land would grow sugar to perfection.

26 October, 1886.

E. J. STATHAM.

APPENDICES TO EVIDENCE ON NORTHERN RIVERS.

## REPORT ON THE NORTHERN COASTAL RIVERS.

Mr. W. S. Targett to The President of the Royal Commission on Conservation of Water.

Sir,

I have the honor to report to your Commission a few facts gathered from the experience of fifteen years' residence on the Northern Coast, bearing upon the objects that concern the Commission, in the hope of shedding some additional light on the capabilities and resources of a district not generally known, or properly valued. This lack of knowledge arises in a large measure from the inaccessibility of the coast country, traffic to the metropolis being barred overland by mountainous country, impassable to the west, except by one or two difficult passes, and barred by sea by a continuous series of bar-harbours, only to be navigated by small steamers, and even with these often at extreme risk.

The soil on the banks of the rivers, such as the Hunter, the Manning, the Hastings, the Macleay, and the Clarence, is of extreme fertility, and that of the Wallamba, John's River, Nambuccra, and Bellinger, only less fertile by comparison both in quantity and quality. The Richmond, the Brunswick, and the Tweed belong to another series, the highlands and ranges extending miles from the banks of these rivers being covered with chocolate soil, little, if anything, inferior in richness to the river flats.

But to the southward, in the rich delta of the Manning and neighbouring rivers, the limit of cultivation is the river flats, where only maize, the staple crop, can be profitably grown. The chocolate or volcanic soil is not met with, except in isolated patches, until many miles inland; it is encountered upon the lower terraces of the great range that rises into the plateau of New England.

The whole land is well watered. At the head of each tidal river, at distances from 10 to 100 miles from the sea, there exist on all the rivers mentioned, large and permanent supplies of fresh water, which only require utilizing to irrigate, by gravitation simply, large areas of the lower lands. Besides these main channels, innumerable creeks, many of them having a course of several miles, drain the highlands, and supply their quota to the larger streams. On the Manning such feeders are the Barrington and Bowman Rivers, the Cedar Party, Dingo, Bobo, Lansdowne, and Dawson Creeks, some of which are continuous for miles, and in a minor degree navigable. Large quantities of water could, if required, be made available from any and all of these sources for purposes of irrigation.

On the Hastings River the Maria, Wilson, and Ellenborough Rivers are large affluents, and the circumstances identical with the tributaries mentioned of the Manning.

The great maize-growing district of the Macleay is similarly well-watered, and of the northern rivers the Commission are already informed by local evidence.

Up to the period of the last decade, the chief dangers of the coastal rivers were the periodic floods, which, sweeping down the narrow valleys, scoured crops, stock, barns, and fences in one desolation to the sea. Droughts were rare and of secondary consideration to these disasters, for besides the heavy average rainfall of this portion of the colony, the heavy sea mists and accompanying dews preserve vegetation green long after less favoured districts are dry and bare in the summer sun.

The chief reason why the head waters of the rivers cannot be thoroughly utilized is that a large percentage of the richest farm land, consists of islands lying in the fairway of the rivers, and not to be approached except by crossing a deep and tidal stream. On the Manning fully one-third of the agricultural area is so situated, the chief islands being Dumaresque, Mitchell's, Oxley, and Jones, smaller ones abounding.

These islands present the same characteristics of feature. They are purely alluvial, resting chiefly on clay, and in rare cases on drift. They are highest on the river banks, and slope gradually into swamps, many of which are being drained and devoted to grazing purposes, for which they prove admirably suited. But if irrigation were adopted, it is matter for consideration whether they would not be of more value as natural reservoirs, than when transformed into grazing paddocks.

On all these islands and on the river flats, water can be obtained by sinking wells to the river level, and although in many cases it is too hard and brackish for household purposes, it is never too saline for cattle, who prefer it to sweet water. In most cases, however, the well-water is sweet and wholesome, and little else is used by the residents. From this source, in my opinion, may be obtained all the water required for irrigating the cultivable land now in use on the northern coast rivers. Each farmer could have one or more wells, and with windmills could amply water the rich lands he occupies, and which by this means would be doubled in fertility. For the land is phenomenally fertile. The writer examined a crop of maize growing on a farm near Taree, on the Manning, which this year produced 60 bushels to the acre, and this farm has been under cultivation for thirty-one years, without being manured or fallowed. And the only rotation of crops it has been treated to was that before rust in wheat obliterated the growth of this cereal, a crop of wheat and maize was taken from it in the one season. In 1858, a farmer on Jones' Island took 1,100 bushels and several hundreds of pumpkins from off 10 acres of land, but such an instance was rare enough to be matter of comment.

In connection with the employment of windmills for irrigation purposes it may be here noted that during the greater part of the summer season, when of course the need of irrigation is greatest, north-easterly winds blow regularly each day, the only variations being at periods of electrical disturbance. Furthermore, in drought seasons the north-easters blow with the force and regularity of the monsoons.

In conclusion, it must not be thought that the ridge and forest country is barren or valueless. On the contrary, much of it is admirably suited for vineyards and orchards, producing better wine and finer flavoured fruits than the rich bottom lands. In process of time much of this land will be reclaimed, and it is here that irrigation will be largely required, and no doubt some day utilized. From the Hunter to the Queensland border the foothills of the Dividing Range have the proper exposure for vine-growing, and it would not be hard to discover more land in this scope on which the vine could profitably be grown than all the area at present under cultivation of every kind in New South Wales.

I have, &c.,

W. S. TARGETT.

## IRRIGATION AND WATER CONSERVATION IN RIVERINA.

The Engineer to the Commission to The Secretary, Royal Commission on  
Conservation of Water.

Sir,

Denman Chambers, Phillip-street, Sydney, 28 March, 1887.

In compliance with the Resolution of the Commission, a copy of which was forwarded to me with your letter No. 515, dated 21st May, 1886, I have the honor to submit my report for the information of the President, Vice-President, and members of the Commission.

I have, &amp;c.,

H. G. MCKINNEY,

Engineer to the Commission.

To the President, Vice-President, and Members of the Commission.

## PRELIMINARY.

Gentlemen,

Instructions.

The instructions under which I have inspected and now report on the Southern districts of this Colony were embodied in the following Resolution of the Commission, a copy of it being supplied to me with letter No. 515, dated 21st May, 1886:—

*Resolved*,—That the Engineer be instructed to complete observations at Moama, and then take up similar work at Euston, Wentworth, Tocumwal, and Howlong; to take the discharge of the Darling at Wentworth, and of the Murrumbidgee at Balranald. While obtaining the above information notes should be made as to the best outlets from the river, and on other points connected with diversion of supplies. Having made such observations as are necessary before the river rises, he should take up the examination of the Murray-Murrumbidgee doab with a view of propounding schemes for the utilization of the available water of those rivers."

Works of Inter-colonial interest.

The remainder of the instructions, which related to work to be done conjointly with the Engineer to the Victorian Water Conservation Commission, was subsequently cancelled by letter No. 559, of 14th August, 1886, in which I was requested to confine my attention to works specially affecting this colony. While I acted under this restriction as far as possible, there were points relating to headworks which I necessarily noted, though the concurrence of the Victorian Government will be required in carrying out the works I propose. In fact the Murray cannot be dealt with in a proper and comprehensive manner otherwise than by the conjoint action of the Colonies concerned. It would not therefore in any case be necessary to treat under a separate head the works of conjoint interest in connection with that river.

Nature of inquiry.

It is necessary to explain that I understood clearly at the outset that the investigations which I was required to make were to be of a purely preliminary nature, that I was required to point out the general character of the projects best suited for utilising the available water supply, to estimate the probable extent, cost, and returns of the works proposed, and to indicate the lines which surveys for such works should take. In short, the questions to be dealt with were—(1st) what is the extent of the available supply of water in the South-western districts of this Colony? and (2nd) how can this water be used to confer the greatest benefits on those districts?

Outline of tour. Principal places visited.

In pursuance of the instructions, I left Sydney on the 24th May last, and was engaged on field duties connected with this work till 15th September, when I was recalled to Sydney to proceed, in advance of the Commission, to the coastal rivers, and I did not again leave Sydney to complete my duties in the Southern district till 30th November. These duties I completed and returned to Sydney on 24th December, so that altogether I had only about four months and a half for the field work. During this time I gauged the Murrumbidgee twice at Wagga, twice at Hay, and once at Balranald; and I gauged the Murray twice at Albury, and once at each of the other places selected; namely, Corowa, Tocumwal, Moama, Euston, and Wentworth. At Wentworth I also made a cross-section of the Darling, but as there was no perceptible current there I took the discharge of that river at Tapio, about 12 miles by road from Wentworth. At Deniliquin I made a cross section of the Edward River near the bridge, and as there was no perceptible current there I took an approximate discharge above the place from which the town supply is obtained. In connection with the question of storage of the waters of the Murrumbidgee and its tributaries, I visited the Tantangara Basin and Lob's Hole on the hilly portion of the drainage area, and in the plains I inspected Lake Urana, the Tomboline Swamp, and Lakes Tala, Yanga, Tori, Merimlee, Paika, and Waldaira. In connection with the storage of supplies from the Murray, I visited Lakes Moira and Taila or Benanee. In addition to places of interest specially mentioned in the report, I visited the points of outflow of the Edward River and Gulpa Creek, the confluence of the Goulburn and the Murray, the confluence of the Murrumbidgee and the Murray, the confluence of the Wakool and the Murray, the points of outflow from the Murrumbidgee to Paika Lake, Yanga Lake, and Lake Waldaira, and the points of outflow from the Murray to Benanee Lake.

Visit to office of Water Supply Department, Melbourne.

I also went to Melbourne to obtain information regarding the system of keeping records of the rivers in Victoria, and to ascertain various points regarding the discharge observations on the Murray and its tributaries, which have been made under the directions of the Victorian Government. The records dealing with these matters were most kindly placed at my disposal by Mr. Stuart Murray, now Chief Engineer for Water Supply in Victoria, who also explained the system followed by him in taking river discharges. It is sufficient to mention here that from the records, which are kept in a most complete and elaborate style, I obtained much useful information; but in the case of the method of taking discharges I saw that the system followed, though excellent, would require more time than I could afford.

It

It may be urged in opposition to the conclusions I have arrived at that the time taken was too short; but replying by anticipation to such objections I may state (1) that on a previous occasion (*vide* Appendix to First Report of the Commission) I had made an inspection of the Murray from Dora Dora to Tocumwal, and of the Murrumbidgee from Gundagai to Hay, and taken levels for, and submitted a report regarding the Yanko Creek, which report, it is necessary to add, has been approved by the Harbours and Rivers Department, and adopted in almost every particular; (2) that previous to the preparation of the First Report of the Commission I had made a careful compilation of all levels likely to be useful in connection with possible projects for water conservation in the western plains; (3) that while the gaugings of the rivers were made quickly and with less attention to minute details than in the system followed under the directions of Mr. Stuart Murray, Chief Engineer for Water Supply in Victoria, still all important elements of error were carefully guarded against; and the gaugings were carried out on the same principle as that adopted in Upper India, where it was demonstrated that under fairly favourable circumstances there would not be a total error of more than 7 per cent.; (4) that in all cases I availed myself of the assistance (always most kindly given) of the Government officers in the various districts visited, and of the owners and occupiers of land, and checked as far as possible, by comparison or otherwise, all statements of importance made to me. Hence, so far as discharge observations are concerned, I have made certain that there is no error which can affect my conclusions, and a similar remark applies to information obtained by inquiry.

Sources of information. Explanation of procedure.

As the works which I propose in this report constitute the most important projects yet brought forward in these Colonies in connection with irrigation, I deem it not only right but necessary to mention the experience I have had in connection with similar undertakings. At the outset I may mention that since 1867 I have been employed uninterruptedly on works for irrigation, water supply, and drainage. During my ten and a half years service in the Irrigation Department in India I was fortunate enough to be employed throughout on some of the largest canal works in that country, and, among others, on the Upper and Lower Ganges Canals, which constitute by far the most extensive irrigation works in existence and still more fortunate in the fact that my experience included every variety of canal work, and was acquired under some of the most distinguished officers in that Department. To particularize:—I was employed in turn as the engineer in immediate charge of (1) preliminary surveys, alignment, levelling, and estimating for canals and distributaries; (2) canal construction, including excavation, bridges, weirs, locks, and regulators; (3) management of running canals, for which I qualified by passing an examination on canal law and subjects connected with its administration; and (4) the preparation of large drainage projects which have since been carried out. The officers under whom I was employed included such names as Col. H. A. Brownlow, R.E., late Inspector-General of Irrigation in India, Major F. J. Home, R.E., since Chief Engineer for Irrigation in the Punjab, and Major J. C. Ross, R.E., since Deputy Engineer-in-Chief for Irrigation in Egypt. On my arrival in this Colony, in the beginning of 1880, I was appointed to the first charge of open canal on the Sydney Water Supply Works, under Mr. Moriarty, Engineer-in-Chief for Harbours and Rivers, and remained there till I resigned in November, 1884, on joining the service of this Commission.

Previous experience.

#### GENERAL DESCRIPTION.

An opinion formerly prevailed that there was a distinct watershed line between the Murray and the Murrumbidgee, and such a line has actually been shown in some maps of recent date. I believe I am correct in stating that the true conditions existing were first brought prominently to notice in my report on levels, which was presented to the Commission on 15th January, 1885, and in which it was stated "that the country between the Murray and the Murrumbidgee must be regarded as two main doabs and not one, the Billabong Creek representing the intermediate river;" also "that so far as levels are concerned, the Billabong Creek could be supplied from the Murray as well as from the Murrumbidgee." (*See Appendix to the First Report of the Commission.*) The position thus occupied by the Billabong Creek is most peculiar, there being a fall in the country towards it in a south-westerly direction from the Murrumbidgee, and in a north-westerly direction from the Murray. This peculiarity in the country between these two rivers presents remarkable facilities for irrigation from both. The natural fall of the country and the existence of favourable sites for headworks on the rivers render it easy to divert supplies into canals; and the Billabong Creek will not only afford a ready means for the escape of such water as is not used from the canals, but will also act as a low-level supply channel for the conservation and distribution of this surplus.

Relation of Billabong Creek to Murray and Murrumbidgee Rivers.

In the map of Principal Drainage Areas in New South Wales, which accompanied the First Report of the Commission, the area of the hilly portion of the basin of the Murrumbidgee is given as 11,860 square miles, the corresponding area in the case of the Billabong Creek being 1,330 square miles, and in that of the Murray 2,380 square miles. The latter area includes only the hilly portion of the basin of the Murray in New South Wales. The corresponding area above Albury on the Victorian side is about 4,500 square miles. These may, without material error, be assumed as the effective catchment areas, the remainder of the basins—that is the plain portions—contributing no supply of surface water, except after unusually heavy rains. The catchment area of the Murrumbidgee above Wagga, though greater than that of the Murray above Albury, affords a more uncertain supply of water. This is due to the operation of several causes, the chief being that the fall of rain and snow is greater and more regular on the Upper Murray. But, in addition to this, the mountains are higher on the Murray, the valleys are narrower, and there is a much smaller extent of comparatively level tableland than on the country drained by the Upper Murrumbidgee and its tributaries. In short, the areas on the Murrumbidgee and on the Billabong Creek, which I have classed as "effective," are so in a much less degree than the corresponding area in the Murray basin.

Catchment areas of the Murray and Murrumbidgee Rivers and of Billabong Creek.

While there cannot be any doubt that a considerable proportion of the rainfall which percolates into the ground does not reach the rivers, I do not think there is any reason to believe that the proportion so lost is unusually great. Still, sufficient proof that there is constant underground percolation is afforded by the fact that in a large proportion of the country between the Murrumbidgee and the Murray abundant supplies of fresh water are found, and that in many cases—particularly in the Murrumbidgee-Billabong doab—the water rises to a fairly uniform height in the wells. The available information on the subject points to the conclusion that the water in these wells has no connection with the Murrumbidgee. But in the case of the Murray there are two facts which tend to prove that some water is lost from that river by percolation in a north-westerly direction in the portion between Mulwala and Lake

Underground percolation from the rivers.

Moira

Moira. The first of these facts is that there is a slight flow in the Edward River, near Deniliquin, when there is no apparent flow near its source, and the second is that Mr. Brown, of Tuppall, found by experiment that in his wells there is a perceptible current from south-east to north-west. Judging from my partial inspection of the Victorian side of the Murray, and from inquiries which I made in the district between Echuca and Kerang, I have little doubt that from the portion of the river extending from Echuca to near Swan Hill there is percolation from the Murray into Victoria in a westerly direction. This opinion is corroborated by the discharge observations made at the instance of the Victorian Royal Commission on Water Supply, which show conclusively that there is an important loss of water from this portion of the river. Mr. Stuart Murray stated on this subject, in a memorandum to the Victorian Commission, that the mean discharge for the whole year at Tooleybuc is less than two-thirds of what it is at Echuca, and that too notwithstanding the fact that in the length between these places the discharge of the Murray is augmented by the Campaspe and the Loddon.

Nature of the district between the Murray and Murrumbidgee.

The non-effective drainage areas of the Murrumbidgee, of the Billabong Creek and Edward River, and of the Murray (exclusive of the portion in Victoria), amount to over 19,500 square miles. To this may be added about one-fourth of the tract of country which I have classed under the heading of "Drainage Areas of the Mirool and other Creeks" in the First Report of the Commissioners, but which can be reached by the waters of the Murrumbidgee. This area, amounting to 3,500 square miles, as well as the 19,500 square miles mentioned above—that is 23,000 square miles in all—consists almost entirely of fertile plains, as remarkable in their uniformity as in their productiveness. The chief exception to this description is the tract of high land covered with mallee scrub and situated in the angle between the Murray and the Murrumbidgee. The approximate outline of this land is shown in the accompanying plan. (*See Appendix*). It consists of reddish, sandy soil underlain in many places by deposits of nodular limestone, and it is as a rule densely covered with a stunted variety of eucalyptus (*eucalyptus dumosa*); but it is sometimes traversed by pine (*frenela robusta*) ridges, and occasionally it is interspersed with small patches of open ground. At the junction of the Murray and the Murrumbidgee the mallee land is from 40 to 60 feet above the ordinary level of the river, from which it is here separated by a narrow strip of grey alluvium. Near Wendomal, on the Murray, some miles above the junction, the river impinges against the high land which is there 80 feet above the ordinary water-level.

Rainfall.

In the effective portions of the drainage areas of the Murrumbidgee, the Billabong, and the Murray, the respective mean rainfalls, so far as can be judged from the available returns, are 21.54 inches, 21.35 inches, and 26.17 inches. In the plains the rainfall diminishes from 21 inches at the foot of the hills to 12 inches near the junction of the Murrumbidgee and Murray. From this place to the Darling there is a further slight decrease, the average fall at Wentworth being about 11 inches and at Tapio 10 inches.

District bordering on the Lower Murray.

With regard to the nature of the country from the Murray-Murrumbidgee junction to Wentworth it will be readily seen on inspection of the accompanying plan that there is comparatively little scope for the utilization of the Murray waters there except by pumping. The boundary of the mallee is also the boundary of the high land, and in many places this land is at such a height above the water that pumping would be very expensive. In connection with this district it will be observed that the course of the Willandra Billabong is shown complete on the plan. For the information which enabled this to be done, I am indebted to Mr. Bertram, of Euston, who knows the district thoroughly, and who, in 1870, traced the courses shown.

#### NECESSITY AND OBJECTS FOR WATER CONSERVATION AND DISTRIBUTION IN SOUTHERN RIVERINA.

Necessity for water conservation not appreciated.

To any person intimately acquainted with Riverina and its requirements explanations regarding the necessity for water conservation there will appear superfluous. Owing, however, to the surprising apathy and want of information which exists on this subject outside the circle of those who have learned by experience to appreciate its importance, it is necessary to give a few details to show the enormous loss which this colony sustains through neglect to utilize the available water supply in Riverina. To place the matter in a clear light I cannot do better than state a few simple facts which are beyond dispute.

Mr. Tyson's works for conserving the Lachlan flood waters.

It is well known that, compared to the Murray and the Murrumbidgee, the Lachlan is small in its discharge and uncertain in its periods of flow. While the flow in the Murray has never been known to stop, and the Murrumbidgee has very seldom failed to contribute to the Murray, the periods during which the Lachlan contributes any supply to the Murrumbidgee are the exception and not the rule. Notwithstanding the uncertainty of obtaining any supply from the Lachlan, and notwithstanding the risk attendant on taking any action under the present absence of any definite law or regulation on the subject, Mr. James Tyson, senr., has constructed many miles of channels and several intercepting dams, one series of work alone having cost £14,000. (*See Mr. Tyson's evidence appended to First Report of Commissioners*). Now it is widely known that not one of our pioneer graziers has a more thorough knowledge of the requirements and capabilities of the centre and west of the colony than Mr. Tyson. That he is well satisfied with the returns from these works is shown, not only by his evidence before the Commission, but by the fact that he has lately been constructing other works of a similar description in the same district. The requirements and conditions of that district are precisely similar to those of the lower part of the country between the Murray and the Murrumbidgee.

Private enterprise on the Yanko and Colombo Creeks.

Another point to which I desire to call attention in regard to the wish and the necessity for water conservation in southern Riverina is the offer made and the action taken by the graziers who hold the lands along the Yanko and Colombo Creeks. About three years ago these landholders, including owners of both large and small holdings, submitted to the Government, in writing, an offer to pay pound for pound with the Government up to a total sum of £7,000 for the improvement of Yanko Creek. This offer speaks for itself, when it is considered that the Yanko Creek conveys a small, and hitherto very uncertain, supply during periods when the Murrumbidgee is high, and that the graziers have on previous occasions spent considerable sums with the object of improving the creek, but not with very satisfactory results.

Spirited action of landholders on the Yanko and Colombo Creeks.

In pursuance of this offer, Mr. James Cochrane, of Widgiewa, and Mr. S. M'Caughy, of Coonong, gave a joint guarantee for £3,500 to Government. After the subject of the improvement of Yanko Creek had been dealt with by the Commission, and tenders had been called for the first section of the improvement works, a sum of more than £2,700 was collected within a very short time among the residents of the district through which pass the Yanko and Colombo Creeks. Mr. Cochrane, to whom I am indebted for these particulars, showed me the subscription list which included the names not only of wealthy pastoralists but of selectors of moderate means. It would be difficult to decide whether the two subscriptions of £500 each at the head, or the small sums at the foot, of the list bear more eloquent testimony to the value of water in the Riverina Plains and the demand which exists for its distribution. X

without

Without reference to the corroborating evidence of many competent witnesses, the two facts stated above show sufficiently clearly the necessity for water conservation, and the genuineness of the desire for it on the part of those most interested. Necessity for water conservation inferred.

The objects for which water conservation is required have been practically demonstrated by a number of the most enterprising graziers, so that there is no longer any room for doubt or surmise. The great object of water conservation in Riverina is unquestionably to afford supplies for irrigation, which is an absolute necessity to provide (1) for horses, cattle, and stud sheep; (2) for fodder for tiding over bad seasons; and (3) for miscellaneous crops and for fruit and vegetable gardens. Objects of water conservation.

In connection with this subject, I am indebted to Mr. Bruce, the Chief Inspector of Stock, for the following table showing the number of horses, cattle, and sheep in the district bounded on the east by the railway line from Wagga to Albury, and extending on the west to the junction of the Murrumbidgee with the Murray:— List of stock in the districts now dealt with.

Stock District.	Horses.	Cattle.	Sheep.
Albury .....	4,218	8,829	397,170

Total .....	18,355	29,263	5,061,745

The figures given in this table show that every 1,000 acres of the rich alluvial land of Riverina supports only about 416 sheep, and that the horses and cattle are in the proportion of only three of the former and five of the latter to every 2,000 acres. Yet we continually hear reports of over-stocking, and, more surprising still, these reports, under present circumstances, are well founded. In good seasons it is difficult to obtain sufficient stock to eat off the grass. In a bad season it is in many cases practically impossible to dispose of the surplus stock which the land cannot support, and it is at such times that the complaint of overstocking can be brought forward with effect. The neglect to make proper and adequate provision for deficient rainfall occasions loss in two different ways. First, as the number of stock is necessarily reduced when grass is scarcer, an important proportion of the grass is lost through want of stock when a good season is experienced. The second, and much more serious loss, takes place in bad seasons through death and deterioration among the stock of all kinds, and also through diminution in quantity and deterioration in quality of the wool. There can be no doubt that the best, as well as the only complete remedy for this uncertain state of affairs is irrigation. This fact is well known and fully admitted in Northern Victoria by those who have had practical experience of the question. (See Report on Victorian Irrigation, appended to *Second Report of the Commissioners*.) Fortunately, however, it is not necessary to go outside New South Wales to find men who have sufficient enterprise and forethought to make themselves independent to some extent of the failure of the rainfall. Though the case of Mr. Tyson's work is the only one I have met with in this Colony where irrigation is carried out by gravitation alone, I have seen irrigation practised in a number of cases by pumping from the river. As such works are increasing rapidly in number, and their operations are being extended, it may safely be inferred that they are found to be profitable. I have endeavoured, but without success, to obtain a clear statement of the cost of pumping in such cases; but I have no doubt that this cost can be arrived at by reasoning from similar cases elsewhere. In the Second Report of the Commissioners it is stated, on the authority of Mr. Stuart Murray, then Engineer to the Victorian Water Commission, and now Chief Engineer for Water Supply in Victoria, that the cost of pumping from the Goulburn, near Murchison, was at the rate of 13,824 cubic feet for 1s. The lift there is greater than in most cases where pumping is done by graziers in this Colony; but everything else there was in favour of cheapness. The quantity pumped was very large, the works were easily accessible and near a railway station, and pumping was carried on almost continuously. On pastoral runs pumping is, as a rule, done intermittently, and on a comparatively small scale, and the cost of bringing the plant to the ground and of keeping it in repair is relatively high. Under these circumstances there can be no doubt that the gross cost of pumping on pastoral runs in this Colony is, as a rule, considerably higher than at the Goulburn in Victoria. Taking it, however, at the same rate, we may safely conclude that water obtained at the rate of 13,824 cubic feet for a shilling gives a good return. When the occupiers of land along the river frontage are of this opinion, it is evident that the occupiers of the back country would place a considerably higher value on the water if arrangements were made to convey it to them. We are, therefore, much within the mark in estimating from known facts that the value of the available supply in the Murrumbidgee and Murray may be taken at 1s. for 13,824 cubic feet. Resources of Riverina not developed on account of want of water conservation.

As will presently be shown, the available supply in the Murray at Albury for four months in the year may be taken at 2,000 cubic feet per second, for two other months at 1,500 cubic feet per second, and for the remainder of the year at 1,000 cubic feet per second. It will also be shown that the supply in the Murrumbidgee, which is proposed to be diverted near Wagga, averages over 2,000 cubic feet per second for eight months in the year, and that for a further period of three months 400 cubic feet per second can be used. Although it will very rarely happen that no supply will be available, still in exceptionally good years there may be several months during which little demand will exist, and there may be periods during which no supply can be spared from the river. To allow for such periods it will be safe to assume that the supplies mentioned will be utilized only during eight months in the year. This will give 1,625 cubic feet per second as a mean for the eight months from the Murray, and 2,000 cubic feet per second for the corresponding mean from the Murrumbidgee, or a total supply of 3,625—or (say) 3,600—cubic feet per second from the two rivers. It has already been shown that at a very low valuation the water is worth 1s. for every 13,824 cubic feet. Taking it at this rate and allowing for the utilization of the supply abovementioned during a period of 240 days annually, we come to the startling result that on a very low estimate the value of the available supply in the Murray at Albury, together with that in the Murrumbidgee at Wagga, is £270,000 per annum. But the Cost of water.

estimated Value of the available supply in the Murray and Murrumbidgee.

estimated available supply at Albury and Wagga is not by any means the total supply available from the Murray and the Murrumbidgee. When these rivers are in flood the total supply intended to be drawn off at the places named is a small fraction of the discharge, so that the effect of its withdrawal will be scarcely noticeable. Only a small proportion of the flood-water of the Murray is now proposed to be used—namely, 1,000 cubic feet per second—which is to be diverted at Tocumwal. In the case of the Murrumbidgee, the construction of weirs for diverting flood-water is proposed, but the works for distributing the water are to be left to the landholders. It will be well under the mark to assume that that the weirs will divert 3,000 cubic feet per second for one month in every year, on an average. These together account for a further available supply equivalent in quantity to a flow of 7,000 cubic feet per second for one month. The value of this supply, reckoned for a period of thirty days at the same rate as before, is £65,625. Hence it can safely be stated that the available supply in the Murray and the Murrumbidgee is on a low estimate worth over £335,000 per annum. In other words, the neglect to carry out a comprehensive system of irrigation and water conservation in Southern Riverina entails a direct loss, the amount of which, estimated on a very low basis, and allowing 7 per cent. for waste in distribution, is nearly £312,000 per annum.

National loss through neglect to utilize the waters of the Murray and Murrumbidgee.

Another valuation of water. Areas which could be irrigated by the available supply from the Murray and Murrumbidgee.

There is another way in which the supply now proposed to be utilized may be valued, and that is by estimating the extent of land which the supply would irrigate. In the First Report of the Commission it is mentioned that on the Eastern Jumna Canal a flow of 1 cubic foot per second irrigates 250 acres, and that the same quantity of water from the Ganges Canal irrigates 240 acres. In these cases the management of the distribution of the water is conducted on systematic and economical principles. I may here remark, and it cannot be too often repeated, that it is to India, and not to America, that we must look for information regarding the details of irrigation management. As the table on this subject in the First Report of the Commission clearly shows, India is greatly in advance of other countries, and after it comes Spain, Italy, France, and America, in the order named. It is not probable that in this country we shall, for some time at least, attain to the Indian standard in economy of water; but as there will be no crops in Riverina which will require such a large proportion of water as sugar-cane and rice, which are common crops in Upper India, I think it may safely be assumed that here 1 cubic foot per second will irrigate 200 acres. Hence in the case of the Murray, I estimated that in the spring months the available supply is capable of irrigating 600,000 acres, and during the remainder of the year 200,000 acres in addition. In the case of the Murrumbidgee the question is complicated by the short duration of the high supply, and by the use of Lake Urana as a storage reservoir. It will, however, be safe, under any circumstances, to take the average irrigating capacity of the available supply at 400,000 acres during the spring, and at 150,000 acres during the remainder of the year. These figures give 1,350,000 acres as the area which the available supply in the two rivers is capable of irrigating. But a portion of the supply will be used for filling tanks and for other purposes besides irrigation, and another portion will be lost or wasted. A deduction of 20 per cent. will make ample allowance for these items, and will leave the net area of irrigation at 1,080,000 acres. The rates which landholders in this Colony have stated their willingness to pay for water for irrigation vary from 10s. to £1 per acre. Judging from the known increase due to irrigation of various crops even the higher rate would be very favourable to the landholder. But assuming the lower rate—that is, 10s. per acre—we find that, after allowing a large supply for filling tanks, the value of the remainder for purposes of irrigation is £540,000 per annum. This value of the rivers is an amount which, I believe, will yet be obtained, as it is an estimate founded firstly on the irrigating capabilities of a known quantity of water, and secondly on statements of the value of the water made by many of those who would use it. In the more detailed estimates later on, which show the amounts of revenue that may fairly be expected from the time when the works are brought into complete operation, I have made large allowances for the want of experience of the irrigators and for the practise of partial instead of complete irrigation. These estimates show that, exclusive of the value of the flood-water of the Murrumbidgee, the anticipated gross revenue from the proposed works in connection with the Murrumbidgee and the Murray is £392,500 per annum. The difference between the estimated revenue here stated and the estimated irrigating value of the water given above, represents the value of the flood-water in the Murrumbidgee, plus the sum which can be saved by the economical use of the water supply on which the estimate of revenue is based. The value of the water calculated from its irrigating capability is considerably more than the result obtained on the basis of the cost of pumping. Under the circumstances in which pumping is carried on by pastoralists and others for irrigation, I consider it very improbable that its gross cost is less than double that at the pumping station on the Goulburn. In a number of cases I found that it was considered very good work to flood an acre in an hour. As 13,824 cubic feet—the quantity pumped from the Goulburn for 1s.—would be just sufficient to afford a fair watering to an acre, it is out of the question to suppose that this is pumped for 1s., for it need scarcely be stated that more than that sum would be required in wages alone for the working of an engine for an hour. Reasoning from the fact that in several known instances working an engine for an hour gave a watering to only 1 acre, it is evident that whether the engine was of 40- or 10- horse power the cost of giving an acre one watering could scarcely be under, and might be much over, 2s. per acre. As four or five waterings are frequently required, we find the total cost at 8s. to 10s. per acre. This brings us up to the last estimate, that is £540,000 per annum, as the value of that portion of the national inheritance in Southern Riverina which passes unheeded to the ocean. Summarising the two estimates given, we find (1) that, taking a very low rate for the cost of pumping as the value of the water, the minimum value of the water going to waste is £300,000 per annum; and (2) that taking as the value of the water the rate which landowners say they are willing to pay, and which it would appear that it costs them, a fair market value for the water lost is £540,000 per annum. These figures relate only to the direct loss which the Colony sustains. It is not necessary to enter here on any calculation of the indirect loss, but it will not be out of place to furnish a starting-point for such an estimate. [At present the owners of land throughout Riverina cannot, as a rule, obtain more than £1 5s. to £1 10s. per acre for the best class of land. The value of precisely similar land subject to irrigation in Victoria is estimated at £10 per acre. In addition to this, it has been found by experience that the mere fact of a good supply of permanent water being within easy distance in a dry country—the Wimmera Plains, for example—is sufficient to double or even treble the selling value of the land so situated. Taking these points in conjunction with the fact that the area directly and indirectly affected by the proposed works will be about 23,000 square miles, the question, "What is the annual cost of doing nothing towards water conservation in Riverina?" presents itself in a much more startling light than before.]

Effect of irrigation in raising the value of land.

## AVAILABLE SUPPLY OF WATER.

The discharges of the Murray at Albury, and that of the Murrumbidgee at Wagga, during the past eight years are clearly shown in the accompanying diagrams. In the case of the Murray at Albury, I gauged the river at three different heights, namely, 8.58, 11.92, and 12.90, these being the readings on the new gauge, on which 8.0 corresponds to what has been known as "summer level." I hoped to obtain the results of observations at Albury taken by the Victorian Government, but found on application that none had been made at that place. The discharges for intermediate heights on the gauge have therefore been arrived at by calculation. In doing this I was met by the difficulty that the discharges do not increase in anything like the theoretical ratio. This is easily explained by the presence of snags and other obstructions, which, when the river is low, concentrate the surface fall, and cause a series of rapids alternating with pools of comparatively still water. As the river increases in height, and the obstructions become more completely covered, the surface of the stream becomes more uniform, till at length the effect of the obstructions entirely disappears from view. From the observations made, and from the calculations based on them, I have obtained the following results:—

Height on gauge.	Discharge in cubic feet per second.	Remarks.
7.0	896.6	Calculated.
8.0	1,074.6	do
8.58	1,178.85	Gauged.
9.0	1,576.0	Calculated.
10.0	2,560.6	do
11.0	3,545.6	do
11.92	4,509.25	Gauged.
12.0	4,582.5	Calculated.
12.90	5,773.09	Gauged.

In the resolutions of the joint conference of the Water Commissions of New South Wales and Victoria it was recommended that "the whole of the waters of the Upper Murray and its tributaries, and the whole of the waters of the Lower Murray to the boundary of South Australia, shall be deemed to be the common property of the colonies of New South Wales and Victoria. And, subject to the reservation of such compensation water as the Trust may from time to time determine, each of the said colonies shall have the right to take and divert one-half of such water at such point or points as may, with the sanction of the Trust, be fixed on as most suitable for the requirements of such Colony." The Trust here referred to is a Joint Trust proposed to be elected from the two Colonies for the administration of the Murray. (See *Second Report of the Commissioners.*)

Proposed agreement with Victoria regarding the Murray waters.

The arrangements proposed by the Victorian Government to utilize the Murray waters are:—(1) To divert a portion of the supply in the Mitta Mitta and Kiewa Rivers; (2) to pump a supply from the Murray at Koonoomoo near Tocumwal; (3) to pump a supply from the Murray near the head of the Gunbower Creek; (4) to divert an increased supply through Deep Creek. Some other projects of minor importance have been suggested, but no decision appears to have been arrived at regarding them.

Victorian projects for utilizing supplies from the Murray.

With reference to the first project, it would appear unlikely that any large supply will be drawn from the Mitta Mitta or the Kiewa, as the rainfall is fairly sufficient, and as works for irrigation from these rivers would necessarily be very costly. In the second project it is proposed to pump 242 cubic feet per second from the Murray near Koonoomoo. Under the third scheme the quantity proposed to be drawn from the Murray for the irrigation of high land in the Gunbower District is 200 cubic feet per second in the winter months, and 100 cubic feet per second in the summer months. The fourth project is to improve Deep Creek to such an extent as to make it capable of discharging 1,050 cubic feet per second when the river is in flood. It will be seen from these projects that only a very limited portion of the Murray waters is proposed to be used when the river is low; but that it is intended to divert large quantities of flood-water. It should be observed also that the first place at which it is proposed to draw off a supply on the Victorian side of the river is below the confluence with the Ovens, where the discharge is considerably greater than at Albury.

Quantities proposed to be drawn from the Murray by Victoria.

The points to be attended to on the part of this Colony, in accordance with the understanding arrived at, are:—(1) That sufficient water should be left in the Murray at all times to meet Victorian demands so long as these are within the limits agreed on; and (2) that the total quantity abstracted from the river for the use of this Colony should not exceed one-half the total discharge. The proposals which I have now the honor to make are much within these conditions.

Effect of the understanding arrived at.

The accompanying table (*See Appendix*), giving the heights on the gauge at Albury during the past eight years, shows that on an average of 121 days per annum during that period the height on the gauge has exceeded 12 feet. Comparing this fact with the table of discharges already given, it appears that during four months per annum, on an average, the discharge exceeds 4,580 cubic feet per second. In the same manner, comparing other gauge readings with the corresponding discharges, we find that on an average of 156 days per annum during the same period of years the discharge exceeded 3,545 cubic feet per second; that on an average of 204 days the discharge exceeded 2,560 cubic feet per second; and that on an average of 283 days it exceeded 1,576 cubic feet per second. In proposing, as will presently be explained, to divert 2,000 cubic feet per second during four months in the year, 1,500 cubic feet per second during two other months, and 1,000 cubic feet per second for the remaining months during which it may be required, it will be readily seen that the quantity thus withdrawn will be much under the limit allowed. It will make this point clearer to state that in the four or five months during which the Murray is usually in flood the 2,000 cubic feet per second which I propose to divert near Albury will frequently be less than one-fifth of the total discharge at that place. Regarding the diversion of a flow of 1,000 cubic feet per second at Tocumwal during a minimum period of four months annually, I regret that I had no opportunity of gauging the flood discharge at that place; but fortunately in this case I was able to obtain important information from the Victorian Government to supplement what I had compiled from my own observations. When I gauged the discharge at Tocumwal on 29th July last, the gauge for the corresponding period at Albury was under 9 feet—that is less than a foot above

Supply in the Murray available for use in New South Wales.

IRRIGATION AND WATER CONSERVATION IN RIVERINA.

"summer level"—and the gauge in the Ovens at Wangaratta showed only 1 foot 2 inches. Both rivers were most unusually low for that period of the year, and yet the discharge at Tocumwal was almost exactly 2,000 cubic feet per second. This represents a period when a partial supply would be withdrawn near Albury and none at Tocumwal. Within a few days after this discharge was taken the river rose rapidly, so that when I measured the discharge at Corowa, on 7th August, I found that it had reached 5,172 cubic feet per second. This may be taken as an example of the state of the river when the full supply would be flowing in both canals. The following statement, based on the approximate mean discharge of the Murray below the junction with the Ovens, as estimated by the Chief Engineer for Water Supply in Victoria, affords very satisfactory information on this point. It will be observed that while my estimate of the results which can be obtained by utilizing a portion of the waters of the Murray are on the hypothesis that the upper canal would be running for eight months annually, and the lower canal only for four, this table shows that a very large supply would be left in the river if the upper canal were maintained in constant use and the lower for six months in the year.

Month.	Mean discharge for month in cubic feet per second.	Supplies diverted into canals.	Supply left in river.	Remarks.
		c. f. per sec.	c. f. per sec.	
January .....	2,372	1,000 (U)	1,372	Quantities marked "(U)" are those which might be diverted into the upper canal; those marked "(L)" the quantities for the lower canal.
February .....	1,876	500 (U)	1,376	
March .....	1,555	500 (U)	1,055	
April .....	1,308	500 (U)	808	
May .....	2,082	1,000 (U)	1,082

October .....	8,236	{ 2,000 (U) 1,000 (L) }	5,236	
November .....	5,142	{ 2,000 (U) 1,000 (L) }	2,142	
December .....	3,565	{ 1,500 (U) 500 (L) }	1,565	

Comparison of Victorian discharge observations with quantities proposed to be utilized in New South Wales.

It is necessary to note that the discharges here given for the various months are given only as approximations, and that, judging from the observations I have taken, I believe them to be considerably under the mark. Not only so, but it is evident from other returns, prepared for the Victorian Government, that the discharges above given for the Murray below its junction with the Ovens are under-stated. In support of this conclusion I have prepared the following table by combining the approximate discharge of the Ovens at its junction with the Murray with the approximate discharge of the Murray below the Mitta Mitta, and with the Kiewa at Kiewa.

Month.	Mean Monthly Discharge in cubic feet per second.				Supply to be diverted into N.S.W. Canals.	Supplies left in River.	Remarks.
	Murray below Mitta.	Kiewa at Kiewa.	Ovens at the Murray.	Total for Murray below Ovens.			
January .....	2,376	200	1,231	3,807	1,000 (U)	2,807	“(U)”, as before, indicates “Upper,” and “(L)” “Lower,” the former referring to the supply to be taken off near Albury, and the latter to the supply diverted at Tocumwal.
February .....	1,639	131	745	2,515	500 (U)	2,015	
March .....	1,202	96	546	1,844	500 (U)	1,344	
April .....	1,145	68	384	1,597	500 (U)	1,097	
May .....	1,963	82	468	2,513	1,000 (U)	1,513	
June .....	2,019	112	637	2,768	1,000 (U)	1,768	
July .....	3,754	359	2,040	6,153	{ 1,500 (U) 500 (L) }	4,153	
August .....	5,460	546	2,482	8,488	{ 2,000 (U) 1,000 (L) }	5,488	
September .....	7,182	1,024	3,878	12,084	{ 2,000 (U) 1,000 (L) }	9,084	
October .....	7,216	912	3,886	12,014	{ 2,000 (U) 1,000 (L) }	9,014	
November .....	4,677	468	2,126	7,271	{ 2,000 (U) 1,000 (L) }	4,271	
December .....	3,494	279	1,588	5,361	{ 1,500 (U) 500 (L) }	3,361	

Conclusions regarding Victorian discharge observations.

As the gaugings for the Mitta, the Kiewa, and the Ovens were made for various heights of those rivers, and at different periods, the discharges obtained for them are no doubt accurate, and as in the computations for the Murray below its junction with the Mitta the discharges of the latter were available as a check, I have no doubt the above table is fairly correct. The former table was based on only one discharge observation on the Murray, and my own experience of that river has abundantly demonstrated that a series of discharges based on one set of observations—no matter how carefully these observations may have been taken—is likely to be misleading. In the latter table, too, the discharges are much more nearly in harmony with my results than those previously given, as will be seen by comparing them with the diagram appended. On account of my not having had an opportunity of gauging the Murray during a high flood, I have not attempted to calculate the discharges for heights of more than 13 feet on the Albury gauge—that is, for more than 5 feet above “summer level.” I could not, therefore, prepare a complete statement of average discharges; but judging from the observations I have made, I feel confident that the latter statement of discharges, based on the results arrived

IRRIGATION AND WATER CONSERVATION IN RIVERINA.

arrived at by the Victorian Government, are under rather than over the mark. I am well aware that short periods have occurred when little or no supply could be spared from the Murray. For instance, I was informed by the Hon. J. Graham, M.L.C. of Victoria, that in the early part of 1839 he was able to walk across the Murray near Albury on stepping stones, there being only a small stream trickling among the pebbles. With reference to this, it should be mentioned that several hundred cubic feet per second might be flowing among and under the pebbles and boulders which, in some places, cover the bed of the Murray, whilst it would be possible to walk across in the manner stated. Severe droughts such as that at the period mentioned very rarely occur on the Upper Murray, and it is so far satisfactory that the low discharge of the Murray due to them almost invariably corresponds with the period when there would be least demand for a supply from canals. Notwithstanding the occasional partial failure of the supply, there is, as already stated, reason to believe that the second statement of average discharges is under rather than over the correct quantities. Under these circumstances, the list of average quantities left after deducting the total supplies which are proposed to be drawn off for the use of this Colony speaks for itself. There is, in fact, very much less ground for intercolonial misunderstanding regarding the Murray waters than is generally supposed. New South Wales is the only Colony favourably situated for utilizing the available supply when the river is low; and when the Murray is in flood all the works proposed, or ever likely to be proposed, will utilize but a small portion of the total discharge.

Groundlessness of intercolonial misunderstandings regarding the Murray waters.

In dealing with the waters of the Murrumbidgee the case is much simplified by the fact that no intercolonial questions are involved. But in considering the means by which the supply can be utilized, it will on several grounds be necessary to take the river as a whole, and to point out the methods of conferring the greatest benefit on the entire district through which it flows. The following table shows the discharge at Wagga for various heights on the gauge from 1 foot up to 9.69 feet, and also the discharge for 21 feet on the gauge:—

Discharge of the Murrumbidgee.

Height on gauge.	Discharges in cubic feet per second.		Remarks.
1	621.46		Gauged at Gundagai.
2	1,063.4		Calculated.
3	1,457.7		do
4	1,949.9		do
5	2,524.6		do
6	3,235.7		do
7	4,064.4		do
8	5,006.3		do
9	6,068.7		do
9.69	6,869.82		Gauged at Wagga
*	* * *		* * *
21	24,136.49		Gauged at Wagga

From the table appended it will be seen that during an average of ninety-five days annually the river stands above 6 feet on the gauge, that on an average of 128 days annually it is over 5 feet, that on an average of 158 days it is over 4 feet, that on an average of 202 days it is over 3 feet, and that on an average of 247 days it is over 2 feet. Comparing the table of discharges with this abstract of the gauge readings, it appears that while the discharge of the Murrumbidgee during flood is very great, the high state of the river is not so regular and does not last so long as in the case of the Murray. Fortunately the presence of Lake Urana will go far towards equalizing the two cases by affording storage space for flood-waters, which can be used afterwards as occasion may require.

Great range in the discharge of the Murrumbidgee.

In the projects now brought forward it is intended that the supply in the Murrumbidgee should be utilized to the fullest extent practicable. The following tabular statement shows the supply available for division at the proposed weir site at Pomingalarna, near Wagga, and the approximate quantity allotted to each division of the work:—

Proposals for utilizing the waters of the Murrumbidgee.

available discharge in cubic feet per second.	Number of days for which available.	Approximate quantity in cubic feet per second allotted to			Remarks.
		Lake Urana.	Southern Canal system.	Northern Canal system.	
4,000	72	2,000	1,000	1,000	It is assumed that the canal will be empty for one month in the year for silt clearance and repairs.

PROPOSED CANALS FROM THE UPPER MURRAY.

When I made the somewhat hurried inspection of the Murray, the results of which were given in my report of 8th April, 1885 (*See Appendix to First Report of the Commissioners*), the only suggestion of a definite nature which had been made, so far as I am aware, on the subject of diverting supplies of water from the Murray into New South Wales, was that of Mr. George Gordon, as stated in his evidence before this Commission. (*See Mr. Gordon's evidence in Appendix to First Report of the Commissioners.*) Mr. Gordon's opinion then given was that water could be diverted from the Murray for irrigation purposes at Tocumwal, and, as will be seen later on, this opinion is confirmed by my inquiries. Although no definite scheme besides this was proposed, various suggestions have been thrown out that there is a probability that a canal could be constructed to conduct the water from some part of the Upper Murray across the dividing range and into the catchment area of the Billabong Creek. From the examination of the Upper Murray which I have made, it is not difficult to understand how such an impression could be obtained. Above Albury the course of the Murray lies among hills, and as a rule the river valley is narrow, the hills steep, and occasionally there are rapids. Under these circumstances it might be inferred that there is a high rate of fall in the river, and that in consequence of this the river above Jingellic reaches as great an elevation as some of the lower passes on the dividing ridge.

Previous suggestions regarding canals from the Murray.

Before

Economic principles to be attended to in canal construction.

Before entering on this question of diverting supplies from the Upper Murray for irrigation purposes, it is necessary to call attention to an important guiding point in connection with the question of cost of work. It will readily be admitted that the first question which will be asked by the public about any great irrigation project will be, "Will it pay?" Replying to this question, I have no hesitation in stating that, while irrigation canals properly constructed in the plains of Riverina will give a splendid return on their cost, such canals, if carried to any considerable distance through the mountainous district bordering on the Murray, will be a commercial failure. In the former case the canals will be cut in deep alluvial soil, and will require no lining. In the latter case a canal would pass along hill sides which are in many places precipitous; it would have to cross numerous ravines; and its channel, where it was not in rock-cutting or in tunnels, would as a rule require to be lined with masonry or concrete. As will be shown presently, if a canal from the Upper Murray be a possibility, only a very low rate of fall would be available. Let it be supposed, however, that a rate of fall of 6 feet per mile could be allowed through tunnels. The cost of a tunnel without lining of any kind, having the rate of fall mentioned, and capable of discharging 1,000 cubic feet per second, would be at least £12 per lineal yard, and if lining were required the cost would not be under £40 per lineal yard. Open cutting in rock for a canal of the same discharging capacity, and with a fall of a foot and a half to a mile, would vary in cost from £8 to £12 per lineal yard, and where lining of masonry or concrete was required the amount would be higher in nearly the proportion which the cost of lined bears to that of unlined tunnel. On the other hand, the cost of an open canal in Riverina capable of carrying the same quantity of water, and with a fall of a foot and a half per mile, would not exceed £2 per lineal yard. Works such as would be required in connection with a canal in the Upper Murray district are frequently constructed for the purpose of supplying towns with water. As 1s. per 1,000 gallons is a fair rate for water in such cases, the returns justify works of such a costly description. But if the water were used for irrigation purposes, a fair rate would then be 10s. per acre. As the complete irrigation of a crop during one season would require on an average at least 40,000 cubic feet of water per acre, it would be necessary to accept 1s. for 4,000 cubic feet (or 25,000 gallons). In other words, a fair rate for water for irrigation would be only 1-25th part of a fair rate for water supplied for domestic purposes in a town. This explains how a certain class of works would be a great financial success if used for the purposes of water supply to a town, while similar works applied to the purposes of irrigation would prove a disastrous failure.

Question of tapping the Murray above Albury.

On my first inspection of the Murray, I found (1) that it was quite impracticable to bring a canal down the Murray Valley with an increasing height above the river; and (2) that there was no place between Albury and the 7-mile Creek from which a supply could be taken across the dividing ridge. As the distance between the Murray River and the catchment area of the Billabong Creek increases rapidly beyond the 7-mile Creek, I inferred that it would be impracticable to tap the Murray further up than that place. As there still remained some who thought that a canal might be constructed from some point above Jingellic, either from the Murray or from one of its principal tributaries, I visited the Tumbarumba Creek, Paddy's River, Tooma River (locally known as Possum Point Creek), also inspected the Murray from some miles above its junction with the Tooma to Jingellic and crossed the Jingellic Pass. At all the important points on this tour I made observations with the aneroid barometer, and I checked the working of the aneroid on the railway both before and after my tour. As I fully anticipated, I found that for a series of observations extending over a number of days this instrument is of very little value for such purposes as I required it; but that for observations taken on the same day, and under similar conditions of weather, the results were very fairly accurate. The difference in height between Tumbarumba and the junction of Tumbarumba Creek and Paddy's River, and also the difference between Tumbarumba and the Tooma Hotel, near the junction of Tumbarumba and Maracle Creeks, were measured under favourable circumstances, and are, I believe, fairly accurate. The point from which I started at Tumbarumba was found by the Railway Department to be 2,188 feet above Sydney high-water mark. Proceeding from this, I found that the elevation of the junction of Tumbarumba Creek and Paddy's River is 1,178 feet, and that of the Tooma Hotel which is situated at a short distance below the junction of these with Mannus Creek, 963 feet. From the latter place to the bank of the Murray, about 3 miles above its junction with the Tooma, I took barometer readings both going and returning, and found that the bank of the Murray at the place stated is 65 feet below the Tooma Hotel, so that its reduced level is almost exactly 900 feet. These levels may be depended on as fairly correct; but I am not in a position to make a similar statement in favour of the series from Tooma to Culcairn, via Jingellic and Germanton, though the first day's observations, which gave a fall of 85 feet from Tooma to Jingellic are probably not very wide of the mark. Working forward with my observations on the basis of the known level at Tumbarumba, I found the elevation of Jingellic Pass to be 1,763 feet, while, reducing back from the known level at Culcairn, the aneroid readings give 1,425 feet for the same place. One of the members of the Commission (Mr. F. B. Gipps, C.E.), made the elevation of that pass 1,670 feet, while another observer lately informed me that after taking every care in his arrangements he had found the height of the same point to be 1,900 feet. There is little doubt that the correct height is between the highest and the lowest of these results; but for my present purpose it will be sufficient to assume that the elevation of the Jingellic Pass above the sea is at least 1,425 feet. Granting this, the utter impracticability of conducting any supply from the Upper Murray or its tributaries across the dividing range by way of the Jingellic Pass is at once evident. The Jingellic Pass is admitted to be the lowest and the most favourable place at which it would be possible to conduct a supply of water from the basin of the Murray to that of the Billabong Creek, and yet we find that this pass is, on a very low estimate, 525 feet higher than the Murray is at a point 30 miles distant up the river in a direct line. It is useless to think of tapping the river further up than the latter place, as its general direction is almost straight away from the pass, and the country through which it flows becomes more difficult to deal with. Tunneling through the dividing ridges has been suggested, but examination of the northern slope of the ridge shows that this is not to be thought of. On the side of the ridge towards the Murray the hillsides are steep and the glens narrow; but on the northern side the country may fairly be described as an undulating table-land, with a moderate general slope towards the north-west. I found that in a distance of 2 miles from the Pass towards Germanton there is a fall of only 250 feet, although the place where I took the observation was the bed of a creek.

Question of drawing supplies from the mountain tributaries of the Murray.

While admitting that the idea of constructing a canal from the Upper Murray is not worth further consideration, it may be stated by some that the case is different with the tributaries of that river. From inspection of these tributaries, and from inquiries regarding them, I have no doubt that the

Tooma

Tooma River, or Possum Point Creek, is the only one which can be depended on to afford a permanent supply. I forded this river below the place where it is joined by the waters of Paddy's River, and of Tumarumba, Mannus, and Maracle Creeks, and found that the river there had a surface width of 80 feet, a mean depth of about 2½ feet, and a surface velocity of about 3 feet per second. The mean velocity under these circumstances would be about 2½ feet per second, and, taking it at this rate, the discharge was 450 cubic feet per second. This was the state of the river on 12th December last, when the snow-water was still passing down, and the supply was above the average. The discharge of the united creeks which flowed into the Tooma a few miles above the place where I forded it was at the same time about 130 cubic feet per second. Any supply drawn from the Tooma would, on account of the level already mentioned, require to be taken off at some place many miles above the junction with the united waters of Paddy's River and Tumarumba, Mannus, and Maracle Creeks. The catchment area of the Tooma at Mount Manjar, near which it would be necessary to divert any such supply, is under 300 square miles—that is, about one-fortieth part of the catchment area of the Murrumbidgee at Wagga, and one-twenty-third part of that of the Murray at Albury, and even about 16 per cent. less than the area which is to supply Sydney with water. From the result of my observation of the discharge it is evident that under favourable circumstances the quantity of water available will not as a rule exceed 300 cubic feet per second, and, judging from the dimensions of the catchment area, it is certain that the mean available supply must be much less than this. Again, supposing it were possible to divert the available supply into the basin of the Billabong Creek, the channel conveying the supply would have to pass round the valleys of Maracle Creek, Paddy's River, and Tumarumba and Mannus Creeks, and cross the intervening ridges. I believe that this would involve a length of at least 100 miles of conduit before Jingellié Pass would be reached, and the country through which this conduit would extend is incomparably more difficult than that through which the Sydney water-supply canal has been constructed. We are sometimes told that in America irrigation canals are constructed under difficulties such as these, and as this statement is believed by many it is necessary to point out here the very small foundation on which it rests. Two of the canals which are often referred to as being among the boldest of American irrigation works are the North Poudre Canal and the Northern Colorado or Platte Canal. In both cases the supply for irrigation flows through a series of tunnels and flumes before reaching the land to be irrigated. But, as is shown by the following table, the length of these works is quite insignificant compared to the length of conduit of a similar description on a canal from the Tooma:—

Comparison with American canals.

Nature of Conduit.	North Poudre Canal.			Northern Colorado or Platte Canal.		
	Dimensions.	Gradient per Mile.	Length.	Dimensions.	Gradient per Mile.	Length.
Tunnel .....	Feet. 6 × 6	Feet. 15·84	Feet. 920	Feet. 20 × 12	Feet. 5·28	Feet. 625
Flumes .....	8 × 6	10·56	3,400	28 × 7	5·28	2,700
„ .....	12 × 4½	10·56	750	.....	.....	.....
Canal in Pick and Shovel Work.	12 base, 4 deep, slopes 1 to 1	5·28	Miles. 2	.....	.....	.....
Canal in earthwork .....	20 base, 3½ deep, slopes 1½ to 1	2·11	5	40 base, 6 deep, slopes 1 and 2 to 1.	1·76	Miles. 47
„ .....	10 base, 3½ deep, slopes 1½ to 1	2·11 to 3·17	40	30 base, 6 deep, slopes 1 and 2 to 1.	·76	5
„ .....	.....	.....	.....	25 base, 4½ deep, slopes 1 and 2 to 1.	2·00	23

From the above may be deduced the following points:—

- Distance which North Poudre Canal flows in tunnels, flumes, and hard ground before reaching the land to be irrigated. .... Nearly 3 miles.
- Corresponding distance for Northern Colorado or Platte Canal ..... Two-thirds of a mile.
- Corresponding distance for a canal from the Tooma ..... At least 100 miles.

Summary of comparison with American canals.

It will also be remarked that the rate of fall through the tunnels is high, namely, from 1 in 1,000 to 3 in 1,000. Owing to this increased rate of fall in these parts of the conduits, much smaller sections suffice for the discharge; but in the case of a canal from the Tooma no such economy could be exercised; for not only could such high rates of fall not be given, but it is extremely doubtful whether even 1 foot per mile could be allowed.

Among those who favoured the idea of constructing a canal from the Upper Murray there was an impression that once the water reached the northern side of the dividing ridge all difficulties would have disappeared, but this also was a serious mistake. In the first place the creeks which flow into the Billabong are as a rule wide and shallow, and are choked up with sand. It is not surprising, therefore, that the water which flows in these creeks rarely reaches the Billabong. Besides, the district through which these creeks flow is high and undulating. Hence to turn a supply of water into these creeks would be sheer waste, and to construct a canal would involve serious expense, owing to the unfavourable nature of the country. The instructions of the Commission necessitated the setting at rest of the question regarding canals from the Upper Murray and its tributaries. I think the points now brought forward are sufficient to show that such canals are impracticable, if not impossible, and that even if practicable they would labour under unusual disadvantages, and would afford a comparatively insignificant supply.

Further difficulties in the way of canals from the Murray above Albury.

In my report on the river Murray, dated 8th April, 1885, I informed the Commission that I had discovered at Bungownah or Bungowannah, about 7 miles from Albury, a site for the headworks of a canal possessing the following advantages:—“1st. It is at the last range of hills with only open plain country beyond, so that there would be no rock excavation and no difficult country to pass through. 2nd. The river valley is at this place moderate in width and bounded by hills. 3rd. The depth of cutting, so far as can be judged without a survey, would be comparatively slight from the outset.” To these advantages are

Best site for an offtake from the Murray.

are to be added the following, which I reported to the Commission on 19th August last :—“4th. That the greatest depth of cutting likely to be encountered will be under 20 feet, and that this will not extend to a distance of more than three-quarters of a mile. 5th. That the maximum height of weir required to divert a permanent supply into the proposed canal will not be more than 10 or 11 feet—that is, about one-fourth of the height of the weir which is proposed to divert the supply for the Goulburn irrigation project in Victoria. 6th. That the natural advantages possessed by the proposed site are decidedly superior to those of the position of the headworks of any one of the three great irrigation canals on which I was employed during the period of my service in the Indian Irrigation Department.

Position of proposed offtake.

The position of the proposed site is close to the boundary of the counties of Hume and Goulburn, and is about 300 feet down stream from the 12-mile mark of the survey of the Murray River which was made under the direction of Mr. Moriarty, Engineer-in-Chief of the Harbours and Rivers Department. This survey commenced at Union Bridge, Albury, so that the site is 12 miles and 300 feet by river from that place. The normal width of the river there is about 300 feet—that at the surface of the water at the time of my inspection being 294 feet—while the width from edge to edge of bank was 305 feet. A spur from the Jindera Range of Hills is at this place impinged on by the river, and forms an effective barrier to the construction of a remunerative canal from any point above it. The rock of which this spur is chiefly composed is granite of an inferior description, at least so far as can be judged by that exposed; but near the top of the hill, and facing towards the Murray, I found rock of a hard and durable description, and of a distinctly basaltic appearance. Its colour is of a dark-bluish grey, and its fracture compact and crystalline. The highest point of the spur is within 1,000 feet of the river, and attains an elevation of 500 or 600 feet above it.

Necessity for adopting the site selected.

Immediately below the point where the Jindera Hills touch on the Murray the valley rapidly widens out, the hills becoming lower and more distant till they disappear altogether, and the river assuming a much more tortuous course. This great irregularity in the course of the river, together with the widening out of the valley, are almost as effective obstacles to taking a supply for a canal from the Murray below the Jindera Hills as these hills are to drawing off a supply from above them. These considerations bring the question of the best site for a canal head on the Murray within very narrow limits; in fact, the best site for this purpose must be within 50 yards of the place I have described.

Advantages of site confirmed by Victorian investigation

The conclusions at which I have arrived on this point are strongly confirmed by the result of inquiries made on behalf of the Victorian Government. It is well known that in Victoria the question of irrigation and of water conservation and supply throughout the country has received much more attention than in this Colony, and that there is a department there the sole duties of which are the construction and administration of works for those purposes. It is not surprising, therefore, that when my report of 8th April, 1885, proposing the construction of a canal from the Murray at Bungowannah, came to the notice of the Department of Water Supply of Victoria, the Hon. A. Deakin, the Minister of that Department, caused inquiry to be made regarding the proposals I had put forward. The objects of this inquiry were to ascertain, first, whether the site is as favourable as I believed it to be, and, second, if so, whether it could be utilized for the diversion of a portion of the Murray waters into Victoria also. I had the honor of being informed by Mr. Deakin that the result of his inquiries confirmed the opinions I had given regarding the favourable character of the weir site which I suggested, but that the site was not favourable for the Victorian side of the river.

Additional advantages of proposed site.

In addition to the advantages of this site which have been pointed out, there are others of a very important nature. In the first place, stone for building purposes and for crib work is at the site, and in practically unlimited quantities. In the second place, timber suitable for almost all purposes required can be obtained in abundance in the immediate neighbourhood. In the third place, the Albury railway station is little more than 7 miles distant, and is reached by a good metalled road, which passes within half a mile of the site. These are important advantages in connection with the cost of the weir. There is still another point in favour of the site, and that is, that the Murray there is exceptionally shallow; but this might be inferred from what is stated above regarding the small height of weir required.

Design of weir.

With regard to the design of the weir, it would now be impossible to do more than describe this in general terms. My recent inspection of the site showed that the length of the weir proper will be greater than I at first anticipated; but I found no reason to modify the opinion expressed in my report of 8th April, 1885, that the weir proper should be movable. This part of the work would require to be altogether about 350 feet in length; but in addition to this it will be necessary to carry a line of crib work across to the high land on the Victorian side of the river. This crib work would not require to be continuous, as there are strips of high land, the apple-trees on which show that they are not within the reach of floods. The line of the proposed weir from the southern bank of the Murray to the high land near the Victorian railway crosses a series of gum and apple flats and shallow lagoons. The object of the crib work will be to prevent the river from changing its course during high floods, and this object can be attained by carrying the line of crib work across all the lagoons and depressions. The weir proper should be designed so as to afford at least as much water-way as at present for the passage of floods; and the crib work should be so arranged that while it will prevent the formation of any new channels, it will not interfere with the flow of water over the low lands during high floods. The total distance on the line of weir from the Murray to the high land on the Victorian side is almost exactly a mile; but judging from levels which I took I do not think that the crib work will be required throughout more than one-third of that length.

Probable cost of weir.

With regard to the total cost of the weir, I find that Wiswall's tilting weir, which has been adopted with satisfactory results in several cases on the Irwell and the Mersey in England, and a modification of which might be adopted here, has not in any case cost more than £50 per lineal foot. So far as I have been able to ascertain, the circumstances under which those weirs were constructed differed in no material point from that of the proposed weir except in regard to the cost of labour. The object of the weirs on the Irwell and the Mersey was to facilitate navigation; but this does not affect the question of the cost or suitability of a similar weir for the purposes of irrigation and water supply. The effect of the weir is the same in both cases, namely, to raise the normal level of the surface of the river above them, and to allow of the free flow of the river in times of flood. I believe that an allowance of 50 per cent. on the English cost would meet the difference in circumstances of the two cases. This would give a rate of £75 per lineal foot for the Bungowannah weir, or a sum of £26,250 for the cost of the

the entire weir proper. Throughout the 440 lineal yards which would require a protection of crib work, I believe a fair average for the cross-section of such work would be 12 square yards. This gives a total of 5,280 cubic yards of stone, to which has to be added the cost of excavation and of the timber cribs. I estimate that a rate of 10s. per cubic yard would cover all these items; so that the total cost of the protective work across the low land would be £2,640. This gives the gross cost of the weir as £28,890, or (say) £29,000.

According to the levels taken by the Department of Harbours and Rivers, the fall in the surface of the river from Albury to Bungowannah is 13.24 feet. What has been termed "summer level" at Albury is 489.63 feet above Sydney high-water mark; so that the corresponding level of the river at Bungowannah is 476.39 feet. As it would be desirable to have the bed of the canal at the off-take considerably above the bed of the river, I propose 475 as the Reduced Level of the former. At about 20 miles from its head the canal will cross the surveyed line of the proposed railway from Culcairn to Corowa, the crossing-place being about 36 miles from the former place and 13½ miles from the latter. The reduced level of the ground there is 464; and as the fall from the canal head to the off-take of the Jerilderie Branch will be at the rate of 1 in 5,000, the canal at this railway crossing will be in 10 feet of cutting. On the accompanying map (*see Appendix*) the main canal and its branches are shown; the known levels also are marked, and the directions of surface water and of creek are indicated by arrow-heads. It need scarcely be stated that the detailed surveys and levels will show that in some cases it will be advantageous to deviate more or less from the lines shown; but I have little doubt that the general arrangement proposed for the distribution of the water will be found the most suitable. While I think that in any case it will be necessary for the Government to construct the main canal and its principal branches, the minor channels for the distribution of the water should be constructed under fixed regulations, and subject to Government approval by the persons using them. The approximate details of the main canal and its principal branches are as follows:—

Description	Slope of bed.	Bed width.	Side slopes.	Maximum depth of water.	Calculated discharge in cubic feet per second.	Reduced Levels		Lengths.
						Beginning of length.	End of length.	
Main Canal from head to Jerilderie Branch	1 in 5,000	feet 84	1½ to 1	feet 8	2,003	475	422	miles 50
Jerilderie Branch	1 in 2,750	15	1½ to 1	6	342	422	359	33
Main Canal from Jerilderie Branch to Tuppal Branch	1 in 3,333.3	64	1½ to 1	7	1,489	422	396	16
Tuppal Branch	1 in 2,500	12	1½ to 1	6	303	396	331	31
Main Canal from Tuppal Branch to end, near Moulamein	1 in 3,333.3	42	1½ to 1	7	1,002	396	222	110

The Reduced Levels in the foregoing table are based on (1) the known levels along the course of the River Murray; (2) the levels on the line surveyed for a railway from Culcairn to Corowa; (3) the levels at Jerilderie obtained by the railway survey to that place; (4) the levels at Deniliquin, as ascertained from the Deniliquin and Moama Railway Company; (5) the regularity in the slope of the country; and (6) the direction of flow of surface water. Taking all these points into consideration, there can be no doubt that the practicability of the project is assured, though it is only to be expected that in matters of detail alterations will be necessary. For instance, a more complete examination of the soil through which the canal will pass may show that in some cases it will be advisable to reduce the rates of fall by the introduction of vertical drops at intervals. There are several other points which suggest themselves, but it is sufficient to state that a complete network of levels will be required throughout the whole district which the canal and its branches will affect. These levels will be required in connection with the proper alignment of distributaries—a most important matter in connection with any irrigation project.

I have already described the position and the advantages of the proposed weir site at Bungowannah, and may now explain some of the leading principles of the canal system which I propose to take off from that place. For a distance of about two-thirds of a mile from the headworks the main canal will skirt the base of the Jindera Hills, and the excavation will be light on account of the presence of a lagoon extending for some distance along the proposed line of canal. At about the distance named, and within a quarter of a mile of Bungowannah Park, the canal will enter a short length of deep cutting—probably the only deep cutting which will be required. Beyond this cutting the line will follow the margin of the land subject to floods, but keeping just outside it, till the canal finally emerges on the open plains within a few miles of Howlong. From the latter place to Coreen the direction of flow of surface water shows that a good rate of fall is available; and from Coreen westward the uniformity of the country is all that could be desired.

So far as I was able to ascertain, the proposed lines are those from which the adjacent country can be best irrigated by gravitation—in other words, the lines shown are intended to be, and are believed to be, the main ridge lines of the district. I anticipate that the country through which the canal lines are shown will be covered with a network of distributaries which will carry the water to all parts of the district bounded on the south by the Murray and the Edward River, and on the north by the Billabong Creek. The proposed work will also, if necessary, supplement the present supply to the town of Deniliquin, and afford abundant supply to Jerilderie and Moulamein.

In addition to the Main Canal and Branches shown, I believe it will be necessary to construct a channel from the former to the Murray. This channel will leave the Main Canal at about 4 or 5 miles from Bungowannah. Its objects will be, first, to provide for the escape of any flood or surface water which may find its way into the canal; and, second, to provide the means of scouring out the silt which will be deposited in the canal near its head. This channel is not shown on the plan, as its position cannot be defined within narrow limits till surveys are made.

The

Levels and general description of proposed canal and branches.

Data on which project is based.

Explanation and details regarding Main Canal.

Principle of distribution.

Scouring channel and escape.

Detail of estimated quantities and cost.

The estimated approximate quantity and cost of the earthwork in the main canal and its branches is shown in the following table:—

Description.	Length in Miles.	Estimated Mean Depth of Excavation.	Estimated Quantities in Cubic Yards.	Rate per Cubic Yard.	Cost.	Remark.
		feet.			£	
Main Canal (1st length) ...	20	12	4,787,200	1/6	359,040	The depths of excavation assumed are considerably more than will be required to afford material for the banks.
Main Canal (2nd length) ...	30	8	4,505,600	1/4	300,373	
Jerilderie Branch ...	33	5	726,000	1/0	36,300	
Main Canal (3rd length) ...	16	6	1,370,500	1/3	85,656	
Tuppall Branch ...	31	5	591,100	1/0	29,555	
Main Canal (4th length) ...	110	6	6,582,400	1/2	383,973	
Totals .....	240	.....	18,562,800	.....	1,194,897	

Summary of cost.

In addition to the excavation, the principal works required will be the regulators at the heads of the various branches, as well as at the head of the Main Canal, the outlets to distributaries, and the bridges to provide for cross traffic. As the canals will, as far as possible, follow ridge lines, there will be very little cross drainage to provide for. I believe it will be found that the only places where any such provision will be required will be in the first 10 miles of the Main Canal. Taking all these items and also the escape channel into account, the approximate cost will be as follows:—

Excavation of Canal and Branches ... ..	£1,195,000
Weir at Bungowannah ... ..	29,000
Regulator at Main Canal head ... ..	5,000
Three other regulators at £5,000 ... ..	15,000
Bridges—40 averaging £300 ... ..	12,000
Distributary heads—30 at £500 ... ..	15,000
Drainage culverts—2 at £1,500 ... ..	3,000
Excavation of escape channel—say 450,000 cubic yards ... ..	30,000
Cost of surveys ... ..	16,000
Compensation for land ... ..	25,000
<b>Total ... ..</b>	<b>£1,345,000</b>
Add 5 per cent. for contingencies ... ..	67,250
<b>Total estimated cost ... ..</b>	<b>£1,412,250</b>

Explanations regarding estimate.

While I fully anticipate that there will be items which are here overlooked, I believe that the cost of such items will be more than balanced by the savings which can be effected. There is one item in particular which I am confident will be shown to be capable of reduction to an important extent, and this item is canal excavation. In calculating the quantities of excavation in the Main Canal and Branches, I have taken the cross section as being the same throughout in every case; whereas an irrigation canal diminishes in section as the supply is drawn off by the distributaries. As it would not be possible now to estimate for this decrease in the cross section of the canal, I deemed it the best as well as the safest course to base the calculation on the maximum quantities in each case. On another ground also, I believe, it will be found that the estimates for excavation lean to the side of caution. While the most economical conditions for a canal would be those under which the quantity excavated would be just sufficient to make up the banks, the quantity allowed in the estimates is in every case greatly in excess of this. The rates too are higher than those paid for similar classes of work in Victoria.

Estimate of returns.

With regard to the returns which may be expected from the Upper Murray Canal System described, although I anticipate that the water will be used extensively for stock purposes, and that it will also afford a supply to some of the townships which can be reached by it, still the returns will in the main depend on irrigation. In short, the former items will be so small compared to the latter, that in estimating the revenue they may here be omitted altogether. Of the gross discharge, amounting to 2,000 cubic feet per second, which the canal will carry during the spring months, a portion will be lost by percolation, absorption, and evaporation, and a further portion will be wasted or will remain unused. If 10 per cent. be allowed for these losses, we have an effective discharge of 1,800 cubic feet per second. Under proper management each cubic foot per second will irrigate at least 200 acres, but as the majority of those using the water will require several years' experience before they understand how to use the supply to the best advantage, it will be safer to assume that one cubic foot per second will irrigate only 150 acres. The total area irrigated in one season will therefore be 270,000 acres. It will frequently happen that only partial irrigation will be carried out, and to meet such cases, I think that something like the Indian practice of charging half-rate when only one good flooding is given to the land might be followed with advantage. Taking one-third of the irrigated area as included under this description, we have for the spring season 180,000 acres of fully irrigated land at 10s. per acre, and 90,000 acres partially irrigated, at 5s. per acre. This gives the gross annual revenue from spring irrigation as £112,500. During the second irrigating season, the net mean flow in the canal for a period of four months can be taken at 1,000 cubic feet per second, and for the remaining four months of the year at 500 cubic feet per second. For such crops as lucerne, which derive benefit from artificial watering at all seasons, the quantity available throughout would be that last named. A portion of the supply would be used throughout the second season for summer crops, and a portion would be expended on partial irrigation. On the whole, it might safely be assumed that of the 150,000 acres irrigated in the second season, about 110,000 would be completely, and 40,000 partially, irrigated. Reckoning at the same rate as before, we obtain the sum of £65,000 as the return during the second season. This added to that previously arrived at for the spring season, gives a gross revenue of £177,500 per annum. We have already seen that a liberal estimate of the gross cost of the project is £1,412,250. The interest on this at 4½ per cent. is £63,549, which leaves for maintenance, management, and profit, the sum of £113,951 per annum. Under these circumstances, I consider that it may safely be stated that the proposed work will return a clear profit of £100,000 per annum, besides paying

paying  $4\frac{1}{2}$  per cent. on the capital invested. In making this statement, I desire to call attention to the fact that while the cost of the various items estimated for has been taken at liberal rates, and the maximum probable quantities are allowed for,—in the case of revenue, reasonable, not to say low, rates for the water are assumed, and an over-sanguine view of the economical use of the water is avoided. I have dealt only with the direct revenue from the works, but this, though highly satisfactory, would be altogether overshadowed by the indirect gain to the Colony. The estimation of the value of the indirect results, I leave to others who understand what are the present capabilities of Riverina, and what its capabilities would be if the works proposed were carried out.

#### WATER CONSERVATION AND IRRIGATION ON THE LOWER MURRAY.

I have already mentioned that the only suggestion regarding offtakes for irrigation purposes from the River Murray which proved useful to me in my recent investigations was one made by Mr. George Gordon, formerly Chief Engineer for Water Supply in Victoria. Mr. Gordon's statement to which I refer is to be found in his evidence before this Commission (*see Appendix to First Report of the Commissioners*), and reads as follows:—"From near Tocumwal to the Wakool River a large extent of country could be irrigated by gravitation, and the water could be taken off the Murray at a trifling cost. The Murray rises there about 13 or 14 feet, as against 35 feet at Echuca, and I think the valley of the Edward and the Wakool admirably suited to an irrigation scheme." At an interview which I had with Mr. Gordon some time after this evidence was given, he repeated his opinion, and added that he believed the best place for drawing off a supply would be at some point near the head of the Tuppal Creek. This question was briefly dealt with in my report of 8th April, 1885 (*see Appendix to First Report of the Commissioners*); and the result of my inquiries then, and of my more extended investigations recently, has been to confirm the suggestions made by Mr. Gordon.

Previous suggestions regarding irrigation canals from the Murray.

In my report referred to, the following brief description of the condition of the Murray near Tocumwal is given:—"Beginning at Mr. MacFarlane's Baruga Station, and about 8 miles upstream from Tocumwal, there is a series of creeks into which the flood-water of the Murray occasionally flows. It is not unlikely that the levels and surveys will show that several of these creeks can be utilized with advantage; but so far as I could ascertain in the limited time at my disposal, the Tuppal Creek will be the most easily dealt with in proportion to the benefits it will confer. Commencing as an ill-defined depression in the ground at the bank of the Murray, about  $2\frac{1}{2}$  miles down stream from Tocumwal, the Tuppal Creek becomes deeper and better defined, till at 12 miles from Tocumwal its depth is about 12 feet, and its top width about 35 feet. This creek is here very similar to the Yanko, to which it is in other respects a counterpart, as its relation to the Murray corresponds exactly to the relation which the Yanko Creek bears to the Murrumbidgee. There is, however, a difference in regard to the manner in which the Tuppal receives the flood-water. When the surface of the Murray at Albury is 9 or 10 feet above what is there termed 'summer level' no supply is received into the Tuppal Creek at its head, but the flood-water passes into it through several small creeks near Wopperana. The most important of these small creeks are the Narangi Tuppal, and the Native Dog Creeks. Before the flood-water will pass into the Tuppal Creek at the head, the height on the gauge at Albury must be 12 feet, or more—that is, the reduced level of the surface of the river at Albury must be 502." I repeat these particulars, as my recent investigations have shown no reason to modify them. In addition to the creek mentioned there is a series of outlets for flood-water from the Murray between Tocumwal and Lake Moira. The most important of these outlets are the Edward River and the Gulpa Creek. It was pointed out in my previous report that beyond Corowa the rate of slope of the land is greater than that of the surface of the river, and these conditions continue as far as Lake Moira. The result of this is that from Tocumwal to the latter place extensive tracts of land are inundated during floods, and it is a noteworthy point that the low-lying land near the head of the Edward River, subject as it is to be under water from three to five months every year, produces the best red gum timber found in this colony. I was considered fortunate in being able to reach the head of the Edward by land at the end of July last, as at that period of the year it is generally impossible to go within some miles of that place excepting in a boat. The Edward River leaves the Murray at only about a third of a mile above the Gulpa Creek, and like the latter it takes off at an acute angle with the Murray. At its head the Edward is from 50 to 60 feet wide, and at the time of my inspection the banks and the lands adjoining were from 5 to 6 feet above the standing water in the river. The gauge at Albury corresponding to that date was about 1 foot above "summer level," and that at Moama slightly over 3 feet above "summer level." The channel of the Edward gradually shallows out to a distance of about  $1\frac{1}{2}$  miles from the Murray, where it divides into a network of small creeks. These unite in extensive reed beds, so that at about 3 miles from its head the Edward returns to its original section. Beyond this place as the country rises, the cross section of the Edward enlarges till at 9 miles it is very similar to what it is at Deniliquin.

Overflow in times of flood at and below Tocumwal.

At its head the Gulpa Creek is about 30 feet wide. The standing water there at the time of my inspection was about 6 feet below the level of the banks, and the depth of water was 8 feet. As in the case of the Edward River, the creek channel shallows out to a distance of about  $1\frac{1}{2}$  miles where it disappears in the reed beds. Beyond these reed beds the Gulpa Creek re-forms, and at this place it is joined by Warwick Creek, which flows from Lake Moira. The latter creek flows almost as soon as the Gulpa. When the reading on the gauge at Albury was 1 foot 3 inches above "summer level," and that at Moama about 4 feet 3 inches above "summer level," I was informed that a rise of 1 foot at the head of the Gulpa Creek would cause it to run to the reed beds, and that a rise of about 2 feet would be required to cause the Gulpa to run to its junction with the Edward. This is the first water which would flow in the Edward, as a slightly higher rise in the Murray would be required to make that river run from its head. Residents at Deniliquin reckon that they should have a flow in the Edward when the Murray stands at 6 feet on the Echuca gauge. This rule cannot, however, be general, as in a case when a rise takes place in the Goulburn, whilst the Murray is low, the gauge at Echuca will show the rise, but the Murray at the head of the Edward will remain comparatively unaffected. Besides the gauge returns show that in some cases, even when the Murray is high and the gauge at Echuca is over 6 feet, the Edward at Deniliquin fails to rise. Two points are, however, clear; namely, that in the first place no flow takes place in the Edward till what may fairly be termed "a moderate flood," occurs in the Murray, and in the second place, that the quantity which passes down the Edward is a very small proportion of the total discharge of the Murray—probably not more than one-fortieth at the outside.

Gulpa Creek and Edward River.

Project for water supply to the district between the Murray and the Edward.

It may at first sight appear strange that the greatest obstacle to a complete solution of the question of water supply and irrigation in the district between the Edward and the Murray, arises from the remarkable facilities which exist there for the distribution of water. The explanation of this apparent paradox is that this part of the country is intersected in almost all directions by creeks and ana-branches, which in some cases rival the Murray in the dimensions of their channels. The latter feature is particularly noticeable in the case of the Wakool near its junction with the Murray. These channels are not, as a rule, well adapted for the conveyance of a supply for purposes of irrigation, as it would in many cases be difficult if not impracticable to draw the water from them by gravitation. On the other hand the construction of a system of high level canals is rendered difficult and expensive owing to the number of aqueducts which would be required across the various creeks and flood channels. The most complete method of dealing with the case would be to have an artificial high level canal combined with a low level supply in the Edward River, the water to be drawn from the former by gravitation, and from the latter either by pumping or by raising the surface level at intervals to such an extent as to enable supplies to flow off. This would make effective provision for the entire district between the Edward and the Murray, as the high level canal would follow the course sketched on the plan from Tocumwal across the Deniliquin and Moama Railway at a few miles north of Mathoura; and thence along the boundary of the counties of Cadell and Townsend and through the centre of the land lying between the Wakool River and Niemur Creek, while the low level supply would be carried by the Edward River, the Wakool River, and the creeks connected with both. The high level canal would cross the Edward River and the Gulpa Creek, and also the Wakool River, expensive works being involved in both cases, and it would also cross several minor flood channels. Under these circumstances it would be impossible to give even an approximate estimate of the canal here suggested; but as the work is one which would afford a supply of water by gravitation to all parts of the county of Cadell, except some high ridges, and also to the southern part of the county of Townsend and to the strip of land between the Niemur and the Wakool, the question is well worthy of full investigation. The practicability of supplying the Edward River and the numerous creeks and flood channels connected with it, has already been proved by nature, and all that is required in this matter is to make such arrangements as will ensure a more regular and prolonged supply of water when the Murray is high. The principal works required to effect this object are: 1st, a weir across the Murray; 2nd, a channel leading from the Murray at this weir to the Edward; 3rd, a regulator on the Edward to prevent a back flow to the Murray; and 4th, a regulator on the Wakool near its junction with the Murray.

Proposed weir at Tocumwal.

In Mr. Gordon's evidence, already mentioned, a weir is not referred to, though it seems probable that its use was intended. The circumstances under which a weir would be constructed at Tocumwal are in several respects favourable. In the first place it seems not improbable that the Government of Victoria would be willing to join in bearing the cost of such a work, as a proposal has actually been made in that Colony to establish a pumping station at about 8 miles up the Murray from Tocumwal. I have had no communication with the Victorian Water Supply Department on this subject, but a plan showing ground and flood levels on both sides of the Murray near Tocumwal was very kindly supplied to me by Mr. Watson, Engineer-in-Chief for Railways in Victoria, and I noticed on examining this plan that there is a strong probability that a supply can be taken off in a south-westerly as well as in a north-westerly direction from the site which I propose for a weir. The advantages of a weir over pumping machinery in such a case will be at once admitted, and if my surmise as to the suitability of the proposed site for the purpose of Victoria prove correct, I have little doubt of the co-operation of that Colony. Another point which may have an important effect in connection with the construction of the proposed weir is the possibility of combining it with a road bridge. The question of the necessity for a bridge across the Murray at Tocumwal is one which has been repeatedly raised by residents of that neighbourhood, and it is one which will require to be dealt with sooner or later. As it would be an easy matter to combine a road-bridge with a weir, the cost could be divided with advantage to both interests. Taking all points into consideration, I believe that the best site for a weir near Tocumwal is on the straight reach below the punt, and near the line surveyed for a railway by the Victorian Government. A cross section of the Murray at this place is appended. To meet all possible objections it will be necessary to design the weir so that the waterway during very high floods will remain undiminished.

Canal from Tocumwal to the Edward River.

In the construction of the canal, to conduct the diverted supply to the Edward, I propose to utilize Tuppal Creek as far as practicable. As the course of this creek is tortuous, I assume as the rate of fall one foot per mile, though the natural slope of the country in a direct line to the junction of the Tuppal Creek with the Edward must be considerably greater than this. Although I have no doubt that an important saving can be effected by pursuing the course stated, still it would be impossible at present to estimate the extent of this saving. To allow a safe margin for all contingencies, I have prepared the estimate for quantities of excavation for an artificial canal throughout the whole distance from the Murray to the Edward. The full estimated cost of the weir on the Murray is also given, and the cost of the regulator on the Edward is estimated from the section of that river which I took at Deniliquin. With regard to the dimensions of the canal required to carry the proposed supply, I find that one with a bed-width of 56 feet, side-slopes of  $1\frac{1}{2}$  to 1, a fall of 1 in 5,000, and a depth of 7 feet of water, will discharge 1,076 cubic feet per second. These are, therefore, the dimensions of the channel which I propose to adopt. Allowing for a length of 36 miles of canal, with a mean depth of 9 feet of cutting, the estimate for the proposed work will stand as follows:—

Estimated dimensions and cost.

Weir across the Murray at Tocumwal	...	...	...	£30,000
Canal excavation—3,277,120 cubic yards at 1s. 4d.	...	...	...	218,475
Regulating weir on the Edward	...	...	...	20,000
Do. Wakool	...	...	...	15,000
				£288,475
Total for work	...	...	...	£288,475
Cost of survey	...	...	...	3,000
Compensation for land	...	...	...	2,000
				£288,475
Add 5 per cent. for contingencies	...	...	...	19,423
				£307,898

or, say, £308,000.

It

It has already been shown that during the months of August, September, October, and November, a supply of 1,000 cubic feet per second for the work can be depended on, and that during July and December a supply of 500 cubic feet per second is available. It need scarcely be added that throughout the remainder of the year a supply can frequently be obtained; but I take no account of this in the estimate of returns. While I believe that in many places irrigation from these works by gravitation will be practicable, I have deemed it best to assume that pumping will in every case be resorted to, and that in consequence of this a rate of only 5s. per acre will be levied for the use of the water. As the supply will flow almost entirely in old channels, the sides of which are almost impermeable, the loss of water will be very slight. Besides, as it will have to be lifted by pumping, those using it will naturally endeavour in every way to prevent waste. Under these circumstances, I have no doubt that I am within the mark in assuming that the proposed supply will irrigate at least 150,000 acres. Taking this area at 5s. per acre, which is only half of a reasonable rate when the water is delivered by gravitation, the gross return amounts to £37,500 per annum. 4½ per cent. on the outlay would amount to only £13,860, and as the length of artificial canal will be very small, the annual cost of maintenance and management will be comparatively insignificant.

Estimated revenue from the Lower Murray Canal.

I wish to call attention to the fact that in every item of these works I have purposely adopted liberal if not high rates for the cost, and maximum measurements for the computation of quantities, and have on the other hand assumed low rates in estimating the return. Notwithstanding this, the estimates show that this project, as in the case of the Upper Murray Canal System, will be highly remunerative.

Estimates based on maximum quantities and moderate returns.

In connection with the surveys for the Upper and Lower Murray Canal Systems, a point which will call for attention is the survey of the lands on the Lower Murray which are subject to inundation. Fortunately a large proportion of these lands is reserved by Government as State Forests. The following statement, for which I am indebted to the Mines Department, shows approximately the extent of the red gum forest reserves on the southern rivers :—

Land subject to inundation from the rivers.

River.	Approximate area of red gum Forest Reserves.	Remarks.
	Acres.	
Murray .....	202,110	These reserves are in some cases being reduced in area, but about two-thirds of the present total may be taken as liable to flood in ordinary seasons.
Wakool .....	39,542	
Edward .....	73,236	
Niemur .....	31,499	
Total for Murray and Ana-branches.	346,437	
Murrumbidgee .....	44,565	

From this statement it appears, that over 230,000 acres of gum forest are inundated in ordinary seasons by the Murray and its ana-branches. While I have little doubt that the division of the full supplies proposed will have no appreciable effect on these forests, claims might arise in connection with alienated lands which are benefited by floods. The record of the river gauges which have been supplied to the Government Astronomer and those which are being obtained by the Commission, will furnish most valuable evidence in connection with this question. But in addition, I think that a complete statement should be made out, showing in detail the extent, nature, and ownership of lands subject to inundation, and the dimensions and capacity of all important lakes and lagoons which are periodically filled by flood water. The readings of the river gauges, corresponding to the period when such lakes or lagoons are filled from the rivers, should also be carefully noted, and the uses (if any) to which the supplies of water thus stored are devoted.

Necessity for full information about land liable to inundation.

For some distance on both sides of Lake Moira, the land near the Murray is so low, and is inundated for such lengthened periods, that any effect which the proposed works may have on the river will be beneficial in this neighbourhood. The first place, west of the proposed works, at which any large quantity of flood-water from the Murray is stored is Taila or Benanee Lake. This is a fine natural reservoir about 2¼ miles in length by 1½ in width, and I was informed on excellent authority that during the thirty years previous to 1884 there was not a single year during which a supply failed to flow into it from the Murray. In that year alone the supply in the lake was not replenished. Mr. Bertram, of Euston, has informed me that the Murray has to rise to 10 feet on the present gauge at Euston before any water flows into the lake, and that a further rise of 3 feet would be required before any considerable extent of the low land, near the lake, would be inundated. Benanee Lake is a deep, well-defined, natural reservoir, and though there was a good supply in it at the time of my inspection, it was then 10 feet lower than it is after ordinary floods. Taila Creek, through which the lake receives its supply, is tortuous in its course and varies greatly in its cross section. At one place it widens out, and its position is almost lost in a large lake bed covered with polygonum. This large depression has to be filled before the flood-water can reach Benanee Lake.

Moira and Benanee Lakes.

Though I am confident that the effect of the works already proposed will be scarcely perceptible in time of flood, I have no doubt that the most satisfactory method of dealing with the Murray water is to take up the question in the most comprehensive manner,—that is, to deal with the entire river as far as the boundary of South Australia. In the case of Benanee Lake, a very moderate expenditure would suffice for the improvement of Taila Creek, and for the construction of a weir and stop-gate for the retention of the flood-water in the lake. I believe it will be found that by making such improvements it will be possible to increase largely the supply ordinarily stored in the lake, and also to provide for a more regular and more extensive flooding of the land between it and the river.

Necessity for dealing with the Murray as a whole.

Beyond Benanee Lake the only other important natural reservoir is Lake Victoria. This I had not an opportunity of inspecting; but the following particulars, for which I have to thank Mr. Robert Tully, of the Lake Victoria pastoral station, give a fair idea of its nature:—1st.—The lake is filled from the Murray every year through a creek called the Rufus. 2nd.—The reading on the gauge at Wentworth when the supply begins to flow in through Rufus Creek is 3 feet. 3rd.—The approximate maximum depth of the lake is 25 feet. 4th.—The banks of the lake are of white sand like that on the sea shore; the hills around it are also of shifting sand with nothing growing on them but a little barley grass in spring. 5th.—There is no record or tradition that the lake was ever dry. To these points I may add that the approximate dimensions of Lake Victoria are 9 miles by 5 miles.

Lake Victoria.

In

Opinions and evidence in support of irrigation projects.

In concluding the portion of my report relating to the River Murray I may state that, while from my first visit to Riverina I was confident that irrigation works there, on an extensive scale, would be both practicable and remunerative, I have found that my most favourable anticipations can be far more than realized. It is ground for much satisfaction to me that I am well supported in the opinions I have advanced. As already mentioned, the practicability of tapping the Murray at Bungowannah, near Albury, is endorsed by the present Water Supply Department of Victoria; whilst Mr. George Gordon, one of the foremost engineering authorities in the Colonies, and formerly Chief Engineer for Water Supply in Victoria, has given a decided opinion in favour of irrigation from the Murray by means of an offtake at Tocumwal, and he thinks that the water drawn off there can be used by gravitation. Mr. W. C. Bennett, Commissioner and Engineer-in-Chief for Roads and Bridges, has at every opportunity during the last thirty years advocated the construction of irrigation canals from the Murray, and has given the opinion that such works would not only confer enormous benefits on the country, but would, if properly carried out, afford handsome returns on the capital expended on them—for instance, see (*in Appendix to First Report of the Commissioners*) Mr. Bennett's examination before a Board of Inquiry at Deniliquin in 1866. It seems surprising that such opinions, repeatedly given by the head of an important Department, should not have led long ago to a full consideration of the important question of water conservation. It is equally surprising to observe the comparative apathy of the public—especially if we compare the almost complete absence of interest in such questions here with the enthusiastic manner in which irrigation is dealt with under very similar conditions in California. If the landowners and merchants of this Colony were to read the resolutions adopted at the recent State Irrigation Convention in San Francisco, they might at first be disposed to conclude that the persons who framed and passed those resolutions were theorists and enthusiasts, and it would no doubt be difficult for them to realize that those persons were leading representatives of agriculture and commerce in California. It must, however, be borne in mind that whilst this Colony hesitates to take any step towards a comprehensive irrigation scheme, our neighbours in Victoria display a spirit of enterprise which is well worth imitation. One thing is certain in regard to this question, and that is, that the longer we defer dealing with the question of the utilization of our rivers, and particularly of the Murray, the greater will be the difficulties which we must encounter. On the other hand, by entering at once on a complete and comprehensive system of management of our rivers, and proceeding without delay to carry out the surveys for the works which I propose in Riverina, we shall anticipate difficulties, paralyze interested opposition, and lay the foundation of a system of water conservation, without which permanent prosperity in the interior of the Colony cannot be attained.

Necessity for action.

#### THE MURRUMBIDGEE RIVER AS A SOURCE FOR CANALS.

Best site for an offtake from the Murrumbidgee.

From its junction with the Tumut River to the place where it falls into the Murray at the township of Weimby, the Murrumbidgee has a length of about 700 miles, and throughout all this distance not a single tributary of any consequence flows into it. Between the Tumut and Narrandera several creeks do contribute considerable supplies to the Murrumbidgee in times of flood; but as sources of permanent supply their value is purely local. The river also is very tortuous, and flows in an everchanging course through alluvial plains from a few miles west of Wagga to the Murray—a distance of about 580 miles. Under these conditions the loss of water from the river is naturally great, so that the discharge perceptibly diminishes as the Murray is approached—a fact which is borne out by my discharge observations, though these are not sufficient to enable me to state the proportion of this decrease. These considerations make it clear that in order to be able to draw the largest available supply as well as to command the greatest area, the river should be tapped before it enters the plains; whilst on the other hand considerations of economy in canal construction dictate the placing of the canal head as near the plains as possible. Reasoning in this manner, and after inspecting the Murrumbidgee from a considerable distance above Gundagai down to 6 miles below Wagga, I came to the conclusion that the best site on the Murrumbidgee for the head works of a canal is at the foot of the Malibo Range, and almost in a line with the boundary between the Counties of Clarendon and Bourke; and I reported to this effect on 8th April, 1885. (*See Appendix to First Report of the Commissioners.*) My recent investigations fully confirmed the favourable opinion I had formed regarding this site, and a suggestion for which I am indebted to Mr. C. W. Bolton, District Surveyor, of Wagga, has been the means of enabling me to add greatly to the proposal, which I brought forward in the report referred to. In the report of 8th April, 1885, I pointed out the possibility of diverting a supply of water from the Murrumbidgee at the site mentioned, and of conducting it through the centre of the country lying between that river on the north, and the Billabong Creek and Edward River on the south. Recently, when I was dealing more fully with the question, Mr. Bolton, in the course of a consultation which I had with him regarding the nature of the Murrumbidgee District, threw out a suggestion that a supply might be diverted at my proposed weir site along the north side of the river as well as along the south side; Mr. Bayliss, L.S., gave a similar opinion, and, as will be shown, further on, all the evidence I have collected goes to confirm their ideas on this subject.

Position of proposed site.

On my recent inspection, I found that the strip of alluvial land near Wagga through which the Murrumbidgee pursues a more or less tortuous course, runs out on the south side of the river at the Pomingalarna home station, and on the north side about half-a-mile further down. At the latter place the river impinges on a rocky ridge—the end of the Malibo Range,—and runs beside this ridge for a distance of about 300 yards. The boundary between the Counties of Clarendon and Bourke follows the summit of the Malibo Range; and the site which I propose for a weir across the Murrumbidgee is about 5 chains downstream from the point at which the county boundary meets the river. The flank of the range in the line of the proposed weir site rises to a height of 75 to 80 feet above the ordinary level of the river; but the summit of the range at the place where it approaches nearest the river has a height of at least 150 feet. On the south side of the river the low alluvial flat which begins at Pomingalarna is succeeded near the proposed weir site by a high alluvial flat, close beside which a lagoon strikes off from the river. A portion of this lagoon can be utilized for a canal, which would therefore require little excavation near its head. The edge of the high ground would in this place serve as one bank of the canal, while the other bank would have to be made up. There are few trees on this high flat, but as those found on it are gum trees, this land is probably subject to flood, and a small bank would therefore be required along the high ground as well as on the other side of the canal. In order to have the head works in solid ground throughout, it would be best to carry the southern outlet for a short distance through the high flat, and beyond this length the lagoon should be utilized. By the construction of a weir in the site shown on the accompanying plan, the following results would be gained:—

(A)

## (A) NORTH CANAL—

- (1.) This canal would start in rock cutting, and would be easily protected against influx of flood water.
- (2.) It would pass through high sidelong ground for about a third of a mile, and after that its course would lie through alluvial plains.
- (3.) The average depth of cutting in the first third of a mile would be about 20 to 25 feet.
- (4.) Rock foundations would be obtained for the canal head, and for at least the north end of the weir.

Conditions under which canals would take off.

## (B) SOUTH CANAL—

- (1.) Starting in about 17 feet of excavation, the canal would pass into the lagoon at about 200 feet from its head, and it would then have solid ground only on its right side down to the most westerly part of the lagoon.
- (2.) With the exception of the short length of cutting near its head, this canal would require very little excavation in the first half-mile of its length; but a bank would have to be made up along its left side.
- (3.) At the most westerly part of the lagoon where it begins to turn towards the river, the canal would enter cutting of about 16 feet in depth.
- (4.) The exclusion of flood-water from the southern canal would require to be very carefully dealt with, and it would probably be advisable to have a set of floodgates at the place where the canal finally enters firm ground—that is at a little over half a mile from the headworks.

For the Murrumbidgee as for the Murray, I believe that the best style of weir would be one of a similar description to those lately adopted on some of the English rivers, and it should be so designed that there will be no diminution of the present waterway in times of flood. The total length of weir required is about 300 feet, which, at the same rate as already estimated in the case of the Murray, will cost £22,500; and I do not anticipate that the cost of protection works in conjunction with the weir will add more than £500 to this amount. I therefore estimate the gross cost of headworks at £23,000.

## MURRUMBIDGEE SOUTHERN CANAL SYSTEM.

The "summer level" of the Murrumbidgee at Wagga is 562 feet above Sydney high-water mark, and that at the proposed weir site, which is about  $12\frac{1}{2}$  miles by river below Wagga Wagga, may safely be taken at 550. The best Reduced Level for the bed of the canal at the offtake would depend on several circumstances; but it must be about 548—so near that level in fact, that no difference which can occur in regard to it will affect my conclusions.

Taking 1 foot 6 inches per mile, the Reduced Level of the canal bed at 32 miles, where the Urana Branch will take off, will be 500. At 56 miles the main canal will cross the line of the Narrandera-Jerilderie Railway, and if the same rate of fall be continued, its Reduced Level at the crossing will be 464; which is a suitable level for crossing under the railway, at about 14 miles from Narrandera. From 56 miles to the head of the Conargo Branch at 77 miles, the fall would continue at the rate of 18 inches per mile, and the Reduced Level at the latter place would be 432.5. From the head of the Conargo Branch to the head of the Wangonilla Branch at 105 miles, the fall would be at the rate of 2 feet per mile, and the Reduced Level at the latter distance would be 376.5. From the head of the Wangonilla Branch, at 105 miles, to 129 miles, the fall will be at the rate of 2 feet per mile, and the height at the latter place will be 328.5. From 129 miles to the end of the canal at 186 miles, the fall will be at the rate of 18 inches per mile, giving 243 as the Reduced Level of the canal bed at the tail.

Comparing these levels with others actually known, we find (1) that a suitable place can easily be found for crossing the Narrandera-Jerilderie Railway; (2) that at 80 miles the Reduced Level of the canal bed would be 428 feet, while that of the ground on the railway line on the opposite side of the Murrumbidgee is 431 feet; (3) that the Reduced Level at 115 miles will be 358, while that at a point much nearer the river on the opposite side is 351; and (4) that at 150 miles, which is nearly opposite to Hay, the proposed Reduced Level is 298, while that of the ground at Hay is 304. While, therefore, the positions of the various canals and branches are given only as good approximations, it is evident both from the figures given and from a study of the configuration of the country, that both the positions shown for the canals, and the rates of slope stated, can in the main be adhered to.

The length of the Urana Branch will be about 35 miles, and taking the rate of fall at 18 inches per mile, the Reduced Level at Lake Urana will be 447.5 feet, that is  $87\frac{1}{2}$  feet higher than the ground level at Jerilderie. The distance in a direct line from Lake Urana to Jerilderie is only 23 miles. It is at once evident from these figures and from the known uniformity of the district, that the practicability of irrigating the plains between Lake Urana and Jerilderie direct from the Urana Branch of the Murrumbidgee Southern Canal is beyond question; but an important point to be determined is whether this can be effected indirectly by using Lake Urana as a storage reservoir, and irrigating from it. Although I have not been able to obtain any record of levels of Lake Urana, still there is important evidence available on this subject; namely, that afforded by the action of the Cocketjedong and Colombo Creeks.

So far as I have been able to ascertain, the depth of water in Lake Urana in 1870 did not exceed 12 feet, and it is doubtful whether it reached that limit. Yet the Cocketjedong Creek flowed from the lake to the Billabong Creek for several months. It will be safe, therefore, to assume that a depth of 10 feet of water in the lake will cause a flow to the Billabong Creek, as the depth in the lake was certainly under 10 feet before the flow ceased. The length of the Cocketjedong Creek is about 14 miles, and the distance from its confluence with the Billabong to Jerilderie is 22 miles—altogether 36 miles. Reasoning from the analogous cases of the Yanko and Billabong Creeks, the rate of fall in the distance mentioned must be about a foot and a half per mile, which would give the Reduced Level of the outlet from the lake as 397 feet, and the bed-level of the lake as about 387 feet. Hence if we take such measures as will enable the lake to contain water to a depth of 25 feet, its surface when full would be at a Reduced Level of 412. As already shown, the height at which, with a liberal rate of fall, a supply of water can be delivered from the Murrumbidgee at Lake Urana is 446 feet; so that even if the lake be at a height of 34 feet above that estimated, the supply from the Murrumbidgee can be delivered by the system of canals proposed. That the level of the lake-bed arrived at as above—that is 387 feet—cannot be in any important degree different to the actual elevation is evident from the following facts:—

- (1) That the country extending from Lake Urana to Jerilderie on the south-west, and to the Yanko and Colombo Creeks on the west and north-west is remarkably uniform.

(2)

- (2) That in a high flood there is a steady flow from the lake to Jerilderie through the Cocketjedong and Billabong Creeks, and that the Reduced Level of the bed of the latter creek at Jerilderie is 343, and its distance from the lake, as the creeks flow, 36 miles.
- (3.) That the Reduced Level of the land along the railway line at the part nearest Lake Urana varies from 374 to 398.
- (4.) That the Colombo Creek, at a place where its flood level has a reduced level of about 400, has been known to overflow into Coonong Creek and through it on to Urana Lake.

Practicability of filling Lake Urana from the Murrumbidgee.

These facts merit careful consideration, as in the first place they put the practicability of filling Lake Urana from the Murrumbidgee beyond all doubt; and in the second place they reduce the question of the actual level of the lake down to very narrow limits. From the second statement there can be little doubt that the Reduced Level of the bed of the lake is not less than 380; and from the fourth statement it is absolutely certain that the bed of the lake is at an elevation of less than 400 feet and that it is probably under 390. Besides establishing absolutely that the lake can be filled from the Murrumbidgee, these facts show that the fall from the river is so great that water-power on an extensive scale will be rendered available. On the other hand, the levels do not show whether the water stored in the lake can be used to irrigate the plains near Jerilderie by gravitation, though both the levels available and the height of the lake bank compared with the land adjacent lead to the belief that a considerable portion of the water stored can be so used.

Lake Urana.

Lake Urana (*see* accompanying plan) is a natural reservoir 15,000 acres in extent. After heavy rains it receives a supply of water from the Urana and Coonong Creeks, but this supply is small and precarious, so that the lake is generally dry except in a tract of swampy land which represents the deepest part of the basin. Near Coonong the bank of the lake is only 12 feet high, but it gradually increases towards the township of Urana till it reaches a height of fully 40 feet. The top of the bank here is sandy, but the bed of the lake and the slope of the bank are of heavy loam and clay. The lake bed is lightly timbered with stunted gum trees, many of which are dead. The latter furnish interesting evidence regarding the heights and duration of past floods. The height of the last great flood in the lake is clearly shown by a fringe of young gum trees, the contour traced by which touches in some places the foot of the lake bank, while at others it is 300 to 400 feet distant from it. It is evident from this that the last flood occupied but a very small portion of the capacity of the lake.

Proposed increase to the capacity of Lake Urana.

The extreme northern and extreme southern portions of the bank of the lake are lowest. That near the place where the Coonong Creek flows in has already been described as about 12 feet high, but the bed of the lake is much raised at that place. The lowest land bordering on the lake is generally considered to be that on the extreme south, and this is 14 or 15 feet above the level of the lake bed. Mr. J. J. Crowe, Appraiser of Runs, informed me that if dams were constructed at the two places mentioned, the lake could easily be rendered capable of containing water to a depth of 30 feet. The same gentleman estimated that the maximum length of dam required would be 2 miles. Taking the average height of bank required as 12 feet, which I believe is in excess of what the average will be, the quantity of earthwork required will be 183,000 cubic yards. But assuming it at 200,000 cubic yards, and taking a through rate of 1s. 6d. per cubic yard, we obtain a total cost of £15,000. On the other hand, taking an average depth of 25 feet over the total area of 15,000 acres, we find that the total capacity of the lake is 16,335 millions of cubic feet. Comparing the capacity with the cost, we find that the water will be stored at a rate of 54,450 cubic feet, or 340,300 gallons for one shilling. It will perhaps, give a clearer idea of the storage capacity thus provided, at an estimated cost of £15,000, if it is added that the quantity of water mentioned above is more than 14 times the available capacity of the Prospect Reservoir in this Colony, and nearly twenty times the available capacity of the Yan Yean Reservoir in Victoria. Considering that in a dry season the great expanse of fertile plains surrounding Lake Urana bears the appearance of a desert, and that the rising township near its margin is badly supplied with water, the fact that not only has no attempt been made to use the lake, but that attention has not even been called to its advantages, is most surprising. It is only right, however, to mention that much credit is due to the Surveyor-General and to Mr. Bolton, District Surveyor of Wagga, for their action in recommending that the lake should be reserved from sale and from lease.

Details of the Southern Main Canal system.

As a flow of 2,000 cubic feet per second will require 94½ days to fill the lake, I think the Urana branch should have not less than this discharging capacity. As I propose to have the southern system of canals on such a scale as to admit of the utilization of 1,000 cubic feet per second in addition to the supply contributed to Lake Urana, the details regarding the Main Southern Canal and Branches will be as follows:—

Description.	Length.	Rate of Fall.	Side Slopes.	Depth of Water.	Calculated Discharge.	Nature of Section.
Main Canal from head to Urana Branch .....	32 miles.	1½ feet per mile.	1½ to 1	8 feet.	3,019·4	Double trapezoid Bed, width=100' Berm width=144' Bed ..... = 62' Berm width=106'
Urana Branch .....	35 "	"	"	"	2,004·6	
Main Canal from Urana Branch to Conargo Branch .....	45 "	"	"	7 "	996·2	Bed ..... = 43'
Conargo Branch.....	61 "	"	1 to 1	6 "	218·4	" ..... = 21'
Main Canal from Conargo Branch to Wangonilla Branch .....	28 "	2 "	"	7 "	825·6	" ..... = 32'

Grand total							£1,452,000

As in the case of the Murray canals, I have taken the cross-sections of each canal, or portion of canal, as uniform throughout the whole length, though a diminution will be made in almost every case. I have also assumed that the canal will be in excavation in every case to the full depth of water provided for, though it will, in many places, be easy to arrange the level so as to have the quantity in embankments nearly equal to the excavation. In the first section of the Main Canal and the Urana Branch I have adopted a double trapezoid, as that will be the most economical as well as the most suitable style for the conditions to be fulfilled. If on examination of the subsoil it is found that a higher rate of fall can be adopted without danger to the banks and bed in these portions of the works, this should be done, as a smaller section would then suffice for the proposed discharge. I have included in the estimate the cost of carrying the Main Canal across the Yanko Creek in an aqueduct. The most economical aqueduct for this purpose will probably be an open galvanized iron flume resting on red gum trestles. With the aqueduct should be combined an escape into the creek, so that surplus water could be passed into the latter when necessary.

Probability of reducing the estimated cost.

A method has been suggested above by which the earthwork in the Urana Branch, and probably also in the Main Canal to the head of that Branch, might be reduced in an important degree. It is probable that in addition to this a large reduction might be effected in the excavation for the Wangonilla and Conargo Branches by omitting their connection with the Billabong Creek. This connection is intended to provide for carrying off water which may remain unused; but there can scarcely be a doubt that it will be easy in both cases to make arrangements by which all surplus water will be disposed of. When I was in charge of the last 56 miles of the Baree Doab Canal in the Punjab, in 1875-76, a large proportion of the surplus water was used for the irrigation of a state forest. This forest was planted shortly after the construction of the canal, on the recommendation of the engineer in principal charge, as he foresaw that years would elapse before the supply would be fully utilized, and that a large quantity of water would in the meantime run uselessly to the River Raree unless some measures were taken such as he proposed. As the system of distributaries there has since been extended, and the area of the state forest has been increased, I have no doubt that unused surplus water is now almost a thing of the past. I have every reason to believe that in Riverina a permanent arrangement of an analogous nature could easily be made.

Utilization of surplus water.

With regard to the returns which may be expected from the Murrumbidgee Southern Canal System, the first item to be considered is the value of the water stored in Lake Urana. As already shown, this lake can, on a low estimate, be made to contain a supply of over 16,000 millions of cubic feet of water. With the arrangement which I propose for filling it, I estimate that a quantity equal to the total capacity, together with the quantity lost by evaporation, will be supplied to the lake every year. This will be effected by keeping the Urana Branch running to its full discharging capacity when the river is in flood, and by diverting into that Branch all the water which can be spared from the other canals during the remainder of the year. Of the supply diverted into Lake Urana, I believe that it will be found practicable to use a large proportion by gravitation; but as the information on this point is incomplete, I shall assume only half the value which water supplied by gravitation would possess. The value then which I place on the water for the purposes of this estimate is one shilling for 10,000 cubic feet. At this rate, and taking the capacity of the lake in round numbers, as 16,000 millions of cubic feet, we find that the annual selling value of the water stored in the lake will be £80,000. The Main Canal is designed to carry 1,000 cubic feet per second, from which I allow 100 cubic feet per second for loss and waste. This leaves a net quantity of 900 cubic feet per second, and as this can be depended on for three months only on an average, I estimate that 600 cubic feet per second will be used for what may be termed

Estimate of returns.

termed complete irrigation, and 300 cubic feet per second for partial irrigation. The former quantity will irrigate an area of 90,000 acres at 10s. per acre, and the latter 45,000 acres at 5s. per acre. The return from the former will therefore be £45,000, and from the latter £11,250, making a total of £56,250 for the irrigation done in spring. But partial flooding will be carried on during the remainder of the year, so far as the supply will allow, and I believe that a moderate estimate of the returns from this will be another sum of £11,250. The gross revenue of the Murrumbidgee Southern Canal System, including Lake Urana, will thus be £147,500 per annum, or nearly 10½ per cent. on the gross outlay. 4½ per cent. on the latter would amount to £65,340, so that the annual amount left for maintenance, repairs, and profit would be £82,160, and it need scarcely be stated that the cost of maintenance and repairs would be a very small proportion of this amount.

As in the case of the Murray Canal, I have taken no credit here for the filling of dams and tanks, nor for the supply of townships with water, nor for occasional supplies to the Billabong and Yanko Creeks. In short, I have purposely estimated the work on a liberal scale and the revenue on a low basis.

#### THE MURRUMBIDGEE NORTHERN CANAL SYSTEM.

I have already mentioned that to Mr. Bolton, District Surveyor of Wagga, is due the credit of suggesting the practicability of carrying a canal along the north side of the Murrumbidgee, as well as of pointing out approximately the line which it should take. I need scarcely add, however, that as in the case of the other works proposed, I have worked out all details unaided.

Taking the Reduced Level of the bed of the Northern Murrumbidgee Canal at the head as 548, the line of canal will have to cross the railway about 37 miles from its head, about 45½ miles from Junee, and 15½ miles from Narrandera. Allowing a fall of 1 foot per mile, the reduced level of the bed of the canal at that place will be 511, and it will therefore be in about 8 feet of cutting, the reduced level of the ground at that place being 519. Continuing the same rate of fall to 60 miles, which is near Mount Bunganbil, the Reduced Level there will be 488 feet. After crossing the railway, the line of canal will pass parallel to the drainage line, at the bottom of which flows the Long Plain Creek, and will at last cross this drainage line near the source of the creek. From 60 miles to 100 miles a fall of at least 2 feet per mile can be allowed, as at this rate the Reduced Level of the canal bed at the latter distance would be 408, while that of the ground on the railway line about 4 miles distant is 401. From 100 miles to 123 miles, where the Nicholson Branch strikes off, a fall of at least 2 feet per mile may still be allowed, as the level at the latter place would be 362, while the level at the corresponding point on the railway line is 351. From the Nicholson Branch bifurcation to the end of the canal at 181 miles, the rate of fall, judging from the elevation of Hay, would be at the rate of 1 foot 6 inches per mile.

The only part of the canal regarding which doubts can be raised as to its practicability, is the portion extending from the railway to Mount Bunganbil. I am aware that the Long Plain Creek flows from north to south, and crosses the railway near the point at which I propose to take the canal across in the opposite direction, and I have also ascertained that in the flood of 1870, the waters of the Mirool Creek inundated the plains on its southern side and reached Mejum Swamp. Notwithstanding this I believe this part of the project to be practicable for the following reasons:—

- (1.) The place at which I propose to carry the canal across the railway is a low ridge running north and south, and the ground level there is 28 feet higher than the plains immediately west of Narrandera, and 17 feet higher than the bed of the Long Plain Creek.
- (2.) While there is but a very slight fall near this place from the Mirool towards the Murrumbidgee there is a very considerable fall in a westerly direction. This point tells strongly in favour of the opinion that the requisite fall can be obtained in a north-westerly direction such as that proposed for the canal.
- (3.) Supposing that it were proved that a slight increase in the elevation of the canal would be necessary or advantageous, it would be easy to design the canal so as to give it a fall of 9 inches instead of 1 foot per mile, and this would raise the bed 9½ feet at the railway crossing and 15 feet at the 60 miles distance.
- (4.) If the plains near Mount Bunganbil be so high as to necessitate a fall of only 9 inches per mile to that place, it follows that the westerly fall in the plains through which the proposed Main Canal will pass is much over 2 feet per mile, and much greater than the corresponding fall along the railway line from Narrandera to Hay. But there is no reason whatever to believe that there is any such increased rate of fall in the country along the line of the proposed canal. On the contrary, just as the Mirool Creek in flood is a very sluggish stream compared to the Murrumbidgee, thereby indicating a greater slope in the latter case, so it is natural to infer that the westerly fall in the plains near the Murrumbidgee is greater than the corresponding fall in the plains near the Mirool Creek.

On the grounds above stated, I believe it may safely be concluded not only that a canal can be constructed from the proposed railway-crossing to the plains, near Mount Bunganbil, but that a fall at the proposed rate of 1 foot per mile can be obtained. With regard to the remaining length of the Main Canal, there is no room for doubt; the Mirool Creek and the railway line afford ample evidence as to the direction and rate of fall of the unbroken plains through which the proposed canal will flow. The Mirool Creek is an excellent guide so far as it goes, but it ceases entirely at the Barren Box Swamp, near Groongal. Mr. Baylis, L.S., who surveyed the land near the end of the creek, informed me that on careful examination of the swamp referred to, he found not only that there was no outlet, but that the bank or side of the swamp was low only at and near where the Mirool enters it. Mr. Baylis ascertained that in 1870, a stream about a chain wide and 1 foot deep was flowing into this swamp for eight months. At a distance of some miles in a north-westerly direction from the Barren Box Swamp, the surface water gradually collects and flows towards the Lachlan in a creek called the Mea Mea. The manner in which this creek has been formed by the surface water is precisely similar to the case of the Coonong Creek, which flows into Lake Urana. It is probable that the Mea Mea Creek has sometimes being mistaken for the Mirool, and that this has given rise to the statements which have been made that the Mirool flows to the Lachlan.

As the information bearing on the best positions for branches from the Main Northern Canal is very meagre, and as it seems not unlikely that a large proportion of the water supply will be drawn off the Main Canal by distributaries, I have suggested two branches only—namely, the Cooper Branch, taken off at

at 66 miles, and the Nicholson Branch at 123 miles. The proposed details regarding length and sections of the Main Canal and Branches are as follows:—

Details and estimated cost of the Northern Murrumbidgee canal system.

Description.	Length in miles.	Rate of fall.	Bed width.	Side slopes.	Depth of water.	Calculated discharge in cubic feet per second.	Quantity of excavation in cubic yards.	Rate per cubic yard.	Cost.
Main Canal from head to 60 miles ...	60	1 ft. per mile.	ft. 54	1½ to 1	ft. 7	1,012·2	7,128,000	s. d. 1 6	£. 534,600
Main Canal from 60 miles to 66 miles...	6	2 ft. per mile.	36	1½ to 1	7	990·2	381,920	1 2	22,279
Cooper Branch .....	20	do ...	10	1 to 1	5	155·8	293,400	1 0	14,670
Main Canal from Cooper Branch to Nicholson Branch.	57	do ...	30	1½ to 1	7	841·4	3,160,080	1 2	184,338
Nicholson Branch.....	20	do ...	10	1 to 1	5	155·8	293,400	1 0	14,670
Main Canal from Nicholson Branch to end.	58	1 ft. 6 in. per mile.	20	1 to 1	6	344·6	1,464,320	1 2	85,419
Total cost for excavation.....									£ 855,976
Add half cost of weir on Murrumbidgee .....									11,500
Bridges for cross traffic .....									20,000
Regulators for Main Canal and Branches .....									12,000
Distributary heads .....									10,000
Surveys .....									8,000
Total .....									£ 917,476
Add 5 per cent. for contingencies .....									45,874
GRAND TOTAL .....									£ 963,350

The quantity of water which I propose to distribute by means of the Murrumbidgee Northern Canal System is the same as that estimated for the Southern System, exclusive of that for Lake Urana. The returns for the Northern System, estimated on the same low scale of rates as in the latter case, amount to £67,500 per annum; whilst  $4\frac{1}{2}$  per cent. on the estimated expended capital would be only £43,348 per annum.

Estimated revenue.

In preparing the estimate of cost in this case, I have assumed that there would be an average depth of 9 feet of cutting in the first 60 miles of the Main Canal, and for the remainder of the Main Canal and for the branches I have taken the excavation as being equal to the full depth of water in every case. I need scarcely state that it will be possible in many, if not most, places to make a more economical arrangement than this. Besides, as in the other cases already dealt with, the quantity of excavation is calculated from the cross-section at the head of each branch and at the beginning of each division of the main canal; whereas the rule will be that the cross-sections will be diminished as the supply is drawn off.

Basis of estimates.

## LOWER MURRUMBIDGEE INUNDATION CANALS.

Perusal of the evidence given before the Commission by some of the lessees of land on the Lower Murrumbidgee convinced me that no project for the utilization of the waters of the Murrumbidgee would be complete unless the claims of the land subject to inundation were provided for. On this account during my tour of inspection, I gave special attention to the nature and extent of the overflow from the Murrumbidgee in times of flood, and made careful examinations of the principal channels through which the overflow takes place, as well as of the lakes, which afford extensive storage for the flood-water.

Land subject to inundation to be provided for.

In the course of this inspection I found that there are extensive tracts of land which derive benefit to an important extent from the occasional floods to which they are liable; and that a number of lakes, the most permanent and important of which are Tala, Yanga, Paika, and Waldaira, depend almost entirely on the flood-water of the Murrumbidgee for their supply. The rise of the Murrumbidgee to a sufficient height to flood the low land and to fill the lakes is always a matter of great uncertainty, and seems to have been exceptionally uncertain in recent years. Removal of this uncertainty, and provision of means by which the low land could be flooded during even a moderate rise in the Murrumbidgee, would be of immense benefit to the owners and occupiers of the land along its banks, and would place them in an incomparably better position than they are in now even in the best season in regard to water supply. Mr. James Tyson, jun., of Tupra, in reply to inquiries which I made, informed me that the height of the gauge at Hay requires to be 13 feet, before any considerable overflow takes place on the west side of the Murrumbidgee south of its junction with the Lachlan. Mr. J. H. Morphett, of Yanga, gave 14 to 15 feet on the gauge at Hay as the height at which a good supply overflows on the east side of the river between the Lachlan and Balranald. From Balranald to the Murray the information I was able to obtain was not conclusive, as the question there is complicated by the action of back-water from the Murray. Judging from my inspection of the outlet to Lake Waldaira and of other places between Balranald and the Murray, I believe that a much smaller rise at Hay would cause an overflow at those places than would be required to produce a similar effect between Balranald and the Lachlan. Mr. A. Lawrence, of Canally, informed me that the Murrumbidgee water commenced to flow into Lake Waldaira on 23rd August last, when the height on the Hay gauge was only 5 feet. Comparing these facts with the river records, I find that a great proportion of the low lands which depend so largely on the Murrumbidgee floods can have derived no benefit whatever from that source during the years 1883, 1884, and 1885. In 1882 when the river rose to over 22 feet on the gauge at Wagga, the corresponding rise at Hay was only 16 feet and the height at the latter place remained over 13 feet for eight days only. Under the system which I now propose, a supply of flood-water would have been obtained on the Lower Murrumbidgee during that year for at least 19 days; during 1883, for 18 days; during 1884, for 6 days; and during 1885 for 11 days; and that, too, after allowing for the maximum supply which I propose to draw from the river near Wagga. It may be here pointed out that the discharge corresponding to a height of 21 feet on the gauge at Wagga is over 24,000 cubic feet per second, that is more than six times the total quantity which I propose to divert near that

Lands benefited and lakes filled by flood-water.

Uncertainty of overflows.

that place. During the eight days corresponding to those on which the gauge at Hay was over 8 feet in 1882, the mean discharge passing Wagga must have been about 20,000 cubic feet per second. If we deduct 4,000 cubic feet per second from this as the quantity to be diverted into the proposed canals, and an equal quantity for loss from the river between Wagga and Hay—and the latter is certainly a high allowance—the quantity available for flooding purposes below Hay, was 12,000 cubic feet per second. This volume of water flowing for eight days only, was sufficient to flood 571,240 acres to a depth of 4 inches; but I have no doubt that the useful work done by that flood was only a small fraction of this.

Importance of flood-waters.

Proposed method of ensuring the distribution of flood-waters.

The method by which I propose to ensure the distribution of a proportion of every ordinary flood over the low-lying land on the Lower Murrumbidgee is to construct a series of weirs in the river, leaving the various owners and occupiers of the land to distribute the waters according to their requirements. I have not the slightest doubt that with the supply of water thus assured, those benefiting by the weirs would gladly pay the interest on the cost of their construction. I have not had the opportunity of deciding on all the sites at which weirs will be required, but have, however, inspected those which would, I believe, be found the most suitable.

Yanko Creek.

The possible necessity for a weir in the Murrumbidgee below the head of the Yanko Creek is a question which it is better to allow to stand over pending further observation of the effect of the work now being done for the improvement of that creek. As the work already done has been of great service, and as further important improvements are in progress, I do not anticipate that there will be any necessity for a weir. In past years the creek flowed only during high flood, and on such occasions the entire supply which I propose to draw off near Wagga will produce very little perceptible effect on the river. Besides, the Southern Canal System will carry a high level supply every year through the district in which the Yanko Creek affords a much smaller supply at a low level at the uncertain intervals when there are high floods in the Murrumbidgee.

First site for weir below Hay.

At a distance of about 12 miles west from Hay, and at the boundary of the Pevensy Run, there is a short lagoon of the common horseshoe type, on the south side of the Murrumbidgee. The west side of this lagoon is the first place, after the Yanko Creek, at which the Murrumbidgee overflows in any great quantity in ordinary high floods. In extraordinary floods the river overflows its southern bank in many places; but these occurrences are very rare, and need not be taken into account. Hence Pevensy on the Murrumbidgee corresponds closely with Tocumwal on the Murray, and, as at Tocumwal, the banks here are of about the same height on both sides of the river. At the time of my inspection the river gauge at Hay showed a height of 11ft. 2in., and the banks at Pevensy were from 10 to 12 feet above the surface of the water. A rise of 9 feet in the surface level would have been required before the water would begin to flow over in a south-westerly direction. The width of the Murrumbidgee here at the surface level is scarcely 170 feet, that is, slightly less than at Hay.

Nature of weir proposed.

Immediately below the lagoon a weir could be constructed without any difficulty. The highest land there on both sides of the river is timbered with box, and the distance between the box land on the two sides of the river is about 500 feet, of which about 250 feet would be on the river proper, and the remainder on a gum flat on the north side. The height of the box land above the surface of the river at the time of my visit was about 13 feet, while the gum flat referred to was from 5 to 7 feet above the surface level. The style of weir which I propose for this place is one similar in its general description to those which are now commonly adopted in Victoria—that is, a weir fixed for the greater part of its height, but at the top provided with moveable panels. A suitable weir of this description could, I believe, be constructed for £6,000. The line of canal and the branches show the directions in which the flood-water could be diverted most easily, so far as the available information shows; but this is a point which, as already stated, I propose to leave to the landholders to deal with.

Other weirs proposed.

Below Pevensy a series of weirs will be required, the first probably near Maude, and the second below the junction of the Murrumbidgee and the Lachlan. Regarding the site for the latter weir, Mr. James Tyson, jun., suggested a place called Coliegunyah, about 3 miles below the junction of the two rivers; but I ascertained that that site would labour under the disadvantage of being of little use to the land on the east side of the river. It is doubtful, however, whether a site which will suit the requirements of both sides of the river can be found in this neighbourhood. I followed up the course of the Murrumbidgee on its east side to a place called Redbank, within a few miles of Coliegunyah, and failed to find such a place. It may, therefore, be necessary to have two weirs within a few miles, below the junction with the Lachlan—one for the benefit of each side of the river.

Proposed weir at Yarrowal.

The next place where a weir will be required is about 10 miles up stream from Balranald, where there is an excellent site at the parish of Yarrowal, in the Paika Lake run. In this case also the site is more favourable for the west than for the east side of the river, as the flood-water will fill Paika and several other lakes. The width of the river here is only about 140 feet between the tops of the banks, and the foundation of the weir will be in soft rock. A substantial weir can be constructed here for £2,500.

Proposed weir near Balranald.

A weir on the Murrumbidgee, at a short distance down stream from Balranald, would have the double advantage of benefiting the town and the low-lying land on both sides of the river. Levels would, however, be required to determine the most suitable site to serve both purposes. The question of providing for navigation has also to be borne in mind. I estimate that a suitable weir, fixed throughout the greater part of its length, but having a moveable portion of sufficient length to permit of navigation, could be constructed for £7,000.

Proposed weir near Lake Waldaira.

About 10 miles above the junction of the Murrumbidgee with the Murray, is the outlet through which the flood water from the former river fills up the Waldaira and other lakes. The mean width of the Murrumbidgee at that place is about 135 feet. About 500 feet down stream from the main outlet creek which fills Lake Waldaira, is a smaller outlet, 10 to 11 feet above the surface of the river at the time of my inspection. This flows into the main outlet, which is called Manie Creek. This creek, at a distance of about  $1\frac{1}{2}$  miles from the Murrumbidgee, divides into two, one part going to Lake Waldaira, and the other back to the Murrumbidgee. A dam has been thrown across the latter part so as to direct the whole of the overflow to the lake. Beyond Lake Waldaira, and connected with it by a creek, is a large lake bed which is filled only during very high floods. This lake is known to have received flood-water from the Lachlan through the Willandra Billabong. A weir constructed on the down stream side of the smaller outlet to Lake Waldaira would have the effect of keeping that lake permanently supplied, besides flooding low lands on both sides of the river. I estimate that the cost of a weir which would fulfil these purposes and provide for navigation would be £6,000.

The

The total probable cost of weirs for the Lower Murrumbidgee would thus stand as follows:—

Pevensey Weir	... ..	£6,000	Estimated cost of weirs.
Maude	... ..	5,000	
Two near Lachlan Junction at	£4,000	8,000	
Paika Weir	... ..	2,500	
Balranald Weir and Navigable Pass	... ..	7,000	
Waldaira	... ..	6,000	
Total		£34,500	

Interest on this sum at  $4\frac{1}{2}$  per cent. amounts to £1,552 10s. per annum. In other words, this is the sum which the landholders from Pevensey to the junction of the Murrumbidgee would have to pay annually to the Government, in return for a full river permanently, and an overflow at least once a year.

#### STORAGE OF WATER ON THE MURRAY AND MURRUMBIDGEE.

In dealing with the question of storage of water in Riverina, the points which first call for consideration are (1) the necessity for such storage, and (2) the use for which the water so stored is required. Regarding the former point, the result of my inquiries showed that in the case of the Murray, the supply in the river has on the whole been so regular that the necessity for supplementing it in dry seasons by means of reservoirs in the upper part of the basin has never been felt; but that in the case of the Murrumbidgee, the great range of the river from low supply to high floods has frequently raised the question of storing a portion of the flood-waters, so as, to some extent, to equalize the flow. In both cases all the evidence tends to show that abundance of water is always available for stock; but that if water were supplied for irrigation purposes to provide hay, &c., for tiding over bad seasons, and increasing the productive capabilities of the land, there would be a strong demand for it, particularly in dry seasons. The conclusion at which I arrived in regard to the Murray was, that while there is no immediate necessity for storing flood-water on the upper parts of that river, such necessity will arise when the value of water becomes better understood; and therefore, that if reservoir sites are to be found in which water can be stored at a reasonable cost, they should be reserved or resumed by Government. In the case of the Murrumbidgee, the greater uncertainty of the supply, and the enormous volume of the flood-water which flows to waste, taken into consideration with the demand which exists for it, would warrant immediate steps towards carrying out storage reservoirs.

Necessity and  
objects for  
storing flood-  
waters.

Although I made inquiries on the subject, I heard of no sites for reservoirs on the Upper Murray, which, with the limited time at my disposal, would have justified a visit. On the Upper Murrumbidgee the question stood in a different position, as a site was actually surveyed there for the Commission by the late Mr. C. Haylock, L.S., and at the request of the Commission I had examined and reported on the plan and sections which Mr. Haylock submitted (*see Appendix to First Report of the Commissioners*). Lob's Hole, at the junction of the Tumut and Yarrangobilly Rivers was also mentioned in evidence before the Commission as a favourable place for storing flood-water to augment the supply in the Murrumbidgee. Under these circumstances, I deemed it necessary to include these proposed reservoir sites in my tour of inspection. Lob's Hole I found to be altogether unsuitable as a site for a reservoir, as the valleys of both the Tumut and the Yarrangobilly are narrow, and the inclination of both rivers comparatively steep. The case of the Tantangara Basin is quite different, as a very large body of water could certainly be stored there by the construction of a dam at The Gulf. On examination of Mr. Haylock's plan and section I reported that, judging from them, a dam having a mean length of 300 feet, and a maximum height of 84 feet, would impound 2,416 millions of cubic feet of water. The impression which I received on inspection of the site was that the storage capacity is even greater than that indicated by the plan, as the dam would throw back the water to a considerable distance up the course of Little Nungar Creek in addition to covering the area surveyed. One important disadvantage of the Tantangara Basin is its great distance from the Riverina plains, owing to which the water stored would be diminished considerably in quantity before it could reach the district in which it is required. The whole question of the utilization of the Tantangara Basin depends on the cost of storage. In connection with this I found that stone suitable for concrete or masonry can be obtained in abundance at the proposed site of the dam, and that no difficulty would be experienced in carting cement to that place. The dam would require to be of solid masonry or concrete, it would have a rock foundation and would abut on rock at both ends. As the capacity of the reservoir has, I believe, been under estimated owing to incompleteness of the survey, and as, even with the storage estimated, the reservoir could contribute over 300 cubic feet per second for three months when the river is low, I strongly recommend that a complete contour survey of the basin should be made.

Possible sites for  
reservoirs.

Tantangara  
Basin.

The natural storage reservoirs in the Riverina plains are much greater in number and importance than is generally known. Tala and Yanga contain large permanent supplies and Paika is almost permanent, so that it seems surprising that more use has not been made of them. Lake Urana which has already been dealt with is the only one which, in my opinion, is well situated for use in connection with a great irrigation project benefiting a large number of persons. But there is a series of lakes besides Tala, Yanga, and Paika, all of which are of large storage capacity, and which will be filled annually when the proposed weirs are carried out. In these cases the diverted flood-water will be distributed by the landholders, and the filling of the lakes as well as the flooding of the land will have to be a matter of mutual understanding and agreement on the part of those interested.

Lakes in the  
plains of  
Riverina.

#### NAVIGATION.

On the Murray, navigation above Tocumwal has all but ceased, as will be seen from the table in the Appendix, for the figures in which I am indebted to Mr. C. C. Pope, of the Customs Department, Moama. The only river traffic of any importance above Echuca is in timber, which is chiefly obtained between Tocumwal and Bama. The table also shows the amount of traffic on the Edward and the Murrumbidgee, the figures in the latter case illustrating the rapid fall in the number of steamers since the railway to Hay was opened. As there is every reason to anticipate a continued decrease in the river traffic above Balranald, I have not, in the estimates already given, provided for navigation above that place.

Decline of river  
navigation.

In connection with the subject of river navigation there is a point which was mentioned to me by Mr. J. H. Morphett, of Yanga, which is worthy of note. Mr. Morphett informed me that he had observed that

Damage caused  
to the river banks  
by steamers.

that the wash from the river steamers had carried away the banks of the Lower Murrumbidgee to such an extent as to affect the height to which the flood-water rises. The channel has, in his opinion, been enlarged, and the increased waterway allows the flood-water to escape more freely, so that the flood cannot rise to such a height as formerly.

The most important use of our rivers.

On the whole, the navigation of our south-western rivers is beset with so many difficulties and uncertainties, that its decline is not surprising. Already the generally accepted opinion among those who have studied the question, is the same as that given in his evidence before the Commission by Mr. Bennett, Commissioner and Engineer-in-Chief for Roads and Bridges, namely, that "in future the rivers will be utilized for the purpose of water supply, and in producing something to transport rather than in transporting it."

#### SUMMARY AND CONCLUSIONS.

Action required.

In the foregoing report I have endeavoured to show what can be done with the waters of the Murray and Murrumbidgee, and have indicated the best places for drawing off the supplies, and the methods by which the water can be distributed. We have now to consider the important question: What steps should first be taken towards carrying out the proposed works? In reference to this there are two matters which must be attended to before the works are initiated, but which call for attention without delay, whether the proposed works are carried out or not. These branches of the question are—(1) The systematic gauging of the rivers, and (2) legislation regarding water rights.

Necessity for systematic gauging of the rivers.

The gauging of the rivers is a work which urgently demands attention. In the case of the Murray, a knowledge of the volume of water corresponding to all heights on the gauges is an absolute necessity, in view of questions which are arising on the subject of intercolonial rights. But in addition to this, the gauging of both the Murray and Murrumbidgee, and indeed of all our rivers, is a primary step towards the utilization of the available supply and the protection of the rights of the State and of individuals. In their relation to the subject of irrigation, our landholders may be divided into three classes:—1st, those who believe in the benefits of irrigation, and who make the most of their opportunities to practise it; 2nd, those who from want of information or experience on the subject have no settled opinion regarding it; and 3rd, those who are directly opposed to irrigation, either because they think it is impracticable, or because they think it is not required, or because they know it would promote settlement on the land. The numbers of the first class, who, it is almost needless to state, include the most enterprising settlers, are making use of the opportunity afforded by the inaction of the others. It behoves the Government, both in its own interests and in those of the persons immediately concerned, to make itself acquainted with the extent to which the natural supply of water is utilized, and, while protecting both its own interest and those of private individuals, to avoid placing any check on legitimate enterprise. The systematic observation of the discharge of the rivers is the first step towards placing the Government in a proper position in regard to these questions.

Necessity for legislation.

The necessity for legislation in regard to water rights is admitted on all hands; but only the few who have had an opportunity of making a practical study of the question are aware of the urgency for action. As a means of stifling enterprise, by preventing the utilization of the natural water supply of the country, the British Law of Riparian Rights could scarcely be excelled. For instances of the operation of this monstrous law we have only to look back on the records of dams which have been constructed and guarded by armed men; of other dams which, after construction in this way by one armed mob, have been cut through by another; of many cases where dams were needful but were not built through fear of litigation, and of the purchase of extensive pumping plant which frequently lies idle for the same reason. The evils arising from the British law of Riparian Rights were brought prominently to public notice in California about a year ago in an important lawsuit, the immediate result of which was to temporarily stop the progress of irrigation in that State and cause serious losses to some of the irrigators. "Anti-riparian leagues" were promptly formed throughout the State, and no doubt legislation of a remedial character will be passed, if it has not been passed already. In this case proper legislation appears not to have been thought of till the public indignation was aroused by the stoppage of agricultural enterprise, and by the losses to individual irrigators. This mistake has been avoided by our neighbours in Victoria, who have anticipated difficulties by passing a comprehensive bill, limiting and defining riparian rights after the manner proposed in the draft bill contained in the First Report of the New South Wales Water Commission.

Necessity for complete surveys.

In the statement descriptive of the projects which I have here brought forward for systems of canals from the Murray and the Murrumbidgee, I believe that I have shown ample ground to warrant the commencement of surveys for the proposed works. On the manner in which these surveys are carried out will depend largely, not only the first cost, but the efficiency of the proposed canals. In Mr. Deakin's very instructive report on irrigation in America, the evils arising from the neglect to make proper surveys as well as from the want of engineers acquainted with canal construction are clearly set forth. As an instance of this, Mr. Deakin says "There are thirty-two canals taken out of the Kern River where eight would have been abundant; and at Fresno, half-a-dozen where two would have sufficed. What loss this involves may be estimated from a calculation of the State engineer, who, after a careful examination of two of these canals, finds that their combined stream could have been carried in one channel, at a saving of 20 per cent. of the water conveyed. The engineering defects of such works are palpable, and are not disputed or disguised." This state of affairs is readily explained by Mr. Deakin's remark "These works have been built often without engineers, almost always without plans." No doubt he might have added "without surveys". Facts such as these show that the first step towards the preparation of the most suitable designs for canal works is a comprehensive survey carried out under experienced supervision. I may add, also, that while works such as those now proposed cannot be constructed without legislation, I am not aware that there exists any such bar to the prosecution of the surveys. If my estimate be correct regarding the annual loss which the Colony sustains through neglect to utilize the waters of the Murrumbidgee and the Murray, the figures I have given will recommend the commencement of the surveys more forcibly than would any words which I can use.

I have the honor to be,

Gentlemen,

Your obedient servant,

H. G. M'KINNEY, M.E., M.I.C.E.,

Engineer to the Commission.

LIST

LIST OF APPENDICES TO IRRIGATION AND WATER CONSERVATION  
IN RIVERINA.

(A) *Printed Matter.*

1. Tabular statement showing abstract of readings of the river gauge at Albury from 1879 till 1886.
2. Tabular statement showing abstract of readings of the river gauge at Wagga from 1879 till 1886.
3. Statement showing the dates and heights of the most important floods in the Murrumbidgee since 1853.
4. Gaugings of the River Murray at Echuca since 1865, as made by the Victorian Department of Water Supply, and kindly supplied to me by Mr. Stuart Murray, Chief Engineer.
5. Tabular statement regarding the Murray River trade prepared by Mr. C. C. Pope, of the Customs Department, Moama.
6. Tabular statement regarding the Murray River trade prepared by Mr. D. J. M'Kinnery, of the Customs Department, Wentworth.

(B) *Plans.*

1. Map of the Murray and Murrumbidgee Districts, showing the proposed canals on a scale of 4 miles to an inch.
2. The same map as above on a scale of 16 miles to the inch.
3. Diagram showing discharge of the Murray at Albury from 1879 to 1886.
4. Diagram showing discharge of the Murrumbidgee at Wagga Wagga from 1879 to 1886.
5. Cross-section of the Murray at Albury.
6. Cross-section of the Murray at Tocumwal.
7. Cross-section of the Edward at Deniliquin.
8. Cross-section of the Murrumbidgee at Wagga.
9. Diagram showing heights of the Murray at Albury, Echuca, and Swan Hill, kindly supplied by Mr. George Gordon, late Chief Engineer for Water Supply in Victoria.

## GAUGINGS OF THE MURRAY RIVER AT ECHUCA.—MEMORANDUM.

*Site.*—These gaugings of the Murray have been taken at the railway bridge which crosses the river from Echuca to Moama; the bridge being about 25 chains above the site of the gauge-staff. A section, by levelling and soundings, has been made of the waterway at the downstream face of the bridge, and of its continuation by the timber viaduct across the low ground on the New South Wales side of the river.

*Current Velocities.*—Velocities of the current have been measured by current-meter (Révy's pattern) similar to that previously used for obtaining velocities in the Goulburn, Loddon, Mitta, Kiewa, and Campaspe Rivers. Such measurements were obtained for the following river levels, viz.:—18ft. 6in., 15ft. 6½in., 11ft. 7in., 7ft. 3in., 3ft. 11in., 2ft. 9in., and 1ft. 9in. on the gauge at the Echuca Wharf. As the water-level in no case remained quite constant throughout the operation of gauging, the recorded velocities in each set have been reduced, where necessary, to the level at which the greatest discharge was actually measured in that set; so as to obtain final results dependent, as far as possible, on actual measurements rather than on measurements amended by equation. Where reductions had to be made, the velocities throughout a vertical were reduced in the ratio, ascertained by direct measurement, of the variation of surface velocity at that vertical. At 15ft. 6½in. on the gauge, surface velocities only were measured; but at all the other levels complete sub-surface velocities were obtained. These were taken in verticals, 10ft. apart across the stream, at 4in. under the surface of the water, at 8in. above the river bed, and at intermediate points not exceeding 5ft. apart. The method employed for measuring the sub-surface velocities was that described in Révy's "Hydraulics of Great Rivers." The instrument was allowed to record for about 3 minutes at each immersion, the exact time being noted by chronograph. At each point of measurement two readings at least were taken; if these were discrepant, further trials were made until satisfactory agreement was obtained. A difference of about 5 per cent. in the number of revolutions per minute was allowed; and, although this margin was sometimes slightly exceeded, usually the difference was much less. The means of the adopted readings were employed in the computations. The greatest depth at which velocities were obtained was 37ft. 4in. The measurements were taken on a line drawn across the river channel, 17ft. below the downstream face of the bridge; except in the case of those corresponding to 3ft. 11in. on the gauge, which were taken some distance down the river, applied to the section at that point, and the resultant volume divided by the area of the cross-section at the bridge to obtain the mean velocity there.

*Computations.*—The mean velocity in each vertical is computed from a diagram, constructed by plotting a curve of velocities from surface to bottom; the depths being drawn to a scale of 4ft. to an inch, and the velocities plotted as ordinates to a scale of 40ft. per minute to an inch. The mean velocity in the vertical was then obtained by dividing the area of the figure, contained between the vertical and its corresponding curve, by the depth. With these mean velocities in verticals, as ordinates to a horizontal line representing the water-level, a curve of mean velocity was plotted on a diagram of the cross-section of the river for each gauging. The discharge was then computed by multiplying each portion of the area of the cross-section, contained between adjacent verticals in which velocities were measured, by the mean ordinate for that area, and adding the products. At 15ft. 6½in. on the gauge mean velocity was reduced from surface velocity by comparison of surface with mean velocity at 18ft. 6in., and at 11ft. 7in. At 18ft. 6in., this ratio was 1 : 0.966, and at 11ft. 7in. it was 1 : 0.901; at 15ft. 6½in. it was taken as 1 : 0.938. Finally, a curve of mean velocities for all levels of the river was plotted as follows:—the work being similar to that already described in the case of the Goulburn. The total volume of discharge at each level divided by the cross-sectional area of the flowing water was used to obtain mean velocity at that level. These were plotted as ordinates to a curve, the abscissæ representing the corresponding values of the hydraulic radius. The curve thus plotted passes through the extremities of all the ordinates except those at 2ft. 9in. and 1ft. 9in., one of which falls a little without and the other within the curve. At these levels there were contrary currents, whose velocities had to be treated as negative quantities, and apparently still water, giving no velocity ordinates. The discrepant character of the final velocity ordinates at 2ft. 9in., and at 1ft. 9in., may be in some way related to these facts. The mean velocity curve was produced to find the velocity of the river at higher levels than those at which gaugings were made. The discharges on the flat banks extending back from the main river channel have been computed separately. On the Victorian bank, which is comparatively clear, the velocity was taken as bearing the same ratio to that in the main channel, as the square root of the hydraulic radius of the waterway on the bank does to the square root of the hydraulic radius in the main channel, for the same surface level. On the New South Wales bank, which is covered with thick scrub, a much lower velocity was arbitrarily assumed.

*Staff-readings.*—The daily levels of the river down to March, 1886, used in computing the tabulated discharges, have been obtained from a file of the Melbourne *Argus*, in which newspaper they have been published since September, 1865. For the years 1866 and 1869 the records are incomplete, the heights being omitted for some months when the river was low. The staff-readings for Sundays, and for other occasional days for which no records have been published, are interpolated as intermediate between those of the preceding and succeeding days. Some obvious typographical errors were similarly corrected. In March, 1886, a gauge-staff was erected by the Victorian Water Supply Department at the Echuca Wharf, from which daily readings are now being taken. The zero of this gauge was set at the same level as that of the gauge from which the readings published in the *Argus* were taken, viz.:—276.83 feet above L.W.M. Hobson's Bay, to Echuca Railway datum. The highest recorded flood occurred on the 4th November, 1870, when the reading was 38ft. 9in. To ascertain whether the readings given in the *Argus* were reliable, full inquiry was made; when it was found that they had been taken daily by the Wharf Master, telegraphed to Melbourne, and posted at the General Post Office for public information. There is no reason to doubt their accuracy.

*Drainage Area and Rainfall.*—The drainage area of the Murray at Echuca consists of 13,200 square miles of ranges and mountainous country, 3,120 square miles of undulating country, and 3,080 square miles of plains, or a total of 19,400 square miles. Of this area, 16,400 square miles are in Victoria, and 3,000 square miles in New South Wales. The rainfall and proportion of total rainfall discharged are given in a table for the years 1883, 1884, 1885, and 1886. The rainfall has been obtained from the yearly rainfall maps published at the Observatory. The records prior to 1883 are insufficient to enable it to be ascertained, especially for the Upper Murray basin. The proportion of total rainfall discharged by the Murray at Echuca is about one-half of that for the Goulburn at Murchison, for the four years for which it is given.

No opportunity occurred during last year of gauging high flood discharges at Echuca, but as the velocity readings extend from 1ft. 9in. to 18ft. 6in. on the gauge-staff, and are well distributed, and the level at which the river would cease to flow has been ascertained, and used as the point of origin of the final velocity curve, and as that curve passes through the extremities of all the ordinates, with the comparatively unimportant exceptions before noted, there is no doubt that the velocities used, and therefore the resultant volumes of discharge, are accurate, within practical limits, up to about 24ft. on the gauge-staff. The computed discharge of the river, when at this level, is 1,130,250 cubic feet per minute, and all discharges not exceeding this may be taken as quite reliable. Higher discharges can only be looked on as approximations, and more subject to error the more they exceed those obtained by actual measurements. It is believed, however, that even the highest tabulated discharges may be taken as fair approximations.

To enable some idea to be formed of the flood discharge of the Murray River at Echuca, it may be pointed out that, during the months of July, August, and October, 1870, the mean discharge was equal to rather more than twice the capacity of the Yan Yean reservoir in every twenty-four hours; whilst for the months of October and November in the same year it was equal to nearly three times the capacity of that basin in every twenty-four hours.

STUART MURRAY,  
Chief Engineer of Water Supply.

If the gauges at Albury and Wentworth each stand at 6 feet, there will be sufficient water for through navigation. The heights required for through navigation on the Murrumbidgee are 8 feet at Narrandera, 6 feet at Hay, and 4 feet at Balranald. By the term "value of trade" is here meant only the value of the cargoes taken up the rivers from Moama.

Barges, 131; average tonnage of each about 150 tons.

Custom House, Wentworth, 26 June, 1886.

D. J. M'KINNERY,  
Sub-Collector of Customs.

REPORT

## REPORT ON THE PROPOSAL TO DIVERT WATER FROM THE SNOWY RIVER INTO THE MURRUMBIDGEE AND LAKE GEORGE.

To the President and Members of the Commission,—

Gentlemen,

Consequent upon Mr. Surveyor-General Adams' evidence taken by the Commissioners as to the possibility of diverting the waters of the Snowy River into the Murrumbidgee River, Mr. Licensed-Surveyor Haylock was instructed two years ago to carry out a contour survey between a point on the Dividing Range 10 miles above Cooma and the proposed point of diversion on the Snowy River.

This survey was left uncompleted when only about one-half the necessary distance had been traversed ; consequently Mr. Haylock's investigation was rendered of no material value to the Commission.

The question as to the possibility of the scheme being still in abeyance, it was decided to set it at rest before closing the Commission, as far as could be determined, by a reconnaissance of the country and the taking of barometric levels.

I was therefore deputed by the Commission to make a cursory examination of the country, and to connect by barometer readings the terminal point of Mr. Haylock's survey with the proposed offtake on the Snowy.

I have now the honor to submit the result of my investigations.

The lowest gap in the main divide between the Snowy and Murrumbidgee Rivers is situated near the main road from Cooma to Jindabyne, and at the head of Slack's Creek, a tributary of the Murrumbidgee, also distant about 11 miles in a south-west direction from the town of Cooma, and about 300 feet higher in altitude. This position in the range was ascertained by Mr. District-Surveyor Betts, and in his deduction I concur.

The trend of the divide is from N.W. to S.E., and the country is exceedingly open, gently undulating, and of trap and granitic formation alternating.

The bench-mark at this initial point in the range I observed as being approximately 3,000 feet above sea-level, and for reference as a datum it will be designated as being of that altitude, and through this gap the Snowy River waters must be conducted for the purpose of augmenting the supply in the Murrumbidgee, and for the irrigation of the rich plains of Monaro, extending towards Myalla and Bombala on the south, and Micilago on the north.

Mr. Haylock ran a contour line from this gap in the divide for a distance about 31 miles westerly towards the Snowy River, following approximately the course which the proposed conduit would take. Over this distance the country is rolling, and of trap and granite formation, with a considerable depth of subsoil. Although Mr. Haylock's contour appears exceedingly sinuous, in consequence of the number of small creeks around the heads of which his traverse was conducted, yet there are no engineering difficulties in the way of excavating a canal to conduct the water ; and in many instances a short tunnel or aqueduct would materially shorten the distance. The main obstruction in the way of the scheme is a high range known as the Jindabyne Range, and a spur from it called Varney's Range, which intercept the direct course the conduit would take between the Snowy River and the terminal point of Mr. Haylock's survey.

The Jindabyne Range rises with considerable acclivity from the bed of the Eucumbene and Snowy Rivers to a height of 700 or 800 feet, and as far as I could ascertain there exists no possible gap in this range through which the waters could be conducted.

It would be necessary to contour round the southern extremity of Jindabyne and Varney's Ranges, thereby increasing the length of excavation very considerably, as shown on the accompanying plan. This, however, I believe, could be materially reduced by tunnelling from the Eucumbene to the Wullwye Creek, as will appear from the same plan.

From simultaneous readings of the aneroid barometer, I found that the junction of the Eucumbene and Snowy Rivers was 153 feet below the gap in the divide between the Murrumbidgee and Snowy ; the junction of the Crackenback and Snowy, about a mile above the point where the Eucumbene joins the Snowy, is practically of the same elevation.

The Eucumbene River takes its rise on the Kiandra Plains, and drains a large extent of country in its flow to the junction of the Snowy, the length of the river from its source to this junction being about 50 miles, and the watershed area 520 square miles.

I observed that the Snowy River, about 5 miles above its junction with the Crackenback River, showed a greatly increasing grade for every mile traversed up stream, flowing over granite boulders of considerable size. No reach of water exists, such as is to be found near its junction with the Eucumbene, and the ranges on each side rise to a height of a thousand feet above the bed of the river.

I noted the height at the junction of the Gungarlin and Snowy Rivers to be about 3,350 feet above sea-level, or 350 feet above the point where it is proposed to cross the divide at the head of Slack's Creek.

The discharge of the Snowy River at a very short distance below this junction, at a time when the river was abnormally low, was estimated by Mr. District-Surveyor Betts, and subsequently by myself, as 8,000,000 gallons per hour ; and it is estimated that the combined waters of the Crackenback, Snowy, and Eucumbene would ensure a minimum supply of 16,000,000 gallons per hour.

Indications on the bank of the Snowy showed that the river was fully 10 feet higher during the melting of the snow than at the time of my visit in February ; and within my own observation, after 1 inch of rainfall being registered on the gauge, the river rose 2 feet higher. The action of wind upon the snow-drifts has been known to cause a rise of 2 feet in the height of the river. According to Mr. Betts, the river is in flood during the melting of snow from the middle of September to the end of December. Roughly speaking, he estimates that the section would be 100 feet wide, 8 feet deep, with a velocity of 3 to 4 miles per hour—equivalent to a discharge of about 90,000,000 gallons per hour.

The Snowy and Gungarlin Rivers drain 32 miles along the course of the Australian Alps from Mount Kosciusko (the highest peak in Australia, 7,260 feet) to Bull's Peak and Clear Hill, embracing the principal snow-fed tributaries.

I propose that the canal should tap the Snowy River at a point about 2 miles below the Gungarlin junction, and at 3,180 ft. elevation, or 180 ft. level above the gap in the divide at Slack's Creek; the Crackenback, if necessary, being deflected into the Snowy to meet the point of offtake. The proposed canal would cross the Eucumbene near Burn's Creek, at 3,170 feet level, or, according to Mr. Surveyor Pennefather's recent observations, at 170 feet above the gap at Slack's Creek. The Eucumbene above this junction has a drainage of 495 square miles, and is largely augmented by snow-waters, the mean rainfall alone at Kiandra being 61 inches.

I consider there are no engineering difficulties to prevent the construction of a canal from the Snowy to the Gap over the course as proposed on the plan. The nature of the country is entirely granitic, with occasional outcrops of trap formation, and where rock is met with it is chiefly of decomposed granite, and not difficult of excavation.

There are so many permanent feeders to the Snowy River below the proposed canal that I consider no private or public requirements would suffer by the diversion.

The approximate length of the canal to the Gap, as taken from the accompanying map, would be 79 miles, but if  $6\frac{1}{2}$  miles of tunnel and fluming were substituted its length would possibly be reduced to 38 miles.

The water in the Snowy River is particularly pure and wholesome, but that in the Eucumbene is impregnated to a considerable extent by the clay-washings from the sluicing operations at Kiandra Gold-field.

Should it be possible to construct the proposed canal, the diverted Snowy waters would not only give the largest augmentation to the volume of the Murrumbidgee at a time of year when but little supply would be available, but they would command the whole of the Monaro Plains, from Micilago on the north to Bombala on the south, the greater part of which land is admirably adapted to the growth of cereals.

I may point out that the Snowy River, below the Eucumbene junction and at Buckley's Crossing, runs through many miles of fine open country, which is to a large extent cultivated; but near its point of discharge, in Gippsland, its course lies through rugged country, which, apparently, could not be used for any purpose whatever.

At Snow Plain, on the Gungarlin River, at a height of about 4,500 feet above the sea, an oaten crop of 30 or 40 acres was the most luxuriant that came under my notice. On the open plains adjacent to the Snowy River the last wheat crop was very good, averaging about 25 bushels to the acre.

I am of opinion that the vastness of the Monaro plains, their richness of soil and salubrity of climate, are not, as a whole, widely or sufficiently understood and recognised. Water supply and railway communication are required to more fully make manifest its ample resources.

In the Cooma District the rainfall is very meagre. In 1884 there were only 14 inches, and for the last five years it did not average more than 17 inches per year. And it is a noticeable fact that this rich district suffered severely in the late drought, and perhaps to a more protracted period than any other in the Colony. From this fact it is evident that a canal such as is proposed would be of immense advantage.

At the proposed offtake from the Snowy large quantities of fine timber exist, especially mountain ash, which could be made use of for fluming, &c. A large saw-mill, driven by water-power, is now being worked on the Gungarlin River. It turns out mountain ash principally, which can be supplied in any quantity at the mill at 10s. per 100 ft.

#### FURTHER PROPOSED EXTENSION TO LAKE GEORGE, AND LACHLAN-MURRUMBIDGEE DIVIDE.

Judging from the respective levels between Slack's Creek, 3,000 feet elevation, and the bed of Lake George, 2,206 feet, it seems feasible to suppose that the project now shadowed forth might be extended to include a diversion from the main canal above proposed into the lake, drawing supplies from the Umaralla and Big Badja Rivers in the course of the canal. Although it would be possible to tap the Murrumbidgee near Cooma to afford a supply to the lake, yet such a course would not be advisable, as the supply in that river is not more than adequate to meet the demands below, seeing that provision has to be made for canals through Riverina; whereas the enormous supply obtainable from the melting of the vast snow-drifts on the eastern slopes of the Australian Alps now runs absolutely to waste.

The consequent development of such a scheme would be the construction of a canal from Lake George along the divide between the Lachlan and Murrumbidgee Rivers. By means of such a canal a large extent of arable land would be placed within the reach of irrigation, and the auriferous districts of Temora, Young, Wombat, and Grenfell, where the miners, whose industry depends on a supply of water for hydraulic and ground-sluicing, would be placed in a position to an extent now scarcely realizable, possibly leading to the development of a future Sandhurst. Mr. C. S. Wilkinson, Geological Surveyor, informs me that with water for hydraulic sluicing it would take fifteen years to exhaust the deep leads below the town of Young. The accompanying plan exemplifies the proposed scheme, giving levels and all other data obtainable.

Mr. Betts, who made the surveys in the neighbourhood of Lake George some years ago, asserts that it would impound a depth of water of 120 feet, with an area of 300 square miles, without overflow. But it must be borne in mind that the bed of the lake being 2,206 feet, and the railway station at Bungendore 2,291 feet, 85 feet of water in Lake George would entirely submerge the town, unless dammed back.

According to Mr. Russell, Government Astronomer, both in 1823 and 1874 the depth in the lake was 24 feet 6 inches, and he believes that at some far distant period the lake has been very much deeper. The area of the lake is estimated at present at 38,000 acres, and the greatest depth 9 feet. In 1838-39 the lake, according to information supplied by Mr. Russell, was dry; and again, for the last time, during the period 1846-50.

In January, 1876, the capacity of Lake George for a mean depth of 18 feet was equal to eighteen times the gross contents of the Prospect Reservoir, or 18,621,900,000 gallons.

The waters of the lake are slightly brackish for domestic use, but for stock and irrigation purposes there seems to be no doubt as to their adaptability. The mineral salt now held in solution would possibly be entirely dissipated by the forming of an outlet, and by the lake being replenished from the pure waters of the Snowy.

The relative heights above sea-level of important points in connection with the whole scheme are enumerated below. The levels of the Snowy River and the main divide between this river and the Murrumbidgee are from barometer observations only, all other levels being fixed by railway survey.

Snowy River (offtake of canal) ... ..	about 3,180 feet.
Gap (in main divide, Slack's Creek) ... ..	about 3,000 "
Cooma ... ..	2,707 "
Bombala ... ..	2,339 "
Umaralla River (crossing railway)... ..	2,348 "
Micilago ... ..	2,278 "
Queanbeyan ... ..	1,870 "
Bungendore ... ..	2,291 "
Lake George (bed of) ... ..	2,206 "
Goulburn ... ..	2,071 "
Gunning ... ..	1,893 "
Main divide (between Lachlan and the Murrumbidgee, 13½ miles from Gunning)... ..	2,254 "
Yass ... ..	1,657 "
Bowning ... ..	1,804 "
Binalong ... ..	1,568 "
Main divide, Lachlan and Murrumbidgee, between Galong and Burrowa ... ..	1,798 "
Burrowa (flood level) ... ..	1,597 "
Murrumburrah ... ..	1,268 "
Main divide, Lachlan and Murrumbidgee, between Murrumburrah and Young ... ..	1,842 "
Young ... ..	1,416 "
Grenfell ... ..	1,339 "
Cootamundra ... ..	1,079 "
Temora ... ..	—

In the preparation of this report I have received valuable information, otherwise unobtainable, from Mr. P. F. Adams, Surveyor-General; Mr. A. C. Betts, District Surveyor; and Mr. H. C. Russell, Government Astronomer.

In conclusion, I am fully cognisant of the magnitude of the proposed schemes, but great national necessities warrant correspondingly bold measures of relief. The levels and general configuration of the country from the Snowy River to Lake George demand instrumental examination, as they apparently point to an endowment from Nature for the express purpose of conducting water from an enormous snow-fed reservoir to the rich plains of Monaro, and thence, after being stored in Lake George, to be distributed over thousands of square miles of arable land lying in the doab of the Lachlan and Murrumbidgee Rivers, now subject to long periods of disastrous droughts which render futile the labour of husbandry, cripple all mining industry, and surround with dread uncertainty every form of pastoral enterprise.

I attach appendices as follows:—

Map showing line of proposed canal.

Plan and sections of Lake George, reproduced from Mr. H. C. Russell's pamphlet.

1887.  
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

ROYAL COMMISSION ON CONSERVATION OF WATER.

(CORRESPONDENCE IN REFERENCE TO DISSENT OF MR. F. B. GIPPS, C.E., FROM FINAL REPORT.)

*Ordered by the Legislative Assembly to be printed, 31 May, 1887.*

*[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Honorable the Minister for Mines,—Copies of correspondence and papers in connection with the dissent of Mr. F. B. Gipps, C.E., to the Final Report of the Royal Commission on Conservation of Water.]*

F. B. Gipps, Esq., C.E., to The Secretary of the Royal Commission on Conservation of Water.

Sir,

Sydney, 10 May, 1887.

Hearing that my dissent to the final report of the Royal Commission of Conservation of Water, as signed by me yesterday morning, has not been forwarded with the Commissioners' report, I have to request that you will herewith hand me, or forward immediately to my address, 84, Elizabeth-street, Sydney, a copy of such dissent, as handed you by the Government Printer yesterday, in order that it may be laid on the Table of the House of General Assembly this evening, as I refuse to acknowledge any other document.

I am, &c.,

FREDK. B. GIPPS, C.E.,  
Member of the Royal Commission on Conservation of Water.

Forwarded through the Chief Inspector of Public Watering Places to the Honorable the Minister for Mines, for his information.—J. S. RAMSAY, 11/5/87.

F. B. Gipps, Esq., C.E., to The Minister for Mines.

Sir,

84, Elizabeth-street, Sydney, 10 May, 1887.

I have the honor to address you in order to protest against a certain document, which I learn from the Assistant Secretary of the Water Conservation Commission has been attached to the Final Report of the Commission, and forwarded you for presentation to Parliament, and which purports to be my dissent, being received as such, and I have to request that you will be good enough to substitute the enclosed amended paper of dissent in its place.

My dissent to their report was read at a meeting of the Commission on Friday last, and as it appeared to give umbrage to certain members I offered to modify any statement that might appear to reflect in any way disparagingly on my colleagues, but it was at once ruled that the Commission could not interfere with my personal opinion, and that it should be attached to the Final Report, whilst the meeting was adjourned to Saturday morning to determine what action should be taken relative to my dissent. I would here remark that hitherto any report from a Commissioner has invariably been criticised and generally modified by the Commission in some form before being adopted, and that therefore in conceding to the Commission the same right in their consideration of my dissent, I evinced only a courteous desire to comply in any possible way with any modification of it they might wish, but they abruptly refused to entertain my offer.

Owing to an important business appointment on Saturday I could not attend the adjourned meeting of the Commission, but previous to it I left a few slight alterations in the wording and figures of my dissent that I considered advisable after a more careful reading of the printed proof, and after checking the figures of certain tables in it on Friday night.

On attending the meeting of the Commission yesterday morning I learned that the meeting on Saturday, including Commissioners Donkin, Kidd, M'Mordie (Roads Department), Gilliat (Mines Department), and Townsend (Railway Department), had ruled that my alterations should not be allowed.

At the close of yesterday's meeting I had the alterations in my dissent initialled by the Assistant Secretary as to their correctness, and waited at once on you for authority to have the amended paper printed, but was informed you were engaged.

Knowing that the Final Report was to be signed that afternoon, and that therefore no time was to be lost, I called at once on the head of the Government Printing Office, and in an official memorandum requested him to print my alterations in time for the amended dissent to accompany the Final Report that afternoon.

Shortly after it appears that the Assistant Secretary called, and directed him, on the authority of the Commission, not to alter the dissent.

With all due submission I contend that I had a perfect right to alter the first proof of my dissent at any time before it was attached to the report, and as long as such alteration related only to simple verbal and figure amendments which did not involve any material change of opinion, especially after the Commission had affirmed on Friday that they could not interfere in any way with my dissent, and I contend that the document which the Assistant Secretary informs me has been attached to the Final Report of the Commission is not my dissent as desired by me to be attached to such report, and I have to request that you will receive the enclosed amended dissent and substitute it in its place.

I have, &c.,

FREDK. B. GIPPS, C.E.

[Enclosure.]

DISSENT ON CERTAIN POINTS FROM THE COMMISSIONERS' REPORT.

I REGRET to be compelled to differ from the rest of the Commissioners relative to the treatment proposed for the irrigation of the districts included in the lower portion of the Murray and Murrumbidgee valleys, or what are termed by our Engineer as the south-western districts of the Colony. The reasons for my objections may be stated as follows:—

1. Because I consider that the examination and survey of these rivers should comprise the whole area of their basins, instead of the limited portion recommended by the Commissioners.
2. Because I consider that the storage and distribution of the Murray and Murrumbidgee Rivers should commence at a much higher point on their streams than the above recommendation contemplates.
3. Because I consider the permanent canals proposed, with the exception of the Lower Murray Canal, are impracticable under present conditions, and, for many reasons, are inadvisable.
4. Because I consider that by erecting a series of movable weirs across these rivers, and by pumping with the horse-power available from the fall of water over the crest of such weirs, a large volume of water could be thrown into surface or inundation canals, which would irrigate different sections of the country far more economically than would be possible by the proposed permanent canals. It is evident that no correct estimate of the water supply to be derived from any river basin can be properly gauged unless its rainfall records are accompanied by a faithful representation of its topographical features. For in some parts the rain falls into swampy flats, where it quickly evaporates and soaks into the soil; whilst in other parts, where steep ridges prevail, it serves at once to swell mountain torrents, and to produce floods. In order, therefore, to derive the highest value from rainfall it is absolutely necessary to initiate such a system of examination and survey as will ensure the fullest advantage being taken of the physical features of the country, so that each section of a watershed may be made to contribute its largest capacity of water supply. Especial attention should, however, be directed to the storage of water in the high lands of a river basin, because when it is known in what position and quantity water can be stored at such an elevation it is easy to determine how it can be distributed to the best advantage. In fact there should be one continuous chain of evidence from the top to the bottom of every valley as to its water-supply, and as to the best means of conserving and distributing such supply, otherwise its value can never be justly appreciated.

By simply surveying detached portions of a river basin, in order to provide only for their requirements, great and lasting injury may be done to the basin as a whole. Such a course might seriously interfere with, and perhaps altogether prevent, the due development of its powers for water-supply, thus prohibiting the promotion of different industries which could have been maintained by a more efficient and systematic treatment of the basin. In this country, unfortunately so liable to continuous droughts, we cannot afford to lose any opportunity in connection with increasing the water-supply, when and where most available; therefore it is the more necessary that there should be an exact examination and survey of the Murray and Murrumbidgee valleys before the country is committed to the expensive irrigation canals proposed.

With regard to the storage and distribution of the Murray and Murrumbidgee waters, it seems to me that the Commissioners in their support of the above canals have been too much influenced by the figures of the Engineer, who, in his proposals for such capacious permanent canals, without any provision for storage of water above their point of off-take, appears to have been guided ~~entirely~~ by his experience on the Barse Doab Canal in India. But in that country the constant streams of some of the largest rivers in the world contribute a fraction of their supply to feed the canals, whereas in this country the longest rivers are often reduced to mere brooks. Their flow is so irregular that no dependence can be placed on them for a constant supply of even the smallest volume, whilst just at the time their streams are lowest the country suffers most from drought. Hence the positive necessity for some provision for storage reservoirs before constructing canals.

In my Report on the Upper Murray, included in the Appendix of the First Report of the Commission, I have drawn attention to several sites for impounding lakes, of so great capacity that not only would they serve largely to diminish the evil consequences of high floods, but they would conserve sufficient water to maintain a constant navigable stream from Welaregang to Albury—over 150 miles—and it would then be available for irrigation canals below. Besides these sites, I am convinced, after an examination and partial instrumental survey of the country at the head of the Tooma River (one of the chief tributaries of the Upper Murray), that the large swamps and flats at the foot of some of the highest

highest peaks offer excellent opportunities for the conservation of immense sheets of water, which could be conducted by an economical canal along the divide of the Murray and Murrumbidgee Rivers so as to command the Marracle, Tumberumba, Ouranne, and Jingellie Gold-fields, after which it would provide for the irrigation of a large tract of the rich agricultural lands in the Billabong Valley from Germanton downward.

Our Engineer, Mr. McKinney, M.I.C.E., after a ~~hurried ride through the district on beaten tracks,~~ has instructed the Commission that such a canal would be a commercial failure, in comparison with his proposed low-level canals, on account of the difficulties attending its construction, and its consequent great expense. He also ridicules the accepted idea that American canals are constructed under similar difficulties, although he has never visited that country, and has consequently had no experience in the construction of such canals. Actual observation and experience, both in America and this country, compel me to differ entirely from his opinion relative to the cost of such a canal; and in support of my contention I append a list of American canals, some of which have been constructed through the roughest portions of the Sierra Nevada Mountains.

		<b>672'3</b>	<b>363,642,000</b>	100,000 0 0	5,000 0 0

The greater portion of the La Grange Canal is cut in granite, and in places it is supported by solid stone walls from 50 to 70 feet high. Thus it is evident to any unprejudiced mind that canals can be constructed in a mountainous country at a much lower estimate than those inexperienced in their construction can possibly imagine; and this is chiefly due to the great fall or steep declivity that can be given them, owing to their elevation, which largely reduces their sectional area. By actual survey of over 30 miles of the rough precipitous ridges near the head of the Tooma and Tumut Rivers, and by the construction of a large ~~running~~ ditch, 6 miles in length, I have proved that canals could be constructed as economically in our mountain ranges as in the Sierra Nevadas, as an equal fall is available. The ~~actual-population~~ that would be served by the high-level canal proposed by me would be over 1,000, exclusive of towns; and this, owing to the inducement offered by a large permanent water-supply for hydraulic sluicing, would rapidly increase, whilst the settlers served by the proposed low-level canals from the Murray would not exceed 500. Therefore, by assuming (after a hasty inspection, and without a more careful examination) that there is no possibility of irrigating or improving the water-supply of the Upper Murray District, a very great injury may be inflicted on its principal industries, and its settlement thereby retarded.

**mining  
numbers of  
settlers  
and miners**

My reasons for objecting to the proposed permanent canals are as follows:—1. Insufficiency of water-supply. 2. Great cost of construction. 3. Cost of maintenance. 4. Small returns, and consequent heavy loss to the State, which would increase annually. 5. Possibility of changing the course of both rivers connected with them during a heavy flood.

In the first place it must be assumed that a constant stream will have to be allowed to flow down the Murray and Murrumbidgee Rivers for the supply of settlers on both banks, and to satisfy claims on account of riparian rights. For this purpose I would allocate 1,500 cubic feet a second, which would represent a flow in the river Murray of 1 foot above summer level at Albury, and a flow of 3 feet in the Murrumbidgee above summer level at Wagga Wagga. On this hypothesis, and by taking as a basis of calculation the Government Astronomer's records of the mean height above summer level of the western rivers, it appears that the supply available for the proposed Murray River Canal below Albury in 1885 would have been almost nil for January, February, March, April, May, and December; for July, 800 cubic feet per second; for June, August, and November, about 2,000 cubic feet per second; and for September and October, over 2,000 cubic feet per second. For six months, therefore, during the driest period, there would have been only a small uncertain and intermittent supply for the canal, barely sufficient to account for leakage and evaporation, whilst its service for the rest of the year would have been greatly neutralised on account of the abundant rainfall in June, August, and September. According to the records of the Murrumbidgee flow for 1884, the supply available for the proposed permanent canals would have been almost nil for January, February, March, April, May, June, August, and December; for July, 300 cubic feet per second; for September, 2,300 cubic feet per second; for October, 800 cubic feet per second; and for November, 1,000 cubic feet per second. Consequently, there would only have been a scanty intermittent supply for eight months in that year, whilst the copious rainfall in June and October would have largely neutralised the benefits of the canal's supply in July and September. From this it is apparent that neither the Murray nor Murrumbidgee canals can be termed permanent, nor can they be made so without very extensive storage provision above their points of off-take.

The cost of the proposed Murray Canal just below Albury is estimated at £1,412,250, but this provides for no lining, for no interest during construction, and for only £25,000 for land resumption. In comparison with the cost of similar works in Europe this estimate is decidedly low. The average cost of French canals, only 5 feet deep, is £11,600 a mile. The Cavour Canal in Italy cost £80,470 a mile. The Caluso Canal, Italy, with a supply of only 366'26 cubic feet a second, and the steep declivity of 17 feet per mile, cost £1,700 a mile. But supposing this Murray Canal could be constructed for £1,412,250,

it

it is still questionable whether it would prove a profitable work. The interest on the cost, at  $4\frac{1}{2}$  per cent., would amount to £63,549 a year, and the working expenses are estimated at about £13,951 per annum, whilst the gross revenue is estimated at £177,500 per annum. This estimate evidently assumes that the whole irrigable area commanded by the canal will be irrigated immediately after its completion, which is hardly probable, considering that there are not more than 500 settlers dwelling on it, and their homesteads are scattered, whilst a few large landholders own most of the rest of it. Even if the district were densely populated, on comparing the prospective returns of such a work with those actually obtained in India, where labour costs only £3 a year for an ordinary workman, it will be seen by the following table that very different results might be anticipated than those suggested in the estimate of our Engineer.

Name of Canal.	Year.	Outlay to end of year.	Interest at $4\frac{1}{2}$ per cent.	Working expenses.	Receipts from water-rates.	Irrigab area in acres.	Irrigated area in acres.

\* Estimated.

there It is evident, therefore, that even under exceptionally favourable circumstances, when there is a very extensive area under cultivation supporting a dense population, and when labour is very cheap, both for cultivation, for the construction of the canal, and its maintenance, that even then large irrigation canals are rarely profitable.

In the above table it will be seen that the lowest working expenses are noted opposite the Agra Canal, which has a capacity of 2,000 cubic feet a second, being equal to that proposed for the Murray Canal. If, with labour at £3 a man per annum, it cost £8,300 to maintain and serve the distribution of the supply of the canal, it must surely be assumed that similar services in this country would cost more than double that sum.

At the same time I fear many generations would pass away before the returns of the Murray and Murrumbidgee Canals would realise sufficient to cover even the interest on their cost of construction.

According to the valuable report on the state of the Public Lands by Messrs. Morris and Rankin, in 1883, it appears that there were only 244 settlers in the Deniliquin District, including the counties of Townsend, Cadell, and Wakool, and embracing 4 million acres at the lower end of the Edwards and Billabong Rivers, whilst  $2\frac{1}{2}$  million acres were aggregated in large estates. The Counties of Denison and Hume were little better, the selectors having chiefly sold out to pastoralists; consequently less than 500 *bona fide* settlers would be benefited by the proposed Murray Canals. Nor does the prospect of profitable canals improve with the Murrumbidgee Canals, for most of the country traversed by them is in the hands of pastoralists, whilst in the instance of Waradgery County, having an area of 1,836,160 acres, the land is almost entirely included in twelve pastoral holdings. There is no doubt that these canals would greatly increase the value of alienated land in the districts they would traverse, but unless the Government resumed it, the State would reap no advantage from such enhancement.

were Bearing in mind that the slope of the Murray Canal from the point of off-take at Bungowanna is 1 foot in 5,000 feet, whilst that of the river itself averages only 9 inches a mile from that point downward, it appears possible that, unless the headworks are very substantial, and of sufficient height to resist the entrance of any flood, the river—such a flood as 1867, which was 27 feet above summer level, and 10 feet above the right bank below the site of weir—might force its way into the canal, and pouring down it with overwhelming force, might form an entirely new channel for itself. Such a disaster has actually happened in the Mississippi River from the cutting of a channel of less than one-quarter the area of the proposed canal. The same danger threatens the Murrumbidgee Canal, which has a fall of  $1\frac{1}{2}$  feet towards the Urana Lake, in comparison with a fall of only 10 inches a mile in the river bed. Thus there would be a possibility of these two rivers reuniting their streams near Jerilderie, and following the course of the Billabong River.

In consideration of the many and serious defects I have alluded to, it is evident that the proposed canals, under present conditions, would be injudicious and impracticable.

As an instance of the stimulus to manufacturing as well as agricultural industries that might be anticipated from the erection of movable weirs in favourable positions across the Murray and Murrumbidgee Rivers, I would briefly refer to the experience of a similar structure across the Kansas River at Lawrence. The river bed at the point of its location is 600 feet wide, and is composed partially of rock, sand, fine gravel, and strata of blue clay. The length of the weir is 700 feet; its height is 8 feet. It provides a supply to two canals 60 feet wide on one bank and 50 feet on the other. The available horse-power from these canals is estimated at 2,500, which it is anticipated might be increased to 4,000 horse-power by adding 2 feet to the height of the weir. The canals are each  $\frac{1}{2}$  mile long, and their frontages are divided into water-power allotments from 150 to 450 feet in length. The water-power not only provides motive-power for several large mills, but also raises several million gallons of water a day, 150 feet high, for the supply of the town.

13,200 The value of this power on the Murray and Murrumbidgee Rivers at each point of location of weirs, estimating only on the small average flow of 500 cubic feet a second, with a fall of 10 feet, would be equal to 567 theoretical and 400 effective horse-power with turbines. No less than 14,076 cubic feet of water could be raised 16 feet high a minute by 400 horse-power, which is far more than that proposed by the largest pumping scheme on the Victorian side of the Murray. This height of 16 feet would be sufficient for the discharge of the water supply into surface or inundation canals, which would cost infinitely less in construction and maintenance than the proposed permanent canals, whilst the supply could be distributed with much greater facility. The

The cost of the movable weirs, if constructed on the Poiree Needle system, would not exceed £40 a foot,—so that it may be estimated that they could be thrown across the above rivers at a cost of £20,000 each, including headworks for canal. This estimate is based on the average width of the rivers not exceeding 400 feet.

The rent of the available horse-power at each station, at £10 per horse-power per annum, would probably return over £1,000 a year, supposing Water Boards to rent it for the supply of surface canals constructed under their authority. Supposing Government constructed the canals from each station, the supply of 14,976 cubic feet a minute would be sufficient to irrigate 60,000 acres in winter and 25,000 acres in summer. With a charge of 5s. per acre a revenue of £21,250 would be realized, which would allow of 5 per cent. on an outlay of £200,000 for the construction of the canal and weir works, and £11,250 per annum for maintenance expenses.

13,200

The advantage of such a system is at once apparent. It could be expanded gradually to meet the requirements of the country; it would stimulate all classes of industry, because the same water-supply would be available for a large number of weirs on each river flowing from one pond to another, and on its course distributing the great benefit of 400 horse-power at each weir location, and it would cost far less than permanent canals. With all due deference, therefore, to the opinions of my colleagues, and with much regret at being called on to differ from them, I would submit that the system of impounding the Murray and Murrumbidgee Rivers by movable weirs would, on account of the above reasons, be of far greater advantage to the country than the proposed permanent canals.

FRED. B. GIPPS, C.E.

F. B. Gipps, Esq., C.E., to The Minister for Mines.

Sir,

84, Elizabeth-street, Sydney, 11 May, 1887.

I have the honor to inform you that I have, this morning, received a copy of the final report of the Royal Commission Water Conservation, including, and for the first time apprising me of, the remarks of the Commissioners on my dissent to it.

The Commissioners, in these remarks, assert that I have made a series of statements, some of which are at variance with facts, and others very misleading, and they throw doubt on my list of American canals, though I declared the report of the State Mineralogist of California as my authority.

In consideration of the grave imputations asserted in these remarks impugning both the truth of my word and the rectitude of my intentions, I have to request that you will be good enough to attach my protest, handed you yesterday, to the final report of the Commission, including the alterations I required in my dissent, and further that you will grant me an inquiry by an impartial Board open to the public to investigate the truth or otherwise of the statements made by me which are declared to be false and misleading by the Commissioners.

I was quite unaware of the nature of these remarks till now, as at the last meeting of the Commission that I attended, on Monday morning, they were not brought up, and I would request to be informed when these remarks were written and printed, and who was the author of them.

I have, &amp;c.,

FRED. B. GIPPS, C.E.

The Assistant Secretary Royal Commission on Conservation of Water  
to Mr. H. A. Gilliat.

Sydney, 11 May, 1887.

In compliance with your verbal instructions, I have the honor to submit the following statement in reference to Mr. F. B. Gipps' dissent to the Third and Final Report of the Royal Commission on Conservation of Water:—

1. The dissent of Mr. Gipps, in his own handwriting and signed by him, was handed to me by him, on May 4th. I still retain this document.
2. At the meeting of the Commission, on Friday, May 6th, I distributed printed copies of the dissent to the members of the Commission then present.
3. Mr. Gipps formally submitted his dissent to the Commission, and it was read by me.
4. Mr. Gipps suggested several typographical corrections; and these having been admitted by the Commissioners the dissent was received by unanimous resolution.

Appended A is the dissent in its amended form as received.

I beg to submit extracts from the Minute Book of the Commission which will explain the proceedings in connection with the dissent:—

*Extract from Minute of Friday, May 6.*

Mr. Gipps submitted a dissent to the final report, which was read.

On the motion of Mr. Townsend, seconded by Mr. M'Mordie, the dissent, with several typographical corrections, was received.

Debate ensued.

In connection with paragraph 2, page 2, Mr. M'Mordie expressed a wish for information as to the length of Mr. Gipps' experience in America, and as to the works which he had observed.

Mr. Gipps stated that he had had no experience on waterworks in America, and had observed only one or two of the canals referred to in the table.

On the motion of Mr. Townsend, seconded by Mr. M'Mordie, it was resolved that a special meeting of the Commission should be held to-morrow (Saturday) morning, at 10 o'clock, to consider Mr. Gipps' dissent.

W. S. TARGETT,

Chairman.

*Extract from Minutes of Saturday, May 7.*

Resolved, that Mr. Gipps be asked to attend this meeting of the Commission.

The consideration of Mr. Gipps' dissent was proceeded with.

A memorandum in reply to the dissent was submitted, and was read by the assistant secretary.

Resolved, that the dissent as printed and received at yesterday's meeting be attached to the final report, and that the memorandum, as representing the reply of the Commissioners, follow the dissent.

Mr. Gipps to be informed that the dissent having been already received, the Commissioners decline to consent to its being altered as desired by him, and have resolved that it be published with the final report as received.

RUSS. BARTON, Chairman.

*Extract*

*Extract from Minutes of Monday, May 9.*

At Mr. Gipps' request the assistant secretary read the alterations which Mr. Gipps desired should be made in his dissent, and which the Commissioners at their meeting on Saturday had declined to accept.

Mr. Targett moved, and Mr. Franklin seconded,—“That so much of the resolution passed at Saturday's meeting as affects the figures in the tables be rescinded, and that Mr. Gipps be permitted to amend the tables as he may desire.”

Mr. Gipps intimated that he would not accept such resolution, whereupon the motion was withdrawn.

The meeting adjourned till 3 p.m. same day, at which hour the Government Printer had promised to send two copies of final report.

At the meeting in the afternoon Mr. Gipps was not present.

The President, W. J. Lyne, Esq., M.P., was present, and took the chair.

The assistant secretary informed the Commissioners that he had not yet received the two copies of the final report from the Government Printer, and proceeded to make a statement as follows:—After the meeting in the morning had risen Mr. Gipps came to the desk of the assistant secretary, and asked him in the presence of Mr. Donkin, to mark on a copy of the dissent the alterations which Mr. Gipps desired to make, and which the Commissioners had disallowed. Mr. Gipps asked the assistant secretary to initial the dissent as being a true copy of the alterations, and stated he desired the paper for the purpose of showing it to the Hon. the Minister for Mines. At 1 o'clock the assistant secretary called on the Government Printer to ascertain what progress was being made with the final report, when the Printer informed him it would be delayed in consequence of the fact that Mr. Gipps had called on him with a copy of the dissent, altered and initialled by the assistant secretary, and had requested that the final report should be so altered. The assistant secretary informed the Government Printer that the Commissioners had declined to sanction these alterations, and he requested the Printer to issue the final report in accordance with the proof furnished by the assistant secretary.

The Commissioners resolved that, having heard the statement of the assistant secretary, they desire to express their strong sense of disapproval of the action of Mr. Gipps.

Appendix B is the copy of the dissent referred to in the foregoing as having been obtained from me by Mr. Gipps for the purpose of showing it to the Hon. the Minister for Mines. It will be observed that Mr. Gipps' signature to it appears on page 4, the dissent in full extended to page 5.

J. S. RAMSAY,

Late Assistant Secretary to the Commission.

## APPENDIX A.

## DISSSENT ON CERTAIN POINTS FROM THE COMMISSIONERS' REPORT.

I REGRET to be compelled to differ from the rest of the Commissioners relative to the treatment proposed for the irrigation of the districts included in the lower portion of the Murray and Murrumbidgee valleys, or what are termed by our Engineer as the south-western districts of the Colony. The reasons for my objections may be stated as follows:—

1. Because I consider that the examination and survey of these rivers should comprise the whole area of their basins, instead of the limited portion recommended by the Commissioners.
2. Because I consider that the storage and distribution of the Murray and Murrumbidgee Rivers should commence at a much higher point on their streams than the above recommendation contemplates.
3. Because I consider the permanent canals proposed, with the exception of the Lower Murray Canal, are impracticable under present conditions, and, for many reasons, are inadvisable.
4. Because I consider that by erecting a series of movable weirs across these rivers, and by pumping with the horse-power available from the fall of water over the crest of such weirs, a large volume of water could be thrown into surface or inundation canals, which would irrigate different sections of the country far more economically than would be possible by the proposed permanent canals.

It is evident that no correct estimate of the water-supply to be derived from any river basin can be properly gauged unless its rainfall records are accompanied by a faithful representation of its topographical features. For in some parts the rain falls into swampy flats, where it quickly evaporates and soaks into the soil; whilst in other parts, where steep ridges prevail, it serves at once to swell mountain torrents, and to produce floods. In order, therefore, to derive the highest value from rainfall it is absolutely necessary to initiate such a system of examination and survey as will ensure the fullest advantage being taken of the physical features of the country, so that each section of a watershed may be made to contribute its largest capacity of water-supply. Especial attention should, however, be directed to the storage of water in the high-lands of a river basin, because when it is known in what position and quantity water can be stored at such an elevation it is easy to determine how it can be distributed to the best advantage. In fact there should be one continuous chain of evidence from the top to the bottom of every valley as to its water-supply, and as to the best means of conserving and distributing such supply, otherwise its value can never be justly appreciated.

By simply surveying detached portions of a river basin, in order to provide only for their requirements, great and lasting injury may be done to the basin as a whole. Such a course might seriously interfere with, and perhaps altogether prevent, the due development of its powers for water supply, thus prohibiting the promotion of different industries which could have been maintained by a more efficient and systematic treatment of the basin. In this country, unfortunately so liable to continuous droughts, we cannot afford to lose any opportunity in connection with increasing the water-supply, when and where most available; therefore it is the more necessary that there should be an exact examination and survey of the Murray and Murrumbidgee valleys before the country is committed to the expensive irrigation canals proposed.

With regard to the storage and distribution of the Murray and Murrumbidgee waters, it seems to me that the Commissioners in their support of the above canals have been too much influenced by the figures of the Engineer, who, in his proposals for such capacious permanent canals, without any provision for storage of water above their point of off-take, appears to have been guided entirely by his experience

on the Baree Doab Canal in India. But in that country the constant streams of some of the largest rivers in the world contribute a fraction of their supply to feed the canals, whereas in this country the longest rivers are often reduced to mere brooks. Their flow is so irregular that no dependence can be placed on them for a constant supply of even the smallest volume, whilst just at the time their streams are lowest the country suffers most from drought. Hence the positive necessity for some provision for storage reservoirs before constructing canals.

In my report on the Upper Murray, included in the appendix of the first report of the Commission, I have drawn attention to several sites for impounding lakes, of so great capacity that not only would they serve largely to diminish the evil consequences of high floods, but they would conserve sufficient water to maintain a constant navigable stream from Welaregang to Albury—over 150 miles—and it would then be available for irrigation canals below. Besides these sites, I am convinced, after an examination and partial instrumental survey of the country at the head of the Tooma River (one of the chief tributaries of the Upper Murray), that the large swamps and flats at the foot of some of the highest peaks offer excellent opportunities for the conservation of immense sheets of water, which could be conducted by an economical canal along the divide of the Murray and Murrumbidgee Rivers, so as to command the Marracle, Tumberamba, Ouranie, and Jingellic Gold-fields after which it would provide for the irrigation of a large tract of the rich agricultural lands in the Billabong Valley from Germanton downward.

Our Engineer, Mr. McKinney, M.I.C.E., after a hurried ride through the district on beaten tracks, has instructed the Commission that such a canal would be a commercial failure, in comparison with his proposed low-level canals, on account of the difficulties attending its construction, and its consequent great expense. He also ridicules the accepted idea that American canals are constructed under similar difficulties, although he has never visited that country, and has consequently had no experience in the construction of such canals. Actual observation and experience, both in America and this country, compel me to differ entirely from his opinion relative to the cost of such a canal; and in support of my contention I append a list of American canals, some of which have been constructed through the roughest portions of the Sierra Nevada Mountains.

Name of Canal.	Length in Miles.	Discharge in cubic feet per second.	Discharge in 24 hours in gallons.	Total Cost.			Cost per mile.		
				£	s.	d.	£	s.	d.
North Blomfield ... ..	157	800	432,000,000	141,768	0	0	903	0	0
Milton ... ..	80	750	405,000,000	78,315	0	0	978	0	0
Eureka Lake ... ..	163	625	337,500,000	144,668	0	0	887	0	0
South Yuba ... ..	123	{ 1,750 750	{ 945,000,000 405,000,000	112,337	0	0	913	0	0
San Juan ... ..	32	325	175,000,000	58,618	0	0	1,832	0	0
La Grange ... ..	20	750	405,000,000	90,000	0	0	4,500	0	0

The greater portion of the La Grange Canal is cut in granite, and in places it is supported by solid stone walls from 50 to 70 ft. high. Thus it is evident to any unprejudiced mind that canals can be constructed in a mountainous country at a much lower estimate than those inexperienced in their construction can possibly imagine; and this is chiefly due to the great fall or steep declivity that can be given them, owing to their elevation, which largely reduces their sectional area. By actual survey of over 30 miles of the rough precipitous ridges near the head of the Tooma and Tumut Rivers, and by the construction of a large mining ditch, 6 miles in length, I have proved that canals could be constructed as economically in our mountain ranges as in the Sierra Nevadas, as an equal fall is available. The number of settlers and miners that would be served by the high-level canal proposed by me would be over 1,000, exclusive of towns; and this, owing to the inducement offered by a large permanent water-supply for hydraulic sluicing, would rapidly increase, whilst the settlers served by the proposed low-level canals from the Murray would not exceed 500. Therefore, by assuming (after a hasty inspection and without a more careful examination) that there is no possibility of irrigating or improving the water-supply of the Upper Murray district, a very great injury may be inflicted on its principal industries, and its settlement thereby retarded.

My reasons for objecting to the proposed permanent canals are as follows:—1. Insufficiency of water-supply. 2. Great cost of construction. 3. Cost of maintenance. 4. Small returns, and consequent heavy loss to the State, which would increase annually. 5. Possibility of changing the course of both rivers connected with them during a heavy flood.

In the first place it must be assumed that a constant stream will have to be allowed to flow down the Murray and Murrumbidgee Rivers for the supply of settlers on both banks, and to satisfy claims on account of riparian rights. For this purpose I would allocate 1,500 cubic feet a second, which would represent a flow in the river Murray of 1 foot above summer level at Albury, and a flow of 3 feet in the Murrumbidgee above summer level at Wagga Wagga. On this hypothesis, and by taking as a basis of calculation the Government Astronomer's records of the mean height above summer level of the western rivers, it appears that the supply available for the proposed Murray River Canal below Albury in 1885 would have been almost nil for January, February, March, April, May, and December; for July, 800 cubic feet per second; for June, August, and November, about 2,000 cubic feet per second; and for September and October, over 2,000 cubic feet per second. For six months, therefore, during the driest period, there would have been only a small uncertain and intermittent supply for the canal, barely sufficient to account for leakage and evaporation, whilst its service for the rest of the year would have been greatly neutralised on account of the abundant rainfall in June, August, and September. According to the records of the Murrumbidgee flow for 1884, the supply available for the proposed permanent canals would have been almost nil for January, February, March, April, May, June, August, and December; for July, 300 cubic feet per second; for September, 2,300 cubic feet per second; for October, 800 cubic feet per second; and for November, 1,000 cubic feet per second. Consequently, there would only have been a scanty intermittent supply for eight months in that year, whilst the copious rainfall in June—

and October would have largely neutralised the benefits of the canal's supply in July and September. From this it is apparent that neither the Murray nor Murrumbidgee canals can be termed permanent, nor can they be made so without very extensive storage provision above their points of off-take.

The cost of the proposed Murray Canal, just below Albury, is estimated at £1,412,250, but this provides for no lining, for no interest during construction, and for only £25,000 for land resumption. In comparison with the cost of similar works in Europe this estimate is decidedly low. The average cost of French canals, only 5 feet deep, is £11,600 a mile. The Cavour Canal in Italy cost £80,470 a mile. The Caluso Canal, Italy, with a supply of only 366·26 cubic feet a second, and the steep declivity of 17 feet per mile, cost £1,700 a mile. But supposing this Murray Canal could be constructed for £1,412,250, it is still questionable whether it would prove a profitable work. The interest on the cost, at 4½ per cent., would amount to £63,549 a year, and the working expenses are estimated at about £13,951 per annum, whilst the gross revenue is estimated at £177,500 per annum. This estimate evidently assumes that the whole irrigable area commanded by the canal will be irrigated immediately after its completion, which is hardly probable, considering that there are not more than 500 settlers dwelling on it, and their homesteads are scattered, whilst a few large landholders own most of the rest of it. Even if the district were densely populated, on comparing the prospective returns of such a work with those actually obtained in India, where labour costs only £3 a year for an ordinary workman, it will be seen by the following table that very different results might be anticipated than those suggested in the estimate of our Engineer.

Name of Canal.	Year.	Outlay to end of year.	Interest at 4½ per cent.	Working expenses.	Receipts from water-rates.	Irrigable area in acres.	Irrigated area in acres.
		£	£	£	£		
Baree Doab.....	1877-78	1,537,990	67,955	50,240	93,876	... ..	266,995
Agra.....	1877-78	808,479	32,215	8,319	3,709	.....	163,634
Orissa .....	1876-77	1,728,400	76,300	18,050	4,049	100,000	100,000
Midnapore .....	1876-77	683,500	29,790	9,570	6,150	80,000	54,000
Sone .....	1876-77	1,908,504	73,660	18,620	5,090	500,000	300,000
North Behar .....	1884-85	1,100,000	45,000	10,000	7,500	100,000	50,000

It is evident, therefore, that even under exceptionally favourable circumstances, when there is a very extensive area under cultivation supporting a dense population, and when labour is very cheap, both for cultivation, for the construction of the canal, and its maintenance, even then large irrigation canals are rarely profitable.

In the above table it will be seen that the lowest working expenses are noted opposite the Agra Canal, which has a capacity of 2,000 cubic feet a second, being equal to that proposed for the Murray Canal. If, with labour at £3 a man per annum, it cost £8,300 to maintain and serve the distribution of the supply of the canal, it must surely be assumed that similar services in this country would cost more than double that sum.

At the same time I fear many generations would pass away before the returns of the Murray and Murrumbidgee Canals would realise sufficient to cover even the interest on their cost of construction.

According to the valuable report on the state of the Public Lands by Messrs. Morris and Rankin, in 1883, it appears that there were only 244 settlers in the Deniliquin District, including the counties of Townsend, Cadell, and Wakool, and embracing 4 million acres at the lower end of the Edward and Billabong Rivers, whilst 2½ million acres were aggregated in large estates. The Counties of Denison and Hume were little better, the selectors having chiefly sold out to pastoralists; consequently less than 500 *bonâ fide* settlers would be benefited by the proposed Murray Canals. Nor does the prospect of profitable canals improve with the Murrumbidgee Canals, for most of the country traversed by them is in the hands of pastoralists, whilst in the instance of Waradgery County, having an area of 1,336,160 acres, the land is almost entirely included in twelve pastoral holdings. There is no doubt that these canals would greatly increase the value of alienated land in the districts they would traverse, but unless the Government resumed it, the State would reap no advantage from such enhancement.

Bearing in mind that the slope of the Murray Canal from the point of off-take at Bungowanna is 1 foot in 5,000 feet, whilst that of the river itself averages only 9 inches a mile from that point downward, it appears possible that, unless the head works are very substantial, and of sufficient height to resist the entrance of any flood, the river—in such a flood as 1867, which was 27 feet above summer level, and 10 feet above the right bank below the site of weir—might force its way into the canal, and pouring down it with overwhelming force, might form an entirely new channel for itself. Such a disaster has actually happened in the Mississippi River from the cutting of a channel of less than one-quarter the area of the proposed canal. The same danger threatens the Murrumbidgee Canal, which has a fall of 1½ feet towards the Urana Lake, in comparison with a fall of only 10 inches a mile in the river bed. Thus there would be a possibility of these two rivers reuniting their streams near Jerilderie, and following the course of the Billabong River.

In consideration of the many and serious defects I have alluded to, it is evident that the proposed canals, under present conditions, would be injudicious and impracticable.

As an instance of the stimulus to manufacturing as well as agricultural industries that might be anticipated from the erection of movable weirs in favourable positions across the Murray and Murrumbidgee Rivers, I would briefly refer to the existence of a similar structure across the Kansas River at Lawrence. The river bed at the point of its location is 600 feet wide, and is composed partially of rock, sand, fine gravel, and strata of blue clay. The length of the weir is 700 feet; its height is 8 feet. It provides a supply to two canals 60 feet wide on one bank and 50 feet on the other. The available horse-power from these canals is estimated at 2,500, which it is anticipated might be increased to 4,000 horse-power by adding 2 feet to the height of the weir. The canals are each ½ mile long, and their frontages are divided into water-power allotments from 150 to 450 feet in length. The water-power not only provides motive-power for several large mills, but also raises several million gallons of water a day, 150 feet high, for the supply of the town.

The

The value of this power on the Murray and Murrumbidgee Rivers at each point of location of weirs estimating only on the small average flow of 500 cubic feet a second, with a fall of 10 feet, would be equal to 567 theoretical and 400 effective horse-power with turbines. No less than 13,200 cubic feet of water could be raised 16 feet high a minute by 400 horse-power, which is far more than that proposed by the largest pumping scheme on the Victorian side of the Murray. This height of 16 feet would be sufficient for the discharge of the water-supply into surface or inundation canals, which would cost infinitely less in construction and maintenance than the proposed permanent canals, whilst the supply could be distributed with much greater facility.

The cost of the movable weirs, if constructed on the Poiree Needle system, would not exceed £40 a foot,—so that it may be estimated that they could be thrown across the above rivers at a cost of £20,000 each including headworks for canal. This estimate is based on the average width of the rivers not exceeding 400 feet.

The rent of the available horse-power at each station, at £10 per horse-power per annum, would probably return over £1,000 a year, supposing Water Boards to rent it for the supply of surface canals constructed under their authority, or—Supposing Government constructed the canals from each station, the supply of 13,200 cubic feet a minute would be sufficient to irrigate 60,000 acres in winter and 25,000 acres in summer. With a charge of 5s. per acre a revenue of £21,250 would be realized, which would allow of 5 per cent. on an outlay of £200,000 for the construction of the canal and weir works, and £11,250 per annum for maintenance expenses.

The advantage of such a system is at once apparent. It could be expanded gradually to meet the requirements of the country; it would stimulate all classes of industry, because the same water-supply would be available for a large number of weirs on each river flowing from one pond to another, and on its course distributing the great benefit of 400 horse-power at each weir location, and it would cost far less than permanent canals. With all due deference, therefore, to the opinions of my colleagues, and with much regret at being called on to differ from them, I would submit that the system of impounding the Murray and Murrumbidgee Rivers by movable weirs would, on account of the above reasons, be of far greater advantage to the country than the proposed permanent canals.

FRED. B. GIPPS, C.E.

#### APPENDIX B.

##### DISSENT ON CERTAIN POINTS FROM THE COMMISSIONERS' REPORT.

I REGRET to be compelled to differ from the rest of the Commissioners relative to the treatment proposed for the irrigation of the districts included in the lower portion of the Murray and Murrumbidgee valleys, or what are termed by our Engineer as the south-western districts of the Colony. The reasons for my objections may be stated as follows:—

1. Because I consider that the examination and survey of these rivers should comprise the whole area of their basins, instead of the limited portion recommended by the Commissioners.
2. Because I consider that the storage and distribution of the Murray and Murrumbidgee Rivers should commence at a much higher point on their streams than the above recommendation contemplates.
3. Because I consider the permanent canals proposed, with the exception of the Lower Murray Canal, are impracticable under present conditions, and, for many reasons, are inadvisable.
4. Because I consider that by erecting a series of movable weirs across these rivers, and by pumping with the horse-power available from the fall of water over the crest of such weirs, a large volume of water could be thrown into surface or inundation canals, which would irrigate different sections of the country far more economically than would be possible by the proposed permanent canals. It is evident that no correct estimate of the water-supply to be derived from any river basin can be properly gauged unless its rainfall records are accompanied by a faithful representation of its topographical features. For in some parts the rain falls into swampy flats, where it quickly evaporates and soaks into the soil; whilst in other parts, where steep ridges prevail, it serves at once to swell mountain torrents and to produce floods. In order, therefore, to derive the highest value from rainfall, it is absolutely necessary to initiate such a system of examination and survey as will ensure the fullest advantage being taken of the physical features of the country, so that each section of a water-shed may be made to contribute its largest capacity of water-supply. Especial attention should, however, be directed to the storage of water in the high lands of a river basin, because when it is known in what position and quantity water can be stored at such an elevation it is easy to determine how it can be distributed to the best advantage. In fact there should be one continuous chain of evidence from the top to the bottom of every valley as to its water-supply, and as to the best means of conserving and distributing such supply, otherwise its value can never be justly appreciated.

By simply surveying detached portions of a river basin, in order to provide only for their requirements, great and lasting injury may be done to the basin as a whole. Such a course might seriously interfere with, and perhaps altogether prevent, the due development of its powers for water-supply, thus prohibiting the promotion of different industries, which could have been maintained by a more efficient and systematic treatment of the basin. In this country, unfortunately so liable to continuous droughts, we cannot afford to lose any opportunity in connection with increasing the water-supply, when and where most available; therefore it is the more necessary that there should be an exact examination and survey of the Murray and Murrumbidgee valleys before the country is committed to the expensive irrigation canals proposed.

With regard to the storage and distribution of the Murray and Murrumbidgee waters, it seems to me that the Commissioners in their support of the above canals have been too much influenced by the figures of the Engineer, who, in his proposals for such capacious permanent canals, without any provision for storage of water above their point of off-take, appears to have been guided entirely by his experience on the Baree Doab Canal in India. But in that country the constant streams of some of the largest rivers in the world contribute a fraction of their supply to feed the canals, whereas in this country the longest rivers are often reduced to mere brooks. Their flow is so irregular that no dependence can be placed on them for a constant supply of even the smallest volume, whilst just at the time their streams are lowest the country suffers most from drought. Hence the positive necessity for some provision for storage reservoirs before constructing canals.

largely

In

In my Report on the Upper Murray, included in the Appendix of the First Report of the Commission, I have drawn attention to several sites for impounding lakes, of so great capacity that not only would they serve largely to diminish the evil consequences of high floods, but they would conserve sufficient water to maintain a constant navigable stream from Welaregang to Albury—over 150 miles—and it would then be available for irrigation canals below. Besides these sites, I am convinced, after an examination and partial instrumental survey of the country at the head of the Tooma River (one of the chief tributaries of the Upper Murray), that the large swamps and flats at the foot of some of the highest peaks offer excellent opportunities for the conservation of immense sheets of water, which could be conducted by an economical canal along the divide of the Murray and Murrumbidgee Rivers so as to command the Marracle, Tumberumba, Ouranne, and Jingellie Goldfields, after which it would provide for the irrigation of a large tract of the rich agricultural lands in the Billabong Valley from Germanton downward.

visit to

Our Engineer, Mr. McKinney, M.I.C.E., after a hurried ~~ride through~~ the district ~~on beaten tracks~~, has instructed the Commission that such a canal would be a commercial failure, in comparison with his proposed low-level canals, on account of the difficulties attending its construction, and its consequent great expense. He also ridicules the accepted idea that American canals are constructed under similar difficulties, although he has never visited that country, and has consequently had no experience in the construction of such canals. Actual observation and experience, both in America and this country, compel me to differ entirely from his opinion relative to the cost of such a canal; and in support of my contention I append a list of American canals, some of which have been constructed through the roughest portions of the Sierra Nevada Mountains.

Name of <del>Land</del> Canal.	Length in Miles.	Discharge in cubic feet per second.	Discharge in 24 hours in gallons.	Total cost.			Cost per Mile.		
				£	s.	d.	£	s.	d.
North Blomfield .....	157	800	432,000,000	141,768	0	0	908	0	0
Milton .....	80	750	405,000,000	78,315	0	0	978	0	0
Eureka Lake .....	163	625	337,500,000	144,668	0	0	887	0	0
South Yuba .....	123	1,449.4	782,676,000	112,337	0	0	913	0	0
		( 1,750	945,000,000						
		( 750	405,000,000	150,000	0	0	1,300	0	0
San Juan .....	32	325	175,000,000	58,618	0	0	1,832	0	0
La Grange .....	20	750	405,000,000	90,000	0	0	4,500	0	0
		672.3	363,642,000	100,000	0	0	5,000	0	0

The greater portion of the La Grange Canal is cut in granite, and in places it is supported by solid stone walls from 50 to 70 feet high. Thus it is evident to any unprejudiced mind that canals can be constructed in a mountainous country at a much lower estimate than those inexperienced in their construction can possibly imagine; and this is chiefly due to the great fall or steep declivity that can be given them, owing to their elevation, which largely reduces their sectional area. By actual survey of over 30 miles of the rough precipitous ridges near the head of the Tooma and Tumut Rivers, and by the construction of a large running ditch, 6 miles in length, I have proved that canals could be constructed as economically in our mountain ranges as in the Sierra Nevadas, as an equal fall is available. The actual population that would be served by the high-level canal proposed by me would be over 1,000, exclusive of towns; and this, owing to the inducement offered by a large permanent water-supply for hydraulic sluicing, would rapidly increase, whilst the settlers served by the proposed low-level canals from the Murray would not exceed 500. Therefore, by assuming (after a hasty inspection, and without a more careful examination) that there is no possibility of irrigating or improving the water-supply of the Upper Murray District, a very great injury may be inflicted on its principal industries, and its settlement thereby retarded.

My reasons for objecting to the proposed permanent canals are as follows:—1. Insufficiency of water-supply. 2. Great cost of construction. 3. Cost of maintenance. 4. Small returns, and consequent heavy loss to the State, which would increase annually. 5. Possibility of changing the course of both rivers connected with them during a heavy flood.

In the first place it must be assumed that a constant stream will have to be allowed to flow down the Murray and Murrumbidgee Rivers for the supply of settlers on both banks, and to satisfy claims on account of riparian rights. For this purpose I would allocate 1,500 cubic feet a second, which would represent a flow in the river Murray of 1 foot above summer level at Albury, and a flow of 3 feet in the Murrumbidgee above summer level at Wagga Wagga. On this hypothesis, and by taking as a basis of calculation the Government Astronomer's records of the mean height above summer level of the western rivers, it appears that the supply available for the proposed Murray River Canal below Albury in 1885 would have been almost nil for January, February, March, April, May, and December; for July, 800 cubic feet per second; for June, August, and November, about 2,000 cubic feet per second; and for September and October, over 2,000 cubic feet per second. For six months, therefore, during the driest period, there would have been only a small uncertain and intermittent supply for the canal, barely sufficient to account for leakage and evaporation, whilst its service for the rest of the year would have been greatly neutralised on account of the abundant rainfall in June, August, and September. According to the records of the Murrumbidgee flow for 1884, the supply available for the proposed permanent canals would

would have been almost nil for January, February, March, April, May, June, August, and December; for July, 300 cubic feet per second; for September, 2,300 cubic feet per second; for October, 800 cubic feet per second; and for November, 1,000 cubic feet per second. Consequently, there would only have been a scanty intermittent supply for eight months in that year, whilst the copious rainfall in June and October would have largely neutralised the benefits of the canal's supply in July and September. From this it is apparent that neither the Murray nor Murrumbidgee canals can be termed permanent, nor can they be made so without very extensive storage provision above their points of off-take.

The cost of the proposed Murray Canal just below Albury is estimated at £1,412,250, but this provides for no lining, for no interest during construction, and for only £25,000 for land resumption. In comparison with the cost of similar works in Europe this estimate is decidedly low. The average cost of French canals, only 5 feet deep, is £11,600 a mile. The Cavour Canal in Italy cost £80,470 a mile. The Caluso Canal, Italy, with a supply of only 366·26 cubic feet a second, and the steep declivity of 17 feet per mile, cost £1,700 a mile. But supposing this Murray Canal could be constructed for £1,412,250, it is still questionable whether it would prove a profitable work. The interest on the cost, at  $4\frac{1}{2}$  per cent., would amount to £63,549 a year, and the working expenses are estimated at about £13,951 per annum, whilst the gross revenue is estimated at £177,500 per annum. This estimate evidently assumes that the whole irrigable area commanded by the canal will be irrigated immediately after its completion, which is hardly probable, considering that there are not more than 500 settlers dwelling on it, and their homesteads are scattered, whilst a few large landholders own most of the rest of it. Even if the district were densely populated, on comparing the prospective returns of such a work with those actually obtained in India, where labour costs only £3 a year for an ordinary workman, it will be seen by the following table that very different results might be anticipated than those suggested in the estimate of our Engineer.

Name of Canal.	Year.	Outlay to end of year.	Interest at $4\frac{1}{2}$ per cent.	Working expenses.	Receipts from water-rates.	Irrigable area in acres.	Irrigated area in acres.
		£	£	£	£		
Baree Doab .....	1877-78	1,537,990	67,955	50,240	93,876	.....	266,995
Agra .....	1877-78	808,479	32,215	8,319	3,709	.....	163,634
Orissa .....	1876-77	1,728,400	76,300	18,050	4,049	100,000	100,000
Midnapore .....	1876-77	683,500	29,790	9,570	6,150	80,000	54,000
Sone .....	1876-77	1,908,504	73,660	18,620	5,090	500,000	300,000
*North Behar .....	1884-85	1,100,000	45,000	10,000	7,500	100,000	50,000

\* Estimated.

It is evident, therefore, that even under exceptionally favourable circumstances, when there is a very extensive area under cultivation supporting a dense population, and when labour is very cheap, both for cultivation, for the construction of the canal and its maintenance, that even then large irrigation canals are rarely profitable.

In the above table it will be seen that the lowest working expenses are noted opposite the Agra Canal, which has a capacity of 2,000 cubic feet a second, being equal to that proposed for the Murray Canal. If, with labour at £3 a man per annum, it costs £8,300 to maintain and serve the distribution of the supply of the canal, it must surely be assumed that similar services in this country would cost more than double that sum.

At the same time I fear many generations would pass away before the returns of the Murray and Murrumbidgee Canals would realize sufficient to cover even the interest on their cost of construction.

According to the valuable report on the state of the public lands by Messrs. Morris and Rankin, in 1883, it appears that there were only 244 settlers in the Deniliquin District, including the counties of Townsend, Cadell, and Wakool, and embracing 4 million acres at the lower end of the Edwards and Billabong Rivers, whilst  $2\frac{1}{2}$  million acres were aggregated in large estates. The counties of Denison and Hume were little better, the selectors having chiefly sold out to pastoralists; consequently less than 500 *bona fide* settlers would be benefited by the proposed Murray Canals. Nor does the prospect of profitable canals improve with the Murrumbidgee Canals, for most of the country traversed by them is in the hands of pastoralists, whilst in the instance of Waradgery County, having an area of 1,836,160 acres, the land is almost entirely included in twelve pastoral holdings. There is no doubt that these canals would greatly increase the value of alienated land in the districts they would traverse, but, unless the Government resumed it, the State would reap no advantage from such enhancement.

Bearing in mind that the slope of the Murray Canal from the point of off-take at Bungowanna is 1 foot in 5,000 feet, whilst that of the river itself averages only 9 inches a mile from that point downward, it appears possible that, unless the headworks are very substantial, and of sufficient height to resist the entrance of any flood, the river—such a flood as 1867, which was 27 feet above summer level, and 10 feet above the right bank below the site of weir—might force its way into the canal, and pouring down it with overwhelming force, might form an entirely new channel for itself. Such a disaster has actually happened in the Mississippi River from the cutting of a channel of less than one-quarter the area of the proposed canal. The same danger threatens the Murrumbidgee Canal, which has a fall of  $1\frac{1}{2}$  feet towards the Urana Lake, in comparison with a fall of only 10 inches a mile in the river bed. Thus there would be a possibility of these two rivers reuniting their streams near Jerilderie, and following the course of the Billabong River.

In consideration of the many and serious defects I have alluded to, it is evident that the proposed canals, under present conditions, would be injudicious and impracticable.

FREDK. B. GIPPS, C.E.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## PROSPECT RESERVOIR.

(RETURN RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 17 May, 1887.**Questions—*

5. MR. WALKER to ask THE SECRETARY FOR PUBLIC WORKS,—

- (1.) How much brickwork was done for the Prospect Reservoir contract between 1st June, 1886, and 1st February, 1887?
- (2.) How much (if any) yet remains to be done?
- (3.) What has been the cost for supervising the work done in the period mentioned?
- (4.) Is it the intention of the Government to complete the remainder of the work at a like cost?
- (5.) What is the total amount paid yearly to Government officials on the Prospect Reservoir contract?
- (6.) What are the duties of the officials?
- (7.) What is the salary of each?
- (8.) Does the Prospect Sanitation Association obtain a free water right from the temporary supply for baths, &c., and for supplying the inhabitants with water at a fixed charge?
- (9.) Are any Government officials on the Directorate of the Prospect Sanitation Association?
- (10.) Is the Government aware that the first dividend of the above Association was at the rate of 20 per cent. for three months?
- (11.) What has been the cost of repairing leakages, &c., in the canal, from the Reservoir Basin to the Pipe-head Basin (some 4 miles in extent) since it has been taken off the contractor's hands, and passed by Government officials?
- (12.) What have been the duties of Mr. Hackett since his special work of Pipe Inspector has ceased?

*Replies—*

- (1.) 114 cubic yards.
- (2.) About 140 cubic yards.
- (3.) The Inspector who looks after the brickwork has also the supervision of the masonry and concrete. It is not possible, therefore, to say exactly what the inspection of the first mentioned work has cost; his salary during the period mentioned amounted to £156.
- (4.) Yes.
- (5.) £2,621 3s.
- (6.) To direct and superintend the constructions in all their parts.
- (7.) District Engineer—R. H. Ryan, £600; assistant—A. H. Jacob, £260; timekeeper—T. W. Lackey, £311; inspectors—E. Jackson, £233 5s.; E. Hackett, £233 5s.; G. Davies, £233 5s.; W. Nicholas, £186 12s.; J. Davies, £186 12s.; chairman—J. Jekyll, £108 17s.; maintenance man—F. Edwards, £108 17s.
- (8, 9, and 10.) With regard to these questions the inquiry promised has elicited the following explanation from the engineer in charge of the Works (Mr. Ryan):—  
“Yes; the water is given free to the baths and now is, and always has been, given free from the 30-inch main pipe below the dam for the use of the people of the encampment everywhere along its line where tapped. If the supply in this pipe failed at any time the Reservoir has always been opened to the people to get water from. I am informed a small sum is charged to any one getting a supply at the baths in the camp to save carriage I presume, and for the convenience of procuring it there, not for the water itself, which can always be got free as above mentioned.”
- “(9.) Yes; Edward Jackson and Ernest Hackett, Inspectors.
- “(10.) From inquiries I find that for the first three months after the baths were opened they paid a dividend at the rate of 20 per cent.; since then it has paid nothing, and at present it is not paying its working expenses. I am informed the promoters or proprietors of the baths with one exception are men engaged on the works, and the Doctor in charge of the camp states that the sickness at present is much below the average of other places equally populated, evidently an improvement on former times.”

The

The following additional explanation is also given :—

“The precaution has always been taken to see that the water was open to the people of the camp, where it had always been open; if they preferred to pay for the water instead of coming for it to the main pipe to get it free, that was their own affair not mine; I suppose they paid simply for the convenience of getting it close to their houses. If the meaning of the Engineer-in-Chief's memo. was that the Bathing Association were to provide pipes, taps, and other appliances, together with the necessary supervision at their own expense for the use of the public, I must admit that I did not interpret his meaning correctly. I only tried to take a practical view of the matter. Nothing has been taken from the people that they enjoyed previous to the starting of the baths; on the contrary the facilities for getting a supply of water free from the main pipe are greater now than then.”

I am not at all satisfied, neither is Mr. Moriarty, with the position occupied by the officers, referred to in Mr. Ryan's report, and I have accordingly directed that they are at once to resign their position as Directors, or leave the works.

(11.) £1,976 12s. 6d.

(12.) E. Hackett's duties since the pipe laying proper was finished have been of a general character, such as looking after the erection of barbed wire boundary-fences, constructions at siphon outlet, erection of a portion of valve gear, erection of gauge-house, telephone line, and any works that he is competent to superintend and may be useful on. He also has charge of the pipes and valves, supplying the water to Sydney at present, which constantly require looking after.

1887.

(SECOND SESSION.)

## NEW SOUTH WALES.

## COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.

(BOROUGH OF NEWCASTLE—AMENDED BY-LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 13.

Colonial Secretary's Office,  
Sydney, 10th March, 1887.

## BOROUGH OF NEWCASTLE.—AMENDED BY-LAWS.

THE following Amended By-laws, made by the Council of the Borough of Newcastle, under the "Country Towns Water and Sewerage Act of 1880," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above-cited Act.

HENRY PARKES.

BY-LAWS under the "Country Towns Water and Sewerage Act of 1880."

THE Council of the Municipality of Newcastle do, by virtue of the authority vested in them by the Country Towns Water and Sewerage Act, 44 Victoria No. 14, hereby make and establish the following By-laws for carrying into effect the purposes and provisions of the said Act, and declare that the same shall stand in the place of and instead of all By-laws heretofore in force, which By-laws heretofore made are hereby repealed.

By-laws to enable the Council of the Borough of Newcastle to establish a rate for water supply purposes, and for fixing the scale of charges for water supplied by meter, under the powers conferred by the Country Towns Water and Sewerage Act, 44 Victoria No. 14.

The Council of the Borough of Newcastle doth hereby, pursuant to and in exercise and execution of the powers and authorities conferred by the "Country Towns Water and Sewerage Act of 1880," make the following rate, to take effect from the first day of January and the first day of July in each year, upon all lands and tenements within the area of any Water District within which water is authorized to be supplied:—

1. The rates and charges hereinafter specified are those which the owners and occupiers of lands and tenements shall pay in respect of water supplied otherwise than by meter for domestic purposes.

2. On every house, tenement, or land there shall be paid to the Council the annual minimum sum of ten shillings, and in no case shall water be supplied at less than that sum.

3. On every house or tenement there shall be paid the rate of five shillings per room for each and every room in such tenement, all out-houses to be excluded except bath-houses.

4. The charge for water supplied by meter for steam-boiler purposes shall be at the rate of two shillings per thousand gallons. The minimum quantity to be charged for water supplied to any such boiler shall be ten thousand gallons per month.

5. The charge for water supplied by meter for manufacturing and other purposes, unless otherwise specified, shall be at the rate of two shillings per thousand gallons. The minimum quantity to be charged for water supplied shall be ten thousand gallons per month.

6. The charge for water supplied by meter to ships and vessels in the port shall be at the rate of four shillings per thousand gallons, and each party taking water for use of ships, &c., shall provide their own meter.

7. The charge for water supplied by meter to charitable institutions for all domestic purposes shall be at the rate of two shillings per thousand gallons.

8. The charge for water supplied by meter to cricket and bowling clubs shall be at the rate of two shillings per thousand gallons. The minimum quantity to be charged for shall be two thousand gallons per month.

9. The charge for water supplied by meter for irrigation, gardens, nurseries, and private fountains shall be at the rate of two shillings per thousand gallons. The minimum quantity to be charged for shall be two thousand gallons per month.

10. The charge for a temporary supply of water during the erection of new buildings shall be ten shillings per centum on the amount of contract for stonework, brickwork, and plastering; or the Council may require a meter to be fixed, and the charge shall be two shillings per thousand gallons.

11. The charge for warehouses and wholesale stores, not being domiciles, shall be four shillings per thousand gallons. The minimum quantity to be charged for water supplied shall be two thousand gallons per month.

12. The charge for water supplied for motive power, public baths, and troughs in streets shall be at the rate of two shillings per thousand gallons. The minimum to be charged for shall be two thousand gallons per month.

13. All accounts for water supplied under special agreement or by meter shall be paid monthly.

Made and passed by the Council of the Borough of Newcastle, this twenty-seventh day of September, in the year of our Lord one thousand eight hundred and eighty-six.

EDWARD S. HOLLAND,  
Town Clerk.

(L.S.) JOHN THORN,  
Mayor.

1887.

(SECOND SESSION.)

## NEW SOUTH WALES.

## COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.

(BOROUGH OF ALBURY—BY-LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 13.

Colonial Secretary's Office,  
Sydney, 6th April, 1887.

## BOROUGH OF ALBURY.—BY-LAWS.

THE following By-laws, made by the Council of the Borough of Albury, under the "Country Towns Water and Sewerage Act of 1880," for the management and regulation of the Water Supply of that Municipality, having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above-cited Act.

HENRY PARKES.

## BOROUGH OF ALBURY.

BY-LAWS FOR THE MANAGEMENT AND REGULATION OF  
WATER SUPPLY.

THE Council of the Borough of Albury, subject to and in exercise and execution of the powers and authorities conferred on such Council by the "Country Towns Water and Sewerage Act of 1880," make the following By-laws :—

1. No person shall be supplied with water by measure until he shall have signed a contract with the said Council in the form or to the effect contained in the Schedule hereto.

2. The following charges are those which owners and occupiers of land and tenements, or other persons, shall pay in respect of water supplied by the said Council by measure, that is to say, for water supplied (except in cases hereinafter mentioned or in cases of special agreement with the said Council), at the rate of 1s. 6d. per 1,000 gallons.

3. The minimum quantity of water to be charged for, where water is supplied by measure, shall be, if for domestic and other than domestic purposes, the quantity of which the charge at 1s. 6d. per 1,000 gallons would be equal to the amount of the assessed rate which would be payable for lands, tenements, or premises so supplied, if supplied otherwise than by measure, and if for other than domestic purposes only, 25,000 gallons per quarter.

4. A supply of water for domestic purposes shall not include a supply of water for livery or carriers' stables or a supply for any manufacturing purposes or for irrigation or for water power or for fountains or for any ornamental purposes, and the supply of water for other than domestic purposes solely shall in all cases be by measure.

5. For water supplied for public-house troughs, 20s. per annum for each trough; and for steam boilers, 15s. per annum for each horse-power of such steam boiler; for water-carts supplied from the stand pipes, 1s. per load of 500 gallons or less.

6. For water supplied temporarily to buildings in course of progress, 20s. per centum on the amount of contract price for stonework, brickwork, and plastering, or the said Council may require a meter to be fixed, and make the ordinary charge fixed for water supplied by measure, or may make a special agreement in respect of the charge for such water.

7. Water required for market gardens, nurseries cultivated for trade or for purely agricultural purposes, and cricket and bowling clubs and public baths, may be supplied by measure at the rate of 1s. per 1,000 gallons.

8. Water supplied to hospitals or other charitable institutions for all purposes shall be at the rate of 6d. per 1,000 gallons.

9. For water supplied to any lands, tenements, or premises not before specified and not chargeable with or paying Borough rates, shall be supplied by measure at the rate of 1s. 6d. per 1,000 gallons, or by special agreement with the said Council.

10. No person shall use a hose attached to any tap or pipe used for the purpose of supplying the water of the said Council for domestic purposes to any tenement or premises for watering any garden, laying dust, or for any other purpose whatsoever, unless where a water-meter is fixed and the water supplied by measure; and any person offending against this By-law shall be liable to a penalty not exceeding £5.

11. No screw-tap shall be placed on any garden or yard at the outside of any tenement or premises supplied with water of the said Council to which a hose could be attached, unless a water-meter is fixed and the water supplied by measure; and any person offending against this By-law shall be liable to a penalty not exceeding £5.

12. No meter shall be allowed to be affixed unless the dial of the same is capable of registering 1,000,000 gallons, except by special consent in writing of the said Council.

13. If any meter shall cease registering, or be reported as out of repair or registering inaccurately, the said Council shall estimate the charge for water consumed during the period such meter was not in working order and until it is repaired and refixed, either by taking an average of the quantity used during the previous quarter or during the corresponding period of the previous year, or the said Council may insert a check-meter on the service-pipe.

14. The following rates and charges are those which the owners and occupiers of lands and tenements shall pay in respect of lands and tenements to be supplied with water by the said Council for domestic purposes other than by

measure :—(1) On every house or tenement of £10 assessed annual valuation by the said Borough, or under, 10s. per annum. (2) On every house or tenement above the annual assessed value of £10, a rate of 1s. for each £ sterling on the amount of the annual assessed valuation by the said Borough. (3) Unimproved town lots and suburban lands shall be charged a minimum rate of 2s. 6d. per lot up to £50 annual assessed capital valuation by said Borough, and all in excess of this, £5 per centum on said annual assessed capital valuation.

15. Before any person shall affix any service-pipe to any pipe of the said Council, or alter, repair, or in any manner interfere with any pipe of the said Council, or any service-pipe, cock, or fitting connected with the pipes of the said Council, he shall obtain from the said Council a license in that behalf to execute such works; and any unlicensed person affixing, altering, repairing, or in any manner interfering with such pipe, service-pipe, cock, or fitting as aforesaid, shall be liable to a penalty not exceeding £10.

16. Before any such license shall be granted by the said Council, the person applying for the same shall satisfy the said Council that he is a competent plumber.

17. Any person, whether licensed as aforesaid or not, who shall offend by opening any ground so as to uncover any pipe or pipes, the property of the said Council, without giving two days' notice to the said Council of his intention so to do, or who shall in any way tamper with or alter any pipe, the property of the said Council, without the permission in writing of the said Council being first obtained, or who shall wilfully or carelessly break, injure, or open any lock, cock, valve, pipe, work, or engine, the property of the said Council, shall be liable for each such offence to a penalty not exceeding £20.

18. Any person, whether licensed or not, as aforesaid, who shall lay any pipe to communicate with the pipes of the said Council without giving two days' notice of the day and hour when such pipe is intended to be made to communicate with the pipes of the said Council, or who shall make such communication except under the superintendence and according to the directions of some officer of the said Council, or shall lay any leaden or other pipe to communicate with the pipe of the said Council, of a strength and material not sanctioned by the said Council, shall be liable for each such offence to a penalty not exceeding £5; and in the event of continuing the offence, to a further penalty of £2 for each day after the notice of the offence from the said Council.

19. Lead piping of the following weights :—

Diameter of Pipe.	Weight of Pipe per yard.
$\frac{1}{2}$ in.....	5 lb.
$\frac{3}{4}$ in.....	6 lb.
$\frac{1}{2}$ in.....	7 $\frac{1}{2}$ lb.
$\frac{3}{4}$ in.....	9 lb.
1 in.....	12 lb.
$1\frac{1}{4}$ in.....	16 lb.
$1\frac{1}{2}$ in.....	20 lb.

And galvanized iron piping of approved quality only will be allowed for external and internal services. Ordinary connections with sub-mains must be made with proper ferrules, to which, for iron service, a length of not less than 3ft. of lead pipe must be attached. One service-pipe only to each tenement will be permitted, and for houses rated at £20 per annum and under, the bore of such service-pipe must not exceed  $\frac{1}{2}$  in.

20. If any person shall neglect to repair any service-pipe conveying water from the pipes of the said Council into the premises of such person, after having received notice from any officer of the said Council that such service-pipe requires repairing, the said Council may stop the water from flowing into such premises, either by cutting off the service-pipe, or otherwise, as to the said Council may seem fit, until the necessary repairs shall have been effected. The service-pipes

from the main being the property of the owners or occupiers of the tenements supplied by such service-pipes, the occupier (if any), and if none, the owner, shall in every instance in which any damage shall be caused by reason of such service pipe being leaky or otherwise out of repair or broken, be liable to a penalty not exceeding £5; and in the event of continuing the offence, to a further penalty of £2 for each day after notice of the offence from the said Council.

21. Any person supplied with water by the said Council who shall wilfully or negligently allow the same to run to waste shall be liable for each offence to a penalty not exceeding £5; and in the event of continuing the offence, to a further penalty of £2 for each day after notice of the offence from the said Council.

22. Any person, whether licensed as aforesaid or not, connecting any service-pipe or branch service-pipe with any steam boiler for the purpose of supplying the same with water without first affixing a self-acting valve for preventing the pressure of the steam reversing or affecting the dial of the meter, shall be liable to a penalty not exceeding £5; and in the event of continuing the offence, to a further penalty of £2 for each day after notice of the offence from the said Council.

23. Any person receiving water from the said Council who shall take or carry away any such water from his premises, or who shall allow any person to take or carry away any such water, or who shall sell the same to any other person, shall be liable to a penalty not exceeding £5.

24. Any person, not having agreed to be supplied with water by the said Council, who shall take or carry away any water from any drinking tap through a private or public service pipe, shall be liable to a penalty not exceeding £5.

25. All charges for water supplied by measure or under special agreement shall be paid on the first days of January, April, July, and October in each year, or as may be agreed on by the said Council.

26. In the construction of these By-laws, the word "person" shall be deemed to extend to and include a corporation whether aggregate or sole, and the words "said Council" shall mean the Council of the Borough of Albury.

THE SCHEDULE HEREINBEFORE REFERRED TO.

MEMORANDUM of Agreement this \_\_\_\_\_ day of 188 \_\_\_\_\_, between \_\_\_\_\_ of Albury, \_\_\_\_\_ of the one part, and the Council of the Borough of Albury of the other part, whereby the said \_\_\_\_\_ agrees to take water by measure supplied by the said Council, at the rate of \_\_\_\_\_ per 1,000 gallons, to be used in or upon the land, tenements, or premises in the occupation of the said \_\_\_\_\_ situated in \_\_\_\_\_ street; and such water shall be used for the purposes of \_\_\_\_\_ only; and the said \_\_\_\_\_ agrees to pay the said Council for the water so supplied, on the first days of January, April, July, and October in each year; and the said Council agrees to supply such water at the rate aforesaid, provided always and it is hereby agreed that the said Council shall not be liable to any penalty or damages for not supplying such water, if the want of such supply arises from drought or other unavoidable cause or accident; and the said Council may terminate this agreement at any time by giving the said \_\_\_\_\_ three weeks' notice in writing to that effect.—As witness the hands and Common Seal of the said parties hereto.

Given under our Common Seal, this \_\_\_\_\_ day of \_\_\_\_\_, 188 \_\_\_\_\_.

The foregoing By-laws were made and passed by the Borough Council of Albury, and the seal of the said Council was hereunto affixed, the twenty-third day of December, 1886.

JNO. H. PAINE, (L.S.) G. H. BILLSON, Mayor  
Council Clerk.

1887.

(SECOND SESSION.)

## NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.  
(BOROUGH OF BATHURST—BY-LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 13.

Colonial Secretary's Office,  
Sydney, 17th June, 1887.

## BOROUGH OF BATHURST.—BY-LAWS.

THE following By-laws, made by the Council of the Borough of Bathurst, under the "Country Towns Water and Sewerage Act of 1880," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above cited Act.

HENRY PARKES.

BY-LAWS made in pursuance of the powers contained in the "Country Towns Water and Sewerage Act" 44 Vic. No. 14, section 13, for the supply and distribution of water, and determining the rate or charges to be made therefor.

1. The rate to be paid in respect of lands and tenements to be supplied with water for domestic purposes, otherwise than by meter, or in respect of lands and tenements distant not more than fifty yards from any main constructed by or vested in the Council, shall be, and it is hereby fixed at, one shilling in the pound on the value of such lands and tenements as assessed in each year for the purpose of the ordinary Municipal rates, the payments to be made in advance in two equal payments, on the first day of January and the first day of July in each year, but the minimum payment shall be ten shillings per annum.

2. In the case of any lands or tenements becoming liable to be rated for water during the currency of a half-year, the rate shall be immediately payable, but so much thereof only as is proportionate to the unexpired portion of the half-year.

3. The bore of any service pipe, shall not exceed  $\frac{3}{4}$  of an inch, unless with the consent of the Council, in which case the rate to be paid shall be fixed by special agreement between the Borough Council and the owner or occupier requiring such pipe; and any such agreement shall be binding upon any subsequent owner or occupier so long as the said service pipe is in use.

4. The charge for water to be supplied by meter to any lands or tenements for domestic purposes, as defined as aforesaid, shall be at the rate of one shilling per thousand gallons, but the minimum payment in respect of any house, land, or tenements for which a meter is supplied shall be at the rate of one shilling per month.

5. The charge for water supplied by meter for irrigation, gardens, nurseries, private fountains, or other purposes of a like nature, and not otherwise herein provided for, shall be at the rate of one shilling per thousand gallons; or where the water is used for domestic purposes also, at the rate of one shilling per thousand gallons.

6. The charge for water supplied by meter for steam-boiler purposes, or for manufacturing or other similar purposes, shall

be one shilling per thousand gallons, and the minimum quantity chargeable in such cases shall be five thousand gallons per month.

7. The charge for water supplied by meter to any cricket, racing, or bowling club, or any club or institution of a similar nature, shall be at the rate of one shilling per thousand gallons.

8. Where water is required for a temporary supply during the erection of new buildings, the charge shall (if no meter be used) be ten shillings per cent. on the amount of the contract work for stonework, brickwork, or plastering, or if a meter be fixed, the charge shall be at the rate of one shilling per thousand gallons.

9. The charge for warehouses and wholesale stores shall be at the rate of one shilling per thousand gallons, and the minimum to be charged therefor shall be two thousand gallons per month.

10. The charge for all buildings or institutions of a public or semi-public nature not coming within the exceptions in section 35 shall be at the rate of one shilling per thousand gallons.

11. The charge for water supplied for motive power, public baths, or wash-houses, not coming within the exceptions in section 35, shall be at the rate of sixpence per thousand gallons, and the minimum quantity to be charged for shall be ten thousand gallons per month.

12. The Borough Council may in any case insist upon water being supplied per meter.

13. All accounts for water supplied per meter, or under special agreement, shall be paid monthly.

Made and passed by the Council of the Borough of Bathurst, this sixteenth day of May, in the year of our Lord one thousand eight hundred and eighty-seven.

(L.S.) THOS. A. MACHATTIE,  
DAVID C. WILLIAMSON,  
Town Clerk.

Mayor.

## NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.  
(BOROUGH OF GOULBURN—BY-LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 13.

Colonial Secretary's Office,  
Sydney, 22nd June, 1887.

## BOROUGH OF GOULBURN.—BY-LAWS.

THE following By-laws, made by the Council of the Borough of Goulburn under the "Country Towns Water and Sewerage Act of 1880," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above-cited Act.

HENRY PARKES.

## MUNICIPAL COUNCIL OF THE BOROUGH OF GOULBURN.

REGULATIONS for the guidance of licensed plumbers in supplying water to houses, in the Borough of Goulburn and Suburbs.

1. Notice of intention to connect service-pipes or water-meters to the mains, or to any other service-pipe in each case to be lodged with the Town Clerk, and for the correct information in such notice the plumber will be strictly responsible. The premises will then be inspected, and when the agreement is signed and rate paid, the plumber will receive a printed authority to proceed with the work. The ground is not to be opened, or pipe connected, until he has such authority. Printed forms of the notice to be obtained from the Town Clerk.
2. In all cases where it is intended to connect a service-pipe to the service-pipe of any other premises a written permission from the owner or occupier of such premises must be sent to the Town Clerk before the authority to connect will be granted.
3. In every case of repairs to service-pipe, or where it may be wished to transfer service-pipes from one main to another, or to connect with other service-pipes, or where any change or alteration to them may be required, in any way, notice of such repair or alteration, &c., must be given in writing to the Town Clerk at least twenty-four hours before any such work shall be commenced, except in cases of great waste of water, when immediate steps must be taken to stop the leak, and notice given to the town Clerk of the same forthwith.
4. All service-pipes must be laid 18 inches below the surface of roadway and gutters and meters, where required, fixed in accordance with the direction of the Town Clerk or other authorized officer of the Municipal Council; and on each service-pipe connected with the mains must be fixed two stop-cocks, one at the junction of the main, and other on the footpath, 1 foot 6 inches from the building lines, enclosed in an iron box with proper lid. All service-pipes, taps, stop-cocks, ball cocks, valves, &c., shall be equal in quality to samples kept in the Town Clerk's office or be approved of by the Town Clerk, or other authorized officer of the Municipal Council.
5. All service-pipes connected with the water mains are to have a length of at least 2 feet of  $\frac{3}{4}$ -inch lead pipe, weighing

9 lbs. per lineal yard, or where a 1 inch service is authorized, the lead pipe to weigh 12 lbs. per lineal yard, between the stop-cock in the main and the galvanized iron service-pipe; and where the service-pipes are entirely of lead, the weights for respective sizes are to be as follows, viz. :— $\frac{1}{2}$  inch, 4 lbs.;  $\frac{3}{4}$  inch, 9 lbs.; 1 inch, 12 lbs.; all joints throughout the service are to be of the kind known as wiped joints. The lead pipe above referred to is to be joined to the stop-cock at the main, and to the galvanized iron service-pipe by means of a barrel union, similar to that on view in the Town Clerk's Office, or other approved fittings.

6. No service-pipe will be allowed to communicate with any cistern, tank, or vessel intended or used for the reception of rain-water.

7. All water meters to be enclosed in a strong wooden box; all keys of both meters and boxes to be lodged at the Town Clerk's Office, immediately after the meters are fixed. The Municipal Council reserves the right of affixing their own locks to the meters and boxes; twenty-four hours' notice to be given of the day on which it is intended to connect meters, in order that the proper officer may attend and see them fixed correctly. On no account are plumbers or other persons to take off, alter, or otherwise interfere with meters or pipes connecting the same, unless by permission of the Town Clerk, and in the presence of an authorized officer of the Corporation.

8. The officers connected with the Water Service are strictly enjoined to report every case of infringement of these Regulations, and the plumber offending against any of them will have to show cause why his license should not be suspended or cancelled, as may be thought proper in the circumstances of the case, besides being held responsible for any damages occasioned by his so transgressing any of the Regulations.

9. All licensed plumbers to attend at the Town Clerk's Office, on or before the 10th January, in each year to have their names and licenses registered and the latter endorsed. Only such plumbers as comply with this Regulation will be deemed "Licensed Plumbers," and allowed to work as such.

10. In each ward certain days in each week will be set apart upon which connections with the mains may be made. Upon those days the Council's officers will be in attendance in those

districts, in order to attend plumbers, and plumbers must in all cases give two days' notice at the Town Clerk's office of their intention to make connections, and indicate on the wall or kerb by a temporary mark (w) where they propose to cross the footpath.

11. The Council's workmen are to open the trench, bore the mains, and insert the stop-cock within the city boundaries, the stop-cock being of the kind, a sample of which is on view at the Town Clerk's office, the same being left at the Town Clerk's office along with the notice to connect.

12. By the time these operations are completed, the plumber who has been employed to lay on the service must have taken all his measurements, prepared all the pipes to the exact length, complete with lead connections of approved length and weight per yard, properly jointed to cap linings, barrel union, &c., ready for attachment to the stopcock, so as to avert any delay in the refilling of the trench.

13. In the event of the articles abovenamed not being ready for fixing at the period named, the trench may be filled in again by the Council's workmen, and the re-opening and filling of the same shall be paid for by the plumber, in addition to whatever other payments which may accrue under these Regulations.

14. All expenses of labour in drilling, inserting stop-cock, opening and filling trenches, shall be borne by the plumber; the account for the same to be delivered without delay, and paid by him to the Town Clerk immediately on receipt of the account. Failing due attention to the latter directions, the Council may forfeit the license of the said plumber.

15. All service-pipes within the city boundaries are to be 1½-inch galvanised iron pipes, or, if of lead, may be ¾ inch from the end of the lead connection to the building line, but the stop-cocks are to be ¾ inch.

A printed copy of the above Regulations will be given to each licensed plumber.

An annual fee of twenty shillings will be charged for each license; but for every quarter of a year that elapses a rebate of five shillings will be allowed.

Made and passed by the Council of the Borough of Goulburn, this eighteenth day of April, in the year of our Lord one thousand eight hundred and eighty-seven.

(L.S.) FRANCIS TAIT,  
Mayor.

J. B. SALMON,  
Town Clerk.

BY-LAWS under the "Country Towns Water and Sewerage Act of 1880."

The Council of the Municipality of Goulburn do, by virtue of the authority vested in them by the Country Towns Water and Sewerage Act, 44 Victoria No. 14, hereby make and establish the following By-laws for carrying into effect the purposes and provisions of the said Act.

By-laws to enable the Council of the Borough of Goulburn to establish a rate for water supply purposes, and for fixing the scale of charges for water supplied by meter, under the powers conferred by the Country Towns Water and Sewerage Act, 44 Victoria No. 14.

The Council of the Borough of Goulburn doth hereby, pursuant to and in exercise and execution of the powers and authorities conferred by the Country Towns Water and Sewerage Act of 1880, make the following rate, to take effect from the first day of January and the first day of July in each year, upon all lands and tenements within the area of any water district within which water is authorized to be supplied.

1. The rates and charges hereinafter specified are those which the owners and occupiers of lands and tenements shall pay in respect of water supplied otherwise than by meter for domestic purposes.

2. On every house, tenement, or land there shall be paid to the Council the annual minimum sum of ten shillings, and in no case shall water be supplied at less than that sum.

3. On every house or tenement there shall be paid the rate of five shillings per room for each and every room in such tenement, all out-houses to be included except water-closets, in all stables every two stalls to be rated as one room.

4. The charge for water supplied by meter for steam-boiler purposes shall be at the rate of two shillings per thousand gallons, the minimum quantity to be charged for water supplied to any such boiler shall be five thousand gallons per month.

5. The charge for water supplied by meter for manufacturing and other purposes, unless otherwise specified, shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for water supplied shall be five thousand gallons per month.

6. The charge for water supplied by meter to charitable institutions (hospitals excepted) for all domestic purposes shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for water supplied shall be five thousand gallons per month.

7. The charge for water supplied by meter to cricket and bowling clubs, and all other pleasure or show grounds whatsoever, shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for shall be two thousand gallons per month.

8. The charge for water supplied by meter for irrigation, gardens, nurseries, and private fountains, shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for shall be at the rate of two thousand gallons per month.

9. The charge for a temporary supply of water during the erection of new buildings shall be ten shillings per centum on the amount of contract for stonework, brickwork, and plastering, or the Council may require the meter to be fixed, and the charge shall be two shillings per thousand gallons.

10. The charge for warehouses and wholesale stores not being domiciles shall be four shillings per thousand gallons; the minimum quantity to be charged for water supplied shall be two thousand gallons per month.

11. The charge for water supplied for motive power, public baths, and troughs in streets, shall be at the rate of two shillings per thousand gallons; the minimum to be charged for shall be two thousand gallons per month.

12. All accounts for water supplied under special agreement or by meter shall be paid monthly.

13. Upon receiving a petition signed by two thirds of the ratepayers in any public way in the said City, or in any part of such way, the Council may cause the same to be watered; or they may in their discretion cause any public way to be watered, and may impose on the tenants or owners of buildings in such public way a uniform rate sufficient to cover the expense, which rate shall be assessed upon and according to the amount for which such buildings are assessed for the purposes of the City rate, in addition to every other rate hereby authorized and made payable; and every such rate may be made, levied, enforced, and recovered in like manner as any City rate.

Made and passed by the Council of the Borough of Goulburn, this twenty-eighth day of March, in the year of our Lord one thousand eight hundred and eighty-seven.

(L.S.) FRANCIS TAIT,  
Mayor.  
J. B. SALMON,  
Town Clerk.

1887.

(SECOND SESSION.)

## NEW SOUTH WALES.

## COUNTRY TOWNS WATER AND SEWERAGE ACT.

(NOTIFICATIONS UNDER, FOR WATER SUPPLY WORKS AT WAGGA WAGGA, GOULBURN, ALBURY, AND BATHURST.

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 125.

## WAGGA WAGGA WATER-WORKS.

In accordance with the provisions of the Country Towns Water and Sewerage Act 44 Vic. No. 14, section 125, I, John Sutherland, the Minister for Public Works of the Colony of New South Wales, have the honor to report, for the information of His Excellency the Governor and Executive Council, that the works for the supply of water for the Borough of Wagga Wagga, in the said Colony, which, under the provisions of the before-recited Act, and at the request of the Council thereof, have been constructed under the direction of the Minister for Public Works of the said Colony, have been completed.

Given under my hand this sixteenth day of February, 1887.

JOHN SUTHERLAND.

COPY Resolution submitted to and passed unanimously by the Council of the Municipality of Wagga Wagga at a special meeting of the Council held on the 18th day of May, A.D. 1882.

"That the Council of the Municipality of Wagga Wagga, having taken into consideration the question of water supply for the town of Wagga Wagga, do hereby request His Excellency the Governor, with the advice of the Executive Council, to take all such steps and cause such works to be executed and completed as may be necessary to provide a water supply for the town of Wagga Wagga, and the said Council, on behalf of the Municipality of Wagga Wagga, hereby agree to do and undertake all the liabilities and obligations mentioned in section 125 of the Act 44 Vic. No. 14, and it is hereby expressly agreed that such liability is accepted for the total amount to be expended on such works whatever such amount may be."

A. F. BOLTON,  
Mayor.

## NOTIFICATION OF COMPLETION OF WATER-WORKS FOR THE BOROUGH OF WAGGA WAGGA, UNDER 44 VICTORIA, NO. 14.

NEW SOUTH WALES, } Proclamation by His Excellency The Right Honorable CHARLES ROBERT, BARON  
to wit. } CARRINGTON, a Member of Her Majesty's Most Honorable Privy Council,  
(L.S.) } Knight Grand Cross of the Most Distinguished Order of Saint Michael and  
CARRINGTON, } Saint George, Governor and Commander-in-Chief of the Colony of New  
Governor. } South Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, having duly sanctioned the carrying out of certain works for and in connection with the supply of water to the Borough of Wagga Wagga in the said Colony, for and towards the completion of which said works public funds were provided by Parliament; and whereas the said works have been reported to me as complete by the Minister for Works, in accordance with the provisions of the 125th section of the before-recited Act: Now, I, the Governor aforesaid, with the advice of the Executive Council, hereby declare by this notification that such works are complete, to the intent that the Council of the said Borough of Wagga Wagga, within and for the purposes of which the said works have been constructed, shall take over the same and the administration and management thereof, upon the terms and conditions prescribed by the before-recited Act.

In witness whereof, I have hereunto set my Hand and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixteenth day of February, in the year of our Lord one thousand eight hundred and eighty-seven, and in the fiftieth year of Her Majesty's Reign.

By His Excellency's Command,  
JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

## GOULBURN WATER-WORKS.

IN accordance with the provisions of the Country Towns Water and Sewerage Act 44 Vic. No. 14, section 125, I, John Sutherland, the Minister for Public Works, of the Colony of New South Wales, have the honor to report, for the information of His Excellency the Governor and Executive Council, that the works for the supply of water for the Borough of Goulburn, in the said Colony, which under the provisions of the before-recited Act, and at the request of the Council thereof, have been constructed under the direction of the Minister for Public Works of the said Colony, have been completed.

Given under my hand, this sixteenth day of February, 1887.

JOHN SUTHERLAND.

COPY Resolution submitted to and passed by the Council of the Municipality of Goulburn at a special meeting of the Council held on the 5th day of May, A.D. 1881.

Present:—His Worship the Mayor (in the Chair), and Aldermen M'Connell, Taylor, Caldwell, Wardle, and Osborne.

Moved by Alderman Caldwell, seconded by Alderman Osborne, and carried, "that the Council of the Municipality of Goulburn, having taken into consideration the question of water supply for the City of Goulburn, do hereby request His Excellency the Governor with the advice of the Executive Council, to take all such steps and cause such works to be executed and completed as may be necessary to provide a water supply (without reticulation) for the city of Goulburn, and the said Council, on behalf of the Municipality of Goulburn, hereby agree to do and undertake all the liabilities and obligations mentioned in section 125 of the Act 44 Vic. No. 14, and it is hereby expressly agreed that such liability is accepted for the total amount to be expended on such works whatever such amount may be."

## NOTIFICATION OF COMPLETION OF WATER-WORKS FOR THE BOROUGH OF GOULBURN, UNDER 44 VICTORIA, No. 14.

NEW SOUTH WALES, } Proclamation by His Excellency The Right Honorable CHARLES ROBERT, BARON  
to wit. } CARRINGTON, a Member of Her Majesty's Most Honorable Privy Council,  
(L.S.) } Knight Grand Cross of the Most Distinguished Order of Saint Michael and  
CARRINGTON, } Saint George, Governor and Commander-in-Chief of the Colony of New  
Governor. } South Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, having duly sanctioned the carrying out of certain works for and in connection with the supply of water to the Borough of Goulburn, in the said Colony, for and towards the completion of which said works public funds were provided by Parliament, and whereas the said works have been reported to me as complete, by the Minister for Works, in accordance with the provisions of the 125th section of the before-recited Act: Now, I the Governor, aforesaid, with the advice of the Executive Council, hereby declare by this notification that such works are complete, to the intent that the Council of the said Borough of Goulburn within and for the purposes of which the said works have been constructed, shall take over the same, and the administration and management, thereof, upon the terms and conditions prescribed by the before-recited Act.

In witness whereof, I have hereunto set my hand and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixteenth day of February, in the year of our Lord one thousand eight hundred and eighty-seven and in the fiftieth year of Her Majesty's Reign.

By His Excellency's Command,  
JOHN SUTHERLAND.

GOD SAVE THE QUEEN !

## ALBURY WATER-WORKS.

IN accordance with the provisions of the Country Towns Water and Sewerage Act 44 Vic. No. 14, section 125, I, John Sutherland, the Minister for Public Works, of the Colony of New South Wales, have the honor to report for the information of His Excellency the Governor and Executive Council, that the works for the supply of water for the Borough of Albury, in the said Colony, which under the provisions of the before-recited Act, and at the request of the Council thereof, have been constructed under the direction of the Minister for Public Works of the said Colony, have been completed.

Given under my hand, this fifteenth day of February, 1887.

JOHN SUTHERLAND.

COPY Resolution submitted to and passed by the Council of the Municipality of Albury at a special meeting of the Council held on the 30th day of January, A.D. 1882.

Present:—His Worship the Mayor (in the Chair), and Aldermen Thorold, Edmonson, Frew, Lamport, Gulson, Walder, Billson, and Hunter.

Moved by Alderman Thorold, seconded by Alderman Frew, and carried, "that the Council of the Municipality of Albury, having taken into consideration the question of water supply for the town of Albury, do hereby request His Excellency the Governor, with the advice of the Executive Council, to take all such steps and cause all such works to be executed and completed as may be necessary to provide a water supply (without reticulation) for the said town, and the said Council on behalf of the Municipality of Albury, hereby agree to do and undertake all liabilities and obligations mentioned in section 125 of the Act 44 Vic. No. 14, and it is hereby expressly agreed that such liability is accepted for the total amount to be expended on such works whatever such amount may be."

JOHN H. PAYNE,  
Council Clerk.

NOTIFICATION

NOTIFICATION OF COMPLETION OF WATER-WORKS FOR THE BOROUGH OF  
ALBURY, UNDER 44 VICTORIA, No. 14.

NEW SOUTH WALES, } Proclamation by His Excellency The Right Honorable CHARLES ROBERT, BARON  
to wit. } CARRINGTON, a Member of Her Majesty's Most Honorable Privy Council,  
(L.S.) Knight Grand Cross of the Most Distinguished Order of Saint Michael and  
CARRINGTON, Saint George, Governor and Commander-in-Chief of the Colony of New  
Governor. South Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council, of the said Colony, having duly sanctioned the carrying out of certain works for and in connection with the supply of water to the Borough of Albury in the said Colony, for and towards the completion of which said works public funds were provided by Parliament; and whereas the said works have been reported to me as complete by the Minister for Works, in accordance with the provisions of the 125th section of the before-recited Act: Now, I, the Governor aforesaid with the advice of the Executive Council, hereby declare by this notification that such works are complete, to the intent that the Council of the said Borough of Albury, within and for the purposes of which the said works have been constructed, shall take over the same, and the administration and management thereof, upon the terms and conditions prescribed by the before-recited Act.

In witness whereof, I have hereunto set my Hand and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this fifteenth day of February, in the year of our Lord one thousand eight hundred and eighty-seven, and in the fiftieth year of Her Majesty's Reign.  
By His Excellency's Command,

JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

BATHURST WATER-WORKS.

In accordance with the provisions of the Country Towns Water and Sewerage Act 44 Vic. No. 14, section 125, I, John Sutherland, the Minister for Public Works of the Colony of New South Wales, have the honor to report for the information of His Excellency the Governor and Executive Council, that the works for the supply of water for the Borough of Bathurst, in the said Colony, which under the provisions of the before-recited Act, and at the request of the Council thereof, have been constructed under the direction of the Minister for Public Works of the said Colony, have been completed.

Given under my hand, this sixteenth day of February, 1887.

JOHN SUTHERLAND.

The following Resolution was passed at a meeting of the Council held on Wednesday, April 20th, 1881:—"That the Bathurst Borough Council acknowledge the receipt of letter from the Department of Public Works enclosing copy of minute from the Engineer-in-Chief for Harbours and Rivers, *re* water-works. And, being desirous of at once securing a permanent water supply for Bathurst, is willing to accept from the Government the terms mentioned therein, and to comply with the 125th clause of the Country Towns Water Supply and Sewerage Act of 1880, and that the required statement of the revenue of the Borough for the past year be at once prepared and forwarded to the Government."

EXTRACT from Minute of Engineer-in-Chief for Harbours and Rivers, referred to in the Resolution of the Bathurst Municipal Council.

"The Minister having at the urgent representations of the Municipalities interested, viz, Albury, Wagga Wagga, Goulburn, and Bathurst, sanctioned calling for tenders for the pumping engine, &c., in connection with the above water supplies, it now becomes desirable, I think, that the coporate bodies referred to should be officially communicated with on the subject.

"The 124th section of the Country Towns Water and Sewerage Act of 1880 gives the Governor power to construct and complete works for water supplies under certain conditions.

"But inasmuch as the 125th section of the Act imposes upon the Corporations benefited the burden of paying for the works when completed, I think the implication is clear that before we accept any tender or incur any expense, the express consent of the Corporations liable should be first formally obtained.

"I would, therefore, beg to suggest that the Corporations herein named be informed that the Government are prepared to carry out their respective water supplies—excluding the reticulation of the towns, which must be left to themselves to arrange—under the provisions of the 124th clause of the Act, and that tenders have already been received for the engines, boilers, and pumps; but that no tender can be accepted or other obligation incurred until, by an express resolution of their Councils respectively, they intimate to the Government their willingness to come under the obligations of the Act, more particularly those referred to in the 125th clause as to the repayment of the cost of such works.

"When such resolutions have been received, the authority of the Governor-in-Council, under the 124th clause, should be obtained for carrying out the works.

\* \* \* \* \*  
"But in each case the Council must understand that the Government does not bind itself to the exact amount, and that they must be prepared to pay whatever the cost may be. The Government will of course use every economy; but the point I have mentioned should be expressly and unmistakably referred to in the resolutions of the Councils to prevent any misunderstanding hereafter."

NEW SOUTH WALES.

## COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.

(NOTIFICATION OF CONSTRUCTION OF WORKS FOR WATER SUPPLY TO LISMORE.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14.

Department of Public Works,  
Sydney, 28th June, 1887.

NOTICE is hereby given that His Excellency the Governor, with the advice of the Executive Council, has been pleased, under the powers conferred upon him in that behalf by the 124th section of the Country Towns Water and Sewerage Act of 1880, 44 Vic. No. 14, to authorize the construction, under the direction of the Minister of Public Works, of the necessary works for water supply for the town of Lismore, at the request and pursuant to the resolution of the Municipal Council of the said town of Lismore, copy of which resolution is appended hereto for general information.—Dated at Sydney, this 28th day of June, 1887.

JOHN SUTHERLAND,  
Minister for Works.

CORP Resolution submitted to and passed by the Council of the Municipality of Lismore, at a meeting of the Council held on the 5th day of July, A.D. 1886:—

“That the Council of the Municipality of Lismore having taken into consideration the question of Water Supply for the town of Lismore, do hereby request His Excellency the Governor, with the advice of the Executive Council, to take all such steps, and cause such works to be executed and completed as may be necessary to provide a water supply for Lismore, and the said Council, on behalf of the said Municipality, hereby agree to do and undertake all the liabilities and obligations mentioned in section 125 of Act 44 Vic. No. 14; and it is hereby expressly agreed that such liability is accepted for the total to be expended in such works whatever such amount may be.”

LUD. BERNSTEIN,  
Mayor.

## NEW SOUTH WALES.

## LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTIONS FOR SEWERAGE PURPOSES, PARISH OF BOTANY.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable  
to wit } CHARLES ROBERT, BARON CARRINGTON,  
a Member of Her Majesty's Most  
(L.S.) } Honourable Privy Council, Knight  
CARRINGTON, } Grand Cross of the Most Distinguished  
Governor. } Order of Saint Michael and Saint  
George, Governor and Commander-in-  
Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the sewerage of the City of Sydney and its suburbs in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the Acts to apply sums out of Consolidated Revenue Fund of New South Wales towards services of 1886, and for services to be hereinafter provided for by loan, and whereas the land hereinafter described is required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the sewerage of the said City of Sydney and its suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other encumbrances whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee, with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate in the parish of Botany, county of Cumberland, Colony of New South Wales: Commencing at the south-west corner of the first portion of land described in the resumption of land notified in the Gazette of the 21st July, 1882, No. 293; and bounded thence by the southern boundary of said resumption of land bearing south 80° 57' east 105 6 links; thence by a line bearing south 27° 44' west 795 8 links to Gardener's Road; thence along the north

side of said road by a line bearing north 80° 45' west 105 2 links; and thence by a line bearing north 27° 44' east 796 links, to the point of commencement,—being a strip of land 100 links wide throughout, containing 3 roods and 7 3 perches, and being the property of William Cooper.

In witness whereof I have hereunto set my hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twenty-fifth day of October, in the year of our Lord one thousand eight hundred and eighty-six, and in the fiftieth year of Her Majesty's Reign.

By His Excellency's Command,  
WILLIAM JOHN LYNE.

GOD SAVE THE QUEEN!

NOTIFICATION OF RESUMPTION OF LAND UNDER  
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable  
to wit. } CHARLES ROBERT, BARON CARRINGTON,  
a Member of Her Majesty's Most  
(L.S.) } Honourable Privy Council, Knight  
CARRINGTON, } Grand Cross of the Most Distinguished  
Governor. } Order of Saint Michael and Saint  
George, Governor and Commander-in-  
Chief of the Colony of New South  
Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the sewerage of the City of Sydney and its suburbs, in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the "Public Works Loan Act of 1879," and whereas the lands hereinafter described are required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said lands are situated, declare that the lands hereinafter described have been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the sewerage of the said City of Sydney and its suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said lands shall forthwith be vested in the Minister for Public Works and his successors on behalf of Her Majesty for the purpose of the said last-mentioned Act, for an estate of

inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way or other easements whatsoever, and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee with the powers stated in the said last-mentioned Act: And I declare that the following is a description of the lands hereinbefore referred to, that is to say:—

All that piece or parcel of land situate in the parish of Botany, county of Cumberland, Colony of New South Wales: Commencing at a point bearing north 79 degrees 56 minutes west 1,075·8 links from the north-west corner of the intersection of Annabels Lane and Mudbank Road; bounded thence on the south by the northern boundary of Annabels Lane, being a line bearing north 79 degrees 56 minutes west 45·4 links; thence on the west by a line bearing north 10 degrees 4 minutes east 327·2 links; thence on the north by the southern boundary of St. John-street, being a line bearing south 79

degrees 56 minutes east 45·4 links; thence on the east by a line bearing south 10 degrees 4 minutes west 327·2 links, to the point of commencement, containing 23·7 perches, being portion of allotments 43 and 44 of a subdivision of 15½ acres by J. R. Hatfield, the owners of which are supposed to be William, Joseph, Samuel, and George Clift.

In witness whereof I have hereunto set my hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixteenth day of April, in the year of our Lord one thousand eight hundred and eighty-six, and in the forty-ninth year of Her Majesty's Reign.

By His Excellency's Command,

W. J. LYNE.

GOD SAVE THE QUEEN!

1887.

(SECOND SESSION.)

## NEW SOUTH WALES.

## POLICE DEPARTMENT.

(REPORT FOR 1886.)

Presented to Parliament by Command.

## The Inspector-General of Police to The Principal Under Secretary.

Sir, Police Department, Inspector-General's Office, Sydney, 13 January, 1887.

I do myself the honor to submit, for the Colonial Secretary's information, the following Report, respecting the Police Service, for the year 1886.

Appended will be found a table exhibiting the names of the Police Stations in each district and the strength of the Force at each.

During the year new Stations were established at the undermentioned places:—

District.	Station.
Northern ... ..	Harwood Island.
Southern ... ..	Captain's Flat. Reid's Flat.
Eastern ... ..	Otford. Fig-tree.
Western ... ..	Nevertire.
North-eastern ... ..	Ballast Pit (Homebush to Waratah Railway). The Glebe, Newcastle. Lake Road, " "
South-western ... ..	Hatfield.
Murray ... ..	Yarrangobilly.

With the approval of the Government I have readjusted the boundaries of several of the Departmental Police Districts, taking some Stations from the western division, which was too extensive for supervision by one superintendent, and forming a new district with head-quarters at Bourke, to comprise the stations detached from the west and including some of the Namoi District (which latter has been discontinued as a separate command), the remainder of the stations therein being retransferred to the North-western District, where the officer in charge had not sufficient work. These changes entailed no additional expenditure.

The increase in the Force, provided by the Estimates, consisted of sixty-eight officers and men, all ranks, but this addition has not been adequate to meet the demands for police protection, which are admittedly reasonable. The increase in the population in Sydney and suburbs during the year has been very considerable, probably about 13,000, whilst not more than a dozen additional constables could be provided.

A considerable augmentation of the Metropolitan Police Force is certainly requisite; 100 additional men would not be in excess of the requirements. In the subjoined statement is shown the number of miles of streets in the city and suburbs laid out in beats, or having to be patrolled by constables, also the present Force available for duty.

Return showing the mileage of streets in the Metropolitan District, and the maximum number of constables available for duty at one time:—

Stations.	Mileage of Streets.	Maximum number of Constables on duty at one time.	Total strength of each Division.	Remarks.
No. 1 ... ..	23 $\frac{3}{4}$	23	89	In the suburbs and some portions of the city during the early part of the night both the day and night reliefs are on duty. This accounts for the difference in the maximum number on duty in proportion to the total strength in the various divisions.
2 and suburbs...	61	22	79	
3 " ... ..	160	36	92	
4 " ... ..	97	20	69	
5 " ... ..	865	40	67	
North Shore ... ..	130 $\frac{1}{2}$	9	21	
Redfern ... ..	64 $\frac{1}{4}$	5	22	
Total ... ..	1,401 $\frac{1}{2}$	155	439	

The suburbs have so rapidly increased in extent that the number of constables now employed is wholly insufficient to afford the necessary protection, and complaints are consequently frequent. It occupies several hours to patrol some of the beats through, and as the movements of the constables are of course watched by evil-doers, crimes and disorderly acts can be committed with a full knowledge that the Police cannot arrive in time to prevent them.

There are also many settlements in the interior where Police Stations are required, which I am not in a position at present to establish.

216 appointments have been made during the year to make up the complement as voted, and to fill the vacancies occasioned as under:—

Resignations	...	...	...	...	...	...	...	96
Discharges	...	...	...	...	...	...	...	34
Dismissals	...	...	...	...	...	...	...	18
Superannuations	...	...	...	...	...	...	...	24
Deaths	...	...	...	...	...	...	...	11

The proportion of voluntary retirements from the Service is nearly the same as the two previous years, and large enough to prove that more remunerative employment is still to be found.

One officer died during the year, Inspector George Waters, who had served thirty-one years in this Colony, and previously in the London Metropolitan Force. He was universally respected as an upright intelligent officer.

Five police pensioners died, who had been in receipt of pensions varying from £26 to £116 per annum, aggregating in the total to £390 per annum.

Twenty-three members of the Force were superannuated during the year, sixteen upon pensions of from £68 to £325 per annum, amounting in all to £1,949 per annum, besides seven members of the Force who received gratuities upon their discharge, which formed a charge of £593 upon the fund.

Eight widows of members of the Police Force were awarded gratuities amounting to £2,204 in all, and one widow has received a pension of £40 per annum.

Notwithstanding these heavy additional charges the income for the year was more than sufficient to cover the expenditure, though I still consider that legislation is urgently necessary to place the funds upon a more satisfactory basis, on the lines suggested in my special report on the subject, dated the 16th December, 1885.

Unfortunately it is again necessary to refer to the recurrence of outrages upon females, and the prevalence of other offences against the person committed by a disorderly class, which ordinary punishment appears inefficacious to repress.

To whatever causes it may be attributed it is impossible to ignore the existence of a large and increasing number of criminal youths in the community, apparently devoid of all moral principle, wanting indeed in industry, honesty, morality, sobriety, and manly feeling, who must develop into a highly dangerous criminal class.

The records afford irrefragable proof that education must not be relied upon alone, or indeed to any appreciable extent, to overcome criminal tendencies, or to cure habits of idleness and vice.

In advance of the usual yearly publication of Criminal Statistics, now in course of preparation, I have caused the following figures to be extracted from the watch-house records in the Metropolitan District for the year 1886:—

Year.	Total apprehensions.	Total for drunkenness or forming part of charge.
1881	22,657	13,949
1882	19,639	11,842
1883	21,831	13,312
1884	23,458	13,925
1885	2,4713	14,946
1886	26,621	15,741

It will be observed that the apprehensions have increased to the very large total of 26,621 persons, being 1,908 more than the previous year, a very unfavorable record, even allowing for the increase in the population. It will also be noticed with concern that the number of drunkards incarcerated has increased by 795.

The arrests for assault (aggravated, common, or resisting police) have also been very numerous, the total being 1,320 cases.

I have further ascertained from special police reports that out of 1,263 inquests held during the past year, in no less than 224 cases violent or sudden deaths have been caused either directly or indirectly by intemperance.

With regard to crime in the Colony generally it is gratifying to find that other serious offences are certainly decreasing.

Though the beneficial effects of legislation may be over-estimated yet it might prove a powerful auxiliary in regulating matters which at present in their uncontrolled state contribute both directly and indirectly to swell the criminal ranks.

The following may be enumerated as objects towards which legislation might be directed to the advantage of the community:—

For the better protection of girls from outrage, immorality, and vice.

For the regulation of dancing saloons, and other places of amusement for the young.

For the inspection, regulation, and control of factories and workshops in which the young of both sexes are employed.

For the regulation of common lodging-houses.

For ensuring decent accommodation in the dwellings of the poorer classes.

For extending the operation of that most valuable measure—"The Industrial Schools Act,"—

1. To admit of neglected children likely to lapse into criminal or immoral habits being brought under its provisions; and
2. To extend the age of girls, liable to be dealt with under the Act, to eighteen.

The

The increasing duties devolving upon me in Sydney have prevented me from being long absent from town inspecting, but with the increased facilities for travelling I have been able to visit a good many districts where I have almost invariably found the barracks, horses, arms, and other equipment in a highly creditable condition; and what is of greater importance, the police of all ranks in a state of efficiency, and held in favorable estimation by the magistracy and all respectable citizens.

I have inspected all the head-quarters stations and examined the books thereat.

The work devolving upon the police, outside their ordinary duties, is still increasing, and absorbs a large portion of their time. They are also about to undertake the work hitherto performed by Forest Rangers.

As an example of extra duty thrown on the Department, I may mention that 663 missing friends inquiries have been instituted during the year, many of which emanated from England, and involved considerable correspondence and research. In 367 instances the inquiries were successful.

The conduct of the members of the Police Force during the year has been, with few exceptions, very good, the number of dismissals for misconduct being considerably below the average.

I have, &c.,

EDMUND FOSBERY,  
Inspector-General of Police.

RETURN showing Strength and Distribution of the Police Force on the 31st December, 1886.

1886-7.

(SECOND SESSION.)

NEW SOUTH WALES.

## PRISONS.

(REPORT FOR 1886.)

Presented to Parliament by Command.

The Comptroller-General of Prisons to The Minister of Justice.

Department of Prisons, N.S.W., Comptroller-General's Office,  
Sydney, 28 April, 1887.

Sir,

I have the honor to render my Departmental Report for the year 1886.

From the usual tabulated statistics attached, it will be seen that the number of prisoners in confinement on the 31st December, 1886, was 2,500 as against 2,562 at the same date of the previous year, while, in the meantime, the population had advanced from 980,573 to 1,030,762, thus showing a decrease of 62, notwithstanding the augmented numbers of the population.

The entries and discharges for the year show respectively 20,614 and 20,676 as against 20,740 and 20,644 for 1885. Of these there were of distinct persons 14,085 as against 14,328.

The labour returns give a total value of the application of labour—inclusive of £32,389 16s. 10d. for the internal purposes of the prisons—of £40,235 4s. 10d. as compared with £39,742 17s. 7d.

The hospital returns show—as treated in hospitals, 1,839 as against 2,167; out of hospital, 21,435 and 22,671; deaths, 48 and 49.

The reconvictions stand:—For the 1st class, or more serious offenders, sentenced to five years and upwards, 2nd, 3rd, and 4th, or more frequent, 23, 10, 23 as against 20, 19, 29. 2nd class, being under sentences of less than five years, other than those sentenced to “imprisonment only,” without hard labour; and drunkards and petty offenders, 108, 43, 115, as against 133, 81, 72. Third class (imprisonment only), 93, 31, 51, 101, 38, 35; drunkards and petty offenders, 1,325, 552, 814, 1,337, 579, 911.

The education returns show a diminution in instruction, consequent upon the closing, temporarily, of the school in Darlinghurst Prison, because of a pressure for accommodation.

As regards progress in buildings. While the building of the important Central Western Prison at Bathurst has made much progress towards completion, the Public Works Prison at Trial Bay has been advanced to a stage admitting of preliminary occupation, the surrounding wall and necessary internal and external buildings have been so far completed. There are, however, only 62 cells in the one wing yet constructed. These are occupied singly by prisoners. It is my hope not to be compelled to resort to the associated system in this prison, which is constructed and proposed to be conducted on the lines of English Public Works Prisons.

The Trial Bay Prison is, in my view, destined to fill an exceptionally important place in the prison system of the Colony.

As is almost generally known, its purpose is the construction of a breakwater to form a harbour of refuge. This work of construction gives room for the unlimited application of labour, the most material provision in furtherance of prison administration.

Parliament has, in the Criminal Law Amendment Act, provided for the granting to prisoners under sentences of sufficient length of “Licenses for Public Works,” which means an amelioration towards the expiration of their time of the conditions of imprisonment, in the direction of partial freedom from restraint, and other advantages, accustoming the men to some self-guidance in preparation for final liberation, and enabling them to earn, at limited rates of wages, some means for a new start in life.

To give effect to this design of Parliament, the Government has assented to a code of regulations, which will come into operation so soon as the necessary arrangements may be completed.

Under these Regulations a prisoner under sentences of ten years and upwards may, on certain conditions, obtain a license eighteen months previous to liberation—those under sentences of five years and upwards, one year, and those of three years and upwards, six months.

I have estimated that under these conditions about 100 men will become eligible for licenses.

There was naturally a serious doubt whether these men, or rather some of them, would be content to remain on the Peninsula, if there huttet, with the temptation to abscond. And so it has been determined to hut them inside the space enclosed by the prison walls, thus obviating that risk.

They will be treated differently, and worked separately from the ordinary prisoners, with whom they will not be allowed communication, but still will be in security and in complete control.

The timber for the huts, which will be erected by the prisoners now there, has been ordered, and it may be anticipated that the regulations will soon be in operation.

When this time arrives there will be available for work on the breakwater somewhere towards 150 men, which number will in the progress of time be materially increased.

The contemplated working out of the license system is partly on the lines of the well-known Intermediate Prison at Lusk in Ireland, which was examined by myself, but is a large advance upon that prison, which only held from 25 to 30 men employed on farm ground. It will be in fact the most important departure in the direction indicated that has been made by any country, and it is to be hoped will have a corresponding success.

Exception has been taken to the scale of the new Central Prisons at Goulburn and Bathurst, which have been constructed on complete modern principles, with adaptations to the circumstances of the country.

These two prisons were projected so far back as 1867, with the full approval of the present Prime Minister, under whom I was then directly acting. At the present time there are confined in Goulburn Prison 330 prisoners, I regret to say in a great measure under the associated system. Had it not been for this relief the prisons, consequent on the increased numbers incarcerated by the operation of the Criminal Law Amendment Act with its extended sentences, would have been absolutely congested. With the completion of the Bathurst prison, which provides 320 cells, and the occupation of Biloela for petty habitual offenders, I begin to see the way to the improved system of criminal treatment for which I have for years been striving. The two important prisons first-named will give a far more valuable return for their cost than will any expenditure of a cognate character of which I have knowledge.

During the year the "overcrowding" of Darlinghurst Gaol attracted much public concern and comment upon data (although a serious evil did exist), which induced conclusions much in advance of the facts, and which I attribute to exaggerated and sensational forms of expression, possibly used inadvertently, in the correspondence laid before Parliament. The subject was in fact incomplete, inasmuch as the report which my responsibility required me to make followed the comments, and was not laid before Parliament.

The movement, however, had the effect of again calling attention to the necessity for providing for petty town offenders. A site was selected for a penitentiary, but difficulties arose. The large cost had to be considered in present circumstances, and a more immediate relief presented itself in the occupation of the old prison buildings at Biloela, leaving the question of a proper penitentiary in abeyance.

The occupation of these buildings by the Industrial School will shortly cease, and then they will be occupied by this Department.

Not only will Darlinghurst Prison be thus relieved of the class of prisoners mentioned, but a means will be obtained for an entirely different treatment of the younger offenders, popularly known as the "Larrikin" class, under conditions which will give a salutary weight to the deterrent element of imprisonment, and at the same time breaking up their association within the prison walls, it being borne in mind that association outside is the main-spring of the evil tendencies and actions of the class mentioned.

The treatment referred to, and for the introduction of which I will submit regulations for approval, will consist of separate treatment throughout all sentences of prisoners between the ages of 16 and 25, under sentences up to six months.

They will be worked and fed in their cells, have no communication with other prisoners or among themselves, and will have as low a diet as is consistent with health, with due provision for exercise.

Such a system I recently saw in work in Victoria where it has been partly established. I am informed by the Inspector-General of Penal Establishments there that out of 200 who have been so treated only 10 have returned. If it should have equal success in this Colony it cannot fail to be of equal benefit to the younger offenders and to the State. It may be found to be practicable to extend the system in a modified form to young female offenders. Under it the evil effects of prison association at an early stage of crime will be arrested.

The treatment will chiefly be carried out on young metropolitan offenders, and in Darlinghurst, wherein I can see my way to the necessary arrangements.

The advantages of treatment by separation are in a great degree lost in the cases of habitual criminals. Habit of crime is too strong for any mode of dealing with, and but few can in any conditions be redeemed from its power.

Turning to the statistical information given at the commencement of this report, it will be seen that under all the headings by which progress or retrogression are measured, there is a decided improvement upon the previous year, which is in itself satisfactory irrespectively of the expectation of additional advantages held out by the preceding paragraphs.

The officers of the staff have continued efficiently to discharge their duties; and I may remind you that their appearance and smartness have commended themselves to your own favourable comment.

The general behaviour of the prisoners has been satisfactory.

With regard to reformatories, I can only, in respect of the Female Reformatory at Shaftesbury, report its continued good working under the able management of the Matron-Superintendent.

The time has come when I feel called upon, being the Officer charged with the control of such institutions, to offer some remarks upon the long-vexed question of a Male Reformatory.

In 1882 I was entrusted with a mission by the present Attorney-General, then Minister of Justice, to examine into the working of the Male Reformatory of Victoria at Ballarat.

I was confirmed by my examination in my previous idea that a male reformatory should be of the character of an agricultural institution.

I am aware that the marked success of the Industrial School-ship "Vernon" has led many to prefer a vessel and marine training, but I attribute much of that success to the personal administration of the commander, and still hold to the agricultural plan.

The boys, further, although of the same class, could hardly, in view of the distinction drawn, be treated in a precisely similar way.

Under date 30th August, 1882, I reported fully on the question, giving my reasons in favour of a land reformatory, and I believe that it was on my report that the vote which has been expended at Rookwood was obtained. It is due to myself to mention that I was in no way consulted as to the Rookwood design, which circumstance I attribute to the late Sir Alexander Stuart having projected legislation to separate the reformatories from the charge of my office.

I have, &c.,

HAROLD MACLEAN,

Comptroller-General.

(SECOND SESSION.)

NEW SOUTH WALES.

**PRISONS REGULATION ACT.**

(ADDITIONAL REGULATIONS UNDER.)

Presented to Parliament, in accordance with the Act 4 Vic. No. 29, sec. 5.

Department of Justice, Sydney, 10 December, 1886.

His Excellency the Governor, with the advice of the Executive Council, has been pleased, under the Act of Council, 4 Victoria No. 29, to make the following additional Gaol Regulations.

JAMES P. GARVAN.

**ADDITIONAL PRISON REGULATIONS.****DIVINE SERVICE.**

1. Regulations Nos. 24 and 25 are cancelled, and the following are substituted therefor:—
2. All prisoners will, on admission into prison, be entered for the services of the denomination which they may respectively select, and will be required to attend the services of such denomination.
3. The denominations recognized shall be the Church of England, Church of Rome, Presbyterian, Wesleyan, and Hebrew, and also any duly authorized alien missions in connection therewith.
4. In the case of prisoners objecting to be entered for any one of the denominations named, and to attend the services thereof, such prisoners shall not be required to attend, but shall remain in their cells during the time of service, if there be one service only on any one day, or if there be more services, during the period of the first service taking place. But any prisoner who may have so objected will be permitted at his own desire, subsequently, to attend any service that he may select.
5. No sectarian influence shall be brought to bear upon any prisoner. If a prisoner duly entered for a denomination shall desire to change to another, he may make application to the Gaoler, who will call upon him to state whether he is impelled by conscientious conviction, or is moved by any other motive. The Gaoler shall then notify to the Chaplain of the denomination from which the prisoner desires to secede the fact of the application, and forward to the Comptroller-General therewith any remarks that the Chaplain may desire to offer, together with his own report thereon.
6. If it be made to appear to the Comptroller-General that the motive of the prisoner is obviously other than the impulse of conscientious conviction, he may refuse to accede to the application, otherwise he will notify his approval to the Chaplains respectively concerned.
7. Any prisoner after having been entered for any one denomination, and refused permission to pass to another, will only be exempted from attendance at the service of the denomination from which he has seceded on the like condition as in the case of prisoners exempted as above provided of remaining in their cells during Divine Service.

1887.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## PRISONERS FLOGGED IN GAOLS.

(RETURN SHOWING NUMBER OF.)

*Ordered by the Legislative Assembly to be printed, 23 June, 1887.*

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 2nd June, 1887, That there be laid upon the Table of this House,—

“ A Return showing the number of Prisoners flogged in the various gaols of the Colony for infraction of discipline, during the five years ending the 31st of May, 1887; also, showing the offences for which such punishments were inflicted, such Return not to include the names of the Prisoners on whom such punishments were inflicted.”

*(Mr. Wall.)*

A RETURN showing the number of Prisoners flogged in the various Gaols of the Colony for infraction of discipline, during the five years ending the 31st of May, 1887.

Gaol.	Number flogged.	Offence.
Sydney ... ..	2	Persistently mutinous and defiant conduct, beyond the suppression by cell punishment, in shouting aloud and endeavouring to induce other prisoners to join in misconduct.
Do ... ..	2	The like mutinous and defiant conduct, accompanied by smearing the walls of his cell with ordure.
Do ... ..	1	The like misconduct, with use of abusive and obscene language to his warders; also making use of abusive and insulting language to the Visiting Surgeon while undergoing dark cells punishment.
Do ... ..	1	Mutinous conduct and creating disturbance in chapel during religious instructions; also threatening language and resisting his warders, and wilfully destroying property.
Parramatta ... ..	4	Leading part in serious general mutiny.
Do ... ..	1	Gross insubordinate conduct and threatening the officers.
Do ... ..	1	Violent assault on a fellow prisoner.
Do ... ..	1	Assault on officers.
Do ... ..	4	Defiant insubordination in a crowded yard, with the object of creating a general disturbance.
Bathurst ... ..	1	Continued insubordinate conduct in cell while undergoing punishment, and burning his clothes.
Goulburn ... ..	1	Disobedience, resisting and assaulting warders, using insulting language to Visiting Surgeon.
Do ... ..	1	Malingering, continued insubordination, assaulting his warder, and destroying cell furniture.
Do ... ..	1	Continued insubordinate conduct and violent language, attempting to assault warder, with use of threats.
Albury ... ..	2	Disobedience of orders, gross insubordination, continued disorder in cells when locked up, shouting, whistling, and inciting other prisoners to do so.
Deniliquin ... ..	1	Continued refractory and defiant conduct from May to December, 1883, including fighting, with threat to murder his warder, and insulting and defiant language when before the Magistrate's Court.
Total number flogged...	24	

HAROLD MACLEAN,  
Comptroller-General.

## BRITISH NEW GUINEA.

## Mr. H. O. Forbes' Report.

To His Excellency the Honorable John Douglas, C.M.G., Her Majesty's Special Commissioner for British New Guinea.

Sir,

Dinner Island, South-eastern New Guinea, December, 1886.

I have the honor to forward to your Excellency the following *résumé* of the chief events that have occurred in this district during the period I have had the honor of acting as Deputy Commissioner, with some observations and suggestions thereon.

Accompanied by Mrs. Forbes, I arrived here by H.M.S. "Swinger" from Suao on the 21st June last, and took up my quarters in the Mission House rented by the Government from the London Missionary Society.

Samarai, or Dinner Island, occupies a charming situation within a circle of high wooded islands and a bay of the mainland whose elevated blue peaks shut in the view northward. The Rev. S. McFarlane had planted a large number of cocoa-nut palms, and laid out a long avenue which affords a shady promenade, while numerous handsome-leaved crotons and scarlet hibiscus are planted everywhere about, giving quite a garden aspect to what would otherwise have been a rather barren shingly foreshore. A short examination of the island, however, revealed several serious defects. The water supply was in a most unsatisfactory condition. There is no running water in the island, and the whole of the drinking water had to be obtained from one hole of a filthy description. Then a large swamp was found to occupy several acres of the north-west portion, which at the close of the wet season cannot but be very detrimental to the salubrity of the island. The Mission buildings were in a very dilapidated state, and required many additions and repairs to render them habitable; nor are they situated on the best site, being all on the low flats, and not exposed enough to the sea winds, which here ought to be fully courted.

When it was announced to the natives that I had been sent to Dinner Island to represent the Government, I was looked on by them with the greatest suspicion. They declared that they would have nothing to do with "the Government," and that they did not want "the Government" among them at all. For some time they gave myself and my residence a wide berth. They placed the Government in the same category as the man-of-war, of which, though they visit every vessel with perfect freedom when anchored here, they have an undercurrent of wholesome dread. It was many weeks before they could be persuaded to undertake any work for us.

A few days after our arrival, Lieutenant Commander Marx kindly permitted a few of his men to aid in cutting a trench through the sand from the swamp to the sea, to try how far it might be possible to drain off the water. A large quantity was thus removed, but not nearly all, as there was evidently percolation through the coral floor. It continued to discharge a vigorous stream till the next spring tide, which silted up the mouth completely, as well as flowed into the swamp in abundance. It became evident that it was impossible to effect our purpose by draining. A greater probability of success, as I have already proposed to your Excellency, lies in filling it up by degrees with shingle from the shore and with earth from the surrounding hills. When once accomplished, almost the only objection to Dinner Island as a residence would be removed.

On the 17th August, the "Coral Sea," the schooner under Captain Colin Thompson, placed at my disposal, arrived at Dinner Island, and she has been employed by me in visiting the safer portions of the region under my jurisdiction. Following your Excellency's instructions, I visited Doini (Blanchard), Rogea (Heath), Sariba (Hayter), Middle, and Coast Islands, with a view to selecting the best site for the Government residency. Doini presents good positions, as far as regards outlook, at its south-western end; but there is a deal of swampy ground in the vicinity, while there is no good water near enough to the site best suited for a residence. Rogea offers a good site for a house on its narrow isthmus, near a fine tumbling stream of water; there is a general absence of swampy ground, while there could be obtained a beautiful outlook Dinner Island-wards, with a fine sandy beach on the other side convenient and accessible. In Stanley Bay, in Sariba, a grassy shoulder of a hill, between 200 and 300 feet above the sea level, offers a delightful spot for a dwelling. No swamp land is close enough to interfere with the health of the locality. There is (at some distance) plenty of running water. Coast and Middle Islands are both unsuitable for the desired purpose.

The objection, however, to all these islands is that the anchorage they afford for men-of-war or of large vessels is either too small (as in Stanley Bay) for more than one vessel, or in all of them too exposed in certain winds. The Dinner Island anchorage is commodious enough for all purposes, and, according to the testimony of the officers of the various ships of war that have been stationed in these waters, is in all seasons the safest one in the China Straits. As this anchorage has been chosen by the Admiralty for its head-quarters in South-eastern New Guinea, it is advisable that Dinner Island should be retained as the head-quarters also of the New Guinea Government. It is centrally situated in the Straits; while there are several eminences, about 190 feet above the sea level, suitable for residency site, commanding a beautiful and cheerful outlook, and open to the sea breeze from all sides. A small portion of a reef on the south-west corner is uncovered at low spring tides, but as it is chiefly a rocky spit without much live coral on it, little or no harm can come from it.

The temperature of Dinner Island has been throughout the past six months too high to make a zinc-roofed house a healthy or agreeable abode; a house of native materials, palm-leaf or grass thatched, with plank floors and sides, if desired, a structure on wood piles 7 to 8 feet high, surrounded by a wide verandah, would be far the most salubrious dwelling here, even for a permanent Government residence. The thatch would require renewing not oftener than once in two or three years; and it can be changed in a few days' time. The collecting of rain water will always be a necessity in whatever island the residency is placed, as even where there is perennial water, the streams in the height of the dry season are always very low. The outbuildings, such as the store-room, &c., could be all zinc-roofed, and could without difficulty, with the necessary size of tanks, supply the season to season's water.

Soon

Soon after the arrival of the "Coral Sea," I employed her crew to sink a couple of wells, one of which now I am glad to say, affords a moderately abundant supply of fairly good water.

The chief centres from which the trade of the district is worked are South Cape, Dinner Island, Teste Island, Killerton Island, Milne Gulf, and Nuakata (Lydia) Island, stations now or formerly occupied by missionary teachers, where safe contact with the natives can be more depended on than elsewhere. On the 23rd August, Kissack and Co. (a firm comprising three European partners), removed their headquarters from Teste Island to Dinner Island, and established on a portion of land leased to them on this island, the nucleus, I hope, of a future colony. With the exception of one Chinaman, who has a residence at South Cape, the rest of the traders in these waters have no residential quarters, but peregrinate the Archipelago, living on their vessels and bartering therefrom with the natives for such products as they are in quest of.

The commercially valuable products of the region are at present few in number. The chief are bêche-de-mer, copra, tortoise-shell, and pearl-shell of several sorts, of which the white shells are large and valuable, averaging about 4 lbs. each, and obtained mostly below 16 fathoms of water. Two kinds of dammar, not of the best sorts, but of some value, which is found in Sariba, St. Aignan, and on the mainland in abundance, has not been much collected. Possible products in the future are sago, pine, ebony, and various minerals reported from some of the islands, but as yet without sufficient evidence to warrant one in describing them more definitely.

The past six months shows a sadly dark catalogue of crimes perpetrated by the natives of this region on white men, as I have communicated to your Excellency from time to time. Now, reporting as an unbiassed witness, I feel convinced from my own observations, that a great deal of this hostility has been inaugurated by the white man himself. The accounts given to me by natives who have been labouring in Australia, wherever I have met them—in the Louisiades, in Lydia Island, and along the north-east coast—have been the same, a tale of hardship and injustice bitterly expressed. From information given to myself, it is evident that nearly every native taken from the Louisiades was either kidnapped or entrapped into consent by false statements. Apart from this, the infamous crimes and injustices committed by one such man—and there have been others since—as MacCort (or MacCortie), who was murdered in the Louisiades, are enough to inflame the natives of the Archipelago against any white man for a whole generation. Many who have deserved only well of their murderers have fallen victims to the crimes of such predecessors. Nor can it be denied that several traders have lost their lives by natives actuated by the desire of loot. When once this terrible duel has been commenced in which every forfeit of a life on the native side at the hands of a white man, or through his direct or indirect instrumentality, demands, at whatever length of time after, from his nearest relative or his heirs, the head of a murdered white man in satisfaction, it is difficult to foresee in what crowd or on what shore, distant perhaps from the scene of any former outrage, the avenger may find a victim whose death concludes his feud and inaugurates another; nor is it easy to suggest how it may be stayed.

The natives of the Louisiades and of the neighbouring islands are a very intelligent people, capable, I believe, of being made good friends of. They appear to be quite as amenable and capable of instruction as the Malays. See them in management of a European vessel for instance; they have mastered all the details, can furl sails, steer, or obey an order with all the precision and competency of a Malay crew. They have taken appreciatively to such new products as have been given them; pineapples are becoming every year more common; tomatos and different sorts of melons that have been given to them have been cultivated by them, and under proper direction they would soon, I am sure, by raising crops of maize and rice larger than they could consume, be able to offer them in barter for other necessaries.

The island belt stretching eastward from Milne Gulf and China Straits may be roughly divided into three portions; the first, comprising the islands nearly adjoining the mainland as far east as Teste Island, are well populated, all are high and composed of stratified or volcanic rocks, covered with cultivated patches. In the second portion, from Teste Island eastward to the Loumard entrance to the Sunken Barrier (including the Conflict Group), the islands are quite low and flat, and are entirely of coral formation. They are covered with little or no soil for the sustenance of any vegetable products of much value except cocoanuts. The third portion is the Calvados chain (including the extra reef groups of St. Aignan, Redlich, and Deboyne), commencing with Real Island (where the land again attains a considerable elevation), and terminating with Rossel Island. These islands are composed of stratified or metamorphic rock, and many of them are of value. The larger of them are inhabited. Of the larger islands of the first group, such as Moresby, and especially Fergusson Island (Goschen Straits), few have been explored owing to the supposed hostility of the inhabitants, but judged from the shore they appear to be capable of being largely cultivated if the natives were once shown how to cultivate such remunerative products as maize and hill rice. Along the shores of the islands of the second group abundance of most excellent kinds of edible fishes are to be had, which might be profitably cured by bêche-de-mer fishers and copra collectors, in addition to their usual work. Coconut planting might be largely resorted to on these islands, with great future advantage to leaseholders. The third group contains many islands, such as St. Aignan, which ought yet to yield a large revenue. The large island of Sud Est has most favourably impressed me. It contains many grassy plains and large patches of gently undulating land and much less steep country than New Guinea territory generally, maize and rice, and if it were nearer civilization sugar-cane also, might be largely grown. Portions of Joannet Island, and Kaluma—which is also sparsely wooded—are capable of producing crops of the same cereals. But with only the long-shore acquaintance which has yet alone been possible to obtain, it is not safe to give any decided opinions for the guidance of the general public.

On the 13th November, H.M.S. "Dart," (Lieutenant Commander Field), which had been engaged for fully six months in the triangulation of the area between South Cape, Teste Island, and East Cape, left for Australia, having completed the survey. When the charts are published these intricate waters will be one of the easiest and safest ocean bye-ways to navigate, owing to the extreme care and minuteness with which all the operations have been conducted.

On the 10th November, H.M.S. "Diamond" arrived at Dinner Island, and, after a few days' stay, proceeded to St. Aignan, where such punishment as was possible was inflicted on the natives there for the attempted assassination of Lieutenant Commander Marx. Thence she proceeded to Joannet Island, but Captain Clayton, finding it impossible to accomplish any retribution by a white force, returned to Dinner Island, where he met and reported the circumstances to your Excellency.

Very

Very little of the work which your Excellency's representative ought to have been able to do has been possible to be accomplished, owing chiefly to the very disturbed state of native feeling in the Archipelago. A much more comprehensive account might be given by him six or eight months hence as to the mineral wealth and likely productions of the Louisiades and of a good wide margin of the mainland, if an armed guard of seven or eight trusty South Sea Islanders were given him. Such force would be sufficient to enable him to penetrate anywhere with absolute safety. Until his duties have increased so as to occupy his whole time—which is far from being the case at present—at head quarters at Dinner Island, he can be employed in no service more beneficial to the Protectorate than constantly moving round—one subordinate European, competent to look after the Residency and to clear and otherwise adjust matters with vessels calling at the port, being sufficient for some time yet to come to act in his absence—his district with such a force, slowly accustoming the natives everywhere to the presence among them of a representative of the Government fearlessly able to penetrate where he wishes, exercising authority over all classes wherever he arrives, punishing petty cases summarily and removing for trial more serious offenders; gradually and patiently subverting by his influence, while suggesting and commending the reverse of their obnoxious customs (which are, it is too often forgotten, perfectly moral and right in their eyes, and imperative on them as sanctified by generations of unbroken use and wont); distributing seeds and introducing the knowledge among them of the cultivation of such products as tobacco, maize, and rice, all of which could be the most remuneratively cultivated in the islands of the eastern portion of the Louisiade Group and on the shores and back lands north of Milne Gulf.

The "Coral Sea" is far from a suitable vessel for doing any efficient work in these seas. Without comfort, and having no accommodation, it offers no refuge from the tropical sun, one twelve hours' exposure to which renders any work of brain or hand out of the question for days. I should recommend to your Excellency that the vessel placed at the disposal of the Deputy Commissioner here should be fitted with accommodation which will enable him to utilize the many hours of his voyages, otherwise wasted during calms and contrary winds, in accomplishing the clerical work, which inevitably accumulates during these journeys. There should be room also for the guard proposed above.

The movement throughout the district of your Excellency's representative has not been without a beneficial effect on the natives. At first repudiating the Government as anything but beneficial to them, they are beginning to recognize that it is not "all gammon," that Government "all same father belong New Guinea man," and also that it has more power, and they less ability to evade that power, than they at first believed. For this reason alone, I would submit that it would be very disadvantageous to the interests of the Protectorate here, especially at the present juncture, if the representative of the Government at Dinner Island were permanently removed. The east end of New Guinea is daily becoming of more importance; the number of vessels making Dinner Island their port of entry is largely on the increase, and the continued accession of Europeans to our numbers, whose doings require official supervision, and between whom questions, constantly arise for settlement, make it almost imperative that there should henceforth be a representative of the Government here.

Considering that one of the causes assigned for the recent Joannet massacres was a quarrel *re* a rifle, it might be well for your Excellency to draw renewed attention in the *Gazette* to the laws in force with regard to the carriage and introduction of firearms into the Protectorate waters; those also with reference to spirituous liquors—which I have some reason to believe are often given to the natives; and I should recommend that opium be included in the list of prescribed articles, as Chinamen are now frequenting the region.

At the change of the monsoons the natives seem to suffer greatly. Numbers of sufferers have applied to me for medicine without my being able always to supply them. I would suggest to your Excellency that a fairly stocked medicine chest and some nutritive medical comforts should be placed in charge of the Deputy Commissioners on the coast.

On the 31st December, died here Dick Kiake, the L.M.S. Teacher, who has exerted a powerful and beneficial influence on the natives over a wide area, and to whom not only every man-of-war vessel and trader visiting in these waters for many years has been indebted in varying degree for good services, but also the Government, which has oftener than once publicly acknowledged his courageous and worthy conduct.

I have, &c.,

HENRY O. FORBES,

Acting Deputy Commissioner.

## Report of Special Commissioner.

### BRITISH NEW GUINEA.

GENERAL Sir Peter Scratchley [died on the 2nd of December, 1885. Mr. Deputy Commissioner Romilly, in virtue of the provisions of the Commission appointing General Scratchley, assumed office, and administered it until the 27th of February, when I received a Commission from Her Majesty appointing me Special Commissioner for the Protected Territory of British New Guinea. Mr. Romilly left on sick leave for England.

It became necessary for me to proceed to Brisbane, Sydney, and Melbourne, in order to wind up affairs in connection with the administration of Sir Peter Scratchley, and to confer with the Australasian Governments contributing to the maintenance of the Protectorate. After communicating by telegram with Her Majesty's Secretary of State for the Colonies, I terminated the charter of the steamship "Governor Blackall" from the Australasian Steam Navigation Company, and received some of the contributions of the Australasian Colonies for the year ending the 1st of June, 1886, in accordance with the conditions laid down in Lord Derby's despatch of the 9th May, 1884.

#### *Mr. Fort's Report.*

General Scratchley's papers were, soon after his death, collated by Mr. G. S. Fort, his private secretary, and a report was published which contains a large amount of most valuable information connected with the Protectorate. My experience on the coast of British New Guinea during the last six months entitles me to say that I can confirm the general tenor of Mr. Fort's report, which may be accepted as a faithful account of conclusions arrived at after the cruise of the "Governor Blackall." I regard it as, on the whole, a safe guide for those who have to consult for the future of British New Guinea.

*Mail*

*Mail and trading services.*

While in Sydney I arranged the terms of a contract with Messrs. Burns, Philp, & Co. for a service along the coast of New Guinea, from Thursday Island to Port Moresby and Dinner Island. A copy of this contract (*Appendix A*) is herewith attached. The s.s. "Victory," 80 tons burden, has been placed on this line, and has kept up her monthly trips regularly since the commencement of the contract. She will soon be replaced, I hope, by a larger and more suitable vessel. I am at present in communication with Messrs. Burns, Philp, & Co. on this subject.

*Charter of the schooner "Governor Cairns."*

On my return to Brisbane on the 19th of April, I arranged with the Government of Queensland for the charter of the "Governor Cairns," schooner of 68 tons. (*Appendix B*.) She has answered her purpose well.

From the 8th May, when she left Brisbane, until the 6th December, she has been under weigh eighty-three days, has sailed 6,053 miles, and has conveyed me and my staff to many of the principal points on the southern shores of British New Guinea. She is now laid up at Cooktown, and will be available for service next year on the same terms, after the north-west season has passed over. On the 17th September she grounded on a reef in surveyed waters, and sustained some damages, which were made good at Cooktown, involving some considerable expenditure, and a detention in port of five weeks.

*Steamer "Albatross."*

The Queensland Government having lately purchased the s.s. "Albatross," 84 tons burden, for service in Torres Straits, have considerably placed her at my disposal for the purpose of visiting the adjacent coasts of New Guinea. I have authorized Mr. Milman, the Resident Magistrate at Thursday Island, to act on my behalf in this respect, and he has permission from his Government to do so. When engaged in duties connected with the protectorate his expenses will be paid by me.

*The "Coral Sea."*

It was necessary to make some temporary provision for the service of the Protectorate in China Straits. For this purpose I chartered the lugger "Coral Sea," 18 tons burden, engaging with her master, Colin Thompson, that he was to sail her and find her, for a monthly payment of £40. She has been at the disposal of Mr. H. O. Forbes at Samarai (Dinner Island), and is still there. She is manned by Malays, and has done good service.

*South Cape, China Straits, and Samarai.*

On my first visit to the eastern portion of the Protectorate I was accompanied by Mr. and Mrs. H. O. Forbes, Dr. Clarkson, the Medical Superintendent of the Polynesian Hospital at Mackay, and by General McIver. I had made an arrangement with Mr. Forbes, after his return from Sogari, that he should represent me in China Straits, at any rate until the end of the year, leaving it to be an open question whether or not he should then enter on the resumption of his exploration work.

I rented the Mission premises at Samarai, and I placed at Mr. Forbes's disposal the "Coral Sea." Dr. Clarkson, who had obtained leave of absence from the Government of Queensland, was attached to my staff in his professional capacity, and I was also accompanied by Brigadier-General McIver, who had "placed his sword at my disposal." This happily was not required. He had taken a considerable interest in the proclamation of the Protectorate, and though I did not feel justified in granting him permission to reside in New Guinea, I was able to afford him an opportunity of visiting many points on the coast between Samarai and Thursday Island. My generous consideration for him was, however, insufficiently appreciated, I fear.

The prevailing character of the mainland at South Cape, and of the islands in China Straits, is that of a mountainous region covered with dense tropical vegetation. The climate is exceedingly humid, and though the scenery is very beautiful it is not a country which is likely to attract European settlement. I should not regard it as an exceptionally unhealthy region if reasonable precautions are taken to avoid living under insanitary conditions. Its capacity for the growth of coconuts and the manufacture of copra is practically unlimited; but the supply of coconuts is not large at present, and does not much exceed the requirements of the native population. As a central point from which to direct administration, I prefer Samarai (Dinner Island) to South Cape. I am not, however, satisfied with the sanitary conditions of Samarai. There is a swamp in the centre of the island, and there is an exposed reef to windward. The former may be got rid of; the latter cannot. As a site for a settlement I should prefer either Stanley Harbour on Zareba (Heath Island), or the neck of an isthmus on Logia (Heath Island), opposite to Stanley Harbour. At both of these places there is good anchorage and an abundant supply of running water. As an anchorage, however, Her Majesty's ships of war prefer Samarai, and this consideration dominates at present.

I think, however, that on better acquaintance the anchorage at Stanley Harbour might be found to be quite as good as at Samarai, and as a site for a settlement it is, in my opinion, superior to any I examined in China Straits. Zareba (Hayter Island) is a large island, abounding in rich soil, fine forest, and running water. The natives also are perfectly friendly, and, being tolerably numerous, could soon be made to influence the neighbouring tribes on Basilaki and Moresby Island, who at present have rather an evil reputation. Mr. H. O. Forbes has in the meantime consented to remain at Samarai until the end of March. He proposes then to visit Australia in order to ascertain if he is likely to receive support in his explorations in the vicinity of Mount Owen Stanley and the Great Dividing Range. Mr. Kissack has, with my permission, established a store and trading station at Samarai.

It will be necessary, when authority is fully constituted, to appoint some one permanently to represent the Government of the Protectorate in China Straits. The Resident there should have under his orders a sufficient force to make his authority respected. He should have a smart lugger, and a force of not less than ten men. Eight Fijian policemen, under the command of a European officer who could handle a sailing craft, would suffice, I think, for the purpose of maintaining and protecting both the natives and Europeans in China Straits and the neighbouring islands. Her Majesty's ships of war will occasionally visit the group, as they do at present, but they cannot be expected to undertake police duties, and should not be asked to do so.

Port

*Port Moresby and the Valley of the Laloki.*

Port Moresby, as the head-quarters of the London Missionary Society, is the best known and the most important point on the coast of British New Guinea. It is a magnificent harbour, though a good deal cut up by coral patches, and it will require to be well buoyed and beacons before it can take rank as a first-class port. The inner or Fairfax Harbour is completely land-locked, with very fairly even soundings giving 4 and 5 fathoms. The surrounding hills do not leave much level ground on the shores of the harbour, and the country has often been spoken of by visitors as dry and comparatively barren. The past season has been an exceptionally moist one, and I have only known it under this favourable aspect; but in the valleys and on the slopes of the hills there are many fine specimens of forest trees; and the enclosed plantations of the natives lead me to conclude that the climatic conditions of Port Moresby are not so unfavourable to cultivation as they have sometimes been represented to be. The native village of Hanuapata, built in the shallow water between the island of Elevara and the rising ground on which the Mission premises are situated, is a collection of somewhat fragile tenements built on piles. The native population numbers about 800 men, women, and children, the children being pretty numerous. There are some small villages at the head of the harbour and on the hills lying to the north-west of the Mission Station. The native population thus indicated, including those occupying the littoral of the bay and the detached villages on the hill-sides, does not exceed 1,200. A road passing up a valley at the back of the Mission Station crosses the surrounding range of hills at a summit of about 400 feet, and thence descends to level country, which it traverses for some 8 miles, until the Laloki River is reached. The whole of this country, and indeed almost the whole valley of the Laloki, is unoccupied by the natives, and is only used occasionally by them as hunting-ground, which they beat for wallaby and kangaroo. It is well grassed and abundantly watered. Port Moresby, I think, must be regarded as the future centre of British administration in New Guinea. It is true that there are other equally fine harbours on the coast, and there are districts more fertile and populous; but is it there that the influences which now prevail have taken most deep root, and I regard it as the present seat of such government as has been established.

*Surveys at Port Moresby.*

The late Special Commissioner authorized Mr. Assistant Deputy Commissioner Musgrave to purchase certain portions of land from the natives. These instructions were somewhat enlarged by me, and have resulted in the acquisition of a continuous block of land amounting to some 900 acres, which will be quite sufficient at present for purposes of immediate settlement, whenever it is deemed expedient to authorize it. It seemed to me to be very desirable that the land thus acquired should be defined by survey, and for this purpose I secured the services of Mr. Cuthbertson, a gentleman who had carried out similar work in British North Borneo and in Northern Australia at Port Darwin. The surveys have been carried out by an efficient party of six Europeans at a cost of £787. Mr. Cuthbertson has now completed the plans, which are well executed, and include a feature survey of the country for 8 miles out of Port Moresby on the road to the Laloki crossing. Mr. Cuthbertson's report is attached (*Appendix C*), as also a paper by Mr. Musgrave on this subject. In connection with the survey of the new township of Granville, I have arranged that Mr. Goldie shall receive, in exchange for the site he at present occupies near the Mission Station, certain allotments in lieu of those surrendered by him for the use of the natives. I have purchased his store, which I propose to convert into a school for the natives, and he is now erecting a new store on the new site, which is more healthily situated.

*Native Policy at Port Moresby.*

I am able to report that the officers of the Protectorate resident at Port Moresby have acquired a very considerable influence over the neighbouring native population, and that this has been exercised with very beneficial results in repressing the intertribal atrocities which are the normal incidents of New Guinea life in its savage state. During the short period of little more than twelve months since Mr. Assistant Deputy Commissioner Musgrave has resided at Port Moresby, he has extended his controlling influence to the Hula district eastward, and to the Manu Manu and Kabadi districts westward. He has been faithfully and intelligently aided in this policy by the Messrs. George and Robert Hunter, who were appointed as Native Protectors by the late Special Commissioner. They are both of them familiar with the native language, and have been constantly employed in moving about, both along the coast and inland, acting in every case under the instructions of Mr. Musgrave, who has certainly acquired a decided ascendancy over the native tribes within the area described. In order to further their work I thought it desirable to purchase a small cutter of 10 tons, which is now constantly employed on the coast. This influence has now extended even as far as Aroma and Kerefunu, which places I have myself visited several times. On the last occasion of my visit I arranged terms of pacification between these powerful tribes, and I had the satisfaction of ascertaining that they were anxious to extend this compact to the Anamarupu tribe, with which they have been constantly at variance. I am anxious, however, to consolidate our influence over the area we already command without extending it too rapidly. I attach Mr. Musgrave's report on native affairs. (*Appendix D*.) It is of considerable importance as indicating his method, and in this matter he has displayed a zeal which deserves the success which has already attended his efforts in his most useful work. The present force at the disposal of Mr. Musgrave at Port Moresby consists of Messrs. George and Robert Hunter, who are acting as Government Agents and Native Protectors; Maka; three South Sea Islanders; and a scratch lot of young natives who act as the crew of the whaleboat in Port Moresby. In addition to these I have appointed Mr. George Kerr, master of the "Maino" cutter, and he has two Malays under him. In the event of any exceptional circumstance arising requiring an increased force, volunteers for the purpose can generally be found. It will be desirable, I think, to obtain some trained men from Fiji, and with a force of twelve men, six afloat and six ashore, I can guarantee that order shall be maintained and intertribal atrocities prevented for at least 60 miles along the coast.

*Land Policy.*

The land question is no doubt the cardinal one upon which almost everything connected with British policy within the Protectorate will turn. It is the primary consideration, both as regards the present native inhabitants and those schemes of colonization which have at various times been suggested.

Even so far back as 1875 Lord Carnarvon was approached by solicitations from a proposed association of persons styled "The New Guinea Colonizing Association." The reply which was then addressed by the Secretary of State to the applicants seems to me to be so apposite that I think it well to reproduce it now. (*Appendix E*.) It lays down a standard of policy which is equally applicable at the present moment.

On

On the other hand, a charter has of late years been granted to an association in British North Borneo, where the conditions of settlement must be somewhat similar to those in British New Guinea, and were so regarded by the late Special Commissioner, who appears to have been not unfavourably disposed to some such similar concessions. (*Vide Mr. Fort's Report.*)

For my own part, I think that the true interests of the natives and their advancement in the scale of life are not inconsistent with some encouragement being given to European settlement. In further illustration of this subject I beg to attach a correspondence (*Appendix F*), which throws some light upon this complex subject.

#### *Missionary Enterprise.*

In Mr. Fort's report a sufficiently ample statement has been made of the facts of the case to render it unnecessary for me to recapitulate them. A great and noble enterprise has been conducted by a set of most self-sacrificing men, who have carried the message of Christ to a savage race of inhuman murderers. The first stages of this transmutation have been effected at the cost of a great sacrifice of life among the devoted South Sea Island teachers, who have, under the guidance of the London Missionary Society, been the chief instruments in the partial conversion of these interesting though bloodthirsty savages. I regret to say that I cannot regard the work of the society as progressive. The brave and earnest men who devoted the best years of their lives to the work of evangelisation on an unknown coast cannot renew their youth, as we might wish that they could. They are not succeeded by men competent to follow up the task they commenced, and the work of the Mission languishes just now from the lack of new men who are prepared to devote their lives to an efficient attack upon the deep incrustation of barbarism which still prevails. Mr. McFarlane has retired permanently, I understand, from the Mission. Mr. Chalmers is now in England, and Mr. Lawes is left almost alone. I hope that new and efficient workers will be found, for a work so well commenced should be carried to a successful completion.

The French Catholic missionaries of the Order of the Sacred Heart have commenced work at Yule Island. I trust that the humanising influences which they will doubtless bring to bear on the natives will be productive of much benefit to the Protectorate. Under British administration, I have no dread of any seriously prejudicial rivalry between missions acting under different directions, but animated, I hope, by the same spirit.

A correspondence I have had with the Rev. W. Lawes on this subject (*Appendix G*) will serve to indicate the course of events in connection with the French mission. As a matter of ecclesiastical discipline, the brothers of the Sacred Heart will probably affirm their right to establish missions where they choose. As a matter of practical administration, I have no doubt that they will find it most convenient to occupy unappropriated ground. The field of operation is so large that there ought to be no difficulty in establishing a fair understanding on this point.

It is not improbable that an Anglo-Australian mission may be established in the Louisiade Group. The South Sea Island teachers require sometimes to be controlled. I found it necessary to administer a severe caution in the case of a native lad who was killed by being pushed from the platform of the teacher's house at Kappa Kappa. In another case, that of the teachers at Rigo and Sarowa, they had offered rather serious obstruction to Dr. Clarkson and Mr. Hunter while on a journey to the head of the Kemp-Welsh. One of them had also spoken very disrespectfully of me and my officers. I felt it necessary to send for those teachers, and the result of the lengthy investigation which took place was a suspension of their residence in their respective districts for three months.

#### *Exploration.*

Mr. H. O. Forbes conducted, during the latter months of 1885, an exploratory expedition in the direction of the summits of the Mount Owen Stanley Range. He established a camp at Sogari, and besides making an extensive botanical collection, he effected a good deal of valuable triangulation. The wet season, however, having set in, and the funds at his disposal being exhausted, he was obliged to abandon his enterprise at that time. On meeting Mr. Forbes at Cooktown in May last, I ascertained from him that he would require £2,000 in order to follow up his explorations over a period of six months from June to December. I offered for this purpose to appropriate £500 from the funds of the Protectorate, if the rest of the amount required could be subscribed from the Australian Governments. It did not, however, at the time appear to be probable that this amount would be forthcoming, and Mr. Forbes in the meantime undertook to reside in China Straits, where he has been most useful. I attach to this report one of Mr. Forbes's letters to me in order to show the sort of work he has had to do in China Straits. (*Appendix IV.*) He hopes still to resume his scientific exploratory work in the vicinity of Mount Owen Stanley, and if the Australian Colonies should be willing to find £1,500 for this purpose I should feel justified in recommending a grant of £500 from the funds of the Protectorate towards his expenses. I have lately received an offer from some experienced Queensland colonists to conduct an exploration party by way of the heads of the Kemp-Welsh River across the Dividing Range to Dyke Ackland Bay, and if Mr. Forbes's proposed expedition is not carried out I may be able to avail myself of their offer.

#### *Trade and Revenue.*

I find it difficult to speak with any certainty on these points. Everything depends upon the land policy adopted. If settlement, even in a modified and restricted form, is authorized, trade will grow and revenue will come in. The limitations which have resulted from the system of permits established since the proclamation of the Protectorate has caused trade, small as it even then was, to diminish rather than to increase. During the period I have held office about 400,000 feet of timber has been exported. There is plenty of bêche-de-mer on the coast, and there are valuable pearl-shell beds, but the repeated massacres of the men engaged in these occupations have acted as a great discouragement to enterprise of this kind, and it practically does not exist at the present time. Nor have I felt justified, under present circumstances, in giving any encouragement to the development of these industries, when it was not in my power to afford the people engaged in them any protection, or to place them under any satisfactory regulated system. As regards the collection of revenue, I have not thought it desirable, with my present inchoate legislative powers, to attempt to levy any duties on imported goods. I have issued a regulation under which I propose to collect a royalty of a 1s. per 100 feet on all cedar exported from the Protectorate, and I propose to collect this at the ports of entry, with the assistance of the Customs authorities in Australia. In the event of any refusal to pay this duty I should withhold the permit (*Appendix H*) or passport which is at present issued to those who are employed in this industry.

*Financial.*

I entered upon the duties of administration in entire ignorance of the requirements of the situation and an overdraft at the bank of £2,319 2s. 10d. I have endeavoured to shape my expenditure in accordance with immediate necessities. It was necessary to maintain the establishment at Port Moresby, and to carry out some improvements there. Houses had to be built for the accommodation of the officers of the Government. It was necessary to provide a lockup. (*Appendix V.*) Surveys had to be made, water was laid on, and a variety of improvements incidental to first settlement had to be carried out. A list of these improvements will be found attached to this report. (*Appendix II.*) They are really the assets of the administration and are not inconsiderable. It was necessary also to provide for my own locomotion along the coast, and some provision had to be made for supervision, both at Thursday Island and in China Straits.

A statement is attached of receipts and expenditure for the half-years ending, respectively, the 1st June and the 1st December. (*Appendix IA and IB.*) The date of the first financial year—the year ending 1st June, 1885—was fixed by Lord Derby in his despatch of the 9th May, 1884. It would be convenient, I think, if an alteration could be made in this respect, and that the financial year should be made to terminate on the 30th June.

I have had some difficulty in coming to an understanding with the Government of New Zealand as to the period on account of which their payments have been made. Two payments respectively of £2,668 18s. 9d. have been made by that Government; the first was for the year ending 1st June, 1885, and the second, according to intimation, was for the year commencing 1st June, 1886; this leaves an interval for the year ending 1st June, 1886. I trust, however, that this may be regarded merely as a difference as to dates, and that an arrangement may be arrived at.

*Estimates for the Year ending 1st June, 1888.*

I shall be prepared shortly to submit an estimate of expenditure for the year ending 1st June, 1888, though I trust that in the meantime some arrangement for a permanent provision may be arrived at by Her Majesty's Government acting in concert with the Governments of the Australasian Colonies.

*Requisition for Contributions on Account of the Year ending 1st June, 1887.*

I have requisitioned the contributing Governments for the current financial year ending 1st June, 1887. On account of that year, I have as yet received no payments, except from New Zealand.

It would be more convenient, and a more equitable arrangement, I think, if, in future, payments were made in advance. The difficulties of administration in British New Guinea are sufficiently great without adding to these the difficulties of possible financial embarrassment.

*The Necessity for a Steamer.*

I wish, in conclusion, to say that it is exceedingly desirable, for the purpose of maintaining order along the coast, and for the purpose of protecting life and property both native and European, that the Commissioner or Administrator should, without further delay, be provided with a steam-vessel. Her Majesty's Government have offered to do so; and I trust that this proposal will soon be carried into effect. H.M.S. "Dart" has been spoken of as the type of a vessel suitable for this purpose. She was, I believe, a steam yacht, which was originally owned by Lord Eglinton. Some similar vessel could probably be purchased in England for a sum of money well within the £18,000 which has been spoken of for this purpose. She ought to have good sailing qualities, combined with steaming capacity worked at a minimum of expenditure. Captain Cyprian Bridge, R.N., supplied General Scratchley with an estimate of expenditure suitable for such a vessel (*Appendix III*), and I have no doubt that this probable expenditure is one which will serve as a useful guide.

JOHN DOUGLAS,

Her Majesty's Special Commissioner for British New Guinea.

Brisbane, 31st December, 1886.

## APPENDIX A.

MEMORANDUM of agreement entered into this thirtieth day of April, eighteen hundred and eighty-six, between the Honorable John Douglas, C.M.G., Her Majesty's Special Commissioner for the Protected Territory in New Guinea, and Messrs. Burns, Philp, & Co., Limited, of Brisbane, Townsville, &c. (Queensland), and Sydney (New South Wales).

It being essential to the proper development of New Guinea that steam communication should be established between Thursday Island and Port Moresby, and whereas Messrs. Burns, Philp, & Co., Limited, are already engaged in trading between and with these ports, the following arrangements are herewith agreed upon between the Honorable John Douglas, C.M.G., and the said firm.

Messrs. Burns, Philp, & Co., Limited, agree to run a monthly steam service between Thursday Island and Point Moresby (and to extend the service if required by the development of trade from Port Moresby along the south-east coast to East Cape), carrying the public mails and despatches for the Honorable John Douglas without charge other than hereafter specified.

Messrs. Burns, Philp, & Co., Limited, undertake to gradually establish trading stations along the coast at various points, under the management of good and reliable men, who shall be approved by Her Majesty's Commissioner. These stations shall be formed for the purposes of collecting copra, bêche-de-mer, and other products, and offering inducements to the natives to engage in industry and in the development of the natural resources of the country.

The sites for such stations shall be selected, or, if not selected, approved by Her Majesty's Special Commissioner or public officer appointed by him. It is understood that the land upon which the stations are built, and any water frontages upon which wharves are erected or other improvements made, will be held by Her Majesty's Special Commissioner for the sole use\* of Messrs. Burns, Philp, & Co., Limited, unless and when required for public purposes; and should such lands or water frontages, in consequence of being so required, be resumed or sold by Her Majesty's Special Commissioner, then the improvements shall be valued at the time of resumption or sale, and the amount of such valuation shall be paid to Messrs. Burns, Philp, & Co., Limited.

Her

\* "Sole use" to be interpreted in accordance with the telegrams interchanged on this point.—  
JOHN DOUGLAS.

Her Majesty's Special Commissioner shall allow Messrs. Burns, Philp, and Co., Limited, to take passengers (within limits as to number, to be specified by himself from time to time) from Australia to New Guinea, always provided that the said firm guarantee that such passengers shall not become a burden upon the Government, and that they comply with the regulations and sign the usual "Memorandum of Conditions" required from approved travellers or immigrants, copy of which is hereunto annexed.

In the event of the steamship employed breaking down or requiring to proceed to Townsville or elsewhere for repairs, then Messrs. Burns, Philp, and Co., Limited, shall be allowed to substitute a sailing vessel until repairs are effected, and thus obviate the necessity of keeping a second steamship ready for emergencies.

In consideration of the due fulfilment of the terms of the steam service named, Her Majesty's Special Commissioner agrees to pay to Messrs. Burns, Philp, and Co., Limited, and Messrs. Burns, Philp, and Co., Limited, agree to accept in full settlement, the sum of fifty pounds sterling per month. The said steam service will date from the 1st day of July next, and terminate on the 30th day of June, eighteen hundred and eighty-nine. Should the steamer be detained for repairs longer than two months in one year, then the payment for such excess of time shall be only at one-half the rate per month stated.

It is finally understood that this agreement may be terminated on either side subject to six months' notice being given from one side to the other, in so far as the mail service and subsidy are concerned, and that the provisions of this agreement are subject to confirmation by Her Majesty's Secretary of State for the Colonies, although acted upon by Her Majesty's Special Commissioner.

JOHN DOUGLAS,  
Special Commissioner.

BURNS, PHILP, & CO., LIMITED,  
Per JAMES BURNS,  
Managing Director.

Telegram from Her Majesty's Special Commissioner, Brisbane, to Messrs. Burns, Philp, and Co., Sydney.  
26 April, 1886.

I PROPOSE to insert in agreement *re* tenure of station sites a few words stating that actual tenure shall be similar to that of the pearl-fishing stations at Thursday Island. Do you agree. This will not interfere with valuation clause. Contract to date from 1st July.

JOHN DOUGLAS.

Telegram from Messrs. Burns, Philp, and Co., Sydney, to Her Majesty's Special Commissioner, Brisbane.  
28 April, 1886.

AGREE alteration *re* tenure trading stations, also commencing 1st July, unless you think dates should assimilate with Australian Company fortnightly service. Make alterations and return corrected copy signed.

BURNS, PHILP, & CO.

#### APPENDIX B.

##### CHARTER "GOVERNOR CAIRNS."

THE following are the conditions of charter of the schooner "Governor Cairns," now lying at the Port Office Wharf, Brisbane, between the Honorable the Colonial Treasurer of Queensland on the one part, and Her Majesty's Special Commissioner for New Guinea on the other hand.

The Honorable the Colonial Treasurer of Queensland undertakes to put the said schooner in good and seaworthy condition, to fit her out with sufficient sails and standing and running gear, anchors, chains, awnings, and two boats, to deliver her at Brisbane to whomsoever the said Special Commissioner may appoint for that purpose.

Her Majesty's Special Commissioner for New Guinea undertakes on his part to take every reasonable care of the said vessel and equipments, to keep the vessel insured against total loss for the sum of £2,000 in the name of the Honorable the Colonial Treasurer of Queensland, in any respectable marine insurance office in Brisbane, and to do nothing that will vitiate that insurance.

He further undertakes at the expiration of this charter party to give the vessel up, with all her equipments, in Brisbane, to the Queensland Government, or such officer as the Honorable the Colonial Treasurer may appoint, in as good condition as when received, fair wear and tear excepted; that in order to ascertain if any injury has been received, he undertakes to dock her for survey, and any injury she may be found to have received, to make good, before being taken over by the Queensland Government. The said Special Commissioner undertakes to pay to the said Honorable the Colonial Treasurer, at the expiration of each calendar month, the sum of £25 as rent for the said schooner.

The said Special Commissioner further undertakes to pay all wages and expenses of crew, stores, and supplies of all kinds, and to make good and replace anything that may be lost or injured, and to keep the vessel clean, thoroughly painted, and protected as far as possible from the weather; to have the spars and blocks regularly attended to, the former kept greased or varnished, and the pins of the latter taken out, and their position shifted, and the sheaves blackleaded at proper intervals. The chains are also to be got on deck and overhauled at least every two months.

This charter party is to continue in force from the 1st May, 1886, to the 1st January, 1887, from which first-mentioned date the rent as aforesaid is to accrue.

It is also agreed that the said Special Commissioner has the option of purchasing the said schooner "Governor Cairns" at any time during the currency of this charter for the sum of £2,000, to be paid by the said Commissioner to the Honorable the Colonial Treasurer of Queensland, and upon such purchase being made and completed, the conditions of this charter party to cease and determine.

Signed on the 1st day of May, 1886, by Her Majesty's Special Commissioner for New Guinea, and by the Colonial Treasurer of Queensland, in the presence of	}	JOHN DOUGLAS, Special Commissioner for New Guinea. JAMES R. DICKSON, Colonial Treasurer.
E. B. CULLEN.		

## APPENDIX C.

## No. 1.

Sir,

Survey Camp, Port Moresby, 21 September, 1886.

I have the honor to make the following report in connection with the surveys that I have completed—viz., the townships of Granville East and West, public reserves, native and mission reserves, cemetery, etc. Firstly, I would state that I have carried out the whole work as nearly as I can, according to the instructions in the Queensland Survey Regulations, which differ considerably from those I have always been used to—viz., South Australia; Queensland work being all carried on from magnetic north, that of South Australia from true meridian.

The first work in connection with a survey such as I have just completed in a new country under Queensland Regulations is to lay down a true meridian line, and then ascertain the variation of the compass, and carry on the work on whole degrees of magnetic bearings, no odd minutes. However, the nights were so very cloudy for some four to five weeks after my arrival that I was unable to obtain sufficiently good observations to start my survey from; so, in order to lose no more time than possible, I commenced the work as I should have done under similar circumstances in South Australia, and ran my beach traverse and other work, on contained and subtended angles. From one of these lines I eventually fixed my true meridian and variation, and have calculated the magnetic bearings as shown on my plans throughout the work. In my field-book, besides the bearings, will be found the contained and subtended angles for reference if necessary. The grass and rough nature of the hills, and the swarms of green ants and hornets which infest the scrubs, I have found a very great drawback to the progress of my work. My party also have suffered considerably from sickness, owing, I should think, to the exceptionally wet season we have had during my residence here.

The township of Granville West, situated near Paga Point, or, I should say, between Paġa Hill and Goldie Law, and extending from the Port Moresby Beach to Ila Beach, comprises about 50 acres of land. There are, including the beach roads, seven streets, the inner ones being 2 chains wide, the beach frontages averaging about 3 chains. The blocks are all cut up into  $\frac{1}{4}$ -acre allotments and classed in sections according to Queensland Regulations—viz., Sections I. to VI.—and contain 107 lots, numbered as per plan. All corners, etc., are marked with hardwood pegs, and numbers cut on sides, and mostly trenched with good stone trenches indicating direction of lines. When the ground would allow, trenches are cut in the soil. The most part of the town consists of rough flint boulders, excepting in the Gap, where the soil is a blue clay. I should think a gang of coolies would soon make a good clearance of these boulders, which, if placed on the main roads and broken up, would serve well for metal, but would require good blinding. Water is at present scarce, but I feel satisfied that with suitable appliances there would be no great difficulty in obtaining a good well. The most suitable way of connecting the two townships, in my opinion, will be by a road running along the beach, skirting Goldie Law on the northern side, by quarrying out that hill along the foot. The road at the back, along Ila Beach and across the Gap, would, I think, cut up considerably with any heavy traffic, and is much longer, and its approach to the Gap would require considerable amount of metal before it could be much used.

The township of Granville East lies about 80 chains north-easterly from Granville West, and is, so far, cut up into eight sections. The outside roads are 2 chains, the inner ones being 1 chain. The allotments are all  $\frac{1}{4}$  acre and are marked with hardwood pegs, the ground being mostly of a blue clay character; the trenches are cut in the soil. Here there are only two sections—Nos. III. and IV.—cut up into allotments. The others can easily be done with the chain should they be required, and no surveyor here. The 2-chain road named Lawes-street, on the western boundary of the town, will be the main thoroughfare until such time as a road can be made facing the beach as surveyed through the mangroves, where there is a firm bottom, and will eventually make a first-class road, but at a considerable expense. This town is well supplied with water, there being beautiful springs at the north-eastern corner, where I have surveyed a considerable road deviation which takes in the springs and allows a good roadway on either side of them. The hills on this side are mostly of limestone formation, whilst at Granville West they are mostly flintstone. Granville East to the northward is bounded by the reserve for public purposes, botanic gardens, &c., and for the latter I consider an admirable site is chosen. This public reserve extends northerly for about 31 chains and average depth about 16 chains. It comes down to the beach traverse on the western side, and is bounded on the eastern side by a 2-chain road skirting the hills at the back of Government bungalows connecting the north-east corner of Granville East with the Laloki road. This road also bounds the native reserve on the eastern side, which lies immediately north of the public reserve and runs in that direction for 27 chains, where the Laloki road, which separates it from the Mission block, joins the beach traverse; the 2-chain road bounding it on the east joins the Laloki road 10 chains 35 links from this point easterly. The native village immediately faces it to seaward. In the south-eastern corner of this block there are also some valuable springs. Northerly from here is the Mission block, which takes in all their dwellings, huts, and church, situated on a good rise and facing the coast traverse. For 21 chains north-westerly and westerly from this point, it leaves the hill and runs along the coast traverse for 17 chains 50 links, thence easterly for about 20 chains to a bend in the Laloki road. About 20 chains from its intersection with the beach traverse the most part of this land is of a swampy nature, and covered with long reeds and jungles. It would, I think, if cleared be suitable for the growth of rice. This block contains an area of rather more than 31 acres. At 8 chains from this junction with the Laloki road easterly, is a 1-chain road running in a north-north-westerly direction for 13 chains about to the cemetery, which contains 3 acres of land; it is also approached by a road skirting the hills to the northward of the Mission.

The timber on all this portion contained in these surveys is a stunted bastard gum of no use. There are a few acacia, likewise useless. The grass is spear-grass, and is very abundant. The Laloki road is run to the Gap, when it reaches the hills; I considered it unnecessary to offset it on the hill-side, as they are useless to anything but road purposes, and it will, I think, be many years before the full width of 2 chains will be required on the hill-sides. There will be considerable cutting necessary to make this road, owing to the steep sides of the hills, but the grade is very little, and when made will be found to be an easy approach. I have always avoided doing more damage to bananas or garden fences than actually necessary for the work, and in every case have avoided cutting down coconuts and sago palms, &c.

I have laid out townships, roads, &c., as nearly as possible according to instructions received from either yourself or Mr. Douglas. In some cases I have deviated a little, where in my opinion there has been a more suitable course.

The

The difference in length of the two roads connecting the two townships from centre of Granville West to junction with main road is round Goldie Law to northward about 90 chains, round Ila Beach about 120 chains.

Plans of the two townships and a general plan of the whole survey completed I forward herewith, which I trust will meet with satisfaction.

My field-book, which will take in the road to junction of the Goldie and Laloki, together with plans and report on same, I will send in as soon as possible after its completion.

I have, &c.,

WALTER R. CUTHBERTSON,  
Surveyor.

To the Deputy Commissioner, Port Moresby.

No. 2.

Sir,

Survey Camp, Granville, 27 October, 1886.

I have the honor to furnish the following report on the road recently surveyed by me to the Laloki River.

I found that the present native track was as good a road as it was possible to find, so that I have almost followed that the whole course, straightening it up as much as possible. The distances are as follow:—From traverse at beach, near native village, to gap in range, 91 chains 30 links; to first water, 225 chains; to Vaigana Creek, 439 chains; to Laloki River, 632 chains; along river-bank to crossing, 56 chains; making a total of 688 chains from beach traverse to Laloki River crossing, or  $8\frac{1}{2}$  miles. The road is offset as a 2-chain road; the whole distance excepting crossing the range, where I considered an offset unnecessary, being only suitable for road purposes.

After striking the river I have surveyed a road of an average width of 3 chains along the river-bank as far as the crossing. This is, I think, necessary as a travelling stock reserve and approach to water for all public purposes. This should, I think, be continued along the river as the survey of the country progresses; my two-chain road of course runs into this. It is useless surveying a road immediately down to a crossing, as that continually changes in a river subject to any freshes; for instance, where the water is shoal this season it may probably be deep next, and so on. The three-chain road along the river bank, therefore, gives access to a crossing, wherever it may be, at any particular season.

The same should be done on the opposite bank, and the two-chain road commenced cutting out from it wherever the country may prove most suitable for the purpose. During the whole time I was working on this road we had heavy rains daily, which caused floods in the river. I was therefore unable to give any opinion on the crossing itself, as I could not get up to it; but from Mr. George Hunter's report who has crossed there, I should think it would easily be made a convenient ford.

The country for about 2 miles on either side of the road I have sketched with prismatic compass, and in my plan will, I think, have given a very good idea of the surrounding country. I would not have it taken that this sketching is even supposed to be precisely accurate, but quite sufficiently so for the guidance of anyone either travelling the country or to take up selections from. Of course before any accurate fixing of hills, &c., can be made, "trig." stations must be built on their highest points, and tops cleared so as to get reliable bearings to the same point. This would entail considerable time and expense. However, with the short time at my command, and the very unfavourable state of the weather, I have managed to map in a good portion of the country behind the range, which I trust will prove serviceable until such time as a more minute and accurate survey can be made. During the whole of the distance of the road-line surveyed by me there was not more than 5,000 [links?] of burnt country; the remainder was covered with grass between 4 and 5 feet high, which would not burn, being too green, and if started there was no wind to carry the fire any distance. This grass I had to cut down the whole distance, which very much lengthened my work. The country throughout is of a limestone formation and I came across no signs of any mineral. For the most part it is a pastoral country, if not wholly so; in the flats there is some good soil, but of no great extent, suitable for growth of maize and such-like produce. The timber is mostly stunted gum (poor), excepting on the banks of watercourses and surrounding the lakes at Vaigana, or what in Northern Australia we should term "tea-tree swamps." Here is found abundance of Leichhardt pine, a very useful timber in all countries where the white ant is to be found (it will not touch this pine); and from it, splendid flooring-boards and so forth can be cut. It is a timber easy to work, and very pretty; it is a yellow colour, well adapted for tables, chairs, &c., in these countries. On the country surrounding these lakes, horses and cattle should, I think, thrive well, if not too much molested by leaches and alligators. The latter are numerous in a deep waterhole leading into these lakes, and would, I fancy, be capable of doing considerable destruction to young stock. During my camping term in the vicinity, the absence of game on these lakes makes me think they would most probably be plentiful in them as well as the waterholes where we saw them ourselves.

The country northward of these lakes, as far as the eye can span, is low-lying, apparently swampy lands, timbered with low scrub.

To the westward for about a mile low ranges are passed over, all well grassed, which would give good high feeding-ground for stock in the wet when the flats are boggy. I should have liked to have run a line from the junction of the two native tracks this side of Vaigana to the junction of the Goldie and Laloki, which it was my intention to have done; but owing to the heavy rains which fall daily, and with the amount of sickness in my camp, I did not think I should be doing my duty either to my party or myself by staying out to complete that work, so, at your suggestion, struck camp.

Myself I suffered considerably with scrub-itch, which, together with worry of my men being sick, and long hours in the sun during the day, in a stifling atmosphere, with no wind and heavy rains, and no sleep at nights, completely knocked me up. I used quarts of kerosene to destroy this itch, but without effect; the best remedy I found was to rub myself all over with Holloway's ointment. Painkiller and St. Jacobs oil had no effect, and for over a week could not get a wink of sleep, so spent most nights walking about keeping the mosquitoes company, which also were somewhat numerous night and day. The water in the creek at Vaigana I do not consider fit for drinking purposes, but by sinking in a gravelly bed can secure first-class water, the holes being choked with decomposing vegetable matter. There was nothing that I met with in any way differing much from the surrounding country on which to write a lengthy report, more than to say it is all evidently a good pastoral country, and trusting this, together with the plan I shall send in as soon as completed, may prove serviceable,

I have, &c.,

WALTER R. CUTHBERTSON,

Surveyor.

To the Assistant Deputy Commissioner.

No.

Memorandum by Assistant Deputy Commissioner Musgrave respecting Acquisition of certain Government Lands.

Government Bungalow, Granville, British New Guinea, 9 November, 1886.

In compliance with your Excellency's verbally expressed wish, I have the honor to report upon the acquisition of Government lands in British New Guinea up to this date.

The first acquisitions on the part of Protectorate officers were the sites of the Government bungalow, comprising about an acre, and a strip extending in a southerly direction from the Argus Villa for about 20 chains along the harbour, and about 4 chains in width. These plots were secured from the Motu and Koitapu people of the villages adjacent to the London Mission Station, in the same manner that the representatives of that Mission originally obtained sites for their buildings and gardens. This is by giving to the claimants of the ground desired certain articles in barter, such as hatchets, gaudy cloth, tobacco, &c. I beg to enclose copies of the authority I received from the late Special Commissioner (Sir Peter H. Scratchley) for making this and other land purchases for the Government. He also intimated to me verbally his desire to take over other lands wherever it was practicable and convenient. His Excellency was not an eye-witness of this first transaction, as his plans obliged him to leave for Redscar Bay on the same day, the 8th September, 1885. A copy of some notes which I made at the time of this purchase is also annexed.

Minute. 3 Sept.,  
1885.

Notes. 8 Sept.,  
1885.

No form of "Memorandum of Land Purchase" has ever been supplied to me, nor did I receive any written instructions other than the authority mentioned.

While referring to this first Government purchase, it will doubtless interest your Excellency to see the accompanying copy of probably the first record of a land transaction in Port Moresby, if not in British New Guinea. This paper was placed in my keeping by the Rev. Mr. Lawes about a year ago. The strip of land along the harbour was secured in order to assign positions for stations to certain traders who had applied for them. The late Special Commissioner was, however, in a doubtful and difficult position with regard to his powers either to acquire or alienate lands. According to a regulation in force on his arrival, and which has never been formally rescinded, Commodore Erskine, at the date of the Protectorate, had enacted that "No settlement or acquisition of land is on any account to be permitted." On the other hand, clause 9 of the Special Commissioner's instructions seems distinctly to imply that land purchases may be made, and apparently at the discretion of the Special Commissioner. He is also given instructions as to his responsibilities and duties, as the clause states, "in the event of any such purchases being made." Further, in clause 10, he is directed "to give all proper encouragement to peaceful and legitimate trade between the natives and persons who may visit the Protectorate." It was so obvious that one of the first essential requisites for trading is a site upon which to put buildings, that I understand the late Special Commissioner held that his commission and instructions gave him sufficient discretionary power to act for the general good, and upon well-approved principles of settlement, and in this sense to relax Regulation No. 4. He therefore determined that Government officers should first treat with the natives in all cases for the acquisition of lands the latter wished to sell, and that a subsequent grant of a provisional right of occupation might be allowed to the foreign settler. This was the course followed in the cases of Mr. Theodore Bevan and Messrs. Davis and Anderson, who both began business here last year, but have since abandoned the settlement. A register book of such licenses for provisional occupation was opened, as I have previously mentioned to your Excellency. No fees were charged, as no power seemed to be conferred for their collection, and on account of the insecurity of tenure allowed.

Memo., Rev. W.  
G. Lawes.  
11 Jan., 1875.

3. On the day following (9th September, 1885), a narrow strip of land was purchased to connect the bungalow site already described in my despatch to Her Majesty's Secretary of State of the , 1885, with the beach purchases.

4. On the 14th September Sir Peter Scratchley settled with Mr. Andrew Goldie for the purchase of the Argus Camp building, and relinquishment of any rights to the site of about an acre of ground, for £30. The purchase of the land from Mr. Goldie was expressly repudiated, as that would have implied a right to sell, and therefore a right of possession on his part. Any such admission would have created a precedent with regard to other land he occupied, and other claimants of the same class.

5. On the 7th day of October it would appear that Sir Peter Scratchley bought a piece of ground at Suau (South Cape). A copy of the memorandum of this purchase is to be found on page 50 (No. 31) of Mr. G. S. Fort's report on the cruise of the "Governor Blackall." The amount paid for this position was about £3 7s. 6d. in trade, but the approximate area is not stated.

6. On the 14th and 15th of October, Mr. Robert Hunter and Ruatoka the Mission teacher bought from the Koitapuan natives of the village of Verentu or Badili certain lands now known in the local surveys as the Badili lands. I did not perambulate the boundaries myself, but I was present, and the Rev. Mr. Lawes also kindly attended at the payment of the claimants. We were assured of their being satisfied with the completion of their sale. One hundred and twenty-eight vendors had to be paid for 333 acres of land. These are the contents of the block as fixed by a recent theodolite survey, of which your Excellency has inspected the plan. The main object in securing this block was to be able, in the event of Port Moresby natives proper being reluctant to sell or making excessive demands for lands urgently needed for settlement, to substitute other holdings equally suited for cultivation, but not equally monopolising wharf frontages, &c. There was risk of these positions being taken by the natives on the advice of certain Malays and South Sea Islanders who have taken Motu women as "wives," and who use some influence over the aboriginal villagers.

The Badili lands lie well within 3 miles of the Government bungalow, cost less than £30 in trade, and are estimated by some persons of Australian experience to be worth £10 per acre, or £3,250. I consider them myself to be in a very important and valuable position as settlement extends. There are numerous fine villa sites upon them, giving fine views along the south coast.

7. The next purchase was also a valuable one to the Government. It consisted of a large block of land on the Vei Mauri and other rivers, about 30 miles west of Port Moresby, in the sub-district of Dora. The Doran tribe have been nearly exterminated by their neighbours, and were willing to sell with the understanding that the Government should grant them such a measure of protection as was possible. The presence of Mr. C. H. Page's timber-getting party on the Vei Mauri River has been, and will continue to be, a sufficient safeguard against hostilities while timber is being obtained. Should the party abandon the spot, however, it will be desirable for many reasons that a Government station be placed in the

the district, which is very fertile and well watered, and in a very accessible position south of the foot-hills of Mount Owen Stanley. The surrounding tribes are on friendly terms also with foreigners. The area is difficult to compute, but may be about 40 square miles. This land purchase was the last made during the late Special Commissioner's term, and during last year.

8. In January two more small plots of uncultivated land were bought at Port Moresby, namely, about  $\frac{1}{2}$  an acre to the south of and adjoining the bungalow site, and a piece of about the same size for a boatman's cottage site. This last was a continuation of the beach lands. The price paid was £4 2s. 10d. for these plots.

9. No further purchases of land were made until after your Excellency's arrival here in June last. Acting upon your memorandum of instructions with regard to the acquisition of lands in conjunction with the surveys at Port Moresby, which it was most important to have effected, Mr. Robert Hunter, as an agent for the Government, accompanied by the Government interpreter and the present chief of the local village, Ah-oo-doo, made purchases from time to time, as other duties permitted, to the extent of about 222 acres. All the cultivated grounds that interrupted the road reserves have been bought at a full price, but the natives have had it explained to them that in future, when the Government make roads for their benefit as well as for the foreigners' convenience, they ought to grant land free for that and other public purposes.

Mr. Hunter began purchasing on the 8th July, and ceased by my direction on the 8th October, having secured all the lands required within the surveyed portion of the settlement, newly entitled "Granville." The recent acquisitions may therefore be summarised as follows:—

*Purchased lands.*

	Acres.
Government domain and bungalow, site, &c., of 9 acres ... ..	52
Granville East, township ... ..	95
Ila Beach, suburban lands ... ..	22
Granville West, township ... ..	50
Badili lands ... ..	333
	552

*Unpurchased lands.*

Paga Hill Reserve ... ..	50
Goldie Law Reserve ... ..	236 $\frac{1}{2}$
Cemetery (assumed for public purposes, within Native Reserve) ...	3
Government Station (late Mr. A. Goldie's holding) ... ..	2 $\frac{1}{2}$
	844

Total acreage ... .. 844

The purchased lands have cost £339 19s. 1d. from the first transaction in 1885 to date, at Port Moresby, and inclusive of the block at Badili. The country lands in Dora and Suau cost £7. 0s. 10d.

With reference to the unpurchased portions, Goldie Law and Paga Hill, the natives themselves ridiculed the idea of the Britanis buying "rocks and stones," as they said. The elevations are very rugged and somewhat steep, and are not cultivated by the natives. They are in fact practically useless to the latter, and it seemed unnecessary (at any rate at present) to buy them.

Your Excellency was an interested eye-witness of the purchase of a portion of garden ground, and is fully aware of the exceptionally troublesome and tedious nature of acquiring land by the present method. The lands purchased at Port Moresby, already stated at 552 acres, involved twenty-seven different transactions on as many different days, and compelled negotiation with and payment of 1,258 different vendors, or rather more than half-an-acre from each native. It seems evident, therefore, that any such process as has been adopted during this season would be too expensive and cumbrous to continue, and it is most desirable that another and more convenient mode of adjusting the relative positions of foreigners and aborigines in respect of land may be settled shortly.

No. 4.

Memorandum by Assistant Deputy Commissioner on the first purchase of Government Lands in British New Guinea.

Government Bungalow, Granville, British New Guinea, 8 September, 1885.

MR. George Hunter, Government Assistant, with the co-operation of the London Missionary Society's teacher, Ruatoka, whose services were kindly allowed by the Revs. Messrs. Lawes and Chalmers, negotiated for the purchase of certain instalments of land in the proposed Government and commercial division of the settlement with twenty-eight Motu and Koitapu natives.

2. The teacher, Ruatoka, having been here since 1873 (twelve years), and being thoroughly conversant with the local natives and their customs (especially in their dealings with foreigners, for the sale of land), was a most valuable agent. Mr. G. Hunter also possessed considerable experience of natives.

3. The portions of land bought from each individual varied in size, but were all small. For each portion, 1 tomahawk, 1 handkerchief, and  $\frac{1}{2}$ -lb. tobacco were given. This appears an almost unfairly low price. The total area bought, however, is not more than 8 acres, and the value of the trade expended amounted to £18 2s. 4d. Thus an acre is worth about £2 5s. None of this land was in cultivation, the natives declining then to sell even a small plantation which intervened between the Government bungalow and the sea. Nor is any of the land at Port Moresby of a fertile character, although several gardens exist. Although it also seems unfair that an individual should receive as much for one square perch as another does for two or three, they are accustomed to this settlement (since they have no areal measure), and the gain to the community is the same as if the total were exactly subdivided amongst the vendors.

4. At 2 p.m. the native vendors gathered at the teacher's house, and their names having been called over and noted carefully, the Rev. Mr. Lawes addressed them at my request. He informed them that I was an officer of the Beretani Government, was allowed to buy land, and had been directed to do so by the Kavana, or great chief. He said, at my request, that "I would buy both the bad land and the good

good land when they were inclined to sell, and that I intended to try and lead the water into their village by-and-by, and save them trouble in the dry season." Each landowner then received his payment and left quite satisfied, and with the intention of selling more land to Mr. Hunter for the Government.

5. In the afternoon fifty-four more natives sold land and were paid in my presence, departing quite satisfied.

The chief Boi Vagai was present throughout the proceedings, from the perambulation of the boundaries to the final payments.

New Guinea Minute Paper.

Received 3rd September, 1885—Answered 9th September, 1885.

To Captain Anthony Musgrave, Acting Deputy Commissioner, Port Moresby.

*Subject.*—Sundry matters to be reported on.

1. Herewith a memo. of certain matters I wish you to inquire into and consider.—1. *Received.*
  2. Reports to be sent when convenient. Some of the points are not ripe for settlement.—2. *Noted.*
  3. I authorize you to incur necessary expenditure in connection with them should you deem it advisable not to wait for my authority.—3. *Noted.*
  4. If there are any other matters you wish to bring up to my notice please do so. I shall be glad at all times to hear from you.—4. *Noted.*
- P. H. SCRATCHLEY.
- Port Moresby, 3rd September, 1885.

Port Moresby.

Matters to be inquired into and considered by Captain Musgrave, Assistant Deputy Commissioner.

1. Tidal gauge automatic. Communicate Captain Pullen's letter herewith to Professor Russell at Sydney, and make preliminary inquiries as to cost, &c.—*Letter drafted for ensuing mail.*
  2. Cleaning boat channel.—*Suggest postponement.*
  3. Purchase of land; all desirable sites to be purchased at a moderate cost; if any reluctance shown, defer.—*Several bought; continue to do so gradually.*
  4. Site for official quarters to be purchased, together with garden, &c., road leading to, and paths.—*Done.*
  5. Site for Government farm.—*Suggest postponement.*
  6. Erection of official quarters. The materials and carpenter may be here on 10th or 11th September. We have to unload vessel. Steam-launch will help, and ship's boats.—*Site purchased. Being cleared. Quarters and board fixed for carpenter. Shed and store ready for materials. Canoes engaged, and Hunter specially to attend to unloading vessel.*
  7. Accommodation for carpenter on shore—*see contract with Aplin, Brown, & Co., herewith.—(See above.)*
  8. Water supply generally.
    - a. For farm.—*Postponed.*
    - b. For quarters, )
    - c. For village, ) *Settled for present.*
    - d. For shipping. )
  9. Boatshed.
  10. Jetty.
  11. Site for native boatmen's quarters—married men; gardens.—*Sites provisionally selected.*
- \* \* \* \* \*

Copies letters received.

Memorandum.

Port Moresby, New Guinea, 11 January, 1875.

THE Rev. W. G. Lawes, of the London Missionary Society, and resident at Port Moresby, having bought the undermentioned plots of ground, Nos. 1, 2, 3, 4, and 5, the former owners in our presence declared the purchase effected, and the land transferred to said W. G. Lawes and his heirs absolutely, which was also ratified by the chiefs Ila, Kupa, Iko, Poe, and Heni. The owners and chiefs expressed themselves perfectly satisfied with the payment.

*Plot No. 1.*—Ground on which dwelling house stands, extending in front about 12 yards, at the back about 16 yards, and bounded at each end by road. Purchased from Mavaraiko for shirt, hatchet, knife, and pocket-handkerchief.

*Plot No. 2.*—Ground in front of house extending down to the sea, bounded by road on eastern side, by Plot No. 3 on western. Purchased from Kupatele for hatchet, shirt, knife, and handkerchief.

*Plot No. 3.*—Ground on west of Kupatele's, bounded on west side by Elivara road extending to the sea at the bottom and to dwelling house at top. Bought of Putitai for a woman's dress, a hatchet, and knife.

*Plot No. 4.*—Ground on which Niue, teacher's, house stands, extending to the sea at bottom, to house and about yards beyond at back, extending as far as cocoanuts on east side and to road on west side. Bought of Touakavera for two shirts, two hatchets, and four pocket-handkerchiefs.

*Plot No. 5.*—Ground on west side of dwelling house extending nearly to top of hill, forward as far as Elivara road, and inland as far as boundary mark. Bought of Huakonia for a shirt, woman's dress, hatchet, and knife.

THOS. SUCKLING, Lieutenant-Commander, H.M.S. "Renard."  
 LESLIE C. STEWART, Sub-Lieutenant, H.M.S. "Renard."  
 S. MCFARLANE.  
 J. THURSTON, Master, s.s. "Ellengowan."  
 HENRY SMITHURST, Engineer, s.s. "Ellengowan."  
 RUATOKA, Rarotongan Teacher."

## APPENDIX D.

## Memorandum on Native Policy in Her Majesty's Protected Territory of New Guinea.

In compliance with your Excellency's wish, I have the honor to state as follows respecting the native policy and events in this Protectorate from June of last year to this date (October, 1886).

In the above period of sixteen months (for three of which—March, April, and May last—I was engaged on official duty with your Excellency in Australia) the late Special Commissioner spent three months (31st August to 29th November, 1885), in cruising in these waters, visiting various points, and collecting information as to the existing state of the country.

His untimely illness and death on the 2nd December prevented his writing a general report as he had intended, and the compilation and printing of his notes and memoranda were subsequently effected by his private Secretary, Mr. G. Seymour Fort. This account of the cruise of the s.s. "Governor Blackall" was published by the courtesy of the Government of Victoria in March last, and it has been read with interest, as I am aware, by your Excellency. It describes the villages visited, and other native matters with which Sir Peter Scratchley dealt.

There is no occasion for me to comment especially on the views expressed in the above report. The late Special Commissioner's opinions and projects regarding British New Guinea were avowedly of a tentative character, and some of those referring to a future native policy and control would, I believe, have been widely modified, if not abandoned, had he lived to gain a closer and larger experience of our aboriginal population.

To endeavour to frame and pursue such a policy, for instance, as that signified in the statement, "New Guinea must be governed for the natives and by the natives," would, I consider, be a costly and chimerical experiment in colonial organization, inevitably resulting in failure. It could not retard indefinitely the natural and progressive influences of civilization. Our aborigines are savages in the first stages of barbarism, swayed by intense and degrading superstitions which involve them in ceaseless intertribal feuds and bloodshed, and the first really important protection that the natives require in British New Guinea is from each other. From one end of our territory to the other a chronic state of intertribal hostility prevails, and I much doubt if a day passes in the year without a murder or massacre (often of women and children) taking place in some district. No real tribal discipline or organisation exists, and to "govern by the natives" is a sheer impossibility; but I propose to treat this point more fully hereafter.

I regret that there are also some other points in Mr. Fort's compilation with which my own views do not agree.

2. Mr. Deputy Commissioner Romilly visited this coast in the s.s. "Victoria" (17th June to 12th July, 1885), when the Queensland Government returned the islanders held to be kidnapped from our Eastern Archipelago. He returned to Queensland on the latter date, and accompanied the late Special Commissioner on the arrival of the latter here on the 28th August last. Compelled to leave again for the Australian coast in the middle of October, owing to severe fever, he has not since been in these waters.

Neither from the late Special Commissioner nor from Mr. Romilly (while Acting Special Commissioner for three months) did I receive any instructions or suggestions whatever as to a native policy or my own position in relation to the natives. Such measures as I was constrained, in the interests of peace and security to life and property, to adopt were undertaken with the gravest sense of responsibility for want of proper authority. It was so important for future administrative control, however, that the natives should at once begin to look towards a central authority for advice and friendly dictation, that I felt bound to interest myself and take action in several matters not, strictly speaking, within my powers. I was fortunate, nevertheless, in receiving the full approval of Sir Peter Scratchley for the opinions and actions which I brought to his notice.

3. On my arrival here, on the 17th June last year, in the s.s. "Victoria," I held a commission as Assistant Deputy Commissioner. The powers it conferred were limited to action upon instructions to be given from time to time by the late Special Commissioner. No discretionary legal or administrative authority was thus allowed, and the only instructions furnished to me were to stay at Port Moresby and make a local collection for the Indian and Colonial Exhibition.

Commission  
as Assistant  
Deputy Com-  
missioner,  
26th May, 1885.

These facts I did not think it expedient to make generally known, as I was the only British official representing to a certain extent Her Majesty's authority in the Protectorate.

Without embarking on any important or questionable step, however, I guided myself by the spirit and intention of the general instructions from Her Majesty's Secretary of State for the Colonies to the late Special Commissioner himself. They were similar to those of a later date received by your Excellency, and served in some measure to direct my relations with the natives. Certain previous experience of barbarous tribes in Canada and South Africa, likewise, I felt would enable me to begin the introduction of a native policy after acquiring proper local knowledge.

Two and a half months of this position passed, and then Sir Peter Scratchley arrived at the end of August. He expressed himself fully satisfied and pleased with what little had been done, and agreed in some suggestions for future measures. These were comparatively few, and merely verbal on my part, as I did not then feel assured on several points under my observation.

In addition to seeing what I could for myself, I gathered all the information obtainable from persons of any local experience, such as bêche-de-mer fishers, collectors, &c.; and I must express my obligation to all classes alike for the ready and courteous way in which numerous inquiries were met with, the access also kindly afforded to printed and other matter accumulated for more than ten years at the Mission, and similar facilities from Mr. A. Goldie, collector, explorer, resident, and trader of ten years' experience, who placed his notes, extracts, and time, &c., freely at my disposal. I gained a great deal of useful material for framing a future policy.

With the Rev. Mr. Lawes, the representative of this branch of the London Missionary Society, I was in close communication, as I have stated, for four and a half months, and learned much of his local experience and views with regard to the natives. For his considerate help on many points of interest and value I owe him sincere acknowledgments.

In September, a few days after the arrival of the "Governor Blackall," a further commission was handed to me by Sir Peter Scratchley, creating me a Deputy Commissioner for the portion of the the Western Pacific included in the Protectorate and the Solomon Islands. This Commission was subsequently recalled, owing to a presumable informality in its preparation. That sent in substitution only takes effect in this Protectorate, the Solomons Islands being excluded.

Commission as  
Deputy Commis-  
sioner for  
Western Pacific.

As

As your Excellency is aware, these commissions are limited to British subjects, and give no authority for dealing with cases in which foreigners—*i.e.*, Germans, Chinese, French escapees, &c., and alien natives, Malays, Polynesians, &c.—are included; yet all these are found on this coast.

Had I adhered, therefore, strictly to my increased but still utterly inadequate legal powers under the Western Pacific commission, much valuable time would have been lost in creating proper impressions of discipline and control in the minds of the natives, and those most intimately associated with them by marriage, *bêche-de-mer* fishing, &c.

According to John Stuart Mill, the "true criteria of good government are order and progress." To effect these objects will doubtless take some little time and trouble in this territory, but they are not impossible with firm and consistent management, and could not possibly be promoted by a policy of "masterly inactivity." Confusion would have arisen in the native mind also, since they were led to expect at the date of the protectorate (two years ago) a more decided influence over their conduct and affairs.

After several conversations with him, I received an assurance privately from the late Special Commissioner that I could count upon his support in the case of action I considered it desirable to take. Where I could do so conveniently, therefore, I encouraged the so-called chiefs to appeal to Government authority, and to regard the Resident here as the proper adviser and arbitrator in all difficulties and disputes.

On the departure of the late Special Commissioner from these waters on the 29th November, last year, I received a special warrant or supplementary commission from him, empowering me "to administer the affairs of British New Guinea" during his absence. I regarded this as conferring the fullest authority which he could delegate to act for the maintenance of law and order, and the promotion of civilisation and improvement in respect of all classes. This warrant is dated only four days before Sir P. H. Scratchley's death, after I had been for six months in the local service under his supervision, and I held it conveyed increased confidence in my conduct and views.

Such were the powers with which I was entrusted. I will now state, as briefly as I can, the chief events in which natives were concerned since my association with the Protectorate.

4. One of the first most valuable steps towards adjusting government relations with our natives was the return by the Queensland Government of more than 400 obtained from the Eastern Archipelago and mainland in 1883 and 1884 for the labour trade in that Colony.

At the time it was decided to return these men, Mr. Deputy Commissioner Romilly suffered from ill-health, and it seemed doubtful whether he could superintend, as an officer of the Protectorate, their return, and the compensation provided for relatives who had died in Queensland. It was held important that such an officer should be identified with the duty in order to increase confidence in local authority and its influence amongst the natives. Sir Peter Scratchley therefore proposed to send me in the s.s. "Victoria" to represent the Protectorate. Your Excellency has seen the late Special Commissioner's despatch and instructions to me on this subject, and as they were subsequently overruled I do not annex copies.

Mr. Romilly, having improved in health by the date of the departure of the "Victoria," undertook to accompany her, and reported upon her cruise on his return to Queensland in July. All papers relative to this voyage were printed, and, I believe, are in your possession.

I have already had the honor to draw your Excellency's attention to the fact that there are several New Guinea natives in Queensland, whose term of service expires shortly; and that there are probably a large number of cases of non-compensation for deceased natives. As this principle of compensation was not only admitted, but put in practice to a great extent, it is likely that aboriginals who have gone without a present, besides losing a relative, will be doubly incensed, and prove a dangerous element in the future, unless they realise that a firm and undeviating control is intended.

From records at command, I find that 648 natives have been recruited for the Queensland labour trade, and 404 returned on the voyage of the "Victoria." Not more than 30 of those remaining will probably be returned finally; thus 194 relatives of deceased islanders became entitled to compensation. The Queensland allowance for this object was exceedingly liberal, from a native point of view, and included the following articles and values, *viz.* :—

	£	s.	d.
1 axe	0	4	7
1 double blanket	0	9	0
12 yards turkey red	0	5	4
12 H.K.Fs'	0	3	3
2 hatchets	0	6	0
1 long knife	0	2	0
1 short do	0	1	6
2 lbs. tobacco	0	3	0
1 Water-proof bag	0	3	0
	£1	17	8

I am unaware of the exact number of the above "bundles of trade," as they were called, which were given away on the cruise, but I feel morally sure from reading the printed reports that not half of 194 were so presented.

It was, I venture to think, an unfortunate omission that all our natives were not returned here at the same time. The Queensland Government had strictly prohibited further "recruiting" in New Guinea and adjacent islands. All recruits from New Guinea were understood to have been regularly obtained in the first instance, and consistently with a fair and humane policy it was decided to replace them in their homes. The mortality, according to the report of the Commissioners, had already been great, and it was likely that considerable further loss by death would occur amongst those left behind. Nor would survivors finally be returned under the same favourable conditions. To return four-fifths of the number and leave one-fifth therefore looks like a failure to complete a public action otherwise most salutary to the native impressions in the Protectorate. I accompanied the s.s. "Victoria" to this place, landing at Port Moresby on the 17th of June last year.

Despatch, Sir P.  
H. Scratchley,

Deputy  
Commissioner,  
10th Sept., 1886.

Notices Queens-  
land Govern-  
ment Gazette,  
1886.

5. A few days after my arrival the Rev. Mr. Lawes called my notice to a case of dispute and assault upon a native of Tatana, a village situated in the upper part of the harbour. The assault was by a Malay, a bêche-de-mer fisher. The latter urged theft of a piece of his boat-fittings, and that the native resisted its return when claimed.

The native explained that he found the piece of wood floating about and took possession, or it might have been lost by the tide. The Malay had been living for some time at the village, being married to one of the women, and he owned the only boat at the village. There was no doubt, therefore, that the native knew thoroughly well that he was appropriating the Malay's property.

I cautioned the native against interfering with anything which he had not bought or which had not been given to him, and I warned the Malay against taking the law into his own hands for the future, but to refer to Government authority.

This is a trifling incident in itself, but it illustrates a class of cases likely to become numerous on the coast. Hitherto petty thefts have been dealt with rather summarily by the wronged individual. Shooting pigs and pulling down native cottages have been the means resorted to by missionary teachers, as well as small traders on the coast, while there are also instances of the rifle being used in this district of Moresby for the same reasons.

6. From the 17th June to 31st October I was a guest at the Mission head-quarters here, and received great kindness and hospitality from the Rev. W. G. Lawes and Mrs. Lawes, and I thus had ample opportunities for studying the relations of this branch of the London Missionary Society with the natives, the class of South Sea Island teachers employed by them, and of forming an estimate of the civilizing and evangelising results alleged to have been achieved at their centre of influence and effort.

I also visited villages within a day's ride of the Mission Station, was present at some of the large hunting parties, and interested myself generally in the habits and customs of our aboriginal population.

At the end of July I accompanied the Rev. J. Chalmers on a trip in a whaleboat with a native crew to the sub-districts of Dora and Kabadi, touching at all the principal intermediate coast villages. I received a distinct impression from this journey—namely, that the influence of the Mission in checking intertribal robberies and feuds, even in their oldest sphere of action, Redscar Bay, has been greatly exaggerated, and that Government intervention was indispensable to effect any real and permanent reform.

The village of Manu Manu in Redscar Bay, at the mouth of Galley Reach, occupies a somewhat important, although most unhealthy, position. It was the first point at which an L.M.S. teacher (of this branch of the Mission) was placed in 1872, or fourteen years ago. Its people formerly owned and occupied another village, gardens, and a coconut grove 4 or 5 miles further to the west. A blood-feud with the neighbouring Kabadians compelled flight, and they squatted on the foul and miserable sandbank where they live nearly surrounded by dense and pestilential mangroves. The advantage in the present position is the water boundary of Galley Reach, which, as the Kabadians have no large canoes, affords security. Separated from their garden ground, which they are afraid to cultivate, they have led a wretched existence for some time past, eked out by thefts from the remnant of the Dora tribe next to them inland.

The latter are reduced to a few survivors, chiefly women and children, after a joint massacre a few years ago by the Manu Manu people and a number of Koitapuans, who tenant a strip of the shores to the eastward along Caution Bay.

We took one of the so-called chiefs, "Daira," from Manu Manu to Kabadi with us, and Mr. Chalmers did his best to "patch up a peace." Although, however, the Kabadians professed themselves quite ready for the restoration of the former good understanding, the Manu Manuans have never to this date felt enough confidence in them to return to their original position at Morabi.

I spent a day in walking through the Kabadi country, visiting the different villages and making acquaintance with their leading men or chiefs. Their gardens are fertile and the soil very easily tilled, being a rich friable brown loam. Amongst their banana plantations they seem to cultivate crotons and coleuses, etc. They possess a large breed of pigs, which seemed numerous, but are an inert group of natives. Complaints are made that they are too lazy to reap or sell the surplus produce from their prolific gardens, and from the number I saw lounging in hammocks hung below their huts I have no doubt the statements are true.

In the sub-district of Dora the people complained of the rifling of their gardens by Koitapuans of a coast village of Lea Lea, and we promised to touch there and make inquiries on our return journey. This was accordingly done a few days later, and a vigorous speech made to the Lea Leans by Mr. Chalmers, who speaks the Motuan language (understood for some distance on both sides of Port Moresby) with considerable fluency. It was explained to them that I was a Britani chief sent here to protect their rights, but not to allow thefts and murders, and that they would be punished if they continued to molest the Dorans. These unfortunates would have been exterminated within the last three or four years were it not that Mr. C. H. Page and his timber-cutting party of South Sea Islanders have ensured them protection.

On this expedition I made presents to the chiefs I met, and visited all the villages I could in the time at disposal.

On the 19th August, after my return to Port Moresby, the old chief Gaeta from Lea Lea came to me to explain away the complaints as to his people by Sisikao the chief of the Dorans. I promised, therefore, if Sisikao would forget what passed I would do the same on this occasion.

On the 24th August Daniel Rowan appeared before me to complain of an audacious robbery by natives of Contance Island, about 76 miles east of Port Moresby, where he had been collecting bêche-de-mer. A dispute arose as to the payment for a few fish brought by them for sale, and they then pinioned him and robbed him of a considerable quantity of "trade" on the spot. It is not unlikely that he would have been killed as well, but a Kerepunu woman who was associated with him vociferously warned them of "Man-o'-war." I took a written statement from the two witnesses and referred them to the late Special Commissioner, as I had no means at my command of dealing with the case.

28th August.—His Excellency the late Special Commissioner arrived in Port Moresby.

On the 1st September, Sir P. H. Scratchley received chiefs and leading men of local villages, made them each a small present, and advised them to refer to himself or myself in case of any difficulty. The Rev. Mr. Lawes acted as interpreter.

Assistant  
Deputy  
Commissioner.  
November, 1886.

8th September.—Agreeably to directions from the late Special Commissioner, conveyed in a minute of the 3rd instant, I accompanied Mr. George Hunter and Rualoka, the London Missionary Society's teacher—who has resided here since 1873, and is thoroughly familiar with the native language and customs—to settle the purchase of a site for a Government residence. As I have lately reported separately and fully on the acquisition of lands by the Government to date, it is not necessary to enlarge on this subject.

Feud between  
Kaile and Garia.

20th September.—The local Motuan chief, Boi Vagi, waited on the Special Commissioner with Mr. R. Hunter, and described to him the state of hostility existing between the coast village of Kaile and the hill village of Garia. Kaile village is built on piles on the fringing reef, and is thus tolerably well defended from attack by inland tribes unprovided with canoes, except at "low-water springs." The Kaile women, however, are obliged to resort to the mainland daily for supplies of fresh water and vegetables from gardens on the banks of a creek. In consequence of a former massacre in which Kaile was much, if not entirely, to blame, the Garia people had been stirred up to revenge, and were known to lurk about in the bush to kill any weak party or stragglers. Accordingly, about the 18th or 19th of August, three women of Kaile were surprised and speared in their gardens by Garia men. This, together with threats from Garia chiefs, received through an intermediate friendly village, Mangawarra, created great alarm, and the women would not visit their gardens without a large party of men or the L.M.S. teacher stationed at Kaile accompanying them with his gun. The Mission teacher resides in Garia village. The latter is on a commanding and rugged eminence, partly covered by forest growth and difficult of access.

This harassing attitude continued, and during September the Garia men again surprised a party from Kaile; but the latter, with the assistance of a friendly village, Vaboori, turned on the attacking party and killed them—six in all. The successful natives savagely mutilated the bodies, and the Garians were more incensed than ever. Their object has been for months past (according to New Guinea custom) to "get even"—*i.e.*, to obtain as many lives as have been taken by the Kaileans. It does not matter whose they are, and women and children are preferred because they are less able to defend themselves. A more cowardly, mean, and treacherous rascal than a local native intent on revenge, it would be hard, I believe, to find.

The danger to the weaker villages of Kaile and Vaboori claimed Sir Peter Scratchley's attention. The Garians had declared through Mangawarra that they would descend to the coast in strong force, kill everyone in Kaile, and burn down the village. His Excellency then sent a cutter, with Mr. R. Hunter and the local chief Boi Vagi on board, and left himself for Kaile on the 21st September. On the 23rd the cutter returned with Mr. Hunter, but Sir Peter continued his voyage to the eastward. He stopped at Kappa Kappa, and through Mission teachers of Kappa Kappa and Rigo endeavoured to impress upon the Garians the necessity for avoiding further bloodshed. They were very sullen, however. Only one minor chief came to the "palaver," and they took a peace offering, or "maino," virtually under protest.

By an unfortunate omission, on this occasion, the Garians, although warned off Kaile, were not cautioned as to Vaboori. On this flimsy pretext, therefore, a few days after Sir Peter had left Kappa Kappa, the Vaboorians were attacked, and, according to Mr. Hunter's subsequent report, "I found the village completely deserted, but the women, girls, and boys lately massacred were laid out on platforms about four or five feet high. I counted them—two middle-aged women, six young girls, and two boys between six and seven years old. I also saw the remains of twenty houses burned down."

On the 20th October the news of this massacre reached me, and on the following day I despatched Mr. Robert Hunter to the village of Tupusclei, near to Vaboori, to make inquiries and exercise any useful influence he could in restraining further bloodshed.

From his inquiries it seemed likely that Mr. George Hunter, who had had more experience among the inland people, might produce an effect by visiting the large hill village of Rigo, and he accordingly received instructions from me to proceed there on the 25th October.

The efforts of the Messrs. Hunter at this time were, on the whole, satisfactory; but in December the Garia people recommenced threats, and I was compelled to send Mr. R. Hunter again to Kaile. The Garians at this time wished to wipe out the rest of the Vaboori villagers, and were making preparations to do so.

Mr. Hunter once more succeeded in quieting the hostile feeling for the time, and frequently visited Kaile and the neighbouring villages, by my direction, afterwards. The Garia people still menaced Kaile, however. The latter almost ceased to cultivate their gardens, and were on the verge of starvation. On the 14th of June I had a deputation of chiefs and natives from Kaile asking for protection in cultivating their plantations, as they were all very hungry. I told them that I would once more warn the Garia people, and that they could go on making their gardens. If they were interfered with they were to let me know directly. The party left me then quite satisfied.

Matters went on without any interruption to mention, until Mr. G. Hunter reported on the 14th October that the Garia people had been down to the Kaile limits and returned to their village for a large feast. After this, they intended to descend in force, rob the gardens, kill the villagers, and burn down the village.

[Mr. Musgrave handed this unfinished report to me at Port Moresby on the 2nd December. Up to date I have not received the concluding portion.—J.D. 31st December, 1886.]

#### APPENDIX E.

The Colonial Office to Edward Schubert, Esquire.

Sir,

Dowling-street, 30 October, 1875.

I am directed by the Earl of Carnarvon to acknowledge the receipt of your letter of the 9th instant, transmitting the prospectus of a proposed association, to be styled "The New Guinea Colonizing Association," with a draft of proposed rules and regulations for the guidance of an expeditionary force, and requesting that this project may receive the moral support of Her Majesty's Government, and such legal recognition as the promoters conceive could be given to it by the enrolment of the expeditionary force under the Volunteer Act, and the appointment of certain members of it as Justices of the Peace for the Island of New Guinea.

2. His Lordship has attentively examined the scheme laid before him by you, and regrets that he is obliged to consider it one to which he can in no way give the approval which you seek. Even if the information at present possessed by any persons in this country were such as to afford any assurance, or even any confident expectation, that an expedition such as is projected would not result in commercial failure, in loss of health and life to its members, and in serious disturbances among the native tribes of the island (the probability of any of which consequences would impose a heavy responsibility on a Government which would lend it the weight of an official recommendation), it would be Lord Carnarvon's imperative duty to object very strongly to the leading features of the proposal, on public and constitutional grounds.

3. Even if New Guinea were a part of the Queen's dominions, it would be impossible to entertain the suggestion that a number of persons, brought together by the love of adventure or the desire of profit, should indiscriminately, and without a searching scrutiny into the personal fitness of each, be enrolled or commissioned as members of a military or quasi-military force, whose services within this island could be accepted by, and whose proceedings would be invested with the high sanction of Her Majesty. For service in an unknown country, abounding, as far as has been ascertained, in the gravest physical difficulties, and inhabited by a numerous, powerful, and warlike population, a force would need to be very differently constituted.

4. So, also, with regard to the appointment of magistrates, Her Majesty's Government could on no account accept, as suitable persons to discharge the duties of magistrate in any part of the Queen's Dominions, the unknown conditions of which demand experience and special attainments, such persons as a company might select as its leaders, chaplains, or medical officers.

5. His Lordship directs me to add that he would be glad if, consistently with his duty, he could conclude with this expression of his inability to give to the association that support and recognition which are desired, and leave the members of it to undertake, on their own responsibility, the risks of an enterprise which they appear to think likely to prove remunerative. The position, however, in which Her Majesty's Government now stand with regard to New Guinea is not such as to leave them free to sanction, even tacitly, the acquisition of land within the island by British subject.

6. As you are no doubt aware, the Governments of the Australian Colonies have addressed to Her Majesty's Government strong and formal representations in favour of the annexation of New Guinea by this country. Those representations are now being carefully considered, and, pending such consideration, it is not open to any unauthorized and independent association of Englishmen to take possession of, or to purport to acquire from the savages of the island that land with respect to the acquisition of which, on behalf of her subjects generally, the Queen is now being advised.

7. In the prospectus it is suggested that the association should purchase land from the natives, but in the rules and regulations there is no mention of purchase; the not unreasonable inference from which seems to be that it is now proposed to take by force the very large tracts of land required in order to make a grant of 4 (in some cases 5) square miles to each person joining the expedition. There is no evidence whatever respecting the power of the natives to enter into contracts which would be intelligible to them or binding upon them, or of their willingness to allow private settlers to occupy their country. But if there were no objections from the native point of view to so extensive an appropriation of territory, it would be impossible that any such acquisitions, or ostensible acquisitions, of land could be sanctioned and confirmed in the event of the territory hereafter becoming British. It is clear that, without the funds arising from the sale and lease of lands, it would be impossible to provide for the government of the country; and any persons who may now settle in the country, knowing that Her Majesty's Government is considering the question of annexing it, must distinctly understand that no acquisitions of land made previous to a decision on this subject can be recognised to the prejudice of the Crown.

8. With reference to the concluding paragraph of your letter, I am desired by Lord Carnarvon to point out to you that although, as has already been observed, her Majesty's Government could not permit the exercise of magisterial functions by persons connected with the expedition, there exists, under the provisions of "The Pacific Islanders Protection Act, 1875," a sufficient means of preventing and punishing abuses or outrages committed by British subjects upon the natives of New Guinea.

I am, &c.,

W. R. MALCOLM.

#### APPENDIX F.

##### No. 1.

Dear Mr. Lawes,

Residency, Port Morseby, 7 July, 1886.

It is desirable, I think, that I should state to you in writing some of the points of our conversation yesterday afternoon, in order that we may the more clearly understand the aspects in which we mutually regard the acquisition of land from the New Guinea natives.

2. Finding it necessary to set apart a portion of ground for the interment of the dead, I proceeded in the company of yourself, Mr. Musgrave, and Dr. Clarkson, to select a suitable site. We chose an area estimated at about 4 acres, in a valley a short distance from the Mission Station. The next step will be to ascertain the owners of the ground. We shall have no difficulty, I presume, in doing this. I propose then to offer them a fair price in accordance with prices previously given. It is possible that the owners may refuse to sell, as has been done in the case of some portions of land in the vicinity of the Government buildings. In that event, the land being required for public purposes, I propose to nominate yourself and Mr. Goldie as assessors of its value; to pay that value, when adjudicated, to the owners; and to occupy the ground by enclosing it with a substantial fence. Regulations will then be issued for the interment of the dead. The practice of the natives in this respect is so defective, and so pregnant with danger to all who live in the vicinity of the village, that I am anxious as soon as possible to effect a change in this respect.

3. In reference to the further acquisition of land for the purpose of settlement, and in accordance with my instructions, it will be necessary that I should, on behalf of Her Majesty's Government in this Protectorate, acquire land from time to time from the natives, and in doing so I shall hope to make the most careful provision for their interests in the future. I feel bound, however, to add that, having due regard to the interests of Her Majesty's subjects who may settle in New Guinea when the contemplated sovereignty is proclaimed, it will be necessary to survey and set apart considerable areas of land, the acquisition of such land from the natives being made a matter either of treaty or purchase, or by such other means as may be approved of by the representatives of Her Majesty's authority.

4. It is the more necessary that I should make this statement to you, because, if I am not mistaken, I gather from the expressions of your opinion to me yesterday that you would regard any attempt made in the form of a settlement by the survey and sale of land as the first step towards an infraction of the proclamation made by Commodore Erskine on the 6th November, 1884. I cannot regard it as such, and it is my duty to inform you accordingly.

I am, &amp;c.,

JOHN DOUGLAS.

No. 2.

Dear Mr. Douglas,

Mission House, 7 July, 1886.

I beg to acknowledge the receipt of your letter of this morning *re* land purchases, and thank you for so kindly stating to me your views on the subject. The accompanying letter I had written previous to the receipt of yours; and as it treats only on the subject at issue I take the liberty of sending it, accompanied by a few words of more direct reply to your courteous letter.

The purchase of the land selected for a cemetery would, I think, be justified even if the owners object; because it is directly for the benefit of the natives, and not to be transferred to anyone else. I do, however, think that to compel a native to sell land which he objects to part with would be a direct contravention of the terms on which the Protectorate was proclaimed and accepted by the people on the 6th November, 1884.

I was the translator of the documents into the language, and the interpreter in this and several other dialects. Every line was gone over by the Commodore and myself with Mr. Chalmers, that we might explain it thoroughly to the people. No intimation was given either that Her Majesty would require them to part with large tracts of land to the Government, nor yet that a large influx of white men was likely to spread over the land. On the contrary, they were led to expect that the Protectorate would save them from these. If the case had been put to them as it now appears, I don't think the natives would have accepted the Protectorate.

You will remember, sir, the chiefs this morning said the people were afraid of a number of white men coming.

I am sorry that we should differ in our views on this subject. Practically, I do not think we are far apart. I need not assure your Excellency that I do not wish to see the white man excluded, even if it were possible. I am only anxious that the confidence of the natives should not be shaken, and that the inevitable contact of the races should be for their mutual advantage. In this I know we are at one.

I am, &amp;c.,

W. G. LAWES.

No. 3.

Mission House, Port Moresby, 7 July, 1886.

Sir,

In the conversation which I had with your Excellency yesterday on the land question, I fear I may not have made sufficiently clear to you one or two points to which I attach great importance. The scheme, as I understand it, for the acquisition of land sufficient for the demands of the large number expected, implies compulsory purchase where it may be thought necessary, always reserving a certain area for the indigenes of the soil. For if the acquisition of the land is so essential, I cannot suppose that the plans of the Government would be thwarted by the unwillingness of a few natives to sell their lands. If the proclamation of sovereignty will involve such acquisition of land, then it seems to me that the Government will begin by breaking faith with the people, and the assurance of Her Majesty will be of no more value than the word of a "beach-comber."

The natives were solemnly told, with all the emphasis which a grand naval demonstration could give to the assurance, "Your lands will be secured to you." The whole tenor, again, of both proclamation and address, was to impress upon the natives the belief that no large influx of foreigners would be permitted, and only those allowed to reside in the country for whose personal good behaviour Her Majesty would be responsible.

If thousands, or even hundreds, come to New Guinea, what test can any Government employ to distinguish between the evil and well disposed? "Evil-disposed men will not be allowed to occupy your land" (Commodore's address). If it was the intention of the Imperial Government to throw open the country for settlement, I think the people should have been told of that intention, that they might have had the opportunity of protesting and objecting.

A New Guinean may, in our children's time, complain of deceit and treachery and say, "The first official document printed in our language bore the Queen's name, and assured us that our lands would be secured to us, and before the paper had rotted Her Majesty's Government acquired our lands from us."

I fail to see how the Australian Colonies can utter one word of complaint, when combined Australia, from the Convention in Sydney, advised the Imperial Government that no acquisition of land should be permitted except through the Crown; then *only for missionary or trading purposes*. I go no further, sir, than the Australian Convention went, and only recommend that the resolution be adhered to.

I had the honour of submitting a letter expressing my views on this subject to the late Sir Peter Scratchley, who expressed his cordial approval, but feared they would be very unpalatable to Australia. The letter appeared in the *Times* of 12th February last. If your Excellency has not seen it, and would like to do so, I shall be happy to send it up for your perusal.

In conclusion may I say that I quite believe the commingling of the two races to be possible, and for their mutual advantage, but it must be gradual and by degrees: a stream will fertilise, but a flood will devastate.

I have, &amp;c.,

W. G. LAWES.

To the Honorable John Douglas, C.M.G.,

Special Commissioner for British New Guinea.

No. 4.

Dear Mr. Lawes,

Residency, Port Moresby, 8 July, 1886.

I have received your letters of the 7th instant, and have to thank you for so clearly stating your case.

The matter is one of such importance that I shall certainly submit the correspondence to Her Majesty's Secretary of State for the Colonies.

I have, &amp;c.,

JOHN DOUGLAS.

No. 5.

The Special Commissioner to Mr. Assistant Deputy Commissioner Musgrave.

8 July, 1886.

MR. MUSGRAVE will please to state his views on Mr. Lawes's letters, especially in connection with the existing tribal relationships in which he has lately acquired some experience.

J. DOUGLAS.

No.

Memo. respecting Letters from Rev. W. G. Lawes on 7th July, 1886.

Government Bungalow, 10 July, 1886.

I HAVE the honor to state that I have read the above-mentioned letters with close attention, and now return them to your Excellency.

It is quite impossible for me, however, to accept the interpretation of Mr. Lawes of the views or position assumed by the Imperial Government, or of the pledges given by its representatives at the time of the proclamation of the Protectorate in 1884.

All official documents relative to the occasion are, so far as I am aware, published in the Parliamentary Papers noted in the margin, and I can find no remarks recorded from Commodore Erskine or his deputies which even implied that this country (*i.e.*, British New Guinea) should not become a field for settlement in the future, nor can I discover any hint, on the part of the Imperial Government or its representatives, of the idea that the territory should be held as an almost unbroken native reserve upon which only missionaries and traders are to be allowed a footing—this state of things apparently to last for an indefinite period. The Imperial Government alone had power in regard to the affairs of British New Guinea, and I cannot find any trace of such a policy, either implied or expressed, before the date of the proclamation or afterwards. If Mr. Lawes or Mr. Chalmers conveyed such an impression to the coast natives of the S.E. Peninsula\* of British New Guinea, it seems to me, on existing evidence, that they were neither officially authorised to do so nor in any way justified in so doing. Whatever personal reluctance to settlement of the Protectorate may be felt by Mr. Lawes and Mr. Chalmers, they had no right, if they have done so, to use their position of trust as interpreters to give a stamp of official approval to their individual views, however intense these may be and are believed to be. Mr. Lawes writes that “no intimation was given either that Her Majesty would require them (the natives) to part with large tracts of land to the Government, nor yet that a large influx of white men was likely to spread over the land.” This, although negative evidence, is very likely to be correct; on the other hand, I cannot detect that any intimation was given by the Commodore or his deputies that lands *might* not be so wanted, nor that a large influx of white men *might* not be attracted hither by gold or other objects. No such promises could have been reasonably given by any Government. They appear also in direct opposition to the original line of policy laid down in a letter from the Colonial Office to which I have previously had occasion to invite your Excellency’s attention. There can be no doubt, from this important document, of the original views of Her Majesty’s Government, which contemplate the acquisition from the natives and the sale and lease of local lands by the local Administration. The paragraph to which I refer is as follows:—

“There is no evidence whatever of the power of the natives to enter into contracts which would be intelligible to them or binding upon them, or of their willingness to allow private settlers to occupy their country. But if there were no objections from the native point of view to so extensive an appropriation of territory, it would be impossible that any acquisitions, or ostensible acquisitions, of land could be sanctioned and confirmed in the event of the territory hereafter becoming British. It is clear that without the funds arising from the sale and lease of lands it would be impossible to provide for the government of the country; and any persons who may now settle in the country, knowing that Her Majesty’s Government is considering the question of annexing it, must distinctly understand that no acquisition of land made previous to a decision on this subject can be recognised to the prejudice of the Crown.”

I am unaware of any departure from the policy proposed in the despatch to Mr. Schubert, while recent communications sanction the belief that the inevitable course of settlement which has begun to take place here is expected by Her Majesty’s Government, and is about to be arranged for accordingly on a judicious and humane basis for all classes. As to the pledge quoted by Mr. Lawes—“Your lands shall be secured to you”—unless it be meaningless, it must involve the adoption of some system by which quiet possession shall be ensured to the natives under authority. This in turn necessarily involves the exercise of discretionary power on the part of that authority in organising such a mode and in dealing generally with territorial questions. I need not dwell on the insecurity of land tenure and of the products of the soil among the aborigines themselves of this territory; constantly recurring intertribal feuds disturb the limits of districts, in some cases depopulating them altogether. Besides such lawless acquisitions of the land by native tribes, there is an intermediate harassing state of affairs where a considerable proportion of growing crops are stolen from time to time by stronger neighbours. Thefts of this kind are far from infrequent even here in Port Moresby, among the Motuan people, within the longest settled sphere of Mission influence, and under the wing of the Mission head-quarters.

There are known to be large tracts and spaces of country also unoccupied, and apparently unclaimed by any indigenous population. Under these circumstances it is plain that the phrase, “Your lands will be secured to you,” cannot possibly imply the rigid preservation of agrarian discord and pillage in one part of the territory, and the exclusion of settlers from waste portions of the other.

The local Government will therefore have to interfere, as in all colonies and communities under British rule, subject to the approval of the Colonial Office, to determine and adjust the territorial relations existing between various tribes, in order that certain lands and their products may be secured to them in their true sense. And it is equally impossible to believe that a paternal Government could suffer the plans for the general good to be thwarted through the prejudice and obstinacy of a tribe or some of its members, influenced very possibly by a “beach-comber” who has married one of their women, or by any other equally obstructive person who has gained undue ascendancy over them. The fact is that all the public actions and expressions of those charged with establishing the Protectorate show that they simply and solely intended to guard the aborigines against unscrupulous adventurers. In this connection Commodore Erskine left the Regulation 4—“No settlement or acquisition of land is on any account to be permitted.” Why does Mr. Lawes not quote this statement? Purely, I believe, because he is aware that it could not possibly be construed as applying to a local Government in any literal sense. If he wishes, however, to treat Regulation No. 4 in this inflexible spirit, it would be satisfactory to know whether the Mission have been careful, in obtaining their stores since November, 1884, to abide by the stringent Regulations Nos. 2 and 3, in respect of the landing of spirituous liquors, firearms, gunpowder, &c. It is noteworthy that the Rev. Mr. McFarlane holds diametrically opposite views on the subject of settlement to those of Mr. Lawes, and his opinion is entitled to more weight. He founded the Mission in British New Guinea, and has resided here considerably longer. His knowledge of the portions of Eastern New Guinea and the islands is co-extensive with that of Mr. Lawes, while he has travelled much

Parliamentary Papers C. 4273. Feb., 1885.

\* No. notification at all, I believe, was made to the natives of the N.E. Coast, in the S.E. Islands, or west of the Aird River, as to the Protectorate or directly to any inland tribes.

in

Extracts.  
Lecture of Rev.  
Mr. McFarlane

in the western division, with which part of the territory Mr. Lawes is unfamiliar. In a lecture given in Brisbane in January last, prior to his final retirement from mission work, he summarises his experience gained during 15 years, and encourages strongly the idea of settlement and the development of local natural resources. I append copies of some interesting extracts from the lecture as reported in the *Brisbane Courier* of the 30th January last. The expression, "He would like to see the country thrown open to-morrow," is remarkable, as signifying the abolition of all checks upon the indiscriminate intercourse between aliens and indigenes, and appears to discredit the system of permits to aliens, which the late Special Commissioner introduced as a wise temporary measure of precaution in the interests of both foreigners and aborigines.

Finally, in respect of the acquisition of lands in the district of Port Moresby, to which this correspondence more particularly applies. As the friendly dictation or compulsion of a paternal Government towards its "wards of the Crown" ought not easily to be confounded with the callous and selfish greed and action of the "evil-disposed persons" mentioned in the Queen's proclamation, I cannot see the fairness or the force of the objections of Mr. Lawes to what he defines as "compulsory sale," more especially as he knows that other lands of equal value are in the hands of the local Government for substitution, in lieu of a usual payment in "trade," should the native landowners, whose property is in question, express a preference in the matter. What Mr. Lawes describes as a "compulsory sale" is precisely what it is now proposed to do in Ireland, in order to set agrarian matters on a stable and equitable basis. Sacrifice of individual interests on a reasonably assessed value for public purposes and the general good is an admitted principle, as I understand it, in all forms of administration, and I see no hardship in applying it to British New Guinea, either in the case of European immigrants or a barbarous population who could not understand or forecast the advantages they must necessarily derive from contact with higher grades of civilisation and various public improvements. Mr. Lawes, indeed, admits the principle in the case of land urgently required for a cemetery, nor would he probably urge a serious protest against a road being provided to that point, whether or not the natives suffered some temporary dissatisfaction on the subject.

I have dealt thus at length with the subject, because I desire that your Excellency should not think I have avoided any difficulty which presents itself. This Protectorate, I need hardly say, is no exceptional point of the globe worthy to be jealously guarded in its primitive state. It is no scene where an innocent and united people dwell in condition of Arcadian simplicity and peace and plenty, which should be sympathised with and respected. I believe the natives to be susceptible of improvement, but they have all the vices and customs of savages, and will require an extraordinary union of firmness and consideration in their management. Perpetual murders and intertribal butcheries of the most revolting nature, arising from frivolous or superstitious pretences, are of almost daily occurrence within the Protectorate. Were Mr. Lawes and his teachers all disarmed to-morrow, and Her Majesty's ships withdrawn from the coast for a year or two, it is hardly doubtful, to my mind, what the fate of the Mission would be, even after its 15 years of association with the coast tribes at various points.

A. MUSGRAVE, Junr.,  
Assistant Deputy Commissioner.

Extracts from Lecture by the Rev. S. McFarlane, 29th January, 1886.

\* \* \* \* \*  
"He would tell them something that they did not write about at the time, and that was that the missionaries discovered gold there\* in 1875. He was not such a fool as to write about the matter, or there would have been a rush of people there, many of whom would probably have lost their lives, and the gold-field might have been 500 miles distant. He knew a place where a nugget had been picked up on the beach, but he did not know where it came from. Gold was the most widely distributed of all metals, and the fact of their finding grains of gold did not prove that the field from which it came was within hundreds of miles. \* \* \* \* \*

\* On the Maicassa  
River

"If they wanted land they would have to arrange with the natives for it, and in the vicinity of Port Moresby they would frequently find as many as twenty different natives laying claim to one piece of land. He predicted that, as far as the Peninsula itself was concerned, the land question would in the future prove to be a difficult one. *In the interior, however, they might take up as much land as they liked.* Speaking of the question of the government of New Guinea, he said it could even now be made self-supporting. They had for products pearl-shell, bêche-de-mer, and cedar, and a royalty on these would recoup the cost of governing the island. \* \* \* \* \*

"As for produce, there was such land as he had described. They had about fifty teachers all along the coast, and these had informed him of the large quantities of cedar grown in that portion of the island. He would not be much surprised to find that if gold was ever discovered in New Guinea it would be on the Gulf. There was in that vicinity a spot, about two days' journey from Katou, which had never yet been visited by white men, in which it was possible there might be gold. There was no doubt plenty of mineral wealth in New Guinea, but apart from that there was no doubt the Government could be supported by revenue in the manner mentioned. \* \* \* \* \*

"Mr. McFarlane, in returning thanks, said there was only one thing he could add. There was a feeling abroad that the missionaries would like to keep the island and its belongings to themselves, but such was not the case. He would like to see New Guinea thrown open to-morrow, but he would make it hot for the murderers, black or white, if he were Governor of the country." \* \* \* \* \*  
—From *Brisbane Courier*, 30th January, 1886.

## APPENDIX G.

### No. 1.

Dear Mr. Lawes,

"Governor Cairns," Hall Sound, 3 August, 1886.

We picked up Father Vergus on board a small lugger, on his way from Yule Island to Port Moresby, in order to see me. He returned with me to Yule Island, which I visited yesterday, and his intention is to go on to Port Moresby in order to see you, and in order to come to some understanding with you as to the respective spheres of work which it may be found convenient to adopt as regards himself and yourself as representing, respectively, the mission of the Order of the Sacred Heart and the London Missionary Society.

In this I hope that he will be successful, as it is manifestly undesirable that you should both occupy the same ground, and thus come into unnecessary rivalry where there is such a wide scope for usefulness in humanising and Christianising the natives.

A wholesome rule to adopt would be that the Catholic and Protestant Missions should occupy stations not too closely approximate to one another.

As regards Yule Island, I understand the case to stand thus:—The London Missionary Society undoubtedly occupied Yule Island first; they, however, abandoned it, and formed stations on the mainland. There was no station on the island, and there had been no station on it for some years—four at least, I am informed—when it was occupied on behalf of the Catholic Mission in June, 1885, by Father Vergus and two lay brothers. They were stricken with fever, and in August following they returned to Thursday Island in order to recruit. They handed over the buildings they had erected to the natives, telling them to take care of them during their temporary absence. They returned in January of this year, and they then found that a teacher of the London Missionary Society had been placed on the island. Since then they have erected some buildings, and a house is in course of erection for your teacher, though I understand that he is still resident on the mainland. This, in broad outline, is the present state of affairs.

There can be no doubt that there was, and that there is, a *bonâ fide* intention to occupy the island for mission purposes by the Catholic order, and I cannot but think that it had, for such purposes, been abandoned by the London Missionary Society.

Under such circumstances it seems to me to be a matter of regret that it should now be occupied by the London Missionary Society.

Could you not come to some understanding with one another that you should not occupy stations in too close proximity to one another? And could not I help you to arrive at such a conclusion? Where there is such a wide field there certainly ought not to be any great difficulty in coming to some friendly conclusion so as to avoid the possible contingency of unprofitable rivalry in the winning over of these wild creatures of nature to the gracious influences which you both seek to impart.

I have no more doubt of the genuine desire of the Catholic Mission to do this than I have that it is equally the aim of your great Society. You are both equally engaged in the same noble endeavour, and I should be loath indeed to suppose that there should be any unworthy rivalry, or indeed any waste of strength in bringing to bear the principles of Christianity on the benighted race which occupies this magnificent country.

Protestants and Catholics alike are fighting under the same banner. They are both of them willing to lay down their lives in the same cause, and I am extremely anxious that, so far as my influence is concerned, it should be exercised in the direction of securing a good understanding between yourself as representing the London Missionary Society, and Father Vergus as representing the mission of the Order of the Sacred Heart. The shores of New Guinea ought, I feel, to be as open to them as they are to you.

There have sometimes, in matters of this kind, been contentions, as we know, which did not redound to the credit of those most intimately concerned. It will be my duty, in the position which I at present occupy, to see that no occasion for unnecessary differences should arise, and it is in this hope that I now address you. I have requested Mr. Musgrave to call on you, and to advance by every means in his power the friendly understanding which I hope will be arrived at.

The Rev. W. G. Lawes.

I am, &c.,

JOHN DOUGLAS.

No. 2.

Dear Mr. Douglas,

Port Moresby, 6 August, 1886.

I thank you for your letter of the 3rd, brought by the Rev. Father Verjus, and delivered to me yesterday by Mr. Musgrave. It is a very clear expression of the views which I and my colleagues hold respecting the relations of the two missions. There is not a sentiment in it at variance with my own ideas on the subject. The rule you suggest I accept cordially without any hesitation; it is wise and just, and the only one that will prevent complications and waste of strength.

But a rule of this kind to be effective must be accepted by both parties. In the very friendly conference I had to-day with Father Verjus, I found that their orders from Rome override every rule. I contended that their occupation of Yule Island was a thorough infringement of the rule you suggest for our guidance; that it was much too close to our station at Delena; that the people being one and the same, speaking the same language, coming and going constantly, living sometimes at Delena and sometimes at Yule Island, it was like occupying part of the same village; and that wherever such close proximity exists there is a danger of the evils you deprecate. To this the Father replied that their orders from Rome to occupy Yule Island were definite and explicit, and that they must under any circumstances obey them. That being the case, discussion is useless, and no rule, however good and wise, can be binding. I am quite sure no one who is acquainted with the history of the case can question the fact that the R.C. Station, just opposite Henere's house at Delena, is far too close for peace and comfort.

But while they state the impossibility of even considering the question of removal from Yule, they ask us to remove our teacher from Yule Island.

I think you are aware, sir, that the directors of our Society leave the details of work and the entire management of the Mission to the resident missionaries, who form a committee. The directors do not impose upon us any orders or instructions that may fetter us in the slightest degree. But at the present time I am quite alone, and I could not take upon myself the responsibility of such an important step without first consulting my colleague, who is in England, and the directors of our Society.

At the same time the request seems to me unfair and unreasonable. We do not consider that Yule Island has been abandoned by our Mission. The information you have received respecting the history of our connection with Yule Island is quite correct, but not quite complete. Will you allow me, sir, to supply the missing link?

After the removal of our teachers in 1876, we had no means of re-occupying it until 1882. In 1881, my colleague, Mr. Chalmers, visited the whole of that district to select sites for houses for teachers who were expected early in 1882. He found Yule Island was deserted by the people; that the chief, Lavao, and many of the people had gone to live at Delena. He put up the teacher's house there, and a few months later Mr. Chalmers, Mrs. Lawes, and myself went to Delena and stayed some time. We visited Yule Island, but with the exception of one old man named Rabiei and his family it was uninhabited.

uninhabited. In 1882, Henere came and we placed him at Delena. He was the Yule Island teacher, and would have been placed there if there had been any people left to work among. Rabiei was hurt that they should be neglected. He had been very kind to the first teachers. We promised him that when the people came back to Yule he should have a teacher. I have never been to Delena since, but the old man has come across to know when he was to have a teacher. The island remained uninhabited until the end of 1884 or early in 1885, when the people began to come back to the island. In March, 1885, I wrote on behalf of the Mission for the teacher who is now appointed to Yule, and some time in the course of that year the wood was cut for the teacher's house. It was in fulfilment of an oft-repeated *bona fide* promise. The people gladly built the house, and when I took Ratu the other day they received him most cordially. They told me that they had not quite finished the house, because they were afraid we should deceive them and not keep our promise.

We look upon Yule Island and Delena as being most intimately connected. The chief and owner of the island, whose name it bears, is one of our people, a baptised Christian. The majority of the people at Delena may return to Yule Island at any time. The connection is much closer than between Jane Island, here in Fairfax Harbour, and the village of Port Moresby.

Our Roman Catholic friends at Yule are building their house on our piles; they owe the safety and peacefulness of their lives to our Mission, which Father Verjus frankly admitted. I can but think that if Father Navarre had been acquainted with all the facts of the case his sense of honor would have prevented his occupying Yule Island until he had represented the matter to the authorities at Rome. I expressed to Father Verjus my regret that the interview which he has sought now was not held before they occupied Yule Island.

We recognise fully the right of the Roman Catholic brethren to reside on Yule Island if they deem it honorable and right, and should not think, sir, of appealing to you on the subject or making any complaint whatever.

Pending an answer from England on the subject, I do not think there is any fear of complication. I have given the strictest injunctions to the teachers to avoid everything that may be a cause of offence, and the relations between myself and Father Verjus are quite friendly. Thanking you for the interest you have taken in the matter, and for the suggestions so kindly given.

The Honorable J. Douglas, C.M.G., Thursday Island.

I am, &c.,  
W. G. LAWES.

---

#### APPENDIX H.

##### No. 1.—FORM OF CONDITIONS.

###### *British New Guinea.*

Memorandum of Conditions under which permission is granted to \_\_\_\_\_ to proceed to New Guinea for the purpose of \_\_\_\_\_

1. I undertake faithfully to inform Her Majesty's Special Commissioner, or such public officer as may be specified by him, as to my proceedings at all times within the limits of British New Guinea; to conduct my operations entirely at my own risk, and on the understanding that neither Her Majesty's Special Commissioner nor any public officer of British New Guinea assumes any responsibility whatever, except in the case of official intervention which may be considered necessary.

2. I agree to abide by "*The Arms Regulations Act of 1884*," and all other Regulations now in force in the Protected Territory of British New Guinea, as well as all such Regulations as may be passed from time to time, and to pay to Her Majesty's Special Commissioner such license fees, duties, &c., as may hereafter be levied from time to time within the limits of British New Guinea.

This permission is only to apply to the above stated object, viz. :—

and subject to the fair treatment and payment of the natives in respect to the same.

---

##### No. 2.—FORM OF PERMIT.

###### *British New Guinea.*

Permission is herewith granted to \_\_\_\_\_ to \_\_\_\_\_ in the District of \_\_\_\_\_, in British New Guinea, in accordance with the conditions agreed to by him.

Her Majesty's Special Commissioner reserves to himself the right to cancel this permission, and to call upon the said \_\_\_\_\_ to leave the territory, should he or his agents at any time perform any act which the Special Commissioner may consider detrimental to the maintenance of good order and government within the limits thereof.

Special Commissioner.

## APPENDIX IA.

## Protectorate of British New Guinea.

NOTES.—(a) Two years' contribution. (b) After allowing for an over-payment of £336 16s. 3d. in 1885. (c) Allowing for a further contribution of £30 6s. 2d. received in June, Tasmania has actually over-contributed the sum of £1 18s. 10d.

Cooktown, 29th September, 1886.

JOHN DOUGLAS,  
Special Commissioner.

## CERTIFICATE OF AUDIT.

I hereby certify that I have examined the accounts of the Protectorate of British New Guinea for the period between the 1st March and the 31st May, 1886—amounting on the Credit side (including the sum of £2,349 2s. 10d., balance brought forward) to £4,789 14s. 7d., and on the Debit side to £12,244 19s. 4d., and find—

1. That all sums received have been duly brought to account, and that the several payments made have been correctly computed, and are supported by proper vouchers.
2. That, assuming the population, as ascertained by the census of 1881, to be the basis of assessment, each of the several colonies (with the exception of Fiji) has contributed its full quota. The contribution of New Zealand, however—viz., 2,668 18s. 9d.—and a balance of £30 6s. 2d. paid by Tasmania, did not reach the bank until July and June last respectively, and are therefore not included in the present account. Fiji has not contributed; Tasmania has overpaid £1 18s. 10d.
3. That, in order to enable the Assistant Deputy Commissioner at Port Moresby to make payments in New Guinea without unnecessary delay, a cash credit has been established in his favour with the Queensland National Bank at Brisbane. Accounts and vouchers in support of cheques drawn against this credit should be rendered at least once a month, so as to enable the necessary adjustment entries to be regularly and promptly made in the Commissioner's books. No such entries are, however, included in the three months' accounts now under examination, whilst the bank pass-book shows that considerable sums have been drawn by the Assistant Deputy Commissioner.
4. That, in order to comply with the terms of a despatch from Lord Derby, dated the 9th May, 1884, the financial year of New Guinea has been recently altered, and made to terminate on the 1st instead of the 30th June. The 30th June is, I think, a more convenient period for the termination of the financial year; and as the majority of the Colonies consider that the payments made by them are to the 30th June, 1886, complications are likely to arise if the recent change of date is adhered to.

Department of Audit, Queensland,  
Brisbane, 16th November, 1886.W. L. G. DREW,  
Auditor-General.

## APPENDIX IB—continued.

## Protectorate of British New Guinea—continued.

STATEMENT showing the total Receipts and Expenditure from the 1st June to the 30th November, 1886—continued.

		£	s.	d.	£	s.	d.	£	s.	d.
Ledger	Brought forward.....				6,903	12	11	1,963	13	0
Folio	By Services (exclusive of establishments)—continued.									
	General Contingent Expenditure—

								10,157	8	4
11.	By Balance .....							15	1	4
								£10,172	9	8

Brisbane, 11th January, 1887.

JOHN DOUGLAS,  
Special Commissioner.

## CERTIFICATE OF AUDIT.

I hereby certify that the accounts of the Protectorate of British New Guinea for the six months ended 30th November, 1886—amounting on the credit side to £10,157 8s. 4d., and on the debit side to £2,717 4s. 11d. (which includes a sum of £18 collected as export duty on cedar) have been audited; and I find:—

1. All sums received have been duly brought to account, the several payments made have been correctly computed and are supported by proper and duly certified vouchers.
2. The operations by the Assistant Deputy Commissioner at Port Moresby upon the cash credit granted him for the purpose of making necessary payments in New Guinea, are included in these accounts, the vouchers necessary to enable the Accountant to make the required adjustments in the books of the Special Commissioner having been duly rendered by Captain Musgrave.
3. Accounts representing in the aggregate a considerable sum expended at Port Moresby prior to the 1st June last not having reached the Special Commissioner in time to enable him to embody them in the previous Statement, the effect has been to correspondingly swell the apparent expenditure for the six months now under review.
4. I am glad to be able to certify that the several books submitted for examination, and the vouchers in support of the entries therein, exhibit considerable care on the part of the Accountant.

Audit Department,  
Brisbane, 14th January, 1887.W. L. G. DREW,  
Auditor-General.

## APPENDIX IV.

Sir, Samarai (Dinner) Island, S. E. New Guinea, 10 September, 1886.

I have the honor to report to your Excellency the progress of events in the district under my jurisdiction.

Following my intention indicated in my letter of 6th August last, I proceeded next day on board the s.s. "Victory" to Giligili, Milne Gulf, where I inspected Messrs. Kissack & Co.'s thriving copra station. I then investigated the question of threatened hostilities on the part of the natives referred to in my last letter. I found that Messrs. Kissack & Co.'s Maltese in charge had been guilty of acts offensive to the natives. After some discussion, the matter was arranged between all parties in an amicable manner. I could not help, however, observing that the natives from the surrounding districts, who had come in as spectators of what was going on, exhibited only a very latent friendliness. On my return from this rather malarious district I was laid up for several days by a severe attack of fever.

I have to report to your Excellency a breach of the regulations in force regarding the importation of spirituous liquors. Furey Augustin, a Mauritius half-caste (at one time my servant, but dismissed for bad conduct), imported from the "Victory" spirituous liquors on her arrival. I warned him that it was illegal so to do without a permit, but he repeated the act on the return of the vessel here both from Teste Island and from Milne Gulf. During my absence in Milne Gulf he appears to have had an attack of *delirium tremens*, in which his conduct was so violent that the teacher's family, in whose house he was living, were compelled to take refuge in the bush. Owing to my own illness, it was some days before I could investigate the matter. He fully admitted his offence; but as it is difficult to enforce here any punishment I may desire or find necessary to inflict, I considered it best to take his retribution *ad avizandum*. Meanwhile, I offered him a chance of retrieving his character by good conduct in employment about my house, promising him a fair wage. Only a few days did he conduct himself creditably. He not only refused to recognise, but even tried to resist, before the natives, my authority. I at once held an inquiry on his previous conduct, and took down in his presence the evidence of those who actually saw him with spirituous liquors ashore, drunk, or misconducting himself, and placed him in arrest on board the "Coral Sea," away from intercourse with the natives, till further orders. At the moment of writing, it is my intention to send him to Cooktown by H.M.S. "Harrier," about the 15th instant, if this can be done. This will get rid of an objectionable character out of the Protectorate. On the 16th August last, the "Coral Sea" arrived, after a rough passage, from Port Moresby. On the 18th I considered it my duty to despatch her to examine (*via* Teste Island, owing to the wind) the islands to leeward of the probable route taken by Dick's missing boat. On her arrival at Teste Island, however (where she landed a Raratongan missionary of the London Missionary Society, who is to labour there), she found that canoes from the islands intended to be visited had recently arrived at Teste Island, and reported that none of the missing men had reached their islands. It is now beyond doubt, I fear, that all have perished. Until the 24th August, the "Coral Sea" was occupied in transferring surplus stores on shore, fixing new sails, and getting thoroughly cleaned out (of which she was very much in need). I employed, meanwhile, a couple of the men for two or three days in sinking shafts in search of fresh water. The flat land bore has produced only brackish water; the higher one will, I hope, yet afford us a better supply, but from a depth of 11 feet. Meantime, rain-water is more abundant than desired.

On the 20th August a large canoe-load of Milne Gulf natives—relatives of one of the lads drowned in Dick's boat—arrived in Dinner Island (the place of the boat's starting) to wail. They were mostly armed, and their movements about the island were so suspicious that it was considered advisable to keep a very sharp night-watch on them, lest they should secure someone's head in payment, according to their custom, for the death of their relative. On Sunday, the 22nd, they intimated that they would be satisfied with an exchange of gifts in token of friendship. This was arranged, at my request, by Dick and other residents on the island, when they quietly took their departure.

On the 21st August Mr. Kissack arrived from Teste Island, to select, on behalf of his firm, a site for his house and store, agreeably to your Excellency's permission and terms. Enclosed are copies of the documents relating to this transaction, which I trust may meet with your Excellency's approval.

Enclosed,

Enclosed, also, is my own bank draft for £5, the annual license fee paid me by Mr. Kissack in notes. As the firm is anxious for the completion of the buildings before the arrival of the s.s. "Victory" in October next, operations were begun at once, and are progressing rapidly.

On the 25th August H.M.S. "Dart" arrived from Townsville, after a stormy passage, bringing the mail. The weather experienced by her and the "Coral Sea" supervened here, and continued, accompanied by heavy squalls of wind and rain (detaining the "Dart" at the anchorage here), till the 30th, since when calms and uncertain winds have prevailed.

On the 30th I proceeded to Heath Island, to examine it, in accordance with your Excellency's instructions, for a site for a Government residence (which will be absolutely necessary for your Excellency's representative during the heavy winds and rains of next monsoon, as the edifice of the London Missionary Society is everywhere leaky, and in an insecure condition). I shall make a report on my visit on a future occasion, when I have seen all the other likely localities.

On the 2nd September I proceeded to the Killerton Islands, in consequence of the unfriendly relations between the people of Milne Gulf and Dien, the London Missionary Society's teacher there, and their threats and attack on him. After a long conversation with Dien—whose statements at different times were much at variance and unconfirmable, owing to my having no interpreter through whom to examine the natives—I found it very difficult to discover where the blame lay. I imagine both sides are at fault. I have warned Dien to keep strictly to his missionary duties (he admits he has been hunting "by his boys" for paradise birds in the lands of the tribes of the Gulf, and that he has been making gardens—very probably not illegally—there also), and that if, on further trouble arising, it should be found that he has been encroaching on their rights, he will have to bear the consequences. I warned the natives, also, that if they molest Dien without cause, Government will protect him and punish them. Having on our return journey been becalmed for a whole day under a fierce sun, I was on arrival laid down with a relapse of fever which prostrated me till the 8th instant. On the 9th I proceeded to Blanchard Island, to examine it for a probable site for Government residence; and I shall on a future opportunity report on its suitability.

The following extracts from my diary since date of last writing will afford your Excellency some idea of the rather disaffected attitude of our neighbours, and will probably give good ground for drawing the attention of the Admiral commanding the Australian station to the desirability of their being, now that a considerable colony of whites is establishing itself whose commercial prospects depend on some degree, at least, of security, a man-of-war, other than a surveying ship, more constantly here. Moreover, Messrs. Kissack have (unofficially) drawn my attention to the increased difficulties now to be encountered in Milne Gulf—one of their stations is at Maivara—since the occurrences related below.

"September 4th.—Captain Mullens, of Kissack and Co., called here and reported as follows:—'I have just returned from the Louisiades. Visited Pig Island on the 13th July, and found that the native lad whom I had left there in charge of our station had been murdered, about (as near as I could discover) the 4th of July last, by the Low Woody Islanders. These people had asked me recently to make a station on their island. As the reefs are not productive enough in that vicinity, I told them I would not make one at present. This had evidently offended the Low Woody Island natives. They, about the 4th July, therefore, had proceeded to Pig Island (Low Woody Island is to the north of Joannet Island, and Pig Island, is to the south-east of it) in two canoes with twelve to fifteen men, beheading the lad, taking away the head and all the trade belonging to Messrs. Kissack and Co. The head they traded to the St. Aignan people (who attacked Lieut.-Commander Marx). My boys, who were working on Wooded Islet Reef, about 25 miles to the north-west, when they learned of the outrage—they are Renard Island natives—at once set out for Low Woody Island. I accompanied them in the schooner. I neither prevented nor persuaded them in the matter further than warning them that they should kill nobody. I anchored at Low Woody Island in my usual place. The Renard natives went on shore—where one half of the people, who number in all about 100, are at war with the other half—and burned two houses, and destroyed two canoes.'

"I told Captain Mullens that I would report the whole matter to His Excellency, the Special Commissioner, for instructions.

"Captain Mullens further reports:—'I visited Conde Point, Sudest Island; I found the natives very disaffected, dangerous, and threatening, because a lad belonging to one of the villages there who had been taken away by the 'Elsa,' a vessel belonging to Messrs. Burns, Philp, and Co. (Hovell, master), in the month of January last, under promise of being returned in a month, has not yet been sent back, and he is supposed to be dead. I passed what I believe to have been the 'Elsa,' near South Cape, about the 18th (the exact date I am not quite certain of) of January. She was, I understand, on a voyage from Thursday Island to Brisbane.'

The ancient custom of the natives is absolute and inexorable—a head for every death; so that actions such as this, and Minister's taking away Bari—they are mourning his death now, I hear—have been the cause of too many of the murders in this region. I hope by the end of the following week Bari's people will be rejoicing over his return. Captain Colin Thomson, "Coral Sea," tells me he saw the boy taken by the "Elsa" in March, in Townsville. Hovell meant, he says, to take him to Sydney.

"September 4th, evening.—Ah Pow, a Chinaman in the employ of Ah Gim, schooner 'Pride of the Logan,' came and reported that while lying at anchor off Samoma village, Moresby Island, on Friday night last, the 3rd, with Ah Gim's schooner, the South Cape boys, whom they had employed on board, stole the dingy in the night and made away. These boys had warned Ah Pow that the natives were hostile. They evidently left under fear of the natives."

On Moresby Island (Hoop-iron Bay), Captain Fryer and his mate were murdered. Mr. Kissack tells me that the murderer—such by common repute as well as by his own confession—often visits Teste Island and has boasted to him, as well as to the Teste Islanders, that he killed Fryer, and "he no afraid man-a-war."

"Monday, 6th August.—Charles Berlin (whom I had repeatedly warned against going to Milne Gulf) came to me and reported:—'I have just returned from Maivara, at the top of Milne Gulf, and have had a narrow escape of my life. I reached Maivara on Friday morning, about 5 p.m. Six canoes came off with about fifteen men. I saw they had no spears or weapons on board, so I allowed two old men to come aboard my boat. I was sitting on the hatch with my feet dangling into hold. One of the old men slipped down into the hold and caught hold of my legs before I was aware; the other caught me by the chest and threw me overboard. I, however, managed to catch hold again of part of the rigging and slung myself

myself on board. These men and others from the canoes again seized me, struck me with spars and oars found in the boat, but could not get at my head for the mast, about which I dodged, nor could they get me to loose my hold of the ropes, which I held for my life. Getting one hand free for a moment I knocked one man down with my fist, but could not get at my revolver, which was in its case at my side, because of the men holding me behind. With a kick out behind I knocked first one and then a second over the side into the water. I then got hold of my revolver. I then shot one man through the heart and he fell overboard and sank. I fired at two others but missed, my hand shaking from the contusions from the strokes dealt on it by the natives. I kept two remaining shots for extremities. One old man still continued in the hold trying to get out the tobacco box, every now and then stopping to throw spears at me. I fired one more shot at him but missed. At last those in the canoes alongside called out, "Come away, there is a man killed." The old man then got over the side. I got out my snider and fired several shots after them. I gave the gun then to one of my boys, who also fired, while I got up sail and got away."

"Wednesday, 8th September.—Dick, the London Missionary Society teacher here, came to me and reported:—'Last night I received word from the old chief on Basilisk Island, near Goodman Point, who is a true friend of the white man, that there is some talk of doing something to Whitten, of the cutter 'Albatross,' and his fellows, but that he, the chief, is keeping a good look-out. My son was last week on the 'Dart' as interpreter. Captain Field landed about this same place to take the sun. My boy overheard them, as he believes, talking about 'doing something' to Captain Field. Then the old man—the chief referred to above—said, 'Why, what you going to do that for; don't you see son of missionary in boat?' The other men then ashamed, and all ran away.' Dick further tells me—'I hear the natives of Milne Gulf, Basilaki, and other islands, who come here talking amongst themselves, 'No more frightened man-of-war; man-of-war never pay; Fryer no pay; Fryer's mate he no pay; St. Aignan he cut man-of-war captain; he no pay; man-of-war he no pay no more.' They think, Mr. Forbes, the man-of-war no come no more; and round about them islands it now no more safe.'"

How far these statements of the teacher may be imaginative or exaggerated it is difficult to tell, but there is not a little truth at bottom, and taken with what I have recorded above, I believe they are not unworthy of serious consideration. From this stage of unquiet and hostility in the Louisiades it will be evident that your Excellency's representative can but imperfectly profit by the opportunities at his command. Landing from a vessel like the "Coral Sea," without a protecting company, can be accomplished at very few of these interesting and little known islands, and no exploration or examination of the ultra-shore land can be even attempted at any of them. I hear of what appear to be valuable mineral veins in St. Aignan, and of gums from other islands, which I am most anxious to examine, but it can be done, under present circumstances, only in the face of your Excellency's fatherly caution, for the risks are undeniably great. The dangers would be vastly minimised by the presence of a vessel of war on the station.

On the arrival of H.M.S. "Harrier" on the 14th, I intend, unless I hear of your Excellency's, or of a man-of-war's, early arrival, to proceed to the Louisiades about the 18th instant, and may probably be absent about a month or six weeks.

I have, &c.,

HENRY O. FORBES.

P.S., October 12th, 1886:

Since writing the above a great delay has taken place in obtaining an opportunity for despatch of our mails. Messrs. Kissack and Thompson have this evening announced their intention of sending the "Pioneer" to Cooktown to-morrow morning, so I have hastily to add this postscript.

H.M.S. "Harrier" did not arrive with the mail until the 24th of September, and only then *en route* for the Solomon Islands. Before her arrival Dinner Island became nightly infested with natives from the surrounding islands fully armed, prowling about in quest of some of the people here. As yet none of the moonlighters have been captured or killed, though they have been both fired upon and attacked at close quarters; and none of the Dinner Islanders have been harmed. A guard has had to be kept nightly for several weeks now.

Immediately on the departure of the "Harrier," and just as I was ready to leave for the Louisiades, a report was brought me from Teste Island of a plot to murder the London Missionary Society teacher there. (Later intelligence shows that they have not carried out their intentions, if really formed.) As after Lydia Island Teste Island was one of the Islands I specially intended to examine, I decided, considering the disaffection existing all round, to defer my visit to the Louisiades till the arrival of H.M.S. "Diamond," which will arrive here, as I am informed by the "Harrier," about the end of this month. Even had the state of the natives not caused me to change my plans, it became impossible for me to leave owing to an attack of dysentery and fever, accompanied by an aggravated relapse of inflammation of the ear, from which I am only now just recovering.

I have to report to your Excellency the sad news brought to-day from the Louisiades (whither the "Coral Sea" proceeded a week ago to return the native Bari, sent by your Excellency to me, to his home at Low Woody Island, close to Joannet Island) by Captain Mullens of the "Alice Meade," of the murder of J. A. Craig, master of the ketch "Emily," together with the three Europeans and the five Malays composing his crew. Full particulars are wanting, but it would appear that they were fallen upon at the critical moment of one of the divers emerging from the water, when no one was prepared. The vessel was entirely looted of goods, stores, and weapons, and then completely burned. One boat has been brought here by Mullens, who visited the scene of the murder a few days since, viz., Joannet Island. The 14th September last appears to be about the date of the murders.

This news only serves to confirm more fully the reports and suspicions of native disaffection which I have recorded in the earlier part of this letter.

I have to report to your Excellency that almost all the vessels coming to this portion of New Guinea commit a breach of the regulations which declare Port Moresby the sole port of entry and clearance for the Protectorate waters, as they not only refrain from going to Port Moresby but they fail to call here. Their calling at one or the other port is the only protection the Queensland Government has against the stores shipped out of bond being distributed illegally to ships along the Barrier Reef, and the Protectorate of checking the illicit landing of prohibited articles and of preventing the in-bringing of infectious diseases.

I have to report that a Chinaman, Ah Gim, a bêche-de-mer collector, who held a Protectorate permit from Sir Peter Scratchley, has lost that document; I have refused to give him a new one till after referring

referring the matter to your Excellency, under the following circumstances:—Being known to the Customs authorities at Cooktown as the holder of a permit, and having a Queensland master's certificate, he cleared as master in the schooner "Pride of the Logan," from Cooktown, for Dinner Island. He arrived here with his bonded stores broached, and declared that the portion not on board was landed at South Cape. He further, after giving me false information, deserted his vessel, which proceeded to the Engineer Group without her having any one of the crew (who are all Chinese) with a certificate of any description. Ah Gim has declared that he is nominal master, but that he has nothing to do with the vessel besides to bring her from and take her back to Cooktown. H.M.S. "Harrier," when on her voyage to the Solomon Islands, encountered and boarded this schooner, and ordered her to Dinner Island. I ordered that the vessel could not be in the Protectorate waters without a master on board. As Ah Gim promised to remain on board in future, I gave permission to remove the vessel to prosecute her trade. I consider the offence of acting as nurse-master so serious that I have not considered it right to grant a new permit without reference to your Excellency.

I beg to suggest to your Excellency that Dinner Island should be constituted a port of entry and clearance for the Protectorate, as it is evidently a hardship for vessels from Queensland to have to proceed to Port Moresby only to enter, and then to have to beat up against the monsoon to the Louisiades.

H.O.F.

To His Excellency the Honorable John Douglas, C.M.G.,  
H.M. Special Commissioner for British New Guinea.

I only received this letter on the 6th December. In the meantime I had seen Mr. Forbes at Samarai, and had concerted with him to take action in connection with the Craig massacre.—J.D.

#### APPENDIX V.

##### GENERAL ORDER AS TO PLACES OF IMPRISONMENT WITHIN THE WESTERN PACIFIC.

By His Excellency John Bates Thurston, Companion of the Most Distinguished Order of Saint Michael and Saint George, Her Britannic Majesty's Assistant High Commissioner for the Western Pacific, &c., &c., &c.

[L.S.] JOHN B. THURSTON.

WHEREAS, by the Western Pacific Order in Council of 1877, it is provided that Her Britannic Majesty's High Commissioner for the Western Pacific may, from time to time, by general order under his hand and official seal, prescribe the places within the Western Pacific Islands at which sentences of imprisonment of Her Britannic Majesty's High Commission Court for the Western Pacific are to be carried into execution: Now I, John Bates Thurston, Her Britannic Majesty's Assistant High Commissioner aforesaid, under and by virtue of the power conferred upon me by the said Order in Council and all other power and authority in me vested, do hereby prescribe and appoint Port Moresby, in British New Guinea, to be a place at which sentences of imprisonment of the said Court are to be carried into execution, subject and according to the provisions of the said Order in Council.

Given at Suva, Fiji, this fifth day of February, in the year of our Lord one thousand eight hundred and eighty-six.

By His Excellency's Command,  
WILFRED COLLET,  
Secretary to the High Commissioner.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**CLOCKS IN PUBLIC BUILDINGS.**

(ERECTION AND WINDING OF DURING LAST FIFTEEN YEARS.)

*Ordered by the Legislative Assembly to be printed, 11 May, 1887.*

RETURN setting forth the information asked for in the following Questions (Votes No. 30, 10th May, 1887):—

4. MR. SYDNEY SMITH asked THE SECRETARY FOR PUBLIC WORKS,—

- (1.) The total amount paid to each person for the supply, erection, and winding of clocks in all public buildings throughout the Colony during the last fifteen years?
- (2.) Who prepared the specification submitted by the Colonial Architect for the clock for the new General Post Office?
- (3.) Were tenders publicly invited for the clock intended for Post Office, Balmain; if so, the names of tenderers, and amount of successful tender?
- (4.) How many tenders were received for the supply of public clocks at Bathurst, Maitland, and Goulburn, the name of the successful tenderer, and the total amount paid for the supply and erection of each respectively?
- (5.) Were tenders invited for the supply of turret-clocks in connection with the Bathurst and Goulburn Gaols; the name of the successful tenderer, and the price of each?

*Mr. Burns* answered,—The information asked for by the Honorable Member will be supplied in the shape of a Return.

No. 1.—Statement of Expenditure on Supply, Erection, Winding, &c., of Clocks, during the last 15 years.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## CREMATION BILL.

(PETITION IN FAVOUR OF—DAVID BUCHANAN, BARRISTER-AT-LAW.)

*Received by the Legislative Assembly, 18 May, 1887.*

To the Honorable the Speaker and Members of the Legislative Assembly, in Parliament assembled.

The Petition of David Buchanan, Barrister-at-law, praying that the Cremation Bill now before your Honorable House may be passed,—

HUMBLY SHOWETH:—

That the Cremation Bill now before your Honorable House should be passed in the interests of the public health.

That the present practice of disposing of the dead by burial poisons the air, the water, and the land, and is prejudicial to the health and wellbeing of the community, disseminating disease and death silently and unperceived, and is consequently a source of constant and continually increasing danger to the living.

That the process of cremation, as it may be seen at the present time in operation in England and other countries, brings about the same result as burial, namely, consumption of the body to ashes, with this difference, that while cremation consumes the body to ashes in about half-an-hour, thereby destroying every germ of disease and every possibility of infection, the process of burial leaves the body to go through all the stages of loathsome corruption, sending up poisonous gases from the earth, and thus endangering, in a serious degree, the health of the living.

That the possibility of crime escaping detection through the operation of cremation is most stringently and carefully prevented by the wholesome clauses, for that purpose embodied in the Bill now before your honorable House, which clauses preclude the possibility of such a thing; while under the process of burial there is the far more terrible and appalling danger of burial alive, which has not unfrequently happened, proved by the fact that, on disinterring bodies, many of them have been found turned right round in their coffins, and lying on their faces, with distinct evidence of a struggle, the bare thought of which out-horrors horror.

That under the Bill before your Honorable House cremation is not compulsory but optional, so that those who approve of burial may still practice that process without let or hinderance; while the thousands that would take advantage of the crematory process would relieve our burial-grounds of a frightful and dangerous overcrowding that could not but have a beneficial effect upon the general health of the people.

That although the evils of those crowded burial-grounds may not be at once seen as directly traceable to that source; still we have the testimony of high medical authority that many virulent epidemic diseases have had their origin in the poisoned air from burial-grounds, and hence the unanimity amongst medical and scientific men in recommending cremation as preferable from its cleanness, speediness, and safety to the dangerous process of allowing an innumerable crowd of dead bodies to lie in the earth, going through the slow process of corruption and decay, and unquestionably endangering the health and lives of the living.

That on the grounds stated, your petitioner humbly prays that your Honorable House will pass the Cremation Bill as a large contribution to the health, safety, and wellbeing of the community.

And your petitioner, as in duty bound, will ever pray.

DAVID BUCHANAN.

**DIVORCE EXTENSION BILL.**

(PETITION IN FAVOUR OF GENERAL ASSEMBLY OF THE PRESBYTERIAN CHURCH OF  
NEW SOUTH WALES.)

*Received by the Legislative Assembly, 24 March, 1887.*

To the Honorable the Legislative Assembly in Parliament Assembled.

The Petition of the General Assembly of the Presbyterian Church of New South Wales,—

HUMBLY SHOWETH:—

That your Petitioners regard Wilful Desertion, as well as Adultery, to be a valid ground of Divorce, in accordance with the teaching of Holy Scripture and the Confession of Faith held by the Church and many other Presbyterian Churches throughout the world.

Your Petitioners therefore pray your Honorable House to pass a measure providing for extension of Divorce to cases of Wilful Desertion within the Colony of New South Wales.

And your Petitioners, as in duty bound, will ever pray.

Signed in name and by authority of the General Assembly—

WILLIAM BAIN, Moderator.  
JAMES S. LAING, Clerk.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**IMPERIAL CONFERENCE.**  
(CORRESPONDENCE RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 14 April, 1887.*

Telegram from the Premier, Queensland, to The Colonial Treasurer, New South  
Wales.

Brisbane, 21 October, 1886.

I SUGGEST that each of the Australian Governments should request Governor to telegraph to Secretary of State asking whether, in view of threatened European complications, and of the delay likely to arise in giving effect to Admiral Tryon's proposals, the Imperial Government can take any steps to strengthen Australian Squadron. Gillies concurs.

The Colonial Treasurer, New South Wales, to The Premier, Queensland.

Sydney, 21 October, 1886.

HOPE to reply to-morrow to your message with reference to proposed application to Imperial Government to strengthen Australian Squadron.

The Colonial Treasurer, New South Wales, to The Premier, Victoria.

Sydney, 21 October, 1886.

AM in receipt of your telegram from Premier of Queensland with reference to proposed application, in view of probable European complications, and the likelihood of considerable delay in finally arranging naval defences of these Colonies, to the Imperial Government, to strengthen squadron on this station. Hope to reply to-morrow, when I will also advise you of the views of this Government.

Minute by The Colonial Treasurer.

The Treasury, New South Wales, Sydney, 22 October, 1886.

*Subject:* As to suggested application to Imperial Government to strengthen Australian Squadron.

A TELEGRAM was yesterday received by me from Sir Samuel Griffiths, Premier of Queensland, suggesting that, in view of threatened European complications, and of the likelihood of there being yet considerable delay in placing the Naval defences of these Colonies on a good basis, application by cable should be made to the Imperial Government, through His Excellency the Governor, to strengthen the squadron on this station.

2. I have informed Sir Samuel Griffiths, that I hope to communicate to-day the views of this Government upon the subject.

3. Having in view the almost continual apprehension of an European conflict which has existed for some time past, it seems to me that, pending the making of definite arrangements on the basis of the proposals submitted to Imperial Government, as the outcome of the meeting of His Excellency Admiral Tryon and the Premiers of Victoria, Queensland, and New South Wales, on board H.M.S. "Nelson," on the 26th and 27th April last, an application might, as suggested by Sir Samuel Griffiths, be made for the placing on this station of additional ships of war.

4. Of course, while pressing upon the Imperial Government the necessity for this step, care would be taken, as far at least as this Colony is concerned, that nothing would be done which would be calculated to in any way embarrass the Admiralty in the disposition of its vessels.

5. I am of opinion that, if the Imperial Government accede to the proposed application, a *pro rata* contribution should be made by all these Colonies towards defraying the cost of the maintenance of the additional vessels while on this station. This contribution could not possibly be viewed as anything out of the way, as the proposals before referred to, as the outcome of the meeting on board H.M.S. "Nelson," provided that each Colony should make a proportionate contribution towards the maintenance of an increase in the Squadron on this station.

6.

6. The following documents are attached hereto :—

1. Copy telegram from Sir Samuel Griffiths, dated 21st October.
2. Copy of my reply, dated 21st October.
3. Copy telegram addressed to Premier of Victoria, and
- \*4. Copy memorandum, dated 15th May last, containing the views of this Government as to the joint naval defence of Australasia; submitted by me to His Excellency.

P. A. JENNINGS.

\* Laid upon the Table of the Legislative Assembly on 20th May, 1886.

---

Telegram from The Agent-General to The Colonial Treasurer.

London, 2 November, 1886.

INQUIRIES being made respecting naval defence; will report shortly.

---

Telegram from The Agent-General to The Colonial Treasurer.

London, 5 November, 1886.

At an interview with Secretary of State for the Colonies assured no cause for alarm. Admiralty will protect British Colonies in case of need.

---

Telegram from His Excellency the Governor to The Principal Secretary of State for the Colonies.

Government House, 1 November, 1886.

GOVERNMENT of N.S.W. being anxious in view of delay necessary to take place in carrying into effect proposals for outer Naval Defence of Australasian Colonies discussed with Admiral of the Fleet by Premiers of Queensland, Victoria, and N.S.W., and substantially agreed in by all other Colonies for the squadron here to be strengthened in anticipation of European operations of war, my Government informs me N.S.W. and other Colonies are alarmed at matter, and owing to serious attention excited thereby and feeling of insecurity there exists much agitation may be expected shortly to be set on foot for immediate increase of strength of the squadron—they therefore request that I inform you that while they do not wish to appear to be anxious to interfere with the strategic arrangements respecting the forces of H.M. Government, they would be glad to know whether in case of declaration of war such arrangement could be made so as to afford facilities for increased naval protection.

CARRINGTON.

---

The Principal Secretary of State for the Colonies to His Excellency the Governor.

London, 2 November, 1886.

REFERRING to your telegram of 1st November, transmit following telegram to Victoria and Queensland:—  
“Her Majesty’s Government are not aware of any ground for the apprehension entertained in the Australasian Colonies, and have no reason to anticipate (any difficulty in) warlike operations. Should the necessity unfortunately arise the steps necessary for efficient protection would be at once communicated to you.”

---

The Principal Secretary of State for the Colonies to His Excellency the Governor.

My Lord, Sir,

Downing-street, 25 November, 1886.

You will no doubt have remarked that in the Queen’s Speech on the prorogation of Parliament, Her Majesty was pleased to refer to Her Colonial and Indian Possessions in the following terms:—  
“I have observed with much satisfaction the interest which, in an increasing degree, is evinced by the people of this country in the welfare of their Colonial and Indian fellow subjects; and I am led to the conviction that there is on all sides a growing desire to draw closer in every practicable way the bonds which unite the various portions of the Empire. I have authorized communications to be entered into with the principal Colonial Governments with a view to the fuller consideration of matters of common interest.”

2. The communications thus promised with the Colonies have engaged the careful consideration of Her Majesty’s Government, and they have come to the conclusion that the Queen should be advised to summon a Conference, to meet in London in the early part of next year, at which representatives of the principal Colonial Governments will be invited to attend for the discussion of those questions which appear more particularly to demand attention at the present time. I request you to inform your Ministers of this proposal, which I am confident will be very satisfactory to them, and to express the hope which I entertain of their cordial co-operation.

3. In the opinion of Her Majesty’s Government, the question which is at once urgent and capable of useful consideration at the present time is that of organization for military defence. The patriotic action of the Colonies in offering contingents of troops to take part in the Egyptian campaign made a deep and lasting impression on the public mind, and was the first practical result of much careful work during recent years. It is a necessity of the case that the measures which have been taken in each Colony, as well for the organization of the local forces as for the construction of local defensive works, are, to a great extent, not yet fully understood and appreciated in other parts of the Empire. The close and thorough examination of the whole subject of Imperial Defence, which was completed by the Royal Commission presided over by the Earl of Carnarvon, has led to the execution of extensive and important defensive

defensive works in various parts of the Empire; and the cordial co-operation offered to Her Majesty's Government by the Colonies in carrying out this policy indicates their desire to arrive, so far as may at present be practicable, at a common basis of action. This work is still being actively pressed on with the assistance of a Standing Committee, which is continuously occupied with matters relating to Colonial Defence.

4. Much yet remains to be done; and it is of course unavoidable that secrecy should continue to be observed with regard to many of the defensive measures in progress or in contemplation. The time has, however, now arrived when an attempt may fairly be made to attain to a better understanding as to the system of defence which may be established throughout the Empire. For this purpose an interchange of knowledge as to the state of preparation, or as to the capabilities of organization in each Colony, would lead to a more thorough understanding of their wants and wishes; but whilst Her Majesty's Government would thus be prepared to recommend for the consideration of the Conference certain principles calculated to promote the general defence of the Empire, it is not our intention in calling the Conference to commit either the Imperial Government or any Colony to new projects entailing heavy expenditure, but rather to secure that the sums which may be devoted to this purpose may be utilized to the fullest extent, with complete knowledge of all the conditions of the problem.

5. Second only in importance to this great question is one concerning in a special degree the interests of the Empire in time of peace. The promotion of commercial and social relations by the development of our postal and telegraphic communications could be considered with much advantage by the proposed Conference. It is a subject the conditions of which are constantly changing. New requirements come into existence, and new projects are formulated every year. It is obviously desirable that the question of Imperial intercommunication should be considered as a whole, in order that the needs of every part of the Empire may, as far as practicable, be provided for, and that suggestions may be obtained from all quarters as to the best means of establishing a complete system of communication without that increased expenditure which necessarily results from isolated action.

6. Two leading subjects for consideration have been referred to, but it is not impossible that there may be some other important question which, in the general opinion of the Colonial Governments, might properly and usefully be brought under consideration. But I should deprecate the discussion at the present time of any of the subjects falling within the range of what is known as Political Federation. There has been no expression of Colonial opinion in favour of any steps in that direction; and Her Majesty's Government are of opinion that there would be no advantage in the informal discussion of a very difficult problem before any basis has been accepted by the Governments concerned. It might, indeed, be detrimental to the ultimate attainment of a more developed system of united action if a question not yet ripe for practical decision were now to be brought to the test of a formal examination.

7. The Conference will necessarily be purely consultative, and it will therefore not be material that the Colonies should have equal or proportional representation upon it. The desire of Her Majesty's Government would rather be that its constitution should be sufficiently comprehensive to include, in addition to the Agent-General or other specially deputed representative of each Government, any leading public man who may be at liberty to come to England next year, and may be specially qualified to take a useful part in the deliberations. It will, I think, be convenient that I should preside at the Conference, and I need not say that I anticipate much advantage to myself and to Her Majesty's Government from the opportunities of acquiring information which will thus be afforded to me.

8. I will only add, in conclusion, that I am confident that your Government will, as I do, feel deep interest in this first attempt to bring all parts of Her Majesty's Empire into joint deliberation. However modest the commencement may be, results may grow out of it affecting, in a degree which it is at present difficult to appreciate, the interests of the Empire and of the civilized world.

I have, &c.,

EDWARD STANHOPE.

P.S.—My own opinion is that the best time for meeting would be the month of April or May, but I should be glad in this matter to be guided by the general opinion of the Colonial Governments.

Seen.—P.A.J. Cabinet. Recommended that member of Government and Agent-General in London be appointed to represent colony at Conference.—P. A. J. Agent-General informed by cablegram.

### Telegram from The Principal Secretary of State for the Colonies to His Excellency the Governor.

London, 6 December, 1886.

REFERRING to Queen's speech proroguing Parliament, Her Majesty's Government propose Conference in London early next year with Colonial representatives to discuss coastal defence of colonies, telegraphic communication with colonies, and other important questions, exclusive, however, of political federation, which question is not yet ripe. Conference should be consultative, and number of representatives to each colony not material. Suggested Conference should include, in addition to Agent-General, a specially deputed representative man and any leading public man with special qualifications who may be here. Secretary for the Colonies will preside. Conference probably April or May. Despatch sent 25th November explaining fully.

### Telegram from The Premier, Queensland, to The Colonial Treasurer, New South Wales.

Brisbane, 13 December, 1886.

Do you propose to be represented at Conference in London next year? Agent-General informs me that all Colonies should be specially represented.

Telegram

Telegram from The Colonial Treasurer, New South Wales, to The Premier,  
Queensland.

Sydney, 14 December, 1886.

IN answer to your telegram of yesterday's date (received this morning) as to the proposed Conference in London next year, we purpose waiting the receipt of Mr. Stanhope despatch of 25th ultimo before taking any decisive step in relation to the matter.

The Agent-General, to The Colonial Secretary.

Sir,

5 Westminster Chambers, Westminster, S. W., 17 December, 1886.

I have the honor to forward herewith, a print of a circular letter from The Secretary of State for the Colonies, to the Governors of Colonies under responsible Government, a copy of which you will doubtless have received ere this reaches you.

I have no comment to make upon the proposal, except to state that Mr. Stanhope desires, if possible, that the conference should take place in April.

I have, &c.,

SAUL SAMUEL.

Telegram from The Premier, Queensland, to The Colonial Treasurer, New South  
Wales.

Brisbane, 23 December, 1886.

WE have determined that I shall attend the London Conference as Special Representative with the Agent-General. We thought the importance of the matter, as well as the occasion of Her Majesty's Jubilee, demanded special action.

Telegram from The Principal Secretary of State for the Colonies to His  
Excellency the Governor.

As at present advised I think about 1st April may be convenient time for opening the Colonial Conference here.

Seen, Cabinet.—P.A.J.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**IMPERIAL CONFERENCE.**

(FURTHER CORRESPONDENCE RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 22 April, 1887.***Telegram from The Agent-General to The Colonial Secretary.**

18 April, 1887.

At meeting Conference to-day Imperial Government submitted amended proposal for Naval Defence; total cost not exceeding £120,000 a year on peace footing, extra cost in time of war to be entirely borne by Imperial Government. Offer includes improved class of ships. Delegates agreed submit proposal for decision of their Governments. Victoria, however, objected to apportionment of contribution on basis of population only, and urged that it should be based upon population, trade, and tonnage. Do you approve of these proposals? Secretary of State for the Colonies anxious for immediate reply. Please telegraph reply as soon as possible.

S. SAMUEL.

**Telegram from The Colonial Secretary to The Representatives at Imperial Conference.**

Sydney, 21 April, 1887.

THIS Government is deeply sensible of the careful consideration which has been given by Her Majesty's Government and the Colonial Representatives to the question of Naval Defence at the Imperial Conference, but it does not feel that it should be called upon to express any approval at this stage of the proposals submitted. The initial Despatch of 25th November says expressly that it was not the intention in calling the Conference to commit either the Imperial Government or any Colony to new projects entailing heavy expenditure, and that the Conference was necessarily to be purely consultative; and, moreover, the Despatch is silent respecting the naval branch of defence, as distinguished from the general question. This Colony is represented on the basis of the conditions laid down in Mr. Stanhope's Despatch. We shall be anxious to act in consultation with the other Australian Colonies with a view to secure united concurrence in any scheme of naval defence which has been maturely considered by the Imperial Conference; but we desire to express the opinion that any such agreement, to be of a lasting character, must receive the sanction of the respective Australian Parliaments.

Cabinet (all Ministers present) approve.

HENRY PARKES.

**Telegram from The Colonial Secretary, New South Wales, to The Honorable Duncan Gillies, Victoria.**

Sydney, 21 April, 1887.

I SEND by to-night's mail copy of our reply to Delegates at Imperial Conference respecting Scheme for Naval Defence. I presume you will receive this by noon to-morrow.

HENRY PARKES.

**The Colonial Secretary, New South Wales, to The Honorable Duncan Gillies, Victoria.**

Sir,

New South Wales, Colonial Secretary's Office, Sydney, 21 April, 1887.

Referring to my telegram of this date, I have now the honor to transmit herewith a copy of the reply from this Government to the Delegates at the Imperial Conference respecting the Scheme of Naval Defence.

I have, &amp;c.,

HENRY PARKES.

1887.

---

**IMPERIAL CONFERENCE.**

(FURTHER CORRESPONDENCE RESPECTING.)

---

*Ordered by the Legislative Assembly to be printed, 27 April, 1887.*

---

**Telegram from The Agent-General to the Colonial Secretary.**

London, 20 April, 1887.

GOVERNMENTS Victoria, Queensland, New Zealand, South Australia have announced acceptance of Imperial Government proposal for Naval Defence, subject approval by their Parliaments.

---

**Telegram from The Agent-General to The Colonial Secretary.**

London, 21 April, 1887.

It is clearly understood that proceedings are purely consultative; and in course of construction of the question of Naval Defence, Imperial Government were induced to reduce largely the contribution proposed originally by Admiral Tryon, and offer to furnish improved class of ships—project not new. Military Defence mentioned in Mr. Stanhope's Despatch intended to include Naval Colonial Governments having substantially approved Tryon's proposal. It was agreed delegates should submit modified proposal for the decision of their Governments, particularly as Imperial Government are anxious that the question of Naval Defence should be decided as quickly as possible. It has been suggested that the apportionment of contribution of Colonies might be fixed by arbitration of Board of Trade.

---

**Telegram from The Colonial Secretary to The Representatives at Imperial Conference.**

26 April, 1887.

WE are prepared to submit Naval Defence proposals of Imperial Conference to Parliament. Fail to see the advantage of conditional approval, and should prefer having full text of proceedings before us. Does not appear to us specially urgent.

**IMPERIAL CONFERENCE.**

(APPOINTMENT OF DELEGATES.)

*Ordered by the Legislative Assembly to be printed, 14 April, 1887.*

The Colonial Secretary to Sir Patrick Jennings, K.C.M.G.

Dear Sir Patrick,

Sydney, 27 January, 1887.

I have been informed that you had some thought before you retired from office of going to London as one of the representatives of the Colony at the Imperial Conference.

I wish to say that if this was so I shall be happy to give effect to your intention by recommending your appointment.

I understand from the Secretary of State's Despatch that the Conference will be purely of a consultative character, and I think it has been wisely decided to keep its proceedings within such limits; still its deliberations must have a valuable effect in promoting a good understanding between England and her Colonies.

Yours, &amp;c.,

HENRY PARKES.

Sir Patrick Jennings, K.C.M.G., to The Colonial Secretary.

Dear Sir Henry,

Reform Club, 28/1/87.

I delayed my reply to your kind note of yesterday until I made inquiries as to how far it would be practicable for me to reach London in time for the Conference, the date of which seems to have been altered several times.

I find I can be in London on the 29th March at furthest, and possibly by the 21st March. I thank you very much for your offer to recommend my appointment as a Representative of the Colony at the Conference, and, if appointed, I will give my best services and assistance on the consultation of that body, and I altogether agree with you in hoping and believing that very valuable results will accrue from its deliberation.

Believe me, &amp;c.,

P. A. JENNINGS.

**Minute for The Executive Council.**

Appointment of Representatives to Imperial Conference.

Colonial Secretary's Office, Sydney, 2 February, 1887.

I RECOMMEND the appointment of Sir Saul Samuel, K.C.M.G., C.B., Agent-General, Sir Patrick Alfred Jennings, K.C.M.G., and the Honorable Robert Wisdom, Q.C., M.L.C., to represent the Colony at the forthcoming Conference, to be held in London, upon Imperial and Colonial Defence, and other subjects, during the present year.

HENRY PARKES.

**Minute of The Executive Council.**

HIS Excellency the Governor lays before the Council a Minute Paper by the Honorable the Colonial Secretary, recommending that Sir Saul Samuel, K.C.M.G., C.B., Agent-General, Sir Patrick Alfred Jennings, K.C.M.G., and the Honorable Robert Wisdom, Q.C., M.L.C., be appointed to represent the Colony at the forthcoming Conference, to be held in London, upon Imperial and Colonial Defence, and other subjects, during the present year.

2. The Council advise that the gentlemen referred to be appointed Representatives of the Colony at the said Conference.

ALEX. C. BUDGE,

Clerk of the Council.

The

The Principal Under Secretary to The Secretary to the Post Office.

Sir, Colonial Secretary's Office, Sydney, 10 February, 1887.  
I am directed by the Colonial Secretary to request that you will invite the Postmaster-General to be so good as to cause me to be furnished with information regarding Post and Telegraph Communication since 1885, for the use of the Representatives of the Colony at the forthcoming Conference, to be held in London, upon Imperial and Colonial Defence, and other subjects, during the present year.

I have, &c.,  
CRITCHETT WALKER,  
Principal Under Secretary.

The Colonial Secretary to the Agent-General.

Sir, Colonial Secretary's Office, New South Wales, 11 February, 1887.  
His Excellency the Governor, with the advice of the Executive Council, has deemed it expedient to appoint you to be one of the Representatives of this Colony at the Imperial Conference to assemble in London in April next.

2. It is expressly stated by the Secretary of State that the Conference is to be of a consultative character, and that it is the desire of Her Majesty's Government that questions relating to political federation be excluded from its deliberations. In the views so expressed this Government entirely concurs.

3. In joining in the deliberations of the Conference the Government depends upon your intimate knowledge of the Colony and your experience gained in Parliament and in the conduct of public affairs for your guidance; and it is felt that you will studiously protect the interests of the Colony, and not even by implication commit the Colony to any new line of policy until any such question as may arise shall have been submitted by cable to this Government, and you shall have been specifically instructed on the subject.

4. It appears to me that much good to the Colonies generally must result from the proceedings of the Conference in promoting a fuller and more correct knowledge of Intercolonial as well as Imperial questions, and in strengthening a cordial feeling of attachment between the different parts of the Empire.

I have, &c.,  
HENRY PARKES.

Similar letters were addressed to Sir Patrick A. Jennings, K.C.M.G., and the Hon. Robert Wisdom, Q.C., M.L.C.

Commission appointing Sir Saul Samuel, K.C.M.G., C.B.

BY His Excellency the Right Honourable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

To Sir SAUL SAMUEL, K.C.M.G., C.B., Agent-General for the Colony of New South Wales, London,—  
Greeting:

WHEREAS it has been determined by Her Majesty's Imperial Government to hold a Conference in London, at which Representatives of the principal Colonial Governments have been invited to attend, to consider matters relating to Imperial and Colonial defence, the promotion of commercial and social relations by the development of postal and telegraphic communications, and other subjects of common interest: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, do, with the advice of the Executive Council of the said Colony, hereby appoint you the said Sir SAUL SAMUEL to represent and act in behalf of the Government of New South Wales in and at the said Conference in association with Sir PATRICK JENNINGS, K.C.M.G., and the Honourable ROBERT WISDOM, Q.C., M.L.C., to confer and deliberate with the other Representatives thereat assembling, and to report from time to time, should occasion arise, to seek fresh instructions, and finally to report fully the proceedings of such Conference,

Given under my Hand and the Seal of the Colony, at Government House, Sydney, in New South Wales aforesaid, this eleventh day of February, in the year of our Lord one thousand eight hundred and eighty-seven, and in the fiftieth year of the Reign of Her Majesty Queen Victoria.

(L.S.)

CARRINGTON.  
By His Excellency's Command,  
HENRY PARKES.

Entered on record by me, in REGISTER OF PATENTS, No. 12, pages 511-512, this eleventh day of February, one thousand eight hundred and eighty-seven.

For the Colonial Secretary and Registrar of Records,  
CRITCHETT WALKER,  
Principal Under Secretary.

Commission appointing Sir Patrick Jennings, K.C.M.G., and the Hon. Robert Wisdom, Q.C., M.L.C.

BY His Excellency the Right Honourable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

To

To Sir PATRICK JENNINGS, K.C.M.G., and the Honourable ROBERT WISDOM, Q.C., M.L.C.,—

Greeting :

WHEREAS it has been determined by Her Majesty's Imperial Government to hold a Conference in London, at which Representatives of the principal Colonial Governments have been invited to attend, to consider matters relating to Imperial and Colonial defence, the promotion of commercial and social relations by the development of postal and telegraphic communications, and other subjects of common interest: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, do, with the advice of the Executive Council of the said Colony, hereby appoint you the said SIR PATRICK JENNINGS and the said ROBERT WISDOM to represent and act in behalf of the Government of New South Wales in and at the said Conference in association with the Agent-General resident in London, SIR SAUL SAMUEL, K.C.M.G., C.B., to confer and deliberate with the other Representatives thereat assembling, and to report from time to time, should occasion arise, to seek fresh instructions, and finally to report fully the proceedings of such Conference.

Given under my Hand and the Seal of the Colony, at Government House, Sydney, in New South Wales aforesaid, this eleventh day of February, in the year of our Lord one thousand eight hundred and eighty-seven, and in the fiftieth year of the Reign of Her Majesty Queen Victoria.

(L.S.)

CARRINGTON.  
By His Excellency's Command,  
HENRY PARKES.

Entered on record by me, in REGISTER OF PATENTS, No. 12, pages 513-14, this eleventh day of February, one thousand eight hundred and eighty-seven.

For the Colonial Secretary and Registrar of Records,  
CRITCHETT WALKER,  
Principal Under Secretary.

The Colonial Secretary to Sir Patrick Jennings, K.C.M.G.

NEW SOUTH WALES.

Sir,

Colonial Secretary's Office, 11 February, 1887.  
Referring to my letter of the present date, I have now the honor to transmit to you herewith the papers specified in the accompanying schedule for use at the forthcoming Conference, to be held in London, upon Imperial and Colonial Defences and other subjects.

I have, &c.,  
HENRY PARKES.

A similar letter was also addressed to the Hon. Robert Wisdom, Q.C., M.L.C.

*Papers referred to.*

1. Imperial and Colonial Defences.
2. New Guinea.
3. New Hebrides.
4. Postal and Telegraphic Communication.

The Colonial Secretary to Sir Patrick Jennings, K.C.M.G.

New South Wales, Colonial Secretary's Office,  
Sydney, 25 March, 1887.

Sir,

I have the honor to inform you that His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of your being allowed a bonus of £1,000 to defray the cost of your passage to and from England, and to cover all your other expenses in connection with your appointment as a representative of this Colony at the Conference to be held in London upon Imperial and Colonial Defence and other subjects during the present year.

I have, &c.,  
HENRY PARKES.

A similar letter was also addressed to the Hon. Robert Wisdom, Q.C., M.L.C.

The Principal Under Secretary to The Under Secretary for Finance and Trade.

Sir,

Colonial Secretary's Office, Sydney, 25 March, 1887.

I am directed by the Colonial Secretary to state, for the information of the Colonial Treasurer, that His Excellency the Governor with the advice of the Executive Council has been pleased to approve of the gentlemen named in the margin being allowed a bonus of £1,000 each to defray the cost of their passages to and from England and to cover all their other expenses in connection with their appointment as representatives of this Colony at the Conference to be held in London upon Imperial and Colonial Defence and other subjects during the present year.

I have, &c.,

CRITCHETT WALKER,  
Principal Under Secretary.

Sir Patrick  
Alfred Jennings,

Telegram from the Agent-General to The Colonial Secretary.

London, 1 April, 1887.

JENNINGS, Wisdom, and self, had interview with the Secretary of State for the Colonies,—has no intention of permitting discussion of Imperial Federation at Conference.—We shall resist any such proposal.

Telegram to The Agent-General and other Representatives at Imperial Conference.

Sydney, 1 April, 1887.

TELEGRAM in papers that Sir Henry Holland proposes to bring question of Imperial Federation under discussion at Imperial Conference. This appears directly opposed to paragraph six of Colonel Stanhope despatch of 25th November, to which your attention is called. I doubt if you should take part in any such discussion.

Telegram from the Premier of Victoria to The Colonial Secretary, New South Wales.

Melbourne, 4 April, 1887.

THE following telegram is published in a Melbourne paper to-day; thinking you might not see it, I forward a copy:—"London, 3rd April. It has been arranged that, in addition to the matters already notified, the Imperial Conference will give consideration to the question of the administration of New Guinea, the New Hebrides dispute, and the deportation of recidivistes to the Pacific. It is understood that Sir Patrick Jennings, as one of the representatives of New South Wales, will take an antagonistic stand against the delegates of the other Australian Colonies on these questions, and especially with regard to the New Hebrides."

Telegram from The Colonial Secretary to Delegates to Imperial Conference.

Sydney, 5 April, 1887.

IF questions of administration of New Guinea, or occupation of New Hebrides, or deportation of French recidivistes to Pacific come before Conference I hope you will be able to co-operate with Victoria and Queensland and other Colonies. Any impolitic course in treatment of questions should be carefully avoided, but united action between the chief Colonies desirable in view of future interests of Australasia.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LAND AT CORNER OF PITT AND BRIDGE STREETS.

(JOHN GARSE'S LETTER OF 15 JUNE, 1887, AND TREASURY MEMORANDA.)

*Ordered by the Legislative Assembly to be printed, 13 July, 1887.*

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 11th July, 1887, That there be laid upon the Table of this House,—

“ A copy of Mr. John Garsed's letter, dated 15th June, 1887, giving the information relative to the payment of rents for land at the corner of Pitt and Bridge Streets, together with the Treasury Memoranda on the subject.”

(*Mr. Hurley.*)

No. 1.

J. Garsed, Esq., to The Secretary for Lands.

[O.H.M.S.]

Sir,

Helsarmel, Leichhardt, 15 June, 1887:

The following is copied from the Votes and Proceedings of the Legislative Assembly:—

*Friday, 10 June, 1887.*

Land at corner of Pitt and Bridge Streets:—Mr. HUGH TAYLOR (for Mr. HURLEY) asked the SECRETARY FOR LANDS,—Having regard to the replies given by him on Friday last, 3 June, in respect to the Crown land at the corner of Pitt and Bridge Streets,—

- (1.) Will he inform the House who received the rents upon the same from the time the Crown took possession under a Writ of Intrusion, issued 23 December, 1862?
- (2.) Have these rents been paid from the time the Crown took possession?
- (3.) Will he produce an attested copy of the Conditional Grant of date 23rd December, 1839; also, an attested copy of any other referring to same land (if any).

Mr. GARRETT answered:—The records of the Treasury do not disclose the information sought as regards the payment of rent. On page 11 of the Progress Report of the Select Committee, ordered by this House on the 17th May, 1878, to be printed, will be found a copy of the grant referred to.

Truth cannot be destroyed,—One Mr. Thomas Gale, who resides at Petersham, has for many years past received the Crown rents, but cannot say if he received the rents from date, the Crown under a Writ of Intrusion, issued 23rd December, 1862,—but to my knowledge Mr. Thomas Gale never erected the buildings or paid one shilling towards the cost of the buildings.

I have before me—(Progress Report, and I now turn to page 11)—the substance of Conditional Grant, executed by His Excellency the Governor, at Government House, Sydney, on the 23rd December, 1839.—Signed, Geo. Gipps.

520—

At a public auction held in conformity with the regulations made for the sale of Crown lands, one John Terry Hughes, on the 15th August, 1839, conditionally purchased an allotment of Crown land, area 6 perches, bounded on one side by the then Pitt-street, and on the other side by a lane  $11\frac{1}{2}$  feet in width.

*The Conditions.*

- (1.) Upon the express condition that the said John Terry Hughes should construct an archway over the Tank Stream, according to a plan deposited in the office of the Town Surveyor.
- (2.) Condition : That John Terry Hughes should erect a first-class building on the said land within two years from 15th August, 1839, the day of sale thereof.

Provided always if the said conditions, or any part thereof, be not duly observed and performed, the said land shall be forfeited.

No attempt was made, either by John Terry Hughes or John Jobbins, or John Jobbins' trustees, to carry out either condition, therefore the land was absolutely forfeited to the Crown on the 15th August, 1841.

The said land,  $11\frac{1}{2}$  feet in width, was reserved by the Government for access to the back of eleven allotments, formerly the old lumber-yard. Those eleven allotments were sold by the Government, subject to a building condition, but His Excellency the Governor, on the 20th November, 1848, was pleased to release the said eleven allotments of land having a frontage to Bridge-street from the building condition attached to them.

The particulars of allotment conditionally sold to John Terry Hughes on 15th August, 1839:—This allotment is no portion of the old lumber-yard; it was an ugly allotment owing to the Tank Stream, an open stream, flowing through the same.

The records in your department merely go back to date 9th August, 1856, and not to 15th August, 1839. The Surveyor-General to Mr. Assistant-Surveyor Burrowes:—This letter refers to Mr. Randle's account for covering in a portion of the Tank Stream.

In September, 1856, the Surveyor-General was most anxious to widen the said  $11\frac{1}{2}$  feet reserved lane to 25 feet wide, and was under the impression the trustees in Jobbins' estate were the legal owners of said allotment of Crown land conditionally purchased by John Terry Hughes on the 15th August, 1839, and forfeited to the Crown on 15th August, 1841.

Read Conditional Grant dated 23rd December, 1839, and you cannot travel outside of the grant.

Mr. Burrowes' duty to have read the present grant. It is evident from last answer to questions no other, with the exception of said Conditional Grant, existed.

On record:—Mr. Assistant-Surveyor Burrowes received a letter dated 31st March, 1857, from Messrs. Nichols & Williams, solicitors, in which Mr. Burrowes is informed that the trustees of the will of the late Mr. Jobbins have no power or authority to surrender the present grant and accept another grant of other land, however beneficial, as no doubt it will be, to the estate. It appears the only course will be to obtain an Act of Council to enable the Government and trustees to do what is required, to which we can see no possible objection.

The said conditional grant was merely waste paper after the allotment was forfeited to the Crown, for non-fulfilment of said conditions.

The said reserved lane was widened, which left a piece of Crown land between Old and New Pitt Streets.

Early in 1857 I instructed Mr. W. R. Smart to purchase, on my account, an allotment of land, corner of Bridge and New Pitt Streets. Mr. Smart shortly after informed me in substance:—The trustees in Jobbins' estate had no power at that date to sell me the land, but if I would lease the land for a short term (if so) the trustees would have the power to sell me the land before the expiration of lease; but in the event I did not purchase the land, I was to have the power to sell any building that I might erect upon the land.

Mr. Assistant-Surveyor Burrowes marked out the boundary of the land, upon which I erected my Commercial Chambers at a cost of about £1,500. I had no idea Mr. Surveyor Burrowes had marked out an allotment of Crown land, and the trustees did not obtain an "Act of Council."

I admit that I have no legal right to the rents of my Commercial Chambers from date the Crown took possession of the land, neither can any other person have a legal right to the rents.

I trust the department will take immediate action to recover the rents dating from the time the Crown took possession.

In your department you will read my letter to the Surveyor-General dated Willow Lodge, Glebe, 28th March, 1857, in which I inform the Surveyor-General I have leased the allotment of land (late Jobbins'), and the officers in your department on reading will learn that at the date of my letter the Tank Stream was an open stream. I made it my business yesterday to learn from a person in occupation of a portion of my buildings, who received the rents.

To arrive at the facts, another Select Committee should be appointed to bring up a final report (after the Crown Solicitor and myself are examined). Owing to the advanced period of the session on the 17th May, 1878, the chairman, John Hurley, Esq., had not time to bring up a final report.

It is never too late to inquire into facts.

I have, &c.,

JOHN GARSED.

No. 2.  
Question.

LEGISLATIVE ASSEMBLY.—FRIDAY, 10TH JUNE, 1887.

No. 3. Mr. Hurley to ask the Secretary for Lands, having regard to the replies given by him on Friday last, 3 June, in respect to the Crown land at the corner of Pitt and Bridge Streets:—

- (1.) Will he inform the House who received the rents for the same from the time the Crown took possession under a Writ of Intrusion, issued 23 December, 1862?
- (2.) Have these rents been paid, and is it his intention to cause the Department to take immediate action to recover the same, dating from the time the Crown took possession?
- (3.) Will he produce an attested copy of the conditional grant of date of 23 December, 1839; also an attested copy of any other grant referring to same land?

Copy of Memoranda furnishing particulars for Mr. Secretary Garrett's reply to above.

Will the Under-Secretary for Finance and Trade be good enough to say if any rents were paid, and if so from whom were they received by the Treasury and the amount.—R.H.D. (for the U.S.). 9 June, 1887. Very urgent. Mr. Walford,—Register and let me know if there are any papers in the records of the Treasury on this subject.—J.T., 9/6/87. I cannot find trace of any papers.—J.S.W., 9/6/87. The Under-Secretary. Mr. Newcombe,—Are you aware of any rents having been paid into the Treasury on account of the property referred to.—J.T., 9/6/87. I am not able to trace any payments on this account.—W.N., 9/6/87. The Under-Secretary for Lands. B.C., 9/6/87.—J.T. (for U.S.).

1887.

(SECOND SESSION.)

NEW SOUTH WALES.

**NITRO-GLYCERINE EXPLOSIVES.**

(AMENDED RATES FOR LIGHTERING, DELIVERING, AND STORING.)

Presented to Parliament, pursuant to Act 40 Vic. No. 1, sec. 41.

The Treasury, New South Wales,  
15th January, 1887.

AMENDED RATES AND CHARGES FOR LIGHTERING, DELIVERING, AND STORING OF NITRO-GLYCERINE EXPLOSIVES.

It is hereby notified, for general information, that in virtue of the provisions contained in clause 1 of the "Gunpowder and Explosives Rates Act of 1884," His Excellency the Governor, with the advice of the Executive Council, has been pleased to prescribe the following rates and charges for Lightering, Delivering, and Storing any Explosive within the meaning of the Act 40 Victoria No. 1, in substitution for the rates and charges prescribed in the third, fourth, and fifth Schedules to such last-mentioned Act,—such rates and charges to be levied and paid on all Nitro-glycerine compounds on and from 1st February, 1887.

P. A. JENNINGS.

**Schedule of Amended Rates for Lightering, Delivering, and Storing of Nitro-glycerine Compounds, made in virtue of the provisions of the "Gunpowder and Explosives Rates Act of 1884."**

**RATES OF LIGHTERAGE FROM SHIP OR VESSEL BY WHICH NITRO-GLYCERINE COMPOUNDS ARE IMPORTED.**

	£	s.	d.
For each barrel or package containing fifty-one pounds of any nitro-glycerine compound and upwards to one hundred pounds .....	0	0	6
For each barrel or package containing fifty pounds of any nitro-glycerine compound and under.....	0	0	4

Any explosive other than gunpowder to be liable to similar charges.

But if the rates shall in any case not amount to ten shillings, the minimum charge instead of the above rates shall be ten shillings.

**RATES OF CHARGES FOR DELIVERY OF NITRO-GLYCERINE EXPLOSIVES FROM MAGAZINES BY LAND AND WATER TRANSPORT, OR SEPARATELY, AS THE CASE MAY BE.**

	£	s.	d.
For one or any number up to ten barrels or packages each containing not more than fifty pounds of any Nitro-glycerine compound but not exceeding ten packages, to be conveyed by land and water at one time on each person's order, the minimum charge to be.....	0	10	0
For every barrel or package each containing not more than fifty pounds of any Nitro-glycerine compound in excess of ten packages conveyed by land and water—at per package.....	0	0	6
For one or any number up to ten barrels or packages each containing fifty-one pounds of any Nitro-glycerine compound and up to one hundred pounds, but not exceeding ten packages to be conveyed by land and water at one time on each person's order, the minimum charge to be .....	1	0	0

	£	s.
For every barrel or package, each containing fifty-one pounds of any Nitro-glycerine compound and up to one hundred pounds in excess of ten packages, to be conveyed by land and water at—per package .....	0	1 0
And in cases of land carriage (exclusive of railway carriage) and water transport being separately done in either of the foregoing cases the charges shall be at half the rates hereinbefore stated.		
For each delivery to places more than two miles distant from the Magazines in Sydney or Newcastle harbours respectively, an extra charge per mile or portion of a mile by land and water to and from such place of delivery to be made for every fifty packages or portion thereof, say .....	0	2 6
For each delivery from any Magazine, other than those of Sydney and Newcastle aforesaid, for every fifty packages or portion thereof, a charge of—per mile to and from such Magazine .....	0	0 2
And for every hour or portion of an hour exceeding thirty minutes, during which the boats or vans may be detained .....	0	5 0
Any explosive other than gunpowder to be liable to similar charges.		

**RATES OF STORAGE.**

## PRESBYTERIAN CEMETERY AT MACLEAN.

(PETITION FROM PRESBYTERIAN RESIDENTS OF THE LOWER CLARENCE.)

*Received by the Legislative Assembly, 11 May, 1887.*

To the Honorable the Speaker and the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Presbyterian residents of the Lower Clarence,—

HUMBLY SHOWETH:—

That the General Assembly of the Presbyterian Assembly of the Presbyterian Church of New South Wales has taken steps and removed the names of Messrs. James M'Donald, Donald Shearer, and Francis M'Kenzie, the surviving Trustees of the Presbyterian Cemetery at Maclean, who were elected in public meeting assembled, and appointed and gazetted by the Government, thereby depriving your Petitioners of their legal rights to the said Cemetery, a privilege they have enjoyed for the last twenty-two (22) years; and your Petitioners would point out that at the aforesaid public meeting it was unanimously agreed that the aforesaid Trustees, together with Messrs. Alexander Cameron and John M'Lachlan, since deceased, should represent the entire Presbyterian body on the Lower Clarence then existing.

Your Petitioners would point out to your Honorable House that the aforesaid Cemetery was granted by the Government about the year 1863 or 1864, A.D., a period at which the said United Presbyterian Church of New South Wales, now claiming exclusive right to the said Cemetery, was not then in existence.

Therefore your Petitioners contend that the Presbyterian Assembly, which embodies within itself but a small portion of the Presbyterians in the district, and which continues to enjoy a common right with your Petitioners to the use of the Cemetery, were not justified in adopting the course they did.

And your Petitioners humbly pray that your Honorable House will restore to them the aforesaid Presbyterian Cemetery, Maclean, as their legal rights, and reinstate Messrs. James M'Donald, Donald Shearer, and Francis M'Kenzie, as Trustees, their number to be completed in the regular and legal way, there being no grounds of complaint against them by the General Presbyterian body on the river.

And your Petitioners humbly pray that your Honorable House will take these premises into favourable consideration and grant their request; and your Petitioners, as in duty bound, will ever pray.

[Here follow 307 signatures.]

NEW SOUTH WALES.

**PUBLIC ABATTOIR, GLEBE ISLAND.**  
(AMENDED ORDERS AND REGULATIONS)

Presented to Parliament, pursuant to Act 14 Vic. No. 36, sec. 4.

The Treasury, New South Wales,  
8th June, 1887.

**PUBLIC ABATTOIR, GLEBE ISLAND.**

His Excellency the Governor having been pleased, with the advice of the Executive Council, further to amend the "Orders and Regulations" concerning the Public Abattoir at Glebe Island, as published in Government Gazette of 3rd December, 1886, it is hereby notified that, in lieu thereof, the following shall be enforced, on and after the 1st day of July, 1887.

J. F. BURNS.

**ORDERS AND REGULATIONS.**

1. The Abattoir shall, during the period from 1st October to 31st March, be open daily (Sundays excepted) for the despatch of business, from the hours of 5 o'clock a.m. to 6 o'clock p.m. (except on Mondays, on which day the Abattoir will be open from 2 o'clock a.m. to 6 o'clock p.m., and on Saturdays from 2 o'clock a.m. to 3 o'clock p.m.), and during the period from the 1st of April to the 30th September, from 6 o'clock a.m. to 6 o'clock p.m. (excepting on Fridays, when the hours will be from 5 o'clock a.m. to 6 o'clock p.m., and on Saturdays, from 5 o'clock a.m. to 3 o'clock p.m.); and no slaughtering of cattle will be permitted during any other hour or day than the hours and days above mentioned, nor shall any person be allowed to come within the enclosures of the Abattoir except at such times as they are open for business. Pigs, lambs, and calves may, however, be slaughtered and dressed at the Abattoir during the nights of Friday, between the 1st of October and the 31st of March in each year.

2. The slaughter-houses shall, with the exception of six beef, six mutton, and two pig slaughter-houses, be retained in the hands of the Government for the use of the public.

3. Six beef, six mutton, and two pig slaughter-houses may be submitted to public competition, by lease, at an upset price to be announced at the time of sale, should it be decided to submit the same to auction.

4. A fee of threepence for inspecting brands shall be charged upon every head of horned cattle slaughtered in the leased houses.

5. Parties desirous of using the slaughter-houses reserved by the Government shall be permitted to do so on payment of the following fees:—

	s.	d.
For every ox, cow, bull, or heifer, or steer (including inspection fee of 3d.).....	1	0
For every calf not exceeding six months old (including an inspection fee) .....	0	6
For every sheep or lamb .....	0	1½
For every head of swine.....	0	6

6. All fees shall be paid at the office of the Inspector of the Abattoir, on demand, to such officer, or to his Assistant, and shall thereafter be paid into the Colonial Treasury under such directions as shall from time to time be given by the Secretary for Finance and Trade.

7. Printed receipts shall be given to all parties paying fees.

8. No person or persons shall yard or slaughter, or cause to be yarded or slaughtered, any animal at the reserved slaughter-houses without the sanction of the Inspector or Assistant Inspector.

9. The hours during which cattle may be driven in and yarded for slaughter shall be from 5 o'clock a.m. to 8 o'clock a.m., between the 1st October and the 31st March, and from 6 o'clock a.m. to 8 o'clock a.m., between the 1st April to the 30th September in each year, daily, including Sundays; and cattle shall in all cases be inspected before being slaughtered. Milch cows and stall-fed cattle may be driven in between the hours of 12 noon and 3 o'clock p.m., during week days only.

10. No person or persons shall slaughter, or cause to be slaughtered, any animal in any of the slaughtering-houses on Glebe Island, without the sanction of the Inspector or Assistant Inspector. And in all cases when carcasses are brought to the Abattoir dressed or to be dressed, notice shall be given to the Inspector or the Assistant Inspector on the arrival of the same; but no animal slaughtered outside the Abattoir and brought there with the head detached from the body will be allowed to be dressed there. In no case shall the body be brought into the Abattoir until seen by the Inspector or Assistant Inspector. In all cases the owner thereof, or the persons occupying a slaughter-house, shall be held liable for any breach of this Regulation.

11. Any animal brought to the Abattoir for slaughter, which appears to the Inspector or Assistant Inspector to be diseased, shall be disposed of in such manner as the Inspector or Assistant Inspector may direct, to secure the slaughtering, examination, and final disposal of the same. If the owner shall object to such direction, he may require the animal to be

inspected by an officer of the Board of Health, whose decision shall be final. In all such cases the owner of the animal, or the person occupying the slaughter-house, shall be held liable for any breach of this Regulation.

12. The Inspector and Assistant Inspector are hereby empowered to control and direct the traffic, wheeled or otherwise, for the safety and convenience of business at the Abattoir.

13. Should any animal die while in the pens connected with the Abattoir, the owner of the animal, or person occupying the pen at such time, shall immediately remove the whole carcase from the island, and destroy the same forthwith.

14. All animals on which fees are charged shall be reported to the Inspector or Assistant Inspector without delay, and the fees paid forthwith; failing such payment either of the said officers may close and lock the doors leading from the pens to the pithing or slaughtering floors, until the said fees are paid.

15. Sheep and cattle will not be permitted to remain in the Abattoir pens for more than forty-eight hours from the time of being brought in.

16. No lessee or occupier of any slaughter-house connected with the Abattoir shall expose for sale any meat which has been condemned by the Inspector or Assistant Inspector; and any such lessee or occupier shall, when ordered to do so by the Inspectors aforesaid, immediately remove such meat from the Abattoir, and cause the same to be destroyed by fire or boiled down for the purpose only of extracting tallow. The Inspector or Assistant Inspector is hereby empowered, in the event of non-compliance with his order for the removal of the said meat, to destroy the same at the cost of such lessee or occupier.

17. The lessee or occupier of any slaughter-house shall thoroughly cleanse the same, to the satisfaction of the Inspector or Assistant Inspector, immediately after slaughtering has been carried on, and with respect to the offal and blood, may select and shall immediately remove, each day, at such time during the day as may be appointed by the Inspector or Assistant Inspector for the purpose, such portions, not being the whole of such offal and blood, as the said lessee or occupier may require for disposal for human food; and failing such removal at the time so appointed, the whole of such offal and blood may be removed by the Government.

18. The premises attached to, and the roadways in front and rear of, each slaughter-house shall be kept clean by the lessee or person occupying or using the same, to the satisfaction of the Inspector or Assistant Inspector of the Abattoir.

19. The lessees of sheep and pig slaughtering-houses shall severally furnish to the Inspector or Assistant Inspector, at their respective offices, on or before the 4th day of each month, a monthly return of all such animals as shall have been slaughtered at such houses.

20. No hide, carcase, or spleen of any horned cattle (not having been previously inspected) shall be removed from any slaughter-house until after the same has been inspected by the Inspector or Assistant Inspector of Abattoir.

21. Any meat found blown at the Abattoir may be condemned by the Inspector or Assistant Inspector, and the owner or person found blowing the same will be held liable.

22. The lessee or occupier of any slaughter-house shall cause the vessels and water used in dressing carcases therein to be kept clean to the satisfaction of the Inspector or Assistant Inspector.

23. Cattle, as they are brought in for slaughter, shall be kept separate from those already in the yards, until the brands of those so brought in shall have been inspected.

24. All hides, skins, heads, feet, and offal shall be removed from the Abattoir only by way of the road at the rear of the buildings.

25. The hours fixed for driving animals into the pens of the reserved mutton slaughter-houses shall be from 6 o'clock a.m. to 6 o'clock p.m., between the 1st of October and the 31st of March in each year, and between the 1st of April and the 30th of September the hours shall be from 7 o'clock a.m. to 4 o'clock p.m. in each year.

26. It is strictly prohibited to place candles or lights of any description upon or against the walls, or upon or against any portion of the woodwork of the Abattoir or stables, or any other building or buildings in connection therewith; and the lessee or person occupying the Abattoir or stable where such prohibited candle or light is found will be held responsible for the same.

27. In cases where water is found running to waste in any Abattoir, the lessee or occupant will be held responsible for such waste.

28. Gaming is prohibited at the Abattoir, also the tossing up or pitching of coin, throwing of dice, or playing of cards, under any pretext whatever.

29. Any person wilfully or negligently causing injury to any Government property of any description whatever at the Abattoir will be held responsible for the same.

30. The use of obscene or offensive language, the throwing of missiles, filth, or muck of any kind, or riotous conduct, or disorderly noise, is strictly prohibited within the enclosure of the Abattoir.

31. The lessee or occupier of any slaughter-house is prohibited from using, or causing to be used, any instrument for driving in cattle to the Abattoir, other than such as may be approved of by the Inspector or Assistant Inspector.

32. The Inspector or Assistant Inspector, or any other officer connected with the Glebe Island Abattoir, may at any time enter to view any of the slaughter-houses connected with the Abattoir, whether leased or otherwise; and no person or persons shall obstruct, molest, or assail with abusive or offensive language, either the Inspector, Assistant Inspector, or any other officer connected with the Abattoir while in the execution of his official duties.

33. It shall be competent for the Inspector of the Abattoir at any time, should any person or persons occupying any of the slaughter-houses reserved by the Government be found breaking or continuing to break any one or more of the Regulations made concerning the Public Abattoir at Glebe Island, to refuse to allow such person or persons to use any of the slaughter-houses reserved by the Government.

34. The owner or driver of any vehicle used for the transmission of meat from the Abattoir shall keep the same and the awnings used therewith in clean and proper condition to the satisfaction of the Inspector or Assistant Inspector of the Abattoir; and further, the driver of any such vehicle during the transmission of such meat shall keep himself and clothing in clean and proper condition to the satisfaction of the Inspector or Assistant Inspector, and shall wear, while loading meat, a garment formed with a hood for covering the head, the garment to extend below the hips, and to be made of strong oilskin.

35. The lessee or occupier of any beef slaughter-house shall cause the contents of the paunches and intestines to be deposited on the manure pit at the rear of the Abattoir; and the lessee or occupier of any sheep or pig slaughter-house shall cause the contents of the paunches and intestines to be deposited in the shoot erected for that purpose.

36. The lessee of any beef slaughter-house or houses shall not slaughter, or cause to be slaughtered therein, any sheep, lambs, or pigs.

37. Persons are prohibited from bringing to and depositing at the Abattoir offal or other offensive matter.

38. The lessees or occupants of the slaughter-houses shall limewash the walls of their respective houses inside every month, between the dates of the 1st and 7th inclusive of each month, to the satisfaction of the Inspector or Assistant Inspector. The Department to supply, free of cost, the necessary quantity of lime for such purpose.

39. Any person or persons offending against or failing to comply with any of the orders and regulations contained in paragraphs 1, 8, 9, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 34, 35, 36, 37, and 38 shall for each and every offence forfeit and pay a sum not exceeding five pounds.

40. Any person or persons offending against any of the orders or regulations contained in paragraphs 10 and 11 shall for each and every offence forfeit and pay a sum not exceeding five pounds nor less than fifty shillings.

1887.

### Observations.

#### Question 1.

Whether or not these newspapers at the present time are registered according to the requirements of the Newspaper Acts it is impossible for me to say. The Acts require a registration of all newspapers on every change of ownership, &c. Some of these newspapers, therefore, may have changed ownership several times since their last registration. See sections 2, 3, and 16, 8 Geo. 4 No. 2; see also section 6, 5 Vic. No. 19.

I believe a great many of these 117 newspapers have ceased being published; which of them I am unable to state.

#### Question 2.

Nearly the same observation will apply to this question. Again, some of the recognizances, &c., may not be in strict conformity with the requirements of the Acts. To examine each set of papers in reference to each newspaper critically, would involve time, which it is impossible for me, consistently with the due performance of my regular duties, to bestow.

#### Question 3.

In addition to these 117 newspapers properly registered, so far as I know, there are several newspapers registered, but not in compliance with the Acts.

FRED. CHAPMAN,

Prothonotary.

15/4/87.

—  
LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

SUNDAY LECTURES, &c., IN THEATRES.

(OPINIONS OF VARIOUS ATTORNEYS-GENERAL UPON.)

*Ordered by the Legislative Assembly to be printed, 15 June, 1887.*

Opinion of Mr. Attorney-General Wisdom.

The Crown Law Offices, Sydney, 3 September, 1880.

It is very doubtful whether the Lecture advertised to be delivered by Mr. Proctor on Sunday evening next is an "entertainment" within the meaning of the Act 21 Geo. III c. 49. Taking into consideration the preamble and purview of that statute, I am inclined to think that it is not, but even if it be, the Police have no power summarily to interfere with it. If the delivery of the lecture be an offence against the statute the proper course will be to proceed against the parties offending, either for the penalties, or by way of prosecution as prescribed in the Act. This, however, may form a subject for consideration hereafter.

I do not think either, that this is such a case as is contemplated in section 5 of the Public Exhibitions Act (14 Victoria, No. 23). That section authorizes the Colonial Secretary, whenever he shall be of opinion "that it is fitting for the preservation of good manners, decorum, or of the public peace, so to do, to forbid by writing under his hand the acting or presenting any stage-play, or any act, scene, or entertainment of the stage, as hereinbefore mentioned, or part thereof, or any prologue or epilogue, or any part thereof in such theatres, &c." Now Mr. Proctor's proposed lecture does not come within the class of entertainments which may be forbidden under the above, nor can it be said to be necessary to prohibit, in order to the preservation of good manners, decorum, or the public peace.

ROBERT WISDOM, A.-G.

Opinion of Mr. Attorney-General Dalley.

I AM of opinion that the Colonial Secretary may, if he deems it expedient, embody in the license issued by him the condition which is contained in the Victorian license, as to Sunday openings of the theatre being subject to his consent.

W.B.D., 6/8/84.

Opinion of Mr. Attorney-General Want.

I HAVE read Mr. Dalley's opinion with regard to this matter, and fully concur with it.

I cannot see how in any way this entertainment can be held to come under the designation of a theatrical representation, or a theatrical performance. The license granted in this case contains a prohibition against performances authorized, yet being performed, on Sunday, Good Friday, or Christmas Day; but there is nothing in section 2 of the principal Act, 14 Vic. No. 23, to prevent a person receiving payment for the use of a building for any purpose which is not referred to by the 2nd section of that Act. It also seems to me that a concert is not an entertainment, which, under section 5 of the 14 Vic. No. 23, could be forbidden, on the grounds that such prohibition is necessary, on the grounds of good manners, decorum, or public peace. I must therefore concur in the opinion expressed by Mr. Attorney-General Wisdom and Mr. Attorney-General Dalley.

J. H. WANT.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

**SUNDAY LECTURES AND ENTERTAINMENTS.**  
(PETITION FROM INHABITANTS OF NEW SOUTH WALES.)

---

*Received by the Legislative Assembly, 5 July, 1887.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned inhabitants of New South Wales,—

HUMBLY SHOWETH:—

That your Petitioners regard with much satisfaction the action of the Government in prohibiting the use of licensed buildings for lectures and entertainments on the Lord's Day, for which a fixed charge is made, as they consider that such lectures and entertainments are an infringement of statute law at present in force in the Colony, and subversive of good government and morality.

They therefore pray that your Honorable House will be pleased to uphold the decision of the Government, and refuse to allow any such lectures or entertainments on the Lord's Day.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 36,200 signatures.*]

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

THE OPIUM TRADE.

(PETITION—MODERATOR OF THE FEDERAL ASSEMBLY OF THE PRESBYTERIAN CHURCHES OF AUSTRALIA AND TASMANIA.)

*Received by the Legislative Assembly, 5 April, 1887.*

To the Honorable the Speaker and the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petitioner of the undersigned the Moderator of the Federal Assembly of the Presbyterian Churches of Australia and Tasmania, in common with his fellow Ministers and Elders, who constitute the said Federal Assembly of the Presbyterian Churches of Australia and Tasmania, and whom, *ex officio*, he is appointed to represent,—

HUMBLY SHOWETH:—

1. That your Petitioner, having in view the well-being of this community, regards with feelings of alarm the largely increasing consumption of opium by Chinese residents of the Colony.
2. That the use of opium is exceedingly hurtful to all persons who habitually indulge in that narcotic, and also to the general population, for the following reasons:—
  - a. That the constant use of opium is calculated to impair the moral and physical systems, and consequently to induce habits of indolence.
  - b. That by reason of the indolence so induced the persons so affected are unfitted for and undesirous of pursuing any mechanical or other useful occupation, and that to this cause are to be attributed the gambling and criminal propensities of Chinese opium-eaters.
  - c. That the conditions under which opium is consumed in this community cause large numbers of Chinese to assemble in ill-ventilated and crowded apartments, whereby, in addition to the obvious evils arising from the use of the opium, these resorts are turned into hot-beds for the generation of fevers and cognate diseases.
  - d. That many European girls and women, after being induced to use the narcotic, become *habitués* of the same resorts, and that scenes of the grossest immorality ensue.
3. Your Petitioner accordingly desires to point out—
  - (1.) That the use of opium in China is confined to the very lowest orders of Chinese society, and that those using it are regarded unfavourably by their fellow-countrymen.
  - (2.) That in the event of the introduction of opium into New South Wales being prohibited by law, there will be very little inducement for its consumers to come to this Colony, while, on the other hand, Chinese of a superior class, recognizing that under the altered conditions their presence on these shores would be more favourably regarded, will, in all probability, be led to cast in their lot among us.

Your Petitioner therefore humbly prayeth—

1. That at an early date a measure may be framed and laid before the Parliament prohibiting the importation of opium into this Colony, excepting for medicinal purposes, and that such measure may also provide against the sale of opium, excepting for medicinal purposes, and where the purchaser can produce a satisfactory prescription or certificate from a duly and legally qualified practitioner asking or recommending that the same may be supplied.

2. That the said measure may be so framed as to come into operation at the expiration of six months from the passing thereof.

Signed at Sydney, in the name and on behalf of the Federal Assembly of the Presbyterian Churches of Australia and Tasmania, this twenty-eighth day of July, one thousand eight hundred and eighty-six.

JAMES NISH, D.D.,  
Moderator.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data.

In the second section, the author outlines the various methods used to collect and analyze the data. These include direct observation, interviews with key personnel, and the use of specialized software tools. Each method is described in detail, highlighting its strengths and potential limitations.

The third section presents the results of the study. It shows a clear trend of increasing activity over the period observed. The data indicates that the most significant changes occurred in the latter half of the study period.

Finally, the document concludes with a series of recommendations based on the findings. It suggests that further research should be conducted to explore the underlying causes of the observed trends. Additionally, it provides practical advice for how the information can be used to improve operational efficiency.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**THE UNEMPLOYED.**

(PETITION FROM, TO BE HEARD AT BAR OF THE HOUSE.)

*Received by the Legislative Assembly, 5 April, 1887.*

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

The humble Petition of the undersigned Unemployed Artisan and Labouring Classes of Sydney,—

HUMBLY SHOWETH :—

That for the period of the last eighteen months, and more particularly during the last six, the want of continuous and remunerative employment has been keenly felt by a large section of the industrial classes, entailing a large amount of deprivation and suffering upon themselves and families, which is so extremely opposite to the former conditions of Australian life.

That your Petitioners who have entered into engagements to provide themselves with a freehold home for the better bringing up of a family are now sorely troubled with the fear of losing the hard-earned savings of the past in being unable to meet the periodical payments required to accomplish that object through this long-pressing want of continuous and remunerative employment.

Your Petitioners therefore humbly pray,—

That a representative or representatives of the unemployed artisan and labouring classes appointed in public meeting assembled may be heard at the Bar of your Honorable House, with the object of bringing more directly before your Honorable House the hardship and distress caused by this lengthened want of employment, and devise such means as will give relief and open up avenues for permanent and profitable employment, so as to restore the favourable conditions of the Australian labour market of former times.

And your Petitioners, as in duty bound, will ever pray.

Signed on behalf of the above Petitioners,—

E. J. EDWARDS, Chairman.

THOMAS SYMONS, Secretary.
